Production Note

Cornell University Library produced this volume to preserve the informational content of the deteriorated original. The best available copy of the original has been used to create this digital copy. It was scanned bitonally at 600 dots per inch resolution and compressed prior to storage using ITU Group 4 compression. Conversion of this material to digital files was supported by the Andrew W. Mellon Foundation. Digital file copyright by Cornell University Library 1995.

This volume has been scanned as part of The Making of America Project, a cooperative endeavor undertaken to preserve and enhance access to historical material from the nineteenth century.

LITTELL'S

LIVING AGE.

E Pluribus Unum.

"These publications of the day should from time to time be winnowed, the wheat carefully preserved, and the chaff thrown away."

"Made up of every creature's best."

"Various, that the mind
Of desultory man, studious of change,
And pleased with novelty, may be indulged."

TABLE OF THE PRINCIPAL CONTENTS

THE LIVING AGE, VOLUME CXXXVI.

THE TWENTY-FIRST QUARTERLY VOLUME OF THE FIFTH SERIES.

JANUARY, FEBRUARY, MARCH, 1878.

EDINBURGH REVIEW.

Ulfilas, the Apostle of the Goths, . . . 195
Dr. Schliemann's Exploration of Mycenæ, ... 643

QUARTERLY REVIEW.

Lord Melbourne, ... 387
A French Critic on Goethe, ... 451
March of an English Generation through Life, ... 515

BRITISH QUARTERLY REVIEW.

Precious Stones, ... 707

WESTMINSTER REVIEW.

Charles Sumner, ... 579
The Education of Girls: Their Admissibility to Universities, ... 685
The Telephone, ... 761

CONTEMPORARY REVIEW.

On the Hygienic Value of Plants in Rooms and in the Open Air, . 47
Russian Aggression, as Specially Affecting Austro-Hungary and Turkey, 94
The Ninety Years' Agony of France, . 131
The Greek Mind in the Presence of Death, Interpreted from Reliefs and Inscriptions on Athenian Tombs, ... 280
The Little Health of Ladies, ... 302

FORTNIGHTLY REVIEW.

Humming-Birds, ... 3
Florence and the Medici, ... 67
The Dutch in Java, ... 323

NINETEENTH CENTURY.

Hydrophobia and Rabies, ... 220
France as a Military Power in 1870 and in 1878, ... 259
An Oxford Lecture by Ruskin, . . 502
Shakespeare in France, ... 533
Benedict de Spinoza, ... 771
How the Turks Rule Armenia, . . 809

BLACKWOOD'S MAGAZINE.

Schools of Mind and Manners, . . . 352
French Home Life. Religion, . . . 559
A Ride for Life, ... 631
Above the Clouds: a Reverie on the Bel Alp, ... 678

FRASER'S MAGAZINE.

Murder of Commissioner Fraser, . . 440
The Great Fourfold Waterfall, . . 493

GENTLEMAN'S MAGAZINE.

Quevedo, ... 736

CORNHILL MAGAZINE.

Charlotte Brontë, ... 23
The Celt of Wales and the Celt of Ireland, ... 151
The Czar's Clemency: a Polish Priest's Story, ... 294
Will o' the Mill, ... 366
Congregational Singing, ... 419
A Ring of Worlds, ... 797

MACMILLAN'S MAGAZINE.

Heligoland, ... 58
Modern Life and Insanity, ... 178
Dulcissima! Dilectissima! 445
Natural Religion, ... 477
Docteur Lavardin: a Sketch, . . . 525
Constantinople, ... 619

GOOD WORDS.

Doris Barugh, ... 34, 76, 241

EXAMINER.

Irrigation in India, ... 189
The Vice of Talking Shop, ... 380
Lay-Figures, ... 818

SPECTATOR.

The Prince Consort's Savings, . . . 55
Forgetfulness, ... 62
Smith's Poor Kin, ... 186
Pepperiness, ... 191
Charles Dickens's Verse, ... 237

AUTUMN.

THE dying leaves fall fast,
Chestnut, willow, oak, and beech,
All brown and withered lie.
Now swirling in the cutting blast,
Now sodden under foot — they teach
That one and all must die.

This autumn of the year
Comes sadly home to my poor heart,
Whose youthful hopes are fled.
The darkening days are drear,
Each love once mine I see depart
As withered leaves and dead.

But is it all decay?
All present loss? — no gain remote?
Monotony of pain?
Ah no! I hear a lay
The robin sings — how sweet the note,
A pure unearthly strain.

And, of all flowers the first,
Beneath these leaves in spring shall blow
Sweet violets blue and white.
So all lost loves shall burst,
In springlike beauty, summer glow,
In Heaven upon our sight.

Macmillan's Magazine. M. C. C.

VIXI PUELLIS. (Hor. iii. 26.)

WE loved of yore, in warfare bold
Nor laurelless. Now all must go;
Let this left wall of Venus show
The arms, the tuneless lyre of old.

Here let them hang, the torches cold,
The portal-bursting bar, the bow,
We loved of yore.

But thou, who Cyprus sweet dost hold,
And Memphis free from Thracian snow,
Goddess and queen, with vengeful blow,
Smite, — smite but once that pretty scold
We loved of yore.

Spectator. AUSTIN DOBSON.

AN UNEQUAL GAME.

A MOMENT of loving and laughter,
A jest and a gay good-bye.
If you one short week after
Forget, why may not I?

To you but a moment's feeling,
A touch and a tender tone;
A wound that knows no healing
To me who am left alone.

A wound, and an aching wonder
That lightly you go from me,
That we must be kept asunder
By the cold abiding sea.

Blackwood's Magazine.

AN OCTOBER GARDEN.

IN my autumn garden I was fain
To mourn among my scattered roses:
Alas for that last rosebud which uncloses
To autumn's languid sun and rain,
When all the world is on the wane!
Which has not felt the sweet constraint of June,
Nor heard the nightingale in tune.

Broad-faced asters by my garden walk,
You are but coarse compared with roses:
More choice, more dear that rosebud which uncloses
Faint-scented, pinched, upon its stalk,
That least and last which cold winds balk;
A rose it is tho' least and last of all,
A rose to me tho' at the fall.

Athenæum. CHRISTINA G. ROSSETTI.

FONS BANDUSIÆ. (Hor. iii. 13.)

O BABBLING spring! than glass more clear,
Worthy of wine, and wreath not sere,
To-morrow shall a kid be thine
With swelled and sprouting brows for sign,
Sure sign! of loves and battles near.

Child of the race that butt and rear!
Not less, alas! his life-blood dear
Shall tinge thy cold wave crystalline,
O babbling spring!

Thee Sirius knows not. Thou dost cheer
With pleasant cool the plough-worn steer,
The wandering flock. This verse of mine
Shall rank thee one with founts divine;
Men shall thy rock and tree revere,
O babbling spring!

Spectator.

AN AUTUMN SONG.

THE wind is sighing,
The rose is dying,
The swallow is flying
Over the sea;
The leaf is yellow,
The fruit hangs mellow,
The summer's knell, low,
Sounds o'er the lea.

Winter is coming,
East winds are dumbing,
The golden bee's humming,
The reaper's at rest;
Young Love, a rover
'Mong corn and clover,
His wanderings over,
Flies to my breast.

HORACE L. NICHOLSON.
St. James's Magazine.

From The Fortnightly Review.

HUMMING-BIRDS.

THERE are now about ten thousand different kinds of birds known to naturalists, and these are classed in one hundred and thirty families which vary greatly in extent, some containing a single species only, while others comprise many hundreds. The two largest families are those of the warblers, with more than six hundred, and the finches, with more than five hundred species spread over the whole globe; the hawks and the pigeons, also spread over the whole globe, number about three hundred and thirty and three hundred and sixty species respectively; while the diminutive humming-birds, confined to one hemisphere, consist of about four hundred different species. They are thus, as regards the number of distinct kinds collected in a limited area, the most remarkable of all the families of birds. It may, however, very reasonably be asked, whether the four hundred species of humming-birds above alluded to are really all distinct — as distinct on the average as the ten thousand species of birds are from each other. We reply that they certainly are perfectly distinct species which never intermingle; and their differences do not consist in color only, but in peculiarities of form, of structure, and of habits, so that they have to be classed in more than a hundred distinct genera or systematic groups of species, these genera being really as unlike each other as stonechats and nightingales, or as partridges and blackcocks. The figures we have quoted, as showing the proportion of birds in general to humming-birds, thus represent real facts; and they teach us that these small and in some respects insignificant birds constitute an important item in the animal life of the globe.

Humming-birds are, in many respects, unusually interesting and instructive. They are highly peculiar in form, in structure, and in habits, and are quite unrivalled as regards variety and beauty. Though the name is familiar to every one, few but naturalists are acquainted with the many curious facts in their history, or know how much material they afford for admiration and study. I propose, therefore, to give a brief and popular account of the form, structure, habits, distribution, and affinities of this remarkable family of birds.

The humming-birds form one compact family, named *Trochilidæ*. They are all small birds, the largest known being about the size of a swallow, while the smallest are minute creatures whose bodies are hardly larger than a humble-bee. Their distinguishing features are, excessively short legs and feet, very long and pointed wings, a long and slender bill, and a long extensible tubular tongue; and these characters are found combined in no other birds. The feet are exceedingly small and delicate, often beautifully tufted with down, and so short as to be hardly visible beyond the plumage. The toes are placed as in most birds, three in front and one behind, and have very strong and sharply curved claws; and the feet serve probably to cling to their perch rather than to support the weight of the body. The wings are long and narrow, but strongly formed, and the first quill is the longest, a peculiarity found in hardly any other birds but a few of the swifts. The bill varies greatly in length, but is always long, slender, and pointed, the upper mandible being the widest and lapping over the lower at each side, thus affording complete protection to the delicate tongue, the perfect action of which is essential to the bird's existence. The humming-bird's tongue is very long, and is capable of being greatly extended beyond the beak and rapidly drawn back, by means of muscles which are attached to the hyoid or tongue bones and bend round over the back and top of the head to the very forehead, just as in the woodpeckers. The two blades or laminæ, of which the tongues of birds usually seem to be formed, are here greatly lengthened, broadened out, and each rolled up; so as to form a complete double tube connected down the middle, and with the outer edges in contact but not united. The extremities of the tubes are, however, flat and fibrous. This tubular and retractile tongue enables the bird to suck up honey from the nectaries of flowers and also to capture small insects, but whether the latter pass down the tubes or are entangled in the fibrous tips and thus drawn

back into the gullet is not known. The only other birds with a similar tubular tongue are the sun-birds of the East, which, however, as we shall presently explain, have no affinity whatever with the humming-birds.

The colors of these small birds are exceedingly varied and exquisitely beautiful. The basis of the coloring may be said to be green, as in parrots; but, whereas in the latter it is a silky green, in humming-birds it is always metallic. The majority of the species have some green about them, especially on the back; but in a considerable number rich blues, purples, and various shades of red are the prevailing tints. The greater part of the plumage has more or less of a metallic gloss, but there is almost always some part which has an intense lustre as if actually formed of scales of burnished metal. A gorget covering the greater part of the neck and breast most commonly displays this vivid color, but it also frequently occurs on the head, on the back, on the tail-coverts above or below, on the upper surface of the tail, on the shoulders or even the quills. The hue of every precious stone and the lustre of every metal is here represented; and such terms as topaz, amethyst, beryl, emerald, garnet, ruby, sapphire, golden, golden-green, coppery, fiery, glowing, iridescent, refulgent, celestial, glittering, shining, are constantly used to name or describe the different species. No less remarkable than the colors are the varied developments of plumage with which these birds are adorned. The head is often crested in a variety of ways; either a simple flat crest, or with radiating feathers, or diverging into two horns, or spreading laterally like wings, or erect and bushy, or recurved and pointed like that of a plover. The throat and breast are usually adorned with broad, scale-like feathers, or these diverge into a tippet, or send out pointed collars, or elegant frills of long and narrow plumes tipped with metallic spots of various colors. But the tail is even a more varied and beautiful ornament, either short and rounded, but pure white or some other strongly contrasted tint, or with short pointed feathers forming a star, or with the three outer feathers on each side long and tapering to a point; or larger, and either square or round, or deeply forked, or acutely pointed; or with two middle feathers excessively long and narrow; or with the tail very long and deeply forked, with broad and richly-colored feathers; or with the two outer feathers wire-like and having broad spoon-shaped tips. All these ornaments, whether of the head, neck, breast, or tail, are invariably colored in some effective or brilliant manner, and often contrast strikingly with the rest of the plumage. Again, these colors often vary in tint according to the direction in which they are seen. In some species they must be looked at from above, in others from below, in some from the front, in others from behind, in order to catch the full glow of the metallic lustre. Hence when the birds are seen in their native haunts, the colors come and go and change with their motions, so as to produce a startling and beautiful effect.

It is a well-known fact that, when male birds possess any unusual ornaments, they take such positions or perform such evolutions as to exhibit them to the best advantage while endeavoring to attract or charm the females or in rivalry with other males. It is therefore probable that the wonderfully varied decorations of humming-birds, whether burnished breast-shields, resplendent tail, crested head, or glittering back, are thus exhibited; but almost the only actual observation of this kind is that of Mr. Belt, who describes how two males of the *Florisuga mellivora* displayed their ornaments before a female bird. One would shoot up like a rocket, then suddenly expanding the snow-white tail like an inverted parachute, slowly descend in front of her, turning round gradually to show off both back and front. The expanded white tail covered more space than all the rest of the bird, and was evidently the grand feature of the performance. Whilst one was descending, the other would shoot up and come slowly down expanded.*

The bill differs greatly in length and shape, being either straight or gently

curved, in some species bent like a sickle, in others turned up like the bill of the avoset. It is usually long and slender, but in one group is so enormously developed that it is nearly the same length as the rest of the bird. The legs, usually little seen, are in some groups adorned with globular tufts of white, brown, or black down, a peculiarity possessed by no other birds. The reader will now be in a position to understand how the four hundred species of humming-birds may be easily distinguished, by the varied combinations of the characters here briefly enumerated, together with many others of less importance. One group of birds will have a short round tail, with crest and long neck-frill; another group a deeply-forked broad tail, combined with glowing crown and gorget; one is both bearded and crested; others have a luminous back and pendent neck-plumes; and in each of these groups the species will vary in combinations of color, in size, and in the proportions of the ornamental plumes, so as to produce an unmistakable distinctness; while, without any new developments of form or structure, there is room for the discovery of hundreds more of distinct kinds of humming-birds.

The name we usually give to the birds of this family is derived from the sound of their rapidly-moving wings, a sound which is produced by the largest as well as by the smallest member of the family. The Creoles of Guiana similarly call them *bourdons* or hummers. The French term, *oiseau-mouche*, refers to their small size; while *colibri* is a native name which has come down from the Carib inhabitants of the West Indies. The Spaniards and Portuguese call them by more poetical names, such as flower-peckers, flower-kissers, myrtle-suckers, — while the Mexican and Peruvian names showed a still higher appreciation of their beauties, their meaning being rays of the sun, tresses of the day-star, and other such appellations. Even our modern naturalists, while studying the structure and noting the peculiarities of these living gems, have been so struck by their inimitable beauties that they have endeavored to invent appropriate English names for the more beautiful and remarkable genera. Hence we find in common use such terms as sun-gems, sun-stars, hill-stars, wood-stars, sun-angels, star-throats, comets, coquettes, flame-bearers, sylphs, and fairies; together with many others derived from the character of the tail or the crests.

The Motions and Habits of Humming-birds. — Let us now consider briefly the peculiarities of flight, the motions, the food, the nests, and general habits of the humming-birds, quoting the descriptions of those modern naturalists who have personally observed them. Their appearance, remarks Professor Alfred Newton, is entirely unlike that of any other bird. "One is admiring some brilliant and beautiful flower, when between the blossom and one's eye suddenly appears a small dark object, suspended as it were between four short black threads meeting each other in a cross. For an instant it shows in front of the flower; again another instant, and emitting a momentary flash of emerald and sapphire light, it is vanishing, lessening in the distance, as it shoots away, to a speck that the eye cannot take note of." Audubon observes that the ruby humming-birds pass through the air in long undulations, but the smallness of their size precludes the possibility of following them with the eye farther than fifty or sixty yards, without great difficulty. A person standing in a garden by the side of a common althæa in bloom, will hear the humming of their wings and see the little birds themselves within a few feet of him one moment, while the next they will be out of sight and hearing. Mr. Gould, who visited North America in order to see living humming-birds while preparing his great work on the family, remarks that the action of the wings reminded him of a piece of machinery acted upon by a powerful spring. When poised before a flower, the motion is so rapid that a hazy semicircle of indistinctness on each side of the bird is all that is perceptible. Although many short intermissions of rest are taken, the bird may be said to live in the air — an element in which it performs every kind of evolution with the utmost ease, frequently rising perpendicularly, flying backward, pirouetting or dancing off,

as it were, from place to place, or from one part of a tree to another, sometimes descending, at others ascending. It often mounts up above the towering trees, and then shoots off like a little meteor at a right angle. At other times it gently buzzes away among the little flowers near the ground; at one moment it is poised over a diminutive weed, at the next it is seen at a distance of forty yards, whither it has vanished with the quickness of thought.

The rufous flame-bearer, an exquisite species found on the west coast of North America, is thus described by Mr. Nuttall: "When engaged in collecting its accustomed sweets, in all the energy of life, it seemed like a breathing gem, a magic carbuncle of flaming fire, stretching out its glorious ruff as if to emulate the sun itself in splendor." The Sappho comet, whose long forked tail barred with crimson and black renders it one of the most imposing of humming-birds, is abundant in many parts of the Andes; and Mr. Bonelli tells us that the difficulty of shooting them is very great, from the extraordinary turns and evolutions they make when on the wing; at one instant darting headlong into a flower, at the next describing a circle in the air with such rapidity that the eye, unable to follow the movement, loses sight of the bird until it again returns to the flower which at first attracted its attention. Of the little vervain humming-bird of Jamaica, Mr. Gosse writes: "I have sometimes watched with much delight the evolutions of this little species at the moringa tree.* When only one is present, he pursues the round of the blossoms soberly enough. But if two are at the tree, one will fly off, and suspend himself in the air a few yards distant; the other presently starts off to him, and then, without touching each other, they mount upwards with strong rushing wings, perhaps for five hundred feet. They then separate, and each starts diagonally towards the ground like a ball from a rifle, and wheeling round comes up to the blossoms again as if it had not moved away at all. The figure of the smaller humming-birds on the wing, their rapidity, their wavering course, and their whole manner of flight are entirely those of an insect." Mr. Bates remarks that on the Amazons during the cooler hours of the morning and from four to six in the afternoon humming-birds are to be seen whirring about the trees by scores; their motions being unlike those of any other birds. They dart to and fro so swiftly that the eye can scarcely follow them, and when they stop before a flower it is only for a few moments. They poise themselves in an unsteady manner, their wings moving with inconceivable rapidity, probe the flower, and then shoot off to another part of the tree. They do not proceed in that methodical manner which bees follow, taking the flowers seriatim, but skip about from one part of the tree to another in the most capricious way. Mr. Belt remarks on the excessive rapidity of the flight of the humming-bird giving it a sense of security from danger, so that it will approach a person nearer than any other bird, often hovering within two or three yards (or even one or two feet) of one's face. He watched them bathing in a small pool in the forest, hovering over the water, turning from side to side by quick jerks of the tail, now showing a throat of gleaming emerald, now shoulders of glistening amethyst, then darting beneath the water, and rising instantly, throw off a shower of spray from its quivering wings, and again fly up to an overhanging bough and commence to preen its feathers. All humming-birds bathe on the wing, and generally take three or four dips, hovering between times about three or four inches above the surface. Mr. Belt also remarks on the immense numbers of humming-birds in the forests, and the great difficulty of seeing them; and his conclusion is, that in the part of Nicaragua where he was living they equalled in number all the rest of the birds together, if they did not greatly exceed them.

The extreme pugnacity of humming-birds has been noticed by all observers. Mr. Gosse describes two meeting and chasing each other through the labyrinths of twigs and flowers, till, an opportunity occurring, the one would dart with seeming fury upon the other, and then, with a loud rustling of their wings, they would twirl together, round and round, till they nearly came to the earth. Then they parted, and after a time another tussle took place. Two of the same species can hardly meet without an encounter, while in many cases distinct species attack each other with equal fury. Mr. Salvin describes the splendid *Eugenes fulgens* attacking two other species with as much ferocity as its own fellows. One will knock another off its perch, and the two will go fighting and screaming away at a pace hardly to be followed by the eye. Audubon says they

* Sometimes called the horse-radish tree. It is the *Moringa pterygosperma*, a native of the East Indies, but commonly cultivated in Jamaica. It has yellow flowers.

attack any other birds that approach them, and think nothing of assaulting tyrant-shrikes and even birds of prey that come too near to their home.

The food of humming-birds has been a matter of much controversy. All the early writers down to Buffon believed that they lived solely on the nectar of flowers; but since that time every close observer of their habits maintains that they feed largely, and in some cases, wholly, on insects. Azara observed them on the La Plata in winter, taking insects out of the webs of spiders at a time and place where there were no flowers. Bullock, in Mexico, declares that he saw them catch small butterflies, and that he found many kinds of insects in their stomachs. Waterton made a similar statement. Hundreds and perhaps thousands of specimens have since been dissected by collecting naturalists, and in almost every instance their stomachs have been found full of insects, sometimes, but not generally, mixed with a proportion of honey. Many of them in fact may be seen catching gnats and other small insects just like fly-catchers, sitting on a dead twig over water, darting off for a time in the air, and then returning to the twig. Others come out just at dusk, and remain on the wing, now stationary, now darting about with the greatest rapidity, imitating in a limited space the evolutions of the goatsuckers, and evidently for the same end and purpose. Mr. Gosse also remarks: "All the humming-birds have more or less the habit, when in flight, of pausing in the air and throwing the body and tail into rapid and odd contortions. This is most observable in the *Polytmus*, from the effect that such motions have on the long feathers of the tail. That the object of these quick turns is the capture of insects, I am sure, having watched one thus engaged pretty close to me. I observed it carefully, and distinctly saw the minute flies in the air which it pursued and caught, and heard repeatedly the snapping of the beak. My presence scarcely disturbed it, if at all."

There is also an extensive group of small brown humming-birds, forming the sub-family *Phaëthornithinæ*, which rarely or never visit flowers, but frequent the shady recesses of the forest, where they hunt for minute insects. They dart about among the foliage, and visit in rapid succession every leaf upon a branch, balancing themselves vertically in the air, passing their beaks closely over the under surface of each leaf, and thus capturing, no doubt, any small insects that may lurk there. While doing this, the two long feathers of the tail have a vibrating motion, serving apparently as a rudder to assist them in performing the delicate operation. Others search up and down stems and dead sticks in the same manner, every now and then picking off something, exactly as a bush-shrike or a tree-creeper does, with the difference that the humming-bird is constantly on the wing; while the remarkable sickle-bill is said to probe the scale-covered stems of palms and tree-ferns to obtain its insect food. It has also been often stated that, although humming-birds are very bold and easily tamed, they cannot be preserved long in captivity, even in their own country, when fed only on syrup. Audubon states that when thus fed they only live a month or two and die apparently starved; while if kept in a room whose open windows are covered with a fine net, so as to allow small insects to enter, they have been kept for a whole year without any ill effects. Another writer, Mr. Webber, captured and tamed a number of the ruby-throat in the United States. He found that when fed for three weeks on syrup they drooped, but after being let free for a day or two they would return to the open cage for more of the syrup. Some which had been thus tamed and set free, returned the following year, and at once flew straight to the remembered little cup of sweets. Mr. Gosse in Jamaica also kept some in captivity, and found the necessity of giving them insect food; and he remarks that they were fond of a small ant that swarmed on the syrup with which they were fed. It is strange that, with all this previous experience and information, those who have attempted to bring live humming-birds to this country have fed them exclusively on syrup; and the weakness produced by this insufficient food has no doubt been the chief cause of their death on, or very soon after, arrival. A box of ants would not be difficult to bring as food for them, but even finely-chopped meat or yolk of egg would probably serve, in the absence of insects, to supply the necessary proportion of animal food.

The nests of the humming-birds are, as might be expected, beautiful objects, some being no larger inside than the half of a walnut-shell. These small cup-shaped nests are often placed in the fork of a branch, and the outside is sometimes beautifully decorated with pieces of lichen, the body of the nest being formed of cottony substances and the inside lined with the finest and most silky fibres. Others suspend

their nests to creepers hanging over water, or even over the sea; and the Pichincha humming-bird once attached its nest to a straw rope hanging from the roof of a shed. Others again build nests of a hammock form attached to the face of rocks by spider's web: while the little forest-haunting species fasten their nests to the points or to the under sides of palm-leaves or other suitable foliage. They lay only one or two white eggs.

Geographical Distribution and Variation. — Most persons know that humming-birds are found only in America; but it is not so generally known that they are almost exclusively tropical birds, and that the few species that are found in the temperate (northern and southern) parts of the continent are migrants, which retire in the winter to the warmer lands near or within the tropics. In the extreme north of America two species are regular summer visitants, one on the east and the other on the west of the Rocky Mountains. On the east the common North American or ruby-throated humming-bird extends through the United States and Canada, and as far as 57° north latitude, or considerably north of Lake Winnipeg; while the milder climate of the west coast allows the rufous flame-bearer to extend its range to beyond Sitka to the parallel of 61°. Here they spend the whole summer, and breed, being found on the Columbia River in the latter end of April, but retire to Mexico in the winter. Supposing that those which go furthest north do not return further south than the borders of the tropics, these little birds must make a journey of full three thousand miles each spring and autumn. The Antarctic humming-bird visits the inhospitable shores of Tierra del Fuego, where it has been seen visiting the flowers of fuchsias in a snow-storm, while it spends the winter in the warmer parts of Chili and Bolivia. In the southern parts of California and the central United States three or four other species are found in summer; but it is only when we enter the tropics that the number of different kinds becomes considerable. In Mexico there are more than thirty species, while in the southern parts of Central America there are more than double that number. As we go on towards the equator they become still more numerous, till they reach their maximum in the equatorial Andes. They especially abound in the mountainous regions; while the luxuriant forest plains of the Amazons, in which so many other forms of life reach their maximum, are very poor in humming-birds. Brazil, being more hilly and with more variety of vegetation, is richer, but does not equal the Andean valleys, plateaux, and volcanic peaks. Each separate district of the Andes has its peculiar species and often its peculiar genera, and many of the great volcanic mountains possess kinds which are confined to them. Thus, on the great mountain of Pichincha there is a peculiar species found at an elevation of about fourteen thousand feet only; while an allied species on Chimborazo ranges from fourteen thousand feet to the limits of perpetual snow at sixteen thousand feet elevation. It frequents a beautiful yellow-flowered alpine shrub belonging to the *Asteraceæ*. On the extinct volcano of Chiriqui in Veragua a minute humming-bird, called the little flame-bearer, has been only found inside the crater. Its scaled gorget is of such a flaming crimson that, as Mr. Gould remarks, it seems to have caught the last spark from the volcano before it was extinguished.

Not only are humming-birds found over the whole extent of America, from Sitka to Tierra del Fuego, and from the level of the sea to the snow-line on the Andes, but they inhabit many of the islands at a great distance from the mainland. The West Indian islands possess fifteen distinct species belonging to eight different genera, and these are so unlike any found on the continent that five of these genera are peculiar to the Antilles. Even the Bahamas, so close to Florida, possess two peculiar species. The small group of islands called Tres Marias, about sixty miles from the west coast of Mexico, has a peculiar species. More remarkable are the two humming-birds of Juan Fernandez, situated in the Pacific Ocean four hundred miles west of Valparaiso in Chili, one of these being peculiar; while another species inhabits the little island Mas-a-fuera, ninety miles further west. The Galapagos, though very little further from the mainland and much more extensive, have no humming-birds, neither have the Falkland Islands; and the reason seems to be that both these groups are deficient in forest, and in fact have hardly any trees or large shrubs, while there is a great paucity of flowers and of insect life.

The three species which inhabit Juan Fernandez and Mas-a-fuera present certain peculiarities of great interest. They form a distinct genus, *Eustephanus*, one species of which inhabits Chili as well as the island of Juan Fernandez. This, which may be termed the Chilian species, is greenish in both sexes, whereas in the two

species peculiar to the islands the males are red or reddish-brown, and the females green. The two red males differ very slightly from each other, but the three green females differ considerably; and the curious point is, that the female in the smaller and more distant island somewhat resembles the same sex in Chili, while the female of the Juan Fernandez species is very distinct, although the males of the two islands are so much alike. As this forms a comparatively simple case of the action of the laws of variation and natural selection, it will be instructive to see if we can picture to ourselves the process by which the changes have been brought about. We must first go back to an unknown but rather remote period, just before any humming-birds had reached these islands. At that time a species of this peculiar genus, *Eustephanus*, must have inhabited Chili; but we must not be sure that it was identically the same as that which is now found there, because we know that species are always undergoing change to a greater or less degree. After perhaps many failures, one or more pairs of the Chilian bird got blown across to Juan Fernandez, and finding the country favorable, with plenty of forests and a fair abundance of flowers and insects, they rapidly increased and permanently established themselves on the island. They soon began to change color, however, the male getting a tinge of reddish-brown, which gradually deepened into the fine color now exhibited by the two insular species, while the female, more slowly, changed to white on the under surface and on the tail, while the breast-spots became more brilliant. When the change of color was completed in the male, but only partially so in the female, a further emigration westward took place to the small island Mas-a-fuera, where they also established themselves. Here, however, the change begun in the larger island appears to have been checked, for the female remains to this day intermediate between the Juan Fernandez and the Chilian forms. More recently, the parent form has again migrated from Chili to Juan Fernandez, where it still lives side by side with its greatly changed descendant.* Let us now see how far these facts are in accordance with the general laws of variation, and with those other laws which I have endeavored to show regulate the development of color.* The amount of variation which is likely to occur in a species will be greatly influenced by two factors — the occurrence of a change in the physical conditions, and the average abundance or scarcity of the individuals composing the species. When from these or other causes variation occurs, it may become fixed as a variety or a race, or may go on increasing to a certain extent, either from a tendency to vary along certain special lines induced by local or physiological causes, or by the continued survival and propagation of all such varieties as are beneficial to the race. After a certain time a balance will be arrived at, either by the limits of useful variation in this one direction having been reached, or by the species becoming harmoniously adapted to all the surrounding conditions; and without some change in these conditions the specific form may then remain unaltered for a very long time, whence arises the common impression of the fixity of species. Now in a country like Chili, forming part of a great continent very well stocked with all forms of organic life, the majority of the species would be in a state of stable equilibrium, the most favorable variations would have been long ago selected, and the numbers of individuals in each species would be tolerably constant, being limited by the numerous other forms whose food and habits were similar, or which in any way impinged upon its sphere of existence. We may, therefore, assume that the Chilian humming-bird which migrated to Juan Fernandez was a stable form, hardly if at all different from the existing species which is termed *Eustephanus galeritus*. On the island it met with very changed but highly favorable conditions. An abundant shrubby vegetation and a tolerably rich flora; less extremes of climate than on the mainland; and, most important of all, absolute freedom from the competition of rival species. The flowers and their insect inhabitants were all its own; there were no snakes or mammalia to plunder its nests; nothing to prevent the full enjoyment of existence. The consequence would be, rapid increase and a large permanent population, which still maintains itself; for Mr. Moseley, of the "Challenger" expedition, has informed the writer that humming-birds are extraordinarily abundant in Juan Fernandez, every bush or tree having

* In the preceding account of the probable course of events in peopling these islands with humming-birds, I follow Mr. Sclater's paper on the Land-birds of Juan Fernandez, — Ibis, 1871, p. 183. In what follows, I give my own explanation of the probable causes of the change.

* See *Macmillan's Magazine*, Sept., 1877, "On the Colors of Animals and Plants."

one or two darting about it. Here, then, we have one of the special conditions which have always been held to favor variation — a great increase in the number of individuals; but, as there was no struggle with allied creatures, there was no need for any modification in form or structure, and we accordingly find that the only important variations which have become permanent are those of size and of color. The increased size would naturally arise from greater abundance of food with a more equable climate throughout the year, the healthier, stronger, and larger individuals being preserved. The change of color would depend on molecular changes in the plumage accompanying the increase of size; and the superior energy and vitality in the male, aided by the favorable change in conditions and rapid increase of population, would lead to an increased intensity of colór, the special tint being determined either by local conditions or by inherited tendencies in the race. It is to be noted that the change from green to red is in the direction of the less refrangible rays of the spectrum, and is in accordance with the law of change which has been shown to accompany expansion in inorganic, and growth and development in organic, forms.* The change of color in the female, not being urged on by such intense vital activity as in the case of the male, would be much slower, and, owing probably to inherited tendencies, in a different direction. The under surface of the Chilian bird is ashy with bronzy-green spots on the breast, while the tail is entirely bronze-green. In the Juan Fernandez species the under surface has become pure white, the breast-spots larger and of a purer golden-green, while the whole inner web of the tail-feathers has become pure white, producing a most elegant effect when the tail is expanded.

We may now follow the two sexes to the remoter island, at a period when the male had acquired his permanent style of coloring, but was not quite so large as he subsequently became; while the change of the female bird had not been half completed. In this small and comparatively barren island (a mere rock, as it is described by some authors) there would be no such constant abundance of food, and therefore no possibility of a large permanent population; while the climate would not differ materially from that of the larger island; variation would therefore be checked, or might be stopped altogether; and we find the facts exactly correspond to this view. The male, which had already acquired his color, remains almost undistinguishable; but he is a little smaller than his immediate ancestral form, indicating either that the full size of that form had not been acquired at the period of migration, or that a slight diminution of size has since occurred owing to a deficiency of food. The female shows also a slight diminution of size, but in other respects is almost exactly intermediate between the Chilian and Juan Fernandez females. The color beneath is light ashy, the breast-spots are intermediate in size and color, and the tail-feathers have a large ill-defined white spot on the end of the inner web, which has only to be extended along the whole web to produce the exact character which has been acquired in Juan Fernandez. It has probably remained since its migration nearly or quite stationary, while its Juan Fernandez relative has gone on steadily changing in the direction already begun; and the more distant species geographically thus appears to be more nearly related to its Chilian ancestor.

Coming down to a more recent period, we find that the comparatively small and dull-colored Chilian bird has again migrated to Juan Fernandez, but it at once came into competition with its red descendant, which had firm possession of the soil and had probably undergone slight constitutional changes exactly fitting it to its insular abode. The new comer, accordingly, only just manages to maintain its footing; for we are told by Mr. Reed, of Santiago, that it is by no means common; whereas, as we have seen, the red species is excessively abundant. We may further suspect that the Chilian birds now pass over pretty frequently to Juan Fernandez, and thus keep up the stock; for it must be remembered that whereas, at a first migration, both a male and a female are necessary for colonization, yet, after a colony is formed, any stray bird which may come over adds to the numbers, and checks permanent variation by cross-breeding.

We find, then, that all the chief peculiarities of the three allied species of humming-birds which inhabit the Juan Fernandez group of islands, may be fairly traced to the action of those general laws which Mr. Darwin and others have shown to determine the variations of animals and the perpetuation of those variations. It is also instructive to note that the greater variations of color and size have been accompanied by several lesser variations

in other characters. In the Juan Fernandez bird the bill has become a little shorter, the tail-feathers somewhat broader, and the fiery cap on the head somewhat smaller; all these peculiarities being less developed or absent in the birds inhabiting Mas-a-fuera. These may be due, either to what Mr. Darwin has termed correlation of growth, or to the partial reappearance of ancestral characters under more favorable conditions, or to the direct action of changes of climate and of food; but they show us how varied and unaccountable are the changes in specific forms that may be effected in a comparatively short time, and through very slight changes of locality.

If now we consider the enormously varied conditions presented by the whole continent of America — the hot, moist, and uniform forest-plains of the Amazon; the open llanos of the Orinoco; the dry uplands of Brazil; the sheltered valleys and forest slopes of the eastern Andes; the verdant plateaus, the barren paramos, the countless volcanic cones with their peculiar alpine vegetation; the contrasts of the east and west coasts; the isolation of the West Indian islands, and to a less extent of Central America and Mexico, which we know have been several times separated from South America; and when we further consider that all these characteristically distinct areas have been subject to cosmical and local changes, to elevations and depressions, to diminution and increase of size, to greater extremes and greater uniformity of temperature, to increase or decrease of rainfall, and that with these changes there have been coincident changes of vegetation and of animal life, all affecting in countless ways the growth and development, the forms and colors, of these wonderful little birds — if we consider all these varied and complex influences, we shall be less surprised at their strange forms, their infinite variety, their wondrous beauty. For how many ages the causes above enumerated may have acted upon them we cannot say; but their extreme isolation from all other birds, no less than the abundance and variety of their generic and specific forms, clearly point to a very high antiquity.

The Relations and Affinities of Humming-birds.— The subject of the position of this family in the class of birds and its affinities or resemblances to other groups, is so interesting, and affords such good opportunities for explaining some of the best-established principles of classification in natural history in a popular way, that we propose to discuss it at some length, but without entering into technical details.

There is in the eastern hemisphere, especially in tropical Africa and Asia, a family of small birds called sun-birds, which are adorned with brilliant metallic colors, and which, in shape and general appearance, much resemble humming-birds. They frequent flowers in the same way, feeding on honey and insects; and all the older naturalists placed the two families side by side as undoubtedly allied. In the year 1850, in a general catalogue of birds, Prince Lucien Bonaparte, a learned ornithologist, placed the humming-birds next to the swifts, and far removed from the *Nectarinidæ* or sun-birds; and this view of their position has gained ground with increasing knowledge, till now all the more advanced ornithologists have adopted it. Before proceeding to point out the reasons for this change of view, it will be well to discuss a few of the general principles which guide naturalists in the solution of such problems.

It is now generally admitted that, for the purpose of determining obscure and doubtful affinities, we must examine by preference those parts of an animal which have little or no direct influence on its habits and general economy. The value of an organ, or of any detail of structure, for purposes of classification, is generally in inverse proportion to its adaptability to special uses. And the reason of this is apparent when we consider that similarities of food and habits are often accompanied by similarities of external form or of special organs, in totally distinct animals. Porpoises, for example, are modified externally so as to resemble fishes, yet they are really mammalia. Some marsupials are carnivorous, and are so like true carnivora that it is only by minute peculiarities of structure that the skeleton of the one can be distinguished from that of the other. Many of the hornbills and toucans have the same general form, and resemble each other in habits, in food, and in their enormous bills; yet peculiarities in the structure of the feet, in the form of the breast-bone, in the cranium, and in the texture and arrangement of the plumage, show that they have no real affinity, the former approaching the kingfishers, the latter the cuckoos. These last-mentioned peculiarities have no direct relation to habits, and they are therefore little liable to change, when from any cause a portion of the group may have been driven to adopt a new mode of life. Thus all the Old World apes, however much they may

differ in size or habits, and whether we class them as baboons, monkeys, or gorillas, have the same number of teeth; while the American monkeys all have an additional premolar tooth. This difference can have no relation to the habits of the two groups, because each group exhibits differences of habits greater than often occur between American and Asiatic species; and it thus becomes a valuable character, indicating the radical distinctness of the two groups, distinctness confirmed by other anatomical peculiarities.

On the other hand, details of organization which seem specially adapted to certain modes of life, are often diminished or altogether lost in a few species of the group, showing their essential unimportance to the type as well as their small value for classification. Thus, the woodpeckers are most strikingly characterized by a very long and highly extensible tongue, with the muscles attached to the tongue-bone prolonged backward over the head so as to enable the tongue to be suddenly darted out, and also by the rigid and pointed tail, which is a great help in climbing up the vertical trunks of trees. But in one group (the *Picumni*), the tail becomes quite soft, while the tongue remains fully developed; and in another (*Meiglyptes*) the characteristic tail remains, while the prolonged hyoid muscles have almost entirely disappeared, and the tongue has consequently lost its peculiar extensile power. Yet in both these cases the form of the breast-bone and the character of the feet, the skeleton, and the plumage, show that the birds are really woodpeckers, while even the habits and the food are very little altered. In like manner the bill may undergo great changes, as from the short crow-like bill of the true birds-of-paradise to the long slender bills of the *Epimachinæ* which latter were on that account long classed apart in the tribe of *Tenuirostres*, or slender-billed birds, but whose entire structure shows them to be closely allied to the paradise-birds. So, the long feathery tongue of the toucans differs from that of every other bird, yet it is not held to overbalance the weight of anatomical peculiarities which show that these birds are allied to the barbets and the cuckoos.

The skeleton, therefore, and especially the sternum or breast-bone, affords us an almost infallible guide in doubtful cases, because it appears to change its form with extreme slowness, and thus indicates deeper-seated affinities than those shown by organs which are in direct connection with the outside world, and are readily modified in accordance with varying conditions of existence. Another, though less valuable guide, is afforded, in the case of birds, by the eggs. These often have a characteristic form and color, and a peculiar texture of surface, running unchanged through whole genera and families which are nearly related to each other, however much they may differ in outward form and habits. Another detail of structure which has no direct connection with habits and economy is the manner in which the plumage is arranged on the body. The feathers of birds are by no means set uniformly over their skin, but grow in certain definite lines and patches, which vary considerably in shape and size in the more important orders and tribes, while the mode of arrangement agrees in all which are known to be closely related to each other; and thus the form of the feather-tracts, or the "pterylography" as it is termed, of a bird is a valuable aid in doubtful cases of affinity.

Now, if we apply these three tests to the humming-birds, we find them all pointing in the same direction. The sternum or breast-bone is not notched behind; and this agrees with the swifts, and not with the sun-birds, whose sternum has two deep notches behind, as in all the families of the vast order of *Passeres*, to which the latter belong. The eggs of both swifts and humming-birds are white, only two in number, and resembling each other in texture. And in the arrangement of the feather-tracts the humming-birds approach more nearly to the swifts than they do to any other birds; and altogether differ from the sun-birds, which, in this respect as in so many others, resemble the honey-suckers of Australia and other true passerine birds.

Having this clue to their affinities, we shall find other peculiarities common to these two groups, the swifts and the humming-birds. They have both ten tail-feathers, while the sun-birds have twelve. They have both only sixteen true quill-feathers, and they are the only birds which have so small a number. The humming-birds are remarkable for having, in almost all the species, the first quill the longest of all, the only other birds resembling them in this respect being a few species of swifts; and lastly, in both groups the plumage is remarkably compact and closely pressed to the body. Yet with all these points of agreement, we find an extreme diversity in the bills and tongues of the two groups. The

swifts have a short, broad, flat bill, with a flat, horny-tipped tongue of the usual character; while the humming-birds have a very long, narrow, almost cylindrical bill, containing a tubular and highly extensible tongue. The essential point however is, that whereas hardly any of the other characters we have adduced are adaptive, or strictly correlated with habits and economy, this character is pre-eminently so; for the swifts are pure aërial insect-hunters, and their short, broad bills, and wide gape, are essential to their mode of life. The humming-birds, on the other hand, are floral insect-hunters, and for this purpose their peculiarly long bills and extinsile tongues are especially adapted; while they are at the same time honey-suckers, and for this purpose have acquired the tubular tongue. The formation of such a tubular tongue out of one of the ordinary kind is easily conceivable, as it only requires to be lengthened, and the two laminæ of which it is composed curled in at the sides; and these changes it probably goes through in the young birds. When on the Amazon I once had a nest brought me containing two little unfledged humming-birds, apparently not long hatched. Their beaks were not at all like those of their parents, but short, triangular, and broad at the base, just the form of the beak of a swallow or swift slightly lengthened. Thinking (erroneously) that the young birds were fed by their parents on honey, I tried to feed them with a syrup made of honey and water, but though they kept their mouths constantly open as if ravenously hungry, they would not swallow the liquid, but threw it out again and sometimes nearly choked themselves in the effort. At length I caught some minute flies, and on dropping one of these into the open mouth it instantly closed, the fly was gulped down, and the mouth opened again for more; and each took in this way fifteen or twenty little flies in succession before it was satisfied. They lived thus three or four days, but required more constant care than I could give them. These little birds were in the "swift" stage; they were pure insect-eaters, with a bill and mouth adapted for insect-eating only. At that time I was not aware of the importance of the observation of the tongue, but as the bill was so short and the tubular tongue not required, there can be little doubt that the organ was, at that early stage of growth, short and flat, as it is in the birds most nearly allied to them.

In respect of all the essential and deep-seated points of structure, which have been shown to offer such remarkable similarities between the swifts and the humming-birds, the sun-birds of the eastern hemisphere differ totally from the latter, while they agree with the passerine birds generally, or more particularly with the creepers and honeysuckers. They have a deeply-notched sternum; they have twelve tail-feathers in place of ten; they have nineteen quills in place of sixteen; and the first quill, instead of being the longest, is the very shortest of all; while the wings are short and round, instead of being excessively long and pointed. Their plumage is arranged differently; and their feet are long and strong, instead of being excessively short and weak. There remain only the superficial characters of small size and brilliant metallic colors to assimilate them with the humming-birds, and one structural feature — a tubular and somewhat extensile tongue. This however is a strictly adaptive character, the sun-birds feeding on small insects and the nectar of flowers, just as do the humming-birds; and it is a remarkable instance of a highly peculiar modification of an organ occurring independently in two widely separated groups. In the sun-birds the hyoid or tongue muscles do not extend so completely over the head as they do in the humming-birds, so that the tongue is less extensible; but it is constructed in exactly the same way by the inrolling of the two laminæ of which it is composed. The tubular tongue of the sun-birds is a special adaptive modification acquired within the family itself, and not inherited from a remote ancestral form. This is shown by the amount of variation this organ exhibits in different members of what is undoubtedly one family. It is most highly developed in the *Arachnotheræ*, or spider-hunters of Asia, which are sun-birds without any metallic or other brilliant coloring. These have the longest bills and tongues, and the most developed hyoid muscles; they hunt much about the blossoms of palm-trees, and may frequently be seen probing the flowers while fluttering clumsily in the air, just as if they had seen and attempted to imitate the aërial gambols of the American humming-birds. The true metallic sun-birds generally cling about the flowers with their strong feet; and they feed chiefly on minute hard insects, as do many humming-birds. There is, however, one species (*Chalcoparia phœnicotis*) always classed as a sun-bird, which differs entirely from the rest of the species in having the tongue flat, horny, and forked

at the tip; and its food seems to differ correspondingly, for small caterpillars were found in its stomach. More remotely allied, but yet belonging to the same family, are the little flower-peckers of the genus *Diceum*, which have a short bill and a tongue twice split at the end; and these feed on small fruits, and perhaps on buds and on the pollen of flowers. The little white-eyes (*Zosterops*), which are probably allied to the last, eat soft fruits and minute insects. We have here a whole group of birds considerably varied in external form, yet undoubtedly closely allied to each other, one division of which is specially adapted to feed on the juices secreted by flowers and the minute insects that harbor in them; and these alone have a lengthened bill and double tubular tongue, just as in the humming birds. We can hardly have a more striking example of the necessity of discriminating between adaptive and purely structural characters. The same adaptive character may coexist in two groups which have a similar mode of life, without indicating any affinity between them, because it may have been acquired by each independently to enable it to fill a similar place in nature. In such cases it is found to be an almost isolated character, connecting apparently two groups which otherwise differ radically. Non-adaptive, or purely structural characters, on the other hand, are such as have, probably, been transmitted from a remote ancestor, and thus indicate fundamental peculiarities of growth and development. The changes of structure rendered necessary by modifications of the habits or instincts of the different species have been made, to a great extent, independently of such characters, and as several of these may always be found in the same animal, their value becomes cumulative. We thus arrive at the seeming paradox, that the *less* of direct use is apparent in any peculiarity of structure, the *greater* is its value in indicating true, though perhaps remote, affinities; while any peculiarity of an organ which seems essential to its possessor's well-being is often of very little value in indicating affinity for other creatures.

This somewhat technical discussion will, it is hoped, enable the general reader to understand some of the more important principles of the modern or natural classification of animals, as distinguished from the artificial system which long prevailed. It will also afford him an easily remembered example of those principles, in the radical distinctness of two families of birds often confounded together, — the sun-birds of the eastern hemisphere and the humming-birds of America; and in the interesting fact that the latter are essentially swifts — profoundly modified, it is true, for an aërial and flower-haunting existence, but still bearing in many important peculiarities of structure the unmistakable evidences of a common origin.

ALFRED R. WALLACE.

ERICA.*

TRANSLATED FOR THE LIVING AGE FROM THE GERMAN OF

FRAU VON INGERSLEBEN.

XI.

THE ABDUCTION.

THE next day brought equally bright sunlight, and the guests at the watering-place all went out on the sea. The princess' yawl appeared garlanded with flowers and adorned with tiny flags, and the lovely woman felt so much flattered by the attention she attracted, that she even bestowed a patronizing smile on Caroline Sternau, who, with her family, had joined the party.

Erica had only seen the gay throng from a distance. Seated on the steps of her veranda, she watched for the return of the little flotilla. The distance was too great for her to be able to distinguish individuals, but she knew that the first boat contained the princess, Elmar, and Caroline, and endeavored to make her imagination complete the picture. Absorbed in her fancies, she remained on the steps for some time longer. Evening was closing in, the bright colors in the western sky were fading, and one star after another appeared. Erica knew that the princess had accepted an invitation to spend the evening with a neighboring family, and therefore paid no attention to Christine, who called her as she carried the lamp into the little parlor, whose glass doors opened upon the veranda.

At last she saw a large party come up the street in the twilight. The figure of the princess, in a gleaming white cloak, was clearly visible, and to her surprise she perceived little Carlos beside his mother. True, she knew that the latter rarely left the boy, but the hour seemed somewhat late for the little fellow. In spite of her efforts, she could not distinguish the persons who followed, but she heard Caroline's

musical laugh, and recognized the deep voice of Herr von Wehlen, who seemed absorbed in an animated conversation.

When the party had ascended the hill to the neighboring house — whose lighted windows gleamed brightly in the darkness — she at last rose and went in. Christine had already set the table, and Erica, who always made tea for her mother, approached it to perform her duties. The invalid was lying in an armchair with half-closed eyes, in a sort of lethargy, a condition that frequently overpowered her, and which she was no longer able to shake off as before by her strength of will. She therefore took no notice of Erica's restless manner, and indeed could scarcely hold the cup her daughter handed to her.

After the meal was over, the latter, as usual, took a book to read aloud to her mother for an hour. Her mind was not fixed upon what she was reading, and it therefore not only lacked expression, but often distinctness. The listener, who usually criticised everything very subtly, and considered the hour devoted to reading aloud more as a lesson than a time of recreation, seemed, however, perfectly satisfied, for she made no remark, and Erica went on and on, occasionally glancing at the clock to see whether the appointed time had expired.

At last Christine entered the room. She made a pretext of some errand, and then with the familiarity of an old servant, instantly commenced a conversation.

"Nobody would believe what kind of doings are going on in Waldbad. Every day there is some new amusement, and to-day, when they have all been out on the sea for hours, they might surely spend the evening quietly at home. But no, our neighbor — who would be much better employed if he kept his children's rabbits in order — is giving a great party to-night. All the rooms are crowded with people, who are laughing and making such a noise that one can hear it in our garden through the open windows, and they're playing on the piano and dancing besides. Our well is half empty, for of course everybody wants some water to drink, and none will do except ours. What is to come of it, I'm sure I don't know."

Her mistress, who slowly rose from her chair, put a stop to Christine's eloquence. "I am tired and will go to bed," said the invalid in a low tone. "You would probably like to go out this beautiful evening, Erica, and convince yourself of the truth of Christine's story, so you will be glad to shorten the hour for reading. Good night, my child," and the bowed figure, leaning on the old servant's arm, tottered out of the room.

Erica scarcely found herself alone, ere she pushed open the glass doors and went out on the veranda. A soft breeze was blowing, that gently fanned her cheeks and seemed to lure her forward. At first she found herself surrounded by impenetrable darkness, which appeared all the deeper when contrasted with the bright glow that streamed from the little windows of the drawing-room upon a narrow space in the immediate vicinity of the house. But when she had left this circle of light and entered the gloom, the dark outlines of the bushes, the houses, and all solid substances gradually became relieved against the lighter atmosphere, and she could clearly distinguish her surroundings.

The sky had outspread its majestic mantle of stars, thousands upon thousands sparkled and twinkled above her. Near the horizon, amid the multitude of lesser heavenly lamps, a single star shone forth brightly and majestically, as if it were ruler and the others only vassals. But the illusion could last only a short time, for its changeful light contrasted strangely with the eternal repose of the glimmering little points, and marked it as the fire that blazed in the lighthouse at Swienemünd, as a guiding star to the distant mariners.

Proximity alone gave the little shining spot, in the eyes of short-sighted mortals, its superiority to all the radiant lamps of heaven. Worlds, whose grandeur the human mind can scarcely realize, receded into the background before the tiny, insignificant light kindled by human hands. What pride, and yet what deep humility, should be inspired by the sight! the boundlessness of the intellect and the narrow limits of the senses placed in such direct contrast with each other.

Erica's eyes rested on the bright shining star; its radiant, changeful light was dear and familiar to her. Ever since her childhood it had shone every night, often alone, and she had fancied she could not go to sleep without casting a last glance at it. But this evening her eyes soon wandered dreamily away and roved over the dark surface of the sea, whose low murmur sounded like a gentle lullaby. A soft breeze swept gently over the waves, caressed her hair, and sighed itself into silence amid the branches of the neighboring forest.

A spicy odor of rosin exhaled from the pines; even the bushes, grass, and ferns around sent forth a faint perfume, which

blended with the pure, soft air, and produced a most invigorating atmosphere, as if all nature were intoxicated by the magic of the night. The leaves rustled softly, as though exchanging loving words, and a low, mysterious murmur ran through the boughs as if they were telling each other the most wondrous tales. The faint twitter of a sleepy bird sometimes echoed through the woods, and the monotonous chirping of the cricket blended with the low rustling of the tree-tops, the distant murmur of the waves, into a solemn, divine, and yet sometimes sweet earthly harmony.

The enchanting beauty of the night so completely engrossed the thoughts and senses of the young girl, that she scarcely thought of the real object of her walk. She listened to the soft yet distinct melodies that echoed around her, and in so doing forgot the louder sounds she had come to hear. When, however, she advanced a little farther, memory was again aroused, for the lighted windows of the next house gleamed brightly through the darkness as if they wished to wage a victorious battle against the gloom. Here also the loud confusion of voices that echoed from the dwelling drowned the sweet, eloquent silence of the night.

The discord thus created was so great that Erica felt inclined to turn back, but lingered a moment longer and glanced in at the open windows. The distance was still too great, or her keen eyes were not sufficiently eager, for she recognized no one, and perceiving groups of people promenading near the house she turned and went back to her former solitude. Evidently the guests were not all incapable of feeling the magic that pervaded the outside world, and had left the noisy rooms to enjoy the delightful evening.

Erica now wandered up and down the enclosure she called her garden, and at last sat down on the turf near the yew hedge. From this spot she could neither see the lighted windows, nor hear the murmur of voices, she was once more alone. The melancholy chirp of the cricket sounded close beside her, and the soft breeze sighed through the boughs over her head. She turned towards the sea and eagerly inhaled the delicious freshness borne from its surface by the light wind, but started in terror, for the mischievous zephyr brought at the same time the unmistakable odor of an excellent cigar.

If she had previously felt the light and noise in the next house as a discord, the artificial odor might well appear in striking contrast with the perfumed breath o nature. The dreamy reveries disappeared as if by magic, and she was thrown into such a tumult of agitation that her heart beat stormily.

One of the company had entered her garden, that was certain; but it appeared less evident whether the intruder had encroached upon a stranger's grounds by design or accident, though the latter was scarcely credible, since a low fence enclosed the patch of land. Had the lighted windows attracted him, and he merely wished to satisfy his curiosity, or did he know that this was her home?

Erica paused; she was becoming too bold in her conclusions. Yet amid the numerous doubts that assailed her mind, she felt no uncertainty in regard to one thing and indeed the most important, namely that the possessor of the cigar was no other than Elmar. True, she could give no reason for this assurance, but she did not even think of asking for one.

Meantime the light breeze, like a mischievous kobold, brought the pungent odor of the cigar nearer and nearer. At last the young girl rose and glided slowly away into the shadow of the dark bushes, that she might not be seen by the smoker. When, on reaching her hiding-place, she again looked around, she saw his retreating figure moving over the grass, and suddenly heard Christine's shrill voice pierce the silence of the night.

Erica was so startled by this unexpected annoyance that at first she did not even understand what Christine was screaming so loudly, but Elmar's laugh and musical voice were all the more distinct as he replied.

"My good woman, I'm not meditating any attack on your well. Is water so precious in Waldbad that you are obliged to watch and defend the pump?"

"You talk according to what you know about it, sir," replied Christine, not very politely. "If you have been in Waldbad even a few days, you ought to know that our well has the best water in the whole place."

"Are you Frau von Hohenstadt's servant?"

"Of course I am, I——"

"You see I have heard of the well, though I did not know exactly where it was. I shall ask you for a glass of water from it soon. Good-night," and Elmar walked towards the lighted windows of the next house.

Erica would gladly have hurried forward to check Christine's incivility, but

she could not make up her mind to leave her hiding-place. Meantime Elmar had disappeared in the gloom, and she now saw Christine enter the house. She was again alone, but unfortunately her mind was no longer in harmony with the solitude, and she prepared to go in, but instantly paused again for she distinctly perceived a figure moving near the house. So Elmar had not left the garden, had perhaps merely waited till Christine entered. This conclusion seemed to be confirmed by the conduct of the wanderer, for he approached so near the house that he was plainly visible in the lamplight, boldly gazing into the open windows, and then walked back so near her hiding-place, that she feared she should be discovered.

Crouching almost to the ground, in order to remain concealed under the shadow of the bushes, Erica glided nearer the forest and remained standing beside the light fence that enclosed the garden. Her keen ear caught the sound of footsteps echoing along the path through the woods. She stood under the shadow of a little group of pines, perfectly secure from discovery, straining her eyes to distinguish the advancing figure.

The steps approached quickly, but with a smothered sound, as if the pedestrian wished to make as little noise as possible. Not far from the spot where Erica stood, the path descended the hill and led close by the garden fence. She could therefore distinctly perceive that the approaching figure carried some dark object. Just as the man passed her, she thought she heard a cry issue from the large cloth that was fastened over the bundle. It sounded like the low wailing of a child, and she now distinctly heard a faint moan.

She recognized the voice, and the knowledge flashed upon her mind like lightning. Herr von Wehlen's secret suddenly appeared like a solved enigma. He had come to steal little Carlos, and was just carrying him away from the lighted house.

"Carlos!" she cried, "Carlos! is it you, do you hear me?"

The man started violently at the loud exclamation which sounded so suddenly close beside him, muttered a half-smothered curse between his teeth, and then hurried along the path with redoubled speed, while a louder wail came from the bundle.

"Help!" Erica screamed through the darkness. "Help! help!"

But her voice died away unheard, the north wind had risen, and the loud rustling of the trees drowned her words.

What should she do? If she pursued the fugitive alone, it would probably result only in her own destruction without securing little Carlos's freedom. If she ran across the long distance that separated her from the next house, the robber would obtain a start which would render any pursuit impossible. Stop! another expedient now occurred to her.

She darted back to her house like an arrow from the bow. Elmar could not be far away, with his help the little fellow might be rescued. In spite of her headlong speed, his name echoed clearly and loudly through the night, and she soon heard his reply. With trembling limbs she flew in the direction of the sound, saw his figure, hurried towards him, and, grasping his hand, drew him resistlessly forward.

"Come — we have not a moment — they are stealing little Carlos. He will be carried off on that ship, I know it! Hurry, hurry, or we shall not save him."

Although Elmar did not understand the affair, and could scarcely comprehend the incoherent words, he perceived that some extraordinary event was taking place. The darkness, together with his ignorance of the locality, made him utterly helpless without the aid of his companion, so he held her hand firmly in his own, allowed her to guide him, and promised any assistance she desired.

They soon found themselves in the same path along which the man had just passed with his burden. Erica darted over the ground with perfect ease, she knew every obstacle, and understood how to render it harmless to her companion. In broken sentences — for the speed with which they were running did not permit any other mode of speech — but with perfect calmness, she now explained the object of her pursuit. Elmar did not understand the cause of the abduction, but Erica's positive assurances convinced him of the truth of her statement, and he exerted all his strength to reach the desired goal as quickly as possible.

They now heard rapid footsteps on the path before them.

"There he is!" cried Erica.

But the words had scarcely died away, when a bright flash blazed close before them, and at the same moment a loud report echoed through the silent forest.

"Are you hurt, Erica?" asked Elmar anxiously.

"Not at all. How can he see to aim in this darkness?"

"Stay here, I can follow alone now," and the young man tried to release his hand from his companion's.

But she clung to him anxiously. "Come, come. The robber has gained another start."

A second flash gleamed through the darkness, and again a loud report roused the echoes of the forest. Once more Elmar tried to release himself, and again Erica prevented the attempt, and now the path ran through a glade where the fugitive's figure was distinctly visible. But the forms of the pursuers also appeared, and the robber turned, paused, raised his hand, took aim, and the bullet whizzed by and entered the trunk of a neighboring tree.

"Let us keep back a little," murmured Erica, "we will go round the glade, I have a plan, perhaps it will succeed."

"Guide me wherever you please," whispered Elmar, "I am only a tool in your hands."

Both retreated into the shadow, while the fugitive darted swiftly across the glade. The path now turned aside towards the beach, and when he plunged into the forest again he found his pursuers close at his heels. Again he fired his revolver into the darkness, without avail, as he supposed from the hasty whispers exchanged behind him.

"Let us give him a little start again," said Erica softly, "in this way he will soon fire all his shots harmlessly into the darkness, and I hope will get no time to load again."

The fresh sea-breeze blew into their faces, and the grey dusk that brooded over the sea seemed almost light in contrast with the gloom of the forest. The robber must have had the same feeling, for he looked back towards his pursuers as if he now hoped to be able to take a sure aim.

"Let us show ourselves a moment, and then vanish in the darkness."

The moment was enough to bring another bullet, which splintered the branch of a tree.

"He still has quite a long distance to go before he reaches the boat," whispered Erica, "it is that little black speck on the beach. Stay under the shade of the trees. You can make your way undisturbed in a straight line to the edge of the forest. I must leave you now; a woodcutter's hut is close by, I will call him to our assistance."

She waited for no reply, but drew her hand away, and darted off through the trees amid the dense gloom. Elmar had no time to think of her design, for he was obliged to exert himself to the utmost to find his way and keep in sight of the fugitive. Both had advanced a long distance, when Erica's hand was suddenly put into Elmar's and her voice whispered,—

"The woodcutter had gone to bed, but he will come soon. Here is an axe for a weapon."

He thanked her by a pressure of the hand, took the axe, and weighed it in his grasp.

"It is high time, Erica. See, yonder black spot is quite near. I must face the danger now, but I insist that you remain in the shelter of the forest."

It seemed as if she were conquered by his resolute tone, for she made no remonstrance when he hurried down the little hill to the strand. The fugitive evidently perceived his approach, and perhaps saw the gleam of the axe in his pursuer's hand, for he prepared for a struggle. Once more he raised his arm to fire his revolver, but he did not aim at Elmar, but turned the muzzle of the pistol towards the boat and discharged two shots in quick succession. It was a signal to his confederates, and Elmar knew that he must conquer speedily or perish.

The robber stood quietly in the spot where he had paused, threw the useless revolver on the sand, and tried to draw the sword that hung at his side, but as the bundle in his arms impeded him, and moreover would have made a successful defence impossible, he laid it carefully on the ground close beside him. When the pursuer approached with upraised axe, the sharp sword flashed forth to meet it, and the clash of the two metals striking against each other rang loudly on the silent night. Blow followed blow, but the assailant unfortunately found himself at a disadvantage, for with his strange weapon he was soon compelled to limit his efforts to warding off the strokes of the sword.

Just at that moment a dark object glided out of the woods, and with supple ease moved down the slope close beside the two combatants; and ere either of them noticed it or had the slightest suspicion of its design, the apparition with a hasty gesture snatched the bundle from the ground, and, in spite of its weight, darted swiftly back to the protecting forest.

A fierce imprecation burst from the robber's lips; he attempted to rush after his prey, thereby neglected to be on his guard, and only a hasty movement backward saved him from the death-dealing

blow of the axe. With a cry of fury, he now threw himself upon Elmar, who, defending himself with great difficulty, slowly retreated towards the forest. He felt that he was wounded in the shoulder, and could only offer a feeble resistance, but he held the robber in check; Erica could fly with the child.

He now received unexpected assistance. A gigantic man emerged from the trees and hastily approached the combatants. The huge axe on his shoulder and his herculean limbs must have excited the fears of the wearied robber, for he shrank back and gave Elmar time to reach the shelter of the forest.

Several men, however, were now hastily running up from the boat; the fugitive looked first at them and then at the gigantic figure of his enemy, at whose side Elmar, seeing the approaching foes, had placed himself. If a conflict took place, the men from the boat would doubtless conquer, for there were three of them armed with revolvers. Notwithstanding this, the robber seemed irresolute, glanced into the forest as if looking for the person who had stolen his prey, and then retreated a few steps towards the new-comers.

"Go! I want no fight, the plan has failed. Let us return to the ship."

He himself retired with the others, and as neither Elmar nor the woodcutter felt the slightest inclination to pursue them, their retreating figures soon vanished in the darkness.

"Come, sir," said his ally, "and if you are wounded lean on me. I'll take you to my hut."

XII.

THE RETURN.

Erica's first act, when she knew that she was safe in the protecting forest, was to unfasten the cloth in which the poor boy was closely bound. She heard no sound, perceived no movement, and the terrible fear that the child was suffocated took possession of her soul. When she at last succeeded in unwinding the numerous folds, and little Carlos appeared, his eyes were closed, and no sign of life was visible. Erica screamed aloud in her grief and terror, and placing him on the ground threw herself sobbing beside him.

Life must have just fled, for the little body still felt soft and warm, and as she now covered his face with passionate tears and kisses, it seemed as if he breathed faintly. At this discovery her heart throbbed so violently that she was almost unable to ascertain the truth of her hope. But when she had regained some degree of composure, she distinctly felt his low, regular breathing, exultantly raised him from the ground, and hurried towards the woodcutter's hut.

On reaching it, she pushed the door open and entered the little room, whose sole furniture consisted of a straw bed, a table, a chair without a back, and a fireplace where a few coals were glimmering, by means of which she hastily lighted a pine knot, and fastened the primitive torch in a recess, which the woodcutter probably used for this purpose. She then sprinkled water from the pitcher that stood on the table into the face of the senseless child, and soon saw him move and at last open his great blue eyes.

"Carlos!" she exclaimed joyously; "Carlos, don't be afraid; I am with you, I will take care of you. Don't you know me, Carlos?" she asked, bending over him, as she received no reply.

"Erica!" cried a voice from the door at the same moment, and Elmar entered with his guide.

"Here is our little fugitive, safe and sound," said Erica gayly, approaching Elmar with the child in her arms. "Kiss your uncle, little Carlos, and thank him for having saved you."

"Kiss the good fairy Erica, Carlos, and thank *her* for having saved you," replied Elmar.

"I certainly frightened the robber terribly," laughed Erica.

"No, but you alone wrested his prey from him."

"Well, we won't quarrel about it. I think we all did the best we could, and good Andreas also deserves a share of little Carlos' gratitude."

"He does indeed deserve gratitude; his appearance probably saved my life, for wounded as I was ——"

"You are wounded?" Erica's cheeks lost their rosy hue so suddenly, that her pallor was visible even by the flickering light of the pine knot.

"Probably a mere scratch," cried Elmar hastily, "but it was painful enough for the time to be a drawback in the fight."

"Let me look at it, sir," said the giant Andreas, approaching Elmar.

On examination Elmar's coat was found to be completely soaked with blood, and as it was impossible to roll up the sleeve to reach the wound, Andreas ripped it with his knife. The cut instantly began to bleed profusely again; the woodcutter, who knew something about such injuries,

and had some bandages in his table-drawer, prepared to dress the wound, murmuring incoherent sentences like a conjuration.

Elmar smiled, but made no objection, especially as the blood really soon ceased to flow, and Andreas, spite of his huge hands, understood how to fasten the bandage firmly and painlessly. The sleeve of the coat was then sewed together with a few long stitches, and the little party now thought of returning.

"Andreas will accompany us with his axe," said Erica. "The robbers might return, or some other danger threaten us."

"And if possible carry a lantern to light the way," added Elmar.

Andreas laughed. "I have no lantern, sir. What use should it be? A lantern would only attract danger, if there were any."

"So I am taught a lesson from both sides," replied Elmar. "Well, you wise foresters, do exactly as you choose. Carlos and I will follow blindly."

Unfortunately, however, the little nephew did not fulfil his uncle's promise, for when the huge woodcutter approached to take him in his arms, he began to scream violently, and insisted upon staying with Erica. He even refused to let Elmar carry him, and with the obstinacy peculiar to spoiled children, would let no one touch him except Erica.

As the child could not possibly walk in the darkness, Erica was obliged to lift him in her arms, though with a faint sigh, while Elmar muttered between his teeth remarks by no means flattering to his nephew.

In this way the little procession moved slowly through the forest. Andreas went first, bearing his axe, and Elmar walked beside Erica. When they had moved on in silence for a short distance, Erica suddenly asked, —

"Did you recognize Herr von Wehlen in the robber?"

Elmar stood still in amazement. "Herr von Wehlen? What a strange idea, little fairy! Does he still hover before your mind as a bird of prey?"

"Yes, as a very dangerous and spiteful one, and I am sure that he alone is the originator of the plot."

"But I saw the man quite distinctly, and I assure you that there is not a shadow of resemblance between him and Wehlen."

"It may be so, then he did not perform the work himself, but engaged some one else."

"Little heather-blossom, you will surely vie with my nephew in obstinacy."

Erica, without entering into the joke, answered gravely, "First hear what I can tell you about the matter, and then judge for yourself." She then related the adventure of the double meeting, her second encounter with Wehlen in the churchyard, after which she had seen Wilms' wife approach the spot; and finally the long distance from home that little Carlos had been taken the day before, and in which the fisherman's wife evidently had some share, while the boat which was to take him away to-day waited at the same point on the shore, and Wehlen, coming from that direction, passed by them.

A short pause ensued, while Elmar was reflecting upon what he had heard. At last he said, "It certainly seems like adding link after link to a chain, but still I do not understand what motive could have induced Wehlen to steal the child. Was he in the father's service? I might suppose that the latter had instigated the boy's abduction, not through any love for the child, but for the sake of revenging himself upon the mother."

Erica made no reply, and Elmar was also silent, absorbed in his own thoughts. After a second pause, he exclaimed, "It may be so, Wehlen has the appearance of a clever adventurer, and the prince throws away his money with lavish hands when the point in question is the gratification of his passions. However," and the speaker's voice sank so low that his companion could scarcely distinguish the words, "I beg you not to inform my sister of your suspicions at present. Her conduct cannot be calculated upon, and unfortunately in moments of excitement she is not disposed to listen to reason. Wehlen is a clever, or let us say cunning, man; he will be on his guard, and thus we should only do harm instead of good. And one thing more, Erica. Don't go to the fairy castle with us. Carlos has fallen asleep and will not notice if we change places. I should like to protect you from the sight of Katharina's wild excitement, and besides, your mother will be anxious about your long absence."

"My mother had already retired, but old Christine will be frightened. We have taken a nearer way to the village, and shall pass close by our house. If I don't go with you, I must turn down this cross street. Hark, what is that? The village seems to be in an uproar. There is a confusion of voices, and now lights are gleaming everywhere."

"They seem to have lighted pine torches. Probably the boy's absence has

been discovered and the whole place alarmed."

Little Carlos, as if suspecting the excitement he had caused, suddenly awoke and gazed in astonishment at the approaching flames, but at the same time baffled all hope of Erica's escape, for she had scarcely attempted to put him out of her arms when he clung to her and began to cry.

"It was really hardly worth the trouble we took to bring the obstinate boy back," muttered Elmar indignantly, but made no farther effort to prevent Erica's accompanying him.

They soon approached the torch-bearers, and the shout of the giant Andreas, whose lungs seemed to be in proportion to his body, guided their steps towards the little party. They were surrounded, and as soon as the boy was seen, a loud exultant cheer echoed far and wide, then the torch-bearers ranged themselves around the group and escorted them in triumph through the village, while everywhere new-comers rushed out of the houses to join the procession, which at last advanced very slowly and with considerable difficulty.

Meantime, people returning from all directions brought in their reports, though somewhat vague ones, since everybody spoke principally of the alarm he had himself experienced. In spite of the confusion of voices, the little party only learned that the princess, on hearing of the child's disappearance, had fainted, and been carried home in an almost unconscious condition.

The lighted windows of the little fairy castle cast their radiance far into the darkness, various shadows moved to and fro, and it was evident that numerous sympathizing acquaintances had accompanied the princess home.

A crowd of people thronged the entrance hall and surrounded the new-comers with loud expressions of delight. It was scarcely possible to open the door leading into the room, and when Elmar, pushing forward, at last succeeded in doing so, he stood almost face to face with Herr von Wehlen. Both started back, but the latter quickly regained his composure, and said, cordially, —

"How glad I am to see you! Well, since you are here, you doubtless bring good news of the missing child. Whatever the others might say, I always believed that your disappearance was connected solely with the pursuit of the robber."

"I don't know what people could or might say concerning my disappearance; any sensible person, however, must certainly be of *your* opinion."

"And you bring good news?" asked Wehlen, eagerly.

"The best, the little fugitive himself," replied Elmar, looking his companion steadily in the face.

An expression of anger or suspicion flashed over Wehlen's features; but the next moment he controlled himself, and said with every token of joy, —

"Thank God for it. Where is the much-lamented Carlos?"

"If he has not been completely crushed by the good people in the hall, his bearer will, I think, at last succeed in entering the room."

At this moment the crowd of people at the door drew back, and gave Erica room enough to slip through with the boy. Wehlen had stepped forward, as if he wished to look at the child, and it seemed to the young girl as if his eyes expressed such furious hatred that she trembled and turned pale. Perhaps, however, it was an illusion caused by her own excitement, for the next instant his face was so radiant with joy that Erica began to doubt the evidence of her own senses.

A figure now rose from the sofa at the back of the room, which, as she approached nearer, revealed the agitated features of Fräulein Molly. This agitation, together with her disordered hair and dress, made her almost unrecognizable. She gazed at the boy with a stony stare, and when he bent towards her affectionately, shrank back and said coldly, —

"Go! I hate you!"

Erica was surprised and indignant at this conduct, but she had no time to give it any farther thought, for Elmar requested her to put down the boy, and taking him by the hand walked rapidly towards one of the doors, motioning to her to follow him. The large apartment which they entered was also filled with people, and from the midst of the throng came low sobs, pitiful wails, and sometimes a loud cry of agony, and when at the sight of Elmar the crowd involuntarily made way, they saw the princess lying on a divan. Her clothes were torn, her hair fell in disorder over her shoulders, and her hands were clenched convulsively.

Her eyes were closed, or she was unconscious, for she made no sign of recognition when Elmar and the child approached, and did not seem to notice the loud exclamations of surprise and joy that echoed

around her. Elmar, leading the boy by the hand, stood close beside the couch, but she still made no movement, and he at last exclaimed, —

"Kathinka! don't you see, don't you know us?"

She sprang up so suddenly that her dishevelled hair streamed wildly around her, gazed into her brother's face with a look of hatred, and cried in a tone that only too distinctly revealed the same feeling, —

"Robber, how dare you appear in my presence?"

Elmar laid his hand firmly on her shoulder, and bending over her said calmly, but with resolute decision, —

"Your excitement borders on insanity, Katharina. I have brought Carlos to you, but by Heaven you shall not touch him until you look less like a maniac."

"Carlos! Carlos!" shrieked Katharina, in a tone so piercing that the cry reached the ears of the throng assembled before the house; then starting up she tried to clasp the boy in her arms, but he fled screaming from his mother, whom he no longer recognized in this condition. Elmar instantly stepped between them, and prevented Katharina's progress. The restless eyes roved around as if seeking aid against her brother, but she felt his steady gaze fixed upon her, and at last, against her will, was forced to let her own uneasy glance meet his. Then she closed her eyes, and two large tears rolled down her cheeks as she said in a gentle, plaintive tone, —

"Why do you keep me from my child? don't you see how I am suffering?"

"Come, Carlos! go to your mother," cried Elmar; and the child, though somewhat reluctantly, obeyed the call. The princess clasped him passionately in her arms, but no longer showed the frantic agitation she had previously exhibited. She sat down on the divan, took the boy on her lap, and covered him with tears and kisses.

Elmar remained standing before the group, while relating to his sister and the assembled guests the events of the night. Scarcely mentioning his own share in the pursuit of the robber, he made Erica's services in saving the boy especially prominent, and also claimed the princess' gratitude in behalf of the gigantic Andreas and his axe.

Katharina rose, and taking the boy in her arms, went towards Andreas, who was very awkward in his embarrassment. Her features now wore a gentle, touching expression, joy over the boy's restoration was struggling with the effects of her former anguish. She held out her soft white hand to the laborer and thanked him in a few heartfelt words, while tears dimmed her eyes. Andreas also passed his hand over his eyes, and stammered a reply, which perhaps fortunately for him nobody understood and therefore elicited a universal murmur of applause. But when search was now made for the principal heroine, Erica, it was all in vain, she had disappeared in the crowd.

Katharina seemed so exhausted with grief and joy that she sank back upon her divan, half fainting. Elmar therefore requested all present — whom at the same time he thanked, in his sister's name, for their sympathy — to leave the princess alone, as she was greatly in need of repose. The room was soon empty, and Elmar went in search of the maid, who most unaccountably had not been in the apartment. When he entered the adjoining room, he saw Herr von Wehlen just gliding out of the door, while Fräulein Molly sat at a table, covering her face with her hands.

"Where is the princess' maid?" asked Elmar, in a sterner tone than he had ever used towards the young lady. "How does it happen that my sister is deserted by all her servants just at the moment she most needs their help?"

Fräulein Molly removed her hands, and stared at the speaker.

"Do you include me among the servants, Baron von Altenborn?" she asked with a scornful curl of the lip.

"I spoke of the maid, Fräulein Molly," replied Elmar in his former harsh tone. "I saw you walking in the garden with Herr von Wehlen this evening, and therefore know that *you* cannot venture to appear before my sister, so my remark could have no reference to you."

"And did I hire myself out as a nurse," Molly passionately exclaimed, "that I must watch a sleeping child? Oh, how that woman has treated me, how she insulted and abused me before those people! And all because, for a moment, I forgot the shameful service imposed upon me, and went to walk in the garden a few minutes instead of sitting by the sleeping child. He was lying quietly on the sofa, carefully covered up — what harm could befall him in a friend's house? Could I have any suspicion of the accident that has happened?"

"Perhaps not. But as you promised to stay with the boy —— "

"Promised?" interrupted Molly violently. "Say, rather, I was ordered to do so."

"Very well. As you had submitted to the command, you ought to have executed the commission."

"And if you recognized me in the garden," exclaimed Molly scornfully, "why did you not bestow this lecture upon me then, and frighten me back to my duty?"

"I have made amends for my neglect by restoring the boy to his mother, although perhaps I have thereby destroyed the dowry which was to have established the new household."

"What?" shrieked Molly approaching the speaker, her eyes flashing with angry excitement. "You dare to believe I aided this plot, I"—she faltered, and after a pause, during which she covered her eyes with her hand, continued, "That is a hard punishment for a slight error."

"Forgive me, Fräulein Molly," said Elmar, now moved in his turn; "I have not spoken truly, you were only the unconscious tool of this scoundrel."

Molly's eyes dilated to an almost terrible size, and she gazed into her companion's face with a fixed, stony stare. "Wehlen?" she murmured in a scarcely audible tone. "Is Wehlen said to be implicated in this deed?"

"I fear so, and I fear his attentions to you had no other object than to accomplish it. I seriously warn you to beware of him."

Molly had sunk into a chair, and again covered her face with her hands. Elmar bent over her and said cordially: "Forgive me, Fräulein, if I have caused you pain, but it could not be spared you. And now help me to look for the princess' servants, it is high time for her to go to rest."

She rose mechanically and followed him; they passed through the empty rooms, and at last found the people they sought, who were discussing what had happened with such eager interest that they had forgotten their duties. When Elmar knew his sister was safe in her maid's care, he retired to his own room, as his wound, which no one had noticed, was beginning to be excessively painful. Molly also went to her chamber, but not to rest; she paced up and down the room, murmuring broken sentences. Not until morning dawned did she throw herself upon a sofa, and fall into an uneasy slumber.

From The Cornhill Magazine.

CHARLOTTE BRONTE.

THE well-known phrase as to critics being made of poets who have failed, requires to be supplemented. The best critics are often the poets who have succeeded; a truth which has been more than once illustrated by Mr. Swinburne. I shall not ask whether this can be said unreservedly in reference to his recent essay upon Miss Brontë. As usual, he bestows the most enthusiastic and generous praise with a lavish hand, and bestows it upon worthy objects. And, as usual, he seems to be a little too much impressed with the necessary connection between illuminating in honor of a hero and breaking the windows or burning the effigies of the hero's rivals. I do not wish to examine the justice of his assaults, and still less to limp on halting and prosaic feet after his bounding rhetoric. I propose only to follow an inquiry suggested by a part of his argument. After all, though criticism cannot boast of being a science, it ought to aim at something like a scientific basis, or at least to proceed in a scientific spirit. The critic, therefore, before abandoning himself to the oratorical impulse, should endeavor to classify the phenomena with which he is dealing as calmly as if he were ticketing a fossil in a museum. The most glowing eulogy, the most bitter denunciation, have their proper place; but they belong to the art of persuasion, and form no part of scientific method. Our literary, if not our religious, creed should rest upon a purely rational ground, and be exposed to logical tests. Our faith in an author must in the first instance be the product of instinctive sympathy, instead of deliberate reason. It may be propagated by the contagion of enthusiasm, and preached with all the fervor of proselytism. But when we are seeking to justify our emotions, we must endeavor to get for the time into the position of an independent spectator, applying with rigid impartiality such methods as are best calculated to free us from the influence of personal bias.

Undoubtedly it is a very difficult task to be alternately witness and judge; to feel strongly, and yet to analyze coolly; to love every feature in a familiar face, and yet to decide calmly upon its intrinsic ugliness or beauty. To be an adequate critic is almost to be a contradiction in terms; to be susceptible to a force, and yet free from its influence; to be moving with the stream, and yet to be standing on the bank. It is especially difficult in the case of writers like Miss

Brontë, and of critics who were in the most enthusiastic age when her fame was in its early freshness. It is almost impossible not to have overpowering prejudices in regard to a character so intense, original, and full of special idiosyncrasy. If you did not love her, you must hate her; or, since hatred for so noble a sufferer would imply unreasonable brutality, we may say, feel strongly a hopeless uncongeniality of temperament. The power of exciting such feelings is, indeed, some testimony to an author's intrinsic force; and it may explain the assertion of her latest biographer. If it be true, as he says, that she has been comparatively neglected of late years, that is what may easily happen in the case of writers more remarkable for intensity than comprehensive power. Their real audience must always be the comparatively small number who are in sympathy with their peculiar moods. But their vigor begins by impressing and overawing a large number of persons who do not feel this spontaneous sympathy. They conquer by sheer force minds whom they do not attract by milder methods. In literature, at any rate, violent conquests are generally transitory; and, after a time, those who have obeyed the rule against their natural inclination fall away, and leave an audience composed of those alone who have been swayed by a deeper attraction. Charlotte Brontë, and perhaps her sister Emily in an even higher degree, must have a certain interest for all intelligent observers of character. But only a minority will thoroughly and unreservedly enjoy the writings which embody so peculiar an essence. Some scenery — rich pasturage and abounding rivers and forest-clad hills — appeals more or less to everybody. It is only a few who really love the lonely cairn on a wind-swept moor. An accident may make it the fashion to affect admiration for such peculiar aspects of nature; but, like all affectations, it will die away after a time, and the faithful lovers be reduced to a narrow band.

The comparative eclipse then — if eclipse there be — of Charlotte Brontë's fame does not imply want of power, but want of comprehensiveness. There is a certain *primâ facie* presumption against a writer who appeals only to a few, though it may be amply rebutted by showing that the few are also fit. The two problems must go together; why is the charm so powerful, and why is it so limited? Any intense personality has so far a kind of double-edged influence. Shakespeare sympathizes with everybody, and therefore every one with him. Swift scorns and loathes a great part of the world, and therefore if people in general read Swift, or said honestly what they felt, most readers would confess to a simple feeling of aversion to his writings. There is, however, a further distinction. One may dislike such a man as Swift, but one cannot set him aside. His amazing intellectual vigor, the power with which he states some of the great problems of life, and the trenchant decision of his answer, give him a right to be heard. We may shudder, but we are forced to listen. If with equal force of character his intellectual power had been less, we should feel the shock without the mysterious attraction. He would be an unpleasant phenomenon, and one which might be simply neglected. It is because he brings his peculiar views to bear upon problems of universal interest that we cannot afford simply to drop him out of mind. The power of grasping general truths is necessary to give a broad base to a writer's fame, though his capacity for tender and deep emotion is that which makes us love or hate him.

Mr. Swinburne takes Miss Brontë to illustrate the distinction between "genius" and "intellect." Genius, he says, as the most potent faculty, can most safely dispense with its ally. If genius be taken to mean the poetic as distinguished from the scientific type of mind — that which sees intuitively, prefers synthesis to analysis, and embodies ideas in concrete symbols instead of proceeding by rule and measure, and constructing diagrams in preference to drawing pictures — the truth is undeniable and important. The reasoner gives us mechanism and constructs automata, where the seer creates living and feeling beings. The contrast used to be illustrated by the cases of Jonson and Shakespeare — by the difference between the imaginative vigor of "Antony and Cleopatra," and the elaborate construction of "Sejanus." We must add, however, that the two qualities of mind are not mutually exclusive. The most analytic mind has some spark of creative power, and the great creators are capable of deliberate dissection. Shakespeare could reflect, and Jonson could see. The ideally perfect mind would be capable of applying each method with equal facility in its proper place.

Genius, therefore, manifested in any high degree, must be taken to include intellect, if the words are to be used in this sense. Genius begins where intellect ends; or takes by storm where in-

tellect has to make elaborate approaches according to the rules of scientific strategy. One sees where the other demonstrates, but the same principles are common to both. To say that a writer shows more genius than intellect may mean simply that, as an artist, he proceeds by the true artistic method, and does not put us off with scientific formulæ galvanized into an internal semblance of life. But it may mean that his reflective powers are weak, that he has not assimilated the seminal ideas of his time, and is at a loss in the higher regions of philosophic thought. If so, you are setting limits to the sphere of his influence, and show that he is incapable of uttering the loftiest aspirations and the deepest emo tions of his fellows. A great religious teacher may prefer a parable to a theory, but the parable is impressive because it gives the most vivid embodiment of a truly philosophical theory.

Miss Brontë, as her warmest admirers would grant, was not and did not in the least affect to be a philosophical thinker. And because a great writer to whom she has been gratuitously compared, is strong just where she is weak, her friends have an injudicious desire to make out that the matter is of no importance, and that her comparative poverty of thought is no injury to her work. There is no difficulty in following them so far as to admit that her work is none the worse for containing no theological or philosophical disquisitions, or for showing no familiarity with the technicalities of modern science and metaphysics. But the admission by no means follows that her work does not suffer very materially by the comparative narrowness of the circle of ideas in which her mind habitually revolved. Perhaps if she had been familiar with Hegel or Sir W. Hamilton, she would have intruded undigested lumps of metaphysics, and introduced vexatious allusions to the philosophy of identity or to the principle of the excluded middle. But it is possible, also, that her conceptions of life and the world would have been enriched and harmonized, and that, without giving us more scientific dogmas, her characters would have embodied more fully the dominating ideas of the time. There is no province of inquiry — historical, scientific, or philosophical — from which the artist may not derive useful material; the sole question is whether it has been properly assimilated and transformed by the action of the poetic imagination. By attempting to define how far Miss Brontë's powers were in fact thus bounded, we shall approximately decide her place in the great hierarchy of imaginative thinkers. That it was a very high one, I take to be undeniable. Putting aside living writers, the only female novelist whom one can put distinctly above her is George Sand; for Miss Austen, whom some fanatics place upon a still higher level, differs so widely in every way that "comparison" is absurd. It is almost silly to draw a parallel between writers when every great quality in one is "conspicuous by its absence" in the other.

The most obvious of all remarks about Miss Brontë is the close connection between her life and her writings. Nobody ever put so much of themselves into their work. She is the heroine of her two most powerful novels; for Lucy Snowe is avowedly her own likeness, and Lucy Snowe differs only by accidents from Jane Eyre; whilst her sister is the heroine of the third. All the minor characters, with scarcely an exception, are simply portraits, and the more successful in proportion to their fidelity. The scenery and even the incidents are, for the most part, equally direct transcripts from reality. And, as this is almost too palpable a peculiarity to be expressly mentioned, it seems to be an identical proposition that the study of her life is the study of her novels. More or less true of all imaginable writers, this must be pre-eminently true of Miss Brontë. Her experience, we would say, has been scarcely transformed in passing through her mind. She has written down not only her feelings, but the more superficial accidents of her life. She has simply given fictitious names and dates, with a more or less imaginary thread of narrative, to her own experience at school, as a governess, at home, and in Brussels. "Shirley" contains a continuous series of photographs of Haworth and its neighborhood, as "Villette" does of Brussels; and if "Jane Eyre" is not so literal, except in the opening account of the school-life, much of it is almost as strictly autobiographical. It is one of the oddest cases of an author's self-delusion that Miss Brontë should have imagined that she could remain anonymous after the publication of "Shirley," and the introduction of such whole-length portraits from the life as the Yorke family. She does not appear to have been herself conscious of the closeness of her adherence to facts. "You are not to suppose," she says in a letter given by Mrs. Gaskell, "any of the characters in 'Shirley' intended as real portraits.

It would not suit the rules of art, nor of my own feelings, to write in that style. We only suffer reality to *suggest*, never to *dictate*." She seems to be thinking chiefly of her "heroes and heroines," and would perhaps have admitted that the minor personages were less idealized. But we must suppose also that she failed to appreciate fully the singularity of characters which, in her seclusion, she had taken for average specimens of the world at large. If I take my village for the world, I cannot distinguish the particular from the universal; and must assume that the most distinctive peculiarities are unnoticeably commonplace. The amazing vividness of her portrait-painting is the quality which more than any other makes her work unique amongst modern fiction. Her realism is something peculiar to herself; and only the crudest of critics could depreciate its merits on the ground of its fidelity to facts. The hardest of all feats is to see what is before our eyes. What is called the creative power of genius is much more the power of insight into commonplace things and characters. The realism of the De Foe variety produces an illusion, by describing the most obvious aspects of everyday life, and introducing the irrelevant and accidental. A finer kind of realism is that which, like Miss Austen's, combines exquisite powers of minute perception with a skill which can light up the most delicate miniatures with a delicate play of humor. A more impressive kind is that of Balzac, where the most detailed reproduction of realities is used to give additional force to the social tragedies which are being enacted at our doors. The specific peculiarity of Miss Brontë seems to be the power of revealing to us the potentiality of intense passions lurking behind the scenery of everyday life. Except in the most melodramatic — which is also the weakest — part of "Jane Eyre," we have lives almost as uneventful as those of Miss Austen, and yet charged to the utmost with latent power. A parson at the head of a school-feast somehow shows himself as a "Cromwell, guiltless of his country's blood;" a professor lecturing a governess on composition is revealed as a potential Napoleon; a mischievous schoolboy is obviously capable of developing into a Columbus or a Nelson; even the most commonplace natural objects, such as a row of beds in a dormitory, are associated and naturally associated with the most intense emotions. Miss Austen makes you feel that a tea-party in a country parsonage may be as amusing as the most brilliant meeting of cosmopolitan celebrities; and Miss Brontë that it may display characters capable of shaking empires and discovering new worlds. The whole machinery is in a state of the highest electric tension, though there is no display of thunder and lightning to amaze us.

The power of producing this effect without stepping one hand's-breadth beyond the most literal and unmistakable fidelity to ordinary facts is explicable, one would say, so far as genius is explicable at all, only in one way. A mind of extraordinary activity within a narrow sphere has been brooding constantly upon a small stock of materials, and a sensitive nature has been enforced to an unusual pressure from the hard facts of life. The surroundings must surely have been exceptional, and the receptive faculties impressible even to morbidness, to produce so startling a result, and the key seemed to be given by Mrs. Gaskell's touching biography, which, with certain minor faults, is still one of the most pathetic records of a heroic life in our literature. Charlotte Brontë and her sister, according to this account, resembled the sensitive plant exposed to the cutting breezes of the West Riding moors. Their writings were the cry of pain and of only half-triumphant faith, produced by a lifelong martyrdom, tempered by mutual sympathy, but embittered by family sorrows and the trials of a dependent life. It is one more exemplification of the common theory, that great art is produced by taking an exceptionally delicate nature and mangling it slowly under the grinding wheels of the world.

A recent biographer has given us to understand that this is in great part a misconception, and, whilst paying high compliments to Mrs. Gaskell, he virtually accuses her of unintentionally substituting a fiction for a biography. Mr. Wemyss Reid's intention is excellent; and one can well believe that Mrs. Gaskell did in fact err by carrying into the earlier period the gloom of later years. Most certainly one would gladly believe this to be the case. Only when Mr. Reid seems to think that Charlotte Brontë was thoroughly a gay and high-spirited girl, and that the people of Haworth were commonplace, we begin to fear that we are in the presence of one of those well-meant attempts at whitewashing which "do justice" to a marked character by obliterating all its most prominent features. If Boswell had written in such a spirit, Johnson would have been a Chesterfield, and Goldsmith never have blundered in his talk. When we look at them

fairly, Mr. Reid's proofs seem to be curiously inadequate for his conclusions, though calculated to correct some very important misconceptions. He quotes, for example, a couple of letters, in one of which Miss Brontë ends a little outburst of Tory politics by saying, "Now, Ellen, laugh heartily at all that rhodomontade!" This sentence, omittted by Mrs. Gaskell, is taken to prove that Charlotte's interest in politics was "not unmingled with the happy levity of youth." Surely it is just a phrase from the schoolgirl's "Complete Letter-Writer." It would be as sensible to quote from an orator the phrase, "but I fear that I am wearying the House," to prove that he was conscious of being an intolerable bore. The next letter is said to illustrate the "infinite variety of moods" of her true character, and its rapid transitions from grave to gay, because, whilst expressing very strongly some morbid feelings, she admits that they would be contemptible to common sense, and says that she had been "in one of her sentimental humors." Did anybody ever express a morbid feeling without some such qualification? And is not "infinite," even in the least mathematical sense, rather a strong expression for two? A sentimental mood and a reaction are mentioned in one letter. That scarcely proves much gaiety of heart or variety of mood. If, indeed, Charlotte had always been at her worst, she would have been mad: and we need not doubt that she too had some taste of the gladness as of the sorrows of childhood. The plain truth is, that Miss Brontë's letters, read without reference to the disputes of rival biographers, are disappointing. The most striking thing about them is that they are young-ladyish. Here and there a passage revealing the writer's literary power shines through the more commonplace matter, but, as a whole, they give a curious impression of immaturity. The explanation seems to be, in the first place, that Miss Brontë, with all her genius, was still a young lady. Her mind, with its exceptional powers in certain directions, never broke the fetters by which the parson's daughter of the last generation was restricted. Trifling indications of this are common in her novels. The idealized portrait of Emily, the daring and unconventional Shirley, shows her utmost courage by hinting a slight reluctance to repeat certain clauses in the Athanasian Creed; and the energy with which the unlucky curates are satirized shows the state of mind to which even a young clergyman is still invested with more or less superhuman attributes. The warmth is generated by the previous assumption that a young gentleman who dons a white neckcloth must, in the normal state of things, put off the schoolboy and develop a hidden pair of wings. The wrath excited by their failure to fulfil this expectation strikes one as oddly disproportionate. And, in the next place, it seems that, even in writing to her best friends, Miss Brontë habitually dreaded any vivid expression of feeling, and perhaps observed that her sentiments when spread upon letter-paper had a morbid appearance. There are many people who can confide in the public more freely than in the most intimate friends. The mask of anonymous authorship and fictitious personages has a delusive appearance of security. The most sacred emotions are for ourselves or for the invisible public rather than for the intermediate sphere of concrete spectators. The letters may dissipate some of Mrs. Gaskell's romantic gloom, but they do not persuade us that the Brontës were ever like their neighbors. The doctrine that the people of Haworth were really commonplace mortals, may be accepted with a similar reserve. Undoubtedly every Scotch peasant is not a Davie Deans, nor every Irishman a Captain Costigan. There are natives of the mining districts who do not throw half-bricks at every stranger they see; there are Yankees who do not chew tobacco, and Englishmen who do not eat raw beef-steaks. And so one may well believe that many inhabitants of Haworth would have passed muster at Charing Cross; and one may hope and believe that a man like Heathcliff was an exaggeration even of the most extravagant of the squires in Craven. If there were many such people in any corner of this world, it would be greatly in want of a thorough clearing out. And, therefore, one may understand why the good people of Haworth should be amazed when Mrs. Gaskell set forth as common types the gentleman who fired small shot from his parlor window at any one who came within convenient range, and the man who chuckled over his luck at dying just after insuring his life.

But, for all this, it is permissible also to suppose that there was a strongly marked provincial character in that region, even if Miss Brontë's lifelike portraits were not their own sufficient evidence. All people seem to be commonplace to the commonplace observer. Genius reveals the difference; it does not invent it. In one sense, doubtless, the people were commonplace

enough, and in that fact lay part of their offensiveness. Many of the upper classes, one may guess, were hard, crabbed men of business, with even less than the average of English toleration for sentiment or æsthetic fancies; and their inferiors were sturdy workmen, capable of taking a pride in their own brutality, which would have shocked gentler races. But the precise degree in which these characteristics were manifested must be left to the decision of local observers. We cannot affect to know accurately in what proportion the charge of originality is to be shared between the Brontës and their neighbors; how far the surroundings were unusually harsh and the surrounded abnormally tender. In any case, one may assume that Miss Brontë and her sisters were at once even morbidly sensitive and exposed to the contact of persons emphatically intolerant of morbid sentiment. Their ordinary relation to the outside world seems to be indicated by one peculiarity of Miss Brontë's writing. When young Mark Yorke sees that Moore has been flattered by hearing a lady describe him as "not sentimental," that offensive lad gets down a dictionary and endeavors to dash Moore's pleasure by proving that "not sentimental" must mean destitute of ideas. The trait is very probably from life, and is at any rate lifelike. There are many amiable people who take a keen pleasure in dashing cold water upon any little manifestation of self-complacency in their neighbors. To find out a man's tenderest corn, and then to bring your heel down upon it with a good rasping scrunch, is somehow gratifying to corrupt human nature. A kindly wit contrives to convey a compliment in affected satire. But the whole aim of a humorist of this variety is to convey the most mortifying truths in the most brutal plain-speaking. Now speeches modelled upon this plan are curiously frequent in Miss Brontë's conversations. Hunsden, the first sketch of the Yorke family in "The Professor," composes his whole talk of a string of brutal home-truths. The worse characters, like Miss Fanshawe in "Villette," thoroughly enjoy telling a friendless governess that she is poor, plain, and sickly. And even her favorites, Rochester and Shirley and Paul Emanuel, have just a leaning to the same trick of speech, though with them it is an occasional bitter to heighten the flavor of their substantial kindness. Miss Brontë has as little sense of humor as Milton or Wordsworth; but her nearest approach to it is in some of those shrewd, bitter sayings which are rather more of a jibe than a compliment. When one remembers that the originals of the Yorkes were amongst her most cherished and cultivated friends, and that they are admittedly painted to the life, one may fancy that she had received a good many of those left-handed compliments which seem to have done duty for pleasant jests in the district.

The soliloquies in which her heroines indulge proceed upon the same plan. Jane Eyre sits in judgment upon herself and listens to the evidence of Memory and Reason, accusing her of rejecting the real and "rabidly devouring the ideal." And she decides in accordance with her witnesses. "Listen, Jane Eyre, to your sentence; to-morrow place the glass before you and draw in chalk your own picture, faithfully, without softening one defect; omit no harsh line; smooth away no displeasing irregularity: write under it, 'Portrait of a governess, disconnected, poor, and plain!'"

Similar passages occur in "Shirley" and "Villette," and obviously represent a familiar mood. The original of this portrait was frequently engaged, it would seem, in forcing herself to hear such unpalatable truths. When other people snubbed her, after the fashion of the Yorkes, she might be vexed by their harshness, but her own thoughts echoed their opinion. Lucy Snowe is rather gratified than otherwise when Miss Fanshawe treats her to one of those pleasing fits of frank thinking aloud. She pardons the want of feeling for the sake of the honesty.

Sensitive natures brought into contact with those of coarser grain may relieve themselves in various ways. Some might have been driven into revolt against the proprieties which found so harsh an expression. Poor Branwell Brontë took the unluckily commonplace path of escape from a too frigid code of external morality which leads to the public-house. His sisters followed the more characteristically feminine method. They learnt to be proud of the fetters by which they were bound. Instead of fretting against the stern law of repression, they identified it with the eternal code of duty, and rejoiced in trampling on their own weakness. The current thus restrained ran all the more powerfully in its narrow channel. What might have been bright and genial sentiment was transformed and chastened into a kind of austere enthusiasm. They became recluses in spirit, sternly enforcing a self-imposed rule, though, in

their case, the convent walls were invisible and the objects of their devotion not those which dominate the ascetic imagination.

Theorists who trace the inheritance of rare characteristics might be interested in the curious development thus effected. The father of the family was an Irishman, and the mother a Cornish woman; the aunt, who succeeded her in the management of the household, had a persistent dislike for the character of her northern neighbors; even Charlotte herself, we are told, spake in her childhood with a strong Irish accent. And yet, as we find her saying in reference to the troubles of 1848, she has "no sympathy" with French or Irish. She had been spiritually annexed by the people with whom she lived. She was obtrusively and emphatically a Yorkshire woman, though only by adoption; she is never tired of proclaiming or implying her hearty preference of rough Yorkshire people to cockneys, sentimentalists, and that large part of the human race which we describe contemptuously as "foreigners." She is a typical example of the "patriotism of the steeple." She loved with her whole heart the narrowest insular type. She idolized the Duke of Wellington, with his grand contempt for humbug and ideas, terms synonymous — perhaps rightly synonymous — with many people. When she came in contact with fine foreigners and Papists, it only increased her hearty contempt for forms of character and religion, which one might have fancied *à priori* would have had many attractions for her. If at times she felt the æsthetic charm of parts of the Catholic system, she was but the more convinced that it was a poison, dangerous in proportion to its sweetness. The habit of trampling on some of her own impulses had become a religion for her. She had learnt to make a shield of reserve and self-repression, and could not be tempted to lay it aside when gentle persuasion took the place of rougher intimidation. Much is said by her biographers of the heroic force of will of her sister Emily, who presents the same type in an intensified form. Undoubtedly both sisters had powerful wills; but their natures had not less been moulded, and their characters, so to speak, turned inward by the early influence of surrounding circumstances. The force was not of that kind which resists the pressure from without, but of the kind which accepts and intensifies it, and makes a rigid inward law for itself of the law embodied in external conditions.

The sisters, indeed, differed widely, though with a strong resemblance. The iron had not entered so deeply into Charlotte's nature. Emily's naturally subjective mode of thought — to use the unpleasant technical phrase — found its most appropriate utterance in lyrical poetry. She represents, that is, the mood of pure passion, and is rather encumbered than otherwise by the necessity of using the more indirect method of concrete symbols. She feels, rather than observes; whereas Charlotte feels in observing. Charlotte had not that strange self-concentration which made the external world unreal to her sister. Her powers of observation, though restricted by circumstances and narrowed by limitations of her intellect, showed amazing penetration within her proper province. The greatest of all her triumphs in this direction is the character of Paul Emanuel, which has tasked Mr. Swinburne's powers of expressing admiration, and which one feels to be, in its way, inimitable. A more charming hero was never drawn, or one whose reality is more vivid and unmistakable. We know him as we know a familiar friend, or rather as we should know a friend whose character had been explained for us by a common acquaintance of unusual acuteness and opportunity of observation. Perhaps we might venture to add, that it is hardly explicable, except as a portrait drawn by a skilful hand guided by love, and by love intensified by the consciousness of some impassable barrier.

Mr. Swinburne compares this masterpiece of Miss Brontë's art with the famous heroes of fiction, Don Quixote, Uncle Toby, and Colonel Newcome. Don Quixote admittedly stands apart as one of the greatest creations of poetic imagination. Of Colonel Newcome I will not speak; but the comparison with Uncle Toby is enough to suggest what is the great secret both of Miss Brontë's success and its limitations. In one sense Paul Emanuel is superior even to such characters as these. He is more real: he is so real that we feel at once that he must have been drawn from a living model, though we may leave some indefinable margin of idealization. If the merit of fiction were simply its approach to producing illusion, we might infer that Paul Emanuel was one of the first characters in the world of fiction. But such a test implies an erroneous theory of art; and, in fact, the intense individuality of Paul Emanuel is, in a different sense, the most serious objection to him. He is a real human being who gave

lectures at a particular date in a *pension* at Brussels. We are as much convinced of that fact as we are of the reality of Miss Brontë herself; but the fact is also a presumption that he is not one of those great typical characters, the creation of which is the highest triumph of the dramatist or novelist. There is too much of the temporary and accidental — too little of the permanent and essential.

We all know and love Uncle Toby, but we feel quite sure that no such man ever existed except in Sterne's brain. There may have been some real being who vaguely suggested him; but he is, we assume, the creation of Sterne, and the projection into concrete form of certain ideas which had affected Sterne's imagination. He is not, indeed, nor is any fictitious character, a creation out of nothing. Partly, no doubt, he is Sterne himself, or Sterne in a particular mood; but Uncle Toby's soul, that which makes him live and excite our sympathy and love, is something which might be expressed by the philosopher as a theory, and which has been expressed in an outward symbol by an artist of extraordinary skill. Don Quixote is of perennial interest, because he is the most powerful type ever set forth of the contrast between the ideal and the commonplace, and his figure comes before us whenever we are forced to meditate upon some of the most vital and most melancholy truths about human life. Uncle Toby, in a far less degree, is a great creation, because he is the embodiment of one answer to a profound and enduring problem. He represents, it has been said, the wisdom of love, as Mr. Shandy exemplifies the love of wisdom. More precisely he is an incarnation of the sentimentalism of the eighteenth century. It is a phenomenon which has its bad and its good side, and which may be analyzed and explained by historians of the time. Sterne, in describing Uncle Toby, gave a concrete symbol for one of the most important currents of thought of the time, which took religious, moral, and political, as well as artistic, shapes. In many ways the sentiment has lost much of its interest for us; but, though an utterance of an imperfect doctrine, we may infer that Uncle Toby's soul will transmigrate into new shapes, and perhaps develop into higher forms.

When we measure M. Paul Emanuel by this test, we feel instinctively that there is something wanting. The most obvious contrast is that M. Emanuel is no humorist himself, nor even a product of humor. The imperfections, the lovable absurdities, of Uncle Toby are imbedded in the structure of character. His whims and oddities always leave us in the appropriate mood of blended smiles and tears. Many people, especially "earnest" young ladies, will prefer M. Paul Emanuel, who, like his creator, is always in deadly earnest. At bottom he is always (like all ladies' heroes) a true woman, simple, pure, heroic, and loving — a real Joan of Arc, as Mr. Thackeray said of his creator, in the beard and blouse of a French professor. He attaches extravagant importance to trifles, indeed, for his irascible and impetuous temperament is always converting him into an Æolus of the duck-pond. So far there is, we may admit, a kind of pseudo-humorous element in his composition; but the humor, such as it is, lies entirely on the surface. He is perfectly sane and sensible, though a trifle choleric. Give him a larger sphere of action, and his impetuosity will be imposing instead of absurd. It is the mere accident of situation which gives, even for a moment, a ludicrous tinge to his proceedings.

Uncle Toby, on the contrary, would be even more of a humorist as a general on the battle-field than in his mimic sieges on the bowling-green. The humor is in his very marrow, not in his surroundings; and the reason is that Sterne feels what every genuine humorist feels, and what, indeed, it is his main function to express — a strong sense of the irony of fate, of the queer mixture of good and bad, of the heroic and the ludicrous, of this world of ours, and of what we may call the perversity of things in general. Whether such a treatment is altogether right and healthy is another question; and most certainly Sterne's view of life is in many respects not only unworthy, but positively base. But it remains true that the deep humorist is finding a voice for one of the most pervading and profound of the sentiments raised in a philosophical observer who is struck by the discords of the universe. Sensitiveness to such discords is one of the marks of a truly reflective intellect, though a humorist suggests one mode of escape from the pain which they cause, whilst a philosophic and religious mind may find another and perhaps a more profound solution.

Now M. Paul Emanuel, admirable and amiable as he is, never carries us into the higher regions of thought. We are told, even ostentatiously, of the narrow prejudices which he shares, though they do not make him harsh and uncharitable. The prejudices were obvious in this case to the

creator, because her own happened to be of a different kind. The "Tory and clergyman's daughter" was rather puzzled by finding that a bigoted Papist with a Jesuit education might still be a good man, and points out conscientiously the defects which she ascribes to his early training. But the mere fact of the narrowness, the want of familiarity with a wider sphere of thought, the acceptance of a narrow code of belief and morality, does not strike her as in itself having either a comic or a melancholy side. M. Paul has the wrong set of prejudices, but is not as wrong as prejudiced; and therefore we feel that a Sterne, or, say, a George Sand, whilst doing equal justice to M. Emanuel's excellent qualities, would have had a feeling (which in her was altogether wanting) of his limitation and his incongruity with the great system of the world. Seen from an intellectual point of view, placed in his due relation to the great currents of thought and feeling of the time, we should have been made to feel the pathetic and humorous aspects of M. Emanuel's character, and he might have been equally a living individual and yet a type of some more general idea. The philosopher might ask, for example, what is the exact value of unselfish heroism guided by narrow theories or employed on unworthy tasks; and the philosophic humorist or artist might embody the answer in a portrait of M. Emanuel considered from a cosmic or a cosmopolitan point of view. From the lower standpoint accessible to Miss Brontë he is still most attractive; but we see only his relations to the little scholastic circle, and have no such perception as the greatest writers would give us of his relations to the universe, or, as the next order would give, of his relations to the great world without.

Although the secret of Miss Brontë's power lies, to a great extent, in the singular force with which she can reproduce acute observations of character from without, her most esoteric teaching, the most accurate reflex from her familiar idiosyncrasy, is of course to be found in the characters painted from within. We may infer her personality more or less accurately from the mode in which she contemplates her neighbors, but it is directly manifested in various avatars of her own spirit. Among the characters who are more or less mouthpieces of her peculiar sentiment we may reckon not only Lucy Snowe and Jane Eyre, but, to some extent, Shirley, and, even more decidedly, Rochester. When they speak we are really listening to her own voice, though it is more or less disguised in conformity to dramatic necessity. There are great differences between them; but they are such differences as would exist between members of the same family, or might be explained by change of health or internal circumstances. Jane Eyre has not had such bitter experience as Lucy Snowe; Shirley is generally Jane Eyre in high spirits, and freed from harassing anxiety; and Rochester is really a spirited sister of Shirley's, though he does his very best to be a man, and even an unusually masculine specimen of his sex.

Mr. Rochester, indeed, has imposed upon a good many people; and he is probably responsible in part for some of the muscular heroes who have appeared since his time in the world of fiction. I must, however, admit that, in spite of some opposing authority, he does not appear to me to be a real character at all, except as a reflection of a certain side of his creator. He is in reality the personification of a true woman's longing (may one say it now?) for a strong master. But the knowledge is wanting. He is a very bold but necessarily unsuccessful attempt at an impossibility. The parson's daughter did not really know anything about the class of which he is supposed to be a type, and he remains vague and inconsistent in spite of all his vigor. He is intended to be a person who has surfeited from the fruit of the tree of knowledge, and addresses the inexperienced governess from the height — or depth — of his worldly wisdom. And he really knows just as little of the world as she does. He has to impose upon her by giving an account of his adventures taken from the first novel at hand of the early Bulwer school, or a diluted recollection of Byron. There is not a trace of real cynicism — of the strong nature turned sour by experience — in his whole conversation. He is supposed to be specially simple and masculine, and yet he is as self-conscious as a young lady on her first appearance in society, and can do nothing but discourse about his feelings, and his looks, and his phrenological symptoms, to his admiring hearer. Set him beside any man's character of a man, and one feels at once that he has no real solidity or vitality in him. He has, of course, strong nerves and muscles, but they are articles which can be supplied in unlimited quantities with little expense to the imagination. Nor can one deny that his conduct to Miss Eyre is abominable. If he had proposed to her to ignore the existence of the mad Mrs. Rochester, he would have acted like a

rake, but not like a sneak. But the attempt to entrap Jane into a bigamous connection by concealing the wife's existence, is a piece of treachery for which it is hard to forgive him. When he challenges the lawyer and the clergyman to condemn him after putting themselves in his place, their answer is surely obvious. One may take a lenient view of a man who chooses by his own will to annul his marriage with a filthy lunatic; but he was a knave for trying to entrap a defenseless girl by a mock ceremony. He puts himself in a position in which the contemptible Mr. Mason has a moral advantage.

This is by far the worst blot in Miss Brontë's work, and may partly explain, though it cannot justify, the harsh criticisms made at the time. It is easy now to win a cheap reputation for generosity by trampling upon the dead bodies of the luckless critics who blundered so hopelessly. The time for anger is past; and mere oblivion is the fittest doom for such offenders. Inexperience, and consequently inadequate appreciation of the demands of the situation, was Miss Brontë's chief fault in this matter, and most certainly not any want of true purity and moral elevation. But the fact that she, in whom an instinctive nobility of spirit is, perhaps, the most marked characteristic, should have given scandal to the respectable, is suggestive of another inference. What, in fact, is the true significance of this singular strain of thought and feeling, which puts on various and yet closely allied forms in the three remarkable novels we have been considering? It displays itself at one moment in some vivid description, or — for "description" seems too faint a word — some forcible presentation to our mind's eye of a fragment of moorland scenery; at another it appears as an ardently sympathetic portrayal of some trait of character at once vigorous and tender; then it utters itself in a passionate soliloquy, which establishes the fact that its author possessed the proverbial claim to knowledge of the heavenly powers; or again, it produces one of those singular little prose-poems — such as Shirley's description of Eve — which, with all their force, have just enough flavor of the *devoirs* at M. Heger's establishment to suggest that they are the work of an inspired schoolgirl. To gather up into a single formula the meaning of such a character as Lucy Snowe, or in other words of Charlotte Brontë, is, of course, impossible. But at least such utterances always give us the impression of a fiery soul imprisoned in too narrow and too frail a tenement. The fire is pure and intense. It is kindled in a nature intensely emotional, and yet aided by a heroic sense of duty. The imprisonment is not merely that of a feeble body in uncongenial regions, but that of a narrow circle of thought, and consequently of a mind which has never worked itself clear by reflection, or developed a harmónious and consistent view of life. There is a certain feverish disquiet which is marked by the peculiar manner of the style. At its best, we have admirable flashes of vivid expression, where the material of language is the incarnation of keen intuitive thought. At its worst, it is strangely contorted, crowded by rather awkward personifications, and degenerates towards a rather unpleasant Ossianesque. More severity of taste would increase the power by restraining the abuse. We feel an aspiration after more than can be accomplished, an unsatisfied yearning for potent excitement, which is sometimes more fretful than forcible.

The symptoms are significant of the pervading flaw in otherwise most effective workmanship. They imply what, in a scientific sense, would be an inconsistent theory, and, in an æsthetic sense, an inharmonious representation of life. One great aim of the writing, explained in the preface to the second edition of "Jane Eyre," is a protest against conventionality. But the protest is combined with a most unflinching adherence to the proper conventions of society; and we are left in great doubt as to where the line ought to be drawn. Where does the unlawful pressure of society upon the individual begin, and what are the demands which it may rightfully make upon our respect? At one moment in "Jane Eyre" we seem to be drifting towards the solution that strong passion is the one really good thing in the world, and that all human conventions which oppose it should be disregarded. This was the tendency which shocked the respectable reviewers of the time. Of course they should have seen that the strongest sympathy of the author goes with the heroic self-conquest of the heroine under temptation. She triumphs at the cost of a determined self-sacrifice, and undoubtedly we are meant to sympathize with the martyr. Yet it is also true that we are left with the sense of an unsolved discord. Sheer stoical regard for duty is represented as something repulsive, however imposing, in the figure of St. John Rivers, and virtue is rewarded by the arbitrary removal of the obstacles

which made it unpleasant. What would Jane Eyre have done, and what would our sympathies have been, had she found that Mrs. Rochester had not been burnt in the fire at Thornfield? That is rather an awkward question. Duty is supreme, seems to be the moral of the story; but duty sometimes involves a strain almost too hard for mortal faculties.

If in the conflict between duty and passion the good so often borders upon the impracticable, the greatest blessing in the world should be a will powerful enough to be an inflexible law for itself under all pressure of circumstances. Even a will directed to evil purposes has a kind of royal prerogative, and we may rightly do it homage. That seems to be the seminal thought in "Wuthering Heights," that strange book to which we can hardly find a parallel in our literature, unless in such works as "The Revenger's Tragedy," and some other crude but startling productions of the Elizabethan dramatists. But Emily Brontë's feeble grasp of external facts makes her book a kind of baseless nightmare, which we read with wonder and with distressing curiosity, but with far more pain than pleasure or profit. Charlotte's mode of conceiving the problem is given most fully in "Villette," the book of which one can hardly say, with a recent critic, that it represents her "ripest wisdom," but which seems to give her best solution of the great problem of life. Wisdom, in fact, is not the word to apply to a state of mind which seems to be radically inconsistent and tentative. The spontaneous and intense affection of kindred and noble natures is the one really precious thing in life, it seems to say, and, so far, the thought is true or a partial aspect of the truth, and the high feeling undeniable. But then, the author seems to add, such happiness is all but chimerical. It falls to the lot only of a few exceptional people, upon whom fortune or providence has delighted to shower its gifts. To all others life is either a wretched grovelling business, an affair of making money and gratifying sensuality, or else it is a prolonged martyrdom. Yield to your feelings, and the chances are enormously great that you are trampled upon by the selfish, or that you come into collision with some of those conventions which must be venerated, for they are the only barriers against moral degradation, and which yet somehow seem to make in favor of the cruel and the self-seeking. The only safe plan is that of the lady in the ballad, to "lock your heart in a case of gold, and pin it with a silver pin." Mortify your affections, scourge yourself with rods, and sit in sackcloth and ashes; stamp vigorously upon the cruel thorns that strew your pathway, and learn not to shrink when they lacerate the most tender flesh. Be an ascetic, in brief, and yet without the true aim of the ascetic. For, unlike him, you must admit that these affections are precisely the best part of you, and that the offers of the Church, which proposes to wean you from the world, and reward you by a loftier prize, are a delusion and a snare. They are the lessons of a designing priesthood, and imply a blasphemy against the most divine instincts of human nature.

This is the unhappy discord which runs through Miss Brontë's conceptions of life, and, whilst it gives an indescribable pathos to many pages, leaves us with a sense of something morbid and unsatisfactory. She seems to be turning for relief alternately to different teachers, to the promptings of her own heart, to the precepts of those whom she has been taught to revere, and occasionally, though timidly and tentatively, to alien schools of thought. The attitude of mind is, indeed, best indicated by the story (a true story, like most of her incidents) of her visit to the confessional in Brussels. Had she been a Catholic, or a positivist, or a rebel against all the creeds, she might have reached some consistency of doctrine, and therefore some harmony of design. As it is, she seems to be under a desire which makes her restless and unhappy, because her best impulses are continually warring against each other. She is between the opposite poles of duty and happiness, and cannot see how to reconcile their claims, or even — for perhaps no one can solve that, or any other great problem exhaustively — how distinctly to state the question at issue. She pursues one path energetically, till she feels herself to be in danger, and then shrinks with a kind of instinctive dread, and resolves not only that life is a mystery, but that happiness must be sought by courting misery. Undoubtedly such a position speaks of a mind diseased, and a more powerful intellect would even under her conditions have worked out some more comprehensible and harmonious solution.

For us, however, it is allowable to interpret her complaints in our own fashion, whatever it may be. We may give our own answer to the dark problem, or at least indicate the path by which an answer must be reached. For a poor soul so grievously beset within and without by troubles in which we all have a share, we can but

feel the strongest sympathy. We cannot sit at her feet as a great teacher, nor admit that her view of life is satisfactory or even intelligible. But we feel for her as for a fellow-sufferer who has at least felt with extraordinary keenness the sorrows and disappointments which torture most cruelly the most noble virtues, and has clung throughout her troubles to beliefs which must in some form or other be the guiding lights of all worthy actions. She is not in the highest rank amongst those who have fought their way to a clearer atmosphere, and can help us to clearer conceptions; but she is amongst the first of those who have felt the necessity of consolation, and therefore stimulated to more successful efforts.

From Good Words.

DORIS BARUGH.

A YORKSHIRE STORY.

BY THE AUTHOR OF "PATTY."

CHAPTER XLI.

PLOTTING.

Doris despatched her letter, and then she sat in troubled thought.

It had been a severe wrench to yield her hopes about George, but she felt that they were groundless; and as she must give them up, she did it at once, without looking back or spending more time in regret.

This was not the cause of her trouble.

She was thinking of her child, and how baneful Faith's influence would be as little Phil's rapid development progressed. Would it not be safest and wisest at once to send the housekeeper away? and yet Doris shrank from proposing this to her husband. She believed that he would agree to her wish, but still she shrank from making the request. Mr. Burneston had told her more than once that she disliked Faith because the housekeeper petted Ralph.

"If he would only go away and never come back again!" burst from her impetuously. "He blights my life; he makes me unhappy, for he makes me wicked; he makes me feel hard to myself. Till he came home I was as happy as I could wish, except"—she paused, as a vision of her mother, and a shrinking from her mother's hints that she would like to see Burneston Hall, rose in her mind—"except for one or two things, and now I always feel wrong and vexed. I am hurt if Philip even speaks about Ralph, and no wonder. I have never told of his conduct to Rose; if his father knew all, he would not be so lenient to him. I only dislike him because he is bad and contemptible. No, I am not hard on him." She had begun to walk up and down as she argued with herself, and she stopped short now as if she were answering a suggestion. "If he were good—good as my Phil will be, I think I should like him; if he were good he would like me—and—and——" She resumed her rapid walk. "It is useless to struggle," she said. "I've struggled till I am tired. I hate Ralph! He always makes me feel that I am low-born. I lose my self-possession. I seem not to believe in myself when he is present. I never disliked any one before, unless it was Rose Duncombe. I am determined he shall not make Rica fond of him. She is very impulsive still, and he might set her against me. I cannot give up Rica's friendship; it is more necessary to me than I thought it was. I can tell her things which I could not talk of to Philip; besides, I want to tell her of my doubts about Ralph."

She went to the window and looked out. Ralph and Rica were walking up and down the terrace. She was talking eagerly, and his eyes were fixed admiringly on her flushed, enthusiastic face.

A spasm of sudden jealousy brought the blood springing to Doris's cheeks. She leaned forward, and as she leaned she saw that she was not the only gazer. Faith Emmett was also looking from Ralph's window at the young pair as they moved slowly along beside the grey flower and fern wreathed wall that bordered the river. Faith was smiling in most unusual fashion, and Doris felt yet more irritated.

"That woman *shall* go if she thwarts me at every turn," she said haughtily. "I suppose she thinks Rica is an amusement brought here to occupy Ralph as long as he chooses—but how foolish I am! Her opinion is of no consequence."

Just then, as if she read her friend's thoughts, Rica looked up, and Doris beckoned with unwonted eagerness.

"There's something the matter, I think," said Rica; "I must go to Mrs. Burneston."

"Never mind Mrs. Burneston; she can wait, she can have you any time, and I want you now." Ralph spoke imperiously, and Rica laughed.

"You are nobodv beside Doris," she

said smilingly, and nodding up at her friend's window, she ran indoors.

At the foot of the stairs she met Mr. Burneston.

"Are you going to Doris?" he said; "then will you tell her that I expect my cousin, Mr. Raine, this evening? I asked him some days ago, and as there's no answer, he's sure to come." He looked at her carelessly, but it seemed to Rica that he wanted to see the effect of his words, and she tried so hard to keep an unmoved face that Mr. Burneston thought she was vexed.

"Dear me!" he thought, as he went on to the library; "I fancied we should be more cheerful with Raine here, but it seems I am mistaken. Rica looked quite disconcerted at the idea. I'd better ask Doris why she dislikes him — dear me, what strange creatures women are!" and the soft-hearted squire sat down to finish his newspaper with a disappointed face.

Meantime Ralph had gone to his room, and had found Faith there. He sat down without speaking.

"She's a nice young lady, is Miss Masham, Maister Ralph. She's a real lady." She looked at him keenly between her half-closed lids.

"Yes, old woman, but never mind ladies now. Is there a good dinner? I shall have to give Mrs. Hazelgrave a few lessons in cooking if she sends up such a fricandeau as she did yesterday; it was so tough I could hardly set my teeth in it, and I actually could taste the onions. She really must be less coarse in her notions of flavoring. She wants to go to France for a few months."

"Ah, well, I'll tell her what you say, my dear. Do you know Mr. and Mrs. Boothroyd an' Mr. Raine's coming to-night? then mebbe we'll give you something else to think about besides cooking. He's got an eye in his head, tho' he is so crammed wi' nossions."

"To-night is it? I did not know he was coming; I can amuse myself without him, you old goose."

Faith looked mysterious. She went over to the drawers which she had been putting neat, but presently she closed them and turned round.

"Mebbe two is better than three, Maister Ralph; an' Master Raine's ower maisterful, yu kens."

Ralph stared. "I don't know what you mean, you dear old stupid," he said. "You know I hate hints, Faith; but Gilbert has too much sense to interfere with me. I should like to see any one master me in my own house."

He had been lighting a cigar while he spoke, and he seated himself with his back to the housekeeper, and began to smoke in silence.

Faith stood gazing — at first vacantly, with her unpleasant smile; then, as her yellow eyes rested on her darling's curly head, her straight lip softened, and her eyes grew dark and sweet.

"He's nowt to fear," she said to herself. "Miss Masham 'll not look twice at an awd stick like Mr. Raine wiv that bonny face beside her. Nae, nae, if my lad hes fair play it's all reet; but it's t' missis I'm freeten'd on. She'll do any mortal thing to spite Ralph and tak t' lass frev him. She didn't guess I saw her at yon window froonin' as she looked at t' two on 'em — just as I was gladdenin' my eyes by t' sight o' sich a bonny pair; an' then to call her away when t' poor lass, mebbe, nivver had t' chance afore o' speakin' to such a fine gentleman as my lad. She's nut a match for t' likes o' him, is Miss Masham, but she'll serve to pass time, an' she shannot be taken frev him."

She went out of the room with her usual catlike tread, her eyes and cheeks glowing with the new interest brought into her daily life. Faith Emmett had missed her vocation, she should have been an actress or a police agent, and not having legitimate scope for her talent for intrigue, she was always ready to snatch at and exaggerate every incident of domestic life which could be twisted out of a direct course. It is strange how sensitive such natures are to atmosphere. Doris had only been reawakened to a dread of Faith's mischief-making power by her child's appeal, but Faith knew intuitively that Doris disliked her, and she had decided that the young stepmother would hate Ralph long before his first return from school, and her constant depreciation and innuendoes had strengthened and kept alive the strong prejudice the lad had formed against his father's wife; but for this it is possible that the easy temperament inherited from his father (and before he went to France Ralph's chief characteristic was this easiness) would have softened this dislike and left him open to her influence.

Doris's jealous dislike to the lad had been fostered by Ralph's coldness, and the barrier it raised against all her attempts at cordiality. To Doris government was a necessity. Spite of her father's strong will she had always had power to sway

him; her husband yielded implicitly to her judgment; perhaps the secret of her childish disputes with George was that his will had been as strong as her own, and that he would only yield to a principle which he did not find in his sister. She was large-minded enough to tolerate his resistance, but although she never analyzed her dislike to Ralph, she felt keenly the mortification inflicted by his resistance to her influence, for on this last visit he never lost an opportunity of contradicting her.

"Why on earth," he said to himself as he sat smoking — a practice forbidden in any part of the house but the billiard-room, but connived at by the housekeeper — "why should Gilbert come just now? He's well enough when there's no one else, but he has taken to lecturing lately. I expect Mrs. Burneston's had a hand in this; I owe her one, already, on another score. By Jove, she'd better let me alone in future!"

CHAPTER XLI.

"FIRST IMPRESSIONS."

Doris never showed to so much advantage as when she was receiving her guests. Her natural calm self-possession so helped the sweetness and grace which education had developed that at such times her manner was enchanting. She had long ago conquered her old enemy Mrs. Boothroyd, who was now her slave. Perfection in a woman, according to Mrs. Boothroyd, lay in the possession of some charming accomplishments — playing and singing, for instance, like Mrs. Burneston — and also in the strict observance of all the duties inculcated by society. During Doris's first visit to London, Mrs. Boothroyd had watched her behavior narrowly, and had been so satisfied by the result that on the return of the squire and his wife to Yorkshire she had received her young neighbor with much increased cordiality, and when little Phil was born her attentions had become devoted.

She was a valuable friend to Doris, for being one of those women who announce opinion and insist on its adoption by others, utterly regardless whether offence is given or taken, Mrs. Boothroyd had far more influence in her part of the county than she really merited; so apt are people to be allowed the position they claim boldly for themselves. With all her assumption and hardness she had a love of the beautiful, and she had an affectionate nature; and after a while she craved for the love of this beautiful bit of porcelain, as she called Mrs. Burneston, and came often to see her. Perhaps if Doris had met her advances with any show of warmth there might have been an end of the friendship, but the complete absence of "gush" in the girl's nature increased Mrs. Boothroyd's attempts to overcome her coldness; and these seemed to Doris only a part of the almost universal homage that she had met with in her school life, and also since her marriage.

She had grown to consider Mrs. Boothroyd a sort of motherly friend, to whom she could talk about little Phil and also household plans; and she was really glad to see her this evening.

"Ah, Mrs. Burneston" — Mr. Boothroyd puffed out his words as pompously as ever — "you look as blooming as a rose." The good gentleman's similes were always of the simplest nature.

Doris smiled. "Am I blooming?" she said. "I fancy I am too colorless to deserve the name."

"Yes, indeed, Melville," — his wife had long withdrawn her prohibition against compliments paid to the mistress of Burneston, — "blooming is not refined enough for Mrs. Burneston. Blooming means a rosy color, a dairymaid beauty, a —— "

"I beg your pardon, my dear, but youth and good health will sometimes give a high color, even to young ladies. You can't help it, you know, and what suits one doesn't suit another."

Rica's rosy cheeks were deep red by this time. "I suppose not. I've always been rosy," she said with a sigh which set Gilbert Raine and Mr. Burneston off laughing.

Just then they paired off to go to dinner. Doris forced a smile as she spoke to Ralph. "I am very sorry," she said, "that there is no one for you, but I did not know till too late that your cousin was coming to-day." Then she looked at Raine as he gave his arm to Rica.

Ralph looked savage, but he managed nevertheless to get next Rica at dinner, and to keep her from talking much to Raine.

Rica could not tell how it was. In the morning she had certainly thought Ralph flippant, but still very amusing; now he seemed to her pert and sarcastic. She wondered at Mr. Raine's patience with him, for more than once Ralph spoke rudely to his cousin. "However," she thought as she looked at Raine's intellectual face, eager with interest, now as he combated an argument of Mr. Boothroyd's, now as he uttered one of his dry, quaint

sayings, "I do not suppose he notices; he has no heart or much interest for anything but those horrible old blocks of stone. I believe he is half a stone himself." She turned her thoughts resolutely away from her unconscious *vis-à-vis*, and began to talk to Ralph with more vivacity than she had shown since the beginning of dinner.

At last these two laughed so heartily over one of Rica's stories that Mrs. Boothroyd turned round with a lofty rebuke on her face. Rica met the look, and although she braved it she felt very sick at heart, lest Doris should also disapprove. She had observed the coldness between her friend and Ralph, but her hopeful nature attached little importance to this. "It will all come right in time," she thought, but for all that she wished to avoid any collision on the subject of Ralph. She loved Doris, and thought her almost perfect, but she knew that if she found her friend hard on Ralph she should certainly take his part against his stepmother. She lowered her voice as she went on talking.

Raine was puzzled and vexed. He had not met Miss Masham for three years, and their intimacy had been ended abruptly by his sudden journey to Eton. In the interval Gilbert had learned that it was possible to think again about a woman, all the while despising himself for wasting his thoughts on such an unworthy object. When the squire's letter of invitation reached him he had caught himself wondering whether he should meet Rica at Burneston again, and when he found her sitting with Doris on his first arrival something very like delight came to him, a sensation of keener, warmer pleasure than any he had felt since his first romance ended.

But Rica's manner wounded Mr. Raine. She seemed flurried and excited, vexed, he thought, to have her *tête-à-tête* with Mrs. Burneston disturbed; and now, as he sat opposite her and caught glimpses of her bright face full of laughing enjoyment, he felt sure that he had been wrong, and that Miss Masham had no more heart or ballast than any ordinary woman.

And yet as she rose from table and followed Mrs. Boothroyd from the room, his eyes instantly followed the young girl with admiration. She had none of the statuesque grace of Mrs. Burneston; her movements, and words too, were sometimes abrupt; but there was a freshness and simplicity in Rica, an almost startling vivacity, that suited Raine's taste better than the finish and repose of her friend. She laughed saucily as she went out, and Raine followed the direction of her eyes to Ralph across the table. It seemed to him that these two young creatures exchanged a look of mischievous intelligence.

He frowned, not at them but at his own folly.

"I wonder," he thought, "at what period of their lives men become safe — impervious to woman's will. I fancied it impossible I would ever risk being again deceived. That sudden summons to Eton came just in time, and yet if I had seen more of her then, I should no doubt have discovered imperfections. I should have found out her real self. This Rica Masham I have been dreaming about, when I have thought of such folly at all" — a flush of annoyance rose on his cheek — "was a creature of my own making, quite unlike the true woman."

"Come, Ralph," he said, as the two squires drew close together and began to talk agricultural matters, "shall we take a turn by the river? it's long since you and I were together at Burneston."

Ralph hesitated; he had been surprised and annoyed to hear of his cousin's arrival; he thought he had been sent for to lecture him about Rose, "spoiling my game, too, with Rica — an old fossil!"

"Very well, but let's have a smoke afterwards," he said; "but I mean to go to the drawing-room now — that poor little girl will get bored to death with the dowagers."

For the first time in his life Gilbert Raine felt very angry with Ralph. He had always felt it a kind of duty to take the lad's part against his father, for he considered that even before his second marriage Philip Burneston had neglected his son, but this speech of Ralph's was so puppy-like that Gilbert felt as if he had suddenly awakened, and was taking a new reading of his *protégé*.

"Young coxcomb!" he said to himself as he walked rather stiffly into the drawing-room and left Ralph to close the door, "but perhaps I should say, deluded young fool! Very likely he thinks, poor boy, that Miss Masham really cares to talk to him."

It seemed as if Ralph held this opinion, for he walked straight up to the bow-window in which Rica was, and sat down beside her. Gilbert fumed inwardly against Mrs. Boothroyd, who had stopped him as he came in.

"You care for art, I believe, Mr. Raine, and I want you so much to come over and

see us. I can offer you quite a treat in Mr. Boothroyd's drawings; he copies things in pen and ink so beautifully you could not tell them from the originals — things from the *Penny Magazine*, you know, and other prints."

"I don't care for copies of things," said Gilbert almost savagely, "there's nothing original in it; it is a waste of time."

Mrs. Boothroyd stared. "Ah, but you never saw anything like Mr. Boothroyd's drawings; he does them line for line. He gives up his winter evenings entirely to it, never has time to read a book, or hardly a newspaper; it is such important, all-absorbing work."

Raine shrugged his shoulders. "My dear madam, I'm sorry I can't agree with you; nothing, I think, can be so important in the way of personal pursuit as reading, and it is especially necessary to us country residents — to all, in fact, who live in a small circle." He said this, much as if he had added, "My dear madam, consider yourself in the wrong."

Mrs. Boothroyd smiled loftily, but Doris looked so interested that for the moment Raine forgot Ralph and Rica.

"That may be for some people" — Mrs. Boothroyd gave Gilbert a compassionate glance. "But you see Mr. Boothroyd's mind is so large and comprehensive, and then he has such a store of past reading to go on, that I don't think he requires to read as some do; he did it all as a boy; no fiction or poetry or rubbish of that kind, you know, but solid stuff — Gibbon's 'Decline and Fall,' Alison's 'History of Europe,' and as to 'Lardner's Cyclopædia' — those puce-colored calico books, you know — I fancy he has them by heart. Mr. Boothroyd is very solid; no froth about him, I assure you."

Ralph had been annoyed to find that instead of listening to him, Rica's ears had been strained to follow this conversation; and now, as Doris sat silent, her eyes fixed on the opposite wall, Miss Masham broke in suddenly with glowing eyes and cheeks.

"My father says it's all nonsense not to read novels, and a great mistake. He says people often get ideas and hints and things — in good ones, I mean — not in the way of lectures or advice, but unconsciously given. Oh, will it bore you if I explain myself?" — she looked imploringly at Mrs. Boothroyd, while Raine wondered whether she was acting or whether her freshness was real. "He says people are so apt to go on wrapt up in themselves and their pursuits till they absorb their own sympathies, or rather neglect to cultivate their own powers of appreciation, and that often a character in a story will act like a fairy mirror, showing one the distortion one is aiming after, or else reminding one of the qualities one lacks by seeing those qualities in action — oh, I am so sorry, I've talked too much!" She flushed deeply as Ralph laughed. "You should have stopped me," she said to Doris.

Mrs. Boothroyd smiled benignly. "People's words carry them away, unless they think," she said; "but I like to hear young people's ideas; they're fresh, at any rate," she said in a condoning voice.

At which remark Doris stiffened her neck.

"Rica's words are worth listening to," she said, and Gilbert Raine smiled at her, and took the first opportunity he could find of snubbing Mrs. Boothroyd.

Doris went to the piano and sang; but she was not in good voice; there was something oppressive in Ralph's presence that told even on her singing. The two squires appeared, and her husband came up and spoke to her. Mr. Boothroyd began to talk to Ralph, and, to the young man's extreme annoyance, carried him off to the other end of the room, to question him minutely upon French shooting and French farming. Ralph looked over his shoulder as he followed his tormentor, and he saw Raine take the seat he had left beside Rica.

She looked up shyly as Gilbert placed himself beside her.

"I am ashamed of what I said just now," she said; "I did not mean to preach, but I am afraid it sounded like preaching."

"Of course it did," he said mischievously, "only you forgot to give out the text." Then seeing her disturbed face, "Yes, yes, it was all right," he said abruptly; "but I don't agree with you. I think a man who lives much to himself, or who at any rate moves round in a small circle, gets entirely deadened by self-complacency; he is far too thick-skinned to believe that anything he meets with in a book, especially so trifling a book as a novel, can benefit him; if you were even to describe him to the life, as he appears to you, he would not recognize your portrait."

"I don't agree with you," she said, her eyes growing dark with excitement. "I'm sure you're wrong. People are not so hard-hearted as you think them. It will

sound rude, but I sometimes wonder whether it is yourself that you judge from, for I suppose one gets into the way of judging other people by one's self."

Raine laughed.

"I hard-hearted! I am a perfect sucking dove. Indeed, Miss Masham, I thought you a better judge. I am so tender-hearted that I am constantly imposed on. What can make you think me hard-hearted?"

He laughed, but he looked uneasy and troubled.

"I don't know; you are cleverer than I am, Mr. Raine, and you ought to know better than I do what gives us our first impressions of people."

"But our 'first impressions' are so often wrong. How about 'second thoughts' being best?"

"A great many of those musty old proverbs are wrong. I believe in first everythings," said Rica decidedly. "First impressions, first love, first — first — well, the first sight of any beautiful thing; all these are quite different from any that come after. There is no rapture in second impressions or feelings." Then she looked up alarmed again at her own impulsiveness, but Raine's earnest listening, his dark face full of eager interest, reassured her; he sighed, but he did not speak. It seemed strange to Rica that she liked to sit beside him in silence.

"First love," he said presently in a dreamy voice; "ah, I don't know whether that is best. I sometimes think it is not."

"Well then, I do," said Rica; "there can be nothing so delightful. A man who disbelieves in first love must be a thorough sceptic."

Raine started, but he did not answer; looked sadly at Rica, and then his eyes wandered to the fireplace, where he knew Ralph was standing.

There was such a scowl on the lad's face that Raine looked surprised. He got up and went across to him.

"Shall I come to your room to-night for a smoke, old fellow," Gilbert said, "or will you come to mine?"

"I'm going to bed," Ralph muttered sullenly; "and if those cursed people don't take themselves off I shall go at once."

CHAPTER XLIII.

FRIENDSHIP NOT LOVE.

YOUNG people and impatient people are apt to confound rapidity with certain success. In some of their moods of mind half an hour's delay will suffice, such people think, to destroy the plans of a life; and so they force open the buds of promise and snatch at half-ripened fruit, metaphorically as well as actually. Ralph had watched Rica's face till he could no longer endure what seemed to him her preference for Raine. Certainly she had listened to his own talk at dinner, but then she had laughed and bandied words with him — "chaffed" as it would be called nowadays — but he had not succeeded in getting her to listen with the earnest, half-reverent look she fixed on Raine; nor had she, when talking to him, dropped her eyelids in that lovely pensive fashion till the long dark lashes rested on the glowing cheek.

He was very angry and scornful too. "What could his old dried-up cousin find to say to a lively girl that did not bore her?" He had watched Rica so eagerly, ready at the first sign of weariness to release her from Gilbert's prosing, as in his present mood he called his cousin's talk, and she had only looked more and more interested. He lay awake half the night, tossing and kicking about, and he wakened early next morning with that despondent view of all things with which we are apt to review matters in the grey dawn, and in which we sometimes persuade ourselves that everything will go crooked.

Ralph was much too disturbed to go to sleep again. He rose, and determined before the day was much older he would know the truth about Rica.

"If she prefers to me that crack-brained cousin of mine, a man who doesn't even know how to dress, I shall, of course, have nothing more to say to her. I was a fool to expect any discernment from a friend of Mrs. Burneston's — confound her!"

But as the sun rose higher and poured into his room, and the fresh morning air cooled his hot head, he saw things differently, especially before his looking-glass.

"I'm not at all a bad-looking fellow" — he smiled and showed his white, even teeth — "and beside that brown, shrivelled old Gilbert I'm an Adonis. He's got good eyes, and he's an inch or so taller than I am, but I fancy he has really no chance with a girl if I choose to go in for her. I know he's trying it on with little Rica. I never saw him look at a girl like that before."

He stopped and mused, staring at his own handsome face meanwhile.

"What a fool I am! Why don't I

leave them alone? What on earth do I want with her? What do I want to tie myself by the leg for? I like her — better, perhaps — yes, certainly better than any girl I ever saw. She amuses me awfully, and if Gilbert had kept away we should always have been excellent friends. It's a devil of a shame for him to cut in. But I'm not going to see her snapped up under my eyes. By Jove, I'll just spoil his manœuvres and make sure of my little girl."

He looked at his watch. Rica was not likely to appear for an hour, and Ralph's impatience grew as the minutes passed slowly away. He went down to the terrace to wait for her, and little Phil spied him from the window.

"Ralphie, Ralphie! I want you. Phil wants you welly-welly much."

Ralph waved his hand, and passed on whistling.

"Bother the brat!" he said. Then as he turned at the end of the terrace he caught a glimpse of the sweet little wistful face gazing down at him. "He's not a bad little chap, though," he said. "I wonder my precious stepmother produced anything so like a Burneston. I should have thought any child of hers must have been born red-haired and high-shouldered, like that terrible old Barugh. I suppose the fellow is not much older than my father, either. Confound Rica, why don't she come?"

Coming down to the terrace from the flower-garden was Slater, the gardener.

"Aye, Maister Ralph," he smiled genially at his young master, "bud yu begins t' day betahmes. Ah expec's it's t' French manners. Ah mahnds 'at yu war a rare yan at lossin' t' mornin' when yu war a lahtle lad."

Ralph had been staring up at Rica's window while Slater spoke.

"Look here, Slater," he said; "give me the key of the conservatory; I want to get a few flowers."

Slater screwed up his eyes, and put his head on one side.

"Flooers, Maister Ralph? Ther's flooers an' plenty i' t' hoose, an' if theer's mair needed ah'll gi' 'em. Nae need fer yu ta gan for 'em yersel'."

"Yes, yes, I want some special ones," Ralph spoke emphatically; "let's have the key. I know the door is locked; don't you trouble your head about it; I'll get my own flowers."

Slater looked hard at him with one eye screwed up, but he did not attempt further remonstrance. Not one of the servants ever attempted to question Ralph's will; he had reigned absolutely among them ever since his babyhood. But still Slater prized his choice flowers.

"Ye'll mebbe nut be wantin' monny on 'em," he said deprecatingly, as he handed him the key.

"All right."

The gardener screwed up both his pale blue eyes as he stared after the young man, till they were almost hidden under his red eyebrows.

"Woonkers!" he said, "that's t' fost tahme 'at ivver Maister Ralph hes aks'd mey fer flooers. I' t' neame uv Awd Soss, what can he be oop tiv' noo? Theer mun be a lass if he wants flooers, an' it's nobbut a week sin' Sukey Swaddles seyd 'at t' yung squire waaz littin an' lattin efter Rase Duncombe. Weel, mebbe he thinks yan bird i' t' hand is woth twae i' t' bush: eh, eh, I kens hoo t' wind sits, an' he's rich, an' this lass is as bonny as Rase is, an' sheea's a laady. Ah dizzent lahke tu see t' quality laendering aboot wiv sike as wursels."

He made a sudden wry face, and put his hand over his mouth.

"Zookerins! Ah mun tak' tent o' what ah sehs. Ah forgits t' squire an' t' missis. Nobbut theer's nae sayin' 'at t' Barughs waaz sike as wursels; mebbe t' farmer waaz, bud t' missis mun ha' been a born laady."

He turned away, muttering to himself, "A born laady." Just as he disappeared on his way to the fruit-garden, he murmured, "Nobbut, sheea's ower fond o' meddlin' wiv t' flooer-beds. We's yalways at odds ower 'em."

Ralph came back with some exquisite flowers, and sat down under the cedar-tree to arrange them; but it was a new experiment and he was not skilful, and as he changed the delicate blossoms impatiently from hand to hand the ground at his feet was soon strewn with bright geranium petals.

"Confound it!" he said.

A merry peal of laughter answered him.

"Those poor flowers are not used to be so roughly handled," said Rica mischievously, as she picked up a lovely spray of begonia and gave it to him.

Ralph bit his lips, and made one more effort to group his flowers effectively.

"There, I can't do it any better," he said; "but it's your fault, if you had not come and startled me it would have been first-rate; but you will have the flowers any way, if" — his tone grew graver — "you will make me happy by accepting them."

Rica took the flowers. "Thank you so very much. I love flowers, and I hardly ever get rare ones. There is a special charm to me about wild flowers, and also about these sheltered ones which never breathe outside air — there is just the difference between these and ordinary garden flowers that one finds in people."

Ralph felt inclined to gape; he wished Rica would not take such flights in her talk, and give him the trouble of thinking. "She's too pretty for it; pretty women shouldn't do it," he said, looking at her as she bent over the flowers. "I hate to have to think while I'm looking at a pretty girl;" he pulled his soft beard, and looked and smiled mischievously at Rica.

"I don't quite understand," he said aloud, more for the sake of making her raise her eyes, than because he cared to know what she meant.

As he expected, she looked up, her great grey eyes luminous.

"Well, as a rule, unless we live quite in open country, we see far more ordinary garden flowers than either delicate wild flowers or greenhouse plants. I don't mean buttercups and daisies, and so on, though they are full of beauty. It is just the same with people; for one rare or refined and cultivated person, you see fifty who are educated, perhaps sensible and comfortable in their ideas; but oh, how alike, and how commonplace! — people with whom you can talk by the hour — just surface conversation, like a cat purring — if you are self-controlled. I put that in, because of — dear me, I beg your pardon, I bore you, I'm sure," she broke off abruptly and looked ashamed.

"You needn't mind me," Ralph was secretly getting impatient lest the prayer-bell should ring before he had spoken. "I like to hear you talk, you know, you're so amusing. But I see what you mean, Mr. and Mrs. Boothroyd are purrers. Yes, I know they are a commonplace pair, according to your ideas; but then they're rich and thought a good deal of, and a woman must be like other women; it don't do for her to be eccentric, you know."

"Oh, you would like us all one pattern, like a wall-paper, would you? I hardly see then what would become of likes and dislikes."

"I don't mean that at all," he said abruptly; "you are quite unlike any one I ever saw, and I like you better than any one."

Her eyes opened widely, but her color did not deepen.

"You're very kind; must I make you a curtsy?" Then she said gravely, "Thank you for your good opinion. I should think you often want a sister, don't you? My brothers say they don't know what they should do without a sister."

Between his teeth Ralph cursed all sisters.

"No," he said impetuously, "I don't want a sister, but I do want some one to care for me and think of me — I want you, Rica. Don't you understand?"

Still she did not understand. She thought he was in some sudden trouble which he could not tell his father of, and a sympathy for his loneliness shone in her eyes as she looked in his face, flushed just now with unusual earnestness.

"I am listening," she said sweetly; "what is your trouble? I should like to help you if I can."

"You can if you choose," he said. "Say you like me as much as I like you, and it will be all I want."

She raised her eyes to his in sudden doubt, and then she saw his meaning. While he spoke he had drawn nearer, bending almost over her. His ardent glance brought a burning flush to her face, and instinctively she drew away from him. He thought she was only shy.

"I love you, dearest Rica," he said, "and you love me too, don't you — don't you?" He tried to take her hand, but she drew it away and rose up from the bench beneath the cedar-tree.

"Oh, please don't, Mr. Burneston. I don't know what to say to you."

But her shyness only spurred Ralph's eagerness.

"You are surprised; I've been in a hurry, perhaps," he said; "but you do see how much I care for you — and I'm sure you love me, Rica, though you don't know it, you dear girl."

He certainly was not shy, he took her hand and held it while she stood confounded, wondering how she could make him leave her without being rude.

"I am very sorry," she began, "you are quite mistaken, Mr. Burneston."

But her fear of giving pain made her confused and deceived Ralph.

"No, oh no," he said fondly, "I am not mistaken. I love you with all my heart and soul." He pressed her hand tightly, but Rica drew it suddenly away; his last words had brought back her courage.

"I am still very sorry. I like you very much as a friend; but that is all. I could never think of anything else."

Every word made Ralph more determined.

"Tell me," he said, "have you ever been in love?"

"No." Rica was carried away for a moment by his eager tone; then she flushed suddenly. "And if I had, I scarcely think you ought to ask me."

"My love gives me the right;" but he spoke less confidently. "If love is new to you, you may love me without knowing it. Trust me, it will be all right."

She did not turn away or look confused now, and Ralph felt deeply mortified. His assurance vexed Rica, and took away from her fear of wounding him.

"It is better to be quite plain with you," she said. "I think I am so much older than you that such a thought could not come to me; and listen, please"—for Ralph turned angrily away—"I think, too, that you mistake your own feelings. I had got to consider you as a new brother."

A smothered oath burst from Ralph, and she drew back, fear and disgust showing plainly in her face.

"You had better say you can't bear the sight of me, and be honest at once. I suppose you think that I don't see through all these shams. Just take care of yourself, that's all. Just see that long-tongued cousin of mine doesn't lead you on as you've led me, and leave you in the lurch—and it will serve you right—you've used me shamefully!"

He went away at once, while Rica stood looking after him, all her senses dazed by his words.

CHAPTER XLIV.

THE RISING OF THE STORM.

Ralph hurried away to the house in mad anger—for the anger of a vain man wounded in his supremest vanity is a sort of insanity—he had resolved that Rica should care for him, and that she should confess him irresistible, and he had never doubted his power till he saw her listening to his cousin, and even then the notion that Gilbert could prove a successful rival had seemed too absurd. Instead of confessing love she had pitied him. His eyes blazed with angry light, his face was red with passion, and he carried his hands tightly clenched on each side of him as he met Faith Emmett at the foot of the great staircase.

The sight of her boy always brought a rare sweetness to the housekeeper's lips—her eyes opened widely without any of the yellow light that sometimes flashed between their dark lashes; but at the sight of his troubled face Faith's smile vanished, her forehead wrinkled, and her eyelids drooped.

"What ails ye, mah bairn?" she said, and she laid her brown hand on his arm.

He shook her off angrily.

"Confound you! don't stop me. Can't you see I'm in a hurry?" He pushed past her, and went on up the stairs and along the gallery.

But Faith was not disturbed by his rudeness, she knew her power over him. She followed quickly, and when she too reached the gallery—"Whisht, whisht, mah lad," she said softly, "ye've been crossed, an' mebbe if ye comes along wiv me ye'll find t' reason why. Come, mah honey, ye'll nut be going in to breakfast yonder; ye can have all ye wishes for in t' housekeeper's room."

Ralph shook his head, but his manner was irresolute.

"I don't want breakfast. I want to be left quiet."

Faith turned, looked at him resolutely over her shoulder, and said, "Come," and he followed her down-stairs.

The housekeeper's breakfast was on the table untouched. She had been far too deeply interested in watching Ralph's interview with Rica, and then in trying to know the rights of her darling's discomfiture, to think about eating, though she had a great liking for dainty dishes. "Yey'll be quiet in here, honey." She opened the door of her den, saw Ralph fling himself into a huge armchair, and then bustled off to the still-room in search of some hot coffee and toast for her darling.

When she came back with a tray laden with a fragrant and appetizing breakfast she looked still graver, for Ralph, instead of having attacked, as she expected he would, the cold partridge on the table, sat scowling in the easy-chair, looking far more ready for a fray than a feast.

"Come and take some breakfast, honey," said Faith; "there's cream cakes and kidneys, and an omelette I made o' puppose—ye sud nivver fast on trouble, Master Ralph."

Ralph looked round at the table, but he refused to be tempted.

"Give me a cup of coffee and a bit of bread," he said, "and if you've got anything to tell me, for heaven's sake tell it and have done with it, instead of winking and pursing up your lips and making an old fool of yourself."

Faith winced, but she did not look angry She shook her head sorrowfully at Ralph.

"Eh, eh, it's been allays t' same fra yur cradle uppards; you spiles all by wantin' it ower soon. How could ye think, honey, to ask a lass her mind afore she'd broke her fast? an' mebbe if ye'd left her a week or mair she'd have smiled on ye."

"Do mind your own business," Ralph broke in furiously, stamping his foot. "Say what you have to tell me and have done with it — that is," he rose and moved towards the door, "if you have anything to tell. I don't want to be jawed as if I was six."

Faith's hands clasped themselves tightly together. She had that wonderful power of forbearance so often linked with a strong, passionate nature. Ralph never guessed how deeply she felt his taunts.

"Master Ralph," she began in a deprecating voice, "many's t' time I've told ye that Mrs. Burneston 'ud do you a bad turn, an' see, for all your scaum, she's done it now."

"What has she done? Make haste." He stamped on the floor in his impatience.

"Sit ye doon an' I'll tell ye. Nobbut you are ower good for t' likes o' a poor parson's lass."

He frowned angrily.

"You're talking nonsense, Faith, and you know it; if I want anything, it doesn't matter whether it's good enough for me, I must have it; and I should have thought," a slight flush spread over his face, "that you would prefer Miss Masham to Rose Duncombe."

"Rose!" Faith tossed her head, and the corners of her mouth went down into her chin; "it cud nivver be seemly fer you to speak with such as Rose, nobbut in the way of kindness. But, Master Ralph, you sud look higher than Miss Masham; you may wed with a duke's daughter fer t' asking."

"I shall wed, as you call it, whom I please;" then he flushed angrily at the remembrance of Rica's refusal. "But never mind all this; what has Mrs Burneston done? say it and do be quick."

"I sud ha' thowt you might have guessed; it's clear as daylight — mickle wad hae muckle, an' muckle wad hae mair; t' mistress has getten mickle, but what's that sae long as her fooalks is nut t' same as hersel. Hes not Miss Masham telled ye that she visits at t' Cairn, takes up wiv such as t' Barughs? Nae, nae, Master Ralph, Mrs. Burneston's fain t' wed her friend wiv her brother, an' she'd do it twice as much noo just for to spite you."

Ralph stood still; he leant against the wall thinking and frowning, but at last a smile spread over his face.

"Do you know, Faith, you think you're deuced clever, but you're an extremely foolish old woman? To begin with: such a thing as an attachment between Miss Masham and that lout George Barugh is impossible; and next, how can Mrs. Burneston know anything about me and Rica?"

"Eh, lad, if ye'd allays keep a smile on your bonny face like that, ye looks my ain bairn 'at seemed gone away, an' Satan's hoof 'at had just dinted yer forehead is smoothed out 'o sight now. Eh, lad," she went up to him and laid her hand pleadingly on his shoulder, "I'm not blamin' yu, honey." The soft tenderness that had made her eyes dark and liquid changed into sudden hate. "It's not yur fault if ye're changed, it's she 'at has driven ye fra yur ain home into wicked ways, an' noo that she sees a chance o' your comin' round she tries to step atween you an' ivvery pleasure yey fancy."

The last words renewed Ralph's anger. His resentment against Doris had slumbered in the amusement afforded by his pursuit of Rica, but there came back suddenly his meeting with his stepmother outside the stone cottage, and also Rose's sudden removal from Burneston.

"Curse her!" he said fiercely; "yes, you're right, Faith, there must be an end to this at once;" then as the thought came, "By Jove, she has set Rica against me."

Faith nodded her head eagerly. This was just the mood she had been striving to evoke, and yet, knowing her boy's contradiction, she had begun to feel hopeless of success.

"What did I say to ye; an' did yey mind, when yu an' t' lass were talking beside t' river? I was takin' tent on ye, an' sae was Mrs. Burneston. I saw miss turn her head to t' house, an' I looks, an' theer was t' mistress a' frownin' an' a beckonin', an' I kenned 'at she was oop to keepin' her fra you. When I knows a thing, Master Ralph, I knows it, an' I reads Mrs. Burneston like a book, for a' t' scaum in her face; she hates you an' she hates mey, an' she'll nivver rest till she sees our backs turned on t' Hall."

There was real passion in Faith's voice, but there was not the fierce glance and violent manner she often used to overawe her inferiors. She looked calm and very pale, but her hand trembled as it rested on Ralph's arm.

He stood a moment musing.

"Look here," he said sternly; "I've been wrong all this time. I've never asserted myself, and she thinks she can override me as she pleases. I have taken her insolence too quietly; but we'll see who's master here. My father" — he hesitated, a lingering touch of right feeling reminding him that he had a listener; then the remembrance of Rica's refusal came back with the new aspect of being caused by Doris, and he forgot all restraint.

"The low-born, presuming upstart!" he said; "she to dare to judge and control my conduct — she! Does she think I'm as great a fool as my father, I wonder? If I'd been older when he was duped into that marriage, I should have been justified in shutting him up. He lost his senses, and they've never come back."

By this time Faith had seen the danger of going too far.

"Whisht, whisht, you mustn't blame t' squire, dear," she spoke soothingly, "he's nowt to do with such ways. I heard him tell Mrs. Burneston 'at Miss Masham were not for t' likes o' her brother George."

Ralph stared in utter surprise. Till now he had looked on Faith's assertion about George and Rica as a mere effort of imagination. It was too daring for Doris to dream of such a project.

"You heard! — how?"

"I was in Master Phil's room, and they war speaking out."

"And you listened?" he sneered, and Faith reddened. "Well, of course, that explains everything, and also explains what happened this morning. Well, I'm off."

He nodded and left the room, eager to find Rica. Of course she cared nothing for George Barugh, but he was sure now that she had been prejudiced against him. If his stepmother were determined to marry Miss Masham to her brother George, Doris, he thought, would stick at nothing. If Rica knew how Doris had upset his whole life he was quite sure she would not be guided by her. "After all, Rica's a lady," he said, "and she must have some class prejudice; it is far more natural she should side with me than with a farmer's daughter. They must have finished breakfast by now."

CHAPTER XLIV.

GEORGE'S QUEST.

When George left his sister he rode away slowly up the avenue; he had no heart to go through the village or to pass by the farm and Rose Duncombe's cottage, and, as has been said, the road through the avenue curved round into the Steersley road above the church. As he passed the churchyard gate so many memories crowded over George that he gave his horse the whip, and galloped on till Burneston was fairly left behind him.

"Mother says it hes been a grand thing for Doris to have married t' squire," he said sadly, "but I can't see it. She's not taken happiness to t' Hall, an' she looks worried an' sore-hearted; except when I spoke of t' little lad she scarce smiled. Mebbe it's true that happiness is not so unequal as fooalks says. Mother's nivver tasted the sort o' pleasures that Doris lives among, but, for all that, mother's younger and fresher in spirit than Doris'll ivver be now; it must be sad to hate, as I fear she hates Ralph Burneston, her own husband's son, too."

He sighed at this. He had spoken positively about Rose to Doris, but he felt that marriage was over for him, for it seemed as if his love for Rose had grown hopeless. He knew he could never love any other girl, and, therefore, however despairing her attachment might be to Ralph Burneston, he thought it must like his own surely prove undying. But he was not sighing now for himself or for Rose Duncombe; he was only thinking how completely the practical experience offered by life contradicts the theories of youth and hope. The squire's love for Doris had seemed perfect, and although hers had not equalled it, still George had hoped that her husband's great love would have sufficed for his sister's happiness, would, at least, have drawn her love forth in return.

"But she cannot truly love her husband," he thought sadly; "her own self an' little Phil comes first, an' t' squire last of all. 'Twas plain to me whiles I talked to Mr. Burneston how he loves t' lad; tho' he sees Ralph's been to blame, yet he longs to keep him at home; an' how can Doris set herself against him? I don't like him, but then he's not t' flesh and blood of one that's dear to me. I'm very sorry for him. I thowt Doris 'd be so large-minded, so different to most stepmothers. I'm sadly feared 'tis her pride; she'd like t' set him aside fer t' sake o' her own bairn."

His thoughts went on to Ralph and Rica, and he felt a tender pity lest the girl should fix her affections on such a changeable, unstable character as Ralph Burneston's.

"She's worth better than he, nobbut she

Digitized by CORNELL UNIVERSITY Original from CORNELL UNIVERSITY

may steady him an' lead him up to higher things. Aye, there 'tis, I kenned I'd stumble on't at last. There 'tis — it's at the root of Doris' troubles. She tries t' deal wi' 'em herself. She don't cast 'em on Him that careth for her. Why, if she did she'd rise up fresh and bright, instead of having her young face clouded and grave."

So much thought and sympathy for others had put his own trial aside; but as he drew near to the parsonage at Steersley his trouble came back, and he felt heavy-hearted again.

"Well," he smiled, "I'm not practising my own doctrine; I munnot trust to myself; I mun do what Mr. Hawnby says is best fer t' poor lass."

His mind turned slowly from one idea to another, and he had been so bent on finding Rose at Burneston, that at first he had scarcely entertained the squire's idea that she would be found at Steersley; but when he came in sight of the low grey house a sudden glow of hope warmed his heart. Something told him that Rose was near at hand.

The parsonage stood some way back from the road, screened very much from sight by clumps of Portugal laurel, the garden itself being divided from the highway by a low wooden park paling, grey with the lovely opal tints of time, which had covered much of it with hoary lichen. Behind the house, far away, was the open country; to the right of the parsonage were tall trees, and from these came the peaceful sound of rooks, as the huge black birds sailed solemnly forth from their nests to take their evening gossip overhead.

The grey wooden palings were continued up each side of the grounds to the low stone wall which shut in the back yard and out-buildings. George rode round to the back gate, and as he looked over the palings through the alley of apple-trees, which bordered this side of the garden, he saw a sight which brought the blood to his cheeks and made his pulses quiver. Surely it was Rose who was pacing up and down this sequestered alley quite out of sight, as she thought, for only a tall man on horseback could have seen over the fence into the walk below. She was unconscious of his presence; she walked past him down the alley, her hands clasped together, and it seemed to George in his hurried glance at her, with a sad, stricken look on her face.

He rode on fast, opened the gate for himself, and had put his horse under a shed, before the parson's lad, an old, decrepit man with a hump on his back, found out there was some one in the yard.

George nodded, and asked if the parson was at home.

The old man shook his head. "Nae, nae, mah lad, an' he'll nut com yam mebbe till night. There's a awd lass atween life an' death mebbe three miles aff, an' ye'll not fine t' parson leavin' till his wark's done ov her. Fooalks tell 'at she's been a witch, an' t' awd deevil's feersome noo sheea's deein', she cries out on Awd Soss, an' says he's waitin' fer her soul."

"Poor old creature!" Then George hesitated. "I'll go in an' wait a while," he said, "I want t' speak wi' t' parson."

Bill stared after him.

"Parson he sehd ah war nut tu let onnybody gan in, but yon lad's sae maisterful. Weel, weel, ah'v telled him nowt, an' if t' lass keeps weel oot o' sight, mebbe he'll nut get a sight o' her."

George went rapidly past the house, he scarcely felt his lameness now, the moorland air had so invigorated him. He was anxious to escape the observation of Mr. Hawnby's housekeeper. Fortunately he met Rose at the near end of the apple-tree walk; his fear had been that she would escape at the first glimpse of him.

She looked stupefied as she saw him coming towards her; then, as he held out his hand, she tried to turn away; but it was too late. George caught first one hand and then the other, and held her fast.

"Whisht, lass!" He saw the bright color fly into her face, and he feared a sudden gust of passion. "Nobbut ye'll stand still, I'll loose ye soon enough. Rose, honey, I'se so fain to see ye safe, 'at I's no mind to flout ye fer t' fright ye gave me yon. Tell me, lass" — he loosed one hand; but, spite of her twitching fingers, he kept the other firmly grasped — "what's ye doin' here?"

"I don't know." She looked sullen, and there was such despair in her voice that his heart ached for her.

"I mean, how did you get here, lass?"

He spoke in a soothing voice as he gazed at the girl; her scared, wan look, the hopeless misery in her face, wrung his heart. He saw, as he took in every bit of her tired, drooping figure, that she wore the same gown she had worn that fatal day on the moor; it was soiled and draggled, and George's heart was full of fear as he waited for her answer.

Rose gave him a hasty look; then she turned her head away.

"On my legs, foolish lad; how else d'ye think?" She gave a short laugh.

"My poor lass, 'd'ye mean," he said tenderly, "'at you walked all the way from t' Cairn to Steersley?"

There was the old scornful light in her eyes as she turned round and looked in his face.

"My mercy! you're not changed, lad; ye're as fond as ivver ye was, nae doubt. I walked a' t' way from t' Cairn; easy walking for such as me," she said bitterly. Then she saw tears in his loving brown eyes, and turned away.

"I'll not freeat ye, lass," he said. "I'm onny thankful to find you here safe, an' in such good keeping. T' parson's reeght good, Rose."

"Yes, he's very kind." She spoke carelessly and stopped for a while; then, finding George did not break the silence, she resumed her walk under the apple-trees.

He paced silently beside her. Presently he saw first one tear and then another fall and leave its trace on the bosom of her travel-stained gown. She did not sob or sigh; the tears started to his own eyes, and he dared not speak; his love was too reverent in its nature to force itself on her sorrow. At last she spoke without looking at him.

"Ye're a kind, good lad, an' may ye nivver know t' bitterness of such a lot as mine. D'ye mind, lad, how ye read to me yance o' t' Slough o' Despond an' t' pilgrims flounderin' and strugglin' i' t' mire an' foul water, till they couldn't sae much as see t' land on t' other side? Well, lad, ah was gone further still; ah left strugglin' an' flounderin'. Ah was just sinking." She looked up sharply; the intense pity in his face irritated her, and roused the old defiant spirit. "An' why not, ah'd like to know? No one wad be a bogle t' warse if ah had sunk an' gone out o' mind forivver."

"Rose, Rose! whisht, honey! Ah tells ye ye munnut speak untruths; ye kens there was more than yan 'at wad ha' gone sorrowin' fer yu their lives long."

"More than yan! Ah likes that, ah diz." She laughed harshly, and George winced. "More than yan means two at t' outside, an' that's yersel an' mebbe gran'-mother. Yance ah'd hev made a bigger hole i' life when ah left it, but now"—she looked round wildly, then the sight of the house seemed to recall her straying wits. "God help me!" she said, "ah've laughed at yu, George, fer yur sermons, but ah's learned to trust i' God sin he helped me on t' moor, an' ah knaws he'll have pity on such a wretched thing as a girl which loves a man wivout a heart in his body."

She dried her eyes and kept walking on beside her companion, but George did not speak. His lips moved as he prayed fervently for help and guidance, both for himself and for poor Rose, but he could not find anything to say. He feared to comfort her; if he tried it would most likely set her contradiction in a blaze; for he saw that she was in too overwrought a mood to endure any topic disconnected with her present trouble. He was conscious of some change in Rose. Formerly he had thought that only his exceeding love for her made him sometimes distrustful of his power to convince her, but now there was a dignity in her despair of self that kept him hushed. He felt that the nature he thought he knew so thoroughly had secrets beyond his ken.

All at once she began to speak again, in a quiet, calm voice, and looking straight before her, so as to avoid George's eyes.

"Thank you, lad, for all your kindness. Ah knaws more then you thinks. You came here last night, an' t' rector was away, an' t' housekeeper 'd been told t' haud her tongue, an' so ye went on to t' inn tired an' worn out. If ye'd not started sae early t' mornin' fer Burneston ye'd hev kenned t' truth; but ye'd flitted be time t' rector got to t' Black Eagle."

"But how came they not t' say a word at t' inn? They must know you're here."

Rose shook her head. "Not they. Ah was miles from Steersley when Mr. Hawnby saw me fost. Ah cannot tell ye how ah'd getten so far. Ah got lifts in carts; an' yance a lady—she mun be good, whoever she be—took me on a bit in her carriage. It was night-time, an' she was going post-haste to see a dyin' daughter. Ah telled her ah would fain die, so as her daughter might live, life was nowt to me, ah said; and she cried, poor soul, an' patted me on t' shoulder, and sehd ah was to live for t' sake o' Him who died that ah might live—not for mysel'. 'Tis strange how t' words spoken in darkness sank into mah heart. Ah could scarce make out her face in t' glimmer, but ah knew it must be sweet; her words had a teary sound, but they warmed me as a smile wad ha' done. Ah, she war good. Mebbe if ah'd not travelled along wiv *her*, ah'd not have come away so quiet wiv t' parson."

"Where did you meet him?"

He saw at once he had better have kept silence. The interruption to her flow of

recollections jarred the nerves of the unhappy girl. She tossed her head and gave George a derisive smile.

"Just t' same — same as ivver — poor doited lad!"

But as she found that he kept silence, the longing to tell her story to the end grew too strong to resist. She looked straight before her again and went on.

"T' lady made me stay wiv her till t' daylight came; but then ah would go. She urged me to go on wiv her to her journey's end, but no, that was not fer t' likes o' me; 't was enough for me to see t' fine lady's maid, as soon as 't was light, toss her head at me. T' lady said t' next town was Steersley, so ah said ah'd friends in a village near, an' she was too kind t' ask questions. Then t' parson found me sitting under a hedge. Ah was faint an' weary — t' lady gave me biscuits, but ah'd no heart to eat — an' he bid me get up beside him, an' he took me to an awd lass in a cottage near an' left me all day; an' i' t' evenin', when ah lay sleepin' on t' bed, he came an' fetched me here."

"Thank God!" said George involuntarily.

Rose gave him a smile, but it made her face look old and dreary; it was but the ghost of the saucy, happy smiles that used to be a part of her beauty. It faded into a look of deep sadness.

"Fare ye well, lad," she said gravely; "go back to your ain fooalks, an' nivver trouble more about Rose Duncombe; she's not worthy for yu to think on. Ah dizn't say, forget me. Ah'd like to feel ah had yan true friend to count on; but ye mun change yur way o' thinkin'. Ye mun always mind ah's not t' Rose 'at ye loved yance, but a misguided lass that hes cast herself away. Yur words hes come truer than ye thowt for; George, lad, ah hev ventured too near the flame, an' my wings is singed forivver more" — her voice broke into a sob.

She waved her hand quickly, and darted from him as suddenly as she had left him at the Cairn.

With her went the weight which kept down his power of thinking, and a flood of questions rose to his lips which the very sight of her woeful face, and the hearing of her sad story, had for the time stifled. He looked wistfully up the apple walk, and then shook his head.

"It's mah ain fault, ah'm unready," he said, "but 'tis impish to me, an' it's useless to repine against one's ownself for aught beside sin — it's no sin, Mr. Hawnby says, to be unready and awkward-like, so long as it don't come from being ower full o' wersels, an' only God knows," he said reverently, "how truly ah was taken up wi' t' poor lass. Well, it would be selfish to cross her will, an' ah'll not seek her for this time. Maybe he'll order it different one day."

It was getting too late to return to the Cairn, and he so longed to see the rector that he resolved to sleep at the Steersley inn. As he led out his horse, Mr. Hawnby came hurriedly out of the parsonage. He looked much pleased to see George.

"I'm glad I've met you, my lad. You will find a letter from me when you reach home," he said. "I met Rose as she left you just now. Poor child, she is not fit to talk yet; you must leave her alone. She will not take comfort from you in her present state."

"What is to become of her, sir? It's past bearing —— "

The rector put his hand kindly on George's shoulder.

"Come, come, this is not like you; I thought you would be quite cheered to find she was safe. Leave her alone with me. I am seeking a quiet home for her, for Mr. Burneston will of course agree with me that she cannot return to her grandmother. When she is more like herself I will write and tell you, but depend upon it she is far better among strangers just now. Now I shall send you away, and you had better not try to see Rose again for some time to come."

"You are very good, sir, I've no words to thank you," but George looked sadly downcast.

"Cheer up, my lad," the rector said. "Time is a wonderful healer, and you are both very young, you know, so be hopeful. Now good-bye. God bless you."

He squeezed the lad's hand warmly. "Poor lad," he said, as he watched him trot out of the yard. "He will win her yet, I hope; he deserves to, and she'll come right in time."

From The Contemporary Review.

ON THE HYGIENIC VALUE OF PLANTS IN ROOMS AND THE OPEN AIR.

THE animal kingdom is, as we know, dependent on the vegetable kingdom, which must have existed on the earth before men and animals could live upon it. We may therefore rightly call plants children of the earth. But in so doing we use the language of metaphor, as when we

Original from CORNELL UNIVERSITY

speak of "mother earth." The earth does not directly bring forth either plants or animals. Every plant is the child of a mother plant, descends from one of its own kind like ourselves; but plants derive their nourishment directly from earth, air, and water, and, although generated by plants, are nourished directly by the inorganic breasts of nature, and imply no other organic life but their own. Had plants a voice, they would more correctly speak of "mother earth" than ourselves.

Plants live directly on the lifeless products of earth, and we live directly on the products of plants or on animals which live on them; our existence implies other organic life, and our nourishment is not derived so directly from the earth as that of plants. Since the vegetable world comes between us, *we* should rather call earth our grandmother than our mother. At all events it is an affectionate relationship.

We have a natural feeling of close affinity with the vegetable world, which expresses itself not only in our love of foliage and flowers, but in our fondness for metaphors derived from the vegetable world and its processes. If we were to reckon up how many metaphors in everyday life and in poetry are derived from the vegetable world, and how many from other spheres of nature, we should find a great excess of the former.

Our material relations to plants are also very numerous. The question we are now concerned with is not what food or what medicinal remedies plants provide us with, but the value of plants and plantations in dwellings and in the open air in conducing to health or preventing disease. We have given the subject very little consideration until quite recently, just as we have thought very little of the way in which the pleasures of the table, fine raiment, comfortable dwellings, and many other things, conduce to our well-being. Meanwhile we have been guided by our instincts, which, like nature in general, have, on the whole, guided us rightly. Even now there is not much scientific knowledge on the subject; still there is a little, and something is gained when we begin seriously to reflect on anything, for knowledge is sure then to increase. All that man has ever aspired to and attained, has always existed much earlier in idea than in reality. Ideas are never fully realized, as we all know, and it is only very gradually that they are realized at all.

It is generally asserted that vegetation purifies the air, and chiefly by three functions: firstly, because plants absorb carbonic acid; secondly, because under the influence of sunlight they exhale an equivalent in oxygen; and lastly, because they produce ozone. These facts I need not demonstrate, as they have been placed beyond doubt by vegetable physiologists, chemists, and meteorologists. My task is to show what the direct sanitary effect of these three functions is.

I must at once state that none whatever can be proved to exist. And as this assertion will contradict the prepossessions of many readers, I feel bound to prove my proposition.

As to carbonic acid, the first question is, what is the proper and normal proportion of this gas in the air, next how much more carbonic acid is contained in air which is notoriously bad, and, lastly, whether the air on a surface without vegetation contains essentially more carbonic acid than one having vegetation upon it.

The amount of carbonic acid in the open air has been often determined, and is confined within very narrow limits. It may be said — leaving severe storms or very thick fogs out of the question — to vary between three and four parts in each ten thousand of the volume of the air.

Experiments have also been made on the quantity of carbonic acid in apartments occupied by man, and it is generally taken as the criterion of the quality of the air, ventilation being regulated by it. In very bad air which is undoubtedly deleterious, it has been found to amount to from three to five per mille. One per mille marks the boundary line between good and bad air in a room.

We next inquire whether the atmosphere over a vast tract of country destitute of vegetation contains more carbonic acid than one abounding in vegetation, whether in the former case the amount of carbonic acid approaches one per mille. In 1830, De Saussure began to make researches into the variations in the quantity of carbonic acid in Geneva, and they were continued about ten years later by Verver in Holland, and Boussingault in Paris; in more recent, and very recent times, a great number of experiments have been made on the subject by Roscoe in Manchester, Schufze at Rostock, and myself and my pupils, particularly Dr. Wolffhügel, at Munich. The result is, in the main, that the variations — very small from the first — have been found to be still smaller as the methods of determining carbonic acid have been perfected.

Saussure, who worked by a method

Original from CORNELL UNIVERSITY

liable to give an excess, found from 3·7 to 6·2 parts in ten thousand. He considered that there were also slight variations between summer and winter, day and night, town and country, land and sea, mountains and valleys, which might be ascribed to vegetation. Boussingault, however, found the carbonic acid in the air to be rather less, and the same on an average in Paris and St Cloud; in Paris 4·13 and at St. Cloud 4·14 in ten thousand, which surprised him the more as he had reckoned that in Paris at least 2,944,000,000 litres of carbonic acid were exhaled by men, animals, and fuel.

Roscoe made experiments on the air at a station in the middle of Manchester, and at two stations in the country. He was originally of opinion that the vast manufactures of Manchester, chiefly dependent on the consumption of coal, must produce a perceptible effect on the carbonic acid in the air; but he also discovered that the air in the space in front of Owen's College contained no more than the air at the country stations. He also observed occasional variations; but when the carbonic acid increased or diminished in the city, it was generally just the same in the country. Roscoe found the greatest amount of carbonic acid in the air during one of the thick fogs prevalent in England.

Schulze found the amount of carbonic acid in the air at Rostock to be between two and a half and four parts in ten thousand. On an average it was somewhat higher when the wind blew off shore than off the sea.

In Munich, Wolffhügel found the carbonic acid to between three and four parts in ten thousand. Now and then, but very seldom, he observed variations, the maximum being 6·9 parts in ten thousand in a very thick fog, the minimum 1·5 parts in a heavy snow-storm, when the mercury was very low in the barometer.

It may be asked how the immense production of carbonic acid in cities like Paris or Manchester can thus vanish in the air. The answer is very simple: by rarefaction in the currents of the atmosphere. We are apt not to take this factor into account, but think rather of the air as stagnant. The average velocity of the air with us is three metres per second, and even in apparently absolute calm it is more than half a metre. If we therefore assume a column of air one hundred feet high and of average velocity, it may be reckoned that the carbonic acid from all the lungs and chimneys of Paris or Manchester is not sufficient to increase its amount so as to be detected by our methods.

From this fact it may be logically concluded that if no increase in the carbonic acid in the air is observable, no diminution will be observable from vegetation.

It is a universally recognized and incontrovertible fact that the carbonic acid contained in all the vegetable life on earth is derived from the carbonic acid in the air, in water, and the soil. Many conclude, therefore, that the air in a green wood must contain less carbonic acid than that in a city or that of an extensive tract of waste land. But I can assure them that the air in the Sahara, so called, of Munich, formerly called the Dultplatz, contains no more carbonic acid than the neighboring Eschen grounds. Of this I can give incontestible proof, an argument *ad hominem*. Dr. Zittel brought me several specimens of air in hermetically sealed glass tubes, from his travels in the Libyan desert, from sandy wastes, and from oases, on which I could conveniently make experiments at Munich. The amount of carbonic acid does not differ in the least in the air from the barren waste and the greenest oasis. The case is just the same with the amount of oxygen in the air. It was formerly thought, when imperfect methods were employed, that perceptible variations could be proved. Thus, for example, the outbreak of cholera in 1831 was attributed to a diminution of oxygen in the air, and here and there experiments were made which seemed to confirm the opinion. The hypothesis did not seem improbable, for it was concluded with certainty that in tropical swamps, which are the home of cholera, the oxygen in the air might have been in course of time diminished by the vast masses of decaying matter. But since the method of gas analysis has been arranged by Von Bunsen, the amount of oxygen in the air on the summit of Mont Blanc has not been found to differ from that in a city or in the swamps of Bengal. Neither is it greater in forest or sea air than in the air of the desert.

This absence of demonstrable variation, in spite of the production of oxygen by living plants and the absorption of it by the processes of combustion and decay, becomes intelligible when we consider first the mobility, and then the mass of the air encompassing our earth. The weight of this mass is, as the barometer tells us, equal to that of a layer of mercury which would cover the surface of the earth to the depth of seven hundred and sixty millimetres (more than three-quarters of a

Digitized by CORNELL UNIVERSITY
Original from CORNELL UNIVERSITY

metre). From the weight of this, several billion kilos, some idea can be formed of the volume of the air, when we consider that air, even beneath a pressure of seven hundred and sixty millimetres of mercury is yet 10,395 times lighter than mercury. In masses like these, variations such as those we speak of go for nothing. The amount of carbonic acid and oxygen might perhaps be essentially changed in Paris or Manchester if all organic matter on and in the earth were burning at once.

Even if it is granted, however, in face of these incontrovertible facts, that vegetation exercises no perceptible influence upon the composition of the atmosphere in the open air, many persons will not be disposed to give up the idea that the air in rooms can be improved by plants, because, as is well known, every green leaf absorbs carbonic acid and gives out oxygen under the influence of light. This idea may seem the more justifiable, because, although the production of carbonic acid is not perceptible in the greatest assemblages of human beings in the open air, it is always observed in confined spaces, although the actual production is but small. In the air of a closed apartment, every person and every light burning makes a perceptible difference in the increase of carbonic acid in the air. Must not, therefore, every plant in a pot, every spray, any plant with leaves, make a perceptible difference in a room? Every lover of flowers may be pardoned for wishing to see this question answered in the affirmative. Have not even medical men proposed to adorn schoolrooms with plants in pots instead of ventilating them better, in order that their leaves and stems might absorb carbonic acid from the mouths of the children, and give out oxygen in its stead? But hygiene cannot agree even to this. Hygiene is a science of economics, and every such science has to ask not only what exists and whether it exists, but how much there is and whether enough. The power of twenty pots of plants would not be nearly sufficient to neutralize the carbonic acid exhaled by a single child in a given time. If children were dependent on the oxygen given off by flowers, they would soon be suffocated. It must not be forgotten what a slow process the production of matter by plants is,—matter which the animal organism absorbs and again decomposes in a very short time, whereby as much oxygen is used up as has been set tree in the production of it. It is for this reason that such great extents of vegetation are required for the sustenance of animals and man. The grass or hay consumed by a cow in a cowhouse grows upon a space of ground on which a thousand head of cattle could stand. How slow is the process of the growth of wheat before it can be eaten as bread, which a man will eat, digest, and decompose in twenty-four hours! The animal and human organism consumes and decomposes food as quickly as a stove burns the wood which took so many thousand times longer to grow in the forest.

It would scarcely be intelligible if I were to calculate how much carbonic acid and oxygen a rose, a geranium, or a bignonia would absorb and give out in a room in a day, and to what extent the air might be changed by it, taking into account the inevitable change of air always going on. I will draw attention to a concrete case which every one can understand.

When the Royal Winter Garden in Munich was completed and in use, it occurred to me to make experiments on the effect of the whole garden on the air within it. There could not be a more favorable opportunity for experimenting on the air in a space full of vegetation. This green and blooming space was not exposed to the free currents of air which at once immensely rarefy all gaseous exhalations, but was kept warm under a dome of glass, through which only the light of heaven penetrated. Although not hermetically sealed, the circulation of air in such a building, compared with that in the open air, is reduced over a hundred-thousand-fold.

I asked permission to make experiments for several days at various hours of the day and night, which was readily granted. Now, what was the result? The proportion of carbonic acid in the air in the winter garden was almost as high as in the open air. This greatly surprised me, but I hoped at any rate to have one of my traditional ideas confirmed: I hoped to find less carbonic acid in the day than in the night, supported by the fact that the green portions of plants under the influence of light decompose carbonic acid and develop oxygen. But even here I was disappointed. I generally found carbonic acid increasing from morning till evening, and decreasing from night till morning. As this seemed really paradoxical, I doubled my tests and care, but the result remained the same. At that time I knew nothing of the large amount of carbonic acid of the air, in the soil, the air of the ground, or I should probably have been less surprised.

One day it suddenly became clear to

me why there was always more carbonic acid by day than by night. I had been thinking only of the turf, the shrubs, and trees which consume carbonic acid and produce oxygen, and not of the men and birds in the winter garden. One day, when there were considerably more men at work there than usual, the carbonic acid rose to the highest point, and sank again to the average during the night. The production of carbonic acid by the working and breathing human beings was so much greater than that consumed by the plants in the same time.

The oxygen in the winter garden was rather higher than in the open air; there it was about twenty-one per cent., and in the winter garden twenty-two to twenty-three per cent.

I did not make any experiments on ozone, for reasons which I will give by-and-by.

The amount of carbonic acid in the air in the winter garden cannot be reckoned as telling for or against the hygienic value of vegetation in an enclosed space. Let us inquire, then, into the value of the slight increase of oxygen.

There is a widespread opinion that the breathing of air rich in oxygen effects a more rapid transformation of matter, a more rapid combustion, as we say, in the body. Even great inquirers and thinkers have considered that we only eat and imbibe nourishment to satiate the oxygen streaming through us, which would otherwise consume us. We know now well enough that the quantity of oxygen which we imbibe does not depend on the quantity in the air we breathe, but far more on previous changes in and the amount of transformation of matter in the body, which are regulated by the requirements of breathing. The inhalation of oxygen is not a primary but a secondary thing. When we inhale air at every breath richer than usual in oxygen — for example, when breathing highly compressed air, as divers do, or laborers on the pneumatic foundations of bridge piers — the result is not a larger consumption of matter and an increased production of carbonic acid, but merely a decrease in the number of inhalations. If in air of ordinary density we make about sixteen respirations in a minute, in air of greater density we should involuntarily make only twelve, ten, or eight, according to the density and our need of oxygen; all else remains the same.

Lavoisier, and half a century later Regnault and Reiset, placed animals for twenty-four hours in air very rich in oxygen, but they did not consume more of it than in the ordinary air. An increase of oxygen in the air, therefore, or pure oxygen gas, only produces an effect in certain morbid conditions, in cases of difficulty of breathing, or where breathing has been for some time suspended, because an inspiration communicates more oxygen to the blood than breathing ordinary air. A healthy person can, however, without difficulty or injury, compensate for considerable differences, and an increase or decrease of one or two per cent. of oxygen does no harm, for under ordinary circumstances we only inhale one-fourth of the oxygen in the air we breathe; we inhale it with twenty-one per cent., and exhale it with sixteen per cent.

So far, therefore, as we feel ill or well in a winter garden, it does not depend on the quantity of oxygen in the air, and there is no greater appreciable quantity of oxygen in a wood of thick foliage than in a desert or on the open sea.

Let us, also, for a moment consider the ozone in the air, which may be looked upon as polarized or agitated oxygen. After its discovery, which has immortalized the name of Schönbein, was made known, it was thought for a time that the key had been found for the appearance and disappearance of various diseases, in the quantity of ozone in the air. But one fact, which was observed from the first, shows that it cannot be so; for the presence of ozone can never be detected in our dwellings, not even in the cleanest and best ventilated. Now, as it is a fact that we spend the greater part of our lives in our houses, and are better than if we lived in the open air, the hygienic value of ozone does not seem so very great. Added to this, the medical men of Königsberg long had several ozone stations there, during which time various diseases came and went, without, as appears from the reports of Dr. Schiefferdecker, ozone having the slightest connection with the appearance or disappearance of any of them.

Dr. Wolffhügel, assistant at the Hygienic Institute at Munich, has lately been occupied with the question of the sanitary value of ozone, but has arrived at only negative results.

But in saying this I have no intention of denying that ozone is of great importance in the atmosphere, for I am of opinion that it is. It is the constant purifier of the atmosphere from all organic matter, which passes into it and might accumulate. The air would have been long ago filled

Original from CORNELL UNIVERSITY

with the vapors of decomposition if it were not for ozone, which oxidizes all that is oxidizable, if only time enough is allowed for it, and too much is not expected at once; for, generally, the amount of ozone in the air is so small, that it is consumed in making its way into our houses, without disinfecting them, and we can no more dispense with the greatest cleanliness and best ventilation in our homes than we can essentially change the air in our rooms by means of plants in pots and foliage.

Some of my readers will perhaps ask in some disappointment, in what, then, does the hygienic value of plants and plantations consist? Or do I mean to say that all the money spent by one and another on a parterre of flowers in his house or on a garden, or by a community for beautiful grounds, or by a State for the preservation of forests, with the idea of promoting health, is mere luxury, without any hygienic value? These questions alter our standpoint, and I believe I shall be able to show that even hygiene does recognize a sanitary value in plants and flowers, in the laying out of grounds and plantations, only it offers a different explanation from the ordinary one.

I consider the impression which plants and plantations make upon our minds and senses to be of hygienic value; further, their influence on the conformation of the soil, with which health is in many respects connected; and, finally, their influence upon other qualities of the air than carbonic acid, oxygen, and ozone: among these may be mentioned, in passing, shade in summer, and decrease of wind and dust.

It is an old observation, needing no demonstration, that the cheerful and happy man lives not only an easier, but, on the average, a more healthy life than the depressed and morose man. Medical men, and especially "mad doctors," could tell us much of the great value of a certain relative proportion of pleasurable and painful impressions upon health, and how frequently some unfortunate position, an absence of pleasure, or too much of painful impression, are the causes of serious illness. Man always tries, and has an irresistible need, to balance painful sensations by some kind of pleasure or other, so that often, in order to get himself into a tolerable frame of mind, or to deaden his feelings for a time, he will have recourse to wine, beer, or spirits, though he knows well enough that he will be worse afterwards than before. A certain amount of change and recreation is indispensable, and, failing others, we seek them by injurious means. There are, doubtless, some unhappy and morbid natures who are always discontented, to whom everything comes amiss, and whom it is impossible to help; but the majority of men are easily pleased, find pleasure in little things, though it is but a sorry life they lead. It is something the same with the pleasures of life as with the pleasures of the table; we must relish our food if it is to do us good. What good will the most nourishing diet do me if it creates disgust? Professor C. Voit has clearly pointed out, in his experimental researches into diet, the great value of palatable food, as well as nourishment, and how indispensable a certain variety in our meals is. We think we are only tickling the palate, and that it is nothing to the stomach and intestines whether food is agreeable to the palate or not, since they will digest it, if it is digestible at all. But it is not so indifferent, after all; for the nerves of the tongue are connected with other nerves and with the nerve centres, so that the pleasures of the palate or some pleasure, at any rate, even if is only imagination, which can only originate in the central organ, the brain, often has an active effect on other organs. This is a matter of daily experience. If you put your finger down your throat, you produce retching; many people have only to think of anything disgusting to produce the effect of an emetic, just as the thought of something nice makes the mouth water just as much as tasting the most dainty morsel. Voit showed me one of his dogs with a fistula in the stomach. So long as this dog is not thinking of food, his stomach secretes no gastric juice, but no sooner does he catch sight of a bit of meat, even at a distance, than the stomach prepares for digestion and secretes gastric juice in abundance. Without this secretion the assimilation of nourishment would be impossible. If therefore some provocatives induce and increase certain sensations and useful processes, they are of essential value to health, and it is no bad economy to spend something on them.

I consider flowers in a room, for all to whom they give pleasure, to be one of the enjoyments of life, like condiments in food. It is certainly one of the most harmless and refined. We cannot live on pleasure alone; but to those who have something to put up with in life, their beloved flowers perform good service.

The same may be said of private gardens and public grounds, and of the artistic perfecting of them. The more tastefully laid out, the better the effect. Though

tastes differ, there is a general standard of taste which lasts for several generations, though it varies from time to time and is subject to fashion. As their object is to give pleasure, public grounds should accord with the taste of the age, or aim at cultivating it. This is a justification for going to some expense for æsthetic ends.

The influence of vegetation on the soil is much more easy to determine than on the mind of man. Space fails me to go into all the aspects of this subject, and I will confine myself to some of the most obvious. The difference is most apparent on comparing the soil of a tract of land covered with wood with the soil outside, in other respects alike. The Bavarian Forest Department deserves great credit for having established meteorological stations with special reference to forest culture, under the superintendence of Professor Ebermayer of Aschaffenburg. He has published his first year's observations in a work on "The Influence of Forests on the Air and Soil, and their Climatic and Hygienic Importance," * which may be recommended to every one who wishes to study the subject.

Modern hygiene has observed that certain variations in the moisture of the soil have a great influence on the origin and spread of certain epidemic diseases, as for instance cholera and typhoid fever — that these diseases do not become epidemic when the moisture in the soil is not above or below a certain level, and has remained so for a time. These variations can be measured with greater accuracy by the ground-water of the soil than by the rainfall, because in the latter case we have to determine how much water penetrates the ground, how much runs off the surface, and how much evaporates at once. The amount of moisture in the soil of a forest is subject to considerably less variation than that outside. Ebermayer has deduced the following result from his meteorological observations on forestry: "If from the soil of an open space one hundred parts of water evaporate, then from the soil of a forest free from underwood thirty-eight parts would evaporate, and from a soil covered with underwood only fifteen parts would evaporate." This simple fact explains clearly why the cutting down of wood over tracts of country is always followed by the drying up of wells and springs.

In India, the home of cholera, much importance has been attached in recent times to plantations as preventives of it. It has been always observed that the villages in wooded districts suffer less than those in treeless plains. Many instances of this are given in the reports of Dr. Bryden, president of the statistical office in Calcutta, and Dr. Murray, inspector of hospitals. For instance, Bryden * compares the district of the Mahanadda, one of the northern tributaries of the Ganges, the almost treeless district of Rajpoor, with the forest district of Sambalpoor. It is stated that in the villages in the plain of Rajpoor, sixty or seventy per cent. of the inhabitants are sometimes swept away by cholera in three or four days, while the wooded district of Sambalpoor is often free from it, or it is much less severe. The district commissioner who had to make a tour in the district on account of the occurrence of cholera reports, among other things, as follows: —

> The road to Sambalpoor runs for sixty or seventy miles through the forest, which round Petorah and Jenkfluss is very dense. Now, it is a remarkable fact, but it is a fact nevertheless, that on this route, traversed daily by hundreds of travellers, vehicles, and baggage trains, the cholera rarely appears in this extent of sixty miles, and when it does appear it is in a mild form; but when we come to the road from Arang, westward to Chicholee Bungalow, which runs for about ninety miles through a barren, treeless plain, we find the cholera every year in its more severe form, the dead and dying lying by the wayside, and trains of vehicles half of whose conductors are dead.

In the same report Dr. Bryden continues: —

> I will mention one other fact as a result of my observations, namely, that places surrounded by those vast and splendid groves which are occasionally seen, lying in low and probably marshy situations, surrounded by hills, and which, from the mass of decaying vegetation, are very subject to fever in September, October, and November, are seldom visited by cholera, and if it occurs there are but few deaths, while places on high ground, or in what are called fine, airy situations, free from trees and without hills near, so that they are thoroughly ventilated, suffer very much from cholera.

Murray gives a number of instances showing the influence of trees on the spread of cholera. One of these may find a place here: —

> The fact is generally believed, and not long ago the medical officer of Jatisgar, in Central

India, offered a striking proof of it. During the widespread epidemic of cholera in Allahabad, in 1859, those parts of the garrison whose barracks had the advantage of having trees near them enjoyed an indisputable exemption, and precisely in proportion to the thickness and nearness of the shelter. Thus the European Cavalry in the Wellington Barracks, which stand between four rows of mango-trees, but are yet to a certain extent open, suffered much less than the Fourth European Regiment whose quarters were on a hill exposed to the full force of the wind; while the Bengal Horse Artillery, who were in a thicket of mango-trees, had not a single case of sickness; and the exemption cannot be regarded as accidental, as the next year the comparative immunity was precisely the same.*

We need not, however, go to India to observe similar instances of the influence of a certain degree of moisture in the soil favored by woods or other conditions; we can find them much nearer home. In the cholera epidemic of 1854, in Bavaria, it was generally observed that the places in the moors were spared, in spite of the otherwise bad condition of the inhabitants. The great plain of the Danube from Neuburg to Ingolstadt was surrounded by places where it was epidemic, while in the plain itself there were but a few scattered cases. The same thing has been demonstrated by Reinhard, president of the Saxon Medical College. Cholera has visited Saxony eight times since 1836, and every time it spared the northerly district between Pleisse and Spree, where ague is endemic.

In the English Garden at Munich there are several buildings, not sparsely tenantted — the Diana Baths, the Chinese Tower, with a tavern and outbuildings, the Gendarmerie Station, and the Kleinkessellohe. In the three outbreaks of cholera at Munich none of these places have been affected by it. This fact is the more surprising, as three of them comprise public taverns into which the disease germs must have been occasionally introduced by the public; yet there was no epidemic in these houses, although it prevailed largely immediately beyond the English Garden and close to the Diana Baths in 1854 and 1873. It must have been accidental that no isolated cases occurred, as the inmates of the Chinese Tower, or the Kleinkessellohe, might have caught it in Munich as others did who came from a distance, but had there been single cases, probably no epidemic would have occurred in these houses.

* Report on the Treatment of Epidemic Cholera, 1869, p. 4.

Even if these deductions must be accepted with caution from an etiological point of view, still, on the whole, they indisputably tell in favor of trees and woods.

Surface vegetation has also other advantages, besides its use in regulating the moisture in the soil; it purifies it from the drainage of human habitations, whereby it is contaminated and impregnated. If this refuse matter remains in soil destitute of growing vegetation, further decomposition sets in, and other processes are induced, not always of a salubrious nature, but often deleterious, the products of which reach us by means of air or water, and may penetrate into our houses. But from this indisputable fact, false conclusions are sometimes drawn. Many people imagine that if a few old trees are left standing in an open space their roots will absorb all the impurities from the houses around, and render the refuse which accumulates beneath them innocuous. This idea is not only false in a sanitary point of view, but very injurious, as it prevents people from taking the measures which alone can keep the ground under our houses pure.

We will now explain why the shade of gardens and woods is at certain seasons so beneficial. The human race during its pilgrimage on earth and wanderings over it has many difficult tasks to perform. One of the most difficult is involved in the necessity that all our internal organs, and the blood, whether at the equator or the north pole, should retain an equable temperature of 37·5° Centigrade (98° Fahr.). Deviations of but one degree are signs of serious illness. The blood of the negro and that of the Esquimaux is of the same temperature, while the one lives in a temperature of 40° above and the other 40° below zero (Centigrade). A difference of 80° has therefore to be equalized.

Our organism, doubtless, possesses a special apparatus for the performance of this colossal task, self-acting sluices so to speak, by means of which more or less of the heat generated in the body passes off: these consist mainly in the increase or diminution of the peripheric circulation, and the action of the pores of the skin. But we soon come to the end of our natural regulating apparatus, and have to resort to artificial means. Against cold we have excellent methods in clothing, dwellings, and fires; but at present our precautions against heat are very limited. This is doubtless the reason why higher civilization has extended so much farther towards the polar regions than towards the equa-

tor. The Germanic races, particularly, inevitably degenerate after living for a few generations in the tropics, and must be continually renewed by immigration if they desire to retain supremacy, as is proved by the case of the English in India. They will not be able to settle there and maintain the characteristics which have made them dominant, until means have been found of diminishing the heat of the body at pleasure, as we are able to maintain it in the north. At present our remedies against heat are baths, fans, and shade.

We lose the heat of our bodies in three different ways — by the medium in which we are,— generally the air,— and which can be warmed; by the evaporation of perspiration; and by radiation from bodies of a lower temperature, not taking into account a small portion of heat which goes off in mechanical labor. Under ordinary circumstances in temperate climates, we lose half the heat generated by radiation, one-fourth by evaporation, and one-fourth by the conducting medium in which we are. In proportion as any of these methods is diminished, one or both the others must be increased. As long as possible, our organisms are so obliging as to open and close the sluices themselves without our cognizance, provided that our regulating apparatus is in order, that we are not ill. It is only when our good servant the skin, under certain conditions, has come to an end of its powers, that we begin to feel that we must lend our aid. And thus we have found by experience that in hot weather shade helps the body to keep cool to the needful extent. The chief effect of shelter is to prevent the sun's rays from striking us directly; but if this were all, it would be as cool in the height of summer indoors, or even under the leaden roofs of Venice — which have driven many to frenzy and desperation — as under the shade of a tree or in a wood. It also makes a great difference whether the sun's rays fall on thick foliage or on a roof of slate or metal. A great deal of heat is neutralized by evaporation from the leaves; another portion by the decomposition of carbonic acid, just so much as is set free when we burn the wood and other organic combinations into the composition of which it enters. The heat produced by burning wood in a stove is derived from the sun; it is but the captured rays of the sun again set free by combustion. We learn from Ebermayer's work that the temperature of the trees in a forest and even in the tops of them, is always lower than the air in the forest.

Besides this, shade in the open air always causes a certain draught which acts as a kind of fan. All must have noticed when walking in oppressive heat, when the air seems still as death, that a refreshing breeze arises as soon as a cloud casts a shade. The same thing may often be observed in summer in walking through a street with close rows of houses, when the air is still, and one side is sunny, the other in shade. On the sunny side there is not a breath of air, while on the other there may be a light breeze. This is easily explained; so far as the shade extends the air is cooler than in the sun; layers of air of unequal warmth are of different gravity, and this difference of temperature is the cause of the motion in the air.

The shade of a single tree, therefore, cools not only by intercepting the sun's rays, but also by the effect of gentle fanning. The shelter of a thick wood, however, is much more agreeable than that of a single tree. The air in a wood is cooler than that of an open space exposed to the sun. The air from outside is drawn into the wood, is cooled by it and cools us again. And it is not only the air that cools us, but the trees themselves. Observation has shown that the trunks of trees in a wood breast high, even at the hottest time of day, are 5° Cent. cooler than the air. We therefore lose considerable heat by radiation to these cooler objects, and can cool ourselves more easily at a temperature of 25° Cent. in a wood than at a much lower temperature in an open space. When the objects around us are as warm as ourselves we lose nothing by radiation; what is radiated from us is radiated back by them. This is why we are so uncomfortable in heated and overcrowded rooms. It is generally set down to bad air, and this does certainly contribute to it, but it is chiefly the result of disturbed distribution of heat, as has been plainly shown by experiments on the composition of such air, which makes many people feel ill.

MAX VON PETTENKOFER.

From The Spectator.

THE PRINCE CONSORT'S SAVINGS.

THE court has thought it wise — very justly thought it wise — to take advantage of the publication of the third volume of the "Life of the Prince Consort" to deny

one of the commonest, most widely diffused, and most generally believed of the charges against his memory. It is, perhaps, the only one which has obtained credence among the educated. They, however, as well as the masses, have been possessed by the notion that the prince, who was an admirable manager of affairs — he completely restored the finances of his son's property, the duchy of Cornwall — and who was personally not extravagant, left behind him a large fortune, which was invested in land in South Kensington, and was bequeathed at his death to the queen. His will, it was said, was proved before the archbishop instead of in the ordinary probate office, in order to conceal the truth, and the money was silently added by the queen to her already "vast" possessions. So inveterate was this story that, as Mr. Martin says, it imposed on statesmen of mark, and it exercised, not once, but repeatedly, a very decided political effect. It was one cause, at all events, of the extraordinary fuss made about the dower to the Princess Louise, and has helped repeatedly to embitter speeches against grants demanded on behalf of the South Kensington Museum and the department of Science and Art. The court, it was said, was always jobbing to bring up South Kensington rents. Mr. Martin declares, in the most explicit and definite way, that the story is an invention from beginning to end, that the prince consort spent his whole income, and that he left absolutely no fortune whatever. Mr. Martin's words, which are evidently intended to be unusually vehement, are as follows: —

It may be convenient here once for all to dispose of, perhaps, the only calumny of the many to which the prince was subjected, which, so far as we are aware, keeps any hold upon the public mind, viz., that he had amassed large sums of money out of the income allowed him by the nation, part of which had been invested in the purchase of land at South Kensington, adjoining the property of the exhibition commissioners. The prince never purchased any land at South Kensington, either for himself or his family. Connected as he was with the acquisition of ground there for purely national purposes, the thought of acquiring property in the same locality for personal purposes would never have entered his mind, or the mind, indeed, of any honorable man. But in truth, the prince never had the means to make purchases of this nature. His whole income was no more than sufficient to meet the salaries of his secretaries and other officials and servants, his public subscriptions, and such purchases of works of art as were expected from him. He was often blamed because these purchases were not on a larger scale. The fault was not with him, but in the very limited means at his disposal, and as to these, his only regret was that they did not enable him to do for art and science all that he would have wished. It was only by strict economy that the year's current expenditure was made to square with the year's income, and the prince died, *leaving absolutely no fortune;* indeed, barely enough to meet his personal liabilities. And yet even recently we were assured, upon the authority of an eminent statesman, who survived the prince many years, and who professed to speak from personal knowledge, that he left behind in one of his investments no less a sum than £600,000! The statesman in question was not always exact in his statements, and he was never less exact, or more inexcusably so, than in this instance. But if a man whose position gave weight to his words could propagate so mere a fable, it becomes necessary to give it, and all stories of the same kind, an emphatic denial.

It is impossible for language to be more explicit, and this slander will now, we presume, disappear, like a thousand others. The odd thing about the original story of the savings is not that the public should have believed it — for the public will believe anything, when the figures get beyond £100,000 — but that it should be considered a slander, and a slander so serious that a most reluctant court should, years after the victim's decease, feel it expedient to give it an explicit and as it were detailed denial. Why is it disgraceful to save one's cash? There always will be unkind stories circulating about the royal family. They seldom or never share in the popularity which the occupant of the throne, if only decently attentive to English peculiarities of feeling, can always secure, and they are all slightly injured as well as protected by that kind of twilight in which, ever since the days of the regency, the British court has succeeded in enveloping its proceedings. Something must be said about the central subject for gossip, and as there is nothing true to be said, the story which is most like ascertained truth is repeated in its place. The prince was known to be thrifty, and had stopped much foolish waste at Windsor arising from a ludicrous conflict of authorities, and consequently it was reported that he was making a great fortune. The queen has never asked her subjects for money and was known to be rich, and consequently she was declared to be most parsimonious and to be heaping up wealth so great that any application for dower or appanage for

her children was an injustice to the country. The truth about the latter point was explained by Mr. Gladstone, who said that the queen, a widow and fond of retirement, had saved a fortune, which was not at all unusual in amount, and for which she had many uses; and the truth about the former point is, that it is poor scandal, originally begotten of the vexation felt by employés of the palace when the excessive and wanton waste which in one or two departments had existed in previous reigns was brought under regulation. It will be found, in all human probability, when the queen's memoir is written by some successor to Mr. Martin, that she was exactly as liberal and as careful as most English châtelaines, and that the popular belief to the contrary has arisen solely from her love for quietness, which has disinclined her to play hostess, and to the overcrowding sometimes unavoidable at Balmoral and Osborne. So inveterate, however, is the determination that the queen shall not be faultless, that any story, however absurd, which can be explained on the theory of parsimony receives at once a certain credence. Two years ago, for example, half London "society" believed for some days that the empress of Austria, one of the very greatest ladies in Europe, and moreover, one of the most influential persons, had travelled to Windsor to see the queen, and had been suffered to depart without being offered lunch. The truth was that the empress was in a hurry, and although pressed to stay to a lunch already prepared, went away as she had arranged, but out of this simple incident grew rumor upon rumor. The case is the same, however, in all capitals, and the slanders, though annoying, do not much matter; but it is odd that in this country they should so persistently take this particular direction. Why should not the prince consort have saved his money, if he liked? Nobody in this country, once out of church, thinks saving improper; everybody professes to despise extravagance, and nobody outside a limited circle of tradesmen expects to get anything out of the court expenditure. Why, then, should not the prince have saved, and invested in South Kensington ground rents too, if he knew enough of business to do it? As a matter of fact, he never had the means. He can never have had £40,000 a year clear, and a prince in his position, with a household of his own to pay, arts to encourage, and dependants to protect, very soon finds that an income of that kind, large as it seems to the professional classes, requires to be husbanded with some care. It is not the kitchen which drains the pocket of an English noble. Supposing the prince consort, however, to have had the means, wherein lay such an objection to his saving them that the mere statement that he had saved became a slander and added grievously to his unpopularity? We are absolutely unable to find a reason, except a certain unreasonableness in the temper of the English people. They did not think his allowance enormous. They did not want him to keep up any state separate from that of the queen. They would have been savage if he had spent money in any way which brought him popularity, or influence, or even social esteem. They wanted him to efface himself into the queen's private secretary, which alone among the prince consorts of history he did, and then they scolded because they thought that in his seclusion he had saved a fortune. It was mere unreasoning prejudice, fostered by annoyance at the very slight opening for comment which the prince gave anybody, and dislike of his imaginary tendencies in politics.

We wonder whether the etiquette which at present almost forbids the court either to refute or to punish slander is, in the interests of the monarchy, a wise one. We suspect it is. The statesmen of the Continent do not think so, and are always most jealous to preserve the power of restricting personal comment, but as a matter of fact, they usually fail, the most patent result of their efforts being to make the slanders much more bitter and unscrupulous. Napoleon was libelled everywhere at a time when a libeller was liable to Cayenne, and our own regent got nothing out of his prosecutions except a more accentuated hatred and contempt. The extraordinary sensitiveness of the German emperor, or it may be, of his ministers, does not shield him half so well as the quiescence of the queen, who in most cases of course never sees a libel, and it has not nearly the same effect of dignity. The right assumed by all royal personages on the Continent of refusing a challenge unless it comes from a royal prince, a right never surrendered — for the Duke de Montpensier's opponent was of his own blood — has never injured their reputation for courage, and a certain fortitude or indifference under obloquy does not deteriorate their character in the eyes of the multitude. It is very doubtful if Napoleon III.'s character, properly so called, was injured in Belgium or Switzerland by the literature of libel on him which grew

up in those countries, and quite certain that all the random stories about the Prince of Wales never stopped during his illness the popular prayer for his recovery. We suspect, indeed, that slander on royal persons, so long as they do not make themselves politically offensive to their people, goes very little way. It is not really credited. The people are tickled by it, just as they are by any other romances about the great, but they do not, while perhaps repeating the ill-natured story, believe it to be more than an expression of momentary dislike. If Marie Antoinette, who of all human beings was the one most foully libelled, had been on the popular side, neither the malice of her enemies nor her own indiscretion would have diminished her popularity one tittle, while her one grand prosecution did her more harm than all the inventions of the libellers. Extreme cases might, no doubt, occur, but as a rule, slanderous stories against royal personages are best refuted after they are dead, and in books like Mr. Martin's. Every Democrat in America used to read every day that General Grant was a drunkard, and a horse jockey, and a plunderer, and worse; but the Democrat who would not dine with General Grant, or who judged him differently on account of all these stories, might be sought in vain. He read in them expressions of an opinion that the general should not be re-elected, and that was all.

From Macmillan's Magazine.

HELIOGOLAND.

THERE are few places in Europe where the traveller may feel so secure from the companionship of the ordinary British tourist as in Heliogoland. And yet it is a British possession, and has been one ever since 1814. Up to that date the steep rock in the North Sea, whose name is sometimes spent Helgoland, or Heilgeland, but which we call Heliogoland, had remained in uncoveted and undesired possession of the Danes. Early in the beginning of the present century, however, when strange acts of appropriation were committed under the influence of panic, and justified by the rough-and-ready laws of self-defence, we seized upon this little group of islands lying in the German Ocean, right opposite the mouths of the great rivers Elbe and Weser. It consists of Heliogoland, Sandy Island, and several reefs and rocks, of which only two have been given the distinctive names of the Monk and the Steen. Heliogoland itself is barely a mile long, and its average breadth is only the third of a mile. Even these moderate dimensions are said to be subjected to a steady reduction by the encroachments of the sea. There is every reason to believe that the whole group of islets, which bear distinct traces of change in their physical geography, once formed a single island — large compared to the size of any of its existing fragments.

A bit of old Frisian doggerel describes vividly enough the impression of the traveller who first sees Heliogoland in its summer dress: —

Road es det Lunn,
Grön es de Kaut,
Witt es de Sunn;
Deet es de woaper vant, Helligeland.

Red is the land,
Green is the grass,
White is the sand;
These are the colors of Heliogoland.

And very bright and pretty these colors looked to our eyes, when we dropped the "Sunbeam's" anchor in the harbor last August, after a swift and safe run across — under sail — from Margate in forty-eight hours. The ordinary route is by way of Hamburg, and from thence by steamers making an eight hours' voyage three times a week. Only a couple of these hours, however, are spent at sea, the other five being occupied by a slow progress down the Elbe. Heliogoland is a favorite resort of Austrian and German families, who flock here during the summer months to enjoy the delicious sea-bathing, and the inexpensive, pleasant, *sans-façon* out-of-door life.

Indeed, the *coup d'œil* which first presented itself reminded me of nothing so much as one of the scenes from the opera of "The Flying Dutchman." There was the same bright sea, the dark cliffs, and the sandy shore. The same sort of long wooden pier straggled out into the blue water, and was crowded with groups of sturdy, fair, North Sea fishermen. They were idling about, too, in true theatrical fashion, dressed in loose trousers, light-blue striped sailor shirts, and blue or red woollen caps. Nor did the women look less picturesque in their bright scarlet or yellow bordered petticoats, light over-dresses, and black or chintz sun-bonnets.

Small as is the principal island, it yet boasts of two towns — one on the high land, and one on the low land. There is as much as one hundred and seventy

feet of difference between the two "lands," and the visitor must climb two hundred and three steps, if he would reach the upper town from the seashore. On this "Ober-land" stands the Government House, the church, the batteries and their magazine, and, higher than all, the splendid lighthouse, the lantern of which is two hundred and fifty-seven feet above the sea-level. This lighthouse not only serves as a warning from the rock on which it is built, but is of use to vessels entering the Elbe or the Weser, the Eyder or the Jade. There are about three hundred and fifty houses on this high ground, and eighty on the lower portion of the island, called the "Unter land," holding between them a couple of thousand inhabitants. These dwellings are so neat and clean, that their wooden walls and red roofs help to produce an indescribably comic effect of the whole place having been just taken out of a box of children's toys, and neatly arranged in squares and rows. But the combination of English comfort with Dutch cleanliness and German propriety is very agreeable to the eye.

The church is a curious building, and contains, suspended from the ceiling, several models of ships under full sail, presented, *ex voto*, from time to time. The women sit by themselves down-stairs, in pews marked with their family names; the men sit in a gallery up-stairs, round which has been painted, by no mean artist, a series of scenes from the Old and New Testaments. Some years ago the clergyman wished to paint these pictures out, which would have been a great pity; for, although the mode of treating the subjects has not been perhaps strictly ecclesiastical, they deserve to be retained as relics of a past age. It is to be hoped that some loving hand may even yet be found to copy or photograph these quaint old designs, ere time or progress deals still more hardly with them. The font, too, is especially curious. It is held up by figures so ancient that *cognoscenti* declare they must be the remaining supports of some ancient altar to a heathen deity. When a christening takes place there is a preliminary ceremony of filling this font, and it is pretty to see fifty or a hundred children advancing up the aisle in a procession, each bearing a little mug of water. The service is Lutheran. The clergyman reads from the communion-table, and above it is placed a little box from which he preaches. Besides this he possesses a pew of his own, exactly opposite that appropriated to the governor's use, with the communion-table between. Both these pews are precisely like opera-boxes, and have windows to open and shut. It is not so long ago since prayers used to be offered up in this very church for wrecks; and it was an established custom, if the rumor of one arrived whilst service was being performed, for the clergyman to shut his book, seize the long hatchet-like pike placed in readiness for such an emergency, and lead his flock to their boats. But the mission was scarcely a Christian one, for no survivers were ever permitted to return and tell the tale of what sort of welcome they had received on these inhospitable rocks.

We must remember, however, in mitigation of such hard and cruel facts, that from father to son for many and many a bygone generation the trade and profession of each male inhabitant of Heliogoland had been that of a wrecker, with a very little exercise of the pilot's or fisherman's more gentle craft during the brief summer months. Indeed it has taken the strong repressive measures insisted on and strictly carried out by the present governor, to at all subdue this inborn ten dency to act on the saying of what is one man's extremity being another man's opportunity. The great improvement in wrecking morals and manners which has been accomplished with so much difficulty is, however, but skin deep, and will even now collapse on the smallest chance of escaping detection. Whilst the "Sunbeam" lay in one of the two good harbors of these islands, she was the object of much curiosity and interest. Amongst her numerous visitors were some of the coastguard. They had been duly shown round the yacht, and during this process some wag inquired of the coxswain of their gig what he would like to take first if the vessel were "sitting on the rocks." This is a euphemistic equivalent in Heliogoland for a vessel being cast away. A half-regretful gleam came into his bright blue eyes as the man answered wistfully, "I hardly know, sir; but there is a good deal of copper about." As a matter of fact, we had already observed that the ventilators and bright brasswork of our little ship attracted special notice and many expressions of half-envious admiration. But it is only fair to add that we had other more peaceful and less professional visitors from among the islanders and the *Bāde-gäste*, and I often found beautiful bouquets of flowers and graceful messages of thanks awaiting me on board when we returned from a long day on shore.

The present governor of Heliogoland has indeed made enormous reforms in the system of legalized wreckage which he found in practice on the islands. He has established a volunteer corps of native coast-guards, superintended by eight picked coast-guardsmen from England. *Now*, therefore, when a wreck takes place on the shore, the errand of those battling with the beating surf, the howling wind, and the blinding storms of sleet and snow, to where the poor ship lies stranded on the rocks, is one of succor and not of heartless villany. Formerly the very same men would have only hastened to the spot with their pikes and hatchets, to cut down the bulkheads, force open the hatches, take out the cargo, and break up the ship as quickly as might be for the sake of appropriating her timbers, copper, and ballast. As for the unhappy crew, their fate would probably be similar to that of some passengers by coach to "Frisco" in its earliest days, of whom Artemus Ward makes mention as being the objects of the driver's special attention. This worthy used to make his rounds, kingbolt in hand, as soon as possible after an accident, and proceed to act on his avowed principle that "dead men don't sue; they ain't on it." But in these more civilized days, if rescue has come too late, gentle hands have laid the unfortunate mariners to rest in this bleak spot, and, through the kindness of the governor's wife, each grave in the pretty cemetery in Sandy Island, even though nameless, has been marked by a small black cross, bearing the name of the shipwrecked vessel and the date of its loss, whenever it was possible to ascertain them. The rocket apparatus has been used on many occasions, too, with the best results.

In spite, however, of the utmost vigilance, it sometimes happens that the old trade is still plied, and the governor told me the following story himself: —

He was one day lately caught in a thick fog when out in a boat shooting wild seabirds, and whilst waiting for the mist to lift, he heard a sound of hammering in the direction of a distant reef. His practised ears soon told him what it meant, and in spite of the difficulties raised on the spot by the crew of his boat, and the earnest efforts they made to dissuade him, he persisted in steering towards where he knew the reef lay. Just before reaching it, the fog lifted slightly, disclosing to some sentinel wrecker the swiftly coming boat. In a moment the most absurd stampede took place. Out of the cabin and hold of the unfortunate ship the disturbed pillagers swarmed like bees, hoping to reach their own boats and escape unrecognized. So rapid were their movements, that only two or three of the least agile were captured, but those who succeeded in getting away left behind them their large axes and other ship-breaking implements, on most of which their names had been branded, and which thus furnished the means by which the owners were captured and punished. Since this adventure the wreckers have had to acknowledge that, like Othello, "their occupation's gone," and they have taken every opportunity of enlisting themselves on the side of law and order.

There has been great difficulty too in inducing the natives to use the life-boats brought from England. On more than one occasion the coast-guard men have found the air-boxes broken and the linings cut by the natives, whilst they have themselves been absent on a life-saving expedition. But these obstacles lessen every day, under the firm yet kindly rule of the present governor, who takes the liveliest personal interest in every detail of his administration.

The Waal Channel separates the Downs or Sandy Island from Heliogoland, and both islands are but thinly covered with soil, which is hardly anywhere more than four feet deep. Still there is pasture for cattle and sheep; and fair crops of barley and oats can be raised in summer. The principal revenue of the islands is derived from fish, which are sent to London *viâ* Hamburg, and from a large oyster-bed. For the last fifty years it has also been the favorite summer bathing-place of Austrians and Germans, who come over in great numbers between June and September. The life led by these visitors is a very simple and informal one. Nobody seems to think it necessary to walk up and down at certain hours, or to do any particular thing at regular and stated periods. You may even if you like dig sand-holes with the children, whilst you listen to lovely music played twice a day by a band from Carlsbad.

To enjoy Heliogoland you must be a good walker, for there are no horses on the island, and every place has to be visited on foot. There is a nice breezy walk across the highest point of the island to the north end, where a curious rock stands boldly out, almost separate from the mainland. The cliffs are full of caves and grottoes, which are illuminated twice a year. A reckless expenditure of blue lights and rockets takes place on these occasions, producing, I am assured, a very enchanting and magical effect. We were

so unfortunate in the weather during our short stay, that one of these illuminations which was impending, and formed the staple subject of conversation during many weeks, had to be postponed over and over again, and we never beheld it.

The system of bathing at Sandy Island is organized to perfection, and it was impossible to help contrasting it with the seaside manners of Ramsgate, where we had last bathed. The *Bāde-gäste* are taken across to Sandy Island in private boats or in omnibus boats, which run every five minutes, from 6 A M. to 2 P.M. The bather provides himself with a ticket before starting, and has no more trouble. Ladies and gentlemen bathe on different sides of the island, and in different places, according to the wind and tide. We landed in our own boat, and I was much amused at the respectful distance at which the old pilot, who was carrying my bathing-gown, stopped. In his dread of approaching too closely to the forbidden precincts, he made the *Bāde-frau* walk at least a quarter of a mile to meet us. It certainly was a treat to bathe in such pure and clear water beneath so lovely and bright a sky. One feels like a different being afterwards. Part of the programme consists in taking a *Sonne-bad*, and basking in the balmy air on the little sand-hills, sheltered by the rocks from too much wind or sun. The bather has no trouble or anxiety on his mind about machines or towels. They are all provided for him, and the price is included in his original ticket. After the bath it is *de rigueur* to go and breakfast at the restaurant pavilion on the beach, where you feel exactly as if you were sitting on the glazed-in deck of a ship. The food is excellent, and Heliogoland lobsters fresh out of the water are as different from the familiar lobster smothered in salad and sauce, as caviare, newly taken from the sturgeon and eaten on the banks of the Volga, is from caviare eaten on the banks of the Thames out of a china jar. Then after this excellent breakfast, if the *Bāde-gast* is inclined for exercise, he may stroll about very pleasantly to the point of the reef, where he will hardly be able to turn his head without seeing the ribs of some unfortunate vessel sticking up out of the sea-sand; or he may return to the mainland and listen to the sweet music of the Carlsbad band, and even do a little mild shopping. The *specialities* of the island consist of hats, muffs, tippets, and many pretty things made from the plumage of the grey gull and other wild sea-birds which nest among the rocks. Besides these there are various ingenious little articles manufactured by the inhabitants during the long, cold, dark winter evenings.

The " Ober-land," or upper part of the town, can boast of several good hotels and restaurants, and in summer some two or three hundred guests sit down daily at the principal *table d'hôte*. For evening amusement, there is a bright, cheery little theatre, where a really good company plays nightly the most sparkling and pretty pieces with a *verve* and finish which reminds one of a French play-house. An occasional ball at Government House is a great treat, and warmly appreciated by the fortunate guests.

There is a generally received fable to the effect that Heliogoland is overrun with rabbits, which are rapidly and surely undermining the whole of Sandy Island, and will eventually cause it to disappear beneath the sea. But, as a matter of fact, there is not a single rabbit on the island, nor has there been one in the memory of the present generation. The wild-fowl afford excellent sport. The guillemots breed in immense quantities among the picturesque rocks of the west coast, and in the autumn large numbers of woodcock land here on their way south in search of summer climes. In the town itself two large poles are erected at the corner of every street, and between them a net is suspended, by means of which many birds are caught during their flight. Mr. Gätke, the permanent secretary to the government, has a most interesting ornithological collection, consisting entirely of birds that have been shot *on* the islands, but embracing specimens of numerous foreign varieties. Many of those we saw must have found their way hither from Africa, from the Himalayas, and even from Australia, besides a peculiar kind of gull (Ross's gull) from the arctic regions, of which even the British Museum does not possess a specimen. Mr. Gätke talks of publishing a book on this collection of feathered wanderers whose flight has ended here.

During the winter the rocks swarm with wild-fowl of all kinds — swans, geese, and ducks, but only two of the species breed there, the razor-hawk and the guillemot. In the spring, when the rocks are literally covered with these birds, the effect must be inexpressibly droll, and the noise tremendous.

Insignificant as the place seems to most of us, Heliogoland has given a great deal of trouble in her day. Barely ten years ago she was the bugbear of insurance

offices and shipowners, and a well-known refuge for masters desirous of getting rid of their vessels in a comfortable manner. No vessel once on the neighboring reefs, or on the main island, was ever allowed to depart, while those wrecked in the Elbe or the neighboring rivers were simply plundered by the Heliogoland fishermen and pilots under the plea of salvage. The renumeration for discharging or pilfering a cargo used to be settled in full assembly of the *Vorsteherschaft*, whose members, being principally pilot officers and wreckers themselves, were naturally interested in the amount of the reward received for salvage.

No debts could be recovered in the island, no legal decrees enforced, and a creditor had to wait for the death of an obstinate debtor, on the chance of his property coming before the court. The credit of the island, until lately, was at a very low ebb indeed, and, in order to increase its funds, contracts for public gambling were entered into between the *Vorsteherschaft* and some German lessees, which had the desired effect for the moment. It is difficult to imagine that so small a place could, in the few years between 1815 and 1868, have involved itself in a public debt to the extent of 7,000*l*. At present, in spite of the abolition of the gaming-tables and a great outlay on public works, this sum has been reduced to somewhere about 3,000*l*. To the wise and prudent administration of the present governor, this, as well as every other improvement, is due. Under his beneficent rule, Heliogoland has changed so much that the visitor of even fifteen years ago would not recognize, in the orderly, neat, thriving little settlement, the ruinous, lawless, bankrupt island of those comparatively recent days. ANNIE BRASSEY.

From The Spectator.

FORGETFULNESS.

IN the October number of *Mind*,— which keeps up its high standard of scholarly thoroughness in all its papers, though it might, we think, give at times rather more space than it does to subjects of general interest, without sacrificing anything in that direction, — there is a thoughtful paper on "Forgetfulness," by Mr. Verdon, in which the writer argues with a good deal of force against the now rather prevalent notion that there is no such thing as total forgetfulness, that under adequate conditions every modification the mind has passed through may be restored, and recognized as the representative in memory of what had once before been presented in direct experience. Sometimes people will tell you that in the process of losing consciousness by drowning, they have, in a moment or two, passed through, in vision, the whole of the experience of their previous lives, including incidents which, so far as they knew, they had completely and absolutely forgotten. Now, of course, statements of this kind are necessarily very vague, and hardly capable of verification. Those who give such evidence, if cross-examined, would not probably maintain that they really passed through in vision the long line of all the purely mechanical actions of their lives, all the times they had yawned, or coughed, or sneezed, or hummed a tune, every crossing of a *t* and dotting of an *i* in every line written by them from childhood to the date of the drowning,— that all the motes that they had once seen in a sunbeam had been seen again in the same order as before; they can hardly mean all this. What they do probably mean is simply that all the more stirring incidents of their life which had become deeply engraved on their memory before by their association with some grave action or strong passion, some deep emotion, or some serious pang of remorse, recur at such a time in due order. If they mean more than this, there is this great difficulty about the statement,— that we are all of us absolutely incompetent to say of the greater part of our least interesting experiences, whether they are faithfully represented in memory or not. Let any man walk down two or three yards of a busy street. Of course a vast number of impressions are made on his retina and on his ears; probably a good many associated ideas pass rapidly through his mind; one or two odors will be perceived; he will feel the pavement with his feet and his stick in two or three different places; and he will have some sort of notion of the warmth or coldness of the air through which he passes or, at least, of the changes of temperature. Now, within (say) three minutes, let him repeat the very same walk, and take all the pains in the world to note the similarities and differences in what he experiences. We are very certain that even though the person in question were a Charles Dickens himself, he will simply not be able to assure himself whether or not he saw before many things that he sees now, and heard before many things

that he hears now. He will not know whether or not he treads on precisely the same spots on the pavement as before, and places his stick on the same; he will not know whether the currents of air meet him in precisely the same places; and he will not know whether or not the same associations pass through his mind in precisely the same order. Now, if this be so when a man repeats, as nearly as the changes of the external world admit, the same experiences within three minutes, for the very purpose of recognizing all that is recognizable, and discriminating what is different,—it stands to reason that in a review of life, however vivid it may be, occurring many years after most of the events reviewed, it would be simply impossible to say whether all the images which pass in vision before you are or are not real memorial pictures of your former experience. If your original perceptions are so vague, — as in ninety-nine cases out of every hundred of half-attentive perception they are, — that within the next five minutes you are unable to say whether they are repeated accurately or not, how is it conceivable that under any spell whatever you can be quite sure that they have been repeated accurately at the interval of many years? We can only remember distinctly what we have vividly experienced. If the first experience is blurred and faint, the best conceivable return of it to memory must be blurred and faint also; nor can we usually, in the case of a blurred and faint first-hand experience, recall, even immediately, the degree in which each part of the image was thus blurred and faint. We confess, therefore, that we agree with Mr. Verdon in entertaining the profoundest doubt of the truth of the now rather common assumption that memory may one day restore to our recognition *every* experience of our past life. We should say that a very large part of life is consumed in experiences so little unique and so very like thousands of other experiences, that even if they did recur to our mind's eye in precisely the same form as before, we should be unable to affirm with confidence that they were the same. If the twenty thousand dinners that a middle-aged man had eaten were all to be paraded with the most faithful accuracy before his imagination, how is he, who probably hesitates in the witness-box whether or not the claimant before him be his own old friend or an impostor who closely resembles him, to swear to their identity? There are no doubt such things as infallible attestations of memory. If five minutes ago I were meditating a great crime or a great deed of any sort, I know that this was so, as well as I know where I am now. But as to ninety-nine hundredths of the minutiæ of human existence, memory, even when fresh, refuses to attest anything with absolute certainty. And it is at least exceedingly difficult, even if not quite impossible, to suppose that what memory could not attest at all when the event on which it was questioned was quite fresh, it could infallibly attest when that event was the vanishing point of a long past.

We hold, then, with Mr. Verdon that there is no real ground for supposing that *all* past states of consciousness must be recoverable and identifiable by us as the veritable states through which we actually passed. As a general rule, it is only moments of somewhat vividly concentrated life that we can positively attest in memory at any great distance of time; while common and commonplace experiences can hardly be discriminated clearly from each other even at the shortest intervals. We believe that in every man's life there are not only many experiences which have not been distinct enough when they occurred to be clearly and faithfully remembered, but also many which are so often partially repeated without critical and momentous differences, that even the most complete restoration of some of them in consciousness could not be identified individually, but only as types.

But nothing that we have said must be interpreted as throwing any doubt on the well-established fact that what has once been thoroughly well known, though since apparently quite forgotten, in consequence of the displacing power of new associations and new habits, may be brought back into full recollection again by any circumstances, — such, for instance, as those of a fever, — which in their turn obliterate the more immediate present, and set the mind working again in the old grooves. Nobody can doubt the truth of some of the stories of people who in illness have repeated sentences from a language quite unknown to them in their ordinary state, but which, as is subsequently ascertained, were impressed on their ear in childhood or youth, by hearing them constantly repeated, till at last these sentences had become as familiar to them as the inarticulate cries of London are to one who has long lived in the London streets, cries which, in like manner, disappear from the memory, so soon as the ear ceases to be familiar with them. And these stories certainly prove that anything which has

once been thoroughly familiar may be revived again in the memory, by striking the proper key-note in the music of old association, — at least if it be struck at a time when the mind is shut out from the disturbing influence of immediate practical interests, and temporarily imprisoned in the past. All this is in no way inconsistent with what we have been maintaining, — namely, that it is impossible to distinguish clearly in memory what you have never distinguished clearly even in direct knowledge, that you cannot surely recognize what you have never surely known. You may certainly have the most vivid recognition of things very long indeed forgotten, and as you would suppose, absolutely forgotten, supposing always that they were once thoroughly familiar, as almost every one must have experienced at times even in dreams. But then what is it that has apparently obliterated these familiar things from memory? It is the claim on the attention of a long succession of other duties and interests, and if these for a time be excluded, even though only by the images of a dream which diverts the mind into long-deserted tracks, there is no reason at all why the old attitude of mind should not be resumed, and when resumed, should not appear as fresh and natural as ever. Moreover, nothing is more likely to be suddenly revived in this way than a long-disused mechanical habit, with some old link in the chain of which the eye or ear suddenly finds itself again in contact. All experience shows that as nothing is so easy as to forget mere words and names, even when the things they represent are quite clearly before the mind, so the only way to recollect them is not so much to dwell on them, as to get into some well-worn groove of habit, by the help of which you come upon them unawares, in the midst of equally familiar words. Thus it has been noted that even people who suffer from that very serious disease of the brain called aphasia, almost always *swear* correctly, indeed say anything correctly which they are not *trying* to say, but which just completes a chain of old associations. Aphasic patients can scold the servants — an operation in which they are started, as it were, by a habit, rather than by a set purpose — when they cannot even get nearer to the word "moon" than to call it "that public light," or to the word "card" than "cigar." Carried back into an old groove of habit, they will run straight, though if they were to pick their own way, they would go blundering from side to side. Thus the man who forgot his most intimate friend's name, when he wanted to introduce him, recovered it at once in the mere swing of the familiar imprecation with which he said, "Confound you, Robinson, what *is* your name?" But the ease of the process of recovering such a dropped stitch in the memory, if you can only go back a few stitches and come upon it with the momentum of an old habit, is no argument at all in favor of the proposition that complete forgetfulness is impossible. For the truth is, that a very great proportion of our lives is made up, not of habitual actions which come quite pat, but of half-perceived, half-discriminated, half-grasped circumstances, which we could not clearly recall the next instant, for the very excellent reason that they were not clearly presented to us when they were presented. Anything which the mind has once really made its own, it may recur to, even long after it had seemed to be obliterated; but what has never been its own when it was first in contact with our thought, cannot become so in memory. You may disinter a long-buried train of associations, as you may disinter an old Roman road long hidden by the superincumbent dust of ages. But then the train of associations must have been there, and must have been firmly welded together once, before it can be possible to disinter it. Great portions of our lives are unrememberable simply because they have never been vividly lived, and indeed, in all the minutiæ of their detail, hardly could have been vividly lived at all. If you don't know what you see at the time you see it, it is no great fault of the memory if you cannot remember it when you see it no longer.

DETERMINATION OF THE HEIGHTS OF CLOUDS. — Mr. Alexander Ringwood, of Adelaide, has sent home a short paper on this subject, which appears to have been privately printed. He proposes to carry out the observations with a small simple altazimuth instrument. The principle is intelligible enough. The sun's altitude being known, and the edges of the projections of cloud shadows being parallel to the sun's rays: if we have a map of the country round the station, and mark on it the spots where the sun's rays strike through clouds, or where the shadows of clouds fall, the determination of the height of the cloud stratum is effected by plane trigonometry, if we observe the altitude of the precise points in the cloud.

LITTELL'S LIVING AGE.

Fifth Series, Volume XXI. | No. 1752.—January 12, 1878. | From Beginning, Vol. CXXXVI.

CONTENTS.

I. FLORENCE AND THE MEDICI, ... *Fortnightly Review*, ... 67
II. DORIS BARUGH. A Yorkshire Story. By Katharine S. Macquoid, author of "Patty." Part XI., ... *Good Words*, ... 76
III. RUSSIAN AGGRESSION, AS SPECIALLY AFFECTING AUSTRIA-HUNGARY AND TURKEY. By Louis Kossuth, ... *Contemporary Review*, ... 94
IV. ERICA. Part VIII. Translated for THE LIVING AGE, from the German of . . *Frau von Ingersleben*, ... 108
V. WITHIN THE PRECINCTS. By Mrs. Oliphant, ... *Advance Sheets*, ... 118
VI. RUGBY FOOTBALL, ... *Tatler*, ... 127

POETRY.

A SUMMER EVENING, ... 66
THE HONEST FARMER, ... 66
A MAN'S REGRET, ... 66
AT HER DOOR, ... 66
A MOMENT, ... 66

MISCELLANY, ... 128

PUBLISHED EVERY SATURDAY BY
LITTELL & GAY, BOSTON.

TERMS OF SUBSCRIPTION.

For EIGHT DOLLARS, *remitted directly to the Publishers*, the LIVING AGE will be punctually forwarded for a year, *free of postage*.

An extra copy of THE LIVING AGE is sent gratis to any one getting up a club of Five New Subscribers.

Remittances should be made by bank draft or check, or by post-office money-order, if possible. If neither of these can be procured, the money should be sent in a registered letter. All postmasters are obliged to register letters when requested to do so. Drafts, checks and money-orders should be made payable to the order of LITTELL & GAY.

Single Numbers of THE LIVING AGE, 18 cents.

A SUMMER EVENING.

I.

THE summer sun is setting,
The sky is red in the west,
And over all hangs silence,
And a feeling of peace and rest.

II.

The sultry day is over,
The light begins to fade,
The farmer's weary horses
Are standing in the shade.

III.

The golden light of sunset
Shines on the corn-fields round,
And the breeze, as it passes over,
Makes a sweet, rippling sound.

IV.

The range of distant mountains
Looks dark against the sky;
And right across the river,
A path of light doth lie.

V.

I gazed till my eyes were dazzled,
At the slowly sinking sun,—
Till the stars peeped out above me,
Telling the day was done.

Spectator. ANON.

THE HONEST FARMER.

(TO AN OLD TUNE.)

HAPPY I count the farmer's life,
Its various round of wholesome toil;
An honest man with loving wife,
And offspring native to the soil.

Thrice happy, surely!—in his breast
Plain wisdom and the trust in God;
His path more straight from east to west
Than politician ever trod.

His gain's no loss to other men;
His stalwart blows inflict no wound;
Not busy with his tongue or pen,
He questions truthful sky and ground.

Partner with seasons and the sun,
Nature's co-worker; all his skill
Obedience, ev'n as waters run,
Winds blow, herb, beast their laws fulfil.

A vigorous youthhood, clean and bold;
A manly manhood; cheerful age;
His comely children proudly hold
Their parentage best heritage.

Unhealthy work, false mirth, chicane,
Guilt,—needless woe, and useless strife,—
O cities, vain, inane, insane!—
How happy is the farmer's life!

Fraser's Magazine.

A MAN'S REGRET.

O MY child-love, my love of long ago,
How great was life when you and I were young!
The world was boundless for we did not know;
And life a poem for we had not sung.

Now is the world grown small, and we thereon
Fill with wise toil and woe each flying day;
Elves from the wood, dreams from my heart are gone,
And heaven is bare, for God is far away.

O my child-love, cannot you come again,
And I look on you with grave innocent eyes?
Your God has many angels; I would fain
Woo for one hour one angel from the skies.

O my child-love, come back, come back to me,
And laughing lead me from the care and din;
Lay on my heart those small hands tenderly
And lovingly to let the whole world in.

Blackwood's Magazine.

AT HER DOOR.

A FOOL for my doubting and dreaming
And following up and down!
Shall I fill my life with scheming
For a touch of my lady's gown?

Shall I plot from night to morning
For the glance of a woman's eye?
And take the wage of scorning,
And wear shame's livery?

O footman, O wonder of whiteness
And diplomatic cockade,
O footman of much politeness
For my lady's lady's-maid,—

As you open the door of the carriage,
Just tell her I've gone away,
But will come to dance at her marriage
On somebody's happy day.

Blackwood's Magazine. J. R. S.

A MOMENT.

WHEN the lightning flashes by night,
The raindrops seem
A million jewels of light
In the moment's gleam.

And often in gathering fears,
A moment of love
To jewels will turn the tears
That it cannot remove.

Spectator. F. W. B.

From The Fortnightly Review.

FLORENCE AND THE MEDICI.

"Di Firenze in prima si divisono intra loro i nobili, dipoi i nobili e il popolo, e in ultimo il popolo e la plebe; e molte volte occorse che una di queste parti rimasa superiore, si divise in due." — MACHIAVELLI.

I.

FLORENCE, like all Italian cities, owed her independence to the duel of the papacy and empire. The transference of the imperial authority beyond the Alps had enabled the burghs of Lombardy and Tuscany to establish a form of self-government. This government was based upon the old municipal organization of duumvirs and decemvirs. It was, in fact, nothing more or less than a survival from the ancient Roman system. The proof of this was, that while vindicating their rights as towns, the free cities never questioned the validity of the imperial title. Even after the peace of Constance in 1183, when Frederick Barbarossa acknowledged their autonomy, they received within their walls a supreme magistrate, with power of life and death and ultimate appeal in all decisive questions, whose title of *potestà* indicated that he represented the imperial power — *potestas*. It was not by the assertion of any right, so much as by the growth of custom, and by the weakness of the emperors, that in course of time each city became a sovereign state. The theoretical supremacy of the empire prevented any other authority from taking the first place in Italy. On the other hand, the practical inefficiency of the emperors to play their part encouraged the establishment of numerous minor powers amenable to no controlling discipline.

The free cities derived their strength from industry, and had nothing in common with the nobles of the surrounding country. Broadly speaking, the population of the towns included what remained in Italy of the old Roman people. This Roman stock was nowhere stronger than in Florence and Venice — Florence defended from barbarian incursions by her mountains and marshes, Venice by the isolation of her lagoons. The nobles, on the contrary, were mostly of foreign origin — Germans, Franks, and Lombards — who had established themselves as feudal lords in castles apart from the cities. The force which the burghs acquired as industrial communities was soon turned against these nobles. The larger cities, like Milan and Florence, began to make war upon the lords of castles, and to absorb into their own territory the small towns and villages around them. Thus in the social economy of the Italians there were two antagonistic elements, ready to range themselves beneath any banners that should give the form of legitimate warfare to their mutual hostility. It was the policy of the Church in the twelfth century to support the cause of the cities, using them as a weapon against the empire, and stimulating the growing ambition of the burghers. In this way Italy came to be divided into the two world-famous factions known as Guelf and Ghibelline. The struggle between Guelf and Ghibelline was the struggle of the papacy for the depression of the empire, the struggle of the great burghs face to face with feudalism, the struggle of the old Italic stock enclosed in cities with the foreign nobles established in fortresses. When the Church had finally triumphed by the extirpation of the house of Hohenstauffen, this conflict of Guelf and Ghibelline was really ended. Until the reign of Charles V. no emperor interfered to any purpose in Italian affairs. At the same time the popes ceased to wield a formidable power. Having won the battle by calling in the French, they suffered the consequences of this policy by losing their hold on Italy during the long period of their exile at Avignon. The Italians, left without either pope or emperor, were free to pursue their course of internal development, and to prosecute their quarrels among themselves. But though the names of Guelf and Ghibelline lost their old significance after the year 1266 (the date of King Manfred's death), these two factions had so divided Italy that they continued to play a prominent part in her annals. Guelf still meant constitutional autonomy, meant the burgher as against the noble, meant industry as opposed to feudal lordship. Ghibelline meant the rule of the few over the many, meant tyranny, meant

the interest of the noble as against the merchant and the citizen. These broad distinctions must be borne in mind, if we seek to understand how it was that a city like Florence continued to be governed by parties, the European force of which had passed away.

Florence first rose into importance during the papacy of Innocent III. Up to this date she had been a town of second-rate distinction even in Tuscany. Pisa was more powerful by arms and commerce. Lucca was the old seat of the dukes and marquises of Tuscany. But between the years 1200 and 1250 Florence assumed the place she was to hold thenceforward, by heading the league of Tuscan cities formed to support the Guelf party against the Ghibellines. Formally adopting the Guelf cause, the Florentines made themselves the champions of municipal liberty in central Italy; and while they declared war against the Ghibelline cities, they endeavored to stamp out the very name of noble in their state. It is not needful to describe the varying fortunes of the Guelfs and Ghibellines, the burghers and the nobles, during the thirteenth and the first half of the fourteenth centuries. Suffice it to say that through all the vicissitudes of that stormy period the name Guelf became more and more associated with republican freedom in Florence. At last, after the final triumph of that party in 1321, the Guelfs remained victors in the city. Associating the glory of their independence with Guelf principles, the citizens of Florence perpetuated within their State a faction that, in its turn, was destined to prove perilous to liberty.

When it became clear that the republic was to rule itself henceforth untrammelled by imperial interference, the people divided themselves into six districts, and chose for each district two ancients, who administered the government in concert with the potestà and the captain of the people. The ancients were a relic of the old Roman municipal organization. The potestà, who was invariably a noble foreigner selected by the people, represented the extinct imperial right, and exercised the power of life and death within the city. The captain of the people, who was also a foreigner, headed the burghers in their military capacity, for at that period the troops were levied from the citizens themselves in twenty companies. The body of the citizens, or the *popolo*, were ultimately sovereigns in the State. Assembled under the banners of their several companies, they formed a *parlamento* for delegating their own power to each successive government. Their representatives, again, arranged in two councils, called the Council of the People and the Council of the Commune, under the presidency of the captain of the people and the potestà, ratified the measures which had previously been proposed and carried by the executive authority or *signoria*. Under this simple State system the Florentines placed themselves at the head of the Tuscan League, fought the battles of the Church, asserted their sovereignty by issuing the golden florin of the republic, and flourished until 1266.

In that year an important change was effected in the constitution. The whole population of Florence consisted, on the one hand, of nobles or *grandi*, as they were called in Tuscany, and on the other hand of working-people. The latter, divided into traders and handicraftsmen, were distributed in guilds called *arti;* and at that time there were seven greater and five lesser arti, the most influential of all being the guild of the wool-merchants. These guilds had their halls for meeting, their colleges of chief officers, their heads, called *consoli* or priors, and their flags. In 1266 it was decided that the administration of the commonwealth should be placed simply and wholly in the hands of the arti, and the priors of these industrial companies became the lords or Signory of Florence. No inhabitant of the city who had not enrolled himself as a craftsman in one of the guilds could exercise any function of burghership. To be *scioperato*, or without industry, was to be without power, without rank or place of honor in the State. The revolution which placed the arts at the head of the republic had the practical effect of excluding the grandi altogether from the government. Violent efforts were made by these noble families, potent through their territorial possessions

and foreign connections, and trained from boyhood in the use of arms, to recover the place from which the new laws thrust them; but their menacing attitude, instead of intimidating the burghers, roused their anger and drove them to the passing of still more stringent laws. In 1293, after the Ghibellines had been defeated in the great battle of Campaldino, a series of severe enactments, called the Ordinances of Justice, were decreed against the unruly grandi. All civic rights were taken from them; the severest penalties were attached to their slightest infringement of municipal law; their titles to land were limited; the privilege of living within the city walls was allowed them only under galling restrictions; and, last not least, a supreme magistrate, named the gonfalonier of justice, was created for the special purpose of watching them and carrying out the penal code against them. Henceforward Florence was governed exclusively by merchants and artisans. The grandi hastened to enrol themselves in the guilds, exchanging their former titles and dignities for the solid privilege of burghership. The exact parallel to this industrial constitution for a commonwealth, carrying on wars with emperors and princes, holding haughty captains in its pay, and dictating laws to subject cities, cannot, I think, be elsewhere found in history. It is as unique as the Florence of Dante and Giotto is unique. While the people was guarding itself thus stringently against the grandi, a separate body was created for the special purpose of extirpating the Ghibellines. A permanent committee of vigilance, called the college or the captains of the Guelf party, was established. It was their function to administer the forfeited possessions of Ghibelline rebels, to hunt out suspected citizens, to prosecute them for Ghibellinism, to judge them, and to punish them as traitors to the commonwealth. This body, like a little State within the State, proved formidable to the republic itself through the unlimited and undefined sway it exercised over burghers whom it chose to tax with treason. In course of time it became the oligarchical element within the Florentine democracy, and threatened to change the free constitution of the city into a government conducted by a few powerful families.

There is no need to dwell in detail on the internal difficulties of Florence during the first half of the fourteenth century. Two main circumstances, however, require to be briefly noticed. These are (i.) the contest of the Blacks and Whites, so famous through the part played in it by Dante; and (ii.) the tyranny of the Duke of Athens, Walter de Brienne. The feuds of the Blacks and Whites broke up the city into factions, and produced such anarchy that at last it was found necessary to place the republic under the protection of foreign potentates. Charles of Valois was first chosen, and after him the Duke of Athens, who took up his residence in the city. Entrusted with dictatorial authority, he used his power to form a military despotism. Though his reign of violence lasted rather less than a year, it bore important fruits; for the tyrant, seeking to support himself upon the favor of the common people, gave political power to the lesser arts at the expense of the greater, and confused the old State system by enlarging the democracy. The net result of these events for Florence was, first, that the city became habituated to rancorous party strife involving exiles and proscriptions; and secondly, that it lost its primitive social hierarchy of classes.

After the Guelfs had conquered the Ghibellines, and the people had absorbed the grandi in their guilds, the next chapter in the troubled history of Florence was the division of the *popolo* against itself. Civil strife now declared itself as a conflict between labor and capital. The members of the lesser arts, craftsmen who plied trades subordinate to those of the greater arts, rose up against their social and political superiors, demanding a larger share in the government, a more equal distribution of profits, higher wages, and privileges that should place them on an absolute equality with the wealthy merchants. It was in the year 1378 that the proletariate broke out into rebellion. Previous events had prepared the way for this revolt. First of all, the republic had been democratized through the destruction of the grandi and

through the popular policy pursued to gain his own ends by the Duke of Athens. Secondly, society had been shaken to its very foundation by the great plague of 1348. Both Boccaccio and Matteo Villani draw lively pictures of the relaxed morality and loss of order consequent upon this terrible disaster; nor had thirty years sufficed to restore their relative position to grades and ranks confounded by an overwhelming calamity. We may, therefore, reckon the great plague of 1348 among the causes which produced the anarchy of 1378. Rising in a mass to claim their privileges, the artisans ejected the Signory from the public palace, and for a while Florence was at the mercy of the mob. It is worthy of notice that the Medici, whose name is scarcely known before this epoch, now come for one moment to the front. Salvestro de' Medici was gonfalonier of justice at the time when the tumult first broke out. He followed the faction of the handicraftsmen, and became the hero of the day. I cannot discover that he did more than extend a sort of passive protection to their cause. Yet there is no doubt that the attachment of the working-classes to the house of Medici dates from this period. The rebellion of 1378 is known in Florentine history as the tumult of the *ciompi*. The name ciompi strictly means the wool-carders. One set of operatives in the city, and that the largest, gave its title to the whole body of the laborers. For some months these craftsmen governed the republic, appointing their own Signory and passing laws in their own interest; but, as is usual, the proletariate found itself incapable of sustained government. The ambition and discontent of the ciompi foamed themselves away, and industrious working-men began to see that trade was languishing and credit on the wane. By their own act at last they restored the government to the priors of the greater arti. Still the movement had not been without grave consequences. It completed the levelling of classes, which had been steadily advancing from the first in Florence. After the ciompi riot there was no longer not only any distinction between noble and burgher, but the distinction between greater and lesser guilds was practically swept away. The classes, parties, and degrees in the republic were so broken up, ground down, and mingled, that thenceforth the true source of power in the State was wealth combined with personal ability. In other words, the proper political *milieu* had been formed for unscrupulous adventurers. Florence had become a democracy without social organization, which might fall a prey to oligarchs or despots. What remained of deeply rooted feuds or factions — animosities against the grandi, hatred for the Ghibellines, jealousy of labor and capital — offered so many points of leverage for stirring the passions of the people and for covering personal ambition with a cloak of public zeal. The time was come for the Albizzi to attempt an oligarchy, and for the Medici to begin the enslavement of the State.

The constitution of Florence offered many points of weakness to the attacks of such intriguers. In the first place it was in its origin not a political but an industrial organization — a simple group of guilds invested with the sovereign authority. Its two most powerful engines, the gonfalonier of justice and the Guelf College, had been formed, not with a view to the preservation of the government, but with the purpose of quelling the nobles and excluding a detested faction. It had no permanent head like the doge of Venice, no fixed senate like the Venetian Grand Council; its chief magistrates, the Signory, were elected for short periods of two months, and their mode of election was open to the gravest criticism. Supposed to be chosen by lot, they were really selected from lists drawn up by the factions in power from time to time. These factions contrived to exclude the names of all but their adherents from the bags, or *borse*, in which the burghers eligible for election had to be inscribed. Furthermore, it was not possible for this shifting Signory to conduct affairs requiring sustained effort and secret deliberation; therefore recourse was being continually had to dictatorial commissions. The people, summoned in parliament upon the great square, were asked to confer plenipotentiary authority upon a committee called *balia*, who proceeded to do what they chose in the State, and who retained power after the emergency for which they were created passed away. The same instability in the supreme magistracy led to the appointment of special commissioners for war, and special councils, or *pratiche*, for the management of each department. Such supplementary commissions not only proved the weakness of the central authority, but they were always liable to be made the instruments of party warfare. The Guelf College was another and a different source of danger to the State. Not acting under the control of the Signory, but using its own initiative, this

powerful body could proscribe and punish burghers on the mere suspicion of Ghibellinism. Though the Ghibelline faction had become an empty name, the Guelf College excluded from the franchise all and every whom they chose on any pretext to admonish. Under this mild phrase, *to admonish*, was concealed a cruel exercise of tyranny — it meant to warn a man that he was suspected of treason, and that he had better relinquish the exercise of his burghership. By free use of this engine of admonition, the Guelf College rendered their enemies voiceless in the State, and were able to pack the Signory and the councils with their own creatures. Another important defect in the Florentine constitution was the method of imposing taxes. This was done by no regular system. The party in power made what estimate it chose of a man's capacity to bear taxation, and called upon him for extraordinary loans. In this way citizens were frequently driven into bankruptcy and exile; and since to be a debtor to the State deprived a burgher of his civic rights, severe taxation was one of the best ways of silencing and neutralizing a dissentient. I have enumerated these several causes of weakness in the Florentine State system, partly because they show how irregularly the constitution had been formed by the patching and extension of a simple industrial machine to suit the needs of a great commonwealth; partly because it was through these defects that the democracy merged gradually into a despotism. The art of the Medici consisted in a scientific comprehension of these very imperfections, a methodic use of them for their own purposes, and a steady opposition to any attempts made to substitute a stricter system. The Florentines had determined to be an industrial community, governing themselves on the co-operative principle, dividing profits, sharing losses, and exposing their magistrates to rigid scrutiny. All this in theory was excellent. Had they remained an unambitious and peaceful commonwealth, engaged in the wool and silk trade, it might have answered. Modern Europe might have admired the model of a truly communistic and commercial democracy. But when they engaged in aggressive wars, and sought to enslave sister cities like Pisa and Lucca, it was soon found that their simple trading constitution would not serve. They had to piece it out with subordinate machinery, cumbrous, difficult to manage, ill-adapted to the original structure. Each limb of this subordinate machinery, moreover, was a *point d'appui* for insidious and self-seeking party leaders.

Florence, in the middle of the fourteenth century, was a vast beehive of industry. Distinctions of rank among burghers, qualified to vote and hold office, were theoretically unknown. Highly educated men, of more than princely wealth, spent their time in shops and counting-houses, and trained their sons to follow trades. Military service at this period was abandoned by the citizens; they preferred to pay mercenary troops for the conduct of their wars. Nor was there, as in Venice, any outlet for their energies upon the seas. Florence had no navy, no great port — she only kept a small fleet for the protection of her commerce. Thus the vigor of the commonwealth was concentrated on itself; while the influence of the citizens, through their affiliated trading-houses, correspondents, and agents, extended like a network over Europe. In a community of this kind it was natural that wealth — rank and titles being absent — should alone confer distinction. Accordingly we find that out of the very bosom of the people a new plutocratic aristocracy begins to rise. The grandi are no more; but certain families achieve distinction by their riches, their numbers, their high spirit, and their ancient place of honor in the State. These nobles of the purse obtained the name of *popolani nobili;* and it was they who now began to play at high stakes for the supreme power. In all the subsequent vicissitudes of Florence, every change takes place by intrigue and by clever manipulation of the political machine. Recourse is rarely had to violence of any kind, and the leaders of revolutions are men of the yard-measure, never of the sword. The despotism to which the republic eventually succumbed was no less commercial than the democracy had been. Florence in the days of her slavery remained a *popolo.*

The opening of the second half of the fourteenth century had been signalized by the feuds of two great houses, both risen from the people. These were the Albizzi and the Ricci. At this epoch there had been a formal closing of the lists of burghers; henceforth no new families who might settle in the city could claim the franchise, vote in the assemblies, or hold magistracies. The Guelf College used their old engine of admonition to persecute *novi homines*, whom they dreaded as opponents. At the head of this formidable organization the Albizzi placed themselves, and worked it with such skill that

they succeeded in driving the Ricci out of all participation in the government. The tumult of the ciompi formed but an episode in their career toward oligarchy; indeed, that revolution only rendered the political material of the Florentine republic more plastic in the hands of intriguers by removing the last vestiges of class distinctions, and by confusing the old parties of the State.

When the Florentines in 1387 engaged in their long duel with Gian Galeazzo Visconti, the difficulty of conducting this war without some permanent central authority still further confirmed the power of the rising oligarchs. The Albizzi became daily more autocratic, until in 1393 their chief, Maso degli Albizzi, a man of strong will and prudent policy, was chosen gonfalonier of justice. Assuming the sway of a dictator, he revised the list of burghers capable of holding office, struck out the private opponents of his house, and excluded all names but those of powerful families who were well affected towards an aristocratic government. The great house of the Alberti were exiled in a body, declared rebels, and deprived of their possessions, for no reason except that they seemed dangerous to the Albizzi. It was in vain that the people murmured against these arbitrary acts. The new rulers were omnipotent in the Signory, which they packed with their own men, in the great guilds, and in the Guelf College. All the machinery invented by the industrial community for its self-management and self-defence, was controlled and manipulated by a close body of aristocrats with the Albizzi at their head. It seemed as though Florence, without any visible alteration in her forms of government, was rapidly becoming an oligarchy even less open than the Venetian republic. Meanwhile, the affairs of the State were most flourishing. The strong-handed masters of the city not only held the duke of Milan in check, and prevented him from turning Italy into a kingdom, they furthermore acquired the cities of Pisa, Livorno, Arezzo, Montepulciano, and Cortona, for Florence, making her the mistress of all Tuscany, with the exception of Siena, Lucca, and Volterra. Maso degli Albizzi was the ruling spirit of the commonwealth, spending the enormous sum of eleven million five hundred thousand golden florins on war, raising sumptuous edifices, protecting the arts, and acting in general like a powerful and irresponsible prince.

In spite of public prosperity, there were signs, however, that this rule of a few families could not last. Their government was only maintained by continual revision of the lists of burghers, by elimination of the disaffected, and by unremitting personal industry. They introduced no new machinery into the constitution, whereby the people might be deprived of its titular sovereignty, or their own dictatorship might be continued with a semblance of legality. Again, they neglected to win over the new nobles (*nobili popolani*) in a body to their cause; and thus they were surrounded by rivals ready to spring upon them when a false step should be made. The Albizzi oligarchy was a masterpiece of art, without any force to sustain it but the craft and energy of its constructors. It had not grown up like the Venetian oligarchy, by the gradual assimilation to itself of all the vigor in the State. It was bound, sooner or later, to yield to the renascent impulse of democracy inherent in Florentine institutions.

Maso degli Albizzi died in 1417. He was succeeded in the goverment by his old friend, Niccolo da Uzzano, a man of great eloquence and wisdom, whose single word swayed the councils of the people as he listed. Together with him acted Maso's son, Rinaldo, a youth of even more brilliant talents than his father, frank, noble, and high-spirited, but far less cautious. The oligarchy, which these two men undertook to manage, had accumulated against itself the discontent of overtaxed, disfranchised, jealous burghers. The times, too, were bad. Pursuing the policy of Maso, the Albizzi engaged the city in a tedious and unsuccessful war with Filippo Maria Visconti, which cost three hundred and fifty thousand golden florins, and brought no credit. In order to meet extraordinary expenses, they raised new public loans, thereby depreciating the value of the old Florentine funds. What was worse, they imposed forced subsidies with grievous inequality upon the burghers, passing over their friends and adherents, and burdening their opponents with more than could be borne. This imprudent financial policy began the ruin of the Albizzi. It caused a clamor in the city for a new system of more just taxation, which was too powerful to be resisted. The voice of the people made itself loudly heard; and with the people on this occasion sided Giovanni de' Medici. This was in 1427.

It is here that the Medici appear upon that memorable scene, where in the future they are to play the first part. Giovanni

de' Medici did not belong to the same branch of his family as the Salvestro who favored the people at the time of the ciompi tumult. But he adopted the same popular policy. To his sons, Cosimo and Lorenzo, he bequeathed on his death-bed the rule that they should invariably adhere to the cause of the multitude, found their influence on that, and avoid the arts of factious and ambitious leaders. In his own life he had pursued this course of conduct, acquiring a reputation for civic moderation and impartiality that endeared him to the people, and stood his children in good stead. Early in his youth Giovanni found himself almost destitute by reason of the imposts charged upon him by the oligarchs. He possessed, however, the genius for money-making to a rare degree, and passed his manhood as a banker, amassing the largest fortune of any private citizen in Italy. In his old age he devoted himself to the organization of his colossal trading business, and abstained, as far as possible, from political intrigues. Men observed that they rarely met him in the public palace or on the great square.

Cosimo de' Medici was thirty years old when his father Giovanni died in 1429. During his youth he had devoted all his time and energy to business, mastering the complicated affairs of Giovanni's banking-house, and travelling far and wide through Europe to extend its connections. This education made him a consummate financier; and those who knew him best were convinced that his ambition was set on great things. However quietly he might begin, it was clear that he intended to match himself as a leader of the plebeians against the Albizzi. The foundations he prepared for future action were equally characteristic of the man, of Florence, and of the age. Commanding the enormous capital of the Medicean bank, he contrived, at any sacrifice of temporary convenience, to lend money to the State for war expenses, engrossing in his own hands a large portion of the public debt of Florence. At the same time his agencies in various European capitals enabled him to keep his own wealth floating, far beyond the reach of foes within the city. A few years of this system ended in so complete a confusion between Cosimo's trade and the finances of Florence, that the bankruptcy of the Medici, however caused, would have compromised the credit of the State and the fortunes of the fundholders. Cosimo, in a word, made himself necessary to Florence by the wise use of his riches. Furthermore, he kept his eye upon the list of burghers, lending money to needy citizens, putting good things in the way of struggling traders, building up the fortunes of men who were disposed to favor his party in the State, ruining his opponents by the legitimate process of commercial competition, and, when occasion offered, introducing new voters into the Florentine council by paying off the debts of those who were disqualified by poverty from using the franchise. While his capital was continually increasing he lived frugally, and employed his wealth solely for the consolidation of his political influence. By these arts Cosimo became formidable to the oligarchs and beloved by the people. His supporters were numerous, and held together by the bonds of immediate necessity or personal cupidity. The plebeians and the merchants were all on his side. The grandi and the *ammoniti*, excluded from the State by the practices of the Albizzi, had more to hope from the Medicean party than from the few families who still contrived to hold the reins of government. It was clear that a conflict to the death must soon commence between the oligarchy and this new faction.

At last in 1433 war was declared. The first blow was struck by Rinaldo degli Albizzi, who put himself in the wrong by attacking a citizen indispensable to the people at large, and guilty of no unconstitutional act. On September 7th of that year, a year decisive for the future destinies of Florence, he summoned Cosimo to the public palace, which he had previously occupied with troops at his command. There he declared him a rebel to the State, and had him imprisoned in a little square room in the central tower. The tocsin was sounded; the people were assembled in parliament upon the piazza. The Albizzi held the main streets with armed men, and forced the Florentines to place plenipotentiary power for the administration of the commonwealth at this crisis in the hands of a *balia*, or committee selected by themselves. It was always thus that acts of high tyranny were effected in Florence. A show of legality was secured by gaining the compulsory sanction of the people, driven by soldiery into the public square, and hastily ordered to recognize the authority of their oppressors.

The bill of indictment against the Medici accused them of sedition in the year 1378, that is in the year of the ciompi tumult, and of treasonable practice during

Digitized by CORNELL UNIVERSITY Original from CORNELL UNIVERSITY

the whole course of the Albizzi administration. It also strove to fix upon them the odium of the unsuccessful war against the town of Lucca. As soon as the Albizzi had unmasked their batteries, Lorenzo de' Medici managed to escape from the city, and took with him his brother Cosimo's children to Venice. Cosimo remained shut up within the little room called Barberia in Arnolfo's tower. From that high eagle's nest the sight can range Valdarno far and wide. Florence with her towers and domes lies below; and the blue peaks of Carrara close a prospect westward than which, with its villa-jewelled slopes and fertile gardens, there is nought more beautiful upon the face of earth. The prisoner can have paid but little heed to this fair landscape. He heard the frequent ringing of the great bell that called the Florentines to council, the tramp of armed men on the piazza, the coming and going of the burghers in the palace halls beneath. On all sides lurked anxiety and fear of death. Each mouthful he tasted might be poisoned. For many days he partook of only bread and water, till his gaoler restored his confidence by sharing all his meals. In this peril he abode twenty-four days. The Albizzi, in concert with the balia they had formed, were consulting what they might venture to do with him. Some voted for his execution. Others feared the popular favor, and thought that, if they killed Cosimo, this act would ruin their own power. The nobler natures among them determined to proceed by constitutional measures. At last, upon the 29th of September, it was settled that Cosimo should be exiled to Padua for ten years. The Medici were declared grandi, by way of excluding them from political rights. But their property remained untouched; and on the 3rd of October Cosimo was released.

On the same day Cosimo took his departure. His journey northward resembled a triumphant progress. He left Florence a simple burgher; he entered Venice a powerful prince. Though the Albizzi seemed to have gained the day, they had really cut away the ground beneath their feet. They committed the fatal mistake of doing both too much and too little — too much because they declared war against an innocent man, and roused the sympathies of the whole people in his behalf; too little, because they had not the nerve to complete their act by killing him outright and extirpating his party. Machiavelli, in one of his profoundest and most cynical critiques, remarks that few men know how to be thoroughly bad with honor to themselves. Their will is evil; but the grain of good in them — some fear of public opinion, some repugnance to committing a signal crime — paralyzes their arm at the moment when it ought to have been raised to strike. He instances Gian Paolo Baglioni's omission to murder Julius II. when that pope placed himself within his clutches at Perugia. He might also have instanced Rinaldo degli Albizzi's refusal to push things to extremities by murdering Cosimo. It was the combination of despotic violence in the exile of Cosimo with constitutional moderation in the preservation of his life, that betrayed the weakness of the oligarchs, and restored confidence to the Medicean party.

In the course of the year 1434 this party began to hold up its head. Powerful as the Albizzi were, they only retained the government by artifice; and now they had done a deed which put at nought their former arts and intrigues. A Signory favorable to the Medici came into office, and on the 26th of September, 1434, Rinaldo in his turn was summoned to the palace and declared a rebel. He strove to raise the forces of his party, and entered the piazza at the head of eight hundred men. The menacing attitude of the people, however, made resistance perilous. Rinaldo disbanded his troops, and placed himself under the protection of Pope Eugenius IV., who was then resident in Florence. This act of submission proved that Rinaldo had not the courage or the cruelty to try the chance of civil war. Whatever his motives may have been, he lost his hold upon the State beyond recovery. On the 29th of September a new parliament was summoned; on the 2nd of October, Cosimo was recalled from exile and the Albizzi were banished. The intercession of the pope procured for them nothing but the liberty to leave Florence unmolested. Rinaldo turned his back upon the city he had governed, never to set foot in it again. On the 6th of October, Cosimo, having passed through Padua, Ferrara, and Modena like a conqueror, re-entered the town amid the plaudits of the people, and took up his dwelling as an honored guest in the palace of the republic. The subsequent history of Florence is the history of his family. In after years the Medici loved to remember this return of Cosimo. His triumphal reception was painted in fresco on the walls of their villa at Cajano under the transparent allegory of Cicero's entrance into Rome.

By their brief exile the Medici had gained the credit of injured innocence, the fame of martyrdom in the popular cause. Their foes had struck the first blow, and in striking at them had seemed to aim against the liberties of the republic. The mere failure of their adversaries to hold the power they had acquired, handed over this power to the Medici; and the reprisals which the Medici began to take had the show of justice, not of personal hatred, or of petty vengeance. Cosimo was a true Florentine. He disliked violence, because he knew that blood spilt cries for blood. His passions, too, were cool and temperate. No gust of anger, no intoxication of success, destroyed his balance. His one object, the consolidation of power for his family on the basis of popular favor, was kept steadily in view; and he would do nothing that might compromise that end. Yet he was neither generous nor merciful. We therefore find that from the first moment of his return to Florence he instituted a system of pitiless and unforgiving persecution against his old opponents. The Albizzi were banished, root and branch, with all their followers, consigned to lonely and often to unwholesome stations through the length and breadth of Italy. If they broke the bonds assigned them, they were forthwith declared traitors, and their property was confiscated. After a long series of years, by merely keeping in force the first sentence pronounced upon them, Cosimo had the cruel satisfaction of seeing the whole of that proud oligarchy die out by slow degrees in the insufferable tedium of solitude and exile. Even the high-souled Palla degli Strozzi, who had striven to remain neutral, and whose wealth and talents were devoted to the revival of classical studies, was proscribed because to Cosimo he seemed too powerful. Separated from his children, he died in banishment at Padua. In this way the return of the Medici involved the loss to Florence of some noble citizens, who might perchance have checked the Medicean tyranny if they had stayed to guide the State. The plebeians, raised to wealth and influence by Cosimo before his exile, now took the lead in the republic. He used these men as cat's-paws, rarely putting himself forward or allowing his own name to appear, but pulling the wires of government in privacy by means of intermediate agents. The Medicean party was called at first *Puccini* from a certain Puccio, whose name was better known in caucus or committee than that of his real master. To rule through these creatures of his own making taxed all the ingenuity of Cosimo; but his profound and subtle intellect was suited to the task, and he found unlimited pleasure in the exercise of his consummate craft. We have already seen to what extent he used his riches for the acquisition of political influence. Now that he had come to power, he continued the same method, packing the Signory and the councils with men whom he could hold by debt between his thumb and finger. His command of the public moneys enabled him to wink at peculation in State offices; it was part of his system to bind magistrates and secretaries to his interest by their consciousness of guilt condoned but not forgotten. Not a few, moreover, owed their living to the appointments he procured for them. While he thus controlled the wheel-work of the commonwealth by means of organized corruption, he borrowed the arts of his old enemies to oppress dissentient citizens. If a man took an independent line in voting, and refused allegiance to the Medicean party, he was marked out for persecution. No violence was used; but he found himself hampered in his commerce — money, plentiful for others, became scarce for him; his competitors in trade were subsidized to undersell him. And while the avenues of industry were closed, his fortune was taxed above its value, until he had to sell at a loss in order to discharge his public obligations. In the first twenty years of the Medicean rule, seventy families had to pay four million eight hundred and seventy-five thousand golden florins of extraordinary imposts, fixed by arbitrary assessment.

The more patriotic members of his party looked with dread and loathing on this system of corruption and exclusion. To their remonstrances Cosimo replied in four memorable sayings: "Better the State spoiled than the State not ours." "Governments cannot be carried on with paternosters." "An ell of scarlet makes a burgher." "I aim at finite aims." These maxims represent the whole man, — first, in his egotism, eager to gain Florence for his family, at any risk of her ruin; secondly, in his cynical acceptance of base means to selfish ends; thirdly, in his bourgeois belief that money makes a man, and fine clothes suffice for a citizen; fourthly, in his worldly ambition bent on positive success. It was, in fact, his policy to reduce Florence to the condition of a rotten borough: nor did this policy fail. One notable sign of the influence he exercised was the change which now came over the

foreign relations of the republic. Up to the date of his dictatorship, Florence had uniformly fought the battle of freedom in Italy. It was the chief merit of the Albizzi oligarchy that they continued the traditions of the mediæval State, and by their vigorous action checked the growth of the Visconti. Though they engrossed the government, they never forgot that they were first of all things Florentines, and only in the second place men who owed their power and influence to office. In a word, they acted like patriotic Tories, like republican patricians. Therefore they would not ally themselves with tyrants or countenance the enslavement of free cities by armed despots. Their subjugation of the Tuscan burghs to Florence was itself part of a grand republican policy. Cosimo changed all this. When the Visconti dynasty ended by the death of Filippo Maria in 1447, there was a chance of restoring the independence of Lombardy. Milan in effect declared herself a republic, and by the aid of Florence she might at this moment have maintained her liberty. Cosimo, however, entered into treaty with Francesco Sforza, supplied him with money, guaranteed him against Florentine interference, and saw with satisfaction how he reduced the duchy to his military tyranny. The Medici were conscious that they, selfishly, had most to gain by supporting despots who in time of need might help them to confirm their own authority. With the same end in view, when the legitimate line of the Bentivogli were extinguished, Cosimo hunted out a bastard pretender of that family, presented him to the chiefs of the Bentivogli faction, and had him placed upon the seat of his supposed ancestors at Bologna. This young man, a certain Santi da Cascese, presumed to be the son of Ercole de' Bentivogli, was an artisan in a wool-factory when Cosimo set eyes upon him. At first Santi refused the dangerous honor of governing a proud republic; but the intrigues of Cosimo prevailed, and the obscure craftsman ended his days a powerful prince.

By the arts I have attempted to describe, Cosimo in the course of his long life absorbed the forces of the republic into himself. While he shunned the external signs of despotic power, he made himself the master of the State. His complexion was of a pale olive; his stature short; abstemious and simple in his habits, affable in conversation, sparing of speech, he knew how to combine that burgher-like civility for which the Romans praised Augustus, with the reality of a despotism all the more difficult to combat because it seemed nowhere and was everywhere. When he died at the age of seventy-five, in 1464, the people whom he had enslaved, but whom he had neither injured nor insulted, honored him with the title of *Pater Patriæ*. This was inscribed upon his tomb in S. Lorenzo. He left to posterity the fame of a great and generous patron, the infamy of a cynical, self-seeking, bourgeois tyrant. Such combinations of contradictory qualities were common enough at the time of the Renaissance. Did not Machiavelli spend his days in tavern-brawls and low amours, his nights among the mighty spirits of the dead, with whom, when he had changed his country suit of homespun for the habit of the court, he found himself an honored equal?

J. A. SYMONDS.

From Good Words.

DORIS BARUGH.

BY THE AUTHOR OF "PATTY."

CHAPTER XLVI.

HATE.

DORIS had also seen the abrupt parting between Ralph and Rica, and she guessed they had quarrelled.

Mr. Burneston frowned and grumbled at his son's absence from the breakfast table.

"Late rising is a very bad habit," he said to Rica; "I hope, my dear, you don't indulge in it."

"I? oh no, I'm always up early," she said abruptly; "but indeed, Mr. Burneston, your son is not late this morning, he was in — in the garden before I came down."

The squire had looked at her in his usual easy, careless fashion, but as she went on speaking his gaze became earnest, for she grew crimson, hesitated, and ended by looking down into her plate, wishing she could get anywhere out of sight.

Raine had been reading a letter, but the pause that followed made him conscious that something was happening. He looked up and saw the squire's puzzled face, and Rica's guilty confusion. He had been very happy this morning, and his absorption had been caused by a resolve, spite of the letters, which urged his return home, to spend another week at Burnes-

ton. He had heard Ralph's name, and some instinct told him that his cousin was being discussed, and now Rica's face showed him that her interest in the young fellow was much warmer than he had supposed. He felt all at once irritable and cynical.

"Where's Ralph this morning?" he said impatiently. He looked first at Mr. Burneston, then at Rica, and ended with Doris.

"He will be here directly, I dare say," Mrs. Burneston answered calmly. Then she looked on to Rica, "Have you finished, Rica?" she said. "I want to show you some songs that have come up from London; we can try them presently, if you like."

"Very well, I'll come now," and Rica rose to follow her friend.

"What would ladies do in the country, I wonder, without parcels from London?" Raine said. "They are about the only outside help you have in getting through the day." He looked directly at Rica.

"I don't think educated women need outside help of that sort," she said so seriously that Mr. Burneston looked astonished. "It seems to me that women as a rule waste fewer minutes than men do; they have so many small duties to fill up little corners of life with."

"Or they think so," Raine said, so bitterly that even the squire wondered at his tone. "One thing is certain, they can always flirt in any corner of life, and then they can talk — that is the inestimable advantage they possess over the slower, dumber animals. They have nimbler and better-balanced tongues."

"Come, come, Gilbert, I thought love of dress and tidiness used to be the chief feminine defects in your catalogue; you are growing spiteful, old fellow."

"I've no doubt," Rica said, "that Mr. Raine would like our tongue tips to be burnt as they used to be by the Inquisition."

Doris laughed. "He is incorrigible; Philip, you had better read him a lecture." She moved to the door. "Come, Rica, are you ready?"

Mrs. Burneston had noticed Rica's confusion, and then Gilbert's vexed manner; but she did not look at him as she rose to open the door, or she would have seen that he was frowning at her.

"Rica cannot care for that unfledged boy," he thought. "I can't do her the injustice to think that she cares for him seriously — but why does she flirt? Why need she notice him in the way she does? She's but an ordinary woman, after all. How right I've been all through these years; women can't be trusted. That girl only encourages Ralph because she sees he must be a rich man some day, and she is a poor clergyman's daughter, so she keeps him in tow. I believe it's half of it Mrs. Burneston's doing. She is charming to look at and pleasant to talk to, and so on, but she is thoroughly worldly and scheming, the worst possible adviser such a girl as Rica Masham could have, and yet" — he closed the door on the two ladies — "I thought Mrs. Burneston disliked her stepson too much to wish to marry him to her friend. I can't make her out, she's a sphinx. They are all sphinxes. But what a fool I am to worry about it! I'll go back to Austin's End."

The sphinx leads the way to her sitting-room, but when they reached the book landing facing the Clytie, Rica stopped.

"I'll not come with you now, Doris; I'll come presently."

Her friend turned round and gave her a long, searching glance, then she smiled.

"Shall I tell you what you mean, Rica?" Then seeing a vexed look in her friend's face, "I know you want to avoid me just now; but don't be afraid, dear, I'm not going to tease you," she said gravely; "but I do earnestly wish to ask you a question at once."

"Very well; I'll come now. I don't pledge myself to answer your question, you know," she said saucily.

She said to herself as she followed Doris, —

"I shall not tell her; she is not Ralph's own mother, and I don't think she judges him fairly. I should hate her if she had the stiff, polite manner with me she has with that boy. If I had not been a coward I might have told her how unkind she is, and so have helped the poor fellow."

Like all impulsive people, Rica was full of quick contrition, and her anger at Ralph's vehemence to her had soon melted into self-condemnation. Her manner must have deceived him, and led him on, she thought, or he would not have spoken as he had done. She gave a little sigh. Why had it been natural to feel at her ease with Ralph — almost a stranger — and yet with Mr. Raine, whom she had met before at Burneston, she had each day, so it seemed to her, to begin the acquaintance afresh? Life was a great puzzle.

"I am not going to stay long with you this morning," she said to Doris. "I have

to write to my father and tell him when to expect me."

Doris gave her one of the sweet rare smiles which little Phil had inherited.

"You may as well sit down and listen instead of standing," she said. "And Rica, dear, you must not talk of going home, I want you so much. I cannot part with you yet. Is it your quarrel this morning that makes you talk of going away? I think you have quarrelled with Ralph, have you not?"

"Doris!" said Rica impetuously, "I told you I should not answer questions; there are several reasons why I must go home."

Doris fixed another of her long, searching glances on her friend; at first Rica stood it bravely, but at Doris's next question her cheeks burned and her hands grew cold all at once.

"Do you like Mr. Raine, Rica?"

Rica struggled angrily with her confusion. She forced a laugh, and looked up at her friend saucily.

"I really don't know. What does it matter? Why do you ask me? Perhaps I do a little."

"A good deal, I think. Come, Rica, am I your friend or am I not? Friends should have no secrets."

"I really do not know how to answer you. Sometimes I think I like him, and then, when we have parted quite good friends, he says, next time we meet, something so very rude, so horribly unkind about women. Did you hear what he said just now? I could hardly keep the tears out of my eyes, I was so angry."

Doris smiled. "You are too sensitive. He is only teasing you. However, dear, you have answered my question. You would not care for the opinion of a man you dislike — it would not bring you to tears."

She bent down and gave her friend a warm kiss.

This was so unlike Doris that Rica felt puzzled. Very rosy she returned the kiss, but did not know what to say next.

"I mean this" — Doris saw the question in her eyes — "I was beginning to be really afraid that you cared for Ralph, and this troubled me. Mr. Raine is so much better suited to you than that boy——"

Rica colored violently, and rose up to go away.

"Oh, please don't!" she said, "I know I shall displease you some day, for all your love and goodness to me; but I can't talk this kind of talk — only, yes — stop an instant; there is something I will say out to you." Her eyes brightened with sudden energy, and she went hurriedly on. "I know I ought to have said it sooner. Doris dear, why are you always so unkind to Ralph Burneston?"

More than once at Pelican House, Rica, in her abrupt, frank remonstrances, had taken her friend's proud reserve by storm; but since Doris's marriage a barrier had come between these two which even Rica's playful fearlessness had shrunk from overleaping.

At this direct question Doris first flushed deeply; then, as the color fled away, leaving her paler than before it came, she looked coldly and proudly at her friend.

"In what way am I unkind? A general charge is vague, and means really nothing."

Rica started; a cold chill fell on her glowing mood. She could not have believed that Doris could have spoken to her so haughtily. For a moment she hesitated. It seemed to her that any further urging must certainly produce a quarrel, and she could not bear to quarrel with Doris. Against this hesitation her independent spirit rose. She had a right as Doris's chosen friend to tell her of her faults; she was quite willing to take advice about her own, and she resented the tone in which Doris had spoken; it stung her and set her temper on edge.

"It seems to me you never speak really kindly to him — your manner is forced. You treat him like a stranger. Why, I am much more intimate with him than you are."

"I could justify my coldness towards Ralph by telling you of his misconduct; but that would really be unkind. He is a very unsatisfactory person. Do not let us talk of him."

She turned away deeply wounded; she was utterly disappointed in Rica. Ralph must have gained great influence to make the girl take his part against her own friend.

"Ah, but, Doris, look at me now, and don't be angry." She took both her friend's hands; but Mrs. Burneston did not smile. "Years ago, when I was here, you always spoke of him in the same cold, severe way, as if he were a sort of criminal, when he was really only a boy; and he's only a boy still — only a year older than our Egbert, and you can't think how indulgent my father is to Egbert; he says it is the greatest mistake to be unloving to boys."

"Your father doubtless knows how to manage his own son, but you do not know how he would behave in my place," said Doris. She spoke very coldly, but so quietly that Rica had no idea of the storm she had raised.

It had come to this, then, Doris thought. The hateful tie of caste obliterated all memories of past affection and of present kindness; for to her practical mind, with its ever-increasing worldly views, these visits to Burneston were for Rica steps in the social scale not to be attained by other means. Rica considered Ralph her equal, and had towards him a fellow-feeling, a sympathy, which could not exist between her and a farmer's daughter.

"My own folly for taking her to the Cairn, and asking her to my wedding!" She had said this to herself with whitening lips while she listened to Rica.

"Oh, Doris, you are angry still!" the girl said eagerly, "and it's all my fault. Say you forgive me. Perhaps I should not interfere; indeed I do it in love, and of course I might have done it better; I am sure to blunder at things. If I could only be father for five minutes! I believe I mean this; you, who are so clever and so perfect in your ways, can get so much power over people. Oh, Doris! remember how you could make the girls love you, even without trying, at Pelican House; couldn't you, if you chose, still make this boy love you, and be guided by you — worship you almost? Remember he's never had a mother to teach him since he's been any age. When I saw him on your wedding-day I thought, ah, how he will improve! for, indeed, it seemed to me you would be an angel in the house."

Doris's lips relaxed their unpleasant tension.

"Rica, you forget one thing," she said sadly. "I never was what you fancied me; I am not an angel — far from one. You are so very enthusiastic that you exaggerate both the bad and the good in me. If Ralph Burneston had been different to me I might have been different to him. Now it is too late."

"Oh, Doris! and he so loves your boy, and Phil dotes on his brother."

A dark shadow, the darkest Rica had ever seen there, fell on the lovely face.

"I am very sorry for it, for as he grows older I cannot possibly allow them to associate. Ralph's example would ruin his brother. Rica, once for all, you do not know this young fellow as I do."

There was such intense bitterness in her tones that Rica recoiled. It seemed to her that some other woman had usurped the lovely shape of her friend, Doris was so entirely transformed when she spoke of Ralph Burneston.

Should she cease speaking, and pray all the more earnestly that Doris's heart might soften? and yet that longing to finish our work which so often mars it made Rica's tongue restless.

"Only just this," she said pleadingly, "and I will not return to the subject. You are such a loving, devoted mother, that I can't help thinking if you would try and look on Ralph as really your own son, you would end by loving him; and I firmly believe in the power of love; it is a transforming power, it unlocks all hearts; only love must be shown by acts, not kept within us as a theory."

"And you have been trying to win Ralph's love. You foolish girl! you have been making your own misery." Doris gave way to her anger at last. "Ralph is only amusing himself with you, he will not marry you; and if he did he could not make you happy; he is vicious and good-for-nothing, while Gilbert Raine is in every way a suitable match for you."

Rica's face was as red as fire.

"It is you who exaggerate now, Doris. What have I done to gain Ralph's love? You misjudge me; and besides, I do not think it is nice to speak to me in that way of a man who seeks every opportunity to quarrel with me, as Mr. Raine does. Why should I look on men in the light of possible husbands? The very idea is a restraint, and besides it is quite uncalled for."

She was so deeply mortified that the tears filled her eyes, and she turned to go away, and Doris did not try to prevent her.

She was very much disappointed in Rica. It was arrogant beyond belief that a young girl living in such seclusion should presume to judge her, and above all should refuse to be guided by her.

"It shows" — Mrs. Burneston drew herself up proudly — "the extreme ignorance and narrow-mindedness of these people who live out of the world; just like all religious people," she sneered, "unless you agree with them you are wrong."

She was very forlorn in that moment. Only yesterday her husband had shown her a letter from George announcing Rose's safety; and while he urged that the news should for the present be kept from Ralph, he also said that it would be wise to keep the lad, if possible, for some months under home influence.

And Mr. Burneston had said to his wife, —

"You will try and help me to make home as pleasant as we can for poor Ralph?"

Everybody on the side of Ralph, and now even Rica.

Doris asked herself how she could get through these months with her present feelings towards Ralph.

"He is so deceitful," she said. "If he were just to speak out his feelings for me, his father would never forgive him. I know he loathes and despises me." She sat down and began to think. Somehow her power seemed to have lost its firm foundations. Her husband was as fond of her as ever, but on the subject of Ralph she saw he doubted her judgment, and in the first year of their marriage he had relied on her implicitly.

"He has been more with Ralph since then," she said, "and I know Philip thoroughly; he is very good, I suppose better than any one else is, because he makes no profession of goodness; but he is weak, and those who see him daily gain a daily increasing influence. Who knows that Ralph will not gradually bring him to think less of me? It is not a question of whether I could bear it or not" — Doris looked strangely good and earnest, for she really thought she was right — "but it must be quite wrong to let any influence come between man and wife, and I know that Ralph's is a bad influence." And then came the thought of little Phil; it would be a cruel wrong to expose her darling to his brother's teaching; and already the child was too fond of Ralph.

"And there is no weakness in Phil, baby as he is; it is easy to see that. He might, as he grows older, insist that Ralph should always stay here, and then what should I do?'

Such a writhe of uncontrollable hatred rose against the enforced calmness of these last minutes, that she clenched her hands in a physical effort against it.

Then she stood still, holding her forehead with both hands, in deep thought.

"Why do I struggle so? I have tried not to hate him, and I can't help it; I will hate him, he is bad and hateful; and he shall not live here to spoil all my life and to ruin my child."

CHAPTER XLVII.

AT LAST.

THE afternoon sun was shining on the river, a broad golden stretch spread from the stone bridge on the right to the frail wooden bridge of planks leading from the foot of the village to the meadows across the water, and besides this a golden radiance painted the trunks and branches of the trees, and came through the leaves in chequered patterns on the yellow road that led from the Hall to the wooden bridge — a radiance that was rather metallic than genial, for the nipping touch of autumn was in the air, so that it was but a worldly kind of sunshine, after all, dazzling to the eye, but bringing no heart-glow with it.

Doris and Rica Masham were coming back from Mrs. Duncombe's cottage. The girl had expressed a wish to visit some of the villagers. Mrs. Burneston had taken her up to the stone cottages, but as Mrs. Duncombe was fast asleep, and Joseph Sunley was rheumatic, cross, and averse to conversation, they were coming home at a brisk pace beside the river.

The previous day had worn away slowly and uncomfortably — as days do that hold in them the weight of a dispute — and to-day, except to Mr. Burneston, had been full of uneasy constraint. Ralph had been dogged and sullen towards his stepmother and silent to Miss Masham, except that he had tried more than once to speak to her alone, and when he found she avoided this he had looked angry. Doris had been unusually silent and stately to all. While Gilbert Raine had been sometimes cynical and bitter in speech, and then ashamed of his own harshness, as he remarked Rica's avoidance of his young cousin; and then again, as he felt how stiff and cold her manner had become to himself, he lapsed into his old belief, and cursed the caprice of a woman.

Rica was sure she ought to go home. She longed to get away from the unspoken strife which existed between Doris and her stepson. When she met her friend at luncheon, after their quarrel, she had felt shy, and Mrs. Burneston had at first been very silent; but in the long afternoon's drive she had recovered herself, and joined in the talk between Rica and her husband. Miss Masham knew that it would be worse than useless to try for any decided spoken reconciliation with Doris, and besides, she felt that it would be difficult for her friend to excuse her own words about Gilbert Raine. The color came rushing to the girl's face when she met Mr. Raine, it was so very humbling to think that Doris had really intended to make up a match in her friend's presence.

"To throw me in fact at the head of a

man who already has a low opinion of women; and I thought Doris so high-minded. Oh, how could she do it?"

She had been busy with these thoughts as she walked up through the village with her friend; and Doris too walked on silently. They had exchanged a few words with Mrs. Crewe standing at her gate, and now walking back to the Hall beside the sun-lit river, they were each again busy with their own thoughts.

Rica was trying to say she must go home without offending Doris. Ralph had spoken to her again in so marked a manner, that she feared he meant to renew his proposal. She did not wish to betray him to Doris, and yet if she stayed on at Burneston it might be difficult to keep the matter from her. And in regard to her feelings towards Mr. Raine, Rica was puzzled. She knew that, for a time at least, she should be glad to part from Doris till the memory of so many years of love had swept away the new and painful impression she had lately received. She was sure she should be very glad to get away from Ralph's admiration, and yet she was not glad to leave Burneston; the thought even of going was keenly painful. Her cheeks glowed as she walked beside her friend, and she hung her head a little. It began to dawn on her that after all she did care for this rude cynic, who lost no chance of mortifying her; last night she had learned that his silence wounded her more than his words did, and she had found herself at breakfast-time this morning longing for and yet shrinking from his coming.

And yet when, after luncheon, she had turned markedly away from Ralph, and had come up to Mr. Raine, who was examining an old picture at the other end of the room, though for a moment he had smiled and seemed ready to speak, he suddenly turned his back upon her, and became absorbed in studying the picture.

Her color grew yet deeper as she thought of these things, and there was anger mixed with it now against Gilbert Raine.

All at once a bright idea came to release Rica from this humiliation, for it was terribly humbling to find her thoughts engrossed by a man who was not only rude and contradictory, but who actually avoided her as much as he could.

"I do not care for him as a man," she smiled at her own fear, "it is only his talk that interests me — it is so brilliant, so very different to any I have ever heard; there is nothing in it that sounds stereotyped or commonplace; yes, it is only his talk, and I have the chance of hearing so little good talk except my father's!"

"Doris," she said abruptly, as they walked side by side, "you won't be vexed with me, will you? but I must go home the day after to-morrow."

Mrs. Burneston's delicate eyebrows rounded with surprise, but she looked very sad.

"So soon? I am sorry." She tried to speak very courteously. "You have quickly tired of Burneston this time, Rica."

"No, indeed I have not; and I will come again if you will kindly give me a chance; but I believe for several reasons that I ought to go home now."

Doris did not answer; they had nearly reached the stone bridge, and there came bounding towards them Mr. Burneston's collie-dog.

Next moment Ralph Burneston appeared advancing to meet them.

"I should like to know, dear," Doris spoke very quietly, "whether this decision of yours has anything to do with Ralph; I don't think you really care for him, but your manner towards him puzzles me."

"Does it? Well then, listen: I shrink from him so much, that unless you wish me to stay with you now, I shall hurry on to the Hall alone directly he joins us."

Doris gave her such a grateful glance that Rica felt puzzled too.

"I do not think he will walk with us," Mrs. Burneston said calmly; "if you were alone it might be different."

But Ralph was hastening towards them; he was beside them in a moment, and he turned at once and walked by Rica, making some remark on the glow which the walk had given her.

"I must hurry on," she said to Doris, "I want to ask Jane to do something for me before dinner."

Ralph quickened his steps too, and walked on with her. Rica looked over her shoulder at Doris — it seemed to her that Mrs. Burneston could so easily make an excuse for keeping her stepson beside her.

But Doris never thought of seeking such an excuse; she rejoiced in this chance of showing Ralph that Miss Masham disliked his attentions.

"Ralph, you had better stay with me," she said; "Rica does not want company."

Ralph looked very angry.

"Will she always treat me like a boy?" he muttered. Then aloud he said, "Miss Masham can speak for herself. Say I

may come with you," he whispered low to Rica.

His manner showed the girl that her fear was well founded.

"No, indeed," she said kindly, "I will go alone. I prefer it. Good-bye," she nodded, and went on hurriedly.

But Ralph kept close beside her.

"At least, you will let me say three words?" He was eager and determined, and Rica saw that she must speak out.

"No, indeed, Mr. Burneston, indeed I cannot; I will not listen to another word from you." She had stopped as she began to speak, and stood facing him. She wished Doris would come up and help her instead of standing a few yards off beside the collie-dog, like a picture framed in by the glowing sunshine.

"That is because you have been set against me," he said angrily, "because I have been slandered. You have been listening to Mrs. Burneston, you *shall* listen to me," and he snatched at Rica's wrist.

She was not taken by surprise, and she twisted herself free in an instant, and went back to Mrs. Burneston — only for an instant; before Ralph had recovered himself the two ladies had come up with him, his stepmother looking very proud and pale. Rica kept her face turned away.

"You seem to forget yourself, sir, altogether," Doris said, "and what is due to a lady and my visitor."

She spoke with intense haughtiness; in her heart she triumphed that Ralph should have so far forgotten himself in her presence. Her face grew very set and hard.

"Miss Masham is my friend and my visitor, and she shall not be annoyed."

"Annoyed!" he laughed scornfully. "I like that! Pray, how do you know she is annoyed? I know rather more about women than you do, Mrs. Burneston, though you do know everything. Miss Masham listened to me fast enough till you tried to set her against me. It was bad enough before; but I said nothing then. This time I tell you plainly I won't have it. I am almost of age, and I won't be interfered with. I'll not be treated like a boy by you."

Doris looked at him for a moment before she answered, "You behave so like a man" — her lip quivered with scorn — "and you consider yourself a gentleman, both in conduct and manner!"

Her contempt stung him out of all reticence.

"Look here!" he said fiercely. "So far I have treated you much better than you could have expected; but don't try any of your airs on me — they don't impose on me. I will not be interfered with by you. I am my own master, and if I choose to talk to Miss Masham, nothing you can tell her against me shall prevent it."

Doris stood stupefied; the insult to her own pride effaced all thought of Rica, and her perfect blanched silence subdued Ralph spite of himself. "You had better go on," he said more quietly, "and overtake Miss Masham; tell her I was quite in earnest in my proposal yesterday morning. She will listen to me all right; she was quite ready till you came between us."

Doris forced her white lips open; her surprise at this avowal roused her.

"Is it possible," she said coldly, "that you do not see? She will not listen to you at all! She considers you only a boy. If she loves any one, it is Gilbert Raine."

"And this is your work, too. It may have been part of your breeding to go prying and interfering into other people's affairs, but I tell you, once for all, to leave me alone. Because my father was weak enough to take you out of your proper station, do you imagine for one moment he has made you his equal, or that you can have the slightest influence with me? I tell you again, I'll not submit to it. You have made mischief enough. Keep your proper place. I don't interfere with you. I believe, if you could, you'd make my father disinherit me. You can't do that, try as you will; but I tell you what you can do, you may make things very unpleasant for yourself in the future."

He stopped from sheer want of breath, his face and voice alike full of passion.

Doris could not have interrupted, even if she had tried; his very words had stunned her; they had struck at her like a shower of stones or a blinding storm of hail.

Now that he paused, expecting a torrent of angry words, there was a dead silence.

The collie-dog had grown impatient, and came bounding back to see what was happening, but the two figures stood motionless on the yellow road. At last Doris forced herself to speak.

"You are a coward!"

That was all she said, and she smiled; but Ralph felt as if some one had struck him on the face.

"Coward or not," he said fiercely, "we'll see who's master yet at Burneston."

He hurried recklessly away, the dog bounding on in front, past the village, past the plank bridge; hurried on without tak-

ing any heed where he was going till he ran right up against Gilbert Raine.

"Hulloa, my lad! do you want to send me spinning into the river? You should look ahead."

Gilbert spoke irritably. He was standing taking a sketch of the bridge and the tree-shaded river-bank, and the shock of Ralph's onset had almost upset him.

"Why do you stand in the way?" — Ralph spoke savagely. "I'm in a humor to quarrel with any one — with you especially!"

"*Ergo*, you are in want of the doctor; you can have no possible reason to quarrel with me — you are simply bilious."

"Simply don't be a fool, Gilbert. But I recollect I do want to speak to you. Is it true or is it not true that Miss Masham cares for you?"

The dark, wrinkled face was bent down over his drawing.

"Who said this?" He did not look up.

Ralph was too full of passion to discriminate nicely, and, indeed, Raine's manner might have deceived a cooler observer. He was so afraid of believing that he seemed to be concealing his real thoughts.

"Then it's true — oh, confound you all!" he said. "I believe from first to last you're all against me."

Gilbert Raine had recovered himself. "Be quiet, my boy!" he said. "I have no right to think Miss Masham cares for me, but ——"

Ralph stopped him angrily.

"You are going to say you care for her — for a girl half your age. I wonder you're not ashamed to think of her — you, a wrinkled, middle-aged man, who've lived three parts of your life among musty old books! How dare you think of a bright, fresh young creature like Miss Masham, and what have you to offer her?" he said contemptuously, for he saw a change in Raine's face, and he resolved to make the most of his selfishness.

Raine's manner had changed; he was calm and cold as he answered.

"You don't know what you are talking about, you silly fellow! But I'll tell you one thing, my boy; I am sure that for five years at least you are not fit to be trusted with the happiness of any woman."

Ralph glared at him for an instant, muttered something, and then he turned sullenly back towards the Hall.

CHAPTER XLVIII.

THE STEPMOTHER.

Is time something abstract, something that can be measured? There may be souls to whom hours and minutes, weeks and days, may seem equal in length; but there are, no doubt, happy mortals whose existence moves serenely and in measured paces along the level roads of commonplace life. The roads turn sometimes to avoid a morass or a river, or even a hill that might expend breath in the climbing, though a boundless prospect is to be gazed on from its topmost height. Nothing that should not come there ever does come to alarm or even surprise the very ordinary and tranquil-pulsed wayfarers who journey along the level monotony.

It was very hard on Doris that, being placed by destiny in a position guaranteed to be commonplace and uneventful by all the outward keys of such existences, life should have become for her as eventful as if she had lived on moderate means in a city, with a daily struggle to earn her daily bread there. And these excitements and heart-burnings, and now this tremendous uprising of her whole nature, had all one origin — the presence, the existence even of Ralph Burneston.

She had been alone, by the clock, about an hour; her feelings would have told her that half a day had passed since she reached her own room. She had gone home mechanically, and then, having put off her things, she went to her sitting-room.

She had not rung for her maid; it seemed to her that the humbling she had received must be painted on her face; her mortification left no room for anger — a dull ache was over heart and brain.

Ralph had only said the truth. And now came another thought: when Phil knew the truth would not he judge her as Ralph did?

"He will never tell me so in words," the pale, proud lips quivered as this thought came, "but he will grow to look on me as — as" — she was walking up and down the little room, her gown gathered in one hand; as she turned she stopped with a scared face. She saw a form advancing towards her — tall and broad, his red hair glowing as he reached the stream of light, so level now that it only lit the middle of the room. Her heart seemed to stand still, but in an instant the vision was gone — the place where it had stood was empty.

Doris shivered from head to foot. She felt herself suddenly brought to judgment. Phil might never look on her as she looked on her mother, that would be impossible, and for an instant her pride took comfort in this thought of her own superiority;

but her father — no, Doris felt to the very bottom of her soul that her father was her superior. Spite of his broad speech, his rough, red hands, his homely, unpolished ways, he had one noble quality for which she honored him, honored him all the more that she felt incapable of attaining it, and that quality was self-respect. He was neither ashamed of himself nor of his belongings.

How well she remembered what had happened during her last visit to the Cairn! Walking one day with her father on the moor, a carriage had passed near them in the road below, in which she thought she had recognized Mrs. Boothroyd. Even now she shrank at the remembrance of the shame that had seized on her at the dread of recognition; and although some weeks later she had learned her mistake, Mrs. Boothroyd being still in London, she had never forgotten her terror.

But Doris knew that if her father had been well born, all these outward blemishes would not have troubled her. It was from his homely station, and, above all, his calling as a farmer that she shrank; and although Phil would never shrink from her personally, yet he had just the same right to be ashamed of her origin.

"Ashamed of me!" She stood like a statue. It seemed to her she could not live through such an agony as this. She tried to throw herself back a few years. When she left Pelican House she had come home resolved to be true to herself, and she had been true till she married. How she had sunk since then!

The thought of Ralph came back, and she rose from her despairing humiliation with desperate energy. "I was raw and ignorant then," she said. "After all, the world teaches us wisdom. Why should Phil ever know the truth, at least till he is old enough to be free from prejudice?"

When this precise period was to arrive Doris did not determine, but she believed firmly that if her boy could only be kept free from low, corrupting influences, especially the influence of Ralph, he would grow to be a perfect man, godlike in his large and generous views of life. This was to be the outcome of his natural goodness, for Doris did not believe in the help afforded by religious training against human infirmity.

"It is so all through life," she said bitterly. "However false the insult or accusation, the insult remains; it can never be washed out."

Yes, the time had come for decided action. She resolved that she would not see Ralph Burneston again — that as long as she was its mistress the Hall should be closed against him. But still she hesitated as to the means. She could only obtain his banishment by an appeal to his father, and she shrank from making this appeal. She did not shrink from the sight of her husband's sorrow; her hatred to Ralph blinded her to the right he had to his father's love, a right, indeed, which, if remembered, would have sharpened her purpose; she only feared Mr. Burneston's weakness of will, for, after all, he might not have courage to carry out her wishes.

"I have been a fool!" There was a new expression in her eyes, a dire, vengeful look that drove womanhood from the delicate face, leaving it a mask of sharply-cut features so pale that her long eyelashes looked intensely black as they touched the white cheeks. "Why did I interfere when I saw he had begun again with Rose? If he had really disgraced himself Philip would then have banished him at once, and I should have been held blameless. Well, that is over. It was an opportunity given me, and I let it pass. I must trust now to my power over Philip. If that fails ——" She stopped and put her hand to her forehead.

Her head ached sorely, she felt bruised all over; but she had no feeling for herself; her heart swelled almost to suffocation, for she had not shed one tear since she and Ralph parted. She dared not give way for a moment, for she had only herself to depend on. Even Rica was ready to take Ralph's part against her! each time she had spoken of him to her husband, he had asked her to be less hard in her judgment. Doris hated strife, not because of its sin, but because her fastidious nature shrank from its pettiness and discourtesy, and she knew that she must have angry words with her husband before she should get him to see with her eyes.

"It used not to be so," she said. "Once he thought my judgment perfect — he never questioned my wishes — and so he will again when he is separated from Ralph; his daily influence destroys mine. Yes, he was right when he said I should see who was master at Burneston. I must see Philip at once, for" — she hesitated — "I am not sure, but I must make sure."

She rang the bell. Now that she had decided she was eager to act. She must give no chance to Ralph to get a hearing before she did.

"Has Mr. Burneston come in?" she said to Benjamin.

"Yes, ma'am, t' master's in the study."

He looked hard at her, for she was strangely pale; there was a forced, unusual sound in her voice.

"Tell him I wish to speak to him, either here or in the study."

CHAPTER XLIX.

DORIS SPEAKS.

MR. BURNESTON was very busy examining papers that had arrived from his agent at Steersley during his absence. He had nearly finished his work, and this unusual summons disturbed him.

"Tell your mistress I am very busy, and say I should like her to come here if she is in a hurry," he said, "or say I will be with her in about half an hour."

Doris thought this message a proof of her declining influence. She made no answer, but as soon as Benjamin had departed she went down to the study. Her heart beat so violently as she reached the door that a tinge of color rose on her face.

"How can I be so foolish?" she said. "What can I be afraid of?"

"Come in." But Mr. Burneston went on writing, his back was to the door, so he did not see her face.

"If you really cannot spare me a few minutes I will go," she said in a hard, strained voice, "but I have something to say which requires your whole attention."

Mr. Burneston frowned and bit his lips, then he cleared off his annoyance and smiled as he turned round to his wife.

"Well, what is this wonderful something that will not wait? What is it? You look quite ill! Sit down here, darling. But I would have come up if you had only had a little patience."

Plainly he had not seen Ralph. Doris felt relieved; he took her hand, and made her sit beside him.

"Philip, I want to ask you first to listen patiently and with all your attention. You do not always take my part now."

His fair, serene face grew troubled. He guessed that the "something" related either to Faith or Ralph.

"I think there is no need to have any question of the kind," he said sadly. "It seems to me that a husband and wife should take the same view of matters."

"I fear in this case it is quite impossible." He looked at her, and the set stiffness of her face annoyed him.

"You pique yourself on your justice," he said, "and yet though I am always ready to care for all that you love, Doris, you refuse to share my feelings in this way."

"I must speak out, Philip. It may be hard for you to hear; but it is no question of feeling now. Ralph has insulted me — has spoken to me in a way which makes it impossible for us to live together any longer." She paused. "I have come to ask you to send him away from this house."

As she went on her courage came back; it seemed to her that he could not refuse her request.

Mr. Burneston's face was full of pain.

"My dear, you take offence so easily, just like all women; you make so much of words." He stopped in surprise and some alarm too, for Doris rose from her chair and stood facing him like a Fate, her arms hanging stiffly beside her, her face fixed, but with a dark storm in her eyes. Mr. Burneston finished his sentence. "I thought you so much grander and nobler than any ordinary woman. I am afraid I have mistaken you."

"You can think so, of course; possibly you agree with your son, and consider that no insolence can be too great towards a person who is not born a lady; it is for you to decide. Please let me tell all. He has told me to-day that I am an upstart; he has said — well," she went on proudly, "he has only said the truth about my origin and the folly of my marriage; and he has asserted that his power over you is greater than mine is. Stay, Philip, I have not done. You must act as you choose; but if Ralph is to stay here I go away at once and I take Phil with me. He shall not be ruined by his brother's teaching, nor shall he learn to despise his mother by hearing her insulted."

Her eyes flashed, for once she let passion have its way; she looked a splendid picture of wrath as she stood quivering before her astonished husband.

"You are mad," he said, and then he stopped; but Doris did not speak. She stood waiting his decision.

"Doris," he said, "I do not for a moment excuse Ralph's conduct, but I never saw you like this before. You know I can't bear exaggeration. Remember you are speaking of only a boy. It is — well, it is not at all like you to speak in such a manner."

It is singular how a crisis of feeling brings out the salient points of contrasted natures at their superlative degree.

"I only say what I mean," she answered.

Mr. Burneston shook his head, and a fretful look passed over his face.

"If you would only use your own good sense," he said, "you must see that what you propose would be, perhaps, the boy's ruin. Consider the great advantage Ralph gains by staying here. I don't take his part for a moment. I am grieved and surprised that he should so far forget himself and what is due to you, and to me also. I could not have believed it if any one else had told me. You are quite sure, my dear, you have made no mistake?"

He looked at her with a feeling of relief; this new hope, feeble as it was, was something to cling to.

She moved her head disdainfully.

"If you had been present, even you would say I have been merciful. No, Philip, do not lessen my respect for you. For once assert your own authority, or I must do as I say, I must remove Phil from his brother's influence."

Mr. Burneston shook his head. There was a painful flush on his forehead.

"If you would sit down and keep yourself quiet it would be so much better. I am going to find Ralph. I shall speak to him as severely as even you," there was a sorrowful emphasis on the words, "can wish; and I am sure he will make you as humble an apology as you can desire. It may be," he said impressively, out of the longing of his heart, "that you will both go on together better; after this there will be no concealed bitterness between you."

There was a beseeching anxiety in his eyes as he looked at his wife; but Doris was not in a mood to bear this. She might have been quelled by a will stronger than her own. His weakness only increased her anger.

"There are some offences which cannot be pardoned," she said haughtily. "Cannot you see that this breach is beyond healing? I cannot live with a person I hate, and Ralph has made me hate him. Some day, Philip, your eyes will be open to your own injustice. You know your son's vices, and yet you expect me not only to tolerate his daily companionship, but to submit meekly to gross insult; and because I refuse, you are angry. Well, you must choose between him and me, and I expect he will offer you the same choice."

His wife's rudeness wounded Mr. Burneston sorely.

"You are as self-willed as he is, Doris. Why, even your brother George, who has more cause of quarrel with Ralph than any of us have, says it will do wonders for the lad if we can only manage to keep him at home a year or so. If he goes away angry he will most likely go back to his old habits and companions, and be utterly ruined."

Doris had stood thinking during these words.

"Do you mean to say that, let Ralph disgrace himself ever so much, you have no power to leave any of your land away from him?"

There was a keen eagerness in her voice and manner that jarred on her husband.

"Certainly not, unless" — he stopped abruptly.

"Unless he brings himself within the penalties of the law, you mean; and a man may be a most infamous scoundrel, and yet escape punishment. Ralph is a scoundrel already, and he will have all, and Phil —— "

Her husband's eyes had opened in wide wonder. This was the first time she had really let him see the truth.

"Stop, Doris." He spoke very coldly. It seemed to her with disgust. "Phil is as well provided for as he can be; and now do not let us recur to this subject. I will try to forget it, and you, my dear, must, for my sake, receive Ralph's apology. No, I really cannot hear any more."

He retreated hastily, fearing another attack, while Doris sank exhausted on a chair, sight blurred and hearing deadened by the force she had been putting on herself.

Mr. Burneston too felt blinded. It seemed to him, as he crossed the hall on his way to Ralph's room, that he had got a shock. His whole nature had revolted against his wife's manner, and above all against her last words. She who had seemed incapable of the slightest meanness or calculation — had she then cherished hatred against Ralph because he was the heir of Burneston? It was incredible, and spite of his grief the loyal gentleman strove against the thought as against a positive injury to Doris.

He had found his way mechanically to Ralph's room, and to his surprise his son's voice said "Come in" when he knocked.

Ralph sate moodily in a chair near one of the windows; his pipe lay beside him, but he had not been smoking. He nodded when his father came in, and pushed a chair towards him. But Mr. Burneston stood still, looking at his son with real sternness on his gentle face.

"I thought you were a gentleman," he said, "and I find I am mistaken. You will come with me at once and apologize to Mrs. Burneston."

"I can't do that, father! I am sorry for you, but you must have known this sort of thing would happen some day. Why need you worry about it? Leave me to settle it with Mrs. Burneston."

"You seem to forget, sir, that you are talking of my wife! I insist on an apology."

His father's anger quieted Ralph.

"I can only say again I'm very sorry for you. I can't be sorry I've spoken out. If you knew how I've been used, you'd ——"

"Hold your tongue, sir!" said his father savagely.

"But you shall listen to me!" the boy said desperately. "I've no quarrel with you, and never will have. You and I would have been fast friends if no mischief had been stirred up between us. There, I'm not going to vex you any more! Remember I am your own son, and you owe me some love." His blue eyes looked so pleading that his father turned away. "I'd made up my mind, dull as this place is, to stay here with you a few months, but I see it can't be. If you like, I'll go away for a bit; it's just as unpleasant for me as it is for any one."

"No!" Mr. Burneston tried to speak. "I do not wish to send you away. You have behaved very ill and for my sake as well as for your own you must apologize. If you consider the matter you will see there is no other way."

Ralph shook his head, and put his hands in his pockets.

"Can't do it! I wouldn't if I could." He muttered the last words.

Mr. Burneston took no notice. He was worn and weary with all this strife.

"You are excited now," he said; "you will come to your senses presently, and then, Ralph, I shall be grievously disappointed if you don't see things differently. You owe a full apology; you have insulted a lady, and that lady your father's wife. You had better keep to your rooms till you are more reasonable; and understand distinctly, I forbid you to leave Burneston without my permission. Good-night! Faith will bring you all you want."

CHAPTER L.

AT CROSS-PURPOSES.

Gilbert Raine tried to go on with his sketch; but it grew more and more difficult for him to draw, and he grew more and more impatient. He closed his sketch-book.

"Who on earth has been talking to Ralph about Miss Masham?"

If he had hazarded a guess he might have hit on the truth; but Mr. Raine's mind was apt to be hazy on matters of real life, and he disdained hasty conjectures. The longer he thought the more certain he felt that Miss Masham liked Ralph Burneston better than she liked him.

"I don't profess to understand women," he said uneasily. "I have not had much to do with them; but surely a girl would never snub and tease a man she cares for, and Rica has often snubbed me."

He walked slowly towards the Hall, trying to recollect exactly what Ralph had said, and suddenly he got a clue to the young fellow's meaning.

He stopped short in his walk.

"He meant Mrs. Burneston when he said 'that woman.' She certainly is in Miss Masham's confidence; I might sound her." He put both hands in his pockets and went on again very slowly, his head bent forward. "What has come to me?" he said. "More than fifteen years ago I swore I would never trust a woman again, and actually I am thinking of putting myself in the power of two of them — for of course Mrs. Burneston will go straight to her friend and tell her everything. Yes, I can fancy their jokes and laughter over the queer old bachelor's love."

The color rose brightly in his face. He tried to think of something else. But it was no use; in the midst of his calculations of time and expense about some alterations at Austin's End, Rica's blooming face and merry laugh came unsummoned.

"Nonsense!" he said testily; "it's not true. I have not paid her marked attention, nothing that any one could notice. I have really avoided her lately. What could have made that mad boy talk in such a way?"

This time he smiled; a little lingering hope helped to curve his lips.

"I am not kind to her; I have not treated her well all day," he said. "I'll try another tack, and see if I can get her to smile at me as she smiles at Ralph — at least, as she did smile at him; she was cross to him at luncheon. I'll ask her if they have quarrelled."

Rica's favorite nook, when she was not with Doris, was in a low window of the library; but lately Raine had observed

that she always got up and went out of the room when he entered it.

The library was a large room, rarely occupied except by Gilbert Raine and Miss Masham. It looked empty to-day as he came into it; but going along to its farther end he saw Rica, as he expected, curled up in a low chair, reading. She looked absorbed in her book, and Raine smiled.

"She is not taking anything very deeply to heart," he said cynically; "I might have been sure of that. When a girl shows her feelings so easily on the surface, there is little depth in them."

The Persian carpet only covered the centre of the room, and his footsteps on the oak floor roused her. She uncurled herself and sat upright.

"Pray don't let me disturb you." He thought she looked vexed. "You seem very much interested in that paper book. Is it a French novel?"

"No; I never read French novels." She looked saucy and satirical.

Raine bent down over the book. "May I look? Alfieri, 'The Filippo.' Well, yes, that is exciting — rather beyond Alfieri's usual mark, I think. Are you a great admirer of this poet?"

"No; he is so cold-blooded, so very uninteresting, I think; but Gomez is a finely-drawn character."

"Ah! you like villains, do you?"

"No, I don't," Rica felt that she was being teased, "but I like decided characters, really good people or really bad ones." She spoke with the irritation Raine seemed now always to create in her.

"Then you like very few people. Hardly any one is wholly good or wholly bad."

"How wilful you are! I did not say that. I like people who have good qualities, I mean qualities out of which goodness may spring. I like people who are not cold and cynical."

"And yet you do not like my cousin, Ralph; he is not cold."

Rica looked up startled. Raine had put more meaning into his words than he intended.

"When did I say I disliked Mr. Ralph Burneston?" she said hastily. "I do not dislike him."

Raine stood looking at her with a very puzzled face, then he went on recklessly.

"I have offended you somehow or other, I am always offending you, and I really did not mean to vex you."

Rica laughed, but she was vexed too.

"I am glad to hear it," she said gravely, and then she took up her book, as much as to say, "Do not interrupt me any more," and she wished Mr. Raine would go away.

"I must really set myself right with you, Miss Masham. I will not keep you a minute." He was hurt, but he was determined there should be no more misunderstanding between them. "Perhaps I have no right to speak of it, but Ralph seemed to think I have had something to do with your — your — well, he certainly gave me the impression that you had quarrelled."

"And if we had," Rica grew crimson, "what could you have to do with it?"

She looked so scornful that Raine hesitated. "I beg your pardon," he said, "I believe it was something Mrs. Burneston told him."

He stopped; he had blundered on without considering that Ralph's words might sound to Rica as he wished them to sound for himself, and till he came to Doris's name she had listened, but this was too much. She could not realize his meaning. She felt dazed and foolish; a feeling that Doris had spoken openly about her to Mr. Raine, and that she must leave him at once, was all she could grasp.

She got up hastily, but she could not raise her eyes; her face was scorched with shame and anger.

"You are entirely mistaken," she said. "Mrs. Burneston would not discuss me with your cousin, and certainly not with such a stranger as you are to me."

Raine was surprised at her haughtiness.

"She has been copying Mrs. Burneston," he said, and then he put himself in Rica's way as she moved towards the door.

"What have I done now?" he said earnestly. "I have offended you again. I beg your pardon, do forgive me, and for heaven's sake let me try and explain. I never was so far from wishing to vex you; perhaps I am incapable of pleasing you; won't you sit down again and let me try?" he said imploringly.

But Rica was so upset, so deeply mortified, that she read him all wrong. She only saw in this unusual wish to please her an assurance founded on the belief that she really cared for him. Her eyes smarted with unshed tears, and her heart ached painfully, it was so full of righteous wrath against Doris. She shook her head.

"There are things best left unexplained, and this is one," she forced herself to smile, and then in her natural manner she said, "Talking things over is often apt to show

the worst side of them; let me pass, please."

Without waiting she walked round him, and was out of the room before her disturbed listener had collected his wits.

"Good heavens!" he said, when at last he could grasp the subject again, "I am an ass! I have made a precious fool of myself, too, just when there was something in her face; by Jove, I'm an ass, a consummate ass."

He stood there overwhelmed with confusion.

He was by far the cleverest person at Burneston Hall; he had read more and seen more than most men, and yet he felt so helpless, so thoroughly ignorant how to get out of this scrape in which he had plunged himself, that when the door opened and in came little Phil calling for Ralph, the tall, keen-witted man felt as if even that babe were wiser than he was.

The little fellow ran up to him, "Where's Ralphie?"

"Ralph's not here, my dear," he said. "Ralph never comes into the library, Phil."

The child shook his head and looked up, his little face was very sad.

"Me can't find him," he said; "me's been everywhere, in mamma's room, and Faith's room, and in study, me can't find Ralph."

There was a despairing sound in the sweet childish voice. Gilbert looked at him more attentively, and saw that Phil had been crying.

"Ralph's out, my boy," he said, soothingly.

Phil shook his head.

"No, no! Me saw him come in."

Just then the door opened softly, and Phil's nurse appeared with a scared face.

She looked much relieved to see her charge.

"I beg your pardon, sir," she curtsied to Raine, "but I couldn't tell what had happened to Master Phil; he's wild to find Mr. Ralph, and just now he slipped away from me and I couldn't think what could have become of him."

"Do you know where Mr. Ralph is?"

"I don't know, sir." There was a confused look in the woman's eyes that puzzled Raine.

"Come along, old fellow." He stooped down and lifted Phil on to his shoulder. "We'll see if we can find papa."

"Me doesn't want papa — me wants Ralph."

Not even the ride on a tall shoulder, usually one of the delights of his life, could chase the sadness from the child's voice, and earnest dark eyes. "Help me find Ralphie," he half sobbed.

"What is Ralph about?" Gilbert said to himself, and then, with his usual directness, he went straight to his cousin's study.

CHAPTER LI.

BITTERNESS.

DIRECTLY his interview with Ralph was over, Mr. Burneston went to the housekeeper's room. He said a few words to Faith, and bade her keep the matter entirely to herself.

"You can say Mr. Ralph is not well," he said carelessly, and then he went out and across the meadows beyond the river — a sort of aimless wandering to get rid of the time, and to avoid the chance of another talk with his wife.

He would have been wiser if he had sought out Rica or Raine, and asked them to bear him company. His thoughts went with him, and they would be listened to. He could not tell what had happened, or how it had been effected, but it seemed to him that all at once a gulf had come between him and Doris — a space that could not be bridged over. He could not specify the feeling, but it seemed suddenly possible that he had only been married for the position he could give his wife and her children, and also — and this was the thought he tried hardest to flee from — that nature had triumphed at last, and that, spite of all her training and seeming refinement, Doris was different to himself, and looked on things in a lower and coarser way than he did.

Well, and if she did? He had married her with his eyes open. He could not expect a miracle.

"But she has been a miracle," he said earnestly. "No other woman in such a position would have behaved so well. It is only this shock rousing me up rudely from my dream of perfection that has disgusted me. I must force myself to forget this afternoon."

Easier to say than to do. He could not close his eyes and ears to the memory of his wife's flushed face and contemptuous looks, and her angry, defiant words.

"How harshly she spoke! She was like a creature transformed," he said sadly.

Was this the true Doris — forced out of all the artificial restraints of her education and her position — a Doris likely to reappear whenever her will was set aside or her dislikes thwarted? He could not lay

this terrible doubt; and when he came down to dinner, so late that it had been announced before he reached the drawing-room, he found himself looking at his wife with new eyes, wondering at her coldness and silence. No one remarked on Ralph's absence, and Doris imagined he had left the Hall.

When dinner was over she went away to her room, leaving Rica to amuse herself alone.

Little Phil always came to help his mother dress for dinner, but to-day he had not come, and Doris, busy with her own thoughts, had not sent for him.

She was very angry with her husband. It seemed to her that he had put her claims and Ralph's on the same level. Her whole being dilated with immeasurable haughtiness.

What had she ever done to Ralph that could be weighed against the coarseness of his insult to her? and yet his father thought Ralph's conduct such a trifle that he asked her to remember the lad's age.

"If any one had so spoken to mother father would have horsewhipped him," she said bitterly. Her heart went out in a kind of longing anguish to the Cairn. If she could only have her father's sympathy just now and could listen to his righteous indignation, she should be soothed. She never thought of asking his counsel. It would have seemed extraordinary to Doris to ask advice from any one; that would have been a tacit acknowledgment that she herself was wrong.

"Ralph even sees it as I do," she said bitterly. "He sees that we cannot live in the same house."

She rang her bell as soon as she reached her room.

"Tell nurse if Master Phil is not in bed to bring him here."

"Yes, ma'am."

The maid went, but the nurse did not bring little Phil. Doris waited, and then she went up to the night nursery. She longed to ease her troubled heart by the sight of her darling.

The tiny bed was empty, and she went back to her own room; at the door she met the nurse.

"Where is Master Phil? he should be in bed," she said rebukingly, for it was long past the child's bedtime.

"I'm very sorry, ma'am." The nurse's confused, hurried manner frightened Doris. "He — he won't come away, ma'am."

"Come away from where. What do you mean, nurse?"

"He's there, ma'am," she jerked her head backwards, "sitting outside Mr. Ralph's door, and he says he won't come away; nor he won't eat his bread-and-butter neither."

"Won't? — nonsense! Light me along the gallery."

The nurse hurried on — her mistress's imperious manner alarmed her.

CHAPTER LII.

RALPH'S VIGIL.

The storm that had swept over Doris, rending away all self-control and gentleness, was raging yet more fiercely in the bosom of the housekeeper.

Mr. Burneston's announcement that Ralph would keep his room that evening had filled her with lofty contempt.

"He's a poor creature, t' squire is," she said; "he cannot guide his own bairn athoot shutting him up."

But there was a certain solace in feeling that she should have her boy all to herself; and when she carried up Ralph's dinner she was full of smiles. He took little notice of her, and did not condescend in any way to satisfy her curiosity.

Later, when she came again, she brought in little Phil, and then to her surprise Ralph turned on her in fierce anger.

"Take away that brat," he said; "how dare you bring him into my room without leave? He and his cursed mother are the plagues of my life."

"Whisht, whisht!" Faith frowned and shook her head. "How can an innocent bairn like yon plague ye? See, he wants to kiss you, poor little lad."

"Where has you been? Me wants you, Ralphie." The child put his hand confidingly on his brother's knee, and looked up in his face.

Ralph jumped up abruptly, and went away to the window, turning his back completely on the room. The child did not cry, but looked frightened and appealingly at Faith.

Her spirit rose against Ralph's harshness.

"Poor wee bairn!" she said. "Mr. Ralph, you're not setting your brother much of an example as to manners."

"Take that child away, I tell you, and keep him out of my sight," he said angrily, as Phil tried once more to clasp his hand with his tiny fingers. He pushed him away, and the child burst out crying.

The young fellow's heart was really softening towards the child, and if he had been alone he would probably have submitted to Phil's coaxing ways, but the

child's likeness to his mother had maddened him.

Phil shrunk away and clung to Faith's apron.

"For shame of yourself!" she said, as she raised the little fellow in her arms. "I couldn't hev thowt ye'd be so cowardly."

It was an unlucky word. It brought the memory of his discomfiture back keenly, and he turned round furiously on Faith.

"Take that child away, and don't show your face here again unless you can hold your tongue — or, stay, you can bring me some brandy, and be quick, d'ye hear?"

His manner cowed Faith. There was a wild excitement in it that made her shrink from answering him. As she closed the door behind her she heard the key turn in the lock.

Phil struggled in her arms till she set him down, and then he began to cry. "Ralph's angry with me," he sobbed, "an' me's not naughty."

The nurse was waiting in the gallery, and she tried to quiet and lead the child away.

But Phil would not be pacified. He left off sobbing, and seated himself on the mat outside his brother's door.

"Me stay here," he said decidedly. "Ralph come out presently and say me's not naughty."

Faith stood still. Ralph's words had stupefied her. This was Mrs. Burneston's doing then. No one would have guessed at the tempest that had risen in the tall, slender woman as she stood there rigid.

The nurse's voice entreating Phil to come away irritated her.

"You'll disturb Mr. Ralph next," she said. "Leave the child awhile, an' he'll tire of himself. I'll see he takes no harm."

And the nurse had left him till she heard that her mistress had gone up-stairs.

Meanwhile Faith stood so wrapt in her own anger that she would scarcely have noticed the child's departure if little Phil had followed his nurse.

But there was no feebleness in her wrath — through it she went on forecasting what the end of this struggle might be.

It was, she saw plainly, a struggle for power between Mrs. Burneston and Ralph and herself, represented by the squire. In less than a year Ralph would be of age, and then he would have a home perhaps of his own, where she felt sure she could, if she chose, be mistress, but to wait for this would be yielding up a right. Both she and Ralph had lived at the Hall much longer than Mrs. Burneston had, and if they left there would be no one to check her pride.

"The squire 'ud not dare say his soul was his own if he was left to that woman. She's ruined my boy, body an' soul," Faith said sternly. "She's driven him to drink an' wicked ways, an' she'll do as she likes wi' t' squire, poor fond hoit."

She looked down at the child; he was still sitting against the door, but his head had drooped on his cheek; he was asleep.

"God help ye, poor ill-starred bairn!" She stooped and laid him down on the sheepskin rug. "Sleep while ye may; wiv such a mother ye've a fitful life afore ye."

She went off to do Ralph's bidding, leaving the sleeping child alone. She had not gone many minutes when Doris came along the gallery, and saw Phil lying like a faithful dog beside his brother's door.

A spasm of pain twisted her face. She silenced the nurse's exclamation by a hasty gesture, and then she stooped and tenderly raised the sleeping child.

His weight was almost beyond her strength, but she never paused till she reached her bedroom, then she sat down, and still holding little Phil in her arms, she undressed him and laid him in her own bed.

Then she walked into the outer room, and beckoned the nurse to follow her.

"How did this happen?" Mrs. Burneston said sternly.

"I'm sure I don't know, ma'am; it's really Mrs. Emmett's fault, not mine at all."

Doris's eyes were full of anger, but she kept it out of her words.

"When I engaged you to take charge of Master Philip, I told you he was never to be left in Mrs. Emmett's care."

"Yes, ma'am," there was a tearful sound as the nurse answered, "but Master Phil has been fretting for his brother all the afternoon; and at last Mrs. Emmett comes suddenly into the gallery out of Mr. Ralph's room, and she takes Master Phil by the hand away from me and into the room and shuts the door."

"Well, what else?"

"He didn't stay long with Mr. Ralph, but when he came out he wouldn't stir from the door. I asked him to come and help you dress, but nothing would move him. I stayed with him, ma'am, till I was tired out, and then Mrs. Emmett said she'd stay while I fetched his supper from the nur-

sery; but it wasn't a bit of good, ma'am, so I waited till I thought you had come up from dinner, and that's just as it happened, ma'am."

Doris stood still, trying to think: it was very difficult to shape out any plan in the wild anger that mastered her. Her husband evidently refused to do what she asked; Ralph was to stay at the Hall to defy her and to rob her of her child's love.

"We will see who conquers," she said contemptuously. Aloud she bade the nurse go away and send her maid to her.

She sat down at her writing-table and wrote these words to her husband: —

"Phil is not well. I shall not leave him this evening. Will you therefore sleep in your dressing-room? I do not wish to have any further discussion about your son. I hear he is still in the house.

"DORIS BURNESTON."

She went to the window and threw it open; she was almost stifled with the intensity of pent-up feeling.

She might conquer; her own heart told her that she would conquer, but at what a price! She could never forget that her husband had taken his son's part against her, and that if he yielded it would be for the sake of peace, not from conviction or love of her.

"I must always despise him. I must always feel ——" Even to herself she could not say it. A huge overleaping wave of pride stifled the thought, and tried to hide even from her remote consciousness the thought that her husband did not consider her his equal. Her sitting-room windows looked westward, and the sky was full of yellow light this evening, though under the trees it had grown dusk. It was oppressively warm, and as Doris leaned out the evening air brought no refreshment to her hot forehead. Presently, close beneath the window, came a murmur of voices, and then she saw figures disappear round the angle of the house.

She went back into her bedroom, which occupied the end of the opposite wing to Ralph's, and had windows on two sides. She looked out, watching the two figures.

Yes; she was right; it was Rica's white dress that she had seen. Her friend and her husband were walking slowly, side-by-side, along the terrace.

This was a relief; she had so feared Mr. Burneston would come to seek her.

She opened her note again and added a postscript, —

"Do not come to my room. Phil is now asleep."

And then she desired her maid to give the note to Mr. Burneston when he came indoors.

"I shall not want you to-night, Burnell," she said; "I am anxious not to awaken the child."

A strange fascination drew her back to the window. She looked across at Ralph's room; there were lights within, but the curtains were drawn, and the branches of the huge weeping beech, already mentioned, surrounded this end of the house, and made it indistinct in the failing light. A slight breeze was rising, moving the branches gently to and fro.

Rica was still pacing up and down the terrace with Mr. Burneston; but while Doris watched, Gilbert Raine came out of the house from the garden entrance and joined them in their walk.

Doris had not been thinking of them while she looked, but now a new idea came to her in connection with Rica. She thought she would go home with her for a time till Ralph had left Burneston.

"She is vexed with me, but that is simply her own folly and prejudice. If she had heard Ralph Burneston's words to-day beside the river, she must have changed her opinion of him."

She thought Rica's vexation would quickly yield to delight when she told her her project of paying her a visit; her schoolfellow owed her so very much, Doris argued, that she would surely be glad to discharge some part of the obligation. Just now in the distorted state of her mind, she thought of this more than of the love that had been between them.

Doris had threatened her husband that if Ralph stayed at the Hall she would leave it, but she cared far too much for the opinion of the world to do this in a way likely to compromise Mr. Burneston and herself. She would not go to the Cairn. Her father and George would ask questions, and her mother would fuss, and just now she could not endure interference of any sort. This quiet parsonage, where she would be treated as an honored guest, was the retreat she longed for; and her visit there would show her husband that she was in earnest.

Little tenderness mingled with the stern sadness with which she looked from the window at her husband. At last the sound of his laughter reached her, and she closed the window and turned away.

If she had stayed a moment longer, she

would have seen Mr. Burneston come into the house in search of her.

Rica was following him, but Gilbert Raine stopped her.

"Miss Masham, will you listen to me for a minute?" he said. "I often find fault with you, but have I ever accused you of being unjust?"

In the half-light Rica felt more at her ease with him; even if she did look foolish she knew he could not see it.

"I never said you did."

There was more of her old brightness in the tone, and Gilbert took courage.

"Ah, but I thought you very unjust — and not long ago, either."

"I suppose you want me to ask why, just to give you a chance of teasing."

"I am not in a teasing humor, and whether you ask or not I shall tell you; you refused to hear my excuse for having offended you. Now, this was more than unjust; it was ungenerous — it was putting me in the wrong without appeal."

Something — a deep undertone — in his voice quieted her pride. Her heart throbbed strangely, but not with the pain it had suffered in the library. What it was she did not know; but something made her half shrink from, and yet drew her on strongly, irresistibly, to trust in Gilbert Raine. She felt sure he would not misjudge her, and once more she spoke naturally.

"I am glad you allow me some generosity."

She looked up smiling, but the tender, serious look that met hers quenched her sprightliness, and made her shy again.

"I want you to listen to me seriously." He began to walk faster, as if the movement helped him. "I did not mean to speak so soon; I fear you are not prepared for what I want to tell you. I have no choice. Did I not hear you tell my cousin just now that you are going to leave us?"

"Yes."

"Well, then," he went on hurriedly, "I must tell you something before you go. I had meant you to find it out for yourself, but it can't be helped. Do you remember that talk on the staircase years ago?"

Her large round eyes opened widely.

"Yes, I remember — about Clytie, and some other things; but why do you want to know?"

"Ah!" — he drew a long breath — "it is something to me that you do remember. Well, ever since that day I have been trying to forget that talk."

There was a pause. Rica's heart was loosed of such a mighty restraint that her sauciness came back.

"You have been trying ever since? You have not tried very hard then."

She laughed, and he laughed too — hardly so naturally as Rica did, for his fear that she would not listen to what he wanted to say had made him strangely nervous.

"Yes; and besides that, I refused more than one invitation to Burneston lest I should meet you here. I thought you were like other women, and I did not want to be reminded of you. Are you angry at this confession?"

"Why should I be angry? — and yet I am. Why do you speak always so scornfully of women?"

"I will tell you some day; I am not sure enough yet. You are, perhaps, after all only an ordinary woman."

"I am quite sure I am a very ordinary woman." She laughed, but not easily; his manner puzzled her. "But, Mr. Raine, tell me if I offend you so much as to make you avoid me, why do you tell me all this?"

He smiled, though he had grown very earnest. It seemed to him no girl who was merely trifling with him could be so frank.

"I want to know," he said hurriedly, "whether I have done wisely in coming here after all. Tell me candidly whether I should not have spared myself a disappointment by staying away altogether?"

Rica was blushing deeply, but he could not see this in the dying light.

"I hardly know how to answer," she said at last.

"Shall I put a plainer question? When you go away from Burneston, will you forget me, or will you feel as I do, that there must be no question of parting between us two?" He waited impatiently. "Are you, or are you not sorry to leave Burneston?" he said angrily, for he thought he was again deceived.

"I am glad for most things," she said frankly; then all at once she understood the pain his silence expressed, "but I am sorry for others."

"One question more — have I anything to do with your sorrow?"

"Well — yes!"

He took her hand in his, and drew her under the cedar-tree.

"I am not used to young ladies," he said, "and I am an awkward old bachelor; but I do love you as well as I can love. Rica, will you be my wife? Tell me at once."

Rica shook her head.

"You are making a mistake," she said earnestly. "If you knew more of me you would never ask me. You can't think how full of faults I am. And then I never can help teasing. I should offend you altogether perhaps."

He drew her closer to him, and put his arm round her.

"My child," he said tenderly, "you have made me very happy. It is I who ought to fear for my worthiness; but I will not be satisfied, old as I am, unless yon can give me your whole heart. Do you think you can do this, Rica?"

She hesitated. "Yes, I think I can," she whispered, and in that moment father and mother and all the merry home party were completely forgotten; new and sudden as it was, it seemed to Rica that she had never known what the word love meant before.

Presently they came out from under the cedar-tree, and walked up and down, sometimes talking, but chiefly silent in that unspeakable newness of bliss which no words can render — the glimpse of perfection which is given us for a brief space on earth, for each seems to the other so perfect in those first unreal moments of union — a bliss that does not stray an inch beyond the lover and his beloved, they are so wrapped in it they have no thought but for each other — a bliss which is selfish to all the world besides, and yet unselfish to the being which shares it.

Gilbert Raine could rouse himself from this first taste of happiness to feel the wind blowing keenly across the river, and to take Rica indoors lest it should chill her; but he never roused to remember how he had stood holding Rica's hands in his, and listening to her simple confessions beneath his young cousin's window.

Ever since his meeting with Rica in the library he had been so bent on winning her, that he had had no thought for aught else, and Ralph's absence during the evening had been altogether unheeded by him.

And all this time, while these two hearts had been pouring joy into one another's lives, Ralph had stood watching them, or rather divining their presence, betrayed even in the gloom by the white dress of Rica.

Faith had returned to his room with the brandy. He asked her where his father was; and she told him that the squire was walking up and down the terrace with Miss Masham.

Ralph went to the window and saw Gilbert join them. Then he watched his father's departure, and all that followed.

It was the bitter end of all. But for the hope of winning Rica, and thus triumphing over his stepmother, he would have defied his father, and left Burneston at once; as it had proved, he had only stayed to witness Gilbert's triumph. He could not see Raine and Rica distinctly, but he felt sure enough from their movements that no ordinary talk was passing between these two.

When they disappeared under the cedar-tree, he uttered a heartfelt curse.

"It is that woman's doing — all of it," he said. "She could not marry her to her brother, so she puts Gilbert in his place. I'll not stay here like a caged bird, to see their love-making. No, my friends, when you come to look for me to-morrow, the cage will be empty."

He drank off some brandy, and then he went again to the window.

His cousin and Miss Masham stood beneath it, and even in the gloom he could see that Raine held the girl's hands in his.

"The old fool!" he said furiously, "but I'll spoil his game yet."

He set the door open between his rooms, and kept walking up and down, stopping now and then to drink, and then resuming his walk, his hands thrust deeply into his pockets.

It seemed as if he could not stop for a moment. Twelve o'clock struck by the clock over the stables, and still he walked quickly up and down.

The wind had by this time become furious, and the huge branches of the beech-tree rattled against one of his windows, but he seemed unconscious of time or sound — he kept walking up and down.

From The Contemporary Review.

RUSSIAN AGGRESSION,

AS SPECIALLY AFFECTING AUSTRIA-HUNGARY AND TURKEY.

BY LOUIS KOSSUTH.

It will not be amiss to ventilate a little the Eastern question. Not as if I could say anything new, but because purified notions may consolidate instinctive aspirations into convictions, and longings into purposes.

The Eastern question is a European question. There is no power in Europe

Generated on 2020-05-04 08:49 GMT / https://hdl.handle.net/2027/coo.31924079893586

that would not feel that the phases of that question are connected more or less, mediately or immediately, with its own interests.

Whence comes the importance of this question?

How and when did the Eastern question become a European question?

By the increase of the Russian power and since the time when Russia — by the diminution of the Turkish empire, and the dismemberment of Poland — *increased to formidable proportions, and thus became dangerous to the freedom of Europe.*

I feel thankfully indebted to the Porte. And I do not, like many people, consider gratitude to be a burden, but to be a dear obligation. I learned to esteem highly the noble qualities of the Turkish national character. And I learned it the more from the admirable phenomenon, that this people of tenacious morals could not be corrupted in their rich social virtues even by the pestiferous air which has floated over them from Constantinople through a period of several centuries, during which this capital has been converted into a witch-kettle of European intrigues, fighting for the maintenance of the equilibrium. This corrupt influence has found among the higher circles around that kettle individuals accessible to bribery; but the country people remain attached to the moral feelings and to the holy relics of social virtues, in the same way as in Hungary the eternal holy flame of nationality has been kept burning around the hearths of our people, whilst it has been extinguished in the palaces. It is true that the Turkish people remain still far behind in what we call civilization. This is not the fault of their susceptibilities, nor of their willingness. But it is quite certain that only national morality can supply a good soil for the roots of liberal institutions, and that they decay or become false without it. Quite as certain is it that the world would admiringly contemplate how easily the most liberal institutions would take root, how naturally they would become acclimatized among the Turkish people if Europe would but prevent the hereditary foe of the Turkish empire from interfering with the spread of endeavors inspired by the warnings of time.

But these are my personal views, my individual sympathies. Sympathies, however, are no centre of attraction for the politics of the world; but self-interest is. And though for a long time the conservation of the Turkish empire was a dogma of the politics of the European equilibrium, and is still so *in foro conscientiæ*, it does not follow that Europe is in love with the Turks, but only that it *abhors the increase of Russian preponderance.* And rightly so.

The Eastern question is a question of Russian power. "*Hinc omne principium, huc refer exitum.*" This is the summary of European interests, considered from the European point of view. Every policy is either a cheat or a fallacy which does not take this fact as a starting-point.

The Eastern question is a question of Russian power. If this line be struck out, the Eastern question ceases, *ipso facto*, to be a European question. It descends at once to the level of internal questions, whose changing phases may be followed sympathetically or antipathetically, according to the inspiration of political principles or instinctive feelings; but they will never disturb the sleep of any European power. The Turkish Porte may succeed (and I wish from my innermost soul that she may succeed) in conciliating all her nationalities, of diverse races and creeds, either on the ground of equality of rights, surrounded by constitutional institutions, or by personal union, or on the ground of a strict federative system; or if she does not succeed, and on the ruins of her fallen power the nationalities of her empire should rise to autonomy, asserting their national individuality, all this will not threaten the peace or the liberty of Europe — all this will never be converted by anybody into a European question.

On the contrary, the Eastern question lies in the actual situation. Every aggression, either on the integrity of the Turkish empire or on her sovereignty, will always threaten the peace of Europe, because every direct or indirect increase of Russian preponderance in Europe will be a step to the fulfilment of that prophecy of Napoleon, that "*Europe will become Cossack.*"

They speak of humanity. Good God! where is the *Christian* power in Europe that has not unscrupulously disowned human feelings, not only when its own interests were concerned, but very often from mere revenge? What bitter feelings and remembrances crowd into my brains with feverish heat when I think that I am a Hungarian! and how many other terrible examples could I quote, through the long line of historical atrocities, down to the insane brutality of the French Commune, and to the subsequent reprisals of loosened fury! And I ask, where and when

has the trampling down of humanity, the traces of which are visible all over the world, been made a European question?

But it is impossible not to feel indignation in our human bosoms when we see that the very same power which rose by trampling down the freedom of its people, from the Vistula to the Behring Strait, from the Euxine to the glacial sea, covers its dangerous schemes with the veil of humanity, and increases continually the giant stature of its power by such systematic consistency and pitiless cruelty as stand unequalled in history.

There is no question of humanity here, but simply of the increase of Russian preponderance. The one is only dust thrown into the eyes of mankind that they may not see the other.

And they speak of freedom, of self-government! But the thing stands thus, that whilst Russian power presses upon the south-eastern part of Europe, the Christian nationalities of the Turkish empire will never be reconciled to the suzerainty of the Porte, nor can they become free and independent. They can only be instruments of Russian policy — sometimes by force, sometimes willingly, but always serviceable instruments.

Look at Servia. As far as the Porte is concerned Servia was a free country, quite as much so as any other European nation, and she wanted nothing but the mere title to be entirely independent. She was more independent than Hungary is at present with respect to her political, financial, and economical administration, in every point of view, even as regards the tribute payable to the Porte. But she was not free, she was not independent, with respect to Russia; she could not be so. Whoever has a protector, has a master too. Not that the Servians would not prefer to be free Servians, rather than vassals under Russian rule; but because they are unable to resist Russian pressure. This is the fatal necessity of the situation. The dust of verbal assurances was thrown into the eyes of Europe from St. Petersburg. It was said that the czar kept back Prince Milan from waging war. But Russian agents stirred up the fire of war; the easily inflammable passions of the Servian people were fanned by the prospect of securing Bosnia, and by the phantasmagoria of a "great Servia." Russian money overflowed Servia, a Russian general was placed at the head of the Servian army; Russian officers, and even such as were in active military service, were sent expressly on furlough; and thousands of Russian soldiers crowded to Servia. And thus under the Servian mask it was that Russia began war against the Turks, in order to get a pretext to continue the war unmasked. The Servians were intoxicated with the war-cry of Slavonian liberty (which liberty blooms of course in Russia very nicely!) without perceiving that they fought, bled, and died, not for freedom, but in the interests of Russian preponderance. And what has become of "free" Servia? There she hangs on Russia's pleasure. She is at present a vassal of Russia. Russian military patrols keep the Servians "in order" at Belgrade. These are very edifying things, and very instructive too.

Or, let us look at Roumania. I have here no room to draw up an epitome of history, but it would be very advisable if the diplomatists would do so and study it a little. They would learn therefrom what is meant when Russia guarantees "self-governmental reforms" by "occupation of territory." I wish only to recall to mind, that since the time of the capitulation between Mircea and the sultan Bajazet on the part of Wallachia, and between Bogdan II. and Selim I. on the part of Moldavia, the Porte has always respected the liberty and self-government of Roumania. She has respected them in such an unheard-of liberal way, that the mighty Porte, the sovereign power, conceded to her vassals the most unbounded religious liberty, excluding even from these vassal provinces her own creed, and did not grant to her own Mohammedan subjects even the right of possessing there any landed property. The Turks have never violated that treaty. *Never!* Roumania was free; she is indebted for all her troubles and misfortunes (and, alas, how much has she suffered!) to the meddling of Russia. And every Roumanian patriot feels that if Russian power surrounds Roumania — this island in the midst of a Slavonian sea — his fatherland will be broken to pieces by the folds of the boa-constrictor. Every Roumanian dog knows it! And it was Europe that guaranteed the freedom and neutrality of Roumania!

And still Roumania is the high-road by which Russia marches to wage war against Turkey. Roumania is still the basis of the Russian war operations against the Porte, as it was in the year 1849 of those against the Hungarians. The Roumanian government prayed with clasped hands to the guaranteeing powers that they would protect her neutrality. But the Russians are very clever politicians; they chose the

right moment in which to stir up anew the Eastern question.

England is powerful. She can defend Constantinople and sweep the Russian flag from the seas. But she is not a Continental power. She *alone* cannot send an army of some hundred thousand men to Roumania.

France is still maimed; she begins to recover, but she suffers from her past losses. If she were not maimed, Russia would not dare what she dares now.

The German imperial government has polite words for every one, but it is its policy not to allow an alliance of any European power with Turkey against Russia, in order to localize the war. If this succeeds, it will be of the greatest service to Russia, as she will thus have an opportunity of preparing for the occupation of additional territory by raising internal convulsions in the Turkish provinces. And she will do it at the given time as well in Hungary as in Austria. And what is the key to this policy of Prince Bismarck? Nothing else but that he is afraid to offend Russia, as she might think of giving to France an aiding hand to procure revenge.

Lucky Italy, who deserves her luck for her constancy centuries ago, and who wins provinces by losing battles, is on the lookout to see whether there is visible on the horizon a completing ray of light for the "*stella d'Italia*."

In the councils of Austria the traditional demon of "rapine" goes about, and where he does not appear, the paralysis of irresolution "hums and haws" from one day to the other.

Hungary is a province, and not a State; she cannot follow an independent policy. She has given up herself. She is treatied to death.

They counted on all this at St. Petersburg, ere the "pacific" czar Alexander became such a resolute "champion."

For Roumania the end will be that the free Roumania whose neutrality has been guaranteed by the powers will be held in dependence by Russia, as she has been so many times before. The Roumanian-Russian alliance is an accomplished fact, and by it Roumania has become the auxiliary of Russia. What could the Roumanians have done? Could they, left alone to themselves, have resisted the Russian pressure? Could they, wolf-like, have shown their teeth to her whom the European powers regard with lamb-like patience? The situation coerced them.

This is the philosophy of the Eastern question. As long as Russia is conscious of her overwhelming power, and knows that she may press with all her might upon the Turkish empire, nobody can there become free or independent. They may change masters, get a new patron, but the new patron's vital power consists in an autocracy in whose outspread arms freedom dies, and only the weeds of the *Nihilismus* pullulate secretly. Such a "patron" they may get, but nobody can become free under "Russian protectorship."

And it is right that I should mention here what misconceptions there are as to the meaning of the tide of feelings and apprehensions that shakes the nerves of the Hungarian nation. They say the Hungarians are afraid of the freedom of their neighbors, the Slavonians. This is not true. It is only intrigue that can say so, only blindness or silliness that can believe it.

Hungary and the Hungarians' love of liberty are "twins born the same day." They have lived together a thousand years. The Hungarians nowhere and never feared, and do not fear liberty. And they were never exclusive in their love of liberty; they never accommodated even their privileges to certain races. And we are the less afraid of the liberty of our Eastern neighbors, since I feel thoroughly convinced that if these nations were to become free,—really free, not Russian serfs,—then Hungary (if she may still keep the mastership of her own destiny) would be quite ready to inaugurate with them such defensive combinations as, though in the interest of the European equilibrium, would also uphold and secure *their individual national independence*.

And I am convinced also that such a combination, in which the Turkish nation may very naturally join, is one of the chief necessities of the logic of history. Only in this order of ideas can be found security for the independence of minor nations against the pressure of the greater aggrandizing powers.

We are not afraid of liberty, but of the increase of Russian power. That is what we Hungarians are afraid of. We fear that if the Turkish empire should be dismembered, if its sovereignty should be undermined previous to the removal of this danger, and if this dismemberment and undermining should be provoked by Russia, and turned to her profit, the result would not be that free nations would rise out of the ruins of the Turkish empire, but rather the result would be Rus-

sian occupation, or else (which is the same thing, though more dangerous) Russian servitude, accompanied, as a compensation, by the "grand idea" of affinity of race as a honeyed cake; and the Slavonian nations would be fettered to the Russian yoke. This would, in some inevitable way, have a tendency to enslave Hungary as well, and we should finally, after many and great struggles, be brought to perdition, as Poland was a century ago.

And I must observe that the danger that threatens us, threatens still more the Austrian empire. There is between us such a community of interests as gives the power to secure the removal of this danger; and the government can thus count on the whole nation, which would rise as if her millions were only one man, not merely in blind obedience, but with all the power which a nation can exert when it defends its existence, its very life.

This is the danger that shakes the heart-strings of the Hungarian nation. This makes it ready for every exertion, for every sacrifice, in order that the integrity of the Turkish empire and the sovereignty of the Porte may not become a prey to Russian tyranny and aggrandisement.

Remove this danger, and we shall always approve the regenerational endeavors of the Turkish nationalities, and shall feel great pleasure if this regeneration succeed without destruction of races, language, or creed,— the old internal hatreds being superseded by equal laws and equal freedom. We Hungarians shall thus acquire in the Turkish empire such friends as could not be found elsewhere on the surface of the whole earth. But if fate, whose skein is composed of the thread of the immutable past, should decide that all these endeavors shall be fruitless, owing to so many impediments being thrown in the way of their fulfilment by foreign intrigues, egotism, meddling, and passion, then we are very much afraid of the liberty of our neighbors. If the contrary happen, however, we will welcome them at the round table of free and independent nations; we will offer them our hands, and aid them so that their liberty and independence may be secured against every external aggression.

Far from my fatherland I live in solitary seclusion, and shall die there. But if I am forced to forget much, there is something I can never forget; it is that I know the Hungarian heart, on whose throbbing my hand has so often rested.

I shall now state why I think that Hungarian public opinion should occupy a determinate position on this Eastern question.

It was diplomatically acknowledged during the crisis of 1854, how dangerous Russian power had become to the liberty of Europe, and it was then seen that the future could only be secured against the renewal of this question by that power being reduced to lesser proportions, such as would not endanger Europe.

This was what England aimed at in the Crimean war of 1854. But her programme could not be carried out then in consequence of the *attitude of Austria*, as may be seen from some of the articles in the French *Moniteur*, containing those official revelations with which Napoleon III. tried to soothe English public opinion, the fluctuations of which I then strove to direct, and which strongly demanded the restoration of Poland.

And the programme not being carried out is the reason why this question now shows itself in a still more dangerous form than it has ever done since that time.

In a more dangerous form, I say, because the Russian preponderance of power has assumed such a character as against the liberties of Europe generally, and against those of our country particularly, as shows her aim to be new territorial annexations.

The emperor of Russia has written upon his banner "The Slavonic Cause." This was the phrase used by him on the occasion of his warlike speech at Moscow. This phrase had hitherto been paraded only in the Slavonian dictionaries for private use; it had not before appeared in the plan of the confessed policy of the Russian government. It now appears from beneath the ground, where it had before worked mole-like, — rising, on the arms of the absolute autocrat of eighty-two millions of serfs, to the daylight as an active power. The czar now occupies the position of the declared champion of Panslavism.

And what is this Panslavism? This is no merely national matter, no affair of national freedom. It absorbs the different Slavonic nations into one single race. It substitutes race for nationality; power of race for liberty.

The signification of "the Slavonic Cause" as a Russian war-cry is this: that the cabinet of St. Petersburg seeks, wherever there are Slavonians, instruments wherewith to paralyze the policy of some other power, to cripple its force, and to find in the Panslavists wedges

with which it may split states asunder, if they stand in the way of Russia's extension of power; and to create new combinations, either as her tools or her objects, for the sake of her aggrandizement.

At present it is the Turkish empire that is the anvil upon which Russia strikes with her Panslavistic hammer. Her first object is the country which forms an angle betwixt the vital artery of our fatherland and Austria, the Danube, and her estuary on the coast of the Euxine.

That after the Turks, we and Austria would next be struck upon, is quite clear. Not to see this, is blindness. To see and not to prevent it, is suicide.

This is no mere question of sympathy or antipathy. It is a matter of vital importance for Hungary, that the integrity and sovereignty of the Turkish empire should be secured, and that Russia, who is the enemy of the liberties of Europe, should have her poison-fangs torn out, before she can consolidate and increase her annexations for her own advantage.

This is the philosophy of the situation.

It is a fact, that with respect to this danger the workings of diplomatists afford to us Hungarians no comfort. They dissimulate; they will not even show that they are aware of the real danger.

The traditions of the past are very disquieting. It is an historical fact that there is not a single example of Austria having taken the part of Turkey against Russia. She has always been biassed in favor of Russia. She has always, indeed, declared openly for her. There have been cases when she acted as mediator, as at Nimierow; and as soon as she heard of the capture of Cracow by the Russians, and their invasion of the Crimea, she attacked with armed force the oppressed Turks. She made a treaty with the Russians for the dismemberment of Turkey. She had a share in the prey. She accepted the half of Moldavia (Bukovina) as a compensation for Poland, of which she got only a small part. So it was planned by Kaunitz and Gallitzin.

These are the traditions of Viennese policy on the Eastern question.

That a continuation of this traditionary policy would be dangerous in the highest degree, to our fatherland and to the monarchy, is clear. To permit Russia to become either the direct lord or the dictator of the southern Slavonians, to be the steel hoop which compresses them, is equivalent to multiplying the splitting wedges.

I cannot believe that these dangerous traditions can be continued within the circles of a constitutional government. But there are very influential circles, apart from constitutional bodies, that stick to this traditional policy. They are fond of those siren songs, which are always heard when Austria has lost something, and whose burden is, "Go for compensation to the East."

These are very disquieting things. And it is a fact, that the Hungarian government has till now done little to soothe or appease the mind of the nation. Its reservedness has transgressed the farthest limits. Though reservedness may be safe in some cases, when it overreaches itself it is a fault, a blunder.

Now, as the situation is full of danger, as diplomacy gives no comfort, as the traditions of the past are disquieting, and as the government does nothing to appease the people, it is not only a natural consequence, but it is also a postulate of self-preservation, that the nation should now occupy such a position on the Eastern question as should make the whole world aware what is the political tendency most conformable or most contrary to our national interests.

The interruption of the manifestations of public opinion caused by the very sinister prorogation of the Hungarian Diet, was explained, if not as a change of mind, at least as a loss of interest, and gave rise to the apprehension that in the councils of the Viennese cabinet certain influences, whose existence is an open secret, might gain the preponderance.

This apprehension was very well founded. The "taking up" of a position preparatory to becoming a sharer in the booty was nearly accomplished when, fortunately, the Turkish victories stopped these dangerous preparations, and Hungarian patriotism watchfully called out, "Be on thy guard, Hungarian! who will keep watch for thee, if thou thyself doest it not for thy fatherland?" And it spread all over the country, loudly proclaiming to friends and foes that the Hungarian nation wakefully watched.

When I speak of the Hungarian nation, I do not mean the Magyar race, but every faithful son of the fatherland, without distinction of race, tongue, or creed, who sticks patriotically to that type of government which has belonged to Hungary for a thousand years, and who wishes to see also Hungary remain as Hungary in the future, with her unity and indivisibility forever secured.

This it is that serves as a criterion of the public opinion of the Hungarian nation. This, and not an inflamed sentimentality, sympathetic or antipathetic, is the starting point of the conviction, that dikes should be raised against the Russian extension; for if we do it not we expose our fatherland and the monarchy, whose interests in this respect are identical, to the necessary consequence that the Russian power, increased already by the dismemberment of Poland to formidable proportions, would attack, after this new augmentation of force, the Austro-Hungarian monarchy as a boa-constrictor that compresses her giant folds around the body of her prey, or as a hundred-armed polypus that screws itself into the flesh.

That this would be the unavoidable consequence of Russian extension cannot be doubted, considering the geographical position and ethnographical situation of the Austro-Hungarian monarchy.

Then it will no more be a question of the Hungarian race, — reduced by the Russophiles only to four millions of inhabitants; it will be a question whether Hungary shall remain Hungary.

And now it is necessary to point out a dangerous network which already hangs around us. This network is knitted out of that erroneous conception that the power of Russia can only become dangerous to us by territorial occupation.

They say, "The czar has given his word that he will not *occupy;* and the czar is an honest man" (Brutus is an honorable man); "let him then manage" (I very nearly wrote mismanage) "in the East. The present vocation of the Austro-Hungarian monarchy is to remain in readiness" (and of course only in the south, where we can do mischief to the Turks, but in no imaginable case to the Russians), "and only to step into action if the czar should break his word, and want to occupy whilst the peace negotiations last. Oh! then we shall draw out the sword from the scabbard, and then we shall do — this and that."

The nation should be on its guard against this network. It is a very dangerous network.

Firstly, I say, if the czar should come out victoriously from this war, then the Vienna cabinet will not draw the sword to impede the czar in his occupation, but only that it may participate in the booty. God save our poor country from this suicidal tingling of swords, where infamy would cover the suicide! But let us keep also in mind that God protects only those who defend themselves.

Secondly, I say, even if the Viennese cabinet would impede at *such a time* the Russian occupation, it would not find a single ally to assist it to overthrow an accomplished fact, such as it could secure at present, if it wished it, for the far easier task of preventing Russian occupation from becoming an accomplished fact. Prussia would not help her out of this difficulty with Russia; France would not help her; Italy would not help her. The Vienna cabinet would then have, not an ally more but *a mighty ally less*, one who under given circumstances would prove better than any other, *and this is the Turk.* We should lose him by yon network policy; we should lose him without replacing him by any other. We should lose him, whether the czar occupied territory or not. In the case of his raising army after army against the forsaken Turks and finally conquering them — then, of course, a Turkish alliance would be out of the question. Or if the Turk, losing patience at the foul play of Europe, and above all of the Vienna cabinet, should say, "Well, if Europe, and especially the Vienna cabinet, does not care for me, I do not care for them either," and should sign a separate peace with Russia — then the Vienna cabinet might stare at yon wooden idol, chiselled by its own political wisdom, and write protocols, which would be "set aside" by the "world's judge," History, as has always happened.

Thus this policy of looking out for the keeping or not keeping of the czar's word is either bad calculation or criminal calculation; either crime or folly. Take your choice!

But there is a still more decisive view for us. This is, that the menacing danger for the Austro-Hungarian empire would not be removed even if the czar kept his word and did not occupy; for even if he did not occupy, but terminated the war victoriously, the fact that he had conquered would secure for him the power of leadership — that dictatorial influence which is his designed aim, and is written on his banner as "the Slavonic Cause." And for the Austro-Hungarian monarchy the danger is not greater from the czar extending his power by occupation than it would be if he showed by victory that he can be a mighty stronghold of "the Slavonic Cause," and thus extend his influence over the eastern Slavonians and over those that are with them in the same camp, viz., our neighbors on the left hand

as well as those on the right hand, and also in our own country. These he could dispose of as their leader, their lord, their protector. The Muscovite papers do not conceal that as the banner of "the Slavonic Cause" is unfurled, so after the Turkish "Slavonic Cause," the "Slavonic Cause" of the Austro-Hungarian monarchy will follow. And this is no idle boast; it is logic. This latter kind of Russian extension is really more dangerous for us and for Austria than any occupation of territory, — a mode of extension which does not win over, but alienates, those whose country is occupied. It is not a desirable fate to be a Russian subject, and an occupation is, at the worst, but a boa-constrictor, against which it is still possible to struggle; but the other one is the polypus: if he pierces into our flesh, there is no possibility of extrication left for us.

The danger which arises from the Russian movement cannot be averted effectually from the Austro-Hungarian empire by watching the czar's promise; for in either case he will occupy a conspicuous place on the page of history as the victorious leader of Panslavism. The Slavonian aspirations towards a universal monarchy will gather around czarism; this will be the star that will lead the way, the Messiah to whose call they will listen, the idol they will adore, the lord who will command them, and whose obedient serfs they will be; and *thus Panslavism will develop into Panslavo-Czarism.*

But if we send the czar who unfurled the Panslavonic banner back as a loser, then the wings of his Ghengis-Khanic flight will be clipped, the charm broken, and the Panslavic aspirations will lose their force. The Slavonians will perceive that it is not safe to carve for themselves an idol, in order to adore him as the god of liberty. The prop will be found broken, and the support will fall asunder like loosened sheaves. The different Slavonic nations will not seek salvation in the worshipping of the czarism that leads to Russification, and therewith to the fetters of slavery, to drunken misery, and dreams of brutality; but, in the conservation of their individual nationality, in the elevation and maintenance of the vestal fire of their self-esteem, they will find the road that leads to freedom. And we Hungarians will welcome them heartily on this road, accompany them with warm sympathy, as we accompanied them in past times, and as far as we are able aid every pulsation of the vital power of yon miraculous Slavonic "*living statue*," whose national consciousness has never been broken, either by seduction or by the storm of long sufferings.

Really, if there be any situation that is clear, the present one is.

The Turk has understood the signs of the time. He gave a constitution to the communities of his empire, without distinction of race, tongue, or creed, on the basis of equality before the law. His enlightened statesmen provided that all the excrescences of exclusiveness which had been successively added to the morally pure civilization of Mohammedanism, should be buried in the grave of the past. The czar of all the Russias threw his army into the midst of this peaceable undertaking, to prevent the Turks from realizing this liberty. He was afraid that when even the half-moon should reflect the glare of the sun of liberty, this glare might penetrate into the darkness of his servile empire, as the beams of the Hungarian peasant emancipation had penetrated the night of Russian slavery.

The Austro-Hungarian government must reckon with itself as to what can be claimed legally and fairly from the Turkish government in the interests of its Christian subjects, without undermining thereby the existence of the Ottoman empire. Let them come to a mutual understanding with each other. It will not be so difficult, since the Porte has intelligence and good-will as well. They should conclude a treaty of alliance on the basis of this understanding, for the repulse of the Russian attack which threatens our fatherland and the Austrian monarchy very dangerously. With this alliance consummated, let Austria-Hungary say to Russia, "Well, the Turks have administered justice to their subjects, and thou wouldst still continue the war. This can have no other meaning than that thou strivest to extend thy power. This we cannot permit in the interests of our monarchy, and we are firmly resolved not to allow it. Then let the bloodshed cease."

And it would cease. The Russian would not expose himself to the chance, that whilst the Turkish lion stood in front of him, the Austro-Hungarian military force should take up a position behind his back and cut off his retreat. The fatherland and the monarchy would be saved without striking a single blow, or at a proportionately small sacrifice; which sacrifice might be reduced to the concentration of a conspicuous army corps. This demonstration should of course be made on

the Danube and in Transylvania, but not in Dalmatia, nor on the Croatian military frontier, which would be very ridiculous if it were not at the same time very suspicious. And with the safety of the fatherland and of the monarchy the demands of humanity would be considered also, for it is indeed very shocking that there should be a war in the nineteenth century, which, in its horrors, exceeds the Mongol invasion in the thirteenth century. And the protection of the Eastern Christians would also be vouchsafed, without crippling the integrity and independence of the Turkish empire or the dignity of the State. These results, which can be attained thus, but only thus, would secure the weight, the authority, the splendor, and the fame of our monarchy in the highest degree.

I have only tried to show the political bearings, not to lay down precise schemes of action. I feel convinced that the looming danger can only be averted from our country and from the monarchy by a policy having the above-named tendency.

And it is certain that, with such a tendency, the government could securely count on the self-sacrificing readiness of the entire Hungarian people without exception of party.

And why does not the government attempt it? Such a chance is very rare. Why not use it? These circumstances open up to Count Julius Andrassy the opportunity of covering himself with great and lasting glory. He can become the savior of his fatherland, of the monarchy, of the reigning dynasty, if he will understand the work of the hour. He will be their gravedigger if he does not do it, or if he dares not do it.

What hinders him from daring it?

I hear Prussia mentioned. Yes, ten years ago the nation was frightened into the Delegations by the Russian hobgoblin, and now she is like to be driven into the arms of Russia by the terror of Prussia.

I will not deny the Russian inclinations of the Berlin cabinet. The personal leanings of the emperor William have a share in this, possessing undoubtedly great weight in the decision of the Berlin policy. And the false position of Germany has also a share therein, into which false position she has been thrown by the conquest of Alsace and Lorraine, which seems even to push into the background a consideration which should never be lost sight of by Germany, at present the first power of Europe. This consideration is that every increase of the Russian power must necessarily compromise the primatial position of the German empire in Europe; and that in the last analysis — against which personal inclinations struggle in vain — it may lead to a collision between the German and Slavonian races, the like of which has not yet been witnessed by the world. Rome and Carthage cannot exist side by side for long.

But however strong the present inclinations of the Berlin cabinet may be, they cannot go so far as to compel Prussia to take Russia for her patron, and become the client of the latter. And, in the last resort, the German imperial policy has to reckon with the other German princes and with the German nation; and among the former, as well as in the ranks of the latter, there are those who recollect Russian patronage and the significance of clientship for Germany under Russian rule. And those who recollect this would soon warn the Berlin cabinet that German blood belongs to Germany, and not to the Russians.

The knowledge of the logic of history, which I have acquired by long study and painstaking (and the cares that whitened my hair have their own tale to tell), and, at last, experience, have taught me that the German emperor might give advice in the shape of Russian inspirations, but that, whatever be the policy of the Vienna cabinet in the Eastern question, it is certain, that, to favor Russia, the German empire will never declare war against the Austro-Hungarian monarchy.

I take all that they say about Prussian threats for mere claptrap, originating from yonder camarilla, that strives — and alas! strives with great effect — *that the Vienna cabinet should do the same things in aid of the aggressive Russian policy against Turkey that it did against Poland, when Russia undertook to annihilate the independence of that unhappy country, and for the same end — viz., that she should become a sharer in the robbery*, instead of allying herself with Turkey, as she ought to have done with the Poles, to frustrate the robbery.

This is the danger which I see, like a death-prophecying bird, with outstretched wings, fluttering over my country; and my patriotism stimulates me to call to mind other things in connection with certain premonitory reflections on the rising manifestations of public opinion.

I repeat, that the important point for the Hungarian nation in this question is this: that by the war which rages in our neighborhood the vital interests of our

fatherland as well as those of Austria are jeopardized.

I place weight on the fact that at present the vital interests of Austria are in harmony with our vital interests.

My views on the subject of the connection between Austria and Hungary are known. These interests are in such opposition with reference to the reciprocal State life and mutual State economy, that it is utterly impossible even to fancy any form of connection that would be satisfactory to both countries. It is for this that I remain in exile — a living protest against this connection.

I do not, therefore, consider it to be my duty to feel sad forebodings for the special interests of Austria when its danger does not at the same time threaten the interests of our fatherland. But when the danger of the one walks arm in arm with that of the other, I put great weight thereupon, in order that Austria should feel the danger in unison with Hungary.

We stand in the face of a war that threatens our country and Austria with mortal dangers if we do not aid the Turks in impeding the extension of Russian power. This war has found Austria in a State connection with Hungary. I do not think that Russia would listen to us if we should tell her she should delay the war till this connection be dissolved. She would surely not delay. Then things stand thus: that the same king of Hungary whom our nation asks to frustrate the Russian aggressive policy is also emperor of Austria. This Austrian emperor stands very often in opposition to the king of Hungary. This time he is not so. And I think that the wishes of our nation can only gain in weight when she asks her sovereign to fulfil his duty as savior of the country, by acting as he ought to do as king of Hungary; also, in the mean time, pointing out that this is his interest as emperor of Austria as well. It is for this reason — namely, that I like to appeal also to Austrian vital interests — that I repeat emphatically that the vital interests of Hungary and of Austria are identical.

This view is perfectly justified by the political significance and far-reaching importance of the Eastern question as it stands with reference to us.

If the Turkish empire were to be under no pressure from the power that threatens the liberty of Europe, — a colossus increased to formidable proportions by the dismemberment of Poland — then the Eastern question would be nothing else than a home question between the Turks and the other peoples of different races in the Turkish empire.

And if this question stood thus, neither the integrity nor the dismemberment of the Turkish empire, nor the reforms conceded or denied to the nations of that empire, would affect in the least, not the more distant countries of Europe, but not even us or Austria, who are her neighbors, except from a humanitarian, sympathetical, or antipathetical point of view.

We have learned to appreciate justly the fundamental features of the Turkish character. We are aware, as I have said, that we possess in the Ottoman nation such reliable friends as we could not find anywhere else in the world, because our interests are so identical that there is not only no opposition, but not even a difference between us. We recollect gratefully the generosity shown to us by the Turks in the days of our sorrow; and it is honorable on our part to remember this warmly just now in the days of their sorrow. And so it is certain that we Hungarians should follow all regenerational endeavors of the Turks with heartfelt sympathy and blessing. We should feel gratified if they succeeded in removing the obstacles in their way to liberty. On the other hand, if in consequence of Russian pressure the dismemberment of the Ottoman empire should be identical with the aggrandisement of Russia, there would not be a single Hungarian who would not consider the territorial integrity of Turkey, and the upholding of its sovereignty, as a *conditio sine quâ non* of the maintenance of our own integrity and independence. No one would think of shedding his blood nor offering aid to the Turks if it were not for the threatening attitude of Russia; but for that we should not look with anxiety on the aspirations of the Slavonic nations.

Though all the provinces of Turkey should gain such an "autonomy" (!) as that which is prepared for the Bulgarians by Prince Cherkaski after the Russian pattern and in the Russian language, still the Eastern question would not be solved, but would then be revived in the face of Europe, and especially in that of Hungary and Austria, in such tremendous proportions as it has not yet reached.

Yes, because the Eastern question, I repeat again, is a question of Russian power; clearly, distinctly, a question of Russian aggrandisement.

And it will remain so until Europe, after a tardy repentance, shall at last determine the restoration of Poland, and thus avert

Digitized by CORNELL UNIVERSITY

the curse from herself which she has incurred by the crime of that partition.

Only by the restoration of Poland can Russia be pushed back upon her ancient boundaries, where she could in her still vast empire let her subjects become free men, and thus occupy a still glorious and prominent place at the round table of civilized nations, but a place whence she could no more threaten us and Austria and Europe with her Panslavo-Czaristical and universal-monarchical ambitions. Only when it shall be made sure on the banks of the Vistula that she can never more suffocate Turkey — only then will the Eastern question step down to an internal, and, if you like it, to a humanitarian level, and be solved in such a way as not to be dangerous to Europe.

But so long as this does not happen, the Eastern question will always remain a Russian question of power. If the Turkish empire should be dismembered in consequence of Russian pressure, or even if it should be crippled, I repeat that every inch lost by the Turks would only increase Russian power. The diminution of Turkish sovereign independence would increase Russian influence, which would act as a dissolving poison on us and on Austria; and the unavoidable consequence would be that the nations which had been severed from the Turkish rule would not become free, but Russian serfs — forming the tail of that boa-constrictor which presses us closely, the arms of that polypus which clings to our flesh.

These are the considerations which induce the Hungarians to adopt the view that their very existence is endangered by the war in their neighborhood.

And these considerations are so momentous that, if we Hungarians should continue to look on in cowardly inactivity at the dismemberment of the Turkish empire, or, which is identical, at the aggrandizement of Russian power, if we should look on in cowardly inactivity while the boa-constrictor gathers material to form a new tail from the southern Slavonians, while the polypus makes out of them new trunks, — it would be such suicidal insanity that I cannot find a word to designate it. We should be worse than the worms creeping upon the ground if we did not protect ourselves against it.

These are sad times. After so much blood has been spilt that the nations might become independent, we are still in the position that the fancy and the will of two or three purple-clad mortals are decisive, and not the will of the people. But the Hungarian people will live — they will not go so far in their resignation as to commit suicide for the sake of any mortal man whatever. We must raise *a dike against the extension of Russian power.* And to do that, we must *conserve and uphold the unity and the independence of the Turkish empire;* for at present that is the practical way to construct a dike. This view is firmly upheld by the Hungarian nation, whatever form of expression they may use to state their will; and in this respect all the Hungarians are of the same opinion without difference of party. They are of the same opinion, for they are convinced that this *is a vital interest of our fatherland. And justly therefore Hungary feels indignation, and disavows — the whole Hungarian nation does it — that immoral and impolitic idea, that the Austro-Hungarian monarchy should become an accomplice in the occupation of any part of Turkey for the sake of the enemy of our country's vital interests.*

Governments should never be in opposition to the popular wishes when governments wear the constitutional toga. It is the worse policy if they are. On the present occasion the wishes of the nation show themselves so unmistakably plain, that it would be a dangerously daring feat if the government should try to elude them by some parliamentary trick. It is a question of existence. The nation knows this well. And ours is a loyal nation. Therefore, I say to those in authority, comply with her wishes. Don't force her to take in her own hands the insurance of her life. She will do it if she is forced to it, because she will not die. The Hungarian nation will not be a worm to be trampled upon by the heel of the tramplers. She will not suffer that the bowing diplomatists of czars and Cæsars should convert Hungary into a powder-barrel to be exploded by Russian intrigues with a Panslavonic match.

They told thee, Hungary! "Be reconciled with Austria that thou mayest be safe from the Russian." Thou hast been reconciled: let us see the conciliator, where is he?

Almighty Father! if the Hungarians were but independent!

De profundis ad te, Domine, clamavi.

I know that what I have been saying is nothing new. But still I thought it right to speak my mind, as the prime minister of Hungary has made a very startling declaration.

When it was resolved in a public meet-

ing of citizens that the integrity of the Turkish empire should be upheld even by armed force, the prime minister of Hungary gave the following answer: "*That it is not allowable to shed Hungarian blood for the interests of any other power, and that the government will never give its consent that the heroic sacrifice of the Hungarian nation should be made for others.*"

So the Hungarian prime minister still considers the upholding of the Turkish empire against the Panslavonic standard-bearer, the Russian czar, as being for the interests of "others."

Every inhabitant of Hungary who wishes the conservation of our country, and those, also, who speculate on her overthrow, know that *our country's existence is at stake.* The prime minister is, perhaps, the only man in Hungary who does not see this.

But since the crippling of the integrity of the Turkish empire is identical with the aggrandizement of Russian power, nobody in the world has the right to say that Hungarians are sacrificing Hungarian blood for the sake of others when they offer to shed it for the upholding of the integrity of the Turkish empire. The prime minister ought to know that this willingness is a flower that has grown in the soil of self-preservation, and opened its cup under the shining of the purest patriotic sunbeams.

The Hungarian prime minister has spoken a startling word. If this is to be the standpoint of the government, I declare most emphatically that the interests of Hungary are in dangerous hands.

Whoever, *in this war*, considers the upholding of the Turkish empire to be a foreign cause, *will not raise a dike to the extension of the Russian power: for he is not far from the thought of sharing with the Russians in the Turkish booty.*

But I should like to believe that this most unlucky expression was only an unconsidered pistol-shot, which went farther than it was intended. I do not say that the Hungarian government has deliberately thrown itself into the arms of those who are undoubtedly stirring dangerous questions in the regions of diplomatic circles. I can doubt, I can foresee, but I cannot assert, for I don't know it. But alas! I know, that neither in the declarations of the Hungarian government, nor in the actions of the leader of the foreign policy, can a Hungarian patriot find comfort.

It will not be amiss to call to mind now, when the representatives of the country are assembled again, that the nation, without difference of parties, expects that they will rise above party spirit and secure the fulfilment of the nation's will.

The most weighty declaration of the Hungarian prime minister has been that in which (I quote it word by word) he assured the House of Representatives that *there is not a single person among the leaders who thinks it ought to be the aim of our foreign policy that the power and sovereignty of Turkey should be changed.*

This declaration has been greatly applauded, because (as I know positively) on both sides of the House many persons who were present, at the first hearing interpreted the speech, full of diplomatically clever phraseology, as assuring them that the directors of the foreign policy of the monarchy would hold it to be their task to see that the power and sovereignty of Turkey should remain unchanged.

Alas! the Hungarian prime minister did not only not say this, not only did he not want to say it, but, on the contrary, when some days later two of the representatives ascribed this sense to the declaration of the prime minister, the latter contradicted that explanation of his words.

"*Quæsivi lucem, ingemuique reperta.*"

The far-famed ministerial declaration comes to nothing else but this: "The house of our neighbor is so situated with reference to our house, that if his catches fire ours will catch fire too. The house of our neighbor has been attacked by robbers and incendiaries with torches. Our household takes fright for our dwelling, and the responsible watcher of the Hungarian household says, 'Don't be anxious; I give you the assurance that amongst us, your watchmen, there is none who would hold that it is his task to burn down our neighbor's house!'"

The other declaration of the prime minister has been, that "*the government has not given to any one, in any sense whatever, a promise what it will do; nor have they assumed any obligation, but they possess their full freedom of self-decision.*"

From this declaration we learn two things, but neither of them is comforting. We learn that the government does not know yet what it will do. It has no fixed aim. Its policy has no certain tendency. It sails about without a compass. It expects good luck wherever the wind shall blow. If this be policy, it is a very improvident one.

"The hour brings its own counsel" (*Kommt Zeit, kommt Rath*). This is the

summary. Such determination according to the occasion may be a very good thing in itself, it is well to know *how* we shall reach the aim we have in view; but I don't think, in the present international imbroglio of affairs, which endangers the vital interests of the country, that to relegate the tendency of policy (not the *how*, but the *what!*) to the chance of future decision, can be advisable or even permissible.

And I am very fearful that the prime minister has told the truth. I see that the minister of foreign affairs, by the consent of the leaders of both parties, has constructed for himself a scheme wherein he can indeed place many things, but what are these things? This he leaves to the future. "*Kommt Zeit, kommt Rath.*" The signification of the plan is the following: "Let the Russians do whatever they like. Our position towards them is a friendly neutrality." *Neutrality, and friendly:* a steel hoop, made of wood! *Contradictio in adjecto.* But, alas! still true. *Friendly* towards Russia; *hostile* towards Turkey; but no *neutrality.* When a country is affected in her vital interests by a war, as our country is now, neutrality is an absolute impossibility. Inaction is no neutrality. That this hitherto observed inaction has been of great service to the Russians is a fact crying to heaven and earth. But I will now continue the scheme. "If the Turks shall be victorious, everything will remain as it has been; and we shall mediate during the final negotiations, in order that the Turk may not press too hardly on the Russians, with whom we shall keep on 'friendly terms.' If, on the contrary, the Russians advance victoriously, 'we shall take up a position' in behalf of the conquered Turks; we shall strive to moderate the Russian exactions at the final negotiations; but in any case, if the Russians rob, we will rob too *if possible down to Salonica!* And then we will say to Hungary and to Austria, '*Well, we have secured the interests of the monarchy in the face of the Russian extension-policy.* The Russians have annexed, but we have annexed also; the equilibrium which was upset by robbery has been restored by robbery.'"

Such is the "scheme" of the policy of "*freedom of self-decision,*" of which the prime minister has been boasting. I shall be very glad if the patriotism of the national representatives should give such a guarantee for the fulfilment of the people's wishes as may refute my suspicion — I had nearly written my "*certainty.*"

The second thing we learn from the quoted declaration is this, that our government *has no ally.* I think that, under such circumstances, there are two things which are the chief duties of a government. The one is that it shall see its way clearly with reference to the tendency of its policy, — of this I have spoken already; the other is that, in order to secure this policy, it should think of getting allies. It is a bad case that the government has no allies. I could even call this also neglect of duty, because they could have had allies if they had had a good policy.

But it is still worse that the *untrammelled attitude,* of which the prime minister has boasted, *favors the Russians.* Since the beginning of the complications we have heard of nothing so emphatically as the confederacy of the three emperors, which was formally styled "a friendly understanding." One of those three confederates is the czar. My dear fatherland! thou art indeed in great danger from that *untrammelled attitude* which operates in friendly relations with Russia. Hitherto it has acted in that way. I could cite many testimonies; I will quote only a single one.

The government says it has no obligations. What! Has it not entered into an engagement to let Roumania be occupied by Russia who unfurled the banners of "the Slavonic Cause," and so to convert this province into a place for her military operations, notwithstanding that the neutrality of that country has been guaranteed by the European powers, under whose protectorate it has been placed? Yes, they have engaged themselves, and by a formal bargain, because they have expressly stipulated, as a reward, that the czar shall not force Servia into war.

This fatal obligation is the source of all the evils which have happened hitherto and which will happen hereafter, and of all the dangers that threaten our country.

But the thing does not end here. The world is filled with anxiety lest even this stipulation should be omitted, and lest the Viennese cabinet should not try to prevent the czar from taking Servia into action. Lo! because the Turkish lion has struck the czar over the fingers, the great czar is in want of the perjury of little Servia, to whom Turkey the other day granted forgiveness. Thus the *untrammelled attitude leans* again *towards Russia.*

The representatives of Hungary will, no doubt, without party difference, feel the danger that menaces them through this new aggravation of circumstances.

I must now advert to a third govern-

mental declaration, and I find it very weighty.

When an interpellation was directed to the government with reference to its policy, instead of confessing its leanings, it avoided the question by declaring *that the interests of the Austro-Hungarian monarchy have led and will lead their policy, and that the interests of the monarchy under every circumstance will be considered.*

The government, in fact, always serves up the same dish, nobody knowing whether it is fish or flesh, not even the butler who serves it. This is the question, in what direction (*not by what means but in what direction*) the minister seeks his policy? and whether he seeks it in a direction conformable to the interests of the monarchy?

If they should again serve a dish, which is neither "fish nor flesh," in the House of Representatives, and if the House should be contented with this assurance (as we heard out of doors), that "*the government keep before their eyes the wish of the nation that the interests of the monarchy — in opposition to the Russian policy of extension — should be secured,*" the ambiguity of the situation would not be at all changed, and the door would still be left open; so that if events took another turn, the water would be turned to grind the mill for those "influences that wish to get a share," and our nations would some morning awake to find that, under the *pretence of securing the interests of the monarchy*, things had happened which the nation abhors as it does damnation.

I do not speak so because I have forebodings; it is not my object to enter into questions of principles. I don't want to quote the sad pages of our own history, nor the examples of Polignac or MacMahon, to show that it has always been so; and that there has never been any impiety without the reigning power invoking interests of State when committing it. But as we stand in view of the danger of Russian extension, I pray my countrymen to look for that page of history where they will see it written, *how the Viennese cabinet understands the securing of the interests of the monarchy when face to face with Russian aggressive policy!* This has such an actuality of interest that I nearly shudder when I think of it.

Whoever looks at those pages must feel convinced *that the Viennese cabinet never did understand the securing of the interests of the monarchy so that the Russian extension should not be permitted; it but so understood them as that whenever the Russians commit robbery, Austria must rob as well,— that when Russia extends herself, Austria ought to do the same.*

So, I repeat for the third time, it understood them at the division of Poland, and so it has understood them ever since, without exception, when face to face with the Russian policy of extension.

This is an awful remembrance.

And this they call the policy of restoring the equilibrium!

And what has history said of that awful policy? I do not speak even of morals, of honesty — which is always the best policy in the end, though it was a long time ago struck out of the vocabulary of diplomacy. I point to facts.

By this policy the Russian power has been swollen to giant-like proportions, which now menace the whole world. The consequence of this policy is the war of to-day, and Russia now smooths her way, through the Turkish "Slavonic cause," to the Hungarian and Austrian "Slavonic cause."

On the other hand, this policy of sharing has not saved the Austrian dynasty from withering. Russia has grown up; Austria has dwindled.

And what will be the result if the Vienna cabinet should again follow this damnable policy of expediency?

In the past it has put a razor in the hand of Russia; now it would put this razor to the throat of Hungary, and also of Austria.

"*Duo cum faciunt idem, non est idem.*"

There can be no doubt that what the Russians would rob from the Turks, what their influence would win on both shores of the lower Danube and on the Balkan peninsula, would form a real increase of their power, an augmentation of their strength; and the influence thus acquired would act upon the Slavonians of the Austrian empire, and upon those of the Hungarian crown, like the loadstone on iron. Those Slavonians that would be caught by Russia, she would take with her.

On the contrary, what the Viennese cabinet would pilfer, under the shadow of the Russian highwayman, from the Turkish empire, would only weaken us, and become eventually our death; because it would eternally multiply and put into further fermentation all the already fermenting and dissolving elements. The Slavonians who would be caught by the Viennese cabinet would take the latter with them.

And what would be the infallible final

result? The punishment of *talio.* If St. Petersburg and Vienna should divide the rags of the torn Turkish empire, twenty-five years would not elapse before the Russians, the Prussians, and the Italians would divide Austria and Hungary among themselves, perhaps leaving something of the booty to Wallachia, as the reward of subserviency to Russia. This is as true as that there is a God.

Well, I feel no call to be anxious about the dismemberment of Austria, if free nations might step into her place; but I do feel it my duty to be anxious about a dissolution by which Russian power and Russian influence would be increased. I feel it so much my duty, that if our fatherland were connected with Austria only by the ties of good-neighborly friendship, and if Austria were threatened by the Russians, I would most determinedly say to my countrymen, "Defend thy Austrian neighbor to the last drop of thy blood against Russia," just as I say now, "Defend thy Turkish neighbor to the last drop of thy blood against Russia."

The reigning dynasty of Austria must reckon with the logic of history. A time may come — it must come — when her German provinces — will go home. Well, well, I say: the royal throne of the palace at Buda is a very glorious seat. It will be good to think about how, after its thousand years' history, it may not be menaced by the Russian monster — neither in the form of a boa-constrictor, nor in that of an hundred-armed polypus. The time is come to think of it, now that the Turkish lion is fighting his life or death struggle so gloriously. Let us not lose the opportunity. "*Sero medicina paratur.*" "Mene! Mene! Tekel! Upharsin!"

I do not say that the Hungarian government has given itself up to the impulses of robbery, I say only, that this is not excluded from the "scheme." This vampire sits on its bed, on its chest, on its arms. Shake off the vampire, I say. *Free your arms, and step at the head of the nation.* It is a glorious place. In such a great crisis it is a very small ambition to aim, by the cleverly construed phrase of "taking notice," at getting a vote of confidence from your party. You should act so that the confidence of the whole nation should surround you. You can do it. You should adopt the policy that has been pointed at by the whole nation. You should not contradict yourselves, for you said that your *hands were free.*

To the representatives of the nation I would like to cry out from my remote solitary place, "The fatherland is in danger, — in such danger as it has never been in before, viewing the irrevocability of the consequences. Then let the fatherland not be made a party question among yourselves, my countrymen! Let the genius of reconciliation hover over you when you stand arm in arm around the altar of our fatherland. I do not ask you to upset the government, but I beg of you to place it in such a situation that its stability would be guaranteed by the fulfilment of the nation's wishes. *The action of Servia has supplied you with an opportunity which answers even diplomatical considerations.* Don't let this occasion escape you."

The fulfilment of the nation's will is the purest loyalty. I say so — I, who never yield. It is true I do not like the Austrian eagle in our fatherland. But I wish not that this eagle should be consumed in flame by the Russian; and I shudder at the thought that Hungary may be the funeral stake.

I am a very old man. I long ago overstepped the line assigned by Scripture as the limit to human life. Who knows whether this be not my last word? May it not be the voice of one who cries in the desert!

ERICA.*

TRANSLATED FOR THE LIVING AGE FROM THE GERMAN OF

FRAU VON INGERSLEBEN.

XIII.

FRAULEIN MOLLY.

WHEN Erica returned, she found old Christine in the greatest excitement, and was received with a torrent of reproaches. In self-defence she related the rescue of the child, but the old servant was not inclined to be softened. She, Christine, could not see why Fräulein Erica need run after the robber; there were certainly people enough in Waldbad to bring back stolen children. But when she discovered the Fräulein's absence, she had instantly made up her mind that the latter would be senseless enough to run into the dark forest, which, apart from all other dangers, was not at all proper for a young lady.

Christel rarely used the title of "Fräulein," except when she was angry with

her; it was a sort of declaration of war, and Erica saw, from the frequent repetition of the word, how much she had angered the old servant. She was, however, so utterly exhausted in body and mind by her exertions and excitement, as for the moment to be unable to put Christel into a better humor. She could scarcely undress herself, and the old woman, who perceived this, helped her, and though muttering and grumbling, put her to bed as carefully as a child.

The next morning every shade of anger had vanished from Christel's brow. Erica, from her windows, even heard her giving an attentive neighbor a full account of her young mistress's heroic deed. There were many portions of the story which Erica could not remember, but Christel related them with most convincing positiveness, and the listener smiled with still greater amusement, when Christel wound up by repeatedly assuring the neighbor that there was not another person in all Waldbad, except "our Erica," who under such circumstances would have succeeded in bringing back the stolen child. The following day the events of the night were the universal topic of conversation, both to the inhabitants of Waldbad and the summer visitors. The few persons who had gone to bed early the evening before, and therefore not been excited themselves, learned with amazement and some little regret the minutest details of the story, perhaps with considerable amplification.

Elmar's deed, in the mouths of the young girls, became an act of heroism which surrounded his brow with a halo of glory, and made him an object of the most intense interest to all the fair sex in Waldbad. Erica, on the other hand, of whose very existence most of the young men had hitherto been ignorant, occupied their thoughts with equal suddenness, and was declared a famous little girl, worthy of the greatest attention.

The giant Andreas, though he had also been very active in the liberation of the child, attracted little notice from society, and was forced to be satisfied with being the hero of all the woodcutters and fishermen in the neighborhood. He, however, was perfectly contented with his modest share of fame, as well as the liberal gifts of the brother and sister, which enabled him to gratify all his moderate wishes, build a little house, and marry his Anne Marie.

Frau von Hohenstädt seemed so ill that the news of Erica's adventure was broken to her very cautiously, and even this slight outline of the events produced such an exhausting effect upon her as to make every one very anxious all day. Perhaps, however, this diversion of her thoughts to some other subject was fortunate for Erica, since it aided her to more rapidly regain the composure of mind which had been somewhat shaken by the events of the night.

Late in the afternoon she saw from her window Valentin, the liveried footman, ascending the hill that led to the house, heard him exchange a few words with Christine, and then noticed that he handed her a letter. She had just time to regain her composure, at least outwardly, when the old servant entered the room.

The note was addressed to Erica, and when she unfolded the sheet her eyes rested for the first time on Elmar's handwriting.

"These lines must inform Fräulein Erica that both sister and brother are for the moment unable to express their thanks in person. Kathinka is not allowed to leave her bed to-day, and the doctor, on account of my slight wound, has ordered me to remain in my room for the present. Our preserver therefore must not be angry with us if we delay our visit and cannot tell her, until some future time, how deeply we are indebted to her."

This was the whole of the letter, which aroused a feeling somewhat akin to disappointment. She scarcely knew herself what she had expected, but a slight shade of coldness seemed to pervade the lines. The danger incurred together during the previous night had made Elmar appear like an intimate acquaintance, nay, friend, and now she felt as if the letter had been written from the standpoint he had previously taken towards her. A shade of bitterness even mingled with her thoughts, when she said to herself that they would come to express their thanks, and in so doing think the affair settled and then trouble themselves no more about her.

Her eyes remained fixed mechanically upon the sheet of paper, and she gave herself up to her thoughts so long that her invalid mother noticed it.

"Have you received any bad news, child, that you look at that letter so mournfully?" she asked gently.

Erica started, and handing the sheet to her mother, said somewhat evasively, —

"I don't think the news so bad. The princess is of course a little exhausted by her agitation, and her brother's wound is said to be slight."

The old lady read the note with some

difficulty. When she came to the signature, her features expressed surprise, and she asked almost eagerly, "Altenborn? Am I right, Altenborn?"

"Yes, mamma, that is the name."

"And from what part of the country is this Baron von Altenborn?"

"I don't know exactly. I heard that his estates were not far from the frontiers of France."

The invalid again took the letter and read it attentively, then turned to her daughter.

"How does it happen that this young man calls you Fräulein Erica, how does he know your Christian name?"

Erica blushed crimson. "I really don't know, mamma," she stammered in great embarrassment, "he has always called me so."

"Always called you so? Then you have seen him often. You told me about the beautiful princess and her little son, but, so far as I am aware, never mentioned her brother."

Erica was fortunately spared a reply, for the doctor entered the room to visit the invalid. This time he seemed less disposed to inquire after the health of his patient than to tell her his own experiences, and gave a most circumstantial report of the princess's condition, the baron's wound, and the undisturbed health enjoyed by little Carlos in spite of his alarm. He had probably already done this in twenty houses, and intended to carry his news to twenty more, for he had scarcely finished his story when he rose, recommended his patient to keep perfectly quiet, and hastily glided out of the room.

The latter was only too well aware that medical aid, far from curing, could scarcely alleviate her disease, to feel offended by her physician's partial sympathy for the health of others. Besides the repose recommended was an imperious necessity, for the invalid, exhausted by reading the short letter, as well as by the doctor's visit, leaned back on her couch, and remained motionless for nearly three hours.

The next day brought the old lady somewhat better health, and Erica could leave her for a short time to take her usual walk. According to an old habit, she directed her steps towards the sea, and soon reached the shore, which at this time was deserted and lonely. Only two persons were strolling up and down, in whom she soon recognized Fräulein Molly and Herr von Wehlen. On making this discovery, Erica was strongly tempted to turn back, but she had already been seen, and besides, she surely had no cause to fear the man's glances of hate.

But she did not encounter any. On the contrary, Wehlen spoke to her kindly, almost cordially, and paid her heroic courage the most extravagant compliments, while Molly stood beside him like a statue, with her eyes fixed upon the ground. When he took leave of the ladies, she looked up, gazed steadily into his face, then nodded slightly, and said in a tone of mockery, —

"The *ladies* wish you a great deal of pleasure on your lonely walk." Then, much to Erica's surprise, she passed her hand through her arm, and drew the astonished girl away, walking quickly forward until one of the undulations of the down concealed them from Wehlen's eyes, when she paused, and covering her face with her hands, exclaimed in a trembling voice, —

"It is true. Oh God, it is true!"

Erica stood beside her in the greatest perplexity, and as she naturally imagined the remark referred to Wehlen and his supposed share in the robbery, answered quickly, —

"So you are also convinced of it? I have not the slightest doubt."

Molly removed her hands from her eyes and stared at the young girl. "So this child already knows," she murmured, "the sparrows have twittered it from the roofs, and I, I alone was blind and believed in love and faith."

"What are you talking about, Fräulein Molly?" asked Erica timidly.

"What am I talking about, child? Of the old love that is ever new, of feigned love, of — pshaw!" cried the speaker, suddenly interrupting herself, and tossing her head impatiently. "Is it not the same deception that is practised upon wealthy heiresses whom men woo for their millions, while they seem to adore their persons? What do you think, Erica, should not I too be admired, idolized by all the world, if I possessed a million?"

"Certainly," replied Erica frankly.

Molly laughed a hard, dry laugh, which made Erica shrink. "Well, you see, child, unfortunately I don't have these millions, and am therefore the insignificant, unnoticed companion of the Princess Bagadoff. So insignificant that the haughty lady, I fear, only raised me to this enviable position in order to feel safe in her own house at least, and be able to close the Argus eyes with which she watches over her brother's heart."

"Her brother's heart?" The words had escaped Erica's lips before she realized what she was saying, but as they were now spoken she had the courage to add, "What do you mean by that, Fräulein Molly?"

"It is very simple," said Molly, with her former strange laugh. "The princess is jealous of this adored brother's love, and tries every means to guard his heart from cherishing an affection for any other woman. Perhaps this love is also a little tainted by the egotism common to all, who knows?"

She uttered the last words in a loud, scornful tone, which made them all the more incomprehensible to Erica, who looked into the speaker's face with such an inquiring expression, that the latter continued, —

"You don't understand me, child. Of course, how should you? Wait a few years and see. You are poor, like me, and have as small a share of beauty; it will not be long ere life enlightens you about all these things. You do not desire the explanation, as I see by those pouting lips. No one desires it, child, but fate does not inquire about our wishes. Come, sit here on the down, I will tell you my story."

"My parents were rich and aristocratic, and — as the old muses say — no one sung beside my cradle that I should ever be obliged to earn my bread. Our house was always thronged with visitors, and everybody flattered 'the charming little Molly.' Perhaps the expensive mode of living might have encroached upon my parents' property, which was still farther diminished by various misfortunes. Friends became fewer, flatterers to little Molly rarer, and when at last my father and mother both died within a very few days of each other, leaving scarcely enough to pay their debts, my relatives — at my guardian's earnest entreaty — were obliged to take me into their house.

"The charming *little* Molly must have probably become a very unattractive *great* Molly, for I was neglected by every one, and always felt in other people's way. My beautiful, or rather wealthy cousins so completely outshone me, that most of the visitors at the house were scarcely aware of my presence, and as the role of Cinderella seemed exactly adapted to me in every particular, one could scarcely blame my aunt for allotting it to me.

"In this situation, it seemed like a deliverance when, two years ago, the Princess Bagadoff offered me the position of companion. At first I could scarcely understand this great kindness, but soon perceived that my repulsive, rather than my attractive qualities, had recommended me to her.

"This lady is the very incarnation of selfishness, which in her has reached the height of developing into a certain degree of ingenuousness, and therefore never draws her into any contention with the outside world; but she understands only her *own* rights, not those of others, and so her acts — in this respect — are never vacillating, while her ordinary conduct, which is dependent solely on caprice, and regulated only by her own arbitrary will, seems doubly so. But it would be a great mistake to suppose that these whims can be controlled or guided by apparent submission. She instinctively feels even the most covert assault upon her independent sovereignty, and defeats it with victorious swiftness and certainty.

"Her almost adoring love for her boy is only one of the forms into which this egotism has crystallized. She loves in him her expanded self, the continuation of her own existence, and moreover has the advantage of convincing herself and others of her exemplary virtue, her wonderful maternal affection, and would think it perfectly natural if she were called a pattern for all other women. Must not all who surround her be delighted with the labor this rare maternal love imposes upon them? Can *her* sweet boy be a burden to any one? Certainly not, and only she herself — owing to her nervous sensibility — sometimes feels this burden and gets rid of it as quickly as possible.

"If the baron is correct in his assertion, and the child's father is really the originator of the intended abduction, he has been skilful enough to hit upon the only spot where he could wound her. Poor little Carlos — who is always used as a shield to cover his mother's wishes — might perhaps have fared better, if he had really been removed to the barren steppes of Russia. The father's hatred would perhaps have been more beneficial to him than the mother's love, which corrupts and poisons his mind, and will make him the most miserable, contemptible of egotists.

"I am not personally acquainted with the prince, but if, as they say, at the time of the divorce — which occurred a few years ago — the whole blame was thrown upon him, and the child given to the mother, while the father was denied any right to the possession of the boy, the judges acted like short-sighted men, who formed

Digitized by CORNELL UNIVERSITY
Original from CORNELL UNIVERSITY

their opinions solely by appearances. The prince may be rough and inconsiderate, and have treated his wife accordingly, but even the gentlest and most yielding man would have been roused to fury by such a nature.

"The brother of this estimable sister, who since the divorce has enjoyed the happiness of sheltering her in his castle, has undoubtedly for this sole reason, cultivated the calmness natural to him until it has become a fine art. I do not understand what induces him to show his sister so much consideration — it certainly is not love — but I know he does it, and most earnestly endeavors to avoid an open quarrel. How long he will succeed I cannot tell, I only know that, in spite of everything he can do to prevent it, this breach will, must come.

"In spite of the princess's touching affection for little Carlos, notwithstanding that she lives only for and in her child, she squanders with lavish hands the large property which the prince was forced to settle on her and the boy.

"If the point in question is the gratification of any of her whims, she has no consideration and throws away sums entirely out of proportion, both to the object to be gained and her own means. If I am not greatly mistaken, little Carlos has already been robbed of a portion of his patrimony by his affectionate mother, and I am equally mistaken if the large possessions of her brother are not destined to repair the breaches.

"This brother's marriage would therefore be inopportune in every respect, and as he himself is narrow-minded enough not to perceive it, his careful sister is obliged to take the trouble of mounting guard over him. For this reason she desires at least to have repose when they are at Castle Altenborn, and therefore must employ a particularly unattractive companion. True, there are other ladies at the castle, Baron von Altenborn's grandmamma and her companion, but as the latter is sixty years old there is no danger of any assault upon the heart of the young master of the house.

"It was somewhat humiliating for me when I made this discovery; but I had been accustomed to so many mortifications for years, that I soon became reconciled, and even tried to turn the circumstance to my own advantage by making myself so extremely unattractive, that I believe I really became almost insupportable to the good baron, but convinced the princess of the advantage of my presence. It was only by causing her to feel that I was indispensable, that I could, in some degree, control her whims and compel her to treat me decently.

"Poverty is seldom beneficial to the character, Erica. A poor woman lives on a war footing with society, which denies her the barest necessities; and war has stern laws, the morality of smiling peace would lead to utter destruction."

The speaker paused and gazed thoughtfully at the ground, then after a long silence continued: "Let me finish my story. For two years I lived in this way, if not happily at least comfortably, and desired no change in my fate, because I was convinced that it must result to my disadvantage. Then we came here ——"

Again Molly paused and cast down her eyes, as she continued softly, in words that seemed to have very little connection with the last sentence. "Wehlen was the only man who ever showed any attention to me. What marvel was it if he won my heart, if I dreamed of a happy future? The dream has vanished, leaving naught save the bitterness of the illusion.

"Do not shed tears for me, Erica!" she continued, in a loud, passionate tone. "I am only atoning for my sin. How could I forget that I was unlovely? how could I be such a fool as to suppose I had really won the heart of that man, who has travelled over all Europe, and seen the beauties of every country? I *ought* to have known that nothing but motives of interest could attract him to me, and the knowledge would have put me on the track. So perhaps the princess was right in the torrent of reproaches, though not the insults, with which she loaded me before the whole company, and I forgive her.

"A parting from her, however, is no less unavoidable. For the sake of my own self-respect I cannot expose myself to another such scene, and, besides, the princess will not conquer her distrust of me, so the relation can no longer be maintained on either side."

"Does the princess know that Herr von Wehlen is the real robber?" asked Erica in surprise.

"Oh, no! she would scarcely believe it, and it is better so, for she would allow impulse to urge her on to the wildest conduct. There is no danger that the attempt will be repeated. The fairy castle is to be watched day and night by men in the princess's pay, and besides Herr von Wehlen just told me that he had received important letters which required his imme-

Original from CORNELL UNIVERSITY

diate departure." Molly's voice trembled as she uttered the last words, and it was possibly to conceal her emotion, that she continued with scornful bitterness, —

"Herr von Wehlen intends to pay her Highness a farewell visit; the beautiful woman will take a gracious leave of him, and as he has too much tact to remind her of the existence of the companion who has now fallen into disgrace, and yet does not wish to be uncivil, he has just made his adieux to me on the beach. We, too, shall leave here very soon; the princess has become uneasy, and — Molly Sassnitz will once more rove over the world, a leaf whirled about at the mercy of the wind. Whither it will take me I know not."

She paused, and Erica did not interrupt the silence. She was reflecting upon what she had heard. The tale, however, was not so painful and disappointing to her as it would have been a few days before. The halo which had surrounded the beautiful, aristocratic lady had already received a crushing blow during the scene witnessed the night before.

What had this woman, half insane with grief, in common with the tall, beautiful vision which had seemed to be supported so gracefully, and yet so firmly, by its own strength? Would, ought a really noble spirit to allow its self-control to be destroyed to such an extent, even by the greatest misfortune? Must not her cheeks forever burn with shame at the disgraceful recollection that she had charged the boy's preserver, her own brother, with having stolen him? Erica had been put to flight by the humiliation the princess had brought upon herself by this unjust accusation. When Molly now rose, she also sprang up, and holding out her hand, said cordially, —

"I thank you for your confidence, Fräulein Molly. I will not abuse it, nor shall your story fail to bear fruit. It has shown me how many false appearances are produced by ignorance and short-sightedness, and the lesson will not be lost. I will pray to God for your future happiness, and you must do so too, Fräulein Molly, then you will no longer feel like a leaf borne along at the mercy of the wind, you will know that the storm can play no tricks with you."

Molly threw her arms around Erica's neck, and laid her head upon her shoulder. "I am very miserable, Erica," she murmured, weeping. "Pray for me. I should only utter the petition with my lips; my heart is cold and dead, even the thought of God cannot warm it."

She raised her head, kissed Erica on the forehead, and then walked quickly away without another word.

Erica went slowly home, reflecting on what she had heard, and adding thread to thread to bridge over the many gaps in her knowledge. She also thought of her conversation with Elmar, and his strange comparison, which she had imagined referred to Wehlen. Now she thought she knew that he had alluded to his sister, but could have given no reason why the idea sent the blood to her cheeks, and crimsoned them with burning blushes.

XIV.

THE VISIT.

JUST after Erica had left home to have her momentous conversation with Molly, Christine rushed into the invalid's room in the greatest excitement. Her movements betrayed such unusual haste and agitation, that the sick lady started up in alarm, but before she could ask a question Christine exclaimed, —

"Here is the servant who brought the letter yesterday. The princess wants to call on you, and is already coming up the hill with the little prince."

An expression of by no means pleasurable surprise flitted across the invalid's features. "I am very ill-prepared to receive visitors, and Erica is not at home. Go and meet the lady and ask her to excuse me, Christine."

"But you surely won't send the princess away?" cried Christine in astonishment. In the agitation caused by the visit, the old servant seemed to have entirely forgotten her usual anxiety for the invalid.

"The princess will not be inclined to talk to a sick woman, so go, Christine."

The old woman, shaking her head, hurried down the steps of the veranda and advanced towards the princess. Katharina, accompanied by her son and his nurse, was already quite near, while the liveried Valentin waited close to the house, eying its dilapidated appearance with somewhat contemptuous glances.

Christel, however, did not vouchsafe to give him her answer, but hurried towards the princess who was slowly approaching, and explained in the most circumstantial manner the combination of unlucky circumstances which would render it impossible to receive her visit. Katharina was evidently not inclined to let her plan be thwarted so easily, she turned towards the nurse — who for the moment occupied Fräulein Molly's place — and asked, —

"Does the woman want to tell us that the daughter has gone out, and the mother is ill, or have I misunderstood her."

"Your Highness has understood correctly," replied the nurse, with a smile by no means flattering to Christine.

"Well, now we are here, we will see the sick lady a moment, that cannot possibly do her any harm. Go on, my good woman, and show us the way."

Christine looked at the speaker in some little perplexity, and hesitated, but the princess, in spite of this reluctance, continued her way so quietly, that the lady's firmness must have intimidated the old servant, for she now approached the veranda.

The invalid was extremely surprised and very indignant, when Christine suddenly threw open both folding-doors — she knew what was proper, as she always assured all the neighbors — and the princess entered the room. She cast a reproving look at the old servant, which seemed to crush her, but she hastily whispered to her mistress that the lady insisted upon coming in, and then placed a chair for her.

Frau von Hohenstädt quietly waited until her guest had approached near enough to hear her feeble voice, and then said politely, but in spite of the faint tone in which she was compelled to speak, very resolutely,—

"As the Princess Bagadoff has not heeded my request that she would permit me to decline her visit, she must not be angry if I do not come forward to receive my guest. My weakness will not permit me to do so."

"How sorry I am to find you so ill, my dear Frau von Hohenstädt," said Katharina with the most winning cordiality, as she seated herself. "I really could not allow myself to be sent away, as I think you will soon feel, since we have so many things to discuss."

"To discuss?" asked the old lady in astonishment.

"And so this is the house, the room, in which our dear Erica has hitherto spent her life. How deeply all this moves me; how much value the simplest thing acquires when it belongs to those who are dear to us!"

"You are right in the broadest sense of the words, your Highness, we can love even inanimate objects, and thus ugly things may become dear."

"You have mountain-ash trees before the door, I see. What a beautiful red the berries turn, only unfortunately the color announces the approach of autumn. In Russia my cook made an excellent jelly of these berries, but I can't have it here, no German or French cook knows the receipt."

"You ought to send to Russia for it," replied the invalid with a faint smile.

"I suppose the picture over your sofa is a portrait of dear Erica, when she was a child?"

"No, it is my eldest daughter, who died when only eight years old."

"How very sad! Have you any other children?"

"I had five, but God has left me only Erica."

"I was told that your maiden name was Kroneck, perhaps you are related to the Kronecks of Falkenhausen?"

"They are my cousins," replied the invalid with evident coldness, and then added in the same tone, "I must beg your Highness to drop this subject, it pains and agitates me."

Katharina looked at the speaker in astonishment. "There are quarrels in every large family," she answered carelessly, "one ought not to be disturbed by them. But to come to the object of my visit, I see I can for the present express my gratitude for my little Carlos's rescue only to Erica's mother."

"I must not accept your thanks," replied the invalid with a sad smile. "It was very much against my will that Erica undertook the hazardous enterprise, and if I had known of it, I should certainly have forbidden her to do so."

The princess's cheek flushed crimson, and her restless eyes flashed angrily. "You are jesting, madame. You cannot possibly mean to say that you would not have prevented a most shameful act of villany."

"In so far as it was to be prevented by my daughter's assistance, most assuredly I do. The fortunate result of her adventure is a great mercy, for which we ought to offer fervent thanks to God, but which we could not possibly expect. A woman who has lost everything except this one daughter, must possess more than human generosity to be willing to sacrifice her jewel, even for so great a prize."

Katharina rose and went to the window. Her eyes wandered restlessly over the scene, and it was not until after a long pause that she turned back into the room, and again approached the invalid.

"Really, madame," she began, in a tone of almost mocking courtesy, "you are so extremely frank that I could not at first find words to answer."

"I am surprised, your Highness," replied the invalid quietly. "A lady whose maternal love is so greatly lauded, ought to think my statement so natural that any assurance to the contrary would appear like hypocrisy."

"We who belong to the fashionable world are so accustomed to the constant hypocrisy of politeness, that any different treatment must always seem somewhat singular."

"I thank you for the information, princess. You teach me the peculiar advantages of my secluded life."

Katharina, who had not resumed her seat, but remained standing before her companion, once more went to the window to look at the view, and then paced up and down the room again, while the invalid, whose nerves could endure neither noise nor restlessness, leaned back in her chair, and by the involuntary expressions of pain that flitted over her face betrayed the torture this constant bustle inflicted. The rustling sound made by Katharina's long silk dress, as it swept over the floor, at last became so unendurable that she touched the bell standing beside her, to summon the servant. The princess, startled by the unexpected sound, paused in the centre of the room, while Christine opened the door and rushed up to her mistress.

"I am ill," whispered the latter faintly; "take me to my room. The princess will excuse me."

Katharina must have had very quick ears, for she had caught the murmured words, and hastily approaching the sick woman, said quickly, "I deeply regret this indisposition, but nevertheless must insist upon having a moment's audience. The servant can stay in the next room and come in presently."

But Christine did not allow herself to be intimidated by the authoritative manner. Her mistress's pale face destroyed all her reverence for the aristocratic lady, and she paid no attention to her commands, but looked inquiringly at the invalid.

"Go, Christine," murmured the latter, "the princess, in consideration of my health, will doubtless make her communication in as few words as possible."

This, however, did not seem to be the case, for Christine had already obeyed the command and left the room, and yet Katharina did not utter a syllable, but on the contrary seemed inclined to continue her promenade. At last she controlled her restlessness, stood close beside the invalid, and began with almost incoherent haste,—

"As you will not accept my thanks, I won't trouble you with them; but you must at least permit me to do all that lies in my power for our guardian angel, Erica. Fräulein von Sassnitz, my companion, is about to leave my house for various reasons. I therefore offer the position to Erica, and hope her mother will make no objection. Erica will thus have an opportunity to enter society, and in a position which will procure for her all the advantages she unfortunately lacks at home. True, I am aware that she now possesses neither the accomplishments nor the familiarity with the forms of society which I can and must expect from my companion, but she is a dear and, I think, bright child, and therefore will soon acquire what she lacks. I myself will do all in my power to train her, and when in a few years I bring her back, you will be astonished to see into what a beautiful flower the little heather blossom has bloomed."

Katharina paused and gazed eagerly at the invalid, who was leaning back in her chair perfectly motienless, and apparently unsympathizing. A pause ensued, which the princess, in her impatience, soon interrupted, for she continued,—

"Well, you do not reply. I think my proposal was at least worth an answer. I suppose it will be hard for you to part with your only child, but true maternal love thinks only of the child's happiness, and is ready to make every sacrifice."

"Certainly, your Highness," replied the invalid in a faint voice, making an effort to sit upright in her chair. "But do you think it can be for Erica's happiness to leave her mother in a condition in which every hour, every moment, death stands beside her couch, and threatens to deal the final blow?"

"He menaces those in health also, Frau von Hohenstädt, it is the universal lot of men. And even granting that you are nearer your end than we, ought you not therefore to think solely of providing for your daughter's future, ought you ——"

An almost imperious gesture from the invalid suddenly silenced Katharina, who noticed the change in her companion with a vague sense of fear. The latter now sat erect in her chair, and her voice sounded full and clear as she replied.

"My life here has been devoted solely to the one purpose of securing Erica's future, and I can say without boasting, that I have done everything in my power. But to send my daughter, the only treasure fate has left me, away from my death-bed, is

beyond my strength, beyond the strength of any human being, and therefore God will not demand the sacrifice. I place my child's future in his hand, and rely on him alone, for I have learned the perishableness of all earthly things, and that mortals, even the richest and most powerful, can never offer any security for the future."

"In that case, madame, I can do no more," replied Katharina coldly. "You rudely reject every attempt to show my gratitude, and if I were as selfish as the majority of people unfortunately are, I should rejoice that in this way every sacrifice was spared me. But on the contrary I am grieved to be unable to do anything for Erica, and, to justify myself to her, shall be compelled to tell her that her mother alone prevents any tangible expression of my gratitude."

She was silent, and looked at the invalid as if awaiting a reply. But the latter lay in her chair with closed eyes, so rigid and motionless, that Katharina suddenly trembled at the thought that she might be dead. Seizing the bell on the table, she rang it so violently that Christine rushed into the room in great alarm.

"Look to your mistress, my good woman," cried Katharina anxiously; "see if she is dead, or only fainting."

"Merciful God! what has happened?" shrieked Christine, rushing up to the invalid's chair. Bending over her, she listened to her faint almost inaudible breathing, and the almost equally imperceptible beating of her heart. When convinced that only a fainting fit, not death had attacked her mistress, she again stood erect, and without the slightest vestige of respect in her manner, said in a loud, stern voice, —

"The princess can now see for herself how much mischief she has done by her visit. My mistress ordered me to send you away; but how is a poor servant to prevent any whim a great lady takes into her head? If any intruder comes to the well, I can scold and drive him away, but I can't possibly get rid of a princess who forces herself into the house. If this is the way aristocratic people express their thanks for having their little princes saved from robbers, our Erica had better not tire herself out the next time, but leave it to others."

Katharina was at first fairly petrified by the unexpected assault, but afterwards seemed amused by the comicality of Christine's wrath. At last she laughed aloud, and would perhaps have wholly forgotten the fainting woman, had not Christine, spite of her torrent of words, hastily applied all the remedies at hand. She untied her cap-ribbons, opened her dress, sprinkled water in her face and rubbed her temples with some restorative. Katharina's laugh irritated her beyond endurance, and she burst forth again,—

"I see nothing ridiculous here. Perhaps great ladies have other ideas of amusement, we poor people don't laugh when we see a fainting woman, but rush forward to help, especially when it is our own fault."

"Enough, my good woman!" said Katharina, not without dignity. "Your conduct is well suited to excite my mirth, since it is beneath my anger. Here is a gold piece for you, it shall make amends. I am sincerely sorry for your mistress' illness, but my visit cannot possibly have had the slightest connection with it. I will send my servant to help you carry the sick lady to her bed."

"I'll take the gold piece, for it will enable me to get my poor mistress many a comfort without her suspecting it. But as for the help of yonder liveried gentleman, who is standing outside turning up his nose at our house, I thank you kindly, but I can do without it."

"As you choose, my good woman. But as you intend to make such good use of the money, I will empty my purse in your hand. Your mistress seems too ill to trouble herself about the source of your expenditures, or perhaps even notice them. So get whatever she needs, and if you want more, come to me."

"I thank you, Frau Princess. I'll spend it to the very best of my ability," said the old woman, deeply moved, as Katharina poured a shower of gold into her apron. This seemed to restore peace between the contending parties, and Christine even accompanied the princess to the door of the adjoining room, where little Carlos and his nurse were waiting, but hastily returned to her mistress, took the lifeless figure in her arms as if she had been a child, and carried her to bed.

Meantime Katharina descended the steps of the veranda, thinking to herself. "'Like master, like man,'" is an old proverb, and I can't wonder at the comical rudeness of the maid, but on the contrary easily understand why poor little Erica possesses so few attractions. Carlos, however, does not notice such things yet, and loves her in spite of her defects, and I will therefore do everythng in my power to have her with me. If the mother does

soon, which is to be expected, I can gain my point without any difficulty, and thus put the girl under obligations to me for life.

When Erica returned home, Christel gave her a full account of the visit that had just been received. The princess's gold piece had greatly softened the old woman, and she therefore allowed Erica to suppose that her mother's prolonged fainting fit had been caused by an unfortunate accident, rather than actual want of consideration on the part of the lady. The invalid had now regained her consciousness, but Erica dared not go into her room, as she required the most perfect rest and quiet.

The next morning Frau von Hohenstädt felt well enough to see her daughter. She called Erica to her bedside, feebly motioned to her to sit down beside her couch, and then began in a low tone,—

"Princess Bagadoff was here yesterday, Erica. From gratitude for the service rendered to her boy, she has offered you the position of companion, which is made vacant by Fräulein Sassnitz' departure. I, however, declined it in your name, for — good heavens, what is the matter, Erica?" exclaimed the invalid in alarm, "you are as pale as death."

Erica's change of color was indeed so remarkable, her agitation so unmistakable, that she could not conceal it. She stammered a somewhat incoherent explanation, but her mother scarcely heeded her words. She gazed lovingly into her daughter's face, and said gently, "How can you suppose, child, that I would let you leave me, you who are the sole joy of my life?"

Erica fell on her knees beside her mother's bed, and throwing her arms around her, whispered with suppressed sobs, "My dear, dear mother, my home is with you."

The invalid smiled mournfully, and gently stroked her daughter's silken hair. "Calm yourself, Erica, you shall not leave your home yet. At the same time, I will frankly tell you that I do not like your princess. Apart from all other considerations, I would not consent to have you dependent upon this woman. Promise me, Erica, never to become Princess Bagadoff's companion."

The young girl gazed into her mother's face with an expression of mingled astonishment and inquiry, but when she perceived that the invalid's eyes rested upon her in anxious suspense, answered gently, "I promise, mamma."

"Thank you, my dear child. We will discuss this subject more fully in a few days; I am not strong enough to do so now."

"What more is there to say, mamma?" asked Erica, again surprised.

"Many things, my daughter," replied the invalid, in a low, sad tone. Then she again passed her hand lovingly over the hair of her unsuspecting child, and said wearily, —

"Leave me now, Erica. Perhaps God will send me the sleep I have not had all night."

When Erica entered the sitting-room, she went to the window and gazed steadily out of doors. It was the same one through which Katharina's glances had roved over the landscape the day before. The young girl's large, dreamy eyes, which rested mechanically on the various objects without, formed a striking contrast to the flickering light of the elder woman's restless looks. Erica stood motionless, absorbed in her own thoughts, but the changing expression of her features revealed that her reverie was a sad one. Now and then a sigh escaped her lips, and at last tears sprang to her eyes, which, as they rolled slowly down her cheeks, roused the dreamer to a sense of her situation. She hastily wiped them away with her handkerchief, and tried to remove the treacherous traces, then raised her head with an air of mingled grief and defiance, saying aloud, —

"I will never allow myself to be forced into a state of war."

She started at her own words, moved away from the window, went to the mirror, and gazed into it long and earnestly. She was so absorbed in watching her own image in the glass, that she did not notice Christine, who paused on the threshold in astonishment. The old servant's exclamation recalled her wandering thoughts. She nodded gaily to her, and then stepping directly in front of the amazed Christine, said almost solemnly, —

"Am I very ugly, Christine?"

"Good gracious, Erica, what nonsense!"

"I see I am very ugly, Christel," laughed Erica. "But," she added gravely, "do you think that people are loved only for their beauty?"

"If that were so, Erica, our good pastor would not be loved. It would hardly be possible to see an uglier man, and yet everybody knows he is an angel in human form."

"Yes, that is true," said Erica, in the same grave tone. "I too will try to be an angel in human form, help, counsel and save like my noble teacher, then people will love me and forget my ugly face."

WITHIN THE PRECINCTS.

BY MRS. OLIPHANT.

CHAPTER I.

ST. MICHAEL'S.

THE Abbey Church of St. Michael's stands on a low hill in a flat and fertile country. The holy places which are sacred to the great archangel seem to settle naturally upon a mount; and this, one of the noblest structures consecrated under his name, had all the effect of a very high elevation — so wide-spreading was the landscape round, so vast the sweep of plain, fields, and woods, great parks and commons, and gleaming white villages like ships at sea, which could be seen from its walls and terraces. Though the settlement was ecclesiastical, the place had been walled and defensible in the days when danger threatened wealth whatever form it assumed. Danger, however, had long been far from the thoughts of the dignified corporation which held its reverend court upon the hill. The Abbey was as splendid as any cathedral, and possessed a dean and chapter, though no bishop. It was of late Gothic, perpendicular and magnificent; and the walls and towers which still surrounded it, and even the old houses within the precincts, were older still than the Abbey, and could have furnished many "bits" to make the heart of a mediæval architect glad. The very turf which filed the quadrangle and clothed the slope of the Dean's Walk was a production of centuries; the chapter-house was full of historical documents, and the library of rare books; and there were antiquarian fanatics who protested that the wealthy living belonging to the Abbey, and its old endowments, were the least of its riches. Nor was this establishment on the hill confined to ecclesiastical interests only. The beautiful church was the chapel of an order of knighthood, and opposite to it — forming an integral part of the pile of building — was a line of small ancient houses, forming a kind of screen and inner wall of defence to the sacred citadel, which were the lodges of a supplementary order of pensioners — chevaliers of St. Michael — which at the time of the foundation had given such a balance as the Middle Ages loved, of Christian charity and help, to the splendor and braggadocio of the more glorious knights. Thus the little community which inhabited this noble old pile of buildings was varied and composite. The highest official in it was the costly and aristocratic dean, the lowest the lay clerks, who were housed humbly in the shadow of the church in a little cloister of their own, and who daily filled the Abbey with the noblest music. The Deanery was at the east end of the abbey, and included the great tower which showed for miles round, with its lighted windows, rising up into the night. The canons' houses, if not equally fine, were still great old houses standing on the edge of the hill, their walls rising straight from the green slopes dotted with trees, round the foot of which a little red-roofed town had gathered; and the Abbey itself stood between those stately habitations and the humbler lodgers of the chevaliers, which shut off the lower level of sloping bank on the other side. The dean himself was of a great family, and belonged not only to the nobility, but higher still, to the most select circles of fashion, and had a noble wife and such a position in society as many a bishop envied; and among his canons were men, not only of family, but possessed of some mild links of connection with the worlds of learning and scholarship, — even it was said that one had writ a book in days when books were not so common. The minor canons were of humbler degree; they were the links between gods and men, so to speak, between the Olympus of the chapter and the common secular sphere below. We will not deceive the reader nor buoy him up with hopes that this history concerns the lofty fortunes of the members of that sacred and superior class. To no such distinction can these humble pages aspire; our office is of a lowlier kind. On Olympus the doings are all splendid, if not, as old chroniclers tell, much wiser than beneath amid the humbler haunts of men. All that we can do is to tell how these higher circles looked, to eyes gazing keenly upon them from the mullioned windows which gave a subdued light to the little rooms of the chevaliers' lodges on the southern side of St. Michael's Hill.

These lodges were two stories in height, with very small rooms and very solid masonry, little gardens in front of them, and a tower at each end. Many creeping plants clung about the old walls, and especially there were clouds of Virginia creeper, which made them glorious in autumn. It was, however, on a summer afternoon, at the time this history begins, that Lottie Despard — the only daughter of Captain Despard, a chevalier not very long appointed to that office — sat with her head out through the open window, framed between the mullions, watching the broad slope of the Dean's Walk which lay

between her and the church, and led to the Deanery and the heights beyond. The Deanery was at this moment the most important place in the world, not only to Lottie, but to many other spectators who thronged the slope beneath her window. For this day a great event had happened in St. Michael's. The dean's only daughter, Augusta Huntington, had been married that morning with all the pomp imaginable. It had been like a royal wedding, sumptuous in ritual, in music, and fine company; and now after taking a little repose during the time which the wedding-party spent at breakfast, the Abbey precincts were beginning to fill again with little groups, and all the people within to come to their windows, to see the bride and bridegroom go away.

Lottie Despard was beyond all comparison the prettiest, and she was also the youngest, of all the ladies in the lodges. She was of Irish descent, and she had the whiteness of skin, the blackness of abundant hair, the deep blue eyes that so often go with Milesian blood. Such eyelashes had never been seen at St. Michael's; indeed, they had never been seen anywhere "out of Mrs. Jarley's waxworks!" some ill-natured critics said. Sometimes, when Lottie was specially pale or weary, they seemed to overshadow her face; but she was neither weary nor pale at this particular moment. She was in great excitement on the contrary, and flushed with expectation. Though she was only the daughter of a poor chevalier, Lottie had advantages which separated her from the rest of that little company. Her father was of good family, a point on which she insisted strenuously; and she herself was the possessor of a beautiful voice. The former particular would not have been of much advantage to her, for what was the Despards' old and faded quality to the great people at St. Michael's? But a voice is a different matter; and there had arisen between Miss Huntington and the chevalier's daughter a kind of intimacy very flattering (the neighbors thought) to Lottie. They had sung together so much and seen so much of each other, that the lodges expected nothing less than that Lottie would have been asked to the wedding or even — greater honor still! — to be a bridesmaid; and Lottie herself had been wounded and disappointed beyond measure when she found herself left entirely out. But there was still the possibility that the bride might show she had not forgotten her humble friend altogether; and it was for this that Lottie was waiting so anxiously as the time of departure approached. A word, a sign, a wave of the hand surely would be vouchsafed to her as the carriage passed. Her heart was beating loudly as she bent out of the window, — a pretty sight to see from without, for the window was framed in luxuriant wreaths of green, with trailing tendrils of the young delicate leaves which in autumn flamed like scarlet flowers against the wall. The people who were gathering on the road below gave many a look at her. And, though the young ladies from the shop, who had got half-an-hour's leave to see how their handiwork looked in the bride's travelling-dress, were deeply sensible of the fact that a poor chevalier's daughter was no better than themselves, yet they could not help looking and envying Lottie, if only for the window at which she could sit in comfort and see everything that went on, instead of standing in the sun as they had to do. They forgot her, however, and everything else as the carriage drove up to the Deanery to take the bridal pair away. The dean's daughter was so much the princess of the community that a compromise had been made between popularity and decorum; and it was in a carriage partially open, that an admiring people might behold her as she passed, that she was to drive away. There was the usual long waiting at the door while the farewells were made, during which time the outside world looked on respectfully; and then, with a crowd of "Good-byes" thrown after her, and a few — but only a very few, for the Deanery was nothing if not decorous — white satin slippers, and a prance and dash of the impatient horses, and a flourish of the coachman's whip, and a parting gleam of the wedding favor on his breast, the bridal pair rolled rapidly past, and all was over. How quickly they went, everybody said, and how well she looked; and how well that brown dress looked, though it had been thought rather dowdy for such an occasion; and the feather in the hat, how well it matched, about which there had been so much trouble! Some who had the time paused to see the wedding-guests disperse, and catch other beatific glimpses of fine bonnets and gay dresses; but most of the spectators, after this last and crowning point of the performance, streamed down the slope and out at the great gateway, and were seen no more.

Lottie drew in her head from the window the moment the carriage passed. She grew red when other people grew pale, being pale by nature; and her face was

crimson as she withdrew it from the opening, and came in again to the little room in which most of her life was spent. Her lips were closed very tight, her soft forehead contracted, her blue eyes, gleaming with anger and disappointment, were (most unwillingly) quenched in tears. She clasped her hands together with a vehement clasp. "It would have cost so little to give a look!" she cried; then bit her lips and clenched her hands and stamped her foot upon the floor, in a forlorn but vigorous effort to restrain her tears.

"What does it matter to you?" said a tall young fellow, sufficiently like Lottie to prove himself her brother, who had looked out lazily over her head while the carriage was passing. He had his hands in his pockets and a slouching gait generally, and looked too big for the little room. She had almost pushed against him in her rapid movements, for his movements were never rapid, and he had not had time to take one hand out of his pocket before she flashed round upon him with two red spots on her cheeks and fury in her heart.

"What does it matter? Oh, nothing! nothing!" cried Lottie. "Why should anything matter? It only shows me a little more, a very little more, how cold the world is, and that nobody has a heart!"

"Few people have very much, I suppose," said the young man; "at least, so the governor says; and sometimes it's hard lines, or so I hear. But what good or harm could it do you to have a parting sign from *her?* I knew she would never give it you. I knew she would be thinking of nobody but herself —— "

"What did you know about it?" cried the girl. "You were never a friend of hers! you were never begged and prayed to go and sing at the Deanery! she never came down the Abbey Hill to look for you! But me she has done all that for; and when I thought just for once she would let everybody see that Lottie Despard was a friend — O Law, for the love of heaven, go and work at something, and don't stand there staring at me!"

"What am I to work at?" said the young man with a yawn. "It's past working hours; besides, in summer how can any one work? I can't make head nor tail of that Euclid when the sun is shining."

"But when the sun is not shining, Law?"

"Oh! then," said the youth, with a bright Irish smile breaking over his somewhat cloudy face, "I can make out the head, but not the tail, and the sting is in the tail, you know! Good-bye, Lottie, and never mind any mother's daughter of them. They cannot make us anything but what we are, whatever they may do."

"And what are we?" said Lottie to herself, as her brother strolled lazily out. There was more air to breathe when he was gone, which was something. She sat down upon the little old faded sofa, and shed a few more bitter tears of disappointment and mortification. We all like to think well of ourselves when that is possible; to think well of our belongings, our people, our position in the world — all that makes up that external idea of us which we make acquaintance with often years before we know our own real being. No one can tell what the atmosphere of well-being, of external credit, and public esteem is to a child; and this Lottie had never known. They had been poor, but poverty is no hindrance to that feeling of harmony with the world around which is the higher soul of respectability. But there had not been much about the Despards to respect. The father had been a good officer in his day, and if he had not been without money and interest, and everything that could help him on, might have been distinguished in his profession. But those were the days of purchase, and Captain Despard had remained Captain Despard, and had bitterly resented this fact. His wife, too, though she was Lottie's mother and sacred on that account, had not been of a kind to reclaim for her husband the failing credit of his life. They had lived, as most poor officers on half pay with pretensions to gentility and hankerings after pleasure, do live. They were in debt all round, as need not be said; and Mrs. Despard's life would have been rendered miserable by it if she had not escaped from the contemplation by means of every cheap merry-making or possible extravagance she could attain to. All had been huggermugger in Lottie's early life; a life not destitute of amusements, indeed, but full of bitterness, small mortifications, snubs, and the cold shoulder of social contempt. Lottie herself had heard in childish quarrels, through the frank recriminations of her childish companions, the frankest statements of what other people thought of her parents; and this had opened her baby eyes prematurely to the facts of the case. It must be supposed that there was some respectable grandpapa, some precise and orderly aunt in the Despard kindred, who had given to Lottie a nature so different

from that of her immediate progenitors. As she grew older everything about her had looked to Lottie as the fairy splendor looked in the eyes of the disenchanted human spectator. Her mother's gay dresses, which she once thought so pretty, came to look like the miserable finery they were; her mother's gaiety had become noise and excitement. Her father's grand air grew the poorest false pretension; for must he not know, Lottie thought, how everybody spoke of him, how little any one thought of his assumption? And the house was miserable, dirty, disorderly, mean and gaudy, full of riot and waste and want and poverty — one day a feast, another nothing. Even careless Law — the big boy who was too much at home, who was scarcely ever at school, and who often had no clothes to go out in — even Law saw how wretched it was at home, though he was hopeless as well as careless, and asked his sister what was the good of minding, what could they do? But Lottie was not of the kind which can let ill alone, or well either, for that matter. She did mind; and as she grew older, every week, every day added to the flame of impatience in her. Just, however, when that was coming beyond the possibility of further repression, Mrs. Despard fell ill and died, and Lottie at sixteen was left alone, miserable, with remorseful thoughts of having recently blamed the mother who was now out of reach, and to whom she could never make amends for those injurious secret fault-findings; and full of anxieties unspeakable — forlorn wonderings what she was to do, and eagerness to do something. Her grief was lightened by the feeling that now she had everything in her hands and could "make a change," even when it was made more heavy by the thought that she had found fault in her heart with the mother who was dead. It seemed to the girl that she must be able, by dint of devoting herself to it, to change everything,— to keep the house in order if she did it with her own hands, to pay the bills wherever the money came from. She was overflowing with life and energy and activity, and disapproved of all the ways of the past. She was like a new king coming to the throne, a new ministry of idealists bent upon undoing all their predecessors had done and doing everything as it ought to be done. Alas, poor Lottie! the young king with all the stiff precedents of a hundred years against him, the young ministry confronted by a thousand problems, and finding their ideal pronounced impracticable on every side, were nothing to the heaven-born reformer of the household with a pleasure-loving, impecunious father to whom debt was second nature, and who always had preferred fun to respectability. And she dashed at her reforms too boldly, as was natural to her age, insisting upon brushings and sweepings till Betty threw up her situation, and asking for money till her father swore at her. "It is to pay the bills, papa! I want to pay the bills!" she had said, reduced to plead for that which she thought she had a right to demand. "D—— the bills!" was all Captain Despard replied.

And even Law, when Lottie tried to order him off to school, was unmanageable. He was no reformer like his sister, but on the whole preferred going just when it suited him and lounging at home between. To be sure home was less amusing now that poor mammy, as they called her, was gone. Her laughter and her complaints, and her odd visitors, and all her slipshod ways, had kept noise and movement, if nothing more, about the house. The tawdry women and the shabby men who had been her friends were all afraid of the dulness which naturally follows a death in the family. Some of these women, indeed, had come to Lottie all tears and kisses, offering to stay with her, and asking what they could do; but their sympathy did not comfort the girl, who even in her deepest grief was all tingling with plans and desires to be doing, and an eager activity and impatience to make the changes she wished. But they fluttered away every one when the first excitement was over, and the dulness that is inevitable fell upon the house. To do them justice, there was not one among them who would not have come daily to "sit with Lottie," to comfort her with all the news that was going, and tell her that she must not mope. But Lottie wanted none of their consolations, and did not miss her mother's friends when they abandoned her. She did not miss them, but Law did. Yet he would not go to school; he sat and made faces at her when she ordered and scolded him. "If I didn't do what *she* told me, do you think I will do what you tell me?" said Law; and then Lottie wept and prayed. "What will become of you, Law? what will you ever be good for? Papa has no money to leave us, and you will not be able to do anything!"

"Who said I wanted to do anything?" said Law flippantly; and then, "Who said I should not be able to do anything?" he added with offence. "I can pick it up whenever I like." But Lottie, preternat-

urally, awfully wise, feeling the burden of the world upon her shoulders, knew that he could not pick it up when he pleased. She knew that education had to be acquired painfully, not sipped a little mouthful at a time. She had never had any education herself, but yet she knew this, as she knew so many things, by instinct, by constant critical observation of the habits which she disapproved. There are few more vigorously successful ways of finding out what is right than by living among people whom we feel indignantly to be wrong.

"You may think what you like," she said, "Law — but I *know* that you cannot learn anything in that way. Three days at home and one at school! I wonder they let you go at all. I wonder they don't turn you out. I wonder they did not turn you out long ago!"

"And that is just what they are always threatening to do," said Law, laughing, "but they have not the heart of a mouse, the fellows at the grammar school. And they'll never do it, though I shouldn't mind. I should be free then, and never have to trouble my head about anything at all."

"You'll have to trouble your head when you have to work and don't know how," said Lottie. "Oh, if I was a boy! It's no use wishing, I am only a girl, and you are a great lump, neither one nor the other; but if I were only a boy, and could get something to do and a little money to pay these bills ——"

"Oh, dash the bills, as papa says. He don't say 'dash,'" said Law, with provoking calm; "but then I shouldn't swear."

"Oh, Law, I should like to beat you!" said Lottie, clenching her little fists in impotent anger, and setting her teeth. But Law only laughed the more.

"You had better not," he said, when he had got over his laugh, "for I am a deal stronger than you."

And so he was, and so were they all, much stronger than poor Lottie; even Betty, who would not scrub, but who was too well used to all the ways of the family and aware of all their troubles to be sent away. She fought for a time hard and bitterly, striving with all her might to clean, and to dust, and to keep things straight, to the infinite discontent of everybody concerned. But yet perhaps the girl's struggles were not utterly without use; for when the next astonishing change came into their lives, and their little income was suddenly increased by half, and a removal made necessary, Captain Despard, of his own accord, turned Lottie's despair in a moment into hope and joy. He said, "Now, Lottie, you shall have things your own way. Now you shall see what you can do. This is a new start for us all. If you can keep us respectable, by Jove, you shall, and nobody shall stop you. A man ought to be respectable when he's made a chevalier of St. Michael." Lottie's heart leaped up, up from where it lay fathoms deep in unutterable depression and discouragement. "Oh, papa, papa, do you mean it? Will you keep your word?" she cried, happy yet dubious; and how he kept it, but with a difference, and how they set out upon this new chapter in their career, shall be told before we come back again to Lottie in her proper person, in the little drawing-room in the chevaliers' quarters within the Abbey precincts, on Miss Huntington's wedding-day.

CHAPTER II.

THE CHEVALIERS' LODGES.

THE name of a chevalier of St. Michael sounds very splendid to innocent and uninstructed ears. It is a title which stands alone in England at least. Poor knights have been heard of both in flesh and blood and in confectionery, in other places; but the title chevalier is preserved in St. Michael's and there alone. Lottie thought it very imposing, and her heart leaped, partly with a sense of her own injustice all her life to her father, of whose merits, in youthful irreverence, she had hitherto thought but little. He must be, she thought involuntarily, a great deal braver, better, and altogether of more importance than she had supposed, when his qualities could win him such a distinction from his country; for that it was a distinction accorded by the country Lottie had no manner of doubt in those days. She was overawed and overjoyed: first of all on account of the people in Fairford, where they had hitherto lived, and who had shown but little respect for the family; but much more on her own account. She felt reconciled to herself, to her kind, to all her circumstances, when she reflected that she was the daughter of a chevalier of St. Michael, and that Betty would never leave Fairford, and that Captain Despard had expressed himself in favor of respectability as a thing to be cultivated. Life suddenly took a new aspect to her. She thought they would be able to shake off every incumbrance when they went away. Her father would henceforward live a stately and dignified life as became his position. He would not haunt the places

where billiards were played, and wear a number of shabby coats, each worse than the other, but every one with a flower in it. The flower, which most people would have thought a softening clause, was intolerable to Lottie; it looked like a piece of braggadocio, a wilful defiance of public opinion or declaration of independence. But henceforward, if he must wear a flower, it must be at least in a tolerable coat; henceforward he would be trim and smooth, and come in at a respectable hour; henceforward there should be no bills except weekly ones, and Law should go to school — nay, Law was too old for school now — but at least he would read with a tutor, and grow into a creature of whom his sister might be proud. Perhaps this was but another way of expressing the domestic tyranny of which Lottie's will was full. She was so anxious to be able to be proud of her father and brother; was not that another way of saying that she wanted to get them up, or down, to her feminine standard, and control and bind and keep them at her apron-string? So, perhaps, a cynic might have said. But Lottie was unconscious of any such intention. She was eager to have something which she had not, the opposite of what she had — and thus, too, it may be said, she fell into a commonplace.

But when the family got to St. Michael's, Lottie's hopes came to a melancholy conclusion. Not only did Captain Despard remain very much the same — which was a thing that most people anticipated — and Law decline the tutor upon whom Lottie had set her heart: but St. Michael's itself and the chevaliership turned out something very different from the girl's exalted expectations. She found that this office was not looked upon on the spot as a reward of distinguished merit bestowed by the country, but only as a sort of pension for a number of shabby old soldiers whose friends had scraped together interest enough to have them thus poorly provided for. She found a hierarchy of a totally different kind constituted and reigning in which these poor chevaliers had no place. And she found herself — she whose chief inspiration was this proud and eager desire to be somebody — in a place where she could never be other than nobody, and where no nobler self-denial on the part of her father, no virtue in Law, could call forth the acclamation of the world. In Fairford there were people as poor as themselves whom all the world thought well of, and of whom Lottie was envious; but here she was one of a class who were not thought very well of, and whom nobody esteemed; while at the same time close before her eyes, daily visible, appeared the class to which in imagination and by right of nature Lottie felt herself to belong, the real upper class; refined people with libraries and quantities of books; ladies who had all manner of accomplishments, who could play, and who could draw, and speak foreign languages. But they took no notice of Lottie, nor for that matter of anybody belonging to the chevaliers; the very tradespeople in the town looked coldly at her, she thought, when she gave orders for her small purchases to be sent to the lodges, and the only people who came to see her were the other chevaliers' wives and daughters, whom Lottie, moved by the popular sentiment, even when she fought most bitterly against it, felt herself disposed to despise. It is not pleasant to find that only your own class take any notice of you. If a baker's wife were to be visited by none but bakers' wives she would not like it, though perhaps her most intimate friends would naturally be in the trade; and Lottie did not like it. She had expected something so different. Society, she thought, and a brighter world were going to open upon her; and lo! nothing at all opened upon her except the new little community of shabby old soldiers with their wives, disposed to be fine, as her mother's friends had been, and able to carry out their inclinations, oh, so poorly! poor shabby ladies with their reminiscences of gay garrisons or gossiping Indian stations. Some of them had seen a great deal of life, and might have furnished much amusement to an observant young woman. But Lottie was sore, and disappointed, and humbled in her own conceit.

And there was another way in which the word of promise was kept to her ear, with far other meaning than she had hoped. Captain Despard had a very serious interview with his daughter when they arrived in their little house. He called her out of the little box which was her drawing-room to the other little box where he had established himself, and deigned to enter upon the question of income.

"Now, Lottie," he said, "you have chosen to bother me lately about money, and expressed views which I could not sanction about weekly bills."

"Only to save you trouble, papa," said Lottie; "if we do it every week, we may

hope to keep within our income; but how can you ever do that when you leave butchers and bakers for a year?"

"My child," said Captain Despard, with his grand air, "circumstances have enabled me to yield to your wishes. I don't say if it's a system I approve or don't approve. I say to myself, Lottie is my only girl, and she is like her dear mother; she shall have her way. From this day, my dear, the new income which I receive from my country will go straight into your hands. It is but a pittance. A poor soldier stands a poor chance in these times, but such as it is, my love, it shows your father's trust in you. Take it, Lottie, and pay your bills according to your pleasure. I will ask no questions; weekly, monthly, or once a quarter, as long as I have a bit of dinner and a cup of coffee when I want it. Your father's confidence in you is perfect, Lottie, and I leave it all to you."

"Papa!" said the girl, trembling, half delighted, half frightened, half taken in by that grand air. But he would hear no more. He kissed her forehead with the favorite action of the *père noble*, and hurried away. "No thanks, my child; no thanks," he said.

It was a pittance. Lottie stood when he left her gazing after him, her veins tingling with mingled disappointment and pleasure. To the inexperienced it seems always possible to do a great deal with a little, and the power of paying bills at all seemed a heavenly power. But Captain Despard chuckled to himself as he went away. He had purchased by that fine address the right to be disagreeable ever after, to wave his hand loftily, and to decline all knowledge of details. "Keep to your bargain, my dear, and I'll keep to mine," he had the right to say; and whereas some of his former income always had to be wasted upon the household, let him make what resistance he would, at least that would be the case no longer. Thus Lottie had her way, but in such a changed form that it no longer seemed her way. With the addition of the St. Michael's allowance she had hoped that there would be plenty for all needs; but what was she to do with the St. Michael's allowance and no more? Nevertheless, Lottie plucked up a heart. To feel that she had something was always exhilarating, and inexperience has wild hopes which knowledge does not venture to share. Her little room was full, for a week after, of little bits of paper scribbled over with calculations. She was determined to do it. If the dinner was not good enough for papa, he must just go and dine elsewhere. And there was no Betty to make herself disagreeable, but only a young girl, whom Lottie, heaven save her! meant to train. Once a week or so Law and she could very well do without a dinner. They were both still great on bread and butter, and capable, not knowing anything about digestion, of swallowing innumerable cups of tea. Her fond hopes of furniture and "picking up things" to make the little old house pretty, must be relinquished, it was true; but still at nineteen one can put up with a great deal in the present. There is always the future, so much of the future, like the sky and the plain from St. Michael's hill, spreading above, below, everywhere without limit or bound, save in the eyes which can only reach a certain distance. So Lottie comforted herself for "just now," and marched on into her life, colors flying and drums beating, taking as little heed as she could of those stragglers who would always fall out of the ranks — her father always shuffling off to some new haunt or other, the places which such men find out by instinct in the least-known locality, and large, loose-limbed Law, whose vague career was always dubious, and who could not keep step. Never mind! Lottie herself set out, brave, head erect, eyes straight, all her faculties in fullest attention to the roll of her own cheerful drum.

The earliest part of her career here, however, was brightened yet disturbed by a discovery which considerably confused her mind in her outset, and seemed to open better prospects before her. Lottie found out that she had a voice. She had known that she could sing long before, and had performed many a time in the little parlor at Fairford to the admiration of all hearers, singing every new comic song that burst upon the little provincial world from the music-halls in London, and knowing no better, so long as she was a child. There was no harm in the songs she sang, nothing but absolute silliness and flippancy such as is natural to that kind of production; but as Lottie grew into womanhood, and began by instinct to know better, she gave them up, and knowing no others except some ancient sentimental ditties of her mother's, gave up singing, so far as a musical creature can give up what is another kind of breathing to her. But when she heard the choir in the Abbey Church, Lottie woke up, with such a delightful discovery of what music was, and such an ecstatic finding out of her own powers, as words cannot express. She had an old, jingling, worn-out piano,

and had "learned to play" from her mother, who knew nothing about it, except as much as could be taught to a schoolgirl twenty years before; but this meagre instruction, and the bad instrument, and the half-dozen "pieces" which were all Mrs. Despard's musical library, had not attracted the pupil, and it was not till she heard the organ pealing through St. Michael's, and the choristers singing like angels — though they were not like angels out of doors — that Lottie awoke to a real consciousness of her own gift. She had never had any education herself. Though she was so anxious for school for Law, it had not occurred to her that she wanted any schooling. Lottie was narrow-minded and practical. She did not understand self-culture. She wanted Law to learn, because without education he could not do anything worth thinking of, could not earn any money, could not get on in the world. Perhaps it is true that women have a natural inclination to calculate in this way. She did not care a straw for the cultivation of Law as Law, but that he should be good for something, get a good situation, have some hopes of comfort and prosperity. For herself, what did it matter? She never could know enough to teach, and Captain Despard would not let his daughter teach; besides, she had plenty to do at home, and could not be spared. She could read and write, and do her accounts, the latter very well indeed; and she had learned to "play" from her mother, and she could sew, rather badly at first, rather well now by dint of practice. What did a girl want more? But Lottie discovered now that a girl might want more.

"Is there any place where they will teach you to sing without money?" she said one day to old Mrs. O'Shaughnessy, her next-door neighbor, the old lady of all her neighbors whom Lottie liked best.

"Me jewel!" cried the old lady; "and is it without a charge you're meaning? They send an account if you do but look at them here, me dear."

"All of them?" said Lottie; "for I can sing, and I should like to learn to sing; but, you know, I can't pay — much ——"

"I know; nothing at all, if you're like us, me honey. But maybe you're better off. O'Shaughnessy, we don't make a secret of it, rose from the ranks, and we've never had a penny — I don't care who knows it — barring our pay."

"We are not like that," said Lottie, drawing herself up. "Papa was always a gentleman" ("Then I don't give much for such gentlemen," murmured the other chevalier's lady under her breath), "and we have a little. That is — I mean he has a little — papa has a little," the girl said, on the edge of a confidence; and then stopped suddenly short.

"It don't do much for the children, I'll go bail," said the old lady. "That's the worst of fine gentlemen, me dear. O'Shaughnessy he asks me for a shillin' when he wants it, bless him — and that's the only way when there's so little. Singing, is it? If you're always to make such a stand on being a lady, me friend Lottie, I don't see how I can help you; but if you will come in free and comfortable, and take a dish of tay when Rowley's there — oh, to be sure, puff! my lady's off — but there's no harm in it; and he'll make you die with laughin' at him, him and his airs — and they tell me he has the best voice and the best method of any of the lay clerks."

"A singing man!"

"Well, and that was what ye wanted!" said the old woman. "You know as well as me, Miss Lottie, there's no singin' woman here."

Lottie protested that she could not consent to appear in such company — that papa would not allow it — that it was impossible. But she ended by promising to "run in" before old Major O'Shaughnessy began his rubber, and see this singing man. And the result was that, half out of friendship for his Irish hosts who did not pretend to be above him, and half out of pride to be interrogated so graciously about his invalid daughter by a young lady who gave herself such airs, Rowley, the first tenor, agreed for so low a rate as had never been heard of before to train Miss Despard's beautiful voice. "If the young lady had been a little boy, and if the signor could but ha' gotten hold on it!" Rowley said, in enthusiasm. It was the voice, which is impersonal, of which he spoke, and the signor was the organist. But good fortune had not as yet thrown him in Lottie's way. Soon, however, Rowley began to whisper it about that he had got a pupil who was quite good enough for Exeter Hall, if not for the Italian Opera, and the whole community was interested. Lottie herself, and her pretty looks, had not attracted any notice — but a voice was a very different matter. And then it was that steps were taken to make, for Lottie only, a "practicable" gap in the hedge of prickles which surrounded the cloisters and kept intruders out. Miss Despard was invited

cautiously to join the St. Michael's Choral Society, in which the divinities on the hill did not disdain to mingle their voices even with the lower-born outside the Abbey walls. And when it became known what a voice Lottie's was, the most remarkable thing happened that had occurred for at least a hundred years. The dean *called!* It was not Lady Caroline, but the dean; and a gentleman's visit, as is well known, is not the same thing as a lady's. But Lottie, who knew nothing of the laws of society, was flattered and happy, and saw a hundred lovely visions unfolding before her when the dean invited her to go to a private practice which was then going on in the Deanery drawing-room. "My daughter bade me fetch you, Miss Despard, if you would be good enough to come," he said gravely; but waited very impatiently till she was ready, in great terror lest "the father" should make his appearance, and his visit be construed into a call upon Captain Despard. Lottie put on her hat with her heart leaping and bounding. At last she had done it! At last paradise was opening before the peri! At last the wrongs of fate were to be set right, and herself conveyed back into her natural sphere. She went by the dean's side demurely, with downcast eyes, across the slope to the Deanery garden. The very stones felt elastic under her feet, there was a ringing of excitement and delight in the air and in her ears. She arrived breathless at the door, though they had not walked fast. So absorbed was she by all that was about to happen that Lottie never thought of the sensation there ran through the Abbey when the dean was seen walking to his own dignified door in company with Captain Despard's daughter. *That* Miss Despard? Lottie? The chevaliers, and their wives and daughters, could not believe their eyes.

Lottie held her head as high as usual when she came back. It no longer drooped with diffidence and delight. Once more she had come down with a jar into the realms of reality from those of hope. She was not received with open arms in that higher celestial world. Miss Augusta Huntington said, "How do you do, Miss Despard?" very sweetly, but Lady Caroline only bowed with her eyelids, a new mode of salutation which Lottie did not understand, and kept aloof — and no one else said anything to Lottie, except about the music. They gave her a cup of tea when all was over, but Lottie had to drink it in silence, while the others laughed and chatted. She was not of them, though they had brought her among them for the sake of her voice. "Are you going, Miss Despard?" said the dean's daughter, putting on the same sweet smile. "We are so much obliged to you for coming — the next practice is next Tuesday. Will you come as early as possible, please?" It was on Lottie's lips to say no — to tell them that she was a lady too, a better gentlewoman than they were, since she would not have treated any stranger so. But she was fortunately too shy to say anything, and made her exist hastily, and not so gracefully as the others who were at home. But she would not allow, even to herself, that she had come down again in that painful tussle with reality, which is so much different from dreams. She kept very quiet and said nothing, which seemed the wisest way. And as she walked home with a much more stately gravity than was her wont — a state put on to console herself for humiliation and disappointment and to vindicate, so to speak, her own dignity to herself, but which the lookers-on gave a very different interpretation of — Mrs. O'Shaughnessy, nodding and smiling, and in a state of great excitement, threw up the window and called to her as she was going past. "Come up, come up, and tell me all about it," the old lady said, so audibly that some of the ladies and gentlemen who had been in the Deanery turned round to look, and smiled at each other, making Lottie furious. As she could not stand there and explain before all the world, Lottie obeyed the call, and rushing up-stairs to the kind old Irishwoman's little bit of a drawing-room, appeared crimson with shame and wrath at the door.

"How could you call out so loud and make them laugh?" she said, with a strong inclination to burst into hot tears.

"Laugh, was it? and sure I'm ready to laugh too. To see you and his reverence the dean, Miss Lottie — no less would serve you! — arm in arm like a pair of young ——"

"We were not arm in arm," said Lottie, stamping her foot. Then she had the sense to perceive that the wicked old Irishwoman would but laugh the more at her petulance. She put her music on the table with a recovery of her dignified manners, and sat down.

"What did he say to ye? and what did me Lady Caroline say to ye? and were they all wild over yer beautiful voice, me honey?" said the old lady. "Come, take

off your hat, me pet, and ye shall have the best cup o' tea in the Abbey. And tell me all about it," she said.

"I have had a cup of tea, thank you," said Lottie. "Oh, yes, they are all well enough. Nobody talked to me — but then, I didn't expect them to talk to me. They wanted me to sing — and I sang — and that was all."

"And what more would you have, me jewel?" said Mrs. O'Shaughnessy. "Now, you take my advice, Lottie. I'm old, and I know the world. Take what you can get, me dear, and wait till your time comes. Don't go and take offence and throw up the cards, and lose all you've got for a tantrum. Tantrums pass off, but life goes on. If they don't speak to you, it's their loss, for you have a clever little tongue o' your own. And you'll not be long there till they find out that. Don't say a word, me honey. I'll not bother you; but never take offence with the gentry——"

"The gentry!" cried the girl, furious, starting to her feet. "I am as much a lady as any of them — and more, for I would not be such — I would not be unkind——"

"Well — well — well! There, I have put my foot in it!" said the old lady. "I was thinking of meself, me dear, as if ye were a girl of me own. But you *are* a lady, honey; one has but to look at you," said the astute old woman; "and just you wait a bit, and all will come as it ought — sure, I know it will."

Lottie did not much trust the assurance, but she took the advice, feeling a quick admonition within herself as to the absurdity of her complaint, and the horrible possibility of anybody supposing that she felt herself not to be of the gentry, as good as any dean's daughter. So she went to the next practice, taking no notice of any want of courtesy, and the result was that there arose a kind of intimacy, as has been indicated, between Miss Huntington at the Deanery and the daughter of the poor chevalier — an intimacy, indeed, of a peculiar kind, in which all that was given came from the side of the poorer and insignificant, and the great young lady was content with taking all that poor Lottie was so willing to give. She sang the solos in their private little concerts, and though her science was less perfect than her voice, her ear was so good that Lottie was able to be a great deal of use. They sent for her when they had parties, when there was any one who wanted entertaining, and put Lottie to the only unnecessary personal expense she had ever gone into — a white muslin frock to make her presentable among that fine company. And thus she had gone and come, and had been called upon on all occasions, but without making any nearer advance than at first. Lady Caroline still made her a little inclination of her eyelids, though now and then she went so far as to say, "How do you do, Miss Despard?" All of this, however, Lottie would have pardoned, if the bride, when she went away, had but at last remembered her, and made her some little sign of farewell.

From The Tatler.

RUGBY FOOTBALL.

FOOTBALL is undoubtedly in itself a fine and vigorous sport. It should call forth the qualities of skill, pluck, and endurance. But what sane, unbiassed person can say that the "game," as it is now played in almost every town throughout the kingdom, possesses one single attribute entitling it to popularity? What can honestly be said of a "sport" in which mere brute force bears the palm from pluck and skill? It is a common boast of those to whose perverted genius the revival of Rugby football is due that they rescued it from extinction by converting it from a rough-and-tumble scramble into a science. Truly, a science they have made it, but it is one of maiming and manslaughter. It is no longer demanded that the ball shall be skilfully manipulated past all opposition, or guided to a spot where overwhelming concentration will carry the day. These splendid innovators have given a death-blow to the tactical skill of the game, which was its chief beauty. The Rugby football-player *par excellence* of to-day is a man who is prepared to go upon the field with his life in his hand; and the pet of the team is he who can inflict most injuries and incite the greatest terror by his ferocity. The football arena is no longer a space for good-natured, if arduous, contention for supremacy; that has been supplanted (improved upon, they would have us believe) by a fierce hand-to-hand struggle of weaponless savages.

The forward players, with the ball in their midst, engage in a *mêlée* of which promiscuous kicking not infrequently forms an important part, and which bears a close resemblance to the contention of a box of infuriated spiders over a solitary fly. But it is on a back player getting the ball, and attempting to run with it, that the

Public Domain / http://www.hathitrust.org/access_use#pd
Digitized by CORNELL UNIVERSITY
Original from CORNELL UNIVERSITY

course brutality of the "game" fully manifests itself. From the moment of picking the ball from the ground the player who holds it becomes a being for whom the delicate attentions customarily paid by red Indians to one of their number who is "running the gauntlet" would be considered too humane and considerate. He is beset in every possible way, fair or foul. He will not relinquish his hold, but struggles for freedom; he is subjected to semi-strangulation. But he is still unconquered, and, by dint of leaving a moiety of his shirt in the hands of the enemy, he once more breaks away. The foe is upon him again, however, and just as he nears the goal line, and success seems certain, he is seized suddenly by the legs and dashed to earth with a violence that deprives him for some minutes of his senses. On rising it is more than likely that his collar-bone is broken or his knee-cup smashed, in which case he will be a cripple for the remainder of his days. Or, if he escape permanent injury, it does not by any means follow that the player by whom he was "tackled" will be so fortunate. Every time a player resorts to the expedient of "collaring low," which means dashing blindly at the legs of a man running at full speed, he runs a frightful risk of injury. Not one, two, or three, but hundreds of instances occur during every season, with unfailing certainty, in which players are borne from the field with broken ribs, legs, or arms. The thing has become so common that the fact of being a "crack" player at Rugby football is synonymous with the possession of a frame that has experienced every conceivable description of fracture. Ask a dozen old players why they discontinued playing. It is notorious that many city firms and companies decline to retain the services of a football-player, so much loss have they sustained by the absence of their clerks on account of serious injuries. Let those who doubt inquire of the accident insurance companies how much is paid every year for football accidents. One of the largest has paid more for football than for gun and fire casualties put together.

Why should young men be thus permitted to risk life and limb with impunity? Let a couple of boxers, to whom hard knocks are but as pats from a cat's paw, engage in a bloodless combat, and everybody will fly out against the magistracy for non-interference. When a female acrobat, who knows perfectly well what she is about, and whose life is far too valuable to be heedlessly risked, adds a few feet to a sensation dive, the outcry is yet greater. Yet football, with its absolute certainty of permanent bodily injury to many, and inevitable proportion of fatal disaster, is not only permitted to flourish, but is actually applauded as a beneficial institution. We distinctly say that a so-called "game," the prominent feature of which is coarse brutality, and which fosters an utter disregard for human life and limb, can only have a tendency towards moral degradation; and we warn parents to consider well before committing their sons to the tender mercies of Rugby football.

PROF. ASAPH HALL has succeeded in obtaining a number of observations of a bright spot which he had noticed on the night of December 7th, 1876, on the ball of Saturn, and thereby deducing a value of the period of the planet's rotation, which is probably more accurate than any previous determination. The spot in question was two or three seconds in diameter, round and well defined, and of a brilliant white color. Besides Washington, it was, at Prof. Hall's request, observed at several other American observatories, and the time of rotation concluded (assuming the spot to have no proper motion on the surface of the planet) is 10h. 14m. 23·8s. mean time. Sir William Herschel's determination (given in the *Philosophical Transactions* for 1794) was 10h. 16m. 0·4s., and was derived from the different appearances of a quintuple belt in the winter of 1793–4. Prof. Hall points out a curious mistake, which had been copied into nearly all books on astronomy, assigning 10h. 29m. 16·8s. as Herschel's value of Saturn's rotation — this being in fact the time of rotation of Saturn's *ring*, not that of the planet itself.

LITTELL'S LIVING AGE.

Fifth Series, Volume XXI. | No. 1753.—January 19, 1878. | From Beginning, Vol. CXXXVI.

CONTENTS.

I. THE NINETY YEARS' AGONY OF FRANCE. By Prof. Goldwin Smith, ... *Contemporary Review*, ... 131
II. ERICA. Part IX. Translated for THE LIVING AGE, from the German of . . *Frau von Ingersleben*, ... 143
III. THE CELT OF WALES AND THE CELT OF IRELAND, ... *Cornhill Magazine*, ... 151
IV. MACLEOD OF DARE. By William Black, . *Advance Sheets*, ... 163
V. THE STORY OF MAXIMILIAN AT MIRAMAR AND AT QUERETARO. Translated and abridged for THE LIVING AGE, from advance sheets of . . . . "*A Travers L'Autriche*," . . 171
VI. MODERN LIFE AND INSANITY, . *Macmillan's Magazine*, . . 178
VII. SMITH'S POOR KIN, ... *Spectator*, ... 186
VIII. IRRIGATION IN INDIA, ... *Examiner*, ... 189
IX. PEPPERINESS, ... *Spectator*, ... 191

POETRY.

THE NORTHERN LIGHTS; a Norse Superstition, ... 130
LET BYGONES BE BYGONES, ... 130
VALENTINE'S DAY, 1873; an Unpublished Poem, by Charles Kingsley, ... 130

PUBLISHED EVERY SATURDAY BY
LITTELL & GAY, BOSTON.

TERMS OF SUBSCRIPTION.

For EIGHT DOLLARS, *remitted directly to the Publishers*, the LIVING AGE will be punctually forwarded for a year, *free of postage*.

An extra copy of THE LIVING AGE is sent gratis to any one getting up a club of Five New Subscribers.

Remittances should be made by bank draft or check, or by post-office money-order, if possible. If neither of these can be procured, the money should be sent in a registered letter. All postmasters are obliged to register letters when requested to do so. Drafts, checks and money-orders should be made payable to the order of LITTELL & GAY.

Single Numbers of THE LIVING AGE, 18 cents.

THE NORTHERN LIGHTS.

A NORSE SUPERSTITION.

"Nay, mother, nay; the pictured coal is glowing,
Dully and redly on the hearthstone there;
Yon was no flame of careless idlers' throwing,
Nor rocket flashing through the startled air;
'Twas but the gleaming of the Northern Lights —
Ah, there again, they reddened Huntcliff heights.

"So, let me raise you softly on the pillow,
See, how the crimson lustre flares and dies,
Turning to red the long heave of the billow,
And the great arch of all the starless skies;
The fishers say such beauty bodes them sorrow,
Telling of storm, and wind to blow to-morrow."

"No, child, the busy wife may bait her lines,
And net and gear lie ready for the morning,
No presage in that wavering glory shines,
No doom in the rich hues the clouds adorning;
They do but say the lingering hours are past,
The gates, the golden gates, unclose at last.

"Won, the long hill so steep and drear to climb,
Done, the long task so bitter hard in learning;
The tears are shed, and garnered up by time,
The heart beats, freed from all its lonely yearning;
The bar swings back, and, flooding seas and skies,
Burst out the deathless lights of Paradise.

"See, see, by the great valves of pearl they stand,
Friends, children, husband; see glad hands outreaching!
For me, for me, the undiscovered land,
Its promise in that roseate signal teaching;
Ay, kiss me, child, the lips will soon be dumb,
That yet in earthly words can say, 'I come.'"

Again the banner of the Northern Lights
Waved broad and bright across the face of heaven;
And in the cottage on the rugged heights,
The passing radiance, by their glory given,
Showed a pale orphan weeping by the bed,
And the calm smiling of the happy dead.

All The Year Round.

LET BYGONES BE BYGONES.

Let bygones be bygones; if bygones were clouded
By aught that occasioned a pang of regret,
Oh, let them in darkest oblivion be shrouded;
'Tis wise and 'tis kind to forgive and forget.

Let bygones be bygones, and good be extracted
From ill over which it is folly to fret;
The wisest of mortals have foolishly acted —
The kindest are those who forgive and forget.

Let bygones be bygones; oh, cherish no longer
The thought that the sun of affection has set;
Eclipsed for a moment, its rays will be stronger,
If you, like a Christian, forgive and forget.

Let bygones be bygones; your heart will be lighter,
When kindness of yours with reception has met;
The flame of your love will be purer and brighter
If, Godlike, you strive to forgive and forget.

Let bygones be bygones; oh, purge out the leaven
Of malice, and try an example to set
To others, who, craving the mercy of heaven,
Are sadly too slow to forgive and forget.

Let bygones be bygones; remember how deeply
To heaven's forbearance we all are in debt;
They value God's infinite goodness too cheaply
Who heed not the precept, "Forgive and forget."

Chambers' Journal.

VALENTINE'S DAY, 1873.

AN UNPUBLISHED POEM.

Oh! I wish I were a tiny browny bird from out the south,
Settled among the alder-holts, and twittering by the stream;
I would put my tiny tail down, and put up my tiny mouth,
And sing my tiny life away in one melodious dream.

I would sing about the blossoms, and the sunshine and the sky,
And the tiny wife I meant to have in such a cosy nest;
And if some one came and shot me dead, why then I could but die,
With my tiny life and tiny song just ended at their best.

Charles Kingsley.

From The Contemporary Review.

THE NINETY YEARS' AGONY OF FRANCE.

FOR ninety years, since the time when Calonne called together his Assembly of Notables, and when the voice of the Revolution was first heard announcing a reign of hope, love, freedom, and universal peace, — for ninety years has France struggled to attain a settled form of constitutional government; and apparently she is farther from it now than she was in 1787, — apparently, but not, we will hope, in reality. In this last crisis the mass of her people have exhibited not only a steadiness of purpose for which we were little prepared, but a self-control which is full of the highest promise. In spite of everything that the conspirators who had seized the government could do to provoke the nation to violence which might have afforded a pretext for using the public force against the public liberties, the nation has conquered by calmness. Conspiracy and illegality have passed from the side of the people to that of the reactionary government. This shows that considerable way has been made since the days of the Faubourg St. Antoine.

Real progress is to be measured, not by change of institutions, but by change of character. The Revolution made a vast change in French institutions: it could not change French character, which remained as servile under the despotism of Robespierre as it had been under that of Louis XIV. Character seems now, after ninety years of desperate effort and terrible experience, to be coming up to the levei of institutions. Perhaps France has reason to be grateful to De Broglie and his marshal for giving her assurance of that fact, though their names will be infamous forever.

The reasons of the political failure of 1789 are manifest enough; we need not seek them in any mysterious incapacity of the Celtic race in general or of the French branch of it in particular for constitutional government. These mysterious capabilities and incapabilities of races in truth are questionable things, and generally tend, upon closer inspection, to resolve themselves into the influence of circumstance perpetuated and accumulated through many generations. England, guarded by the sea, has had comparatively little need of standing armies, and she has thus escaped military despotism, since fleets cannot interfere with politics; yet even she might have fallen under a military despotism, and foreign critics might now be moralizing on the inherent incapacity of her people for any government but that of force, if when the army of James II. was encamped on Hounslow Heath there had not been a William of Orange to come over to our rescue. France has had frontiers; therefore she has had standing armies, and her rulers have been masters of legions. She was exposed to foreign invasion for a whole century, from the time of Edward III. to that of Henry VI.; and again, at the crisis of her destiny in 1791, she was assailed by the arms of the coalesced powers of reaction. On each occasion her people, to secure national independence, were compelled to renounce liberty, and the government was inevitably invested with a military dictatorship of defence, which, once acquired, was perpetuated in political despotism. It would be difficult to prove that, under more auspicious circumstances, the States-General, which at one period in the fourteenth century entered on a course of reform as bold and comprehensive as anything done by the framers of the Great Charter or the Parliaments of Henry III., might not have developed into a British House of Commons.

The political crisis of 1789 was in itself one of the most tremendous kind; it was nothing less than the collapse, amidst bankruptcy and general ruin, of the hereditary principle of government, the only principle which France or the greater part of Europe up to that time had known. But it was desperately complicated by its connection with a social and a religious crisis equally tremendous. It came upon a people totally untrained to political action, without political instruction, without a political press, without even the common information which a newspaper gives about passing events; without the means of judiciously choosing its political leaders, or even political leaders among whom

a judicious choice could be made; without any good political writers, except Montesquieu, whose authority, as we shall presently see, was practically misleading. At the same time this people had, in common with all intellectual Europe, been excited by visions of boundless and universal happiness, of new heavens and a new earth, to be attained by a change of the social system and of the form of government. Amidst such disadvantages, and in face of a reaction at once political, social, and religious, the desperate reaction of privilege, both social and ecclesiastical, fighting for its existence, and not scrupling, in its transports of rage and terror at the appearance of liberty and equality, to combine with Robespierre in order to defeat Lafayette, success would have been almost a miracle. But then, to extinguish the last hope, came a coalition of the kings, hounded on by the too eloquent ravings of Burke, whose total failure to understand the difficulties under which the French reformers labored was discreditable to him as a political philosopher, while his frantic invocations of war, and, in his own hideous phrase, of "a long war," were disgraceful to him not only as a political philosopher but as a man.

The republican constitution formed after the overthrow of the Terrorists was not a good one. The institution of two chambers was a mistake, arising from an illusion of which we shall presently have to speak; a sufficient control over the executive directory was not secured to the representatives of the nation; the judiciary was not placed on a proper footing. Still it is probable that the constitution would in time have worked and given to France law and order under a republic, had it been administered by tolerably honest hands, and had it not been exposed to military violence. But a revolution, especially an abortive revolution, leaves behind it a fearful legacy not only of disappointment, lassitude, mistrust among the people, but of depravity among the chiefs. It gives birth to a race of intriguers, utterly selfish, utterly unprincipled, trained to political infidelity in the school of fortunate apostasy, steeped in perfidy by the violation of unnumbered oaths, and at the same time familiar with the revolutionary use of violence. Such was the offspring of the revolutionary periods of ancient history both in Greece and Rome. Thucydides saw and painted them; they impressed their character on Roman politics after the civil wars of Marius and Sylla. Such again was the offspring of the English Revolution; the Lauderdales and Shaftesburys, the scoundrels who formed the governments and led the factions of the Restoration, who carried on religious persecutions while themselves were infidels, shut up the exchequer, made the Treaty of Dover, got up the Popish Plot, seized the municipal charters, judicially murdered Russell and Sidney. But never was there such a generation of these men as that which emerged from the wreck of the dreams of Rousseau and from the deadly struggle of factions which ended with the fall of Robespierre — Tallien, Fréron, Barère, Barras, Rewbell, Talleyrand, Merlin, Fouché, and their crew. Political corruption was aggravated by the corruption of morals, caused by the outburst of sensualism which naturally ensued after the dreadful repression and the savage Spartanism of the Terror. To this general depravity was added the volcanic fury, still unabated, of party passions raging in the breasts of factions which but yesterday had been alternately revelling in the blood of each other. It was by military violence, however, that the constitution was at last overthrown, and its fall was the beginning of that supremacy of the army which unhappily has been from that hour, and still is, the fundamental fact of French politics. The hand which, at the bidding of traitors in the Directory, dealt the first blow, was that of Augereau, but the hand which planned it and dealt the final blow was that of Bonaparte. In estimating the result of the first experiment in republican government, this must always be borne in mind.

The appearance of Bonaparte upon the scene with his character and his abilities may be truly called the most calamitous accident in history. An accident it was, for Bonaparte was not a Frenchman; he

was made a French soldier by the chance which had annexed his country to France, without which he would have been a Corsican brigand, instead of being the scourge of the world. Little did Choiseul think that the rapacity which added to France Corsica, would be the cause a century afterwards of her losing Alsace-Lorraine. As to the greatness of the calamity, few doubt it except the train of mercenary adventurers whose existence in France, as a standing and most dangerous conspiracy against her liberties, is itself the fatal proof of the fact which they would deny. What may have been the extent of Napoleon's genius, political or military, is a question still under debate, and one of a kind which it is difficult to settle, because to take the measure of a force, whether mechanical or intellectual, we must know the strength of the resistance overcome. The Revolution had swept the ground clear for his ambition, and had left him in his career of aggrandisement almost as free from the usual obstacles without as he was from any restraints of conscience or humanity within. Death removed the only three men who were likely to make a stand, Hoche, Marceau, and Kleber, from his path. He disposed absolutely of an army full of burning enthusiasm, and which, before he took the command, though it had recently met with some reverses, had already hurled back the hosts of the coalition. In Europe, when he set out on his career, there was nothing to oppose him but governments estranged from their nations, and armies without national spirit, mere military machines, rusty for the most part, and commanded by privileged incompetence. England was the only exception, and by England he was always beaten. The national resistance which his tyranny ultimately provoked, and by which, when he had provoked it, he was everywhere defeated, in Russia, in Germany, even in decrepit Spain, was called into existence by his own folly. He ended, not like Louis XIV., merely in reverses and humiliations, but in utter and redoubled ruin, which he and his country owed to his want of good sense and of self-control, and to this alone, for he was blindly served, and fortune can never be said to have betrayed him, unless he had a right to reckon upon finding no winter in Russia. Before he led his army to destruction he had destroyed its enthusiastic spirit by a process visible enough to common eyes, though invisible to his. Nor was he more successful as a founder of political institutions. He, in fact, founded nothing but a government of the sword, which lasted just so long as he was victorious and present. The instability of his political structure was shown in a lurid light by the conspiracy of Malet. Of its effect on political character it is needless to speak; a baser brood of sycophants was never gathered round any Eastern throne.

At the touch of military disaster the first empire, like the second, sank down in ignominious ruin, leaving behind it not a single great public man, nothing above the level of Talleyrand. The code survived; but the code was the work of the jurists of the Revolution. With no great leading principle was Bonaparte personally identified, except the truly Corsican principle of confiscation, to which he always clung. The genius of the moral reformer is to be measured by the moral effect which he produces, though his own end may be the cup of hemlock. The genius of the adventurer must be measured by his success; and his success is questionable when his career, however meteoric, ends in total disaster. This is not the less manifest to reflecting minds because the pernicious brightness of the meteor still dazzles and misleads the crowd. But the greater Napoleon's genius was, the worse was it for France and for mankind. All his powers were employed in the service of the most utterly selfish and evil ambition that ever dwelt in human breast. It has been justly remarked that his freedom from every sort of moral restraint and compunction lent a unity to his aims and actions which gave him a great advantage over less perfectly wicked men. As to religion, he was atheist enough to use it without scruple as a political engine, and to regret that the time was past when he might, like Alexander, have given himself out as the son of a god. His selfishness is to be measured not merely by the unparalleled sacrifices of human blood and suffering

which he offered to it; not merely by the unutterable scenes of horror which he witnessed without emotion, and repeated without a pang; but by the strength of the appeal which was made to his better nature, had he possessed one, and the splendor of the reward which was held out to him, if he would have kept his allegiance to the interests of his country and of humanity. What happiness and what glory would have been his if, after Marengo, he had given the world a lasting peace, and with it the fulfilment, so far as fulfilment was possible, of the social and political aspirations for which such immense and heroic efforts, such vast sacrifices, had been made! Never, in all history, has such a part been offered to man. Instead of accepting this part, Napoleon gave the reins to an ambition most vulgar as well as most noxious in its objects, and to the savage lust of war, which seems after all to have been the predominating element in this Corsican's character, and which gleamed in his evil eye when the chord was touched by those who visited him at Elba. The results were the devastation of Europe, the portentous development of the military system under which the world now groans, the proportionate depression of industry and of all pacific interests, the resurrection in a worse form of the despotisms around which the nations were fain to rally for protection against a foreign oppressor, and the new era of convulsions and revolutions which the resurrection of the despotisms inevitably entailed.

Of all the effects of Napoleon's career, the worst perhaps was the revelation of the weakness and meanness of human nature. What hope is there for a race which will grovel at the feet of sheer wickedness because the crime is on an enormous scale, and the criminal is the scourge, not only of one nation but of his kind? Next in the order of evil were the ascendency given to the military spirit and the example of military usurpation. The military spirit it was that, excited by the flagitious writings of Thiers, and weakly flattered by the house of Orleans, overturned constitutional government in 1832. The example of military usurpation was followed by Napoleon's reputed nephew, who in his turn was driven by the discontent of the army, combined with the influence of his priest-ridden wife, into the war which overthrew his empire, at the same time bringing the invader for the third time into Paris. The blow which military passion and the spirit of aggrandizement received in that defeat was to France a blessing in disguise. To it she owes the recovery, however precarious, of free institutions, of which there would otherwise scarcely have been a hope. But even now, France, after all her efforts and revolutions, is to a fearful extent at the mercy of a stupid and self-willed soldier, a third-rate master even of his own trade, totally devoid of political knowledge and of sympathy with political aspirations, but at the head of the army, and, as his language to the soldiery on the eve of the elections proved, sufficiently wanting in the true sense of honor to admit into his mind the thought of using the public force with which he is entrusted for the overthrow of public liberty. No institutions, however sound and stable in themselves, can afford to a nation security for legal order while there is a constant danger of military usurpation. Nor is it easy to see how the danger can be removed, so long as an army strong enough to overpower all national resistance, and blindly obedient to command, is at the disposal of the executive for the time being.

Two years hence, if not before, there will be another crisis; and it is idle to conceal the unhappy and ignominious fact, that the decision will rest ultimately with the army and with those whom the army obeys.

Whether, under the new system of universal military service, with such influences as that of the Erckmann-Chatrian novels, the soldier has become more of a citizen and the army less of a knife ready, in any hand by which it may for the moment be grasped, to cut the throat of public liberty, the event will show. The French peasant, if left to himself, is not fond of war; he hates the conscription, and has done so from the time of Cæsar; the fatal ascendency of the military spirit is due, not to him, but to a series of ambitious rulers. This is true, but it does not save France from being, as a matter of fact, to a lamentable extent a stratocracy. How the army can be placed in safe hands is a problem of which it is almost impossible to suggest a complete and permanent solution. The reduction of its numbers by the definite adoption of a pacific policy is the only real security for the continuance of political liberty. In France the peril is greatest and its manifestations have been most calamitous, but it extends more or less to all the European nations. Everywhere in Europe public liberty and human progress are to a fearful extent at the mercy of the vast standing armies which

are maintained by the mutual jealousies of nations, assiduously stimulated by courts and aristocracies in the interest of moral and political reaction. He who said that science could not be better employed than in devising means of destroying prætorians, gave utterance, in a cynical form, to a melancholy truth. It would be a happier way of escape from the danger if soldiers could possibly be made to understand their real duty to their country.

By the restoration of the Stuarts, and the temporary recovery of its ascendency by a defeated and vindictive party, England was thrown back into political discord, violence, and intermittent civil war for three quarters of a century. The same calamity befell France, though in her case the restoration was the work of foreign hands; and the same or even greater allowance for the disturbing influence must be made. As no institutions can be proof against military treason, so none can be proof against passions which go beyond political antagonism, beyond even the utmost violence of party, and are, in fact, the passions of civil war. The factions which encountered each other in the legislative assemblies of the restoration were the same which not long before had encountered each other on the battle-fields of La Vendée. Their hostility, scarcely diminished since they met in arms, was incompatible with that common allegiance to the constitution and its objects, in spite of divergences on special questions, which is the first condition of constitutional government. Both extremes in the Assemblies of Louis XVIII. and Charles X. were striving, not to give effect to their respective policies by constitutional means, but to overthrow the constitution itself, one extreme in the interest of absolutism, the other in that of democracy. It was then as it is now, when the monarchical and aristocratic party is manifestly using the marshalate and Senate, not to modify legislation in a conservative sense, but to overthrow the republic, as, if it had been successful in controlling the elections, it would unquestionably have done. In such a case institutions can do no more than prolong for themselves a precarious existence by being so ordered as to prevent rather than facilitate a pitched battle between parties which, when it once occurs, causes an outbreak of violence, and leads back to civil war.

Napoleon, besides restoring superstition for his political ends, restored aristocracy, though the fear of limiting his despotism made him dislike creating an hereditary house of peers. This also has been a hostile and disturbing force, against which the republic, founded on equality, has always had and still has to contend. The set of upstarts whom Bonaparte bedizened with tinsel dukedoms of course gave themselves greater airs than the old nobility of France. Such a fellow as Cambacères was very particular about being called Monseigneur; but a certain union of interest, if not a social union, has by this time been brought about between old privilege and new; and the attack on the republic under De Broglie has been at least as much an aristocratic conspiracy as anything else. So manifest is this as to found a hope that the army, which is tolerably loyal to equality, if not to liberty, might recoil from supporting what it must see to be an aristocratic reaction. An aristocracy, while it exists, will never cease to intrigue against institutions based upon equality; and the total prohibition of hereditary titles was justly felt by the framers of the American Constitution to be essential to the security of their republic.

Another adverse force, against which free institutions have to contend in France, too often noted to need more than recognition in its place, is the tendency, derived from the old *régime*, but handed on in an intensified form by the Bonapartes, to administrative centralization, which, notwithstanding the improvement of local institutions, still decidedly preponderates over local self-government. The influence exercised by De Broglie and his accomplices over the elections, through prefects of their appointment, is a fatal proof of the fact. From the same inveterate spirit of encroachment on one side, and submission on the other, arises the want of independence in the judiciary which has been so disgracefully displayed in the late political trials. The resistance made by the constituencies to the prefects shows that improvement is going on; but a century of effort is not too much to throw off maladies so deeply seated as these.

The special influence, however, to which we wish here to point as having interfered with the success of elective government, and as still imperilling its existence in European countries generally, but notably in France, is the ignorant and fallacious imitation of the British Constitution. We wish we could hope that the few words we have here to say on this point would meet the eye of any French statesman, and direct his attention to the subject.

Burke denounced the political architects

of 1789 for constructing their edifice according to theoretic principles instead of building it on old foundations, and he contrasted their folly with the wisdom of the old Whigs. Considering that the old Whigs were aristocrats who had inherited the territorial plunder of the courtiers of Henry VIII., and who desired to preserve that inheritance, and, with it, the power of an aristocracy, their economy in innovation was as natural as it was wise. But it would have tasked the sagacity of Burke to discover what old foundations for constitutional government there were in the France of 1789. France had then been, for at least a century and a half, a despotism with a strictly centralized administration. The semblance of provincial government survived; but it masked without really tempering the action of the satraps of the monarchy; and feudalism, crushed since Richelieu, had left behind no genuine remnant of local liberty, but only the antiquated machinery of social oppression, which Richelieu had done almost nothing to reform. Yet the political architects of 1789 did build on old foundations, the only old foundations which anywhere presented themselves — the foundations of the English Constitution. And it may confidently be said that, compared with that renowned, time-honored, and much-lauded model, the newest creation of the brain of Sieyès would have been a safe and practical guide. The clockwork constitutions of Sieyès displayed a fatal ignorance of the real forces; but at all events they involved no incurable self-contradiction. It was not absolutely impossible to make them work. But it was absolutely impossible, and had been actually proved to be so by English experience, to make the British Constitution work, as the British Constitution was understood by Frenchmen and by Englishmen themselves.

The received version of the British Constitution was that given by Montesquieu, in perfect accordance with the forms of British constitutional law. Montesquieu, a great genius in his day, while he explained the forms with philosophic eloquence, failed to pierce through them to the real political forces. In this respect he is like De Tocqueville, whose work, admirable in many respects, is still an account of the forms, not of the real forces, and consequently is of little value as a practical guide to American politics, and is seldom quoted by American politicians. The legislative power is the sovereign power. But Montesquieu believed that the sovereign power, in the case of the British Constitution, was really divided among king, Lords, and Commons. He also believed that the legislative, executive, and judiciary powers were not only distinct, but independent of each other, and that the mutual independence of those powers was the palladium of constitutional government.

The British Constitution is a single elective assembly, in which the whole of the legislative, and therefore the whole of the sovereign power is really vested. This assembly virtually appoints the members of the executive, who are the leaders of its majority, and through the executive the ministers of justice. Round it still cling, as it were, the wrecks of an old feudal monarchy and of an old feudal House of Peers, but from both of them the power has long passed away, to centre in the Commons, though, strange to say, not only foreign observers, but English statesmen, long remained unconscious of the fact.

Whether the sovereign power, which could not be divided, should be vested in the crown or in the representatives of the people, was the question which, after vain attempts to settle it by debate, was fought out with arms between the Parliament and the Stuarts. It was decided, after a century of conflict and several vicissitudes of fortune, in favor of the representatives of the people, who finally triumphed in 1688. From that time the monarchy has been *fainéant*, interfering with the government only by means of back-stairs influence, or by forming for itself, underhand, a party in the House of Commons, as it did during part of the reign of George III. William III., being the head and the general of a European coalition, kept for his life the Foreign Office and the War Office in his own hands; but after a slight resistance, ending with his attempt to veto the Triennial Act, he was obliged to relinquish every other kind of power; and, in the reign of his successor, the transfer of the sovereignty to Parliament was complete. As to the House of Lords, it has no power left in itself but that of obstruction on minor questions; on great questions it merely registers the vote of the majority of the House of Commons. This was settled in 1832, in the case of the Reform Bill, and again in 1846, in the case of the Corn Laws. On both those occasions the measures would notoriously have been rejected by an overwhelming majority had the House of Lords been an independent assembly. The result showed that it was nothing of the kind. King, Lords, and Commons work together harmoniously in

England, not because each of them exercises its share of the sovereign power temperately, and with due respect for the rights of the others, which is the common and the orthodox belief, but because two of them are politically non-existent. Restore real sovereignty to the crown, and you will have the Stuarts and the Long Parliament over again.

Following, however, as they thought the successful example of England, the framers of the French Constitution of 1789 attempted to divide the sovereign power, leaving a portion of it in the king, and vesting the remainder in the representatives of the people. The result, the inevitable result, was collision, and soon a conflict which, though neither party knew it, was essentially internecine. The weaker, that is to say, the monarchy, fell; but in the desperate efforts necessary to get rid of the opposing force and to vindicate the sovereignty to itself, foreign intervention adding to the fury of the conflict and to the general difficulties of the crisis, the nation fell into convulsions, into a reign of violence, into the Terror, and after the Terror into military dictatorship and despotism. The same fatal situation was reproduced under the restored monarchy; again an attempt was made to divide the sovereign power between the king and the assembly which represented the nation. In which of the two that power should rest, was the issue once more really debated through all those fierce sessions of the Restoration legislature, while the ground heaved with conspiracy, and ever and anon the mutterings of civil war were heard in the streets. At last Charles X. made a desperate effort to cut the knot and render himself sovereign; by his failure and fall the question of sovereignty was decided for the time in favor of the representatives of the people. What power Louis Philippe retained, was retained not of right (for he subscribed to the doctrine that he was to be guided by constitutional advisers assigned him by the majority in the Chambers), but by personal influence and corruption. It was in corruption, in fact, that monarchical power made clandestinely its last stand. Louis Phillippe's fall, as we have already said, was due not so much to political causes, in the proper sense of the term, as to Chauvinism conspiring against a *bourgeois* king whose policy was peace, though he yielded too much to the fancied necessity of sacrificing, by military display and menace, to the idol of war. At the same time the fresh impulse given to the revolutionary movement in Europe by the struggles of oppressed nationalities caused an insurrection in France against the surviving forms of monarchy and the influences by which they were upheld. Chauvinism and the fear of anarchy together gave birth to the second empire, under which the sovereign power reverted from the representatives of the nation to the monarch, who was in all but form a despot, as before the legislature had been, in all but form and saving illicit influence, the king. The second empire went to the grave of the first by the same road, the military aggressiveness which was the condition of its existence leading it on at last to ruinous defeat. Now again comes a nominal republic; but, unfortunately, there is still a king, and the hopeless problem of carrying on government with a divided sovereignty presents itself afresh. The marshal, having the command of the army, and being supported by those who desire a return to monarchy, struggles for the sovereign power; and the question at the late election was whether that power should belong to him and the ministers of his personal choice, or to the nation. From 1789 onwards, there has been a chronic though intermittent struggle for the sovereign power several times; that power has been transferred and retransferred; there have been periods in which it was doubtful where it resided; but it has never been divided, nor is a division possible in the nature of things. The attempt can only lead to a conflict which will probably end, as it did in England, in civil war.

Those who found an elective government must not fancy that they can at the same time preserve monarchy. They must be logical, because they will find that in this case not to be logical is to plunge into practical confusion. They must vest the sovereignty absolutely and beyond question in the nation. Their first care must be to establish on an immovable foundation the principles, that the nation alone makes and alone can alter the constitution; that to the nation alone all allegiance is due, and against it alone can treason be committed; that all other authority, however high, is merely derivative, responsible, and bounded by the written law; that the sovereignty of the nation is exercised through its representatives duly elected; and that to these representatives the obedience of all executive officers must be paid. This done, they

may afford to make any conservative regulations with regard to the election of the national assembly and the mode of its proceeding that they please; and where freedom is young, they will find careful regulations of this kind needful. It is the game of the Bonapartists, first to assert the sovereignty of the nation, and then to make the nation permanently divest itself of its sovereignty by a *plébiscite* in favor of the Bonaparte family and the brood of adventurers whose instruments the Bonapartes are. Of course, no legislation can prevent a national suicide; but clear declarations of principle are not barren because they are not endowed with force to defend themselves against treachery or violence: and it would be important to declare that the national sovereignty is inherent as well as entire, and that no single generation can by its act divest future generations of their right.

So long as there is a single head to the State there will always be some danger of a revival of monarchical pretensions, and of a dispute as to the seat of the sovereign power, at least in any country where monarchy has long existed and monarchical ideas have taken root. America is republican soil, on which hardly any but democratic ideas can grow; the sovereignty of the nation is firmly established not only in documents, but in the minds of the people; the president is elected for a short term, his powers are clearly bounded by the written law, he has hardly any military force at his command; yet Jackson showed a tendency to encroachment, and the jobbers who plundered the community under Grant betrayed their desire not only of increasing, but of perpetuating his power. A single head of the State is a fancied necessity; the Swiss constitution, which, instead of a single man, has a council with a president whose function is only to preside, presents great advantages in this respect, and is the safest model for adoption. It moreover gets rid of that which is the scourge even of America, but far more of any country where the questions that divide parties are so fundamental and party hostility is so deadly as in France — a presidential election, which periodically stirs up from their depths all the most violent passions, excites the most turbulent ambitions, and brings all questions to a dangerous head. The framers of the American Constitution were in some degree misled, like the framers of the French Constitution, by their British model which they reproduced in a republican form; they imagined that it was necessary to have something in place of the king, and the elective presidency with all its evils is the result.

Another signal and calamitous instance of mistaken imitation of the British Constitution is the power of dissolution, which the other day, in the hands of a disloyal president and Senate, was so nearly the means of overturning the republic. In the days in which the power of legislation, with the other attributes of sovereignty, resided in the crown, and Parliaments were merely consultative, or at most instruments for supplying by the grant of subsidies the occasional necessities of the crown, it was a matter of course that they should be summoned only when the crown needed their presence, and dismissed as soon as their advice had been given and they had voted their supplies. Our modern power of dissolution is a survival of this original state of things. But with us it is no longer practically in the hands of the king, or of any authority outside Parliament; it has passed, with the other attributes of the sovereign power, to the Parliament itself. It is exercised by a Parliamentary minister, by whose advice the crown is bound on this as on all other questions to be guided, for the purpose of testing the relative position of parties in the country; and its exercise is limited to that object by restrictions which, though tacit and to be found in no book on constitutional law, are perfectly understood and observed by both parties as the rules of the game. It is in fact the mode by which the House of Commons adjusts itself to the public opinion which is the basis of its power. This has not been seen by those who, thinking to reproduce the British Constitution, have vested in an authority really external to the Parliament, such as the French marshalate, a power of dissolution, which is in fact a power of extinguishing for the time, and may in disloyal hands be used as a power of extinguishing forever, the organ of the national sovereignty, and the national sovereignty itself. We know well that in the case of France the fault does not lie with the friends of the republic; but it is not in France alone that the error respecting the power of dissolution has prevailed.

Dissolutions and general elections are alike obsolete bequests of old feudal polities; and though by the practical temperament and the political experience of the English they have been tacitly accommodated, like other parts of the historic sys-

tem, to the requirements of the present day, they are alike in themselves evil as well as obsolete. The existence of the assembly which is the organ of the national sovereignty, and without which the nation is practically powerless, ought never to be suspended for an hour; from its suspension in any country in which elective institutions have still a disputed title, and are threatened by hostile machinations, the most serious dangers may arise. General elections are evil, because they bring on those violent conflicts of opinion, and pitched battles between parties, which when the differences of sentiment are so extreme as they are between the Ultramontanists and the Liberals, the Legitimists and the Radicals in France, are in the highest degree perilous, and, as the recent crisis has plainly indicated, might, in a very inflamed state of feeling, lead at once to an outbreak of violence and civil war. To avert such conflicts, to avoid pitched battles of opinion, to make the stream of political progress glide within its banks, and with as few cataracts as possible, ought to be the aim of all framers of elective constitutions. An elective assembly renewed, not all at once, but by instalments, and at regular periods fixed by law, independent of the will of any functionary, will fulfil the condition of uninterrupted life, without which usurping governments, like that of De Broglie, may always be tempted to suspend its existence or get rid of it altogether; and it will conform steadily, yet promptly enough, to the changes of public opinion, without those violent revolutions which general elections are apt to produce, and without giving the excessive predominance which they are apt to give to the question or the cry of the day. The necessity under which party leaders find themselves of providing a question and a cry for a general election has had a bad effect even on English legislation.

Another illusion which has led to strange consequences in France, and in all other countries where the building of constitutions has been going on, including the British colonies, is the notion that the House of Lords is a senate moderating by its mature wisdom the action of the more popular house. As we have had occasion to say elsewhere, the House of Lords is not a senate; it is an old feudal estate of the realm; its action has been, not that of ripe wisdom moderating popular impulse, but simply that of privilege combating, so far as it dared, all change, in the interest of the privileged order. Whether its influence is really conservative may be doubted; in the first place, because its resistance to change, being unreasoning and anti-national, is very apt, as the history of the first Reform Bill shows, to provoke the revolutionary spirit rather than to allay it; and in the second place, because it operates as a practical ostracism of the great landowners, who, under the circumstances of English society, would otherwise certainly find seats in the House of Commons. The real stronghold of English conservatism is the preponderance of the aristocratic, or rather plutocratic element in the House of Commons. But at all events the House of Lords furnishes no model to any country which has not an hereditary and territorial aristocracy, or a privileged order of some kind, having its base, and presenting a fulcrum of resistance, outside the body of the nation. If both assemblies emanate from the nation, whatever diversities there may be in the mode of their election, and even if the senate be not directly elected, but nominated by a government itself the offspring of election, the attempt to make the national sovereignty check and restrain itself by acting through two organs instead of one, and confronting its own impulses with its own cooler wisdom, must ultimately fail. So long as the same party has a majority in both assemblies, the double machinery will work smoothly, but at the same time it will be ineffective. But when the party which is in a majority in the popular assembly is in a minority in the senate, as soon as an important question arises there will be a collision between the two houses, and the result will be a dead-lock, which will last till the nation compels one of the two assemblies to give way, declaring thereby in effect that the national sovereignty is delegated to the other. Nor is there any real advantage in the delay which the dead-lock causes, sufficient to compensate for the violence of the struggle, and the dangerous excitation of turbulent and revolutionary passions. Such is the experience of the British colonies in Australia, while in Canada the senate is a cipher, and its debates are not even reported. In Italy the same party was at first in the majority in both chambers; but the other day a change took place in the popular chamber, and at once there were symptoms of collision. In France, the Senate at each great crisis of the constitution has proved impotent or useless, as the historian of parliamentary

government in France admits; but it is now showing a tendency, as might have been expected, to become the citadel of a party, or rather a group of parties, bent on overturning the republic in the interest of some form of government more favorable to aristocracy; and in this way it threatens to prove not a nullity, but a danger of the first magnitude, and an instrument of attempts, such as the attempts of De Broglie, which may plunge the country again into civil war. If the example of the American Senate is cited in favor of a second chamber, it must be remembered that the American Senate represents the federal principle as opposed to the principle of population, and that its authority and usefulness, whatever they may be, thus depend on its connection with a federation.

Besides, of what special elements do you wish your senate to consist? What is to be the special character of its members compared with those who sit in the lower house? Till this is distinctly settled, all devices for particular modes of election or appointment are devices without an object; they are machines for producing something which itself is not determined. Do you wish your senate to consist of old men, in accordance with the literal meaning of the name, and with the habit of primitive nations? It will represent the infirmities of old age. Do you wish it to consist of the rich? It will be the organ of a class interest, odious and the object of suspicion to all the rest of the nation. Or do you wish it to consist of the best and most trustworthy of your public men? If you succeed in putting these men into the senate, you will deprive the popular chamber of its guides and of those most able to control its impulses and passions, and in a manner ostracize your legislative wisdom. Something like this happened to Cromwell when he thought to temper the fractiousness of the House of Commons by restoring the Upper House: to supply materials for his Upper House he had to take his best men from the Lower; the lead in the Commons was broken up; the two houses fell foul of each other; and the Parliament was dissolved in a storm.

Instead of attempting to divide the sovereignty, which is really indivisible, and to make the nation perform the chimerical operation of producing by election a check upon itself, attention should, we venture to think, be directed, more carefully and systematically than it has ever yet been, to the constitution of the representative assembly, to the mode and rate of its renewal, to the securities for its deliberate action and for the exclusion from it of mere passion and impulse, to such questions as that between direct election and election through local councils or other intermediate bodies, to the qualifications for the franchise in the way of property, age, education, or performance of national duties. It is singular, for instance, that amidst all the discussions about vetoes, absolute or suspensive, to be reposed in kings or presidents, no one has thought of requiring an absolute majority of the whole house for the passage of an opposed measure, or of giving to a minority, if it amounts to a certain proportion of the house, a limited power of delay.

But of all the things borrowed by France and other nations from the British Constitution the most palpably absurd and calamitous, in its general application, is the system of party, which sets up the great offices of state as the prizes of a perpetual conflict between two organized parties, and relies upon the perpetual existence of these two parties and the ceaseless continuance of their conflict as the only available means of carrying on constitutional government. It is strange that any one should have fallen into such a trap who had studied the Parliamentary history of England. In this country there have throughout been two Parliamentary parties, and two only; while the objects sought by both have been so definite and of such importance as at once to ensure cohesion, and to justify, in some degree at least, allegiance to the party standard. The conflict of parties has, in fact, been the means of carrying on and regulating a series of organic changes and reforms in a democratic, or at least in a popular, direction. The adherents of each party have been able to say, with truth, that they were contending for the ascendency of certain definite principles in government and legislation. At the same time there have been certain principles common to both parties, which, with the remarkable aptitude of the nation, and the retention of the leadership on both sides by a section of the aristocracy, have always, in modern times, kept the contest within bounds. Even so, party has often shown that it is but a fine name for faction; and in the pauses of progress, when there was no great question before the country, the generous emulation of party leaders has sunk into a personal struggle for place

with all its rancor and all its meanness. Such, however, as it is, the ground for the existence of the party system is peculiar to England, and has its explanation in her political history: the attempt to reproduce the system in other countries, without the ground for its existence, will be not only senseless, but noxious in the highest degree. To divide a nation forever into two factions, and to set these factions to wage a perpetual war, such a war as that of factious always is, and with the usual weapons of intrigue, mutual calumny, and corruption, is surely the strangest plan ever deliberately adopted by a political architect; and if we could be convinced that this was the only possible mode of carrying on constitutional government, we should regard the case of constitutional government as hopeless. How can our political salvation be found in a system of which it is the inherent tendency, one might almost say the avowed object, to stir up discord, to excite unpatriotic passions, to stimulate selfish ambitions, to deprave political character, to destroy that reasonable loyally to the national government on which the very existence of a free community depends? If the absurdity of such a theory is not manifest enough in itself, let inquiry be made into the working of the system of party in the British colonies, where it has been retained for the personal benefit of groups of politicians, when, all organic questions having been settled, the public grounds for such combinations and for allegiance to party have ceased to exist; it will soon become manifest what are its effects upon the efficiency, purity, and stability of government, on the morality of public life, on the political character of the people. In the United States there was ground enough, and more than enough, for the existence of party while the nation was divided on the question of slavery; and it is not surprising the party spirit should have prevailed over allegiance to the nation, or that there should have been a party conflict of the utmost bitterness, which, being brought to a head by an election to the presidency, ended in a civil war. But the old materials for party having been thus exhausted, and new materials not presenting themselves, the combinations are breaking up, the lines are becoming confused, and the present government, in undertaking the work of administrative reform, hardly relies more on the support of its own party, the regular managers of which are all against it, than on that of the best section of the other party, and less on either than on that of the nation at large.

The historian of parliamentary government in France, M. Duvergier de Hauranne, who tacitly assumes throughout his work the necessity of the party system, states its theory thus: "In free countries, where liberty is not of yesterday, there always exist, in the bosom of society, two principal tendencies, one towards liberty, the other towards authority, which manifest themselves in all legal ways, above all in the way of elections, and which usually produce two parties, having each its principles, its opinions, its flag. Of these parties one has the majority, and governs, not directly but indirectly, by the influence which it exercises, the choices which it indicates, the measures which it defends or combats. The other becomes the opposition, and watches the government, controls it, keeps it up to the mark, till such time as faults or a movement of public opinion change the relative position of the parties, and give it in its turn the right and the power of governing." Two tendencies, according to this eminent writer, there must always be in the nation, one towards authority, the other towards liberty; and these tendencies are the foundations of the two parties, by the perpetual conflict of which government is to be carried on. But suppose a man to have an equal and well-balanced regard, both for authority and for liberty, to which party is he to belong? Or is he to remain in a state of suspension, and to be eliminated from politics, because he thinks rightly and is free from undue bias? Suppose the nation itself to have arrived at a reasonable frame of mind, to be practically convinced that, while the preservation of ordered liberty is the object for which authority exists, rational allegiance to authority was essential to the preservation of liberty — what then? Because the nation was all of one opinion, and that opinion evidently the right one, would the possibility of good government be at an end? Then, again, do not those who hold the view of M. Duvergier de Hauranne perceive that, while it is essential to their theory that there should be only two parties, that of authority and that of liberty, that of the government and that of the opposition, the fact is that in France there are a dozen, that the same is the case in other countries, and that even in England, though the Conservative party, which is a party of interest, retains its unity, the Liberal party, which is a party

of opinion, is splitting into sections, which are becoming every day less amenable to party discipline, and therefore weaker as a whole? It is evident that, as intellectual activity and independence of mind increase, sectional differences of opinion will multiply, and party organization will become more impracticable every day. Nothing will be left us but hollow, treacherous, and ephemeral combinations of cliques which have no real principle of union, and which will be torn asunder again by mutual jealousies almost as soon as they are combined. Intrigue and cabal will continually gain force; the hope of a stable government will grow more faint; until at last the people, in sheer weariness and despair, will fling themselves at the feet of any one who promises to give them stability and security with the strong hand.

An executive council, regularly elected by the legislature, in which the supreme power resides, and renewed by a proper rotation and at proper intervals, so as to preserve the harmony between the legislature and the executive, without a ministerial crisis or a vote of censure, is the natural and obvious crown of an elective policy; and to something of this sort, we venture to think, all free communities will be ultimately compelled to have recourse, by the manifest failure of the party system. If further security for the responsibility of the executive to the legislative, and for the maintenance of harmony between the two, were deemed needful, it might be provided that, besides the limitation of office to a certain term, each member of the council should be liable to removal at any time for special cause, by the vote of a certain proportion of the assembly. Such a provision would have enabled the French legislature to get rid of Barras and his two accomplices in the Executive Directory as soon as it became manifest that they were conspiring against the constitution.

A national assembly, elected under such conditions as may appear to be most favorable to the ascendency of intelligence and public spirit, representing the undivided sovereignty of the nation, always in existence, renewed by such instalments as may preserve its popular character without rendering it the sport of temporary passion, legislating under rules the best that can be devised for securing deliberate action, and in its turn electing the members of a responsible executive — such, once more, seems the natural organization of a community which, in the course of human progress, has discarded the hereditary principle, and adopted the elective principle in its stead. No constitution can protect itself against the external violence of a great army if the army is willing, at the bidding of a military usurper, to cut the throat of public liberty. No constitution can change the political character of a nation, or cure, as by magic, the weakness and servility contracted by centuries of submission to a centralized and arbitrary administration. No constitution can neutralize the bad effects produced on public spirit and on mutual confidence by the decay of religious belief in the minds of a great part of the nation, and the absence or imperfect development of any new faith. No constitution can eliminate the general vices of human nature, or the special vices of the particular nation. But such a constitution as we have indicated would at least not contain in itself the certain seeds of its own destruction; it would not be liable to legal dissolution by any external power; it would continue to exist, to do its work better or worse, to renew itself by an operation as regular as the seasons, and which there could never be a special temptation to interrupt; without inducing torpor, it would avoid anything like a violent crisis, such as is brought on by a general election, especially after a penal dissolution; it would keep the way always open to the reform of what is bad, by means of improved elections and without a revolution; it would give full play to any increase of virtue and intelligence which there might be among the people; its course would no doubt be at first somewhat halting and unsatisfactory among a people whose training has been so unfortunate, but it could hardly fall to the ground, or fail to answer in a tolerable way the ordinary ends of government.

Of the present constitution, unfortunately, the contrary is true. It does contain in itself the almost certain seeds of its own destruction. The quasi-monarchical power, presidency, marshalate, or whatever it is to be called, and the Senate, which is sure to have an aristocratic character, will probably remain, as they are now, the double basis of a perpetual reaction in favor of the hereditary principle, to which privilege, with good reason, clings; and recent experience renders it highly probable that the two, if firmly united, would be able by successive dissolutions, combined with the exercise of government influence in the elections, to place in the utmost peril, and practically to annihilate, the organ of the national sovereignty and

the national sovereignty itself. The constitution of "three powers" is a constitution of civil war.

In discussing constitutions, however, and the revision of constitutions, we are haunted by the unwelcome apprehension that something of a sterner kind may yet be in store for France. We do not greatly fear that a soldier, whose name is associated with nothing extraordinary or great except defeat, will conceive the design of founding a military empire in his own interest. We do not greatly fear the clericals, since the catastrophe of Eugénie and her priests, and when Ultramontanism, in spite of its recent spasm of aggressive energy, is manifestly losing ground throughout educated Europe. We do not even greatly fear Bonapartism in itself, simply as a movement in favor of the restoration of a military despotism for the benefit of a discredited dynasty. What we fear is the implacable hostility of aristocracy to a republic based upon equality. In France the three aristocracies, Legitimist, Orleanist, and Bonapartist, are now collectively strong; their wealth has greatly increased; they begin to feel a common interest, social and political, though they are at present ranged under the banners of different pretenders, and have hitherto, by their disunion, saved the republic. One and all they instinctively hate equality, and those hate it most bitterly whose nobility is of yesterday. You may demonstrate as clearly as you please that aristocracy has had its hour, that humanity is passing into another phase, that the best and most glorious part which a man who inherits the influence of aristocracy can play is to smooth the transition into a new era: some of the finer minds, and of those who can hope to maintain ther position by their own character and intellect, will perhaps listen to you; the mass will obey the bias of class, cling to privilege, and constantly conspire against equality and any institutions by which equality is upheld. Their feelings towards the democratic masses are not those of mere political difference, but of hatred more bitter than that which is felt by a foreign enemy, and aggravated by contempt. The aristocratic conspiracy, for such at bottom it was, of De Broglie and Fourtou has for the moment failed; but the attempt will be perpetually renewed; and it will be fortunate indeed if the question between the republic and the aristocracy is finally decided without adding another convulsion to the ninety years' agony of France.

GOLDWIN SMITH.

ERICA.*

TRANSLATED FOR THE LIVING AGE FROM THE GERMAN OF

FRAU VON INGERSLEBEN.

XV.

THE DEPARTURE.

FRAULEIN MOLLY had already said that the princess felt uncomfortable in Waldbad and would therefore soon leave it, and in fact ever since the time of Carlos's abduction, Katharina's mind had been fixed upon going away from the village. Although every precaution was taken to render any repetition of the attempt impossible, the princess lived in continual fear of losing her boy.

Moreover, the universal excitement the event had created made the position of affairs in Waldbad less agreeable to Katharina. To be sure, the sympathy of all classes was exhibited in a manner which she had never before been able to obtain, either by her rank, her lavish expenditure, or even her personal attractions. But the mode in which this sympathy was shown annoyed and oppressed, instead of pleasing her, for the hours of unutterable grief which these people had shared with her placed them on a more familiar footing in her society.

They had seen the woman, around whom circumstances had hitherto diffused a certain halo, overpowered by grief, helpless, and feeble. In spite of all external differences, anguish had crushed its victim as completely as it would have vanquished any other mortal, and therefore the greater part of the bulwark of distinction had fallen. But at the same time they thought that this glimpse of the beautiful woman's heart had revealed warm, deep feelings, and they therefore gave her a double share of love in return for their deficiencies in outward deference.

People in general have a strong resemblance to children, only unfortunately this similarity shows itself more in the immaturity than in the instinctive purity and truth of childhood. Bright, strongly-marked colors dazzle and allure young eyes, which are not yet able to perceive more delicate shades, and thus a picture whose subject stands forth boldly from the canvas will naturally win more applause from the multitude than the masterpiece of art in which the outward form is merely the husk of the soul within. Even the most uneducated eye will discover the

meaning of the first picture, and thus be filled with a certain sense of gratification at its own correct perception, while few persons can rise to the height of the real work of art, and there are always few spirits that can soar from earthly to heavenly things.

Thus Katharina's loud grief and total loss of composure seemed to the multitude a proof of her deep feelings, her ardent maternal love. But for her sobs and shrieks her anguish would not have been discovered or believed; but these outward tokens victoriously conquered the doubts of even the most incredulous. The few who, possessing greater delicacy, were wounded and repelled by this want of self-control, disappeared in the throng of panegyrists, because they were silent, while the others loudly announced their opinions.

In this way a circle of eager and cordial sympathizers, who advanced far beyond the limits of their former acquaintanceship, had gathered around Katharina. The partition which external circumstances had formed between them was broken, and the chasm of higher social position bridged over by the warm interchange of feeling which united the multitude to the princess. Unfortunately this sympathy soon died out of Katharina's heart, and the eager but somewhat too obtrusive and informal manner in which it was displayed by others grew very burdensome.

We ought not to judge the princess too severely, for experience teaches that the close connection with our fellow mortals into which necessity and misfortune bring us, is so beneficial that it almost paralyzes our grief, but nevertheless — and we can all test it — as soon as the necessity disappears, the anxiety is removed. This same close connection may easily become an oppressive chain. While formerly sustained by the consciousness that we were not alone, but among sympathizing friends, we are now oppressed by the expectation that we must continue to feel with equal keenness an emotion which borrowed its intensity from the exigency of the moment.

Relations which have been produced by unusual circumstances must be broken, if life is to flow on in its accustomed channel. We, therefore, often falsely complain of ingratitude, when it is only our own short-sightedness which prevents us from recognizing the laws of nature. Grief is simply a messenger from heaven, it makes us better and purer, enlarges our powers of loving, but mother earth asserts her rights only too soon, and sinks her children into their former egotism.

The woman, hitherto a total stranger to the princess, on whose shoulder she had unconsciously leaned her head, who had supported her in her arms, and whispered consoling words in her ear, felt bound to her forever. The sailors who had been summoned to search for the lost boy, and to whom the mother had expressed her thanks with tears and sobs, had been devoted to her in body and soul from that moment, but asked in return a constant remembrance. The throng who had sympathizingly surrounded her when, overwhelmed with anguish, she struggled on the verge of madness, pursued her with familiar tokens of love, and expected a response.

Katharina was too wise not to perceive that the uncomfortable warmth of this universal sympathy must not be too quickly cooled by her own conduct, unless she wished to expose herself to the harshest condemnation. The thermometer of feeling must move gradually up and down, for its sudden bounds reveal corresponding throbs in human hearts, which are difficult to heal, and even when cured show their deep wounds forever by the broad scars that remain.

But what Katharina's reason clearly perceived, her disposition — the sole ruler to which she bowed — was unable to execute. She could not endure the constraint, for she had never learned to control her feelings, and thus a hasty departure was the only solution of the difficulty. With almost frantic haste she ordered preparations to be made for this departure, preparations which, in consequence of the magnificent style of housekeeping, unnecessary, and almost absurd for the short time of her stay, were somewhat extensive.

Unfortunately her brother's wound, which, in consequence of his neglect, had become somewhat serious, was a disagreeable obstacle to this speedy departure. Katharina would not go without him, and, impatiently awaited his convalesence. She began to hate the doctor, who repeated his prohibition every morning, fancied he was acting in Elmar's interest, and told the latter that his reluctance to travel was an unmanly yielding to a little pain. Elmar knew his sister too well to be angry with her for this reproach, neither did it wound him that she had not uttered a word of gratitude for the rescue of the boy — was he not Carlos's uncle, and therefore merely doing his duty when he saved his little nephew?

"If you will give me any sensible reason for the necessity of our immediate departure, Kathinka," he answered quietly, in reply to her persistent entreaties, "I am ready to risk my health."

"This excuse about your health is ridiculous, my dear Elmar," replied his sister angrily. "You are quite well enough to travel, and the plain truth of the matter is that you are determined to stay here."

"If that were my intention, I should need no pretext. Probably you are not aware that the Sternaus received a telegram this morning, which will compel them to leave Waldbad this afternoon. The consul is dangerously ill, and has sent for his family."

"You seem to be on very confidential terms with these people," and Katharina's flushed cheeks, as well as the irritated tone in which she spoke, plainly showed her agitation.

"*These people* are kind enough to send every day to inquire about my health, and their servant told the news this morning."

This information produced the effect intended, for Katharina, without any farther consideration for her brother, determined to leave Waldbad the next day. The following morning, however, the physician declared the latter's wound so much healed that he might travel without fear of a relapse, and Elmar therefore said he would accompany her. Katharina shrugged her shoulders, and regretted that she had allowed herself to be deceived several days by this farce. Elmar laughed, but made no reply, for he knew that no assurances from him would soothe his sister's suspicions.

Erica had never called upon the princess of her own free will, but Katharina had sent for her several times and overwhelmed her with tokens of her love and gratitude.

Erica, whose feelings towards her had sustained such a complete transformation, had been still farther prejudiced by her mother's unfavorable opinion, but she could not help being a little won over by the lady's extravagant expressions of esteem and friendship, and thereby was rendered so irresolute that her usually frank manner became constrained, and she was thus robbed of her greatest charm.

Towards Katharina she was really somewhat awkward and unamiable, merely because she reflected before she spoke, instead of yielding entirely to impulse. Too little versed in social forms to be able to maintain the proper medium between a suitable degree of politeness and due reserve, the princess's unfavorable opinion was only too well justified. She felt this herself, and the knowledge increased her uncomfortable constraint, till she was unable to appear as usual towards any one except little Carlos, whose affection for her daily increased.

In spite of this state of affairs, the princess remained true to her resolution to obtain Erica for her companion, and even condescended to ask Fräulein Molly to remain in her house for a time, until both parties had made satisfactory arrangements. Molly, however, coldly declined, and Katharina — offended by this reception of her advances — angrily desired the separation to take place at once, but Elmar opposed this plan with so much decision, that Katharina consented not to dismiss her companion until she reached Castle Altenborn.

On this occasion she informed her brother that she intended to take Erica in Fräulein Molly's place, and said that she could not show her gratitude better than by training the unattractive young girl, while at the same time her boy's affections would have a new object, and relieve her a little of the burden that rested on herself.

Elmar smiled somewhat scornfully at his sister's eager explanation, and thereby irritated her into giving still more ample details of her admirable intentions towards the young girl, from which she would not be deterred, either by her consciousness of the great labor, or the knowledge of the jeers that would be lavished upon her good-nature. In reply to her brother's question about the mother's reception of her proposal, she was at last obliged, in spite of skilful evasions, to acknowledge that it had been declined, and confess that only the invalid's approaching death afforded her a prospect of gaining her end.

"Really, Katharina!" said Elmar very gravely, "only your simplicity rendered it possible to propose such a plan under such circumstances. We will suppose that you were really urged on by feelings of gratitude to the young girl, or one could not help shuddering at the abyss of heartlessness you have disclosed."

"You are a fool, Elmar!" replied Katharina in a gay, bright tone. "I think the burden I am ready to impose upon myself is a sufficient proof of my gratitude. But you men are all egotists, and do not comprehend a woman's capacity for self-sacrifice."

On the day of departure only cheer-

ful faces were to be seen in the little fairy castle. The princess was delighted to leave a place which had become uncomfortable to her, Fräulein Molly was equally rejoiced to see the end of a companionship which was daily growing more unendurable, and even Elmar was glad to turn his back upon a house that was very dull for him. The servants seemed equally well satisfied; they had fallen into the natural error of expecting to find amusement for themselves in a trip to a watering-place, and this expectation had not only remained unfulfilled, but they had actually had far less pleasure than at Castle Altenborn.

The princess sent for Erica again that morning to take leave of her. She embraced and kissed her, and as a souvenir put around her neck a gold chain, from which hung a locket set with diamonds, containing her own miniature. The young girl, who had never before possessed any article of jewelry, blushed with pleasure, and thanked the princess cordially with deep emotion. Katharina kissed her again, and then left her alone with her happiness.

Erica approached the window to look at the picture more closely. It was exquisitely painted, and a speaking likeness, but the face seemed more youthful and there was a certain happy repose upon the features which contrasted very favorably with the constant restlessness of the original. Fräulein Molly, who chanced to enter the room, had scarcely glanced at the magnificently framed picture, when she started back exclaiming, —

"What? Did the princess give you *this* portrait?"

"Yes," replied Erica in surprise; "is there anything remarkable about the picture?"

"It was her bridal gift to the prince. He wore it around his neck for years, until his love grew cold and he threw the concealed jewel aside like a cast-off garment, and finally sent it back to his divorced wife."

Erica involuntarily seized the chain and hastily snatched it from her neck.

"Are you superstitious, Erica?" asked Molly.

"On the seashore, and among the fishermen it is easy to become so. Hitherto, however, I have always kept the consciousness of my superstition to myself, though I have been unable to conquer it."

"Then my incautious remark caused you pain, I wish I had not made it."

"Never mind, Fräulein Molly, I shall probably never meet the princess again, so her gifts will bring me no misfortune."

"Certainly, Erica, neither the picture nor the chain can injure you, but I doubt whether you have seen the original for the last time, or I am entirely mistaken in my knowledge of human nature."

Erica looked inquiringly into her companion's face, but before the latter could explain herself more clearly, Elmar opened the door. Erica had not seen him since the eventful evening of the robbery, and therefore involuntarily advanced a few paces towards him. Elmar also hastily approached, and holding out his hand, said cordially, —

"Welcome, companion of my sufferings! I was just going to your house, for I could not possibly leave this place without seeing you. How have you borne the excitement and exertions of that night?"

"Better than you seem to have done, Baron von Altenborn," replied Erica somewhat formally. "You look pale."

"Do I really?" laughed Elmar. "It is a pity that I can't turn this interesting pallor to more account, but unfortunately Fräulein Caroline went away yesterday."

"Don't be uncivil, baron," said Molly, while Erica gazed silently out of the window.

"Ah! you punish me with the 'baron'! You know the sensation aroused by the title is about as agreeable as the scratching of a knife on a china plate."

"Then you must have been very well pleased with me during the short time of our intercourse," replied Molly with a mischievous curtsy.

Erica understood neither the unusual, and, as it seemed to her, causeless gaiety of Fräulein Molly, nor did Elmar's manner meet with a response. She felt sad and out of humor, and wished to go away. Just as she raised the chain, which was lying on the window-sill, to put it in her pocket, Elmar's eyes rested upon it, and his bright face suddenly clouded as he asked hastily, —

"Did Kathinka give you that chain, Erica? *Madame la princesse* is always the same," he continued with cutting contempt, turning to Molly. "Grant me one request, Fräulein Molly," he instantly added in his former jesting tone, "though it is tolerably uncivil. Leave me alone a moment with my young friend. I have some things to say to her which even your discreet ear must not hear."

"My curiosity is not excited," replied Molly slowly, "or rather I anticipated your

wish, and was just going away. But let me first tell you that *Madame la princesse* is not always the same, but knows how to gain her own will under all circumstances, so your words will be vain."

"Will against will, Fräulein Molly, we'll try. Has my tone wounded the little sensitive plant?" asked Elmar, when Molly had left the room.

She made no reply, but the shadow that rested on her face clearly revealed her feelings. Her compressed lips quivered with mingled grief and indignation, the lids drooped heavily over her eyes, and the clear brow was furrowed with deep lines of thought. Elmar gazed at her a moment, and then said with a faint sigh,—

"Unfortunately, I have no time to call back the sunlight to those features. Katharina may come in at any moment, so I must take advantage of these few seconds to entreat you, Erica, to answer my sister's proposal to take you as companion in Fräulein Molly's place with a decided refusal."

The words certainly seemed by no means adapted to restore Erica's cheerfulness, indeed the shadow on her face deepened, and she answered gravely,—

"My mother has already declined the offer, I have no voice in the matter."

Elmar looked out of the window without making any reply, he seemed embarrassed by the mode in which she had worded her answer. "Certainly," he said at last, "your mother now has the sole right to decide, but you will grow older, become more independent, Erica, and then you will have full freedom."

"I will never leave my mother of my own free will," cried Erica passionately.

Elmar again glanced through the pane. Was it possible that the daughter had no suspicion of her mother's condition? And if so, would it not be almost a sin to destroy this innocent confidence in the future? "I expected no different course," he said after a still longer pause, "but I must have some positive security. Give me your hand, and promise solemnly that, under no circumstances, will you accept a situation with the princess."

"I promise," replied Erica softly, placing her hand in Elmar's. Her indignation had vanished, but her grief had grown still deeper, and she could scarcely restrain her tears.

"Don't hang your head so, little heather blossom," said Elmar in a very different tone, "there are plenty of real troubles in life, and we must therefore be economical with our grief. What, tears! I really believe, little fairy, you are trying to unman me."

The jesting tone was not calculated to restrain Erica's tears. She pressed both hands over her eyes to restrain and conceal the increasing flood. Elmar threw his arm around her and drew her towards him. "Don't cry, Erica," he whispered softly, "we are only parting for a short time. I will certainly come back again next year, and," he added in a fonder tone, "if you ever need a friend, call upon me. I will obey the summons wherever I may be." He touched her brow with his lips, and vanished before Erica fully comprehended what had happened.

She too now left the room and walked slowly towards home. The promise of another meeting, the certainty of his sympathy, were inexpressibly consoling to her, and it did not occur to her for some time that Elmar had shown a great deal of presumption in attributing her tears to his departure. True, she could not give any very clear account of their cause, even to herself, but of course it was probably her regret at parting from a family she had learned to love.

She blushed with shame at the thought that her conduct had authorized the young man's boldness, nay, even given cause for the belief that her tears flowed especially for Elmar's departure. At each examination, she found her behavior more and more improper and incomprehensible, and yet she could feel no lasting anger either with herself or the young baron, while the low whisper in which he had promised to return still rang in her ears. She went home as if in a dream, and her mother was obliged to remind her that she had intended to carry the princess a bouquet of flowers from the pastor's garden.

That afternoon a crowd of people thronged around the fairy castle, to watch the princess's departure. At last she appeared at the door in travelling costume, nodded kindly to the bystanders, expressed her thanks for the flowers with which her carriage was so richly adorned, and uttered a few words of regret that she was compelled to leave Waldbad. Little Carlos seemed to feel this sorrow less, for he eagerly watched the carriage that was to take him away, and could hardly be induced to notice the farewell greetings and join his mother in nodding and kissing his hand. Elmar also seemed pleasantly excited, although he bowed in every direction, while Fräulein Molly sat beside the princess like a statue, and took no part in the bustle.

Erica, holding her huge bouquet, stood concealed amid the crowd, unable to summon up courage to come forward. Her heart had again grown so heavy that she feared her farewell might betray her grief too plainly, and she would probably have carried her bouquet home again, if little Carlos had not seen her and attracted his mother's attention.

Now she was obliged to come forward, and, handing the flowers into the carriage, stammer an incoherent farewell. Katharina bent towards her to receive the bouquet, and whispered as Elmar had done that morning: "We shall not be separated long, we shall soon meet again, Erica."

The horses started, and the carriage soon disappeared from the eyes of the throng. The princess's whisper, however, did not afford the young girl the same consolation that her brother's had done, and she felt sadder than she would have believed it possible to do a few hours before.

XVI.

THE CONVERSATION.

When Erica awoke the next morning, the prevailing emotion in her heart was that of boundless desolation. The day stretched before her in such immeasurable length that she scarcely knew how to fill the hours which usually vanished only too rapidly. She felt disinclined to work or study, and a walk in the open air seemed to be the only thing that had not lost all charm for her, for she determined to take one immediately after breakfast. Just as she was in the act of leaving the house, Christine summoned her to her mother's bedside. The message surprised and alarmed her, as the invalid of late had always spent the morning alone, and she hastily obeyed the call.

Erica found her mother already dressed and sitting in her chair. She greeted the young girl lovingly, and pointed to a seat, but either because she wished to escape observation, or in accordance with old custom, Erica took the little stool and placed it at the invalid's feet. The latter made no objection, and as usual laid her hand affectionately on her daughter's head; but as she still kept silence, Erica at last ventured to ask timidly, —

"You wanted to speak to me, mamma. But perhaps you feel too weak?"

The invalid sighed and answered slowly, "Yes, Erica, I feel very weak; but nevertheless I must speak to you before it is too late, before these lips are forever silent."

"Mamma!" was the only word Erica could utter. Her large eyes gazed, as if paralyzed with terror, into her mother's face, and her whole form trembled. The veil which had hitherto concealed the sick woman's condition from her eyes was torn away, and the impending loss of the dearest treasure she possessed on earth suddenly stood before her like a threatening spectre.

Frau von Hohenstädt again passed her hand lovingly over her daughter's soft hair, but did not speak. Large tears now welled into Erica's stony eyes, and letting her head fall into her mother's lap, she murmured sobbing, —

"Mamma, you were almost always as sick as you are now; you won't leave me, God will not tear you from me."

"Be calm, my child," whispered the invalid, "do not make this terrible hour too hard for me. Let us unite in gratitude to God who has granted me so long a respite, and use the short interval of time that still remains to talk of your future."

"I can have no future without you, mamma! I will die with you."

"If you really love your mother, Erica, compose yourself. I cannot endure the sight of your grief, and it will render it impossible for me to say what I ought — must tell you."

Erica raised her head, and forcing back her tears, replied with quivering lips, "I will weep no more, mamma, I am perfectly calm."

"My own dear child," whispered the mother, bending forward to press her lips upon the daughter's brow. "You have witnessed my long hours of suffering, Erica," she added in a somewhat louder tone, "you know that life had no joy for me except your presence."

"I know it, mamma," murmured Erica. She had again bowed her head on her mother's lap, and closed her eyes, while large tears ran slowly down her cheeks.

"Then you will not wish to disturb by your grief the rest for which I long. You will be sustained by the thought that your mother has at last found peace, entered the kingdom where there is no sorrow or weeping."

"Yes, mamma," replied Erica, in an almost inaudible tone.

"Your future, my dear child, was the only thing that made it hard for me to leave this world; which, in spite of my grief and sufferings, still induced me to implore God to spare me to you. Your whole education was designed to steel your body and mind, in order to enable you to

withstand the storms of life. Your development, although in accordance with my hopes and wishes, was slow, and at seventeen you are still almost a child."

"I am a child no longer, mamma! This hour makes me cross the gulf and renders me ten years older."

"Grief matures the mind more rapidly than joy; so I will not despair because you are now in the midst of the battle of life. God in his great mercy has taken the bitterest sting from my dying hour; I need not leave you perfectly helpless. You are surprised, my Erica, and will be still more so when I tell you that probably the rash deed you performed that night is the sole cause of this relief. I cannot explain the matter in any other way. When I have told you all you can judge for yourself."

The invalid made a pause, but Erica did not interrupt it, and after a long silence she continued: "You know, my child, although I have never spoken to you about the matter, that our former easy circumstances were greatly changed by unforeseen misfortunes. Ill and feeble as I was, I could not think of supporting myself, and in order to live and provide for your education was forced to convert the small, very small, amount of property that remained into an annuity, which ceases at my death. This income, even in the economical way in which we lived, was barely sufficient to defray our expenses, and necessity compelled me to sell our last piece of property — this little house — which I had hoped to keep for you. The sum it would bring was small, it is true, but the cottage is dilapidated and of little value, though land in Waldbad is much higher than formerly.

"It thus became impossible to secure your future independence, and I should perhaps have felt this inability still more bitterly, if my own life had not too clearly shown me the perishableness of all earthly riches. When this summer I perceived the speedy approach of death, and was forced to realize that I had but a short time to remain with you, my dear child, I thought it my duty to use in your behalf the few worldly advantages I still retain.

"You know, Erica, that we have many wealthy relatives, but you also know I have never claimed their assistance, but on the contrary, in consequence of my misfortunes, remained aloof from them. I think I was right, but even a good principle may be carried too far. Praiseworthy consistency in this case can easily become obstinacy and narrow-mindedness, whose sting is turned against ourselves.

"Although your education entitles you to enter the circle where you have been destined to gain your daily bread, our secluded, lonely life has made it impossible for you to acquire the social forms on which its members place a great, perhaps undue, value.

"Under whatever name you may wish to enter a family, whether governess or companion, a certain familiarity with the rules of etiquette is always required, and this familiarity cannot be obtained in solitude, but only by intercourse with society. You are to have an opportunity to learn these forms in the house of one of your relatives. This is a request we can make without infringing on our self-respect, and whose fulfilment we are entitled to expect from those so nearly allied to us. God gave me no sister, to whom I should naturally have turned in such a case, and so I hesitated whether to apply to my cousin who inherited my parents' estates as the next male heir, or to my cousin Vally, who was educated with me.

"I decided in favor of the latter, because I know very little of my cousin Kroneck, while Vally and I maintained for years a constant correspondence, which I gradually dropped. Vally, with her punctilious observance of the rules of etiquette, and practical common sense, seemed to me the best person to add the finishing touches to my child's education. The thought of her apparently cold, nay, chilling manner, did not deter me; on the contrary, I hope it will give a beneficial counterpoise to a training bestowed by a mother who is only too weak in heart and mind. I therefore wrote to Vally a few weeks ago, and received a cordial, nay, for her cold manner, extremely affectionate, reply, in which she warmly accedes to my request.

"I was grateful to her with all my heart, especially as she has four daughters, and I hope this large family circle will afford my Erica an opportunity to acquire that ease in her intercourse with others, in which she is now so greatly deficient.

"Besides, I wished, before my death, to sell this house in order to pay every little debt and place the small sum remaining in your guardian's hands. The pastor — that true friend whom God has given me in my misfortunes for a support and consolation — will of course be this guardian, and with his assistance I have already been trying for a long time to dispose of our little property as advantageously as

Original from CORNELL UNIVERSITY

possible. Hitherto, however, the offers were so small that we could not accept them, though we were forced to acknowledge that in the dilapidated condition of the house no large sum could be expected.

"Such was the state of affairs, when a few days ago a price was suddenly offered which not only far exceeded our expectations, but also the real value of the estate. Although a lawyer from the city managed the affair, and solemnly assured us that the Princess Bagadoff was *not* the purchaser, neither the pastor nor myself doubted it for an instant, and both instantly agreed to accept the offer. You had done the lady a service which placed her under obligations for life, and there was a delicacy in the manner of discharging this debt of gratitude, which, to tell the truth, I had not expected from the princess, and which on every account I should have considered it wrong to decline.

"Her agent wished to make me believe that his principal, delighted with the situation of Waldbad and the location of our house, which is certainly the most beautiful spot in the village, wished to secure the property at any cost, in order to erect a handsome villa. The dilapidated condition of the cottage was therefore a matter of no consequence, since the walls would sooner or later be torn down, and the purchaser set a higher value upon the quantity of land that belonged to the estate, as he intended to have it laid out in pleasure-grounds. To induce me to gratify her wish — as if I should object to disposing of my little property at so great an advantage — the purchaser would willingly defer the execution of her plans a few years, as she was about to set off on a long journey. I might therefore remain in undisturbed possession of the house, if I would permit certain necessary repairs to be made.

"The good princess had even provided for my old Christel, by appointing her to take charge of the house. If I had not already been determined to accept so much delicate kindness with heartfelt gratitude, this last proof of it would certainly have induced me to do so. The thought of my faithful old Christel, who had devoted her life to my service, was one of the bitterest drops in my cup of sorrow. Unable to provide for her future, I was forced to leave her to the sympathy of strangers, since I was compelled to positively reject our noble friend's offer to receive her in his house. Now her future is secure; she will remain in a familiar spot, can procure greater comforts than before, and also make herself useful according to her strength. She will keep the old house and some day the new one in order, and its owner will doubtless be satisfied with her choice."

"If this sale had been made a few weeks earlier, I probably should not have written my letter to Vally. You can now pay a sufficient sum to enter a family as an independent member, and will therefore not be exposed to the necessity, always bitter to a woman, of gaining your own bread. You can thus use your strength for your own culture as well as the advantage of your companions, and it will be your own fault if you feel yourself a useless member of the great human family.

"I should now prefer to let you become a part of the pastor's household, but I do not wish to sunder the bond that has just been reunited, for I believe it is the will of God. The circle you are about to enter is a cultivated and truly Christian one. Vally's education and character afford me ample security for that fact, so I can feel at ease in regard to your lot in this respect.

"The only change I have made is that you will not go to your cousin's house until early next spring. You can more quickly overcome your grief for my loss among friends and amid your old familiar surroundings, and moreover will not enter a stranger's family during the time of deep mourning. I, however, shall be spared the pain of leaving this house, which has become inexpressibly endeared to me by the sorrow I have endured within its walls. I shall not keep the new owner out of her property for years or even months, but I thank her none the less warmly for granting me a quiet death in the dear old rooms."

Erica, who had hitherto sat almost motionless, absorbed in an agony of grief, now clasped her mother in a passionate embrace, exclaiming through her sobs, "Don't talk so, you are breaking my heart, mamma!"

"Do not grudge me my repose, my child," whispered the mother, "your innocent heart has but a faint idea of the sufferings God has imposed upon me. And now let us end this conversation, Erica, my strength is beginning to fail."

The low, tremulous tone in which the invalid spoke, only too plainly proved the truth of her words. Anxiety for her mother crowded every other thought out of Erica's mind, and she started up to help her to her chamber and perform all the little services she required. Every idea, every feeling was now fixed upon one

object; beside the life of her dear mother, everything seemed a matter of indifference, there was nothing in the past or future that could arouse her interest. The grief caused by the farewell she had taken yesterday seemed like a dream, and Elmar's last words appeared prophetic.

When during the day her mother grew somewhat stronger, Erica, at her request, was obliged to go into the open air, and as a walk now possessed no charms for her, she seated herself on the down to enjoy the fresh sea-breeze. She had not been there long when she saw the pastor's wife approaching her.

"I knew I should find you here, Erica," she said gravely; "come with me to your mother."

Something in her voice and face made the young girl's heart shrink. Her eyes rested on the speaker with a fixed stare, as she shrieked despairingly, "My mother is dying!"

"Come, Erica," said her companion tenderly, taking her by the hand and drawing her towards the house. The young girl walked beside her in silence, only her loud breathing betrayed the agitation of her soul. They soon reached the cottage, and Erica started when she saw the windows behind which her mother was lying in the agonies of death.

Before they went up the steps of the veranda, the pastor's wife whispered, amid suppressed sobs, "You will be strong, Erica; you will not make your dear mother's death harder by your wild grief."

Erica could not answer; the emotion she was struggling so violently to repress made it impossible. But the pastor's wife must have trusted her without any assurances, for she gently pressed the hand that rested in hers, and hastily ascended the steps with her companion.

Erica's first glance at the invalid as she entered the room told her that she was approaching a death-bed. The features had already assumed the pinched appearance, the terrible livid hue, which is the certain sign of the departure of life. The glazing eyes of the dying woman expressed deep contentment when she perceived her daughter, and a faint smile played around her pallid lips.

Erica sank on her knees beside the bed, and burying her face in the pillows strove to stifle her agonized sobs. Her mother laid her hand upon the young girl's head in benediction, for she was no longer able to speak, and when Erica raised her head and fixed her tearful gaze upon the dying woman, a glance of inexpressibly loving farewell beamed from the dim eyes. It was the last sign of life, for the pupils remained fixed, the heart stood still, the spirit had departed.

For a moment Erica was fairly stupefied by the blow that had fallen upon her, then her agony, so long repressed, found vent in loud lamentations. Sobbing passionately, she threw herself upon the beloved corpse and covered the rigid face with her tears. The pastor, who with the doctor and the faithful old Christel stood beside the death-bed, let this wild anguish take its course without interrupting it, or striving to lessen it by any consolation, and only when the exhausted girl leaned her head upon the pillow, did he approach and whisper loving, soothing words in her ear.

At last he took her in his arms, and with a little gentle force removed her from the room, then allowed her once more to give way to her grief, and afterwards, exerting the same gentle violence, led her away to his own house. When Erica crossed the threshold of her home, she knew that henceforth it would be hers no longer, that she had lost the place where she had felt safe from all the storms of life, and now the battles of this life would begin. She almost broke down as the full weight of this consciousness burst upon her, and only the pastor's supporting arms saved her from falling, and rendered it possible for her stumbling feet to reach the abode that was to be her present asylum.

From The Cornhill Magazine.

THE CELT OF WALES AND THE CELT OF IRELAND.

On Christmas night last, the present writer witnessed a little spectacle which, trifling in itself, seems, for reasons to be presently stated, not unworthy of description and consideration.

The scene was at night in a huge barn outside a village in a certain lonely mountain district in the heart of Wales. Not a fashionable, tourist-haunted village, the reader is requested to bear in mind, but a scattering of some twenty cottages of the solid, almost Cyclopæan, Welsh stone-masonry, of which (with the exception of the parsonage) the most imposing edifices are the post-office, the smithy, and the turnpike gate-house. No "public" or drink-shop of any sort exists in Llan——, but, *en revanche*, besides the church are two large Dissenting chapels, belonging of

course to the small farmers whose holdings are dotted over the surrounding hills. The assembly, though modestly announced on the tickets of admission (price 6*d.*) as only a *Cyfarfod Llenyddol* (Social Meeting), was in truth a miniature Eisteddfod, or competition for prizes, by poets, essayists, singers, and *improvisatori.* Of course on reading this, the English reader at once beholds with his mind's eye the energetic parson of the parish originating the whole scheme, working it up diligently to the honor of Christmas, laying the squire under contribution for prize-money, and employing all the young ladies in the neighborhood in decorating the hall with texts in Gothic characters as undecipherable as Chinese to the parishioners.

Nothing could possibly be further from the Eisteddfod of Llan——, which was devised, paid for, and performed exclusively by and for the villagers themselves, the carpenter, the blacksmith, and a score of farmers. Naturally every arrangement was of the simplest kind. The rough-hewn stone walls of the barn, with the rock on which they stand projecting here and there through the floor, were only relieved by two inscriptions — "A Merry Xmas," and "*Cymru lân gwlad y gân,*" "Fair Wales the Land of Song" — emblazoned with holly leaves and berries, on white calico, and illuminated by three rather smoky lamps pendent from the beams above. Of what degree of luxury the "stall seats" may have boasted I cannot tell, the well-packed crowd thoroughly occupying every inch of sitting and standing room. At the upper end, near a table, sat the young, pleasant-looking chairman, with a white rosette on his breast, together with the principal candidates for the prizes; and the competition went on with great *verve* and rapidity for about a couple of hours. I was unfortunately absent when the *penillion* was sung — a peculiar Welsh form of improvisation in dialogue, wherein both performers choose some theme, and respond to one another in impromptu song to a certain familiar tune. This was said to have been done (as is often the case) with cleverness and humor, little incidents of the hour and friendly personalities being introduced into the rhymes. After the *penillion* came a really charming glee, sung with feeling and delicacy, and rather erring on the side of being too *piano* and subdued, than of anything approaching the music-hall style of exhibition. This was listened to by the audience with breathless attention and encored enthusiastically, and after it followed an original poem of some twenty stanzas on the "Robin," repeated in a sort of recitative by the author, an intellectual-looking man, a small shopkeeper in a neighboring village. Each verse of this poem apparently contained some playful fancy, or as an Elizabethan writer would have said a "conceit," which was thoroughly appreciated and enjoyed by the audience, and secured a prize for the composer. Next came a short essay on the "Duties of Mothers to their Children," by the wife of the carpenter of the village, whose husband and daughters took the chief parts in a really excellent song which, with the distribution of the prizes, concluded the amusements of the evening.

As I walked home in the moonlight, with the snow-capped mountains and silent brown woods around my path, the reflection struck me very forcibly that the people who could originate and enjoy such a refined entertainment as I had witnessed must differ in many essential particulars from the peasants of most other countries with whom I had acquaintance. I thought of how the English agriculturalist, when left to choose his own diversion, invents such sports as tumbling in sacks, grinning through a horse-collar, and climbing a greasy pole for a leg of mutton; how his ideal of heaven has been confessed to be a "public with a fiddle going;" and finally how when the parson and the squire undertake to afford him entertainment apart from the supreme attractions of victuals and drink, it is considered indispensable to choose for the penny reading or the musical performance, literature and melodies indefinitely less refined than those which the spontaneous good taste of these Welsh men and women had led them to prefer. In France again, I thought how the young men and women would have insisted on a dance — possibly the cancan — instead of such an *anodyn* style of amusement, as they would have deemed our Cyfarfod. When the idea presented itself of the inhabitants of an Irish village of no greater pretension than Llan——, unassisted by squire or clergyman, getting up on their own account such an Eisteddfod, the incongruity of the notion was so startling that it brought vividly to a focus the impressions I had been receiving, through a residence of many years in the two countries, of the vast and not easily explicable difference which exists between the Celtic populations of Wales and Ireland. Perhaps in these days, when a very influential school of thinkers seem prepared to resolve every human characteristic

—moral, intellectual, religious, and æsthetic — into a matter of hereditary transmission, it may not be uninteresting or useless to spend a little study on a problem touching so nearly the assumed law of such transmission. Here are two branches of the same great Celtic family, distantly allied — as philologists affirm, considerably *more* distantly than the Irish from the Highland Scotch, for example — but still of the same blood, members of that same earliest swarm which left the old Aryan home for the West before history began. They have dwelt for several thousand years side by side as next neighbors, in countries under the same latitude and with a similarly pluviose climate, and propinquity to "the melancholy ocean." For several centuries they have both been under the rule of the same conquerors. Intercourse between them at a very early period was so close that several saints and heretics,* legends and musical airs, are to this day attributed to Wales by Welsh, and to Ireland by Irish archæologists. Yet instead of exhibiting such obvious and striking resemblances as might have been anticipated, under circumstances so similar, and instead of progressing together step by step in prosperity, the differences, or rather contrasts, in the characteristics and fortunes of the two people are so much more salient than their likenesses, that nine Englishmen out of ten forget that they are anywise akin, and no statesman dreams that because one act of Parliament is fitted for Ireland, it is likely to be needed in Wales.

Without pretending to offer novel observations on themes so familiar as the characteristics of the two countries, I think that an attempt to lay them side by side in parallelism may not be without a certain interest, and possibly not without use. Either the laws of heredity are not exactly what we have of late been led to suppose, or the causes which have interfered with their action on so large a scale and in so decided a manner deserve to be carefully investigated. Could Ireland be rendered prosperous, contented, and loyal as Wales, could the Irish be clothed, and educated, and inspired with the same hopeful industry as the Welsh, no greater boon could befall the empire. And, it may be added, could the Welsh by made to observe certain laws of moral conduct as sacredly as do the poor peasantry of Ireland, it would likewise be a gain to the virtue of the world. Whether we are to look for the cause of the difference in the wrongs and miseries of past ages or in the existing economical, political, or religious conditions of the two countries, is therefore a problem fairly claiming the attention of every thoughtful Englishman.

The chief *present* differences between Wales and Ireland (which ought to be borne in mind, but on which we shall not further touch in this paper) are as follows: Ireland is ultra-Catholic, Wales ultra-Protestant. Wales has an Established Church which is not the church of the masses. The Church of Ireland has been disestablished. The land of Ireland is chiefly held by men of Saxon race. The landowners of Wales are still very generally Welshmen by blood and sentiment. Wales possesses innumerable mines and quarries all over the country, holding out bribes to speculation and keeping the wages of labor exceedingly high. Ireland, being almost exclusively an agricultural country with little industry except the linen trade, there exist few opportunities of fortune-making, and the wages of labor are proportionately small. Finally, while Ireland has gone in a vicious circle, her wrongs and sufferings creating a class of agitators, and agitation preventing the development of the resources of the conntry, Wales has had few wrongs and no agitators; jealousy has been out of question between the small and poor and the great and rich country; and patriotism has assumed the harmless form of enthusiasm for the national language, music, and monuments. Instead of a Home Rule meeting, there is an Eisteddfod.

Preliminary to any parallel between the Welsh and Irish nations, it is to be marked *en passant* that, while both have well-marked characteristics, the smaller and geographically less isolated country is more distinctly individualized and keeps closer to its traditions than the large island. If, for example, we take *language* as a test of sustained nationality, we find the old "Cymraig" to this day both the spoken and written language of the whole principality; scarcely a Welshman, save a few of the upper classes, being ignorant of it, and about half the nation, it is supposed — for no statistics exist — understanding no other tongue. Books in considerable numbers are yearly printed in Welsh, and a great many very popular and fairly edited newspapers. Nor do the zealous Cambrians forsake their beloved language even when they cross the Atlantic; no less than fourteen journals, we are

* Pelagius = Morgan (Sea-born) being one of the most eminent.

told, are published in Welsh in the United States and Canada.

Pretty nearly the converse of all this holds good respecting Ireland. I have been favored by the registrar-general of Ireland, Mr. Burke, with calculations founded on the admirable returns prepared under his direction and that of his predecessor Mr. Donnelly, from whence the following facts come to light: —

In the year 1861, 19·1 per cent. of the population of Ireland spoke Irish, namely 1,105,536 persons. In the year 1871 this proportion had sunk to 15·1 of the population, namely, to 817,875 persons. Thus it appears that the use of the Irish language is dying out at the rate of more than two hundred thousand persons in ten years; a fact made still more obvious by another table, showing that during the ten years in question the proportion of ages had changed still more markedly than the numbers of speakers. The younger generation are all learning English, and only the parents retain the use of their native tongue. How many persons can read and write in Irish as well as speak it, I do not know; but the number must be very small, as is certainly also that of the publications of any kind in the Irish language issuing from the press of recent years. Of an Irish newspaper I have never heard.

Next to language perhaps we may place *music* as a feature of distinctive nationality; and here again the Welsh hold their own most tenaciously. The exquisite old Irish airs, wild and melancholy with the sadness wherewith nature sweeps the organ of the autumn woods and wintry waves, or simply joyous like the song of the thrush, this rich treasure of melody — where is it now to be found save bound up with Moore's tinsel verses in the volumes printed fifty years ago in London? There may be districts in Ireland where the peasants still sing their own music, but it has never happened to the present writer to hear them; whereas every man, woman, and child in Wales seems to know and to be able to sing remarkably well a whole repertory of the fine old martial national airs. Nothing is more common in passing a mountain cottage than to hear the "March of the Men of Harlech" or "*Ar-hyd-y-Nos*" in the voice of the young farmer or his wife at their work, or of a group of the lovely Welsh children playing round the door.

In *dress* again the Welsh have kept longer to their national costume than the Irish. The red cloak has utterly disappeared from the grey Irish landscape which it once brightened; and even before the cloak, the red petticoat vanished; that once famous red petticoat which formed the theme of one of the oldest and quaintest of the national ditties — grotesque enough and yet pathetic too.

But even yet about one Welshwoman in fifty (bless her!) wears the dear old high-crowned broad-brimmed beaver hat, the tidy white cap, the cotton bed-gown, and the short stout linsey petticoat, leaving free the agile foot and ankle cased in strong shoes and home-made worsted stockings. To see one of these women at seventy and even eighty years of age, carrying a bundle of sticks or half a sack of potatoes or any such "unconsidered trifle," on her back, or walking straight up a mountain like the side of a house, knitting all the way and never pausing to take breath; or else digging away in her garden, and wheeling about huge loads of soil or gravel, is to behold a spectacle of vigor and cheerfulness for which it will take a world of reading, writing and arithmetic to compensate when the stuffy school and the love of vulgar finery learnt there shall have made it altogether a thing of the past.

Other particulars might be added, but those of language music, and dress I think suffice to prove that Welsh nationality is better preserved and more pronounced at the present day than the nationality of Ireland. We may now proceed to draw our intended parallel between the recognized characteristics of the two nations, noticing the broad features of family likeness where they come into view, and the less accountable unlikeness which seems to prevail in nine points out of ten. Of course such a sketch might be made much more complete and instructive by including the other great branches of the Celtic tree in our purview, Gaelic, Breton, and Cornish. For such a task, however, a volume would be needed, not an article.

Physically, it seems impossible to trace the cousinship between Welsh and Irish. Nothing in the form of head, countenance, or complexion betrays the fact. There are, of course, tall and short men in both countries, but no districts in Wales are inhabited by such dwarfs as people Connemara, or such Anakim as may be found in Tipperary. In both countries the women have special claims to beauty, but Irish loveliness is always a little in the "free and unconfined" *genre* of Nora Creina, while a "Maid of Merioneth"

belongs to the well-braced, sure-footed, self-reliant type which might claim the eulogium of King Lemuel: "She girdeth her loins with strength, she strengtheneth her arms." Unhappily, this grand figure, resembling the Trastevarina in Rome, is becoming daily more rare. As to particular features, the beautiful Irish eye — grey, with long dark lashes, and with the lids deep set and well chiselled — an eye speaking mingled innocence, mirth, and tenderness quite unmatched by any human orb — this loveliest eye has no analogue in the Welsh feature. On the other hand, the Irishman's frightful prognathous jaw, as seen in Munster and Connemara, is unknown in Wales; as is also the coarse lip which, in a lesser degree, is likewise distinctive of the Milesian race.

The question is surely curious. What has caused this difference in the *physique* of the two nations? Both have lived for ages on the same simple fare of oatmeal, milk, and potatoes (to which the Welsh now add endless tea-drinkings), under equally rainy skies. Yet while the Welshman is said to display the very same form of skull and delicacy of the muscular attachments which distinguished his progenitors who dwelt in the Denbighshire caves in the stone age, in the society of the *Bos longifrons* and the wolf, his Irish cousin has managed to introduce (or preserve?) in the human countenance a mouth scarcely improved since the much remoter date when we were apes; and to forestall eyes which might beam beneath our brows when we become angels.

Pass we now upward to mental characteristics. Here there is certainly some family likeness. There is a nimbleness about the wits of a Celt which gives him an advantage over a Saxon such as that possessed by a man with a stiletto over one with an unwieldly Excalibur — that is to say, a Celt of Wales or Ireland, for the Scotchman is as much slower than the Englishman, as the Welshman and Irishman are more rapid. The whole mental machinery of the Welsh and Irish seems better oiled than that of the Saxon. They catch an idea as a good player catches a shuttlecock; and the speaker is never called upon, in the ineffably tiresome way so common in England, to repeat his remark that his auditor may be enabled to swallow and digest it before he reply. The retort comes sharp and quick as the snap of a revolver. Anger, pleasure, tears, and laughter follow the flash which gives occasion to them, and do not go on rumbling in English fashion three minutes afterwards. The Celt may deserve sometimes to be called indiscreet, wrong-headed, and scatter-brained; but no one would ever dream of applying to him the epithets of dullard, Bœotian, clodpole, numskull, or dunderhead. He may be silly, but is never beef-witted.

As a consequence of this rapid consumption of ideas, Welshmen in particular are ready to be excited about everything, and (as always happens far away from the great centres of public interest) more especially in local gossip. Their lively wits seem actually to famish for such pabulum. To hear the clatter of tongues when Welshman encounters Welshman on the road, or the still more animated buzz as of a whole swarm of bees, at a little railway station where a dozen passengers await the train, is to be reminded rather of the streets of Marseilles than of any English place of meeting, where a nod and a "good morning" are the utmost efforts of good fellowship.

All this refers pre-eminently to Wales. In Ireland the energy for chatter is obviously less vehement, and the equally quick wits are content with reasonable intervals of silence. But the different *pace* of Celtic minds may there be no less traced by a comparison of the really delightful intelligence of a school of Irish children with the heaviness and slowness of a similar and much better fed and clothed class, in any part of England, even in the great towns. I have often tested the ability of young Irish boys and girls, either to understand a piece of humor or to appreciate an act of heroism, or, generally, to take in any idea quite new to them; and never yet failed of success. But the very same joke, or story, or new idea, presented to very "sharp" English town boys has been utterly misunderstood.

IMAGINATION is a faculty which I suppose will on all hands be conceded pre-eminently to the Celtic race, and yet perhaps it would be more proper to credit it with the *poetical temperament* than with the actual power of imagination in its higher walks. The phrases, the ideas, the music, a thousand sweet wild-flower-like ways of both Welsh and Irish, show that temperament, and distinguish it from the dull commonplace of the vulgar Saxon, very much as the names of the two conical mountains over the Bay of Dublin pertain to the Irish, who called them the "Gilded Spurs," and to the English, who named them the "Sugarloaves." But when it comes to the creation of great poems, the

Celt is certainly open to the sneering question whereby illogical persons have supposed that the claims of women to political rights might be dismissed: —

> Where is your Iliad, your Macbeth,
> Your soul-wrought victories?

The kind heavens will preserve me, I trust, from the audacity of attempting to form an estimate of the rank justly belonging to Celtic poetry compared to the masterpieces of Greece, India, Italy, Germany, and England, but I have never heard the most enthusiastic Welshman claim for Dafydd ap Gwyllim himself a place much above Chaucer; and one point at all events is patent, that the merit of Erse and Cymric poetry is not of that solid kind which can bear translation, but depends in principal measure on the apt fulfilment of a number of arbitrary and intricate rules of rhythm and rhyme, whose shackles the higher class of poetic genius would hardly condescend to endure. In later centuries some millions of Irishmen and thousands of Welsh have spoken English. How does it chance, if either race have great poetic gifts, that we have no Welsh-English poetry at all, and in Ireland only a few spirited Fenian ballads, beside older poems which can scarcely be called national, since Goldsmith and Moore might as well have been cockneys? Why is there no Irish, or Welsh, Walter Scott, or Robert Burns?

Gibson made in marble the only Welsh poems I have ever seen which could convey the sense of beauty to the Saxon, and they were inspired very evidently by a muse whose birthplace was much nearer to Parnassus than to the bardic seat of genius — Cader Idris.

Again, it would be hard to define in what way æsthetic taste has been displayed (except in music) by either Celtic nation for ages back, since the days of the beautiful antique Irish jewellery. Certainly it is not exhibited in architecture. No uglier towns or houses than Irish ones exist in Europe; and when the most has been made of the Rock of Cashel, and a very few other early ruins, and of the four or five fine classic buildings of the last century in Dublin, there is scarcely a relief from architectural hideousness from Cape Clear to the Causeway, unless in the modern mansions of the Anglo-Irish gentry undistinguishable from those of England.

Such a thing of beauty as a genuine old English cottage — brick, stone, or wooden, thatched and rose-grown, such as may be seen by scores in Warwickshire, or Kent, or the New Forest — never yet came from Celtic hands. An Irish peasant or farmer, if he be left to himself, without interference from his landlord, builds his house (even if he be well able to afford a good one) in the least pretty spot in his holding, and in a manner to render his materials, whether stone and slate, or mud and thatch, as little sightly as it is possible to be. As to the regular typical mud cabin, there is something about it absolutely *sottish*. Nor is the complacent squalor of the place ever relieved by a well-kept bit of flower-garden, or a few creepers over the walls, unless beneath the tyrannical rule of the neighboring squire. Indoors, the furniture is simply the cheapest and commonest which can be made to serve the necessary use of bed, cupboard, chairs, and tables; and the works of art are confined to colored prints, which may possibly fulfil some religious purpose, but assuredly do not meet any æsthetic want of human nature. Not even in dress do the Irish peasantry display any taste. A farmer going to market at Mullingar in his long, ill-made coat, whose tails, if the day be rainy, he is compelled to tuck under his arms on either side to prevent them from dabbling his legs, is a spectacle of clumsiness at which it is scarcely possible to refrain from laughing, and even the charming beauty of Irish girls of all classes fails often to obtain its due meed of admiration for want of better taste in its adornment. Poverty, of course, explains much; but the poverty of an Italian *contadina*, or the wife of a Fellah Arab, is quite as great as that of most Irishwomen, and *their* dress renders even personal ugliness picturesque and graceful.

The case against Welsh taste is not so strong. If the Cymry do not create beauty, they do not mar the beauty which nature spreads so richly around them. Their houses (of massive stone, in most parts of the country), with dormer windows breaking the outline and latticed panes, have an aspect of durability, and even of dignity, which accords well with the landscape; and almost invariably they are placed in good positions, backed by the heather-crowned hills, and with brooks babbling by the moss-grown walls of the little old orchard of plum and apple trees. Honeysuckles, wild roses, foxgloves, ferns, and ivy hang from every bush or nestle undisturbed beneath every wall — and a painter could scarcely choose a lovelier scene than some of these mountain homesteads for a background, and in front of them a group of the beautiful, refined-looking

Welsh children, playing with the puppy or "paiddling i' the burn." Within the cottage will be found two or three ancestral pieces of fine old oak furniture, dresser and coffer, and perchance a chair or bedstead, which, with the huge wide fireplace entirely relieves the poverty of the place from any aspect of sordidness. The dress of the inmates, too, though far gone of late from the original admirable old costume, is never ragged, and is indeed in general only too *soigné* and expensive for the fortunes of the wearers, whose pride causes them to spend much more on their clothes than on their food.

This matter of the commissariat is not to be altogether passed over in discussing the taste of the Welsh and Irish, who equally regard it with ill omened indifference. The stimulus to the industry of man and the housewifeliness of woman which a taste for good and varied food affords elsewhere, is absolutely wanting in Ireland and Wales; and in the latter country even well-to-do farmers live on a miserable diet of everlasting tea and exceedingly bad bread. Indifferent butter, abominably ill-cured bacon, and herrings salted always a day too late and never eaten fresh at all, seem to afford their only and rarely admitted luxuries. Nor can those whose business it is to cater for English travellers in Wales be by any means induced to pay proper attention to securing vegetables and fruits, and better meat than the wretchedly ill-fed mutton, which enjoys an altogether fictitious reputation, on the strength of the very different Welsh mutton fattened for the table of private gentlemen or for the London market. Till Welsh innkeepers and lodging-house keepers mend their ways in this respect, they must be contented to limit their customers to persons who are willing to practise a good deal of mortification of the flesh during their scenery-hunting, and to pay for it too as if they were dwelling among the flesh-pots of Clifton, Burnemouth, or Brighton. In many pretentious Welsh hotels it is usual to behold four or five dishes set out for luncheon on an imposing long table, every one of them consisting of the last remains of a joint of cold mutton in a state which would scarcely be presented in an English servants' hall. Of other food of any kind — *non c' è.*

Surely it is idle to go on talking of the peculiar æsthetic capacities of two nations who have never possessed any national art except music, and whose houses, dress, tables, and gardens display less taste and care even than those of the confessedly poorly-endowed Saxon.

So far as imagination creates superstitious fears and fancies, both Welsh and Irish notoriously exhibit it freely, but the guess may be hazarded that the prevailing Calvinism of the principality has given it the graver complexion which it therein seems to wear. Ghosts still appear constantly all over Wales, and (according to a bygone fashion, of which they ought to be ashamed) always leave behind them an odor of brimstone after their apparitions; while birds of evil omen (kittiwakes and curlews especially) screaming at night round a house are regarded with unaffected dread and abhorrence.

Irish imagination, though it has called up the banshee and an abundance of hereditary curses, revels chiefly in more *riante* dreams — the Leprachaun and Phuca (Puck); the beautiful invisible Island of St. Brandan in the far Atlantic; the towers of the submerged city beneath Lough Neagh; and the endless droll legends of the giant Fin McCoul.

As regards HUMOR, it would appear that both Welsh and Irish Celts (notably *not* Scotch ones) have vastly quicker and keener sense of wit and fun than any class of Saxons, short of the most intellectual and cultivated of all. But, though the Welsh peasant knows a joke the moment he sees it (which is much more than can be said of his English brothers), and is a merry fellow in his own way, it is very rare indeed to hear from him any such *bons mots* as may be freely gathered from an Irishman's discourse. To bamboozle a Manchester tourist by selling him a hawk as a *Welsh parrot;* and in a court of justice to turn the tables on an overbearing cross-examining barrister, who was sneering at the witness for carrying turf in a sack, by the rejoinder that it was "always carried so formerly at T.," — the *parvenu* barrister's native place — the Nazareth of the principality, from whence no good thing can come, — these are jests in the true Welsh spirit. It will be seen at a glance how widely they differ from the pure fun of Hibernia: such jokes, for example, as that of the car-driver whom the prim and elderly English governess "engaged for an hour," and who replied to the obnoxious stipulation, "Ah, thin, ma'am, and won't ye take me *for life?*" Or the priest who, when consulted by a parochial sceptic about the nature of miracles, gave the man a kick, and asked him, "Did he feel it?" "In coorse I did," responded the injured inquirer. "Well

then, remember this! It would have been a *miracle if you did not.*"

Passing to the AFFECTIONS, it will be admitted by every one that the maternal sentiment abounds in both the nations of whom we write. Happy is the child who has an Irish nurse or a Welsh mother! The hideous stories of cruelties to infants which every now and then come to light in English cities are unheard of among Celtic populations, and the passionate affection they commonly show for their beautiful little children, or even for their foster children, is delightful to witness. No danger in boarding out pauper orphans in either country! In the matter of conjugal and fraternal attachments also there seems to be a shade more warmth of feeling; or perhaps it would be more fit to say that the poor in Ireland and Wales manifest an amount of sentiment for which only the well-to-do find either leisure or power of expression in England.

The general standard of courtesy among acquaintances and towards strangers is also unquestionably higher both in Wales and Ireland (wherever tourist-dealing has not spoiled it) than in any part of the north of England, perhaps even than in the more genial south and west. There is an inborn politeness in the Celt, a talent for saying graceful things, which the Saxon only attains at the culmination of culture and refinement. There seems to be, however, some difference between the two Celtic races wherewith we are concerning ourselves, as regards the converse of politeness, when it breaks down under pressure. There is a capacity for the very vulgarest insolence in an irate Irishman of the lower class, quite unparalleled elsewhere, and it is often painfully instructive to observe how rapidly the tone of obsequiousness is exchanged for this foul-mouthed insolence when the hope of gaining anything by adulation is disappointed. A tribe of creatures so debased in this way as the beggars of Killarney and Wicklow disgrace no other country. Welshmen are proverbial for a hasty temper, but they never seem to forget themselves in their anger as do the Irish. On the contrary, they exercise a surprising degree of self-control when offended, and exhibit caution and reticence which, taken with subsequent evidences of enduring vindictiveness, border on hypocrisy. As a rule, they seek balm for their wounded feelings so continually in the law courts that they probably deserve their reputation of the most litigious people in Europe.

Mendicity in Wales is only practised by tramps, gipsies, and tinkers. Thus charity, in the almsgiving sense, has no place among Welsh virtues, but the people are abundantly kind and helpful to one another in illness or distress. In Ireland, as everybody knows, the poorest cabin will offer such entertainment as it possesses to every wayfarer who asks for shelter or food. In scores of cases I have known poor widows on the verge of starvation give freely their "bit of bread" to the first "bowzy" beggar who thinks fit to stop at their door. Of course, Roman Catholic ethics have much to do with this national habit, and also with the selection of the profession of mendicancy by those highly devout persons who form (or did form a few years ago when I visited the spot) the staple of the band of pilgrims at St. Patrick's Purgatory in Lough Derg.

Both Welsh and Irish are, I think, more kind to animals generally than the English peasantry. Irishmen treat their horses, cattle, and pigs in a very friendly way, and a celebrated physiologist, resident in Dublin, informed me that public opinion in Ireland would never permit of vivisection demonstrations — a dictum which it is satisfactory to see verified by the recent Parliamentary return, showing that not a single license for the practice has been taken out under the new act for any laboratory or school in Ireland. The same holds good of Wales, where the affection of the people for their intelligent sheep-dogs would naturally make the notion of scientific torture detestable. The position of a dog in a Welsh farmhouse is indeed to the last degree pleasant and independent. He lives at large, pursues his vocation of driving the sheep with professional zeal, carries on untrammelled his feuds, friendships, and flirtations with all the other sheep-dogs in the neighborhood, is valued by his master, caressed by the children, and known by name and reputation to everybody within a dozen miles of his abode.

We now come to a matter of supreme importance in the character and lives of both Welsh and Irish — their peculiarly fervent sense of RELIGION. Ireland was a holy isle even in pagan times; an isle of Christian saints while yet half Europe worshipped Odin; and to this day she is a land of faith in a sense which could not justly be applied to England, much less to France or Germany. In Wales again, the seed of fervid pietism scattered broadcast a hundred years ago by Wesley and Whitefield, found its most congenial soil, and the nation continues yet in a

state of revivalism, from which an English town invariably falls away a month after the departure of its Moodys and Sankeys. The chapel-building and chapel-going, the Bible-reading and hymn-singing, the Sabbatarianism, the perusal of religious biographies and scriptural commentaries, all carried on by the hard-working peasantry and artisans, surpass anything we ever witness in England. In all this the zeal of the Welsh Dissenter is quite on a par with that of the Irish Catholic, and occupies in the same way the foreground of life. How singular is the reflection that creeds so far apart as Romanism and Calvinism should command similar enthusiasm in races so nearly akin; and how our shallow theories about "the Celt needing a symbolical cultus," or "priestly direction," stand rebuked by such indisputable facts! The Irishman finds in Romanism, the Welshman in Calvinism, the scaffolding whereon each builds his own inner temple, the pegs whereto he can hang his genuine religious emotions and be equally content.

The influence of all this fervent religion in actual life is, alas! far from being as satisfactory as it ought to be in either country. With so noble a force at disposal, all the besetting sins of the two countries should be swept away; but Father Mathew himself failed to place a permanent check on Irish drunkenness; and the zealous Welsh ministers either do not or cannot shame their flocks, with all their prayer-meetings and Bible-readings, into anything like the strict chastity of the poor Irish peasantry. It is greatly to be desired that some of the opprobrium attached by Welsh opinion to the *malum prohibitum* of breaking the fourth commandment could be extended to the *malum in se* of disregarding the seventh.

A very important and collateral influence of the intense Puritanism of Wales, is the absence of all such public amusements as races or gambling, and the universal culture of a good deal of what must be termed intellectual pursuits. Wherever Bible-reading prevails as it does in Wales, there, even in a purely secular sense, there must be a high standard of education. The Bible of course affords, by itself alone, a splendid education, such as the peasantry of no Catholic country in the world enjoys; and the Welshman, through his strictly-kept Sundays, and the long winter evenings in his mountain cottage, studies not only the Bible, but commentaries and books bearing upon it, till he possesses a store of ideas richer and better worth than is acquired in many a *lycée* in France or Italy. The Church of England in Wales labors hard and honestly, but under the grievous disadvantage of being the Church almost exclusively of the rich and their immediate dependants, including not a few doubtful characters extruded from the membership of the chapels. Much vitality cannot be looked for in a congregation of fifteen or twenty persons in an ancient edifice built to contain six or eight hundred, while all the other inhabitants of the districts crowd the roads on the way to their own self-supported little Bethels. A fatal mistake seems to be made also by those clergymen and land-owners who endeavor to bring back the masses to church by something approaching to ritualism. A few fervid Evangelical preachers might yet fill the churches of Wales, but if the numerous Holy Cross brethren holding Welsh livings, and other Ritualists, have their way, disestablishment cannot long be delayed.

As regards MORALITY as distinct from religion, the same broad characteristics notoriously prevail among the Celts of Wales and Ireland. The theological virtues, as the schoolmen call them, charity, faith, piety, and patience, are prominent — the moral virtues of justice, truth, temperance, and prudence in the shade. Thus we see the superstructure reaching sometimes to a saintly elevation, but the solid foundation which ought to support it is wanting. The love of justice and of truth, which forms the very backbone of every worthy Englishman's nature, is replaced in the Irishman and Welshman by the very imperfect substitute of personal loyalty or general kindliness.

To an Anglo-Saxon living in a Celtic country it always appears that there is an unaccountable lack among his neighbors of the spirit so familiar to him at home, which cannot rest till *justice be done* — till a crime be detected or encroachment resisted, or any act of oppression exposed and stopped. On the contrary, of such abstract sentiments as these he perceives no trace; but every *personal* consideration of kinship, friendship, common sectarianism, or politics, are freely and even unblushingly cited as motives for neglecting or overriding justice.

In Ireland of course it has been always notorious that wherever agrarian crime was in question (and often where the crime was not agrarian), the prisoner's chances of escape depended less on the evidence which could be produced against him than on the *personnel* of his jury,

among whom there might always be expected a few "boot-eaters," *i. e.*, men who have sworn that they would rather starve (or *eat their boots*) than agree to a verdict of "Guilty." It is less known how much of the same sort of favor prevails over justice in Wales. A man who is tried there by a jury of his neighbors has always a splendid chance of escape; but if some of them happen to be also his fellow chapel-goers of the same denomination, his acquittal may, it is feared, be predicted with approximate certainty. Not long ago a case of sheep-stealing occurred in the principality, the evidence against the accused man appearing quite overwhelming. The jury nevertheless brought in a verdict of "Not guilty," and one of them subsequently remarked to the prosecutor: "We were obliged to acquit So-and so, you know; but all the blotting paper in the kingdom would not wipe the stain from his character!" The opinion of a late eminent Welsh judge of the judicial fairness of his countrymen was amusingly revealed by his exclamation, when his hounds had just overtaken a hare: "By G—, a Cardiganshire jury can't save her now!"

In lesser matters the same fatal precedency of favor over justice may be noted, both in Ireland and Wales, by every one who looks out for it. In the latter country an additional motive against just severity appears to be the very lively fear of giving offence to one another which troubles Welshmen. Whether it be that the chapels exert some occult authority, or that social ostracism is specially to be dreaded in Wales, or that the men—though physically brave—are morally cowardly, I cannot say; but certain it is that the development of wholesome heat against injustice is very much checked; and while Welshmen are commonly said to be peppery and hot-headed, they may be frequently seen to bear with self-restraint annoyances from their equals which would draw from an Englishman at the least some very strong language, and from an Irishman an immediate recourse to fisticuffs.

There is, indeed, a most striking difference in this respect between the temperaments of the two Celtic nations. To Irishmen a secret is a sore burden. Even the proverbial "peasant cunning" traceable all the world over, is with them childishly transparent. In the upper class, no less than in the lower, the tendency to talk about their own affairs, their likings and dislikings, projects and disappointments, is almost irresistible; insomuch that it becomes quite a marked characteristic of any Irishman or Irishwoman when he or she attains the average of English reticence. The consequences, it is needless to say, of this excessive candor are often extremely inconvenient; but it must be owned, that though not a very dignified it is a very lovable characteristic, and one which harmonizes well with a very healthy and innocent *for intérieur*. The Welshman's temper is precisely the reverse. He is so cautious and secretive that he rarely ever risks himself to praise or condemn anybody. He cherishes his grudges (and they are, it is to be feared, numerous enough) in such privacy that it is hard to discover them; he keeps his own counsel, and of course has his reward. There is a tension in the whole moral atmosphere of Wales in consequence of this intense secretiveness and caution which, as it becomes more and more sensible to the Saxon sojourner, is as stifling as when the air is overcharged with electricity without breaking in wholesome thunder and rain.

With respect to the great and most important virtue to which the name of morality is often given *par éminence*, the contrast, as every one knows, between Wales and Ireland is most complete. The peasantry of Ireland are at the very summit of the scale of the whole world. Of those of Wales the best that can be said is, that errors which are too common and far too lightly judged, are usually followed by marriage, and that there is but little venal vice. On this subject it would not be fitting here to say more; but of course there is no department of social life in either country which is not more or less affected beneficially by the national virtue or injuriously by the vice.

As to sobriety M. Rénan observes, in his essay "*Sur la Poésie de la Race Celtique*," that so strong in the Irish Celt is the "longing after the infinite" that when he has no other method of gratifying it he seeks the infinite by drinking "*une liqueur forte qui s'appelle le wisky*." In less "poetic" races the taste for liquors *qui s'appellent l'eau de vie*, le Schiedam, le Kirsch, raki, or rum is not supposed to be derived from so lofty a source; but whatever be the origin of the sentiment, the Celt is neither, I fancy, very much before or behind his neighbors in liking what he euphuistically styles "a drop." The simple truth seems to be that whenever people have nothing particularly interesting or stimulating in their daily lives, and especially when they are sub-

ject to the influences of a damp and variable climate, the propensity to give a "fillip to nature" in the cheap and easy way furnished by alcohol, will always prevail; and the differences observable will be more in the way in which they get drunk than in the fact that they drink to excess. The Celt seldom "boozes;" he may be a drunkard, but he is very rarely a sot. A great difference, of course, is made by the fact that the Irishman possesses his own cheap and excellent whisky, under whose too inspiring influence he naturally quickly becomes roaring drunk and generally violently pugnacious. The Welshman has only his comparatively mild and proportionately expensive "cwrw," sold in most parts of Wales at twice the price of English ale; and when he is fain to tipple too much, the results are more somniferous and less alarming. An extraordinary proportion of Welshmen are now teetotallers, and those who continue to drink do not dream of taking any stimulant with their daily meals, but only imbibe their ale on market-days, when they go to the public-house and make a bout of it — perhaps half-a-dozen times a year. The chief difference between England and Wales as regards drinking seems to be that a rather higher class of persons drink to excess in Wales than are often known to do so in this generation in England.

The characteristics of nations always come out prominently in the matter of VERACITY. The French *mensonge* (qualified often by highly moral writers as "*sublime*") differs essentially from the Italian *bugia*, which merely betrays that the *bugiardo* is naturally superior to the pitiful consideration of such trifles, light as air, as mere spoken words.

Again, the genuine Anglo-Saxon lie is recognizable at a glance, by its clumsiness, its want of ease, grace, and precision; and, generally, by a slightly perceptible hesitation indicative of the fact that its author is ashamed of it — or at least expects to be expected to be ashamed of it, if exposed — a state of disquietude entirely foreign to the sentiments of the Frenchman or Italian.

Quite distinct from any of these is the Celtic lie, which is always fluent, ingenious, and also ingenuous; wholly free from that *mauvaise honte* which mars the English falsehood. But here also the different genius of the severed branches of the Celtic family may be clearly traced. The Welshman does not lie like the Irishman, nor either of them like the Scotchman, whose "lee" (when Calvinism permits) is a very bad fib indeed, being told with a perfectly lucid sense of the disgrace properly appertaining thereto.

The typical Hibernian falsehood appears to the dull Saxon intellect chiefly in the shape of a rhodomontade or gasconade, a big, boastful lie, such as the frog who tried to swell himself out like the ox might be supposed to have uttered, had he had an opportunity of addressing the spectators of his experiment. As this kind of lie naturally offends the *amour propre* of the persons to whom it is addressed (unless the speaker be clever enough to enlist it on his side by making them feel proud of the honor of the society of the descendant of so noble a race, the rightful owner of so splendid an estate), it is common for the indignant British listener to speak of it with deep disgust and severity. Probably nothing in the world has tended so much to depreciate the Irish (also with slight variation the American) character in English estimation, as the efforts both nations make to impress on their hearers the notion of their own and their country's claims to unbounded admiration. The Welshman never gives in to this kind of thing at all. He is exceedingly proud, but not at all boastful or vulgarly fond of talking of great people. While Irish provincial papers still write of local magnates much in the tone they did when Goldsmith satirized their description of "the *august*" party who accompanied Mrs. Keogh, Welsh journals trouble themselves very little about anybody, save always Sir Watkin Wynn, whose progresses are much more interesting to Welshmen than those of Queen Victoria.

A very striking characteristic which seems to pervade the whole Celtic race in all its branches is the total absence of that love of finished work — indeed generally of any kind of order in work — which is so deeply rooted in the Saxon temperament. There are not many Englishmen who can contentedly quit a task with a small portion of it incomplete, and who would not cheerfully bestow a few extra strokes of scythe or spade to finish it. So far from experiencing any such uneasiness, Welshmen and Irishmen usually leave, as it would seem actually on purpose, a corner of their fields unploughed, and a single haycock or half a ridge of potatoes unsaved. Of the general untidiness of Welsh and Irish farms — the gates off their hinges, the brooks which are

allowed to overflow the roads — the shallow streams which are forded daily by scores of persons for want of a few stepping-stones — of all this kind of thing it is needless to speak, seeing that the complaints concerning it are reiterated in every book treating of either country. "Order" may be "Heaven's first law," but it is not even the second or the twentieth law of Wales or Ireland. No Welsh or Irish servant (the former even less than the latter) can be induced, by entreaties or objurgations, to lay a table or arrange a room for two consecutive days in the same way, or to place the articles in their charge in daily use in the same receptacle. The sort of orderly mechanism of an English household is absolutely impossible with Welsh or Irish servants, who are extremely clever, honest, obliging, everything else that can be desired, but who will merely be driven to rebellion by the effort to make them, in the English sense, orderly.

The fact seems to be that a rule, even if he have had a voice in making it, is to the Celt, *per se* a hateful thing to be broken at once. So far from being "law-abiding" like the Saxon, the Celt cannot abide a law. The fact that he did a thing yesterday (which affords to Englishmen and to all domestic animals a certain reason for doing it to-day) is to the Celt, on the contrary, a cogent reason for neglecting to do it, or doing the contrary. His "freedom" will never "slowly broaden down from precedent to precedent," but must be wholly unprecedented to give him the least satisfaction.

We come, finally, to the consideration of a point of character wherein, instead of resembling each other, the Irish and the Welsh Celt are at opposite poles — their difference in regard to it constituting, I conceive, one of the principal reasons for the adversity of the one race and the prosperity of the other, viz., PRUDENCE and FRUGALITY. "*Fionn a'n diu uisge amarach*" (Wine to-day, water to-morrow) is an ancient proverb which seems to have come out of the very heart of Ireland. There is no genuine Irishman, or even Anglo-Irishman, however his conscience, will, or ambition may have caused him practically to put away the temptation, who does not at bottom long to act on that principle. His genial (and, let us add, his generous and religious temperament) are all in favor of taking the goods the gods provide him, enjoying the present sunny hour, taking no thought for the morrow, and trusting to "luck" or Providence, or the kindness of neighbors (such as he would himself readily show), to help him out of the ditch if he happen to fall into it. Of course we all know what is the result when this kind of thing is carried on more or less by several millions of people — namely, the precise converse of that constant accession of wealth and influence which belongs to the eminently prudent race of Caledonia, a country which may be "stern," but is anything but "wild," as regards affairs connected, however remotely, with £ *s. d.* To the individual it may sometimes be questioned, whether a prudent temperament secures so much of happiness, taking all the years of life together, as a careless and impulsive one. Of all dreary disillusions, the dreariest must be that of the rich old man, who has denied himself every pleasure while he had senses and emotions to taste it, and sits down to partake at the eleventh hour of the feast of life, when appetite is dead and love has fled, and disease lays its grip on him, and reminds him that it is time to go to that bed which all his balance at the banker's can unfortunately make neither more warm or more soft. But however it may be for the man himself, there can, I suppose, be no doubt that the fewer prudent and frugal persons there are in any country, so much the less prosperous that country will be; and thus it comes to pass that the land where the principle of "Wine to-day, water to-morrow" has too many adherents, is (other potent causes aiding to the result) in the condition of Ireland for centuries back.

The Welshman, on the other hand, though he objects to order as much as the Irishman, has no recklessness about him; on the contrary, his distinguishing characteristic is prudence. He takes a great deal of thought for the morrow — denies himself almost necessary food, learns English and everything else which he thinks can help his advancement, speculates cautiously in mines and quarries with his little savings, and travels about the world to see where he can best find an opening, or else pushes himself at home into some profession considerably higher than his antecedents would seem to warrant. In no part of the British Isles can there be found, I imagine, so many men who began life as the sons of small farmers or tradesmen of the humblest class, and who now occupy the position of clergymen, doctors, solicitors, and even barristers in their native country, while their nearest relations remain in the class of peasants. And the Welshman "takes a polish" remarkably well, sinks his provincialism, and does

no discredit to any position to which he may attain. While an Irishman, if he be vulgar, remains a vulgar Irishman to the end of the chapter, and never loses his brogue or his boastfulness, a Welshman, with finer tact, acquires to a great extent the voice and manners of those with whom he associates.

Thus it comes to pass that, while the great natural gifts of an Irishman are constantly wasted, and lead to nothing save the passing enjoyment of the hour for himself and friends, it rarely happens that a Welshman possesses ability without turning it to practical account, and mounting several steps in the social ladder before he dies. A country abounding in the means of education and in openings for profitable industry, wherein this climbing process is carried on by all the most energetic spirits in every town and parish, is tolerably sure to be loyal and contented. We need perhaps scarcely look any further for explanation of the present peace and prosperity of Wales. F. P. C.

MACLEOD OF DARE.

BY WILLIAM BLACK.

CHAPTER I.

THE SIX BOYS OF DARE.

THE sun had sunk behind the lonely western seas; Ulva and Lunga and the Dutchman's Cap had grown dark on the darkening waters; and the smooth Atlantic swell was booming along the sombre caves; but up here in Castle Dare, on the high and rocky coast of Mull, the great hall was lit with such a blaze of candles as Castle Dare had but rarely seen. And yet there did not seem to be any grand festivities going forward; for there were only three people seated at one end of the long and narrow table; and the banquet that the faithful Hamish had provided for them was of the most frugal kind. At the head of the table sat an old lady with silvery-white hair and proud and fine features. It would have been a keen and haughty face but for the unutterable sadness of the eyes — blue-gray eyes under black eyelashes that must have been beautiful enough in her youth, but were now dimmed and worn, as if the weight of the world's sorrow had been too much for the proud, high spirit. On the right of Lady Macleod sat the last of her six sons, Keith by name, a tall, sparely-built, sinewy young fellow, with a sun-tanned cheek and crisp and curling hair, and with a happy and careless look in his clear eyes and about his mouth that rather blinded one to the firm lines of his face. Glad youth shone there, and the health begotten of hard exposure to wind and weather. What was life to him but a laugh, so long as there was a prow to cleave the plunging seas, and a glass to pick out the branching antlers far away amid the mists of the corrie? To please his mother, on this the last night of his being at home, he wore the kilts; and he had hung his broad blue bonnet, with its sprig of juniper — the badge of the clan — on the top of one of the many pikes and halberds that stood by the great fireplace. Opposite him, on the old lady's left hand, sat his cousin, or rather half-cousin, the plain-featured but large-hearted Janet, whom the poor people about that neighborhood regarded as being something more than any mere mortal woman. If there had been any young artist among that Celtic peasantry fired by religious enthusiasm to paint the face of a Madonna, it would have been the plain features of Janet Macleod he would have dreamed about and striven to transfer to his canvas. Her eyes were fine, it is true: they were honest and tender; they were not unlike the eyes of the grand old lady who sat at the head of the table; but, unlike hers, they were not weighted with the sorrow of years.

"It is a dark hour you have chosen to go away from your home," said the mother; and the lean hand, resting on the table before her, trembled somewhat.

"Why, mother," the young man said lightly, "you know I am to have Captain ——'s cabin as far as Greenock; and there will be plenty of time for me to put the kilts away before I am seen by the people."

"Oh, Keith," his cousin cried, for she was trying to be very cheerful, too, "do you say that you are ashamed of the tartan?"

"Ashamed of the tartan!" he said, with a laugh. "Is there any one who has been brought up at Dare who is likely to be ashamed of the tartan? When I am ashamed of the tartan I will put a pigeon's feather in my cap, as the new *suaicheantas* of this branch of Clan Leoid. But then, my good Janet, I would as soon think of taking my rifle and the dogs through the streets of London as of wearing the kilts in the south."

The old lady paid no heed. Her hands were now clasped before her. There was sad thinking in her eyes.

"You are the last of my six boys," said she, "and you are going away from me too."

"Now, now, mother," said he, "you must not make so much of a holiday. You would not have me always at Dare? You know that no good comes of a stay-at-home."

She knew the proverb. Her other sons had not been stay-at-homes. What had come to them?

Of Sholto, the eldest, the traveller, the dare-devil, the grave is unknown; but the story of how he met his death, in far Arizona, came years after to England and to Castle Dare. He sold his life dearly, as became one of his race and name. When his cowardly attendants found a band of twenty Apaches riding down on them, they unhitched the mules and galloped off, leaving him to confront the savages by himself. One of these, more courageous than his fellows, advanced and drew his arrow to the barb; the next second he uttered a yell, and rolled from his saddle to the ground, shot through the heart. Macleod seized this instant, when the savages were terror-stricken by the precision of the white man's weapons, to retreat a few yards and get behind a mesquit-tree. Here he was pretty well sheltered from the arrows that they sent in clouds about him, while he succeeded in killing other two of his enemies who had ventured to approach. At last they rode off; and it seemed as though he would be permitted to rejoin his dastardly comrades. But the Indians had only gone to windward to set the tall grass on fire; and presently he had to scramble, burned and blinded, up the tree, where he was an easy mark for their arrows. Fortunately, when he fell he was dead. This was the story told by some friendly Indians to a party of white men, and subsequently brought home to Castle Dare.

The next four of the sons of Dare were soldiers, as most of the Macleods of that family had been. And if you ask about the graves of Roderick and Ronald, what is one to say? They are known, and yet unknown. The two lads were in one of the Highland regiments that served in the Crimea. They both lie buried on the bleak plains outside Sevastopol. And if the memorial stones put up to them and their brother officers are falling into ruin and decay — if the very graves have been rifled — how is England to help that? England is the poorest country in the world. There was a talk some two or three years ago of putting up a monument on Cathcart Hill to the Englishmen who died in the Crimea; and that at least would have been some token of remembrance, even if we could not collect the scattered remains of our slain sons, as the French have done. But then that monument would have cost £5000. How could England afford £5000? When a big American city takes fire, or when a district in France is inundated, she can put her hand into her pocket deeply enough; but how can we expect so proud a mother to think twice about her children who perished in fighting for her? Happily the dead are independent of forgetfulness.

Duncan the Fair-haired — Donacha Ban, they called him, far and wide among the hills — lies buried in a jungle on the African coast. He was only twenty-three when he was killed; but he knew he had got the Victoria Cross. As he lay dying, he asked whether the people in England would send it to his mother, showing that his last fancies were still about Castle Dare.

And Hector? As you cross the river at Sadowa, and pass through a bit of forest, some corn-fields begin to appear, and these stretch away up to the heights of Chlum. Along the ridge there, by the side of the wood, are many mounds of earth. Over the grave of Hector Macleod is no proud and pathetic inscription such as marks the last resting-place of a young lieutenant who perished at Gravelotte — *Er ruht sanft in wiederkämfter Deutschen Erde* — but the young Highland officer was well beloved by his comrades, and when the dead were being pitched into the great holes dug for them, and when rude hands were preparing the simple record, painted on a wooden cross — "*Hier liegen — tapfere Krieger*" — a separate memento was placed over the grave of Under-Lieutenant Hector Macleod of the ——th Imperial and Royal Cavalry Regiment. He was one of the two sons who had not inherited the title. Was it not a proud boast for this white-haired lady in Mull that she had been the mother of four baronets? What other mother in all the land could say as much? And yet it was that that had dimmed and saddened the beautiful eyes.

And now her youngest — her Benjamin, her best-beloved — he was going away from her too. It was not enough that the big deer-forest, the last of the possessions of the Macleods of Dare, had been kept

intact for him, when the letting of it to a rich Englishman would greatly have helped the failing fortunes of the family; it was not enough that the poor people about, knowing Lady Macleod's wishes, had no thought of keeping a salmon-spear hidden in the thatch of their cottages. Salmon and stag could no longer bind him to the place. The young blood stirred. And when he asked her what good thing came of being a stay-at-home, what could she say?

Suddenly old Hamish threw wide the oaken doors at the end of the hall, and there was a low roar like the roaring of lions. And then a young lad, with the pipes proudly perched on his shoulder, marched in with a stately step, and joyous and shrill arose the salute. Three times he marched round the long and narrow hall, finishing behind Keith Macleod's chair. The young man turned to him.

"It was well played, Donald," said he, in the Gaelic; "and I will tell you that the Skye College in the old times never turned out a better pupil. And will you take a glass of whiskey now, or a glass of claret? And it is a great pity your hair is red, or they would call you Donull Dubh, and people would say you were the born successor of the last of the MacCruimins."

At this praise — imagine telling a piper lad that he was a fit successor of the MacCruimins, the hereditary pipers of the Macleods — the young stripling blushed hot; but he did not forget his professional dignity for all that. And he was so proud of his good English that he replied in that tongue.

"I will take a glass of the claret wine, Sir Keith," said he.

Young Macleod took up a horn tumbler, rimmed with silver, and having the triple-towered castle of the Macleods engraved on it, and filled it with wine. He handed it to the lad.

"I drink your health, Lady Macleod," said he, when he had removed his cap; "and I drink your health, Miss Macleod; and I drink your health, Sir Keith; and I would have a lighter heart this night if I was going with you away to England."

It was a bold demand.

"I cannot take you with me, Donald; the Macleods have got out of the way of taking their piper with them now. You must stay and look after the dogs."

"But you are taking Oscar with you, Sir Keith."

"Yes, I am. I must make sure of having one friend with me in the south."

"And I think I would be better than a collie," muttered the lad to himself, as he moved off in a proud and hurt way toward the door, his cap still in his hand.

And now a great silence fell over these three; and Janet Macleod looked anxiously toward the old lady, who sat unmoved in the face of the ordeal through which she knew she must pass. It was an old custom that each night a pibroch should be played in Castle Dare in remembrance of her five slain sons; and yet on this one night her niece would fain have seen that custom abandoned. For was not the pibroch the famous and pathetic "*Cumhadh na Cloinne*," the "Lament for the Children," that Patrick Mòr, one of the pipers of Macleod of Skye, had composed to the memory of his seven sons, who had all died within one year? And now the doors were opened, and the piper boy once more entered. The wild, sad wail arose; and slow and solemn was the step with which he walked up the hall. Lady Macleod sat calm and erect, her lips proud and firm, but her lean hands were working nervously together; and at last, when the doors were closed on the slow and stately and mournful "Lament for the Children," she bent down the silvery head on those wrinkled hands and wept aloud. Patrick Mòr's seven brave sons could have been no more to him than her six tall lads had been to her; and now the last of them was going away from her.

"Do you know," said Janet quickly, to her cousin across the table, "that it is said no piper in the west Highlands can play 'Lord Lovat's Lament' like our Donald?"

"Oh yes, he plays it very well; and he has got a good step," Macleod said. "But you will tell him to play no more laments to-night. Let him take to strathspeys if any of the lads come up after bringing back the boat. It will be time enough for him to make a lament for me when I am dead. Come, mother, have you no message for Norman Ogilvie?"

The old lady had nerved herself again, though her hands were still trembling.

"I hope he will come back with you, Keith," she said.

"For the shooting? No, no, mother. He was not fit for the shooting about here: I have seen that long ago. Do you think he could lie for an hour in a wet bog? It was up at Fort William I saw him last year, and I said to him, 'Do you wear gloves at Aldershot?' His hands were as white as the hands of a woman."

"It is no woman's hand you have,

Keith," his cousin said; "it is a soldier's hand."

"Yes," said he, with his face flushing, "and if I had had Norman Ogilvie's chance —— "

But he paused. Could he reproach this old dame, on the very night of his departure, with having disappointed all those dreams of military service and glory that are almost the natural inheritance of a Macleod of the western Highlands? If he was a stay-at-home, at least his hands were not white. And yet, when young Ogilvie and he studied under the same tutor — the poor man had to travel eighteen miles between the two houses, and many a time in hard weather — all the talk and aspirations of the boys were about a soldier's life; and Macleod could show his friend the various trophies and curiosities sent home by his elder brothers from all parts of the world. And now the lily-fingered and gentle-natured Ogilvie was at Aldershot; while he — what else was he than a mere deer-stalker and salmon-killer?

"Ogilvie has been very kind to me, mother," he said, laughing. "He has sent me a list of places in London where I am to get my clothes and boots and a hat; and by the time I have done that, he will be up from Aldershot, and will lead me about — with a string round my neck, I suppose, lest I should bite somebody."

"You could not go better to London than in your own tartan," said the proud mother; "and it is not for an Ogilvie to say how a Macleod shall be dressed. But it is no matter. One after the other has gone; the house is left empty at last. And they all went away like you, with a laugh on their face. It was but a trip, a holiday, they said: they would soon be back to Dare. And where are they this night?"

Old Hamish came in.

"It will be time for the boat now, Sir Keith, and the men are down at the shore."

He rose — the handsome young fellow — and took his broad blue bonnet with the badge of juniper.

"Good-bye, Cousin Janet," said he, lightly. "Good-bye, mother. You are not going to send me away in this sad fashion? What am I to bring you back — a satin gown from Paris? or a young bride to cheer up the old house?"

She took no heed of the passing jest. He kissed her, and bade her good-bye once more. The clear stars were shining over Castle Dare, and over the black shadows of the mountains, and the smoothly swelling waters of the Atlantic. There was a dull booming of the waves along the rocks.

He had thrown his plaid around him, and he was wondering to himself as he descended the steep path to the shore. He could not believe that the two women were really saddened by his going to the south for a while; he was not given to forebodings. And he had nearly reached the shore, when he was overtaken by some one running with a light step behind him. He turned quickly, and found his cousin before him, a shawl thrown round her head and shoulders.

"Oh, Keith," said she, in a bright and matter-of-fact way, "I have a message for you — from myself — and I did not want aunt to hear, for she is very proud, you know, and I hope you won't be. You know we are all very poor, Keith; and yet you must not want money in London, if only for the sake of the family; and you know I have a little, Keith, and I want you to take it. You won't mind my being frank with you. I have written a letter."

She had the envelope in her hand.

"And if I would take money from any one, it would be from you, Cousin Janet; but I am not so selfish as that. What would all the poor people do if I were to take your money to London and spend it?"

"I have kept a little," said she, "and it is not much that is needed. It is £2000 I would like you to take from me, Keith. I have written a letter."

"Why, bless me, Janet, that is nearly all the money you've got!"

"I know it."

"Well, I may not be able to earn any money for myself, but at least I would not think of squandering your little fortune. No, no; but I thank you all the same, Janet; and I know that it is with a free heart that you offer it."

"But this is a favor, Keith," said she. "I do not ask you to spend the money. But you might be in trouble; and you would be too proud to ask any one — perhaps you would not even ask me; and here is a letter that you can keep till then, and if you should want the money, you can open the letter and it will tell you how to get it."

"And it is a poor forecast you are making, Cousin Janet," said he cheerfully. "I am to play the prodigal son, then! But I will take the letter. And good-bye again, Janet; and God bless you, for you are a kind-hearted woman."

She went swiftly up to Castle Dare again, and he walked on toward the

shore. By-and-by he reached a small stone pier that ran out among some rocks, and by the side of it lay a small sailing launch, with four men in her, and Donald the piper boy perched up at the bow. There was a lamp swinging at her mast, but she had no sail up, for there was scarcely any wind.

"Is it time to go out now?" said Macleod to Hamish, who stood waiting on the pier, having carried down his master's portmanteau.

"Ay, it will be time now, even if you will wait a little," said Hamish. And then the old man added, "It is a dark night, Sir Keith, for your going away from Castle Dare."

"And it will be the brighter morning when I come back," answered the young man, for he could not mistake the intention of the words.

"Yes, indeed, Sir Keith; and now you will go into the boat, and you will take care of your footing, for the night is dark, and the rocks they are always slippery whatever."

But Keith Macleod's foot was as familiar with the soft seaweed of the rocks as it was with the hard heather of the hills, and he found no difficulty in getting into the broad-beamed boat. The men put out their oars and pushed her off. And now, in the dark night, the skirl of the pipes arose again; and it was no stately and mounful lament that young Donald played up there at the bow as the four oars struck the sea and sent a flash of white fire down into the deeps.

"Donald," Hamish had said to him on the shore, "when you are going out to the steamer, it is the 'Seventy-ninth's Farewell to Chubralter, that you will play, and you will play no other thing than that."

And surely the Seventy-ninth were not sorry to leave Gibraltar when their piper composed for them so glad a farewell.

At the high windows of Castle Dare the mother stood, and her niece, and as they watched the yellow lamp move slowly out from the black shore, they heard this proud and joyous march that Donald was playing to herald the approach of his master. They listened to it as it grew fainter and fainter, and as the small yellow star trembling over the dark waters became more and more remote. And then this other sound — this blowing of a steam-whistle far away in the darkness?

"He will be in good time, aunt; she is a long way off yet," said Janet Macleod. But the mother did not speak.

Out there on the dark and moving waters the great steamer was slowly drawing near the open boat; and as she came up, the vast hull of her, seen against the starlit sky, seemed a mountain.

"Now, Donald," Macleod called out, "you will take the dog — here is the string; and you will see he does not spring into the water."

"Yes, I will take the dog," muttered the boy, half to himself. "Oh yes, I will take the dog; but it was better if I was going with you, Sir Keith, than any dog."

A rope was thrown out, the boat dragged up to the side of the steamer, the small gangway let down, and presently Macleod was on the deck of the large vessel. Then Oscar was hauled up too, and the rope flung loose, and the boat drifted away into the darkness. But the last good-bye had not been said, for over the black waters came the sound of the pipes once more, the melancholy wail of "Mackintosh's Lament."

"Confound that obstinate brat!" Macleod said to himself. "Now he will go back to Castle Dare and make the women miserable."

"The captain is below at his supper, Sir Keith," said the mate. "Will you go down to him?"

"Yes, I will go down to him," said he; and he made his way along the deck of the steamer.

He was arrested by the sound of some one crying, and he looked down, and found a woman crouched under the bulwarks, with two small children asleep on her knee.

"My good woman, what is the matter with you?" said he.

"The night is cold," she said, in the Gaelic, "and my children are cold; and it is a long way that we are going."

He answered her in her own tongue.

"You will be warmer if you go below; but here is a plaid for you, anyway;" and with that he took the plaid from round his shoulders and flung it across the children, and passed on.

That was the way of the Macleods of Dare. They had a royal manner with them. Perhaps that was the reason that their revenues were now far from royal.

And meanwhile the red light sill burned in the high windows of Castle Dare, and two women were there looking out on the pale stars and the dark sea beneath. They waited until they heard the plashing of oars in the small bay below, and the message was brought them that Sir Keith had got safely on board the great steamer. Then they turned away from the silent and

empty night, and one of them was weeping bitterly.

"It is the last of my six sons that has gone from me," she said, coming back to the old refrain, and refusing to be comforted.

"And I have lost my brother," said Janet Macleod, in her simple way. "But he will come back to us, auntie; and then we shall have great doings at Castle Dare."

CHAPTER II.

MENTOR.

It was with a wholly indescribable surprise and delight that Macleod came upon the life and stir and gayety of London in the sweet June time, when the parks and gardens and squares would of themselves have been a sufficient wonder to him. The change from the sombre shores of lochs Na Keal and Iua and Scridain to this world of sun-lit foliage — the golden yellow of the laburnum, the cream-white of the chestnut, the rose-pink of the red hawthorn, and everywhere the keen translucent green of the young lime-trees — was enough to fill the heart with joy and gladness, though he had been no diligent student of landscape and color. The few days he had to spend by himself — while getting properly dressed to satisfy the demands of his friend — passed quickly enough. He was not at all ashamed of his country-made clothes as he watched the whirl of carriages in Piccadilly, or lounged under the elms of Hyde Park, with his beautiful sliver-white and lemon-colored collie attracting the admiration of every passer-by. Nor had he waited for the permission of Lieutenant Ogilvie to make his entrance into at least one little corner of society. He was recognized in St. James's Street one morning by a noble lady whom he had met once or twice at Inverness; and she, having stopped her carriage, was pleased to ask him to lunch with herself and her husband next day. To the great grief of Oscar, who had to be shut up by himself, Macleod went up next day to Brook Street, and there met several people whose names he knew as representatives of old Highland families, but who were very English, as it seemed to him, in their speech and ways. He was rather petted, for he was a handsome lad, and he had high spirits and a proud air. And his hostess was so kind as to mention that the Caledonian Ball was coming off on the 25th, and of course he must come, in the Highland costume; and as she was one of the patronesses, should she give him a voucher? Macleod answered, laughingly, that he would be glad to have it, though he did not know what it was; whereupon she was pleased to say that no wonder he laughed at the notion of a voucher being wanted for any Macleod of Dare.

One morning a good-looking and slim young man knocked at the door of a small house in Bury Street, St. James's, and asked if Sir Keith Macleod was at home. The man said he was, and the young gentlemen entered. He was a most correctly-dressed person. His hat and gloves and cane and long-tailed frock-coat were all beautiful; but it was perhaps the tightness of his nether garments, or perhaps the tightness of his brilliantly polished boots (which were partially covered by white gaiters), that made him go up the narrow little stairs with some precision of caution. The door was opened and he was announced.

"My dear old boy," said he, "how do you do?" and Macleod gave him a grip of the hand that nearly burst one of his gloves.

But at this moment an awful accident occurred. From behind the door of the adjacent bedroom, Oscar, the collie, sprang forward with an angry growl; then he seemed to recognize the situation of affairs when he saw his master holding the stranger's hand; then he began to wag his tail; then he jumped up with his forepaws to give a kindly welcome.

"Hang it all, Macleod!" young Ogilvie cried, with all the starch gone out of his manner, "your dog's all wet! What's the use of keeping a brute like that about the place?"

Alas! the beautiful, brilliant boots were all besmeared, and the white gaiters too, and the horsey-looking nether garments. Moreover, the Highland savage, so far from betraying compunction, burst into a roar of laughter.

"My dear fellow," he cried, "I put him in my bedroom to dry. I couldn't do more, could I? He has just been in the Serpentine."

"I wish he was there now with a stone and a string round his neck," observed Lieutenant Ogilvie, looking at his boots; but he repented him of this rash saying, for within a week he had offered Macleod £20 for the dog. He might have offered twenty dozen of £20, and thrown his polished boots and his gaiters too into the bargain, and he would have had the same answer.

Oscar was once more banished into the bedroom; and Mr. Ogilvie sat down, pretending to take no more notice of his boots. Macleod put some sherry on the table, and a handful of cigars; his friend asked whether he could not have a glass of seltzer-water and a cigarette.

"And how do you like the rooms I got for you?"

"There is not much fresh air about them, nor in this narrow street," Macleod said frankly; "but that is no matter, for I have been out all day — all over London."

"I thought the price was as high as you would care to go," Ogilvie said; "but I forgot you had come fresh up, with your pockets full of money. If you would like something a trifle more princely, I'll put you up to it."

"And where have I got the money? There are no gold mines in the west of Mull. It is you who are Fortunatus."

"By Jove, if you knew how hard a fellow is run at Aldershot," Mr. Ogilvie remarked confidentially, "you would scarcely believe it. Every new batch of fellows who come in have to be dined all round; and the mess bills are simply awful. It's getting worse and worse; and then these big drinks put one off one's work so."

"You are studying hard, I suppose," Macleod said, quite gravely.

"Pretty well," said he, stretching out his legs, and petting his pretty moustache with his beautiful white hand. Then he added, suddenly, surveying the brown-faced and stalwart young fellow before him, "By Jove, Macleod, I'm glad to see you in London. It's like a breath of mountain air. Don't I remember the awful mornings we've had together — the rain and the mist and the creeping through the bogs? I believe you did your best to kill me. If I hadn't had the constitution of a horse, I should have been killed."

"I should say your big drinks at Aldershot were more likely to kill you than going after the deer," said Macleod. "And will you come up with me this autumn, Ogilvie? The mother will be glad to see you, and Janet too; though we haven't got any fine young ladies for you to make love to, unless you go up to Fort William, or Fort George, or Inverness. And I was all over the moors before I came away; and if there is anything like good weather, we shall have plenty of birds this year, for I never saw before such a big average of eggs in the nests."

"I wonder you don't let part of that shooting," said young Ogilvie, who knew well of the straitened circumstances of the Macleods of Dare.

"The mother won't have it done," said Macleod, quite simply, "for she thinks it keeps me at home. But a young man cannot always stay at home. It is very good for you, Ogilvie, that you have brothers."

"Yes, if I had been the eldest of them," said Mr. Ogilvie. "It is a capital thing to have younger brothers; it isn't half so pleasant when you are the younger brother."

"And will you come up, then, and bury yourself alive at Dare?"

"It is awfully good of you to ask me, Macleod; and if I can manage it, I will; but I am afraid there isn't much chance this year. In the mean time, let me give you a hint. In London we talk of going *down* to the Highlands."

"Oh, do you? I did not think you were so stupid," Macleod remarked.

"Why, of course we do. You speak of going up to the capital of a country, and of going down to the provinces."

"Perhaps you are right — no doubt you are right; but it sounds stupid," the unconvinced Highlander observed again. "It sounds stupid to say going up to the south, and going down to the north. And how can you go down to the Highlands? you might go down to the Lowlands. But no doubt you are right; and I will be more particular. And will you have another cigarette? and then we will go out for a walk, and Oscar will get drier in the street than in-doors."

"Don't imagine I am going out to have that dog plunging about among my feet," said Ogilvie. "But I have something else for you to do. You know Colonel Ross of Duntorme."

"I have heard of him."

"His wife is an awfully nice woman, and would like to meet you. I fancy they think of buying some property — I am not sure it isn't an island — in your part of the country; and she has never been to the Highlands at all. I was to take you down with me to lunch with her at two, if you care to go. There is her card."

Macleod looked at the card.

"How far is Prince's Gate from here?" he asked.

"A mile and a half, I should say."

"And it is now twenty minutes to two," said he, rising. "It will be a nice smart walk."

"Thank you," said Mr. Ogilvie; "if it is all the same to you, we will perform the journey in a hansom. I am not in training

just at present for your tramps to Ben-an-Sloich."

"Ah! your boots are rather tight," said Macleod, with grave sympathy.

They got into a hansom, and went spinning along through the crowd of carriages on this brilliant morning. The busy streets, the handsome women, the fine buildings, the bright and beautiful foliage of the parks — all these were a perpetual wonder and delight to the new-comer, who was as eager in the enjoyment of this gay world of pleasure and activity as any girl come up for her first season. Perhaps this notion occurred to the astute and experienced Lieutenant Ogilvie, who considered it his duty to warn his youthful and ingenuous friend.

"Mrs. Ross is a very handsome woman," he remarked.

"Indeed."

"And uncommonly fascinating too, when she likes."

"Really."

"You had better look out if she tries to fascinate you."

"She is a married woman," said Macleod.

"They are always the worst," said this wise person; "for they are jealous of the younger women."

"Oh, that is all nonsense," said Macleod bluntly. "I am not such a greenhorn. I have read all that kind of talk in books and magazines: it is ridiculous. Do you think I will believe that married women have so little self-respect as to make themselves the laughing-stock of men?"

"My dear fellow, they have cart-loads of self-respect. What I mean is that Mrs. Ross is a bit of a lion-hunter, and she may take a fancy to make a lion of you ——"

"That is better than to make an ass of me, as you suggested."

"And naturally she will try to attach you to her set. I don't think you are quite *outré* enough for her; perhaps I made a mistake in putting you into decent clothes. You wouldn't have time to get into your kilts now? But you must be prepared to meet all sorts of queer folks at her house, especially if you stay on a bit and have some tea — mysterious poets that nobody ever heard of, and artists who won't exhibit, and awful swells from the German universities, and I don't know what besides — everybody who isn't the least like anybody else."

"And what is your claim, then, to go there?" Macleod asked.

"Oh," said the young lieutenant, laughing at the home-thrust, "I am only admitted on sufferance, as a friend of Colonel Ross. She never asked *me* to put my name in her autograph-book. But I have done a bit of the jackal for her once or twice, when I happened to be on leave; and she has sent me with people to her box at Covent Garden when she couldn't go herself."

"And how am I to propitiate her? What am I to do?"

"She will soon let you know how you strike her. Either she will pet you, or she will snuff you out like winking. I don't know a woman who has a blanker stare, when she likes."

This idle conversation was suddenly interrupted. At the same moment both young men experienced a sinking sensation, as if the earth had been cut away from beneath their feet; then there was a crash, and they were violently thrown against each other; then they vaguely knew that the cab, heeling over, was being jolted along the street by a runaway horse. Fortunately the horse could not run very fast, for the axle-tree, deprived of its wheel, was tearing at the road; but, all the same, the occupants of the cab thought they might as well get out, and so they tried to force open the two small panels of the door in front of them. But the concussion had so jammed these together that, shove at them as they might, they would not yield. At this juncture, Macleod, who was not accustomed to hansom cabs, and did not at all like this first experience of them, determined to get out somehow; and so he raised himself a bit, so as to get his back firm against the back of the vehicle; he pulled up his leg until his knee almost touched his mouth; he got the heel of his boot firmly fixed on the top edge of the door; and then with one forward drive he tore the panel right away from its hinges. The other was of course flung open at once. Then he grasped the brass rail outside, steadied himself for a moment, and jumped clear from the cab, alighting on the pavement. Strange to say, Ogilvie did not follow, though Macleod, as he rushed along to try to get hold of the horse, momentarily expected to see him jump out. His anxiety was of short duration. The axle-tree caught on the curb; there was a sudden lurch; and then, with a crash of glass, the cab went right over, throwing down the horse, and pitching the driver into the street. It was all the work of a few seconds; and another second seemed to suffice to collect a crowd, even in this quiet part

of Kensington Gore. But, after all, very little damage was done, except to the horse, which had cut one of its hocks. When young Mr. Ogilvie scrambled out and got on to the pavement, instead of being grateful that his life had been spared, he was in a towering passion — with whom or what he knew not.

"Why didn't you jump out?" said Macleod to him, after seeing that the cabman was all right.

Ogilvie did not answer; he was looking at his besmeared hands and dishevelled clothes.

"Confound it!" said he; "what's to be done now? The house is just round the corner."

"Let us go in, and they will lend you a clothes-brush."

"As if I had been fighting a bargee? No, thank you. I will go along till I find some tavern, and get myself put to rights."

And this he did gloomily, Macleod accompanying him. It was about a quarter of an hour before he had completed his toilet; and then they set out to walk back to Prince's Gate. Mr. Ogilvie was in a better humor.

"What a fellow you are to jump, Macleod!" said he. "If you had cannoned against that policeman, you would have killed him. And you never paid the cabman for destroying the lid of the door; you prized the thing clean off its hinges. You must have the strength of a giant."

"But where the people came from — it was that surprised me," said Macleod, who seemed to have rather enjoyed the adventure. "It was like one of our sea-lochs in the Highlands — you look all round and cannot find any gull anywhere; but throw a biscuit into the water, and you will find them appearing from all quarters at once. As for the door, I forgot that; but I gave the man half a sovereign to console him for his shaking. Was not that enough?"

"We shall be frightfully late for luncheon," said Mr. Ogilvie, with some concern.

THE STORY OF MAXIMILIAN AT MIRAMAR AND AT QUERETARO.

FROM ADVANCE SHEETS OF A WORK,

"A TRAVERS L'AUTRICHE."

Translated and abridged by E. W. Latimer for THE LIVING AGE.

MIRAMAR is situated about three miles from Trieste. The drive to it is charming. The traveller follows the line of the coast, crimped into smiling bays and beaches, edged with a lace-work of beautiful white foam. The color of the ocean is bright blue on a clear day, the sea air full of invigoration, the murmur of the breaking surf as gentle as a sigh. Flocks of white gulls sweep under the blue sky, and over the blue water; great ships come and go far away on the horizon; while in-shore, here and there, some coasting vessel, wing and wing, with its red sails, touches the landscape with a bit of vivid color.

On a picturesque promontory, at the termination of the road, stands Miramar; now almost like a place of pilgrimage, once poor Maximilian's and poor Carlotta's happy home.

The story of this castle has never yet been told in print, and as I had it from the lips of a near and dear personal friend of Maximilian, I trust the reader will find it acceptable even at second hand.

In 1856 the young archduke Maximilian was commander-in-chief of the navy of Austria, which achieved all its importance under his command. At that time he had no interest in Miramar. His ambition was to be made viceroy of Lombardy at some future day. He had been round the world in his frigate the "Novara;" he had travelled into Greece and Asia Minor; he had visited Spain, Portugal, and Sicily; he had been in Egypt and the Holy Land. He loved the ocean like a true sailor, and had taken up his residence at Trieste to be near its shores. He was often known to go out alone in a light boat in rough weather, the dash of danger in the expedition adding pleasure to the excitement of a battle with the winds and waves.

One day, in a great storm, his light boat was blown like a feather round Cape Gignano. In a moment it lay still under the lee of the land. Maximilian landed, and found the spot so charming, and the sea-view so superb, that he resolved to build a little villa there for fishing. He bought the land at once, and began by setting out exotics, persuaded that the soil of such a spot would be favorable to tropical vegetation.

A year later he married the daughter of the king of the Belgians (named Charlotte, after his first wife Charlotte of England), and the golden wand of this fair bride transformed his bachelor's fishing-hut into the palace of an emperor.

At this period of his life Maximilian (both an author and a poet) was greatly interested in architecture. He drew the plan of that exquisite memorial church

Digitized by CORNELL UNIVERSITY
Original from CORNELL UNIVERSITY

which is one of the chief beauties of Vienna; and he draughted, with his own hand, the plan of the grounds and castle of Miramar. The work was pushed on rapidly, yet in 1858, when Austria was forced to give up Lombardy, nothing at Miramar was complete but a fancy farmhouse on one of the heights of the property. Maximilian, however, came hither with his wife, and found it so delightful that when at length the castle was ready for occupation, they lingered in the farmhouse which they loved as their first home. It was a large Swiss châlet, covered over with wild vines and honeysuckle; surrounded by groves of camellias, and pyrus japonica. How delicious life must have been to the husband and wife in this solitude, fragrant with flowers, vocal with the songs of singing birds, — a glory of greenness round the house, the blue sky overhead, the smiling ocean at their feet, and holy love and loving kindness everywhere about them!

In this spot, as it seemed, they realized the modern dream of love *and riches* in a cottage.

Maximilian's natural generosity rendered wealth indispensable to his complete happiness; for he loved to surround himself by artists, learned men, and men of letters. He paid them every kind of attention in his power, and did not omit those little gifts which are "the beads on memory's rosary." Ah, if those walls could speak, if those trees could repeat what they have heard, we might see into the clear depths of a generous heart, and perceive how every project that he ever formed in life was worthy of his pure and noble soul!

When one wanders through these peaceful shades, when one lingers by these gorgeous beds of flowers, one feels how happy life must have been in this new Paradise. And when one thinks that he is dead, and she is worse than dead, one is moved to pain and pity by the very beauties of the scene. One cannot wander through these gardens without dreams of their past happiness, and in the dim walks, where the sunlight flickers through green leaves, one seems to see the shadowy forms of a loving husband and wife fading away into the dimness of the gloaming. It is Paradise lost — and alas! in this, as in that other Paradise, the Eve — the sweet young wife — was tempted by ambition. She took the apple, ate, and gave it to her husband.

On the tenth of April, 1864, the Mexican deputies, commissioned to offer Maximilian the imperial crown, arrived at Miramar.

"We come," said Don Gutierrez de Estrada, "to beseech you to ascend the throne of Mexico, to which you have been called by the voice of a people weary of anarchy and civil war. We are assured you have the secret of conquering the breasts of all men, and excel in the rare knowledge of the art of government."

Maximilian replied that he was ready to accept the honor offered him by the Mexican people; that his government would be both liberal and constitutional. "I shall prove, I trust," he said, "that liberty may be made compatible with law. I shall respect your liberties, and uphold order at the same time."

Don Gutierrez thanked the archduke in the name of the Mexican nation; and then the new emperor swore upon the Gospels to labor for the happiness and prosperity of his people, and to protect their independent nationality.

After this Don Gutierrez took the oath of allegiance to the emperor in the name of the city of Mexico. Maximilian then embraced him, and hung around his neck the cross of the new Order of Guadeloupe, of which he was the first member.

Three days after this the imperial pair quitted the soil of Austria. Early in the morning the port of Trieste and the road to Miramar were astir. Friends from all parts of the Austrian empire were hastening to bid farewell to the archduke whom they loved.

The "Novara," and the French frigate "Themis," were lying in the stream ready to start, and near them, riding at anchor, were six steamships belonging to the Austrian Lloyds, full of spectators.

At about one o'clock P. M. the emperor, with his wife leaning on his arm, entered the town hall, where about twenty deputations were assembled to offer him farewell addresses. Maximilian was much moved, and when the burgomaster of Trieste spoke of the grief that all the people of that city would feel at his departure, he burst into tears. He embraced the burgomaster, shook hands with those around him, and whispered, as if to himself, "Something tells me I shall never see this dear country again!"

His chivalric and poetic nature was very susceptible to sad presentiments. His book of travels is full of them.

After leave-taking, their majesties entered the magnificent barge prepared for their use by the city of Trieste; a salute of one hundred guns reverberated from the

sides of the mountain; while thirty thousand hats and handkerchiefs waved a sad farewell.

Maximilian and Carlotta embarked on board the "Novaro," which carried the Mexican flag. By four o'clock both vessels were hull down in the offing, and not till then did the crowd separate. Those with telescopes had seen, up to the last moment, a figure standing on the poop, with its face turned towards Miramar, and knew it for the form of Maximilian.

The "Novara" touched at Jamaica. On the 28th of May it came in sight of the shores of Mexico, and cast anchor in the harbor of Vera Cruz.

The emperor and empress had expected a public reception. There was nothing of the kind. No welcome awaited them, not even an official one. This was the more extraordinary because the "Themis" had been sent forward to announce the approach of the imperial party. Their disappointment at this want of enthusiasm was great. The French vice-admiral did his best to repair the unfortunate omissions. He gave orders for a show of festivity; but it was plain to see from the indifference of the people in the streets that they had no part or lot in the demonstration.

Were these the Mexicans whom they had been assured were wild with ardor to receive them? — who had been by all accounts as eager to implore Maximiliam and Carlotta to reign over them as the frogs in the fable had been to obtain their king?

After leaving Loma Alta Maximilian proceeded towards his capital in a shabby English barouche; his journey seeming rather like the expedition of an adventurer, than the progress of an emperor.

Passing through Orizaba and Puebla, the emperor and empress entered Mexico on the twelfth of June. There a theatrical kind of reception was prepared, which was not agreeable to either of them. In the evening, when there was a public performance in the theatre in honor of the new sovereigns (who were present), not half the boxes were filled.

The "Halls of the Montezumas" — the Palace of Chapultepec, which had been assigned them as their residence, was destitute of comforts of every kind, and was much more like a second-class hotel than a habitation fit for princes.

The emperor was advised to make an immediate journey through his new dominions in order to judge for himself of their popular aspirations, and resources; but what did he find? A country broken down by war; without roads, without schools, without agriculture. "The only thing in this country, sire, that is well organized," said a Mexican whom he was questioning about the state of affairs, "is robbery." There was thieving everywhere. The emperor's palace, and even his private apartments, were not spared. After a reception of officers high in military command, his revolver, inlaid with gold and ivory, which was lying on a table by his side, had disappeared; and the empress missed two watches which had gone astray under the dexterous fingering of her maids of honor. Lopez, who was then commandant of the palace, wishing to give the emperor a proof of the accomplishments of his subjects in matters of this kind, offered to steal off of his writing-table, within two hours, and without being seen, any object agreed upon. He even said he believed he could carry off the writing-table itself, a joke at which Maximilian laughed heartily.

When he returned to his capital, after a journey of great peril, the emperor ordered the construction of several highroads, granted lands and privileges to two or three railroad companies, founded a good many schools, and set on foot a Mexican Academy of Arts and Sciences. His own taste for natural history was so great that he gave some foundation for the charge made against him that he would frequently shut himself up in his own work-room to stuff birds. He devoted great attention to improvements in agriculture, and planned a manufacturing city and seaport on the gulf, which he intended to call Miramar.

His wife was an indefatigable helpmeet. She worked with him, and worked for him. She wrote all his European correspondence, and could be curt and energetic when occasion called for self-assertion. When Marshal Bazaine interfered, on the part of the French government, to prevent the medal of Maximilian's Order of Merit being hung on a red ribbon, because that was the color appropriated to the Legion of Honor, she answered the marshal's letter by gumming a small wild poppy on her paper, and writing beneath it, in the name of her husband, "A ribbon of this shade has been adopted for my order. This flower was created previous to the institution of the order of the Legion of Honor."

But whilst emperor and empress were laboring for the improvement of their realm, the Juarists increased in strength,

and the banditti carried on their profession with impunity, up to the very gates of the capital. Day after day they robbed the stage between Mexico and Jalapa. The Marquis de Radepont, a quiet traveller, saved himself by killing half-a-dozen highwaymen with his revolver; but the Belgian ambassador, on his way to announce to their Imperial Majesties the accession of Leopold II., brother of Carlotta, was robbed of all his money and his jewelry.

In consequence of these disorders, Bazaine induced the emperor to sign an order to all the civil and military authorities, to treat all armed guerilla bands as brigands, and apply to them the utmost rigor of the law. He did not foresee that he was signing his own death-warrant, when he put his hand to this act of just severity.

The French occupation of Mexico was drawing to a close. Napoleon III. was only waiting an occasion to withdraw his stake, and the United States soon furnished him the opportunity. Maximilian, who fully understood by this time the true condition of Mexico, and foresaw all the dangers of his position when the French troops should be withdrawn, sent the empress at this crisis to Europe, to represent the condition of things to the French emperor, and to remind him of his promises. Her cold reception at the Tuileries is now a matter of history. Her prayers and entreaties were of no avail. From Paris she went to Rome, where the first symptoms of her mental malady declared themselves.

The unhappy princess was haunted by the idea that her enemies wanted to poison her. She refused to eat or drink, and would take nothing but fruit. Her first visit to the pope was made while he was breakfasting, when she snatched his cup of chocolate from his hand and swallowed it eagerly, exclaiming, "I am sure that no one can have wished to poison *you!*"

She insisted on dining with the pope, and on passing the night at the Vatican. She was pacified at last by being put, with the lady in attendance on her, into the adjoining chamber to that of his Holiness; and the door of communication was carefully locked, lest she should attempt during the night to disturb the venerable man. The next morning measures were taken to forward her to Miramar. On reaching that beloved place she grew more calm. She recovered for a time her interest in music, painting, and literature. The Sclavic peasants round her considered her a saint. When she passed they used to kneel down on the highway. To this day many refuse to believe in Maximilian's death. "He will come back! We know he will come back!" is the cry of the Dalmatians and Istrians who cherish his memory.

Meantime matters in Mexico grew worse every day. Bazaine and his forces had abandoned the cause of Maximilian. Sooner than leave him the artillery and ammunition they could not transport, they threw it all into the River Sequia and Lake Texcoco. It was whispered that Bazaine privately negotiated with the followers of Juarez to give the emperor up to them for fifty thousand dollars. The consummation of this treachery was, however, reserved for Lopez (a connection of Bazaine's, through his wife, a lady of Mexico), a man who had been admitted into his familiar intimacy by Maximilian. Prior to the withdrawal of the French troops the French government made several efforts to induce Maximilian to abdicate. "I know all the difficulties before me," he replied, "but I shall not give up my post. A son of the house of Hapsburg never retreats in the face of danger."

Nevertheless, Maximilian, after he had received the news of his wife's insanity, made up his mind not to remain long in Mexico. He hoped at least to save his dignity, to return to Europe as an emperor, and not a fugitive, and lay aside his crown of his own accord. With this in view he set out for Orizaba, where the "Dandolo" corvette was waiting to receive his orders. But his generals gathered round him, and persuaded him to remain, promising him the support of men and money. Maximilian, on the strength of these assurances, returned to Mexico, protesting that he remained only for the good of his people, and was influenced neither by personal considerations, nor political interests of his own.

The departure of the French troops left the way clear for the party of Juarez. It rapidly gained strength, and prepared to beseige the emperor in his capital. "I cannot bear to expose the city to danger," said Maximilian, who, in spite of being continually harassed and cruelly deceived day after day, never failed in consideration for those about him. He retired to Queretaro, where Generals Miramon, Mendez, Castillo, Mejia, Avellano, and Prince Salm-Salm, had gathered together a little army of about eight thousand men.

Maximilian at Queretaro showed all his nobleness of spirit, kindliness of heart, and simplicity of life during the siege, which lasted over two months. He shared the fatigues and privations of his common

soldiers, and lived, as they did, on the flesh of mules, whilst the officers' tables were more than sufficiently supplied. He exposed his person upon all occasions; taking daily walks upon the bastions as tranquilly as he might have done in the green alleys of his distant home. One day his eyes fell upon six dead bodies dangling from the branches of six trees. He turned away in terrible emotion. They were the bodies of six of his own couriers, who had fallen into the hands of the enemy.

He might easily have cut his way out at the head of his cavalry, but he hesitated to abandon his foot soldiers. Nor would he capitulate. "I will die sword in hand," were now his daily words.

Every day his men brought in prisoners. Even when these prisoners were suspected of being spies he would not order their execution. "No — no," he said, "if things go well there is no harm done, — if ill, I shall not have their blood upon my soul."

When the siege had lasted seventy days, provisions grew so scarce that there was no alternative but a sortie or surrender.

The sortie was decided on. On the night of May 14, 1866, the seven thousand men still remaining in Queretaro were to break through the lines of the enemy, and endeavor to make their way to Vera Cruz. Singularly enough the Juarist general Escobedo had fixed on the 15th of May for his final assault.

Neither sortie nor assault took place. The treason of Lopez hindered the one and rendered the other unnecessary. Lopez, whom Maximilian had loaded with all sorts of kindness — Lopez, who called himself the most devoted friend of the emperor — *Lopez* had sold his friend's and benefactor's life for two thousand ounces of gold! One year before, when Lopez had been at Puebla in attendance on the empress, he had sent for his wife, who, having made a hurried journey, was prematurely delivered of a son. "I cannot allow your son," wrote Maximilian, "to come into the world in another man's house. I send you the enclosed sum; purchase the house in which your son was born."

Having kept up constant intelligence with the camp of the besiegers, Lopez, on the coming of May 13, sent a note to Escobedo offering to deliver over to him the Convent of La Cruz, which was the emperor's headquarters.

Escobedo accepted his proposals. About midnight Lopez and his troops went over to the enemy. The soldiers of Juarez quietly marched in and surrounded the convent, where the emperor and his staff were sleeping. At dawn of day Maximilian dressed himself, woke up Prince Salm-Salm, and they went out together, with no arms but their swords. As they reached the gates the emperor perceived the enemy's soldiers on guard, and turning towards his companion cried, "We are betrayed. Here is the enemy!" At this moment Lopez, who had seen them come into the courtyard, pointed out the emperor to Colonel Rincon Gallardo, who was in command of the detachment of Juarists.

Rincon was an honorable soldier, and a kind-hearted man. He said, loud enough to be heard by his own men and Maximilian, —

"Nothing but citizens! Let them pass, they are not soldiers!"

The emperor and Prince Salm-Salm then walked through the convent gates, and made their way in haste to the opposite quarter of the city. The streets were silent and deserted. Suddenly a sharp fire of musketry was heard in a neighboring street, mingled with Juarist and Imperial war-cries. Miramon with his troops was holding one of the widest streets of Queretaro, when a ball hit him in the face. He fell, half blinded, and was taken prisoner.

The emperor, with Generals Mejia, Castillo, Avellano, and Prince Salm-Salm, retired to a little hill which commanded the city. They had no artillery, no means of defending their position. They stood on the bare rocks where they had taken refuge, like shipwrecked sailors waiting for the fatal rising of the water. General Escobedo, a coarse, brutal man, formerly a muleteer, prepared to charge up the hill, with four battalions of infantry, and a strong party of cavalry.

"Do not fire: you will shed blood to no purpose," said the emperor to the little band of true-hearted followers who surrounded him. Then in a low, sad voice he ordered one of his aides-de-camp to fasten a white handkerchief to the end of a bayonet.

The Juarists, who were ascending the hill, came to a halt. There was profound silence for a moment. Then a man dressed in the uniform of a Mexican general, with black pantaloons tucked into his riding-boots, and gold epaulettes upon a black frock coat, came forward. He paused a moment as he stepped out of the little group, and looked around him. Then

he descended the hill with a firm step, followed by several other generals.

The Juarists saluted him by their party cry, *Viva la libertad!* They recognized the emperor. Maximilian marched straight up to General Corona, who was in command of a body of United States volunteers called the Legion of Honor. It was composed of about fifty men, each with the rank of officer.

"General," he said, "both man and fortune have betrayed me. There are widows and orphans enough already in the world. Here is my sword."

"Sire," replied Gorona, forgetting he was emperor no longer, "sire, keep your sword."

He then proposed to Maximilian to get on horseback, and escorted him with the other prisoners to the Convent of Santa Teresita.

There the emperor and his generals were shut up in the cellars of the building, and not only had to sleep on the bare ground, but were left to suffer from cold and hunger. In a few days, however, Princess Salm-Salm brought them some relief. They were then transferred to the Convent of La Capuchina, and their friends obtained permission to send them wine, clothes, and provisions. The conduct of Princess Salm-Salm in the last act of this tragedy was that of a heroine. She crossed the enemy's line in order to get out of the city of Mexico, and was twice near being shot by the soldiers of Diaz. She was accused of supplying money to the Austrian soldiers confined at Chapultepec, and was imprisoned at Gaudeloupe. At last she got leave to quit Mexico for Europe, but managed to join her husband at Queretaro. Thence, hiding by day and travelling by night, she made her way to San Luis de Potosi where Juarez was living. When Maximilian heard of this brave enterprise on his behalf, he could not refrain from tears.

The prisoners were three weeks at La Capuchina, in complete uncertainty as to what would become of them. Indeed, the Juarists seemed much embarrassed by their prize. On the tenth of June they were informed that Juarez had sent an order to have them tried before a court-martial which would be held on the twelfth of June.

"Where are you going to take me?" asked Maximilian, on that day, of the officer who came to escort him.

"To the court-martial."

"Where is it held?"

"In the theatre."

"Then I shall not accompany you. I will not be made a public spectacle in a theatre. You may go alone."

The officer went away, seeing that nothing but force would change his resolution.

Generals Miramon and Mejia were dragged upon the stage where the court-martial was sitting. The play-house was crowded with spectators. It was a tragedy with nothing to pay. The deliberations lasted three days. The emperor was accused of usurpation, with instigating and exciting civil war, and of causing the deaths of forty thousand patriots hanged and shot in consequence of his order of Oct. 3, 1865,—an order issued, as we know, at the express instance of Bazaine.

On the morning of June 15, 1866, General Escobedo presented himself in the prison, holding the sentence of the court in his hand.

Maximilian who could guess his fate, said gently,—

"Read it, general. I am ready to hear you."

Maximilian, Miramon, and Mejia were condemned to be shot.

"I understand you," said the emperor, with perfect calmness. "The law of Oct. 3, 1865 was made to put down robbers,—this sentence is the work of murderers."

Escobedo laid his hand on his revolver with a sudden exclamation at these words. Then recovering himself he replied, "I presume a criminal must be allowed the right to curse his judges."

Maximilian turned his back on him, and Escobedo left the prison.

The execution had been ordered for the next morning, but it was put off till the 19th, by order of Juarez.

Meantime the English and Prussian ambassadors hastened to Juarez, hoping to obtain his mercy for the late emperor. But Juarez was inflexible, and declared the execution was necessary for the safety of the republic.

During the night before his death Maximilian asked his jailors for a pair of scissors. He was refused. Then he implored one of them to cut off a lock of his hair. When that was done he wrote the following pathetic letter to Carlotta.

My Beloved Carlotta,—

"If God should permit you some of these days to get well enough to read these lines, you will know how sad has been my fate ever since your departure. You took with you my happiness, my very life, and my good fortune. Why did I not take your advice? So many sad things

have taken place, — so many unexpected catastrophes and undeserved misfortunes have fallen on me, that I have now lost heart and hope, and look upon death as my good angel. My death will be sharp and sudden, without pain. I shall fall gloriously — like a soldier — like a conquered sovereign. . . . If you cannot, dearest, bear up under your load of sorrow, if God in his mercy soon reunites us by your death, I will bless his fatherly hand, which now seems very heavy upon me. Adieu! Adieu!

"Your poor MAX."

He kissed this letter, folded into it the light, silky lock of his own hair, and placed it with other letters he had written to his mother, the archduchess Sophia, and other friends. I have seen several of these letters. They were all in French, and written in a clear, firm, regular hand. His noble nature gleams through every line. One understands the irresistible personal sympathy he inspired in all who knew him. His enemies were aware of this, and no judge or general sat on his court-martial who had ever known him.

As six o'clock was striking the door of his prison was unbarred.

"I am ready," said Maximilian, coming forward to meet the officer.

As he stepped forth from the door of the convent he exclaimed,—

"What a lovely morning! I have always fancied I should like to die in sunshine — on a summer day."

He got into the carriage in waiting. Miramon and Mejia followed him, with the priest who attended them in their last moments. They were escorted by a body of four thousand men, and were driven to the same rocky height on which they had surrendered, the Cerro della Campana. They sat upright in the carriage during the drive, with a proud smile on their faces. They were carefully dressed, as if for an occasion of festivity. The population of the place was all abroad to see them pass, and looked at them with silent pity and admiration. The calmness and self-possession of the emperor about to die touched the heart of the most indifferent spectators. The women turned aside to hide their tears. Maximilian was a remarkably handsome man, his beautiful light hair was parted by a straight line to the nape of his neck from his forehead; his blue eyes were clear and soft, with a beseeching look in them; his hands were beautifully white, his fingers elegant and taper.

At the last town in their road General Mejia suddenly changed color, and fell back in his place in the carriage. He had caught sight of his wife pale and dishevelled, with her little baby in her arms, and all the appearance of a mad woman. He drew back behind his comrades, and covered his face, with a sob.

The party arrived at the foot of the little hill.

The emperor sprang out, brushed off some dust which had settled on his clothes, and going up to the shooting party, gave each man an ounce of gold.

"Take good aim, my friends," said he. "Do not, if possible, hit me in the face, but shoot right at my heart."

One of the soldiers wept.

Maximilian went up to him, and putting his cigar-case of silver filigree into his hand said,—

"Keep that, my friend, in remembrance of me! It was given me by a prince more fortunate than I am now."

The non-commissioned officer in command of the party then came up, and hoped he would forgive him.

"My good fellow," said Maximilian cheerfully, "a soldier must always obey orders. His duty is to do his duty."

Then turning to Miramon and Mejia, he said,—

"Let me, true friends, embrace you for the last time!" He did so, and then added, "In a few minutes we shall be together in a better world."

Turning to Miramon, he said, "General, the bravest man should have the place of honor. Take mine!"

Mejia, being very much cast down by the sad spectacle presented by his poor distracted wife, Maximilian again pressed his hands, saying,—

"God will not abandon our suffering survivors. For those who die unjustly things are set right in another world."

The drums began to beat. The end was near.

Maximilian stepped forward, mounted on a stone, and addressed the spectators.

"Mexicans! Men of my rank and of my race who feel as I feel, must either be the benefactors of the people over whom they reign, or martyrs. It was no rash ambition of my own which called me hither,— you yourselves invited me to accept your throne. Before dying let me tell you that with all the powers I possess I sought your good. Mexicans! may my blood be the last blood that you shed; may Mexico, the unhappy country of my adoption, be happy when I am gone!"

As soon as he had resumed his place, a sergeant came up to order Miramon and Mejia to turn round. As traitors they were to be shot in the back.

"Farewell, dear friends," said Maximilian, and, crossing his arms, he stood firm as a statue.

When the command was given, "Shoulder arms!" a murmur of protestation, accompanied by threats, rose among part of the crowd composed of Indians. Their national superstitions and traditions had attached these simple people to the emperor. They had a prophecy among them that one day a white man would come over the seas and set them free. And many of them looked for this saviour in Maximilian.

The officers in command turned towards the crowd, shaking their swords. Then came the words, "Take aim! Fire!"

"Long live Mexico!" cried Miramon.

"Carlotta! Poor Carlotta!" exclaimed Maximilian.

When the smoke of the volley cleared away three corpses lay upon the earth. That of the emperor had received five balls. They were put into the coffins which lay ready near the place of execution, and, escorted as they had been before, they were carried back to the Convent of the Capuchins.

"The emperor being dead, we will do all honor to the corpse of an archduke of Austria," said Colonel Miguel Palacios, to whom this care was given.

He was embalmed, and the coffin placed in a vault.

The Russian ambassador, Baron Magnus, in vain solicited the body of the late emperor. The Austrian vice-admiral, Tegetthof had to come and personally demand it in November 1867. The admiral at the same time obtained the release of the Austrian soldiers still retained as prisoners, and Prince Salm-Salm, lying under sentence of death since the execution of his master.

As for the traitor Lopez, instead of the two thousand ounces he expected, he only got seven thousand piastres ($7000). His wife refused to live with him after his treachery to Maximilian, and once when he went to see General Rincon Gallardo, to request his influence in getting reinstated in his rank in the Mexican army, which he had forfeited by his connection with the imperial government, the answer he received was,—

"Colonel Lopez, if I ever recommend you for any place, that place will be under a tree, with a rope around your neck, tied to one of its branches!"

Maximilian will live in history as a good man, and a martyred sovereign. To this day the Indians of Queretaro will not put up an adobe hut without inserting in it a pebble from the place of his execution. On the very day he perished, an order signed by him was received in Europe, not for rifled cannon, not for needle-guns, to secure him on his throne, but for two thousand nightingales, which he desired to have purchased in the Tyrol, to add to the attractions of his empire.

VICTOR TISSOT.

From Macmillan's Magazine.

MODERN LIFE AND INSANITY.

THE relation between modern civilized life and insanity cannot be regarded as finally determined while a marked difference of opinion exists in regard to it among those who have studied the subject; nor can this difference be wondered at by any one who has examined the data upon which a conclusion must be formed, and has found how difficult it is to decide in which direction some of the evidence points. Statistics alone may prove utterly fallacious. Mere speculation, on the other hand, is useless, and indeed is only misleading. It is a matter on which it is tempting to write dogmatically, but where the honest inquirer is quickly pulled up by the hard facts that force themselves on his attention. Nothing easier than to indulge in unqualified denunciations of modern society; nothing more difficult than a cautious attempt to connect the social evils of the present day with the statistics of lunacy. Nothing easier than to make sweeping statements without proof, nothing more difficult than to apportion the mental injury respectively caused by opposite modes of life; totally diverse social states of a nation often leading to the same termination — insanity. These are closely bound together in the complex condition of modern civilized society. No doubt if we care for truth, and avoid rash assertions, we do it at the expense of a certain loss of force and incisiveness. Dogmatic statements usually produce more effect than carefully balanced and strictly logical positions. Honesty, however, compels us to speak cautiously, and to confess the difficulties to which we have referred.

We shall not enter at length into the question which is at once raised by an

Original from CORNELL UNIVERSITY

inquiry into the relation between modern life and insanity — whether lunacy is on the increase in England. Twenty years ago there was one lunatic or idiot officially reported to 577 of the population; the latest returns place it as high as one in 370. Were we to go further back, the contrast would be far greater. That the increase of known cases of insanity has been very great, no one, therefore, disputes. Further, that the attention paid to the disease; the provision made for the insane; the prolongation of their lives in asylums, and the consequent accumulation of cases, and other circumstances into which our limits forbid us to enter, account for the greater part of this alarming apparent increase, is certain. Whether, however, there is not also an actual increase, unaccounted for by population, or by accumulation, remains an open question, which statistics do not absolutely determine. At the same time we think that it is quite probable that there has been some real increase.

To what social class do the great mass of our lunatics belong, and to what grade of society does the striking apparent increase of the insane point? The large majority of lunatics under legal restraint undoubtedly belong to the pauper population. On the 1st of January, 1877, of the total number of patients in asylums and elsewhere (in round numbers sixty-six thousand six hundred), about fifty-nine thousand were pauper, and only seventy-six hundred private patients. These figures, however, fail to convey a correct statement of the relative amount of insanity existing among the class of the originally poor and uneducated masses and the class above them, because in a considerable number of instances members of the middle and still higher classes have become paupers. Again, the wealthy insane remain very frequently at home, and do not appear in the official returns. We believe this class to be very large. Probably we get a glimpse of it from the census of 1871, which contained sixty-nine thousand lunatics, idiots, and imbeciles (and we have good reasons for knowing that this return was very far short of the truth), yet it exceeded the number given by the lunacy commissioners in the same year by twelve thousand! A large number no doubt lived with their families because these could well afford to keep them at home. None would be in receipt of relief, or they would have appeared in the commissioners' report. Another most important qualifying consideration remains — *the relative numbers of the classes of society from which the poor and the well-to-do lunatics are derived.* Several years ago the Scotch commissioners estimated the classes from which private patients are derived at only about an eighth of the entire population of Scotland; a proportion which would make them at least as relatively numerous as the pauper lunatics. No doubt in England the corresponding class of society is a larger one; but whatever it may be,* a calculation based upon the relative proportion of different social strata in this country would vastly reduce the apparent enormously different liability to insanity among the well-to-do and the poorer sections of the community, although, with this correction, the pauper lunatics would still be relatively in the majority.

The disparity between the absolute number of pauper and private patients has greatly increased in recent years. In other words, the apparent increase of insanity is mainly marked among those who become pauper patients. This is certainly in great measure accounted for by the disproportionate accumulation of cases in pauper asylums, for reasons into which it is not now needful to enter. It assuredly does not prove that there has been anything like a corresponding growth of insanity among the poor as compared with the rich.

In any case, however, the illiterate population does yield a very serious amount of insanity, and the fact is so patent that it shows beyond a doubt that ignorance is no proof against the inroads of the disease. The absence of rational employment of the mental powers may lead to debasing habits and to the indulgence in vices especially favorable to insanity, less likely to attract a mind occupied with literary and scientific pursuits. No doubt mental stagnation is in itself bad, but the insanity arising out of it is more frequently an indirect than a direct result. If a Wiltshire laborer is more liable to insanity than other people, it may be not merely because his mind is in an uncultivated condition, but rather because his habits,† indirectly

* We are informed by Dr. Farr that the proportion between the upper and middle classes on the one hand, and the lower classes on the other, is as 15 to 85. Calculated on this basis, the proportion of private and pauper lunatics to their respective populations would be 1 in 484 for the former, and 1 in 353 for the latter — a very different result from that obtained by the usual method of calculating the ratio of private and pauper lunatics to the whole population, viz., 1 in 3,231, and 1 in 415.

† Dr. Thurnam, the late superintendent of the Wilts County Asylum, found that the proportion of cases caused by drink in this county was very high — in one year (1872) amounting to 34 per cent.

favored by his ignorance, and the brain he inherited from parents indulging in like habits, tend to cause mental derangement. It is conceivable that he might have had no more mental cultivation, and yet have been so circumstanced that there would have been very little liability to the disease. This distinction is extremely important if we are tracing causes, however true it would remain that ignorance is a great evil. A South Sea islander might be much more ignorant than the Wiltshire laborer, and yet not be so circumstanced that he would be likely to transgress the laws of mental health. The ignorance of an African tribe and that of a village in Wilts may be associated, the one with very little, the other with very much lunacy. Mr. Bright's "residuum" of a civilized people, and a tribe of North American Indians are alike uneducated, but, notwithstanding, present totally different conditions of life. We have no doubt that in a civilized community there will always be found by far the larger number of insane persons. There are three grand reasons for this. First, because those who do become insane or are idiotic among savages, "go to the wall" as a general rule; the other reasons are to be discovered in the mixed character and influence of European civilization; its action on the one hand in evolving forms of mental life of requisite delicacy and sensibility, easily injured or altogether crushed by the rough blasts from which they cannot escape in life; and on the other hand in producing a state confounded, as we have said, with savagery, but which differs widely from it, and is, simply in relation to mental disorders, actually worse. Recklessness, drunkenness, poverty, misery, characterize the class; and no wonder that from such a source spring the hopelessly incurable lunatics who crowd our pauper asylums, to the horror of ratepayers, and the surprise of those who cannot understand why the natives of Madagascar, though numbering about five million, do not require a single lunatic asylum. We may add that they do not destroy the few insane and idiots which they have.

It is constantly forgotten that while there is nothing better than true civilization, there is something worse than the condition of certain savages, and that almost anything is better than that stratum of civilized society which is squalid, and drunken, and sensual; cursed with whatever of evil the ingenuity of civilized man has invented, but not blessed with the counteracting advantages of civilization. The conclusion, so far from damping the efforts of progress and modern developments of science, should stimulate us to improve the moral and physical condition of this class, and so lessen the dangers to mental disorder among them. The belief that savages are free from some of the insanity-producing causes prevalent in modern civilized England is quite consistent with the position taken in this article that education, ample mental occupation, knowledge, and the regularly trained exercise of the faculties exert a highly beneficial influence upon the mind, and thus fortify it against the action of some of the causes of insanity.

The relative liability of manufacturing and agricultural districts to mental disease has excited much discussion. This has partly arisen from the assumption that the latter may be taken as the representatives of savages. As we have shown this to be false, the comparison between these two districts does not, from this point of view, possess any value. On other grounds, however, it would be very interesting to determine whether urban or rural lunacy is most rife. Here, however, the worthlessness of mere statistics is singularly evidenced, and the difficulty of accurately balancing the weight of various qualifying circumstances becomes more and more apparent. An agricultural county may be found here and there with less lunacy than a manufacturing county, but if a group of counties be taken in which the manufacturing element is greatly beyond the average, and another group in which the agricultural element greatly preponderates, we find one lunatic to four hundred and sixty-three of the county population in the former, and one to three hundred and eighty-eight in the latter, showing an *accumulation* of more insane paupers in the agricultural districts. But it is very possible that if we knew how many *become* insane, the result would be very different indeed. This, in fact, has been found to be the case in Scotland, where the lunacy commissioners have taken great pains to arrive at the real truth. In a recent report it is shown that while three Highland counties have, in proportion to the population, a decidedly heavier persistent burden of pauper lunacy than two manufacturing counties which are chosen for comparison, the number of lunatics receiving relief — that is, actually coming under treatment — is proportionally larger in the latter than in the former. In other words, the proportion of fresh cases of pauper lunacy appearing on the poor-roll is higher in

urban than rural districts. The commissioners refer this result partly to the greater prevalence of the active and transitory forms of mental disorder — cases which before long are discharged — and partly to the greater facility of obtaining accommodation in an asylum free of charge in a city, from its being at hand; and the greater wealth of the urban districts offering no obstacle to admission. They attribute the above-mentioned persistent rural lunacy chiefly to the constant migration of the strong from the rural to the urban districts; the necessary exodus of the physically and mentally healthy leaving behind an altogether disproportionate number of congenital idiots, imbeciles, and chronic insane in the agricultural counties. Hence, returning to England, it is quite clear that the mere ratio of accumulated pauper lunacy to the county population, which is constantly relied upon, proves little or nothing as to the relative liability to insanity of the agricultural and manufacturing districts. One conclusion only can be safely drawn from such figures, until minute investigations have been made into the circumstances attending rural and urban lunacy in England as has been done in Scotland — namely, that while theory is apt to say that a country life, passed, as it seems to be supposed, in pastoral simplicity, will not admit of the entrance of madness into the happy valley, fact says that whatever may be the ultimate verdict as to the relative proportion of urban and rural lunacy, a large amount of insanity and idiocy does exist in the country districts, and that the dull swain, with clouted shoon, but too frequently finds his way into the asylum.

A glance at the annual reports of our lunatic asylums reveals the main occupations of the inmates and the apparent causes of their attacks. In a country asylum like Wilts the great majority of patients are farm laborers, with their wives and daughters; and next in order, domestic servants and weavers. The number of farmers, or members of their families, is small. The character of the occupations in the population of an asylum like that for the borough of Birmingham of course differs. Here we find mechanics and artisans heading the list, with their wives. Those engaged in domestic occupation form a large number. Shopekeepers and clerks come next in order. In both asylums are to be found a few governesses and teachers. Inn-keepers, themselves the cause of so much insane misery in others, figure sparingly in these tables.

Among the causes, intemperance unmistakably takes the lead. This is one of those facts which, amid much that is open to difference of opinion, would seem to admit of no reasonable doubt. Secondly follows domestic trouble, and thirdly poverty. At the Birmingham Asylum, out of four hundred and seventy admissions in three years, eleven cases were attributed to "over application" — a proportion much lower than that observed in private asylums.

Recently, Mr. Whitcombe, assistant medical officer at the Birmingham Borough Asylum, has done service by publishing the fact that, during the last twenty-five years, out of three thousand eight hundred pauper patients admitted into that asylum, five hundred and twenty-four, or fourteen per cent., had their malady induced by drink, and that the total expenditure thus caused by intemperance amounted, in maintenance and cost of building, etc., to no less than 50,373*l.* during that period.

Some years ago we calculated the percentage of cases caused by intemperance in the asylums of England, and found it to be about twelve. This proportion would be immensely increased were we to add those in which domestic misery and pecuniary losses owed their origin to this vice. Although ratepayers grumble about the building of large lunatic asylums, it is amazing how meekly they bear with the great cause of their burden, and how suicidally they resent any attempt made to reduce by legislation the area of this widespread and costly mischief.

It is worthy of note that drink produces much less insanity in Warwickshire outside Birmingham than in Birmingham itself.

In connection with this aspect of the question, an interesting fact, recorded by Dr. Yellowlees, when superintendent of the Glamorgan County Asylum, may be mentioned: that during a "strike" of nine months, the male admissions fell to half their former number, the female admissions being almost unaffected. "The decrease is doubtless mainly due to the fact that there is no money to spend in drink and debauchery." High wages, however, would be infinitely better than strikes, if the money were spent in good food, house-rent, and clothing.

The diet of the children of factory operatives in Lancashire points to one source of mental degeneration among that class. Dr. Fergusson, of Bolton, gave important evidence not long ago which indicated the

Original from CORNELL UNIVERSITY

main cause of their debility and stunted development, whether or not they are worse now than they were. He does not consider that factory labor in itself operates prejudicially, and reports the mills to be more healthy to work in now than they were in years past. The prime cause producing the bad physical condition of the factory population is, in his opinion, the intemperate habits of the factory workers. By free indulgence in stimulants and in smoking, the parents debilitate their own constitutions, and transmit feeble ones to their children. Instead of rearing them on milk after they are weaned, they give them tea or coffee in a morning, and in too many instances they feed them upon tea three times a day. In short, they get very little milk.

Mr. Redgrave, the senior inspector of factories, does not consider that this miserable state of things has increased — we hope not — but he admits that more women are employed in the mills than formerly, and that this is most disastrous to the training of children. Some curious figures have been published, showing the weight of children at various years of age in the factory and agricultural districts, the comparison being greatly in favor of the latter.

Another cause of deterioration mentioned is that at least one half of the boys in the mills from twelve to twenty years of age either smoke or chew tobacco, or do both; a habit most prejudicial to the healthy development of the nervous system. It was recently observed by Mr. Mundella that the lad who began at eight years of age in a mine without education, and who was associated with men whose whole ambition was a gallon of beer and a bull-dog, was not likely to grow up to be a Christian and a gentleman. We may add he would be very likely to end his days either in a prison or in a pauper asylum. It is observed in a recent report of the Royal Edinburgh Asylum that "such coal and iron mining counties as Durham and Glamorgan produce, in twice the proportion we do, the most marked and fatal of all the brain diseases caused by excesses." It may be stated that the relation between crime and insanity, especially weak-mindedness, is one of the most intimate character, both in regard to the people who commit criminal acts and their descendants. Our examination of the mental condition of convicts, and of their physiognomy and cerebral development, has long convinced us that a large number of this class are mentally deficient; sometimes from birth; at other times their mental development being arrested by their wretched bringing up. From the reports of the English convict prisons generally, it appears that one in every twenty-five of the males is of weak mind, insane, or epileptic, without including those sufficiently insane to be removed to an asylum. The resident surgeon to the general prison of Scotland at Perth (Mr. Thompson) gives a proportion of twelve per cent.; founded upon a prison population of six thousand prisoners.

Having referred to the bearing of the habits of one large portion of the population upon the manufacture of insanity, we pass on to the consideration of the relation between higher grades of modern society and mental disorder. It has been observed in institutions into which private and pauper patients are admitted, that the moral or psychical causes of lunacy are more frequently the occasion of the attack with the former than the latter class. This is not always accounted for — as might have been expected — by there having been less drink-produced insanity among the well-to-do patients; for in the Royal Edinburgh Asylum, where this disparity strongly comes out, there is even a higher percentage of insanity from this cause among the private than the pauper lunatics. The history of the daily mode of life of many members of the Stock Exchange would reveal, in the matter of diet, an amount of alcoholic imbibition in the form of morning "nips," wine at luncheon, and at dinner, difficult to realize by many of less porous constitutions, and easily explaining the disastrous results which in many instances follow, sooner or later, as respects disturbances of the nervous system, in one form or other. In fact, by the time dinner is due, the stomach is in despair, and its owner finds it necessary to goad a lost appetite by strong pickles and spirits, ending with black coffee and some liqueur. When either dyspepsia or over business work is set down as the cause of the insanity of such individuals, it should be considered what influence the amount of alcohol imbibed has exerted upon the final catastrophe as well as the assigned cause. But whatever may be the relative amount of insanity produced among the affluent and the poor, of this there can be no doubt, that certain mental causes of lunacy, as over study and business worry, produce more insanity among the upper than the lower classes. We have examined the statistics of six asylums in England for private patients only, and have found this to be the case.

At one such institution, Ticehurst, Sussex, we find, from statistics kindly furnished us by Dr. Newington, that out of two hundred and sixty-six admissions, twenty-nine were referred to over study, and eighteen to over business work. Only twenty-eight were referred to intemperance. Allowing a liberal margin for the tendency of friends to refer the disease to the former rather than the latter class, the figures remain striking, as pointing to the influence of so-called over-work. We say "so-called" because there is an apparent and fictitious as well as a real over-work. Both, however, may terminate in nervous disorder. Over-work is often confounded with the opposite condition — want of occupation. Civilization and mental strain are regarded by many as identical, and in consequence much confusion is caused in the discussion of the present question. It is forgotten that an idle life, leading to hysteria and to actual insanity, is much more likely to be the product of civilization than of savagery or barbarism. This is quite consistent with the other truth, that without civilization we do not see evolved a certain high pressure, also injurious to mental health. A London physician, Dr. Wilks, when speaking of a common class of cases, young women without either useful occupation or amusements, in whom the moral nature becomes perverted, in addition to the derangement of the bodily health, observes that the mother's sympathies too often only foster her daughter's morbid proclivities, by insisting on her delicacy and the necessity of various artificial methods for her restoration. It is obvious that such a case as this is the very child of a highly organized society, that is, of a high state of civilization, and yet that such a young lady is not the victim of high pressure or mental strain in her own person, although it is certainly possible that she may inherit a susceptible brain from an over-worked parent. However, the remedy is work, not rest; occupation, not idleness. We certainly do not want to make her more refined or artificial, but more natural, and to occupy herself with some really useful work. A luxurious idle life is her curse. That insanity itself, as well as mere hysteria, is developed by such a mode of existence, we fully believe. The mind, although not uneducated, deteriorates for want of either healthy intellectual excitement, the occupation of business, or the necessary duties of a family. Life must have an aim, although to achieve it there ought not to be prolonged worry.

In the same way there is the lady instanced who eats no breakfast, takes a glass of sherry at eleven o'clock, and drinks tea all the afternoon, and who, "when night arrives, has been ready to engage in any performance to which she may have been invited." Clearly she is the product of a highly artificial mode of life, found in the midst of modern civilization. She is certainly not suffering from mental strain; at the same time she is the outcome of the progress from barbarism and the hardy forms of early national life to our present complex social condition. We have particularly inquired into cases coming under our own observation in regard to the alleged influence of over-work, and have found it a most difficult thing to distinguish between it and other maleficent agents which, on close observation, were often found to be associated with it. We do not now refer to the circumstances which almost always attach themselves to mental fatigue, as sleeplessness, but to those which have no necessary relation to them, as vice. Here we have felt bound to attribute the attack to both causes, certainly as much to the latter as the former. In some cases, on the other hand, we could not doubt that long-continued severe mental labor was the efficient cause of derangement. In a large proportion of other cases we satisfied ourselves that over-work meant not only mental strain, but the anxiety and harass which arose out of the work in which a student or literary man was engaged. The over-work connected with business, also largely associated with anxiety, proved a very tangible factor of insanity. Indeed it is always sure to be a more tangible factor of mental disease than over-work from study, because of the much greater liability to its invasion during the business period of brain life, than the study period. At Bethlem Hospital, Dr. Savage finds that there are many cases in which over-work causes a break-down, "especially if associated with worry and money troubles." Among the women, the cases are few in number. In one, where there was probably hereditary tendency, an examination, followed in two days by an attack of insanity, may be regarded as the exciting cause. Monotonous work long continued would seem to exert an unfavorable influence on the mind. Letter-sorting, short-hand writing, and continuous railway travelling are instanced. If diversified, hard work is much less likely to prove injurious. During a year and a half twenty men and eight women were admitted whose attacks were attributed to over-work. The employments of architect,

surveyor, accountant, schoolmaster, policeman, and bootmaker were here represented. Seven were clerks, two of whom were law-writers; two were students, one being "an Oxford man who had exhausted himself in getting a double first, and the other a medical student preparing for his second college." Of the women, five were teachers, one a schoolgirl, and two dressmakers. Three of the teachers were in elementary schools, one a governess, and the other a teacher of music and languages. If over-work alone did not, strictly speaking, cause the mental breakdown, still the concomitants must be blamed for these melancholy results.

A late medical officer to Rugby School (Dr. Farquharson,) in defending that institution from a charge of injury in the direction of which we now speak, considers that instances of mental strain are more common at the universities, "for not only are the young men at a more sensitive period of life, but they naturally feel that to many of them this is the great opportunity — the great crisis of their existence — and that their success or failure will now effectually make or mar their career. Here the element of anxiety comes into play, sleep is disturbed, exercise neglected, digestion suffers, and the inevitable result follows of total collapse, from which recovery is slow and perhaps never complete." (*Lancet*, Jan. 1, 1876.) He thinks he has seen an increase of headaches and nervous complaints among poor children since compulsory attendance at Board Schools was adopted, and records a warning against too suddenly forcing the minds of wretchedly feeble, ill-fed and ill-housed children, and against attempts to make bricks too rapidly out of the straw which is placed in our hands.

The psychological mischief done by excessive cramming both in some schools and at home is sufficiently serious to show that the reckless course pursued in many instances ought to be loudly protested against. As we write, four cases come to our knowledge of girls seriously injured by this folly and unintentional wickedness. In one, the brain is utterly unable to bear the burden put upon it, and the pupil is removed from school in a highly excitable state; in another, epileptic fits have followed the host of subjects pressed upon the scholar; in the third, the symptoms of brain fog have become so obvious that the amount of schooling has been greatly reduced; and in a fourth, fits have been induced and complete prostration of brain has followed. These cases are merely illustrations of a class, coming to hand in one day, familiar to most physicians. The enormous number of subjects which are forced into the curriculum of some schools and are required by some professional examinations, confuse and distract the mind, and by lowering its healthy tone often unfit it for the world. While insanity may not directly result from this stuffing, and very likely will not, exciting causes of mental disorder occurring in later life may upset a brain which, had it been subjected to more moderate pressure, would have escaped unscathed. Training in its highest sense is forgotten in the multiplicity of subjects, originality is stunted and individual thirst of knowledge overlaid by a crowd of novel theories based upon yet unproved statements. Mr. Brudenell Carter, in his "Influence of Education and Training in Preventing Diseases of the Nervous System," speaks of a large public school in London from which boys of ten to twelve years of age carry home tasks which would occupy them till near midnight, and of which the rules and laws of study are so arranged as to preclude the possibility of sufficient recreation. The teacher in a high school says that the host of subjects on which parents insist instruction being given to their children is simply preposterous, and disastrous alike to health and to real steady progress in necessary branches of knowledge. The other day we met an examiner in the street with a roll of papers consisting of answers to questions. He deplored the fashion of the day; the number of subjects crammed within a few years of growing life; the character of the questions which were frequently asked; and the requiring a student to master, at the peril of being rejected, scientific theories, and crude speculations, which they would have to unlearn in a year or two. He sincerely pitied the unfortunate students. During the last year or two the public have been startled by the suicides which have occurred on the part of young men preparing for examination at the University of London; and the press has spoken out strongly on the subject. Notwithstanding this the authorities appear to be disposed to increase instead of diminish the stringency of some of the examinations. The *Lancet* has recently protested against this course in regard to the preliminary scientific M. B. of the London University, and points out that the average of candidates who fail at this examination is already about forty per cent., and that these include many of the best students.

This further raising of the standard will, it is maintained, make a serious addition to the labors of the industrious student who desires the M.D. degree. Whether this particular instance is or is not a fair example, we must say, judging from others, that it seems to be thought that the cubic capacity of the British skull undergoes an extraordinary increase every few years, and that therefore for our young students more subjects must be added to fill up the additional space.

The master of a private school informs us that he has proof of the ill effects of overwork in the fact of boys being withdrawn from the keen competition of a public school career, which was proving injurious to their health, and sent to him, that they might in the less ambitious atmosphere of a private school pick up health and strength again. He refers to instances of boys who had been crammed and much pressed in order that they might enter a certain form or gain a desired exhibition, having reached the goal successfully and then stagnated. He says that the too extensive curriculum now demanded ends in the impossibility of doing the work thoroughly and well. You must either force unduly or not advance as you would wish to do; the former does injury, and the latter causes dissatisfaction.

Of mental stagnation among the poor we have already spoken; an analogous condition among the well-to-do classes, not to be confounded with that of the young lady already described as seen in the London physician's consulting-room, deserves a passing observation. Excessive activity and excessive dulness may lead to the same dire result. Hence both conditions must be recognized as factors in the causation of mental disease. We have said that the indirect action of the latter is more powerful than its direct action, but there are no doubt cases of insanity which arise from the directly injurious influence of intellectual inactivity. The intelligence is inert; the range of ideas extremely limited; the mind broods upon some trivial circumstance until it becomes exaggerated into a delusion; the mind feeds upon itself, and is hyper-sensitive and suspicious, or it may become absorbed in some morbid religious notions which at last exert a paramount influence and induce religious depression or exaltation. From the immediate surroundings of the individual, whether in connection with parental training or from ecclesiastical or theological influences, or perhaps a solitary condition of life, there may be a dangerously restricted area of psychical activity. Prejudices of various kinds hamper the free play of thought; the buoyancy of the man's nature is destroyed; its elasticity broken; its strength weakened; and it is in fine reduced to a state in which it is a prey to almost any assertion however monstrous, if placed before it with the solemn sanctions which from education, habit, or predilection it is accustomed to reverence. Fantastic scruples and religious delusions frequently spring up in this soil. Such persons have been saved from the evils of drunkenness and vice; they have also been sheltered from worry and excitement, yet, to the astonishment of many, they become the inmates of a lunatic asylum. They have in truth escaped the Scylla of dissipation or drink, only to be shipwrecked on the Charybdis of a dreary monotony of existence. On this barren rock not a very few doubtless perish, and if parents they transmit to a posterity deserving our sincerest pity, mediocre brains or irritably susceptible and unstable nerve tissue.

On the dangers arising from waves of religious excitement, it would be easy to dilate, but we shall content ourselves with remarking that if they have been exaggerated by some, they have been improperly ignored or denied by others. They are real; and frightful is the responsibility of those who, by excited utterances and hideous caricatures of religion, upset the mental equilibrium of their auditors, whether men, women, or children.

One remarkable feature of modern life — Spiritualism — has been said to produce an alarming amount of insanity, especially in America. It has been recently stated by an English writer that nearly ten thousand persons have gone insane on the subject, and are confined in asylums in the United States; but careful inquiry, made in consequence, has happily disproved the statement, and we learn that the amount of insanity produced from this cause is almost insignificant — much less than that caused by religious excitement.

Looking broadly at the facts which force themselves upon our attention, we may say that a study of the relation between modern life and insanity shows that it is of a many-sided and complex character; that the rich and the poor from different causes, though certainly in one respect the same cause, labor under a large amount of *preventible* lunacy; that beer and gin, mal-nutrition, a dreary monotony of toil, muscular exhaustion, domestic distress, misery, and anxiety, account largely, not

only for the number of the poor who become insane in adult life, but who from hereditary predisposition, are born weak-minded or actually idiotic; that among the middle classes, stress of business, excessive competition, failures, and, also in many cases, reckless and intemperate living, occasion the attack; while in the upper classes intemperance still works woe — and under this head must be comprised lady and gentlemen dipsomaniacs, who are not confined in asylums; that while multiplicity of subjects of study in youth and excessive brain-work in after life exert a certain amount of injurious influence, under-work, luxurious habits, undisciplined wills, desultory life, produce a crop of nervous disorders, terminating not unfrequently in insanity. In a state of civilization like ours, it must also happen that many children of extremely feeble mental as well as bodily constitutions will be reared who otherwise would have died. These either prove to be imbeciles, or they grow up only to fall a prey to the upsetting influence of the cares and anxieties of the world. A considerable number of insane persons have never been really whole-minded people; there has, it will be found on careful inquiry, been always something a little peculiar about them, and when their past life is interpreted by the attack which has rendered restraint necessary, it is seen that there had been a smouldering fire in the constitution for a lifetime, though now, for the first time, bursting forth into actual conflagration.

Lastly, modern society comprises a numerous class of persons, well-meaning, excitable, and morbidly sensitive. Some of these are always on the border-land between sanity and insanity, and their friends are sometimes tempted to wish that they would actually cross the line, and save them from constant harass. When they do, it is easier to make allowance for them and their vagaries.

Whatever uncertainty there may attach to some aspects of this inquiry, unquestionable conclusions have been drawn; and if these only accord with results arrived at from other considerations, they are valuable as confirming them. Had there appeared to be among the poor and ignorant a striking immunity from attacks of insanity, a strong argument would have been afforded, and would probably have been employed, against the extension of education at the present day to the working classes. Nothing, however, in our facts or figures supports such an anti-progressive view; and if the educated classes did not sin against their mental health in so many ways, they would doubtless compare more favorably than they do, in fact as well as in mere figures, with the uneducated poor. So again with regard to intemperance and all that it involves, in spite of the difficulty of discriminating between the many factors which often go to make up the sum total of causes of an attack, we have no doubt of the large influence for mental evil exerted by drink — always admitting that where the constitution has no latent tendency to insanity, you may do almost what you like with it, in this or any other way, without causing this particular disease. A man will break down at his weak point, be it what it may.

Again, the lessons are taught of the importance, not of mere education, but a real training of the feelings; the evil of mental stagnation, not simply *per se*, but from the train of sensual degradation in one direction, and of gloomy fanaticism in the other, engendered, and the danger of dwelling too long and intently on agitating religious questions, especially when presented in narrow and exclusive forms which drive people either to despair or to a perilous exaltation of the feelings. To true religious reformers, the physician best acquainted with the causation of mental disease will award his heartiest approval. Only as the high claims of duty, demanded from man by considerations of the dependence of his work in the world upon mental health, of what he owes to his fellow-men, and of what he owes to God, are fulfilled as well as acknowledged, will civilized man benefit by his civilization, as regards the prevention of insanity. Unpreventible lunacy will still exist, but a great saving will be effected for British ratepayers when that which is preventible shall have been reduced to a minimum by the widest extension of a thorough, but not oppressive and too early commenced education, by the practical application of the ascertained truths of physiological and medical science, and by the influence of a Christianity, deep in proportion to its breadth, which shall really lay hold of life and conduct, and mould them in accordance with itself.

D. HACK TUKE.

From The Spectator.

SMITH'S POOR KIN.

THE case of Smith's Poor Kin seems to us the *reductio ad absurdum* of the English method of dealing with the authority

of the "dead hand," as Lord Lyttelton used to call it, — that is, the right of a testator to bind Parliament and the courts in perpetuity. Two hundred and fifty years ago an Alderman Smith left a small sum of money, the interest of which was to go forever towards the redemption of Christians captured by the Turks, and the protection of his poorest descendants, "the sick, aged, and impotent," from the worst evils of poverty. It was not to make them better off, but to save them from actual want. The trustees bought land in Kensington, covering the modern Hans Place and Cadogan Place, which has increased in value with the growth of London until it now yields £11,000 a year, and will by-and-by yield much more. Algerine piracy ceased long ago, the "Turks" are pirates only by land, and the whole income was therefore made available in 1772, by act of Parliament, for the alderman's kin, of whom there are now four hundred and twelve. The "scheme," however, worked very badly. The heirs, in hopes of some advantage under the will, have kept their pedigrees in memory; they consider the property to be, in certain events, "of right" theirs, and some of them, it can scarcely be doubted, wilfully produce those events. They are to be helped if they are poor, and consequently they either keep poor by abstaining from work, or they pretend to be poor when they are not, according to the founder's idea of poverty. The latter course of conduct is indefensible, but the former is no sufficient legal reason for refusing them their money. There is no moral wrong in poverty, indeed many people of the highest character for piety and judgment hold, as a council of perfection, that it would be better to keep poor, and no Church goes the length of saying that in the earning of wealth there is moral gain. There is consequently no moral reason whatever why, if the "dead hand" is to be implicitly obeyed, Alderman Smith's poor kin should not have the income of his estate. It has increased, but so has the income of Guy's Hospital or the Duke of Northumberland's property, but nobody for that reason claims any right to take either away; and if a Radical argues that unearned increment belongs to the State, he is set down as a Red Republican. To say that a sick Smith ought not to have £500 a year for life is, in a country of inequalities, no argument, and the whole income, on the principles upheld by Lord Salisbury and most Tories, should be distributed among the poorest section of the alderman's descendants.

They are not to have it all, nevertheless. The legislature being, as usual in England, a good deal wiser than the individuals who compose it, has invested the Rolls Court with power, on the demand of the charity commissioners, to make in such cases "arrangements" for the general good of the community, and such arrangements are as final as if they had been made by legislative act. The court is informed that the money is in part wasted in gifts to the undeserving, every Smith being, of course, "poor" in his own eyes, and in part so applied as to encourage pauperism, and finding these allegations justified by the evidence, immediately proceeds to override the provisions of the will as interpreted by the act of 1772. Inventing, in the public interest, a theory that Alderman Smith intended to secure some end not secured in his will, the master of the rolls decrees that half the property is enough for Smith's poor kin, and that the other half shall be expended on objects presumably excellent, but not in the least specially beneficial to the alderman's relatives. In other words, the will, the operation of which is pronounced injurious, is half set aside and half re-sanctioned, the thumb and index finger of the "dead hand" being, as it were, amputated, while the mutilated stump is suffered to remain. The right to £11,000 a year is pronounced injurious to distressed Smiths of the alderman's clan, and in the public interest £5,500 a year is confiscated; but at the same time, in order that the injurious process may not wholly stop, £5,500 a year is devoted to it. Sir George Jessel, in fact, decrees in one and the same breath that legacies in perpetuity, to be distributed to people because they are poor, offer premiums on pauperism, and ought to end; and that they are not injurious, and ought, therefore, to continue. That this is good law we do not dispute, but that it is also a wise compromise we cannot admit for one moment. Either Alderman Smith's descendants are entitled to all the money, the relief of Turkish captives being impossible, or they are entitled to none of it, or they are entitled only to the income he intended them to have, and with no one of these suppositions does the decision agree. If the first is correct, Sir George Jessel should either have granted the money in annuities, without reference to consequences, or if he thought himself bound to act as guardian, should have founded a splendid high school, with free admissions or even free bursaries, for the Smith clan; if the second is correct, he should have taken

the whole sum for purposes of public utility; and if the third, he should have taken the whole, minus the income the alderman intended to go to his descendants. In rejecting all these courses, he accepted a compromise which can be defended only on the grounds that it is legal, and that it does not grievously affront public opinion.

Nevertheless; the settlement is approved, and it is easy to see why. The English people cannot make up its mind what it wishes to do or thinks it right to do about the "dead hand." It is not willing, on the one hand, to leave the testator alone, and act upon his will to all future time. No State, to begin with, can allow a power of indefinite accumulation for centuries, which might vest all property in one man's hand, or make a man so rich that if he were capricious or viewy, the ordinary business of the country could not go on. We could not, for example, endure Mr. Parnell with power to produce a "Black Friday," or shut up the Bank of England whenever he considered the chancellor of the exchequer not quite sufficiently civil. So indefinite accumulation is prevented by law. Then many bequests are considered ridiculous, or useless, or immoral in their effects, so power to regulate them is handed over to the courts or to State commissions, or in certain cases to the trustees, subject to official sanction. The "dead hand" is, in fact, in certain cases paralyzed. On the other hand, there is the greatest dislike to amputate it, by declaring that in future Parliament will regulate all continuative or perpetual bequests. It is felt, and felt justly, that such a rule would act in discouragement of accumulation, and interfere very greatly with liberty of bequest. It might dry up a resource by which the nation has very largely benefited, and would undoubtedly diminish greatly the volume of the stream of charity. And it would, above all, limit that individualism, that tendency to oddity and to quaintness for which Englishmen, Philistines as they are, have still a kindly corner in their hearts, and which they would be exceedingly loth finally to crush out. Under the operation of the two feelings — the impulse to prevent waste, and the impulse to leave the testator alone — we have the present system, in which some abuses, like the distribution of St. Katherine's fund, are tolerated for years, and others, which happen to come into court, like this Smith trust, are half cured, and half so treated that they are pretty certain as the years flow on to become worse than ever. In the next generation the moiety of the alderman's fund assigned to his poor kin will probably have doubled — for London is still low-rented, compared with other capitals — while the poor kin themselves will be a regiment, perhaps fifteen hundred strong. The money will then be absolutely wasted in minute doles, which will have no result beyond keeping up a false idea that all the members of the family are protected in the last resort from poverty. Is it not almost time that the country should come to some decision upon this subject in its own mind, and give intending testators fair warning how far it will and will not carry out their testamentary injunctions? If there is, as nobody doubts, a point of time at which the "dead hand" should cease to be powerful, why should not that point be fixed? And if there is, and nobody doubts there is, a degree of increment in property which may make a bequest either injurious or ridiculous, why should not that degree be legislatively declared? Suppose, for example, that Parliament passed an act allowing the charity commissioners to deal freely with any bequests for charitable objects more than a hundred years old, would that arrangement in any serious degree interfere with the stream of charity? That it would be much more honest than the present system is clear, but would it produce any practical ill-effect? Our own belief is that men rarely or never look more than a century ahead, and that certainty for a century would encourage the charitable to make bequests as much as certainty forever. Or suppose that in the same act any increment on charitable incomes beyond threefold the amount obtainable at the testator's decease were also carried off to the general fund of charity, would that disturb testators? We venture to doubt it greatly. Not one man in five hundred who makes a charitable will expects any increment of the kind, or would be willing, if he did, to leave it all at the disposal of the charity. The majority, we imagine, would be much more willing that the Parliament of the day should decide where their surplus charity should go, and would plead only that wherever it went their names should be recorded and their memory kept alive, — a stipulation with which, in almost all cases, it would not be difficult to comply. At present we rob the testator's legatees for the benefit of the public, and do not secure to the public the benefit for which the individual is robbed.

From The Examiner.

IRRIGATION IN INDIA.

FAMINE is at least as great a danger to our Indian empire as the czar of Russia, and precautions against its recurrence are no less necessary than precautions against interference with our road to the East. But precautions for the one purpose as much as for the other ought to be well considered and worthy of a community which may still claim to be partially rational and practical. We may be firmly convinced of the necessity of protecting our road to India, and of the necessity of preventing the recurrence of famine, but that is no reason why we should rush into rash undertakings without counting the cost or estimating the probable result. For the last year and more a few rowdy journalists, Jews, and stockbrokers, have been trying to persuade us that our road to India would be jeopardized, and our power and prestige as a nation irretrievably ruined, if we did not expend incalculable blood and treasure for the support of a decaying dynasty at Constantinople. They have not condescended to argument, but they have shown vast powers of declamation and abuse; the country has heard them, and has not been persuaded. All Englishmen who have not lost their senses have settled down into the conviction that for the security of our road to India a firm hold of Egypt is a sufficient and infinitely less costly precaution. For this they are prepared to contend with all their resources and all their fighting power, and they are too confident in their strength to be turned aside from their purpose by any amount of ignorant or interested literary fury.

The prevention of famine in India has received comparatively little attention amidst the noise raised over the other great question, but Mr. Bright's speech at Manchester has done something to get a hearing for it. Mr. Bright has taken up Sir Arthur Cotton's panacea for the prevention of famine — irrigation. Only irrigate, and you will save the people, and protect the empire from a crushing load of debt. Now, before accepting irrigation as the one thing needful, however much we may admit its importance, the subject should be thoroughly discussed. The history of what has been done in one of the provinces of our Indian empire, Bengal, may be accepted as a contribution to the discussion. Bengal is the wealthiest, largest, most populous, and best-known of the provinces in British India. There are now irrigation works in this province in South Behar, in Midnapore, and in Orissa, and it may be stated without exaggeration that Sir Arthur Cotton is their originator and author. The earliest and most important of these works is what is known as the Orissa project. It is not correct to assert, as is done by Colonel Chesney, in the *Fortnightly Review*, quoted with approval by Mr. Bright, in his speech, that the Orissa works are the outcome of the great famine of 1866. So long ago as 1858, Sir Arthur Cotton was deputed by government to report on the advisability of irrigation in Orissa. He reported that it would be necessary to carry out a system of works that would completely regulate the waters of the province, similar to those in the Godavery and Kistna deltas, and urged that government should at once take the project in hand as being eminently practicable and advantageous. He also suggested, if government was unwilling to execute these works itself, that an English company should be permitted to carry them out. In accordance with this suggestion the East India Irrigation and Canal Company was formed in 1860. The arrangements made between government and the company were that government was to give all land free of charge; that the company was to construct the works, and, when these were ready for irrigation, to distribute the water; whilst government was to collect the water-rates, and, after deducting the cost of collection, to pay the remainder over to the company. The works were commenced in November, 1863, and by the end of 1865 water first became available from the company's works for the irrigation of land. But the people refused to take water, and the works proved a failure. At the end of October, 1867, the company was prepared to supply water to 153,000 acres, whereas the area actually under irrigation amounted to only 9,836 acres. The whole gross revenue from the commencement to October, 1867, only amounted to 4,339*l*. The returns thus not coming in, the shares of the company fell in the market, and bankruptcy stared the shareholders in the face. About the same time, the same company had under consideration the irrigation of a part of South Behar adjoining the Sone River, and their project here also was accepted by government on the understanding that the agreement must end if the company did not make satisfactory progress with their works. But, from want of funds, the company were never even able to commence work on the Sone project. Irrigation in Bengal was in a state of col-

lapse. At this epoch, however, government intervened, as much, there is reason to believe, in the interest of the shareholders as of irrigation; and after somewhat lengthy negotiations, the Orissa and Sone projects became the property of government on January 1, 1869, on payment of the sum of 1,040,050*l*. In other words, government bought at par value, at the price of more than a million sterling, shares which at their market value were worthless.

Since this time the works of the Orissa project (including Midnapore) and of the Sone project have steadily progressed to completion. The outlay has been prodigious, and the loss on them enormous. The total capital outlay on irrigation works in Lower Bengal up to March 31, 1876, was 4,072,742*l*., and not less than 1,494,000*l*. will be required to complete the works that are in progress; the gross income from these works in 1875-76 was 23,043*l*., and the working expenses were 52,949*l*.; there was a dead loss on the year's operations, independently of interest on borrowed capital, of 29,906*l*.; the net loss in interest and working expenses during the year was 203,700*l*., and the total accumulated loss up to March 31, 1876, was 878,100*l*. With one trifling exception, there has always hitherto been an annual loss on the working of the canals. The only canal in Bengal that has ever paid its working expenses for the year is the Hidgelee tidal canal, in Midnapore, which was constructed in the first instance for irrigation purposes, but, as the water was found to be salt, it has been exclusively used for navigation. The extraordinary traffic of 1874, in order to meet the famine demand in the upper parts of Bengal, so raised the navigation tolls of that year that they gave a profit over working expenses of about 50*l*.

The Orissa and Midnapore canals had cost, up to March 31, 1876, 2,482,039*l*., and are so far completed that water for irrigation on a large scale has been obtainable for several years past; in 1875-76 these canals yielded an income of 17,953*l*. while the working expenses were 41,406*l*.; including interest, the net loss on these canals was 122,567*l*., and the total loss up to March 31, 1876, was 666,131*l*. The further works which it is proposed to undertake in Orissa will cost about 368,000*l*. more. There does not, however, appear to be the smallest chance of an adequate return from this great expenditure.

The Sone canals had cost, up to the end of 1875-76, 1,521,366*l*., and more than 1,185,000*l*. will be required to complete them. The income in 1875-76 was 5,090*l*., and the working expenses were 11,543*l*. In this case also there is no probability that they will, for many years to come, pay the interest on the capital outlay.

Such is the history and present condition of the irrigation works in Bengal. The bare statement of the above facts, derived from official sources, which have been published, is more eloquent than any commentary on them could be. Practically the works are, and always have been, at a dead-lock. The Irrigation Department is over-officered, and the difficulty is not to find men for the work, but work for the men. Large sums of money have been literally squandered in order to find useless employment for engineer officers who would otherwise have been sitting at the Presidency. On the other hand, the people do not care for the canals; they grudge the land, and view the construction of the distributary channels as a grievance. Irrigation is not popular, and has failed to produce the wonderful results anticipated from it.

The reason of this failure is not far to seek. The canals are unnecessary, for they have been laid down in a country where there is already an adequate supply of rain water. The circumstances of Orissa are unlike those of the Indus basin, or of the upper Ganges basin, or of the lower peninsula of India. There are dry zones that may fairly be said to stand in absolute need of irrigation. But in Orissa, and indeed all over Bengal proper, irrigation is a mere expensive luxury, occasionally useful, sometimes injurious, and never absolutely necessary except in extraordinary years. In Bengal and Orissa, the rainfall is not only sufficient in quantity, but it is, broadly speaking, regular in its incidence. It is not, of course, the case that the rains are always so regular as to yield a first-rate harvest; but it is a very rare occurrence when they fall so irregularly as to yield a crop insufficient for the support of the people. During the present century there has been only one famne in Orissa, that of 1866, and only one year, 1874, when there was any real approach to famine over Bengal generally. Behar, the large territory that lies to the north-west of the territories under the lieutenant-governorship of Bengal, is somewhat differently situated, but even there drought and famine are of very rare occurrence. If there is to be irrigation in Bengal, it should be in parts of Behar only. But it remains to be seen whether

the Sone irrigation works, established in Behar, have not been constructed on a scale which will render them a ruinous insurance against the occurrence of a possible but fortunately improbable famine.

The inutility of irrigation in Bengal, and the enormous useless expenditure that has been incurred by the State on the construction of irrigation works in that province, has recently been the subject of active discussion in India. The expenditure was incurred by the imperial government, and that government has renounced its liability for the payment of current expenses and of the current interest due on the capital expended. Those charges are henceforth to be borne by the provincial government of the lieutenant-governor of Bengal. But that government does not possess the funds wherewith to meet so large an annual outlay, and it has been found necessary to impose what is known as a compulsory water-rate on the people. In other words, all persons whose lands fall within the area irrigable by canal distributaries will now be compelled to pay a water-rate for their land every year, whether they want the water or not, and whether they take it or not. The injustice of this imposition is not among the least of the evils that have attended the introduction of irrigation in India into a province where it was not wanted.

From The Spectator.

PEPPERINESS.

WE wonder what is the source of the mixture of sympathy, not to say approbation, with which pepperiness, as distinguished from bad temper, is generally treated by the world, especially by the literary world? Miss Brontë teaches all her readers almost to fall in love with a peppery little professor mainly because he is peppery. Sir Walter Scott hardly ever draws a peppery person whom he does not evidently heartily like at bottom, — even Hector MacTurk, in "St. Ronan's Well," though an idle, loafing soldier, who spends his time in fomenting quarrels and promoting duels, is obviously a favorite, whom he intends the reader to like, and whom the reader accordingly does like; while the attractiveness of many characters of a far better class, — the Antiquary himself, for example, — is made to centre in their pepperiness. And no doubt the general English taste is of the same kind. When people hear of a very peppery speech, unless it be directed against themselves, they laugh, and rather cherish a tenderness for the man who gave vent to it. It may be said, perhaps, that in the case of Mr. Freeman's recent rebuff to Mr. Armitage, the pepperiness of that rebuff has been rather sharply criticised. But we suspect this is for quite a different reason. Mr. Armitage, a Royal Academician, had applied to Mr. Freeman — whom he did not know — for advice as to a question of costume in the Norman period, — whether or not a serf ought to wear a collar such as Scott represents Gurth as wearing in "Ivanhoe." He got at first a somewhat snappy and not quite intelligible reply for his pains; and next, when he pressed for further information, relying on the advice of "Tom Taylor and other literary friends," who had counselled him to consult Mr. Freeman, he received a severe snub, for them as well as for himself, in the shape of an assurance that the historian's time was too well occupied to answer queries put to him on the advice of people of whom he knew nothing; though if Mr. Armitage had come recommended by "Mr. Gladstone or Professor Stubbs," it might have been more to the purpose. And this snappish reply of Mr. Freeman's has been the subject of a good deal of comment in the press, and on the whole, rather unfavorable comment. But it is pretty clear that, except perhaps in the case of those whom the snub directly affected, the motive of the unfavorable comment is not in any considerable degree the pepperiness of the reply itself, but rather a political motive, — the wish, on the one hand, to diminish the estimation in which the judgment of an historian of repute, who is now so famous for his pro-Slavonic sympathies, is held by the public, or the wish, on the other hand, of those who agree with Mr. Freeman to exonerate themselves from any imputation of sympathy with his brusquerie. We very much doubt if any one on either side not directly affected by the remark has criticised it from any other than this semi-political motive. People probably know that Mr. Freeman has been overloading himself with gratuitous and very responsible work for the oppressed Slavs, and they know that such work, when combined with the heavy work of an historian of very laborious and minute accuracy, is exceedingly likely to generate a good deal of highly compressed impatience in the character of a man whose feelings

are so ardent as Mr. Freeman's. And so thinking, they naturally do not take very much more account of this fiery snub to Mr. Armitage and his friends, — quite undeserved though it was, — than they would of a squib going off when it gets a sharp blow. Indeed, editors print every day much less excusable outbursts of pepperiness than this, on questions purely literary, and evidently are rather amused by them than offended. It is evident, that Lucy Snow, in "Villette," took a good deal of pains to provoke peppery little outbreaks from M. Paul Emanuel. Who does not enjoy the scene in the picture-gallery when she will look at the not very respectable picture of a fleshy Cleopatra, and ask him questions about his opinion of it, after he had so very peremptorily led her away from the picture and told her not to set eyes on it again? The pepperiness of the man has a charm for her in itself, though not perhaps as much as the peremptoriness. She likes his imperiousness best, but she likes his outbreaks of fiery temper too. And that, we suppose, is the feeling generally with us English. We dislike bad temper, but admiringly encourage a fiery temper, — if it be only a fiery temper, — and unless it explodes at our own expense we rather like the man who owns it the better. The choleric character in comedy is always a favorite, and we should like very much to know why.

No doubt part of the reason is that people always feel kindly to a character which, in very marked and conspicuous aspects at least, is within their power, and like a musical instrument, will give out certain tones under their manipulation. It does not increase the respect for a man, but it does the feeling of fellowship with him, that he is sure to respond in a given way to a given stimulus, and that you possess the means of applying that stimulus at will. Such a man is liked partly as a natural phenomenon, on the display of which, under given circumstances, you can always rely. Just as men like to show off a fine echo in a particular spot, and will elicit it day after day, to the admiration of their different guests, so they like to show off the flashes of temper with which a friend answers the application of the well-known irritants. The pleasure in it is almost like the professional pleasure with which a medical practitioner sees the blister rise where he has applied the plaster, or the chemist, when he has predicted the liquidation of a gas, displays the result of the pressure he has applied. In short, these irascible tempers verify their friends' predictions, and also illustrate their power of playing upon character.

But probably another and more worthy reason for the tolerance, and something more than tolerance, with which peppery tempers are regarded, is that it is supposed that at least there must be something in these fiery people childlike and devoid of guile, since they have learned so little of policy as to respond without fail to any external stimulus. Men who control their temper so as to keep it more or less in harmony with their ruling purpose, may be and often are very superior to the average man, and sometimes, again, are — morally, at least — very inferior to him; but in either case they are more or less beyond his fathoming, and though they may use him he can never hope to use them. Now, as simplicity of character is always more popular than depth of character, any trait which, like superficial irascibility, has its explanation on the very surface, carries with it a certain *primâ facie* promise of straightforwardness and naturalness which are in themselves attractive. And again, a peppery temper has so much of the disturbing effects of pepper itself on the mucous membrane of those who come into close contact with it, and is apt to produce such sudden and altogether unexpected convulsions, to present such absurd contrasts between the heat of the feeling roused and the minuteness of the cause which has excited that feeling, that the humor of the situation alone has a certain amount of fascination for those who do not suffer from the irascibility roused. In short, pepperiness is grotesque, both in its origin and its results, and whatever is grotesque has has in it an attractiveness for the English people. When Meg Dods flourishes her broom, and Captain Hector MacTurk wards it off with his soldierly cane, all the spectators are delighted; and the same amusement which results in literature from the imaginary collisions of irritable tempers, results also in life from their real collisions. But all our reasons come to this in the end, — that pepperiness is intrinsically superficial, childish, and irrational, and that, man being what he is, the contemplation of what is superficial, childish, and irrational in other men has a charm of its own.

IX. RUHMKORFF, ... *Nature*, ... 256

POETRY.

HOLY COMMUNION, ... 194
SLEEP, ... 194
THE BEGUILING OF MERLIN, . . . 194

PUBLISHED EVERY SATURDAY BY
LITTELL & GAY, BOSTON.

TERMS OF SUBSCRIPTION.

For EIGHT DOLLARS, *remitted directly to the Publishers*, the LIVING AGE will be punctually forwarded for a year, *free of postage.*

An extra copy of THE LIVING AGE is sent gratis to any one getting up a club of Five New Subscribers.

Remittances should be made by bank draft or check, or by post-office money-order, if possible. If neither of these can be procured, the money should be sent in a registered letter. All postmasters are obliged to register letters when requested to do so. Drafts, checks and money-orders should be made payable to the order of LITTELL & GAY.

Single Numbers of THE LIVING AGE, 18 cents.

HOLY COMMUNION.

"As the living Father hath sent me, and I live by the Father; so he that eateth me, even he shall live by me." — ST. JOHN vi. 57.
"Amen, Allelujah!"

WE sing the everlasting truth
  Of words that Jesus said:
There is a holy human life
  Upon the earth we tread.
It was poured out our faith to win,
It has prevailed against our sin,
It brings eternal glory in,
  E'en here among the dead.

O Lord of all the angel host
  And of the church above,
We know thee in the midst of us
  By thy descending dove.
We in our prison stained and dim,
With cherubim and seraphim,
Lift up to thee the heaven-born hymn
  Of joy, and praise, and love.

Hail, bread of God that men may take! —
  His spirit teaches how.
The dying soul that eateth thee
  Shall even live as thou.
"Come, eat," the faithful witness saith
To sinners breathing mortal breath,
"And live forever after death;
  Yea, live forever now."

This being, with its ransomed powers,
  Oh let thy body feed,
And make the very life it lives
  An endless life indeed.
With faith in thy anointing shod,
It chooses paths which thou hast trod,
And offers to the living God
  Its whole immortal need.

Soldiers and servants by thy grace,
  But helpless children first,
We gather round our Father's board
  In hunger and in thirst.
Bold through the love which thou hast shown,
Rich without substance of our own,
We give thee, not our best alone,
  But all our least and worst.

The treasure worthless in our hands
  Transformed in thine we see.
Thou takest from us what we are,
  How spoiled soe'er it be.
In thy participating name,
We pour out sorrows, tremblings, shame,
The empty hope, the failing aim;
  And then we feast on thee.

It is for service that we live,
  Destroyer of our sin.
It is to keep the children's place,
  With all its discipline.
But sweet be our communion song,
The whole contented way along.
God gave us thee, and we are strong
  For life to triumph in.

Sunday Magazine. A. L. WARING.

SLEEP.

O GENTLE sleep! the gracious gift and blest,
    Of God's own sending;
O sacred sleep! dear foretaste of that rest
    Which knows no ending;
Sweet promise of that far-off Paradise
    Of calm release,
Where weary ones may lean on Jesus' breast,
    And close their eyes,
    And be at peace.

Earth "presses down;" the hearts that would ascend
    Droop, faint and weary;
So distant seems the lifelong journey's end,
    The way so dreary;
Each day's fierce struggle tires us out, as though
    We could no more,
Then comes thine handmaid, Sleep, our griefs to tend,
    With balm for woe,
    And strength in store.

We lay us down in peace, — thy touch divine
    Our eyelids closing;
Darkness, — thy secret place, — becomes the shrine
    Of our reposing;
Gently we breathe our souls into thy care,
    So glad to be
One day more near to that home-rest of thine,
    Which we may share
    With saints and thee.

So night by night we linger at thy feet,
    Until the morning;
Glimpses of heaven, bright visions pure and sweet,
    Our dreams adorning;
And if thy voice, kind Lord, we seem to hear,
    That word most blest
For willing souls, with sympathy replete,
    Falls on our ear,
    "Sleep, — take your rest!"

GENEVIEVE M. I. IRONS.

Sunday Magazine.

THE BEGUILING OF MERLIN.

GLAMOR of bud, and blossom, and sweet May,
Glamor of life, and of love's burgeoning,
When through gray mists of eld a second spring
Glances a moment, flying — ah, welaway,
Needed there other witcheries, O fay,
Of olden rune's low crooning, and the swing
And rhythm of lissom limbs in mystic ring,
To charm the sage into thy thrall and prey?

But, ah, the horror of those eyes athirst
For draughts of fuller life, that drink for these
Thy soul's sly poison to the subtler lees,
Knowing it poison — seeing the past accurst,
To-day a lie, hope like a bubble burst,
And worse than death creep on by slow degrees!

From The Edinburgh Review.

ULFILAS, THE APOSTLE OF THE GOTHS.*

In the dying days of the old Roman empire of the West, when men with strange barbarian names were sitting on the curule chairs of consuls and riding at the head of legions; when nothing but the imperial purple was withheld from the Germanic soldier of fortune, and hardly anything but that faded garment was left for the descendants of Æneas to aspire to, — in those days of startling ethnologic upheaval, some poet, unknown to fame, sat wearily through a long and noisy banquet, at which the loudest of the talking and the deepest of the drinking were done by the unwelcome strangers; and returning home tired of the clamor, and exceedingly filled with the scorning of the alien, poured forth his indignation in the following epigram: —

Inter HAILS Goticum SKAPJAM jam MATJA ja DRIGGKAM
Non audet quisquam dignos educere versus:
Calliope madido trepidat se jungere Baccho,
Ne pedibus non stet ebria musa suis.†

We read this curious effusion with a mingled feeling of shame and pleasure, in the thought that these masterful conquerors, whose rough speech jarred so harshly on the delicate Italian ear, were, if not precisely ancestors of ours, at least kinsmen of our ancestors; that their words are our words; that we may perhaps lay claim to a little of their strength, while their besetting sin is still our national vice and bane — drunkenness. "HAILS Goticum" we know well enough in *hail* and *wassail:* SKAPJAN is the German *schaffen*, our own *shape*. MATJAN connects itself with the English *meat*, and DRIGGKAN (pronounced drinkan) is but too obviously our ancestral *drink*. These four Gothic words on the surface of a Latin epigram, like boulder-stones on a glacier, might very easily have been all that history could trace of the language spoken by the Germanic nations at the time of their descent upon the Roman empire.

It is to Ulfilas, the Gothic translator of the Bible, a name dear to philologists, but scarcely yet familiar enough to the majority even of educated Englishmen, that we owe nearly all other knowledge than this epigram afforded of the earliest forms of Teutonic speech. And our acquaintance with Ulfilas himself, and our motive for the study of his writings, have been wonderfully augmented since the beginning of this century. One paragraph in Gibbon's thirty-seventh chapter expressed, with his usual accuracy and force, nearly all that was then known concerning him. It commences thus: —

Ulphilas, the bishop and apostle of the Goths, acquired their love and reverence by his blameless life and indefatigable zeal; and they received, with implicit confidence, the doctrines of truth and virtue which he preached and practised. He executed the arduous task of translating the Scriptures into their native tongue — a dialect of the German, or Teutonic language; but he prudently suppressed the four Books of the Kings, as they might tend to irritate the fierce and sanguinary spirit of the barbarians.

Already also a century before Gibbon, Francis Junius (whose name was Latinized from the French Du Jou) had published Ulfilas's translation of the Gospels, and had acquired in the process a certain number of Gothic derivations for English words, of which Dr. Johnson freely availed himself in his dictionary while quizzing Junius's wild notions of etymology in his preface. But the great philological movement at the beginning of this century, of which Jacob Grimm may be taken as the type, was the first cause of a true appreciation and scientific study of the work of Ulfilas. Scholars had found out what incalculable assistance was rendered by the study of Sanskrit towards the affiliation

and comparison of the various languages of the "Indo-European" stock. Grimm and his fellow-workers perceived that Gothic offered a promise of similar assistance to him who would study the history of the languages of the Teutonic family. Nor has this promise been belied. The Bible of Ulfilas has illustrated our kindred languages, as might have been expected from this venerable monument of Teutonism, which is seven centuries older than the Scandinavian "Edda," five centuries older than the High German "Niebelungen Lied," three centuries older even than the "Paraphrase" of the Northumbrian Caedmon.

While the work of Ulfilas has thus received an unexpected increase of value from the services rendered by it to one of the youngest of modern sciences, philology, light equally unexpected and not less valuable has been thrown upon his life and opinions by the discovery at Paris of his biography, written by *Auxentius*. To this biographer we owe almost all that is vivid and personal in our present knowledge of a character which was dim and almost mythical in the days of Gibbon. The Auxentius to whom we are thus indebted was not either of the two bishops of Milan with whom we are brought in contact in reading the life of Ambrose. His see was Dorostorus in Mœsia, a place familiar to our generation by its modern name of Silistria. He tells us himself that he was a pupil and friend of Ulfilas, and we may conjecturally assign to him a date between A.D. 330 and 390. The story of the decipherment of his MS. at Paris, in the year 1840, by a German student, has a little of the romance of bibliography about it, and shall be told at the conclusion of this paper.

Lastly, "Where did Ulfilas work?" For that also is a point which modern — very modern — history happens to illustrate. The province of Mœsia, which was the scene of the labors of this earliest of Teutonic authors, and from which the somewhat unfortunate name of Mœso-Gothic has been applied to his language, was pretty nearly conterminous with Servia and that Bulgaria "of which we have heard so much." And his birthplace was in Dacia, that province which Trajan conquered with so much toil, and which Aurelian, one hundred and seventy years after Trajan, with such true statesmanship abandoned to the Goths. But those one hundred and seventy years of Roman occupation of Hungary, Transylvania, Moldavia, and Wallachia produced among other results these two. First, Ulfilas must have imbibed in his childhood some knowledge of the Latin tongue, as still spoken by the subject provincials in Dacia; and hence, probably, the fact that his translation shows traces of the influence of the old Latin version (the Itala) as well as of the Greek original. Secondly, at the present hour, the interposition of some millions of men in Roumania and Transylvania, speaking the Daco-Romansch language, and thrust like a wedge between the two great masses of the Slavonian race, decidedly affects, and in some degree may facilitate the solution of the Eastern question. Marcus Ulpius Trajanus still moulds the east of Europe.

The scenes in which the life of the Gothic apostle was passed almost necessitated so much of reference to contemporary politics; but we shall not transgress in the same manner again. Henceforth we concern ourselves with no events that have happened within the last fourteen hundred years. Our proto-Teutonic author was not of pure Teuton origin. His ancestors were Cappadocians, carried away captive by the Goths, about the middle of the third century, from the village of Sadagolthina, near the city of Parnassus. This place was in the very centre of Asia Minor, near the large inland sea of Tatta. But in the two generations which passed away between that enforced migration and the birth of Ulfilas, there was plenty of time for the Cappadocian captives, while still perhaps retaining their ancestral Christianity, to become Goths in language and thought, a change which seems to be attested by the very name which the parents of Ulfilas bestowed upon their offspring. As for that name of his, it is written in various ways, in consequence, no doubt, of the barbarous northern W with which it commenced. Wulfila, Vulfila, Hulfila, Gulphilas, Οὐλφίας,

Οὐρφίλας, are the different forms under which it appears. The first is probably the correct one, though the Grecized *Ulfilas* has now so thoroughly established itself that it is not worth while to attempt its eradication. It is conjectured that its meaning may have been "wolf-cub," a name which would have been most appropriate had the boy turned out a Visigothic freebooter, while it is paradoxically inappropriate for him who was to be the shepherd and bishop of so many of his fellow-countrymen, and the first to write down for them the words, *Ik im hairdeis gods* ("I am the good shepherd"), *Asneis gasaiwith* WULF *qimandan* ("The hireling seeth the *wolf* coming"), *Jah sa* WULFS *frawilwith tho jah distahjith tho lamba* ("And the wolf teareth them and scattereth the sheep").

The birth of Ulfilas occurred at a critical time in the history of Christianity and the empire. In that year (311) the emperor Galerius died, and the persecution of the Christians ceased. Next year Constantine adopted the *labarum* upon his standards, and *in hoc signo* defeated his Roman rival, Maxentius. In 323, when Ulfilas was twelve years old, Constantine overcame Licinius, and the Christian, or rather Christianizing, emperor became sovereign of the whole Roman world. When the future bishop of the Goths was fourteen years old, the great council of Nicæa was assembled, and five years later the new capital was dedicated, which bore the name of the city of Constantine.

More relevant, perhaps, to our present purpose, than these dates, would be the history of the wars which, during this time, were fitfully commenced and abandoned, between the Romans and the Goths; but our information as to these is fragmentary and the dates are not well ascertained. It seems pretty clear, however, that a war of this kind was waged in the year 332; and when we hear that it terminated unsuccessfully for the Goths, and that their king, Araric, sent hostages, of whom his own son was one, to Constantinople, we may perhaps, without making too large an assumption, couple this fact with the statement of a biographer friendly to Ulfilas,* that he, during the reign of Constantine "was sent with others by the ruler of his nation on an embassy to Constantinople, for the barbarians of his country were subject to the emperor." The difference between a hostage and the envoy of a subject people is not so great as to put the two narratives very far asunder; and the age of Ulfilas, twenty-one, (supposing we have got the year rightly fixed) would fit the former character better than the latter.

At any rate it seems probable that much of his time between 331 and 341 was passed at the great metropolis of the Eastern Empire, that he then obtained that thorough knowledge of the Greek language which he certainly possessed, and that to this time must be assigned his conversion to the Christian faith, unless, as we have before suggested, Christianity, of some sort or other, was the religion in which he was born and educated. But, even so, the Christian Goths in Dacia, during the years of his childhood and youth, are probably well described by Auxentius, as "living an indifferent life, in hunger and poverty of the preached word"—*in fame et penuria predicationis indifferenter agentes;* and the residence at Constantinople may well have been the turning-point in his life, the influence which changed languid acquiesence into missionary earnestness on behalf of his ancestral faith.

The young Gothic stranger who, whether hostage or envoy, seems to have taken up his residence for a time at Constantinople, was, before long, ordained *lector*. This was a subordinate office, the lowest but one in the whole ecclesiastical hierarchy, but it is a significant fact that the ceremony of ordination was performed by handing to the new reader a copy of the Scriptures, and that the duties upon which he then entered consisted not only in reading to the congregation the lessons taken from the Gospels and from St. Paul's Epistles, but also in exercising a librarian's office, and taking charge of the sacred codices when they were not being used in divine service.

We may, therefore, with much probability conjecture, though we cannot prove, that it was during these years between

* Philostorgius, ii. 5.

twenty and thirty, while he was officiating at Constantinople as lector, perhaps at times making missionary journeys to his kinsmen in Dacia, that the great thought occurred to his mind, "Why not put down the Gothic speech of my childhood in written words, and translate into them the Greek codices which I am daily handling?" Surely we are not wrong in calling it a great thought. The missionary of to-day, with the experience of many generations of predecessors to guide him, does not find it an over-easy task to fix the gutterals, the breathings, the aspirates of a barbarous tribe in characters invented for the use of a nation speaking a very different kind of language; and even when this is done, the labor of translating the Scriptures into the newly-written speech is often lifelong. But this man, with no guides or precursors on his difficult path, conceived in his own brain the idea of both tasks, and accomplished both. He comes before us as a Cadmus-Wickliffe, bringing as gifts to his nation the first Teutonic alphabet and the first Teutonic Bible.

Translations of the Bible into various Syrian and Egyptian dialects had been made before the time of Ulfilas, but these were already literary languages. We may safely assert that his version was the first that had been made of either the Jewish or the Christian Scriptures into a language that was then accounted barbarous. On such an important subject as the invention of the Gothic alphabet and the translation of the Scriptures, it will be well to quote, even at the risk of a little repetition, the *ipsissima verba* of our authorities. Unfortunately Auxentius is too deeply engaged in doctrinal discussions to give us any information as to his master's greatest claim to the gratitude of posterity. We have, therefore, to take our details from three ecclesiastical historians who flourished half a century or more after the death of Ulfilas, but who, though differing as to many other circumstances of his life, speak with remarkable unanimity as to this.

Philostorgius, the Arian historian of the Church, who lived from about 358 to 427, says (ii. 5): "Ulfilas carefully watched over his people in many other ways, but, especially, he invented for them letters of their own, and having done so, translated into their speech all the Scriptures except the Books of Kings, which contain the history of wars: whereas this nation is already very fond of war, and needs the bit rather than the spur, so far as fighting is concerned."

Socrates (about 380–450) writes (iv. 35): "Then also Ulfilas, the bishop of the Goths, invented the Gothic letters, and by his translation of the Divine Scriptures into the language of the Goths, enabled the barbarians to learn the oracles of God."

Sozomen (also about 380–450) says: "Ulfilas was the first inventor of letters for them" (the Goths), "and he translated the holy books into their own speech" (vi. 37).

Jornandes, or Jordanes, the historian of the Goths, speaks of "their primate Vulfila, who is said to have instructed them in letters ("*De Rebus Geticis*," li.). But he should, perhaps, hardly be considered an independent authority, as he flourished about the middle of the sixth century, and evidently builds, as much as possible, on the foundations laid for him by the ecclesiastical historians, Socrates and Sozomen.

If this great literary labor was begun at Constantinople, and in the third decade of the life of Ulfilas, we may, nevertheless, safely conjecture that it was not ended then. Many years were doubtless spent upon the task; yet his friend Auxentius tells us also that he left behind him "many tracts and many expositions, written in the three languages — Greek, Latin, and Gothic, useful and edifying for those who heard them, and for himself an eternal memorial and reward. "As the middle and later years of his life were passed amid much stress of persecution, exile, controversy, and "that which must have come upon him daily, the care of all the churches," we have proof of considerable literary activity on the part of this first of Teutonic authors.

Of this life of intellectual toil we yet retain some of the most precious fruits. Deservedly the most famous representation of them is the *Codex Argenteus*, a manuscript of the four Gospels. The actual writing of this codex cannot be referred to an earlier period than the close of the fifth century, fully one hundred years after the death of Ulfilas, but there is no reason to doubt that the text is substantially his. The history of this single MS., adequately told, would require an article to itself. Written originally in Italy, probably at Ravenna, carried thence either by the fortunes of war, or by some matrimonial alliance of royalty, or (as some German philologists unkindly suggest) by a dishonest English student in the Middle Ages, who fell ill and died on his homeward journey, it appears next — and that

is all that can be said with certainty — at a Westphalian monastery, in the early years of the sixteenth century. Transported thence to Prague, in the Thirty Years War, it becomes the prize of a Swedish general, who sends it as one of his most cherished trophies to Stockholm. Christina, daughter of Gustavus Adolphus, careless in this, as in so many other things, of her countrymen's desires, allows her secretary, Isaac Vossius, to carry it away with him when he leaves her court and returns to his native Netherlands. From him, however, it was repurchased in 1662 by the Swedish chancellor, Gabriel de la Gardie, for the moderate sum of six hundred reich-thalers (about 31*l.*), and thus, after a few years' exile, it returned to Scandinavia, the traditional home of the Gothic race. There, in the library of the University of Upsal, it still remains, probably the most precious literary treasure which Sweden possesses.

Outside, it still bears the solid silver binding in which Count de la Gardie invested it; within, its noble Gothic characters, illuminated in silver upon a purple ground, explain the real reason of the name *Argenteus*. A few words at the beginning of each section are blazoned in gold instead of silver. At the bottom of each page, a sort of gallery of four arches, resting on Corinthian columns, suggests the influence of the architecture of Ravenna on the mind of the amanuensis, and serves the useful purpose of enclosing the numbers which, under the well-known name of the "Eusebian canons," enabled the student, before the introduction of chapters and verses, readily to compare the text of one Gospel with the parallel passages in the other three.

The *Codex Argenteus* once consisted of three hundred and thirty pages, of which unfortunately only one hundred and eighty-seven now remain. Thus, nearly one-half has perished. A few of the blanks left in the four Gospels are supplied from another source, to which we are also indebted for the fragments, not inconsiderable, though far less than we could desire, of the Epistles of St. Paul. The other Epistles and the Acts of the Apostles are entirely lost.

This other source to which we have referred, and which supplies us with an amount of Gothic text equal to about three-fourths of the *Codex Argenteus*, is the Ambrosian Library at Milan. In this great library, so rich in palimpsests, are three MSS., one of which, to a superficial observer, seemed to contain only a Latin copy of the Gospels; another, Pope Gregory the Great's "Homilies on Ezekiel;" and a third, St. Jerome's "Commentaries on Isaiah." But, under these Latin treatises, the patient labor of Count Castiglione, prompted by the celebrated Cardinal Mai, discovered, about the year 1820, those fragments of the Gothic version of St. Matthew's Gospel and St. Paul's Epistles, which, as we have said, fairly supply the deficiencies of the *Codex Argenteus*, and enable us to read a considerable part of the New Testament in the same form in which Ulfilas circulated it among his brethren in Dacia. Some minute fragments of Genesis, of Ezra, and of Nehemiah have been similarly preserved; but, practically, the Old Testament of the Goths is lost.

To the same source, the palimpsests of the Ambrosian Library, we are indebted for several pages of a commentary on the Gospel of John, which modern scholars have agreed to call by the Gothic term, *skeireins*, "an elucidation;" and a very interesting fragment of an ecclesiastical calendar, from the 23rd October to the 30th November. Both these documents, thus recently fished up from the sea of darkness and oblivion, are found to throw valuable light on the life and teaching of Ulfilas.

The personal and religious interests, however, of these remains, great as they are, will doubtless always be subordinate to that philological interest of which we have already spoken. Here we have the actual language spoken by Alaric and his long-haired Goths, when they stood under the walls of Rome; the language of Theodoric the Ostrogoth; probably also of Genseric the Vandal, and Alboin the Lombard. And this language, when we have made acquaintance with a few of its unfamiliar particles (*jah* = and, *fabai* = if, *unte* = for, and the like), and when we have learned to recognize the stately and beautiful grammatical forms which it contains,* but which we have lost, is seen to be in very truth and essence the same language as our own, to explain our dialectical peculiarities, and sometimes even to ennoble that which we call slang by its illustrious kinship.

Take, in illustration of the first point, the complaint of the Jews, in John vi. 60: *Hardu ist thata waurd: whas mag this hausjan?* It only needs, as to the last

* Such as *theinamma* = German *deinem* = English *thine;* and *habaida, habaides, habaida; habaidedum, habaideduth, habaidedun;* all represented by our significant word *had.*

word, that we should be reminded of the interchangeableness of *s* and *r*, and that we should further compare the German *hören* (to hear), and the sentence will at once read off into English: "Hard is that word; what (man) may hear this?"

Again, when we find in the fifteenth chapter of John, that *frijan* = "to love," and that *jus frijonds meinai sijuth* = "you are my friends" (that is, they who love me); and when we further find that *fijan* = "to hate," and the participle *fijands* = "one who hates an enemy;" we then at once perceive how it has come to pass that *friend* and *fiend*, so like in form, have such different meanings; though it is true that the difficulty still remains to understand how our Teutonic ancestors could allow that one little letter *r* to bridge over the vast gulf between loving and hating. From *fiend* to *ogre*, however, is an easier transition; and when we find in Luke i. 30, as part of the angelic salutation, *Ni ogs thus Mariam*, "*Fear* not thou, Mary," we at once understand that an ogre was originally anything that causes fear.

With this word *fijan* for a clue, we can now thread our way through a longer verse, the twenty-sixth of the fourteenth chapter of Luke. *Jabai whas gaggith* (pronounce the double *g* as *ng*) *du mis jah ni fijaith attan seinana jah aiththein, jah quen, jah barna, jah brothruns, jah svistruns, nauh-uth-than seina silbins saivala, ni mag meins siponeis visan.* "If who" (= any one) "gangs to me and hates not his father and mother" (in the Gothic equivalents of these words we have an extraordinary deviation from a very wide-spread type), "and his wife" (the Gothic for woman has risen into *queen* by a converse process to that by which the Italian *donna* has descended into woman), "and his bairns and his brothers and his sisters, and still then" (*nauh* = German *noch*) "his self's soul" (compare the Scotch *sawl* and the German *Seele*), "he may not be my disciple."

We spoke of the study of our own dialects as being illustrated by the labors of Ulfilas. In the northern, and, we believe, in some of the eastern counties of England, the word to *wilt* is used of the decay of fruit (as, "These pears have wilted"); and this dialectical word, like so many others, is retained in the American vocabulary, though in a rather different sense. Thus, in describing an action in the American Civil War, a journalist wrote, "Our troops wilted" (ran away). This word is accounted for by the Gothic *ga-swiltan*, to die. Again, the Yorkshire *mickle* and the Scotch *meikle* correspond to *mikils*, the regular Gothic equivalent of great. The Scotch *sib* (of kin to) is represented by the Gothic *sibja* (relationship). When a north-countryman says, "*I'm ganging to my bairns*," he speaks, as the texts above quoted show us, almost pure Gothic. We may have been sometimes puzzled to know why Londoners now talk of *shop-lifting*, and why the Scotch borderers used to talk of *cattle-lifting*. But when we read the beautiful Gothic translation of the tenth chapter of John, we see at once that "to lift" in the sense of "to rob" is a rightful Teutonic word. *Saei inn ni atgaggith thairh daur in gardan lambe ak steigith aljathro* ("He that goes not in through the door into the yard of the lambs, but mounts another way,") *sah hliftus ist jah vaidedja* ("he is a thief and an evildoer").

Then, as for words which cannot aspire to a place in a dictionary of dialects: few words in the whole range of slang could seem less dignified than "spry;" yet this, too, can claim a legitimate descent from the Gothic *sprauto*, quickly. In John xi. 29, we are told that Mary, when she heard of the Saviour's approach, *urrais sprauto jah iddja du imma*, "arose quickly and went to him." And in this connection, though not as illustrating the history of slang, we may notice that the Gothic word for "immediately" is *suns*. Thus, Matthew viii. 3: *Jah suns hrain warth thata thrutsfill is*, "and immediately cleansed was his leprosy." The inveterate habit of promising an earlier fulfilment of our intentions than we can hope to perform — that habit which so often makes our five minutes equivalent to thirty — has, in recent times, since the date of the Authorized Version, broken down the meanings of both "by-and-by" and "presently," rendering them quite inadequate representations of the Greek εὐθέως, to which, in our translators' day, they were equivalent. It is interesting, and somewhat reassuring, to see that the very same tendency was at work in the very dawn of our history, turning the energetic *suns* of the soldiers of Alaric into the languid "soon" of our English forefathers.

We have already hinted at the value of the study of Gothic, as illustrating the relationship of the various Teutonic languages to one another, and their affiliation to the great Aryan parent stock. As Sancrit is not itself the Aryan, so neither is Gothic the Teutonic *ur-sprache*, the original speech from which the others have sprung; but each is so many steps nearer

Digitized by CORNELL UNIVERSITY

to the *ur-sprache*, that by mounting up to it we gain a wider and clearer horizon, and can discern the common origin of streams of language which otherwise might have seemed to us hopelessly disparted.

For instance, who, judging from the existing forms of Teutonic speech, would have supposed that we ever had the dual in our grammar? And yet, when we turn to the *Codex Argenteus*, we find dual forms marked out with great clearness and accuracy. For instance, in Mark xi. 2, where Christ sends two of his disciples to bring the ass upon which he is to make his triumphal entry into Jerusalem, he says to them, "*Gaggats in haim tho withra-wairthon iggquis.*" "Go ye two into the village which is over against you two." Had he been addressing more than two persons, the proper forms would have been *gaggith* and *izwis*.

Again, the universal termination of the neuter plural of substantives and adjectives in Gothic is *a*. Thus the *goda waurda* of our kinsmen show a relationship to the *bona verba* of the Roman and the ἀγαθὰ ῥήματα of the Greek, which no termination in our own "good words" reminds us of.

One more illustration may be permitted, though it is by this time one of the commonplaces of comparative etymology. Who, judging from the mere aspect of the words, would suspect a kinship between the *tear* of English speech and its French equivalent? But Ulfilas furnishes us at once with the missing link. We rise from the English *tear* to the Gothic *tagr;* thence by an easy transition, we pass to the Greek *dakni;* thence to the Latin *lacruma;* from which we descend again into the plain of modern languages, and recognize in French the clipped and abbreviated form, *larme*.

As we have said, these illustrations now take their place among the very rudiments of philological science. Still, they retain a great interest, especially for the student who is willing to rediscover them for himself, by a patient study of the Gothic tongue. To read a list of Gothic words in a dictionary or a comparative grammar is like viewing a *hortus siccus*, valuable, it may be, and scientifically useful, but somewhat uninteresting. To read Ulfilas in his own tongue, and find, here a trace of the old long-extinct speech, which was once common to all the Indo-European nations, there a word, or a vowel in a word, which recalls some peculiarity in the dialect of Yorkshire or of Dorsetshire, is like wandering through the forest at spring-time, and gathering its ferns and flowers for ourselves.

We return to the life and times of the great translator. In the year 337, when Ulfilas was twenty-six, the emperor Constantine died, and was succeeded in the eastern part of the empire by his son Constantius. And then was commenced one of the most peculiar reigns of which history has preserved a record; the reign of a man deeply dyed in the blood of relatives and friends, who used the obsequious service of eunuchs instead of entrusting the affairs of the State to honest and capable ministers, whose feeble haughtiness and cowardly ambition bear no trace of the influence of Christianity upon his life, but who, nevertheless, plunged into theological discussions with an eagerness, and continued in the same with a patient endurance, such as we should scarcely find nowadays in a salaried professor of divinity. Now, under the fostering care of this imperial theologian, were produced those wonderful eighteen creeds, the offspring of nearly as many toiling councils; now, to quote a well-known passage from Ammianus, "the very posts of the empire were disorganized by the troops of bishops galloping backwards and forwards at the public expense, to attend what they call 'synods,' convened by the emperor's order, in the hope of bringing every man round to his opinion."

One such synod was held at Antioch in 341,* in order to depose Athanasius, and to expunge the word *homoüsion* from the creed. The president was Eusebius, long known as bishop of Nicomedia, well described as court chaplain of Constantine and Constantius, and now, just at the close of his life, metropolitan of Constantinople. It was at this synod of Antioch, according to the conjecture of Dr. Bessell, that Ulfilas was ordained bishop. We may perhaps doubt whether the words, "he was elected by Eusebius and the bishops who were with him," are quite sufficient to bear the weight of this conclusion. Is it not more probable that some one of his biographers would have mentioned at least the name of Antioch, had that been the place of his ordination? But at any rate the date, and the name of the consecrating bishop, may now be considered as fixed. It was in the thirtieth year of his age, A.D. 341, that Ulfilas was raised from the humble post of lector, and, by Eusebius and the bishops of his party, was elected "first bishop of

* Generally known as "the Synod of the Dedication," the alleged object of the meeting being the dedication of the great church of Antioch.

those who were embracing Christianity in the Gothic country."

The name of Eusebius of Nicomedia, as the patron and friend of Ulfilas, brings us at once to the question, "Which side did the Gothic bishop himself take in the long theological duel of the fourth century?" To this question but one answer can, with any regard to historical fairness, be returned. Ulfilas was an Arian; and, if the apparently unimpeachable evidence of Auxentius be accepted, he was, or believed himself to have been, an Arian all his life. It would have been indeed surprising had he not been on that side. All his religious training appears to have been received in that great city, the centre of ecclesiastical and intellectual activity for the Danubian countries, which his admiring disciple calls "*Constantinopolim immo vero Christianopolim.*" And Constantinople, when he entered it, was feeling the reflux of the tide which, in 325, had borne her and her emperor up to the Nicene high-water mark. Nor would it be too much to say that, from the accession of Constantius in 337, to that of Theodosius in 379 — except for a parenthesis of three years under Julian and Jovian — Arianism, in one form or other, was the dominant creed, the State religion of the East, and that the Athanasians were considered by the majority, at least of the ecclesiastics, to whom Constantinople was the metropolis, as not less of heretics than Sabellius himself.* Now, these forty-two years, from 337 to 379, fill up all the best of the life of Ulfilas, from his twenty-sixth to his sixty-eighth year. From a purely secular point of view, and looking only to the disastrous consequences of the Arianism of the Teutonic invaders of the Roman empire, we may well regret that this should have been the form under which the Gothic apostle received and propagated the Christian faith; but to blame him for his religious position would be, in fact, tantamount to blaming him for having been born in the early part of the fourth century, rather than fifty years earlier or fifty years later.

As for Arianism itself, we must say a few words, in order to prevent the life-work of Ulfilas from being misjudged. We are in danger of forming a wrong estimate of that system of doctrine, if we class it with certain modern forms of religious thought, which are popularly supposed to be its representatives. In point of fact, we probably should not err in asserting that Arianism is as dead as the worship of Jupiter Olympius, and that there is nothing which corresponds to it, or represents it, in any of the schools of belief or disbelief at the present day. Yet, the maxim "*De mortuis nil nisi bonum*" does not apply to creeds and philosophies, and we wish to speak the truth concerning Arianism, whether it be for good or whether it be for evil.

In the first place, we greatly mistake when we suppose that the Arians represented the reaction against "dogma." They hungered and thirsted for dogma; they could not endure to confess ignorance or to acknowledge inexplicable mysteries. Matthew Arnold's criticism upon certain orthodox writers, that "they seem to know as much about God as about the man in the next street," exactly expresses the mental attitude of the Arians. The veil which reverence and love had permitted in primitive times to rest upon the relation of Christ to him whom he spoke of as his Father, must now be torn down, and a clear, exact account of the whole matter, such as would commend itself to the understanding of every man, such as would stand the test of a vigorous dialectical debate in the agora of any Hellenic city, must be given to the whole world. Looking at the entire course of the controversy, we may fairly say that but for the Arian question we should never have had the Athanasian reply, and that the Ὁμούσιον of Nicæa is really the offspring, though the hostile offspring, of the Ἐξ οὐκ ὄντων ἐγένετο of Alexandria. And hence it was, that during the half-century of Arian ascendency the party could never "continue in the same stay." Creed gave birth to creed, and sect split off from sect with a rapidity which would be amusing if we could forget the subject-matter of the controversy; and the efforts of Arian and semi-Arian to frame a religious platform upon which a sufficient majority of bishops could stand to make their views pass for catholic verity, and to ensure that everything above or below their exact mark on the theological thermometer should be condemned as heresy, remind one more of a presidential campaign in America, than of the earnest discussions on high themes of single-minded seekers after truth.

But, secondly, we shall much mistake the feelings and the tendencies of an Arian of the fourth century, if, judging him by his supposed representatives in the nineteenth, we imagine that he wished to elim-

* And in this connection we ought not to forget that Marcellus of Ancyra, whom the Church now regards as a Sabellian heretic, was till 347 fighting side by side with Athanasius against the Arians.

inate the supernatural from Christianity, or consciously took up a position of antagonism to the authority of Scripture. It would be dangerous to venture on a sweeping assertion as to the conduct of any party through the whole of that vast and stormy controversy; but we think it will be admitted that the doctrines of the incarnation, resurrection, and ascension of Jesus Christ were firmly held by a large majority of the Arians, and that the sacrificial import of his death was at least not zealously controverted. In their arguments with opponents, they do not appear to wish to evade the appeal to Scripture, or to be satisfied to say, "True, the Bible says so and so, but we teach differently;" nor do they seem to have been charged, as Marcion was, with mutilating any of the sacred books, or manipulating texts to suit the purposes of controversy. In short, the aim of the Arian creed-makers was to devise a scheme whereby the passages in the New Testament which speak of Christ's subordination to his Father, might be reconciled with those other passages which speak of him as God, and as one with the Father. And this scheme was to be one which could commend itself by dialectics alone to the mere understanding of the natural man. One may think such an attempt unwise or irreverent; one may lament the time wasted over word-mechanisms as complicated and as unreal as the epicycles of the Ptolemaic astronomy; but one may yet allow that their authors did not consciously distort or falsify the texts which they were laboring to bring into harmony with each other. Nor is it historically correct to ascribe to men who appear to have accepted the Christian revelation as unquestionably true, the doubts or the denials of the modern rationalist.

Ulfilas himself, in the fragments of his translation which have been preserved, reproduces the passages which assert the deity of Christ without any trace of faltering or equivocation. One exception, perhaps, should be made. In the celebrated text, Philippians ii. 6, he writes, *saei in Gutha-skaunein visands, ni vulva raknida visan sik galeiko Gutha* ("who, being in God-form, reckoned it not rapine to be himself *like* to God"). Here, surely, some Arian feeling must have caused the pen of the translator to swerve from its usual fidelity; at least, no Gothic scholar seems to doubt that *ibna* (even or equal) rather than *galeiko* would have been the true rendering of the Greek text.

In the biography of which we have spoken, Auxentius describes at great length the theological position of his master. He seems to have belonged to what we may call the left centre of the Arian party, the partisans of Acacius and the favorers of the *homoeon*, who, while rejecting the words "essence" and "substance," confined themselves to the assertion that the Son was like unto the Father, "in such manner as the Holy Scriptures assert."

We must admit that he shared fully in the religious intolerance of his age; and it is important to notice this point, because a historian of later date (Theodoret, iv. 37), in describing the alleged conversion of Ulfilas to Arianism in his old age, says that Bishop Eudoxius got him over to his own side by representing that the whole matter was only a strife about words, and that there was no real difference of doctrine between the two parties.

Not so says Auxentius: —

> In his preaching and expounding he was wont to assert that all heretics were not Christians, but Antichrists; not pious men, but impious; not religious, but irreligious; not reverent, but foolhardy (*non timoratos sed temerarios*); not in the hope, but without hope; not worshippers of God, but without God; not teachers, but seducers; not preachers, but prevaricators — and this whether they were Manicheans or Marcionists; whether Montanists, or Paulinians, or Psabellians (*sic*), or Antropians (Psilanthropists), or Patripassians, or Fotinians (*sic*), or Novatians, or Donatians, or Homousians, or Homoeusians, or Macedonians.
>
> But as a true emulator of the apostles, and imitator of the martyrs, having made himself the enemy of the heretics, he repelled their evil doctrine and built up the people of God, while he put to flight the grievous wolves and dogs, and through the grace of Christ kept his flock as a good shepherd, with all prudence and diligence.

We will now leave for the present the region of polemical theology, and hear Auxentius tell the story of the forty years' episcopate of his master: —

> Thus preaching and giving thanks to God the Father, through Christ, he flourished gloriously for forty years in his bishopric, and with apostolic grace he preached the Greek and Latin and Gothic languages without intermission in the one only Church of Christ: for one is the Church of the living God, the pillar and ground of the truth; and he used to assert and contend that one is the flock of Christ, our Lord and God, one cultivation and one building, one virgin and one spouse, one vineyard, one house, one temple, one the *conventus* of Christians, while all other *conven-*

ticula are not churches of God, but synagogues of Satan.

To praise him as he deserves I am not able, and altogether to be silent about him I do not dare; since to him above all others I am debtor, for he labored more abundantly in me, having in my tender youth taken me from my parents to be his disciple, and taught me sacred letters, and made manifest to me the truth; and by the mercy of God he educated me both carnally and spiritually, as his own son in the faith.

He, by the providence of God and the mercy of Christ, for the salvation of many souls in the nation of the Goths, was from a reader promoted at the age of thirty to the office of bishop, that he might be not only an heir of God and co-heir of Christ, but in this matter also an imitator of Christ and his saints.

The examples of David, Joseph, and our Lord himself, all of whom were, at the same age of thirty, especially manifested as rulers or deliverers, are then adduced and illustrated copiously: —

So it was, when he was thirty years old according to the flesh, that Ulfilas took in hand the aforesaid nation of the Goths, then living indifferently in spiritual poverty and hunger of preaching, that he reformed them according to the evangelical and apostolical and prophetical rule, and taught them to live unto God, and manifested that they were Christians — Christians indeed — and multiplied their numbers.

And when, through the envy and mighty working of the enemy, there was kindled a persecution of the Christians by an irreligious and sacrilegious judge of the Goths, who spread tyrannous affright through the Varbarian (*sic*) land, it came to pass that Satan, who desired to do evil, unwillingly did good — that those whom he desired to make prevaricators and deserters, by the aid and companionship of Christ became martyrs and confessors, that the persecutor was confounded and his victims crowned, that he who tried to conquer had to blush as a conquered one, and they who were tempted rejoiced as conquerors.

Then, after the glorious martyrdom of many servants and handmaidens of Christ, as this persecution was still raging vehemently, after only seven years of his episcopate were expired (*i.e.*, A.D. 348), the aforesaid most holy and blessed Ulfila, with a great multitude of confessors, being driven from "Varbaricum," was honorably received on the soil of "Romania" by the then emperor Constantius of blessed memory; so that, as God by the hand of Moses delivered his people from the violence of Faraoh and the Egyptians, and made them pass through the Red Sea, and appointed that they should serve him, even so, by means of the often-mentioned Ulfila, did God set free the confessors of his holy and only-begotten Son from the Varbaric land, and caused them to cross over the Danube and serve him upon the mountains (of the Balkan) like his saints of old.

Thus did he settle with his people on the soil of "Romania," where, omitting those seven years previously named, during thirty and three years he preached the truth — in this also an imitator of those holy men, for (how often the space of forty years is mentioned in the Old Testament in connection with judgeships and kingships, we know very well).*

This comparison of Ulfilas to Moses, naturally suggested by his bringing the Goths across the Danube to a place of safety, seems to have been a favorite theme with his followers. Philostorgius tells us that "the emperor himself" — apparently Constantius — "held Ulfilas in high honor, so that he would often speak of him as the Moses of his day." It seems probable, then, that these two men, Constantius and Ulfilas, met in personal conference, it may have been more than once or twice. A strange contrast must have been presented by the earnest, energetic Teuton, weather-beaten by the storms of Mount Hæmus, his brow furrowed by the brain toil of his great translation, and the dainty theologizing emperor, waited upon by a herd of sleek eunuchs, "who was never seen to wipe his nose in public, nor to spit, nor to turn his face from one side to the other, and who never tasted an apple in all his life."† As the emperor was born A.D. 316, he was five years younger than the bishop.

Ulfilas and his Christian refugees, distributed through Mœsia according to the decrees of Constantius, received the name of "the Lesser Goths." We have a slight notice of them in Jornandes, the native historian of the race, who wrote about two centuries after the time of which we are now speaking. No one who has been accustomed to consult this historian will place much reliance on his accuracy; still we have often to be thankful to him for details which no one else will give us: —

There were also certain other Goths who are called *minores*, an immense people, with their bishop and primate Vulfila, who is said, moreover, to have taught them letters; and they are at this day dwelling in Mœsia, in the district called Encopolitana.‡ They abode at the foot of the mountains, a numerous race, but poor and unwarlike, abounding only in cattle of divers kinds, and rich in pastures and

* The text of this paragraph is in a very fragmentary state.

† Ammianus Marcellinus, xxi. 16.

‡ Possibly intended for Nicopolitana.

forest timber, having little wheat though the earth is fertile in producing other crops. They do not appear to have any vineyards; those who want wine buy it of their neighbors; but most of them drink only milk.*

As to the history of the Goths in Dacia during the nine years that we suppose to have been occupied by Ulfilas' residence in Constantinople, and the first twenty-two years of his episcopate — that is to say, from A.D. 332 to 363 — we have scarcely any authentic information, and are therefore unable to fill in any details into the meagre sketch given us by Auxentius.

Only, during this period, we hear of the vast extension of the half-mythical empire of *Hermanric*, a stern old warrior, who eventually died of rage, at the mature age of one hundred and ten. If we may believe the Gothic historian, his kingdom extended over the whole of what is now called Lithuania and southern Russia, and touched both the Black Sea and the Baltic. His especial subjects were the Ostrogoths, who had in former times been the eastern, but were now the northern half of the great Gothic nation, and he bore the title of king. The Visigoths, in their Dacian settlement, seem to have occupied the position of subject-allies towards their northern brethren. And for this reason, probably, it was that their rulers bore the title not of king, but of judge. But, to understand what manner of judges they were, we must let our minds dwell rather on the wild forms of Ehud and Jephthah, and other warrior-judges of Israel, than on the ermined sages of Westminster Hall.

It will be observed, therefore, that it is in strict accordance with the political condition of the Visigoths of that day that Auxentius speaks of the persecution which led to the exile of Ulfilas, as kindled "by an irreligious and sacrilegious *judex* of the Goths, who tyrannized over the barbarian land." But who this *judex* was, or what were the names of any of his martyrs, authentic history entirely fails to inform us.

We get another glimpse of the Gothic bishop in his theological relations in the year 360.† A synod of Arian prelates was then assembled at Constantinople. They drew up a creed nearly the same with that which had been so dexterously used at Rimini, recognizing the likeness of the Son to the Father, "in such a manner as the Holy Scriptures declare and teach," but forbidding the use of the terms "essence" and "substance"* as unscriptural and liable to be misunderstood by the common people. This creed, we are expressly told,† was subscribed by Ulfilas.

In the year following, 361, the man of many synods, Constantius, died, and Julian, the would-be restorer of the classic mythology, was sole Augustus. We have no information as to any influence which this change may have exerted on the fortunes of Ulfilas and his *Gothi minores*. The former had now reached the fiftieth year of his life, and the half-way point of his forty years' episcopate. Though we have heard so much of him as an Arian controversialist, it is reasonable to suppose that the strife with heathenism and with the easily besetting sins of his barbarian converts occupied a far larger share of his energies. Acacius against Athanasius, the Homoeon against the Homousion, might be his watchwords when he was face to face with his brother bishops in council beside the Bosporus; but doubtless, when he returned to Mœsia, his chief toil, next to the life-work of his Biblical translation, would be to guard his people against relapsing into the drunken orgies and the wild fevers of gambling which Tacitus notes as characteristic of all the Germanic nations. Often he may have ventured — though this is mere conjecture — across the Danube by one of Trajan's bridges, into his own ancestral Dacia; and, if so, we may be sure that Sabellius and Photinus, Marcellus and Macedonius, were for the time well-nigh forgotten, as he strove to eradicate from the Gothic heart the worship of Odin, "the father of slaughter, the god that carrieth desolation and fire;" as he contrasted Asa-Thor's defeat by Hela with Christ's eternal triumph over death; and as he sought to dim the glories of Valhalla by depicting St. John's vision of the holy city, the New Jerusalem, descending from God out of heaven.

The conjecture that the Gothic apostle had thus been working among his fellow-countrymen is strengthened by the great progress which we find Christianity to have made among them, when, in A.D. 367, the curtain again rises, which for thirty years has hid their nation from our sight. It may be remarked, in passing, that it never again completely falls, since we

have a fairly detailed continuous history of the Visigoths from this date down to the overthrow of their monarchy in Spain by the Moors, A.D. 711.

In the year 363, the imperial line of Constantine came to an end by the death of Julian, on the plains of Mesopotamia. After the short and unimportant reign of Jovian, the two brothers, Valentinian and Valens, were raised respectively to the western and eastern thrones. But for the first two years of their reign there either smouldered or else burst into actual flame the rebellion of Procopius, an imperial notary, who, as a relative of Julian's on the maternal side, made some faint show of an hereditary claim to the succession. The Goths sent him some unimportant succor, professing, and perhaps believing, themselves to be bound to afford him this assistance by loyalty to the house of Constantine.

After the death of Procopius, Valens, refusing to admit the validity of this plea, called the barbarians sternly to account, and, in three campaigns (367 to 369) by the lower Danube, appears to have obtained some material successes. Twice he crossed the river on a bridge of boats; but one year (368) operations were almost suspended by the swollen state of the stream. In the last year, according to a strange story told by Zosimus, the emperor, finding the regular operations of war too tedious, and the encampments of the barbarians among the swamps of the Dobrudscha often hard to storm, told the sutlers and camp-followers that he would pay a certain sum for each head of a barbarian that was brought into his camp. The new auxiliaries thus brought into the field swarmed at night into the forests and marshes, "and soon brought an immense number of heads to the emperor, so that the remaining barbarians sued for peace." We have heard of something like this method of making war in the same province of Bulgaria in our own day.

Peace, then, was concluded in the year 369; and though the Romans seem, upon the whole, to have had the advantage in the field, the basis of the treaty was the *status quo ante bellum*, with perhaps this difference, that the loyalty formerly pledged to the house of Constantine was now transferred to that of Valentinian.

In the conclusion of this treaty, we come for the first time upon the name of *Athanaric*, "a very powerful judge of the Goths at that time." He had apparently in the last year of the war succeeded to supreme power among the Visigoths, reserving perhaps some sort of semi-feudal allegiance to the great Hermanric.* Athanaric, who seems to have been the very type and stronghold of Visigothic conservatism, abhorring all new-fangled Roman ways, whether in religion or in politics, had sworn a dreadful oath, "*sub timenda exsecratione*," that he would never tread on Roman soil. It would have been beneath the dignity of the Augustus to transfer his purple buskins to the now barbarian ground of Dacia; but the difficulty was adjusted by a master-stroke of etiquette worthy of the congress of Westphalia. The ships of emperor and of judge were rowed from the opposite shores of the Danube into full mid-stream, and there the two potentates, each accompanied by a suitable number of guards, met and discussed the conditions of the treaty, and the number and quality of the hostages.

This peace between "Romania" and "Varbaricum" lasted, as we shall see, for eight years — from 369 to 377 — that is, from the fifty-eighth to the sixty-sixth year of the life of Ulfilas. At this point of the history, or perhaps a little earlier, we cut across a portion of the internal history of the Visigoths. It is narrated to us by two ecclesiastical historians, Socrates and Sozomen, who wrote two generations after the event, who were probably ignorant of the language of the people, and whose stories are inconsistent with one another and with the known facts of history. Without wasting time in the vain labor of trying to reconcile their discordance, we will only note that, contemporary with Athanaric, and rivalling and sharing his power, was another chief, *Fritigern*. Less intensely attached to the customs of his forefathers than Athanaric, he probably leaned from the first to the Roman alliance, and the Christian religion. Civil war broke out between the two chiefs. Fritigern asked the help of Rome, which is said to have been conceded to him on condition of his adopting the faith of Christ, as professed by the Arian emperor, Valens. It is said that the Roman troops then crossed the Danube and gained for Fritigern a complete victory over his enemy. But, as the laborious and accurate historian, Ammianus Marcellinus, gives us no hint of any such

* Clinton, on the authority of Isidore of Seville, assigns the year 369 for the accession of Athanaric. (*Fasti Romani*, ii. 167.) Nor do the words of Ammianus Marcellinus (xxvii. 5) really conflict with this date. Some of the writers on the subject who refer the earlier persecutions of the Gothic Christians and the expulsion of Ulfilas (348) to the command of Athanaric appear to have missed this point.

engagement between the years 369 and 377, this is probably only another version of the three years' campaign (366 to 369) already described.

At the period, then, whatever it be, at which we have now arrived, the Visigothic nation was divided into two parts — one Christian, under Fritigern; the other still heathen, under Athanaric. But in the latter portion also, Bishop Ulfilas, who was evidently now extending his labors beyond his own *Gothi minores* in Mœsia, wrought much and made many converts. This excited the rage of the stern *judex*, Athanaric, who treated the innovators with great severity, so that eventually many of the Arian Goths of that period, says the orthodox Socrates, became martyrs for the faith of Christ. This persecution must have raged at some period in the eight years of peace (369 to 377) already mentioned, and the existence of it must be taken as a proof that neither Valens nor Fritigern had emerged from the previous struggle decidedly superior to Athanaric.

Of the histories of these Gothic martyrs we have some, though slight, traces outside of the two Church historians whom we have already quoted. If one visits a library which contains that vast quarry of Catholic biography, the Bollandist "*Acta Sanctorum*," in fifty-three folio volumes, and if from the eight volumes dedicated to the month of September one selects that which includes the lives of the saints whose festivals are celebrated on the fifteenth day of that month, one will find a heading, "*De S. Niceta, Gotho Martyre.*" The story of the life of *Nicetas* is told both in Greek and Latin, and, somewhat condensed, here it is: —

By the side of the famous Danube dwelt the Goths, who had migrated from their fatherland and come as settlers to that region. The young *Nicetas*, sprung from a Gothic stock, had, on account of his noble birth, his shapely body, and his generous soul, obtained one of the foremost places in the nation. Yet he was not a Goth in life, in manners, or in faith; for conviction conquered race, the love-charm of Christ conjured away the vainglory of the barbarian, and the pursuit of virtue weaned him from the Gothic roughness and intemperance.

Evidently it is no Teutonic hand which is tracing for us this picture: —

He went with Theophilus, bishop of the Goths, to the Council of Nicæa, and signed the Confession of Faith there drawn up. Not long after* [really after an interval of forty-four years, 325 to 369] dissensions arose between Fritigern and the every-way terrible Athanaric. The latter conquered; Fritigern fled, and implored the aid of the Roman emperor, who was at that time the Christ-hater, Valens.† He sent some of his troops, then quartered in Thrace, to the help of Fritigern, who, guarded by them and by the remnant of his own army, recrossed the Ister. Bearing the holy cross of Christ before them, they easily overcame the whilom victor, and Athanaric himself was fain to betake himself to shameful flight, the greater part of his army being either slain or taken prisoners. This was the cause why the Gothic nation embraced Christianity.

Then follows a passage concerning Ulfilas, which shall be translated literally, because much stress has been laid upon it by the assertors of the orthodoxy of that prelate, though it is generally now admitted that as a piece of evidence it is of little value, and that his alleged presence at the Council of Nicæa is in the highest degree improbable: —

But Urphilas now possessed the archiepiscopal dignity as successor of Theophilus, with which prelate he had been formerly present at Nicæa, agreeing in his views. He afterwards took part when the second holy and ecumenical council was collected at Constantinople. This man, who was both learned and intelligent, invented shapes of letters and corresponding sounds suitable for the Gothic tongue, and having by means of these translated our sacred and divinely inspired Scriptures into that language, he exerted himself with all his might to induce his fellow-countrymen to learn them. Hence piety took root among the barbarians, and increased from day to day.

The narrative then goes on to tell how Athanaric soon returned, having recovered from his losses, and raged more vehemently than ever against his enemies, but especially against Nicetas, whose nobility of character and lineage marked him out for vengeance: —

Thus, when the pious and gentle Gratian [nephew of Valens] was exercising hereditary rule over Rome,‡ the bloodthirsty Athanaric broke out into cruel persecution of the Christians, and urged those who were about him to do the same. These enemies of God threatened Nicetas with fell wrath; but he heeded them not, and went on preaching the true religion. At length, breaking forth into open violence, they attacked him while he was in

* *'Επεὶ δὲ οὐ πολὺς ἐν μέσῳ διέβη χρονός.*

† *Οὐάλεντι δὲ τηνικαῦτα τῷ μισοχρίστῳ τὰ ῥωμαϊκὰ διείπετο σκήπτρα.*

‡ Gratian was declared Augustus in 369, came into full possession of power on the death of his father (Valentinian I.) in 375, and was assassinated in 383.

the act of preaching, dragged him away by force, and ordered him to abjure his faith. He neither by word nor deed desisted from making open confession of Christ and honoring him as God, but mocked and scorned at all their onslaughts; so when they had cut his body into pieces — ah, what madness! — they then also flung him into the fire.* But the saint, through all these sufferings, ceased not to sing hymns in praise of God, and to believe in him with all his heart. Thus witnessing a good confession to the very end, he, with many of his countrymen, received a crown of martyrdom, and gave up his spirit into the hands of God.

The rest of the "*Acta*," describing how, after a long time, the relics of the saint were transported to Mopsuestia in Cilicia, and what miracles were wrought by them, need not be told here.†

More pathetic in their simplicity, and certainly far more trustworthy than this declamatory narrative, are the few following lines in their own tongue, which are found in a still extant fragment of an old Gothic calendar: —

[October] 23rd [Remembrance of] the many martyrs among the Gothic people, and of Frederic.

29th. — Remembrance of the martyrs who remained with Priest Vereka and Batvin, being [members] of a full church [or of the Catholic church], and being burnt among the Gothic people.‡

The construction of the last sentence is difficult; but there can be little doubt that it relates to the same event which is mentioned by Sozomen (vi. 37), who says that Athanaric sent round a graven image, standing on one of the great Gothic waggons, to the tents of all who were suspected of having embraced Christianity, and burnt whole families of the recusants in their homes; and not only so, but that when men, women, and children (in some cases mothers with their nurslings at their breasts), had taken refuge in a certain church rather than obey his idolatrous edicts, the cruel soldiers of Athanaric burnt the church and all whom it contained.

But the great cataclysm was at hand which was to sweep all the Goths — Pagan and Christian, persecutor and victim, "and the great men, and the rich men, and the chief captains, and the mighty men, and every bondman and every freeman," into one common abyss of misery, from which before many years were accomplished, they were again to emerge world-conquerors.

It was last year (1876) exactly a millennium and a half since the Huns of Asia crossed the shallows of the Sea of Azof and suddenly appeared before the Gothic inhabitants of the south of Russia. Small, flat-headed men, with smooth faces, high cheek-bones, coal-black orbs turning sullenly in "the little holes which served them for eyes,"* they swarmed in upon the settlements of the stately, flaxen-haired, blue-eyed, long-bearded Goth, who shrank from their touch as pollution, and flattered himself with the hope of an easy victory over a troop of such misbegotten knaves. Unfortunately, victory sat upon the other standards. The Huns were all born horsemen. Their steeds were, it is true, more like ponies than chargers; but they were wiry, strong, and swift. An absolute sympathy existed between the rider and his beast, recalling the fables of the ancient centaurs; and they practised in perfection the tactics of sudden attack, feigned retreat, a deadly discharge of arrows, and a rapid return upon their disordered foes, tactics which in the hands of the Parthians, had so often proved fatal to the heavy legionaries of Rome. The Goths found themselves constantly overmatched. A panic fear seized them: they said that the Huns had an unfair advantage in their own abominable ugliness — they were not men at all, they were descendants of an unholy intercourse between Gothic witches and evil spirits.

But, however they might strive to account for their defeats, the facts remained, and soon the whole Ostrogothic kingdom in Lithuania and the Ukraine crumbled to pieces before these Tartar hordes. Hermanric himself, who was now in the one hundred and tenth year of his age, lived to hear of the approach of the terrible invaders, but not to see the ruin wrought by them. Not long before, he had caused a Russian princess to be torn in pieces by

* *Τοῦ σώματος συντρίψαντες νέρη, φεῦ τῆς μανίας, εἶτα καὶ πυρὶ ῥίπτουσιν.*

† The date of this document is doubtful. Apparently the Bollandist compilers of the "*Acta Sanctorum*" took it from a Byzantine hagiologist of the tenth century named Metaphrastes. From what source he took it, we know not; but, as a mere conjecture, and looking to the blurred outlines of the picture on the one hand, and to the amount of fresh, truthful coloring in it on the other, we may presume that the story was reduced to writing towards the end of the fifth century — a generation later than the times of Socrates and Sozomen. It will be observed that the fact of the Arianism of Ulfilas and his converts has either faded out of remembrance or else been purposely suppressed in this narrative.

‡ In the original, "k.g. (gaminthi) thize ana Gutthiudai managaize martyre jah Frithareikeis."

"k.th., gaminthi martyre thize bi Verekan papan jah Batvin bilaif. . . . aikklesjons fullaizos ana Gutthiudai gabrannidai."

wild horses. Her brothers, watching an opportunity of revenge, had wounded him in the side with a spear. The wound was not immediately fatal, but it, and distress for the Hunnish victories and the one hundred and ten years of life together, brought Hermanric to the grave. The Ostrogothic kingdom was swallowed up in the great Serbonian bog of the ravage — empire it cannot be called — of the Huns; and the uncouth horde rolled onward to the settlements of the Visigoths, to try conclusions with them — the uncles of the Turk with the ancestors of the Spaniard; a battle of Lepanto by land, and twelve centuries too soon.

Athanaric proceeded, in a slow and stately way, to prepare for a pitched battle by the banks of the Dniester. He sent forward scouts to watch the movements of the invaders. The latter, when night fell, appeared to compose themselves to slumber; but in reality they silently filed forth out of their camp, crossed the river in a shallow part by the light of the moon, and, mounted on their little ponies, dashed right into the camp and up to the very tent of Athanaric, who only just saved himself by a headlong flight. This kind of engagement, as Zosimus remarks (iv. 20), was the only one which the Huns understood; for "how could they take part in a pitched battle who could not even plant their feet firmly on the ground, but lived, and ate, and even slept on horseback?"

Despoiled of all his treasures, and stripped of his kingly magnificence, Athanaric sought a refuge in the Carpathian fastnesses, whither the Huns, intent on the plunder of the plains, cared not to pursue him. Few of his subjects followed the stern old *judex* thither; the main body of them, after long deliberation, decided to seek for shelter in the Roman territory. The fertile plains of Bulgaria attracted them; the knowledge that Ulfilas and his Christian colony, the *Gothi minores*, were happily settled there, was doubtless an argument with many; but all historians agree that the chief inducement was the thought that the broad Danube would then roll between themselves and the loathed, dreaded, hated Huns.

So now the late lords of Dacia, abandoning their lands to the enemy, flocked down to the Wallachian shore of the Danube, and, greatly agitated, "stretched forth their hands to their old enemies, the Romans, bewailing with loud and lamentable declamation the calamity which had befallen them, urging their request that the passage across the river might be conceded to them, and promising to be henceforth the faithful allies of the empire." * Fritigern was one of the chiefs of this migration; and it is probable, though only Sozomen mentions it, that Ulfilas acted as interpreter and mediator between his countrymen and Valens. The latter, a weak and vain man, was flattered by the proffered allegiance of so many well-formed warriors — estimated at little short of two hundred thousand men in the flower of their military age — and after some deliberation with his ministers, he agreed to receive them within the limits of his empire, to give them homesteads in the province of Mœsia, and to supply them at once with daily rations.

The chief conditions for this generous concession were — 1st, that they should surrender their arms to officers appointed for the purpose; 2nd, that the full-grown males should, when called upon, take the oath of military allegiance and serve as auxiliaries in the army; and, 3rd, that all the new settlers should embrace Christianity. This latter condition, as "Christianity" meant the Arian form of it, to which Valens was zealously attached, is much spoken of and often lamented by the ecclesiastical historians, who sometimes write as if all the Arianism of all the barbarian races were due to this one compact with Valens. It is probable that they have greatly overrated its effect, that most of the fugitives, being adherents of Fritigern and admirers of Ulfilas, were already Christians of the only kind that they had ever heard of, and that the number of those who on this occasion finally renounced the worship of Odin was comparatively trifling.

We have described at some length this reception of the Visigoths within the limits of the Roman empire, because Ulfilas, at this time sixty-five years old, was probably one of the chief negotiators of the treaty; we can only sketch in mere outline the well-known and miserable results of the migration.

The ships of the Romans were employed for days in transporting the Gothic nation across the Danube. The numbers of this living tide of men recalled to the mind of a Roman contemporary (Ammianus) all that Herodotus had told of the myriads of the Persian hosts who invaded Greece. The orders of Valens to strip the newcomers of their arms were scandalously disregarded by the imperial officers, who, intent on helping themselves to their gold, let the steel pass unnoticed. Then came

the question of rations. In promising to feed, even for a short time, so vast a tribe of men — very likely a million in number — Valens had probably undertaken more than the political economy of that day could have accomplished, even in the most zealous and most honest hands. But Lupicinus and Maximus, the prefects of Mœsia, were neither zealous nor honest. Greedy and short-sighted as two Turkish pashas, they enhanced the scarcity by "forestalling and regrating," and at length they offered the Goths, who as a pastoral people knew what good meat was, such carrion as dogs would scarcely have fed upon. For some time this was borne in silence. The Goths saw their last treasures melt away. They sold their children into slavery; they were on the point of selling themselves, but murmurs of discontent began to rise, and Lupicinus heard them. He made a treacherous attempt to seize Fritigern and the other Gothic chiefs, at a banquet near Marcianople, to which he had invited them. The courage and ready wit of Fritigern saved him; but the abortive attempt, like Charles the First's meditated arrest of the five members, kindled the latent heat into a flame, and set two hundred thousand Gothic swords in motion against Rome. The emperor Valens was recalled from Antioch to prosecute the war, which lasted through the greater part of the years 377 and 378. There is no need here to recount its varying fortunes; we hasten on to its terrible and memorable end. On the 9th of August, 378, near the city of Adrianople, the Romans received a crushing defeat. Valens in vain attempted to fly from the field of battle. Wounded by an arrow shot at a venture, he sought refuge in a little hut which was burnt by the Goths, and perished miserably in the flames. It is a favorite remark with the orthodox historians, that the last Arian emperor thus endured in this life some faint foretaste of the torments to which the Goths were doomed in the next for having, at the invitation of this very emperor, embraced the Arian heresy. The loss to the Romans on this fatal day was tremendous: two-thirds of their army lay dead on the field; and the historian Ammianus does not hesitate to rank the defeat of Adrianople side by side with the catastrophe of Cannæ.

To Ulfilas, now verging towards the end of his seventh decade, the events of these memorable years have brought only sorrow. The monarchy of his old allegiance beyond the Danube shattered by a despised foe; the Romans and the Goths, whom he had sought to unite in bonds of friendship, severed by bitter memories of mutual wrong; many, probably, of his own civilized and Christianized *Gothi minores* carried away on that torrent of avarice and revenge which was sweeping their countrymen through all the valleys of Bulgaria and every mountain-pass of the Balkan; and, bitterest thought of all, his own lifelong work of the conversion of the Goths misrepresented and distorted as a mere intrigue between heretics and idolaters — an unholy compact between Arians and barbarians. All this must have been hard to see and to hear, and may well have caused the good old bishop to feel that his life had been wasted. But of this we have no hint in the scanty words of his biographers.

The emperor Theodosius, who was called to the eastern throne on the death of Valens, seems to have pursued a wise policy towards the barbarian intruders into his empire, using sufficient force to make them feel that they could not be tolerated as masters there, yet avoiding cruelty, and not attempting the hopeless task of pushing back that whole warlike nation across the Danube. He took many of their ablest and bravest men into his own service, and generally succeeded, during his lifetime, in keeping them in that position of *fœderati* (subject-allies), which they themselves had sued for in the hour of their extremity.

But his fame as a religious legislator even surpasses that which he acquired as a warrior. Every one knows that it was to him that the Athanasian party owed its final victory, together with the legal right to assume to itself alone the appellation of Catholic, and to brand all its foes with the stigma of heresy. The great council, held at Constantinople in the year 381, which has been accepted by after-ages as the second general council, closed the long Arian controversy, at least as far as the empire was concerned, by an emphatic reaffirmation of the creed of Nicæa, and a condemnation of Macedonius, who denied the personality of the Holy Spirit.

Was Ulfilas present at this council or not? In order to explain our qualified answer to this question, we will transcribe some sentences near the end of the biography written by Auxentius. The text is difficult and fragmentary, and we can only offer a very free translation of a highly conjectural emendation.*

* Dr. Bessell, who has taken extraordinary pains to

Having completed forty years of his episcopate, he went, by the command of the emperor, to the city of Constantinople, to a disputation against the *Psathyropolistæ*. Thither he went, in the name of the Lord God, in order to prevent that sect from teaching and subduing the churches committed to him by Christ, and also for their own sakes, when he had reflected on the disposition of the council, in order that this sect might not be proved to be heretics, and thereby set down as men more miserable than the miserable, condemned out of their own mouths, and worthy to be smitten with perpetual punishment. Now, as soon as he had entered the aforesaid city, his health began to fail, and by this sickness he was taken away from us, like Elisha the prophet.

Assuredly it is right to reflect on the merits of this man, who was thus led by the Lord to die at Constantinople (may we not rather say Christianople?), in order that the holy and spotless priest of Christ might receive burial at the hands of holy men, his fellow-priests, that before such a multitude of Christians, the worthy man, by worthy men, should be worthily and gloriously honored according to his merits.

This certainly looks as if Ulfilas, whose character evidently commanded the reverence even of those who differed from his views, was buried by the fathers of the second general council at Constantinople, in the beginning of the year 381, having been carried off by sickness, in the seventieth year of his age, before he had been able to share in its deliberations. And such we believe to have been the case; but there is some difficulty about this disputation with the Psathyropolistæ, to which he was summoned by the imperial command. The sect known by this cumbrous title split off from the main body of the Arians on a childish and frivolous controversy concerning the *name* of the Eternal.* As one of the watchwords of the Arian party was, "There was a time when the Son was not,"† a discussion arose, whether, in that far-off recess of past eternity, before the Son was, or any creature existed, it could be right to speak of God *the Father*. A certain Dorotheus, of Antioch, said no. His rival, Marinus, the Thracian, said yes, and was abetted in his teaching by Theoctistus, a Syrian. As the latter was a seller of baked pottery (ψαθυροπώλης), it was easy for his opponents, with that happy disregard of the social status of the first teachers of Christianity which controversialists have so often displayed, to taunt the new sect with being themselves base pottery-sellers — mere Psathyropolistæ. Selenas, who was a bishop of the Goths (perhaps a coadjutor of Ulfilas), and, like him, of Phrygian descent, had adopted Psathyropolistic views. Probably the discussion was becoming a dangerously heated one among the yellow-haired converts to Christianity, and Theodosius, who showed throughout his reign a statesmanlike prudence in dealing with the Goths, and a desire to use and regulate, not to destroy them, sent probably for him who bore the most honored name in all their tribes — the Nestor of the nation, Ulfilas — to come to Constantinople, and there settle their differences by his own personal mediation.

This may have occupied the early part of 381; but before May in that year, when the great ecumenical council was assembling, the old man's health had begun to fail him (*statim cœpit infirmari*), and he died. One of the first acts of the collected prelates most likely was, to follow the body of the worn-out Gothic evangelist to the grave. Arians and Athanasians, Homousians and Homoeusians, Acacians, and Anomœans, probably all shared the pious labor. His Arianism would be at least partially atoned for in the eyes of the orthodox by the constancy with which he had fought against the ancestral heathenism of his people. Then too, the august council had not yet been held, had not yet thundered forth its anathema against those who should dissent from its authoritative exposition of the faith, and if the Arians claimed the venerable dead as their own, the Athanasians might still believe that, after a few months of discussion, he would finally have cast in his lot with the Catholic Church; and, above all things, Theodosius himself, the pivot around which the whole council revolved, was anxious to flatter in every possible way the pride of the Gothic nation — to make their heroes his warriors, to admit their saints into his pantheon, to bind together, by peaceful bonds, "Romania" and "Varbaricum" into one state, of which he might be the head.

A striking example of this Gothicizing policy of Theodosius — the best, appar-

make sense of this passage (without, however, a personal examination of the MS.), restores the text thus: "Qui, cum præcepto imperiali, comple:is quadraginta annis, ad Constantinopolitanam urbem ad disputationem . . . contra P(sat)hy(ropo)listas perrexit et eundo in dñi dí ñ (Domini Dei nostri) nomine ne xpi (Christi) ecclesias sibi a xpo (Christo) deditas docerent et contestarentur, intrabat, et ingressus in supradictam civitatem, recogitato ei im . . . de statu concilii, ne arguerentur miseris miserabiliores proprio judicio damnati et perpetuo supplicio plectendi, statim cœpit infirmari," etc.

* So at least Socrates tells us (v. 23), but it is difficult to believe that his account is entirely accurate.

† ἦν ποτε ὅτε οὐκ ἦν ὁ υἱος.

ently, which was then possible for Rome — was afforded in the very same year by his treatment of Athanaric, the grey old Gothic wolf, the unrelenting foe of Christianity and of Rome. Driven by men of other Germanic tribes (who were, according to one account, commanded by his old enemy, Fritigern) from his Transylvanian stronghold, Athanaric was forced to break his filial promise, to cross the Danube, and to seek the aid of the Augustus of Constantinople. Theodosius rode forth some distance from the capital to meet his guest, who was struck with admiration by the high walls, the blue waters of the Bosporus blackened with ships, the teeming multitudes of many languages and many costumes in the streets of the city, and said, "Truly, a god upon earth is this emperor, and he who sets himself in opposition to him is guilty of his own blood." He, too, like Ulfilas, fell sick soon after his entry into Constantinople; the climate, the diet, the myriad new impressions on the brain, being all, doubtless, injurious to the health of a simply-living Goth; and after a few months he died. The magnificence of the funeral which Theodosius prepared for his guest, and his condescension in riding before the bier in all his imperial splendor, were long and gratefully remembered by the barbarians.

One last quotation from the bishop of Silistria will close our account of the life of Ulfilas: —

> Ulfilas, in the very article of death, left to the people intrusted to his care a written exposition of his faith, included in his will, to this effect: —
>
> "I, Ulfila, bishop and confessor, have ever thus believed, and in this alone true faith make my testament to my Lord. I believe that there is one God the Father, alone unbegotten and invisible; and I believe in his only-begotten Son, our Lord and our God, Artificer and Maker of the whole creation, having none like himself. Therefore, there is one God of all [the Father], who is also God of our God [the Son]. And I believe in one Holy Spirit, an enlightening and sanctifying power, even as Christ said to his Apostles, 'Behold I send the promise of my Father in you; but tarry ye at Jerusalem till ye shall be endued with power from on high;' and again, 'Ye shall receive power when the Holy Spirit is come upon you;' and this Holy Spirit is neither God nor Lord, but the servant of Christ, subject and obedient in all things to the Son, even as the Son is subject and obedient in all things to the Father —" [The conclusion of the sentence is wanting].

This fragment of a fragment is the last writing that we have from the hand of our first Germanic author. It only remains to say something concerning the literary history of the document which contains it: the invaluable contemporary sketch by the pupil Auxentius of the life and teaching of his master.

In the Bibliothèque Royale at Paris is a large quarto manuscript, known in the catalogue as "*Supplementum Latinum*, No. 594," and consisting of 331 pages. The body of the MS. contains some treatises of St. Hilary and St. Ambrose, and the acts of the Council of Aquileia, A.D. 381. The parchment is white and fine, the treatises, all on the orthodox side of the Arian controversy, are beautifully written in an uncial hand of very early date; but their contents seem all to have been anticipated in previous publications, and, so far, the MS., though interesting to the bibliographer, has nothing in it of special value even for the ecclesiastical historian.

But round the top and bottom and outer margin of twenty-six folios of the codex, some heretic has scrawled, in a cursive hand, his passionate replies, objurgations, counter-statements, by way of comment on the uncial orthodox text. It is in these *Randbemerkungen*, as the German commentators call them, that all the historical value of the volume consists.

In the year 1840, Dr. Waitz, one of the band of scholars engaged in editing the "*Monumenta Germaniæ Historica*," was informed by a friend, who had been examining the volume from a theological point of view, that these marginal annotations contained the word *Gothi*, and he at once bestowed several weeks on the patient decipherment of such part of them as might be found in any way to illustrate the early history of the greatest Teutonic conquerors of Rome. The task was not an easy one. The thin cursive writing was, of course, somewhat harder to decipher than the bold square uncial character would have been. The bookbinder has in most places pared off a line at the top, a line at the bottom, and several letters from the side; but, worse than this, some orthodox possessor of the MS. in days gone by, indignant at the Arian heresies which engirdled the cherished words of Ambrose and Hilary, has gone over many passages with some sharp instrument, erasing as much of the text as he could without absolutely destroying the parchment. Faint traces of words and letters remained after the zealot had done his worst, and these

some inquiring student, probably in recent centuries, has sought to revive with gallic acid. He failed, apparently, to obtain any satisfactory result; but he has made the work harder for those that came after him. However, over all these difficulties the grand German patience prevailed, and Dr. Waitz was able to evoke out of the faded and half-erased characters a spirit which could bring before us the very form and fashion of our too-long-forgotten kinsman of the fourth century.

A complete publication of the life and remains of Ulfilas is still one of the unpaid debts of English scholarship. In the early days of Ulfilan literature, England was honorably represented. The first reprint of the *Codex Argenteus* was made about 1680, by Francis Junius, who was, as we have said, a naturalized Englishman, with the assistance of Thomas Marshall, a native of this country. In the middle of last century, a very respectable edition issued from the Clarendon press, under the auspices of another Englishman, Edward Lye. But in this century, Germany, Scandinavia, and even Italy, have done more for the study of Mœso-Gothic than our own country, though it is admitted that it lies on our side, rather than on the High-German or the Scandinavian side, of the water shed of Teutonic speech. Stirred by the impulse given by Grimm's "*Deutsche Grammatik*," Loebe, Castiglione, Uppström, Stamm, Bernhardt, and, above all, Massmann, have poured a stream of light upon the works of Ulfilas and the history of the Gothic tongue. Unfortunately, not one of their books is even translated into English. It had to be left to a German professor at Oxford to write, in his lectures on the science of language, the best account in the English language of the life and labors of the Gothic apostle, and, so to speak, to re-introduce him to the British nation. Since then, Mr. Bosworth has given us the Gothic gospels side by side with the Anglo-Saxon, Wickliffe's, and Tyndale's versions, an excellent idea, and well realized. We can heartily recommend both this book and Mr. Skeat's handy little volume, "The Mœso-Gothic Glossary," to those who wish to study the language of Alaric for themselves. But the authors of these works did not profess or desire to cover the whole ground of Gothic philology; and we doubt not that the survivor of them would, with ourselves, gladly hail the issue, from the Clarendon or the Cambridge University press, of a complete and comprehensive "Ulfilas," worthy to take rank as the primal document of that great English literature, of which he may be considered the real though unconscious founder.

[*Published by arrangement with* HARPER & BROTHERS.]

MACLEOD OF DARE.

BY WILLIAM BLACK.

CHAPTER III.

FIONAGHAL.

AND indeed when they entered the house — the balconies and windows were a blaze of flowers all shining in the sun — they found that their host and hostess had already come down stairs, and were seated at table with their small party of guests. This circumstance did not lessen Sir Keith Macleod's trepidation; for there is no denying the fact that the young man would rather have faced an angry bull on a Highland road than this party of people in the hushed and semi-darkened and flower-scented room. It seemed to him that his appearance was the signal for a confusion that was equivalent to an earthquake. Two or three servants — all more solemn than any clergyman — began to make new arrangements; a tall lady, benign of aspect, rose and most graciously received him; a tall gentleman, with a gray mustache, shook hands with him; and then, as he vaguely heard young Ogilvie, at the other end of the room, relate the incident of the upsetting of the cab, he found himself seated next to this benign lady, and apparently in a bewildering paradise of beautiful lights and colors and delicious odors. Asparagus soup? Yes, he would take that; but for a second or two this spacious and darkened room, with its stained glass and its sombre walls, and the table before him, with its masses of roses and lilies-of-the-valley, its silver, its crystal, its nectarines, and cherries, and pineapples, seemed some kind of enchanted place. And then the people talked in a low and hushed fashion, and the servants moved silently and mysteriously, and the air was languid with the scents of fruits and flowers. They gave him some wine in a tall green glass that had transparent lizards crawling up its stem; he had never drank out of a thing like that before.

"It was very kind of Mr. Ogilvie to get you to come; he is a very good boy; he

forgets nothing," said Mrs. Ross to him; and as he became aware that she was a pleasant-looking lady of middle age, who regarded him with very friendly and truthful eyes, he vowed to himself that he would bring Mr. Ogilvie to task for representing this decent and respectable woman as a graceless and dangerous coquette. No doubt she was the mother of children. At her time of life she was better employed in the nursery or in the kitchen than in flirting with young men; and could he doubt that she was a good house-mistress when he saw with his own eyes how spick and span everything was, and how accurately everything was served? Even if his cousin Janet lived in the south, with all these fine flowers and hot-house fruits to serve her purpose, she could not have done better. He began to like this pleasant-eyed woman, though she seemed delicate, and a trifle languid, and in consequence he sometimes could not quite make out what she said. But then he noticed that the other people talked in this limp fashion too: there was no precision about their words; frequently they seemed to leave you to guess the end of their sentences. As for the young lady next him, was she not very delicate also? He had never seen such hands — so small and fine and white. And although she talked only to her neighbor on the other side of her, he could hear that her voice, low and musical as it was, was only a murmur.

"Miss White and I," said Mrs. Ross to him — and at this moment the young lady turned to them — "were talking before you came in of the beautiful country you must know so well, and of its romantic stories and associations with Prince Charlie. Gertrude, let me introduce Sir Keith Macleod to you. I told Miss White you might come to us to-day; and she was saying what a pity it was that Flora Macdonald was not a Macleod."

"That was very kind," said he frankly, turning to this tall, pale girl, with the rippling hair of golden brown and the heavy-lidded and downcast eyes. And then he laughed. "We would not like to steal the honor from a woman, even though she was a Macdonald, and you know the Macdonalds and the Macleods were not very friendly in the old time. But we can claim something too about the escape of Prince Charlie, Mrs. Ross. After Flora Macdonald had got him safe from Harris to Skye, she handed him over to the sons of Macleod of Raasay, and it was owing to them that he got to the mainland. You will find many people up there to this day who believe that if Macleod had gone out in '45, Prince Charlie would never have had to flee at all. But I think the Macleods had done enough for the Stuarts; and it was but little thanks they ever got in return, so far as I could ever hear. Do you know, Mrs. Ross, my mother wears mourning every 3d of September, and will eat nothing from morning till night. It is the anniversary of the battle of Worcester; and then the Macleods were so smashed up that for a long time the other clans relieved them from military service."

"You are not much of a Jacobite, Sir Keith," said Mrs. Ross, smiling.

"Only when I hear a Jacobite song sung," said he. "Then who can fail to be a Jacobite?"

He had become quite friendly with this amiable lady. If he had been afraid that his voice, in these delicate southern ears, must sound like the first guttural drone of Donald's pipes at Castle Dare, he had speedily lost that fear. The manly, sun-browned face and clear-glancing eyes were full of animation; he was oppressed no longer by the solemnity of the servants; so long as he talked to her he was quite confident; he had made friends with this friendly woman. But he had not as yet dared to address the pale girl who sat on his right, and who seemed so fragile and beautiful and distant in manner.

"After all," said he to Mrs. Ross, "there were no more Highlanders killed in the cause of the Stuarts than used to be killed every year or two merely out of the quarrels of the clans among themselves. All about where I live there is scarcely a rock, or a loch, or an island, that has not its story. And I think," added he, with a becoming modesty, "that the Macleods were by far the most treacherous and savage and bloodthirsty of the whole lot of them."

And now the fair stranger beside him addressed him for the first time; and as she did so, she turned her eyes toward him — clear, large eyes that rather startled one when the heavy lids were lifted, so full of expression were they.

"I suppose," said she, with a certain demure smile, "you have no wild deeds done there now?"

"Oh, we have become quite peaceable folks now," said he, laughing. "Our spirit is quite broken. The wild boars are all away from the islands now, even from Muick; we have only the sheep. And the Mackenzies, and the Macleans, and the Macleods — they are all sheep now."

Was it not quite obvious? How could any one associate with this bright-faced young man the fierce traditions of hate and malice and revenge that make the seas and islands of the north still more terrible in their loneliness? Those were the days of strong wills and strong passions, and of an easy disregard of individual life when the gratification of some set desire was near. What had this Macleod to do with such scorching fires of hate and of love? He was playing with a silver fork and half a dozen strawberries: Miss White's surmise was perfectly natural and correct.

The ladies went up-stairs, and the men, after the claret had gone round, followed them. And now it seemed to this rude Highlander that he was only going from wonder to wonder. Half-way up the narrow staircase was a large recess dimly lit by the sunlight falling through stained glass, and there was a small fountain playing in the middle of this grotto, and all around was a wilderness of ferns dripping with the spray, while at the entrance two stone figures held up magical globes on which the springing and falling water was reflected. Then from this partial gloom he emerged into the drawing-room — a dream of rose-pink and gold, with the air sweetened around him by the masses of roses and tall lilies about. His eyes were rather bewildered at first; the figures of the women seemed dark against the white lace of the windows. But as he went forward to his hostess, he could make out still further wonders of color; for in the balconies outside, in the full glare of the sun, were geraniums and lobelias and golden calceolarias and red snapdragon, their bright hues faintly tempered by the thin curtains through which they were seen. He could not help expressing his admiration of these things that were so new to him, for it seemed to him that he had come into a land of perpetual summer and sunshine and glowing flowers. Then the luxuriant greenness of the foliage on the other side of Exhibition Road — for Mrs. Ross's house faced westward — was, as he said, singularly beautiful to one accustomed to the windy skies of the western isles.

"But you have not seen our elm — our own elm," said Mrs. Ross, who was arranging some azaleas that had just been sent her. "We are very proud of our elm. Gertrude, will you take Sir Keith to see our noble elm?"

He had almost forgotten who Gertrude was; but the next second he recognized the low and almost timid voice that said, —

"Will you come this way, then, Sir Keith?"

He turned, and found that it was Miss White who spoke. How was it that this girl, who was only a girl, seemed to do things so easily, and gently, and naturally, without any trace of embarrassment or self-consciousness? He followed her, and knew not which to admire the more, the careless simplicity of her manner or the singular symmetry of her tall and slender figure. He had never seen any statue or any picture in any book to be compared with this woman, who was so fine and rare and delicate that she seemed only a beautiful tall flower in this garden of flowers. There was a strange simplicity, too, about her dress — a plain, tight-fitting, tight-sleeved dress of unrelieved black, her only adornment being some bands of big blue beads worn loosely round the neck. The black figure, in this shimmer of rose-pink and gold and flowers, was effective enough; but even the finest of pictures or the finest of statues has not the subtle attraction of a graceful carriage. Macleod had never seen any woman walk as this woman walked, in so stately and yet so simple a way.

From Mrs. Ross's chief drawing-room they passed into an ante-drawing-room, which was partly a passage and partly a conservatory. On the window side were some rows of Cape heaths, on the wall side some rows of blue and white plates; and it was one of the latter that was engaging the attention of two persons in this anteroom — Colonel Ross himself and a little old gentleman in gold-rimmed spectacles.

"Shall I introduce you to my father?" said Miss White to her companion; and, after a word or two, they passed on.

"I think papa is invaluable to Colonel Ross," said she; "he is as good as an auctioneer at telling the value of china. Look at this beautiful heath. Mrs. Ross is very proud of her heaths."

The small white fingers scarcely touched the beautiful blossoms of the plants; but which were the more palely roseate and waxen? If one were to grasp that hand — in some sudden moment of entreaty, in the sharp joy of reconciliation, in the agony of farewell — would it not be crushed like a frail flower?

"There is our elm," said she lightly "Mrs. Ross and I regard it as our own, we have sketched it so often."

They had emerged from the conservatory into a small square room, which was practically a continuation of the drawing-

room, but which was decorated in pale blue and silver, and filled with a lot of knickknacks, that showed it was doubtless Mrs. Ross's boudoir. And out there, in the clear June sunshine, lay the broad greensward behind Prince's Gate, with the one splendid elm spreading his broad branches into the blue sky, and throwing a soft shadow on the corner of the gardens next to the house. How sweet and still it was! — as still as the calm clear light in this girl's eyes. There was no passion there, and no trouble; only the light of a June day, and of blue skies, and a peaceful soul. She rested the tips of her fingers on a small rosewood table that stood by the window: surely, if a spirit ever lived in any table, the wood of this table must have thrilled to its core.

And had he given all this trouble to this perfect creature merely that he should look at a tree? and was he to say some ordinary thing about an ordinary elm to tell her how grateful he was?

"It is like a dream to me," he said, honestly enough, "since I came to London. You seem always to have sunlight and plenty of fine trees and hot-house flowers. But I suppose you have winter like the rest of us?"

"Or we should very soon tire of all this, beautiful as it is," said she; and she looked rather wistfully out on the broad, still gardens. "For my part, I should very soon tire of it. I should think there was more excitement in the wild storms and the dark nights of the north; there must be a strange fascination in the short winter days among the mountains, and the long winter nights by the side of the Atlantic."

He looked at her and smiled. That fierce fascination he knew something of: how had she guessed at it? And as for her talking as if she herself would gladly brave these storms — was it for a foam bell to brave a storm? was it for a rose-leaf to meet the driving rains of Ben-an-Sloich?

"Shall we go back now?" said she; and as she turned to lead the way he could not fail to remark how shapely her neck was, for her rich golden-brown hair was loosely gathered up behind.

But just at this moment Mrs. Ross made her appearance.

"Come," said she, "we shall have a chat all to ourselves; and you will tell me, Sir Keith, what you have seen since you came to London, and what has struck you most. And you must stay with us, Gertrude. Perhaps Sir Keith will be so kind as to freeze your blood with another horrible story about the Highlanders. I am only a poor southerner, and had to get up my legends from books. But this wicked girl, Sir Keith, delights as much in stories of bloodshed as a schoolboy does."

"You will not believe her," said Miss White, in that low-toned, gravely sincere voice of hers, while a faint, shell-like pink suffused her face. "It was only that we were talking of the Highlands, because we understood you were coming; and Mrs. Ross was trying to make out" — and here a spice of proud mischief came into the ordinarily calm eyes — "she was trying to make out that you must be a very terrible and dangerous person, who would probably murder us all if we were not civil to you."

"Well, you know, Sir Keith," said Mrs. Ross, apologetically, "you acknowledge yourself that you Macleods were a very dreadful lot of people at one time. What a shame it was to track the poor fellow over the snow, and then deliberately to put brush-wood in front of the cave, and then suffocate whole two hundred persons at once."

"Oh yes, no doubt," said he; "but the Macdonalds were asked first to give up the men that had bound the Macleods hand and foot and set them adrift in the boat, and they would not do it. And if the Macdonalds had got the Macleods into a cave, they would have suffocated them too. The Macdonalds began it."

"Oh, no, no, no," protested Mrs. Ross; "I can remember better than that. What were the Macleods about on the island at all when they had to be sent off, tied hand and foot, in their boats?"

"And what is the difference between tying a man hand and foot and putting him out in the Atlantic, and suffocating him in a cave? It was only by an accident that the wind drifted them over to Skye."

"I shall begin to fear that you have some of the old blood in you," said Mrs. Ross, with a smile, "if you try to excuse one of the cruelest things ever heard of."

"I do not excuse it at all," said he simply. "It was very bad — very cruel. But perhaps the Macleods were not so much worse than others. It was not a Macleod at all, it was a Gordon — and she a woman, too — that killed the chief of the Mackintoshes after she had received him as a friend. 'Put your head down on the table,' said she to the chief, 'in token of your submission to the Earl of Huntly.' And no sooner had he bowed his neck than she whipped out a knife and cut his

head off. That was a Gordon, not a Macleod. And I do not think the Macleods were so much worse than their neighbors, after all."

"Oh, how can you say that?" exclaimed his persecutor. "Who was ever guilty of such an act of treachery as setting fire to the barn at Dunvegan? Macdonald and his men get driven on to Skye by the bad weather; they beg for shelter from their old enemy; Macleod professes to be very great friends with them; and Macdonald is to sleep in the castle, while his men have a barn prepared for them. You know very well, Sir Keith, that if Macdonald had remained that night in Dunvegan Castle he would have been murdered; and if the Macleod girl had not given a word of warning to her sweetheart, the men in the barn would have been burned to death. I think if I were a Macdonald I should be proud of that scene — the Macdonalds marching down to their boats with their pipes playing, while the barn was all in a blaze, fired by their treacherous enemies. Oh, Sir Keith, I hope there are no Macleods of that sort alive now."

"There are not, Mrs. Ross," said he gravely. "They were all killed by the Macdonalds, I suppose."

"I do believe," said she, "that it was a Macleod who built a stone tower on a lonely island, and imprisoned his wife there ——"

"Miss White," the young man said modestly, "will not you help me? Am I to be made responsible for all the evil doings of my ancestors?"

"It is really not fair, Mrs. Ross," said she; and the sound of this voice pleading for him went to his heart: it was not as the voice of other women.

"I only meant to punish you," said Mrs. Ross, "for having traversed the indictment — I don't know whether that is the proper phrase, or what it means, but it sounds well. You first acknowledge that the Macleods were by far the most savage of the people living up there: and then you tried to make out that the poor creatures whom they harried were as cruel as themselves."

"What is cruel now was not cruel then," he said; "it was a way of fighting; it was what is called an ambush now — enticing your enemy, and then taking him at a disadvantage. And if you did not do that to him, he would do it to you. And when a man is mad with anger or revenge, what does he care for anything?"

"I thought we were all sheep now," said she.

"Do you know the story of the man who was flogged by Maclean of Lochbuy — that is in Mull," said he, not heeding her remark. "You do not know that old story?"

They did not; and he proceeded to tell it in a grave and simple fashion which was sufficiently impressive. For he was talking to these two friends now in the most unembarrassed way; and he had, besides, the chief gift of a born narrator — an utter forgetfulness of himself. His eyes rested quite naturally on their eyes as he told his tale. But first of all, he spoke of the exceeding loyalty of the Highland folk to the head of their clan. Did they know that other story of how Maclean of Duart tried to capture the young heir of the house of Lochbuy, and how the boy was rescued and carried away by his nurse? And when, arrived at man's estate, he returned to revenge himself on those who had betrayed him, among them was the husband of the nurse. The young chief would have spared the life of this man, for the old woman's sake. "*Let the tail go with the hide*," said she, and he was slain with the rest. And then the narrator went on to the story of the flogging. He told them how Maclean of Lochbuy was out after the deer one day; and his wife, with her child, had come out to see the shooting. They were driving the deer; and at a particular pass a man was stationed so that, should the deer come that way, he should turn them back. The deer came to this pass; the man failed to turn them; the chief was mad with rage. He gave orders that the man's back should be bared, and that he should be flogged before all the people.

"Very well," continued Macleod. "It was done. But it is not safe to do anything like that to a Highlander; at least it *was* not safe to do anything like that to a Highlander in those days; for, as I told you, Mrs. Ross, we are all like sheep now. Then they went after the deer again; but at one moment the man that had been flogged seized Maclean's child from the nurse, and ran with it across the mountain-side, till he reached a place overhanging the sea. And he held out the child over the sea; and it was no use that Maclean begged on his knees for forgiveness. Even the passion of loyalty was lost now in the fierceness of his revenge. This was what the man said — that unless Maclean had his back bared there and then before all the people, and flogged as he had been flogged, then the child should be dashed into the sea below. There was nothing to

be done but that — no prayers, no offers, no appeals from the mother, were of any use. And so it was that Maclean of Lochbuy was flogged there before his own people, and his enemy above looking on. And then? When it was over, the man called aloud, 'Revenged! revenged!' and sprang into the air with the child along with him; and neither of them was ever seen again after they had sank into the sea. It is an old story."

An old story, doubtless, and often told; but its effect on this girl sitting beside him was strange. Her clasped hands trembled; her eyes were glazed and fascinated as if by some spell. Mrs. Ross, noticing this extreme tension of feeling, and fearing it, hastily rose.

"Come, Gertrude," she said, taking the girl by the hand, "we shall be frightened to death by these stories. Come and sing us a song — a French song, all about tears, and fountains, and bits of ribbon — or we shall be seeing the ghosts of murdered Highlanders coming in here in the day-time."

Macleod, not knowing what he had done, but conscious that something had occurred, followed them into the drawing-room, and retired to a sofa, while Miss White sat down to the open piano. He hoped he had not offended her. He would not frighten her again with any ghastly stories from the wild northern seas.

And what was this French song that she was about to sing? The pale, slender fingers were wandering over the keys; and there was a sound — faint, and clear, and musical — as of the rippling of summer seas. And sometimes the sounds came nearer; and now he fancied he recognized some old familiar strain; and he thought of his cousin Janet somehow, and of summer days down by the blue waters of the Atlantic. A French song? Surely if this air, that seemed to come nearer and nearer, was blown from any earthly land, it had come from the valleys of Lochiel and Ardgour, and from the still shores of Arisaig and Moidart? Oh yes; it was a very pretty French song that she had chosen to please Mrs. Ross with.

A wee bird cam' to our ha' door —

this was what she sang; and though, to tell the truth, she had not much of a voice, it was exquisitely trained, and she sang with a tenderness and expression such as he, at least, had never heard before —

He warbled sweet and clearly;
An' aye the o'ercome o' his sang
Was "Wae's me for Prince Charlie!"

Oh, when I heard the bonnie, bonnie bird,
The tears cam' drappin' rarely;
I took my bonnet off my head,
For well I lo'ed Prince Charlie.

It could not have entered into his imagination to believe that such pathos could exist apart from the actual sorrow of the world. The instrument before her seemed to speak; and the low, joint cry was one of infinite grief and longing and love.

Quoth I, "My bird, my bonnie, bonnie bird,
Is that a sang ye borrow?
Are these some words ye've learnt by heart,
Or a lilt o' dool an' sorrow?"
"Oh, no, no, no," the wee bird sang;
"I've flown sin' mornin' early;
But sic a day o' wind an' rain —
Oh, wae's me for Prince Charlie!"

Mrs. Ross glanced archly at him when she discovered what sort of French song it was that Miss White had chosen; but he paid no heed. His only thought was, "*If only the mother and Janet could hear this strange singing!*"

When she had ended, Mrs. Ross came over to him and said, "That is a great compliment to you."

And he answered simply, "I have never heard any singing like that."

Then young Mr. Ogilvie — whose existence, by the way, he had entirely and most ungratefully forgotten — came up to the piano, and began to talk in a very pleasant and amusing fashion to Miss White. She was turning over the leaves of the book before her, and Macleod grew angry with this idle interference. Why should this lily-fingered jackanapes, whom a man could wind round a reel and throw out of window, disturb the rapt devotion of this beautiful Saint Cecilia?

She struck a firmer chord; the bystanders withdrew a bit; and of a sudden it seemed to him that all the spirit of all the clans was ringing in the proud fervor of this fragile girl's voice. Whence had she got this fierce Jacobite passion that thrilled him to the very finger-tips?

I'll to Lochiel, and Appin, and kneel to them,
Down by Lord Murray and Roy of Kildarlie;
Brave Mackintosh, he shall fly to the field with them;
These are the lads I can trust wi' my Charlie!

Could any man fail to answer? Could any man die otherwise than gladly if he died with such an appeal ringing in his ears? Macleod did not know there was scarcely any more volume in this girl's voice now than when she was singing the plaintive wail that preceded it: it seemed to him that there was the strength of the tread of

armies in it, and a challenge that could rouse a nation.

Down through the Lowlands, down wi' the Whigamore,
Loyal true Highlanders, down wi' them rarely!
Ronald and Donald, drive on wi' the broad clamore
Over the necks o' the foes o' Prince Charlie!
Follow thee! follow thee! wha wadna follow thee,
King o' the Highland hearts, bonnie Prince Charlie!

She shut the book, with a light laugh, and left the piano. She came over to where Macleod sat. When he saw that she meant to speak to him, he rose and stood before her.

"I must ask your pardon," said she, smiling, "for singing two Scotch songs, for I know the pronunciation is very difficult."

He answered with no idle compliment.

"If *Tearlach ban og*, as they used to call him, were alive now," said he — and indeed there was never any Stuart of them all, not even the fair young Charles himself, who looked more handsome than this same Macleod of Dare who now stood before her — "you would get him more men to follow him than any flag or standard he ever raised."

She cast her eyes down.

Mrs. Ross's guests began to leave.

"Gertrude," said she, "will you drive with me for half an hour — the carriage is at the door? And I know the gentlemen want to have a cigar in the shade of Kensington Gardens: they might come back and have a cup of tea with us."

But Miss White had some engagement; she and her father left together; and the young men followed them almost directly, Mrs. Ross saying that she would be most pleased to see Sir Keith Macleod any Tuesday or Thursday afternoon he happened to be passing, as she was always at home on these days.

"I don't think we can do better than take her advice about the cigar," said young Ogilvie, as they crossed to Kensington Gardens. "What do you think of her?"

"Of Mrs. Ross?"

"Yes."

"Oh, I think she is a very pleasant woman."

"Yes, but," said Mr. Ogilvie, "how did she strik you? Do you think she is as fascinating as some men think her?"

"I don't know what men think about her," said Macleod. "It never occurred to me to ask whether a married woman was fascinating or not. I thought she was a friendly woman — talkative, amusing, clever enough."

They lit their cigars in the cool shadow of the great elms who does not know how beautiful Kensington Gardens are in June? And yet Macleod did not seem disposed to be garrulous about these new experiences of his; he was absorbed, and mostly silent.

"That is an extraordinary fancy she has taken for Gertrude White," Mr. Ogilvie remarked.

"Why extraordinary?" the other asked, with sudden interest.

"Oh, well, it is unusual, you know. But she is a nice girl enough, and Mrs. Ross is fond of odd folks. You didn't speak to old White? — his head is a sort of British Museum of antiquities; but he is of some use to these people — he is such a swell about old armor and china and such things. They say he wants to be sent out to dig for Dido's funeral pyre at Carthage, and that he is only waiting to get the trinkets made at Birmingham."

They walked on a bit in silence.

"I think you made a good impression on Mrs. Ross," said Mr. Ogilvie, coolly. "You'll find her an uncommonly useful woman, if she takes a fancy to you; for she knows everybody and goes everywhere, though her own house is too small to let her entertain properly. By the way, Macleod, I don't think you could have hit on a worse fellow than I to take you about, for I am so little in London that I have become a rank outsider. But I'll tell you what I'll do for you if you will go with me to-night to Lord Beauregard's, who is an old friend of mine. I will ask him to introduce you to some people — and his wife gives very good dances — and if any royal or imperial swell comes to town, you'll be sure to run against him there. I forget who it is they are receiving there to-night; but anyhow you'll meet two or three of the fat duchesses whom Dizzy adores; and I shouldn't wonder if that Irish girl were there — the new beauty: Lady Beauregard is very clever at picking people up."

"Will Miss White be there?" Macleod asked, apparently deeply engaged in probing the end of his cigar.

His companion looked up in surprise. Then a new fancy seemed to occur to him, and he smiled very slightly.

"Well, no," said he slowly, "I don't think she will. In fact, I am almost sure she will be at the Piccadilly Theatre. If

you like, we will give up Lady Beauregard, and after dinner go the Piccadilly Theatre instead. How will that do?"

"I think that will do very well," said Macleod.

From The Nineteenth Century.

HYDROPHOBIA AND RABIES.

THERE has been an astonishing increase of hydrophobia in this country within the last half-century. Mr. Cæsar Hawkins, writing in 1844, says that only two cases of the disease had been admitted into St. George's Hospital since he first knew it twenty-five years earlier. Now, mention of such cases is constantly being made in the newspapers. Since the beginning of the present year no less than thirteen deaths from hydrophobia have been recorded within the limits of the London registration.

So many erroneous notions are afloat on this subject that it may be neither uninteresting nor useless to the general reader to have a plain, untechnical history of the two diseases, which are inseparably connected by reciprocal relationship, the one being the parent of the other. In the canine race rabies can propagate rabies; but hydrophobia does not (as I believe) ever reproduce itself.

The first thing to be noticed about hydrophobia is, that, frequent as it has become, many medical men pass through life without witnessing the disease at all. Hence there has, strangely enough, sprung up in some minds a fancy that no such disease has ever happened. Sir Isaac Pennington, who was in my time the Regius Professor of Physic at Cambridge, and who had never seen a case of hydrophobia, could not be persuaded that any one else had seen anything more than a nervous disorder, produced by the alarmed imagination of persons who, having been bitten by a dog reputed to be mad, and having the fear of feather-beds before their eyes, have been frightened into a belief that they were laboring under hydrophobia, and ultimately scared out of their very existence. It was at that time currently believed, at least by the vulgar, that any one afflicted with this terrible disorder was dangerous to those about him; and it was customary for his neighbors or associates to put an end at once to his woes and to their own cowardly dread of him, by smothering him between two feather-beds.

But a far more eminent man than the Cambridge professor, even Sir George Cornewall Lewis, was possessed with a similar incredulity on this subject, until convinced of his error by Mr. Hawkins, who had then seen eleven or twelve cases of hydrophobia; a larger number than perhaps any man in this country ever saw before or since. One reason for this was that he had received from Sir Robert Ker Porter, our minister in South America, specimens of a substance called *guaco*, a supposed preventive and cure of hydrophobia and of snake-bites, and had on that account been summoned to cases of hydrophobia by various other practitioners.

I have myself seen four cases of that fearful malady, and I feel sure that no one who has even once watched its actual symptoms could fail to recognize it again, or could mistake any other malady for it, or wish to witness it thereafter. What these truly remarkable symptoms are I shall explain presently. It would, *à priori*, seem incredible that so many persons who have been bitten by mad dogs should have suffered so precisely the same train of symptoms, and have at last died, from the mere force of a morbid imagination. But a single fact conclusive against such a belief is that the disease has befallen infants and idiots, who had never heard or understood a word about mad dogs or hydrophobia, and in whom the imagination could have had no share in producing their fatal distemper.

The steady increase in the population of this kingdom implies a corresponding, though perhaps not proportional, increase in the number of its dogs. In this way the area is ever growing larger of a field ready for the reception of the poisonous germ of rabies, and for the production in due time of a more or less copious crop of hydrophobia. The report for this year of the postmaster-general contains the strange statement made by the local postmaster of a large town in the north of England, that in the year 1876 twenty per cent. of his men — one in every five — were bitten by dogs. A Parliamentary return of last session tells us that in the year ending with last May, nine hundred and seventy-three sheep and lambs were killed by dogs in ten of the counties of Scotland, and in most cases the owners of the dogs could not be discovered. There is in London a home for stray and lost dogs. It has been affirmed in print by the well-known secretary to the Society for Preventing Cruelty to Animals, that upwards of one thousand five hundred

dogs are taken to this home every month. It is notorious that the tax on dogs is evaded to an enormous extent. All this serves to disclose the presence among us of a national nuisance, and a growing source of national dishonesty and of serious national peril. It is grevious to me to have to write in a strain so depreciatory of a race of animals that I love so well. But *corruptio optimi pessima*. It is an illustrative fact that, according to the reports of the registrar-general, no less than three hundred and thirty-four persons died in England of hydrophobia in the decade of years ending with 1875.

Like other specific contagious diseases, hydrophobia has its period of incubation; and it is a somewhat variable period, lying for the most part between six weeks and three months. From a tabular account of one hundred and thirty cases of the disease referred to by Mr. Hawkins, it appears that five-sixths of the whole number occurred between eighteen days and three months. Mr. George Rigden of Canterbury, has lately stated in the *Lancet* the following remarkable fact. He saw many years ago in one of the hospitals in London two patients who had been bitten at the same time by a cat which had been bitten by a rabid dog. Although the two patients had severally received their bites within a few minutes of each other, the respective outbreaks of hydrophobia were separated by an interval of two weeks. A like uncertainty of the access of the disease has been noticed among infected dogs. On the night of June 8, 1791, the man in charge of Lord Fitzwilliam's kennel was much disturbed by fightings among the hounds, and got up several times to quiet them. On each occasion he found the same dog quarrelling; at last, therefore, he shut that dog up by himself, and then there was no further disturbance. On the third day afterwards the quarrelsome hound was found to be unequivocally rabid, and on the fifth day he died. The whole pack were thereupon separately confined, and watched. Six of the dogs became subsequently mad, and at the following widely different intervals from the 8th of June, namely, twenty-three days, fifty-six, sixty-seven, eighty-one, one hundred and fifty-five, and one hundred and eighty-three days.

Much longer periods, however, than any that I have hitherto mentioned are on record. In one instance, which was treated in Guy's Hospital, and the particulars of which were carefully investigated by Doctor (now Sir William) Gull, the disorder broke out more than five years after the patient had been bitten by a pointer bitch below his left knee. There a scar was visible, and the hydrophobic outbreak was preceded by pain in that spot. In the first volume of the *Lancet* the case is narrated by Mr. Hale Thompson of a lad who died hydrophobic seven years after a bite by a dog on his right hip, where there remained a cicatrix. For twenty-five months before his death this patient had been in close confinement in prison, and out of the way of dogs altogether.

Long periods of this kind cannot reasonably be regarded as periods of genuine or normal incubation. In explanation of them I some forty years ago published certain views of my own, but I do not know that they have been (to use a barbarous modern term) endorsed by any of my professional brethren. I imagine that the virus implanted by the rabid animal may remain lodged in the bitten spot, shut up perhaps in a nodule of lymph, or detained somehow in temporary and precarious union with some one of the animal tissues, without entering the blood itself for a longer or shorter time — in some cases, perhaps, never.* Some curious facts, fortifying this hypothesis of mine, have been noticed respecting another animal poison — the vaccine virus. The following statement is quoted by Mr. Grove, in the *Monthly Journal of Medical Science* for November 1853: —

> A girl, aged fourteen years, was seized with influenza. She complained of pain in each arm at the spots where, when an infant, she had been vaccinated; and, in fact, in these places vaccine vesicles now became perfectly developed. An elder sister was revaccinated with lymph thence obtained; beautiful vesicles formed, and ran a natural course.

At the Obstetrical Society of London in 1860, Dr. Hodges stated that

> in May 1854 he vaccinated a little boy three years of age, but the arm did not "rise" within the usual period. In the following May, however, a vesicle spontaneously formed, with an areola on the seventh and eighth days, gradually declining on the eleventh and twelfth; a

* I find that Dr. Anthony Todd Thomson, in the thirteenth volume of the "Medico-Chirurgical Transactions," 1826, has been tiresome enough to forestall me in this suggestion. He is commenting upon a case of hydrophobia caused by the bite of a cat, and he conjectures "that the virus remains dormant in the part where it is deposited by the tooth of the rabid animal, until a certain state of habit renders the nerves in its vicinity susceptible of its influence, and this being communicated, a morbid action is begun in these nerves, and extended to the respiratory nerves, which induce the whole train of symptoms constituting the disease."

permanent cicatrix, marked by pits, remaining and giving evidence of the genuine vaccine disease.

If my hypothesis be well-founded, it may account for some of the cases in which persons bitten by a rabid dog escape hydrophobia altogether.

The well-known fact that the bitten spot, wound, or scar very often becomes the seat of some fresh morbid phenomena (variously spoken of as pain, redness, swelling, coldness, stiffness, numbness, tingling, itching), which spread towards the trunk of the body just before the paroxysmal symptoms of hydrophobia show themselves, is strongly in favor of the belief that the poison may lie inert in the place of the original hurt for some time, and then, in some obscure way, get liberated and set afloat in the circulating blood.

Pain, sensations of pricking, and other peculiar feelings, preceded the manifestation of the hydrophobic condition in three of the four cases seen by myself; in the fourth case no inquiries appear to have been made on that point. In another instance which Mr. Herbert Mayo witnessed and examined after death, he found the inner part of the cicatrix blood-shotten, and a gland in the armpit had swelled at the coming on of hydrophobic symptoms; and I find among my notes of Mr. Abernethy's lectures another striking case still more to the purpose. A very intelligent boy had been bitten in the finger by a dog. He was taken into St. Bartholomew's Hospital. Caustic had been freely used, affecting the sinewy parts, and producing a terrible sore; yet the boy was recovering himself, and the sore was healing. One day, as Mr. Abernethy was going round the hospital, he saw and spoke to the boy, who said he thought he was getting well, but that he had on that day an odd sensation in his finger, stretching upwards into his hand and arm. Going up the arm were two red lines like inflamed absorbents. Doubtless they were such. Mr. Abernethy made light of the matter, ordered a poultice and some medicine. Early the next morning he again visited the ward, pretending that he had some other patient there whom he wished particularly to see; and when going out again he asked the boy, in a careless tone, how he was. The boy said he had lost the pain, but felt very unwell, and had not slept all night. Mr. Abernethy felt his pulse, told him he was rather feverish, as might be expected, and asked him if he was not thirsty, and would like some toast and water. The boy said he *was* thirsty, and that he *should* like some drink. When, however, the cup was brought he pushed it from him; he could not drink. In forty-eight hours he was dead.

The symptoms of hydrophobia, stated in broad outline, are these. Excessive nervous irritability and terror, spasmodic contractions of the muscles of the throat, excited by various external influences, and especially by the sight or sound of liquids, and by attempts to swallow them, and sometimes absolute impossibility of swallowing them, earnest attempts to do so notwithstanding.

When fluids are offered to and pressed upon the patient, he will take the vessel containing them into his hand, but draws back his head to a distance from it with a repelling and apparently involuntary gesture; meanwhile he makes a succession of hurried gasping sighs and sobs, precisely resembling those which occur when one wades gradually and deeply into cold water. The sound of water poured from one vessel into another, gusts of air passing over his face, the sudden access of light, the waving of a mirror before his eyes, the crawling of an insect over his skin — these are things which in a hydrophobic patient suffice to excite great agitation, and the peculiar strangling sensation about the fauces. He goes on rapidly from bad to worse; in most cases more or less of mania or delirium is mixed up with the irritability. Illusions of the senses of sight and of hearing are not uncommon. The sufferer is very garrulous and excited. In some cases, but not in all, there is incontinence of urine. Foam and sticky mucus gather in his throat and mouth, and he makes great efforts by pulling it with his fingers, and by spitting, blowing, and hawking to get rid of it; and the sounds he thus makes have been exaggerated by ignorance and credulity into the foaming and barking of a dog. In the same spirit the palsy of his lower limbs which sometimes takes place, rendering him unable to stand upright, has been misconstrued into a desire on his part to go on all fours like a dog. Vomiting is a frequent symptom. The pulse in a short time becomes frequent and feeble, and the general strength declines with great rapidity. Death occasionally ensues within twenty-four hours after the beginning of the specific symptoms. Most commonly of all, it happens on the second or third day; now and then it is postponed to the fifth day; and in still rarer instances, it

may not occur till the seventh, eighth, or ninth day.

Uusually the paroxysms, becoming more violent and frequent, exhaust the patient; but occasionally the symptoms undergo a marked alteration before death. The paroxysms cease, the nervous irritability disappears, the patient is able to eat and drink and converse with ease, those sights and sounds which so annoyed and distressed him before no longer cause him any disquiet. The late Dr. Latham had a hydrophobic patient under his care in the Middlesex Hospital. On going one day to the ward he fully expected to hear that the patient was dead, but he found him sitting up in his bed quite calm and free from spasm. He had just drunk a large jug of porter. "Lawk, sir!" said a nurse that stood by, "what a wonderful cure!" The man himself seemed surprised at the change; but *he had no pulse;* his skin was as cold as marble In half an hour he sank back and expired.

It has been alleged that tetanus may be mistaken for hpdrophobia, but the differences between the two are very clearly marked. It is true that slight touches of the body will excite the tetanic spasm, but it is the rigid or abiding form of spasm, which relaxes gradually and slowly; whereas in hydrophobia the spasms are sudden and frequent, such as are popularly called convulsions. In tetanus there is no thirst, seldom any vomiting, no accumulation of tough and stringy mucus in the mouth and throat. The mental faculties are clear, and the patient is serene, and what is called heart-whole to the last.

The symptoms of rabies, as witnessed in the dog, have been well described by Mr. Youatt. The earliest is a marked change in the animal's habits. Of course this will be more perceptible by those acquainted with the dog, and cognizant of his habits. The dog becomes sullen, restless, his eyes glisten, there is often slight squinting, and some twitching of the face, with a continual shifting of posture, a steadfast gaze expressive of suspicion, an earnest licking of some part on which a scar may generally be found. If the ear be the affected part, the dog is incessantly and violently scratching it; if the foot, he gnaws it till the skin is broken. Occasional vomiting and a depraved appetite are also early noticeable. The dog will pick up and swallow bits of thread or silk from the carpet, hair, straw, and even dung. Then the animal becomes irascible, flies fiercely at strangers, is impatient of correction, which he receives in sullen silence, seizes the whip or stick, quarrels with his own companions, eagerly hunts and worries the cats, demolishes his bed, and if chained up makes violent efforts to escape, tearing his kennel to pieces with his teeth. If at large he usually attacks such dogs as come in his way, but if he be naturally ferocious he will diligently and perseveringly seek his enemy. About the second day a considerable flow of saliva begins, but this does not long continue, and it is succeeded by insatiable thirst. He appears to be annoyed by some viscid matter in his throat, and in the most eager and extraordinary manner he works with his paws at the corners of his mouth to remove it, and while thus employed frequently loses his balance and rolls over. A loss of power over the voluntary muscles is next observed. It begins with the lower jaw, which hangs down, and the mouth is partially open; the tongue is less affected; the dog is able to use it in the act of lapping, but the mouth is not sufficiently closed to retain the water; therefore, while he hangs over the vessel eagerly lapping for several minutes, its contents are very little, or not at all diminished. The palsy often affects the loins and extremities also; the animal staggers about and frequently falls. Previously to this he is in almost incessant motion. Mr. Youatt fancies the dog is subject to what we call spectral illusions. He starts up and gazes earnestly at some real or imaginary object. He appears to be tracing the path of something floating around him, or he fixes his eyes intently on some spot on the wall, and suddenly plunges at it; then his eyes close, and his head droops.

Frequently, with his head erect, the dog utters a short and very peculiar howl; or if he barks it is in a hoarse, inward sound, totally unlike his usual tone, terminating generally with this characteristic howl. The respiration is always affected; often the breathing is very laborious; and the *inspiration* is attended with a singular grating, choking noise. On the fourth, fifth, or sixth day of the disease he dies, occasionally in slight convulsions, but oftener without a struggle.

It is a common and misleading mistake to think that the rabid dog, like the hydrophobic man, will shun water, and that if he takes to a river it may safely be concluded that he is not mad. On the contrary, as I have already hinted, there is no dread of water, but unquenchable thirst;

the animal rushes eagerly to water, plunges his muzzle into it, and tries to drink, but often is unable to swallow from paralysis of his lower jaw, which prevents him from shutting his mouth.

Another opinion not at all uncommon is that healthy dogs recognize one that is mad, and fear him, and run away from his presence, in obedience to some mysterious and wonderful instinct, warning them of their danger. According to Mr. Youatt this is quite unfounded. Equally mistaken is the notion that the mad dog exhales a peculiar and offensive smell.

I do not know whether the period of incubation in a dog which has been infected with rabies by the bite of another rabid dog has been accurately ascertained; but that the disease may be imparted by a dog so infected before the symptoms of rabies become manifest is clear from the following instance, with which I have been favored by Mr. Wrench, of Baslow, in Derbyshire: —

> A small terrier [he writes] belonging to myself was bitten by an undoubtedly rabid dog, and was consequently destroyed about a fortnight afterwards, and before it had shown any symptoms of disease. In the mean time it had licked the cropped ears of a bull-dog puppy which had not been near the first-named rabid dog, and this puppy went mad about eight weeks after his ears were licked.

From what animals may the infection be received? We are sure that the disease, by the inoculation of which hydrophobia may be caused in man, is common in the dog; and that it has often been communicated to the human animal by the fox also, the wolf, the jackal, and the cat. The death from hydrophobia of a boy after being bitten by a raccoon is recorded by Dr. Russell, of Lincoln, Massachusetts, in the "Transactions of the American Medical Association" for 1856. Mr. Youatt declares that the saliva of the badger, the horse, the human being, has undoubtedly produced hydrophobia; and some affirm that it has been propagated even by the turkey and the hen. The same author mentions a case in which a groom became affected with hydrophobia through a scratch which he received from the tooth of a rabid horse. This would seem to settle the question as respects that animal; but as horses, cows, and fowls do not usually bite, we have not many opportunities of furnishing a positive answer to the general question.

The grandfather of the present Duke of Richmond died, in Canada, of hydrophobia, communicated, it was then thought, by a fox. But I was told in 1862, on the authority of a person who was living at Montreal at the time of the duke's death, and was acquainted with his family, that his disease was caused by the bite of a dog; and I was afterwards informed by Mr. Lawrence Peel, the duke's son-in-law, that it was uncertain whether the bite was made by a fox or by a dog. The duke was interfering in a fray between a tame fox and a pet dog — the fox retreating into his kennel. It is not certainly known which of the animals had rabies.

The disease is said to have been caused by the *scratch* of a cat. Now we know that cats, as well as dogs, frequently apply their paws to their mouths, especially when the latter part is uneasy, as it clearly is in mad dogs. The fact, therefore, of the production of the disease by a scratch from the claws of a cat, if thoroughly made out, would afford no proof, nor scarcely even a presumption, that the disease can be introduced into the animal system in any other way than by means of the saliva.

Several important questions at once present themselves respecting these two diseases.

First, is a man who has been bitten by a mad dog, and in whose case no preventive measures have been taken, a doomed man? I have answered this question in the negative already. Few, upon the whole, who are so bitten become affected with hydrophobia. John Hunter states that he knew an instance in which, of twenty-one persons bitten, one only fell a victim to the disease. Dr. Hamilton estimated the proportion to be one in twenty-five. But I fear these computations are much too low. In 1780 a mad dog in the neighborhood of Senlis took his course within a small circle, and bit fifteen persons before he was killed; three of these died of hydrophobia. The saliva of a rabid wolf would seem to be highly virulent and effective. These beasts fly always, I believe, at a naked part. Hence, probably, the fatality of their bites. The following statement relates exclusively to the wolf. In December, 1774, twenty persons were bitten in the neighborhood of Troyes; nine of them died. Of seventeen persons similarly bitten in 1784, near Brive, ten died of hydrophobia. In May, 1817, twenty-three persons were bitten, and fourteen perished. Four died of eleven that were bitten near Dijon; and eighteen of twenty-four bitten near Ro-

chelle. At Bar-sur-Ornain, nineteen were bitten, of whom twelve died within two months. Here we have one hundred and fourteen persons bitten by rabid wolves, and among them no fewer than sixty-seven victims to hydrophobia; considerably more than one-half. There is no doubt, however, that the majority of persons who are bitten by a mad *dog* escape the disease. This may be partly owing to an inherent inaptitude for accepting it. There are some upon whom the contagion of small-pox has no influence. This peculiarity exists apparently even among dogs. There was one dog, at Charenton, that did not become rabid after being bitten by a rabid dog; and it was so managed that at different times he was bitten by thirty mad dogs, but he outlived it all. Much will depend also upon the circumstances of the bite, and the way in which it is inflicted. If it be made through clothes, and especially through thick woollen garments, or through leather, the saliva may be wiped clean away from the tooth before it reaches the flesh. In the fifth volume of the *Edinburgh Medical and Surgical Journal* there is a case described by Mr. Oldknow, of Nottingham, in which a man was bitten in three different places by the same mad dog, namely, in the groin, the thigh, and the left hand; the bite on the hand was the last. Now it seems that but for this last bite, on a naked part, he might have escaped. It is noteworthy that the local sensations preliminary to the fatal outbreak of hydrophobia occurred only in the hand and arm. The attacking dog probably shuts his mouth after each bite, and thus recharges his fangs with the poisonous material. In a report from America it is stated that of seventy-five cases the injury was received on the hand in forty instances, on the face in fifteen, on the leg in eleven, on the arm in nine.

It is this frequent immunity from the disease in persons who have been bitten that has tended to confer reputation upon so many vaunted methods of prevention. Ignorant men and knavish men have not failed to take advantage of this. They announce that they are in possession of some secret remedy which will prevent the virus from operating; they persuade the friends of those who die that the remedy was not rightly employed, or not resorted to sufficiently early; and they persuade those who escape that they escaped by virtue of the preventive remedy. If the plunder they reap from the foolish and frightened were all, this would be of less consequence; but unfortunately, the hope of security without their undergoing a painful operation leads many to neglect the only trustworthy mode of obtaining safety.

A still more anxious inquiry next arises. Whoever has been bitten by a rabid or by a suspected animal must be considered, and will generally consider himself, as being in more or less danger of hydrophobia. This dread is not entirely removed even by the adoption of the best means of prevention. Now, how long does this state of hazard continue? When is the peril fairly over? After what lapse of time may the person who has sustained the injury lay aside all apprehension of the disease? To this inquiry no satisfactory reply can be given. In a vast majority of instances, indeed, the disorder has broken out *within two months* from the infliction of the bite. But the exceptions to this rule are too numerous to permit us to put firm trust in the immunity foreshadowed by that interval. Cases are recorded in which five, six, eleven, nineteen months have intervened between the insertion of the poison and the eruption of the consequent malady. Nay, there are well-authenticated instances, as I have already said, of the lapse of twenty-five months, of more than five years, or even of seven years. In these cases it is most probable that some unsuspected re-inoculation, some fresh application of the peculiar virus, has taken place. If not, then we must conclude that the poison really lies imprisoned in the bitten part, and only becomes destructive when, under certain obscure conditions, and at indefinite periods, it gets into the circulation.

I say nothing about the morbid appearances found in persons dead of hydrophobia, for I am not addressing professional readers. But, as a help towards determining whether a dog which may have been destroyed under equivocal circumstances was indeed rabid, it may be useful to state that in the stomach of a really mad dog there are always to be found very unnatural contents — straw, hay, coal, sticks, horse-dung, earth — as well as a quantity of a dark fluid like thin treacle, altered blood in fact.

And here it may be well to deprecate and denounce a practice much too common with us, that, namely, of at once destroying a suspected dog by which some one has been bitten, but about the true condition of which there exists no absolute certainty. The dog should be securely isolated and watched; a day or two will be sufficient for solving the anxious ques-

tion. If he should prove really mad, he should then of course be put to death, as mercifully as may be. If, on the other hand, he remains well, not only will the life of a possibly useful and favorite animal be saved, but, what is of incomparably greater importance, the mind of the bitten person will be freed from a harassing sense of dread, with which it might otherwise be haunted for years to come.

The most important question of all in relation to my present purpose, is whether rabies can be excited by any other cause than inoculation of the specific virus; in other words, whether it has any other source than contagion.

Many persons believe that the disease may, and does often, arise *de novo;* and causes have been assigned which certainly are not true causes. Thus it has been ascribed to extreme heat of the weather. It is thought by many to be especially likely to occur during the dog-days; and to be in itself a sort of dog-lunacy, having the same relationship to Sirius that human insanity has to the moon — which in one sense is probable enough. But abundant statistical evidence has been collected in this and in other countries, that the disease occurs at all seasons of the year indifferently. The cautions, therefore, which are annually put forth in hot weather, as to muzzling dogs and so forth, whatever may be their value, would be as opportune at any other time. The disorder has been attributed to want of water in hot weather, and sometimes to want of food, but MM. Dupuytren, Breschet, and Majendie in France caused both dogs and cats to die of hunger and thirst, without producing the smallest approach to a state of rabies. At the veterinary school at Alfort three dogs were subjected to some very cruel but decisive experiments. It was during the heat of summer, and they were all chained in the full blaze of the sun. To one salted meat was given; to the second water only; and to the third neither food nor drink. They all died, but none of them became rabid. Nor does the suspicion that the disorder may have some connection with the rutting period in these animals appear to rest on any better foundation.

Some very interesting points still remain to be considered as to the communication of these diseases from one person or animal to another.

Mr. Youatt, whose experience on this subject was very large, did not think that the saliva of a rabid animal could communicate the disorder through the unbroken cuticle. He believed that there must be some abrasion or breach of surface. He held, however, that it might be communicated by the mere contact of the saliva with the mucous membranes. Of its harmlessness on the sound skin he offered this presumptive evidence — that his own hands had many times been covered with the saliva of the mad dog with perfect impunity. He has recorded some singular instances in which hydrophobia and rabies were caused by contact of the morbid saliva with the mucous membranes. A man endeavored to untie by the help of his teeth a knot that had been firmly drawn in a cord. Eight weeks afterwards he died undeniably hydrophobic. It was then recollected that with this cord a mad dog had been tied up. A woman was attacked by a rabid dog, and escaped with some rents in her gown. In the act of mending it she thoughtlessly pressed down the seam with her teeth. She also died. Horses are said to have died mad after eating straw upon which rabid pigs had died. Portal was assured that two dogs which had licked the mouth of another dog that was rabid were attacked with rabies seven or eight days afterwards. Mr. Gilman, of Highgate, in a little pamphlet on hydrophohia, quotes an instance from Dr. Perceval, in which a mad dog licked the face of a sleeping man, near his mouth, and the man died of hydrophobia, although the strictest search failed to discover the smallest scratch or abrasion on any part of his skin. These facts, if authentic, settle the question; unless, indeed, the lips of those who perished happened to have been chapped or abraded.

It is a fearful question whether the saliva of a human being afflicted with hydrophobia is capable of inoculating another human being with the same disease. Mr. Youatt says it is, that the disease has undoubtedly been so produced. If this be so, the fact should teach us, not to desert or neglect these unhappy patients, still less to murder them by smothering, or by bleeding them to death, but to minister to their wants with certain precautions; so as not to suffer their saliva to come in contact with any sore or abraded surface, nor, if it can be avoided, with any mucous surface. On the other hand, all carefulness of that kind will be superfluous if the disease cannot be propagated by the human saliva. Certainly many experimenters have tried in vain to inoculate dogs with the spittle of a hydrophobic man; but there is one authentic experiment on record which makes it too prob-

able that the disease, though seldom or with difficulty communi*cated*, may yet be communi*cable*. The experiment is said to have been made by MM. Majendie and Breschet, at the Hôtel Dieu, in Paris, and to have been witnessed by a great number of medical men and students. Two healthy dogs were inoculated on the 19th of June, 1813, with the saliva of a patient named Surlu, who died the same day in the hospital. One of these dogs became mad on the twenty-seventh of the following month. They caused this dog to bite others, which in their turn became rabid also; and in this way the malady was propagated among dogs during the whole summer. Now this, though a very striking statement, ought not to be considered conclusive; for it is possible that the disease in the first dog might have had some unknown and unsuspected origin. We have enough, however, in this one experiment to make us observe all requisite caution when engaged in attending upon a hydrophobic patient.

In an elaborate and valuable treatise on "Rabies and Hydrophobia," Mr. George Fleming adduces conflicting evidence as to the safety or danger of drinking the milk of a rabid animal, and he wisely advises the avoidance of such milk. Pertinent to this question I have received from Mr. Wrench, of Baslow, even while this paper is passing through the press, the following history, which shows that the disease is transmissible from the mother to her offspring through the medium of her milk: —

In the middle of May 1876, on Mr. Twigg's farm, Harewood Grange, near Chatsworth, a mad dog bit eighteen sheep out of a flock of twenty-one, which were at the time suckling thirty lambs. The sheep were all bitten about the *face*, and had evidently been defending their lambs during the greater part of the night in which the attack was made. Mr. Twigg examined both sheep and lambs, and could not find a single wound on any of the latter. In about a month both sheep and *lambs* began to die at the rate of two or three a day. The sheep ran wildly about, sometimes carrying stones in their mouths, and the lambs ran away. Of the eighteen sheep that had been bitten sixteen died; and of the thirty lambs, not one of which was believed to have been bitten, fourteen died. On the next farm the same thing happened to a smaller extent.

What can be said of the treatment of hydrophobia or of rabies? There is no authentic case on record that I am aware of in which a hydrophobic person has recovered. As it has been so it is still. Ἰατρὸς ἴᾶται θάνατος — the physician that cures is death. It would be idle to discuss any curative measures after the peculiar symptoms of the disease have once set in.

Not so, however, with respect to prevention; that is the most important object of our practice — that and the euthanasia.

The early and complete excision of the bitten part is the only means of prevention in which much confidence can be placed; and even that is open to a source of fallacy. In the majority of cases no hydrophobia would ensue, though nothing at all were done to the wound. No doubt many persons undergo the operation needlessly. But in no given case can we be sure of this. If excision should for any reason be impossible, the wound should be cauterized. Of the efficacy of the latter plan we have this evidence: Mr. Youatt, who trusted to it, and who had himself been bitten seven times, tells us that he had operated with the lunar caustic — nitrate of silver — on more than four hundred persons, all bitten by dogs unquestionably rabid, and that he had not lost a case. One man died of fright, but not one of hydrophobia. Moreover, a surgeon of St. George's Hospital told him that ten times that number had undergone the operation of excision there after being bitten by dogs (all of which might not, however, have been rabid), and it was not known that there had been a single fatal issue. Excision, in my judgment, must, when practicable, be the most trustworthy and eligible procedure. Trousseau recommends, as a ready and quick preventive, the actual cautery — that is, the destruction of the poison and the tissues of the bitten part by searing them with a red-hot iron. They might be as readily and thoroughly destroyed by brushing the interior of the wound, by means of a glass brush, with nitric acid.

But if the wound be of such a size and in such a place that it can be excised, what is the best method for its excision? This is the advice of my old master, Abernethy: —

The cell [he says] into which a penetrating tooth has gone must be cut out. Let a wooden skewer be shaped as nearly as may be into the form of the tooth, and then be placed into the cavity made by the tooth, and next let the skewer and the whole cell containing it be removed together by an elliptical incision. We may examine the removed cell to see if every portion with which the tooth might have had contact has been taken away: the cell may

Digitized by CORNELL UNIVERSITY
Original from CORNELL UNIVERSITY

even be filled with quicksilver to see if a globule will escape. The efficient performance of the excision does not depend upon the extent, but upon the accuracy of the operation.

Early excision, then, is almost a sure preventive; but in all suspicious cases, if the operation have been omitted in the first instance, it will be advisible to cut out the wound or its scar within the first two months, or at any time before preliminary feelings in the spot foreshow the coming outbreak. Later would be too late. Dr. Richard Bright has recorded a case in which the arm was amputated upon the supervention of tingling and other symptoms in the hand on which the patient had been bitten some time before; but the amputation did not save him.

The new power which we have happily obtained of suspending sensation *generally* by the inspiration of certain vapors, or *locally* by the æther spray, will contribute at least to the prevention of hydrophobia by divesting the process of excision or cauterization of its pain, and therefore of its terrors.

For my own part, if I had received a bite from a decidedly rabid animal upon my arm or leg, and the bite was such that the whole wound could not be cut out or thoroughly cauterized, my reason would teach me to desire, and I hope I should have fortitude enough to endure, amputation of the limb above the place of the injury.

As to the euthanasia, it may best be promoted by some narcotic drug; and I know of none more eligible than the chloral hydrate, administered in such doses and at such intervals as may suffice, without shortening life, to quiet the restless agitation, and to mitigate the sufferings, of its inevitable close. Should the patient be unable to swallow that remedy, recourse may be had, under similar limitation, to its subcutaneous injection, or to some anæsthetic vapor.

What, it may be asked, should be done by or for a man who has been bitten by a rabid animal, and has no access to immediate medical help? Should he, the wound being within reach of his lips, or should another person for him, try to suck out the inserted venom? That would probably be his first instinctive thought. But when I call to mind what Mr. Youatt has said of the danger attending the contact of the poisonous saliva with even sound mucous membranes — and further, the risk that the sucker's lips might, whether he knew it or not, be chapped or abraded — I dare not counsel the expedient of suction. By adopting it the sufferer might be rushing, or bringing his helping neighbor, into the very peril he was anxious to avert.

A cupping-glass would be a safer application of the same principle, provided that the place and size of the wound would admit of its being covered by the glass. But, at best, a cupping-glass extemporized and clumsily used under urgent and agitating circumstances, can scarcely be advisable.

What I should most strongly recommend, and fortunately it is very easy of performance, is this. First, that a bandage tight enough to restrain the venous circulation should be applied just above the wound, between it and the heart; and next, that without any delay a continuous stream of tepid or cold water should be poured from a height, and therefore with a certain degree of force, upon and into the wound. This might be done from the spout of a tea-kettle, or better from a water-tap, and it should be persevered with even for an hour or two, or until the arrival of medical aid. In this way the implanted poison would, in all likelihood, be thoroughly washed away, and the safety of the sufferer secured. Nevertheless this process need not exclude subsequent excision or cauterization, should one or the other be feasible or thought desirable, "to make assurance doubly sure."

The opinion which, as my readers must have anticipated, I entertain, that rabies has at present no other source than contagion, has been combated with the same arguments as have been used in the analogous case of small-pox; such as that the disease must at some time have had a beginning, and therefore why not now? that it often springs up where no contagion can be traced, and sometimes where contagion seems to be impossible. These arguments were discussed in my former paper, and their futility fully demonstrated. I refrain, therefore, from reconsidering them here. But as I then related two striking instances in which contagion had been deemed impossible, but in which its operation was at length detected by some very singular evidence, so I will here give a condensed account of a like result under similar circumstances in respect of rabies.

Mr. Blaine, Mr. Youatt's partner, was consulted about a gentleman's dog, and pronounced it undoubtedly rabid. But the dog, it was alleged, had never for many months been out of doors, nor, indeed, out of the sight of its master, or, in the mas-

ter's absence, of his valet, who had especial charge of the dog. Concurring with Mr. Youatt in opinion, and anxious to learn the truth in a matter so important, Mr. Blaine examined the servants very closely; and it was at length remembered by the footman that he had had to answer his master's bell one morning when the valet, whose business it was to take the dog from the bedroom, was accidentally absent; and he also distinctly recollected that the dog accompanied him to the street door while he was receiving a message, went into the street, and was there suddenly attacked by another dog that was passing, seemingly without an owner. The wandering dog was, no doubt, rabid.

Again, a Newfoundland dog, which was chained constantly to his kennel during the day, and suffered to be at large during the night within an enclosed yard, became rabid; and as no dog was known to have had access to the yard, the owner felt sure that the disease must have arisen spontaneously. Mr. Blaine, however, elicited the facts that the gardener to the family remembered to have heard when in bed one night an unusual noise, as if the Newfoundland dog was quarrelling with another. He recollected, also, that about the same time he saw marks of a dog's feet in his garden, which lay on the other side of the yard, and the remains of hair were noticed on the top of the wall. About the same time the neighborhood had been alarmed by the absence of a large dog belonging to one of the inhabitants, which had escaped from confinement during the night under evident symptoms of disease. Here also was a ready solution of the previous mystery.

I can pretend to no originality on this subject. Mr. Youatt believed that rabies in the dog and in all creatures results always from the introduction of a specific virus into the system. He maintained that a well-enforced quarantine — every dog in the kingdom being confined separately — for seven months would extirpate the disease. And the late Sir James Bardsley proposed a plan which he thought would prove efficacious for getting rid of the pestilence.

> It consists [he wrote] merely in establishing a universal quarantine for dogs within the kingdom, and a total prohibition of the importation of those animals during the existence of this quarantine. The efficacy of this preventive scheme rests upon the validity of the following propositions. First, that the disease always originates in the canine species; secondly, that it never arises in them spontaneously; thirdly, that the contagion, when received by them, never remains latent more than a few months. If these propositions have been established, it clearly follows that by destroying every dog in which the disease should break out during strict quarantine, not only would the propagation of the malady be prevented, but the absolute source of the poison would be entirely suppressed.

It is much to be wondered at that these wise suggestions should have remained so long neglected by our sanitary authorities.

No reference has been made either by Mr. Youatt or by Sir James Bardsley to the possible perpetuation of the disease by rabid cats. Mad cats, however, are far less common than mad dogs. A cat is not an aggressively fighting animal. At any time it would rather fly from than resist an attacking dog; and, if there were no dogs to receive and to impart the disease, rabies would soon, so far as the cat is concerned, die out of its own accord.

I have now set forth to the best of my ability — and perhaps too much in detail — the amount of our knowledge upon a subject which is at present painfully engrossing the attention of the public. I have shown that we possess no valid evidence of the spontaneous origin, nowadays, of rabies in the dog or in any other animal; and that hydrophobia owes its parentage exclusively to the poison furnished in the first instance by the rabid dog, or by rabid animals of the same species with the dog.

I propose next to fortify my position by pointing out that large portions of the habitable world, abounding in dogs, are now, and have always been, entirely free from those dreadful twin pests, rabies and hydrophobia.

It is my good fortune to have found among my own friends and acquaintances several persons able to give me authentic and valuable information on this subject.

Thus the Bishop of Lichfield, who lived more than twenty-five years in New Zealand, tells me that he never heard of a mad dog in those islands, and that Bishop Abraham's experience, who was for seventeen years resident there, agrees with his own.

Bishop Macdougall writes me word that there is in Borneo a native dog, like a small jackal, but with a curly rather than a bushy tail, kept in numbers by the Dyaks for hunting deer and pig. These dogs never bark, but when on the scent for game howl with a very musical note.

The Chinese settlers also have brought in a dog, resembling the Pomeranian breed. These bark abundantly, and among the settlers, who eat the puppies as a delicacy, they are so numerous as to have become a general nuisance; yet during the twenty years in which the bishop resided at Sarawak he never heard of a single instance of rabies.

I was told a few years since by Sir Henry Young that in Tasmania, of which he was for seven years the governor, although there were plenty of dogs, there had been no *mad* dogs, and therefore no hydrophobia. Evidence to precisely the same effect has been furnished to a friend of mine by Sir Valentine Fleming, who left Tasmania in 1874, after a residence there of about thirty-two years. He testifies to the great number of dogs in that colony, and to the total absence of hydrophobia. Again, I have it under the hand of Sir George Macleay, who, with Captain Sturt, diligently explored, for other purposes, all the settlements of what has been well called the "insular continent" of Australia, that the dogs there are troublesomely plentiful, that hydrophobia is utterly unknown, and that rabies has never been witnessed in the dingo, or wild dog of those parts.

It had been stated by Dr. Heineken that curs of the most wretched condition abound in Madreia; that they are afflicted with almost every disease, tormented with flies and heat, and thirst and famine, yet no rabid dog was ever seen there; and I have quite recently been assured by Dr. Grabham, whose personal knowledge of Madeira covers sixteen years, and who states that he is well acquainted with the local traditions, and the writings of medical men there, that rabies and hydrophobia are, and always have been, unknown in that island.

Mr. Thomas Bigg-Wither spent three or four years in south Brazil, within the tropics. He and his party hunted there the wild dog and the jaguar (a species of tiger) with a pack of fifty smooth-haired dogs of various breeds, which gave tongue during their hunting. Mr. Bigg-Wither has assured me that hydrophobia and rabies are quite unheard of in that part of the world.

We have seen that conditions of temperature have nothing to do with the prevalence of these diseases. It is interesting, however, to compare this tropical experience with what has been observed in the opposite climate of the Arctic regions.

Dr. John Rae, who has been good enough to write to me on these subjects, was for twenty years in the Hudson's Bay Company's territory, ten of which years were spent at Moose Factory, on the shore of Hudson's Bay, and a year or or two each at various other stations as far north as the Arctic circle, at all of which dogs in greater or less number are kept for sledging purposes, yet he cannot remember to have seen or heard of a single case of the diseases in question, either in dog or in man. My knowledge, Dr. Rae says, of the Eskimos is much more limited, for, although I have seen these interesting people at various parts of the Arctic coast, I have wintered only twice among them, on both occasions at Repulse Bay. But I never saw or heard of any disease resembling hydrophobia.

My distinguished friend, Admiral Sir George Back, who is cognisant of Dr. Rae's testimony in this matter, fully confirms it by his own experience gathered in five expeditions of discovery to the Arctic regions during a period of eleven years' service.

A portion of Dr. Rae's information, although it has no direct bearing upon my main purpose, may prove as interesting to my readers as it has been to myself: —

> The food of the dogs in Hudson's Bay consists wholly of meat or fish, or of a mixture of both; meat being the chief diet in the prairies, while fish are almost universally given (except when on a journey) in other parts of the country. In the summer, when not required for sledging, the dogs are sent in charge of a man or two to a fishery, where they can be well and cheaply fed. The usual ration is a fish weighing three or four pounds, eaten raw. The best and lightest food for the dogs when at work is dry buffalo or deer meat, about two or two and a half pounds of which is a day's allowance.*

Colonel Home, C.B., an engineer officer living last year for some months at Constantinople, informs a friend of mine that, having a horror of hydrophobia, he made repeated and special inquiries there, and was assured that no instance of the disease was ever known in that city. He describes the scavenger-dog "as being in temper and feeling a dog, but his appearance is that of a wolf — a dog in wolf's clothes. He has short, pricked ears, and a bushy tail which looks as if it had lost

* All those who have been personally conversant with the Arctic sledge-dogs agree in stating that they are subject to a fatal kind of insanity quite distinct from true rabies and accordingly not productive of hydrophobia.

a couple of joints. Usually he is of a foxy hue, but occasionally dark and almost black on the back, where a sore is often to be seen. His fur is very thick and shaggy, and he is of the same size as a wolf." There are in the Zoological Gardens two Syrian wolves which present an exact *facsimile* of the Constantinople scavenger-dog. These dogs, as is well known, form an important institution in Constantinople, clearing the streets and eating all the offal there to be found. Colonel Home speaks of them as friendly and familiar, and in no way a nuisance, unless some tribe of "civilized" dogs quarrel and fight at night with them or with each other, when the noise they make is fearful. These civilized dogs — country or shepherds' dogs — seem to be badly named, for they are fierce and dangerous, and Colonel Home had to shoot one of two which had pursued and attacked him.

In the *Times* newspaper for the 23rd of October, Mr. Ch. Kroll Laporte, of Birkdale Place, Southport, writes that he never heard of a single case of hydrophobia in Africa during travels there extending over two years.

With more time and opportunity at my disposal I might doubtless find further examples of the entire absence of rabies, and therefore of hydrophobia, from certain places: but of this I have surely said enough; and should it be alleged that in other places, where these diseases had previously been unknown, they have at length appeared, my argument will be only strengthened if I can account for this by special circumstances. To take a single instance by way of sample: I have been assured upon unquestionable authority that Demerara had not within the memory of man been afflicted by the presence of hydrophobia till the year 1872, when rabies was imported by the influx of a large number of dogs from Barbadoes, in avoidance of a tax which had there been imposed upon those animals.

If it be admitted that hydrophobia never occurs except from the reception of the specific poison from a rabid animal, it follows that, rabies being expunged, hydrophobia would necessarily disappear. For this end it would seem to be required that all dogs in the kingdom should be subjected to a rigid quarantine of several months, as recommended by Mr. Youatt and by Sir James Bardsley. In order to the effectual enforcement of such quarantine, some legislative measures, and the planning and strict observance of certain regulations on the part respectively of our sanitary authorities and our police officers, are presumably pre-requisites. These are matters with which I am neither called upon nor competent to deal. There will be difficulties in the way, but I am persuaded that, if resolutely grappled with, they will not prove invincible.

Here, then, my share towards the accomplishment of the great object of this paper comes naturally to a close. Meanwhile, until the needful steps for the extirpation of rabies can be fully organized and brought into operation, great vigilance will be necessary to keep in check the existing evil. The superfluity of dogs in the kingdom must be abated by the unshrinking destruction of many; and *all* dogs should be narrowly watched, most especially dogs known to have been bitten or to have been quarrelling, sick dogs, wandering and ownerless dogs, and such as are the playthings of dog-fanciers and others; and all such other measures as may be legal should be taken for lessening the peril and the panic which is at present said to be "frighting the isle from her propriety."

THOMAS WATSON.

WITHIN THE PRECINCTS.

BY MRS. OLIPHANT.

CHAPTER III.

THE ABBEY PRECINCTS.

THE bells began to ring for evensong soon after the bridal party dispersed. Some of them, indeed, stayed for the beautiful service which was a thing that visitors from a distance thought a great deal of, and there were a number of fine bonnets and dresses in the stalls when Lottie went in. The daily service was part of the daily life of the dwellers in the Abbey. There were those who went for devotion, and those who went for the service, and those who went because they had nothing else to do. It was an occupation and an amusement at the same time, and some people thought it a duty. To listen to the service more or less critically, to note if any of the boys' voices were breaking, and whether Rowley sniffed as usual, or Bowler, the great bass, was hoarse; to observe how the minor canons sang, if they were in too great a hurry to get through the service, and who it was that read the lessons; to look at any notable persons that might be there, visitors to the Deanery, or other persons of distinction; to walk in the nave while the signor played the vol-

untary; and finally to pause and talk to one's friends before going home to tea, was the established rule of St. Michael's. The old chevaliers mixed with the ladies, here and there one. They were obliged to go in the morning, and they seldom repeated their churchgoing in the afternoon; but still there were always two or three, and very interesting to strangers were the old soldiers, with their old moustaches and upright bearing. Some of them might have been veteran generals well entitled to throw away an army, but you may be sure there were no prosperous commanders among them. They stood about on the terrace in front of the lodges and talked for five minutes or so before they went in to tea. Tea was generally a solid meal in the chevaliers' quarters, which was treated with much respect, and for which nobody would willingly be late. But Lottie when she came out of chapel and saw the last of the fine people streaming away in their light dresses through the aisle, did not feel much disposed to go indoors to Law and the bread and butter. They could wait. She went and leaned on the low wall close to the library and gazed out upon the landscape below. At the foot of the slope was the street of the little old town, a sweep of steep masonry with old-fashioned red houses, like trees in autumn, on the other side, and beyond that the river meandered between its leafy banks in endless windings, and the great breadth of champaign swept away towards the horizon. At this time of the year it was rich and cloudy with foliage: the trees arranging themselves in every kind of way, singly and in clumps, and groves, and long hedgerows, and surrounding every house and every village and every church-spire as far as you could see. The billowy greenness thus spreading far into the silvery grey of the distance, the sky of a pale blue, faint with summer heat and long drought, spread out like a map before the gazer from that mount of vision. The mottled clouds were floating together and rolling into masses as if with the intention of putting a stop to this long reign of brightness, and the long lines of the landscape and the great vault of the sky dropped together into a haze which also spoke of rain. Lottie leaned disconsolately over the wall, spreading abroad her thoughts over this vast breadth of space and silence. She let them go like a flock of birds flying to all the winds. Thoughts! they were not thoughts but feelings, vague movements of the mind, half sentiment, half-personal sensation. Why she should have been so deeply affected by this marriage she could not have told any one. She did not herself know. It seemed to penetrate through and through her system of life, unsettling everything. After the disappointments of her beginning at St. Michael's, this connection with the Deanery had seemed a thread of promise, a clue to something better, not a very splendid promise indeed, but still something; a little link of ambition which looked better and finer and more noble after it was snapped than it had ever done before. It was not very noble in itself. Lottie felt vaguely that to have so strong a desire for admission within that charmed circle was not a very lofty thing. The people she had seen within it had not satisfied her ideal. Except that they dressed better (some of them at least), they had been very much like the humbler classes with which she was acquainted; and to wish for a footing among them only because they were better off and more highly thought off than her own neighbors was not an elevating sentiment. In the perpetual disappointments to which she had been subject, the slights she had been obliged to put up with, Lottie had felt a great many pangs of shame mingled with the stings of humiliation. She had felt that it was the poorest of ambitions which had taken possession of her. And now that it was over, this sense of unworthiness still mingled with her sense of failure and exclusion. For though it might not be a door into heaven, still to feel that it was shut, to be obliged to turn away, and to see no other door at which she could enter, was hard. Her heart sank down into painful depths of abandonment, and tears came to her eyes in spite of herself. She had nothing to cry about, but her lips quivered and two big tears rose and hung suspended under her long eyelashes, so filling up the whole space before her, that Lottie saw nothing but a waving greenness and blueness, a blurred shadow of earth and sky.

It was just at this moment, while she was still uncertain whether she could get these tears swallowed or whether they must fall, betraying her, that she was aware of some one at her elbow. "I think we shall have rain, Miss Despard," said a deliberate voice; "do you not think we shall have rain? The summer has been so fine that we have no right to grumble. You were the one lady in all St. Michael's whom I most wanted to see."

"I, signor? I do not know what you should want with me," said Lottie, forced by circumstances into rudeness. She did

not want to be rude, but the shock of his sudden address had brought down that shower, falling like drops of a thunder-storm, and she would not turn round to show him her wet eyes. He smiled a little to himself at this petulance, and that was all. He was used to waywardness in young ladies. He was a spare, olive-colored man, not tall, but wiry and close-knit. He had all the aspect of an Italian and the name; but he was not really an Italian, being an Englishman born, a good Tory and a good Churchman, and all that the organist of St. Michael's ought to be. But he was not disinclined to keep up a mystery on this score, having a little love of mystery by nature, and feeling, musically, that his foreign name and looks were in his favor. How far back the signor had to go for his claim to be considered an Italian, nobody knew, but everybody (except the perverse and disagreeable, who would occasionally say Mr. Rossinetti to annoy him), called the musician the signor. His complexion, his moustache, the wonderful dark eyes which were the chief feature in his face, were all of southern origin, and he spoke with a curious deliberation and clear pronunciation of every syllable, which almost looked as if, at one time, there had been difficulties about the language, and as if he had not courage even yet to take any liberties with it. But his accent was as good English as could be desired, and in respect to this as well as to all other questions about his origin the community of St. Michael's were entirely in the dark, as he intended them to be.

"This event," said the signor, in his clear, slow voice, "will bring our little societies, our practisings, to an end, Miss Despard. We were getting on very well. I am sorry to come to an end of anything, and of these above all."

"Yes, I suppose so," said Lottie drearily. "Will it, do you think? She had not very much of a voice."

"No; but there are other things besides voice. You have a very beautiful voice, Miss Despard."

"But I have nothing else," said Lottie, forgetting her precautions and turning quickly upon him; "that is what you mean to say? And you never even allowed before that I had a voice."

"No, not much else," said the deliberate organist; "you have no science, no method. You don't know how to manage what you have got. It is a fine organ by nature, but you cannot produce it as you ought, because you do not know how. To have so much, and to do so little is a great pity. It is a waste of a great gift, it is —— "

"How dare you tell me all this to my face?" said Lottie, transported with vivid anger. She would have taken it more quietly if she had not been weakened in spirit by the discouragement into which she had fallen before. Her fierce, sudden glance was even still unwillingly softened by the wetness of her eyes. But the signor did not flinch. There was a kind of smile in his own as he met her look. He was not afraid of her. He looked, indeed, amiably, genially at Lottie — as she had never seen him look before — and as she turned round she became aware that he was not alone. Over his shoulder, with an alarmed, indignant aspect, which half amused while it consoled her, was another face with which Lottie was very well acquainted. It was the face of his favorite pupil, a young man who followed the signor about like his shadow, always a few steps behind him, always in devout contemplation of him. But young Purcell was not of this mind to-day; he was looking at his beloved master with a mixture of rage and pathos very droll in their combination. Lottie was easily moved, and almost before the words of the defiance had left her lips a laugh forced itself after them. She had to turn round again to conceal the conflict of sudden mirth in her face.

"Would you rather I said it to others than to you? No, because that would do you no good —— "

"And do you really think that I — I——"

Why should she laugh? Young Purcell's face brightened slowly, but took a still more curious look of bewildered inquiry. As for the signor, he thought she had become hysterical, which he believed was a common weakness with womankind in general, and he was alarmed.

"I beg you a thousand pardons if I have seemed rude," he said. "All that I wanted was to begin the conversation; for I have — a little proposal to make."

"Do you call that beginning a conversation to tell me I am quite ignorant, and cannot sing, and waste my voice?" said Lottie, recovering her indignation. "It is not a very civil way."

"Miss Despard, I think you will miss the society's singing, and I want to tell you that it was not good for you. These people were dazzled by your voice," said the organist, with unintentional confusion of metaphor, "and they made use of it. All these fine people they make use of us,

and often forget to say thank you. I was sorry that you should suffer *too;* so was Purcell; he knows what it is — a little. And you have had no teaching, you have not had a thorough professional training as he has —— "

Lottie turned upon him with flashing eyes, and this time she did not laugh at the young man who, over the signor's shoulder, followed every movement of hers with such eager attention. His look of wonder and fear was not less comic than the other changes which had come over his countenance, but she took no notice of it. "I don't know what you mean," she said, "by professional training. What do I want with professional training? What has Mr. Purcell to do with it? What do you mean? how should I suffer? If they thank me, or if they don't thank me, what is that to me?"

The signor cast a glance round at young Purcell, who answered with a look of despair. "If you would but confide in us, we thought we could help you. Indeed, Miss Despard, it is no presumption on Purcell's part, only a fellow-feeling —— "

"Only a feeling — of respect!" This Purcell timidly gasped out, with alarm painted on every feature. Lottie, turning her back to the wall and confronting the two musicians, solemnly made them a very awful curtsy. It was an art she had learned (though the teacher was unaware of the fact) from Lady Caroline; and therefore it was of the very finest and most imposing kind.

"The puzzle is," she said grandly, in a voice not unlike Lady Caroline's, "what the link between us may be."

They were both silenced by this speech, and by her imposing aspect generally; for Lottie was very handsome, and this defiant grandeur suited her. Purcell felt disposed to sink into the earth, and showed it; but as for the signor, he was less alarmed, and, indeed, a little amused — he had seen a great number of heroines, both in public and private life.

"It is always wrong to beat about the bush," he said. "Perhaps I have made a mistake; I thought you probably intended to sing, Miss Despard, as a profession."

"I?" Lottie's voice broke into a half-shriek. "I?" The suggestion gave her a shock which it was hard to get over. She felt a trembling of giddiness and insecurity, as if the ground had suddenly been cut from under her; she could have cried for mortification, injured pride, horrible humbling and downfall. She who had been mourning this change as taking from her all chance of ascent into the society she had a right to, the society she really belonged to — and they thought it was professional work, a profession that she was thinking of! She drew back unconsciously to the support of the wall, and propped herself by it. She could have cried, but pride would not let her. "You are mistaken, altogether mistaken," she said. "I don't suppose that you mean to insult me; but you forget that I am a gentleman's daughter."

Here the ghost of a smile flitted across the signor's olive-colored face. It was as momentary as the passing of a shadow, but yet Lottie saw it, and it stung her as nothing else could have done; she was angry before, but this excited her to passion. She could have flown at him and strangled him for this smile; she understood it well enough. "You smile!" she said. "You think, perhaps, that a poor chevalier, a soldier who is not rich, is not a gentleman. You think it is only money that makes a gentleman. There are many people who are of that opinion; but," said Lottie with a smile, "you will perhaps not be surprised if I think differently. I will bid you good evening, please, now."

"One moment," said the signor; "you must not go away with a wrong impression. Forgive me the mistake, if it is a mistake. You are mistaken, too, Miss Despard, if you think a gentleman's daughter may not sing — to the great generous public as well as to poor little coteries that never say thank you. You mistake, too; but never mind. I meant to have offered, if you would let me, to help you ——"

"Thank you, very much!" said Lottie with great state, "it is not necessary. When I want lessons, I can — ask for them, M. Rossinetti." She had been about to say *pay*, but Lottie was honest, and though she longed to inflict the insult, would not say what was not true. She did not even see young Purcell's pathetic looks as he gazed at her, with the air of a suppliant on his knees, over his master's shoulder; but she saw the half-shrug of the signor's shoulders as he stood aside to let her pass. And perhaps had she but known it there was something comic, too, in the dignity with which she swept past with a little wave of her hand. It was like Lady Caroline, though Lottie did not intend it to be so. The two musicians stood looking after as she walked majestically homewards, with so many commotions in her bosom. She had to pass through the little square in which the lay

clerks lived on her way, and as if to accomplish Lottie's humiliation, Rowley the tenor — who was her teacher — was standing at his door as she passed. Even the chevaliers of St. Michael's "drew a line" at the lay clerks; to associate with them was to descend altogether from any pretence at gentility; and though Lottie was his pupil, Rowley had never transgressed the due limits of respectfulness or pretended to any friendship with the young lady. But the wedding had affected the morals of St. Michael's generally, and made a revolution for the day; and as Lottie passed the tenor took advantage of the opportunity. "How are you, miss?" he said, with a sniff and a lurch which showed the source of his boldness; "won't you come in and have a chat? won't you come in and have some tea with my little girl, Miss Lottie?" Good heavens! what had Lottie done to be addressed in this way; and she knew that the two others would hear this demonstration of intimacy. She rushed passed, stumbling over her dress, wild with resentment and mortification. This was what it was to be poor, to be in a false position, not to be recognized as a lady! One mortification had followed another, so that she did not know how to bear it. Augusta's neglect, the signor's insulting suggestion, and Rowley's familiarity! Lottie did not know which was the most hard to bear.

"Is that you, Lottie? and where have you been?" said Law. "Let's have tea now; I've been waiting and waiting, wanting to go out, and wondering what had become of you." He had begun his bread-and butter on the spot.

"Where is papa, Law?"

"Papa? How should I know? You didn't expect him, did you? I say, I'm going out — do make haste. And look here! I wish you'd speak to him, Lottie. I wish you'd tell him he oughtn't to; I'd give twenty pounds (if I had it) not to have such an uncommon name!"

"It is a very good name — better than any one else's I know. The Despards never were anything but gentlemen."

"Oh! it's a great deal you know about it," said Law, with a groan. "Perhaps once upon a time we were somebody when everybody else was nobody. But when it turns the other way, when we are nobody and everybody else somebody, and when it's known wherever you go whose son you are ——"

"You don't need to continue nobody," she said; "you are a boy, you can do as you like. If we are down now, *you* need not stay down, Law. But then you must not hang about and lose your time any longer. If you will work, you can soon change that."

"Can I!" said the youth; "that shows how much you know. I have never been taught to do anything. If I had been put apprentice to a butcher or a baker when I was young — but you never did anything but bully me to work and go to school. What good is school? If you are to do anything, you ought to be taught when you are young. I have been mismanaged. I doubt if I will ever be good for much now."

"Oh — h!" cried Lottie, with a deep breath of aspiration from the depths of her chest, "if it was only me! I should find something to do. I should not be long like this, lounging about a little bit of a place, following bad examples, doing no work. O Law! if I could put some of me into you; if I could change places with you! Fancy what was said to me to-day. The signor came up to me when we came out of church, and asked me if I was going to sing — for a profession."

"By Jove!" cried Law; he woke up even from his bread and butter, and looked at her with sparkling eyes.

"I had almost said, 'You may be very glad my brother is not with me to hear you ask such a question.' But on the whole I am glad you were not. I said all that was necessary," said Lottie with dignity. "He will never repeat such an insult again."

"By Jove!" Law repeated, taking no heed of what she said, but looking at her with visibly increased respect. "Do you mean to say that he thought you good enough for that?"

"Good enough!" she said, with severe contempt, and a melancholy groan. "I always knew I could sing, even poor mamma knew. But I did not condescend to say much to them. I said, 'I am a gentleman's daughter,' and walked away."

"Well, girls are very funny," said Law. "How you bully me about working! morning, noon, and night, you are never done nagging; but the moment it comes to your own turn ——"

"To my own turn!" Lottie looked at him aghast.

"To be sure. Oh, that's all very fine about being a gentleman's daughter. We know pretty well what that means, and so does everybody. I wonder, Lottie, you that have some sense, how could you be so silly? He must have laughed."

"Oh, hold your tongue, Law! I suppose they thought we were no better

than the most of the people here. When you are poor you are always insulted. I should not care for money, not for itself, not for the gold and silver," said Lottie; "nor even so very much for the nice things that one could buy; but, oh, to be above people's remarks, to be known for what you are, not looked down upon, not insulted ——"

"It depends upon what you call being insulted," said Law; "if any man had said that to me, I should have thought him next to an angel. What is insulting about it? If you like money (and who doesn't like money?) why there's the easiest way in the world of getting it. Sing! I'd sing my head off," said Law, "if that was all that was wanted. And you sing *for pleasure;* you *like* singing! I can't tell what you are thinking of. If I had known you were so good as that — but one never thinks much of one's own sister, somehow," the youth added, with easy frankness. But he was so much excited that he left his tea, and strode up and down the room (three paces and a half, that was all the size of it) repeating "by Jove!" to himself. "If you mean not to do it, you had better not let *him* know you could do it," he announced, after an interval. Never in his life before had the easy-going young man been so moved. "It's untold the money they make," he said.

As for Lottie, her whole being was in a ferment. She looked at her brother with a gasp of pain. The bread and butter had no charms for her on that night of emotion. She took up her basket, which was full of things to mend, and sat down in the window, speechless with vague passion, pain, discontentment. Lottie was not a wise or enlightened young woman. She had not even taken the stamp of her age as many people do who are not enlightened. She had never learned that it was desirable that women should have professions like men. Her thoughts ran entirely in the old-fashioned groove, and it seemed to her that for "a gentleman's daughter" to work for her living, to be known publicly to work for her living, was a social degradation beyond words to express. It implied — what did it not imply? That the family were reduced to the lowest level of poverty; but that was a small part of it — that the men were useless, worthless, without pride or honor; that they had no friends, no means of saving themselves from this betrayal of all the secrets of pride. These were the foolish feelings in her mind. Gentlemen's daughters were governesses sometimes she had heard, and Lottie pitied the poor girls (orphans — they were always orphans, and thus set aside from the general rule), with an ache of compassion in her heart; but it was her private impression that this was a stigma never to be wiped off, a stain, not upon the girl, but upon her family who could permit such a sacrifice. Lottie's view of sacrifice was one which is rarely expressed, but not the less exists, among women and all other persons from whom sacrifices are demanded. Could Alcestis have the same respect after for the man who could let her die for him? Could she go on living by his side and think just the same of him as if he had borne his own burden instead of shuffling it off upon her shoulders? The ancients did not trouble themselves with such questions, but it is a peculiarity of the modern mind that it does. And Lottie, though her point of view was very old-fashioned, still looked at it in this modern way. When Law, whom it was impossible to stir up to any interest in his own work, became so excited over the thought of a possible profession for her, she looked at him with something of the feeling with which Isabella contemplated the caitiff brother in his prison who would have bought his life by her shame. What! would he be "made a man" in such a way? would be buy idleness and ease for himself by exposing her to a life unworthy of "a gentleman's daughter"? She knew he was lazy, careless, and loved his own gratification; but it hurt her to her very heart to think so poorly of Law, who was the only being in the world whom she had ever been able to love heartily as belonging to her.

Let it not be thought, however, that any unwillingness to work for Law, to make any sacrifice for him, was at the bottom of this disappointment in him. She was ready to have worked her fingers to the bone, indoors, in the privacy of the family, for her father and brother. She did not care what menial offices she did for them. Their "position" demanded the presence of a servant of some kind in the house, but Lottie was not afraid of work. She could sweep and dust; she could cook; she could mend with the most notable of housewives, and sang at her work, and liked her people all the better because of what she had to do for them in the course of nature. That was altogether different, there was no shame to a lady in doing this, no exposure of the family. And Lottie was not of the kind of woman who requires personal service from men. She was quite willing to serve them, to wait

upon them if necessary, to take that as her share of the work of life; but to work publicly for her living, what was that but to proclaim to all the world that they were incapable, that they were indifferent to their duties, that there was no faith to be put in them? If Law had leaped up in wrath, if he had said, "No, it is my place to work; I will work; no one shall say that my sister had to earn her living," how happy, how proud Lottie would have been! That was the ideal for a man. It was what she would do herself if she was in his place; and, oh, if she could but put herself in his place, and do what Law would not do! oh, if she could but put herself, a bit of herself, into him, to quicken the sluggish blood in his veins! When Law, having exhausted all that was to be said on the subject, went out (and where did he go when he went out?) Lottie sat at the window and darned and darned till the light failed her. She ploughed furrows with her needle in the forefinger of her left hand; but that did not hurt her. Oh, if she could but move them, inspire them, force them to do their duty, or at the worst do it for them, so that the world might suppose it was they who were doing it! That was the aspiration in her heart; and how hopeless it was! "Oh, if I could put some of me into him!" Lottie thought, as many a helpless soul has thought before her. But to move out from the shadow of the house, and betray its nakedness, and take the burden visibly on herself, that was what Lottie felt she would rather die than do.

Meanwhile, in the soft evening, various people were promenading up and down between the Abbey Church and the lodges of the chevaliers. Some of the old chevaliers themselves were out with their wives hanging on their arms. Either there would be two old gentlemen together, with the wife of one by his side, or two ladies with a white-haired old gallant walking along beside them, talking of various things, perhaps of politics when there were two men, and of any signs of war that might be on the horizon, and if two were women, of the wedding, and how Lady Caroline took the marriage of her only daughter. The signor was practising in the Abbey, and the great tones of the organ came rolling forth in a splendor of softened sound over the slope with its slowly strolling groups. Some of the townspeople were there too, not mixing with the others, for the signor's practising nights were known. The moon began to climb after a while behind the chevaliers' lodges, and throw a soft whiteness of broad light upon all the pinnacles of the Abbey; and Lottie dropped her work on her knee, unable to see any longer. When the moon rose, she was thrown into shade, and could watch the people with the light in their faces at her ease. And by-and-by her attention was caught by two single figures which passed several times, coming from different directions, and quite distinct from each other. They both looked up at her window each time they passed, calling forth her curiosity, her scorn, her laughter, finally her interest. Watching them she forgot the immediate presence of her own annoyances. One was the young musician, Purcell, at whom Lottie had secretly laughed for a long time past, at his longing looks and the way in which the vicissitudes of her countenance would reflect themselves in his face. But the other she could not for a long time make out. It was not till, seeing no one, he stood still for a full half-minute in the light of the moon, and looked up at her, that she recognized him — and then Lottie's heart gave a jump. It was young Rollo Russell, Lady Caroline's nephew, the best man at the wedding; and what could he want here?

From The Spectator.

CHARLES DICKENS'S VERSE.

In the January number of the *Gentleman's Magazine* there is a paper of some interest by Mr. Percy Fitzgerald, in which the principal specimens of Charles Dickens's verse are collected together. Dickens does not seem to have written as much verse as Thackeray, nor is there among his efforts of this kind any piece which even approaches in merit some half-dozen or more of Thackeray's little poems, — and we say this without taking into account at all the humorous poems in which verse is only used by Thackeray as a means of enhancing the grotesque effects of his story. No doubt the reason is to be found in the habitual motive of the two great novelists. Dickens was one of the greatest humorists who ever lived, if you mean by a humorist one who could accumulate round the thread of a particular grotesque idea an unrivalled wealth of apt and ever-brightening illustration, partly drawn from his enormous rapidity and accuracy of observation, but still more from the whimsical fancy which made observation in him completely subservient

to his keen sense of the ridiculous. In the deepest sense of the word "humor," — the humor which springs from the subtler paradoxes of *feeling*,— Dickens was not really a creator of anything like the first order. His finest touches are subtle indeed, but they are subtle rather in the mode in which he gives expression to what is intrinsically ridiculous, than in the shades of emotion with which he deals. When, for instance, he makes Mrs. Gamp propose to cut bread and butter for others, and then makes her wander off into reasons for cutting off the crust which show that what she is thinking of is her own "tender teeth," and not any one else's, the exquisite ludicrousness of her speech is due not to any subtle dealing with human emotions, but to the accumulation of external detail with which he embellishes the disclosure of her self-regarding appetites. In his own way, Dickens surpassed any humorist whom England, or perhaps the world, has produced. But then that way was a peculiar way, and depended much more on illimitable resources for harping on the same string without ever saying the same thing a second time, and this without ever swerving from his original idea, than on any fineness of insight into the dissolving colors of human emotion. Now this vast wealth of fancy for the skilful and various illustration of selfishness, or hypocrisy, or childish perplexity, or professional enthusiasm, — in which last Dickens was a greater master than in anything else, — is hardly a qualification for any kind of even comic poetry, and accordingly excepting, perhaps, Mr. Weller's song concerning the bishop's murder and robbery by Dick Turpin on Hounslow Heath, there is no comic poetry of his worth notice. What remains of Dickens's poetry is, almost without exception, picturesque or pathetic in its motive; and whether in the picturesque or in the pathetic vein, Dickens was apt to be so self-conscious that he almost always fell into melodramatic pictures or melodramatic sentiment; and it is this which spoils his poetry, whether his poetic prose or his verse itself. Perhaps the most deservedly popular of all his few poems is the one called "The Ivy Green" in "Pickwick," which is really graceful, but has a conventional sort of plaintiveness that does not ring like true feeling: —

Oh! a dainty plant is the ivy green,
  That creepeth o'er ruins old;
Of right choice food are his meals, I ween,
  In his cell so lone and cold.
The wall must be crumbled, the stone decayed,
  To pleasure his dainty whim:
And the mouldering dust that years have made
  Is a merry meal for him.
    Creeping where no life is seen,
    A rare old plant is the ivy green.

Fast he stealeth on, though he wears no wings,
  And a staunch old heart has he.
How closely he twineth, how tight he clings,
  To his friend the huge oak-tree!
And slily he traileth along the ground,
  And his leaves he gently waves,
As he joyously hugs and crawleth round
  The rich mould of dead men's graves.
    Creeping where grim death hath been,
    A rare old plant is the ivy green.

Whole ages have fled, and their works decayed,
  And nations have scattered been;
But the stout old ivy shall never fade
  From its hale and hearty green.
The brave old plant, in its lonely days,
  Shall fatten upon the past:
For the stateliest building man can raise
  Is the ivy's food at last.
    Creeping on, where time has been,
    A rare old plant is the ivy green.

The half-murderous and ogreish temper attributed to the ivy in that song is, however, a pure bit of commonplace. As the ivy is seen in its richest life where there is most decay, it would occur to any one to depict it as feeding on time and death, and this idea is worked out in every verse. But if that were really the most natural idea suggested, we should regard ivy with more disgust than pleasure, — much as we regard the rank and noxious weeds which really suggest neglect as well as age; and we need not say that that is not really the sentiment with which a plant is regarded that we all cultivate so carefully, and are so glad to see covering bare walls and enveloping the most beautiful and stately of buildings. In fact, Dickens fastened on a commonplace idea which was not really appropriate to his subject, and then worked it out with his usual skill and smartness. But if this bit of verse is hardly true in its sentiment, still less so, we think, are the passages of so-called poetical prose for which his tales are famous. Mr. Fitzgerald says: —

Mr. Horne, the author of "Orion," was the first, we believe, to point out that many tender passages of Dickens's prose writings were virtually blank verse, a theory well supported by these specimens from "The Old Curiosity Shop:" —

And now the bell — the bell
She had so often heard by night and day,
  And listened to with solemn pleasure,
    E'en as a living voice —
  Rung its remorseless toll for her,

So young, so beautiful, and good.
Decrepit age and vigorous life,
And blooming youth and helpless infancy
Poured forth — on crutches, in the pride of strength
And health, in the full blush
Of promise, the mere dawn of life —
To gather round her tomb. Old men were there
Whose eyes were dim
And senses failing,
Grandames who might have died ten years ago
And still been old — the deaf, the blind, the lame:
The living dead in many shapes and forms,
To see the closing of this early grave
What was the death it would shut in,
To that which still could crawl and creep above it!
Along the crowded path they bore her now;
Pure as the new-fall'n snow
That covered it; whose day on earth
Had been as fleeting.
Under that porch, where she had sat when Heaven
In mercy brought her to that peaceful spot,
She passed again, and the old church
Received her in its quiet shade.

Throughout the whole of the above, only two unimportant words have been omitted, *in* and *its*, and "grandames" has been substituted for "grandmothers." All that remains is exactly as in the original, not a single word transposed, and the punctuation the same to a comma. Again, take the brief homily that concludes the funeral: —

Oh! it is hard to take to heart
The lesson that such deaths will teach,
But let no man reject it,
For it is one that all must learn,
And is a mighty, universal truth.
When Death strikes down the innocent and young,
For every fragile form from which he lets
The parting spirit free,
A hundred virtues rise,
In shapes of mercy, charity, and love,
To walk the world and bless it.

So also in "Nicholas Nickleby:" —

The grass was green above the dead boy's grave,
Trodden by feet so small and light,
That not a daisy drooped its head
Beneath their pressure.
Through all the spring and summer time
Garlands of fresh flowers, wreathed by infant hands,
Rested upon the stone.

But these passages suggest to our minds much more the self-consciousness of feeling exulting in its own beauty, than the unstudied pathos of natural emotion. We confess we are unable to enjoy the rhythm which seems to mark that artificial state of mind. Compare these passages with one of Thackeray's most truly pathetic passages, and we see at once how much truer a lyrical "cry" there is in it than in Dickens's solemn and sonorous — we might almost say funeral-sermonlike — grief. We will take the passage where Esmond meets Lady Castlewood after the evening service in Winchester Cathedral: —

"And now we are drawing near to home," she continued; "I knew you would come, Henry, if it was but to forgive me for having spoken unjustly to you after that horrid — horrid misfortune. I was half frantic with grief when I saw you. And I know now, — they have told me. That wretch — whose name I can never mention even — has said it; how you tried to avert the quarrel, and would have taken it on yourself, my poor child! but it was God's will that I should be punished, and that my dear lord should fall." — "He gave me his blessing on his death-bed," Esmond said; "thank God for that legacy." — "Amen, amen, dear Henry!" says the lady, pressing his arm; "I knew it. Mr. Atterbury of St. Bride's, who was called to him, told me so. And I thanked God, too, and in my prayers ever since remembered it." — "You had spared me many a bitter night had you told me sooner," Mr. Esmond said. — "I know it, I know it," she answered, in a tone of such sweet humility as made Esmond regret that he should ever have dared to reproach her. "I know how wicked my heart has been; and I have suffered, too, my dear. I confessed to Mr. Atterbury —— I must not tell you any more. He — I said I would not write to you, or go to you; and it was better even that, having parted, we should part. But I knew you would come back — I own that; that is no one's fault. And to-day, Henry, in the anthem, when they sang it, — 'When the Lord turned the captivity of Zion, we were like them that dream,' I thought, yes, like them that dream, — them that dream. And then it went, 'They that sow in tears shall reap in joy;' and 'He that goeth forth and weepeth shall doubtless come home again with rejoicing, bringing his sheaves with him;' I looked up from the book, and saw you. I was not surprised when I saw you. I knew you would come, my dear, and saw the gold sunshine round your head." She smiled an almost wild smile as she looked up at him. The moon was up by this time, glittering keen in the frosty sky. He could see for the first time now clearly her sweet, careworn face.

Here is the very highest kind of pathos, — the true lyrical cry, — though without the sonorous rhythm which gives so artificial an effect to Dickens's pathos. The truth is, that Dickens's poetry, like his humor, is due to fancy working on the suggestion of external circumstances. He feels the melancholy of a sweet child's death or a neglected boy's early fate, and immediately his fancy sets to work to accumulate round such a theme all the thoughts which conventional associations suggest. But he had little real dramatic insight, no command of those strange rushes of human feeling which defy the presentiment of the world, and therefore the secret of true poetic pathos, which depends on holding the key to these strange ebbs and flows of human feeling, was denied him. Even the passage in which Dickens comes nearest to such lyrical feeling, — the description of little Paul Dombey's death, — is disfigured by the *exalté* tone peculiar to this formal and, as it were, bespoken grief, —

the grief which is expressed on the stage by what are called "tears in the voice."

But in so wonderful and original a humorist as Dickens, one certainly would have expected something of the playful vein in which not only Thackeray, but Hood even more especially, is so great. Yet in point of fact, Dickens has no playful mood, either in prose or verse. He is delightfully, charmingly, inimitably ridiculous; and he is often excessively jovial; but he is never playful. The nearest thing to playfulness, perhaps, is contained in the squib on Southey for his political fickleness, which Mr. Percy Fitzgerald thus records: —

Mrs. S. C. Hall, as is well known, possesses a very remarkable album, filled with contributions, extempore and otherwise, of the most famous persons of the time. On one page Southey had written, in allusion to the autographs of Joseph Bonaparte and Daniel O'Connell, which were inscribed on the next leaf: —

Birds of a feather flock together,
But *vide* the opposite page;
And thence you may gather I'm not of a feather
With some of the birds in this cage.

Later, when Dickens furnished his little contribution, he wrote, in allusion to Southey's change of opinion: —

Now if I don't make
The completest mistake
That ever put man in a rage,
This bird of two weathers
Has moulted his feathers,
And left them in some other cage.

But that is not playfulness; it is sarcasm. In a playful humor you cannot be sarcastic, and you cannot be mirthful. You may be either glad or sad, but you cannot be savage, or exultant, or miserable. It is a mood in which you are inclined to make innocent experiments to bring out the paradoxes of your own, or some one else's, nature, a mood of half-lights, in which you hardly know whether you are most amused by the play of feeling, or most inclined to indulge your sympathy with it. Dickens has no such mood of half-lights. He either piles up the ludicrous till you scream with laughter, or the agonies till you resent them as unnatural, or else he is as jovial as men who have well drunk. Such a mood as Thackeray gives us in making his gold pen describe the things it had written for him for three years back, is unknown to Dickens: —

I've helped him to pen many a line for bread;
To joke, with sorrow aching in his head,
And make your laughter when his own heart bled.

I've spoken with men of all degree and sort —
Peers of the land and ladies of the court;
Oh! but I have chronicled a deal of sport!

Feasts that were ate a thousand days ago,
Biddings to wine that long hath ceased to flow,
Gay meetings with good fellows long laid low;

Summons to bridal, banquet, burial, ball,
Tradesman's polite reminder, of his small
Account due Christmas last, — I've answered all.

Poor Diddler's tenth petition for a half-
Guinea; Miss Bunyan's for an autograph;
So I refuse, accept, lament, or laugh,

Condole, congratulate, invite, praise, scoff,
Day after day still dipping in my trough,
And scribbling pages after pages off.

On the whole, we think Dickens's verse best, when he intends to be neither pathetic nor amusing, but to point a moral with some sharpness. He might have written verse of the didactic-epigrammatic kind, we suspect, with much success. The prologue to Mr. Westland Marston's "Patrician's Daughter" is dignified and vigorous, and the following "parable in verse" is keen, if not quite fair in its drift: —

They have a superstition in the East
That "Allah," written on a piece of paper,
Is better unction than can come of priest,
Of rolling incense, and of lighted taper;
Holding that any scrap which bears the name
In any characters its front impressed on,
Shall help the finder through the purging flame,
And give his toasted feet a place to rest on.

Accordingly they make a mighty fuss
With every wretched tract and fierce oration,
And hoard the leaves — for they are not like us,
A highly civilized and thinking nation;
And always stooping in the miry ways
To look for matter of this earthly leaven,
They seldom, in their dust-exploring days,
Have any leisure to look up to heaven.

So have I known a country on the earth
Where darkness sat upon the living waters,
And brutal ignorance, and toil, and dearth
Were the hard portion of its sons and daughters;
And yet, where they who should have oped the door
Of charity and light, for all men's finding,
Squabbled for words upon the altar-floor,
And rent the book, in struggles for the binding.

The gentlest man among those pious Turks
God's living image ruthlessly defaces;
Their best High-Churchman, with no faith in works,
Bowstrings the virtues in the marketplaces.

The Christian pariah, whom both sects curse
(They curse all other men and curse each other),
Walks thro' the world, not very much the worse,
Does all the good he can, and loves his brother.

That is, we think, the nearest thing to success Dickens ever achieved with verse. He had not the finely modulated mind needful for a lyric poet; nor the knowledge of the heart needful for a dramatic poet, and in satire he was apt to be vulgar, — as for instance, in the dreadfully vulgar invective against the British Lion which Mr. Fitzgerald quotes. But he had a strong didactic impulse, and keen wit to give it edge and incisiveness.

From Good Words.

DORIS BARUGH.

A YORKSHIRE STORY.

BY THE AUTHOR OF "PATTY."

CHAPTER LIII.

BESIDE THE GATE.

THE wind had risen to a gale during the night. Chimney-pots, slates, and branches of trees, scattered in every direction, showed the violence of the storm, and as Mr. Burneston went up the road past the vicarage there was still wind enough to make him pull his hat over his eyes and button his coat more closely.

Last night his own thoughts and the storm had helped to keep him awake, and now, long before his usual time for rising, he had come out to clear his brain.

But the bright morning did not cheer him; he was very sad and troubled; his wife's conduct grieved him bitterly. It was a revelation of her character he was not prepared for. He considered the plea of little Phil's illness a mere subterfuge to screen her temper.

"I must be master in this case," he said, as he reached the vicarage; but he heard no inward echo to this assurance; no effort of will rose up to say, "You shall be master, by my aid."

He stopped before the vicarage gate. "I wonder if Spencer is up," he said. He had no fixed intention of consulting the vicar, but he needed help so sorely that if he could have seen his old friend he would certainly have asked his advice.

Mrs. Riccall, the housekeeper, stood at the open door, and seeing the squire, she curtsied and came forward to answer his question.

She did not think the vicar would be down for a good hour, and Mr. Burneston took his way across the glebe fields.

The geese were there, eating grass and squabbling as if they had been doing so ever since his last visit. The grunting of the pigs, the crowing of cocks and clucking of hens, showed that life was stirring at Church Farm; and all at once he heard the swing of the white gate and Shadrach's call, and he knew that the cows were passing out to the lower meadows.

He was not in a mood to speak to Shadrach or his wife, and he stopped at the gate leading to the rick-yard — the gate made so memorable in his life, and which still had power to stir his heart deeply.

Could it be only nine years since Doris had appeared to him a sudden vision of perfect beauty, as she swung there singing her "fond rhyme"? How long ago it seemed!

More than once during the first year of their marriage he had tried to take her back with him to that sweet memory, and she had shrunk from it — shrunk with such evident dislike that he felt it would be selfish even to let her see the store he set on it.

"Ah!" he said, "who knows! if I had been more masterful I might have gained her respect; I fear she has none for me now, or she would not be so careless of giving one pain."

Unknowingly he was judging his wife hardly in gifting her with a quality she lacked. For her want of sympathy hid from Doris now, as it had in the early days with regard to George and her father, the pain she had given her husband. Her own affection for him was far too tepid to enable her to guess that although he might blame her, his love was too deep to change. She thought he would shrink from her as she now did from him; it would have been impossible to her even to guess his sorrow when he learned that she could sleep without an exchange of forgiveness. The ache was in his heart still.

He stood leaning against the gate, very sad and desponding.

It seemed to him that he must yield; he must send Ralph away again among strangers, or Doris would fulfil her threat and take Phil out of his brother's reach.

"Such wilfulness, too," the poor, weary man said fretfully. "The child need never be with Ralph. Poor Ralph, she is very hard on him."

There was another alternative; he could

speak strongly to Doris, and point out to her how much more dignified it would be to stay at Burneston and compel Ralph's good behavior in future; for Mr. Burneston believed that the young fellow would keep more restraint over himself if he were gently treated. But the squire shrank from this. He could not resolve to go through another scene with Doris; he had suffered too deeply yesterday.

"What a mockery life is!" he thought. "There is no one man or woman who can escape sorrow and disappointment. Gilbert was right when he told me to keep my freedom; he seems happy enough. Just now I would gladly change places with him."

And then, with the impatience of his hopeful temperament, he told himself that it was only a question of time. It was a quarrel between Doris and Ralph, which they would both grow to forget, and that as wisdom and discretion came to Ralph — Mr. Burneston took it as a matter of course that they would come — the lad would learn to value and to love his step-mother. As long as his thoughts centred on Ralph, hope was easy, but it was different when he came back to the real heart-wound — Doris. They had had disagreements, but this was their first quarrel, and how cold and hard and unforgiving she had proved herself! and then he came back to the point from which he had started — "How utterly careless she is of giving me pain!"

Will Slater had also risen early this morning, to ascertain the damage done by the storm, and he walked about his domain growling ominously. Slates had been whirled from out-houses on to cucumber and melon frames; carnations and dahlias lay prostrate on the flower-beds, a new plantation of standard roses was ruined, and a limb of the cherished cedar lay on the grass beneath its parent tree.

"Caps mah, 'at it diz, what fer t' wind comes i' sike a gait. Wind noo an' then theer's nae hairm in, it purifies things, but sike a tearin', rampagin' bullock o' a wind ah nivver heeard on, nor wishes t' hear again. Ther ain't onny Pruvidence in it, sae theer noo!"

He paused and listened as the wind sighed in a wailing gust round the house, as if it refused to submit willingly to the calm that was pressing on its mischievous wings.

"It soughs still," Slater said.

He went slowly on to the other side of the cedar-tree to see the damage done, for it was from this side, farthest from the garden, that the branch had fallen.

"Woonkers!" He stopped in dismay, the ground here was strewn with fragments of boughs from the beech-tree, one branch heaped on another in such confusion that the amount of mischief could not be seen at once. "Woonkers!" he said again; and then he turned to go home, for he had come out without breakfast.

The Hall door opened, and there stood Mr. Hazelgrave in the act of letting out Mrs. Burneston's little King Charles spaniel. The pretty little creature came frisking up to Slater, shaking his long ears, and gambolling with that indescribable outcry of welcome bestowed by small dogs on their favorites.

But Slater did not return the favor.

"Getten oot, ye snablin' cur," he pretended to kick the frolicsome little creature; "ah finns yur splay fut ovver a' mah flower-beds. Gan in wi' ye, d' ye hear; that's wheer ye sud bide, ye larl limb o' Satan."

But the dog went sniffing along the terrace.

"Gan in wi' ye, d' ye hear?" Slater turned wrathfully on the intruder, whose large, heavy paws made him, at times, an object of dislike to the gardener.

The dog crouched at the angry tone, but he would not follow Slater. He went on sniffing till he reached the fallen branches, and then he began to whine and scratch violently.

"An empty bird's nest or sum sike trumpery." The gardener was hungry; and just at that minute he wished he had a switch in his hand.

"Coom oot on 't, ye tastril. Ye ——" He ran after the dog, for the creature had plunged madly down among the fallen branches, and only his black tail, wagging violently, and his furious barking showed where he was.

"Drat t' imp! he'll break a leg or summat. Ah mun see 'im safe indoors; t' bairn Phil's fair set on 'm, and onnything at t' bairn fancies t' mistress thinks a heap on. Sae coom oot o' that, ye — what maks yu so mad? Ye're as hot-footed nobbut ye'd fun your breakfast. Coom oot! Dash mah, ah'll fetch yur scruff oot o' 't."

He scrambled on to the heap of fallen branches, and thrust his hand down to drag the dog out; but the creature resisted violently. Its barking had changed to a moaning whine which puzzled Slater. The dog's struggles, small as he was, had brushed off the twigs and leaves, and made

an opening through which he had forced his way to the lower branches, and he was now beyond the reach of the gardener's arm; but Slater was determined to capture him, and he struggled down among the branches, widening the opening as he went with one of his broad shoulders.

All at once he stopped, and for an instant lay motionless on the heap of branches — then slowly he raised himself on his feet.

His face was still red with the rough struggle among the branches, but his eyes stared wildly, and large drops stood on his forehead; and while he stood the red on his cheeks faded to a ghastly paleness, and his lower jaw fell.

"My God!" he said.

Then he stumbled on to the house as if his sight failed him; a sort of instinct rather than any reasoning process — he was too frightened to think — made him go round to the front entrance instead of that which opened on to the lawn.

Till now he had kept a dead silence. He had not even attempted to call the dog away; but just beyond the door, at the open gates leading to the stable-yard, stood Lot Groves, Mr. Sunley's deputy, who had come upon a message from the sexton to the squire.

Then the full horror of what he had seen, half hidden among the beech-trees, thrilled through the dazed man's frame, and he shouted out with all his strength.

"Theer's murder yonder — murder! Ah says. Theer's t' yung squire liggin' dead an' cauld atween t' beech boughs."

"Murder!" Lot flung both arms up at the word, and then ran wildly out at the front gate. "Murder!" he shouted as he went; and then the steep ascent of the village street quieted him.

But when he came in sight of Sunley's cottage, and saw the sexton at his door, nodding across to Shadrach Swaddles at Church Farm gate, Lot's panic terror found voice again.

"Murder!" he cried. "Murder doon at t' Hall! T' yung squire's liggin deead under t' windys among t' beech boughs. He's bin murdered i' t' night."

The squire had stood some time at the gate fighting his own thoughts, and at the strange confused murmur of voices, he roused as if from sleep; there were several speakers, so it seemed to him, and all at once came a woman's shrill scream of horror.

He roused and turned quickly; and while he tried to gather in the meaning of these sounds he saw Joseph Sunley hobbling up to him, with a flushed face and excited gestures.

Behind him came Shadrach Swaddles trying to hold the old man back; and just in sight were several figures running. Sukey's face was white and scared, her blue eyes opened widely, and her fair hair floating in the wind.

"What's the matter with you all?"

That was all he had time to say.

Joseph Sunley had got up to him; and as he opened his toothless mouth his tongue quivered with the awful message he had come to speak.

Shadrach's face, too, was full of awe; and he caught at Joseph's arm with his rough fingers.

"Hev a care, Maister Sunley. Donnut be tellin' it sudden."

The squire stood spelled. He grew pale and leant against the gate. He could not ask a question.

"Theer's murder been done at t' Hall!"

Joseph's voice cracked as he screamed in the squire's ear. "T' yung squire's lying dead atween t' trees!"

Mr. Burneston's face grew grey, his lips moved, and so did his right arm slightly; his stick fell from his hand; then his whole figure swayed and rested heavily on the gate.

"It's t' Lord's will," Joseph began; but Shadrach's eyes were keener; he pushed the old man aside rudely, just in time to catch Mr. Burneston in his strong arms as he fell forward rigid, but with open eyes.

"Sukey," he called over his shoulder, "run doon tu t' parsonage an' fetch help tu carry t' squire tu t' Hall at yance. Tell t' parson he has fainted off dead."

The man's voice was hoarse with suppressed feeling; but Joseph Sunley felt aggrieved at this sudden loss of an audience.

"Bon it!" he said querulously, "ah thowt t' squire was mair manful. Mebbe it's t' suddenness on it, an' a wee blood-letting wad bring him reeght eneeaf. Ah've gitten a blood-letter somewheres."

"Whisht, ye awd hoit." Shadrach spoke sternly. "Ye'll nut dare tu touch t' maister whiles ah hands 'im. Gang yer ways; it's yu 'at hev worked t' mischief. Help mey, Sukey;" and he began to loosen the squire's collar and stock.

Timothy Tyzach hobbled forward, and looked curiously in the silent face.

"Mah gran'fayther war the same," he said calmly, with that strange want of emotion one sees in the very old, "and he nivvers spoke again."

Lot Groves stood stupid and silent, staring first at Sunley (who had looked foolish since Shadrach's rebuke) and then at Mr. Burneston.

And all this while the squire lay grey and silent in the man's arms, so heavily inert, that strong, broad-shouldered Shadrach had to lean heavily on the gate to keep his footing.

CHAPTER LIV.

BESIDE THE DEAD.

DORIS had not slept better that night than any of the other inmates of the Hall. The child, too, had been restless. But towards morning Doris had fallen into a deep sleep, with little Phil sleeping sweetly beside her.

She roused at last, and it seemed to her that the knocking she now heard had been going on for some time while she slept; then she remembered that she had fastened the doors of her room when the maid left her. She got up hastily and went to the door. The nurse was waiting there with a pale, troubled face, but her mistress was too much preoccupied to notice it.

"If you please, ma'am, I am come for Master Philip, and — and Mr. Raine wishes to see you as soon as you are ready."

Little Phil waked and sate up. "Mamma, me wants Ralphie," he said. "Will Ralphie kiss me now, mamma?"

Doris kissed him and hurried him away. She was vexed that his first thought should be of his brother. She felt puzzled, but she did not choose to ask a question. "I will ring as soon as I am ready," she said. Had it really come to this? Had her husband asked his cousin to mediate between them?

Her lip curled, and she went on dressing without ringing for her maid.

But Mr. Raine was in an impatient mood. Just as she was dressed came another summons.

"Mr. Raine told me to say he is waiting in your sitting-room, ma'am."

Doris felt haughty and ill at ease. Yesterday, for the first time in her life, she had sought a special interview with her husband, but it had jarred her to seek it — she so much disliked anything out of the ordinary tenor of life, anything which roused emotion. The dispute that had followed rankled. She was angry with her own want of self-control, and now this thought that her husband had consulted Mr. Raine made her very angry; it would have been so much wiser if he had kept their dispute to himself.

She found Mr. Raine standing in the middle of her sitting-room. If she had not been so self-centred she must have seen how agitated he was. He remained standing, even when she seated herself.

"You sent for me," she said coldly.

"Something very sad, very terrible, has happened," he said abruptly. The strange tone in his voice made Doris look at him fully, and then the change in his face struck her at once. He looked ten years older, and his hair was rough and disordered.

"What is it?" she said. She looked round with a sort of gasp; she had no room for any thought but her child, and Gilbert Raine guessed at her fear.

"It is Ralph — an accident," he said. "Poor dear fellow — he — he — we suppose that he fell from his bedroom window in getting out during the storm last night. He is dead."

Her thoughts went more swiftly than his words did.

"Dead!" she repeated. Then a slight shiver passed over her and she sate silent.

Raine had already told the news to Rica, and she had burst into tears.

"How cold this woman is!" he thought; then he said, "Do you know where your husband is, Mrs. Burneston? — he has not been told."

"Are you sure he is not in his dressing-room?"

Raine shook his head. "He is away somewhere." Then he broke out suddenly, "Oh, Mrs. Burneston! think what a blow this will be to him! he was so proud of Ralph."

Doris felt as if she was turning to stone, but she tried to rouse herself.

"Where is he?" she said mechanically, and then with a change of manner, as a sudden fear shot painfully through her brain, "Where is little Phil? Surely — surely they will not let the child —— "

Raine was shocked by her seeming want of feeling.

"The child is probably in his nursery. So far, Mrs. Burneston," he said formally, "I have done what seemed right to do, but now I must go in search of my cousin. Will you come down with me and see if all is done that he would wish done for the poor boy?"

He turned away hurriedly; his voice was choked, and yet Doris sate still apparently unmoved by this terrible blow.

"Thank you; I will come presently,"

she said. "Please do not lose a minute in going to seek for Mr. Burneston. You did not say where you had put ——"

He interrupted her — "In the library; do go down as soon as you can." Then, carried away by his feelings, he looked at her earnestly. "Indeed, Mrs. Burneston, I speak for your own sake; if you don't go down your want of interest will be remarked on; I think you should show yourself as soon as possible."

Doris looked at him keenly.

"I am going down," she said; "but I beg you to find my husband and break this sad news to him gently."

Something in her look startled Raine. It was reproachful, he fancied, but he had no thoughts to spend on Doris; his heart ached so sorely for the bereaved father.

Doris felt deeply misunderstood. The sudden news had terribly shocked her, but she had been too long accustomed to hide her feelings from observation to give way to them now in the presence of Gilbert Raine. Yet while she had felt more horror than she could have been expected to feel for anything connected with Ralph Burneston, she had been misjudged. She rose up as soon as Gilbert had departed. She was thankful she had not to break the tidings to her husband. He too would probably have misjudged her.

"My sorrow would not have satisfied him," she said; "his will be such demonstrative grief. Poor Ralph! I wish it had not happened just now." She stopped, and went on thinking — "We should never have agreed. He would have brought perpetual strife between Philip and me; after all, it is the suddenness one regrets. If it could have come in a less painful way — poor Ralph!"

She shrank from going down, and yet the wisdom of Raine's suggestion struck her forcibly; for she had an intuitive knowledge that the household guessed at her dislike to her stepson. But as she went slowly down the broad staircase a strange feeling of guilt gathered and seemed to take complete possession of her. A flush rose on her cheeks and seemed to burn there.

Benjamin Hazelgrave stood at the library door very sad and downcast.

He did not speak when his mistress approached, but he deferentially unlocked the door, and opened it for her to go in.

Doris had never seen death, she shuddered and trembled at the idea of seeing it alone; she wished she had asked Rica to bear her company, and she half turned back to seek her, but the butler was looking fixedly at her, then he shut the door and she was alone. She made an effort to quiet her agitation, and went slowly forward into the room.

The shutters had all been closed, but some light came in through the round tops of the windows, and from two tall candles on a table.

Doris felt in a dream. She saw dimly that one of the large writing-tables was covered with a sheet; the white covering told out powerfully in the gloom of the room. A strong shuddering seized on Doris, and she shrank from the awful presence dimly indicated beneath the shrouding linen, and for a moment she clung to one of the tall chairs for support. She was struggling against herself — not only against her fear, but against the horrible unnatural joy that had suddenly wakened in her at the sight of that rigid form on the table. Her boy was heir now. Who could claim his inheritance? "No one! no one!" she repeated. But she hated herself for the thought even while it came; and how earnestly in this moment of sore temptation she strove to be good, to be what she considered noble, forgiving, and magnanimous, wholly without one mean thought to alloy her greatness! — in vain, she could not conquer; the passion she had cherished and warmed so long in her bosom would have its triumph; she would have given much to be able to shed a tear for the fair lad struck down in the pride of his youth and beauty, and instead she found herself planning the future she had so long coveted for her child, even while she stood beside his dead brother.

All at once she started violently, and if she had not clung again to the chair she must have fallen on the floor in the ghastly terror that seized her; for something stirred the white covering, and she forced herself by a great effort to look steadily.

"Ah!" — and then she darted forward and snatched her child to her bosom.

Phil cried out passionately, and struggled in her arms.

"Don't take me away; me wants to stay with Ralphie, mamma," he cried. "Ralphie wake soon."

Before she could speak, before she could even realize what was passing, a figure, which till now she had not seen in the gloom, rose up from kneeling beside the body. It was Faith Emmett; her grey hair hung loosely about her face, and her eyes were red and swollen.

"Whisht!" she raised her hand solemnly. "Ah'm shamed on ye, Mistress

Burneston, to come troublin' t' rest o' t' dead."

"Hush!" Doris spoke sternly; she had set Phil down, but she kept his hand tightly clasped in hers. "How could you bring the child to such a dreadful sight? It was frightfully wrong." Her voice shook with agitation.

"It's for yu to haud yer peace." Faith's anger rose, and her eyes gleamed malignantly. "Ah wonders yu can bear tu face yur wark. Yes, Mistress Burneston" — her voice rose with a wailing sound as if she were chanting a dirge — "yur wark — yu may not hev caused his death wi' yer ain hands, but fer all that yu hev caused it; yu took all t' pleasure an' all t' joy oot o' t' poor lad's life; yu bred strife atween him an' his father, where noane wad ha bin athowt yu; nivver a word o' love, nivver a thowt o' kindness did yu gi' him fra first to last, an' noo yu can show skime nae langer, yu take yer bairn fra him as if he war too gude fer t' likes o' his ain brother."

The words had stabbed deeply, but still Doris tried to maintain her self-possession.

"Silence!" she said; "you are in great grief, and you don't know what you say. Hush! you must not stay here unless you can control yourself; Mr. Burneston will be here soon."

"He may come," she said, "but ah've getten maist reeght to him" — she pointed to the table as she spoke — "fer ah've loved him all thro' bad an' gude alike; t'were all yan to me. Ah, God knows hoo ah loved him!" Then some memory came back, she raised her head, pushed her hair from her face, and pointed one finger at Doris.

"Yes, 'tis yer ain wark; ye've sent him tu meet his God wi' his sins on his head, but they'll lie at your door, not his; it was you that druv him to wild ways, yu that ruined his peace. May God reward yu fer it! An' noo yu thinks yer way's clear, an' yer bairn is heir to Burneston; an' yu dares to come an' threaten me beside him 'at ye've wranged so sorely."

Her words had come like a torrent, but now Doris roused herself to check them.

She spoke sternly. "At such a time, and here too, beside him, how dare you use such words? Silence!" she said commandingly, for Faith's yellow eyes blazed with fury, and she came close up to her mistress and shook her finger menacingly in her face.

Doris turned to go away; the woman seemed to her a maniac. She had never fathomed the violence of Faith's nature, till now so sternly repressed in her presence.

The old woman glared as if she would spring upon her. "Silence you!" she screamed out. "What hev ah to fear, ah that hev loved him allays? 'Tis yu that hev warked t' wrang that sud suffer."

Phil broke in with his sobbing, pitiful cry, —

"Ralphie, me wants Ralphie."

"Ay!" she went on, her eyes full of scornful triumph; "all his cry, poor bairn, has bin fer Ralphie — ye'll nivver loose his love for his dead brother — ye are nothing beside him." She had softened a little as she looked at the child, but now she spoke out again loudly and wildly, "Go, go! what fer are yer here skiming at mey? Ah wonnut hev ye stand here to freeat t' sperrit o' him — him that ye've bin t' rewin on" — she raised her hand solemnly. "No; ah'll speak oot mah heart. Ah calls on t' Lord to curse yu, yu an' yur bairn 'at ye hev sinned fer. May ye nivver know joy nur peace. May t' bairn turn your life into a long sorrow, an' when yu comes to die may yur sperrit nivver rest, but wander moanin' about lahke ye hev made ithers moan their lives lang."

She flung herself on her knees again beside the table. Doris might have been one of the chairs for any heed she took henceforth of her presence.

Mrs. Burneston was scarcely conscious of her own existence. She had snatched Phil and held him to her bosom as if to shield him from the frightful words, but her hands trembled so that she could hardly grasp the child. Phil clung to her, frightened. Faith's violent words and gestures had terrified him into silence.

Doris turned and seemed to grope her way blindly to the door. She felt as if Faith's words were weapons, and could strike Phil even in her arms.

"God help me!" she murmured, but the words came mechanically. There was in them neither faith, nor trust, nor love. How could there be? She had loved self only all her life. She, who had so little love for God's creatures, could not look lovingly to God for help; hers was only the cry of helpless humanity. God had made her — he was bound to help her in her need.

Her standard of right and wrong represented to Doris good and evil; as to any love of God or of prayer in the abstract, such ideas had not visited her busy brain, or when brought there temporarily by some chance remark made by George or

Rica, had been dismissed as unreal and visionary.

And now she felt blind and helpless, and yet with an eager, clutching longing for help; a sense of wrong-doing oppressed her, and Faith's words sounded again and again in her ears. She only felt that she must get away from this old mad woman.

She reached the door at last; her limbs trembled so that she could hardly carry the child, and yet she feared to loose him from her arms.

At last she was safe in the hall: it was empty, and her heart leaped with intense relief as she sank exhausted into a chair.

Little Phil struggled down out of her arms, and went back to the door of the library.

"Come here." She roused herself to speak. "Come here directly, Phil."

The child shook his head, and grasped the door-handle.

"Me want to wake Ralphie," he said in his little decided voice.

Doris rose and tried to get him away, but he cried out loudly. She turned the key and left him standing there. She was too full of anguish to struggle with him; her confidence and self-possession were gone. It seemed to her horrible that the child should leave her for his dead brother.

She went on to the entrance door and looked out; the chill air refreshed her throbbing head. She was so wrecked of human love that she felt an unusual longing for her husband's return. There would at least be peace between them now, she thought, and then she shuddered as Faith's awful words came back. She turned towards the great gates. If her husband had gone to the village he would come in that way.

At the gate stood Benjamin Hazelgrave and his wife, and several of the servants, some pointing with their fingers and talking together.

What was happening? What were these people waiting for?

The gates stood open, and it seemed to Doris that it would distress her husband to have to pass through such an assemblage when he came in. She called to Benjamin, but her voice did not reach him. He was as eager as the rest, craning his neck to see what was passing outside.

Doris went down the steps. She was resolved to spare her husband this trial.

As she reached Benjamin there was a movement in the group of gazers, they parted right and left, and Gilbert Raine came hurriedly towards her through the passage opened for him. He took her hand, and led her back quickly to the house.

"What is the matter? Have you found Philip?" His silence puzzled her. She could not see that the poor fellow was striving to find the kindest way to speak.

"Yes," he said; then he went on in an excited voice, "Oh, Mrs. Burneston, you must prepare yourself for more trouble; I hardly know how to tell you what has happened. Poor Phil is quite struck down by this terrible accident. I fear he is paralyzed. They are bringing him in."

Doris started and pressed her hands tightly together, but her wits came back; she seemed steadied in a moment.

"Do not fear for me," she said firmly. "Have you sent for the doctor?"

"Yes — yes, I have sent."

Watching the sad procession as it came slowly through the gates, mechanically her eyes rested on the bearers — Ephraim Crewe, Shadrach Swaddles, and two of Crewe's farm servants; Joseph Sunley and old Tyzach; Mr. Spencer walking sadly last of all — but she could not nerve herself to look at her husband's face; she only saw that he lay there motionless, and she turned and led the way in silence to her own bedroom.

CHAPTER LV.

"SHE CAN TELL ME."

"HE must not be left an instant," the doctor sent for from York had said, after he had seen Mr. Burneston. And Doris answered, "I shall not leave him."

She had watched for three days and nights beside her husband. He had recovered consciousness in a few hours, but he was very feeble, and had not attempted to speak.

It seemed to Doris, as she sat looking straight before her at vacancy, that her brain too had received a shock.

She did not acknowledge the justice of Faith's accusation, but a consciousness of wrong-doing — an entirely new consciousness to Doris — oppressed her. It was not, she well knew, only from her devotion and love to her husband that she sat wasting, so it seemed to her, these hours in his room; his own man or Phil's nurse would perhaps have tended him just as well, but this would have left her free to think, and there was an actual relief in forcing herself to perform hard, unusual duties. She had rung to inquire for her child soon after her husband's conscious-

ness returned, and the nurse had brought him to the bedroom door; but the instant the child saw his mother he began his cry for Ralphie. Doris sent him away, and sternly denied herself the luxury of gazing at her darling.

She rarely looked at her husband as he lay there; the likeness between his face and that other one lying in the gloom down-stairs made her shudder and shrink from him.

It seemed to Doris that Ralph's spirit was gazing at her out of his father's eyes.

"Doris" — she started and uncovered her face, his voice sounded cold and changed, she thought — "you had better lie down and rest — you will be ill;" then he stopped, but he left off looking at her. Then, after a few minutes, "Be so good as to send Faith Emmett; she is used to nursing.

The blood that had left her face till it was ghastly in its whiteness, came back and dyed her cheeks and throat, her strong indignation at this injustice almost choked her, and yet she dared not try to utter it; had not the doctor said the slightest agitation might prove fatal? And yet angry as she was that Faith should be preferred to her, she clung more in that moment to her husband than she had ever done before.

"I — I am not tired, Philip," she ventured to say in a low, pleading voice; "indeed I would rather stay. I want to nurse you."

He frowned again. He seemed to have some trouble in finding his words, for his lips moved and he looked sad when no voice followed the movement.

"You must go," he said at last. "Send Faith; she can tell me —— "

And then Doris saw — the veil was rent suddenly from her eyes, and she saw with the painful clearness which attends the first vision of those who have been blind. Oh! why had she never seen before that her duty was to live her husband's life as well as her own? And instead she had so cut herself off from all sympathy with his natural feelings towards Ralph that Faith's sympathy was more prized than hers.

"She can tell me!" Doris shrank into herself; the name of Ralph could never more be spoken between her and her husband. He knew not only that she had hated his son, but that she had coveted his inheritance. "She can tell me." She! this woman who had cursed her and scorned her must be set in her place by her own order, and Philip must never know the insults she had endured from her. It was a bitter punishment.

She looked at him; his eyes were fixed on her as if he were impatient for her to go, and she rose slowly.

"Send Faith," he said, and then he closed his eyes without even a smile of farewell.

Doris was too utterly crushed to think of self as she crossed the room to obey him. She rang for Mr. Burneston's man and then went to her room. It was still very early, and she waited some time before she summoned her maid — waited in a sort of dull stupor; then she rang and desired her to tell the housekeeper to go to Mr. Burneston. Even for her husband's sake she could not have met Faith Emmett face to face.

"You can tell nurse to bring Master Phil here, if he is awake," she said.

The woman hesitated. She was in great awe of her mistress, who scarcely ever spoke to her except to give her orders; but Mrs. Burneston's worn face and heavy eyes moved her pity.

"Oh, ma'am," she said timidly, "won't you lie down and rest? Sleep would do you good — you look so worn; and Master Phil would be ready against you woke."

Doris stared in surprise.

"I am quite well," she said coldly. "I wish Master Phil to come to me."

"Yes, ma'am." But at the door the maid turned again. "Master Phil is not very well, ma'am. Nurse asked the doctor to look at him yesterday."

"Not well! — why was I not told?" Then she recollected herself. "You are right, Burnell; go on and tell nurse I am coming to see him."

How long ago it seemed since she had gone to seek her darling, and had found him lying — she shuddered at that memory and turned hastily into the nursery. Phil lay in his little cot; the nurse and Burnell were both looking at him earnestly. Neither of them spoke when Mrs. Burneston came in, but they drew aside that she might see her child.

He did not see her, though his dark eyes were wide open, strained on vacancy. His sweet little face was very pale, and round his eyes were large dark rings; his lips, too, looked purple and fevered, and his nose pinched and wasted.

Doris bent down and kissed his hot cheek, but he took no notice.

"How long has he been like this?"

"Not long, ma'am; he's been fretting ever since you took him from the library.

He's eaten nothing, ma'am. The doctor said he'd eat when he was hungry, but he's done nothing but fret and call for his brother, and now, ma'am, he won't rouse nor take notice."

Doris set her teeth hard. Come what might, she would not yield up her darling.

"I should like to see Mr. Raine," she said; "will you ask him to come to me at once?" Never in her whole life had Doris felt so utterly alone. Her husband had sent her from him, her child was ill, dying perhaps, and she must save him herself — there was no one to help her.

Gilbert Raine had a surprised look on his face when he came into the nursery.

Doris took his hand and began to speak quickly. "Thank you for coming," she said. "You sent for the York doctor the other day. Will you send for him again at once?"

"Good heavens! Is Philip worse, and have you left him? Ah, Mrs. Burneston, why did you not let me nurse him?"

He spoke impetuously. He had not forgiven Doris's coldness about Ralph, and he thought she had deserted her husband for the sake of her child. It was more than she could bear.

Gilbert looked at the nurse and pointed to the door, and when she had gone he stood feeling horribly ashamed of himself till Doris checked her sobs and was able to speak.

"My husband is not alone," she said; "I came away by his wish. I came here and found Phil like this," she said, pointing to the little disfigured face. "He is very ill — that Steersley doctor has no skill to save him, but the doctor from York might, if you will send for him without delay" — then clasping her hands fervently — "without the delay of a minute."

Raine's heart had reproached him keenly. He had never made a woman cry before, and when he saw the little wan, suffering face in the cot he felt like a criminal.

"I beg your pardon," he said humbly; "Rica said the child was poorly, but I did not know he was so ill. I will go to York myself at once and bring back the doctor."

He was bending over the cot, his face was on a level with hers. Doris put her lips suddenly to his forehead and kissed him.

"Thank you," she said, "you are a good man!"

He shook both her hands warmly. "My dear child, keep a good heart," he said, "I will be back soon. Let Rica help you, and do take a little rest." And he went.

A faint smile stole over her face. "They are friends at last, then!" she said.

CHAPTER THE LAST.

NORTHWARD.

THE north wind felt wintry in its keen crispness, and the sky had the lowering look which so often heralds snow.

The sharp air made John Barugh's eyes smart, and he sent his chin down among his wraps for shelter as he drove northward. He was in the last stage of his journey, but he was going round by a cross road, so as to strike the Steersley road above the town itself — the direct highway would have taken him through Steersley, and this would have caused a longer delay, and he knew George would expect him to call on Mr. Hawnby.

"Neeah, neeah!" John squared his shoulders and bent his head before the pitiless keenness of the wind. "Ah'll nut leave t' track for onnybody; ah've com to see Doris."

There had been great consternation at the cairn, when Joseph Sunley wrote to George a full account of Ralph's death, and of the squire's seizure.

George's first impulse was to go over to Burneston Hall and see what was really happening. At so great a distance it was difficult to believe in such terrible misfortunes, especially as Mr. Sunley narrated them, in a concise, cold-blooded manner, as if he were telling the story to strangers. But when John read the letter, he noticed at once that Mr. Raine was at Burneston, and he told George to stay where he was. In a few days came a letter from Miss Masham, but there was no word of wishing for George's presence.

George wrote to Doris expressing the family sympathy, but no answer had been received from her.

At length came a few hurried lines.

"Father, will you come to me? My darling is taken away, and I am left alone. My husband is still very ill. I cannot do without you. DORIS BURNESTON."

This was the first time they had heard of the child's illness.

For some minutes there was dead silence, and then Dorothy flung her apron over her head and sank weeping into a chair.

John Barugh looked into his son's eyes an instant, and then he said softly, —

"God help her! Ah mun gan noo. Ah sehd ah'd nivver set foot i' t' Hall, bud then ah nivver thowt ah'd be needed, bud

Digitized by CORNELL UNIVERSITY Original from CORNELL UNIVERSITY

Doris says she cannut deea athoot me — bless her! Ah mun geh t' day. Coom, awd lass, coom, thoo mun thenk o' Doris, nut o' theesel'; thenk o' t' poor lass wi' her deead bairn."

But Dorothy rocked herself in her chair.

"What does the man think I'm thinking of? My poor girl — my blessed little Phil!" she said between her sobs; and then she rose to prepare for her husband's departure.

"We'll never say so much to poor dear Doris," she said to George, as her husband drove away; "but if she'd sent for me to nurse the precious darling it might have ended differently. I've no faith in your fine, stuck-up nurses."

"I don't suppose, mother" — George looked very sad at the thought of Doris's trouble — "that she ever trusted him to a nurse; be just to our Doris, she was wrapped up in little Phil."

The name set poor Dorothy off again, and then she looked reproachfully and with streaming eyes at George.

"Of course she was, my dear, but not more than I was in you, lad. Ah, children are careful comforts. Oh dear, oh dear! what will come next?"

John Barugh had had a long journey; he had changed his horse, but even this one was beginning to flag when he came in sight of the square grey tower and weird fir-trees of Burneston. His own spirits, too, which at first had risen with rapid driving through the keen air, had grown very depressed.

"Mah poor lass! the one thing her heart was fair set on, was little Phil," he said tenderly; "an' noo 'at sheea needs comfort t' husband cannot gi' it. Eh, bud it's hard on Doris."

He had resolved to go past the church gate and round by the vicarage, so as to avoid the village, but as he passed the church a wheezy "Hulloa!" stopped him. He looked over the gate; Joseph Sunley was hurrying away from his deputy, Lot, whose shock head showed above the edge of a half-made grave, and the sexton was waving his thin arms to attract notice.

John Barugh reigned up his horse, and waited by the gate.

"Weel, neeghber, an' hoo's a' wi' ye at t' cairn? It's lang syne ye cam fer tu tak' a look at us."

"Yes," the farmer said gravely. "Ah've coom to t' Hall; mah lass — Mrs. Burneston, that is," he corrected himself — "she's sent for mey."

"Eh, it's a sair judgment on her, neeghber; nobbut yu tempt t' Lord he'll hev it oot wi' ye. She couldn't bide t' other lad, an' shu nivvers shed a tear to see him cut off in his prime, an' noo her ain bairn, 'at she set afore God Almighty, he's pined an' pined till he's pined his lahtle life oot, an' he's taken fra her an' laid besahde his brother."

"Ye're hard on her, Joseph Sunley," John spoke hastily; "wheea can say shu nivvers shed a tear? an' Doris nivvers was great at crying fra t' tahme sheea was a lahtle lass, bud" — his voice grew sad again — "d'ye meean 'at t' lahtle lad's laid besahde his brother already?"

Joseph nodded.

"Yis, yis, t' deea afore yesterda'; ah seed it deean mysel'. It were sad an' lonesome to see her stan' theer" — he pointed over his shoulder — "as tall an' pale as a lily, an' no soul besahde; sheea had no tears, bud her eyes was swelled an' red wi' crying, so theer noo."

John Barugh drew his hand across his eyes.

"D'ye meean 'at t' squire's too sick yet tu seea his ain bairn put i' t' kirk-geate?"

"Ah meeans what ah sehs, an' ah sehs what ah means," Joseph spoke snappishly. He was not accustomed nowadays to contradiction or cross-questioning. T' squire's a brokken man, t' doctor hes telled mey himself; sehs he, 'T' squire's done fer; he's as awd as yu, Maister Sunley, an' lahkely t' be so t' rest o' his deeas; he may be better noo an' then, bud he'll nivvers be his ain lahke again; and he mun not be wearied.' Eh, things ur reeght doon bad at t' Hall. Mistris Emmett hes flitted — an' nowt's kenned uv her."

John Barugh groaned. He nodded to Sunley, and drove on to the Hall.

The news about the squire seemed to him worse than the loss of little Phil.

"An' he's not more then forty years awd," he said.

He did not ask for Mr. Burneston when he reached the Hall, but was shown at once to Doris's sitting-room.

George had been right about his sister; she had never left her child except now and then to see her husband; but no persuasion or force even could induce little Phil to take food, or to cease fretting for his brother. Ralph's repulse, and the sight of Ralph pale and motionless in the gloomy library, had possessed him, and in his wandering — for his weakness induced fever and then delirium — he cried incessantly, now to his brother to forgive him, and now to waken from his sleep.

Doris sat beside her child with a bursting heart, but tearless to the end, and then she went alone to the churchyard and saw him laid beside Ralph.

Mr. Raine had gone to London to transact some necessary business for his cousin, and Doris had asked Rica to leave her before the end came with little Phil. Her friend begged hard to stay with her, but Doris maintained her wish to be alone.

It was easier to bear her burden unwatched even by her friend's loving eyes; but she had scarcely given way to tears since she parted from her darling — the wound was too deep — it seemed to have burned out all feeling but that of pain.

Only when she came slowly back from the churchyard a great longing had seized on Doris, and she sat down and wrote the note which had brought her father to the Hall — and then her tears came.

Now she heard the sound of wheels, and presently the heavy step that took her back so many years coming along the passage, and she shrank from meeting her father. She rose up, almost resolved to go away; her pride, which had seemed dead since her child had left her, struggled to be heard. How could she let her father see how utterly alone she was? But while she stood hesitating the door opened, and there was her father.

He came forward, for Doris had no power to move, took her hand, and gently kissed her cheek. Her grief-stricken face, so pale against her plain black gown, her bowed head, moved him to the deep, sorrowing reverence a worshipper feels towards a broken Madonna. But as his lips touched her they ended the struggle within her. Like a little child she leaned her head till it rested on her father's shoulder, and then, as she felt the support of his strong arm come round her, fell sobbing on his heart.

"Mah lass, mah poor lass," John said.

That was all. He did not know how to comfort her, and he let her be, just patting her shoulders with his broad hand.

He did not try to check her tears at first. "They'll ease her sore heart," he said to himself; but when he found the tears did not cease, but seemed like to drown the closed eyes and slender, quivering throat, he led her gently to a seat, and placed himself beside her. He wished for George or Mr. Hawnby; it seemed to him that they would know the right thing to say.

"Whisht, mah lass," he said, "yu mun not greet so sair, yu mun tak comfort noo."

The old feeling of her childish days, that she must never be foolish "before father," came back to Doris, and helped her to check her sobs; but still as she spoke large hot tears fell silently on the fingers twisted together on her lap.

"I cannot take comfort," she said sadly. "Where can I get it from? Indeed, father, I am not grieving only — for — for Phil" — she stopped to steady her voice — "there is so much to be sorry for."

"Ah knows." John smoothed her hair with his red fingers. "Ah've heeard, an' it makes me ower sad; bud, lass, t' squire's young yet, an' t' doctors mistak' sometahmes."

Doris shook her head.

"Yes, father, but there is so much that can never be righted now; and think of Philip dragging on years and years of life, and feeling all the while old and helpless. Oh, I cannot bear it!"

She started up and walked to the other end of the room.

John looked after her, and again he wished for George's help to comfort her.

Doris came back, her hands hanging down, her whole figure drooping and despondent.

"Think how young I am, father; I may have to live fifty years of this life. I cannot live it. I love Philip; yes, I know I love him dearly now, but he is as feeble as a child; I cannot bear it. And how can I help him? — I cannot give him back what he has lost. There is no help, no comfort in anything," she said wearily; and she clasped her hands in an anguish of despair.

John had left off wishing for George, his strong sympathy was leading him to the truth; he took the clasped hands in his.

"Mah lass, ye're reeght there," he said. "When sorrow comes there's small help or comfort to be found on airth in onnything or onnybody for onny of us, and we cannot bear our burden oursels; bud Doris, lass, theer's One 'at'll bear it fer us, aye, an' gie us comfort, too; nobbut we ask him to help us to trust in him."

She shook her head.

"That's not for me, father; I'm" — she hesitated. "I'm not good, you know; I mean, not in that way. I did pray to God to spare my child" — her lips trembled — "and what good did it do?"

John looked troubled. He sat silent awhile.

"Mah lass," he said tenderly; and again he put his broad hand caressingly on her bowed head. "When t' lahtle lad

was wiv ye, deead ye gi' him yal he axed fer?"

She raised her head and looked inquiringly at him.

"Weel," he said shyly, "yance He took a bairn fra mey, an' ah wearied an' freeted, an' thowt it waaz mair 'an ah could bear, bud ah've fun' comfort. Ah've learned 'at ah've getten tu deea his will, nut mah ain, an' t' Lord's scheealed mey tu trust him. Ah trusts him noo, at he'll deea yal 'at is reeght fer us — an' nobbut yu axes fer trust, he'll gi' yu that, Doris."

From Chambers' Journal.

CHARLES DICKENS'S MANUSCRIPTS.

A GLIMPSE of the manuscripts of the late Charles Dickens, which now form part of the "Forster Collection" in the South Kensington Museum, conjures up a vision of numerous characters in his popular novels. On looking attentively at the manuscripts, we are at once struck by the number of alterations and interlineations with which the pages abound; and our first sentiment is one of surprise that the books which appear so wonderfully natural and fluent when we read them, should evidently have been the result of much anxious thought, care, and elaboration.

The collection comprises the original manuscripts of the following works: "Oliver Twist," published in 1838–39; "Master Humphrey's Clock," comprising "The Old Curiosity Shop" and "Barnaby Rudge," published in 1840–41; "Barnaby Rudge," a separate volume, 1840–41; "American Notes, 1842; "Martin Chuzzlewit, 1843–44; "The Chimes," Christmas, 1844; "Dombey and Son," 1846–48; "David Copperfield," 1849–50; "Bleak House," which has in the original manuscript a secondary title, "The East Wind," 1852–53; "Hard Times," 1854; "Little Dorrit," 1855–57; "A Tale of Two Cities," 1859; and "The Mystery of Edwin Drood" (his last but unfinished work), 1870. There are also proof volumes from the printers, consisting of "Dombey and Son," "David Copperfield," "Bleak House," and "Little Dorrit," the pages of which bear marginal and other corrections and alterations, in ink, by the author.

Of course, as the collection is placed under a glass case, the public can only see one or two pages of each work; but even with this meagre guide, the acute observer is able in some degree to trace the working of the writer's mind, and to follow to some extent the development of his ideas. As we have already remarked, the first thing which strikes us is the comparatively large number of alterations and interlineations which occur in the manuscript. It is evident that Charles Dickens wrote with the greatest care, and scrupulously revised his writing, in order to render each sentence as perfect as might be. Taking the works in their chronological order, we may notice that in "Oliver Twist," which is open at "Chapter the Twelfth" — "In which Oliver is taken better care of than he ever was before, with some particulars concerning a certain picture" — there are few alterations in the manuscript; the writing also being larger and firmer than in the majority of the later works. Charles Dickens made his alterations so carefully that it is difficult to trace the words which he had originally written; but the one or two which occur on this page give us some little insight into the careful manner in which the author worked up his sentences into a well-rounded and euphonious form. The passage at which this manuscript is opened runs as follows: "The coach rattled away down Mount Pleasant and up Exmouth Street — over nearly the same ground as that which Oliver had traversed when he first entered London in," and here occurs the first alteration, "the D——" is erased, and "company with the Dodger," is written in its place; the author evidently considering the latter a more euphonious form of expression than "in the Dodger's company," as it was doubtless his original intention to make the passage. The alteration to which we have referred may appear, as indeed it is, of exceedingly small significance; but we have mentioned it simply as an instance of the extremely careful way in which Dickens studied the details and minutiæ of composition.

The next manuscript in point of date is "Master Humphrey's Clock," which is open at "No. IV.," headed, "Master Humphrey from his clock-side in the chimney corner," and commences as follows: "Night is generally my time for walking. In the summer I often leave home early in the morning and roam about fields and lanes all day, or even escape for days or weeks together; but, saving in the country" [this originally stood "but at other seasons of the year;" but Dickens doubtless saw that the expression as it now stands would be more consistent with the context], "I seldom go out until after dark, though, heaven

Generated on 2020-05-04 08:49 GMT / https://hdl.handle.net/2027/coo.31924079893586 Public Domain / http://www.hathitrust.org/access_use#pd
Digitized by CORNELL UNIVERSITY Original from CORNELL UNIVERSITY

be thanked, I love its light and feel the cheerfulness it sheds upon the earth as much as any creature living." This page of manuscript has only a moderate share of alterations.

Then we come to the volume of "Barnaby Rudge," which is opened at "Chapter One," and also contains only a moderate number of alterations, one being in the height of the Maypole sign, and another in the distance of Epping Forest from Cornhill; both of which are noticeable as further illustrations of the conscientious love of accuracy which characterized the author's mind. Next in order follows the "American Notes," which has very few corrections, and is opened at the page headed "Chapter the First. Introductory and necessary to be read;" in which the author challenges the right of any person "to pass judgment on this book or to arrive at any reasonable conclusion in reference to it without first being at the trouble of becoming acquainted with its design and purpose." Surely a caution fair and reasonable enough on the part of the writer of a book which he could not but feel would probably give offence, where such an end was farthest from his wish.

"The Life and Adventures of Martin Chuzzlewit" comes next, open at "Chapter I. Introductory. Concerning the pedigree of the Chuzzlewit Family;" and giving us a brief but telling satire on the pride of birth by assuring us that this family "undoubtedly descended in a direct line from Adam and Eve, and was in the very earliest times closely connected with the agricultural interest." This page is notably full of alterations, and seems a fair indication that with Charles Dickens, as with many others, the first step was the most difficult of all. The caligraphy in this as in all the other manuscripts is legible but rather small, the letters being distinctly formed, and the use of abbreviations studiously avoided.

We next turn to "The Chimes," one of those delightful stories with which Dickens introduced to us those Christmas annuals, which now form so important a section of our periodical literature. This again is open at the commencement, where the author lays down the dogma that there are not many people who would care to sleep in a church: "I don't mean at sermon-time in warm weather (when the thing has actually been done once or twice), but in the night and alone." This sentence originally finished with "in the night;" but we can readily imagine the development of the idea in the brain of the writer, and the words "and alone" suggesting themselves as lending an additional ground of fear for the situation. The manuscript of this page bears a moderate number of alterations.

In "Dombey and Son" we find a large number of alterations on the first page, the very title itself having been altered more than once. The sketch of the newly-born Paul, who was placed in front of the fire, "as if his constitution were analogous to that of a muffin, and it was essential to toast him brown while he was very new," is very good indeed; but it is evident that the passage was rather the result of careful elaboration than of spontaneous humor. And the same remark will apply to the opening chapter of "David Copperfield," in which, although the passage descriptive of the birth of the hero is very neat and natural as it now stands, the same careful revision and alteration are again apparent.

"Bleak House" too is notably full of alterations on the first page, especially in the passage which tells us that in the muddy condition of the London streets "it would not be wonderful to meet a mesalosaurus forty feet long or so waddling like an elephantine lizard up Holborn Hill."

In "Hard Times," where we are introduced to the gentleman who wants nothing but "facts," and in the opening chapter of "Little Dorrit," in which we have a description of Marseilles as it "lay broiling in the sun one day," we find a large number of alterations; but in these, as in most of the other instances, the primary words have been erased so carefully that it is next to impossible to form an idea of how the passages originally stood. "The Tale of Two Cities," on the contrary, contains remarkably few corrections; and the opening passage descriptive of "the period" is telling, and apparently written spontaneously. "The Mystery of Edwin Drood" has been opened with good judgment at the last page. The manuscript is very small, but fairly legible, and having but a moderate number of alterations. In a literary sense, it is not perhaps so interesting as some of the others; but it possesses a sad and melancholy claim upon our attention and sympathy, inasmuch as it is the last page of manuscript ever written by this gifted hand.

In the proof volumes with corrections in the handwriting of the author there is nothing which calls for special note save an unimportant deletion in "Bleak House," and a more interesting alteration in "David Copperfield." In the former there is

Original from CORNELL UNIVERSITY

a passage marked "out," in which Sir Leicester Dedlock speaks to Mrs. Rouncewell of her grandson in the following passage: "If (he said) the boy could not settle down at Chesney Wold, in itself the most astonishing circumstance in the world, could he not serve his country in the ranks of her defenders, as his brother had done? Must he rush to her destruction at his early age and with his parricidal hand strike at her!"

In "David Copperfield" we find by a passage in which Mr. Dick is referring to his memorial that his original hallucination took the form of a "bull in a china shop;" a rather trite idea, and it was not until after the proof had actually been submitted to him by the printers that Charles Dickens introduced the whimsical and happier notion of "King Charles's Head."

Before bringing our brief paper to a conclusion, we would venture to suggest to the gentleman or gentlemen to whom is intrusted the arrangement of these manuscripts, that the present position of the manuscripts and printed volumes should be transposed, so that the manuscripts should occupy the lower half of the case, as in their present position it is rather difficult to decipher the caligraphy; and to any one below the ordinary height it must involve an amount of physical contortion as uncomfortable as it is inelegant. The manuscripts being of course of greater interest than the printed proofs, should certainly occupy the more prominent space, especially as the latter could be read without any difficulty if placed in the rear rank.

We have no doubt that many of those who read this short article will have seen the Dickens manuscripts for themselves; many more doubtless will see them; but there will still be a large number who will not have the opportunity; and while we think that our remarks will be endorsed by the first and second classes, we hope that they will prove interesting to the third less fortunate class, and will enable them to enjoy, at least in imagination, a somewhat closer intimacy than they have known before with that great and gifted man, whose books have effected so many beneficial changes both in society at large and in many an individual heart and life, uprooting and casting to the winds much that was base, worthless, and contemptible, and implanting in their stead the seeds of those gentler sympathies and nobler aspirations which find their fruition in a well-spent life.

From Nature.

FETICHISM IN ANIMALS.

MR. HERBERT SPENCER, in his recently published work on the "Principles of Sociology," treats of the above subject. He says: "I believe M. Comte expressed the opinion that fetichistic conceptions are formed by the higher animals. Holding, as I have given reasons for doing, that fetichism is not original, but derived, I cannot, of course, coincide in this view. Nevertheless, I think the behavior of intelligent animals elucidates the genesis of it. I have myself witnessed, in dogs, two illustrative cases." One of these cases consisted in a large dog, which, while playing with a stick, accidentally thrust one end of it against his palate, when, "giving a yelp, he dropped the stick, rushed to a distance from it, and betrayed a consternation which was particularly laughable in so ferocious-looking a creature. Only after cautious approaches and much hesitation was he induced again to lay hold of the stick. This behavior showed very clearly the fact that the stick, while displaying none but the properties he was familiar with, was not regarded by him as an active agent, but that when it suddenly inflicted a pain in a way never before experienced from an inanimate object, he was led for the moment to class it with animate objects, and to regard it as capable of again doing him injury. Similarly in the mind of the primitive man, knowing scarcely more of natural causation than a dog, the anomalous behavior of an object previously classed as inanimate, suggests animation. The idea of voluntary action is made nascent; and there arises a tendency to regard the object with alarm lest it should act in some other unexpected and perhaps mischievous way. The vague notion of animation thus aroused will obviously become a more definite notion, as fast as development of the ghost-theory furnishes a specific agency to which the anomalous behavior can be ascribed."

The other case observed by Mr. Spencer was that of an intelligent retriever. Being by her duties as a retriever led to associate the fetching of game with the pleasure of the person to whom she brought it, this had become in her mind an act of propitiation; and so, "after wagging her tail and grinning, she would perform this act of propitiation as nearly as practicable in the absence of a dead bird. Seeking about, she would pick up a dead leaf or other small object, and would

bring it with renewed manifestations of friendliness. Some kindred state of mind it is which, I believe, prompts the savage to certain fetichistic observances of an anomalous kind."

These observations remind me of several experiments which I made some years ago on this subject, and which are perhaps worth publishing. I was led to make the experiments by reading the instance given in "The Descent of Man," of the large dog which Mr. Darwin observed to bark at a parasol as it was moved along a lawn by the wind — so presenting the appearance of animation. The dog on which I experimented was a Skye terrier — a remarkably intelligent animal, whose psychological faculties have already formed the subject of several communications to this and other periodicals.* As all my experiments yielded the same results I will only mention one. The terrier in question, like many other dogs, used to play with dry bones by tossing them in the air, throwing them to a distance, and generally giving them the appearance of animation, in order to give himself the ideal pleasure of worrying them. On one occasion, therefore, I tied a long and fine thread to a dry bone and gave him the latter to play with. After he had tossed it about for a short time I took an opportunity when it had fallen at a distance from him and while he was following it up, of gently drawing it away from him by means of the long and invisible thread. Instantly his whole demeanor changed. The bone which he had previously pretended to be alive now began to look as if it really were alive, and his astonishment knew no bounds. He first approached it with nervous caution, as Mr. Spencer describes, but as the slow receding motion continued, and he became quite certain that the movement could not be accounted for by any residuum of the force which he had himself communicated, his astonishment developed into dread, and he ran to conceal himself under some articles of furniture, there to behold at a distance the "uncanny" spectacle of a dry bone coming to life.

Now in this, and in all my other experiments, I have no doubt that the behavior of the terrier arose from his *sense of the mysterious*, for he was of a highly pugnacious disposition, and never hesitated to fight an animal of any size or ferocity; but apparent symptoms of spontaneity in an inanimate object which he knew so well, gave rise to feelings of awe and horror which quite enervated him. And that there was nothing *fetichistic* in these feelings may be safely concluded if we reflect, with Mr. Spencer, that the dog's knowledge of causation, for all immediate purposes, being quite as correct and no less stereotyped than is that of "primitive man," when an object of a class which he knew from uniform past experience to be inanimate suddenly began to move, he must have felt the same oppressive and alarming sense of the mysterious which uncultured persons feel under similar circumstances. But further, in the case of this terrier we are not left with *a priori* inferences alone to settle this point, for another experiment proved that the sense of the mysterious was in this animal sufficiently strong of itself to account for his behavior. Taking him into a carpeted room I blew a soap-bubble, and by means of a fitful draught made it intermittently glide along the floor. He became at once intensely interested, but seemed unable to decide whether or not the filmy object was alive. At first he was very cautious and followed it only at a distance, but as I encouraged him to examine the bubble more closely, he approached it with ears erect and tail down, evidently with much misgiving; and the moment it happened to move he again retreated. After a time, however, during which I always kept at least one bubble on the carpet, he began to gain more courage, and the scientific spirit overcoming his sense of the mysterious, he eventually became bold enough slowly to approach one of the bubbles and nervously to touch it with his paw. The bubble, of course, immediately vanished; and I certainly never saw astonishment more strongly depicted. On then blowing another bubble, I could not persuade him to approach it for a good while; but at last he came and carefully extended his paw as before with the same result. But after this second trial nothing would induce him again to approach a bubble, and on pressing him he ran out of the room, which no coaxing would persuade him to re-enter.

One other example will suffice to show how strongly developed was the sense of the mysterious in this animal. When alone with him in a room I once purposely tried the effect on him of making

* See especially an article on "Conscience in Animals," in *Quarterly Journal of Science* for April, 1876.

a series of horrible grimaces. At first he thought I was only making fun; but as I persistently disregarded his caresses and whining while I continued unnaturally to distort my features, he became alarmed and slunk away under some furniture, shivering like a frightened child. He remained in this condition till some other member of the family happened to enter the room, when he emerged from his hiding-place in great joy at seeing me again in my right mind. In this experiment, of course, I refrained from making any sounds or gesticulations, lest he might think I was angry. His actions, therefore, can only be explained by his horrified surprise at my apparently irrational behavior — *i.e.*, by the violation of his ideas of uniformity in matters psychological. It must be added, however, that I have tried the same experiment on less intelligent and less sensitive terriers with no other effect than causing them to bark at me.

I will only add that I believe the sense of the mysterious to be the cause of the dread which many animals show of *thunder*. I am led to think this, because I once had a setter which never heard thunder till he was eighteen months old, and on then first hearing it I thought he was about to die of fright, as I have seen other animals do under various circumstances. And so strong was the impression which his extreme terror left behind, that whenever afterwards he heard the boom of distant artillery practice, mistaking it for thunder, he became a pitiable object to look at, and if out shooting would immediately bolt home — or, if at a great distance from home, would endeavor to bury himself. After having heard real thunder on two or three subsequent occasions, his dread of the distant cannons became greater than ever; so that eventually, though he keenly enjoyed sport, nothing would induce him to leave his kennel, lest the practice might begin when he was at a distance from home. But the keeper, who had a large experience in the training of dogs, assured me that if I allowed this one to be taken to the battery, in order that he might learn the true cause of the thunder-like noise, he would again become serviceable in the field. The animal, however, died before the experiment was made.

GEORGE J. ROMANES.

From Nature.

RUHMKORFF.

WE regret to record the sudden death on December 20, at Paris, of Henry Daniel Ruhmkorff, whose name is so closely connected with the history of magneto-electricity. He was born in Hanover, Germany, in 1803, and but little is known of his early life. In 1819 he wandered to Paris, and obtained a position as porter in the laboratory of Prof. Charles Chevalier, at that time one of the leading French physicists. Here he displayed a remarkable fondness for electrical apparatus, as well as ingenuity in its arrangement, and was enabled shortly after to start a modest manufactory of physical apparatus. Through the efforts of Chevalier and the excellence of the work performed, the business was rapidly extended. In 1844 Ruhmkorff brought out his first invention, a convenient thermo-electric battery. Soon after he turned his attention to magneto-electricity, especially the production of the induced currents, discovered by Faraday in 1832. A long series of experiments resulted in the appearance, in 1851, of the famous "Ruhmkorff coil," with its later modifications, the most important piece of apparatus in this branch of physics. With this powerful adjunct the electrician was enabled to obtain sparks eighteen inches in length, pierce thick plates of glass, and carry out a vast variety of experiments. The invention was rewarded by a decoration and medal at the Exhibition of 1855, while in 1858 it received the first prize of fifty thousand francs at the French exhibition of electrical apparatus. Since then the manufacture of the coils and of electrical machines in general has assumed enormous dimensions, and the leading physicists of Europe are well acquainted with the dingy little bureau in the Rue Champollion, near the University. Personally M. Ruhmkorff was of a quiet, dignified appearance, and despite the disadvantages of his early life, he enjoyed the friendship of the leading Parisian *savants*, and was an honored member of the French Physical Society. M. Jamin delivered an address over the grave, in which he stated that Ruhmkorff died almost a poor man, because he had spent all his earnings on behalf of science and in works of benevolence.

LITTELL'S LIVING AGE.

Fifth Series, Volume XXI. | No. 1755.—February 2, 1878. | From Beginning, Vol. CXXXVI.

CONTENTS.

I. FRANCE AS A MILITARY POWER IN 1870 AND IN 1878. By Sir Garnet Wolseley, . *Nineteenth Century*, ... 259
II. ERICA. Part X. Translated for THE LIVING AGE, from the German of . . . . *Frau von Ingersleben*, ... 271
III. THE GREEK MIND IN PRESENCE OF DEATH, INTERPRETED FROM RELIEFS AND INSCRIPTIONS ON ATHENIAN TOMBS, . . *Contemporary Review*, ... 280
IV. THE CZAR'S CLEMENCY; A POLISH PRIEST'S STORY. Conclusion, ... *Cornhill Magazine*, ... 294
V. THE LITTLE HEALTH OF LADIES. By Frances Power Cobbe, ... *Contemporary Review*, ... 302
VI. THE DECAY OF THE MONARCHICAL PRINCIPLE, ... *Spectator*, ... 315
VII. FRENCH DINNERS, ... *Saturday Review*, ... 317
VIII. SHORT-SIGHT, ... *Spectator*, ... 320

POETRY.

AT ROUEN, ... 258 | CASSANDRA'S SPEECH, ... 258

PUBLISHED EVERY SATURDAY BY
LITTELL & GAY, BOSTON.

TERMS OF SUBSCRIPTION.

For EIGHT DOLLARS, *remitted directly to the Publishers*, the LIVING AGE will be punctually forwarded for a year, *free of postage*.

An extra copy of THE LIVING AGE is sent gratis to any one getting up a club of Five New Subscribers.

Remittances should be made by bank draft or check, or by post-office money-order, if possible. If neither of these can be procured, the money should be sent in a registered letter. All postmasters are obliged to register letters when requested to do so. Drafts, checks and money-orders should be made payable to the order of LITTELL & GAY.

Single Numbers of THE LIVING AGE, 18 cents.

AT ROUEN.*

THE aisles grow dim, and as by winding ways
I eager climb St. Ouen's stately height
The silver censers vanish from my gaze,
As shooting stars upon a dusky night;
I hear the chanted vespers at my feet
Like wordless water-music faint and sweet.

On priest and acolyte and people fall
From western windows many a sapphire ray,
The sculptured knights within the nichèd wall
Look not more marble-like and mute than they.
Living and dead, with fingers clasped, seem praying,
Christ and the angels hear what they are saying.

Where am I now? As if a dream went by,
And dream still fairer came, I breathless gaze,
Fearing to break by whispered word or sigh
The rapture of my spirit's deep amaze.
The sleeping world beneath my vision lies,
Only the stars divide me from the skies.

The city gleams with lights that come and go,
The hills stand out against the opal west,
The river hath a soft and onward flow
As some tired spirit fain to seek its rest,
Whilst from outlying valleys deep between
Tinkles some vesper bell of church unseen.

Monk, martyr, saint, and paladin arise
Around me in a pinnacled array;
An hour ago they seemed to touch the skies,
And now I stand as near to heaven as they.
And mid this mute companionship of stone
I cannot feel that I am quite alone.

For who is quite alone? In solitude,
Things that would else be dumb discourse to men,
Leading the mind to an ecstatic mood
That hath no name and cannot come again.
These sculptured saints and martyrs seemed to be
Spirits that claimed a brotherhood with me.

O life! take back thy burden. I am free.
Pain, sorrow, fruitless toil, love ill-bestowed,
Are as they were not; and the mystery
Of death is as a star that leaves a cloud.
What matters where I go or whence I come?
Spring and the daisies far outlive the tomb.

O, Nature! if I strayed from thy control,
Resume thy empire now, and with delights
Unspeakable, conduct my dreaming soul
From sordid things unto sublimest heights.
Give back the thoughts that once aspired in vain,
New joyful wings with which to mount again!

Ah me! the curfew with its silvery chime
Too swiftly breaks the witchery of the hour;
With clanging keys I hear the beadle climb
The cobwebbed mazes of the belfry tower.
I quit with wistfulness akin to pain
My visionary world for that of men.

The stars are out; gargoyle and image quaint,
Rare ogive, frieze fantastic, oriel,
Hero and martyred monk and virgin saint,
Make up a world where mortals cannot dwell.
Why do I linger? What so chaineth me
Unto this mute and mystic company?

Good Words. M. B. E.

* Visitors to Rouen are, or were, permitted to make the circuit of the superb church of St. Ouen, on the somewhat giddy balustrade girdling it immediately below the tower.

CASSANDRA'S SPEECH.

["AGAMEMNON," lines 1185–1212.]

AHA! aha! Oh woes on woes!
Again the bitter toil of faithful seer
My whirling brain doth vex with first-born bode.
See ye those young ones seated at the house,—
Such spectral forms as are the stuff of dreams?
Children (belike) who died by deed of kin,
They hold, ye mark, their hands all filled with flesh,
Their own flesh, banquet-ripe, aye, (piteous dish!)
The loathsome meal of which their father ate.
I tell you 'tis to punish this he plots,
The dastard lion, slinking in the lair
He watched, forsooth! what time my master came,—
My master, for I cannot choose but serve.
He knows not, he, the captain of the fleet,
Troy's devastator, how the lewd she-whelp
With fawning tongue such welcome hath spun out,
As shall, like Até, win to secret doom.
So far her daring goes. Man-slayer she,
Yet woman. By what name of hateful beast
Shall she be rightly called? Or two-faced snake,
Or rock-housed Scylla, bane of ships and men,
Her offspring Death, her breath a ruthless curse
Blown homewards? How she raised her cry of joy,
The shameless one, as if for battle turned!
What glee she feigns, too, at the safe return!
And now what care I, if thou listen not?
The day will come. And thou shalt see, and soon
Shalt, pitying, say I was too true a seer.

Spectator. E. WELSH.

From The Nineteenth Century.

FRANCE AS A MILITARY POWER IN 1870 AND IN 1878.*

BY SIR GARNET WOLSELEY.

THE believing student of prophecy had better grounds in 1846 for anticipating an early advent of the millennium than he has now. War on a great scale had come to be regarded rather as an historical horror than as a future possibility; no progress had been made between 1815 and that date in military art, scarcely any in the appliances wherewith to practise it effectively. Although the philosophical student might possibly have been able to perceive below the surface of society the germs of that great democratic movement which exploded in 1848, sweeping through the capitals of Europe and shaking in its political upheaval the thrones of great and ancient monarchies, still they must have seemed warnings rather of internal revolution than of foreign war; of a political change that would reverse the balance of power between classes, rather than an uprising of nationality against nationality, that would forever after alter that equilibrium between States which had been devised with so much care and precision in 1815.

The more power was taken from the aristocracies and transferred to the people, the more it was thought trade would flourish and the spirit of warlike adventure and greed of conquest would diminish. The warnings, therefore, passed unheeded, or, if dwelt upon at all, were only regarded as precursors of an order of things that, from the cosmopolitan philosopher's point of view, promised to be altogether an improvement on the past. It is not to be wondered at, therefore, that those who had faith in an eventual reign of perfect and universal peace, should in 1846 have thought the realization of their dream to be near at hand. To the thinkers of theories the wish was father to the thought. The world was to be governed by a new religion — that of peace — of which they were to be the ministering priests.

These sentiments strongly influenced civilized Europe, but in England they found their most pronounced exponents. The petition presented by the peace party to the czar Nicholas did not by any means appear so utterly ridiculous at the time as it would have appeared last spring. Although there are doubtless still many votaries of the theories upon which that party relied, it is doubtful if the party itself has now any organized existence; at any rate, the remembrance that it ever was anything more than a name even in England is owing to the St. Petersburg fiasco in 1854 — an episode in our history that few, if any, practical men can now dwell upon with ordinary gravity.

During the epoch I have referred to, the armies of Europe were very imperfect as military machines; that of England was unworthy of being classed as a fighting implement fit to be employed against an enemy more formidable than a Kaffir or an Asiatic, and, even when so engaged, gained its ends always with difficulty, and not always without discredit and disaster. It was a police force dressed in the guise of soldiers. It was a body — a fine muscular body certainly — without a soul; all ranks were full of courage, without doubt the first and greatest factor in military excellence, but all other warlike instincts were wanting. Its generals, men of Peninsular experience, were old in body and old-fashioned in mind, whilst its regimental officers were entirely ignorant of their profession. They would have made the finest private soldiers in the world, but they were as little acquainted with the art and science of war as the rank and file they were commissioned to lead. It had many points in common with the army which Russia sent into the field last spring.

In France, even under its citizen king, who was eminently a man of peace, the soldier was always regarded with pride and affection, and — although the result arrived at might be unsatisfactory — the efficiency of the army was recognized as an object of great national concern. In this respect it had a great advantage over the military forces of England, part, and a most important part, of which — the militia — had been allowed to die a natural death, the only survivors being a few

* *The Armed Strength of France:* compiled in the Intelligence Branch of the Quartermaster-General's Department, Horse Guards, War Office, by Major C. J. East, 57th Regt., D.A.Q.M.G.

officers whose existence was assumed from their names being retained in the Army List. The private soldier had come to be despised as a drunken, useless member of society, because he did not add directly to the riches of the country by spinning cotton goods; his indirect value was naturally denied in an age believed to be the herald of perpetual peace; and the officer was merely regarded as a red-coated man of pleasure, or as a leading journal described him just before the Crimean War — I quote from memory — "a reckless libertine in time of peace, and a licensed cut-throat in time of war." The French army learnt little from its promenade into Spain in 1823 and from its operations against Antwerp in 1832; at least there resulted no important reforms in its administration, no great improvements in its *matériel* or in its system of tactics.

The army of Prussia, which is now the admiration of the world, had not, in 1846, shown any sign of its coming greatness. As a military power Prussia had been crushed by Napoleon at Jena, and was forced to accede to stipulations which the conqueror believed would prevent her again — at least in his time — from appearing on the battle-fields of Europe. A scheme was, however, devised by General Scharnhorst for counteracting the evil effects of those humiliating stipulations, by means of which they should be respected in the letter, but directly contravened in the spirit. An army nominally of the inferior strength stipulated by treaty was kept on foot, yet in reality a large military force was being created but kept out of sight, and the result was the brilliant part played by Blücher's army in the campaign of 1815. Jena was avenged at Waterloo, and the monuments erected in Paris to commemorate the destruction of Prussia's military power were only saved from the natural fury of that gallant old hussar by the direct interposition of the great English duke.

Prussia, which under Frederick became a great European power through the excellence of her army and the genius of its commander, sank in 1806 into insignificance; indeed it is a curious but still an interesting study to compare the contemptible position it occupied then, and for several subsequent years, with that it now holds in the world's esteem. The military system devised by Scharnhorst was not, however, an automatic machine, or one that could secure effective results, unless worked with intelligent skill. All systems must march with the times to be effective in moments of emergency. The condition of an army cannot remain stationary without deteriorating. Progress is essential to its health. Every invention and discovery in science acts more or less directly or indirectly upon it, requiring modifications, and sometimes even radical changes in its administration, tactics, etc., and, if the necessary reforms are not effected, it falls behind in the race of military efficiency; the machine if left to itself rusts. In the hands of old men an army is prone to live upon its past reputation, until at last all desire for progress is stamped out, and those who like the author of the "Tactical Retrospect," like Stoffel, like Trochu, recognizing its shortcomings, dare to recommend reform, are pointed at as radicals, as men who would overturn the nation's most cherished institutions, and, if so, why not even royalty itself? From 1815 to 1849, and even to 1859, such was the fate in a great measure of the Prussian army. A military system which, when directed by clear brains and stout hearts, was capable of turning out the army that invaded Bohemia in 1866 and France in 1870, when worked in a perfunctory manner under feeble chiefs, produced the inefficient force that served the king of Prussia up to about 1859. Most of us can remember how humble was the *rôle* played by that country during the Crimean War, and many can recollect, a little further back still, the stormy epoch of 1848, when the Imperial crown of Germany was offered to Prussia's king by the revolutionary Diet. Why was it refused by him? It could not be expected that the successors of the great Frederick should be withheld by qualms of conscience. His ancestors had obtained great accessions of territory by a course of conduct which did not suggest too nice scruples in such matters, and they had, from being poor electors of the insignifi-

cant province of Brandenburg, by such means bloomed out into being kings of what they called Prussia.

William is not, therefore, likely to have refused the Imperial crown because he thought it belonged by any prescriptive right to another royal house, or because the hands that offered it were hard and horny and far from clean. It was not that he, an aristocrat, would not stoop to accept that precious bauble from revolutionary citizens, for he had been for some time coquetting with them, and would gladly have received their proffered present. He allowed "I dare not to wait upon I would." Austria's demeanor was not to be mistaken. She would not permit it; and by a strong army, massed along the frontier of Prussia, said to the latter, "Accept that crown, which I claim as mine by right, at your peril." The king could not accept the challenge, because his army was unfit for war; the *Landwehr* held back and did not respond to the summons calling it out. The army could not be made up to war strength, and what is known in history as the "political capitulation of Olmutz" represented the final closing of the period of Prussian military development which had its origin in the great army reform of Scharnhorst. The great reforms that changed the whole character of the Prussian military forces, converting them from a *Landwehr* into an army, began in 1859.

Power in Prussia fell into other hands than those which wielded it in 1855–56, before all that was valuable in the older system attained the completeness which enabled her army to conquer at Königgratz. The Prussians, having recognized that their army was not fit for a great war, set themselves the task of making it fit for war — the only real test of an army's efficiency. They possessed the great faculty of knowing how to wait — a great power in all human affairs — to which they added industrious application. It would be foreign to my subject were I to attempt any description of the reforms and changes effected in the Prussian army during the years immediately preceding Königgratz; but it is desirable I should remark that they were carried out by able, studious, practical soldiers who despised no minutiæ, and who spared no trouble and no thought in working out the great problems entrusted to them, on the due appreciation of which hinged all their hopes of future national greatness. Above all things, be it remembered that it was during a dark and gloomy epoch of Prussian history, whilst she lay sunk beneath the contemptuous neglect of Europe, that her present military efficiency was developed, and her strength built up. During the period to which I refer, few statesmen or generals concerned themselves with what was passing in a poor little modern kingdom which most thought it rather a courteous concession to reckon amongst the great Continental powers.

Yet it was then that the able soldiers whose names first became known to fame in 1866 were quietly, in an unobtrusive and methodical fashion, creating that military system which is at once the admiration of all nations, and the model upon which they strive to form their armies. Their doings and the results they had achieved were, however, perceived by at least one man, and duly reported to his government in despatches of which the world in general knew nothing until they were published by the Prussians themselves, having been captured, amongst other official documents, near Paris in 1870. In a manner that does infinite credit to his patriotism and to his abilities, Baron Stoffel compared the shortcomings of his own army with the order and efficiency which characterized that of Germany. He pointed out the excellence of the machine, not only in design, but in the intelligent and yet easy manner in which it was worked, bringing to light the rapidity with which it was set in motion, and the great improvements that had been introduced into its mechanism after the experience gained in the "Seven Weeks' War."

His warnings passed unheeded; the rulers of France were so blinded by self-confidence and unreasoning pride, that when the first minister declared war in 1870, he said that he did so "with a light heart." But when crushed by defeat she made peace, and as a first duty had to reorganize her military system, Baron

Stoffel's letters served to indicate the point from which her military administrators should start in their work.

The publication now under review affords us a mass of information as to the manner in which that work has been carried out, and affords us ample materials for estimating the present military strength of France. We are bound to acknowledge that it is extremely dry reading; the author being evidently afraid lest he should afford any information that had not been published to the world in Paris. He gives us most interesting figures as to what the strength of the French army should be, but he throws no light upon what it actually numbers at this present time: he describes the organization and objects of the military colleges and army establishments, but he tells us nothing of their present condition, or whether they have succeeded and answered the purposes for which they were created. It is well known that the archives of the Intelligence Department contain ample information as to the present condition of the French army, and as to its value as a military weapon in the hands of those who wield its power; but this is kept for the ear of the minister of war, the commander-in-chief, and other high officials. It is of little use to know that an army numbers half a million of men, unless we are told their value as soldiers. This reticence is unfortunately necessary on the part of officials, especially in works published by official departments. I shall therefore endeavor to clothe with flesh the skeleton of dry details and figures supplied by Major East of the present condition of an army that may possibly play a great part in this coming year.

Before proceeding to deal with the figures in this book, a word, in passing, on the department from which it emanates will not be out of place. That most important branch of our army headquarter staff is in reality of very recent date, although nominally we have long had a department that was supposed to fulfil its duties. Formerly it was little better than a badly arranged collection of maps and statistical information about foreign countries. Now, under able direction, it has assumed its true position in relation to our army, and is engaged in working out the great military problems connected with the defence of Great Britain and of her distant possessions. It performs, in fact, what are generally regarded as the highest and most important duties devolving upon the staff of an army. Upon these duties its officers have been working studiously and in an unobtrusive manner for some years past. Works, similar in nature to that now before us, have already been published by it on the armies of most European nations; and I feel convinced that, should war at any time be forced upon us, our Intelligence Department will be found fully as equal to its duties as the corresponding department in any foreign army can have proved itself to be.

General Trochu, in his remarkable book on the "French Army in 1867," said: "*Nous nous sommes endormis dans la satisfaction de nous-mêmes; nous nous sommes détournés du travail, négligeant les efforts, les recherches, les comparaisons, qui créent le progrès.*" This self-satisfaction, this vain belief in the greatness of the French people and the invincibility of its army — sentiments converted into articles of national faith by the untruthful historians of the first empire — precluded all inquiry into the grounds upon which that faith was based, and in 1870 prevented a sound comparison being instituted between the real military strength of France, even as regards actual numbers, and that wielded by Germany. Had not the power of Prussia been destroyed before by the French army? and why should it be doubted by a generation of Frenchmen educated in the writings of M. Thiers that what was so easily and effectively achieved in 1806 should not be reenacted in 1870? Frenchmen travel so little beyond their own territory, they know so little of what is taking place elsewhere — being prevented studying the press and current literature of other countries by their ignorance of foreign languages — that the great changes introduced into the Prussian army in 1859-60 were practically unknown in France. Baron Stoffel endeavored to impress the emperor and his war minister with their importance, but without effect; the information he gave, the warnings he sounded, fell on stony ground and bore no fruit; "*la lutte de l'imprévoyance, de l'ignorance et de l'ineptie contre toutes les qualités opposées, la prévoyance, l'instruction et l'intelligence*" ended, as such a struggle must always do, in defeat and in well-deserved disaster.

In 1845-46 the army of France numbered about three hundred thousand men raised by conscription in accordance with the law passed in 1832, which law, however, allowed the rich to purchase exemption from personal service by procuring others to serve in their stead. The annual

contingent was then fixed at eighty thousand men, of which a proportion — determined annually by the Chambers — only joined the colors, the remainder being allowed to remain at their homes on leave. Its cost to the country was about 10,000,000*l*. per annum.

No great or very important changes were made in the law of 1832 until 1868, although the number given, forming the annual contingent, varied from time to time according to the contingencies of peace or war. Sadowa and General Trochu's uncompromising *exposé* of the condition of the French army in 1867 seem to have waked up the military authorities of France to a realization of the weakness of their army. That in actual numbers of soldiers ready for war it was far inferior to the army Prussia could assemble in a few weeks on the Rhine, seems then to have been recognized for the first time, whilst the absence of any really reliable reserve to fill up the losses occasioned by war dawned upon the whole people as a surprise. It was felt that, if their old position in Europe was to be maintained, their military force should consist of eight hundred thousand men, one-half of that number being the strength of the standing army in peace, the other half being its reserve. The army law then framed, establishing the principle of universal compulsory service, was devised with that object in view; if fully carried out it would have placed nine annual contingents of one hundred thousand men each at the disposal of the government, whilst the formation of a great reserve army, to be called the National Guard Mobile, was also decreed. This latter was to consist of all the young men not included in the annual contingent for the regular army, and it would, it was estimated, when the new military system had reached its normal condition in 1875–76, give a reserve force of five hundred thousand men. The Chambers would not, however, agree to all the provisions of the law as laid before them by Marshal Niel, and altered those bearing upon the formation of the Guard Mobile so materially as to preclude all possibility of its ever becoming a really efficient reserve force. Indeed Marshal le Bœuf, who succeeded Niel as minister of war, seems to have so thoroughly recognized this, that he took little trouble to give effect to that portion of the new military law. The result was that the declaration of war in 1870 found France without the reserve army which it had been one of the chief objects of the law, as proposed by Marshal Niel, to secure. A few battalions of this Guard Mobile had been organized at Paris, and a few were in the eastern fortresses; but as a reserve it existed only on paper, and the small portion which had been drilled was so utterly worthless, from lack of discipline, that, after a short sojourn at Châlons, it was found necessary to send it back to Paris. Had it been even possible to have found officers and non-commissioned officers for it, and to have mobilized it to its full strength, the arsenals did not contain a sufficient supply of breech-loading rifles or of clothing, etc., to have armed and equipped a reserve force of five hundred thousand men.

In July, 1870, the war strength of the regular army of France was five hundred and sixty-seven thousand men; but deducting from that number the *gendarmerie*, the troops composing the depots, and the garrisons at home and in Algeria, the force available for field operations against Germany would not number more than a little over three hundred thousand men. This was divided into eight army corps and three reserve divisions of cavalry, consisting in all of three hundred and sixty-eight battalions, two hundred and fifty-two squadrons, nine hundred and eighty-four field-guns, and three regiments of engineers.

The punishment that pursued the crime, the madness, of declaring war against Germany, whose field army was two-thirds stronger, and possessing vast and fully organized reserves of well drilled and well disciplined men behind it, is a matter of history with which I need not here concern myself. Without seeking for the national characteristics peculiar to either combatant to account for the overwhelming disasters that befel France as the result of their act of criminal folly, the disproportion between their armed strength is amply sufficient to account for the result. From the first general action — not, of course, including the painful episode now only remembered from having been impiously announced to the world as the "baptism of fire" of the boy prince — to the final destruction of the regular army, Napoleon's troops were outnumbered, I may say, in every battle. If the French military system had been a machine in good working order, and capable of being easily and effectively put in motion, the disproportion in numbers between the combatants in the early engagements on the frontier ought to have been reversed; and it may be fairly assumed that under such circumstances their immediate results would have been favorable to

the French, whose regular troops fought even against odds in those early battles with courage and devotion. It was those early defeats that began the demoralization which culminated in Sedan. It is commonly believed in England that the French fought badly all through the war. This is a gross libel upon their regular army; for, although badly handled at Gravelotte and in the actions round Metz, its courage and actual fighting qualities were conspicuous. Sedan and Metz were its graves; and the ghosts of armies subsequently collected by a ministry of *avocats* could not be expected, in the nature of things, to maintain the ancient prestige of French military power, when called upon to face the best regular army in Europe. Numerous as were the shortcomings of their leaders, imperfect as was their military system, vain, presumptuous, and ignorant as the regimental officers may have been, one need not go back to all these unfortunate facts to account for the complete collapse of the French military power in 1870: their armies were crushed by superior numbers. Defective as their regular army was, it could most certainly have protected France from the disasters which overwhelmed her, if the military forces of Germany had not been numerically as well as morally so vastly superior to hers. The great numerical superiority of the German army enabled it to deal such crushing blows at the outset of the campaign, that the demoralization they engendered among MacMahon's soldiers rendered them subsequently an easy prey at Sedan.

The French have never been good at fighting a losing game. Reverses with us and with our cousins, the Americans, serve to stimulate to increased exertion, to give us renewed energy: but with the Latin races it is otherwise; misfortune engenders despair; there is a want of self-reliance in their disposition that tends to convert early failure in any undertaking into demoralization, and with all people, when demoralization has once taken hold either of individuals, or of communities, or of armies, it is likely to degenerate quickly into cowardice. The *élan* on which the French pride themselves so much is the offspring of success, and success only. "First blood" has even with us been always regarded as an omen of good fortune, but to a French army it is a preface essential to victory.

If I am correct in saying that much of the disasters that befel the French army in 1870 arose from the demoralization in its ranks engendered by the defeats it experienced at the opening of the campaign through insufficiency of numbers, I have given ample reason why it is worth our while to examine what would be the fighting strength of France next spring should her interests require her to appear as a belligerent in Europe. Let us glance in passing at the great reforms recently introduced into her military organization, and the improved instruction afforded to all ranks. Amidst the turmoil of internal party strife, important changes have been worked out quietly and effectively; the struggle for power by the several political parties into which France is divided has not in any serious manner hindered military progress. The direction and management of army affairs have been kept distinct, and outside the realm of party faction. The excellence of the French civil administration, the completeness and perfection of its machinery, has enabled the war ministry to carry out the new recruiting law of 1872 with ease and rapidity, and the well-established territorial division of the country lends itself to the new military system based upon it. The first principle of that law is the obligation of every Frenchman to personal military service. Substitutes are not permitted, and although exemption from personal service is permitted under certain clearly defined conditions, the law is that every man from twenty to forty years of age who is physically fit for work may be required to serve either in the regular army or in its reserves. Those who have at any time been convicted of serious crimes are not allowed to claim the honor of wearing a soldier's uniform. The full term of military service, viz. twenty years, is divided into four periods, — 1st, five years in the regular army; 2nd, four years in its reserve; 3rd, five years in the territorial army; and 4th, six years in its reserve. In order that this obligation should in peace time fall as lightly as possible upon young men studying for the learned professions, etc., a certain number — to be determined from time to time by the minister of war — who pass a specified examination are allowed, upon paying down a lump sum of money for the cost of their clothes and food, to reduce their term of service with the colors to one year, at the end of which they have to pass an examination in military subjects, or to go on serving for twelve months longer. The amount per man so paid this year was fixed at 60*l.*, but under certain circumstances applicants can obtain a reduction entire or remission of this payment.

The population of France, which may be taken at thirty-six millions, has during the last four years given an average of two hundred and ninety-two thousand young men who have each year attained the age of twenty. After deducting from that number those taken for the auxiliary services (twenty-three thousand five hundred per annum), those exempted from the service owing to physical disabilities, from family reasons, and because they belong to religious or educational services, in round numbers, a little less than one-half remains, and from it the annual complement for the naval service, sixty-five hundred, must be deducted. Allowing for every deduction, absentees included — for there are army absentees in France as well as in England — this annual contingent for military purposes amounts to one hundred and thirty-three thousand, divided into two classes, the first of eighty-three thousand, who remain with the colors nominally for five years, and the second of fifty thousand, who from financial reasons are only kept with regiments for periods of from six to twelve months, where they remain *en disponibilité* until they pass into the reserve. In reality, the first class are barely four years in the ranks, for the men do not join until six months after the date from which their service is calculated, and they are allowed to leave their regiments on furlough six months before the expiration of their term of service.

On the 1st of January, 1878, the active army with the colors will therefore consist of, the first class of five annual contingents of eighty-three thousand each, plus the second class of the contingent for the current year, the permanent cadres of the army, the one-year volunteers and the re-engaged soldiers, calculated to give altogether, in round numbers, five hundred and thirty-four thousand men,* due allowance being made for casualties; and *en disponibilité*, of four annual contingents of fifty thousand, calculated to give about one hundred and eighty-four thousand men, similar deductions being made. The total strength of the active army will therefore be seven hundred and nineteen thousand non-commissioned officers and men, or, adding the officers (26,499), the grand total will be, in round numbers, seven hundred and forty-five thousand of all ranks, not including the gendarmerie, or Garde Républicaine, which together amount to twenty-seven thousand men. The reserves of the active army will in future consist of the men, who, having reached the age of twenty-five, have completed their term of five years' army service — that is, it will consist of four annual contingents plus a proportion of the cadres, etc., who will annually pass from regiments into the reserve. When this reserve has reached its normal strength in 1881, it will consist of five hundred and twenty thousand men, all of whom it is intended to call out twice during their reserve service to take part in grand manœuvres; once during their second, and once during their fourth year's reserve service, but upon both occasions for a period of twenty-eight days. Although this reserve created by the law of 1872 will not be in existence in its complete form until the end of 1881, it may be safely assumed that the reserve actually available at this moment amounts fully to five hundred thousand soldiers, who have all been trained in the regular army, for few of those who fought in 1870 are still with the colors.

The men, on completing their army reserve service, pass into the territorial army for five years; they will therefore be twenty-nine or thirty upon joining, and will remain in it until the age of thirty-four or thirty-five. When it has reached its normal strength in 1886, it will consist of five hundred and ninety-four thousand men, allowance being made for casualties. At the age of thirty-four or thirty-five, the men will pass into the reserve of the territorial army, in which they will remain for six years to complete the full term of twenty years' military service, which in future all Frenchmen, not exempted for the reasons already stated, will have to give their country. When this reserve has reached its normal strength in 1892, it will number six hundred and thirty-eight thousand men.

In the last-named year the military strength of France will be in round numbers as follows: —

Active army	719,000
Reserve of active army	520,000
Territorial army	594,000
Reserve of territorial army	638,000
Total	2,471,000

This grand total does not include officers nor the gendarmerie, nor the non-combatants annually allotted to the auxiliary and

* The actual number provided for by the budget of 1877 as present with their corps was only 441,147; the difference is owing to the fact already mentioned, that the men in reality only serve four, instead of five, years with the colors; this reduces the numbers I have given as actually present with their regiments by one-fifth, who are really on furlough, but available at any moment for service if required.

administrative services, manufacture of warlike stores, construction of fortifications, railways, telegraphs, etc. As already stated, twenty three thousand five hundred men are each year told off to these auxiliary branches, but do not serve during peace. There are already about ninety thousand of them in existence available if required, which number will be increased to about one hundred and eighty thousand in 1881, and to one hundred and ninety-one thousand in 1892, when the military system will have attained its normal development.

As regards the present condition of the territorial army, much has recently been effected to make it a reality, by organizing the cadres of the one hundred and forty-five regiments into which it is divided, appointing officers to it, etc.; but nothing has yet been done, even on paper, towards forming its reserve. It may, however, be safely assumed, that in the event of a war this year the territorial army itself would certainly number five hundred thousand men, two-thirds of whom would have previously served either in the regular army or as mobiles during the late war, for whom an abundance of officers would be available. Should France take the field in 1878, I believe its military forces would be as follows: —

Active army	719,000
Reserve of active army	500,000
Territorial army	500,000
Auxiliary services of workmen, etc.	90,000
Total	1,809,000

This total does not include officers, gendarmerie (twenty-two thousand), the Republican Guard (thirty-eight hundred), nor the Customs and Forest Guards (thirteen thousand four hundred).

The active army is divided into eighteen army corps stationed in France and one in Algeria. Each of the former consist of two infantry divisions, the latter of three, one being stationed in each of the three provinces into which that colony is divided. The fighting strength of each army corps is twenty-five thousand infantry, about eighteen hundred sabres, one hundred and two guns, and one thousand engineers, making a total in round numbers of, say, thirty thousand fighting-men, exclusive of police and the administrative departments. France is apportioned off into eighteen regions, each having a population of about two millions, and each containing the headquarters of an army corps. Each region is subdivided for purposes of military administration into eight subdivisions, in each of which there are one or more magazines of arms, clothing, etc., and one or more recruiting offices, in which are kept the lists of the men belonging to the army, its reserves, etc. For each region there are also general supply magazines of all sorts of military *matériel*, from which the subdivision magazines are kept supplied. Each region is thus self-supporting, and an ample supply of arms and stores are kept in it to equip not only all the troops belonging to its army corps, but all those belonging to the depôts, army reserve, and territorial army, for whose organization it is responsible. One great point of difference between the French and Prussian system of recruiting is that, whereas in Germany each army corps is furnished with men drawn exclusively from the region in which its headquarters in peace and its depôts in war are localized, it is only the men belonging to the second class of the annual contingent in the French army who, when mobilized, serve exclusively with the army corps belonging to their own territorial region. The men of the first, or, as we should term it, the standing army, are recruited generally from all parts of France, so that in every division, in every battalion, may be found men from Marseilles, who can with difficulty make themselves understood by their comrades in the same company drawn from Normandy. This is a blot, a weakness in their system, which its conservative framers evidently felt was unavoidable on political grounds. They recoiled with dread from encouraging a provincial spirit in which they believed they saw, if not actually separatist tendencies, at least the germs of revolution. The demon of revolution is apparently never absent from the minds of the French statesmen; it is their national bogey, the flapping of whose wings gives forth a sound terrifying to every man in France whose property is more than the coat on his back. If the Republicans obtain the upper hand in the struggle they are now waging with the executive authority, it is possible they may assimilate their system of recruiting to that of Germany.

When the French army was mobilized in 1870 there were ample stores of arms, clothing, etc., of transport and other material, for it; but, in accordance with the system of centralization then existing, they were so massed in a few grand arsenals and magazines that it was physically impossible to issue them to the troops in due time. Alas! this is still our system

in England, for, practically speaking, all our eggs are in one basket, and that basket is Woodwich, a place extremely unsuited for the purpose. Were our storehouses there destroyed — say by an incendiary — at the beginning of a war, we should be in a bad way. In 1870, in order to economize storage space in their magazines, the wagons and carts for transport purposes were stacked in pieces, the bodies by themselves, the wheels and other parts the same. When suddenly required, it was found it would require about six weeks merely to put them together and get them out of the magazines for issue to the troops. Not only are they now distributed at many storehouses and kept with their wheels on ready for immediate use, but they are kept loaded with the *matériel* they would have to carry if the army were suddenly mobilized. A great and salutary change has been recently effected in relieving the general commanding an army of the trammels which before the war were thrown round him by the intendance. He is now — as he must be in every well-organized army — solely and directly responsible to the minister of war for the entire military administration of the region and troops placed under his command.

I believe it may be most truthfully asserted that to what is known in our army as the "five years' rule" we owe very much of our present military efficiency. According to its provisions, all commands — the position of commander-in-chief of the army alone excepted — from that held by the general commanding-in-chief in India to the command of a regiment of cavalry, or a battalion of infantry, can only be held for a period of five years. If by mistake a bad or inefficient man does obtain a command — an accident that will occur as long as man is fallible — we have at least the consolation of knowing that we shall get rid of him at the end of five years. This rule must eventually result in securing to us a pre-eminence in the efficiency, both mental and physical, of our officers over those of all other nations. In the command of army corps, the French have gone a step further in this respect, only permitting those commands to be held for three years, except under most peculiar circumstances, and then only by the special decree of a ministerial council. It remains to be seen whether, if the party which now commands a majority in the Chamber obtain the control of military affairs, it will carry out this law impartially, or use it as a cover for Republican jobbery regardless of the interests of the army.

As the constitution of our infantry regiments is a subject which came indirectly before Parliament last session, and may probably be again discussed in 1878, it will be instructive to study the establishments fixed for that arm of the service in France. The result of battles must always depend, not only upon the conduct of the infantry, and the manner in which it is handled, but upon its tactical value: and that again — apart altogether from the courage and physical condition of the men — upon its armament, its drill, discipline, and its tactical organization. It is universally admitted that the last named, to be perfect, should correspond in all arms of the service with the organization for administrative purposes. In nearly all modern armies, the battalion war strength is about one thousand fighting men. When Prussia adopted the system of strong companies with few commissioned officers, she was such a very poor country, that, in order to create the great army with which she took the field in 1866, it was absolutely necessary she should economize in every possible way, driving economy even to the very thin line which separates it from inefficiency. To employ as few officers as was compatible with the efficiency of battalions and companies was, therefore, a matter of great moment. The private soldier whose daily pay was to be counted in farthings, and who received no pension, was a cheap article, as every man was compelled by law to serve. But with the officer things were otherwise: he had to be paid so that he might live like a gentleman — a poor one certainly — whilst serving, and he had to be pensioned when no longer fit for work. The plan of having two hundred and fifty men in a company, instead of the old standard number then common to nearly all armies — viz. one hundred — without increasing the complement of officers per company, was one eminently calculated to effect an immense saving in military expenditure. In accordance with it, a battalion of one thousand men would consist of only four companies, and would, therefore, only require four captains, instead of the eight or ten that such a battalion in other armies would have. As long as actual inefficiency was avoided, economy was the great object to secure; so the plan was adopted, and their tactical formations and manœuvres were altered to suit this new organization. It was not, as it seems is commonly believed, that their system of strong companies was

devised to meet a new order of tactics. The "ever unready" and "ever too late" army of Austria, unprovided with breech-loading arms and badly handled, was utterly routed at Königgratz by its well-prepared and scientifically directed enemy armed with the needle-gun. Army economists in England at once jumped to the conclusion that the organization of the army that had been victorious must necessarily be the best, and they lost no time in urging upon our War Department the advisability of copying the Prussian system of strong companies and when the French army subsequently fell a victim to the same conquerors, even military men amongst us were found to advocate that measure. Before 1866 the French army was our common standard of excellence: we copied it in an almost servile fashion even to the peg-top cut of trouser, and the manner in which our overalls were strapped with leather; and it is not saying too much to assert that, were the German army to be defeated by that of China, the same men who were indignant with us for not assimilating our army in every respect to that of France before 1866, and who now clamor loudly for us to imitate that of Prussia, would then see good and wisdom only in the organization of the Celestial army.

That we ought to take lessons from others, even from our enemies, is sound reasoning, copying from them all that is better in their system than in ours; but we should not rush to conclusions and accept as a fact that such or such a victory was owing to a superiority in the tactical organization of the victors' regiments. Men who have themselves commanded infantry skirmishers in action will bear witness to the impossibility of any one captain being able to lead well more than about one hundred soldiers at the outside under a heavy fire: it is physically impossible for him to exercise an effective supervision over a larger number in skirmishing order, or to communicate to them that direct impulse which must emanate from the company leader and from him alone. The old practice of fighting in a closely formed line that used to be likened to a rigid bar of iron has been rendered impossible by the destructiveness of breech-loading fire; in future we must fight in a flexible line like that described by a chain-cable, loosely and unmathematically laid on the ground between any two given points: we must be more or less in open order, with parts of the chain thinly occupied, whilst the men should be thick — in groups in fact — at other and, tactically speaking, more important points of it. This requires a larger proportion of officers to men than was necessary under the mechanical system of fighting in rigid lines, shoulder to shoulder. In 1870 the Germans complained loudly of the insufficiency of their established complement of company officers, and I see that Mr. A. Forbes — who is no mean authority on such a question — in his recent excellent lecture at the United Service Institution, attributes the Russian misfortunes at Plevna and the great disorder in their ranks during their attacks upon that place in a very considerable degree to the small proportion of officers to men in their companies. His impressive warning to us on this subject should be taken to heart by every one interested in our army. My contention is, that the Prussians were victorious in 1866 and again in 1870, not because they had large companies and but few regimental officers, but that their success was achieved notwithstanding the disadvantages they labored under, owing to those serious faults in their tactical organization, and is attributable to causes having no relation whatever to their battalion formation. The one great tactical superiority which our army possesses over all others at present, and which most undoubtedly will go far towards helping us to victory should we ever be engaged in a death struggle with any Continental nation, is, that whilst our enemy's battalion of one thousand men will be divided into four unwieldy companies commanded by four captains, assisted by only a small number of officers, our battalions of a similar strength will have eight captains leading eight handy companies assisted by several subalterns. It is the firm belief of those who have themselves commanded British infantry in action, and who are therefore the best judges on this point, that the foreigner with his four clumsy companies, and without a proper proportion of officers, would be nowhere in such a contest. It must be confessed that there are some able men in our army who think otherwise, but they are chiefly either mere theorists or are men who have never commanded a company of British infantry in action. It is, I think, very much to be regretted that, following the law of worship for success, the French have been led into adopting what, according to my view, is a serious mistake — namely, the German system of ponderous companies with few officers, a system devised by Prussia for economical and not for tactical reasons.

The active forces are armed with the Gras rifle and sword bayonet, the territorial army with the chassepôt converted on the Gras system. The calibre of both is the same —·433 inches — and both use the same ammunition. The Gras rifle is sighted up to nineteen hundred and sixty yards, and its mechanism is simple. The soldier carries seventy-four rounds of ammunition, which is nine less than he carried when armed with the old chassepôt: ten rounds more per man are carried in the battalion ammunition cart, about forty more per man in the divisional ammunition trains, and about twenty-four more per man with the army corps park. All the field-guns in use are breech-loaders, the largest being 3·74 inch steel piece on the Lahitolle principle, with which a proportion of the army corps batteries are armed. The divisional field batteries have the 3·35 inch, and the horse artillery the 2·95 inch bronze guns on the Reffye system. Percussion fuses only are used. Batteries of mitrailleurs are still maintained for field service. The proportion of guns to combatants is about the same as with us, viz., 3·3 per thousand. The attack formation for their infantry has been entirely changed since 1870, and does not now differ very materially from our own. The system of regimental transport for all arms of the service — which has recently been finally adopted by us after years of opposition — is now the law in France. Each infantry regiment in the field of three battalions is allowed twenty-seven one-horse carts, four for the conveyance of officers' baggage, three for ammunition, two for tools, one for reserve supply of boots, etc., seventeen for two day's dry and one day's preserved meat rations, besides three pack animals for medical panniers. To each battalion there is also a canteen-keeper's cart. These carts are all of the same dimensions, and officers are obliged to pack their baggage in boxes made expressly to fit them. Each company officer is allowed one box, which, when filled, is not allowed to weigh more than 30·8 lbs. (that is 10 lbs. less than is allowed to our officers); a canteen is also carried for every four officers, its weight is about 26 lbs. and it holds cooking pots, plates, etc., for that number. Those articles are private property, but the canteen itself and the boxes to contain baggage are supplied by government to all grades. Every soldier carries two day's provision, including preserved meat in tins, which, together with what is in the battalion ration-carts, makes the regiment independent of the divisional and corps trains for four days. The French soldier is not supplied with socks, which, according to our ideas, is a great mistake: the infantry man carries a total weight when equipped for war of 56 lbs. 9 oz., including arms, ammunition, accoutrements, a portion of a *tente d'abri*, etc. — a heavy weight for a man to stagger under during a march extending over, say, eight hours. In complete marching order the weight on the horse of a cuirassier is 19 stone 2 lbs., of a dragoon eighteen stone, of a chasseur or hussar seventeen stone, including one day's rations for the man and one day's corn for the horse.

Our curious anomaly of brevet rank, which is a relic of the purchase system, is unknown in France, where no man can be promoted to a grade without being employed in that grade. Honorary rank does not exist, and if an officer is thought worthy of being promoted, he is considered worthy and fit to exercise the duties of the grade to which he is raised. One-third of the officers are appointed from the ranks, the others come from the military schools; all promotion amongst the officers up to the rank of captain is conferred, two-thirds by seniority and one-third by selection.

The French staff was tried and found wanting in 1870; since then great changes have already been, and are still about to be, made in it. A law on the subject is now before the Chambers. It contains all that is good, and avoids what is known to be radically wrong in our system by all who have had much staff experience in war. Almost all aides-de-camp and orderly officers must be what would correspond in our army with those who have graduated at the Staff College, and they can only hold their appointments for three years, being ineligible for a similar position until after an interval of two years. Formerly the French staff was a corps apart; when an officer received his commission to it he severed all connection with the regiment in which he had hitherto served; thenceforward all his *esprit de corps* was for the staff, and not for any particular battalion or battery, as is the case with us, and once on the staff always on the staff was the rule. The result was a great want of sympathy and cordiality between the staff and the rest of the army, which engendered envy and hatred on the part of the latter, and a supercilious feeling of superiority on the part of the former, which they took little care to conceal.

The staff school and schools of applica-

tion are well-devised institutions for imparting instruction to the several arms of the service, although, as with us, the tendency is rather to pay too much attention to pure science in preference to practical subjects.

The system of instructing soldiers in reading, writing, and arithmetic in the regimental schools is good; all who are not proficient in the three R's have to attend school daily for an hour, which in winter is prolonged to two hours. Great attention is paid to gymnastic instruction, and fencing is taught to the private as well as to the officer. Owing to the great expenditure in horses during the last war, they have become dear and difficult to obtain. To enable the State to obtain quickly the large amount that would be required in the event of war or sudden mobilization, a special law was passed in 1874 enforcing the conscription of horses and mules. An annual census is taken of all six-year-old horses and four-year-old mules, the owners being obliged, under pain of a heavy penalty, to bring them bridled and shod to the appointed places of rendezvous, receiving payment on the spot for all those accepted, the price being fixed definitely in each year's budget.

In all the great military reforms effected and still being carried out in France, the Prussian army has been the model followed, as was the case in that same country a century ago, when the army of Frederick was looked up to as the best in Europe. In their tactical arrangements, in the distribution of their troops into brigades, division and army corps, the German organization has been carefully copied, and above all things it has been sought to give to their reformed army that power of rapidly passing from a peace to a war footing which has been brought to such a high state of perfection in Germany. It is now recognized that neither armies nor men to lead them can be improvised, by a decree, as M. Gambetta endeavored to create them, and that, if any people wish to be eminently a military nation, they must during peace prepare for war. Every detail connected with mobilization must be carefully studied and provided for by regulations, which every agent to be employed in that operation must clearly understand, so that every one may know his part, and be ready to play it at the shortest notice. In fact, the machine should be so ably devised, so skilfully put together, and so carefully kept in perfect working order during peace, that when war is determined on the war minister should have merely to telegraph to the commanders of army corps the simple order, "Mobilize at once," to cause the whole machinery to be placed in effective motion. To secure this desirable end, it is essential that the organization of the troops and the system of military administration should be in peace what it is intended to be in war.

21,675,000*l.* is the "ordinary credit" demanded by the War Department for 1878. One who has good opportunities for knowing, estimates that in the five years between 1872 and 1876 the French spent 160,000,000*l.* for military purposes, of which 70,000,000*l.* were expended on warlike material and fortifications. Yet we hear no complaint from the taxpayer on the subject. The people seem quietly determined to have an army worthy of the nation, and they are faithfully seconded by all ranks in the army itself, whose ambition is to do well. The officer, who was in former times little more than a *flâneur* in uniform, is now anxious to make himself a professional soldier. Formerly he cared little for information about foreign armies; now he is keenly alive to all that goes on in them, as proved by the existence of the *Revue Militaire de l'Etranger*, by far the first military publication on the subject in Europe. No army suffered more from routine — red tape, as we commonly term it — than that of France before the last war: most returns and requisitions used to be made out in triplicate, and circumlocution, the inevitable attendant upon centralization, ruled supreme. The antidote for this evil has been found in localization. Their new defensive works, although not finished, have been pushed on rapidly, and most of their strong places are now well provisioned and supplied with the necessary stores to enable them to stand a siege. They suffer greatly from the want of good non-commissioned officers, a want that it is difficult to supply in a short-service army; we are beginning to feel it ourselves seriously in England, and unless we meet the difficulty by a large increase of pay — no penny-halfpenny addition will suffice — the efficiency of our army will suffer considerably.

I have as far as was possible, with due regard to the information it is desirable to convey in this article, spared my readers all strictly professional details. My object has been to show them, that whilst our attention has been mostly directed to the noisy struggles between those political factions who howl themselves hoarse at

Versailles over questions of parliamentary procedure, the military direction, which politics have not yet been allowed to interfere with, has been steadily and seriously employed in creating a great, powerful army. That it does not yet equal that of Germany, and cannot fully do so for about another ten years, is without doubt; but it is quite as true — remembering the greatly increased power now possessed by the defence — that France has no reason to dread any German invasion in 1878, even supposing that those desirous of crushing her could succeed in uniting what is now known as Germany with that object in view. I write this at a moment when it is impossible to predict whether Marshal MacMahon will or will not succeed in keeping the management of military affairs out of the domain of party politics. If he fails, it is possible the army may be used as a stalking-horse for Republican jobbery, and that its direction may pass into the hands of men more desirous of party success than of national strength and greatness. France can never be great unless she is strong, nor really strong until her army is as powerful as that of any other nation in Europe.

The reorganization of the Prussian army, begun in 1859, was carried on for several years by King William in the teeth of a great parliamentary opposition; the sympathy of England being strongly pronounced in favor of the constitutional party opposed to their sovereign and his military advisers. In like manner, we find that English opinion to-day is on the side of those who take their stand as advocates of parliamentary government in France, in opposition to the marshal's views. We now know that the king of Prussia was right, and his people wrong, in the years immediately preceding the invasion of Bohemia. If the nation had had its own way then, the Prussian army, which is now the admiration of the world, would still be the *Landwehr* it was in 1858, and the successful wars which have converted the king of Prussia into the emperor of Germany could never have been. It is possible that we may yet have to acknowledge that we are equally wrong now in our estimate of the condition of things in France; that mistaken as Marshal MacMahon may be in regard to home politics, he has — following the example of the Prussian king — at least succeeded in making France once more a great military power.

The year 1878 seems destined to be one of great events for Europe, and, as far as one can judge at present, of events pregnant with future injury to England in particular. Germany is our great natural ally as long as she remains simply a mighty military power; should she, however, take possession of Holland and its colonies, her only object can be to rival us upon the sea. It is said she is anxious to see us embroiled in the Eastern war, so that she may do so without opposition. It would, no doubt, be possible to assemble a conference of men in St. James's Hall, who would loudly assert that her possessing herself of Holland was no concern of ours. If an enemy seized upon the Isle of Wight, there is a party in England that would not only deprecate our fighting for it, but would argue it was no loss, that it "did not pay." But should the independence of Holland be threatened, no matter what that party might say, its impotent spluttering would be drowned in the cry for war that would certainly go forth from Land's End to John o'Groat's House. It would then be the alliance of France we should naturally look to. Holland, Belgium, France, and England allied together would form a league, that even proud Germany would feel was too powerful for her to face. Should that union of nations in the defence of right pass from the region of speculation into the world of reality, I hope I have shown that the army of France would be no unimportant factor in summing up the military forces which those allies would have at their command.

ERICA.*

TRANSLATED FOR THE LIVING AGE FROM THE GERMAN OF

FRAU VON INGERSLEBEN.

XVII.

ON THE RHINE.

THE radiance of a sunny spring day rests on the green waves of the Rhine, makes its ripples glitter and sparkle with myriads of stars, and pours a vivifying warmth and brightness over the cities, castles, and vineyards on its shores. How all nature rejoices in the splendor of her spring robes, and how thoroughly everything harmonizes with the cheerful mood of the weather! It really seems as if spring has its home here, and scatters its gifts with partial liberality over this happy valley, where only joy and smiles reign, grief and tears are unknown.

How gaily people throng the streets of the cities, how cheerily acquaintances chat together when they chance to meet, how comfortably the pedestrians stroll along! And even the venders of goods, laden with baskets, do not seem oppressed by their toil, but pursue their avocations with alert steps and merry eyes, and carry on a good-natured rivalry with the draymen, who stride along in blue blouses beside their gigantic horses, humming a song between their teeth, or, if on the highway, comfortably smoking a pipe.

The gates of the stately city houses or castles open to permit the egress of carriages filled with richly-dressed occupants. On roll the equipages past hillsides fragrant with vine-blossoms, stately country houses standing amid parks brilliant with the fresh green foliage of spring, rugged, towering cliffs, and luxuriant fields of grain. In the distance the graceful outlines of a chain of mountains stand forth in strong relief against the radiant blue of the sky, the ruined castles frown darkly down upon the valley and recall the transitoriness of all earthly splendor. But the laughing, sparkling sunlight irradiates these ruins with illusory life, casts warm lights upon the ivy that clings to the crumbling walls, and covers the warning admonition of the past.

And amid all this beauty, the green waves of old Father Rhine glitter and sparkle, as with undiminished vigor the flood rolls on between the banks, and tiny stars of light dance on the surface with roguish glee. Now as ever, his strong back uncomplainingly bears the countless ships and boats, which afford a picture of the most motley life.

This dark, solemn ship, from whose black pipe rises a column of smoke, comes from Holland, its lack of ornament betrays its nationality. Yonder again, that vessel with the gay colors, covered with flags and pennons, is a true child of the Rhine. Wreaths of flowers are twined around the masts, bright coverlids are spread over the seats, and the very crowd on deck unite in pouring forth full, rich melodies. The waves of sound roll harmoniously over the broad surface of the river and die away in gentle murmurs along the sloping banks. All listen, even the quarry-men who destroy the rocks of the Rhine with their axes, rest for a moment to hear the sweet sounds.

But soon the chisels hammer again, and the stones thunder down and are packed in boats, which will be dragged away by yonder busy steam-tug. There it comes panting and puffing, with a line of barges behind it. In spite of its zeal, the progress is very slow, the river, as if indignant at the undue burden imposed upon it, rises in high waves, amid which the smaller boats rock frightfully. The more timid dart towards the bank, the bolder ones remain, but the rowers are obliged to struggle hard, and even yonder floating bath, though firmly anchored, swings wildly from side to side, as if it would fain break from its moorings.

Only the great steamer, whose deck swarms with passengers, quietly pursues its way undisturbed. Representatives of all nations are here assembled, who flock from every quarter of the globe to gaze at the beauty of the German river, yet the Englishman looks at his guide-book, the Frenchman at his fair neighbor, only the German is wholly absorbed in the sight of the wondrous landscape. But now all are looking attentively at the shore, along which a solemn procession is slowly moving. Large banners flutter in the van, white-robed priests move amid the throng, which, attired in gay, often conspicuous colors, resembles a festive gathering rather than a train of penitents. Devout songs echo from the lips, but the eyes are not cast down in reverence, but gaze keenly at the travellers, or occupy themselves with other and more attractive objects.

True, nature is here so beautiful that it is difficult to wholly forget earthly in heavenly things, and although on this occasion reverence for the piety of the pilgrims sustains a severe shock, a glad, grateful appreciation of the beauty lavished upon this world is certainly pleasing to the all-merciful God. So blessings upon thee, beautiful Rhine, favored child of creation. May fruitfulness ever remain in thy valleys, majestic beauty on thy mountains, and peace and joy with thy inhabitants in the palace and the hut.

One of the fairest spots in this famed region is the Siebengebirge, whose soft outlines and lofty peaks unite both grace and majesty. Tradition weaves a magic charm around the crumbling ruins on these mountains, the abysses and gentle declivities that slope down to the valleys. The lord and king of these mountains, the lofty Drachenfels, which now stands forth so clearly against the radiant blue of the spring heavens, and really seems to rule the whole country, is the principal theme of all these legends. Innumerable songs are composed in his honor, young and old, gifted and commonplace poets have sought to glorify him in their verse, and count-

less travellers climb his rugged peak to revel in the magic that surrounds him, and gaze at the wondrous beauty of the world at his feet.

In summer the little city which seems to nestle confidingly to him, like an affectionate child, is never destitute of visitors who are making a pilgrimage to him. The vine-wreathed verandas that overhang the river are always filled with travellers; gay conversation and merry laughter echo from them, or the people unite in song, and the full beautiful chorus bears the notes far away.

Drachenfels, however, has its power of attraction for still wider circles. The whole neighborhood is a favorite spot for travellers to remain for a longer or shorter time, and we see everywhere among the dwellings of the real inhabitants pretty villas prepared for their reception. The houses of the prosperous villagers, which resemble the residences of a city, stand in an almost uninterrupted succession along the banks of the river. One can scarcely tell where one of these villages begins and ends, as pretty country houses everywhere gleam forth from amid their parks or flower-gardens.

In a steeper part of the shore, where the rocks fall sharply down to the water, we see a platform hewn from the stone, surrounded by a broad balustrade, which protects the numerous seats and benches within. No vine can twine around this enclosure, it is true, but tall lindens stand on one side where the rock gives way to rich soil, and their broad branches form a protecting roof over the pleasant loitering-place. An easy flight of stone steps leads directly down to the river, and a number of little boats, which lie rocking on the waves waiting to be used.

On the land side, the platform adjoins a little round pavilion, whose pointed roof bears a fluttering flag which gives visitors, even when at a distance, the pleasing assurance that the occupants of the house are at home. The wide glass doors are thrown wide open, and the balmy spring air can sweep freely through the room, while the eye, equally unrestrained, wanders over the beautiful landscape.

On a sofa, which has been drawn into the middle of the room, reclines a young lady, so deeply absorbed in a book she holds in her hand, that she has no eyes either for the charm of her surroundings, or the boy who is half kneeling on a stool at her feet. But in consequence of this, the latter's glance rests all the more steadily on his beautiful companion, while his features vividly betray his impatience at her continued interest in her reading. A hasty movement at last gives vent to this feeling, and makes the lady raise her eyes, but she instantly looks down at the page again, saying carelessly, —

"Let me alone, Fritz. It isn't time yet."

"It is impossible, Sidonie. You surely won't say that one chapter can last forever."

"Look for yourself, doubting Thomas," replies the lady, smiling and holding out the volume. "I'm just at the seventh paragraph."

"Then deuce take the author and his long-winded chapters," cries Fritz angrily, stamping violently on the floor.

"Your uncle, the fox-hunter, should have taught you better manners, Fritz."

"But, Sidonie, it is your duty, you must surely see that."

"Hush, Fritz! I want to read," and the lady again buries herself in her book.

Fritz is once more reduced to looking on. His eyes rest a few moments on the beautiful face before him, then wander to the window to gaze into the park that adjoins the pavilion, and at the same time cast an angry side-glance upon the page, to see whether the ardently desired end of the chapter will not yet appear.

A slight shade of excitement appears on the young lady's features, though they do not seem inclined to mirror every passing impression so easily. The dark eyes, surmounted by arched brows, whose long lashes are now cast down, have no expression of merry petulance, but look very grave and even somewhat cold for one so young. The high forehead, whose marble whiteness is enhanced by the black hair that surrounds it, also produces an impression of seriousness and self-command. The corners of the delicate lips droop slightly and indicate a firm will, but the eyes are too clear and intelligent to permit a fear that the beautiful girl's character is marred by obstinacy. The straight, slender nose harmonizes charmingly with the eyes and lips, but increases the expression of conscious pride stamped upon the beautiful features.

Her light floating dress, even in her recumbent attitude, falls gracefully around the slender figure, and the lace-veiled arm on which the reader comfortably supports her head might serve as a model for a sculptor. She has carelessly thrust her fingers through her elaborately dressed hair, and soft black curls twine around her hand. She seems so completely absorbed

in the book that she has no attention for the outside world, and yet a close observer would now perceive a watchful, listening expression.

The boy on the cushion instantly notices this change in her features, and looks around in surprise, as he sees no object that could have produced it. But he now distinctly hears hasty footsteps coming up the steps from the river, and a look that would be difficult to decipher, an expression of mingled amusement and vexation sparkles in his eyes, which again rest upon Sidonie, and he perceives a faint flush pass over the pale, aristocratic countenance of the young girl. He starts impetuously from his seat and hurries out upon the platform, where, leaning over the balustrade, he can obtain a full view of the new-comer.

The latter, a tall, slender young man in simple morning dress, nods kindly to the boy, and turns toward the park. Fritz, instead of answering the greeting, rudely tosses his head and rushes back into the pavilion, where he throws himself down on his seat so violently that the stool creaks loudly. Sidonie, whose eyes have followed every movement of the boy, is now again so deeply absorbed in her book that the interruption annoys her. Her frown, however, does not seem to make the impression intended, for Fritz vehemently exclaims, —

"You don't deceive me, Sidonie!"

The young lady raises her eyes from the book, but makes no reply. It almost seems as if she were reflecting, and a shadow of indignation or embarrassment darkens her features, but she must have speedily formed her resolution, for the large, dark eyes sparkle with an almost mischievous light, and she says laughing, —

"Why, yes, you watchful Cerberus, I have read three pages of the next chapter."

"What, that too?" cries Fritz angrily; "then for a punishment you must talk to me at least half an hour. And since we have plenty of time — do you know, Sidonie, you can teach me how people set about making you hate them?"

The same shadow of indignation or embarrassment again appears in the young girl's eyes, but Fritz must have failed to notice it for he continues, —

"It is my most ardent desire to make you hate me, hate me as bitterly as ——"

A quick, imperious wave of the white hand silences him. The dark eyes rest steadily and proudly on the boy's animated features, and the musical voice says in a tone almost startlingly clear and cold, —

"Cease this folly, Fritz! I allow you to take more liberties than any one else, but beware of passing the bounds, or I will deprive you of all your prerogatives."

Fritz pouted scornfully. "Vast prerogatives, certainly! To be able to talk to you for ten minutes at the end of every chapter, and ——"

"And meantime be permitted to sit on the stool and look at me. Do you call that nothing, my spoiled favorite?"

The beautiful face was brightened by its sunniest smile, an almost loving glance rested on the boy, and Sidonie's white hand toyed caressingly with his fair, curly hair.

Fritz's anger melted beneath the beautiful girl's touch. He caught her hand and pressed it to his eyes. "I could die for you when you look at me so, Sidonie," he murmured. "But I should like" — and the dreamy eyes flashed with a merry, mischievous expression — "I should be still better pleased if you would once blush for me as deeply as you did just now for Werner."

The blow aimed with so much diplomatic skill had fallen, but Sidonie gained time to parry it. The loving expression in her dark eyes was transformed into a cold, proud look, and she replied in slow, measured tones, —

"What new folly is this, Fritz? What has that name to do with us? Besides, I hope you will perceive that your father's secretary or steward — or whatever office he fills — is no proper subject for jesting between you and your cousin Sidonie; rally your mother's maid about him."

The young lady's voice became bitterly scornful as she uttered the last words, and her quivering lips also bore witness to her emotion. Fritz gazed intently into her face, and the expression of mingled merriment and vexation was again plainly visible on his features.

"Oh, my gracious cousin, when you wrap yourself in your dignity, I bow most humbly to your noble will. Never again will I offend your ear by mentioning a subject so far beneath you. As for Werner ——"

A scarcely perceptible shiver that ran through the frame of his fair companion made him pause, but the eyes, half veiled by their long lashes, still gazed so calmly and gravely over the river, that Fritz could not finish his jesting speech. So he continued, this time in a much more earnest tone, —

"As for Werner, Ottomar's recommendation secures him a position in our

house which would hardly render it suitable for me to joke with my mother's maid about him."

Sidonie seemed to feel the slight reproof conveyed in her cousin's words, for her long lashes drooped still lower, but she was fortunately spared a reply, as the door leading into the park opened, and a servant in livery entered the room.

"The countess sends me to inform Countess Sidonie that visitors have arrived from Bonn. Perhaps Countess Sidonie may wish to see the gentlemen."

"First let us hear who has come," replied Fritz before his cousin could answer, "then we'll decide whether it will be agreeable to us to see them."

The servant began: "Count Ottomar."

"Pshaw! he can come to us, we won't leave our idyllic solitude for him. Go on."

"Count Landsheim and Count Generode."

"They'll entertain Olga and Lia, we won't trouble ourselves about them, Sidonie. Any one else?"

"Baron von Sonnenstein arrived half an hour ago, and——"

"Dear me, Olga will have her hands full; but we'll stay here, won't we, Sidonie?"

Sidonie's eyes were still fixed upon the river, she evidently heard only a part of what was going on around her, and answered without exactly realizing what she was saying: "Certainly, just as you choose, Fritz."

"Prince von Wolfenhagen and Herr von Lerehfeld have also just arrived," continued the servant.

Fritz started up. "Most respectable blockhead, so you wait until now before telling us," he cried laughing. "Sidonie, the idyl is over. The world and its claims imperiously demand our attention. Let us show that we are worthy inheritors of our name, and heroically accept the struggle to which we are so boldly challenged."

Sidonie smiled, but it was a faint, almost weary smile, that seemed to cast a shadow on her face instead of brightening it. "You are a foolish boy, Fritz," she said, conquering her feelings and speaking in a gayer tone, "and I am doubly foolish to waste my time in talking to such a child. Go, Joseph," she continued, turning to the servant, "tell the countess that I will come immediately."

"Of course, after we have arranged our toilettes a little, in order to meet the battle of life bravely," added Fritz, after the servant had left the pavilion.

He did not seem to be mistaken, for Sidonie was already standing before the mirror, smoothing her disordered hair. Then she passed her hand over the folds of her light dress, pulled at the lace in her sleeves, cast a glance at her whole figure, and then, accompanied by her young cousin, left the pavilion to join the visitors in the park.

XVIII.

THE HOUSEHOLD AND ITS GUESTS.

The pleasure-grounds through which the young cousins now walked were laid out with great magnificence and taste. Nature and art had united to form a beautiful whole, and according to the mood or fancy, one could choose for his rambles dark avenues of lofty old trees, whose interlaced branches shut out even a glimpse of the sky, and whose cool shade defied even the burning heat of summer, or turn into winding gravel paths that led through broad lawns and luxuriant shrubbery, which alternated with graceful groups of trees. The eye here had more opportunity to rove over the beautiful grounds, and could rest upon the sun-illumined peak of the Drachenfels, which towered far above the trees in the park.

All these paths ascended so gently and gradually that the rising ground was scarcely noticed, and it was only on reaching the summit of the hill that one saw, with astonishment, the park lying at his feet. The villa crowning the summit formed a worthy close to the pleasant walk. Half castle, half country-house, its tasteful and even elegant façade harmonized perfectly with its surroundings.

The terrace before it was richly adorned with exotics, but the wide lawn beyond possessed only the trees native to the soil. Beautiful catalpas, tulip-trees with their large blossoms, then luxuriant syringa-bushes and the drooping boughs of the ash. How much fresher and more beautiful they were than the poor exiled children of Italy, which, planted in tubs, dragged but a miserable hot-house existence!

Will not our humane times have pity also on the poor plants, which, deprived of their native soil and air, seem by their sickly appearance to complain of our cruelty? The attempt to transplant the fragrant orange groves of Italy to our northern home, will always fail and seem like child's play, because it is contrary to nature.

Besides, Germany is not poor in beau-

tiful trees, and if they lack the sweet odors produced by the Italian sky, their refreshing scent strengthens and steels, while the fragrance serves only to intoxicate.

The broad lawn before the castle was now enlivened by a group of graceful young figures. Uniforms glittered amid the light summer dresses of the ladies, and even the gentlemen in civilian's dress, in honor of the bright day, had donned lighter colors than the usual monotonous black. They were busily engaged in playing ball, and the game was accompanied with jests and laughter. Often the ball flew far out of its course and the whole circle broke up to look for it, laughing at the unskilful player, who however, if a lady, was treated with more consideration.

Sidonie and Fritz could sometimes obtain a glimpse of the group on the turf, which the latter seemed to watch with great interest, for he eagerly communicated his observations to his cousin. "There is Olga standing between Generode and Sonnenstein, and Lia beside Landsheim. Poor Prince Eduard! Your Kunigunde is still absent, so for the present you must content yourself with the schoolgirl Edith."

Sidonie raised her eyebrows. "Those who live in glass houses should not throw stones, my good Fritz. If I were in your place, I wouldn't make remarks about schoolgirls."

"Oh! so my beautiful cousin is turning her weapons against me, but I will revenge myself. Yes, indeed!" he suddenly exclaimed aloud, "I might revenge myself cruelly if I chose." He looked mischievously at his companion, and then glanced towards a young man, who sat on a bench under a clump of bushes reading, and now became visible at a turn in the path.

Not the faintest tinge of color suffused the marble-like pallor of Sidonie's features, but on the contrary a marble-like coldness appeared in them, which effectually restrained any piece of mischief the boy had perhaps been meditating. Her tall, queenly figure moved quietly on with imposing dignity, the long, trailing dress rustled slightly on the gravel walk and made the young man look up from his book at her approach. An involuntary expression of joyful surprise flitted over his features, he gazed steadily at the pair a few moments, and then hastily rose from his seat.

When the beautiful girl passed him, he made a low, respectful bow, though reverence did not seem to restrain him from watching her very closely. Her features did not betray the slightest trace of emotion; she looked at the young man with the same almost weary indifference that was visible in her eyes as she fixed them on the trees and flowers around. It was doubtful whether she bestowed sufficient attention upon her surroundings to discover the presence of a human being among the world of plants, so steadily did her large black eyes rest upon him. Even the slight bend of the head that acknowledged his respectful greeting seemed so mechanical that it afforded the young man no certainty of any actual recognition.

He looked thoughtfully after her retreating figure, and then fixed his eyes upon the sky, now brilliant with the hues of sunset. There was neither melancholy disappointment, nor anger at the conduct of the haughty young lady in the gaze, but earnest, profound meditation, whose cause could scarcely be found in the meeting that had just taken place. He was so completely absorbed in his reverie that he did not notice Fritz, who suddenly left his companion and darted back to him with the speed of an arrow. The boy's merry eyes sparkled mischievously as he perceived the young man's preoccupation, and he cried laughingly: "Are Sodom and Gomorrah burning, Werner, that you stand here like a pillar of salt?"

Werner started at the unexpected voice, but did not turn his eyes towards the speaker, and still gazed intently at the sky. It seemed as if he wished to finish his train of thought, for his features at last gradually lost their preoccupied expression, and he looked at the boy beside him.

"Have you come back to your senses?" cried the latter. "I hope to find a sufficient degree of attention, when I now declare war against you, war to the knife."

"What do you mean, Fritz?" asked Werner gravely.

"What do I mean? I hope, young man, I need not define a declaration of war. In default of a gauntlet — you see, in spite of mamma's horrible warnings, my hands are bare — I'll throw this iris at your feet."

"And for what reason?" asked Werner, with the same almost singular earnestness.

"For what reason? Am I to allow myself to be scolded on your account, am I to see how Sidonie ——" Fritz suddenly paused, whether startled at the thought of what he was about to say, or anxious to tease Werner, who had hastily turned towards him, could not be decided. It even seemed as if he were going to vanish as quickly as he had come; but Werner caught his hand and thus detained him.

"What do you mean, Fritz?" he asked quietly.

"Aha, so my words at last inspire the young gentleman with some little interest! If you wouldn't take so much trouble to deceive me—you may succeed with some people, but it's perfectly ridiculous to keep up the farce to me."

Werner's attention was no longer engrossed by the speaker. "Go, Fritz," he suddenly exclaimed, "or your companion will join the company without her cavalier."

Fritz, who probably perceived the truth of this remark, ran away at full speed, and Werner sat down on the bench to continue his reading. But the interruption seemed to have been too great, for he soon raised his eyes from the book, glanced towards the merry party on the lawn, and bending aside the boughs that intercepted his view, became absorbed in the beautiful picture before him.

Sidonie was just emerging from the shrubbery with her companion. The circle instantly broke up, and the gentlemen hastened forward to greet the fair girl. She spoke graciously and gaily to them all, and then joined the game, but it must soon have become wearisome to toss the large balls, for Werner saw her leave the circle, and, accompanied by one of the young men, seek a spot shaded by the house, to play battledore. The slight, exquisite figure, with its graceful movements, exactly suited the game, and the young watcher was not to blame if he fixed his attention on this group alone.

But the feelings aroused by the spectacle were by no means pleasant, for a shadow rested on his face, and the deep lines on his brow gave his features an almost threatening expression. "How delighted the prudent aunt will be!" he murmured in an undertone: "there is nothing more pleasing to a zealous teacher than an apt pupil, who understands every signal and acts accordingly. His Highness is an excellent match, and the family still lacks the lustre of a princess. With the exception of that one imported title there is, strangely enough, not a single prince among all the near relatives. Perhaps the marriage would have been still more ardently desired for a child of her own, but I scarcely think so. The niece is like her, and stands nearer to her heart than all her own children put together—and I—have I not——"

The young man paused, and passed his hand over his brow, then rose and walked slowly up the path that led to the spot where the guests were assembled. "It is surely tea-time," he murmured, "and in spite of everything I know that I rob her of her ease. His Highness shall soon feel the disturbing influence of my presence, little as he will suspect the cause."

The active exercise had heightened the color in the cheeks of all the party, even Sidonie's face, which was usually a shade too pale, glowed with a rosy hue. Her partner looked with delight at the increased beauty of his companion, and, absorbed in gazing at her, carelessly let the little shuttlecock fall.

"How awkward, prince!" cried Sidonie laughing. She was so much interested in the game that she vied with the unskilful prince in looking for it, reached the spot where it lay first, hastily raised it, remained standing there, and allowed her partner to take her former place, thus changing her position.

"Who is that gentleman coming slowly through the park?" asked the prince, instead of striking the shuttlecock. "Does he belong to the party, and why didn't he come before?"

Sidonie did not take the trouble to turn towards the new-comer, but answered carelessly: "Oh, he is one of uncle's functionaries! See, there comes the governess with her pupil—we have very patriarchal customs here, odd figures appear from all quarters at meal-times."

"One can scarcely call that young man's figure odd," said the prince; "on the contrary, I should say——"

"Don't be so careless, prince, toss your shuttlecock, we shall be called in to tea directly."

His Highness eagerly obeyed his fair companion's request, and the little shuttlecock again darted to and fro through the air. But now the awkwardness was evidently on Sidione's side, for she often interrupted the game by failing in her stroke. She was probably tired, since, although entirely her own fault, she never attempted to bring back the deserter, but always left the trouble to her cavalier, so it was perhaps a relief to her when a servant interrupted the game by summoning them to tea, which to-night was served in the open air.

The circle that gathered around the table, although few guests were present, was a tolerably large one. The lady of the house, who had hitherto been seated on the veranda, which was shaded by the balcony that projected from the upper story, now came forward. She was probably already on the shady side of forty, but still a beautiful and stately woman,

whose thick, dark hair was yet free from any tinge of grey. The loveliness of her regular features was enhanced by a complexion unusually fine for one of her years, and their dignified expression harmonized admirably with the almost cold composure of her manners.

Her husband, Count Rodenwald, who now slowly left the castle and welcomed the gentlemen, seemed a complete contrast to his wife. Fair-haired and ruddy, he too showed few traces of approaching age, but his by no means regular features expressed so much unmistakable good-nature, and perhaps an equal amount of weakness, that they formed a striking contrast to the proud, dignified bearing of his wife.

His tall and formerly slender figure had gained rather too much flesh with advancing years, and his loose, comfortable clothing made him appear still stouter.

It was almost to be regretted that the children of this couple resembled the father more than the mother. Almost all were fair, with fresh, but by no means marked faces, although youth now lent them a shade of beauty, and the full, but slight figures were graceful and pleasing. The third daughter alone — designated by her brother as the schoolgirl Edith — had inherited her mother's regular features and dark hair. Although not yet grown up — or at least not out in society — her tall figure possessed a certain haughty ease, which gave promise of developing into her mother's quiet dignity.

The oldest son — the only one of the children who had already left home and was now stationed in the neighboring city of Bonn — bore a striking resemblance to his father in form and features, though his expression revealed traces of his mother's quiet firmness. He seemed to be her special favorite, for he had taken very little share in the game, but remained seated by his mother, and she now called him to her side again. The count, on the contrary, sat down near his younger children, and jested and laughed with them, without troubling himself about the entertainment of his guests, probably in the very correct supposition that they would not be neglected.

Now, however, he remembered his duties as host, for, as this was the first time Prince Eduard Wolfenhagen had been in his house for months, he recollected that he had not yet made the acquaintance of all the members of the family. He therefore turned to his children in his usual off-hand fashion, and asked in a tone so loud that every one could hear: "Has any one introduced Werner to Prince Wolfenhagen."

His wife cast a hasty glance at him, which seemed to confuse him, and then instantly replied, "I believe this duty has been neglected; besides it is your office, my dear Edwin," she added, with a faint smile.

"Well then, my dear prince, I will solemnly present you to Herr Werner, my — our" — he hesitated, and looked beseechingly at his wife.

"One of the members of our household," said the lady, as quietly as if it were a matter of course that she should finish her husband's sentences.

"And I, my dear prince," interposed Count Ottomar, "will present to you in this same Herr Werner my most intimate friend."

The prince bowed courteously to the young man who was introduced in this peculiar manner, and addressed a few polite words to him, and as Werner, to his surprise, responded to his questions as if his Highness had expected and desired an answer, it naturally followed that he was drawn into the conversation. This, however, could not be a very unusual occurrence, for the countess's face was unclouded, while her husband seemed more fond of talking and jesting with *this* member of the household than any other.

Only one person in the circle did not seem pleased with this turn of affairs, the beautiful Sidonie's delicate lips were more firmly compressed, and the corners of her mouth drooped still more than usual. She said very little, and the glances she cast at her aunt induced the latter to rise from the table sooner than was perhaps agreeable to the company. The old count openly expressed his dissatisfaction, and in a manner that probably did not harmonize with his wife's wishes.

"What is the matter to-day, children?" he said discontentedly, as he rose from his seat. "We don't meet here to drink a few cups of weak tea, but to talk to each other. I suppose Olga and Lia have been practising some new duet, which will show them off to the best advantage."

The two young ladies had been too well schooled by their mamma not to cover their father's want of tact by their own presence of mind. Olga instantly sprang towards him, and putting her arm coaxingly round his neck said laughing, —

"You naughty papa, to tell tales out of school, now for a punishment we won't sing at all."

"A pleasure we can renounce with lighter hearts," cried Lia, also laughing, "as this time the point in question was not so much *our* artistic performance, as Herr von Sonnenstein's."

"My artistic performance?" asked a thin young man, passing his hand through his somewhat scanty brown hair. "For Heaven's sake, countess, pray tell me in what special branch of art I am expected to show my skill?"

"Don't disclaim, Herr von Sonnenstein," said Lia, with another merry laugh, "it is said that you have a remarkable talent for music."

"I've never heard of anything but a remarkable talent for folly," whispered a young lieutenant of dragoons in the ear of his companion.

"Whoever the traitor may have been," interposed Fritz, "Sonnenstein solemnly protests against the slander."

"Yes, indeed I do, Fritz," replied the latter; "to be sure I took music lessons when I was a boy, but never advanced beyond learning the notes, since my teacher gave me up in despair."

"Then, since we must renounce the delights of music," said one of the young ladies, "suppose we take advantage of the fine weather and go to walk in the park." The proposal met with universal approval from the rest of the party, and the whole company soon broke up into various groups, which gradually disappeared in the leafy avenues. The count remained sitting on a bench talking to Werner, and the countess returned to her sheltered veranda, where her oldest son again followed her.

"You seem sad, Ottomar," said the lady tenderly; "something is troubling you, will you not confide it to me?"

The young man smiled, and raising his mother's hand to his lips, replied in a jesting tone: "But suppose I had done something to displease you, mamma! Would it still be my duty to confess it?"

A sudden change of expression flitted over the lady's calm features: "Oh! I understand! You have been to Rheinau."

Ottomar looked down, and evading the question, answered earnestly, "And would that really displease you, mamma? Have I not been a frequent visitor at that house from my earliest childhood?"

The countess's voice was grave, and even stern, as she replied: "This childish intimacy was a matter of course; they are our neighbors, and moreover people of cultivation and refinement, their house is a pleasant one, so what reason could there be for not associating with them?"

Ottomar's blue eyes rested steadily on his mother's. "Yes, mamma," he replied, "what reason, what pretext could there be?"

"To break off the acquaintance, certainly none; but a mere acquaintanceship does not justify placing ourselves on an equality or forming an alliance with them. The granddaughter of the merchant, who bought his patent of nobility, and whose great-grandfather, I am told, was a respectable shoemaker, is no fitting bride for my son Ottomar, who can choose his future wife from the princely houses of Germany."

Ottomar looked at his mother with an earnest, inquiring glance. "Would the son of this house be equally unsuitable for a daughter of our family, mamma, or would not the same reasoning apply?"

A slight shade of embarrassment appeared on the countess's face. "That question has never been introduced, Ottomar; and besides — the oldest son, the heir of our name — Ottomar!" she suddenly exclaimed in an almost passionate tone, "I could not bear to have you, my pride, the idol of my heart, make an unequal marriage."

"There is very little prospect of my doing so, mamma," replied the son quietly. The beautiful Rosa does not seem to have the slightest desire to become Countess Rodenwald."

The countess slightly shrugged her shoulders, but made no reply, and perhaps both felt it a relief when the count now appeared and interrupted the conversation. Soon after the rest of the party returned, and the gentlemen took their leave; but just as the prince was going up the steps of the veranda to say farewell to the countess, his foot slipped and he sprained his ankle.

He laughed at the accident and tried to limp away, but the lady of the house declared that she could not possibly consent to his departure, as even a trifling injury may easily become serious. The prince made no very serious objections to spending the evening with the family and accepting a bed for the night, so he remained, while Herr von Sonnenstein ordered his carriage to drive home, and the other guests, accompanied by Ottomar, took the nearest way through the park to the Rhine, intending to return to Bonn in a boat.

From The Contemporary Review.

THE GREEK MIND IN PRESENCE OF DEATH,

INTERPRETED FROM RELIEFS AND INSCRIPTIONS ON ATHENIAN TOMBS.

At Athens the gravestones of the ancient inhabitants are not only among the most interesting, but among the most extensive remains. Near Piræus, through all the Ceramicus, and in many other parts of the city, excavations have constantly brought to light a vast quantity of inscribed and sculptured slabs and columns, which have mostly, unlike antiquities of many other classes, remained at Athens, and now fill one wing of the new museum and the whole space in front. But there is a group of gravestones of even greater interest which are left standing, just where they were disinterred, by the old road which led through the gate Dipylon, from Athens to Eleusis, the road annually trodden by the procession at the Eleusinia. These tombs, in size and beauty superior to the rest, are preserved for us, as is supposed, by a fortunate chance.* Sulla, when he attacked Athens and remorselessly massacred the miserable inhabitants, made his approach close to the gate Dipylon. There he erected the long *aggeres* by which his engines were brought close to the wall, and there his soldiers threw down several hundred yards of the city ramparts, which were formed of sun-baked bricks. Hence a vast mass of ruin which completely overwhelmed and buried the lines of tombs immediately without the gate, and preserved them almost uninjured until one day when they were once more brought to the light by a French archæological expedition in the year 1863. The suddenness with which these monuments were overwhelmed is indicated by the fact that some of them were and remain unfinished; the completeness of their disappearance is proved by the silence of Pausanias the traveller, who, passing through all quarters of Athens in the time of the Antonines, would appear to have seen no trace of them. All of the monuments in this group are of course indubitably Athenian, and furnish the best materials for the present paper. Of the stones in the museum it is sometimes impossible to trace the find-spot; some are Bœotian, some from Peloponnesus, some from the islands. But this uncertainty need not debar us from freely referring to almost any as instances, for there is no great or essential difference between Athenian and other gravestones. It will be quite fair to treat, for the present purpose, all monuments preserved at Athens as Athenian, unless they be known to have come from a distance. Of the longer inscriptions a large proportion are from the tombs of foreign residents at Athens.

To the readers who are likely to peruse these pages, there are but two points in gravestones likely to prove very interesting — firstly, the reliefs which they bear;* secondly, the inscriptions engraven on them.

The earliest of Athenian sepulchral monuments, if we leave out of account buildings like the Cyclopean tombs of Mycenæ, or mounds like those recently opened with such splendid results at Spata, in Attica, is the often-cited *stêlê* of Aristion. It represents the deceased on a scale somewhat larger than life, as standing clad in full armor, spear in hand. The ground of the relief is red; traces of color may be seen, or rather might at the time of discovery be seen, on many parts of the body, and holes may be observed made by the pegs which fastened armor of bronze on to the body. The design or idea of this slab differs not much from that of a portrait statue. Clearly in early Greek times, for this statue is given to the very beginning of the fifth century B.C., the survivors wished to see in the monument the dead, as it were, still living among them, still to be seen in his daily dress, and about his daily business.

But it is from the fourth and succeeding centuries before the Christian era, that we inherit the great mass of the sculptured tombstones which crowd the museums. No one can spend a few hours among these without perceiving that the representations fall naturally into four or five classes.

The first class and the most extensive consists of formal groups wanting in distinctive character, which display the dead either alone or in company with others. The companions, where there are such, are sometimes other members of the family, sometimes slaves or attendants, who, in accordance with the well-known canon of Greek art, which gives larger stature to the person of more importance, are always represented as of diminutive size.

* See F. Lenormant's *Voie Eleusinienne*, vol. i.

* On the subject of these reliefs there is no complete work, but several monographs, the best of which are those of Friedländer and Pervanoglu. Where my own notes fail I have quoted the descriptions of the latter writer.

Sometimes the companion is not a person at all, but a favorite animal, a pet dog or bird. Such subjects are common in Macedonian times. The grouping is usually simple and graceful, the attitudes natural and unforced, the movements, if movement there be, measured. But the execution is not of the best, save in a few remarkable cases, and there is a want of invention, nay, there is even vulgarity, in the designs. Like our modern photographers, the inferior Greek artists who condescended to this kind of work had a few cardinal notions as to possibilities of arrangement, and could not easily be induced to depart from them. I will give the details of a few reliefs of this class. (1.) A seated lady, who with her left hand holds the end of the veil which covers her face; before her stands a man facing her. (2.) A pair of sisters, Demetria and Pamphile. Pamphile is seated, and turns her head towards the spectator; with her right hand she grasps the end of her veil. Demetria stands over against her, her right hand folded across her breast, and grasps her veil with her left hand. (3.) A man clad in long *himation* stands, in his hand a scroll. In front of him stands a small male figure, naked, holding a vessel, perhaps an oil-flask. The scroll which the master holds and the flask of the slave seem here to have as little meaning as the books and the flower-baskets of photographic rooms. (4.) A mother clad in flowing Ionian drapery is seated to the left. Her left hand rests on the seat; with her right she lifts something from a little toilette-box which a servant holds out. Round her knees clings a little girl. (5.) A lad stands clasping to his breast a bird which a snake at his feet threatens and springs upward to reach. In other reliefs we find a dog in the place of a snake; sometimes a dog is standing elsewhere in the picture. Tame birds would seem to have been the usual playmates of Athenian children, and tame dogs the constant companions of young men, while in many houses a favorite which would be rarely appreciated in England, a snake, was nurtured.

As this is the commonest class of reliefs, so evidently it is the least original and interesting. Here most is left to the sorry invention and feeble sympathy of the sculptor, who knew nought of the deceased, and allows us to know no more than could be ascertained from the sources of information which among the old Greeks corresponded to the first column of the *Times* or the pages of Burke with us. But it is by no means rare to find on sepulchral slabs a more exact reference to the past life or the habits of the dead. Sometimes we are told more than the bare fact that the departed was father, mother, wife, or sister — was young, old, or in the prime of life. I select the following. (1.) A youth, naked, or wearing the light *chlamys* only, stands holding in his hand the strigil and oil-flask, those invariable accompaniments of gymnastic exercises among the Greeks. No doubt the survivors, who chose the design, wished to indicate that their friend was prominent in manly sports and labors. In this, the field of his best energies, they wished him still to seem to live. (2.) A young man, clad in a *chlamys*, charges with spear advanced a wild boar, which is coming out of its lair; at his side is a dog, which leaps forward at the quarry. Above, on a rock, stands a deer. We see at a glance that this is the tomb of one who loved the chase. (3.) On a rock sits a man in an attitude of grief; beneath is the sea, and on it a boat with or without sailors. It is a generally received opinion that monuments of this character were set up over those who had been wrecked at sea. (4.) A young rider, clad in the light *chlamys* of the Athenian cavalry, charges, at once trampling beneath his horse's hoofs and transfixing with his spear a fallen foe, who tries in vain with his shield to ward off the attack of his triumphant enemy. From the accompanying inscription we know that this monument was erected in honor of Dexilaus, one of the five horsemen at Corinth — that is to say, as is supposed, one of the five horsemen who fell in the battle under the walls of Corinth, in which the Athenians were engaged in the year B.C. 394. The relief thus dates almost from the best time of Attic art, and it is worthy of its time. It does not, of course, represent the moment of the death of the young warrior; we see him strong and triumphant, such as his friends would fain have seen him always; to show him fallen would have suited an enemy rather than a friend. (5.) Another relief, although set up in honor of a man of Ascalon, is clearly of Athenian handiwork and design. A sleeping man rests on a couch. Close to his head rises on its hind-paws a lion, who is clearly ready to slay or carry him off. On the other side of the couch is a warrior who attacks and repels the beast. In the background appears the prow of a ship. From a Greek metrical inscription which accompanies this relief, it would appear that the Phœnician stran-

ger here buried had incurred great peril at some previous period of his life from the attack of a lion, who seems to have surprised him resting on the shore, but who was driven off by the timely arrival of friends just landed from their ship. (6.) A man and his wife, both muffled in ample garments, advance towards the spectator. Between them advances a priestess of Isis, clad in the dress of her calling, holding in her right hand the *sistrum*, in her left the vessel of sacred water. It is possible, the inscriptions which accompany this representation being illegible, that the monument was erected to a father and mother, and to their daughter devoted to Isis. Or it is possible that we have here expressed in a symbolical form the devotion of a man and woman to that mysterious worship which spread in Ptolemaic times from the bank of the Nile over all lands, and their firm trust that in the next world Isis would recognize and protect her worshippers.

Such are a few specimens of the reliefs which give us more precise information with regard to the lives and habits of the dead. In the same way, those who had devoted themselves to a profession appear on their tombs with the badges of that profession; physicians, for instance, with the cupping-glass and other instruments of their daily use. So the priestesses of Apollo and Aphrodite appear with the symbols of their guardian deities. And in this matter it is clear that the Athenians merely followed one of the most natural of all instincts leading to a custom common among all nations. Thus in the Odyssey, the ghost of the drowned oarsman, Elpenor, begs Ulysses, when he reaches the island of Ææa: —

Raise thou a tomb upon the shore beside the
hoary sea,
Memorial of my blighted life for future times
to be;
Make thou my tomb beside the sea, and on it
fix the oar,
Which once among my comrades dear, while
yet I lived, I bore.

And thus, even in our own day, what device is commoner on a soldier's grave than sword and cannon, or on a painter's than palette and brush?

But although the sculptors of tombs usually designed references to the past life of those they commemorated, such was not always the case. After all, past was past, and it were idle to deny that the moment of death brought a vast change over everything. The next class of reliefs have reference to the fact and the moment of death. Among the Romans that fact was symbolized in art frequently by sleep; and among all Christian nations it has become usual to speak of death in metaphorical language borrowed from the rest of night. But it was not usually merely as a deeper sleep that death presented itself to the imagination of Athenian sculptors. They considered death rather as a departure, a going far away from and losing sight of one's family and friends. Scenes of leave-taking are among the most frequent of all sepulchral reliefs. I am not, however, sure that this leave-taking is quite consciously adopted as the image of death. Indeed, all images of death were somewhat distasteful to the joyous sensuousness of Athenian taste. But when an artist had to represent the dead and the surviving friends of the dead in a group, this posture of farewell, which must have been one of the most usual and natural to think of, seems to have frequently suggested itself, and, in virtue of its inherent appropriateness to the occasion, to have become more and more common. This leave-taking presents itself in the least intrusive and gentlest form in those representations where a lady appears dressing herself with the assistance of her maids for an out-door journey, throwing over her head the ample veil, and perhaps handing to an attendant nurse the babe whom she cannot take out into the open air with her. Sometimes the preparations are more advanced; the lady sits or stands veiled and prepared for a journey, and gives her hand to husband or father who stands opposite. Sometimes two men grasp hands as if about to travel in different directions. Occasionally a horse appears in the background, or the head of a horse is seen through a window, which is destined to carry away the master of the house. In this very introduction of the horse we see how much the notion of travel preponderates in those scenes over that of death. For the horse was in no way connected by the Greeks with death. The rider on the pale horse had yet to be introduced to the popular imagination by the writer of the Apocalypse, who must have borrowed from a non-Hellenic source. Dwelling closely hemmed in by the sea, they never thought of the dead as travelling to other worlds by land, but usually as going over the waves mysterious and vast to some distant island, or perhap as penetrating into deep abysses of the land. But for journeys from town to town in Hellas, the horse was the appropriate

conveyer, from which fact he becomes the symbol of all moving and journeying.

The old opinion of archæologists with regard to these scenes of farewell, an opinion grounded on insufficient induction, was that in them the dead were represented as seated, the survivors as standing and taking leave of them. It is now acknowledged that this is not the case. It is true that most commonly in the groups one is seated, while of the standing figures one grasps his or her hand. But a careful study of the accompanying inscriptions proves that it is sometimes the dead person who stands while the survivor sits; and again, in other cases both the dead and the living stand, while sometimes, again, of the several dead persons commemorated some stand and some are seated. The fact is that any pedantic rule of uniformity is put out of the question by the circumstances under which sepulchral reliefs were designed and executed. It was essential to the composition of a group, thought the artists, that some of the figures should stand and others sit; but the question which should do each was settled, not by a desire to convey a careful meaning to the eyes of beholders, but by the study of a little graceful variety, within somewhat narrow limits, and the influence of every-day custom which made it far more natural and usual that a woman should be seated when taking leave of a man, than a man when taking leave of a woman. Sometimes a little life breaks in on the cold formality of the group. Children cling about their mother's knee, or daughters stand by in an attitude betokening their grief; but those circumstances which might move emotion in the spectator are quite banished or kept sedulously in the background. Here, as ever, the Greek abode by that motto, "Nothing in extremes," which expresses the ultimate law of all his art.

Another set of representations introduce us to a scene of banqueting.* (1.) A man reclines on a couch in the posture adoped by the Greeks at their meals; before him a three-legged table. Near his head sits a woman on a chair, holding in her hand the end of her veil. (2.) Similar two figures appear to those in the last relief, but in addition there is in the foreground a slave pouring wine from a larger into a smaller vessel. (3.) A man reclining at table holds a cup in his right hand; near him sits his wife, behind whom is a slave pouring wine from an amphora. Behind the couch stands a draped bearded figure; beneath it is a dog gnawing at some fragment of food. In the place of this dog we elsewhere find a snake. (4.) Two men recline side by side on a couch; in front of one is a three-legged table laden with food. At the two extremities of the couch sit two women. In the foreground is a galley, of which the oars, but not the rowers, are visible, in which is seated a weird figure with matted locks, clad in a short rough cloak, who stretches his hand towards one of the reclining banqueters. This latter figure has usually been taken for the ferryman of the dead, Charon, come to claim the feasters as his passengers into the next world. In scenes of this character, also, it is not unusual to find in the background a horse, or at least the head of one; here, too, the coming journey throws its shadow over the group.

With the sculptures of this class are frequently associated a set of representations, which would seem to have something more than a casual connection with them, though the exact nature of such connection is very obscure. I refer to the *ex voto* tablets commonly set up in Greek temples by those who had escaped from disease, peril, or death, in honor of the deity to whom they attributed their deliverance, and for a lasting memorial of their gratitude. Such tablets have been found in special abundance in the *temeni*, sacred to Hades or Sarapis, as god of the nether world, and of Asklepius and Hygieia. When Sarapis is the deity thus honored, he appears on the tablet as reclining on a couch, on his head the *modius*, which is the symbol of his dominion in realms below, and sometimes as accompanied by his bride Isis or Persephone. A train of worshippers approaches from the side of the tablet, bringing in animals for sacrifice. Of the *ex voto* tablets dedicated to the deities of healing, perhaps the clearest specimen appears copied on certain coins of the city of Perinthus, in Thrace. On these we see Asklepius reclining on a couch. Beside him sits his daughter Hygieia, and in front is a three-legged table laden with food, at the feet of which is a serpent. From the side enters a train of votaries dragging in a sacrificial pig. Above, a cluster of arms hangs on a peg, and through a window appears the head of a horse who stands without. It is not easy to understand the symbolism of all parts of these pictures; but the general meaning cannot be doubtful. We

* M. Albert Dumont has published a volume on this class of monuments; the work has been crowned by the French Institute, but I have been unable to find a copy in English libraries.

see in them representations of the gratitude of those whose health was restored in the temples of the deity Asklepius, the hospitals of antiquity; the train of worshippers represents their family, and the pig of the reliefs had doubtless his original in an animal actually sacrificed to the god. Why the horse and the arms appear in the background we need not try to ascertain.

It will be easily understood how difficult it sometimes becomes in the absence of inscriptions, to tell whether a relief is to be classed among the *ex voto* tablets of deities or among sepulchral scenes. In many cases we seem to be near the border line between the two classes of monuments, as in the following. Two men recline on a couch, each of them holding a drinking-horn. By them sits a woman, while a slave in the foreground is engaged in pouring wine into a vessel. In front appears a three-legged table, beneath which is a snake; in the corner is seen a horse's head. Here horse's head and snake remind us of the *ex voto* tablets; although there can be little doubt that the subject is from a tomb. Both horse's head and snake reappear in the following, which seems to belong to the *ex voto* class of monuments. Two men recline on a couch, one holds a drinking-horn. On either side a woman is seated. Three figures approach in the attitude of worshippers.

Now the greatest perplexity has arisen from the confusion of two classes of reliefs, which may indeed have something in common, but are widely different in meaning. To separate finally the classes, and to trace out their ultimate connection with each other, is a work still to be done, and one which will require patience and judgment. Meantime we may perhaps be permitted to express doubt whether there is a single relief proved by inscription or other circumstance to be from a tomb in which worshippers appear in the act of sacrifice or adoration. Wherever these are seen it seems reasonable, in the absence of evidence to the contrary, to assume that the monument is erected in honor of a deity, not in memory of a man. But all the scenes where simple feasting is going on, where servants are decanting wine, and wives seated, according to the Greek custom, near the couch on which their feasting husbands recline, may be presumed to be sepulchral until proved to be otherwise.

There are three theories, all well supported by the voice of learned men, as to the meaning of those scenes of feasting on tombs. According to the first view, what is represented is the dead supping in Hades. This theory was mainly based upon the confusion above pointed out. The person reclining on the couch was thought to be frequently receiving worship and sacrifice. Sometimes on his head he was supposed to bear the *modius*, the emblem worn by Sarapis in his character of deity of the lower world. Therefore it was assumed that the dead man was deified and represented as receiving high honor from the living. If, however, we allow as sepulchral only the scenes whence worshippers are excluded, then there remains nothing godlike or manes-like in the banqueting figure; we lose all reason for supposing the scene of the banquet to be Hades. Moreover, where the husband reclines there sits the wife; if this be in Hades, how is it that the wife was usually surviving, in fact often erected the tomb to the husband's memory? And indeed nothing could be more dissonant with Greek ideas than to ascribe a glorified existence after death to mortals indiscriminately; at the best Hades was shadowy and cold, and a banquet there would be but a faint and feeble echo of earthly banquets, quite untouched by any high exaltation or any worship from the happier living.

The second theory is that we have in these scenes, in emblematic form, pictures of those feasts at the tomb which the Greeks in ancient, as in modern days, spread from time to time, lest the departed should suffer hunger in the next world. That the dead have the same needs as the living, is a notion widely spread among barbarians and semi-civilized peoples. For this reason the savage buries with the dead chief his horse, perhaps his wife: for this reason many of the nations of antiquity stored bread and wine in the tombs with the corpse. The early Greeks not only buried weapons with the dead, but even whetstones to keep the edges of those weapons bright; and commonly placed in the mouth of each corpse a piece of money to defray the expenses of his journey to the next world. Thus, too, on certain days the survivors held a feast at the tomb of a departed friend, leaving place for the dead and supposing him to partake in the spirit.

It is quite possible that this may be the true account of the matter. Nevertheless, I am more inclined to accept the third of the suggested explanations, namely, that what we see before us on these reliefs is neither more nor less than a daily scene

from the ordinary life of the dead person. If the toilet be represented on the tomb, why should not the family meal, that most charming and most characteristic of all daily scenes? How could husband and wife be shown us in more close and amiable proximity than when feasting together, and feeling the same thrill of pleasure from the enjoyment of earthly good? *A priori* we should have expected eating to be a favorite subject with the composers of sepulchral groups, and should beware of seeking a far-off explanation of our scenes when a nearer one will suffice. It is true that there are, even in the scenes undoubtedly sepulchral, some adjuncts which seem scarcely in keeping with the ordinary dinner-table — the snake, for instance, in the foreground and the horse in the background; but of these an explanation is possible. The snake was commonly domesticated among the Greeks, and so may appear only as a domestic animal. But I prefer the explanation which is ready to see in it an allusion to the future death of the banqueting master of the house, the snake being in many countries, on account of its habit of living in the ground, looked upon as the companion and representative of the dead. In the same way the horse may only convey a delicate allusion to future departure on a long journey. Such slight allusions would seem to suit Greek taste better than more direct references. More direct references, however, do sometimes appear, as in the relief mentioned above as No. 4, where Charon in his bark appears to summon the feasters from their wine.

There are still other ways in which, on the sepulchral reliefs which, so to speak, introduce us into the midst of life, a faint allusion to death, a slight flavor of mortality, is introduced. We often see an urn placed in a corner, such an urn as when a body was burned received its ashes, or such as was set up, as we learn from Demosthenes, over those who died unmarried. Like the skeleton at an Egyptian feast, this urn would seem meant to show that in the gayest moment of life death hovers near, waiting to strike. The same moral is conveyed in other cases, by the appearance at the side or in the foreground of a snake entwined round a tree; the snake being, as I have already remarked, the companion of the dead, sometimes even the embodiment of the dead man's spirit or ghost. And in scenes where there is no allusion to death so concrete or conventional as the above, there is over all an aspect of grief and dissatisfaction. Children or slaves are weeping without apparent cause, or women stand with an arm folded across their breast, their head resting on a hand, in an attitude consecrated by the Greeks to sorrow, not as among us to mere reflection.

All the scenes of which I have spoken have this in common, that they represent to us the deceased, with or without the living. But sometimes, though rarely, the Greeks substituted for these groups a merely symbolical figure of an animal or some fabulous creature. On a tomb at Athens, erected in memory of one Leon, stands a marble lion, evidently in punning allusion to his name. Over the tomb of the celebrated courtesan, Laïs, in the suburbs of Corinth, was a group representing a lioness standing over a prostrate ram, a symbol the reference of which to the extraordinary career and splendid success of the woman is evidently appropriate. Stone snakes often guarded a tomb, in imitation of the living snakes sure soon to glide about it, on the same principle on which, when the Athenians sought a floral decoration for a *stêlê*, they selected the acanthus, which is notorious for freely growing among stones. But it was especially the forms of female monsters, sirens, sphinxes, and harpies, which were selected for the adornment of tombs. All these were spoken of in legend as fatal evils, carrying off to death young men and maidens. The sirens especially slew the young after attracting them by the sweetness of their singing, and so well became the graves of those who were lost in the mid-ardor of their pursuit of the delights of youth.

Battles of heroes and Amazons, Dionysiac revels, and mythological scenes, occurring on sarcophagi, belong invariably to Roman times, and represent phases of thought quite other than those suggested by the reliefs inspired by genuine Greek feeling. It is extremely seldom that any mythological subject is found on Greek tombs at all. Indeed I am aware but of two instances. Charon is allowed, by the general consent of archæologists, to be represented in a scene above described. And in another very interesting representation, which however is not Athenian, Hermes appears as the conductor of souls, leading gently by the hand a young girl to the future world. So small is the part played by the gods in sepulchral scenes. Not a trace appears of scenes of future happiness or misery, no allusion to that future judgment of souls which is so prominently brought before us in Egyptian pictures. Only, in times when the Egyptian

worship of Sarapis and Isis had penetrated to Athens, and served there to impart purer and higher views as to future punishment and reward, we do sometimes find the priestess of Isis going before the departed with all pomp of worship to guide them through the perils of the last journey, and lead them to a safe resting-place. But these scenes only illustrate the triumph of the religious notions of the Egyptians over the susceptible Greeks, at a time when their national city life was extinct, and they were driven by the fewer attractions of the present life to think more about the possibilities of the next.

It seems to be desirable, in view of the unfounded assertions so frequently set forth on the subject of Greek art, to gather what light we can on that most interesting subject from the facts above summarized. In doing so, however, it is above all things necessary to bear in mind the conditions under which sepulchral monuments were designed and executed. And first, it is quite clear that where several persons who died at intervals are buried in one tomb, they cannot all have been adequately represented in the relief which would naturally be the production of a single time. A citizen dies, and a relief is erected over his body, perhaps representing him as taking a farewell of his wife, while his infant son stands by. This same son, maybe, dies in middle life and is buried with his father, and an epigram is inserted on the monument stating the fact. It may thus happen that a man of thirty or forty may appear in the sepulchral relief as an infant. Such slight inconsistencies are inseparable from the nature of these monuments. But it must be confessed that sometimes between inscription and sculpture there are contradictions which cannot be thus easily explained, and which raise serious reflections. The fact is that the conviction is forced upon us by the comparison of a multitude of instances, that very often the relief placed on a tomb did not possess much reference to its contents. There can be no doubt that the more ordinary sorts of representations were made in numbers by the sculptors, and, as we should phrase it, kept in stock by them for customers to choose from. And if the would-be buyer found a group of which the general outline and arrangement suited him, he would scarcely decline to purchase it because it was not entirely appropriate, because it made his wife look twenty years too young, or even turned the boys of his family into girls. Like a true Athenian he would probably be more disposed to make use of such a discrepancy as an argument to induce the seller to lower his price than to incur the expense of having a new slab executed on purpose for him. Those who are let into this secret will not be surprised if they occasionally find a subject repeated exactly on two tombs without variation, nor if a sculptured group is little in harmony with the inscribed list of the dead.

Even in those cases in which a relief was executed by special order on the death of a person, a relief adapted in plan and intended in details to represent the deceased happy amid his family or pursuing his favorite avocation, we must not expect too much. Even here, the sculptor confines himself to a generalized or idealized representation. Probably he knew nought of the dead, almost certainly he took no pains to exactly imitate the living. Hence the same conventional types, the bearded man, the veiled woman, the girl, the infant, repeat themselves almost without variety, through all the Macedonian period of Athenian graves. The men who appear on sepulchral reliefs of the same period are as much alike one to another, as the horsemen of the frieze of the Parthenon, or the fighting heroes of the Ægina pediments. In Roman times this is far less the case; but among the Greeks of the fourth and third centuries B.C., the artist was careful only of the type, and careless of the individual peculiarities; so far at least as existing remains enable us to judge.

Nevertheless it is quite an error to suppose that the Athenians were all cast in one mould. They differed one from another quite as much as an equal number of Englishmen taken at random. And of this the proof is conclusive. For there still exists at Athens a remarkable series of portraits of those citizens who in succeeding years undertook the office of gymnasiarch. This series stretches over a long period, and while it is true that that period belongs to the decline, not the flourishing greatness of the city, yet there is no reason to believe that at the time Athenian blood had been very much mixed with that of other races, or the type deteriorated. Taking these statues then, as portraits of some of the most prominent Athenian citizens, and probably some of the purest-blooded, what do we find? One head is almost African in type, with thick lips and woolly hair; one might be taken for that of an English judge; one for that of an Italian street-musician. Looking on these faces one can scarcely believe that

the artists did not grossly exaggerate the salient characteristics of the faces of those they had to portray. And even if it were so, we may safely affirm that an Athenian crowd of the period must have contained as many widely divergent types as an English or French one. So of the Greek princes who reigned during the third and second centuries before the Christian era over the *disjecta membra*, the fragments of the empire of the great Alexander, we possess quite a portrait-gallery in their numerous and excellent coins. Here, too, we find the widest variety of type, many coins presenting to us heads which no one whose knowledge of Greek art was superficial would suppose to be Greek at all. But although individual Greeks differed thus widely one from another, and although, in the Alexandrine times of Greek art, artists quite understood the art of taking portraits, yet throughout the forms and features of those sculptured on tombs are quite conventionally rendered. And in nothing does one see more clearly than here the blending of Attic good taste with Attic superficiality and dislike of too deep or too persistent emotion. For a tombstone calling up in a general way past life and past happiness would be a constant source of emotion, gentle and melancholy, but not too intense in degree; while the sight of the very features of dead father, mother, wife, or child would be too startling and cause far more pain than pleasure. We moderns are less afraid of pain, and, when we place on tombs any representation of the dead at all, make it as exact a likeness as we can. But most, even now, prefer a mere slab in the graveyard and a portrait in the family-room or the bedroom.

The sources of these generalized types of man, youth, woman, and child are of course to be found in the common feeling of the Hellenic nation working through the brains and hands of the ablest statuaries. As in the accepted type of Zeus, the Greek sculptures embodied all that seemed to them most venerable, wise, and majestic; as in the accepted type of Apollo they combined youthful beauty with supreme dignity; so in the accepted type of matron they strove to embody all the matronly virtues, in the young girl all childish grace and promise, in the bearded man the dignity and self-control of a worthy citizen, such as Aristides or Epaminondas. The type was fixed in the case of human beings, as in the case of the Hellenic deities, by the sculptors of the generation which succeeded those who had fought at Marathon and Platææ, and altered but little after that until the collapse of Hellenic independence and Hellenic art.

Goethe has expressed, in a passage which cannot be too often quoted, the ultimate truth about Greek sepulchral reliefs: —

> The wind which blows from the tombs of the ancients comes with gentle breath as over a mound of roses. The reliefs are touching and pathetic, and always represent life. There stand father and mother, their son between them, gazing at one another with unspeakable truth to nature. Here a pair clasp hands. Here a father seems to rest on his couch and wait to be entertained by his family. To me the presence of these scenes was very touching. Their art is of a late period, yet are they simple, natural, and of universal interest. Here there is no knight in harness on his knees awaiting a joyful resurrection. The artist has with more or less skill presented to us only the persons themselves, and so made their existence lasting and perpetual. They fold not their hands, gaze not into heaven; they are on earth, what they were and what they are. They stand side by side, take interest in one another, love one another; and that is what is in the stone, even though somewhat unskilfully, yet most pleasingly depicted.*

It is a proof at once of the genius of Goethe and of his keen sympathy with all that is truly Greek, that at a time before Greek art was half understood, he was able to judge from the few inferior specimens known to him of the general character of these sepulchral reliefs. That on which he lays his master-hand is certainly their most essential character. Their whole aspect is turned, so to speak, from the future to the past, and from heaven to earth. We whose ancestors have been, for some twelve hundred years, taught constantly that death is but the entrance to wider life, that the world is a place of probation and preparation for eternity, can scarcely place ourselves in thought in the position of men who seem to have found the world charming and delightful, and to have been well satisfied with it, preferring to let their minds dwell on the enjoyments of the past rather than on a future which at best was a cold and gloomy echo of the present world. It is not that they disbelieved in the unseen world, or thought that the soul died with the body; such scepticism was perhaps rarer in antiquity than in modern times, and confined in antiquity as in modern times to a few of the highly educated. But that inevitable future occu-

pied comparatively very little of their time and thought; it was a cold shadow to be kept out of sunny life as much as might be. And when it was thought of, it was thought of without very much either of hope or fear. Terrible punishments in it were reserved for terrible criminals, supreme pleasures for the supremely good, but for ordinary mortals an ordinary fate was reserved, a sort of ghost or echo of their mortal life, made up, like that, of pleasure and pain, but with both pleasure and pain diluted and made ghostly. From discontent with life and repining at the lot assigned by fate, the Greeks would seem to have been singularly free, and no nation ever thought life better worth living. I shall have more to say on this subject further on.

It remains to speak of the inscriptions which accompany or even take the place of the reliefs, and which have sometimes a considerable interest for us. It will be convenient to quote these inscriptions in English; those who wish to compare the original Greek can easily do so in the complete work of Kumanudes.*

There are in the British Museum two sepulchral inscriptions on public tombs † of considerable interest. Of these one contains lists of all the citizens who fell in a single year at the various places where Athens was carrying on war. We learn from Thucydides and Pausanias that it was the Athenian custom thus annually to honor with a public monument all those who had in the previous year fallen in the battles of their country — a custom which must have nerved for death many a soldier's heart, as he reflected that he was sure, if he fell, of a sort of immortality before the eyes and in the memory of his countrymen. The other inscription, which was written under a relief representing three warriors, commemorates those Athenians who fell before Potidæa, in the year B.C. 432. It runs thus: —

Thus to the dead is deathless honor paid,
Who, fired with valor hot, in arms arrayed,
Felt each our fathers' valor in him glow,
And won long fame and victory o'er the foe.

Heaven claimed their spirits, earth their bodies took,
The foemen's gate their conquering onslaught shook;
Of those they routed some in earth abide,
Some in strong walls their lives in terror hide.

Erechtheus' city mourns her children's fall,
Who fought and died by Potidæa's wall,
True sons of Athens, for a virtuous name
They changed their lives, and swelled their country's fame.

The smallness of the number of public epitaphs at Athens is well compensated by the abundance of private ones, of which upwards of four thousand have been already published, while every year brings a multitude of fresh ones to light. I will attempt to class these, as I did the reliefs. The commonest inscriptions by far are those which simply record, in the case of a man, his name, his father's name, and his *deme* or clan; in the case of a woman, her name, that of her father, husband, or husband and father, with their respective demes. Of the numerous epitaphs which remain, perhaps nine out of ten are of this simple character. Probably in most cases they are of the poor, but not in all; for sometimes they accompany reliefs of an elaborate character, or are placed on tombs of great size and pretensions. Than such an epitaph nothing could possibly offend less against good taste, and it was probably thought somewhat sentimental and *gushing* at Athens to indulge in a longer metrical sepulchral inscription. When longer inscriptions occur, they seldom bear much sign either of taste or education. Their grammar is often doubtful, and, when in metre, they halt terribly. They clearly belong to the same class of compositions as the lame verses which abound in English graveyards. It would seem that the swans who sang thus only found their voice at death, but the death of friends, not their own. The chance of such publicity for one's verses as may be gained by placing them on a tomb proved too attractive for them to forego.

In the case of early reliefs we find usually not only the name of the dead, but also of the artist who did the work. In later times this custom dropped, and we have scarcely in any case a clue to the name of the sculptor. This fact is the more curious, inasmuch as in other remains of antiquity, vases, gems, and coins, to insert the artist's name becomes more usual as we approach the best time of art. Not many epitaphs of an earlier period than the year B.C. 400 are preserved, nor are these, except in the case of public tombs, of special importance. One is interesting to students of epigraphy as it bears an exact date, the year B.C. 430, when the plague, following in the wake of the Peloponnesian army, invaded Attica: "I am the tomb of Myrinê, who died of

the plague." Another, of an ordinary Attic type, has a grace and charm which is seldom absent from the productions of Attica while yet unsubdued: —

Let the reader pass on, be he citizen or stranger from afar, having pitied for a moment a brave man who fell in battle and lost his young prime. Having shed a tear here, go by, and good go with you.

To the period between the falling of Athens into Lysander's hands and the times of the Roman Antonines belongs the vast body of the epitaphs. For a more exact chronological classification the materials at present scarcely exist, it being especially hard to determine the period of those inscriptions which are not accompanied by reliefs. It is best therefore to divide them into classes, not by a determination of date, but rather by a consideration of drift and content, and to consider all as belonging to one long period, a period when the Athenian empire had indeed passed away, and external conquests were not to be hoped for; but when Athens still ruled in the realm of mind and attracted to herself the flower of the culture of Hellas and the world. I have already said that the commonest sort of inscriptions comprises only the name of the dead, his father's name, and that of his deme. But not unfrequently a few words of comment were added. The person who paid for the erection of the tomb liked to see some record of his liberality. Thus a stone marks the spot where "his sons buried Julius Zosimianus, the head of the school of Zeno," that is, the head of the stoics of Athens. Another records that "Polystratus set up this portrait in memory of his brother." We frequently find the trade or calling of the deceased mentioned in his epitaph. One Herakleides is stated to have been the greatest master of the catapult, a warlike machine which seems to have required some skill in the handling. Many other trades are mentioned in connection with the dead. One was a bathing-man, another a midwife and physician, another a priestess of the all-producing mother, probably Kybele, another second in rank in joyous comedy, another a bull-fighter. On one tomb the record ends quaintly, after mentioning that the grave contained one or two named persons, with the phrase, "also the others who are represented in the relief," where the stonemason or his instructor seems to have grown tired of a bare list of names, and stopped short in the midst.

All the longer inscriptions which are found on Attic gravestones, if we except only the class of minatory or deprecatory epitaphs, which I reserve to the last, are in metre. To this rule there are few, if any, exceptions, so that the ancient epitaph-writer could at least, unlike the modern, claim the *dura necessitas* as a reason for attempting a metrical composition. I shall, however, render into English prose rather than verse the specimens of these selected for purposes of illustration, as it would convey quite a false impression if I were to disguise their oddities and crudities under the smooth mantle of English heroic verse.

The metrical epitaphs are of four kinds. Those of the first kind are in the form of a dialogue between the dead and the surviving friend, or in some cases of a mere direct address to the dead. The simplest form which such an address can take is the χρηστὲ χαῖρε — "Farewell, lost friend" — which is so usual on tombs of a certain period, but which does not, apparently, appear on any which belongs certainly to an Athenian. Of this simple and touching phrase we find a number of metrical amplifications: —

Farewell, tomb of Melitê; the best of women lies here, who loved her loving husband, Onesimus; thou wert most excellent, wherefore he longs for thee after thy death, for thou wert the best of wives. Farewell, thou too, dearest husband, only love my children.

But an inscription of this kind is necessarily of a late period, and but little in accord with the canon of Greek taste. No doubt when it was set up, it was at once condemned as vulgar by people of culture.

Far more usual and less extravagant is the following, which details a conversation not with the dead, but with his tomb: "Whose tomb are we to call thee? That of famous Nepos. And who of the children of Cecrops begat him? say. He was not of the land of Cecrops, but from Thrace." Another epitaph, after proceeding in verse, suddenly breaks into prose: "And if you seek my name, I am Theogeiton, son of Thymochus of Thebes." Of course it is quite natural that the tombstones should thus speak in the first person in the name and on behalf of the deceased. In some of our commonest English epitaphs such as "Affliction sore long time I bore," we find the same peculiarity; but that a gravestone should give information in reply to cross-questioning is less usual.

The second kind of metrical inscriptions, which is by far the most numerous, speaks of the past life and history of the deceased. Thus over the grave of a soldier we find:—

Of thy valor stands many a trophy in Greece and in the souls of men; such wert thou, Nicobolus, when thou leftest the bright light of the sun and passedst, beloved of thy friends, to the dwelling of Persephone.

Other triumphs besides warlike ones are elsewhere recorded; on the tomb of one Praximus, *the doer*, we read the punning epitaph:—

My name and my father's this stone proclaims, and my country; but by my worthy deeds I attained such a name as few may obtain.

We are not aware in this case to what special kind of deeds the inscription refers; often it is more explicit, as in the following, erected over a young statuary:

I began to flourish as a statuary not inferior to Praxiteles, and came to twice eight years of age. My name was Eutychides,* but that name fate mocked, tearing me so early away to Hades.

On the tomb of one Plutarchus, who seems to have been a merchant, we find a brief history of his life:—

This is the tomb of the discreet Plutarchus, who, desiring fame which comes of many toils, came to Ausonia. There he endured toils on toils far from his country, although an only child and dear to his parents. Yet gained he not his desire, though longing much, for first the fate of unlovely death reached him.

Sometimes out of a whole life one event or circumstance of peculiar interest was taken, and commemorated as well by inscription as relief, as in the case of that Phœnician stranger already mentioned who narrowly escaped the jaws of a lion. The inscription on his tomb describes that escape, and explains the meaning of the representation it accompanies.

The virtues of the dead must always in all countries form the most frequent and suitable subject of sepulchral inscriptions. Athens is no exception to the rule. We find on the grave of a young man:—

Here Euthycritus, having reached the goal of every virtue, lies entombed in his native soil, dear to father and mother, and loved by his sisters and all his companions, in the prime of his life.

A copper-smelter from Crete has the simple and pleasing epitaph:—

* Child of good luck.

This memorial to Sosinus, of his justice, his prudence, and his virtue, his sons erected on his death.

The following is from the tomb of one Sotius:—

Here in earth lies Sotius, superior to all in the art he practised, virtuous of soul, and dear to his fellow-citizens; forever he studied to please all, and his heart was most just towards his friends.

Such are a few of the panegyrics bestowed on men after their death; those bestowed on women are fewer in number, but not less interesting. A young girl is commended for her serious and staid disposition:—

She who lies here coveted not, while alive, garments or gold, but desired discretion and virtue. But now, Dionysia, in place of youth and bloom, the Fates have awarded thee this sepulchre.

More than once we find epitaphs which speak of the virtue and kindness of nurses, evidently set up by young men who had never ceased to care for and respect them. The ancients evidently felt for the wet-nurse who cherished their infancy, slave as she might be, something of lasting and filial affection.

Here is laid in earth the best of nurses, whose foster-child still misses her. I loved thee, nurse, when alive, and still I honor thee though thou art laid in the ground, and shall honor as long as I live.

More characteristic of the Greek disposition than mere praise of the dead are those praises of the good fortune of the departed, which sound almost mocking to modern ears, and yet on a little reflection do not displease. Of one, Symmachus, of Chios, we read on his tomb that through life his joys were many and his sorrows few, that he reached the extreme limit of old age, and lies in Athens, the city dear to gods and men. On the tombs of women it is often stated that they were in comfortable circumstances, and that they lived to see children's children. All the happiness of past life seemed to the Greeks a gain, and even when it was over was to be regarded, not with bitter regret, but gentle sympathy. In one inscription, though a late one, we find an elaborate description of the beauty of the young wife buried below, of her yellow hair, her bright eyes, her snow-white forehead, the ruddy lips and ivory teeth of her lovely mouth. These things were past, it is true, but even so they were something better to look back upon than ugliness.

Sometimes, however, through the gen-

eral level of cheeriness a sadder note breaks : —

My name is Athenaïs, and with grief I go to my place among the dead, leaving my husband and my darling children. A grudging web the Fates spun for me.

When youthful promise is early cut off it is scarcely possible that it should be spoken of without a sound of sad regret. Even the statement of the fact produces this impression : —

If fortune had continued thy life, Macareus, and brought thee to manhood, strong wert thou in the hope that thou wouldst become the guiding spirit of tragic art among the Hellenes. But thou diest not without fame for discretion and virtue.

Even here consolation comes in to modify regret, so true to the happy disposition of the Greeks was the charming saying of Spenser, —

A dram of sweete is worth a pound of sowre.

As in sepulchral reliefs, so in epitaphs, the Greek mourner usually turns his thought to the past, and dwells on the life which is over rather than on any which may be beginning. Nevertheless we do find, here and there, some allusions to the state of the departed which are of great interest, and which furnish us with evidence on a subject still obscure and much discussed, the beliefs of the ordinary minds among the Greeks as to the future life, and as to reward and punishment in it. The small space which these allusions occupy, compared with the whole body of epitaphs, shows how small a corner of the Greek thought was taken up with meditation on matters outside the present life. But the materialism of the Greeks was rather natural and practical than speculative, and we nowhere find any positive denial of future existence. In one or two epitaphs there is an appearance of such denial, but its meaning must not be pressed. Thus, in one case, we find the phrase, "Rising out of earth I am become earth again," and in another epitaph, one Nicomedes, who calls himself the servant of the Muses, says that he is "clad in wakeless sleep." Here we probably only have popular phrases used in a vague and indefinite sense, and without the least intention of theorizing on the nature of the soul. Commoner still are even more vague phrases as to the destination of the soul, which is said to fly to heaven, to air, or to æther.* It is æther which is said in the metrical inscription first quoted to receive the souls of the slain Athenian warriors. So in the following : —

Here Dialogus, student of wisdom, his limbs purged with pure fire, is gone to the immortals. Here lie naked the bones of Dialogus the discreet, who practised virtue and wisdom ; them a little dust hides sprinkled over them ; but the spirit from his limbs the broad heaven has received.

Dialogus was presumably a philosopher, and had learned the difference between soul and body. The words, heaven and the immortals, have to him a somewhat vague meaning, representing rather something hoped for than believed in and expected. There is a stronger flavor of philosophic materialism in the following :— "Damp æther holds the soul and mighty intellect of Eurymachus, but his body is in this tomb." The word αἰθήρ, æther, is certainly used by Homer to signify the abode of the gods, and no doubt the poet of our metrical inscription had Homer in his mind, but here the word "damp" (ὑγρός) seems to point to some materialist notion as to the nature of spirit and its affinity to the upper air. A more popular interpretation must be accepted in other cases, such as : "Earth sent thee forth to light, Sibyrtius, and earth holds thy remains, but æther, the source of thy soul, has received it again."

But the vulgar notions with regard to the future state were certainly borrowed from Homer, sucked in by the many with their mothers' milk, or at latest imbibed at school, where Homer occupied the place taken by the Bible in our Church schools. The Greeks generally were inclined to regard Homer as infallible, and so, when they thought of the future state at all, pictured it according to his teaching. Hence they made it a shadowy realm under the government of Hades and Persephone, a poor, washed-out copy of the brilliant life on earth. The dead go to the chamber of Persephone, or, as it is sometimes phrased, the chamber of the blessed. "The bones and the flesh of our sweet son lie in earth, but his soul is gone to the chamber of the holy." It is clear, from some other inscriptions, that in that chamber rewards were supposed to await the good, and punishments the bad. Thus one man writes on the grave of his nurse, "And I know that, if below the earth there be rewards for the good, for thee, nurse, more than for any, is honor waiting in the abode of Persephone and Pluto."

* οὐρανός, αἰθήρ.

The suggestive *if* is again repeated elsewhere. "If there is with Persephone any reward for piety, a share of that was bestowed on thee in death by Fate." The expression in both instances seems to be rather of a wish or longing than of a sure and certain hope.

Indeed, this wavering tone never becomes full and confident until we come down to the times of Christian inscriptions, when a sudden and marvellous change takes place. To the Christian the place of interment is no longer a tomb, but a sleeping-place. When he speaks of æther and heaven as receiving the soul, the words have quite another ring. Though Christian epitaphs at Athens be somewhat beyond my province, I cannot avoid introducing one or two, if merely for the sake of contrast. The following charmingly combines the genial backward glance of the Greek with the forward glance of the believer: —

> Look, friend, on the sacred beauty of Asklepiodote, of her immortal soul and body, for to both nature gave one undefiled beauty, and if Fate seized her it vanquished her not; in her death she was not forsaken, nor did she abandon her husband though she left him, but now more than ever watches him out of heaven, and rejoices in him and guards him.

Or take another: —

> His body is hidden here in earth, but his soul is escaped to heaven (αἰθήρ) and returned to its source, for he has obtained the reward of the best of lives.

Sometimes one catches a note of a still higher strain, "There, whence pain and moans are banished, take thy rest." I think no one can deny that these epitaphs are quite equal to the pagan ones in literary taste and felicity of language, while in sentiment they mark a striking advance.

It would have been natural to expect that the religion of Isis, which among all ancient faiths clung most closely to the belief in a future life, and which owed to that circumstance its great influence among the later Greeks, would have left in the epitaphs some traces of a surer hope and trust in what was beyond the grave. But such is not the case, and a still more remarkable omission is to be noticed. The great Eleusinian mysteries were celebrated annually, within a few miles of Athens. The whole population must have known more or less of the meaning of the ceremonies; and there were probably few adult Athenians who had not been initiated. But it has always been supposed that the resurrection of the dead and the life to come were the chief matters on which light was thrown during the celebration. It has been thought that the analogy between the sowing of wheat and the burying of the dead, that analogy which the apostle Paul works out in full detail, was then insisted on. Cicero speaks of the mysteries of Eleusis as some of the noblest productions of Attic soil, and declares that they impart not only directions for leading a better life, but also a better hope in death. Polygnotus painted on the walls of the *lesche* at Delphi the punishments suffered in Hades by those who neglected to have themselves initiated in the mysteries. Yet in all the Attic epitaphs which have come down to us, we discern not a trace of any such doctrine as we should have been disposed, from such indications, to attribute to the college of priests who conducted the mysteries. When the next world is at all spoken of, it either appears as the Homeric realm of Hades and his bride Persephone, or else is mentioned in the vague language of the philosophers as æther and heaven. The conclusion seems inevitable. We are strongly warned against attributing too much influence over the ordinary mind, or any very lofty and spiritual teaching, to the mysteries. The wise men, like Cicero and Plutarch, may have found in them deep meaning and profound consolation, reading into them the results of their own philosophy and faith; just as able men of recent times have read into them most of the doctrines of Christianity. But to the common people they were probably a string of outward observances with little inner meaning. Like the sacraments of Christianity, to which in many respects they were parallel, they had a strong tendency to lose all life and become mere form. That their secret was so well preserved can be attributed to but one cause — that their secret, such as it was, was not of a kind that could be communicated. It is certain that throughout Greece, in antiquity, the future life was by the common people looked upon with distaste, if not with dread; and that they had no doctrine tending to soften its repulsion.

Moral reflections and words of advice form a not unfrequent ending to Athenian epitaphs. Sometimes in these nothing more is expressed than a kindly wish for the reader. Thus one stranger after stating that he was shipwrecked, adds in genial spirit, "May every sailor safely reach his home!" Another wishes for all wayfarers who read the stone a prosperous

journey. Sometimes there is a general observation: "It is rare for a woman to be at once noble and discreet;" or a quotation from a poet, as in the case of the well-known line of Menander, "Those whom the gods love die early." Sometimes the occasion is improved, as a Scotch minister would say, and a little sermon read to the passer-by, who is advised to live virtuously, "knowing that the abode of Pluto beneath is full of wealth and has need of nothing," — virtues, that is to say, and not riches, are the only things which will avail after death.

So far with regard to metrical inscriptions. The long inscriptions which are not metrical are nearly always of the same kind as the well-known epitaph of Shakespeare, — curses pronounced against those who shall in future time attempt to move or destroy the grave, curses of which the modern explorer makes very light, apparently supposing that their virtue has in the course of centuries departed. But in ancient time they might be more effectual. They are always of a very late date; so long as the people of Athens had a common feeling and a common pride in their city there was small fear of the violation of the grave of a citizen, but under the Roman emperors the Athenian citizenship and Greek nationality fell to pieces, and no one felt sure of the future. Herodes Atticus, the wealthiest citizen of Athens in the reign of Hadrian, who built the Athenians a splendid marble Odeum, set up a monument to his wife Appia Annia Regilla, "the light of the house," which he thought it necessary to fence by a very unpleasant string of threats.

> By the gods and heroes I charge any who hold this place not to move aught of this: and if any destroy or alter these statues and honors (τιμάς), for him may earth refuse to bear fruit, and sea become unsailable, and may he and his race perish miserably!

The inscription goes on to heap blessings on those who keep the tomb in its place and pay it honor. A lady who bears the Roman name of Antonia hands over, in her epitaph, her tomb to keep to Pluto and Demeter and Persephone and all the nether gods, calling down a curse on all who violate it. In another epitaph we find a formidable list of diseases which are likely to seize the violator — palsy, fever, ague, elephantiasis, and the rest. In another instance the dimensions of the curse are curtailed, and it is put neatly into two hexameter verses, "Move not the stone from the earth, villain, lest after *thy* death, wretch, dogs mangle thy unburied body."

In the last-quoted epitaph it is evidently the writer's intention to threaten a punishment according to the *lex talionis*. To move a tombstone was an offence of the same class, though in degree of course slighter, as to leave the body of a dead man unburied. It is well known how keenly every Greek dreaded that his body should after his death be deprived of burial rites, and how bitterly he condemned all who through fear or carelessness abandoned dead friends to dogs and vultures. No doubt this dread was connected with the very ancient and wide-spread notion that those who remained unburied could not rest in the grave, were repelled from the gates of the world of spirits, and hovered as unhappy ghosts in the vicinity of their corpses. As the first step towards exposing a dead body was the tearing down of the stone which covered it, and as the stone was moreover closely associated with the dead, some of the mysterious horror which guarded the corpse was transferred to the gravestone above it. We may consider ourselves happy that among us gravestones are protected not by curses but by blessings, by cherished memories and associations; and so perhaps it was in the better times at Athens, only when the old civilization was falling into corruption, all gentler ties were loosed, and every man fought for himself and his, with any weapons which came nearest.

One closes the "Corpus of the Sepulchral Inscriptions" with a feeling of surprise — surprise that a people so gifted as the Athenians should be so helpless and tongue-tied in the presence of death. The reliefs do not disappoint a reasonable expectation; in execution at least they put our modern cemeteries to shame, if the range of ideas expressed is somewhat narrow. But the inscriptions are at a far greater depth below Greek poetry and oratory than the reliefs are below the best Greek sculpture. The reason may partly be that the reliefs are the work of professionals, the inscriptions of amateurs. But there are two other reasons of a more satisfactory character. The first of these I have already mentioned, that except in the case of soldiers and of public characters, such as eminent poets, it was considered bad taste at Athens to have an epitaph at all; those, therefore, which we find are mostly written by persons of the less respectable classes, and in the later and worse times of the city. But the deepest reason, at least from the modern point of

view, is that the Greek mind found in death no inspiring power; they might regard its inevitable power with equanimity and even cheerfulness, but in any way to rejoice in its presence, to look upon it with hope and warmth of heart, did not consist with the point of view of their religion. Such feelings at such a time are inspired only by one or two religions of the world, among which there is no place for naturalism. PERCY GARDNER.

From The Cornhill Magazine.

THE CZAR'S CLEMENCY; A POLISH PRIEST'S STORY.

III.

It may have been owing to this omission, or because she had found other reasons to suspect my perspicacity; but the very next morning Paulina came and knelt in my confessional.

On the previous occasion of her coming to make her shrift she had accused herself of the sin of greediness — for eating a few strawberries between meals — and I was prepared for a repetition of some such triviality. But this time she laid her heart bare in one sentence.

"Father," she said, "I love Casimir Barinski."

"And it was you who obtained his pardon?" I rejoined, with mingled sentiments, in which I knew not whether it was anger or pity that predominated.

"Yes," she answered, almost inaudibly, through the grating.

"And you are still a spy — a traitor? You contemplate playing the part of Dalila again towards this man whom you have rendered fatherless, and whom you have aged before his time? Tell me the truth. Out with it."

"I *am* a spy," she faltered; "but by my hopes of salvation, father, if I could become Casimir Barinski's wife, I should be an honest woman. I wish to atone for the evil I have done. My heart has never spoken as it has now, and I feel I could die for this man. If he would take me for his wife I would go away with him wherever he would —— "

She rambled on in this way till I roughly checked her, bidding her give me her confession in order, and, as she valued her soul, not attempt to deceive me as to her proceedings in the past or her schemes for the future. She heaved a deep sigh, so lamentable in sound that it smote me as a reproach, for in one's dealings with this woman it was never possible to know whether she might not be truly contrite. When the fear of the devil was upon her, or when she wanted to coax some favor from her patron saint, she could be truthful by the hour, and upbraid herself with such virulent invectives as tempted one to cry, "Enough!" She began by telling me that she had loved Casimir from the moment of reading his poems, and had applied for his pardon on the spur of her first impulse of remorse. The pardon had been granted the more readily as some personages of high standing at court had also read the poems, and had been touched by them; but a condition had been put to Count Barinski's release, namely that Paulina should do her best to win the late exile into loyalty by offering him some lucrative secret-service employment if he would consent openly to forswear the Polish cause, and put his signature to a document stating that the exiles in Siberia were treated with the utmost humanity. This document was to go the round of the Russophilist journals of Europe.

When I heard Paulina say that she had undertaken this job, and meant to proceed with it, I knew that what she felt for Casimir Barinski might be caprice, but could not be real love, for a woman who loves a man does not begin by speculating on his dishonor. A few minutes before she had declared herself eager to forsake her present life and fly to the end of the earth with the man whose wife she aspired to become; but this inconsistency was after all consistent with the character of a woman who craved for nothing but material enjoyments, and had never let herself be hindered in any enterprise by principle. I let her speak on, and plied her with some questions as to her political doings during the years when she had hidden her conduct from me, but she answered rather shortly that she had confessed these things elsewhere, and been absolved from them. When, again, I tried to elicit information as to her present relations with the police, she replied that, having recently gone on a pilgrimage to the shrine of St. Elizabeth of Hungary in respect of her police tasks, she was entitled to a plenary indulgence, and was not bound to make me any disclosures. It was quite of a piece with these views on religion that she should have concluded by announcing her intention of burning six wax tapers of a pound's weight each before the Lady-altar so that her matrimonial projects might succeed.

I told her dryly that she might save her-

self that expense. "Casimir Barinski is going to be married to another," said I, "and the best atonement you can make him is to leave him alone."

"Ah!" was the answer blown to me through the grating, and her breath came and went in gasps.

"He is going to marry Ioulka Zezioff, whom he tenderly loves," I added implacably. "As for you, the affection he once bore you has died away."

"But it can revive," she responded resolutely.

"No, it cannot," I ejaculated, in wrath. "Be content with the respect he vouchsafes you, and which you so ill deserve. If you married Casimir Barinski without telling him what you are, it would be an imposture that would carry Heaven's curse with it; and if he knew you as I do, he would spurn you with his foot."

"Then you think that I have freed this man from Siberia to throw him into the arms of a rival!" murmured Paulina, in a tone that vibrated.

"You have done your best to kill a patriot, and do you dare to boast of having given him his freedom?" I exclaimed, exasperated. "Out upon you for an impertinent profligate! All your thoughts are devilish, and your presence in this church is a pollution!"

These were harsh words, but I meant them to be so. There was wafted to me through the grating the penetrating odor of a perfume which Paulina used. I could hear the rustle of her silk dress, and I felt outraged to think that the gold wherewith this woman bought her finery, and paid for the tapers she offered to the Virgin — nay, the gold with which she desired to enrich Casimir — was blood-money, counted to her for having sent Casimir's father and brothers, with countless others, to death. I could not see the countess through the wire grating, and of course our conversation had been carried on in whispers, owing to the people who kept entering and leaving the church for short prayers during market hours. She remained silent a moment, and then, without asking me for absolution, remarked that her design to marry Casimir Barinski being a laudable one, she should persevere in the prosecution of it without minding Ioulka Zezioff. She was sorry for the bad opinion I entertained of her, but begged to remind me that all she had just revealed having been communicated to me under seal of confession, I was debarred from reporting a word of it to anybody. This said — in a tone of half-menace, as I fancied — she rose from her knees, and her place in the confessional was almost immediately occupied by a potter's wife, who had contrite avowals to make about the peculations she committed in the course of business.

I knew but too well that Paulina Marienha had only made me her confession in order to close my lips as to facts I might have suspected and acted upon had she not told them me. For my absolution she cared not a doit, since she could go and obtain it of some more accommodating priest, who took no such liberties in lecturing her as I did; indeed, from words she let fall, I had gathered that she was in frequent consultation with a priest who could be no true Pole, for he appeared to have assured her that her treacheries were not culpable, but rather meritorious as proofs of submission to "those in authority over us." I am sorry to say that there is no sin which cannot be twisted into a virtue by a tortuous-minded priest, which reminds me of one who, anxious to get on in the world, solaced a wealthy but immoral lady by persuading her that it is not good to be too virtuous, seeing that excess of virtue leads us to pride — which is as much a deadly sin as that other sin whereof the said lady had accused herself. Sin or not, I certainly had no right to put Casimir on his guard against the Countess Paulina, with regard to things derived from her own lips; but there was nothing to prevent my assisting Casimir to leave the country, according to his own wishes, and this I determined to do without any delay, for I felt that we were in a perilous juncture. Oddly enough — or I should say providentially — the potter's wife to whom I have just alluded became a timely instrument for the work I desired to perform.

If this were not a narrative in which true names have been altered — names of localities as well as persons — I should scruple to write down that Macha Planiwitz, wife of the chief potter in Dolw, was in the habit of charging her husband's customers for more pots than they actually received, and that, moreover, in wholesale transactions she supplied pots of a quality inferior to the samples. These misdoings she confessed once a month or so, with promises of amendment; but she and Planiwitz conducted a yet more serious business in that they smuggled goods into Gallicia and out of it by means of a double-keeled barge, which carried their pots down the Vistula from Dolw to Cracow and back.

Now this double-keeled barge had been

Original from CORNELL UNIVERSITY

the subject of much spiritual wrangling between Macha Planiwitz and me.

A buxom, blue-eyed, and good-humored mother of children, Macha had great reverence for the saints, but was withal too fond of money, so that when she first told me of the barge I found her ready to argue that it was no sin in her and her husband, who were Christians, to defraud the Russians, who were schismatics; the less so, as the schismatic officials of the custom-house were wont to abet the frauds in consideration of being bribed. I had to correct these notions, and, with a sigh, Macha promised that the barge should be suppressed. But eighteen months later, her eldest boy, Peter, being in danger of death by measles, she came to me in great trouble, attributing this trial to the double-keeled barge, which had not been suppressed after all, notwithstanding a variety of fibs she had told me on her knees as to its having been broken up for fire-wood. I offered up prayers for young Peter, requiring his mother to vow more honesty for the future, and when the boy had recovered, she swore by his precious head that the barge should no more be used. But alas for the deceitfulness of women! When, at the end of two years more, Macha's youngest little girl was seized with the whooping-cough, she had to avow with many tears that, although the original barge had no more been used, two other and larger ones had been bought, owing to the extension which Stanislas Planiwitz's affairs were taking. Little Mary was cured of her whooping-cough, and her mother pretended to abjure barges forever; but I was not at all sure but that she had found means of evading the spirit of a vow, which maybe she had fulfilled in the letter.

So as Macha was kneeling and telling me of some profitable mistakes she had been making in her addition sums, I thought of the double-keeled barge, and reflected how convenient a vehicle it would have been for smuggling Casimir Barinski into Gallicia. The difficulty was to extract an avowal from Macha that she still smuggled, for her husband and children were all in good health at that moment.

"Macha," I said suddenly, "you must tell me about the cargo of tea, leather, and furs, you sent off to Cracow last week."

"As I live, father, there wasn't a pound of tea in it," she replied in a flutter.

"You can't deny about the leather and skins though," I proceeded sternly, though I was only going by guess-work. "What do you mean by trying to deceive the saints? Do you think they don't prompt me the questions I ought to put you, and keep an open eye on your games besides?"

"All the Jews in the carrying trade smuggle, and the saints don't hinder them," said Macha dismally. "It's very hard that we Christians shouldn't be allowed to pick up a little of the money which would else go into their pockets."

"Wait till the day of judgment," said I. "You'll see what faces the Jews will pull when they are ordered down-stairs, whilst all the good Christians march off to the right. Not that you'll ever march off to the right though, Macha, for you've told me many a lie about those double-keeled barges."

"Father, if the saints have told you that we've a single double-keeled barge afloat, they've lost the use of their eyes," affirmed Macha, with rather ironical earnestness.

I was somewhat disconcerted, but thought it good to feign anger. "Out upon you for mocking at the saints now!" said I. "Is it because a poor saint has been dead a thousand years and more, that he's to be scoffed at for not knowing the names of the new-fangled craft that ply on our rivers? I suppose you won't tell me that your skins float up stream to Cracow by themselves, with the incantation of some Lithuanian water-witch to speed them?"

"God forbid," exclaimed Macha, and I am sure she signed herself piously.

"Well, then, it's the devil who carries them in his phantom ship, manned by heretics who have died by their own hand? If you don't want me to believe that there's some evil mystery in all this, Macha, you'll let me know in what sort of boat all those skins are hidden."

"It's a steam-launch," murmured Macha, terrified.

The secret was out at last, and I could hear poor Macha behind the grating beginning to whimper. I suspect she was already in conference with the fiend as to how she should elude any new vow I might impose upon her in respect of the vessel from which her husband derived so much more money than from his pots; so she must have felt surprised when I simply questioned her as to the facilities which the custom-house officials allowed Planiwitz for his smuggling. She hastened to say, in self-excuse, that they allowed so many that a saint himself would have been tempted into the contraband trade. They never overhauled the cargo,

but pretended to believe that pots were the only merchandise on board, and it was not ten days since Planiwitz had presented the chief inspector with twenty pounds of Turkish tobacco and ten sacks of Mocha coffee, brought from Cracow on the return journey. I ought to mention that Planiwitz, though a true-hearted Pole, was by birth a Gallician, and had not settled in Dolw till after the rebellion, so that the authorities had no reason to treat him with the mistrust shown to Poles indigenous to the Russian districts. Among these last (that is among the Christians) trade was hampered with so many restrictions that few cared to embark in it.

All I wanted to know of Macha was whether, in the event of Casimir Barinski being hidden on board the launch, there was any danger of the inspectors detecting him, and having ascertained there was none, I proceeded to inform my penitent, in a rather circumlocutory way, what I wanted her to do. She was a good woman, who I knew would willingly render me a service; and yet such awe attaches among the people to the words police and Siberian exile that I doubted how my communication would affect her. But she received it better than I thought, and better, I am sure, than her husband would have done, for women have, according to my experience, more courage than men.

"You want us to carry a patriot out of the country. I see no difficulty," said she, in a whisper; "is it Count Bariniski, whom the papers say has been pardoned?"

"The same, and I charge you, on your soul, Macha, not to confide his plan to any man, save your husband, and the mate of your launch, for you would jeopardize his life. How many men compose the crew of the launch?"

"Two — one is an Austrian, the other a Greek, and neither like the Russians. I will talk to my husband, and bring you his answer to-morrow at this hour."

"And tell him the count wants to start as soon as possible," said I, pleased with her docility. "He was to have got married before starting, but his bride can join him abroad, and they will be married more comfortably where Russian faces are scarce."

Macha reflected a moment, and then the jade thought she would drive a bargain with the saints.

"We take tea and skins on board as ballast," said she; "will it be a sin if we do so on this journey with the count, father?"

"Nobody asks you what you are going to take," muttered I.

"I should like to have my conscience clear," said she, a bit slyly. "May I have absolution for past smuggling?"

"Yes, I absolve thee, for thou art a good woman," said I, and I am glad the grating was there to prevent my seeing her smile, as she must have done, when I so readily gave her a clean bill for all her husband's sins against the revenue.

Truth to say, I was much pleased with what I had accomplished, and I lost no time in making Casimir acquainted with my scheme for his flight; but judge of my mortification when he told me that he had just confided his projects to Countess Marienha, and that she had promised to abet him. It seems he had met her as she was coming out of church, had gone home to lunch with her, and had spent several hours in her company, so that he was in a very enthusiastic mood about her goodness.

He and I were talking together in the courtyard of the house where the Zezioffs lived. Some little Jew boys, with black ringlets and conical caps, were gambling for cherry-stones in the doorway, and I drew my young friend to the opposite end of the yard.

"You must not trust to Countess Marienha, Casimir," said I, in agitation. "She herself would gladly serve you, no doubt; but I am not sure as to the instruments she would use. She is surrounded by people who might play her false."

"What? Do you believe the police have suspicions about her?"

"The police suspect everybody, and I as a confessor know a great deal more about the people here than I can tell you. It is unsafe to involve Countess Marienha in any of your affairs, unsafe for her as well as for you."

"I told her how afraid I was of compromising her, but she laughed at the notion," exclaimed Casimir, removing his felt hat and stroking his furrowed brow. "Great heavens, what a country this has become!" and he went on to say that Paulina had generously volunteered to take him out of the country disguised as one of her servants. As to the Zezioffs, as there was nothing to prevent them from leaving Poland at their pleasure, she would take care that Ioulka and her mother joined him when he was safe over the frontier.

"Yes, trust her for that," I grumbled to myself, feeling persuaded that when once Casimir was gone, Paulina's first care

would be to have Ioulka and her mother arrested and taken to St. Petersburg, where they might undergo a year of "preventive detention" on some charge of being concerned in a political conspiracy. "No, no," I added aloud, "you must leave Poland at once, Casimir, and the countess must know neither where nor how you are going."

I had just said this much, when there sprang up from underground, as it were, the figure of Nicholas Levitski, my sacristan. He stepped out of the house, wearing his usual unctuous smile, made us a bow which brought his hat to a level with his knees, and glided away like a shadow. "Now, what was *he* doing here?" thought I. "This comes of speaking too near to a wall," and I drew Casimir into the middle of the yard to finish our colloquy.

We talked nearly half an hour, and he entered into all my views. At length we were interrupted by Mme. Zezioff and Ioulka, who returned from market and came into the yard, each with a basket on her arm. Ioulka had also a bunch of roses in her hands, and she looked so pretty in her fresh blue-spotted dress and straw hat, that I patted her cheek, and informed her that Casimir would have some secrets to tell her when he got up-stairs. In effect, Barinski and I had decided that Mme. Zezioff ought at once to apply for a passport, as if she and her daughter were going to Berlin to see a relative there, which would throw the police off the scent of the direction Casimir had taken, in case they should suspect the Zezioffs of having been parties to his flight. Once they were all three out of the country they might meet in any city agreed upon, and make thence for Paris, where Casimir would be sure to find friends among the Polish Emigration Committee, who would put him in the way of getting honorable employment. His sister Eveline, too, who, as I heard, was married to a civil engineer, would be able to offer Mme. Zezioff and her daughter a home until the arrangements for Ioulka's own wedding should be completed.

I was right to be thus precipitate in my recommendations; for whilst I was advising Casimir, Paulina Marienha was, on her side, not inactive, and in fact it was a regular contest of speed that had commenced between her and me.

IV.

In the morning I got a favorable answer from Macha Planiwitz. The steam-launch was going to start for Cracow at evening next day, and Casimir was welcome to a corner in the secret hold among the bales of contraband stuff. However, as it was pretty certain that the count's footsteps were for the present dogged by spies, this was the roundabout way he must take in order to reach the wharf and get on board. At six o'clock next evening he was to enter a tobacconist's shop in Sobieski Street with the stalk of a rose in his mouth, and ask for a five-kopeck cigar; by these tokens the tobacconist's wife, who was a friend of Macha's, would know him, and point to a parlor door, which would remain ajar. Casimir would have to pass through the parlor without a word, make for a yard behind, and issue thence into Little Podlack Street, where there are some public baths, which he must enter, requesting a warm bath "with bran." The bath proprietress, another friend of Macha's, would lead him to a bath closet, where he would find a tarpaulin hat, a waterproof cloak, and some shaving-tackle. Having shaved off his beard, and donned his disguise, Casimir must open the closet window, drop into the yard of the bath-house, and by means of a short ladder, placed there in readiness, climb over the wall, and so gain a brandy wharf, which would lead him to Planiwitz's pottery wharf further on, and there the Austrian mate of the launch would be on the look-out, also with a rose in his mouth; and the fugitive must say to him, "I have come to examine the boiler of your launch;" whereupon without a word the mate would conduct him on board, and stow him away among the tea-chests and skins, where he must make such shift to breathe as he could until the launch passed the Austrian frontier.

Such were the precautions needed to assist a patriot in escaping from his own country; and I knew that Macha, while doing her best to shield her husband from any suspicion of complicity, had not exaggerated the risks that would be run if things were managed without proper cunning. She told me that her husband feared to speak to the runaway, or even to see him; and that if it had not been for her entreaties (I think she might have said her "orders," for she was the master spirit of her household) he would not have mixed in so perilous a business. All that Macha begged in requital of her good offices was that I would ask Casimir Barinski to give her some portion of attire that he had worn in Siberia, so that she might cut it up into scapularies for her children to wear as safeguards against lightning and the evil eye — the which I duly promised.

One thing annoyed me, and this was that Nicholas Levitski, who was stealing noiselessly about the church replenishing the oil in the lamps of the lateral chapels, saw Macha on her knees in my confessional. He had seen her there on the day before, for he took faithful ocular note of all who came to shrive themselves; so by-and-by, as I was unrobing in the sacristy, he said with a mealy smile and a voice that came through his nose as through an ill-tuned organ: "Alack, the potter's wife has many a sin to confess, since she comes two days running." "Hold thy peace," said I; "if thou wouldst confess all *thy* sins, a week on thy knees would not suffice thee."

By-and-by, when the midday sun was so hot that the Russian soldiers I met were hanging out their tongues like dogs, I went out to tell the Zezioffs of the arrangements I had made; and I found that they had been to the police-office to apply for their passports. The officials had only put them the usual formal questions, and after taking down a minute description of their features and figures, during which Ioulka had blushed, said her mother, they had promised that the passports should be forwarded next day. I did not see Casimir, for, by the advice of us all, he had entered upon his new situation at the silversmith's; we had even bidden him to talk with Solomon Paskoff as to make the latter believe that he was going to smelt in his service for months, if not years.

That day was spent by Ioulka and her mother in the exciting task of packing for their departure. Casimir did not lodge in the same house as the Zezioffs, but he took his meals with them, and on coming in to dinner he brought a pink note that had been sent to him in the course of the day, inviting him to take tea at the countess's house, at nine o'clock. The Zezioffs, in their honest belief of Paulina's purity, advised him to go, and he went, but said nothing as to his intended escape. On the contrary, he gladdened the countess above measure by consenting to fly with her three days thence, and saying so many gallant things that she must have felt persuaded her blandishments had partly won back his heart, a consummation which her vanity could not deem improbable.

All this Casimir told me next day, when he came to see me at the church during the hour allotted him for dinner. He looked pensive, and as I led him to the space behind the high altar, where we could be in privacy for this interview, the last I should probably ever have with him, he whispered that he had discovered the secret of Paulina's kindness to him. "I should be a simpleton," said he, "if I were blind to the fact that Paulina loves me, father."

"It's no great matter, provided you don't love her," answered I, scrutinizing his face rather anxiously.

"No, I love Ioulka," he rejoined steadfastly; but then a faint gleam shot through his blue eyes as he added: "It's flattering, though, to have kindled a passion in a woman I courted so hopelessly of yore."

"My son, Paulina Marienha is forty years old now."

"It may be, but she still looks young; that is why I treated her yesterday as if she were no more than twenty, and an instinct warned me that the less I talked about Ioulka the more it would please her. Was that a sin, father?"

"Eh, my son! these are points of casuistry I cannot decide outside a confessional," I replied, edging away; though I was mighty relieved to think that, in flirting with the countess, Casimir had doubtless thrown her off her guard and caused her to stay proceedings she might otherwise have taken against Ioulka Zezioff. "Here we are alone," said I, as we reached St. Stanislas' small and dimly lighted chapel behind the high altar. "Kneel down, my son, that I may bless thee before thou goest away."

He knelt down on the flags, humbly bowing his head, and I stretched my hands over him: "God Almighty protect thee, Casimir Barinski, and give thee long life that thou mayest see our poor country freed."

"Amen!" he responded fervently.

"Mayest thou carry the example of Polish virtues to the strange land whither thou goest, so that in learning to honor thee, men may honor thy friendless country!" I added, "Be not like the Poles who fought in the Communal rebellion of Paris, Casimir, and thereby showed ingratitude for the hospitality which a great nation had extended to them. Be not like that madman Bevezowski either, who thought that a cause such as ours could be advanced by assassination. The cross and the sword must be thy weapons, my son, when thy day comes — which, alas! I shall not live to see."

"Who knows, father?" said he, still on his knees. "The Russians may shortly be involved in a war which will lead to

the dismemberment of their empire. When that war comes, can I in conscience join the Turkish standard?"

"No!" said I, after a moment's hesitation. "These men have pardoned thee, and thou canst not use the liberty they have restored to bear arms against them. It is a point of honor. Not till the day when the whole of Poland rises to arms will thy time have arrived; meanwhile, be faithful and patient."

"I will obey you, father," said Casimir; and rising from his knees he threw himself into my arms. There were tears in the eyes of us both; but even as I was embracing the poor fellow whom I loved, I noticed that the drapery of the high altar shook as though there were a cat behind. This made me exclaim at once: "Good-bye, Casimir; thou wilt start to-morrow morning by the road to Kaptcha, in peasant's disguise."

"Kaptcha?" echoed he; but looking up he caught the wink I gave him, and followed the direction of my glance. Nicholas Levitski was just then protruding his bust through the drapery, and held in one hand a bowl full of liquid plaster.

"Father," whined he, "the rats play havoc with the altar-cloth, and I have been stopping their holes."

"Thou art a good servant," said I dryly; "but since thou hast still plaster enough, I will show thee a spot in the crypt where thou mayest stop other holes; I fear the rats have been eating at the shrine of St. Stanislas."

"They are an evil vermin," remarked Nicholas, following me as if anxious to render a service.

"Down these stairs," said I; and, when we had descended a dozen steep steps and reached the crypt, where a feeble oil lamp burns day and night, I let him pass me, then pulled the door behind him, and locked it, crying through the keyhole: "Thou wilt not be wanted till vespers, Nicholas, so thou mayest spend the whole of thy afternoon with the rats."

"But I have not dined, father," he protested, his voice ringing with a piteous sonority under the vault.

"I doubt not that St. Stanislas will consider the sacrifice of thy dinner, and send thee a better appetite for supper!" was my rejoinder, and I returned up-stairs laughing in my sleeve. Casimir Barinski was gone, for a gesture of mine had bidden him depart; so, being alone, I knelt down on the stones, and offered up a prayer that it might go well with him and with his bride Ioulka, even as it went well with Moses when he fled from among the Egyptians.

I had no positive proof that Nicholas Levitski was a spy, but things I had uttered at different times had been noised abroad without its being possible that any save himself could be the retailer; besides which, every Catholic priest in Poland has a spy in his sacristy, so there were reasons enough why I should keep the man locked up in the crypt until Casimir and the Zezioffs had left Dolw. A word from him in the ear of a police inspector would have overturned all our plans.

At four o'clock in the afternoon, Ioulka and her mother went away by the coach which travels from Dolw to Gerinsk, where there is a railway station whence they would take the train for Posen. There were the usual tightly-buttoned police officers at the coach-yard, who closely examined the passports; but Ioulka and her mother were not signalled as being under an interdict from travelling, so they were allowed to seat themselves on the dusty drab cushions of the vehicle without impediment. Mme. Zezioff was a little sad at leaving the town where her married life had been spent; but Ioulka was in high spirits, and chatted gaily to me as her small store of luggage and her mother's was being lifted on to the roof by a Jew ostler much freckled. At last the Ukranian driver, in his white smock, climbed on the box, and gathering the reins of his three flea-bitten horses, clucked his tongue against his cheek and cracked his whip. Ioulka blew a kiss to me, and her mother waved her hand, as the ponderous yellow carriage jolted out of the yard and disappeared down the street amid the yells of the little Jew boys and the barking of those many long-nosed dogs who are suffered to prowl masterless about our towns. When the coach was gone I heaved a sigh of relief and went off to say vespers. Up to the last moment I had feared that Paulina Marienha might have given orders to arrest the Zezioffs.

V.

I PERFORMED vespers without the help of my sacristan, and it was past six o'clock when I went down to the crypt to release him. He looked like a man who has seen a ghost and is famished besides; and, as I expected, his first thought was to scamper home to supper, so that there was no likelihood of his making any revelations to the police for another hour at least. "And when he does make them," mused I, "he will go and say that Casimir is to start to-

morrow in the disguise of a peasant by the road to Kaptcha, so that our enemies will be hunting on the wrong track." With a chuckle over the trick I had played the worthy, I locked the church doors, took the keys home, and having supped off a dish of Vistulan trout, dressed myself for a visit to the countess, whom I wished to see rather out of curiosity than because my visit could avail much at this juncture. On my way I passed by Stanislas Planiwitz's pottery shop, and saw Macha standing in the doorway with her last-born baby in her arms, who clutched a rose in his little fist; by which preconcerted sign I was informed that Casimir Barinski was safe on board the steam-launch.

Paulina received me very affably, although this was not a reception-night, and she was alone in the *déshabille* of a white-laced cashmere *peignoir*. I noticed there was a moist glitter in her eyes and a something subdued and yet ecstatic in her manner, which proved sufficiently that Casimir's flirtation of the preceding day had altogether blinded her and turned her head. She looked like a woman who is in love, and whose passionate artifices are triumphant. Certainly at that moment she would have scorned to do an unkind thing to Ioulka Zezioff, for it was a much greater womanly feat to seduce a lover from his betrothed by the simple might of her charms, instead of having recourse to police interference to crush her rival. At the age of forty, so far as I have seen, women take an extraordinary delight in winning a love battle in a fair fight.

Paulina and I talked about Casimir, for his named seemed to fly incontinently from her lips, so that she could allude to nothing else; but we did not touch upon his marriage or proposed departure in Paulina's company, I being supposed to know nought of this last scheme. We conversed rather about his family, his talents, his sufferings in Siberia — and hereon my fair hostess soon began to shed hysterical tears, vowing that, after all, it was not she who had caused Casimir to be sent into exile, for that he would have been arrested in any case, the government having long noted down his family for persecution. It was but natural that the unhappy woman should now seek to disculpate herself of her great crime against the man she loved, and should lay particular stress on the pardon she had obtained for him. She seemed to be working herself up to the conviction that, since it was she who had prevented the patriot from ending his days in the Oural mines, the remainder of his life properly belonged to her; which proves once again that woman's logic is often at fault.

I said nothing that might grieve the countess, for it was my duty to be courteous, as a visitor in her own house; and so we talked confidentially enough for a couple of hours. It was about ten o'clock, I think, and I was on the point of taking my departure, when a footman came in with a letter on a tray, which he handed to his mistress. Paulina begged my leave to open it; but the instant she had glanced at the first lines, she started to her feet, shot me a glance of viperous hatred such as a she-wolf may throw when she has fallen into a trap; then, bereft of all color, she flew to her desk, and snatched up a pen. She wrote for a minute, panting as her pen flew over the paper; then, without blotting what she had written, she hastily folded the sheet, enclosed it in an envelope, and handed it to the footman, who retired.

This done, Paulina advanced towards me with flashing eyes and arms folded, whilst, in a voice that was almost a scream, she exclaimed, —

"Do you know what I have just done? I have signed an order for the arrest of those two Zezioffs."

"It was a useless piece of work, for they went away this afternoon, and are over the frontier by this time," replied I, calmly.

This information staggered her for a moment. "Fool that I am; I should have had them seized two days ago!" she ejaculated, gasping. "But anyhow, Casimir Barinski shall not escape. I know that he is to leave for Kaptcha to-morrow, disguised as a peasant."

"And what if you do prevent his escape? Love him as you may, you can't force him to marry you against his will."

"But I can send him back to Siberia, and will. I would rather see him there than married to that drudge of a girl!"

"Tut, tut!" said I. "Our enemies are bad enough, but they won't cancel an imperial pardon for the sake of advancing your love affairs. You haven't the power you boast, Paulina."

This sally drove her almost mad.

"Haven't I the power?" shrieked she, as she spread out her hands wildly. "Know that I am queen of this town, and have been for years. I am the only person here in direct relation with the police minister at St. Petersburg; and a line of mine could send *you*, priest as you are, to Siberia."

"I don't believe it," said I; "and in any case feel no fear," nor did I feel any.

"Ah, you think you can defy me, but you will do well not to go too far!" she exclaimed, wringing her hands, and looking as if she would smite me.

"I do defy you," said I, standing up, in wrath; "for there isn't a priest in Poland who would give you absolution if you once laid a finger on one of our order. If we don't all hold together from brotherly love, we do from the necessity of mutual protection, as you well know, else you would have disposed of me long ago."

"I am too good, and that is my weakness!" said Paulina, panting as she dropped, half fainting, on to the sofa. "I have let myself be held in bondage by your superstitions like a child; but I'll turn schismatic."

"And I'll excommunicate you from the sacraments, and denounce you to the Camarilla as a heretic and a traitress, with whom no pact of faith need be kept," cried I, paying her back glance for glance, without quaking.

I knew the sort of woman with whom I had to deal, you see. Half choking with rage, she pointed to the door, and I walked out; but I felt quite confident that she would neither molest me nor suffer others to do so. Religion, as she practised it, was half the business of Paulina's life, and she had need to believe in the inviolability of its ministers. She would have known no peace in sinning if she had destroyed one of us priests who have power to absolve sins.

All this did not prevent my passing a very anxious night, for I had hoped that the news of Casimir's flight, or the intention of it, would not reach the countess till morning, by which time all researches would be vain. I was not so sure that they would be vain at this hour, if actively conducted; and every time I heard the tramping walk of the night police under my window, I quaked lest one of these individuals should knock at my door, and request me to accompany him to the central office, there to answer questions as to my connivance in Casimir's flight. There was no knocking, and I received no police visit till ten o'clock next morning. At that hour a crop-headed man in plain clothes arrived at the church, and told me laconically that I was wanted to identify a dead body.

"Whose dead body?" I asked, my tongue almost cleaving to my palate.

"Casimir Barinski's," he answered. "The man was overtaken as he was trying to escape in peasant's clothes; and as he offered resistance, he was shot down."

"Where? On the road to Kaptcha?"

"Precisely," replied the policeman, with a significant look into my eyes. "It was on the road to Kaptcha."

VI.

Some poor peasant it was who had paid for Casimir Barinski with his innocent life; and, by the time the mistake was discovered, Casimir was safe in Gallicia, with Stanislas Planiwitz's pots and chests of tea. He soon afterwards married Ioulka Zezioff in Paris, and is now employed as a journalist, I believe, in the French capital. I was never molested about his escape, nor was Macha, though, thanks to Nicholas Levitski (as I suppose), we were both suspected; but, then, the Russian police have a policy about hushing up disagreeable matters when these are beyond remedy.

As for Paulina Marienha, she remained six months without coming near me, and I, for my part, did not go near her. One day, however, she walked into our church bravely, attired after her wont, and sending for me out of the sacristy, said, with a grave sort of downcast smile, that she had come to make a confession. Prepared, by her manner, for something serious, I took my seat in the central box of the confessional, while she knelt in that to the left.

"Father," she began, "I accuse myself of the sin of ill-temper in often speaking sharply to my maid ——"

And that was how the Countess Paulina squared her accounts with heaven.

From The Contemporary Review.

THE LITTLE HEALTH OF LADIES.*

In the following pages I propose to speak, not of any definite form of disease, but of that condition of *petite santé*, valetudinarianism, and general readiness to break down under pressure, wherein a sadly large proportion of women of the higher classes pass their years. It is unnecessary, I think, to adduce any evidence of the prevalence of this semi-invalidism among ladies in England, or its still greater frequency abroad, and (em-

* To avoid misapprehension, it may be well to say that this word is here used in its older sense of the "*loaf-givers*." The ill-health of women who are *loaf-winners* is, alas! another and still more sorrowful subject.

phatically) in America. In a very moderate circle of acquaintance every one knows a score of cases of it, of that confirmed kind which has scarcely any analogue in the physical condition of men. If we take a state of perfect soundness to be represented by one hundred, the health of few ladies will be found to rise above eighty or ninety — that of the majority will be, I fear, about seventy-five — and a large contingent, with which we are now specially concerned, about fifty or sixty. In short, the health of women of the upper class is, I think, unquestionably far *below par*. Whatever light their burners were calculated to shed on the world, *the gas is half turned down* and cannot afford anything beyond a feeble glimmer.

Of the wide-extending wretchedness entailed by this *petite santé* of ladies it would be easy to speak for hours. There are the husbands whose homes are made miserable by unsettled habits, irregular hours, a cheerless and depressed, or else, perhaps, an hysterically excitable or peevish companion; the maximum of expenditure in their households, with the minimum of enjoyment. I think men, in such cases, are most sincerely to be pitied, and I earnestly wish that the moans which they, and also their mothers and sisters, not unnaturally spend over their hard lot, could be turned into short, sharp words, resolutely providing that their daughters should not adopt the unhealthful habits and fall into the same miserable state, perpetuating the evil from generation to generation.

As to the poor children of a feeble mother, their case is even worse than that of the husband, as any one may judge who sees how delightful and blessed a thing it is for a mother to be the real, cheerful, energetic companion of her sons and daughters. Not only is all this lost, but the presence of a nervous, *exigeante* invalid in the dwelling-room of the family is a perpetual damper on the healthful spirits of the children; and, in the case of the girls, the mother's demands on their attention (if she be not a miracle of unselfishness) often break up their whole time for study into fragments too small to be of practical use. The *desultoriness* of a home wherein the mistress spends half the day in bed is ruinous to the young, unless a most unusual degree of care be taken to secure them from its ill effects.

Pitiable, however, as are the conditions of the husband and children of the lady of little health, her own lot — if she be not a mere malingerer — is surely still more deserving of sympathy. She loses, to begin with, all the keen happiness of health, the inexplicable, indefinable *bien-être* of natural vigor,

> the joy of morning's active zeal,
> The calm delight, blessing and blest,
> To sink at night to dreamless rest.

She knows nothing of the glorious freedom of the hills and woods and rocky shore; she misses all the relief which lonely rides and walks afford from those petty worries which, like the wasps and ants in the dreadful old Persian torture, are sure to fasten on the poor wretch pinned to the ground. "To be weak is to be miserable." There is no truer maxim; and when we reflect how many women are weak,— not merely in comparison to men, which is nothing to the purpose, but weak absolutely and judged by the standard of nature,— we have before us a vast low-lying field of dull wretchedness profoundly mournful to contemplate. Out of it, what evil vapors of morbid feelings, jealousies, suspicions, hysterical passions, religious terrors, melancholy, and even insanity are generated, who shall estimate? To preserve the *mens sana* otherwhere than in the *corpore sano* is a task of almost superhuman wisdom and conscientiousness. The marvel is, not that so many fail, as that a few succeed in performing it.

Be it noted further, that it is the chronic *petite santé* much more than any positive disease, which is morally so injurious to the sufferer and all around her. I have heard one whose long years of pain seem each to have lifted her nearer to heaven remark with a smile, that "actual pain is always, in a sense, *entertaining!*" She intended, no doubt, to say that it tasked the powers of will and religious trust to bear it firmly. Out of such contests and such triumphs over either bodily or mental suffering, spring (as we all recognize) that which is most precious in human experience,— the gold purified in the furnace, the wheat threshed with the flail.

> Only upon some cross of pain and woe
> God's son may lie,
> Each soul redeemed from self and sin must know
> Its Calvary.

But the high moral results of positive pain and danger seem unattainable by such a mere negation of health as we are considering. The sunshine is good and the storm is good, but the grey, dull drizzle of November — how is any one to gain much

from it? Some beautiful souls do so, no doubt; but far more often chronic *petite sante* leads to self-indulgence; and self-indulgence to selfishness; and selfishness (invariably) to deceit and affectation, till the whole character crumbles to pieces with dry rot.

Now I must say at once that I consider the frequency of this valetudinarianism among women to be a monstrous state of things, totally opposed to any conception I can form of the intentions of Providence or the laws of beneficent nature; and the contented way in which it is accepted, as if it were a matter of course, by society and the poor sufferers themselves, and even by such well-meaning friends of women as M. Michelet, strikes me as both absurd and deplorable. That the creator should have planned a whole sex of patients — that the normal condition of the female of the human species should be to have legs which walk not, and brains which can only work on pain of disturbing the rest of the ill-adjusted machine — this is to me simply incredible. The theory would seem to have been suggested by a study, not of the woman's *body*, framed by the great Maker's wisdom, but from that of her silly *clothes* sent home from the milliner, with tags, and buttons, and flounces, meant for show, not use, and a feather and an artificial flower by way of a head-gear.

Nay, my scepticism goes further, even into the stronghold of the enemy. I do not believe that even the holy claims of motherhood ought to involve — or, if women's lives were better regulated, *would* involve — so often as they do, a state of invalidism for the larger part of married life; or that a woman ought to be disabled from performing the supreme moral and intellectual duties of a parent towards her first-born children, when she fulfils the lower physical part of her sacred office towards those who come afterwards. Were this to be inevitably the case, I do not see how a woman who has undertaken the tremendous responsibilities of a mother towards the opening soul of a child could venture to burden herself with fresh duties which will incapacitate her from performing them with all her heart, and soul, and strength.

One of the exasperating things about this evil of female valetudinarianism is that the women who are its victims are precisely the human beings who of our whole mortal race seem naturally most exempt from physical want or danger, and *ought* to have enjoyed immunity from disease or pain of any kind. Such ladies have probably never from their birth been exposed to hardship, or toil, or ill-ventilation, or bad or scanty food, fuel, or raiment. They have fed on the fatness of the earth and been clothed in purple and fine linen. They are the true lotos-eaters whom he material cares of the world reach not. They

live and lie reclined,

in a land where (in a very literal sense)

it seemeth always afternoon,

and where they find a certain soothing æsthetic emotion in reading in novels the doleful tale of wrong of the "ill-used race of men that cleave the soil," — without dreaming of going down amongst them to make that tale less dismal.

That these women, these Epicurean goddesses of the drawing-room, should be so often the poor, fragile, suffering creatures we behold them, unable to perform half the duties of life, or taste a third part of its pleasures, — this is a pure perversity of things which ought surely to provoke revolt.

What are the causes of the valetudinarianism of ladies?

First, of course, there is a considerable class of inherited mischief, feeble constitutions, congenital tendencies to chronic troubles, gout, dyspepsia, and so on, due to the errors of either parent, or to *their* evil heritage of the same. All that need be said here on this topic is that such cases must necessarily go on multiplying *ad infinitum* till mothers regain the vigor which alone permits them to transmit a healthy constitution to their children.

Next to hereditary *petite santé*, we come to cases where the habits of the sufferers themselves are the cause of the mischief; and these are of two kinds — one resulting from what is good and unselfish, and one from what is bad and frivolous, in the disposition of women.

Women are generally prudent enough about their money; that is, of their own money, not that of their husbands. I have heard an observant man remark that he never knew a well-conducted woman who, of her own fault, became bankrupt. But as regards their health the very best of women have a propensity to *live on their capital*. Their nervous energy, stimulated either by conscience or affection or intellectual interests, suffices to enable them to postpone perpetually the calls of their bodies for food, sleep, or exercise. They

draw large drafts on their physical strength, and fail to lodge corresponding sums of restoring rest and nutriment. Their physical instincts are not imperious, like those of men; and they habitually disregard them when they make themselves felt, till poor nature, continually snubbed when she makes her modest requests, ceases to press for daily settlement of her little bill, and reserves herself to put in an execution by-and-by. The vegetative and the spiritual part of these women flourish well enough; but (as Kingsley's Old Sandy says) "There is a lack of healthy animalism," between the two. They seem to consider themselves as fireflies issuing out of a rose, flitting hither and thither to brighten the world, not creatures of flesh and blood, needing to go to bed and eat roast mutton.

If we study the condition of Mr. John Bull in his robust middle age, we shall notice that for forty years, with few interruptions, he has enjoyed those "reg'lar meals," on which Tennyson's Northern Farmer lays such stress as the foundation of general stability of character. He has also walked, ridden, rowed, skated, smoked his cigar, and gone to his bed (as nearly as circumstances permitted) when the inclination seized him. If now and again he has omitted to gratify his instincts, it has been for a business-like reason, and not merely because somebody did not happen to wish to do the same thing at the same time. He has not often waited for an hour, half fainting for want of his breakfast, from motives of mere domestic courtesy; nor sat moped in a hot room through a long, bright day to keep some old person company; nor resolved his dinner into tea and muffins because he was alone and it was not worth while to trouble the servants; nor sat up cold and weary till three in the morning to hear about a Parliamentary debate wherein he took only a vicarious interest. At the end of the forty years of wholesome indulgence, the man's instincts are more imperious and plain-spoken than ever, and, as a reward for his obedience to them, his organs perform their respective offices with alacrity, to the great benefit of himself and of all dependent upon him. Pretty nearly the reverse of this has happened in the case of Mrs. Bull. Almost her first lesson in childhood was to check, control, and conceal her wants and miseries; and by the time she has grown up she has acquired the habit of postponing them, as a matter of course, to the smallest convenience of A, B, C, and D, father, mother, brothers, even servants, whom she will not "put out of their way" for herself, though no one would so much as think whether they had a way to be put out of, for her brothers. The more strain there is upon her strength, by sickness in the house or any misfortune, the more completely she effaces and forgets herself and her physical wants, recklessly relinquishing sleep and neglecting food. When the pressure is relieved, and the nervous tension which supported her relaxed, the woman breaks down as a matter of course, perhaps never to enjoy health again.

It must be borne in mind, also, in estimating a woman's chances of health, that if she neglect to think of herself, there is seldom anybody to do for her what she does for her husband. Nobody reminds her to change her boots when they are damp; nobody jogs her memory as to the unwholesomeness of this or that beverage or comestible, or gives her the little cossetings which so often ward off colds and similar petty ills. Unless the woman live with a sister or friend, it must be scored one against her chances as compared to a man, that she *has no wife*.

There must, of course, be set against all this the two facts, that the imperiousness of men's wishes and wants leads them often not *only* to do such wholesome things as those of which we have been speaking, but into sundry unwholesome excesses beside, for which in due time they pay by various diseases, from gout up to delirium tremens. And correspondingly, women's comparative indifference to the pleasures of the table keeps them clear of the ills to which gormandizing and bibulous flesh is heir. We all know scores of estimable gentlemen who can scarcely be prevailed on, by the prayers and tears of their wives, to refrain from drinking a glass of beer or port wine which will in all probability entail a fit of the gout next day; but in my whole life I have never known a woman who consciously ate or drank things likely to make her ill, save one mild and sweet old lady, whose predilection for buttered toast overcame every motive of prudence, and, alas! even of religion, which I have reason to believe she endeavored to bring to bear against the soft temptation. But for the purpose we have now in hand, namely, that of tracing the origin, not of acute diseases, but of general *petite santé*, this aspect of the subject is unimportant. It is precisely *petite santé*, which comes of the perpetual neglect of nature's hints — that she wants air, bread, meat, fruit, tea, wine, sleep, a scamper or a canter. It is

definite *disease* which results from over-exercise, over-feeding, and over-drinking.

Would it not be possible, I venture to ask, to cut off *this* source of feminine invalidism, at all events, by a somewhat more respectful attention to the calls of healthful instinct? I am very far from wishing that women should grow more selfish, or less tenderly regardful of the convenience and pleasure of those around them. Even sound health of body — immeasurable blessing that it is — would be purchased too dearly if this should happen. But there ought surely to be an adequate reason, not a mere excuse of whim and caprice of her own or of anybody else, why a woman should do herself hurt or incapacitate herself for future usefulness.

Another source of *petite santé*, I fear, may be found resulting from a lingering survival amongst us of the idiotic notion that there is something peculiarly "lady-like" in invalidism, pallor, small appetite, and a languid mode of speech and manners. The very word "delicacy," properly a term of praise, being applied vulgarly to a valetudinary condition, is evidence that the impression of the "dandies" of sixty years ago that refinement and sickliness were convertible terms, is not yet wholly exploded. "Tremaine" thought *morbidezza* — a "*charming morbidezza*" — the choicest epithet he could apply to the cheek of beauty; and the heroines in all the other fashionable novels of the period drank hartshorn almost daily, and died of broken hearts, while the pious young Protestants who converted Roman Catholics in the religious tales, uniformly perished of consumption. Byron's admiring biographer records how, at a large dinner-party, he refused all viands except potatoes and vinegar (horrid combination!) and then retired to an eating-house to assuage with a beefsteak those cravings which even Childe Harold could not silence with "chameleon's food" of "light and air."

We have advanced indeed somewhat beyond this wretched affectation in our day, and young ladies are not required by *les bienséances* to exhibit at table the public habits of a ghoul. In a few cases perhaps we may opine that women have gone to the opposite extreme, and both eat and drink more than is desirable. But yet we are obviously not wholly free from the "delicacy" delusion. We are not so clear as we ought to be on the point that, though beauty includes *other* elements, yet health is its *sine quâ non*, and that no statuesque nobility of form (much less a pinched waist and a painted face) can constitute a beautiful living human creature, who lacks the tokens of health — clear eyes, clear skin, rich hair, good teeth, a cool, soft hand, a breath like a bunch of cowslips, and a free and joyous carriage of the head and limbs.

Have we not, in the senseless admiration of feebleness and pallor (to obtain which a fashionable lady not long ago literally bled herself by degrees to death), an illustration of the curious fact pointed out by Miss de Rothschild in her admirable essay on "The Hebrew Woman," * namely, that the homage which Christianity won for weakness has tempted women to cultivate weakness to secure the homage? Just as Christian charity to the poor has fostered mendicancy, so has chivalrous tenderness to the feeble inspired a whole sex with the fatal ambition of becoming feeble (or of simulating feebleness) to obtain the tenderness. The misconstruction and abuse of the beatitudes of the gospel, as manifested in the rise of the mendicant order of friars, is notoriously a sad chapter of history. I do not think it a less sorrowful one that an analogous abuse has led to a sort of canonization of bodily and mental feebleness, cowardice, and helplessness among women. Can we question which is the nobler ideal, — the modern, nervous, pallid, tight-laced fine lady of little health, or the "valiant woman" (as the Vulgate calls her) of whom King Lemuel saith, "She girdeth her loins with strength, and strengtheneth her arms. Strength and honor are her clothing; and she shall rejoice in time to come"? †

We have now touched on the subject of dress, which plays so important a part in the health of women that it must here be treated somewhat at length. A little girl in a London Sunday school, being asked by a visitor "why God made the flowers of the field," replied (not unconscious of the gorgeous paper poppy in her own bonnet), "Please, ma'am, I suppose for patterns for artificial flowers." One might anticipate some answer scarcely less wide of the mark than that of this unsophisticated little damsel, were the question to be put to not a few grown women, "Why do you wear clothes?" Their most natural response would obviously be, "To be in the fashion." When we have visibly wandered a long way from the path of reason,

the best thing we can do is to look back to the starting-point and find out, if possible, where we have diverged. In the matter of raiment that starting-point is not hard to find — indeed, to mark it is only to state a series of truisms.

Human clothing has three *raisons d'être*, which, in order of precedence, are these: —

I. — HEALTH.
II. — DECENCY.
III. — BEAUTY.

HEALTH demands, —

1. Maintenance of proper temperature of the body by exclusion of excessive heat and cold.

2. Protection from injury by rain, snow, dust, dirt, stones to the feet, insects, etc.

3. Preservation of liberty of action to all the organs of the body and freedom from pressure.

DECENCY demands, —

4. Concealment of some portions of the human frame.

5. Distinction between the habiliments of men and women sufficient to avert mistake.

6. Fitness to the age and character of the wearer.

7. Concealment, when possible, of any disgusting personal defect.

BEAUTY demands, —

8. Truthfulness. The dress must be genuine throughout, without any false pads, false hair, or false anything.

9. Graceful forms of drapery.

10. Harmonious colours.

11. Such moderate consistency with prevailing modes of dress as shall produce the impression of sociability and suavity, and avoid that of self-assertion.

12. Individuality, — the dress suiting the wearer as if it were an outer body belonging to the same soul.

(Be it noted that the fulfilment of this highest condition of tasteful dress necessarily limits the number of costumes which each person should wear on similar occasions. No one body can be adorned in several *equally suitable* suits of clothes, any more than one soul could be fittingly housed in twenty different bodies.)

Glancing back over the above table, we find this curious fact. The dress of *men* in all Western nations meets fairly all the conditions of health and decency, and fails only on the side of beauty. The dress of *women*, on the contrary, ever variable as it is, persistently misses the conditions of health; frequently violates the rules of decency; and instead of securing beauty, at which it aims first instead of last, achieves usually — ugliness.

It is to be remembered for our consolation and encouragement that men have arrived at their present good sense in dress only within two or three generations. A hundred years ago the lords of creation set beauty above health or convenience, just as the ladies do now, and peacocked about in their peach-blossom coats and embroidered waistcoats, surmounted by wigs, for whose stupendous discomfort even a seat on the judicial bench can scarcely reconcile the modern Englishman. Now, when the men of every European nation have abjured such fantastic apparel, we naturally ask, Why have not the women followed their example? Why is the husband, father, and brother habited like a being who has serious interests in life, and knows that his personal dignity would be forfeited were he to dress himself in particolored, beribboned garments, and why is the wife, mother, or sister bedizened like a macaw, challenging every observer to note how much of her time, thoughts and money must have been spent on this futile object? The answer is one which it is not pleasant to make, discreditable as it is to both sexes. The women who set the fashions dress for admiration; and men like women who dress to be admired; and the admiration given and received is a very poor and unworthy admiration, not much better than a salmon gives to a glittering artificial fly, and having very little more to do with any real æsthetic gratification, — as is proved too clearly by the thoroughly un-beautiful devices to which fashion has recourse. It is the *well-got-up* woman (to borrow a very expressive phrase), not the really well-dressed woman, who receives by far the largest share of homage.

And now let us see how all this concerns the health of women — how much of their *petite santé* is due to their general neglect to make health the first object of dress, or even an object at all compared to fashion.

Tight-lacing among habits resembles envy among the passions. We take pride in all the rest, even the idlest and worst, but tight-lacing and an envious heart are things to which no one ever confesses. A small waist, I suppose, is understood to belong to that order of virtues which Aristotle decides ought to be natural and not acquired, and the most miserable girl who spends her days in a machine more cruel (because more slowly murderous) than the old "maiden" of Seville, yet

always assures us, smiling through her martyrdom, that her clothes are "really hanging about her!" It would be waste of time to dwell on this supreme folly. Mrs. Haweis, in her very noteworthy new book, "The Art of Beauty," has given some exceedingly useful diagrams, showing the effects of the practice on the internal organs and skeleton * — diagrams which I earnestly recommend to the study of ladies who may feel a "call" to perform this sort of English suttee for a *living* husband. Mrs. Haweis says that sensible men do not love wasps, and have expressed to her their "overallishness" when they behold them. Considering how effectively they have hitherto managed to display their disapproval whenever women have attempted to introduce rational attire, it is a pity, I think, that they do not "pronounce" a little more distinctly against this, literally mortal, folly.

I have already alluded to the brain-heating chignons, just gone out of fashion after a long reign of mischief; and along with them should be classed the bonnets which expose the forehead to the cold, while the back of the head is stewed under its cushion of false hair, and which have the still more serious disadvantage of affording no shelter to the eyes. To women to whom the glare of the sun is permanently hurtful to the sight, the necessity for wearing these bonnets on pain of appearing singular, or affectedly youthful, constitutes almost a valid reason against living in London. And the remedy, forsooth, is to hold up perpetually a parasol! — a yet further incumbrance to add to the care of the draggling train, so that both arms may be occupied during a whole walk, and of course all natural ease of motion rendered impossible. In this as in a dozen other silly fashions, the women who have serious concerns in life are hampered by the practice of those who think of nothing but exhibiting their persons; and ladies of limited fortune, who live in small rooms and go about the streets on foot or in cabs, are compelled (if they wish to avoid being pointed at) to adopt modes of dress whose sole *raison d'être* is that they suit wealthy *grandes dames* who lounge in their barouches or display their trains over the carpets of forty-feet-long drawing-rooms. What *snobbery* all this implies in our whole social structure! Some ten millions of women dress, as nearly as they can afford, in the style fit at the most for five thousand!

The practice of wearing *décolletée* dresses, sinning equally as it does against health and decency, seems to be gradually receding — from ordinary dinners, where it was universal twenty years ago, to special occasions, balls, and court drawing-rooms. But it dies hard, and it may kill a good many poor creatures yet, and entail on others the lifelong bad health so naturally resulting from the exposure of a large surface of the skin to sudden chills.

The thin, paper-soled boots which leave the wearer to feel the chill of the pavement or the damp of the grass wherever she may walk, mnst have shortened thousands of lives in Europe, and even more in America. Combined with these, we have now the high heels, which, in a short period, convert the foot into a shapeless deformity, no longer available for purposes of healthful exercise. An experienced shoemaker informed the writer that between the results of tight boots and high heels, he scarcely knew a lady of fifty who had *what he could call a foot at all* — they had mere clubs. And this is done, all this anguish endured, for the sake of — beauty!

Bad as stays, and chignons, and high heels, and paint, and low dresses, and all the other follies of dress are, I am, however, of opinion that the culminating folly of fashion, the one which has most widespread and durable consequences, is the mode in which for ages back women have contrived that their skirts should act as drags and swaddling clothes, weighing down their hips and obstructing the natural motion of the legs. Two hundred years ago the immortal Perrette, when she wanted to carry her milk-pail swiftly to

* Pp. 49 and 50. The preceding pages on what I conceive to be the *raisons d'être* of dress were written before I had seen this exceedingly clever, brilliant, and learned little book. While giving the authoress thanks for her most sensible reprobation of many senseless fashions, and not presuming for a moment to question her judgment in the matters of taste, on which she speaks with authority, I must here enter my humble but earnest protest against the over-importance which, I think, she is inclined to attach to the art of dress, among the pursuits of women; and (most emphatically) against her readiness to condone — if it be only committed in moderation — the offence against both truth and cleanliness of wearing false hair (see p. 173). It seems to me quite clear, that here the whole principle of honesty in attire is sacrificed. If no woman would wish it to be known that the hair on her head never grew there, but on the scalp of some poor French girl, so poor as to be bribed to part with it, or of some unkempt Russian peasant who rarely used a comb in her life, — then the wearing of that false hair is an act of *deception*, and in so far, I hold, both morally, and even æsthetically wrong. I cannot conceive why the *lamp of truth*, which we are now perpetually told must shine on our architecture and furniture, so that nothing must appear stone that is iron, and so on *ad infinitum*, should not shine equally lucidly over the dress of women. Where no deception is meant, and where the object is to supply a want, not to forge a claim to beauty — *e.g.*, in the case of artificial teeth — there is no harm involved.

market, was obliged to dress specially for the purpose.

Légère et court vêtue, elle allait à grands pas,
Ayant mis ce jour-là, pour être plus agile,
Cotillon simple et souliers plats.

From that time to this the "*cotillon simple*," — modest, graceful, and rational, — has been the rare exception, and every kind of flounce and furbelow, hoops and crinolines, panniers and trains, "tied back" costume, and *robe collante* has been successively the bane of women's lives, and the slow destroyer of their activity.

It has been often remarked that the sagacity of Romish seminarists is exhibited by their practice of compelling boys destined for the priesthood to flounder along the streets in their long gowns, and never permitting them to cast them aside or play in the close-fitting clothes wherein English lads enjoy their cricket and football. The obstruction to free action, though perhaps slight in itself, yet constantly maintained, gradually tames down the wildest spirits to the level of ecclesiastical decorum. But the lengthiest of *soutanes* is a joke compared to the multitudinous petticoats which, up to the last year or two, every lady was compelled to wear, swathing and flowing about her ankles as if she were walking through the sea. Nor is the fashion of these later days much better, when the scantier dress is "tied back" — as I am inforned — with an elastic band, much on the principle that a horse is "hobbled" in a field; and to this a tail a yard long is added, which must either be left to draggle in the mud or must occupy an arm exclusively to hold it up. In youth these skirts are bad enough, as exercising a constant check on free and healthful movement; but the moment that the elastic steps begin to give place to the lassitude of middle life, the case is desperate. There is no longer energy to overcome the impediments created by the ridiculous *spancels;* and the poor donkey of a woman hobbles daily round a shorter and shorter course till at forty or fifty she tells her friends with a sigh that she finds (she cannot imagine why) that she cannot walk at all!

Does decency require such a sacrifice as this? Does the utmost strain of feminine modesty ask for it? If it were so, I for one, should leave the matter with a sigh, as not to be remedied. But who in their senses dreams that such is the case? Who, in the age of *robes collantes* and *décolletée* dresses, can pretend that a reasonably full, simply-cut silk or cloth skirt, reaching to the ankles and *no longer*, would not fulfil immeasurably *better* than any fashion we have seen for many a day the requirements of true womanly delicacy? It is for *fashion*, not decency, that the activity of women is thus crushed, their health ruined, and (through them) the health of their children. I hold it to be an indubitable fact that if twenty years ago a rational and modest style of dress had been adopted by English women and encouraged by English men, instead of being sneered down by fops and fools, the health not only of women, but of the sons of women, *i.e.*, of the entire nation, would now be on altogether a different plane from what we find it.*

Reviewing all these deplorable follies, we may learn to make excuses for legislators who classify women with "criminals, lunatics, idiots, and minors." It needs all a woman's knowledge of the pernicious processes to which the opening minds of girls are commonly subjected,— the false and base aims in life set before thom, the perverse distribution towards them of approval and blame, admiration and neglect, and even of love and dislike, from parents, teachers, servants, brothers, and finally from the ball-room world into which they are now launched in childhood,— to enable us to make allowances for them, and retain faith that there sometimes beats a real woman's heart under the ribs of a tightly laced corset, and that a head surmounted by a pile of dead women's hair is not invariably devoid of brains.

How is the remedy for this dreary round of silly fashions ever to be attained? No woman who knows the world and how severe is the penalty of eccentricity in attire, will ever counsel her sisters to incur it for any motive short of a distinct duty. But if the hundreds of ladies who recognize the tyranny of senseless and unhealthful fashions were to combine forces to obey these fashions *just as little as may be*, to go as near the wind in

* The inquiry, How fashions originate and *with whom?* would lead us too far from the subject in hand, but some light is thrown on the way in which complicated arrangements of dress are maintained under every variation and in defiance of the true principles of taste, as well as of health and economy, by the reflection that it would never pay drapers and dressmakers that their customers should readily calculate how much stuff they require for each garment. For further criticism of the follies of female dress — the *torrid and frigid* zones of body and limbs — the "panniers" or "bustles" creating kidney disease; the skewering down of the arms by tight armholes; the veils which cause amaurosis, etc., etc. — and also for some excellent suggestions of reform, see "Dress and Health," a little book printed by Dougall & Son, Montreal, to be obtained in London for the present only by sending 1*s.* 6*d.* in stamps to B., 15, Belsize Square, N. W.

the direction of simplicity, wholesomeness, and ease in their dress as they dare, there would by degrees be formed a public opinion, rising year by year with the numbers and social standing of the representatives of common sense. It must have been in some such way that our great-grandfathers dropped their swords and bag wigs and ruffles and embroidery, and took to dressing — as even the silliest and vainest men do in these days — like rational beings.

Next to unhealthful dress, women may lay their *petite santé* at the door of their excessive addiction to pursuits giving exercise neither to the brain nor yet to the limbs. If the problem had been set to devise something, the doing of which would engage the very fewest and smallest powers of the mind or body, I know not whether we should give the prize for solving it to the inventor of knitting, netting, crochet, or worsted work. Pursued for a reasonable period in the day, these employments are no doubt quite harmless, and even perhaps, as some have urged, may be useful as sedatives. But that a woman who is driven by no dire neccssity to "stitch, stitch, stitch," who has plenty of books to read, and two legs and feet to walk withal, should voluntarily limit the exercise of her body to the little niggling motion of the fingers required by these works, and the labor of her mind to counting stitches, is all but incomprehensible. That the consequences should be sickliness and feebleness seems to follow of course. In old times the ever-revolving spinning-wheel had its full justification in its abundant usefulness, and also in the dearth of intellectual pursuits for women. But it is marvellous that a well-educated Englishwoman, not yet sinking into the natural indolence of age, should choose to spend about a fifth or fourth of the hours God has given her on this beautiful earth in embroidery or worsted work. A drawing-room crammed with these useless fads — chairs, cushions, screens, and antimacassars — is simply a mausoleum of the wasted hours of the female part of the family. Happily there is a sensible diminution in this perpetual needling, and no future Mrs. Somerville will be kept for the best hours of her girlhood "shewing" her daily seam. More intelligent and more active pursuits are multiplying, and the great philanthropist who invented lawn-tennis has done more to remedy the little health of ladies than ten thousand doctors together.

We have now glanced over a number of causes of *petite santé*, for which the sufferers themselves are more or less responsible. Let us turn to some others regarding which they are merely passive.

It is many years since in my early youth, I was struck by a singular coincidence. Several of my married acquaintances were liable to a peculiar sort of headache. They were obliged, owing to these distressing attacks, to remain very frequently in bed at breakfast-time, and later in the day to lie on the sofa with darkened blinds and a considerable exhibition of *eau-de-cologne*. A singular immunity from the seizures seemed to be enjoyed when any pleasant society was expected, or when their husbands happened to be in a different part of the country. By degrees, putting my little observations together, I came in my own mind to call these the "bad-husband headaches," and I have since seen no reason to alter my diagnosis. On the contrary, I am of opinion that an incalculable amount of feminine invalidism arises from nothing but the depressing influences of an unhappy home. Sometimes, of course, it is positive unkindness and cruelty which the poor creatures endure. Much more often it is the mere lack of the affection and care and tenderness for which they pine as sickly plants for sunshine. Sometimes it is the simple oppression of an iron will over them which bruises their pleasant fancies, and lops off their innocent whims, till there is no sap left in them to bud or blossom any more. Not seldom the misery comes of frequent storms in the household atmosphere,— for which the woman is probably as often to blame as her companion, but from which she suffers doubly, since, when they have passed, he goes out to his field or his merchandise with what spirit he can muster, poor fellow! while she sits still where the blighting words fell on her, to feel all their bitterness. Of course it is only unkind *husbands* who make women down-hearted. There are unkind people in every relation, and the only speciality of a woman's suffering from unkindness is, that she is commonly almost like a bed-ridden creature, for whom a single thorn or even a hard lump in her bed, is enough to create a soreness. To those who can get up and walk away, the importance which she attaches to the thorn or the lump seems inexplicable.

This balking of the heart is, I suppose, the worst evil in life to nine women out of ten, whether it take place after marriage in finding an uncongenial husband, or before marriage when a lover leaves them in

the lurch and causes them a "disappointment." This word, I observe, is always significantly used with reference to such events among a certain class of women, as *the* disappointment *par éminence*. When a lady fails to get her book published or her picture hung at the Academy, nobody speaks of her as having undergone a "disappointment." I have no doubt the grief of losing the lover is generally worse than these; but I wish that pride would teach every woman under such circumstances not to assume the attitude of an Ariadne, or settle down after a course of sal volatile into languor and little health till she is found at sixty, as M. About deliciously describes an English old maid, "*tant soit peu desséchée par les langueurs du célibat*." Of this kind of thing I would fain hope we might soon see the end, as well as of the actions for breach of promise, which are a disgrace to the whole womanhood of the country.

But beside heart sorrows, real and imaginary, there are other departments of women's natures wherein the balking of their activities has a deplorable effect on their physical as well as mental condition. Dr. Bridges once gave an admirable lecture at the Royal Institution, concerning the laboring and pauper class of Englishmen. He made the remark (which was received with emotion by the audience) that it was not enough to supply a human being with food and shelter. "Man," he said, "does not live by bread alone, he must have *hope*." May we not say likewise, "Woman does not live by bread alone — nay, nor by the richest *cake*"? She, too, must have hope — something to live for, something which she may look to accomplish for herself or others in God's world of work, ere her night shall fall. A Hindoo lady, lately speaking at a meeting in India, compared Mary Carpenter's beneficent existence to a river bearing fertility to many lands, while the life of a woman in the zenana, she said, resembled rather a pond. Surely every woman worthy of the name would desire to be something more than the pool, were it only a little trickling rill! But in endless cases she is *dammed up* on all sides, and none the less effectually that the soft mud of affectionate prejudice forms the dam. If her friends be rich, she is sickened with excess of luxury, but prohibited from stooping down out of the empyrean of her drawing-room to lend a finger to lift the burdens of a groaning world. If the family income be small, and the family pride proportionately great, she is required to spend her life — not in inspiriting, honorable money-*earning*, but in depressing, heart-narrowing money-*saving*. When the poor soul has borne this sort of pecuniary stay-lacing for a dozen years, and her forehead has grown narrow, and her lips pinched, and her eyes have acquired a certain anxious look (which I often fancy I recognize) as if of concern about sixpences, then, forsooth, the world laughs at her and says, "Women are so stingy!" How gladly, in a hundred cases, would that poor lady have toiled to *earn* — and not to *save* — and have been nobly generous with the proceeds of her industry!

We have heard a great deal of late of the danger to women's health of over mental strain or intellectual labor. I do not say there is never danger in this direction, that girls never study too much or too early, or that the daughters of women who have never used their brains may not have inherited rather soft and tender organs of cogitation to start with. I am no enthusiast for excessive book-learning for either women or men, though in books read and books written I have found some of the chief pleasures of a happy life. Perhaps if it were my duty to supervise the education of girls I should be rather inclined to say, like the hero of "Locksley Hall,"—

> They shall ride and they shall run,
> . . . Leap the rainbows of the brooks,
> Not with blinded eyesight poring over miserable books.

But of one thing I am sure, and that is, that for one woman whose health is injured by excessive study (that is, by *study itself*, not the baneful anxiety of examinations superadded to study), there are hundreds whose health is deteriorated by *want* of wholesome mental exercise. Sometimes the vacuity in the brains of girls simply leaves them dull and spiritless. More often into those swept and empty chambers of their skulls enter many small imps of evil omen. "The exercise of the intellectual powers," says an able lady M.D., "is the best means of preventing and counteracting an undue development of the emotional nature. The extravagances of imagination and feeling engendered in an idle brain have much to do with the ill-health of girls." Another observer, an eminent teacher, says, "I am persuaded, and my experience has been confirmed by experienced physicians, that the want of wholesome occupation lies at the root of the languid debility, of which we hear so much, after girls have left school." * And

another, the principal of one of the largest colleges for women in England, adds, "There is no doubt whatever that sound study is an eminent advantage to young women's health; provided, of course, that the general laws of health be attended to at the same time."

Let women have larger interests and nobler pursuits, and their affections will become, not less strong and deep, but less sickly, less craving for demonstrative tenderness in return, less variable in their manifestations. Let women have sounder mental culture, and their emotions — so long exclusively fostered — will return to the calmness of health, and we shall hear no more of the intermittent feverish spirits, the causeless depressions, and all the long train of symptoms which belong to Protean-formed hysteria, and open the way to madness on one side and to sin on the other.

And now, in conclusion, I must touch on a difficult part of my subject. Who is to blame for all the misery resulting from the little health of ladies?

Of course a large portion of the evil must be impartially distributed throughout society, with its false ideals of womanhood. Another portion rests on parents and teachers; and of course no inconsiderable part on the actual sufferers, who, in many cases, might find healthful aims in life, if they had the spirit to look for them, and certainly need not carry the destructive fashions of dress to the climax they reach in the red-hot race of vanity. There remains yet a share of guilt with the childish and silly men who systematically sneer down every attempt to make women something better than the dolls they play with (just as if they would be at a loss for toys, were the dolls to be transformed into rational creatures), and those others, even more cruelly selfish, who deliberately bar every door at which women knock in search of honorable employment. After all these, I find one class more.

There is no denying the power of the great medical order in these days. It occupies, with strangely close analogy, the position of the priesthood of former times, assumes the same airs of authority, claims its victims for torture (this time among the lower animals), and enters every family with a latch-key of private information, only comparable to that obtained by the confessional. If Michelet had written for England instead of for France, he should have made a book, not on "Priests, Women, and Families," but on "Doctors, Women, and Families." The influence of the family medical man on wives and mothers, and, through them, on husbands and children, is almost unbounded, and if it were ever to be exerted uniformly in any matter of physical education, there is little doubt that it would be effective.

What, then, we may reasonably ask, have these omnipotent doctors done to prevent the repetition of deadly follies in the training of girls generation after generation? Now and then we have heard feeble cautions, given in an Eli-like manner, against tight-lacing, late hours, and excitement; and a grand display of virtuous indignation was, if I remember rightly, exhibited about a year ago in a medical round-robin, against feminine dram-drinking — a vice for which the doctor's own prescriptions are in too many cases responsible. But the steadily determined pressure on mothers and young women, the insistence on free, light petticoats, soundly-shod feet, loose stays, and well-sheltered heads — when has it been exercised? An American medical lady says that at a *post-mortem* examination of several women killed by accident in Vienna, she found the internal organs of nearly all affected by tight-lacing. "Some ribs overlapped each other; one had been found to pierce the liver; and almost without exception that organ was displaced below the ribs. . . . The spleen in some cases was much enlarged, in others it was atrophied,"* and so on. Do the male doctors, who behold these and other hideous sights continually, go out to warn the mothers who encourage girls to this ghastly self-destruction, as they do denounce the poor, misguided Peculiar People and anti-vaccinators who cheat science of her dues?

At last, after the follies of luxury and fashion have gone on in a sort of *crescendo* like the descent of Vathek into the Hall of Eblis, till we seem nearly to have reached the bottom, a voice of warning is heard! It has pealed across the Atlantic, and been re-echoed on the shores of England with a cordiality of response which our men of science do not often give to American "notions." "Women, beware!" it cries. "Beware! you are on the brink of destruction! You have hitherto been engaged only in crushing your waists; now you are attempting to cultivate your minds! You have been merely dancing all night in the foul air of ball-rooms; now you are beginning to spend your mornings in study! You have been incessantly stimulating

your emotions with concerts and operas, with French plays and French novels; now you are exerting your understanding to learn Greek and solve propositions in Euclid! Beware, oh beware! Science pronounces that the woman who — *studies* — is lost!"

Perhaps there are some women, now alive, who did study a little in youth, who even spent their nights occasionally over their books while their contemporaries were running from one evening party to another — who now in middle and advanced life enjoy a vigor which it would be very well for their old companions if they could share. These women know precisely *à quoi s'en tenir* concerning these terrific denunciations.

There is another point on which it seems to me that a suspicion of blame must attach to the medical profession. We all believe that our doctors do the utmost in their power to cure *acute* diseases. When any patient has scarlet fever or small pox or bronchitis, he may be sure that his medical attendant will exert all his skill and care to pull him through. But is it equally certain that out of the twenty thousand men, or thereabouts, who are qualified to practise medicine and surgery in this kingdom, there are not a few who feel only a modified interest in the perfect recovery of chronic sufferers who represent to them an annual income of £50 or perhaps £200? A few months ago there appeared an article in one of the magazines expounding the way in which *legal* business was made to grow in hydra fashion. We have all heard similar accusations against slaters and plumbers, who mend one hole in a roof and leave another. In short, we unhesitatingly suspect almost every other trade and profession of *making work for itself*. Is it clearly proved that doctors are in this respect quite different from lawyers and other men, or that the temptation to keep a wealthy patient coddling comfortably with an occasional *placebo* for twenty years is invariably resisted? The question is not easy to answer unhesitatingly in the affirmative — "Suppose a really radical cure were discovered whereby all the neuralgic and dyspeptic and gouty patients could be made in an hour as sound as so many trivets, do we believe implicitly and *au fond du cœur* that that heaven-sent remedy would be rapturously welcomed by the whole medical profession?" Is there no truth at all in the familiar legend of the elderly lady whose physician, after many years of not unprofitable attendance, advised her to go to Bath, promising to give her a letter to the most eminent local doctor, his intimate friend, to whom he would thoroughly explain her case? The lady, armed with the introductory letter, it is said, proceeded on her way; but the curiosity of a daughter of Eve unhappily overcame her discretion. "It is only about myself after all," she said to pacify her scruples; "and once for all I will learn what dear Dr. D—— *does* think is my complaint. If I am doomed to die, it is better than this prolonged uncertainty." The seal was broken, and the lady read: "Keep the old fool for six weeks, and be sure to send her back to me at the end. Yours truly."

There are at this day in Mayfair and Belgravia, in Bayswater and South Kensington, a dozen houses in every street and square at the doors of which the doctor's carriage stops as regularly as the milkman's cart; and apparently there is just as little likelihood that either should cease to stop. If the old Chinese custom were introduced amongst us, and patients were to pay their physicians a salary *so long as they were in health*, and ceased to pay whenever they required medical attendance, I very much question whether we should see quite so many of those broughams about those doors. I cannot help fancying that if the clockmakers who undertake to wind up our domestic timepieces were to keep them in the same unsatisfactory and perpetually running-down condition as the inner machineries of these doctors' patients, we should in most cases bring our contract with the clockmaker to a close, and wind up our timepieces in future for ourselves.

But more, and in a yet more serious way, the doctors have, I conceive, failed, not only as guardians of the health of women, but as having (as a body) opposed with determined and acrimonious resistance an innovation which — *if medical science be good for anything* — they could scarcely doubt would have been of immense benefit to them.

No one is ignorant how often the most agonizing diseases to which female nature is liable follow from the neglect of early premonitory symptoms, and how often, likewise, lifelong invalidism results from disregard of the ailments of youth. It is almost equally notorious how often these deplorable catastrophes are traceable directly to the poor victim's modest shrinking from disclosing her troubles to a male adviser. When such events are spoken of with bated breath among friends, it is sometimes said that it was the sufferer's

own fault, that she *ought not* to have felt any shyness about consulting a doctor, and that it is proper for everybody to "look on a doctor as an old woman." I confess I do not understand precisely such playing fast and loose with any genuine sentiment of modesty. The members of the Royal Colleges of Physicians and Surgeons and of the Society of Apothecaries are *not* "old women." They are not even all old, nor all good men. A few months before they begin to practise — while they are in the "Bob Sawyer" stage — they are commonly supposed to be among the least steady or well-conducted of youths; and where a number of them congregate together — as in Edinburgh, for example — they are apt to obtain an unenviable notoriety for "rowdyism." I have more than once myself witnessed conduct on the part of these lads at public meetings which every man on the platform denounced as disgraceful. I could not but reflect as I watched them: "And *these* youths a year hence will be called to the bedsides of ladies to minister at hours of uttermost trial when the extremest refinement of tact and delicacy must scarce make the presence of a man endurable! Nay, they *now* attend in crowds the clinical instructions in the female wards of the hospitals, and are invited to inspect miseries of disease and horrible operations on women, who, if of humbler class, are often as sensitive and modest as the noblest lady in the land!"

The feelings of Englishwomen on all matters of delicacy are probably keener than those of the women of any other Western country, and in some particulars may possibly be now and then overstrained. But who could wish them to be changed? Who questions their almost infinite value? In every instance, except the one we are discussing, they receive from Englishmen the respect which they deserve. To propose deliberately to teach girls to set those sacred feelings aside on one point, and that point the one where they are necessarily touched immeasurably more closely than anywhere else, is simply absurd. They could not do it if they would, and they ought not to do it if they could. A girl who would willingly go to a man doctor and consult him freely about one of the many ills to which female flesh is heir, would be an odious young woman. Violence must be done to her natural instincts, either by the pressure of the mother's persuasion (who has undergone the same *peine forte et dure* before her), or else by unendurable anguish, before she will have recourse to aid which she thinks worse than disease, or even death. And so the time when health and life might be saved is lost by delay, and when the sacrifice is made at last, the doctor observes compassionately, "If you had come to me long ago I might have restored you to health, — or an operation could have been performed which might have saved your life. Now, I grieve to say, it is too late."

That the admission of qualified women to practise medicine is the proper and only effectual remedy for this evil is of course obvious to all. In opposing such admission relentlessly, as they have generally done, medical men have incurred a responsibility which to me seems nothing short of tremendous. Whatever motive we may be willing to assign to them above mere pitiful rivalry for practice and profit it is scarcely possible to suggest one which is not grossly injurious and insulting to women, or which ought for a moment to weigh in the balance against the cruel woes to which I have referred, or the just claim of all women to receive, if they prefer them, the ministrations of their own sex in their hours of suffering and weakness.

Doctors are wont to speak — apparently with profound feeling — of the sympathy they entertain for their patients, and to express their readiness (in a phrase which has passed into cant) "to sacrifice a hecatomb of brutes to relieve the smallest pain of a human being." May not women justly challenge them to sacrifice something a little nearer to themselves, — their professional pride, their trades-unionism, and a certain fraction of their practice, — to relieve their entire sex of enormous pain, mental and physical?

I rejoice to believe that the long contest draws to a close, and that, thanks to men like Mr. Stansfeld and Mr. Cowper Temple, there will soon be women doctors, and women's hospitals attended by women doctors, in every town in the kingdom. I rejoice to know that we possess already a few qualified ladies who every day, without wound to the feelings of the most sensitive, receive the full and free confidence of girls and women, and give in return counsels to which many attribute the preservation of life and health; and which — if medical science have any practical value — must afford the rising generation a better chance than ever their mothers have had of escaping the endless miseries to themselves and all belonging to them attendant on the little health of ladies.

From The Spectator.

THE DECAY OF THE MONARCHICAL PRINCIPLE.

NOTHING is more remarkable in the history of the past year than the evidence it affords of the decay of the monarchical principle in Europe. That the principle of legitimacy, of a divine right to govern inherent in the person of a legal king, has died away in the West from the minds of all but a limited class, has long been reckoned among the facts of politics. Statesmen speak of legitimists as some Scotchmen speak of Jacobites, — with a kindly regret that an old party, with some fine qualities and much poetry about it, should have passed away. No great people west of the Vistula now holds the doctrines which under James II. were once preached in England, which were professed as a religion by the courtiers of Louis XIV., and which were once supposed by Protestants, quite erroneously, to be part of the creed of all Catholic populations. There was nothing in the idea of legitimacy, as we have often observed before, repulsive to the human mind, or in any way inherently absurd. Millions believe that the distribution of the "means of grace" has been confided by Providence to a limited caste, renewed by incessant co-optation, and there is no impossibility in a similar delegation of the right to rule. If God built the throne of a founder, he might also endow the founder's children with a preferential claim to govern; and if he suffers calamities to occur bringing misery upon nations, he may also, for some unseen end, suffer bad kings to rule them. Nevertheless, as the multitude grew in knowledge and self-consciousness the faith in divine right died away, until it would be hard to find a million of men in Europe outside Russia who would make any sacrifice even of money to preserve it in its purity. A few nobles, a few scores of thousands of Bretons, Basques, Brandenburghers, and Bavarians, and we have the entire congregation of that ancient cult. The faith, however, in another and less reasonable idea, — the moral claim of hereditary monarchy above all other systems of government, was still supposed to be intact. The royal caste, it was imagined, held it strongly. Most prominent statesmen were, for one reason or another, believed to be devoted to it. The masses had been accustomed to it for ages, were, in fact, in all countries outside Switzerland, less than ten years ago, universally acquiescent in it. It was believed to enjoy the favor of all established Churches, to be held essential by all armies, to be the most jealously guarded dogma of all conservative parties. When a rebellion occurred anywhere, society divided itself into monarchists and republicans, and the monarchists were usually, in all but numbers, decidedly the stronger. If the State were small, "Europe" usually settled that it must have a king, and diplomatists only quarrelled as to who the king and the king's wife should be. The establishment of a republic or the elevation of a mere statesman to the kingship was never seriously discussed. The outbreaks of the Communists in Paris and Carthagena were assumed to have settled the question, and the establishment of a republic anywhere would have been regarded as a menace to order throughout the European world.

Nevertheless the year has been marked by a bitter struggle, conducted in public in the most visible and interesting of all countries, between monarchy and republicanism, and the entire West, from its kings downwards through all classes of society, has been upon the whole hostile to the monarchical solution. In Germany, the last home of the old loyalty, where princes are still powers, and society is cloven in twain by the line of birth, and the army maintains the monarchical idea as a sacred principle, none but Ultramontane voices were raised for the authors of the 16th of May. In France itself, where all rural persons were supposed to be monarchists, a grand majority of the peasantry pronounced for the republic. In England, where society is still not only conservative, but semi-feudal in organization and ideas, not an audible voice was raised for the reactionaries, and the regular organs of conservatism condemned them unreservedly. In Austria, the court and aristocracy rejected the monarchy unless entrusted to the legitimate prince, while the people did not give even sympathy to the cause. In Italy, king, statesmen, and multitude were alike profoundly hostile to the monarchists, and even in Russia the monarchical side met with no effective sympathy. The unanimity of the Continent was amazing, and in spite of many deductions to be made, indicates a profound change in public feeling. It may be alleged, and alleged truly, that each country had a reason for distrusting a French monarchy, apart from its sympathy with especial institutions. Germany expected war, Italy feared the loss of Rome, England hated the Ultramontanes, Austria dreaded change, while the East

was in commotion, France was irritated by disturbance, and even Russia had no wish for the task of recementing her alliances. All these motives were in operation, but twenty years ago none of them would have so completely governed the royal caste, or have so overriden aristocratic feeling, or have so dominated and extinguished party divisions. It may be argued that conservatism, finding the republic in existence, held on conservative principles that it ought to continue to exist; and that is no doubt the fact, but then what a change of sentiment is revealed in that proposition! Religions do not become false to their devotees because they are momentarily suppressed. The republic in France is scarce seven years old, it has been threatened throughout its duration, and it is even now believed by thoughtful observers to be not beyond attack. If a rickety existence of seven years can consecrate a republic in conservative minds, the horror of republicanism cannot be very deep, and the reverence for kingship must be very slight, and have been changed from a faith into a reasoning opinion, held as other political opinions are held, mainly from a conviction of its expediency. And it is extremely difficult to doubt that this is the case, that the old faith has died away, and has been replaced by a theory that the form of government matters little, provided that social order and the security of property are reasonably well secured, and the political ostracism of any class entirely forbidden. That is the idea which is dominating conservatives, although, of course, great sections of them are unaware that they have advanced so far beyond their ancient landmarks, and the change may yet prove one of the greatest which ever occurred in general political thought. Without exaggerating its importance, and without forgetting for a moment the share which local and temporary influences have had in the alteration, this much at least may be stated with great confidence, — the *solidarité* of the monarchists of Europe can no longer be relied on, while the *solidarité* of the republicans can.

We do not know that this change will in any immediate way menace the stability of the remaining thrones of Europe. We rather think that it will not. A certain indifference to forms of government is, on the whole, rather favorable to the form which exists, which is endurable, and which, by the necessity of the case, ceases to persecute. Republicanism becomes much less hot when republicans are treated as reasonable beings, rather too viewy, but not very dangerous to the good order or durability of society. The mere feeling that a monarchy, if too troublesome, might be made to pass away, takes away much of that bitterness arising from a sense of outraged human dignity which everywhere on the Continent, and among particular classes in England, is a main factor of republican opinion. A good deal of republican sentiment exhales under free discussion, while the growth of material interests tends more and more to check the desire for change. A disposition to watch, too, a great experiment in action springs up unconsciously, and there are evils in republics which, when watched, tend to disenchant minds with great influence on the multitude. Unless we are greatly mistaken, the drawback of republicanism will be a certain sordidness, a want of elevation, an absence of self-sacrifice, and institutions in which those defects are patent do not greatly attract. The arming of the ignorant, too, which is the special feature of the modern system of war, may for a time prove greatly in favor of all visible, long-continued, and customary figures. But that the change, though it may not overthrow the monarchies, will profoundly modify them, we cannot doubt. The heavier atmosphere in which they will move will restrain the kings. Already they see the necessity of being popular. Already they listen carefully for the opinion of the numerical majority. Already they tend to accept, not, indeed, constitutionalism in the English sense, which demands a self-effacement too severe for men so varied, but towards constitutional modes of action, the discovery of ministers acceptable to both king and country, the management rather than the defiance of parliaments, the relinquishment in a final sort of way of the control of the national purse. There is not only no royal financier left in the world, but we look round in vain for a man of the caste who assumes to be one. A genuine conviction that their peoples must manage that matter and do manage it better than they can — that the popular instrument is stronger for the extraction of taxes than the royal instrument — has mastered the minds of the caste, and is producing great effects. With this disposition is coming a new fearlessness. Everywhere political riot is stopped with less severity than it was. Everywhere opposition is treated more as erroneous than as wicked action. The kings, in fact, are becoming more statesmanlike, more cau-

tious, more like presidents whose reserved rights it is convenient to keep well out of sight. The total effect of all this is to reduce individualism, to make kings pivots of councils rather than monarchs of the old type, and therefore to make monarchies more restful, more considerate, and less wilful in their modes of action, a process heightened greatly by another change. No unrestrained small monarch can be said to survive. The four little independent kings of Sweden, Holland, Belgium, and Greece are all fettered by their subjects, and the big monarchs are heavily weighted both by the change in feeling of which we have spoken, and which they must perceive, and by the endless consequences which follow their every action. A modern king can hardly be a man of levity, and in his new considerateness, his perception that he is not inevitable, his conviction that he must take trouble and not merely *be*, is a great addition to popular security. The king is still in many countries a great factor in affairs, but he no longer feels himself the head of a party; he no longer believes in divine right, and he no longer thinks that republicanism is as the sin of witchcraft, to be stamped out. That is a great change, for the monarchies, as well as for the people who live under them.

From The Saturday Review.

FRENCH DINNERS.

FRENCH cooks have deserved well of their fellow-men; but it must be added that they have not a little tried the patience of those who have admired their many good qualities. Careful, inventive, and wonderfully hard-working in their own calling, they have certainly signalized themselves when they strayed from it, and attempted to write anything beyond recipes, by such silly extravagance as almost to justify the not uncommon opinion that of all vanities that of the gastronome is the most foolish. Such a belief would not be without much apparent reason if cooks were judged by what some of the most skilful among them have written. Ude, for instance, modestly places his calling above painting, which he classes with music, dancing, fencing, and "mechanics in general," with the breadth of statement natural to one who looks down on these pursuits from so lofty a height. Carême, who signed himself "Carême de Paris," as though he were something between a prince of the blood and the executioner, spoke thus of his work among the pots and pans: "*L'amour de la science me mène sans cesse à de nouvelles méditations, et toutes sont relatives au développement de son progrès;*" and a writer of our own time, undoubtedly one of the first cooks of the day, and admirable for the clearness of his recipes, is so anxious that the products of his art may be appreciated that he tells us how properly to sit at table. "*Pour manger avec aisance et sans raideur,*" he says, "*il faut être assis d'aplomb, très à l'aise et ni trop haut ni trop bas; le buste à égale distance du dossier de la chaise et de la table.*" Many other instances of flights calculated, to make the profane laugh might easily be found; but perhaps the *chefs* have given still more occasion for disrespectful wonder by the marvellous names which they have loved to bestow on their dishes. M. Gouffé, with his usual good sense, protests against these ridiculous appellations, and lays down the simple and obvious rule that the name of a dish ought, as much as possible, to indicate its component parts; but he stands alone; and, generally speaking, his brethren take the greatest pleasure in high-sounding titles which, when applied to food, are utterly unmeaning. "I defy anybody to know what these cooks mean by their jargon," said Mr. Thackeray; and most people who have studied *menus* will agree with him. But in justice to the cooks it should be added that they are not altogether responsible for these senseless terms, their patrons, who ought to have known better, having taken pleasure in encouraging this form of absurdity. Towards high-flown writing, too, these latter have stimulated the heads of the kitchen, their own grandiloquence having been sometimes even greater. When the reader of old gastronomic books comes across such a sentence as that of the Marquis de Cussy, who says of roasting, "*Rôtir est tout à la fois rien et l'immensité,*" he is apt, like Lord Ellenborough when listening to a silly peer, to think that he is responsible for his time, and that he will be able to give but a sorry account of it if he devotes any further attention to such nonsense.

Strangely enough, the most foolish thing connected with French cookery is what the Englishman appears most to prize. For him apparently the absurd names which French cooks have given to food have had the greatest charm. Few indeed are the dinner-givers in London who are

Digitized by CORNELL UNIVERSITY Original from CORNELL UNIVERSITY

bold enough to describe in English the dishes they offer to their friends. Even a public dining-place has a French bill of fare, and is often called a restaurant, so that, oddly enough, an English eating-house is now known by a name which originally meant a French soup. There is not, after all, much reason for thus borrowing a foreign jargon, as many of the dishes of the French kitchen can be easily designated in English. What makes it the more singular that people in this country should take pleasure in reproducing the absurdities of half-educated foreigners is that, notwithstanding the use of French names for food which is thought good enough to offer to friends, or considered likely to be attractive, it may well be doubted whether the majority of Englishmen care much more for French cookery than their untravelled forefathers did. It seems to be commonly thought by female novelists and others equally well informed that the young bachelor of the present day dines at his club off the cunningly devised dishes of a French *chef;* but men who frequent clubs know perfectly well that, though elaborate preparations are served in the strangers' room for the benefit of guests, the majority of dinners in the coffee-room are very plain ones. When men order what they really like, and not what they think it incumbent on them to offer to their friends, they seem, in nine cases out of ten, to prefer the old-fashioned English dinner or something very like it. People, when they return from abroad, sometimes talk of their feasts at Paris restaurants; but a man who spends much time in that city will generally find that his countrymen appear to enjoy themselves very sadly at these places, where outspoken people may not unfrequently be heard to express their desire for something plainer and more substantial than what is offered them. The fact is that, as a rule, an Englishman only moderately likes a French dinner, owing partly to certain peculiarities of taste, and partly to an inveterate and utterly erroneous prejudice which, in spite of his occasional affectation of a liking for French cookery, still influences him strongly, even in these days of much travel. To the men of former generations it seemed a throwing away of the blessings of Providence to waste an appetite on the "pretty little tiny kickshaws" which, as they imagined, were all that a French cook had to offer them. Such trifles might suit men whose digestions were ruined; but it was absurd to put before those who still knew what it was to feel a healthy hunger at dinner-time delicate little flummery, such as fillets of chicken or the like. Solid food was required by the robust appetites of Englishmen; and they naturally preferred to attack good fish and good meat, and not to dally with elaborately-composed little dishes. Hence that liking for the plain English dinner, offering substantial food at the outset, which most Englishmen now really feel, though fashion obliges them when they invite their friends to offer them what is supposed to be an imitation of a French dinner, and sometimes actually is so in part.

In part be it observed; for it is a very curious fact in connection with this commonplace but important matter, that people in England have copied French cookery and French arrangements for their feasts, except just in that particular where the French system was essentially adapted to English tastes. There it has been changed, and changed to the exact opposite of what most men in this country like. The old-fashioned Englishman grumbles at the silly little messes which are offered to him when he is hungry. What he desires is solid food, and, if not as openly contemptuous as his ancestors, he nevertheless despises the arts of the French cooks nearly as much. Strange to say, if he would take the trouble to inquire into the matter, he would find that these very French cooks precisely agree with him on this point, and that the brilliant arrangement by which light dishes are offered to a man while his appetite is vigorous, and heavy ones when it is well nigh satisfied, is a product of our insular genius, and, like some other startling contrivances, is peculiar to this side of the Channel. The French masters of the art understood their calling a great deal too well to be guilty of such an absurdity. As has been said, they often gave preposterous names to their dishes, and their efforts at writing were sometimes silly in the extreme; but they were not at all silly when they kept within the proper lines of their vocation. Their business was to satisfy the appetite in the most pleasing way, and in doing this they showed not only great inventiveness and skill, but also considerable intelligence. Besides the immense attention which they gave to making food nice, they carefully considered the order in which the different kinds of food should be taken; and the conclusion they came to on this latter point was, it may be fairly said, the only one consistent with good sense. It was that at the beginning of dinner, when

the appetite was vigorous, the more solid kinds of food should be offered, and that afterwards, when hunger was partly satisfied, the lighter dishes should follow. That this has long been the rule of the French kitchen can be discovered by any one who cares to refer to the records of feasts which the principal French cooks have left behind them. Or, if this is too much trouble, it is only necessary to turn to Brillat Savarin, who lays down as a dogma that "*l'ordre des comestibles est des plus substantiels aux plus légers.*" The rule thus tersely expressed has long been followed by French cooks, but it has first been clearly explained in English by the author of that extremely amusing work, Kettner's "Book of the Table," who gives two *menus* composed by Carême, in each of which soup is followed by a substantial piece of beef, the fish appearing in one case as an *entrée*, and in the other at the beginning of the second course. According to the arrangement which has for a considerable time been adopted in France, the more solid food, consisting of the larger kinds of fish and of big pieces of meat, comes after the soup, the fish usually being first; but this has not been by any means the unvarying practice. Thus in a great dinner cooked by Carême in 1815, soup was followed by sirloin of beef and veal, and in six out of the ten selected *menus* of that famous cook given in "*Les Classiques de la Table*" the soup is followed by meat. Generally speaking, however, the practice in France has been to serve some large fish after the soup, and then to give what in England would be called the joint.

It will be seen, then, that the French *chef* and the old-fashioned Englishman are really at one on the most essential point in the arrangement of a dinner, both thinking that the most substantial food should be served first, while the appetite is keen. In many matters the tastes of Frenchmen and Englishmen differ greatly, as need hardly be said. The former likes his *relevé* somewhat elaborately prepared, and accompanied by sauce, and he attaches great importance to the *entrées* which follow it; while the Englishman prefers his joint simply roasted, and does not, as a rule, care much about the *entrées* unless tempted by exceptionally good cooking. There are other differences innumerable, but on the main point connected with the satisfaction of hunger the French cook who follows the traditions of his predecessors, and the Englishman who is not ashamed of saying what he really likes, are agreed; and if it were possible to hope that good sense would ever prevail in this country against the dull despotism of fashion, the givers of feasts might be entreated, since they apparently wish to model their dinners on those of the French, to follow French precepts on the point where they are most clearly dictated by good sense, and to give the *grosse pièce*, or *pièce de résistance*, or *relevé*, whichever they may like to call it, at the beginning of dinner, and not when a great part of dinner is over, and all but youthful appetites are beginning to flag. Then indeed the conservative who loudly avows that he likes nothing so much as a good haunch of mutton, and the man of culture who is learned as to the "fundamental sauces" and their infinite combinations, might join hands and dine together in all peace, amity, and good-will.

How it came about that, while French dinners have been so much copied in England, the principal dish has been put in the wrong place, in opposition to the rules which would be laid down alike by the gastronome and the physician, seems at first not an easy matter to understand; but perhaps a guess as to the cause of this curious blunder may be allowed. When Englishmen first became desirous of following the French arrangement, they probably were somewhat puzzled as to where to put the joint — a thing altogether sacred in their eyes, and to be dispensed with under no circumstances whatever. Of what was meant by *relevé* the dinner-giver had no very clear idea; but he saw in French *menus* the word *rôt*, which he knew meant roast, and he concluded that the proper place in a feast for the huge English joint was that which the French gave to the *rôt*. As need hardly be said, the word was not meant to describe such massive fare, being intended for lighter kinds of food, and applying principally to game; but the Englishman had found a place for that which he dearly loved, and he has insisted on keeping it there with national tenacity. It would be hard to persuade him that he has been mistaken, but probably to an over-literal translation of a technical word is due the practice peculiar to English dinners, of serving great pieces of beef or mutton at a time when they cannot by any possibility be wanted.

From The Spectator.

SHORT-SIGHT.

[TO THE EDITOR OF THE SPECTATOR.]

SIR,— As the question mooted in one of your recent annotations is certain, under our present system of compulsory education, to become one of national importance, I trust you will allow me to make a few observations upon "short-sight," a defect which I am in the constant habit of treating, and which has long engaged my attention.

Short-sightedness depends upon an elongation of the globe of the eye from before backwards, and it is moulded in this faulty form in the following way. When children or young adults are engaged many hours daily in close work with bad light or imperfect type, the eye is constantly strained in the effort to see, the internal blood-vessels become seriously congested, and in time exude a portion of their more fluid contents; the outer coat of the ball, tender and dilatable in youth, gives way at its weakest spot posteriorly. The contents of the globe are permanently increased, and the eyeball, instead of a sphere, comes in time to resemble an egg in form; being thus unduly elongated, the rays of light which proceed from distant objects are brought to a focus in front of the retina instead of upon it, and in order to focus them on the proper spot, it is necessary to cause them to diverge before striking the eyeball by the interposition of a concave lens.

I cannot understand how it can be doubted that "trying the eyes," strain, or excessive effort is the cause of this singular affection. Dr. Cohn, of Breslau, examined ten thousand children, and demonstrated that the defect increased progressively in the gradual ascent of the pupils from the elementary to the upper schools,— that is, the more they worked the worse did the defect become.

Clearly nature never intended that we should spend the most considerable portion of our waking moments in persistently staring at small black dots spread out upon a sheet of paper; and the more imperfect the dots and the worse the paper, the more certain she is to punish this infringement of her laws. No one who has read a pocket edition of Schiller, ordinary German small type, or the New York newspapers, can have any difficulty in understanding why so many of our German and American friends should injure their eyes in the attempt to decipher type that is almost illegible.

As to treatment, common sense would dictate that we should remove the cause. I believe Mr. Dana, who was recently proposed as American minister to this country, was threatened in youth with a similar defect, and cured himself by abandoning all literary occupation, and spending two years before the mast. Professor Arlt also tells us of two German medical students, brothers, in whom the affection was developed by close application. One abandoned study for general practice, and retains excellent sight; the other persevered in spite of all warning, and attained great eminence as a teacher, but with the ultimate loss of vision.

For those who cannot intermit their occupation, give up a career, or altogether abandon the path to distinction on account of failing vision, we are obliged to stop the progress of the malady as best we may, by insisting upon the use of concave glasses for reading, so as to relieve the strain, which is greatly dependent upon the too near approach of the object to the eye, directing the patient to work only in good light, which should come from above and behind, and to avoid all attempts at study in the recumbent position, while leaning forward, or when travelling in a railway or other carriage. The medical treatment, which is undoubtedly important, cannot be alluded to here; but considering that this acquired peculiarity is most certainly transmitted by hereditary descent, and that short-sight incapacitates for military and naval service, as well as many other important occupations, it would be well that our school boards should ordain that school-fittings should be such as to secure the objects indicated above; that seats and desks shall not be too low for the stature of the pupils, or too far apart, so as to compel them to lean forward when at work; that the light shall be good, and above all, that the pupils shall not be overtasked. Nothing they can learn can compensate for a grave physical defect which they are liable to transmit to their children and children's children; and we must always bear in mind that the eyeball, which is growing up to twenty years of age, cannot be properly developed unless it is fairly trained out of doors, for distant objects as well as for those which can only be seen a few inches off. I am, sir, etc.,

VIII. MILK SUPPLY, ... *Pall Mall Gazette*, ... 383

POETRY.

A PICTURE, ... 322
SONG OF ARRAN, ... 322
A POET'S PROEM, ... 322
WHITTIER, ... 322

PUBLISHED EVERY SATURDAY BY
LITTELL & GAY, BOSTON.

TERMS OF SUBSCRIPTION.

For EIGHT DOLLARS, *remitted directly to the Publishers*, the LIVING AGE will be punctually forwarded for a year, *free of postage*.

An extra copy of THE LIVING AGE is sent gratis to any one getting up a club of Five New Subscribers.

Remittances should be made by bank draft or check, or by post-office money-order, if possible. If neither of these can be procured, the money should be sent in a registered letter. All postmasters are obliged to register letters when requested to do so. Drafts, checks and money-orders should be made payable to the order of LITTELL & GAY.

Single Numbers of THE LIVING AGE, 18 cents.

A PICTURE.

ONE picture fair within my heart I carry,
Unshadowed by the weary weight of years;
And often, as amid strange scenes I tarry,
A vision of my early youth appears.

The houses clustered on the water's border,
Clear imaged in the softly flowing stream;
The trees beyond it, set in gracious order,
The bridge, the road — delicious is the dream!

Each nook recalls fond thoughts, and memories soften
My heart to those that still by them abide;
I think of those that wandered with me often —
Of those who now in earth lie side by side.

Long years have rolled, and other children gladly
Rove in the woods and by the waterside;
And some who walked with me may eye them sadly,
And think of other days, whose light has died.

And yet it lives, and sheds a wondrous sweetness
Around the ways, else darkly shaded all;
Making the heart, preparèd in all meetness,
Like "darkened chamber," * when the bright rays fall:

A home of beauty, where the past is cherished,
Each common thing made radiant in the light;
No gleam of love or beauty that has perished,
But here, relimned, is clear to inward sight.

W. P. BLACKMORE.

* "The heart is the true *camera obscura*, in the lowliest making pictures that can never be painted." — SCHMIDT.

Good Words.

A SONG OF ARRAN.

O FOR the Arran breezes!
O for the sunny glow!
O for the glens and mountains!
Of just ten years ago.
I see it all in fancy,
As I lie with half-shut eyes,
And fairer still in dreamland,
When slumber o'er me lies.

Where are the happy voices
That gladden'd all the day,
And rose in songs at evening
From boats across the bay?
Where is the fading splendor,
That linger'd, like a smile,
Upon the peaks of Goatfell,
And on the Holy Isle?

Not in my heart is envy
That youth returns once more
In other forms and voices
Than those I loved of yore;
Yet all my heart is craving
For pleasures that are fled,
For voices of the distant,
And voices of the dead.

The mist comes down on Arran,
Rich in its purple dies;
I see that mist no longer,
A mist is o'er my eyes.
O for the Arran breezes!
O for the sunny glow!
O for the loves and friendships!
Of just ten years ago.

Good Words. D. BROWN.

A POET'S PROEM.

IF on the great world's wide and shifting sand
I scrawl my meagre alphabet of song,
What profit have I, think you? Not for long
The pride of its enduring. Time's rough hand
Sweeps all of shadowy fabric from the strand.
So children work upon the tideless shore,
So poets build their pomp. The fresh tides roar,
And desolate the glory each had planned.
Then whereof comes requital? Here and there
Our life's horizon clouds with new regrets;
Our palaces dissolve in thinnest air,
Shiver to dust our loftiest minarets.
Yet, childlike, work we ever on the shore, —
Reap joy in building, and expect no more!

Spectator. W. W.

WHITTIER.

WHEN twilight falls upon our laboring town,
And grateful bells of evening echo far;
When shadows lengthen and grow deeper brown,
And heaven uncurtaineth her earliest star;
While night delays, and sunset's tempered glow
Warms the still landscape with its level ray,
Till the soft light seems ling'ring, loth to go
From that calm Indian summer of the day:
Kindling the edge of some Hesperian sky,
The sweet dawn breaks as our late sun descends,
And, marked alone by the All-Seeing Eye,
Morning with eve in solemn beauty blends:
Thus, time-touched bard, shall sunset prove to thee
The unfading morn of immortality.

CHARLES NOBLE GREGORY.

Dec. 17, 1877.

From The Fortnightly Review.

THE DUTCH IN JAVA.

BY SIR DAVID WEDDERBURN.

THE magnificent archipelago which Holland claims as her Indian empire, and which a Dutch author has described as "a girdle of emeralds strung along the equator," deserves to attract greater attention than it has hitherto done in Europe, more especially in England. It is indeed difficult to obtain books treating of Netherlands India in any language except Dutch, and although Sir Stamford Raffles's work on Java is now somewhat out of date, it is still by far the best available source of information for Englishmen desirous of knowing something about this island, the brightest "emerald of the equator." The work entitled "How to Manage a Colony," by Mr. Money, contains much that is interesting and important about the system of government in Netherlands India, but considerable changes have taken place since Mr. Money visited Java, and his description of the Dutch colonial system is rather that of an advocate than of an impartial critic. He contrasts Dutch rule in Java with British rule in Hindostan, and appears determined to prove that in all essential respects the latter should take an example from the former. On the other hand, such stories as "*Félix Batel, ou la Hollande en Java*," and "*Max Havelaar*," which has been translated into English, are (in the form of a novel or a biography) severe indictments against the entire political system of the Hollanders in the East. How far the publication of such books may have assisted in bringing about the reforms recently introduced into Dutch colonial policy it is not easy to say; it is probable that "*Max Havelaar*," which attracted great attention in the Netherlands, produced considerable benefit in opening the eyes of the public to the evils liable to be fostered under a system of monopoly and secrecy. The story has a distinct appearance of truth and reality, but it is evidently written by one smarting under a sense of personal injury, and little disposed to do justice to those authorities by whom he conceives himself to have been very unjustly treated. The Comte de Beauvoir's account of his travels in Java was the subject of review in a leading Dutch newspaper while I was in that country, and was somewhat severely criticised as exaggerated and misleading. When allowance has been made for youthful enthusiasm in the author, and for his inexperience as a traveller, it seems to me that M. de Beauvoir's descriptions of Java, its scenery and its people, are remarkably graphic and true to nature, although the language may be sometimes a little highflown. Besides Mr. A. R. Wallace's "Malay Archipelago," one or two treatises on the antiquities of Java, and a few colonial bluebooks of the Dutch States-General, no other literary sources of information are available to a foreigner in Batavia. On the other hand, nothing can exceed the friendly courtesy with which information upon any subject is communicated to an inquiring stranger by the Dutch officials and other European residents. Nearly all these gentlemen speak English or French, or both languages, with perfect facility, so that a knowledge of Dutch is almost unnecessary to a visitor, except in order to read the journals. The dialects of Netherlands India are numerous, those spoken in the west, centre, and east of the island of Java being respectively Sundanese, Javanese, and Madurese; but the common mode of communication between Europeans and natives is the Malay language, which plays here the same part as Hindustani throughout the British empire in continental India. Java and Hindostan present many striking contrasts in scenery, in institutions, in manners and customs, these contrasts being due mainly to the great difference in their physical conditions. The glorious fertility of Sunda, with its forest-clad volcanoes, its rushing rivers, and broad green valleys, could certainly not be produced on the arid plains of the famine-stricken Deccan by any amount of energy and wisdom on the part of the government. In order to make a fair comparison between British and Dutch rule in Asia we must pass over from continental India to the island of Ceylon, which in climate, scenery, and products is merely Java on a smaller scale. Java lies

a few degrees south of the equator, Ceylon about as far to the north; in neither island does the temperature vary much throughout the year; in both the rainfull is very copious, especially on the western coasts; but the seasons are reversed, the rains terminating in one island just when they commence in the other. Java and Ceylon were both taken by the British from the Dutch; Java was restored, while Ceylon was retained; both islands are financially prosperous, and both owe their prosperity in a great measure to coffee; but Java has progressed far more rapidly than Ceylon has done under similar natural conditions, and it seems fair to give some credit for this to political administration. The superficial area of Ceylon is just three-quarters of that of Ireland, and nearly one-half that of Java, but the population of Java was in 1871 just seven times that of Ceylon, having increased with steady rapidity since 1816, when it had nearly the same density of population as Ceylon has at present. In Ceylon great tracts of fertile land have relapsed into jungle, tanks constructed under former dynasties have fallen into ruins, large imports of rice are necessary to feed the scanty population, many of whom are not permanent residents, but emigrants from the mainland, working as coolies on the coffee plantations. Java, although three or four times as densely peopled, is able to export rice, the staple food of the inhabitants, as well as the coffee, sugar, indigo, and tobacco from which its European masters derive their wealth. In estimating the merits and demerits of the so-called "culture system" of Java, this comparison with Ceylon is not without significance, nor is it to the disadvantage of the former island.

Englishmen are disposed to believe that no other race except their own understands the management of colonies or the administration of a subject country, and in support of this belief they contrast their own colossal empire with the fragments now alone remaining to those nations who were once their rivals in maritime and colonial enterprise. The truth appears to be that our colonial success is due mainly to our maritime supremacy, which has gradually given us possession of all the most desirable territory, either by conquest or colonization, while other nations are obliged to content themselves with what has been left. In the Eastern seas the flags of France, Spain, and Portugal are still kept flying over possessions, the intrinsic value of which to the mother country is comparatively small, and which attract little attention or interest in the outside world. But the possessions of the Dutch in these seas are on a very different scale. Twice in their short history that indomitable people have established a colonial empire: the first was due to their maritime power, and passed into the hands of the English, their successful maritime rivals; while the existing Netherlands India has been created within the last sixty years, almost unnoticed by the great powers of Europe, among which Holland once held so proud a place. By far the most important and valuable part of Netherlands India is Java (of which the small adjacent island of Madura, incorporated with it for all administrative purposes, may be regarded as a portion), slightly exceeding in superficial area England without Wales, and containing at the last census a population of nearly eighteen millions, four time as great as it had in 1816, when it was restored by the British to the Netherlanders. Many persons regard the surrender of this magnificent island as a piece of reckless folly or quixotic generosity, but it was truly nothing more than an act of simple justice, and one which Englishmen may remember with unmixed satisfaction. We then restored to Holland, our ally at Waterloo, a colony which had formerly been hers, and which we had recovered from the common foe. While the French armies overran the Netherlands, the British fleets took possession of the Dutch colonies in Asia, Africa, and America, until it could be said that the Dutch flag remained flying nowhere on the globe, save over the factory of Desima in Japan. But the restoration of Java provided the nucleus of a new colonial empire, which has since spread gradually over the whole Malay archipelago, and although the outlying possessions are now governed as mere dependencies of

Java, and are still comparatively unproductive, their vast extent and great mineral resources must eventually give them a very high value and importance.

The term "Dutch," used in England to denote Hollanders and in America to denote Germans, is not applied by the Hollanders to themselves, their proper designation being "Netherlanders." Isolated in Europe by the fact that their language is spoken by a few millions only, and is little known beyond their own limits, the Netherlanders carry political modesty to excess, and are only too ready to efface themselves, and to take rank as a small nation, almost apologetic for their great Oriental empire. But the modern Batavians possess certain imperial characteristics in common with the two chief nations of conquerors and administrators, the Romans and English; in particular they practice towards the religion of their subjects a policy of complete toleration, thereby obviating what is perhaps the most serious difficulty in governing alien races. Wherever the Portuguese landed in the East they at once proceeded to build a church; when the Dutch came they established a factory. The Portuguese churches are now picturesque ruins overgrown with tropical vegetation; but the Dutch factories, like those of our own East India Company, have developed into an empire. When the Hollanders wrested from the Portuguese the command of the Eastern seas, they substituted for the Holy Inquisition and Jesuit propaganda a system of complete religious impartiality, from which they have reaped no small advantage — originally as mere traders, subsequently as rulers of a powerful State. It is true that a hard and fast line is drawn between Europeans (and persons assimilated with them) on one side and Asiatics on the other. It may be said generally that the profession of Christianity is sufficient to acquire for any one European privileges (with exemption from native jurisdiction), which are thus enjoyed even by persons of African blood.

At first sight this may appear inconsistent with the principles of religious liberty and equality, for which Netherlanders, in the course of their history, have done and suffered so much. It is, however, a necessary result of carrying those principles into practice where law and religion are so completely intertwined as they are in the East, especially in Mussulman communities. In Java a vast majority of the inhabitants are subject to Mahometan law, of which the priest is the chief interpreter, founded as it is upon the Koran. If a Christian is to enjoy religious equality, it is clear that he must be withdrawn from the jurisdiction of the Mahometan tribunals, and this, accordingly, has been done. No privileged religion is recognized in Netherlands India; but so far as possible the free exercise of peculiar laws and customs is vindicated on behalf of every religious sect. The population is therefore divided into two classes, very unequal in numbers: (1) Europeans, including other Christians, and numbering only a few thousands — these are subject to European jurisdiction only; (2) inlanders or natives, including all Mussulmans and heathens, such as Buddhists or Hindoos, and numbering more than twenty-four millions. This division of the population into two classes is enacted in the code specifying the constitution of Netherlands India; it cannot, therefore, be altered except by the legislative authority of the king and States-General of the Netherlands.

In Dutch India the principle of governing with the aid of native co-operation is carried out with respect to all the Asiatic races; and in this matter the British Indian authorities might learn a useful lesson. As regards the Mussulman people of Java proper, the conquerors have been able to utilize the machinery of government which they found in operation on taking possession. All the other Asiatic races, who are found chiefly in the cities of the seacoast, are subordinated to their own recognized chiefs, and these are responsible to government for the maintenance of order. The Chinese officers bear the titles of major, captain, or lieutenant; they are usually men of wealth and position, exercising personal influence over their countrymen, and are treated with marked consideration by the Euro-

Original from CORNELL UNIVERSITY

pean authorities. The Arabs also have their captains and lieutenants, and there are official chiefs of the Malays, the Buginese, the Bengalis, and the Moormen, these last being Mussulmans from continental India.

Vaccination appears to work successfully in Java, as persons marked with small-pox are rarely seen, and nearly a million are annually vaccinated or re-vaccinated in the island. Now it is precisely in carrying out schemes conducive to the health and comfort of the people, but contrary to their prejudices, such as vaccination, that valuable assistance may be expected from men who understand the people, and combine social influence with official prestige, as do these native chiefs.

Besides all those named, a new race is gradually arising — the offspring of Chinese fathers and Javanese mothers; these half-castes are superior in appearance to either parent, and bear a certain resemblance to the people of Japan.

In the minds of the Hollanders the name of "India" does not denote Hindostan especially, but includes also the whole of the great Malay archipelago; and they are always careful to use the terms "British" or "Continental" India when they wish to distinguish our dominions from their own insular empire, to which has been given the appropriate name of "Insulinde" (Island India). When comparisons are drawn between the modes of administration in British and Netherlands India, there is displayed on either side a certain disposition to believe that things are better managed beyond seas; but the knowledge possessed by individuals of the administrative systems in both countries is seldom sufficient for the formation of a correct judgment upon their relative merits and defects. If the government of British India were to follow the example of the Dutch, and to send a few selected civilians to study minutely on the spot the working of the rival systems, as regards the collection of the revenues, the employment of natives in the public service, the construction of public works, etc., it would be found that we have quite as much to learn as to teach in the management of a great Asiatic dependency.

There are in the world only two States which are constitutional at home and imperial abroad; and those two are Great Britain and the Netherlands. The spectacle of a free European nation ruling with beneficent despotism over a subject Asiatic population, nearly seven times as numerous, is exhibited in the first place by England, and is repeated exactly by Holland upon a smaller scale. It is a remarkable fact that the most important British statistics have only to be divided by ten, in order to be made applicable to the Dutch with approximate accuracy in every detail. Thus, at the last census the population of the United Kingdom was returned at 31,513,442, that of the United Provinces at 3,579,529. The average annual revenue received at the British Exchequer during the last sixteen years has slightly exceeded £70,000,000; that of the Netherlands (exclusive of the Indian contribution) appears to have been as nearly as possible £7,000,000. In 1874 the national debt of Great Britain was £727,993,605; at the same date that of the Netherlands was £77,276,673. When we turn from Europe to Asia the proportions remain substantially unaltered, except in one important particular. The total population of British India, including the feudatory states, was, according to the census of 1872, close upon two hundred and forty millions; while that of the Dutch East Indies was at the same date a little over twenty-four millions. As regards the so-called European troops of the Netherlands colonial army their numbers may seem disproportionately strong, being returned at twelve thousand three hundred and ten, when we had less than seventy thousand European soldiers, all told, throughout our Indian empire. But the disproportion is apparent rather than real, for while our Europeans are all British soldiers, the Dutch "European" companies ought rather to be styled "Christian" companies, including, as they do, men of every race and color who profess Christianity. In fact, less than two-thirds of the rank and file are genuine Netherlanders, so that the usual proportion is here approximately maintained, and there are about ten British soldiers in Hindostan for each Dutch soldier in Netherlands India.

But now we come to a matter in which a great divergence appears from the proportion hitherto maintained between the two empires. During the seven years ending in 1874 the average annual revenue of British India amounted almost exactly to £50,000,000, while the revenue of Java and Madura, which may be called the "regulation provinces" of Netherlands India, has for a similar period averaged 120,000,000 guilders, or £10,000,000 annually. The revenue of Java is thus equal to one-fifth of that of all British India, although its population is barely one-tenth,

being as eighteen millions to one hundred and ninety millions. Moreover, we find that in British India the expenditure has for many years (with the exception of 1866, 1871, and 1872) largely exceeded the revenue, while there has been invariably in Java an annual surplus, amounting in 1864 to 35,000,000 guilders. The surplus has indeed dwindled considerably of late, but this diminution is due, not to any failure in the revenues of Java, which are larger than they were ten years ago, but to the increased cost of governing and protecting an empire which has grown in area with rapidity too great for the due development of its resources. The dependencies of Java in the East Indies have twelve times her area, and only one-third of her population. Java is now the queen of the archipelago, but she has not a monopoly of fertile soil, nor of mineral wealth, in which last particular she is far surpassed by other islands. When the resources of the vast islands of Borneo, Sumatra, and New Guinea have been developed even partially, Java may lose her exalted pre-eminence, but she will also be relieved from her present burden of paying for the administration of poorer neighbors.

Thus in every detail except Indian finance, the parallel holds good between the two nations, English and Dutch, so closely related in blood and language, so long the allied champions of civil and religious liberty, so long also maritime and commercial rivals, and now the only European States ruling over great empires within the tropics. The United Kingdom has far outstripped the United Provinces in population and power, and the two countries have long ago ceased to be rivals; but Holland continues to play her part bravely on the world's stage, and in proportion to her natural resources administers possessions and bears burdens fully equal to those of England. The ease with which she does both (two-thirds of her debt are held at the rate of 2.5 per cent.) shows still superabundant energy and credit, and leaves little sting in the taunt sometimes directed against England, that she is tending to become a second Holland. The Dutch have succeeded after an arduous struggle in establishing their complete supremacy in the island of Sumatra, larger than the United Kingdom or Italy, where Atjeh (Acheen) was the last remaining native state of importance. This is not an occasion, however, for raising the much-abused cry of "British interests in danger." Great Britain can feel neither alarm nor jealousy at the successful progress of the Netherlands, a smaller epitome of herself. We have dealt hard measure to the Dutch upon a good many occasions in history, and even the recent annexation of the Transvaal republic has been to them a somewhat distasteful transaction, as placing a community of Dutch origin under a foreign flag. But the independence of the Netherlands is to Great Britain a matter of the deepest interest, and prosperous as the Belgian kingdom undoubtedly is, its establishment as a separate State may be regretted on the ground that it has rendered more difficult the future maintenance of that independence. If the great manufacturing and coal-producing provinces of Belgium were now able to share the benefits and the burdens of colonial empire with their northern neighbors, a great additional security against foreign aggression would be enjoyed by all, and the United Netherlands would be a power capable of making its independence respected and its alliance desired.

It is naturally the wish of Englishmen that the constitutional states of Europe should not be swallowed up by the great military powers, and it is clearly to their interest that the splendid maritime resources of the Scandinavian countries or of the Netherlands should not pass into the hands of any nation likely to become a maritime rival. Upon this point Englishmen are sensitive to a degree, which is justified by the fact that the security of the British islands and the maintenance of our colonial empire alike depend upon our maritime supremacy, and would not long survive its decay. The nation which for the time being appears to menace this supremacy is certain to be regarded as our "natural enemy," whether it be Spain, Holland, France, or Russia, and the time may not be far distant when even Germany will be so regarded. Certainly a Pan-Teutonic empire extending from the Little Belt to the Adriatic, and possessing the shores of the Baltic and the North Sea from Dantzig to Antwerp, is a more formidable vision of the future, and one more capable of realization, than any conjured up by those whose nightmare is Panslavism. The German provinces of Austria gravitate willingly towards the united fatherland; but the same cannot be said of the Teutonic Netherlands, proud of their distinctive dialect and independent traditions. Still, many Netherlanders apprehend that absorption in the Germanic empire will be their ultimate fate. Such an event would confer upon a

nation already possessing irresistible military strength, the elements of naval power together with a ready-made Oriental empire. It is at least a possible event, and would threaten our Asiatic dominion with the most serious danger to which it can be exposed, the presence of a formidable maritime rival in Asiatic waters. Whether Java and the rest of Netherlands India would benefit by a change which would abolish the trade monopoly of Holland, and throw open the extensive markets of central Europe to the coffee, sugar, and spices of the Malay archipelago, is a consideration not likely to affect the settlement of the matter to any important extent.

The two special characteristics of Dutch administration in Java are the culture system, and the employment of native chiefs in the public service. The culture system was established by General Van den Bosch in 1832, at a period of chronic deficit and threatened insolvency, and resulted in a regular annual surplus. During the generation which witnessed the conversion of a heavy annual deficit into a surplus of three millions sterling, the population of Java doubled itself. The system which produced these astonishing results required the compulsory cultivation by the people of certain valuable products, to be delivered at a low fixed price to the government, who sold them in Europe at an enormous profit. The products so cultivated were those calculated to command the highest prices in the home market, and included originally coffee, sugar, tea, tobacco, indigo, pepper, and cochineal. After a time, it was found expedient to limit the employment of forced labor to the cultivation of coffee and sugar only, and by recent act of the Netherlands legislature the compulsory production of sugar will cease in 1890. The profits made by the government upon this system are so great, that two-thirds of the Java revenue, *i.e.*, nearly seven millions sterling, are annually derived from the sale of colonial produce. Formerly the coffee which each cultivator was bound to deliver was all grown upon special plots of public land, often at a distance from the village, to the great inconvenience of the people. Now the government coffee is chiefly cultivated by each man at his own door, within the village limits, and as the fixed price payable on delivery has been considerably raised, little pressure is necessary in order to insure the cultivation; indeed, I was assured by one of the principal Dutch coffee-planters, that a slight additional increase in price would fairly compensate the villager. The material condition of the Javanese peasant has improved under the culture system, which involves no serious hardship in its present modified form; he is obliged to work, no doubt, when he would prefer to be dozing; but he obtains with little trouble a crop which enables him to clear off all his government dues. He has a sure market for his coffee, and although the price fixed may be rather low, it is payable on delivery; whereas if he were free to dispose of his crop as he pleased it might be discounted and made over, before it was gathered, to the Chinese money-lenders, to whom the Javanese is only too ready to mortgage his future earnings.

On the other hand the operation of the culture system, under which a percentage is received by high officials upon the products salable in Europe delivered by them into the government stores, has a tendency to reduce the cultivation of rice in certain districts, and has even produced at times a serious scarcity. Instructions were consequently issued to all residents in charge of provinces to send in monthly reports to government of the amount of rice exported and imported inter-provincially, as distinguished from the rice exported out of, or imported into, the island of Java. The published reports show how little reliance can be placed upon statistics collected by persons interested in obtaining a particular result. Internal traffic only is included in these tables, and the aggregate exports and imports ought therefore to balance each other, but the provinces altogether return many thousand pikols * of rice as exported in excess of the amount returned as imported. It was the interest of the native officers in each residency to make it appear as if their particular province produced a surplus of food, and these self-contradictory returns have been adduced by opponents of the colonial government to show that official reports in Java are apt to state merely what may seem agreeable to the authorities at home.

Although salt and opium are the only government monopolies recognized by the Dutch in Java, the culture system has given them, for more than forty years, a practical monopoly of the most valuable colonial products, and has been the mainspring of their financial prosperity. Another successful stroke of policy has been their maintenance in working order of the

whole machinery of internal administration, just as they found it under the Mussulmans, while they secured, through the supervision of European officers, such checks and amendments as were deemed sufficient. The title of resident, which is borne by the principal Dutch official in each province, remains unaltered from the time when it was used to denote a representative of the European paramount power at the court of a native prince. The ruling princes, with a few exceptions, have disappeared, but the whole hierarchy of their subordinates remains, and all administrative functions, so far as natives are concerned, are intrusted to them only. A province or residency, containing on an average nearly a million of inhabitants, is divided into several regencies, each of which is governed by a native regent, having under him a host of minor officials, known as *dhemang*, *djaksa*, *wedana*, *mantrie*, etc. The regent invariably is a man of high birth, and frequently is a member of the princely family who once ruled over his district, so that he enjoys a large amount of prestige and influence apart from his authority as a government officer. In each regency is stationed a European assistant resident, whose instructions are to treat the regent with the consideration due from an "elder brother" towards a "younger," and who has under him a certain number of European *kontroleurs*. The duties of the assistant resident and his young Dutch subordinates are simply those of control and supervision, except where Europeans or quasi-Europeans are concerned.

The advantages claimed for this system are that it supplies public servants thoroughly known by and knowing the people, they being controlled in their turn by men of high culture, with European ideas of justice and public duty. Economy in salaries is one result of a system which enlists in the government service the willing aid of all ranks, even the most exalted, among the Javanese. Although Dutch officials receive lower emoluments, besides enjoying far less leave of absence than members of our Indian Civil Service, still it is impossible in any tropical country to secure the services of highly educated Europeans, except at rates more than adequate to command the very best native talent in the market. The dignity and privileges attaching to the government service, and the hope of one day being promoted to its higher offices, render it a career eagerly sought after by native gentlemen of position, who are ready to fill the lower grades at merely nominal salaries. But fixed salaries form only a portion of the emoluments of a Javanese chief in the public service; he receives also a percentage on the amount of taxes collected and coffee delivered by him, besides the arbitrary power, which he still possesses in spite of recent enactments, over the labor of the cultivators. And herein seems to lie the practical weakness of this theoretically excellent system, viz., in the imperfect nature of the control which it enables the Dutch officials to exercise over the Javanese. How far it is possible to protect the poorer classes of Asiatics against their immediate superiors, even by the most efficient European supervision, may be open to question, but the Dutch system in this respect certainly seems to require amendment. The local European officials in Java possess no direct authority over the regents and other native functionaries; nor do they incur direct responsibility on their behalf, as they would if the natives were their own immediate subordinates. The assistant resident of a division is indeed the "elder brother" of the regent, takes precedence of him as president of the *landraad*, or local council, gives him general directions as to collections of taxes, repairing of roads and bridges; but if complaints or accusations are made against the regent to the assistant resident he can only hold an inquiry and report upon the case, through the resident to the central government in Batavia, with whom all real power rests, and who can dismiss without explanation or appeal any official, however exalted. Should a kontroleur have reason to complain of the conduct of a native functionary in a subordinate rank, and should he fail to obtain satisfaction from the offender's native superiors, the case would have to be carried upwards until it reached the supreme government from lack of power in the assistant resident, or even the resident, to deal with it, except in the way of a report.

In British India, on the other hand, native officials are in every sense subordinate to the collector or assistant collector, who is responsible for their conduct and has power to dismiss them, subject to an appeal, which may be carried even up to the secretary of state. It is clear that such an arrangement affords a more efficient control than that of the Dutch, where native functionaries have been guilty of corruption or oppression, although the ultimate court of appeal may be the same in both cases. In Netherlands India

the Europeans and natives may almost be said to constitute two distinct services, working together as naval and military forces do upon a joint expedition; the senior service takes precedence of the junior, and has more gold and silver upon its umbrellas of state, but in its own department, that of native affairs, the junior is not directly responsible to the senior service, which can only appeal to an authority supreme alike over both. Now it is alleged that the central government punish or remove high native officials with extreme reluctance, and regard with disfavor those who bring charges against them, however well authenticated such charges may be. If there be truth in this accusation, and if the omnipotent authorities in Batavia are not willing to do justice strictly and impartially against their own native employes, it is upon them, and not upon the Dutch provincial officers, that the real blame and responsibility must rest. Unless the European assistant residents and kontroleurs are encouraged and supported in any efforts they may make for the protection of the helpless villagers, they will be sorely tempted to let things alone, to live on pleasant terms with their Javanese colleagues, and to report that all is as tranquil or contented in the provinces as it appears superficially to be. Even with the best intentions, and with absolute power at his back, any European in dealing with Asiatics must often find himself utterly unable to protect persons who will in no way take their own part. The first difficulty is to induce them when injured to make a complaint, and the next is to prevent them from withdrawing it when they are confronted with the oppressor against whom they have ventured to complain. This must not be forgotten in considering the present subject, seeing that the Dutch are accused, not of actively oppressing the Javanese, but of failing to protect them against their own chiefs.

It may well be that a mistake has been committed in bestowing upon native chiefs in government pay such a position of dignity and emolument as enhances the natural awe of their subjects, and overshadows that of the Europeans, their nominal superiors. If the idea has got abroad in Java that the native chiefs are regarded as indispensable to the administration, and that the government can hardly be induced to displace them whatever may be their conduct towards their subjects, it is most important that such an idea should be immediately dispelled. Regents strong in the favor of the paramount power are secure against revolt, and are in a position to oppress their people more grievously than independent chiefs could venture to do, and, therefore, for their oppressive acts the paramount power is responsible.

The accusations made by political opponents against the government of Netherlands India can scarcely fail to have a certain basis of truth, for they are founded upon the statement that men are liable to act in an indolent and selfish manner, preferring their own ease and interests to the welfare of those beneath them. Authority is concentrated in the hands of the governor-general and his ministers, who have been hitherto accustomed to govern after a secret and irresponsible fashion, free from the control of independent criticism. Under such a system it was only natural that abuses should spring up, and that internal reformers should be regarded as troublesome innovators, while reform from outside was altogether excluded. But changes have recently taken place, and many reforms have been effected; the old policy of concealment and monopoly has been modified, if not abandoned, and public opinion, as expressed in the home and colonial press, now counts for something in the administration. India attracts now so much attention in the Dutch Chambers as to create alarm in some quarters lest parliamentary pressure may become too important a factor in Indian affairs, and lest ignorant interference may do more harm than can be compensated by good intentions alone. One important advantage the Dutch appear to have gained by giving the most influential classes among the Javanese a direct interest in the maintenance of the existing *régime*. While the regents with their numerous grades of subordinate officers hold positions in no way inferior to those held by them under native sovereignty, and while they conduct the internal administration in the judicial and revenue departments, they have little inducement to desire the expulsion of the Dutch from Java. One of the most serious defects in our own Indian rule is that it offers no satisfactory career, civil or military, to an educated native gentleman of rank and distinction, and although it encourages the development of a cultivated class, it provides no field for their energies. Such a class cannot fail to become a source of embarrassment, if not of actual danger, unless we manage to utilize the natural leaders of the people, as the Dutch have done. We have now, however, governed British India for so long a time without native co-operation,

except in the inferior grades, that we are in a very different position to the Dutch, whose most influential and high-born subjects have never lost the habit nor the desire of serving the powers that be, while ours would have to learn what they have not practised for generations.

The Dutch for their part have been content to govern their subjects in accordance with native ideas, and in making their Oriental conquests have talked very little about the duty of a great Christian nation to convert and civilize ignorant barbarians. They have made no attempt to introduce a national system of education, they even discourage the study of Dutch and other European languages, and they do not profess to regard a native as in any way a political equal. But if their ideal of government is not very exalted, they have fairly fulfilled it, such as it is. They have given to Java peace, prosperity, and religious toleration, with security of person and property; and after paying for the maintenance of all these blessings they consider themselves entitled to appropriate to their own uses the surplus revenue. They do not pretend to govern Java for the benefit of the Javanese alone, and they claim for their own people a portion of the wealth which they have there created. But it may be doubted whether the trade monopoly and the *batig slot*, or favorable balance paid by Java to Holland, do not inflict a greater injury on the enterprise and energy of the home country than on those of the colony itself.

After all, the worst fault of the Dutch government in Java seems to be a habit of putting an unduly favorable aspect upon affairs, of saying peace when there is no peace, and of making optimistic reports to the home authorities. In the words of Max Havelaar: "The government of Netherlands India likes to write to its masters in the mother country that everything is going on as well as can be wished. The residents like to make the same announcement to the government. The assistant residents, who themselves receive hardly any other than favorable reports from the kontroleurs, send in their turn no disagreeable tidings to the residents." According to the same author it is well understood that the government regard with special favor those officials who never trouble them with complaints or vexatious reports as to the conduct of the native functionaries, and he says it has become proverbial that the government will dismiss ten European residents rather than one native regent, and that reasons of state are always to be found for sparing a chief who may have acted oppressively towards the people under his jurisdiction. If such be really the policy of the government it may be expected that subordinates will prove either unable or unwilling to do otherwise than carry it out, and that there will be no effectual appeal for the Javanese against the rapacity and tyranny of their chiefs.

It is laid down in the constitution and regulations of Netherlands India that the special duty of European officials is the protection of the natives, and from the governor-general downwards all are bound by oath to "protect the native population against oppression, ill-treatment, and extortion." This oath is probably not kept by all to the very best of their ability, but at least the charge of pecuniary corruption is not brought against the Dutch Civil Service; this distinguished and honorable body of men being blamed only for lack of energy and courage in denouncing injustice in which they themselves have no share. Still it is the condemnation of the judge when the guilty are absolved, and an omnipotent governor-general must be held responsible for the shortcomings of his subordinates as well as his own.

The antiquities of Java are of the highest interest, they belong principally to an early period in the history of the island, if not to a prehistoric period, and none of any importance exist that are not of a date prior to the Mahometan conquest. Buddhism as a religion has now no votaries in Java, except strangers from distant China, while Brahmanism has been expelled from the great island where it once reigned supreme, although still holding its own in the little island of Bali, eastward of Java. Mahometanism is the religion professed for three centuries by ninety-nine per cent. of the Javanese, but these centuries have not produced a single edifice or work of art to tell their tale to posterity. Mosques, palaces, and tombs in other lands are the enduring monuments of Mahometan wealth, energy, and architectural skill, but in Java these are wanting alike in beauty of form, richness of material, and solidity of structure. This is especially remarkable in the case of imperial and royal tombs, which are in Hindostan the most magnificent and permanent of all Mussulman edifices, and in Java are mere wooden booths, without painting, carving, or any other decoration. Very different are the massive temples and colossal statues of

Boro Boedoer, Mendoet, and Brambanan, where the extinct religions of Hindostan have raised monuments that still defy the injuries of time, and have escaped the hand of the iconoclast. In moist tropical climates the most formidable destroyer of buildings is the vegetation, which forces asunder and throws down the largest blocks of masonry, and has inflicted no little damage upon the Hindoo ruins of Java; most literally does "the wild fig-tree split their monstrous idols." The government has not failed to take some measures for the protection of these ancient monuments, and although more might be done with advantage, the most remarkable temples are cleared of vegetation, and the images of Buddha now run little risk of losing their heads either through Mussulman hatred of idolatry or Christian love of mischief.

The law with reference to treasure-trove is eminently calculated to preserve for the public benefit such curiosities as are discovered in Netherlands India. All precious objects found upon government land (including nearly all the country) are duly credited to the finder, who receives either the full value of each article, or else the article itself, in case the government do not care to acquire it; all ancient monuments situated upon government soil are the property of the public, and the public officials are responsible for their protection. Antiquities which belong to private owners may not be removed from Netherlands India without the permission of the governor-general; if so removed, the home government enjoy the right of pre-emption for the public museums. This last regulation applies to works of art, such as statues and sculptures, but does not include coins or medals. All finders of valuable articles are bound to give notice at once to the public authorities, who have the right of pre-emption; but as the full estimated value must be paid, the temptation to concealment is removed, and the destructive effect of our own barbarous law of treasure-trove is avoided, while the interests of the public are maintained. Until within the last two years only one-half of the value was payable to the finder; but as it was stated on competent authority that valuable antiquities had been lost to the public in consequence, a resolution was passed by the governor-general placing the law in its present satisfactory state. Although care is thus taken of curiosities when found, Dutchmen do not exhibit the same energy as Englishmen in exploring or discovering picturesque and interesting localities, and are wonderfully fond of the steamy flats near the sea to the neglect of hill sanitaria. The European troops are quartered principally in the low country, and the splendid military hospital of Batavia loses half its utility from not being at an elevation of three thousand feet above the sea, which in so moist a climate is considered to be the most salubrious height. The present war minister is in favor of following the British example, and transferring a larger proportion of the Europeans to inland stations; but it is clear that Netherlanders have a weakness for level plains and canals, which remind them of home.

There are four Javanese princes still enjoying a certain degree of independence. The Soesoehoenan * of Soerakarta represents the Mahometan emperors of Java, and is treated with the highest possible respect; but a fort garrisoned by European troops commands his capital and palace. A similar fort overlooks Djokjokarta, the capital of the sultan, who is the second native sovereign. The two remaining princes are of inferior rank, and can hardly be regarded as independent; but each of them entertains a body of fairly disciplined troops. The legion of Pangeran Adipati Ario Mangkoe Negoro at Solo numbers nearly a thousand men, embracing all three arms of the service, and this prince, who is a remarkably enlightened and liberal-minded man, sent a contingent commanded by one of his sons to assist the Dutch in the war of Atjeh.

Netherlands India is garrisoned by an army specially enlisted for that purpose, the national army of Holland not being liable to colonial service. The European portion of this force numbers about twelve thousand men, and, theoretically, two-thirds of them are Netherlanders; but of late years an increasing proportion of foreigners has been recruited and sent out to India. In 1875 the foreign recruits outnumbered the Netherlanders as two to one; but the pressure of the war in northern Sumatra was assigned as a reason for this divergence from an accepted principle of policy. Formerly, many Africans from the Dutch possessions in Guinea were enlisted for Indian service, and a certain number are still included among the so-called European forces. Europeans and natives are formed into separate companies and mixed battalions, the flank companies, all the officers, and a majority of

* The diphthong "oe" in Dutch is pronounced like "oo" in English.

the non-commissioned officers being European, but Christianized natives and half-castes are classed with the whites. Many white soldiers marry Javanese women, and they are allowed to take their families with them wherever they go. The deck of a steamer bound for the seat of war presented a strong contrast to that of a British troopship in smartness and comfort, and the accommodation afforded to the European soldiers with their dusky helpmates and comrades was slender enough; but the gallant fellows did not seem to be dissatisfied, and the mixed battalions are apparently a success. When our own native army in India undergoes the reform which it so urgently requires, some useful hints may be taken from the Dutch, and they may in their turn learn from us how to dress European soldiers within the tropics.

The Mahometan religion is professed by the Javanese; but the spirit of Islam has failed to take possession of this race, and the stranger in Java is astonished at the absence of outward and visible signs to indicate the popular faith of the country. In the centre of every town or large village is the *aloen-aloen*, an extensive grassy lawn, shaded with lofty tamarind and *waringi* trees (*Ficus benjamicus*), and surrounded by the principal buildings, public and private, of the place. Among these is always conspicuous a pagoda-like edifice, which is the mosque; but few and far between are the worshippers there, while the public performance of devotional exercises, at fixed hours, irrespective of locality, a spectacle so familiar to the traveller in other Mahometan countries, is not practised by the Javanese. The only religious observance witnessed by us among the peasantry was the presentation of coins and flowers as offerings to certain Hindoo idols, relics of the ancient faith still occupying niches in the ruined temples of Brambanan. The Mussulman priest is an important functionary, and is recognized as such by the Dutch authorities, but less in a religious than in a civil capacity, as the learned expounder of Mahometan law. A certain number of pilgrims proceed from Java to Mecca (in 1875 there were thirty-four hundred and twenty-eight), and the white turban of a hadji may be seen here and there in the streets among the lacquered and gaily painted hats of Sunda or the peaked caps worn by the Javanese proper, but the probability is that it encircles the head of a Malay or an Arab. Some of the regents are said to be zealous followers of the prophet, and strong objections are entertained by them against the admittance of unbelievers into mosques; but it must be remembered that the conquerors who introduced Mahometanism into Java were of Malay race, and that many of the present chiefs are descended from those fierce and fanatical vikings of the equator. It is, however, in the treatment of women, especially those of high rank, that Javanese fashions are most at variance with those of continental Asia and with general Mahometan custom.

The degree of emancipation enjoyed by Javanese ladies was strikingly illustrated during an interview most politely granted to us by the sultan of Djokjokarta. Attired according to etiquette in full evening costume, although it was an early hour in the morning, we were conducted by the Dutch officer in command of the sultan's horse-guards into the inmost court of the far-spreading *kraton*, or palace enclosure, within which three thousand people reside. Except a few sentries, and one or two officials stripped to the waist in Javanese court fashion, not a man was visible in any of the squares through which we passed, and when we reached the audience chamber there sat his Highness, without courtiers or attendants; but, to our extreme amazement, six charming young ladies were seated in a row on his left hand. We scarcely ventured to look at them, unveiled as they were, but our Dutch friend, after introducing us to the sultan, with whom we shook hands, quietly remarked, "Now you must shake hands with the princesses, with all of them; they expect you to do so."

Fresh from Indian durbars, where a mere allusion to the invisible occupants of the zenana would be a breach of decorum, we could hardly trust our eyes and ears; but each young lady held out her hand with a pleasant smile, and we were afterwards seated between the sultan and his blooming family of daughters. Attendants, literally crawling upon the floor, now approached the august presence, bringing tea, which was dispensed to us by the royal damsels, almost as if we had been in an English drawing-room at five o'clock in the afternoon. Unfortunately our conversation was somewhat restricted, as the English idea could only reach the Javanese mind after undergoing four translations, either oral or mental, through the obliging Dutch captain, who interpreted in French and Malay. Meanwhile, the sound of music attracted our attention, and the sultan courteously suggested that we might like to see a little more of his palace. We

found that the music proceeded from a large open pavilion, where the queen, or principal sultana, was engaged in superintending a dancing-lesson. The pupils were the daughters of court dignitaries and nobles, more than twenty in number, all very young, and evidently taking the greatest pains in the performance of their graceful position drill.

The dancing was accompanied by singing and by the pleasing notes of the *gamelong*, which may be described as the Javanese pianoforte, played by women seated on the floor, and producing a liquid melody peculiar to itself, and very different from the harsh discordance of Oriental music in general. The youthful figures of the girls in their bright and elegant drapery, their earnest faces and elaborate movements, together with the melodious orchestra, combined to render this by far the most pleasing nautch which I have yet seen anywhere in the East, although it was merely a private performance of beginners. The queen was seated on the floor beside a low table, playing at cards with her maids of honor, and received us most graciously, inviting us to inspect everything, even to his Highness's private apartments, and in fact to make ourselves quite at home. The whole affair was like a scene out of "Alice in Wonderland," and we almost expected to be addressed by one of the sultan's many large dogs, or the tame crested pigeons as heavy as hen-turkeys. We were three European gentlemen alone (for the sultan did not accompany us) in a zenana, received by the inmates with friendly, unembarrassed politeness, and allowed to wander at will through marble halls open on all sides to the light of day: there were no lattices, no veils, no guards, not even any dueñas, for all the ladies were young, and many of them very good-looking. To my companion, a member of the Indian Civil Service, thoroughly familiar with Indian habits and ideas, this kindly reception *en famille* by the sultan of Djokjokarta was a new and surprising experience. In Hindostan, the Mussulman religion is professed by a small minority only; but Mussulman ideas as to the seclusion of women have a far more general acceptance, although quite foreign to Hindoo traditions and customs.

Travelling in the interior of Java is particularly agreeable; the roads are good, ponies are abundant, and light vehicles for posting are easily obtained. At all places of importance there are comfortable hotels, kept by Europeans and subsidized by government. Without a subsidy such hotels could not possibly be maintained, as they are not used by the natives, and European travellers are rare: in the year 1875 only seventeen strangers are recorded as having obtained official permission to travel in Netherlands India. The Dutch officials, moreover, have the hospitable habits of Europeans in the East, so that it is not easy to see how the hotel-keepers make a living; yet they seem to flourish, and in a country where Malay is the sole vehicle of communication with the people it is pleasant to find an Italian or German interpreter in one's host, who frequently is not a Netherlander.

The light posting carriages are drawn by four ponies, which are changed frequently, and keep up an excellent pace, where the road is tolerably level. At the hills bullocks or buffaloes are harnessed as leaders, and frequently, where the road descends into a deep ravine, the horses are removed, and a small army of men and boys with ropes attach themselves to the carriage, lowering it into the valley, and hauling it up again on the opposite side. The rivers are well bridged, and these steep inclines, which might be obviated by a little engineering skill at a moderate expense, are the only impediments to rapid locomotion upon the principal roads. The scenery is beautiful and varied, the people and their dwellings are most picturesque, and the total absence of caste enables a stranger, without fear of giving offence, to enter any of the numerous shops and refreshment houses, and partake, along with the natives, of fruit, sweetmeats, coffee, and various refreshing but not inebriating drinks. Everywhere around (especially in Sunda or western Java) eye and ear are refreshed by the sight of fresh verdure and the sound of rushing streams; those who know what it is to ride all day under a vertical sun, without a blade of grass or a drop of water being visible for miles in any direction, can best appreciate the charm of driving along a good road with four stout Makassar ponies through this lovely garden of the tropics.

In order fully to appreciate the scenery and vegetation of Java it is well to ascend one of the volcanic cones in the western portion of the islands, such as the Pangerango Mountain, where an elevation of ten thousand feet can be attained, and which presents a variety of botanical attractions such as can hardly be seen elsewhere. From base to summit the jungle is dense and luxuriant, but you climb gradually from palms, musaceæ and tree-

ferns, through tall forest trees festooned with creepers and epiphytous orchids, to the flora of a temperate climate, and the familiar forms of artichoke and strawberry, primula and plantago. Down the steep slopes tumble many streams, their temperature varying between the boiling point and icy coldness, and in the tepid spray of the hot cascades tree-ferns attain their greatest size, rivalling tall palms in height, and excelling them in the gracefulness of their feathery fronds. Near the top of the mountain trees diminish in size, but the undergrowth is still so thick that it is almost impossible to leave the path. The crater on the highest peak is extinct and overgrown with vegetation, but clouds of mephitic vapor rise from a huge crater somewhat lower, and spread desolation around; when the volcano is active, these vapors reduce large tracts of forest to blackened skeletons, but nature soon repairs her own ravages in a climate like that of Sunda. Animals are rarely heard and yet more rarely seen in these dense jungles, but occasionally a troop of large monkeys may leap crashing from tree to tree, or a great hornbill may fly overhead on creaking wings, and near the summit the twittering of small warblers reminds one of Europe, almost as much as do the honeysuckle and St. John's wort. Large game, in the shape of rhinoceros, tiger, deer, wild bull and wild boars, is indeed abundant in the forests of Java, but is not easily dislodged in such cover, and tigers are more frequently destroyed with poison than in any other manner. The poison used is a decoction from the root of a tree, and has the effect of paralyzing the animal, which is usually found alive and helpless within a short distance of the poisoned carcase and is then despatched. If the tiger is dead when found the skin is sure to be worthless, but by this method splendid specimens are obtained when the track is taken up immediately. Wild pigs do much damage in the rice-fields, and the villagers use for scaring them an ingenious mechanical contrivance, which is worked by the water-power used in irrigation; there are two distinct species indigenous in Java and they afford considerable sport, being shot with the aid of beaters and dogs.

Java is in perfection just after the rains, during the months of April and May, when the whole country, from the smoking craters of the interior to the swamps of the seacoast, is clothed with a vegetation so luxuriant that the ruddy color of the volcanic soil is only visible where a recent landslip has occurred; even precipitous banks are densely festooned with green, and so saturated is the ground with moisture that watercresses flourish on the steep face of roadside cuttings. In plain and valley every square yard of soil, except the village burial-ground, is cultivated and irrigated; magnificent crops of sugarcane, rice, and indigo form a sea of verdure, out of which rise like islands numberless groves of bamboos, cocoanut palms, and fruit-trees. Concealed in these groves are the *dessas*, or native villages, and under their shade is usually cultivated the coffee, which "pays the rent." Some of the lower ranges have been denuded of trees, and display a certain amount of open pasture, but as a rule the mountains are covered with virgin forest, except where clearings have been made for plantations of tea, coffee, or cinchona. High above this fair scene a faint white cloud may be seen curling upwards from the apex of a lofty cone, indicating the volcanic energy that now slumbers beneath, but has broken out violently even within the last few years, and may do so again at any moment.

It may be asked whether the geological condition of Java is not a symbol of its political state, and whether a fair surface does not cover hidden fires in the hearts of the Javanese people. It may be so, but not even a faint white cloud is visible to warn the stranger that such hidden fires exist. Everything externally is tranquil, and in the absence of all means of coercion, tranquillity may be accepted as a fair evidence of contentment. In the wide and populous district of the Preanger Regencies for example, there are no troops at all. A few European soldiers in civil employ and a few native policemen represent the power of the sword, and the most perfect order prevails throughout this beautiful province. The productiveness of the country appears to keep pace with the increasing population. The wants of the masses in all tropical countries are few and simple, and in Java these are amply supplied. While the masses thus enjoy comparative prosperity, those of rank and influence, who might otherwise be dangerous, are enlisted on the side of the government by the possession or the prospect of honorable and lucrative employment. Besides, the Javanese are a gentle and submissive race, unaccustomed to the use of firearms, and could never be formidable as insurgents in a military sense,*

* A Dutch poem describes in glowing language "the last day of the Hollanders in Java," when the long-pent-up fury of the Javanese is to break forth.

although Englishmen in the East, who have not visited Java, sometimes assert that Dutch rule is so arbitrary and oppressive as to engender a spirit of chronic disaffection, and that the Javanese are watching for an opportunity to expel their tyrants and take shelter under the British flag; but I could see no evidence for such an opinion. Without pretending to investigate the inward desires or aspirations of the Javanese, and judging solely from external facts, I believe that the Dutch sovereignty is about as popular and as secure as the rule of a few aliens over a great subject population can ever be made, and that the country flourishes under it as well as a subject country can ever be expected to do.

Tokens of respect, savoring strongly of servility, are still shown in the more remote districts to all Europeans, as well as to high native officials, but the prestige of a white face, apart from gold or silver lace, is not so great in the neighborhood of cities and railroads. On the approach of a superior it is incumbent on all natives to remove their hats, to dismount if on horseback, and if on foot to sit down upon the ground; those who wish to be particularly respectful will even turn their backs upon the great man, as if afraid to look him in the face. When the golden umbrella of the Dutch president passes along a crowded street, denoting the presence of the highest official of the province, a very singular effect is produced, the people sinking down before this conspicuous badge of office, and rising again behind it, like a field of ripe corn in a breeze. The Dutch authorities demand honor and precedence for themselves and other Europeans, but they also set an admirable example of urbanity and even of friendliness in general intercourse with natives. The absence of caste prejudice and religious fanaticism among the Javanese permits a considerable amount of sociability to arise between the two races, and the tone adopted by Europeans towards natives in Java is remarkably devoid of the arrogance and irritability by which in other countries it is too often characterized. It is a very unusual thing for a white man to strike or even to menace a native, and acts of violence, when they do occur, are severely punished. While I was in Batavia, a foreign ship's captain, accustomed, perhaps, to less impartial laws, was undergoing a considerable term of imprisonment for laying violent hands upon a native car-driver.

Perhaps the good-temper and urbanity characteristic of the Dutch in Java may be due partly to the general adaptation of their mode of life to the climate, in which respect they are more successful than our own countrymen, although they decline to adopt the *punkah*. They rise early, and until the meal, known as *rijst-tafel*, which takes place about midday, it is customary to appear in dresses adopted from the natives, and fashioned of the lightest and coolest materials in various colors. The dress of the ladies consists usually of a gaily-colored skirt and a white jacket, with slippered feet, and hair hanging loose or tied in a knot at the back of the head; and very becoming it is, as well as comfortable and cool. If the tight and multifarious garments of Europe have been assumed during the course of the morning, they are again discarded for the afternoon siesta. Until the cool of the evening no one is visible, and if an inexperienced stranger should attempt an afternoon visit, he will inevitably be received with the announcement, "*Tidoer*" (asleep). After sunset, refreshed with a bath and dressed in correct European costume, but without hats, ladies and gentlemen sally forth, driving and walking, this being the fashionable time for paying visits, which may, however, be postponed until after dinner. Should there happen to be moonlight, a drive may be taken even as late as midnight, or there may be an open-air concert in the grounds of a club, where the friends and families of the members are made welcome. The presence of children is a conspicuous feature at the opera and other evening entertainments, and is a natural result of the long repose during the heat of the day, indulged in by all, except a few whose business avocations are such as to prevent them from choosing their own time for work and relaxation.

Planters of tea or coffee in the hill country of Java have as agreeable a calling as any set of men that I have come across, and it would indeed be difficult to find any more kindly and hospitable, or more contented with the lot which has fallen unto them in such pleasant places. They lead active, independent lives, with continuous but not laborious occupation, being able at almost any season to take a holiday for the sake of sport, society, or change of scene. The climate at high elevations is the most favorable to quality in coffee and tea, although heavier crops can be grown in the low country, and the same climate allows Europeans to keep their children around them, and to bring up the youngsters as well-educated, as merry, and almost as

rosy, as if the peaks towering above them were the snowy Alps, and not the fiery Merapi or Gedeh. Labor can be obtained at moderate rates, while excellent roads and bridges facilitate the conveyance of produce to market. Over a docile and industrious population they exercise a patriarchal sway, although they are invested with no magisterial authority, and a planter is obliged to have recourse to a native official if he wishes to punish a refractory coolie. This is sometimes cited as a grievance by European gentlemen, but it seems, in combination with other circumstances, to promote most satisfactory relations between the planters and those whom they employ. The Javanese are a solemn and silent race, even as children, and it is pleasant to see their faces light up at the approach of the master of the plantation, as he passes along with a kindly word or a smile, ready to give a patient hearing to any desirous of addressing him. Joyous cries of "*Toean! toean!*" (master) from the children furnish a tribute of popularity which is above suspicion; and upon one plantation, where we spent several pleasant days, even the absurd tameness of every sort of animal testifies to the rule of kindness governing the whole establishment.

But the amicable relations existing besween masters and coolies are due, not only to the kindliness of individuals, but also to the peculiar position occupied by planters in Java. They compete with the government as producers of coffee, and are ready to pay good wages to free laborers; they are therefore the natural enemies of monopoly and forced labor, and deserve as such the title of "protectors of the poor," to which planters elsewhere can seldom lay claim. To the advice and influence of eminent Dutch planters are largely due the recent reforms introduced into the culture system of Java, and in particular the increased price now payable to the villagers for the government coffee. It has been made a ground of attack against the colonial policy of the Dutch, that they discourage the construction of railroads and the settlement within their territories of independent capitalists, who would develop the resources of the country but might interfere with existing monopolies. Restrictions as to strangers residing in Netherlands India have been, however, relaxed of late years, and in 1875 one hundred and twenty-eight Euro peans, ninety-seven of whom were Netherlanders, received official permission to settle in the country. Only in the northwestern provinces do private individuals hold estates in fee-simple, but in other parts the government will lease land to planters and settlers, and will relieve from compulsory gratuitous labor the people employed upon plantations. Coffee and sugar have been hitherto the most valuable products of Java, but the motto "*In te spero*" has been adopted by a firm of very successful tea-planters, who base their hope chiefly on obtaining for Java tea a higher reputation than it enjoys at present in the London market. Should they succeed in accomplishing this, the cultivation of tea would rapidly develop; but the general climate and soil of Java are favorable rather to quantity than to quality, especially as regards tea and tobacco, in marked contrast to Hindostan, where both these plants attain the highest excellence.

The peculiar form of the island, and the easy communication by sea between the great centres of population, render an elaborate railway system unnecessary in Java, either for military or commercial purposes. Railroads have been constructed, running from the principal ports on the northern coast, into the interior of the island, and linking Buitenzorg, the governor-general's country residence, with Batavia, also Soerakarta and Djokjokarta, the capitals of the great native princes, with Samarang. These lines have been constructed with free labor by the Netherlands India Railway Company, to whom a concession has recently been made for very considerable extensions, with a state guarantee of five per cent. interest for forty years. At the same time the government have purchased the Batavia and Buitenzorg railway (about forty miles in length), paying five million guilders to the company. A State railway is in course of construction in the eastern districts of Java. Now it seems that the existing lines are precisely those most required for developing the resources of the island, and when the proposed extensions are completed the most important districts will all be brought into direct communication with the coast. At any rate, the revenues of the country have not hitherto been burdened with annual payments to European capitalists for large sums of money sunk in the construction of unprofitable railroads; Java pays tribute to Holland, but that tribute has not taken the form of guaranteed interest. Well-intentioned but ill-considered proposals for developing Asiatic resources by the aid of European capital have contrib-

uted not a little to embarrass the finances of British India, and the Dutch authorities in Java are also subjected to increasing pressure from home as to embarking upon similar schemes. The pressure, however, is less, and the power of resistance greater than in our own case.

Beyond all tropical countries Java seems to attract the love and admiration of strangers settling upon her shores, who speak of her as "*nôtre Java bien-aimé*," and are fond of describing her as "the finest island in the world." Swiss mountaineers are at one with lowlanders of Holland upon this subject, and even islanders from Britain can hardly express dissent.

FRAU VON INGERSLEBEN.

XIX.

CONVERSATIONS.

WERNER and Fritz accompanied the departing visitors to the boat, and while the latter walked on with one of the officers, Werner, apparently by accident, lingered behind with Ottomar. The two friends at first walked side by side in silence, but when they had placed a sufficient distance between themselves and the rest of the party, Ottomar began, —

"Tell me, Werner, how do you fare?"

"As well as one can who has committed a hopeless blunder," replied the latter bitterly.

"You would not listen to me when I warned you. However, I think you are man enough to endure and overcome even the most unpleasant consequences of your course."

"Have no fear, I too can live without sunlight, if it must be," replied Werner covering his eyes with his hand.

"Leave our house, I most earnestly entreat you to do so."

"No, I will remain," cried Werner passionately; "the affair has gone too far to be remedied by my departure."

"And Sidonie, Werner? You have made her acquaintance, she neither can nor will forgive you. It is not only your own unhappiness that you have caused."

Werner laughed, though by no means joyously. "Oh, my dear Ottomar, that fear reveals your own kind heart, but at the same time such great simplicity that I can scarcely believe you really feel it. You certainly know as well as I that these ladies need only one hand to hold the interesting '*Almanach de Gotha*,' and like good Christians always keep the other free for the Bible, from which they draw consolation for every situation in life. I suppose the real root of this piety is the struggle to reserve in heaven the superior position which on earth is secured to them by the '*Almanach de Gotha*.'"

The young man's tone was so sharp, so bitterly scornful, that Ottomar looked at him in alarm. "Pray don't allow yourself to be embittered in this way, Werner," he said earnestly. "I really do not know you in this contemptuous mood. You must certainly end the matter as soon as possible."

Werner had regained his composure, and answered more calmly. "That won't do, Ottomar, and, if you wish to know the whole affair, it won't do on your account. Your splendid old father is a little too fond of hunting and gambling, and has got his business matters into the most horrible confusion. My misfortune shall, I hope, prove an advantage to you, but I must work hard for some time longer."

"I have feared this many months," replied Ottomar thoughtfully. "My mother does everything in her power, but — I can frankly say, unfortunately — my good father is not so much henpecked as he seems, and as would be desirable for us. He only allows her to have absolute control over things which are troublesome or indifferent to him; in other matters, on the contrary, he jealously guards his authority as master of the house, and does not even permit her to exert the influence which, as his wife and a very clever woman, she is entitled to claim."

"Yes, your mother is one of the most politic ladies I have ever met."

Although the words were uttered without any tinge of irony or bitterness, only the darkness prevented the speaker from perceiving the sudden flush that crimsoned Ottomar's cheeks. "Do not judge my mother hastily, according to your present feelings, Werner," he answered quickly. "Her character is not one to be easily read, and a superficial observation would lead to very false conclusions. I assure you that the nearer you approach her, the farther you penetrate into the recesses of that reserved nature, the greater will be your love and reverence."

"It was far from my intention to wound

you by any remark about your mother. How could you so misunderstand me, my dear Ottomar?" said Werner quietly.

"I am eager to believe so, Werner, and my defence was directed more against people in general than to you in particular. The sense of the injustice I have done her on your account was especially oppressive to me to-day. She attributed this discomfort to a visit to Rheinau, which was both welcome and unwelcome to me, since my interest in the beautiful Rosa was again brought under discussion."

"To speak frankly, Ottomar, the beautiful Rosa's money would probably be very desirable for you, and I hope to succeed in making this clearly understood by your mother."

"Don't deceive yourself, Werner. Wise and sensible as she is, clearly and impartially as she usually surveys all circumstances, this is her one weak point."

"In spite of all her intelligence, she is hopelessly under the dominion of this miserable '*Almanach de Gotha*,'" said Werner, with a bitter laugh; then, as if instantly realizing his error, added hastily, "Forgive me, Ottomar! Forgive my ill-humor. Besides, I must have been greatly deceived in my observations, or the countess would put no obstacles in the way of the brother's proposing for Lia's hand."

"You have judged correctly enough, I think so myself."

"Well, and ——"

"This time I must laugh at *your* simplicity, Werner," replied Ottomar in a tone whose gayety was somewhat forced. "Are you childish enough not to see the difference between the heir and one of the graces who are not too richly endowed with the gifts of fortune?"

"And do you really love Rosa?"

Ottomar did not answer immediately, then he said slowly, "I do not know, I hardly think so."

"A strange reply, Ottomar."

"Strange, but perfectly true. Perhaps I should feel nothing but the old childish friendship, if I did not know that mamma trembles at every word I speak to her. But hush! it seems to me that the others are listening to our conversation."

"No fear of that! Landsheim is much too absorbed in recalling his conversation with Lia, and Lerchfeld too much engrossed in enjoying the cigar of which he has been deprived for hours, to feel an interest in anything else."

The gentlemen in question, however, who had probably exhausted the few subjects of conversation they possessed in common, waited for them so unmistakably, that the two friends put the best face possible on the matter, and continued their walk in their company.

"I most earnestly entreat you, Fritz," said Count Gernerode, when he had hastily walked a short distance in advance of the rest of the party, "not to be so childish, but tell me what has happened."

"That is," replied Fritz laughing, "be kind enough to consider yourself a lemon, and allow yourself to be thoroughly squeezed. But to-day, most honored lieutenant and beloved cousin in the twentieth degree, I unfortunately know next to nothing moreover, I hope you won't blame me for finding my cousin more interesting than my sisters."

"Oh, stop that confounded folly, Fritz!" angrily exclaimed the cousin in the twentieth degree; "I hope you have not forgotten my commission."

"And I hope you have not forgotten that I am not your grace's valet, and therefore only discharge your commissions as far as it is convenient to me."

"Fritz, you took a fancy to my six-barrelled revolver, you may find it in your room some day, if you are sensible."

"Ah! so the lieutenant is pulling another string," cried Fritz, laughing. "I am really sorry I can do nothing just now to earn the revolver. Mamma, who sees through everything, keeps a strict watch on me, and there is no chance of telling Olga any secret."

"If Sonnenstein had trusted you with one, she would probably make fewer difficulties," said the officer bitterly.

"None at all, my dear Rüdiger; on the contrary, she would smooth the way. The other day at the concert she called Olga's attention to the young man's interesting pallor, which harmonized so admirably with the gentle melancholy expressed in his features."

"Indeed!" replied Rüdiger ironically, "and what did Olga say?"

"Olga made no answer at all, but I took the liberty of remarking that the harmonious pallor was unfortunately caused by a terrible cold in the head, with which Sonnenstein had been afflicted for several days."

"Well done, Fritz, that was a clever answer," exclaimed the young officer laughing. "The ladies often think pale, melancholy faces very interesting."

"Yes, indeed, Rüdiger!" replied Fritz gravely; "I told Olga so at the concert, when she was troubled about your pale, gloomy expression."

"Well, and what did you say?" asked Rüdiger anxiously.

"I said the gloomy pallor was only a faint reflection of the effects of a spree, from which you had suffered quite severely in the morning."

"That is too bad!" the young officer burst forth angrily. "Really, Fritz, you deserve ——"

"A beating?" asked Fritz amiably.

"That is what one gets by having anything to do with a child," muttered Rüdiger furiously.

Fritz glanced mischievously at his companion. "Well, Rüdiger, just have a little patience, I shall gradually learn to understand these delicate distinctions, and know that the truth is only to be spoken about Sonnenstein, while you, on the contrary, require a poetical halo."

"You are an unruly kobold, Fritz," said the young count in a calmer tone, "and I ought not to have allowed my composure to be disturbed by your pranks. Of course you were not guilty of such a blunder."

"I'll think over the matter, Rüdiger, and give you exact information. What do you say to Prince Eduard's sprained ankle?"

"Oh! I could rave at my own folly, that such an idea never occurred to *me*. In spite of the distant relationship between us, the countess has never thought of inviting me to stay."

"And I doubt whether even a sprained ankle would have procured you the invitation. There are plenty of comfortable carriages in the stables, which, under such sad circumstances, would convey you home in the easiest manner. I should therefore advise you, as a friend, to try to secure mamma's favor, rather than Olga's."

"I fear her aversion concerns my purse more than my person, and since I don't see in what way I can obtain a higher place on the civil list, it will be difficult to overcome. At least do me the favor to tell Olga that ——"

"Why! here we are at the Rhine," said a voice close behind them. Unnoticed by the eager speakers, the group in the rear had now almost overtaken them, and Countess Olga therefore did not hear what her distant cousin wished to communicate.

Werner and Fritz remained on the shore for some time, watching the disappearing boat, and then turned and retraced their steps. "I shall probably be obliged to play the part of lemon again," muttered the boy, looking askance at his companion. But he was mistaken; Werner walked on in silence, without asking a question; nay, he scarcely answered the merry chatter of his young companion.

The inmates of the castle were just going to supper when they entered. Count Rodenwald, who liked a rich and abundant table, and was unwilling to give up the early dinner hour, could not be induced to think this meal unnecessary. He merely endured the tea as a little refreshment, and as almost every day brought guests from the city and the neighboring estates and villas, the early tea hours seemed pleasant and convenient even to the mistress of the house.

The prince, to whom every attention had been offered on account of his accident, resolutely declined them all, refused to exchange his boot for one of Count Rodenwald's slippers, and would only consent to have a cushion brought, on which he gracefully rested the lame foot. He would not relinquish the privilege of escorting the lady of the house to the table, while the count, with more courtesy than he usually showed, offered his arm to his beautiful niece.

The prince was really curious to see the odd figures, which, according to Sidonie's account, appeared from all quarters at meal-times. But when only the governess entered, followed by Werner and Fritz, he turned towards her with a question about the report. Sidonie did not hear it, or did not think it worth answering, for she began a conversation about other things, and the prince was so bewitched by the magic of her charms that he forgot everything else.

This spell seemed to exert an equal influence after supper, and the hostess vainly reminded his Highness that his foot required rest. The non-appearance of the prince's valet, who was to have been sent from Bonn by the gentlemen on their return, prevented the countess from breaking up the party, and they therefore remained in the drawing-room some time.

At last the arrival of the servant compelled the prince to say farewell for the night, and his departure seemed very welcome to the daughters of the house, for they instantly withdrew to their chambers, while Sidonie's flushed cheeks and sparkling eyes showed no signs of weariness. When the young people had disappeared, the count, yawning violently, rose from his sofa corner to go to his own room, but his wife laid her hand lightly on his shoulder, saying, —

"One moment more, my dear Edwin, if you please."

"But for heaven's sake, Vally, what can you want in the middle of the night?" asked her husband in surprise.

The lady smiled. "It is not much after eleven. Your watch goes a little faster at night, my dear Edwin."

"Well, what is it then?" and the master of the house threw himself back on his sofa with a very resigned air.

The countess remained standing before her husband, and, bending towards him, said in a half-jesting tone,—

"Much as I dislike to play the governess, Edwin, I must do so now."

"I thought so; now we have it," cried the count indignantly. "At least be kind enough to enumerate the list of my sins as quickly as possible, I am tired."

"So it seems, my dear Edwin," said the countess with delicate irony, "or you would scarcely have sat down in the corner of the sofa directly after supper, and gone fast asleep."

"Oh! I heard everything you said," protested her husband in a somewhat embarrassed tone.

"True, this is the manner in which you often show your interest in the amusement of your guests," continued his wife in her former tone, "but to-day the case was somewhat different. Our neighbors and friends know and love you, they esteem and value your admirable qualities, and —— "

"Pray, Vally, spare your flatteries! You only bestow your bits of sugar when there is a particularly bitter pill to swallow."

"And therefore make concessions to your amiable little weaknesses," continued the lady without noticing the interruption. "But the prince is a comparative stranger, this is the first time he has spent the evening with us, and you ought to have sacrificed a half-hour's sleep to his rank and estimable character. He will be more at home here after a time, and then —— "

"Then of course will also value my admirable qualities, that is what you were probably going to say, Vally. Besides, even a short-sighted mortal like myself can see without spectacles that you are sailing with a fair wind towards a match between him and Sidonie."

"Your figures of speech are not quite so well chosen, my dear Edwin," said the lady in the same tone of quiet sarcasm, "as they undoubtedly would be if you took a little more time to reflect upon them. Besides, if I really favored a marriage between the young pair, I should only be yielding to the wishes of both."

"But Sidonie, I think, is just the same as betrothed. Hardeck wrote me a short time ago —— "

"That is an arrangement made in early childhood, which both parties have declared themselves unwilling to fulfil. Besides, Count Meerburg seems to be a man destitute of all consideration; for under any circumstances it would have been his duty to visit us."

"I think he is travelling in Egypt and God knows where."

"He returned a long time ago. Sidonie feels this neglect very bitterly, and therefore is still more opposed to the intended marriage."

"Well, I don't care! I'll give my blessing upon the alliance with the prince, especially if I can go to bed, Vally."

"But, not, I hope, until you have promised me to stop this very unsuitable jesting with Olga."

"The devil knows what you consider unsuitable," muttered the master of the house. "Perhaps you would like it better if I joked with her about that long, lean hop-pole, Sonnenstein?"

"Certainly, my dear Edwin. That would be perfectly suitable. Sonnenstein is one of the best matches in the country, belongs to an ancient family, and has large estates."

"But his father did not bear the best reputation, and nobody cared to associate with him. He is said to have practised usury like the meanest Jew in the world."

"I think no one says anything against the son."

"No, but he is called a great simpleton. Now Gernerode is a very different fellow. Tall and handsome, sits his horse like a centaur, and shoots like a Norwegian bear-hunter."

"But in my opinion these qualities are not specially advantageous to a married man," said the countess coldly. "Besides, Sonnenstein is no simpleton, it is only his somewhat awkward manner that produces the impression. A wife like Olga will soon change that, and exert an extremely beneficial influence over him."

"So the unlucky Sonnenstein is to undergo a course of training too," muttered the count with a half-amused expression.

A look of pain flitted over the countess's features. She bent towards her husband, and said, in a tone far warmer than one would have expected from those stern lips,—

"Are you really unhappy, Edwin? Believe me, I am still more so in the thought that I am unable to give you joy."

"Why, what idea have you taken into your head, Vally?" replied the count peevishly; "everybody knows that you are an exemplary wife, what causes this ridiculous sentimentality? I sincerely wish, however, that the girls were all happily married, for there will be no peace until then. Unfortunately, there are too many of them, and before Lolo's turn comes, I shall probably be worried into my grave. Besides, another one will arrive day after to-morrow, but I hope, Vally, we shall not have to provide a husband for her too."

"You need not fear, Edwin. Erica will only be a member of our household for a short time."

"What do you intend to do with her then? Where is she to go?"

"Katharina, who, as you are aware, knows her, has already pleaded very earnestly for permission to take her. But I must test Erica's character very carefully before I give my consent, for Katharina is a fool, and, what is worse, a malicious fool, who is hard to deal with, and still more difficult to guide."

The count hastily started from his seat on the sofa. "Listen to me, Vally, I don't like this at all! I don't see why Erica can't remain with us. You were reared by her grandparents, for before your uncle Steinbach died you were as poor as a church mouse — that is, I mean of course quite poor — and so this is a debt of gratitude which we must discharge."

"You look at the matter in a false light, my dear Edwin," said the countess quietly; "the point in question has nothing to do with our advantage, but Erica's. Believe me, I have thoroughly weighed and sifted the whole affair, and given gratitude its full share in it."

"Of course you always have in reserve a special share of wisdom, which we ordinary mortals do not comprehend, so do as you choose. But I shall bring her home from the station myself, I insist upon that at least."

"I am very glad of it, Edwin, but I must not forget to tell you that old Countess Ingolstein is coming to pay us a long visit in a few days."

The count again sprang from his sofa, as if he had been raised by a spring. "Merciful heavens! *this* too, Vally," he exclaimed. "I shall order my travelling carriage at dawn to-morrow, and not return until I know the air is clear again."

"I hope you will not set out on this journey, Edwin, but on the contrary do the honors of your house with your usual cordial, though somewhat off-hand manner."

"That unlucky old Countess Ingolstein counts her marriageable grandsons and granddaughters by the dozen; there is certainly another net to be woven."

"Perhaps so, my dear Edwin," replied his wife laughing, "but aside from that, she belongs to a very noble family, and is allied to the best blood in Germany. Her second daughter is reigning princess of Rüningen, and we are obliged to show due consideration to such a relative."

"Well, one must search for the relationship with a microscope, it is a degree farther off than Gernerode's, which you will not acknowledge."

A slight frown darkened the countess's brow. "I believe, Edwin, that matter is so plain that it requires no explanation," she said in a tone of displeasure.

"It is rather difficult to follow your train of thought, my dear Vally. I shall be compelled to make out a list of the relatives who are agreeable to you, and carry it about in my breast pocket. But don't be angry, Vally! In consideration of the fat old countess's ruling and marriageable descendants, I'll play whist with her every evening at six pennies a point, though, Heaven knows, it isn't the pleasantest thing in life. Are you satisfied, and may I at last go to sleep? I can't keep my eyes open for weariness."

"Good night, my dear Edwin," replied his wife in a somewhat formal tone. "Oh! by the way, did you send off those important letters to Cologne early this morning, or not until the afternoon?"

The count, who was just leaving the room, paused as if rooted to the ground. "I really entirely forgot them!" he cried, drawing a long breath. "It is very unfortunate."

"It is indeed, as it may cause us heavy losses. If you like, I will write them myself at once, and send a messenger to the city on horseback, that they may go by the early train."

"You are my good fairy, Vally, I always say so. Now good-night and pleasant dreams," added the count kindly, without thinking that he had just deprived his wife of her night's rest by the burden imposed upon her.

The countess did not seem tired, for she turned towards the window, opened it, and leaned far out of the casement. The moon was flooding the lawn and shrubbery with its silvery light, which was also faintly reflected from the surface of the little lake. She gazed so intently into the park that it seemed as if she wished to distinguish something under the shadow

of the trees, and the melancholy expression of her features lent them unusual softness, and distinctly showed how completely she was absorbed in her reflections.

Suddenly she covered her eyes with her hands, and a heavy sigh escaped her lips, but the next instant her face once more assumed its former calm expression, she closed the window, rang the bell, ordered a servant to prepare to ride to Bonn, and then sat down at her table to write the letters.

Morning was already dawning, when she sealed the envelopes, handed them to the servant, and retired to her chamber.

XX.

THE OLD AND NEW HOME.

SINCE the terrible moment which separated Erica from her mother and her home, she had lived quietly and peacefully in the pastor's family, where she was treated with the most sincere affection and kindness. The child's natural grief for the loss of her mother was allowed full vent, and thus exhausted itself and left her mind free to once more admit the demands of life. By degrees her wild anguish melted into quiet sorrow, and in the same proportion the outward world again claimed her interest.

True, her walks were still always directed to her mother's grave, but her thoughts were no longer occupied solely with the beloved dead. The sea and forest gradually regained their old charms, and the brown eyes once more eagerly followed the white sails that furrowed the broad surface of the water.

Moreover, thoughts of the future obtained a more and more prominent place in her mind, her fear of it constantly increased; a separation from home seemed unutterably painful, and she also dreaded to enter a family of strangers. She grouped together all that she had seen of that other world — which had certainly been somewhat hostile to her — in order to form some idea of her unknown relatives.

The more brilliant the colors she selected, the greater was the contrast to her own person, and as youth easily runs to extremes, it afforded her a certain sorrowful satisfaction to pursue this contrast to the utmost limits of possibility. It was certain that she could only play the part of Cinderella, as Fräulein Molly had done among her relatives, and she felt so little inclination for the *rôle*, that at the thought her lips curled with an expression of defiance that had never before appeared in her character, perhaps only because opportunity had been wanting.

At last she tried to protect herself against her impending fate. She spoke frankly to the pastor, and begged him not to let her go away. In spite of her small share of worldly knowledge and prudence, she clearly perceived that she must not tell her guardian the true reason of her dislike to her relatives, since he would neither understand nor be disposed to consider feelings, which had a large mixture of vanity and arrogance. She therefore spoke only of her sorrow at being forced to leave her home and her true friends, and earnestly entreated him to save her from a fate, which, as she knew from her mother's lips, had not been the fixed purpose of the dying woman.

The pastor, however, did not think himself authorized to gratify Erica's wish, for the invalid had expressed in the strongest terms her joy that Erica would make the acquaintance of her relatives.

It would be very hard for him to give up his oldest daughter, as he called Erica, but he was so accustomed to obey the demands of duty, that this did not throw the slightest weight into the scale of his resolution.

Thus spring came only too soon, and with it the parting hour. Erica visited all the scenes which were familiar and dear to her, to bid them a solemn farewell. Her heart grew more and more heavy, for where could the spring be so wondrously beautiful as here, where else could it pour out its gifts with such lavish abundance? Now the tangled vines were twined gracefully around the verandas and houses, the blinds opened, and the fresh air streamed into the long-closed rooms. All the people in Waldbad rubbed the winter sleep from their eyes and prepared to receive the summer guests. Erica's old friends and acquaintances would soon arrive, and she must go away to a strange place.

And had not Elmar promised to come back this summer? How often she had recalled those words, how often asked herself whether he would keep his promise! Memories of him, which had been completely crowded into the background by her mother's death, unconsciously rose more and more vividly before her mind. She recalled every circumstance of their acquaintanceship, and on her lonely walks it was always his image that hovered before her memory.

Her departure would now separate her from him forever, he would inquire in

vain and then soon forget her. As a shield against this last thought, her imagination busied itself with the possibility of meeting him at the house of her relatives. They lived on the Rhine, and Caroline had said that his estates were not far from the frontiers of France, so he could not be a great distance away. He had given the pastor his address, that he might call upon him if his assistance should ever be necessary; she looked for the place on the map, but unfortunately there was no very large one at the parsonage, and she could not find the name.

It was a very fortunate accident that Consul Sternau was going to the Rhine on business just at this time, and would take charge of Erica, — the pastor himself would accompany her to Stettin. She went to every house, every hut, to bid the occupants farewell, and begged all to care for her mother's grave. Old Christine was almost angry, surely she was there to attend to the grave. The duty of taking charge of an empty house gave her plenty of leisure, and Erica rejoiced over the comfortable situation of the faithful old servant.

Christine felt special satisfaction in the thought that she could devote her attention to the well in summer as usual. "It is principally the pump, Erica," she said to the latter, "which made us get such a high price for the house. It is certainly worth a few thousand thalers to have the best water in the place, and I'm only surprised that our wise pastor doesn't think so too. Besides, I don't feel very much troubled about your going away, for I know you will soon come back and take your own little room in our house."

"What put that into your head, Christel?" asked Erica in surprise.

"I dreamed it, and afterwards went to Frau Wilms and consulted the cards, and they said so too."

"We will hope so, Christel," replied Erica, sighing. "But if the princess is really the purchaser, it will hardly be the case."

"Do you think the princess is the owner, Erica?"

"I don't know, Christel, but it doesn't seem exactly probable," replied Erica, changing the conversation with apparently causeless haste.

When Erica entered the carriage which was to convey her from her home forever, she cast a long farewell glance at the blue, boundless waves of the sea, on which the sunlight was sparkling, and then sank back overwhelmed with grief. Half the population of Waldbad was assembled, and the leave-taking of the fishermen and their wives and children did not end until the pastor gravely told his young coachman to drive on.

As in those days there were only short distances which could be traversed by rail, the journey to the Rhine was much longer than now, although the consul travelled by extra post and did not stop either day or night. At first Erica was completely absorbed in her own thoughts, and all the old gentleman's efforts to cheer her were unavailing, but afterwards she began to be interested in the country through which they passed, and when they at last took the cars at Cologne, thought she must be dreaming when the conductor announced the goal of her journey.

She left the train with a beating heart, and looked timidly at the crowd of strangers who thronged the station. It was a singular and therefore oppressive feeling to find herself among such a number of unfamiliar faces, and she clung anxiously to the consul's arm. The latter was occupied in looking for the person who had been sent to meet Erica, and seeing a servant in the livery described in the letter, instantly approached him.

Beside the man stood a fair-haired, fresh-complexioned, somewhat stout gentleman, who seemed to be attentively scanning the travellers. When he saw an elderly man with a young girl advancing towards him, he said to the servant, —

"Johann, old fellow, look, there they are!" and then went hastily towards the pair, stopped before Erica, and exclaimed cordially, "You must certainly be Erica, those are your mother's beautiful brown eyes."

The brown eyes gazed with a somewhat puzzled, but very joyful glance into the good-natured countenance before them. Was this the dreaded uncle, at whose cold, reserved manners she had expected to tremble? Could any country nobleman in her native province be more kindly and cordial than this aristocratic dweller on the Rhine? A sigh of relief escaped her lips, she smiled, and involuntarily held out her hand.

The consul made the necessary explanations for her.

"So this is Erica," continued the gentleman, with the same good-natured kindness. "Well, how do you do, my little mouse, give me a kiss and let me look at you, that I may see whether you resemble your mother. You are certainly a pretty, well-bred little girl. What do the women

mean" — the count suddenly paused in embarrassment, and then hastily added, "Come, my little pet, we must go; the horses have been waiting half an hour, and are ready to dash the carriage to pieces."

He took leave of the consul, and Erica was now compelled to say farewell to her last friend. She gave him a thousand messages to all at home, and begged him to tell the pastor in particular how much she was pleased with her uncle. The count laughed heartily at this commission, and said that he was equally overjoyed to make his niece's acquaintance. So they parted gaily, and Erica entered the carriage in the most cheerful mood. The spirited horses dashed swiftly forward, they soon reached the opposite bank of the Rhine, and ere long stooped before the castle-like house, which for some time was to be Erica's home.

Her heart again beat violently as she passed through the beautiful hall, to make the acquaintance of her aunt and cousins. The family was assembled in a room whose open windows afforded a view of the beautiful grounds. Count Rodenwald, who held Erica's hand in his, led her forward, saying, —

"Well, children, here is Erica. Welcome her and kiss her, and then give her something to eat. I suppose she is hungry, to judge from the wolfish appetite I have myself."

Perhaps it was only the contrast with her uncle's unceremonious manner, that made Erica fancy her aunt's formal greeting cold, for there was really no lack of cordiality. She embraced and kissed her niece, and then introduced her to her cousins. Countess Sidonie, who could not be numbered among them, had remained a little aloof, but, after looking keenly at Erica, came forward and said smiling, —

"We dwellers on the Rhine are like Highlanders, and claim kinship to the twentieth degree, so you must let me welcome you as a cousin too."

Erica gazed in mingled admiration and surprise at the tall, aristocratic young girl, who spoke to her so kindly, but she could find no words to answer, and was utterly unable to reply to the greetings offered on all sides. This, however, seemed scarcely expected, the young ladies who knew that Erica had come to the house to be "trained," as their papa called it, thought her embarrassment perfectly natural, and were good-natured enough to do everything in their power to save her from the unpleasant consciousness of her awkwardness.

They therefore accompanied her to her room, where she was left alone for some time to arrange her dress, as well as to become in some degree accustomed to her new surroundings. The impression produced upon her was far more favorable than she had expected; for although the ladies of the family were quite as elegant and aristocratic as she had anticipated, their manner fortunately showed no signs that they intended to allot to her the dreaded *rôle* of Cinderella.

She could not reflect upon the matter long, for she was soon summoned to join the family circle at dinner. Her seat was placed between Edith and her young cousin Fritz, but the latter seemed very dilatory, for his chair was still empty.

"Where is Fritz?" asked the countess, who could not endure any such negligence on the part of a member of the family. "I remember I did not see him come with you."

The count made a hasty gesture of annoyance, and struck his forehead with his hand. "Well, this is a fine business, Vally! I entirely forgot the youngster, and left him in Bonn."

The countess was evidently much annoyed by the news; she cast a grave, almost reproving glance at her husband, but controlled her indignation and said with a half-smile, "It is certainly unfortunate for poor Fritz."

"Ah! well, he can come with the boatman, it is certainly not too late yet."

"The post-bag has been lying on your table for half an hour, Count Rodenwald," said Werner.

The poor count could not shake off his embarrassment. "Indeed," he murmured, "I entirely overlooked it. But why does no one ever remind me of anything?" he continued, in a loud, angry tone. "Why do I have two lazy rascals sitting on the box, if they can't think for me occasionally?"

He looked angrily at Johann, but the latter — who when alone with the count never hesitated to defend himself — did not venture to utter a syllable in the countess's presence, but continued to pass the soup-plates with the same grave, dignified manner. The strict mistress, however, would not suffer her servants to be unjustly reproached, and instantly undertook the defence of the accused Johann.

"You forget, my dear Edwin, that Fritz went to Bonn in the boat, and therefore neither Johann nor the coachman could

know of his presence there; otherwise they would undoubtedly have reminded you to take him."

Perhaps the last remark might have conveyed a slight reproach to her husband, at any rate the count took it so, for he answered angrily,—

"The whole affair springs entirely from your exaggerated attentions to that young fop, Prince Eduard. What was the use of sending Fritz to make special inquiries about his health? He was as lively as a fish in water yesterday, and if he didn't dance, it was only because nobody whistled for him."

Countess Sidonie looked up from her plate and glanced at her aunt, who was sitting beside her, but the latter did not raise her eyes. Singularly enough all the young ladies seemed to take a deep interest in the clearness of their soup, a slight, uncomfortable pause ensued, and all felt relieved when the door was suddenly thrown open, and Fritz entered the room.

"Here I am!" he cried laughing. "I hope you will make preparations to kill a fatted calf and order singing and dancing to celebrate the return of the lost son. Ah! my chair has been placed beside the new cousin," he continued, taking his seat. "That's a very charming attention. As I know you are Erica," he added, turning gaily towards her, "and you are probably equally well aware that I am Fritz, we need no introduction. Only you must be told one thing, that in our family children under twenty call each other thou."

"Could you not check your torrent of eloquence long enough to permit me to ask you how you got home, my dear Fritz?" asked the countess, in a somewhat reproving tone.

"In the best way in the world, mamma. Just as I reached the station, I saw our carriage rolling away at some little distance, and could easily conclude that papa had forgotten the idol of his heart. I quickly formed my plan and went to the Star, where I knew I should find Sonnenstein, who was just driving away. He took the suggestion that he should go round by Dorneck as a special favor to himself, which considered in the right light it certainly was, and so I sat down in the most comfortable corner of the carriage, and alighted just now at the door."

"That was very kind in Sonnenstein, and you ought to have invited him to dinner. How is the prince?"

"Just as well as ever, mamma. He is all ready to sprain his ankle again at the next visit."

The countess did not seem particularly pleased with her son's last answer, for she turned away and spoke to Sidonie. Meantime Erica wondered at the variety of dishes offered to her; it seemed quite impossible to eat all these nice things. Count Rodenwald, who sat opposite, mistook her abstemiousness for diffidence, and pressed her so urgently to take something more, that only the countess's interference saved her from indigestion.

Her young neighbor talked in the gayest manner during the whole dinner, but when they rose from the table, he became faithless, and with a laughing apology offered his arm to Sidonie. Erica perceived with some surprise that Count Rodenwald ceremoniously offered his arm to his wife, and escorted her out of the dining-room. As her cousins followed in pairs, she joined the procession, and went into the grounds, where coffee was served in a vine-covered arbor. Werner and the governess alone were absent from the little circle, and either for this reason, or because all felt in better humor, the conversation was much more free and unconstrained than at the table. Various allusions were made to events with which Erica was unfamiliar, and for the first time a feeling of loneliness, of being in the way, stole over her.

But this state of affairs did not last long, for directly after coffee was served Fritz asked her to walk in the park with him, and his merry conversation soon recalled her former mood.

"I want to tell you, Erica," he said, "we too are in certain measure assigned to each other, so we must strike up a friendship. I have only been here a few months, for I was educated by my uncle, who lives in Eifel. Well, the training of my dear old uncle, the fox-hunter, as Sidonie calls him, has not turned out exactly as mamma desired, so I have come home as a rough diamond to be polished into a brilliant. You, little heather-blossom ——"

An involuntary gesture silenced him. He noticed with surprise the deep blush that crimsoned Erica's cheeks, and was still more astonished when she asked, in a somewhat faltering voice, —

"Who told you that, Fritz?"

"Who told me, Erica?" he answered laughing, "my eyes, my brilliant though unpolished reason."

"I have sometimes been called so before — and — and so I thought — you had been told," faltered Erica in great confusion.

Fritz paused before her and gazed earnestly into her face. "*Et tu, Brute?*" he said, pathetically. "Erica, you have no idea of the extent of the perspective you have opened. We have four graces here already — for even the saucy schoolgirl, Edith, makes pretensions to admiration, though she is a year younger than I — who are surrounded like suns by adoring moons. All these various luminaries produce a most decided summer heat, and the warmth is quite enough for one family."

"I don't understand you, Fritz," murmured Erica, with another blush.

Much to the dissatisfaction of the boy, but on the contrary greatly to Erica's relief, the conversation between the young couple was now interrupted by others, and the remainder of the walk was taken with a large party.

XXI.

IN THE FAMILY.

THE larger circle and totally different surroundings into which Erica suddenly saw herself transplanted, at first produced an almost bewildering influence upon her. She learned so many new things, saw so much that was beautiful, that she could not understand all these impressions, but contented herself with yielding to them. The contrast between her former and present life was so greatly in favor of the latter, that she smiled at her old fear as a childish fancy.

Unfortunately we are all only too much inclined to bestow our special attention on the beautiful husk, and thus it was perfectly natural that the easy, aristocratic life of the new relatives should win the victory over the simple parsonage, with its narrow, commonplace routine of everyday existence. How could the pastor's wife, constantly engaged in the kitchen and nursery, dear and kind as she was, compare with her stately aunt, whose wider view of life embraced other and far greater interests? Even the atmosphere of careless good-nature that surrounded her uncle always possessed a certain something which plainly marked the man of rank, and the pastor's manner, which, spite of his ministerial dignity, was somewhat angular, always suffered when compared with this negligent ease.

Comparisons with the habits of the family, which in Erica's eyes invested even the most ordinary events of everyday life with a certain halo, were still more unfavorable to the parsonage. The housekeeping machinery, which in the latter home appeared so often that one might almost be induced to forget it was only the means to an end, here remained completely out of sight; the fruits were enjoyed without being reminded of the trouble of planting and watering. What a turmoil of baking and coffee-making, what flushed faces and occasionally scolding words always preceded the coming of visitors in the parsonage, while here guests were almost a part of the programme of daily life, and did not seem to require any special orders from the mistress.

When the folding-doors of the dining-room were thrown open, and the ladies in elegant toilettes, and even her uncle in his comfortable frock coat, entered and took their seats with a certain degree of formality, the whole matter acquired an appearance of solemnity. The liveried servants who so quietly took their usual places, and moved so noiselessly and quickly that Erica at first had some difficulty in being ready for their attendance, strengthened the impression made by the numerous courses to which she was unaccustomed.

There was certainly very little ceremony at the parsonage at meal-times, which were usually preceded by Erica's hunting for the scattered children, and when she had collected the little flock, the master of the house, who, absorbed in some train of thought, had failed to hear the summons to dinner, was usually missing, and at last dragged out in his dressing-gown by his desperate wife. Serving the food, though the work was performed by a single maid-servant, was nevertheless somewhat noisy, and the pastor's wife — whose eyes constantly watched the unfortunate Guste — continually exclaimed: "Take care of the plates, Guste! you knock them about as if china could not break. Don't hold the dishes so, you will spill everything, and don't let the spoons fail on the floor, you have dropped enough already."

True, the more brilliant exterior of her new home did not lessen either the love or earnest gratitude which Erica cherished for her foster-parents, but it aided her to overcome her sorrow at parting from them far more than she realized, and even helped her — so dependent are we upon external things — to become accustomed to the unusually cool temperature of feeling which pervaded the family circle, and — like autumnal skies — diffused sunlight without undue heat.

Count Rodenwald's warm reception had so completely won Erica's heart, that he could not fail to retain his advantage for a

long time. His easy, good-natured manner was doubly attractive, because it reminded her of her home, and she was therefore neither disposed nor able to attempt any more profound analysis of his character. She rejoiced in his kindly cordiality, without inquiring into its real cause, and though he was certainly inclined to consider only his own pleasure, she thought this perfectly natural for the master of the house. Although even her ingenuous nature soon discovered that her uncle's society did not specially improve her, nay, on the contrary that he liked to amuse himself with her little weaknesses, she did not reproach him for it, since he never set up for her instructor, and moreover entertained her as well as himself.

Thus her feelings were exactly like those of the children of the family, and even the servants, who all showed Count Rodenwald the greatest affection. In consideration of his pleasant, cordial manner, they cheerfully bore causeless blame, and sometimes even violent anger, which was usually called forth by some error he had himself committed. His inexorably strict, but perfectly just wife never rejoiced in love so warm. She was more feared than loved, but in compensation for this, received a far greater share of respect, and a piece of negligence which might easily have been shown the count, would never have been offered to the countess.

In the wider circle of their acquaintances, the married pair received precisely the same relative share of respect and affection that was bestowed upon them in their own household. When the count answered with a cordial nod and a few friendly words the joyous greetings that everywhere saluted him, his wife responded more formally to the reverential bows her appearance called forth. On seeing the former, people dropped their work to be ready to answer a jest; at the sight of the latter, on the contrary, every one felt an involuntary impulse to be industrious, since her keener eyes would instantly detect the slightest approach to indolence.

The countess's strict household was considered by all the humbler citizens in the neighborhood as the best school where their daughters could be trained to the duties of their future callings, and she was always besieged with requests of this kind. As a rule, the petitioners pleaded on such occasions the godfathership of the count. The latter, with most amiable readiness, accepted every request to stand as godfather, presided at the christening feast with great hilarity, to the delight of the host, and then left all the duties growing out of this relationship to be performed by his wife. Godchildren as cooks and waiting-maids, or valets and gardeners, graduated in vast numbers from the household. The master of the house quietly accepted the praises the admirably trained Lisettes and Lebrechts brought him, and secretly sighed over the lectures of his wife, who most earnestly entreated him to put some limits to these extensive obligations.

Erica's feeling towards her aunt was affection mingled with extreme timidity. Her nature seemed so unapproachable, the gulf formed between them by age and position so impassable, that she despaired of ever being able to cherish any warmer emotions. She could now laugh merrily at her former fear that she would ever be degraded to the situation of a Cinderella in this household. Under the countess's rule, even the most insignificant kitchen maid did not feel herself so oppressed, since though strictly watched in the performance of her duties, she was also protected in her rights. The countess treated Erica exactly like her own daughters, nay, even lavished still greater attention upon her.

Slight as was the evidence of it in external things, Erica felt this constant watchfulness in a thousand trifles, and would have been far more grateful if the consciousness of this perpetual observation had not oppressed and often rendered her uncomfortable. Besides, she did not know exactly what to do to please her aunt, since the standard her mother and teacher had hitherto given her seemed to have no existence here. The countess rarely issued a positive command, or reproved a fault, but directed Erica's own attention to it, and let example and the atmosphere that surrounded her exert its influence.

The young girl soon began to instinctively feel every breach of social etiquette which she committed; by degrees she also obtained familiarity with the laws that ruled in this sphere, and took her position in the family circle on equal terms. Her quick perceptions enabled her to understand her surroundings with a tolerable degree of accuracy, and although the halo through which she had at first seen them was somewhat diminished, enough pleasant and beautiful things remained to make her stay with her relatives seem desirable.

The lavish scale of expenditure on which the household arrangements appeared to be conducted, showed itself, on

closer examination, to be a well-regulated, carefully calculated system of housekeeping, and if the countess apparently troubled herself very little about household cares, it was only because she understood the great art of directing the labor of the servants. She had all the threads of the great establishment in her hand, and required the most thorough account of the work of all her domestics. There was not one of them who did not know him or her self to be overlooked, and would not have feared the keen eyes of the mistress of the house.

Erica, who had been considered by the pastor's wife almost a child, now gradually learned to understand the management of a great household, and by equally slow degrees felt herself an active member of it. She had her own sphere, her strictly appointed duties, which were certainly not difficult to fulfil, as they neither robbed her of much time nor imposed a heavy burden upon her, but which must be punctually and carefully performed, and therefore made her accustomed to order and exactness. Her cousins were in precisely the same condition, each had her allotted task, and the elegant young ladies, whose lives seemed to be devoted solely to amusement, appeared, on closer acquaintance, to be strictly reared to the performance of household duties.

Sidonie alone formed an exception to this rule, as she occupied an exceptional position in the family. Several years ago, when death had robbed her of her parents in quick succession, she had entered the household, but her education was conducted on such widely different principles, that the countess seemed in her case to have completely set aside her usually immovable rules.

On her estates at the old family castle of her race, Sidonie had been reared more like a sovereign princess than the child of a simple count. The old servants, whose forefathers had served the family in the same positions for centuries, saw in their lord a sovereign who possessed unlimited power over their fate, and regulated their conduct accordingly. The lonely life at the castle, only interrupted by the humble visits of the inhabitants of the little city at its feet, favored the arrogant self-esteem, which was only increased by occasional intercourse with people of the same rank, who were also isolated in their own little world.

This seclusion not only heightened the feeling of personal dignity, but prevented a just understanding of the interests of the present day. The strong, irresistible torrent of new ideas had only cast the spray of its waves at the foot of this castle founded on a rock, and the inmates had carefully endeavored to protect themselves against the flood. They were not content with simply lamenting the "good old times," but clung to them with an iron grasp, and as every glance, every entrance into the world only too plainly showed the contrast between matters without and within the castle, they were all the more inclined to shut themselves up more closely than ever, and add still greater strength to the wall between them and the outside world.

In this way the contrast naturally became yet more distinct, and though a child of modern times would probably feel a little inclination to laugh at the sight of this ancient world, it contained so much that was really lofty and noble that on a closer examination the sense of the ridiculous would be silenced. Duty stood in close connection with right, and the strange formality was only a somewhat comprehensive paraphrase of the old motto, *noblesse oblige*. It would certainly be a universal loss if the battering-rams of the present day should level these old family castles, instead of, like good pioneers, building bridges to them from the rocks in the valley. Such a poetic charm pervades the towers and dungeons of these old feudal manors, the singular mode of life in their ancient halls, that the southern portion of our native land possesses a decided advantage over the northern in these very historical traditions.

Amid these surroundings and in the views of this world, Sidonie had been reared. As an only child and sole heiress, she was even more the centre of universal attention than would perhaps have been the case under different circumstances. Thus a feeling of self-esteem had taken root in her childish heart, which gave her bearing a dignity beyond her years, and though it certainly protected her from many a youthful folly, also deprived her of many a youthful pleasure. When about ten years old, a distant relative suddenly put forth claims, which, if legitimate, would deprive Sidonie of the larger portion of her property. Young Count Meerburg's guardian had found a document, according to which his ward was the real heir of most of Count Hardenfels' estates.

True, these estates were entailed on the oldest male heir, but it had hitherto been

supposed that in default of male descendants of the race, the daughters would inherit the property. Documents supporting this view of the case were found in the archives of the castle, nevertheless the proofs brought forward by the zealous guardian seemed incontestable, and a long, unpleasant, and — for Sidonie's interest — very uncertain law-suit appeared inevitable, when Count Hardenfels himself proposed a compromise by means of a marriage between the two children, a plan which was cheerfully accepted by the other party, so that the affair seemed finally settled.

The two young people thus destined for each other were once brought together, as if by accident, but they showed no liking for each other's society, and the attempt was not renewed. Meantime, Sidonie's parents and young Count Meerburg's guardian died, and Sidonie, without any protest from the other claimant, took possession of the property.

She had gone to the house of Count Rodenwald, her mother's brother, and though the family heard of the contract, they had not the most distant idea of its importance.

Count Meerburg, who had attained his majority a few years before, seemed on his side to attach little importance to his union with Sidonie, for even when, after several years spent in travelling, he returned home, he had hitherto neglected to take any step towards consummating the marriage, thereby increasing Sidonie's aversion to the enforced nuptials; and as she herself felt constrained to fulfil the contract only from a sense of filial piety, this negligence almost made her believe herself absolved from the necessity of the sacrifice.

In her uncle's house, where, notwithstanding all aristocratic feelings and class prejudices, the stream of new ideas flowed freely, Sidonie had at first scarcely been able to see her way clearly. She met with so many strange and unfamiliar things that she was bewildered; and this novelty, on closer examination, was so different from what she had supposed, the world assumed a shape so entirely unlike her expectations, that she was almost stupefied. With a simplicity which often provoked smiles from those who surrounded her, she observed these new relations, found familiar, matter-of-course things singular, and many others, which were well adapted to excite universal surprise, perfectly natural.

Her greatest perplexity was of course excited by the numerous highly cultured people who were not of noble birth, but nevertheless surrounded by all the luxuries of life, and whose perfect acquaintance with all the forms of social etiquette made them appear thoroughly aristocratic. Without ever giving the matter a serious thought, she had really believed that people who did not belong to the nobility were all employes and servants of the latter class, and only made an exception in behalf of clergymen — though even them she thought exclusively of as castle chaplains.

Now she encountered an unknown throng of human beings, who bore such an unexpected stamp of equality, that it was unpleasant to her, wounded her self-esteem. Besides, she saw — what she had thought equally impossible — persons of the most noble birth in very reduced circumstances. A distant cousin, whose armorial bearings dated from the earliest centuries, had given her a terrible shock, when in reply to a question about the number of her drawing-rooms, she laughingly answered: "My dear, I have none at all, and receive my callers in my sitting-room. An officer's wife must not occupy a great many apartments, furniture is very troublesome when one is constantly moving." Sidonie could not understand such deficiencies, except as a token of the most pitiable deprivation, and admired the heroism of the young wife's gay laugh.

In a certain sense she fared like Erica; she saw herself transported into a new world, only the two young girls were obliged to enlarge their views of life from widely different standpoints. Sidonie possessed sufficient good sense to accommodate herself to her new surroundings, but the bias received in early childhood had already become too strong to permit an entire transformation in her views of life. She had certainly obtained a wider field of contemplation, but she did not consider what she saw necessary or even good, yielded with a mental protest to the laws of this changed, disjointed world, and was secretly inclined to consider it what the Bible termed the opposite of right and pious.

Nothing but her real amiability, her thoroughly noble nature, could counterbalance the narrow-mindedness and prejudice which sometimes appeared with startling prominence. Her intense pride, which was almost unconsciously softened by girlish modesty and diffidence, scarcely seemed offensive, but appeared a natural attribute of the beautiful, queenly figure. The winning cordiality that sometimes

burst through the cold reserve of her manner, was doubly charming from the force of contrast, and though her bearing was usually repellent rather than attractive, she was perhaps all the more eagerly sought.

She had become warmly attached to her aunt, to whom she felt sympathetically attracted, and with her cast aside her cold reserve, displayed the deepest affection, cheerfully submitted to her keen intelligence and quiet dignity, and thus, in the course of time, was almost dearer to the countess than her own daughters. While the latter were still induced with difficulty to adopt their mother's views, Sidonie readily understood them, and what the young girls felt as a slight restraint, to which they yielded with sighs, Sidonie found a matter of course, and perfectly agreeable.

Thus she and the eldest son of the house were more warmly attached to the countess than to her husband, and as in every large family little cliques are unconsciously formed, she and her cousin Ottomar drew closer to the countess, making a circle which of late Edith, though as yet not fully emancipated from the schoolroom, had tried to join. The other children, on the contrary, were more attached to their father, and though they perhaps esteemed the countess's talents more highly, their hearts drew them towards the good-natured count.

When Erica entered the circle and, attracted by her uncle's affectionate cordiality, gave him a special place in her heart, she involuntarily receded from Sidonie, and drew nearer to her cousins. The young ladies met her with the same warmth, and tried to make her feel at home among them, an effort for which Erica was extremely grateful, until she detected a shade of patronage that was somewhat oppressive.

Although ignorance of social forms now made her irresolute and embarrassed, her nature was too independent not to speedily feel these chains burdensome, and at the same time try to shake them off. Besides, to her great surprise, she gradually perceived that she was far superior to her cousins in actual knowledge. Moreover, although in consequence of the peculiar circumstances of her early education, Erica's mental horizon was at first far more limited than her cousins, it now, after she had entered this new world, became much wider. For instance, relations that were utterly incomprehensible to Sidonie, and in which she knew not how to act, Erica thoroughly understood, and instantly solved the problem.

Gifted with great keenness both of bodily and mental vision, which was increased by early training, she surprised not only her cousins, but sometimes even her aunt, by her quick comprehension of things hitherto utterly unfamiliar, and thus soon exerted over the younger members of the family an influence which completely paralyzed the superiority afforded them by their greater skill in matters of etiquette. Yet, in spite of this mutual intercourse, no really warm affection existed between them, perhaps in consequence of an unconscious feeling of jealousy. Moreover, her two older cousins were for the present so engrossed with their love affairs, and the similar misfortune of knowing that the men chosen by their hearts were not favored by their mother, drew the two sisters so closely together, that they had scarcely room for a third person in their thoughts.

Sidonie had approached Erica with heartfelt sympathy, and imagined her to be a person so harshly treated by fate, that she was almost unpleasantly surprised when she perceived that Erica herself did not view her position in this light. While she was affected to tears by the description of the young girl's childhood, she heard Erica speak of former days with delight, and saw her eyes beam joyously when reflecting upon the past. Her warm sympathy was transformed into astonishment, and at last into a sort of indifference, so that for the present there was a very slight tie between them.

Therefore it happened, almost as a matter of course, that Erica became most intimate with her young cousin Fritz, to whom she was united by the very bond of interest Sidonie lacked. His education, so far as unlimited freedom of movement was concerned, had resembled Erica's, and thus the habit of rambling about unrestrained, which was entirely foreign to the other members of the family, drew them together. As the pastor had earnestly entreated Erica not to neglect her studies, and she was scarcely able to continue them alone, she was attracted to the young governess, and thus of course saw a great deal of her youngest cousin, Lolo. She was teased a little about her youthful companions, and jestingly included under the title of "the children," which appellation was perhaps the principal reason for Edith's absence, since she dreaded to be called by that name, even in sport. This was the sole cause of a want of harmony

between herself and Fritz, which rarely occurred in the family; for while Edith, as a young lady, attempted to look down on the "boy" Fritz, the latter decidedly asserted his year of seniority.

"The children," however, sometimes justified their name by behaving somewhat foolishly. After Erica had partially overcome the bewilderment at first produced by the glittering exterior of her new home, she often painfully felt the loss of the unrestrained freedom she had hitherto enjoyed. She would not give the name of walk to the short strolls of the people here, and her aunt strictly forbade her to ramble about in her old way. Only when accompanied by others, and thus of course by Fritz, was she permitted to climb the hills, feast her eyes on the wide horizon, and breathe freely, unoppressed by the narrow limits of the beautiful valley.

She was wholly unintelligible to the others when she spoke of this narrowness. They laughed when she said she needed a horizon that extended for miles, in order to breathe easily, attributed the fancy to an almost absurd predilection for her old home, and thought time and habit would soon make her smile at it herself.

Even the luxuriant fruitfulness of the happy valley, which at first had so charmed her, now caused a vague sense of oppression, for her eyes had no opportunity to gaze over barren, desert tracts of country, and revel in their wild romance, in which the charm of the terrible blended with the deep solitude. In the same way, the green Rhine seemed beautiful, but a little narrow, and its waves, when contrasted with the towering surges of the sea, too tame and peaceful. Her aunt's prohibition to row on the river, on account of possible danger, secretly excited an inclination to laugh.

The more familiar she became with her new surroundings, the more the first halo disappeared, and the more decidedly every comparison resulted in favor of her former home. As if in punishment, all the things which had at first so greatly outshone her memories of her old life, now turned against her and tortured her with sharp stings. Even the long floating dresses her aunt had had made for her as soon as she arrived, and with which at first she was so much delighted, now seemed like fetters, for they constantly prevented any freedom of motion. Homesickness weighed more and more heavily on her heart, and though she tried to conceal this sorrow from those who surrounded her, it gnawed all the more painfully within, and she would gladly have sacrificed all the splendor around her for the simple life of former days.

Her cousin Fritz, whose education had been somewhat similar to her own, and who had therefore entered with difficulty, and not without some little resistance, into the smooth current of daily life in his parents' house, was a real consolation to her. In him she found some one who understood her, who possessed the same tastes, and as her aunt seemed to approve of the companionship, it was Erica's best support through this trying time.

True, this approval was only apparent on the countess's part, but her quick intelligence soon perceived that here a somewhat more devious path must be pursued to reach the goal. She therefore gave Erica more feedom than she herself liked, because thus alone could she hope to gradually induce the young girl to adopt the habits of the household.

From Blackwood's Magazine.

SCHOOLS OF MIND AND MANNERS.

THE word education has always carried with it two distinct ideas — the acquisition of knowledge, and the discipline which fits for society. One man means by it the power that stimulates thought and brings it in relation with the past; another, the training which adapts the individual for intercourse with his kind. The education of knowledge is compatible with an utter deficiency in the habits and qualities which help men socially; the education which takes the body in hand, and the mind as it regulates temper and manners, may accomplish its object with little help from large and accurate knowledge, or culture of the purely intellectual faculties. We say culture, as distinct from native sense, for a basis of understanding is indispensable for all success; nor can the merest external training effect its purpose unless the intellect works even energetically towards the aim in view. The brain has its part in every effort — nothing is well done without its sustaining action. In old days we find these two modes of training had their appropriate spheres and seasons rigidly assigned to them. Collegiate life drilled the mind: the court — if the pupil had to be made a fine gentleman — took the body and manners in hand, and educated through the outside and the contagion of example; through deportment, expression, action, voice — all that mani-

festation of self that acts on others, and which is caught by observation, and by contact with what is decorous and graceful in manner and phrase. In universities men were made learned; in high-bred society they were taught to please: neither sphere infringed on the other. Those who passed their lives in colleges thought polite society frivolous; and fine gentlemen and ladies regarded the seats of learning as the homes of "rusticity and morosity." Of course there were acknowledged exceptions — the scholars who were also men of the world, and men of distinguished manners who were also deeply read; but it used to be assumed that learning and manners could not be learned in the same school. The satirists of last century delighted in showing up the uncouth pedantry of the one class, and the ignorance, levity, and affectation of the other. The accomplished gentleman must first learn from books, and then set forth on his travels; from which, if we may judge from the notices of the time, more marvels were expected than were often compassed. The bear and the bear-leader, fresh from the seat of learning, made a poor figure to practised eyes. "Most of our travelling youth," writes Lady Pomfret from Florence (1740), "neither improve themselves nor credit their country. This, I believe, is often owing to the strange creatures that are made their governors, but as often to the strange creatures that are to be governed." But the system was an acknowledged one. This "inundation of poor creatures" had a recognized claim on their compatriots; and the great lady, in fact, made her drawing-room at Florence a school of manners, when, to provide against the inconveniences of this inundation as a constant invasion, she opened it for a general reception once a week. "I shall be at home every Friday evening, and at no other time, when I shall also have the pleasure of seeing all the Florentine nobility, whose hospitality and politeness I can never enough commend." But this all belongs to a past day. Learning and propriety of manners have agreed to a compromise. If we have fewer prodigies of erudition, we have fewer prodigies of another sort. Our scholars have learnt even to dispute and quarrel in polite terms; and college training, if it does not accomplish what nothing but intercourse with good general society can accomplish, at least does not overlay its pupils with a rust hard to be rubbed off.

So far, however, in our remarks, education has meant only the education of men. In the last century, at any rate, the one prevailing idea of education for women scarcely included learning at all. It meant simply and emphatically the discipline which fits for society. Through more than half that period manners were the thing in question — manners, and how to improve them; for clearly there was everywhere a great falling off from what had been, whether in France or England. We find Madame de Maintenon (in 1707) confiding to her friend, the Princesse des Ursins, in very plain language, her feelings on this point: "I confess to you that the females of the present day are to me insupportable: their ridiculous and immodest dress — their snuff, wine, gluttony, coarseness, and indolence — are all so opposite to my taste, that it is natural for me to dislike them." "The Spectator," at a date two or three years later, remarks upon the same characteristics, and dreads the conclusion of the war for the influence peace may have upon English ladies. "The whole discourse and behavior," he writes, "of the French, is to make the sex more fantastical, or, as they are pleased to term it, more 'awakened,' than is convenient either with virtue or discretion. To speak loud in public assemblies, to let every one hear you talk of things that should only be mentioned in private or in a whisper, are looked upon as parts of a refined education. At the same time, a blush is unfashionable, and silence more ill-bred than anything that can be spoken." Under this teaching he records the behavior of a fine lady, newly returned from France, at the performance of "Macbeth," who, before the rising of the curtain, breaks out in a loud soliloquy, "When will the dear witches enter?" and before the play was half through, has formed a little audience for herself. "This pretty childishness," he says, "is not to be attained in perfection by ladies who do not travel for their improvement," to add, as it were, point to their ignorance; in imitation of those ladies of the court of France who thought it ill-breeding to pronounce a hard word right — for which reason they took frequent occasion to use hard words, that they might murder them. This authority further adds "that a lady of some quality at court having accidentally made use of a hard word in a proper place, and pronounced it right, the whole assembly was out of countenance for her."

We are not to wonder, when the acknowledged school of politeness had fallen into this decadence, that English manners should be open to criticism. A writer in

"The Tatler" laments (Aug. 1709) "the unaccountable wild method in the education of the better half of the world — the women. We have no such thing as a standard of good breeding." "I was the other day at my Lady Wealthy's, and asked one of her daughters how she did. She answered, she never conversed with men. The same day I visited at Lady Plantwell's, and asked her daughter the same question; she answers, 'What is that to you, you old thief?' and gives me a slap on the shoulder." "Certain it is," he adds, "that the taste of grace and beauty is very much lowered. The fine women they show me nowadays are at best but pretty girls to me, who have seen Sacharissa, when all the world repeated the poems she inspired. They tell me I am old: I am glad I am so, for I do not like your present young ladies." He is apt to think that parents imagine their daughters will be accomplished enough if nothing interferes with their growth or their shape. He sees with indignation crowds of the female world lost to society, or condemned to a laziness which makes life pass away with less relish than in the hardest labor, and forms the idea of a female library, for the cultivation of their minds, with the promise, however, that the books shall not be so deep as to hurt a single feature by the austerity of their reflections. Books, however, came very little into the popular ideas of the right training for girls. Needlework, and a good carriage, were the two points aimed at as the important things. The father wants to send his little girl of nine to a boarding-school in a good air. "I would endeavor," he writes, "she might have education — I mean, such as may be useful, as working well, and a good deportment." The wife opposes "that she is too much a woman, and understands the formalities of visiting and a tea-table so very nicely, that none, though much older, can exceed her." All that is said or implied by Swift of the ignorance of women of this period is borne out by the essayists. He complains that "not one gentleman's daughter in a thousand can read or understand her own natural tongue, as any one may judge who can have the patience to hear them when they are disposed to mangle a play or a novel. They are not so much as taught to spell in their childhood, nor can ever attain to it in their whole lives."

But women, as a fact, being so much more independent than men of regular hard head-training, we mean in everyday social intercourse, — having, as we see, such a knack of catching the prevailing tone of thought, — this ignorance did not really press on the literary public mind to the same extent as hoydenish manners. The finely-mannered woman, whether she could spell or not, being necessarily a woman of good understanding, held her own wherever she found herself.

But all this while there was a tradition of better teaching. One lady wrote an essay to revive the ancient education of gentlewomen in religion, manners, arts, and tongues, with an answer to the objection against this way of education; and the few women who were educated in book education were taught on a thorough plan. Dr. Carter, father of *the* Miss Carter, gave to all his children alike a learned education. The daughters showed a singular aptitude. "My sister Margaret," writes the distinguished Elizabeth, "is studying, or rather seizing upon, Greek." But how extraordinary these pursuits were in women we may gather from the fact, that it was gravely put about in Deal that Miss Carter was going to be a member of Parliament. "Here's all Deal," writes a member of her family, "is in amazement that you want to be a member of the Parliament House; and Mrs. —— was told it, but so strongly affirmed that it was no such thing, that she came to our house to ask." All learning in those days, indeed, all literary taste, turned a woman into a celebrity with the drawbacks of the position. Thus Johnson amuses himself with Lady Hartford's poetical turn in his life of Thomson. "'Spring,'" he writes, "was published in 1728, with a dedication to Lady Hartford; whose practise it was to invite, every summer, some poet into the country, to hear her verses and assist her studies. This honor was one summer conferred on Thomson, who took more delight in carousing with Lord Hartford and his friends than assisting her ladyship's poetical operations, and therefore never received another summons." And yet this lady, besides being a good wife who nursed her husband tenderly in the frequent fits of gout earned by these carousals, was a woman of cultivation and intelligence, as we see from her correspondence with her friend Lady Pomfret, whose experience of travellers of the grand tour we have quoted above. But the rarity of literary distinction in the women of her day, gave a tone to those who cultivated their minds which provokes a smile in the modern reader. These two retired ladies of the bedchamber compliment one

another on the excellence of each other's letters, in a strain which sounds almost fulsome to our ears, but is really honest surprise in both that so much thought, observation, and accuracy of expression should flow from a female pen. Lady Mary Wortley Montagu, more witty and less estimable, comes into their circle. It was an intellectual set of fine ladies, distinct and by themselves. More popular than art, poetry, or the classics, or the books that dealt with such matters, was a volume from the French, "The Art of being Easy at all Times and in all Places, written chiefly for the use of a Lady of Quality" — a work which, if it only succeeded in imparting its lessons to the reader, was not only a useful study for that time, but one which none, even of our more enlightened day, would willingly be without. No age is without its examples of women who have left their mark on literature beyond their own time; but we gather that the Countesses and Lady Mary's, the Miss Carters and Miss Talbots, did not advocate for the use of their sex the same teaching they had acquired for themselves. There is no doubt that the clever women who wrote or led society thought manners the most material point for young ladies with whom they were concerned. Dignity of deportment and behavior, the graces which set off women in society, the good breeding that made home peaceful and delightful, the piety which regulated private conduct without disturbing social life, formed the ideal of the most thoughtful and serious. Some did not go so far in their requirements; and with these there probably was not wanting a sense of complacency in being singular in their attainments. But also there was no machinery for a diffused higher education for girls. We do not doubt that the *unlearning* was more valuable than the teaching of the ordinary school.

I am glad [writes Mrs. Montague, as late as 1773] you intend sending my eldest niece to a boarding-school. What girls learn at these schools is trifling, but they unlearn what would be a great disservice — a provincial dialect, which is extremely ungenteel, and other tricks that they learn in the nursery. The carriage of the person, which is of great importance, is well attended to, and dancing is well taught. As for the French language, I do not think it necessary unless for persons in very high life. All the boarding-schools are on very much the same plan, so that you may place her wherever there is a good air and a good dancing-master.

This seems worldly enough. Whatever a woman's actuating principles, they would now have been veiled by a decorous reference to religion and morals. But, in truth, manners were the paramount consideration in all polite circles, as constituting the only distinction — as they will always be the main distinction — between classes; and how to shine in the drawing-room was the test of them. It was this prevalent idea that stirred the republican spirit of Day to write his "Sandford and Merton," and provoked the sting of the epilogue, —

Hearts may be black, but all should wear clean faces;
The graces, boys! the graces, graces, graces!

But good people, with whom religion was a reality, laid much the same stress upon good breeding. It was a virtue as well as a grace. Mrs. Delany is almost as serious as the worldly fine lady when she comes to the dancing-master. "Dunoyer," she writes to her sister, who consults her on education, "is now, I believe, the best dancing-master in London. His price is high, but he will give the Pauline a better air in a month than a less skilful dancing-master would in three. I believe Lady Cowper has good interest with him, and that may make him take more pains." And she adds, "There is nothing I wish so much for Mary, *next* to right religious principles, as a *proper* knowledge of the polite world." The ordinary teaching that girls were put under she takes for granted; but clearly, to be perfectly well-bred both at home and abroad was a point of more weight with her than accuracy and extent of knowledge. "Nobody can do so much good in the world who is *not* well-bred as those that *are*." These were the days, indeed, when superficial teaching was thought the proper teaching for girls; when every science had its feminine language, as Hindu ladies talk with a difference and with softer terminations than their lords; as "The Young Ladies' Geography," which is to be read instead of novels, "A Young Ladies' Guide to Astronomy," "The Use of the Globe for Girls' Schools," and "The Ladies' Polite Letter-Writer," and so on. At a date when men learned to be scholars and gentleman, not simultaneously, but in a course, it was not unnaturally taken for granted that thoroughness of knowledge in girls was incompatible with the prime essential in woman, perfect manners, — that she should look well, hold herself well, behave herself with dignity and

grace. Ruling in her own sphere, she must be content with an entirely subordinate place where dry knowledge was in question. If she knew more than other women, she was to conceal it, and beware of the example of

> The reasoning maid, above her sex's dread,
> Had dared and read, and dared to say she read.

We have changed all this, not only in tone but in practice. There is no more condescension to feminine weakness in the teaching of girls; what they learn under the modern fashionable system they may learn thoroughly. But as it does not belong to human nature, stationary or progressive, to observe a golden mean — as it is inevitable, where one thing is in the ascendant, that something else should go down — we are not sure that the supreme point now made of mental cultivation, as we see in the modern literature of education, does not threaten a very serious falling off in manners. It is not only neglect but a positive counter-teaching in certain quarters that strikes us, as though the old rules of good behavior, and any strict discipline on this point stood in the way of intellectual development. It speaks for itself that good teaching must be better than bad, and that good teaching disposes to a love of learning; nor do we see any necessary connection between advance of knowledge and decay of manners. To us, indeed, it seems that unless the training of manners, in the full sense of the word, goes along with the teaching of knowledge, the teaching fails of its main purpose as culture.

As one may say that there is a way of learning trifles which strengthens mind and will, all depending on the learner's view of life as a performance or a duty, so there may be a way of acquiring knowledge which yet makes very little impression on character and conduct. In this sense a cultivated manner may be as good a guarantee of a cultivated mind as the most well-chosen list of books plodded through under the stimulus of emulation or some imminent examination; or even for the love of it, if the social duties and checks of good breeding are untaught and disregarded. For, in fact, what a great deal of study of motives and character and of self-study also, what a training of sympathies, goes to the formation of a courteous and engaging manner! Separate learning from discipline, and we really do not know where we are, or what benefit we are conferring on the pupil. To the run of people the use of learning is, in some sense, remote from the lessons learnt, and may be resolved into discipline rather than knowledge. How few people have to do in after-life with the precise teaching of their childhood and youth! What difference, we might ask, does it make to most women whether the astronomy they learnt as girls was called "the use of the globes" or not? Let us not be understood as undervaluing that inestimable advantage, exact knowledge; only we believe the common experience will justify our impression that fructifying knowledge of this high order is for the few. The majority of people learn through the reading of others, not through their own: one part of mankind browses among books for the intellectual nourishment of the species. It is not what most people acquire for themselves at first hand which places them above their ignorant forefathers, but the atmosphere they breathe, the enlightenment of the age, through the influence of its choicer or more laborious spirits. What they read or skim for themselves — or perhaps we should say, what they might read, what they are politely assumed to read — tells little on them; they cannot assimilate it, their private stock of learning being mainly of use in helping to conceal their ignorance; but they hear others talk, they catch a tone, and thus learn unconsciously and accidentally, aided no doubt by glimmerings of once faintly apprehended truth.

What, then, becomes of those who have never been taught that great fundamental in good manners, the habit and art of listening? an art which, to judge by the training of some children, threatens to become obsolete, an art which no people can learn late in life. Writers on the duties of the religious life tell us that contemplation is a habit of mind difficult of acquirement, and needing much practice and self-control. Listening is the same to children, when the talk that passes is not addressed to them individually, when their attention is not courted by lowering the tone to their taste. Yet for certain spaces of time to listen both to conversation and reading as a discipline, we think all who were ever subjected to it will allow to have been a very strengthening, invigorating process. The human voice conveys ideas which, read in books, would excite no interest, make no impression; and even dulness, compulsory quiet, often stimulates thought, by compelling the mind to turn to itself, which desultory reading, to escape from it, would never

have stirred. There is an activity and inventiveness of mind especially induced by inevitable quiet, of which biography furnishes striking examples, and which we believe many a private experience can bear witness to; and there is a study of character which can scarcely take its rise early enough for the finer perceptions without this condition.

This train of thought has been stimulated, not so much by the absence of old-fashioned discipline in manners and the first principles of good breeding in modern households, as by the tone now adopted in books for the young; books written not merely for amusement, but instruction — books not addressed to the parents, but their children; ridiculing old restraints; assuming that the race has been oppressed long enough by absurd restrictions; that children have come into the world to make a noise; that it is the part of good parents to put up with it, and to make every household arrangement with a view to their sole pleasure and convenience. Hitherto manners have always been considered one of the ends of education; but we see tokens of abatement of that jealous care on the subject which alone can succeed in its object. Neglected manners are rarely good manners. No doubt in fiction, and in descriptions of childhood for older readers, a certain wildness and defiance of rule is treated as a proof of spirit, and so far of promise; but it is comparatively lately that books written for children with a didactic purpose, represent disregard of proprieties as the natural indications of mental and moral superiority. At the risk of being thought to make a bugbear of trifles, we will illustrate our argument by an extract from a popular child's serial, we do not doubt in the nursery or school-room of very many of our readers; and bearing on its title-page the name of a clergyman in deservedly high and general esteem: —

It was one of the great conveniences of Redburn vicarage, that you could make yourself heard all over the house without the least trouble. For example, if there were not enough bread-and-butter cut for the school-room tea, you had only to shout " Bread-and-butter ! " at the top of your voice, and Dinah quickly brought up a fresh supply from the kitchen; or if Perry was up on the top of the house administering a worm to a particularly interesting family of starlings in the chimney-pot, and did not notice the time, and eight o'clock struck, Hugh had just to call out "Prayers ! " at the foot of the stairs, and down came Perry, leaving a worm wriggling out of a wide-open yellow mouth. Dr. Guest was of opinion that this was owing much more to the strong lungs and loud voices of his family than anything especially convenient about the house; but the children differed from him. So bells became quite unnecessary articles at the vicarage, which was a good thing, as there was scarcely one that was not broken.

The father, it goes on to say, does not like this state of things, and when he comes home tired from parish visiting, complains to his wife " somewhat bitterly " that the house is a bear-garden. " My dear, what are these children about ? It is really almost intolerable." Mrs. Guest looked at him and only smiled. She was the gentlest, sweetest, best little mother in the world. You know what a good mother means ? It means, among other things, " no nerves," " no headaches," " no fancies," " no thought of self ; " and so she only smiled at the racket going on. Is not this as much as to say that the children of the house are masters of the house; that if the father complains that his house is turned into a bear-garden, he is a grumbler; that the real, true, and admirable mother prefers her children's pleasure to her husband's comfort; that if the mother has " nerves " and " headaches," it is her duty to suppress them, and not damp her children's spirits by using them as a plea for suppressed voices and cautious treading; that no one with admitted infirmities can fulfil the mother's part; that consideration is due, not from children to their parents, but from parents to their children; that home is to be ruled by boy-and-girlhood suffrage ? We know that some will think we are turning a joke into a serious matter; but it is not a joke to instil into children's minds that this is a pleasant state of things, and that those boys and girls are fortunate who can shout for bread-and-butter, and bawl " Prayers ! " from the bottom of the house to its chimney-pots. Of course these unruly young folks are clever, and conscientious, and so on; but what we complain of is, that they are supposed to be cleverer and more studious and more high-principled *because* they lead this wild, rude life. We are quite willing to allow that children should have their own region for noise and license, because their minds are cramped without it; but the moment this region is extended beyond proper limits — the moment, at least, when the sense of a barrier is lost — their education takes a retrograde step. The children whose father and mother are also gentleman and lady, and who are yet allowed to shout,

bawl, and riot, unreproved, are losing caste, and fitting themselves for a lower social level. In cases where the government schools have good and able teachers, the checks imposed by the civilities and refinements of social life constitute the main difference between the education of distinct classes. A clever child of the artisan class has, wherever there is a free library, access to the best books on all subjects, and has perhaps better grounding than, at any rate, the girls of a class many grades above it; *but* it has no restraints. No eye regulates its movement, no sensitiveness modulates the intonation, no authority interposes with its rules. There is no spot sacred to order, decorum, subdued voice, and periods of inevitable silence. What we fear in the present concentration of attention upon book-learning in our leading authorities and administrators of general education (in reaction for a like concentration upon manners in the last century which followed the collapse spoken of), is the deposition of the drawing-room from its place as an educator. Sydney Smith somewhere remarks on the superiority he has observed in point of behavior and manners of the children of people of rank. He does not go into causes, — the view is suggested by a particular instance; but the superiority, such as it is, is surely due to the sense of respect which all surroundings must infuse into the minds of children who see their elders live in state, in a solemnity of splendor and order which their wildest spirits cannot dream of turning into Bedlam. But every drawing-room — every room, indeed, the peculiar seat and throne of father and mother — the room where that mysterious outlet to the world, "company," is received and entertained, exercises this awe-inspiring sense in its degree. It is not the positive splendor but the relative which impresses the child's imagination. Manners have no sanctuary in the laborer's cottage, as ordinarily ruled, nor in the long rows of artisan dwellings; but wherever the mother presides in her proper domain, there she may set up — if she has the art, and much more, the patience — may set up a school which shall fit her child for society, in its graceful civilized sense, by inculcating habits which go farther than books in adapting not only manners but mind, we will say, for this arena.

The apprehension of society as an idea is one of the distinctions between gentility and the commonalty. The younger members of the working-classes have more intercourse with each other out of family life than their social betters; but they have not the idea of a social sphere instilled into their minds, as it is upon those whose early observation is set to work — of a sphere where they are to be viewed on all sides, and judged by a general opinion. The necessity of self-repression makes room for thought, which those children miss who have no formalities to observe and no customs to respect — who blurt out every irrelevance — who interpose at will with question and opinion as it enters the brain. It is this unrestraint which lays the foundation of that self-centred view of life to be observed in the socially untrained. It is by listening, not by talking, that sympathy is acquired — that intellectual sympathy that makes men companionable. This abandonment of old restraints, of which we are jealous, may be one of the reasons why conversation as an art is going out. Children don't learn to talk by chattering to one another, and saying what comes uppermost; neither does reading suffice to this end, single-handed. Good talk should first be recognized as such in others. Attention is the most influential tutor in the fitting use of the tongue. Where we see good talk disregarded by a party of young people, there, we may be sure, the chances of their ever shining socially are small indeed. Mere listening with intelligence involves an exercise of mental speech. Not, of course, that we would confine children to the act of attention; but good talk cannot be maintained under interruption, and observant silence opens the pores of the mind as impatient demands for explanation never do.

Taking all this into account, while freely admitting the superiority of modern teaching from books, we yet regard them as only partial educators. Now and then, even, the sight of children brought up in the old system, which put behavior first — not because it *is* a system, but that the tastes of the mother lean that way — awakes a tender though blind regret for the old relation of lessons to the day's work. For still there are children who accept their lessons as tasks to be learnt, without much considering the future use they are to be put to; whose keener interests are for what they see and hear; whose minds are present to the scene around them; who respond with dutiful alacrity to the training of manners; who are obedient to rule, courteous, friendly, hospitable to strangers in their small, innocent way; who greet with a smile welcome

company, and brighten under it; who watch their mother's eye and obey her behests, and so doing catch her grace of air and movement. These are children, whatever their literary attainments, who will grow into gentle, refining influences; who will perpetuate good traditions, and maintain the charm as well as the virtues of family life. And, moreover, whatever their store of exact knowledge, they will have a diction and facility of expression which perhaps will more than stand comparison with others deeper read but less practised in social intercourse. It all comes to this: on the one hand, children cannot learn manners without being trained to them; on the other, it is equally certain that want of thoroughness in early teaching is a defect scarcely to be got over in after-life, and often bitterly resented as well as regretted by the sufferer. But each day will have its notions of the relative importance of the two, and throw the weight of its influence on the popular side.

While we generalize, our real subject, and often our argument, relates mainly to the education of women. It has been in this that the distinction between the two principles of training with which we began is seen in most marked contrast. The ordinary education of the last century and that of the modern high school presents this contrast in its most pointed divergence of aim. It cannot be denied that the advocates of thoroughness are supported by the success of girl students in many an unaccustomed field of competition. But the stimulus of emulation, in their case so potent, has its period, and wants that succeeding goad of necessity which follows the boy into life. He has all along known that his learning is means towards a very intelligible end. If the girl (not required to work for a living) thinks so in the class-room, society soon undeceives her. Only a genuine love of knowledge (and the rarity of this, in the universal experience, shows that it must always be rare) will sustain her enthusiasm. Hence we see, in so many cases, that the girl whose education has been one of exceptional severity of strain both in its subjects and thoroughness in battling with them, collapses at once when thrown into the natural interests of her age, and cannot be distinguished from other girls either in the interests that absorb her or the aims she works towards. It may be that she is even less fitted for the new scene, the spirit of emulation following her into the fresh arena. The strong excitements of girlhood find her less prepared than where the moral grounding of manners, with all their unconscious yet ever-binding restraints, has been the especial object of the educator. All we would argue is, that these restraints should have been inculcated along with the cultivation of intellect, that it is as great injustice to the child to permit license in manners, as to leave it to scramble into knowledge or to miss the road for want of an adequate guide. It is an especial injustice to the girl of merely average intelligence to assume that if the teaching is but sound, and morals duly inculcated, manners may go to the wall, and be treated as a joke; for if accurate knowledge and grasp of what is once acquired is beyond the learner's intellectual calibre, and the manners have been left to themselves, where is she?

But in treating matters thus seriously, we may be doing our plea injustice. The school of manners, like all other schools, must have its recreation-time, its play-grounds, its theatre of performance. In these days of boating, cricket, football, and athletic games of boys and men — games which take up the time from graver studies, and yet excite the emulation not only of the players, but of tutors and governors in our seats and high places of learning, and which interest the public more than intellectual contests and successes, which are their more proper concern — we do not think it necessary to apologize for the place dancing held in the old system of girls' training. All notices of the last century both as regards the bringing up of girls and the habits of social family life, show that dancing was an education in a sense quite different from what it is, and indeed can be, now, under the changes fashion has accomplished. When Dr. Guthrie slipped a bank-note into a poor scholar's hand, discovering his talent, and pitying the awkwardness which would stand in the way of its development, and told him he would be "much the better of a quarter at the dancing," he had not "round dances" in his mind, but the acknowledged discipline of another school of the art. Dancing had in fact two aspects. It was a grave study, as the main road to a graceful action and carriage; and it was a domestic habit and constant resource; a standing diversion, not confined to ball-rooms and state days, nor to the girlhood and boyhood of life, but a universal relaxation and exercise up to middle life, and almost beyond, to judge by the fiction of the period. The accomplishment, once acquired, was a distinc-

tion; nor was it allowed to rust for want of use. The *chaperones* of that day were not condemned to sit in dazed, yawning rows. It was possible, nay, expected of mothers — even in supreme family ceremonials, of grandmothers — to give the sanction of their participation in the performance. Mrs. Delany, who represents for her sex the mind and accomplishments of her century — admired, respected, imitated in youth and venerated in age — brings the full weight of her prestige to bear upon the uses and importance of dancing in this twofold character. No tutor or head of a house in our day can more keenly appreciate a boating triumph than she the ordeal of a state ball successfully passed by some youthful favorite. Whether it is Lady Betty Bentinck rehearsing her clothes and jewels, and practising dancing in her train, under the tender scrutiny of mother and friend, "looking mighty well, and a very genteel figure," who finds the ball, for which these studies were made, very delightful, for all the heat and crowding; or Miss Wesley (aunt of the Duke of Wellington), "the finest girl I ever saw," "performing miracles at the castle, and much the best dancer there." Her frequent notices of the Wesley family show that this crowning distinction was not won without care. If the duke ever said that the battle of Waterloo was won at Eton and Harrow, something of the same kind might be said of his own share in the victory. One does not immediately see the connection between generalship and iron will, and that success in the arts of music and dancing which distinguished his progenitors; but the fact remains. "I never met," Mrs. Delany writes, "so delightful a man as my hero, Mr. Wesley (first Lord Mornington); so much goodness and friendliness combined." At one time he is her partner in a dance of twenty couple; at another, he and she entertain the young people. "I was placed at the harpsichord, and after jangling a little, Mr. Wesley took his fiddle and played to his daughters' dancing." Again: "We mustered up five couple, and danced two hours. The master of the house (Mr. Wesley) fiddled and danced the whole time." This cheerful family only folllowed the fashion. She looks forward one Christmas to a fortnight in the country, where there is to be company enough to make six couple for country-dances; and "we are to dance every night." Dancing was so habitual a resource, that fiddles were apparently as readily at hand as in Molière's comedies. "While we were eating, fiddles were sent for — a sudden thought. We began before eleven, and held briskly to it till half an hour after two. We were eight couple of as clever dancers as ever eye beheld, though I say it that should not." The ball-room was an arena, and also a spectacle for the lookers-on. People complimented one another, and received the felicitations of friends. "First you must know," writes Lady Mary Wortley Montagu, "that I led up the ball, which you will stare at; but what is more, I believe in my conscience, I made one of the best figures there." These records belong to much the same time that the learned Elizabeth Carter relieved her severer youthful studies by similar relaxations in less courtly scenes. "I walked three miles yesterday," she writes, "in a wind that I thought would have blown me out of this planet, and afterwards danced nine hours, and then walked back again."

That this training of the person in a particular exercise had success in its own line, and results in keeping with the care and time devoted to it, we gather from a description of this same country-dance, in its most finished performance, given by De Quincey in his impressions of a state ball at Windsor, to which he, with an Eton schoolfellow, was invited by Queen Charlotte. To him it had a mystic significance almost Dantesque. As embodying the poetry of our subject — not to say its tragedy — and as a characteristic example of the writer's exquisite style, the reader will not resent our giving the passage without curtailment: —

Of all the scenes which this world offers, none is to me so profoundly interesting, none (I say it deliberately) so affecting, as the spectacle of men and women floating through the mazes of a dance; under these conditions, however, that the music shall be rich, resonant, and festal, the execution of the dancers perfect, and the dance itself of a character to admit of free, fluent, and *continuous* motion. But this last condition will be sought vainly in quadrilles, etc., which have for so many years banished the truly beautiful *country-dances* native to England. Those whose taste and sensibility were so defective as to substitute for the *beautiful* in dancing the merely *difficult*, were sure, in the end, to transfer the depravations of this art from the opera-house to the floors of private ball-rooms. The tendencies even then were in that direction, but as yet they had not attained their final stage; and the English country-dance was still in estimation at the courts of princes. Now, of all dances, this is the only one, as a class, of which you can truly describe the motion to be *continuous* — that is, not interrupted or fitful,

but unfolding its fine mazes with the equability of light in its diffusion through free space. And wherever the music happens to be not of a light trivial character, but charged with the spirit of festal pleasure, and the performers in the dance so far skilful as to betray no awkwardness verging on the ludicrous, I believe that many people feel as I feel in such circumstances — viz., derive from the spectacle the very grandest form of passionate sadness which can belong to any spectacle whatsoever. *Sadness* is not the exact word, nor is there *any* word in any language (because none in the finest languages) which exactly expresses the state — since it is not a depressing but a most elevating state to which I allude. . . . From all which the reader may comprehend, if he should not happen experimentally to have felt, that a spectacle of young men and women *flowing* through the mazes of an intricate dance, under a full volume of music, taken with all the circumstantial adjuncts of such a scene in rich men's halls; the blaze of light and jewels, the life, the motion, the sea-like undulation of heads, the interweaving of the figures, the ἀταχυχλωσις or self-revolving both of the dance and the music, "never ending, still beginning," and the continual regeneration of order from a system of motions which forever touch the very brink of confusion, — that such a spectacle with such circumstances, may happen to be capable of exciting and sustaining the very grandest emotions of philosophic melancholy to which the human spirit is open. The reason is, in part, that such a scene presents a sort of mask of human life, with its whole equipage of pomps and glories, its luxury of sight and sound, its hours of golden youth, and the interminable revolution of ages hurrying after ages, and one generation treading upon the flying footsteps of another; whilst all the while the overruling music attempers the mind to the spectacle, the subject to the object, the beholder to the vision.

The country-dance has always been the pet of English literature, whether as a picture, a school of manners, or the natural and yet orderly exercise for youthful spirits. They have gone out, and dances rather exciting than exhilarating have taken their place. But as the excitement does not extend to the observer as did the exhilaration, the pleasures of the round dance remain unsung. How pleasant are all the notices of the country-dance in Miss Austen, whether it is Fanny Price for once in spirits, and practising her steps before the ball, or Mrs. Elton wondering how her style and Frank Churchill's will suit; or the young people counting up available couples, getting up an extempore dance at a moment's notice, or suggesting that fine analogy between the country-dance and marriage, with which Henry Tilney puzzles his partner, whose attention has been rudely called off from him by John Thorpe! "You will allow that in both man has the advantage of choice; that it is an engagement between man and woman, formed for the advantage of each; that it is their duty each to endeavor to give the other no cause for wishing that he or she had bestowed themselves elsewhere," and — while she still sees them as "so very different" — his concession, "In one respect there certainly is a difference. In marriage, the man is supposed to provide for the support of the woman, the woman to make the house agreeable to the man; he is to purvey, she is to smile. But in dancing, their duties are exactly changed; the agreeableness, the compliance, are expected from him, while she furnishes the fan and the lavender-water. That, I suppose, was the difference of duties which struck you?" Miss Austen, no less than Mrs. Delany, wrote in the long reign of the country-dance, without a thought of its being superseded. George Eliot looks back upon it tenderly as a thing of the past — as the dance in which all classes can mingle, and all ages take their share. Thus, "Mr. Poyser, to whom an extra glass had restored his youthful confidence in his good looks and good dancing, walked along quite proudly 'to be introduced to his partner the great lady of the Hall,' secretly flattering himself that Miss Lydia had never had a partner in *her* life who could lift her off the ground as he could." "Pity it was not a boarded floor!" adds the writer, "then the rhythmic stamping of the thick shoes would have been better than drums. That merry stamping, that gracious nodding of the head, that waving bestowal of the hand, where can we see them now?" Walter Scott, who could scarcely have known the pleasures of dancing from experience, is as regretful in his tone. Late in life he writes in his journal with mingled pleasure and bitterness: "Here [in the assembly rooms at Durham] I saw some very pretty girls dancing merrily that old-fashioned thing called a country-dance, which old England has now thrown aside as she would her creed if there were some foreign frippery offered instead." Nor was verse wanting in its appropriate dirge. A writer in the *London Magazine*, 1823, denounces the immediate success of the substitute, then received into favor: —

> Look where we will, joy seems estranged,
> The dance its very mirth has changed,
> Now formal, once how thrilling!
> The limb alive, the spirit supple,
> The gallant casting off two couple,
> All frozen to quadrilling.

All things come to an end; so it may be said that the country-dance only shared the common fate. But in looking for causes, we find it had at one and the same time two enemies, each in strongest opposition to the other, but united in their attack on this point. And first we will name fashion.

No event [writes Mr. Raikes] ever produced so great a sensation in English society as the introduction of the German waltz in 1813. Up to that time the English country-dance, Scotch steps, and an occasional Highland reel, formed the school of the dancing-master, and the evening recreation of the British youth even in the first circles. But peace was drawing near, foreigners were arriving, and the taste for Continental customs and manners became the order of the day. The young Duke of Devonshire, as the Magnus Apollo of the drawing-rooms in London, was at the head of these innovations; and when the kitchen-dance became exploded at Devonshire House, it could not long be expected to maintain its footing in less celebrated assemblies. In London, fashion is or was everything. Old and young returned to school, and the mornings which had been dedicated to lounging in the Park were now absorbed at home in practising the figure of the French quadrille, and whirling a chair round the room to learn the step and measure of the German waltz.

Beau Brummel, of whom nothing stands the test of time — not a single saying, not a single taste or sentiment — advises a friend to educate his daughters in France on this very argument. "English education," he explains, "may be all very well to instruct the hemming of a handkerchief and the ungainly romp of a country-dance, but nothing else." Fashion, however, was somewhat slower in its conquests sixty years ago than now; but to the middle classes the attack on dancing came at the same time from another quarter. Young people were told that dancing was wrong. Davie Deans's objections were put into English. It was a shocking thing for immortal souls to spend their time in what at best was trifling away precious moments. Young girls were asked how they should like to die dancing; and as they could not say they should, they felt without an answer. It was one thing to dance with as little question of the right to do so as the children in the market-place, and another to have to defend the practice against the vehement denunciations of religious enthusiasm, versed in all the arguments of controversy. Dancing under protest, dancing knowing that the act would bring the performer under sentence of excommunication in certain quarters, changed the character of the pleasure to sensitive minds. This onslaught was partly due to the descent of religious controversy into another rank of thinkers. It will generally be observed that the leaders of a movement are tolerant of the habits and amusements of the classes who make no pretence of climbing to their heights of thought. The head that has been at work on hard knots, and battling with heads of equal strength in controversy, finds relief in the contemplation of youth making merry after its kind; but where the critic is on the same intellectual plane with the dancer, and must either censure or share the sport, then the polemical instinct finds its field. Yet, after all the changes we note, many have been due to some undercurrent of thought, with which neither religion nor fashion had much to do. In fact, young people were beginning to regard society as an intellectual arena. Cleverness which, in Mrs. Delany's time, had related to the heels, now took its throne in the head. It was an age of good talkers; every circle had its example. Poetry was a telling influence; fancy and invention were awakened — not only in some distant, unapproachable region, but in many a home family circle. German came into fashion; a smattering of mathematics was acquired; there was an interchange of sentiment on subjects not hitherto supposed within the feminine range. Young ladies no longer turned from talk worth hearing to discuss in a whisper the last cargo of fans, but were among the most eager and therefore charming of listeners. With sparkling eyes, as we find them described, and blushes, showing the courage of the venture, they would make their voices heard in advocacy of a favorite author; and so a new era began.

The religious world of young ladies relieved more active labors of benevolence by fancy work, with which they filled the baskets of itinerant *protégés;* the bright girls of another school felt an innocent breath of intellectual ambition, and would at any time rather talk with a clever man than dance with him: and thus dancing ceased to be the education it had been, with all its painful early training in the matter of deportment.

That deportment had its discipline of a very severe kind, we gather from autobiographers. Thus Mrs. Sherwood describes her childhood as passed in steel collars and back-boards, as well as restrictions of another kind; for her mother never allowed her children to interrupt conver-

sation — "they were compelled to listen, whether willing or not." The name of this lady — subsequently a pillar of a certain sentimental religious party school — brings us to the mention of the boarding-school to which she went after this strict home rule — one remarkable for the number of noted women it introduced into the world. It was kept first at Reading, then in London, by a Monsieur and Madame St. Quentin — he a French emigrant, and friend of Dr. Valpy. There the pupils saw much of emigrants, learnt to speak French, acted plays, etc.; and whether an extraordinary amount of talent and genius found its way there, or whether a vein was struck at a lucky point of time — whether success was due to good steady teaching or to the unusual relaxations which prevailed there — certain it is that a list of distinguished names are associated with this school; names with nothing in common in tone or aim, but which remain familiar sounds for some distinction or other. Among them we will mention besides Mrs. Sherwood, L. E. L., Miss Mitford, Lady Caroline Lamb, and even Jane Austen, who was there as a mere child, not to separate her from her beloved sister Cassandra. This school is a connecting link between the schools described by Mrs. Montague as places where girls don't learn much, but unlearn the tricks of the nursery, and the higher girls' schools of the present century, alive at least in theory to the duty of fitting girls, not only in their manners for society, but in their minds for the world. There happen to have fallen in our way some records (found in the papers of a lady, once a pupil of remarkable attractions and acquirements) of superior girls' schools — superior, we must assume, from their results; established, the one early in the century, the other some twenty or more years later; both, however, impressing the reader with the change that years have wrought on popular ideas on female training. It is the custom of novelists and educational reformers alike to hold up the mistress of the old, fashionable, or genteel boarding-school to ridicule; but we must say that both these examples show an uncommon fitness for the task undertaken, and a most conscientious sense of duty. The date of the first letters belong to about the time when Beau Brummel, in retirement and disgrace, warned his friend against English training, lest he should see his "girls coming into the room upon their elbows, hear them talk in broad native phraseology, and thump the 'Woodpecker' upon a discordant spinet. Probably Mrs J., as we will call her — who from her writing and other tokens we gather to have been elderly — would have thought any of these enormities better than the slippery graces, which were all he cared for. For, incidentally, we find her imparting to this her favorite pupil her views of the basis of education to be laid in early childhood.

> Whatever the child's temper, there can be no hesitation as to the grand basis, her understanding rightly the condition of the human race as beings accountable to God for that obedience to his commands which, from their fallen nature, they cannot pay if they do only *what they like.* This a child can comprehend, as also its obvious consequences, the necessity of self-control; it can likewise comprehend from the declaration, "In the sweat of thy brow," etc., that nothing good can be obtained without labor; and when convinced of these fundamental truths it will receive a summons to an impalatable task as the voice of wisdom and kindness, and not as an exercise of arbitrary power. There may be deficiency in the performance, but not a resistance of the will; whereas, obedience without the acquiescence of a child's judgment reaches only the outward momentary act, leaving the will uncurbed, and perhaps rebellion striking deeper root within.

This strikes us as the thought of a very practical mind, as indeed is shown all along. Thus, on the dress of her pupils, she writes to the mother, "As I do not like my pupils at their naturally attractive age to be rendered conspicuous by too gay a display, I am tenacious of their style of dress being neat and simple." And she goes on with rules which we imagine would scarcely be tolerated by the young ladies whom we meet in gay files of becoming and varied costumes. There is every sign of thorough grounding, of the work of education going on zealously, and being made pleasant to the pupils — Mrs. J. herself full of plans and resources for bringing home to the mind the teaching that she considers suited to the feminine character and intellect. Deportment and dancing are duties like the rest, and very vigilantly attended to. And that religion was a subject of very earnest teaching, and all the influences of Church ordinances brought to bear, we gather from the mother's comment on her daughter's confirmation. She writes: —

> Your account of your confirmation was truly gratifying to us, and the impression it has made upon your mind could not but afford us the most heartfelt pleasure. It is a ceremony much too little thought of in the present day. When I mentioned the preparation and exam-

ination you would have to undergo to the F—— people, they laughed at me, and said it was never usual to examine respectable people for confirmation.

Being a responsive and favorite pupil, the subject of all this care keeps up a correspondence after leaving, and pays visits, which give us further insight into school life. Thus, a year or two after, she describes herself on a week's visit as a schoolgirl again. "Tuesday last I danced quadrilles with M. N. He said if I would practise with the young ladies a week it would set me up again. I could acquire all the new steps very well in a week." And she gives the history of a curtsy, on paying a call with her dear hostess: —

Mrs. J. begged me before entering the room, not to discredit her school by my curtsy. My heart beat violently. I approached the venerable Mrs. A. with the profoundest respect, put my feet in order to make a complete curtsy, extended my hand, seeing she was inclined to shake hands with me, and began to drop; but unluckily the old lady's arm was so confined with rheumatism, that by the time I had nearly reached the ground our hands were about a yard apart, when they ought to have joined. I was struck with the ludicrousness of the incident, and completely disconcerted.

It was not only on points of ceremony that Mrs. J. adhered to ideas once formed. She represents her class. Strong opinions are necessary in the teacher. No one can inculcate principles without a tenacity of grasp on them herself; and, naturally, we find indications on all hands of what is called prejudice. Mrs. J. was clearly a character. Her young friend having been to see the Roman Catholic chapel in Moorfields, just built, it was made the subject of a homily. Mrs. J., writes one pupil, "laments greatly that that persecuting Church should be so much countenanced. She fears that this land will again see Queen Mary's reign:" to which Mrs. J. adds a postscript of warning much in the spirit of the old precept, "Beware of Papishes, and learn to knit," though couched in language more becoming the intellectual pretensions both of teacher and scholar. In politics she is even more decided in tone: "Never marry a Whig," is her emphatic and repeated injunction. It was the time when politics ran high, and the unfortunate Queen Caroline was before the world, at once a prominent subject and object. Processions such as Theodore Hook commemorates in verse, — the half-a-score Mile-enders got up as Highlanders and shivering in kilts; the tailors escaped from their jailers, passing for sailors, — defiled before the door of Mrs. J.'s nursery of loyalty and propriety. On the Helot principle, the girls were allowed a furtive peep at the show of "tinkers and shopkeepers' apprentices." "One of the hired carriages stopped opposite, containing," writes one, "some *ladies* and *gentlemen*, whose *footman* took from his pocket a bottle and one glass — it appeared like malt liquor of some kind. When he had poured it out, he presented it to the ladies, who, without any ceremony, drank, and appeared to enjoy it. Then the procession moved on, and the bottle was again placed in the footman's pocket." In spite of teaching and warning, however, Radicalism found its way to a *quondam* pupil. It is touching to read how keenly the desertion is felt: —

I have myself met with a sore vexation — no less than of having one of my late pupils disgrace herself by going to Brandenburgh House, where some address was presented to the poor queen. Little did I expect that a young person (of whose heart and understanding I had so good an opinion) would so soon forget the sentiments inculcated upon her whilst under my roof, as within a few months after quitting it to join a tag-rag and bob-tail rabble, consisting, in spite of satin gowns and ostrich-plumes, of every variety of vulgarity and disreputability. Having identified herself with such, she has rejected and forfeited my esteem, and therefore I can never see her again with pleasure. Had it been from compulsion, I should have acquitted her; but her parents, whatever may be their politics, are too indulgent not to have excused her going, had she felt a repugnance to it.

We extract such passages to show the influence aimed at, and in most cases secured. Mrs. J. was an influence in a sense it would be difficult for a schoolmistress to be now. The personal character was a power, and one that extended itself beyond the period of direct contact. Thus she has views on the position of woman as subordinate out of her own province, and had a test by which to gauge a pupil's intellectual cultivation. It was enough if she could have appreciated and enjoyed Dr. Johnson's society, and been by him thought worthy of it. She fears that her pupil is too ambitious of intellectual distinctions, and warns her that

the acquirement of knowledge is delightful within proper limits, beyond which it becomes vanity and vexation of spirit. To be learned, a genius, or in any way a prodigy, I account to be a misfortune to a female, as it removes her from her natural sphere. Providence has endowed each sex with the faculties requisite

to perform the respective duties assigned to it, and successfully ordained that from the right fulfilment of these, happiness shall result. Had a *third order* been necessary, doubtless one would have been created, a *mid-way* kind of being. A woman, therefore, striving to transform herself into such, is at the best unproductive of good, and in most instances only makes herself discontented.

It is of course observable that the subordination of the sex in no way interferes with the good lady's value for her own opinion on large questions. We give the passage as good sense still in its measure, and as a sign of the clash between eighteenth and nineteenth century ideas then beginning to be felt. For this repression of genius as unwomanly, though belonging to the ideas of the time, was giving way under the new currents of thought rising to the surface of society. In letters dating some ten years later, from the other specimen schoolmistress whose correspondence we have access to, younger in character as well as in age, we find a longing for originality as something above mere powers of gaining knowledge. In speaking of a young woman distinguished for her acquirements, her criticism is that she has little of the cleverness for which she gets such credit.

I know her well. I know she is not gifted as she passes for being. Industry and memory, with all her life devoted to effect what these can do, have done much; but no compass of mind, no powers to investigate and combine, no one original idea — always the mere copyist.

This, we see, is a governess who would not allow freshness and originality in a pupil to escape her, nor fail to cultivate it when detected. But in her rules she is, like Mrs. J., strongly against display, though not so distinct in wording. "Young things should trust more to their carriage than to finery; the less remarkable the bonnet the better, the less ribbon the better," — and so on. And of show, off in another field: "If any dare tell you I cultivate a passion for display and showing blue, do me the justice to correct them by word as well as by deed." What we observe in these letters is the distinctly feminine ideal in the mind of all the writers. Dress, language, manners, all have the ladylike in view. No lady could travel without an escort. This difficulty constitutes one of the troubles and expenses of the time. On one occasion it was planned that two brothers were to take charge of their respective sisters and travel home together. "Will calls it great *fun*," writes his fastidious sister. "Though we do not use that word, perhaps we feel the same thing." Any approach to slang was forbidden to the cultivated girlhood of that period; and *fun*, it seems, was not free from the charge of keeping low company — the critics of the previous century telling inferior authors that they mistook *vulgarity* for ease, *fun* for humor, and *pertness* for wit. It was the time when language as well as dress had to be distinctly feminine — when neither foresaw the rough-and-ready uses to which they would one day be turned. Certainly the convenience of an independent work-a-day existence was then little consulted in costume. The contrast between the head-gear of that time and this, represents at one glance the change that has come over things. "Bonnets," writes the same Will, reporting London fashion, "are about the size of the top of a post-chaise." At any rate, thus overshadowed, no girl would be mistaken for her brother, which she can easily be now, with hands in her coat-pockets, and a hat the facsimile of his own, as she fits herself out for all sports and all weathers. All publicity was felt, not so much unfeminine, as impossible. The distinction between private and professional life was one not conceivably to be got over by the women of the home life and the social circle. The English character was supposed incapable, except under professional training, of throwing aside its natural reserve. In the letters before us we find a pupil describing to her sister her singing-lessons, and the master's difficulties under this insular infirmity. "S—— is an invaluable master, though a most conceited creature. His accompaniments are the most delightful I ever heard, which he performs with the greatest ease. He complains without ceasing of the want of feeling in the English ladies, and endeavors in vain to make us smile and sigh and look sad in the proper places." This sort of sheepishness here disclosed is combated in our whole modern system of life as well as education, and with considerable success.

We may have seemed desultory to our readers, but we can assure them that we have never lost sight of our opening distinction between the two meanings of the word education. We have gone through some varieties of it; all — the training of manners, the discipline of deportment, the old quaint ceremonials, the restraints of silence, the decorums of polite society, the curtsies and obeisances of the humbler classes, the deference of the young towards

the old, the observance of children for their parents, the severities of home rule, the long practice and self-restraint necessary to success and full enjoyment even of the favorite recreation, — all imply training more or less painful and laborious; a never-relaxed vigilance in the teacher — docility, patience, and self-command in the learner. Our survey tends to the conclusion that at no time have manners been so left to form themselves as now. We hear of people forgetting their manners, but some of our youth stand in danger of never learning them. While so great a point is made of thoroughness in all other learning, the mere ABC grounding of manners threatens to be left untaught. It seems supposed that, given so much intellectual culture, boys and girls, by the mere process of growing old, turn into polite, considerate men and women. We do not believe it. Many arts and sciences are more easily acquired late in life than a good manner. If people are to behave well, they must be early taught to behave — a practice that demands unceasing sacrifices of minute personal liking to the general pleasure and convenience.

Lately hints have been thrown out that in certain high circles high breeding is going out of vogue. We do not fly at such high game, especially as culture of mind is there alleged to be as much neglected as refinement of manner. It is the classes with whom thoroughness of knowledge is felt of such supreme importance, who need to be sometimes reminded that, in intercourse with his fellows, it is, after all, manners that make the man.

From The Cornhill Magazine.

WILL O' THE MILL.

THE PLAIN AND THE STARS.

THE mill where Will lived with his adopted parents stood in a falling valley between pine woods and great mountains. Above, hill after hill soared upwards until they soared out of the depth of the hardiest timber, and stood naked against the sky. Some way up, a long grey village lay like a seam or a rag of vapor on a wooded hillside; and when the wind was favorable, the sound of the church bells would drop down, thin and silvery, to Will. Below, the valley grew ever steeper and steeper, and at the same time widened out on either hand; and from an eminence beside the mill it was possible to see its whole length and away beyond it over a wide plain, where the river turned and shone, and moved on from city to city on its voyage towards the sea. It chanced that over this valley there lay a pass into a neighboring kingdom; so that, quiet and rural as it was, the road that ran along beside the river was a high thoroughfare between two splendid and powerful societies. All through the summer, travelling carriages came crawling up, or went plunging briskly downwards past the mill; and as it happened that the other side was very much easier of ascent, the path was not much frequented, except by people going in one direction; and of all the carriages that Will saw go by, five-sixths were plunging briskly downwards and only one-sixth crawling up. Much more was this the case with foot-passengers. All the light-footed tourists, all the pedlars laden with strange wares, were tending downward like the river that accompanied their path. Nor was this all; for when Will was yet a child a disastrous war arose over a great part of the world. The newspapers were full of defeats and victories, the earth rang with cavalry hoofs, and often for days together and for miles around the coil of battle terrified good people from their labors in the field. Of all this, nothing was heard for a long time in the valley; but at last one of the commanders pushed an army over the pass by forced marches, and for three days horse and foot, cannon and tumbril, drum and standard, kept pouring downward past the mill. All day the child stood and watched them on their passage — the rhythmical stride, the pale, unshaven faces tanned about the eyes, the discolored regimentals and the tattered flags, filled him with a sense of weariness, pity, and wonder; and all night long, after he was in bed, he could hear the cannon pounding and the feet trampling, and the great armament sweeping onward and downward past the mill. No one in the valley ever heard the fate of the expedition, for they lay out of the way of gossip in those troublous times; but Will saw one thing plainly — that not a man returned. Whither had they all gone? Whither went all the tourists and pedlars with strange wares? whither all the brisk barouches with servants in the dicky? whither the water of the stream, ever coursing downward and ever renewed from above? Even the wind blew oftener down the valley, and carried the dead leaves along with it in the fall. It seemed like a great conspiracy of things animate and inanimate; they

all went downward, fleetly and gaily downward, and only he, it seemed, remained behind, like a stock upon the wayside. It sometimes made him glad when he noticed how the fishes kept their heads up stream. They, at least, stood faithfully by him, while all else was posting downward to the unknown world.

One evening he asked the miller where the river went.

"It goes down the valley," answered he, "and turns a power of mills — six-score mills, they say, from here to Unterdeck — and it none the wearier after all. And then it goes out into the lowlands, and waters the great corn country, and runs through a sight of fine cities (so they say), where kings live all alone in great palaces, with a sentry walking up and down before the door. And it goes under bridges with stone men upon them, looking down and smiling so curious at the water, and living folks leaning their elbows on the wall and looking over too. And then it goes on and on, and down through marshes and sands, until at last it falls into the sea, where the ships are that bring parrots and tobacco from the Indies. Ay, it has a long trot before it as it goes swinging over our weir, bless its heart!"

"And what is the sea?" asked Will.

"The sea!" cried the miller. "Lord help us all, it is the greatest thing God made! That is where all the water in the world runs down into a great salt lake. There it lies, as flat as my hand and as innocent-like as a child; but they do say when the wind blows it gets up into water mountains bigger than any of ours, and swallows down great ships bigger than our mill, and makes such a roaring that you can hear it miles away upon the land. There are great fish in it five times bigger than a bull, and one old serpent as long as our river and as old as all the world, with whiskers like a man, and a crown of silver on her head."

Will thought he had never heard anything like this, and he kept on asking question after question about the world that lay away down the river, with all its perils and marvels, until the old miller became quite interested himself, and at last took him by the hand and led him on to the hilltop that overlooks the valley and the plain. The sun was near setting, and hung low down in a cloudless sky. Everything was defined and glorified in golden light. Will had never seen so great an expanse of country in his life; he stood and gazed with all his eyes. He could see the cities, and the woods and fields, and the bright curves of the river, and far away to where the rim of the plain trenched along the shining heavens. An overmastering emotion seized upon the boy, soul and body; his heart beat so thickly that he could not breathe; the scene swam before his eyes; the sun seemed to wheel round and round, and throw off strange shapes as it turned, which disappeared with the rapidity of thought, and were succeeded by others. Some of these were like gigantic and shadowy birds, and some like contorted and gesticulating men, who vanished before they had time to complete a single gesture. Will covered his face with his hands, and burst into a violent fit of tears; and the poor miller, sadly disappointed and perplexed, saw nothing better for it than to take him up in his arms and carry him home in silence.

From that day forward Will was full of new hopes and longings. Something kept tugging at his heartstrings; the running water carried his desires along with it as he dreamed over its fleeting surface; the wind, as it ran over innumerable tree-tops, hailed him with encouraging words; branches beckoned downwards; the open road, as it shouldered round the angles and went turning and vanishing fast and faster down the valley, tortured him with its solicitations. He spent long whiles on the eminence, looking down the rivershed and abroad on the fat lowlands, and watched the clouds that travelled forth upon the sluggish wind and trailed their purple shadows on the plain; or he would linger by the wayside, and follow the carriages with his eyes as they rattled downward by the river. It did not matter what it was; everything that went that way, were it cloud or carriage, bird or brown water in the stream, he felt his heart flow out after it in an ecstasy of longing.

We are told by men of science that all the ventures of mariners on the sea, all that countermarching of tribes and races that confounds old history with its dust and rumor, sprang from nothing more abstruse than the laws of supply and demand, and a certain natural instinct for cheap rations. To any one thinking deeply, this will seem a dull and pitiful explanation. The tribes that came swarming out of the north and east, if they were indeed pressed onward from behind by others, were drawn at the same time by the magnetic influence of the south and west. The fame of other lands had reached them; the name of the eternal city rang in their ears; they were not colonists, but

pilgrims; they travelled towards wine and gold and sunshine, but their hearts were set on something higher. That divine unrest, that old stinging trouble of humanity that makes all high achievements and all miserable failure; the same that spread wings with Icarus, the same that sent Columbus into the desolate Atlantic, inspired and supported these barbarians on their perilous march. There is one legend which profoundly represents their spirit, of how a flying party of these wanderers encountered a very old man shod with iron. The old man asked them whither they were going; and they answered with one voice: "To the eternal city!" He looked upon them gravely. "I have sought it," he said, "over the most part of the world. Three such pairs as I now carry on my feet have I worn out upon this pilgrimage, and now the fourth is growing slender underneath my steps. And all this while I have not found the place." And he turned and went his own way alone, leaving them astonished.

And yet this would scarcely parallel the intensity of Will's feeling for the plain. If he could only go far enough out there, he felt as if his eyesight would be purged and clarified, as if his hearing would grow more delicate, and his very breath would come and go with luxury. He was transplanted and withering where he was; he lay in a strange country and was sick for home. Bit by bit, he pieced together broken notions of the world below: of the river, ever moving and growing until it sailed forth into the majestic ocean; of the cities, full of brisk and beautiful people, playing fountains, bands of music and marble palaces, and lighted up at night from end to end with artificial stars of gold; of the great churches, wise universities, brave armies, and untold money lying stored in vaults; of the high-flying vice that moved in the sunshine, and the stealth and swiftness of midnight murder. I have said he was sick as if for home; but the figure is inadequate. He was like some one lying in twilight, formless preexistence, and stretching out his hands lovingly towards many-colored, many-sounding life. It was no wonder he was unhappy, he would go and tell the fish: they were made for their life, wished for no more than worms and running water and a hole below a falling bank; but he was differently constituted, full of desires and aspirations, itching at the fingers, lusting with the eyes, whom the whole variegated world could not satisfy with aspects. The true life, the true bright sunshine, lay far out upon the plain. And oh! to see this sunlight once before he died! to move with a jocund spirit in that golden land! to hear the trained singers and sweet church-bells, and see the holiday gardens! And O fish! he would cry, if you would only turn your noses down stream, you could swim so easily into the fabled waters, and see the vast ships passing over your head like clouds, and hear the great water-hills making music over you all day long! But the fish kept looking patiently in their own direction, until Will hardly knew whether to laugh or cry.

Hitherto the traffic on the road had passed by Will, like something seen in a picture: he had perhaps exchanged salutations with a tourist, or caught sight of an old gentleman in a travelling cap at a carriage window; but for the most part it had been a mere symbol, which he contemplated from apart and with something of a superstitious feeling. A time came at last when this was to be changed. The miller, who was a greedy man in his way, and never forewent an opportunity of honest profit, turned the mill-house into a little wayside inn, and, several pieces of good fortune falling in opportunely, built stables and got the position of postmaster on the road. It now became Will's duty to wait upon people, as they sat to break their fasts in the little arbor at the top of the mill-garden; and you may be sure that he kept his ears open, and learned many new things about the outside world as he brought the omelette or the wine. Nay, he would often get into conversation with single guests, and by adroit questions and polite attention, not only gratify his own curiosity, but win the good-will of the travellers. Many complimented the old couple on their serving-boy; and a professor was eager to take him away with him, and have him properly educated in the plain. The miller and his wife were mightily astonished and even more pleased. They thought it a very good thing that they should have opened their inn. "You see," the old man would remark, "he has a kind of talent for a publican; he never would have made anything else!" and so life wagged on in the valley, with high satisfaction to all concerned but Will. Every carriage that left the inn-door seemed to take a part of him away with it; and when people jestingly offered him a lift he could with difficulty command his emotion. Night after night he would dream that he was awakened by flustered servants, and that a splendid equipage waited at the door to carry him down into the plain;

night after night, until the dream, which had seemed all jollity to him at first, began to take on a color of gravity, and the nocturnal summons and waiting equipage occupied a place in his mind as something to be both feared and hoped for.

One day, when Will was about sixteen, a fat young man arrived at sunset to pass the night. He was a contented-looking fellow, with a jolly eye, and carried a knapsack. While dinner was preparing, he sat in the arbor to read a book; but as soon as he had begun to observe Will, the book was laid aside; he was plainly one of those who prefer living people to people made of ink and paper. Will, on his part, although he had not been much interested in the stranger at first sight, soon began to take a great deal of pleasure in his talk, which was full of good nature and good sense, and at last conceived a great respect for his character and wisdom. They sat quite far into the night; and about two in the morning Will opened his heart to the young man, and told him how he longed to leave the valley, and what bright hopes he had connected with the cities of the plain. The young man whistled, and then broke into a smile.

"My young friend," he remarked, "you are a very curious little fellow to be sure, and wish a great many things which you will never get. Why, you would feel quite ashamed if you knew how the little fellows in these fairy cities of yours are all after the same sort of nonsense, and keep breaking their hearts to get up into the mountains. And let me tell you, those who go down into the plains are a very short while there before they wish themselves heartily back again. The air is not so light nor so pure; nor is the sun any brighter. As for the beautiful men and women, you would see many of them in rags and many of them deformed with horrible disorders; and a city is so hard a place for people who are poor and sensitive that many choose to die by their own hand."

"You must think me very simple," answered Will. "Although I have never been out of this valley, believe me, I have used my eyes, I know how one thing lives on another; for instance, how the fish hangs in the eddy to catch his fellows; and the shepherd, who makes so pretty a picture carrying home the lamb, is only carrying it home for dinner. I do not expect to find all things right in your cities. That is not what troubles me; it might have been that once upon a time; but although I live here always, I have asked many questions and learned a great deal in these last years, and certainly enough to cure me of my old fancies. But you would not have me die like a dog and not see all that is to be seen, and do all that a man can do, let it be good or evil? you would not have me spend all my days between this road here and the river, and not so much as make a motion to be up and live my life? I would rather die out of hand," he cried, "than linger on as I am doing."

"Thousands of people," said the young man, "live and die like you, and are none the less happy."

"Ah!" said Will, "if there are thousands who would like, why should not one of them have my place?"

It was quite dark; there was a hanging lamp in the arbor which lit up the table and the faces of the speakers; and along the arch, leaves upon the trellis stood out illuminated against the night sky, a pattern of transparent green upon a dusky purple. The fat young man rose, and taking Will by the arm, led him out under the open heavens.

"Did you ever look at the stars?" he asked, pointing upwards.

"Often and often," answered Will.

"And do you know what they are?"

"I have fancied many things. Are they eyes?"

"They are worlds like ours," answered the young man. "Some of them less; many of them a million times greater; and some of the least sparkles that you see are not only worlds, but whole clusters of worlds turning about each other in the midst of space. We do not know what there may be in any of them; perhaps the answer to all our difficulties or the cure of all our sufferings: and yet we can never reach them; not all the skill of the craftiest of men can fit out a ship for the nearest of these our neighbors, nor would the life of the most aged suffice for such a journey. When a great battle has been lost or a dear friend is dead, when we are hipped or in high spirits, there they are unweariedly shining overhead. We may stand down here, a whole army of us together, and shout until we break our hearts, and not a whisper reaches them. We may climb the highest mountain, and we are no nearer them. All we can do is to stand down here in the garden and take off our hats; the starshine lights upon our heads, and where mine is a little bald, I daresay you can see it glisten in the darkness. The mountain and the mouse,— that is like to be all we shall ever have to

do with Arcturus or Aldebaran. Can you apply a parable?" he added, laying his hand upon Will's shoulder. "It is not the same thing as a reason, but usually vastly more convincing."

Will hung his head a little, and then raised it once more to heaven. The stars seemed to expand and emit a sharper brilliancy; and as he kept turning his eyes higher and higher, they seemed to increase in multitude under his gaze.

"I see," he said, turning to the young man. "We are in a rat-trap."

"Something of that size. Did you ever see a squirrel turning in a cage? and another squirrel sitting philosophically over his nuts? I needn't ask you which of them looked more of a fool."

THE PARSON'S MARJARIE.

AFTER some years, the old people died, both in one winter, very carefully tended by their adopted son, and very quietly mourned when they were gone. People who had heard of his roving fancies supposed he would hasten to sell the property, and go down the river to push his fortunes. But there was never any sign of such an intention on the part of Will. On the contrary, he had the inn set on a better footing, and hired a couple of servants to assist him in carrying it on; and there he settled down, a kind, talkative, inscrutable young man, six feet three in his stockings, with an iron constitution and a friendly voice. He soon began to take rank in the district as a bit of an oddity: it was not much to be wondered at from the first, for he was always full of notions, and kept calling the plainest common sense in question; but what most raised the report upon him was the odd circumstance of his courtship with the parson's Marjarie.

The parson's Marjarie was a lass about nineteen, when Will would be about thirty; well enough looking, and much better educated than any other girl in that part of the country, as became her parentage. She held her head very high, and had already refused several offers of marriage with a grand air, which had got her hard names among the neighbors. For all that, she was a good girl, and one that would have made any man well contented.

Will had never seen much of her; for although the church and parsonage were only two miles from his own door, he was never known to go there but on Sundays. It chanced, however, that the parsonage fell into disrepair, and had to be dismantled; and the parson and his daughter took lodgings for a month or so, on very much reduced terms, at Will's inn. Now, what with the inn, and the mill, and the old miller's savings, our friend was a man of substance; and besides that, he had a name for good temper and shrewdness, which make a capital portion in marriage; and so it was currently gossipped, among their ill-wishers, that the parson and his daughter had not chosen their temporary lodging with their eyes shut. Will was about the last man in the world to be cajoled or frightened into marriage. You had only to look into his eyes, limpid and still like pools of water, and yet with a sort of clear light that seemed to come from within, and you would understand at once that here was one who knew his own mind, and would stand to it immovably. Marjarie herself was no weakling, by her looks, with strong, steady eyes and a resolute and quiet bearing. It might be a question whether she was not Will's match in steadfastness, after all, or which of them would rule the roast in marriage. But Marjarie had never given it a thought, and accompanied her father with the most unshaken innocence and unconcern.

The season was still so early that Will's customers were few and far between; but the lilacs were already flowering, and the weather was so mild that the party took dinner under the trellis, with the noise of the river in their ears and the woods ringing about them with the songs of birds. Will soon began to take a particular pleasure in these dinners. The parson was rather a dull companion, with a habit of dozing at table; but nothing rude or cruel ever fell from his lips. And as for the parson's daughter, she suited her surroundings with the best grace imaginable; and whatever she said seemed so pat and pretty that Will conceived a great idea of her talents. He could see her face as she leaned forward, against a background of rising pine woods; her eyes shone peaceably; the light lay around her hair like a kerchief; something that was hardly a smile rippled her pale cheeks, and Will could not contain himself from gazing on her in an agreeable dismay. She looked, even in her quietest moments, so complete in herself, and so quick with life down to her finger tips and the very skirts of her dress, that the remainder of created things became no more than a blot by comparison; and if Will glanced away from her to her surroundings, the trees looked inanimate and senseless, the clouds hung in heaven like dead things, and even the mountain-tops were disenchanted. The

whole valley could not compare in looks with this one girl.

Will was always observant in the society of his fellow-creatures; but his observation became almost painfully eager in the case of Marjarie. He listened to all she uttered, and read her eyes, at the same time, for the unspoken commentary. Many kind, simple and sincere speeches found an echo in his heart. He became conscious of a soul beautifully poised upon itself, nothing doubting, nothing desiring, clothed in peace. It was not possible to separate her thoughts from her appearance. The turn of her wrist, the still sound of her voice, the light in her eyes, the lines of her body, fell in tune with her grave and gentle words, like the accompaniment that sustains and harmonizes the voice of the singer. Her influence was one thing, not to be divided or discussed, only to be felt with gratitude and joy. To Will her presence recalled something of his childhood, and the thought of her took its place in his mind beside that of dawn, of running water, and of the earliest violets and lilacs. It is the property of things seen for the first time, or for the first time after long, like the flowers in spring, to reawaken in us the sharp edge of sense and that impression of mystic strangeness which otherwise passes out of life with the coming of years; but the sight of a loved face is what renews a man's character from the fountain upwards.

One day after dinner, Will took a stroll among the firs: a grave beatitude possessed him from top to toe; and he kept smiling to himself and the landscape as he went. The river ran between the stepping-stones with a pretty wimple; a bird sang loudly in the wood; the hilltops looked immeasurably high, and as he glanced at them from time to time, seemed to contemplate his movements with a beneficent but awful curiosity. His way took him to the eminence which overlooked the plain; and there he sat down upon a stone, and fell into deep and pleasant thought. The plain lay abroad with its cities and silver river; everything was asleep, except a great eddy of birds which kept rising and falling and going round and round in the blue air. He repeated Marjarie's name aloud, and the sound of it gratified his ear. He shut his eyes, and her image sprang up before him, quietly luminous and attended with good thoughts. The river might run forever; the birds fly higher and higher till they touched the stars. He saw it was empty bustle after all; for here, without stirring a foot, waiting patiently in his own narrow valley, he also had attained the better sunlight.

The next day, Will made a sort of declaration across the dinner-table, while the parson was filling his pipe.

"Miss Marjarie," he said, "I never knew any one I liked so well as you. I am mostly a cold, unkindly sort of man; not from want of heart, but out of strangeness in my ways of thinking; and people seem far away from me. 'Tis as if there were a circle round me, which kept every one out but you; I can hear the others talking and laughing; but you come quite close. Maybe, this is disagreeable to you?" he asked.

Marjarie made no answer.

"Speak up, girl," said the parson.

"Nay, now," returned Will, "I wouldn't press her, parson. I feel tongue-tied myself, who am not used to it; and she's a woman, and little more than a child, when all is said. But for my part, as far as I can understand what people mean by it, I fancy I must be what they call in love. I do not wish to be held as committing myself; for I may be wrong; but that is how I believe things are with me. And if Miss Marjarie should feel any otherwise on her part, mayhap she would be so kind as shake her head."

Marjarie was silent, and gave no sign that she had heard.

"How is that, parson?" asked Will.

"The girl must speak," replied the parson, laying down his pipe. "Here's our neighbor who says he loves you, Madge. Do you love him, ay or no?"

"I think I do," said Marjarie, faintly.

"Well, then, that's all that could be wished!" cried Will heartily. And he took her hand across the table, and held it a moment in both of his with great satisfaction.

"You must marry," observed the parson, replacing his pipe in his mouth.

"Is that the right thing to do, think you?" demanded Will.

"It is indispensable," said the parson.

"Very well," replied the wooer.

Two or three days passed away with great delight to Will, although a bystander might scarce have found it out. He continued to take his meals opposite Marjarie, and to talk with her and gaze upon her in her father's presence; but he made no attempt to see her alone, nor in any other way changed his conduct towards her from what it had been since the beginning. Perhaps the girl was a little disappointed, and perhaps not unjustly; and yet if it had been enough to be always in the

thoughts of another person, and so pervade and alter his whole life, she might have been thoroughly contented. For she was never out of Will's mind for an instant. He sat over the stream, and watched the dust of the eddy, and the poised fish, and straining weeds; he wandered out alone into the purple even, with all the blackbirds piping round him in the wood; he rose early in the morning, and saw the sky turn from grey to gold, and the light leap upon the hilltops; and all the while he kept wondering if he had never seen such things before, or how it was that they should look so different now. The sound of his own mill-wheel, or of the wind among the trees, confounded and charmed his heart. The most enchanting thoughts presented themselves unbidden in his mind. He was so happy that he could not sleep at night, and so restless that he could hardly sit still out of her company. And yet it seemed as if he avoided her rather than sought her out.

One day, as he was coming home from a ramble, Will found Marjarie in the garden picking flowers; and as he came up with her, slackened his pace and continued walking by her side.

"You like flowers," he said.

"Indeed I love them dearly," she replied. "Do you?"

"Why, no," said he, "not so much. They are a very small affair, when all is done. I can fancy people caring for them greatly, but not doing as you are just now."

"How?" she asked, pausing and looking up at him.

"Plucking them," said he. "They are a deal better off where they are, and look a deal prettier, if you go to that."

"I wish to have them for my own," she answered, "to carry them near my heart, and keep them in my room. They tempt me when they grow here; they seem to say, 'Come and do something with us;' but once I have cut them and put them by, the charm is laid, and I can look at them with quite an easy heart."

"You wish to possess them," replied Will, "in order to think no more about them. It's a bit like killing the goose with the golden eggs. It's a bit like what I wished to do when I was a boy. Because I had a fancy for looking out over the plain, I wished to go down there — where I couldn't look out over it any longer. Was not that fine reasoning? Dear, dear, if they only thought of it, all the world would do like me; and you would let your flowers alone, just as I stay up here in the mountains." Suddenly he broke off sharp. "By the Lord!" he cried. And when she asked him what was wrong, he turned the question off, and walked away into the house with rather a humorous expression of face.

He was silent at table; and after the night had fallen and the stars had come out overhead, he walked up and down for hours in the courtyard and garden with an uneven pace. There was still a light in the window of Marjarie's room: one little oblong patch of orange in a world of dark blue hills and silver starlight. Will's mind ran a great deal on the window; but his thoughts were not very lover-like. "There she is in her room," he thought, "and there are the stars overhead: a blessing upon both!" Both were good influences in his life; both soothed and braced him in his profound contentment with the world. And what more should he desire with either? The fat young man and his counsels were so present to his mind, that he threw back his head, and putting his hands before his mouth, shouted aloud to the populous heavens. Whether from the position of his head or the sudden strain of the exertion, he seemed to see a momentary shock among the stars, and a diffusion of frosty light pass from one to another along the sky. At the same instant, a corner of the blind was lifted and lowered again at once. He laughed a loud ho-ho. "One and another!" thought Will. "The stars tremble, and the blind goes up. Why, before Heaven, what a great magician I must be! Now if I were only a fool, should not I be in a pretty way?" And he went off to bed, chuckling to himself: "If I were only a fool!"

The next morning pretty early, he saw her once more in the garden, and sought her out.

"I have been thinking about getting married," he began abruptly; "and after having turned it all over, I have made up my mind it's not worth while."

She turned upon him for a single moment; but his radiant, kindly appearance would, under the circumstances, have disconcerted an angel, and she looked down again upon the ground in silence. He could see her tremble.

"I hope you don't mind," he went on, a little taken aback. "You ought not. I have turned it all over, and upon my soul there's nothing in it. We should never be one whit nearer than we are just now, and, if I am a wise man, nothing like so happy."

"It is unnecessary to go round about with me," she said. "I very well remem-

ber that you refused to commit yourself; and now that I see you were mistaken, and in reality have never cared for me, I can only feel sad that I have been so far misled."

"I ask your pardon," said Will stoutly; "you do not understand my meaning. As to whether I have ever loved you or not, I must leave that to others. But for one thing, my feeling is not changed; and for another, you may make it your boast that you have made my whole life and character something different from what they were. I mean what I say; no less. I do not think getting married is worth while. I would rather you went on living with your father, so that I could walk over and see you once, or maybe twice a week, as people go to church, and then we should both be all the happier between whiles. That's my notion; but I'll marry you if you will," he added.

"Do you know that you are insulting me?" she broke out.

"Not I, Marjarie," said he; "if there is anything in a clear conscience, not I. I offer you all my heart's best affection; you can take it or want it, though I suspect it's beyond either your power or mine to change what has once been done, and set me fancy-free. I'll marry you, if you like; but I tell you again and again, it's not worth while, and we had best stay friends. Though I am a quiet man I have noticed a heap of things in my life. Trust in me, and take things as I propose; or, if you don't like that, say the word, and I'll marry you out of hand."

There was a considerable pause, and Will, who began to feel uneasy, began to grow angry in consequence.

"It seems you are too proud to say your mind," he said. "Believe me, that's a pity. A clean shrift makes simple living. Can a man be more downright or honorable to a woman than I have been? I have said my say, and given you your choice. Do you want me to marry you? or will you take my friendship, as I think best? or have you had enough of me for good? Speak out for the dear God's sake! You know your father told you a girl should speak her mind in these affairs."

She seemed to recover herself at that, turned without a word, walked rapidly through the garden, and disappeared into the house, leaving Will in some confusion as to the result. He walked up and down the garden, whistling softly to himself. Sometimes he stopped and contemplated the sky and hilltops; sometimes he went down to the tail of the weir and sat there, looking foolishly into the water. All this dubiety and perturbation was so foreign to his nature and the life which he had resolutely chosen for himself, that he began to regret Marjarie's arrival. "After all," he thought, "I was as happy as a man need be. I could come down here and watch my fishes all day long if I wanted: I was as settled and contented as my old mill."

Marjarie came down to dinner, looking very trim and quiet; and no sooner were all three at table than she made her father a speech, with her eyes fixed upon her plate, but showing no other sign of embarrassment or distress.

"Father," she began, "Mr. Will and I have been talking things over. We see that we have each made a mistake about our feelings, and he has agreed, at my request, to give up all idea of marriage, and be no more than my very good friend, as in the past. You see, there is no shadow of a quarrel, and, indeed, I hope we shall see a great deal of him in the future, for his visits will always be welcome in our house. Of course, father, you will know best, but perhaps we should do better to leave Mr. Will's house for the present. I believe, after what has passed, we should hardly be agreeable inmates for some days."

Will, who had commanded himself with difficulty from the first, broke out upon this into an inarticulate noise, and raised one hand with an appearance of real dismay, as if he were about to interfere and contradict. But she checked him at once, looking up at him with a swift glance and an angry flush upon her cheek.

"You will perhaps have the good grace," she said, "to let me explain these matters for myself."

Will was put entirely out of countenance by her expression and the ring of her voice. He held his peace, concluding that there were some things about this girl beyond his comprehension, in which he was exactly right.

The poor parson was quite crestfallen. He tried to prove that this was no more than a true lovers' tiff, which would pass off before night, and when he was dislodged from that position, he went on to argue that where there was no quarrel there could be no call for a separation; for the good man liked both his entertainment and his host. It was curious to see how the girl managed them, saying little all the time, and that very quietly, and yet twisting them round her finger and insen-

sibly leading them wherever she would by feminine tact and generalship. It scarcely seemed to have been her doing — it seemed as if things had merely so fallen out — that she and her father took their departure that same afternoon in a farm-cart, and went farther down the valley, to wait until their own house was ready for them in another hamlet. But Will had been observing closely, and was well aware of her dexterity and resolution. When he found himself alone he had a great many curious matters to turn over in his mind. He was very sad and solitary, to begin with. All the interest had gone out of his life, and he might look up at the stars as long as he pleased, he somehow failed to find support and consolation. And then he was in such a turmoil of spirit about Marjarie. He had been puzzled and irritated at her behavior, and yet he could not keep himself from admiring it. He thought he recognized a fine, perverse angel in that still soul which he had never hitherto suspected; and though he saw it was an influence that would fit but ill with his own life of artificial calm, he could not keep himself from ardently desiring to possess it. Like a man who has lived among shadows and now meets the sun, he was both pained and delighted.

As the days went forward he passed from one extreme to another; now pluming himself on the strength of his determination, now despising his timid and silly caution. The former was, perhaps, the true thought of his heart, and represented the regular tenor of the man's reflections; but the latter burst forth from time to time with an unruly violence, and then he would forget all consideration, and go up and down his house and garden or walk among the fir woods like one who is beside himself with remorse. To equable, steady-minded Will this state of matters was intolerable; and he determined, at whatever cost, to bring it to an end. So, one warm summer afternoon he put on his best clothes, took a thorn switch in his hand, and set out down the valley by the river. As soon as he had taken his determination, he had regained at a bound his customary peace of heart, and he enjoyed the bright weather and the variety of the scene without any admixture of alarm or unpleasant eagerness. It was nearly the same to him how the matter turned out. If she accepted him he would have to marry her this time, which perhaps was all for the best. If she refused him, he would have done his best, and might follow his own way in the future with an untroubled conscience. He hoped, on the whole, she would refuse him; and then, again, as he saw the brown roof which sheltered her peeping through some willows at an angle of the stream, he was half inclined to reverse the wish, and more than half ashamed of himself for this infirmity of purpose.

Marjarie seemed glad to see him, and gave him her hand without affectation or delay.

"I have been thinking about this marriage," he began.

"So have I," she answered. "And I respect you more and more for a very wise man. You understood me better than I understood myself; and I am now quite certain that things are all for the best as they are."

"At the same time," — ventured Will.

"You must be tired," she interrupted. "Take a seat and let me fetch you a glass of wine. The afternoon is so warm; and I wish you not to be displeased with your visit. You must come quite often; once a week, if you can spare the time; I am always glad to see my friends."

"Oh, very well," thought Will to himself. "It appears I was right after all." And he paid a very agreeable visit, walked home again in capital spirits, and gave himself no further concern about the matter.

For nearly three years, Will and Marjarie continued on these terms, seeing each other once or twice a week without any word of love between them; and for all that time I believe Will was nearly as happy as a man can be. He rather stinted himself the pleasure of seeing her; and he would often walk half way over to the parsonage, and then back again, as if to whet his appetite. Indeed there was one corner of the road, whence he could see the church spire wedged into a crevice of the valley between sloping fir woods, with a triangular snatch of plain by way of background, which he greatly affected as a place to sit and moralize in before returning homewards; and the peasants got so much into the habit of finding him there in the twilight, that they gave it the name of "Will o' the Mill's Corner."

At the end of the three years, Marjarie played him a sad trick by suddenly marrying somebody else. Will kept his countenance bravely, and merely remarked that, for as little as he knew of women, he had acted very prudently in not marrying her himself three years before. She plainly knew very little of her own mind; and in spite of a deceptive manner, was as fickle and flighty as the rest of them. He had

to congratulate himself on an escape, he said, and would take a higher opinion of his own wisdom in consequence. But at heart, he was reasonably displeased, moped a good deal for a month or two and fell away in flesh, to the astonishment of his serving-lads.

It was perhaps a year after this marriage, that Will was wakened late one night by the sound of a horse galloping on the road, followed by precipitate knocking at the inn-door. He opened his window and saw a farm servant, mounted and holding a led horse by the bridle, who told him to make what haste he could and go along with him; for Marjarie was dying, and had sent urgently to fetch him to her bedside. Will was no horseman, and made so little speed upon the way, that the poor young wife was very near her end before he arrived. But they had some minutes' talk in private, and he was present and wept very bitterly while she breathed her last.

The day broke as he walked homewards. One by one the stars melted and disappeared; one by one the hilltops kindled and grew bright. The river sang in the hush; and Will felt an immense contentment swallowing up a little sorrow, as the sea covers a grain of sand or the day extinguishes a star. She had loved him as he had loved her, as something set apart over life; and henceforward they might continue to love each other, without jar or difficulty, without doubt or after-thought, across the gulf of death. He had been contented in his love when they were two miles apart; he might have been contented if all the seas had flowed between them; and should he not be contented now, when she was caught up into another world, immeasurably far indeed, but perfectly secure and happy?

DEATH.

YEAR after year went away into nothing, with great explosions and outcries in the cities on the plain; red revolt springing up and being suppressed in blood, battle swaying hither and thither, patient astronomers in observatory towers picking out and christening new stars, plays being performed in lighted theatres, people being carried into hospital on stretchers, and all the usual turmoil and agitation of men's lives in crowded centres. Up in Will's valley only the winds and seasons made an epoch; the fish hung in the swift stream, the birds circled overhead, the pine-tops rustled underneath the stars, the tall hills stood over all; and Will went to and fro, minding his wayside inn, until the snow began to thicken on his head. His heart was young and vigorous; and if his pulses kept a sober time, they still beat strong and steady in his wrists. He carried a ruddy stain on either cheek, like a ripe apple; he stooped a little, but his step was still firm; and his sinewy hands were reached out to all men with a friendly pressure. His face was covered with those wrinkles which are got in the open air and which, rightly looked at, are no more than a sort of permanent sunburning; such wrinkles heighten the stupidity of stupid faces, but to a person like Will, with his clear eyes and smiling mouth, only give another charm by testifying to a simple and easy life. His talk was full of wise sayings. He had a taste for other people; and other people had a taste for him. When the valley was full of tourists in the season, there were merry nights in Will's arbor; and his views, which seemed whimsical to his neighbors, were often enough admired by learned people out of towns and colleges. Indeed, he had a very noble old age, and grew daily better known; so that his fame was heard of in the cities on the plain; and young men who had been summer travellers spoke together in *cafés* of Will o' the Mill and his rough philosophy. Many and many an invitation, you may be sure, he had; but nothing could tempt him from his upland valley. He would shake his head and smile over his tobacco-pipe with a deal of meaning. "You come too late," he would answer. "I am a dead man now; I have lived and died already. Fifty years ago you would have brought my heart into my mouth; and now you do not even tempt me. But that is the object of long living, that a man should cease to care about life." And again: "There is only one difference between a long life and a good dinner: that, in the dinner, the dainties come last." Or once more: "When I was a boy, I was a bit puzzled, and hardly knew whether it was myself or the world that was curious and worth looking into. Now, I know it is myself, and stick to that."

He never showed any symptom of frailty, but kept stalwart and firm to the last; but they say he grew less talkative towards the end, and would listen to other people by the hour in an amused and sympathetic silence. Only, when he did speak, it was more to the point and more charged with old experience. He drank a bottle of wine gladly; above all, at sunset on the hilltop, or quite late at night under the stars in the arbor. The sight of something attractive and unattainable seasoned

his enjoyment, he would say; and he professed he had lived long enough to admire a candle all the more when he could compare it with a planet.

One night, in his seventy-second year, he awoke in bed in such uneasiness of body and mind, that he rose and dressed himself and went out to meditate in the arbor. It was pitch dark, without a star; the river was swollen, and the wet woods and meadows loaded the air with perfume. It had thundered during the day, and it promised more thunder for the morrow. A murky, stifling night for a man of seventy-two! Whether it was the weather or the wakefulness, or some little touch of fever in his old limbs, Will's mind was besieged by tumultuous and crying memories. His boyhood, the night with the fat young man, the death of his adopted parents, the summer days with Marjarie, and many of those small circumstances, which seem nothing to another, and are yet the very gist of a man's own life to himself — things seen, words heard, looks misconstrued — arose from their forgotten corners and usurped his attention. The dead themselves were with him, not merely taking part in this thin show of memory that defiled before his brain, but revisiting his bodily senses as they do in profound and vivid dreams. The fat young man leaned his elbows on the table opposite; Majarie came and went with an apronful of flowers between the garden and the arbor; he could hear the old parson knocking out his pipe or blowing his resonant nose. The tide of his consciousness ebbed and flowed: he was sometimes half asleep and drowned in these recollections of the past; and sometimes he was broad awake, wondering at himself. But about the middle of the night, he was startled by the voice of the dead miller calling to him out of the house as he used to do on the arrival of custom. The hallucination was so perfect that Will sprang from his seat and stood listening for the summons to be repeated; and as he listened, he became conscious of another noise besides the brawling of the river and the ringing in his feverish ears. It was like the stir of horses and the creaking of harness, as though a carriage with an impatient team had been brought up upon the road before the courtyard gate. At such an hour, upon this rough and dangerous pass, the supposition was no better than absurd; and Will dismissed it from his mind, and resumed his seat upon the arbor chair; and sleep closed over him again like running water. He was once again awakened by the dead miller's call, thinner and more spectral than before; and once again he heard the noise of an equipage upon the road. And so thrice and four times, the same dream, or the same fancy, presented itself to his senses; until at length, smiling to himself as when one humors a nervous child, he proceeded towards the gate to set his uncertainty at rest.

From the arbor to the gate was no great distance; and yet it took Will some time; it seemed as if the dead thickened around him in the court, and crossed his path at every step. For, first, he was suddenly surprised by an overpowering sweetness of heliotropes; it was as if his garden had been planted with this flower from end to end, and the hot, damp night had drawn forth all their perfumes in a breath. Now the heliotrope had been Marjarie's favorite flower, and since her death not one of them had ever been planted in Will's ground.

"I must be going crazy," he thought. "Poor Marjarie and her heliotropes!"

And with that he raised his eyes towards the window that had once been hers. If he had been bewildered before, he was now almost terrified; for there was a light in the room; the window was an orange oblong as of yore; and the corner of the blind was lifted and let fall as on the night when he stood and shouted to the stars in his perplexity. The illusion only endured an instant; but it left him somewhat unmanned, rubbing his eyes and staring at the outline of the house and the black night behind it. While he thus stood, and it seemed as if he must have stood there quite a long time, there came a renewal of the noises on the road: and he turned in time to meet a stranger, who was advancing to meet him across the court. There was something like the outline of a great carriage discernible on the road behind the stranger, and, above that, a few black pine-tops, like so many plumes.

"Master Will?" asked the new-comer, in brief military fashion.

"That same, sir," answered Will. "Can I do anything to serve you?"

"I have heard you much spoken of, Master Will," returned the other; "much spoken of, and well. And though I have both hands full of business, I wish to drink a bottle of wine with you in your arbor. Before I go, I shall introduce myself."

Will led the way to the trellis, and got a lamp lighted and a bottle uncorked. He was not altogether unused to such com-

plimentary interviews, and hoped little enough from this one, being schooled by many disappointments. A sort of cloud had settled on his wits, and prevented him from remembering the strangeness of the hour. He moved mechanically like a person in his sleep; and it seemed as if the lamp caught fire and the bottle came uncorked with the facility of thought. Still, he had some curiosity about the appearance of his visitor, and tried in vain to turn the light into his face; either he handled the lamp clumsily, or there was a dimness over his eyes; but he could make out little more than a shadow at table with him. He stared and stared at this shadow, as he wiped out the glasses, and began to feel cold and strange about the heart. The silence weighed upon him, for he could hear nothing now, not even the river, but the drumming of his own arteries in his ears.

"Here's to you," said the stranger, roughly.

"Here is my service, sir," replied Will, sipping his wine, which somehow tasted oddly.

"I understand you are a very positive fellow," pursued the stranger.

Will made answer with a smile of some satisfaction and a little nod.

"So am I," continued the other; "and it is the delight of my heart to tramp on people's corns. I will have nobody positive but myself; not one. I have crossed the whims, in my time, of kings and generals and great artists. And what would you say," he went on, "if I had come up here on purpose to cross yours?"

Will had it on his tongue to make a sharp rejoinder; but the politeness of an old innkeeper prevailed; and he held his peace and made answer with a civil gesture of the hand.

"I have," said the stranger. "And if I did not hold you in a particular esteem, I should make no words about the matter. It appears you pride yourself on staying where you are. You mean to stick by your inn. Now I mean you shall come for a turn with me in my barouche; and before this bottle's empty, so you shall."

"That would be an odd thing, to be sure," replied Will, with a chuckle. "Why, sir, I have grown here like an old oak-tree; the devil himself could hardly root me up: and for all I perceive you are a very entertaining old gentleman, I would wager you another bottle you lose your pains with me."

The dimness of Will's eyesight had been increasing all this while; but though he was now as good as blind, he was somehow conscious of a sharp and chilling scrutiny which irritated and yet overmastered him.

"You need not think," he broke out suddenly, in an explosive, febrile manner that startled and alarmed himself, "that I am a stay-at-home because I fear anything under God. God knows I am tired enough of it all; and when the time comes for a longer journey than ever you dream of, I reckon I shall find myself prepared."

The stranger emptied his glass and pushed it away from him. He looked down for a little, and then leaning over the table, tapped Will three times upon the forearm with a single finger. "The time has come!" he said, solemnly wagging his head.

A nasty thrill spread from the spot he touched. The tones of his voice were dull and startling, and echoed strangely in Will's heart.

"I beg your pardon," he said, with some discomposure. "What do you mean?"

"Look at me, and you will find your eyesight swim. Raise your hand; it is dead-heavy. This is your last bottle of wine, Master Will, and your last night upon the earth."

"You are a doctor?" quavered Will.

"The best that ever was," replied the other; "for I cure both mind and body with the same prescription. I take away all pain and I forgive all sins; and where my patients have gone wrong in life, I smooth out all complications and set them free again upon their feet."

"I have no need of you," said Will.

"A time comes for all men, Master Will," replied the doctor, "when the helm is taken out of their hands. For you, because you were prudent and quiet, it has been long of coming, and you have had long to discipline yourself for its reception. You have seen what is to be seen about your mill; you have sat close all your days like a hare in its form; but now that is at an end; and," added the doctor, getting on his feet, "you must arise and come with me."

"You are a strange physician," said Will, looking steadfastly upon his guest.

"I am a natural law," he replied, "and people call me Death."

"Why did you not tell me so at first?" cried Will. "I have been waiting for you these many years. Give me your hand, and welcome."

"Lean upon my arm," said the stranger, "for already your strength abates. Lean on me as heavily as you need; for though I am old, I am very strong. It is but

three steps to my carriage, and there all your trouble ends. Why, Will," he added, "I have been yearning for you as if you were my own son; and of all the men that ever I came for in my long days, I have come for you most gladly. I am caustic, and sometimes offend people at first sight; but I am a good friend at heart to such as you."

"Since Marjarie was taken from me," returned Will, with a break in his voice, "I declare before God you were the only friend I had to look for."

So the pair went arm-in-arm across the courtyard.

One of the servants awoke about this time and heard the noise of horses pawing before he dropped asleep again; all down the valley that night there was a rushing as of a smooth and steady wind descending towards the plain; and when the world rose next morning, sure enough Will o' the Mill had gone at last upon his travels. R. L. S.

From The Spectator.

THE DEATH OF VICTOR EMANUEL.

THE pope has enjoyed, in his own view at least, an hour of supreme triumph, and it has been a Christian one. He has forgiven, with all the plenitude of authority with which the system of Rome invests him, the dying sinner who in health tore from his hands the last temporal dominion of the Church. In all history we know of no scene more strikingly dramatic than this of the pale old priest, unable to leave his couch, in hourly expectation of death, yet in his prostration asserting superiority to the soldier-king who had dethroned him, and sending his forgiveness and the order for the sacraments of the Church to the daring, dissolute trooper, whose destiny it has been to carry up to their culminating point the fortunes of the oldest reigning house, save one, in Europe,— to remake a State divided for a thousand years, and to reduce or raise the Church of Rome once more to a purely spiritual power in the world. Victor Emanuel, king of Italy, has always seemed to observers outside Piedmont something of an enigma, but in Savoy and Turin he has been, from the second year of his reign, thoroughly comprehended. King of Piedmont or king of Italy, he has been from first to last what every ancestor has been, since, a thousand years ago, the dukes of Maurienne found themselves independent, and the race began to hope that north or south, in Provence or in Italy, it should carve out a sufficient realm. No race in Europe has been more consistent. Open the history of France or Italy where you will, and there is always a duke of Savoy, a prince of Savoy, a king of Piedmont, a king of Sardinia, Philibert or Humbert, Amadeo or Victor — the house is too old for a surname — holding the mountain-gates between the two countries, allying himself with both or either, or betraying either or both, but always, amidst all changes, maintaining a reputation for daring, for adroitness, and for a certain determined persistence, which impressed observers even when the politics of the house became most tortuous, or in appearance vacillating. Neither Bourbon nor Hapsburg could ever destroy the house they hated, and even Napoleon failed. The original type of the race is that of the German robber-knight, the bold, unscrupulous baron, who uses his position to crush all whom he can reach; but it was modified by the geographical position of their possessions, hemmed in as they were between stronger States, without a language or a nationality, until the Savoyard became a hereditary diplomatist whom the subtlest feared, a statesman who conciliated while he tyrannized over his few people, a soldier who waged war rather as a captain of free lances than a sovereign. Brave, dissolute, ununscrupulous, yet with some statesmanlike insight and extraordinary tenacity, the line from Humbert II. (1078) down to Victor Emanuel, through eight hundred years of varied fortune, might always have been accurately described as the soldier-dynasty of the Alps, with all the vices and many of the virtues the world attributes to the soldier and the hungry mountaineer. The greatest man of the house till Victor Emanuel appeared, the wonderful general whom our fathers so much admired, and who, by the side of Marlborough, upheld through a long career of victory the cause of Europe against Louis XIV., and who signed himself habitually "Eugenio von Savoye," because he was as much Italian as German, and as much Frenchman as either, appears in his memoirs, under all his court varnish and all his magnanimity, a thorough Savoyard, daring, ambitious, dissolute, luxurious, and persistent as a river. In Victor Emanuel, this last quality, always so perceptible in his house, took a shape that made the fortune alike of his dynasty and of Italy. When after the dark day of Novara he ascended the throne, his subjects expected in the sullenly brave young prince so deeply connected with the Austrian house, an Ital-

ian Hapsburg, a thorough reactionary, and in part they were not deceived. No man had more of the feeling of kingship or the pride of birth than Victor Emanuel, and no man more confidence in his own right to rule. He compelled his Parliament to sign the peace which saved Piedmont; he quarrelled in the very crisis of his fate with Cavour, because the great minister made a remark which the king considered derogatory to his house; he refused the throne of the Peninsula, if he were to be called "King of the Italians;" and he would often aver to the last that it was "hard work to guide his political team." He was, in fact, by temperament a king of the old type, but he had acquired, either from some teaching of his father or the circumstances of his own history, an absolute conviction that to carry his father's policy to success, and rear the throne his father had designed, he must be a constitutional king, and from that resolve he never swerved. His Austrian relatives implored and threatened him to give up the *Statuto;* the priests, whom he, as a dissolute and superstitious man, greatly feared, menaced him with every spiritual suffering; his closest female kinsfolk declared the incessant deaths in his house a judgment from heaven; but the proud, hot-tempered, bull-headed soldier never swerved from the word he had given. He would keep the Constitution as his father had sworn, and maintain his father's cause, and all Italy in one twelvemonth recognized that he was faithful, and fell at the feet of the only Italian prince who could be trusted. Before he had won a province, every Italian city used periodically to be placarded with "*Viva Verdi*," the name of the composer containing the initials of "Vittorio Emanuele, Rè d'Italia," and in every advance his troops had behind them the army of the people.

The popular confidence in Victor Emanuel never wavered, and it was well deserved. Dissolute in private life, a trooper in bearing, a rude sportsman in taste and habits; with no knowledge of literature, and little taste for art; speaking by preference a dialect as rough as the broadest Yorkshire, and never thoroughly mastering Italian; a second-rate general in all but daring; at once reckless and ignorant of finance — so reckless that his debts were a permanent trouble to the treasury, and so ignorant that he never could understand how his vast nominal income went — the king had three of those great qualities which build up in a favoring cycle of circumstance durable thrones. He never feared, or disliked, or tricked the people. He could take a great risk, as he did when he invaded the Romagna; or exercise a grand self-control, as he did when, almost apoplectic with rage, he agreed to the peace of Villafranca, or when he signed away, on the demand of Napoleon, the cradle of his house. And he could recognize and accept and use great servants. His was probably not the insight which has made of the Hohenzollern the most powerful monarch in the world, the insight which picked out Moltke from among soldiers of fortune and Bismarck from among petty squires; but still, among the statesmen around him the king chose right. He alone after Novara insisted, in the teeth of enormous opposition, on choosing Massimo d'Azeglio. There is reason to believe that he hated Cavour personally, though at a time when he was absolute he had selected him; but he never but once, and then for a moment, deserted his great servant. He chafed under Ricasoli's stern rein, but he never overthrew him. He must have writhed often under recent ministers, especially in ecclesiastical affairs, but he never deserted them, even under pressure which to him, at heart a superstitious Catholic, must have been tremendous. It was not that he simply suffered them. To the last his power over every ministry was considerable, and was exercised freely, especially as regards the army and foreign affairs; but he never violated the Constitution, and never acted without his ministers' knowledge. As he told Gambetta, the last foreign statesman who saw him alive, had he been king of France Gambetta would have been his premier, and would have been supported. The origin of his loyalty was, in part at least, his utter fearlessness, which rescued him from that suspiciousness alike of the people and of personages which besets kings, and in part the result of a feeling that he should be personally happier if all went wrong at last, and he was again the chamois-hunting prince of Piedmont; but he was loyal to the bone, and his loyalty built Italy. No man less trusted, however superior in personal character or in intellectual powers, could have excited the same devotion, or received such adhesion from the determined, suspicious republicans whom Italy, in her long years of suffering, had bred. Mazzini never accepted him, but the Mazzinians ceased to plot. In the land of the dagger he was safer from attempts on his life than Queen Victoria in England, and the grief of his whole people at his death shows at once the confidence he had attracted and their keen political sense, which saw that

here, in this rough soldier, was the standard round which all parties and all provinces could rally for the battle of freedom and nationality. That his death endangers the monarchy in Italy we do not believe. Great as the attraction of the example of France is on Italy, the Italians know that the Constitution will secure them all a republic could. They have no Bourbons to destroy, and the new king, though not popular, is free from many of the difficulties which beset his father, especially the hatred borne to him by Ultramontanes, and enjoys the benefit of the deep devotion felt throughout Italy towards his wife, the "Pearl" of the house of Savoy. That the ministry will miss the aid of Victor Emanuel's popularity, of his rough, keen sense in affairs, and of his intimate knowledge of persons, is likely enough; but in Italy genius is endemic, and his place will be supplied. He is not a heroic figure, in our sight, but there are compensations in character; history will pardon the king's vices, as the Church has done, and there will in time, if Italy lasts, gather round the founder of her dynasty that softening halo of distance and indistinctness for which time is now too new. They are all passing, the great figures of our half of the century; and when the old priest has gone, scarcely one of the visible figures present when it began will be still before the world.

From The Examiner.

THE VICE OF TALKING SHOP.

It is very wrong to talk shop. That is one of society's most venerated precepts, even if — not wholly unlike most venerated precepts, in higher codes of morality — it is one of the least obeyed. Not to know it is not to know the rudimentary "my duty towards my neighbor" of social religion. And to enforce it — as occasion may require, of course — must be the duty of every self-respecting diner-out. For if you fall among shop-talkers whose shop is not yours you may get thrown into the background. The predicament is serious; it is not only that you may be prevented from taking part in the conversation with your accustomed excellence, but that you may have to hold your tongue altogether; and, in spite of the many compliments paid to silence by the many sages who have wished to do all the talking themselves, people are apt to assume that when a man says nothing in company it is because he can find nothing to say. And at any rate no one likes to play the part of the mummy at an Egyptian banquet, to be the blank guest whose silence conveys a protest against the whole proceedings, and concerning whom the other guests must needs feel that the best they can do with him is to let him alone. He who finds himself in such a pass will no more doubt that it is a vice to talk shop than he would doubt that it is a vice not to pay one's debts if somebody else persevered in owing him an inconveniently large sum of money.

And yet there is something to be said on behalf of shop. The rule of society no doubt is that we should talk of what we do not know rather than of what we do know; still there are many men, and perhaps some women, who are absolutely unable to obey the rule — except negatively, by not talking of anything. Women who mix at all with the world readily acquire the knack of talking companionably of what they know nothing about — a great many women indeed seem less to acquire it than to have it as a birthright; obedience to the rule sits upon them as easily and as fitly as the furbelows and gauzes in which a man would find himself like a fly in a cobweb. Therefore women, even women with specialities, rarely talk shop. In fact, partly under the dread of those fatal adjectives "blue," "gushing," "strong-minded," and partly from a sort of mental prudery — one which has its good side but also its bad — which objects, as it were, to the real woman being too accurately scanned, they more usually shrink from any discussion of subjects in which they feel a close interest. But there is a large tale of men who never arrive at being able to talk on subjects about which they have neither information nor concern; and the question is, whether in their case it is not worth while to relax the stringency of the rule.

Suppose a man's shop has so engrossed him that it really is the only thing he knows or cares about. He is not uneducated, perhaps not even narrow-minded, but his intellect is not of the much-embracing order, and his profession or his purpose has so absorbed his intellectual sympathies that, just as if he were some great artist, all he sees and learns gets somehow dovetailed into the one theme of his life. Whenever circumstances have led to a man's occupying his time and his thoughts in one especial manner with any sort of zeal, he will unconsciously acquire such a readiness in detecting everything that has the remotest affinity to his paramount topic that it can never be quite out of his memory. There will always be the

Original from CORNELL UNIVERSITY

temptation to get back to it — set him down where you will, some byway brings him back into the familiar highway. Cleverness will not place him out of risk. Indeed, the cleverer he is, the more likely he is to become, to this extent, the slave of his shop. This is not meant of the man of genius, of course, the many-sided man, but of the busy, practical man of common life. Say that he is of more than average intellect, that he has talent, and, still better, a wise and honest love for his science, his art, or whatever may be the name of his work, he will be at a disadvantage as compared with the man who, failing either in the ability or in the energy necessary for concentration, has been enabled to learn a little plausible ignorance on a good many topics of general interest. Now over-concentration may be damaging to the balance of his mind, and without doubt concentration which is in other respects not over-concentration is detrimental to him as a conversationalist, lessening the superficies over which his tongue can travel. But since the poor fellow is so ill off that there is only one class of topics on which he can enter readily, may there not be something gained for his associates as well as for him in letting him go his own way? If one found oneself in the company of the philosopher who has concentrated his life on the dative case, it might be better to put him to discourse on the dative case than to elicit his dulness on the weather. One might not succeed in achieving even a temporary sympathy with his fervor, but one would at least have learned something about the dative case. And a man must be very stupid indeed — or else his listener is very stupid indeed — who can talk freely and earnestly on a subject which thoroughly interests him without the listener's becoming interested, if not in the subject, at least in the interest it has for its exponent. Nor need the listener's interest be lessened, surely, if he is hearing several men skilled and eager in some special pursuit talking with each other, instead of only one such man talking with him.

From The Spectator.

BARON MUNCHAUSEN'S FROZEN WORDS.

THE telephone is the wonder of the day, but among the inventions to which the investigation of this subject has given rise is one of a kind which to us — accustomed as we now are to the electric telegraph — appears still more marvellous than even the telephone itself, one which would enable us to talk further into the future than the telephone will ever enable us to talk into space. Every one remembers the story of Baron Münchausen hearing the words which had been frozen during the severe cold, melting into speech again, so that all the babble of a past day came floating about his ears. Well, that extravagant piece of nonsense appears to have been realized by modern science, though not precisely by Baron Münchausen's suggested method. Professor Barrett's interesting lectures on the telephone contained an account of the invention we refer to, which might strictly be called a telephone in the *time*-sense, since it will so reproduce the tone of words once spoken as to enable those who take the proper measures, to reel them off again in the very same voice as that of the speaker, months — and we may soon, perhaps, be able to say years — after the speaker himself is dead. We do not pretend to describe the talking phonograph minutely, but the principle of it is this. A vibrating metal diaphragm is so arranged as to vibrate in unison with the voice of the speaker, who must be near it, and direct his voice towards it. In connection with this metal diaphragm is a pointer, so adjusted as to dot a piece of tinfoil placed spirally on a revolving drum, with every vibration of the diaphragm. The rate at which the drum revolves must be carefully noted, for in retranslating the effect of the dots on the tinfoil into the vibration of the pointer attached to another vibrating plate, as the drum revolves past it, so as to reproduce in these new plate-vibrations the sound of the original voice, if the revolution were faster than before, the same words would be heard, but in a higher key; while if it were slower, the same words would be heard, but in a lower key. It is, then, quite possible to keep this register of a speech as long as the tin-foil will last without being injured by oxidization. And at present that seems to be only for a few months. Still it is quite conceivable even now, that five or six months after a speech had been uttered, you should hear it reeled off, as it were, from the tin-foil register, by the help of the revolving drum, and a new pointer, pressed by a gentle spring against the tinfoil, so as to enter the dotted apertures previously made in it and excite the old vibrations, as it so enters them, in a new vibrating-plate, so as to form a perfect reproduction both in voice and expression of the words in the original sentence, and indeed so as to make an ignorant person believe that the same lips were repeating what they had

Original from CORNELL UNIVERSITY

uttered months ago, in the very same manner and with the same cadence. In this way you may literally bottle a speech and reproduce it months hence; nor is there anything absurd in the principle in the joke of *Punch's* last "Comic Almanack," which suggested the bottling of various operatic performances and turning on the various taps at given signals. It is even scientifically conceivable, — we do not say it is very probable, — that after this fashion the nineteenth century may talk to the twenty-ninth, and be heard in the very words and cadences of a thousand years ago, — that a speech of Mr. Gladstone's, for example, or of Mr. Carlyle's, or of Mr. Biggar's should be thus registered on some more permanent equivalent for the tin-foil, and the rate of the revolution of the drum be carefully noted as the process takes place, so that when after a thousand years have elapsed, and when a generation of men probably far more different from ourselves than we are from the Saxons of Alfred's time are living here, this voice from the far-away past may be heard, reiterating counsels the very occasion of which is forgotten, or droning out complaints and accusations, the irrelevance of which shall then seem even greater, if that be possible, than it seems to us now. Talk of the urns of your ancestors' ashes, — the drums of their ancestors will be our posterity's most affecting mode of recalling their day. We might conceive every house furnished with such drums and vibrating plates, each stored with some speech, the speaker of which has long since been dead, and the anniversary of birth or death solemnized by the liberation of some one of such speeches from its long entombment. At the accession of each new monarch, we might have a chosen assembly called together to hear the most momentous speech from the throne ever delivered by the most remarkable of his predecessors, since the epoch when this method of preserving speech was first invented, — a Pope Leo XXI., for instance, surrounded by his cardinals, inclining his ear to the vibrating plate, from which should proceed the address uttered by Pio Nono to his last consistory, or a Hohenzollern of the twenty-first century summoning his cabinet to hear with him, for the third or fourth rehearsal, it may be, the precise words of the last assault directed against the see of Rome by the great Prince Bismarck. Nay, we may have speeches prepared expressly for posterity, as so many speeches have, in a metaphorical sense, been said to be. Lord Beaconsfield is just the man to lecture posterity on the great Asian mystery. What is to prevent him from creating a corporate body whose charter shall require them to preserve a drum and tin-foil scroll indented with his prophecy of the mode in which the Asian mystery will unfold itself, — the prophecy to be rehearsed once in every century after his death till its complete fulfilment shall have been verified? Doubtless the prospect is a formidable one. For, what with the many decipherers of apocalyptic riddles, and the many decipherers of scientific and metaphysical riddles, and the many decipherers of currency riddles, who are quite sure that they are right, we may well anticipate that a large part of the occupation of posterity will be either the task of reverentially listening to our very bad attempts at reading the future, or of irreverentially destroying the records intended, but not calculated, to inspire them with admiration of our foresight. Indeed the "drum ecclesiastic" alone, if when properly spiralled with tin-foil it can thus be made to yield back the ancient sounds of primeval controversy, would find quite occupation enough for the ears of posterity, to drown all the drums military of a pretty large Continental war.

But to turn from the more whimsical aspects of this very curious discovery to its more impressive aspects, certainly nothing of modern invention has proved so extraordinary an illustration of the subjective character of space-and-time distinctions as these two kinds of telephones, — the telephone which enables a man to speak at one point and be heard at another, hundreds of miles distant, and the still more curious telephone which enables a man to speak at one point of time and be heard when not only his name, but even his nation, it may be, is forgotten. Some thirty years ago or more a very curious little book was published, entitled "The Stars and the Earth," in which it was shown how, if an eye could be imagined riding on a ray of light reflected from an opening flower and passing on it through endless space and time, such an eye would always see that flower as it was in the same momentary phase of opening in which it appeared at the time that ray was first reflected from it, and would so see it to all eternity, whereas if it travelled the least bit faster, so as to overtake — say, in a thousand years — the ray which left the flower a minute sooner, that eye would be reading backwards the change which we see accomplished in a minute, but would have it spread and subdivided over the period of a thousand years. In the same

way, if an eye could be imagined travelling in the direction of the same ray of light, but rather slower, so as to fall *behind* it by a minute in a thousand years, then it would see the *next* minute, instead of the previous minute, of that opening blossom's history, stretched out to the length of a thousand years. All this was intended to illustrate the extremely subjective character of the nature of time, and to prove that it only requires us to imagine a different relation between our eye and the light reflected from any object, to make a thousand years appear as one day and one day as a thousand years. For of course, if the retina in question were conceived as travelling from the earth so rapidly that in a minute's time it could overtake the ray which left the earth a thousand years ago, then for that one point of space, such a retina would travel in a minute over the history of a thousand years. Well, that was but an imaginative illustration of the subjective character of the meaning of time. But here is a real illustration of it which we may all witness. It may happen even in the lifetime of living men that real conversations will be carried on between the most distant points which beings with earthly bodies can manage to reach; and it may happen, too, also in the lifetime of living men, that the perfect semblance of the voice of one who died during a man's infancy may vibrate in his ear, and repeat his own very words, in his young contemporary's old age. The future, indeed, may hear more wonderful things still. It may hear the voices of every century from and after the nineteenth, though of none before it, reproduced ages hence. The problems which we discuss so hotly as to the mode in which the Greeks and Romans spoke their language may have no existence in relation to the pronunciation of words in any age later than this, for the actual sound of every existing provincial dialect may be reproduced literally, and this for ears to which not only such dialects, but the most classical forms of the most classical languages of our day, will have become quite obsolete. The thirtieth century may hear the orations of a Welsh Eisteddfod and the broad clamor of a Yorkshire horse-fair, in the very accents of our own time. Surely, nothing could be more impressive as a lesson on the undue importance which we attach to time. "We have heard with our ears, and our fathers have told us," may in future apply not merely to the fathers we have seen, but to the forefathers we have never seen. The distinction between dead and living languages, indeed, may thus be in great measure obliterated. The ancient world, — ancient, that is, to our posterity — may be — to the ear, at least, and to the eye also, so far as photography can make it so, — present and living still. Men may live, as it were, in the nineteenth century and in the twenty-ninth at the same time, belonging indeed to the twenty-ninth, but hearing auricular confessions communicated straight from the nineteenth. Will a man so situated have any notion like that which we attach to the irrecoverable "past"? Will he not live in a sort of focus of all spaces and all times, hardly distinguishing, as we do, ancient from modern, and hardly even the near from the distant? Whatever he may lose by that rather bewildering position, he will certainly gain a clearer view of the highly subjective character of time and space, and its almost purely personal significance, — a significance, that is, requiring entirely separate interpretation, in reference to the particular conditions of particular organizations.

From The Pall Mall Gazette.

MILK SUPPLY.

A BRIEF notice appeared in the newspapers a few days ago of the formal opening of a cluster of model dwellings attached to the premises of the Aylesbury Dairy Company at Bayswater. But the erection of these dwellings in St. Petersburgh Place is only the last touch of an organization which may fairly stand as a model for similar enterprises.

Milk is, of course, one of the most important items in the food supply of any great population. It is the sole food of a large number of hand-fed infants, the main element in the dietary of all young children, and for the population generally, whether in health or in sickness, it is of the most serious moment that the milk supply should be not only of good quality and safe from deterioration, but also free from contact with those particles of contagion by which modern sanitary science has shown it to be peculiarly liable to contamination. Until a very recent date the milk trade had received little of the advantages which capital and scientific skill can bestow. It was for the most part in the hands of small tradesmen, and prior to the year of the cattle-plague, when London was studded with small cowsheds, the arrangements of the small dairies of London retained something of old-world simplicity, and were accepted with little questioning as belonging to a traditional

Digitized by CORNELL UNIVERSITY Original from CORNELL UNIVERSITY

type. When, however, cows were swept away by the rinderpest and cowsheds abolished, London had to supply itself from the surrounding counties. About the same time the inquiring analysts began to discover, not only that the cow with the iron tail had more than its fair share of the business, but that, in spite of all that laws could ordain or magistrates could enforce, there were no means of securing with certainty, by the agency of the police court, a really pure milk supply, as the law could never compel milkmen to sell milk above the minimum standard of a supposed invalid cow whose milk does not contain more than ten per cent. of solids, although the experience of all who have investigated the subject shows that honest average milk has a standard of "eleven and one-half per cent. of solids." At about the same time Dr. Ballard, by the investigation of an epidemic of typhoid at Islington, showed that the use of contaminated water in some way or other mixed with milk, which he did not venture to pronounce adulterated, was capable of spreading disease; and subsequent experience in Marylebone, at Eagley, at Penrith, and a dozen other places, told the same tale.

Taught by these facts, and profiting by an experience of some few years gained by Mr. G. Mander Allender (a Berkshire farmer who had successfully commenced a system of supplying pure milk from his own and contiguous farms direct to Londoners through a depot established at Bayswater), the Aylesbury Dairy Company have gradually developed a system of milk supply which, under the direction of scientific experts, has been ingeniously surrounded by a great number of precautions and safeguards.

The first precautions, we note, are taken at the farms. All of these are surveyed and inspected as to their drainage and water supply, the method of cleansing the milk-pails, of cooling the milk, etc. Very stringent conditions are laid down under the advice of the general sanitary superintendent, and maintained by the control of a visiting inspector and sanitary engineer. The collecting sheds of the company at Swindon and the building in which milk is set for cream occupy half an acre of ground, and are of special construction; duly asphalted, thoroughly ventilated, and built so as to be without access of sewer gas. Connected with this is a large cheese-factory, where the skimmed milk and surplus milk is converted into different qualities of cheese. This cheese-factory is on a large scale, and on new models, partly American; and in an adjoining field are erected large model piggeries, where five hundred to six hundred pigs are constantly fattening on the surplus whey. Thus economy and efficiency and perfection of quality are secured.

The milk from fifty farms is brought to London twice a day in cans specially devised to minimize jolting, which have received the medal of the Society of Arts. In London, again, instead of being brought into some little shop dignified with the title of dairy, but communicating with dwelling rooms, or into underground cellars with open drains, the milk is received into a spacious and carefully arranged dairy, tiled, paved, cooled, and shut off from all access of sewer gases, and free from communication with any dwelling house. Every churn of milk is sampled and tested for cream and specific gravity, and the results recorded in a register. The outgoing churns containing milk are all "plumbed" with a leaden seal, such as that used at the custom-house, and the numbered churns are once more sampled, the quality of the sample being again registered in the office. Finally, perambulating inspectors daily take samples of the milk, as it is being delivered at one or another customer's house, and these samples are once more compared with the registered results recorded against the numbered and registered and sealed churns when they were despatched. The accessory operations of the company's business, such as butter-making, are conducted with similar exactness, the latter being churned daily by machinery over ice and with the use of French pressure-mills, which completely free it from extraneous buttermilk and water, of which the excess spoils the quality of a large proportion of even pure English butter. The apparatus for filling the churns and cleansing them with superheated steam, and all the details of the duties of the men, have been thought out with care. The erection of dwellings in which the whole of the milk-carriers and their families are housed and kept under sanitary supervision is one of the most important and the last-added element of safety; and these buildings, too, which were last week inspected by Mr. Lyon Playfair, Mr. George Goodwin, Surgeon-General Mackinnon, C. B., and others well versed in such matters, are pronounced to be also well worthy of imitation as models of good sanitary dwellings for working men. Thus to house and to isolate the milk-carriers who enter twice daily so many houses is an obviously useful sanitary precaution.

LITTELL'S LIVING AGE.

Fifth Series, Volume XXI. | No. 1757.—February 16, 1878. | From Beginning, Vol. CXXXVI.

CONTENTS.

I. LORD MELBOURNE, ... *Quarterly Review*, ... 387
II. ERICA. Part XII. Translated for THE LIVING AGE, from the German of . . *Frau von Ingersleben*, ... 410
III. CONGREGATIONAL SINGING, ... *Cornhill Magazine*, ... 419
IV. MACLEOD OF DARE. By William Black. Part III., ... *Advance Sheets*, ... 428
V. MURDER OF COMMISSIONER FRASER — DELHI, 1835. A Tale of Circumstantial Evidence, ... *Fraser's Magazine*, ... 440
VI. DULCISSIMA! DILECTISSIMA! A Passage in the Life of an Antiquary, ... *Macmillan's Magazine*, . . . 445

POETRY.

MOTHERHOOD, ... 386
A JAPANESE LOVE-SONG, ... 386
THE BLOOM OF THE HEART, . . . 386

PUBLISHED EVERY SATURDAY BY
LITTELL & GAY, BOSTON.

TERMS OF SUBSCRIPTION.

For EIGHT DOLLARS, *remitted directly to the Publishers*, the LIVING AGE will be punctually forwarded for a year, *free of postage*.

An extra copy of THE LIVING AGE is sent gratis to any one getting up a club of Five New Subscribers.

Remittances should be made by bank draft or check, or by post-office money-order, if possible. If neither of these can be procured, the money should be sent in a registered letter. All postmasters are obliged to register letters when requested to do so. Drafts, checks and money-orders should be made payable to the order of LITTELL & GAY.

Single Numbers of THE LIVING AGE, 18 cents.

MOTHERHOOD.

"Her lot is on you" — woman's lot she meant,
The singer who sang sweetly long ago;
And rose and yew and tender myrtle blent,
To crown the harp that rang to love and woe.
Awake, O poetess, and vow one strain
To sing of motherhood, its joy, its pain.

What does it give to us, this mother love —
In verse and tale and legend glorified,
Chosen by lips divine as type above
All other passions? Men have lived and died
For sisters, maiden queens, and cherished wives,
Yet, sealed by God, the one chief love survives.

Yet what is it it gives us? Shrinking dread,
Peril, and pain, and agony forgot,
Because we hold the ray of gladness shed,
By the first cry from lips that know us not,
Worth all that has been paid, is yet to pay,
For the new worship, born and crowned that day.

Then nursing, teaching, training, self-denial,
That never knows itself, so deep it lies,
The eager taking up of every trial,
To smooth Spring's pathway, light her April skies;
Watching and guiding, loving, longing, praying,
No coldness daunting, and no wrong dismaying.

And when the lovely bud to blossom wakes,
And when the soft shy dawn-star flashes bright,
Another hand the perfect flower takes,
Another wins the gladness of the light;
A sweet, soft, clinging, fond farewell is given;
Still a farewell, and then alone with Heaven.

With Heaven! Will he take the tired heart,
The God who gave the child and formed the mother,
Who sees her strive to play her destined part,
And, smiling, yield her darling to another?
Ay, on his cross he thought of Mary's woe;
He pities still the mothers left below.

Tinsley's Magazine. S. K. PHILLIPS.

A JAPANESE LOVE-SONG.

Yes, 'tis autumn, dearest, see
Cold, rough signs on every side;
Listen to the fluttering leaf,
Borne before the tempest tide.
Listen to the mournful song,
Wafted from the pine-trees tall;
Listen to the torrent's voice,
Loud resounding over all.

It was in the gladsome spring,
When we met and told our love;
Nature sang in ecstasy,
The skies were bright and blue above.
Then we hoped, and had no thought
That darksome days could ever be;
The golden hours flitted by
In mirth and loving revelry.

Then summer came — we lovers still
Trifled the long sweet hours away;
In scented woods, and deep, dark shades,
With jest and smile, and old-world lay.
Or, on the cool, broad river's wave,
Floating along, we wove our dream,
Nor thought of those who toiled for gain
In the great city's busy stream.

'Tis autumn now, and winter soon
Will change the fair world's smiling face;
A year, alas! will then have flown,
To us a fleeting moment's space.
Oh, ere the spring come back again,
In all her radiancy divine,
May fortune smile upon our love,
And let me call thee, dearest, mine!

All The Year Round.

THE BLOOM OF THE HEART.

Under the blue of the mid-May sky,
Under the shadow of beech and lime,
Watching cloud-shallops drift idly by,
Free from the thraldom of fate and time;
Lulled by the murmur of breeze and stream,
Twitter of songster, flutter of spray,
That sweetly blend with the waking dream,
And whisper one magical word alway;
Held by the spell of an exquisite face,
A voice that is dearer than all things dear,
Ah, but the world is a fairy place
In the bloom of the heart, the May of the year!

Sitting alone in the waning light,
In the dead November's leaden dearth,
Watching the mists rise ghostly white,
And blend in the shadows, and quench the earth;
Musing for aye on the might-have-been —
Sweet might-have-been that may not be! —
The tender hopes and the fancies green
That faded and fluttered from life's fair tree;
Haunted alway by a vanished face,
A voice that is hushed in the midnight drear,
Ah, but the world is a weary place
In the gloom of the heart, the gray of the year!

FREDERICK LANGBRIDGE.

From The Quarterly Review.

LORD MELBOURNE.*

William, Lord Melbourne, occupied a peculiar as well as eminent position amongst the most distinguished of his contemporaries. The social aspect of his career is quite as striking as the political. Indeed, he interests less as a statesman than as a man; and in the narrative of his life, his personal qualities should stand out in broad relief. It has been truly said of him that he rose to be prime minister of England without commanding eloquence or lofty ambition — lazily and loungingly, as it were — by the spontaneous display of fine natural abilities, by frankness, manliness, and good sense. To realize, to appreciate him, we must have his look and manner before us: we must know not only what he said but how he said it. It is difficult to recall a speech of his, or a scene in which he figured, without recalling his fine form and features, without involuntarily reverting to the well-known lines: —

> Seen him I have, but in his happier hour
> Of social pleasure, ill-exchanged for power:
> Seen him uncumbered with a venal tribe,
> Smile without art, and win without a bribe.

Personal intimacy, therefore, was an almost indispensable qualification in a biographer, to which we do not understand Mr. Torrens to lay claim; nor has he had access to the correspondence in the possession of the family. But he has some marked qualifications for such a task, especially the invaluable one of a long practical acquaintance with the administration of affairs and the working of our system of government. He was appointed a commissioner of the poor-law inquiry in Ireland in 1835. We find him private secretary to Mr. Labouchere (Lord Taunton) in 1846, and member for Dundalk from 1848 to 1852. He has represented Finsbury since 1865, and has carried or suggested more than one important measure of legislation. He is also the author of several works, historical and economical, giving ample evidence of acquirement and capacity. As might be expected, he has produced a book which will command and reward attention. It contains a great deal of valuable matter and a great deal of animated, eloquent writing. The chief objection to it is its length. One volume would have contained all that is individually applicable to Lord Melbourne, and it was worse than superfluous to take us over ground (Catholic emancipation and the Reform Bill, for example) which we have trodden so often of late years that we could find our way across it blindfold. Although he is a declared, decided Whig, his views are broad and tolerant, and we seldom see reason to find fault with his tone; but it is the soundness of his information, the authenticity of his statements, that we shall not unfrequently be compelled to question as we proceed.

In the summary we are about to attempt of the leading events of Lord Melbourne's life, we assume that our readers know as much as they care to know of the general course of legislation, the ministerial changes and the party conflicts, of his time; and we shall keep constantly before us what ought to be the distinctive aim and purpose of biography.

A preliminary chapter of the "Memoirs" is devoted to the manor of Melbourne, the family through which it passed to the Lambs, the gradual rise of the Lambs till they reached the peerage, and the acquisition by an ancestor of Brocket Hall. Melbourne came to them from the Cokes: Sir John Coke, the "Sir Plume" of the "Rape of the Lock," devised it to his son, with remainder to an only daughter Charlotte, who, in 1740, married Matthew Lamb, the son of a Mr. Lamb who is described as a practitioner (*i.e.* an attorney) of long standing in Southwell. He had a brother named Peniston, who, we are told, was admitted to practice at the bar about 1714, when, having long been qualified to earn a considerable income by what is called pleading under the bar, "he went on pleading and demurring, weaving settlements and ravelling threads of adverse wills, till, looking upon parchment, he had ceased to view and half forgotten that there was any shire in the realm but that in which he laid the venue of his life."

* *Memoirs of the Right Honorable William, Second Viscount Melbourne.* By W. M. Torrens, M.P. In 2 vols. London, 1878.

Still, "as his balance rose at Child's, he dreamed pleasant dreams of estates thereafter to be settled strictly in tail male on his own or his brother's progeny;" and, dying unmarried, he left his accumulated wealth to be laid out in land to be settled on his nephew Robert, and, failing issue by Robert, on Matthew in tail male. "This condition proved to be the golden hinge on which eventually the gate of splendor opened to the family." This Peniston died in 1734. Matthew followed his uncle's calling, and became known as a careful, energetic man, who had a taste for the improvement of land and an instinctive faculty for developing its resources: —

For many years he is understood to have acted as confidential adviser to Lords Salisbury and Egmont in matters relating to their extensive estates; and being ever careful to turn opportunities to account, he profited largely by the knowledge thus gained of men and circumstances.

Unless he is much belied, he feathered his nest pretty handsomely at their expense. A visitor at Brocket was surprised at being told by the gamekeeper that a right of fishing through a portion of the property, quite up to the park, belonged to Lord Salisbury. When this was mentioned to Lord Melbourne, he replied with characteristic frankness, "Well, I believe my grandfather did the Salisburys out of some land in that direction, and was generous enough to leave them the fishing."

Brocket was purchased by Matthew of the representatives of Sir Thomas Winnington in 1746, and all the farms originally belonging to the estate were gradually got back and reannexed. Not long afterwards, the Melbourne estate devolved upon him by the death of his brother-in-law. He had sat for Stockbridge, a hired seat, since 1741. He was created a baronet in 1755, and subsequently represented Peterborough in three Parliaments. He died in 1768, leaving to his only son, Peniston, property estimated at nearly half a million.

Without any of the talents which those who went before him had turned to account, the young baronet found himself at three-and-twenty a person of no small consideration. Women persuaded him that he was handsome; politicians only wanted to know what were his views; in the county it was hoped he would reside constantly, and complete the improvements at Brocket his father had begun. Society opened its arms to so eligible a recruit, and before six months he was the suitor, slave, and betrothed of one of the fairest women of her time.

This was Elizabeth, only daughter of Sir Ralph Milbanke, one of the most gifted and fascinating women of her time. Her charm, her social influence, were lifelong. As her personal attractions faded, they were replaced by heart and mind. She was three times painted by Reynolds with more than artistic feeling; and Lord Byron spoke of her, on her death in 1818, as "the best, and kindest, and ablest female I ever knew, old or young." To have been the mother of Lord Melbourne and Lady Palmerston was as proud a boast as to have been the mother of the Gracchi or the mother of the three Dupins.* The list is long of celebrated men who inherited their finest qualities from mothers, but Lord Melbourne is indebted for something more tangible to his. The rise of the family, the advantageous position in which he found himself when he entered the political and social arena, were almost entirely owing to her. The father is accurately described as a "good-for-little, apathetic, kindly man, who never had a quarrel in his life, and who probably never lay awake an hour fretting about anything." There is a notice of him in Messrs. Leslie and Tom Taylor's "Life of Reynolds," which does not convey a favorable impression. After naming him among the friends of Reynolds, they say: —

Lord Melbourne was indeed at this moment (January, 1772) the protector of pretty Mrs. Baddeley. Those who are so inclined may read his ill-spelt, ungrammatical, and fulsome love-letters to her in the "Life" of her, published by her worthy companion, Mrs. Steele. In one of these he tells her that he has been to see her picture at Reynolds', and thinks it will be well done; in another he rejoices that as there is no "Rannela" (where she was then singing) that night, he can enjoy the felicity of a visit to her whom he loves every "min-

* A monument in Père la Chaise is inscribed, "*A la Mère des Trois Dupins.*"

nitt" of his life, "Setterday, Sunday, and every day."

The year after his marriage he was created an Irish baron, by the title of Lord Melbourne of Kilmore; an Irish viscount in 1781; and an English peer in 1815. On the formation of the heir-apparent's household he was named gentleman of the bedchamber: the prince, be it observed, being one of the warmest admirers of his wife. At the Westminster election, when a vote for Fox was purchased by a kiss, she played a part only second to that of Georgiana Duchess of Devonshire, or Mrs. Crewe.

To people these rooms (the Pantheon) we have to call up many of the most beautiful and best known of Sir Joshua's sitters. On this particular occasion (of the opening, Jan. 22, 1772) a great many of the ladies, we are told, chose to adopt male dominoes, and appeared as masculine as many of the delicate macaroni things we see everywhere. Among the most distinguished of these "pretty fellows" were the Duchess of Ancaster, Lady Melbourne, and Mrs. Damer.*

We catch occasional glimpses of Lady Melbourne and her gay doings in Walpole's letters: —

March 27, 1778. — The quadrilles were very pretty. Mrs. Damer, Lady Sefton, Lady Melbourne, and the Princess Czartoriski in blue satin, with blond and *collets montés à la reine Elizabeth:* Lord Robert Spencer, Mr. Fitzpatrick, and Lord Carlisle, and I forget whom, in like dresses, with red sashes, black hats with diamond loops, and a few feathers before, began.

Referring to a petition of Lord Foley and his brother to set aside their father's will, Walpole writes: —

All the ladies, Melbournes, and all the bishops' wives that kill their servants by vigils, are going about the town lamenting these poor orphans, and soliciting the Peers to redress their grievances.

. . . .

Tuesday, May 12, 1778. — I supped after the opera at Mrs. Meynel's with a set of the most fashionable company, which, take notice, I very seldom do now, as I certainly am not of an age to mix often with young people. Lady Melbourne was standing before the fire, and adjusting her feathers in the glass, says she, "Lord! they say the Stock will blow up: that will be very comical."

Much depends upon the tone in which this kind of thing is said. We can believe almost anything of her dissipated habits, but she certainly was not a fool. To gratify her and give full scope to her aspirations, her husband bought a splendid mansion in Piccadilly — the Albany now stands upon its site — and hurried on the improvements at Brocket, which, ugly enough without, became, as it remains, all that comfort and luxury could combine within. At both houses she collected round her the most brilliant society of the most brilliant episode of the social life of England. One of her dearest friends was Mrs. Damer, and we find them constantly coupled in the fashionable correspondence of the time.

August 27, 1783. — (To Seymour Conway.) As I was visiting this morning I received an express from your daughter (Mrs. Damer), that she will bring Madame de Cambis and Lady Melbourne to dinner here to-morrow. I shall be vastly pleased with the party, but it puts Philip and Margaret to their wits' end to get them a dinner: nothing is to be had here: we must send to Richmond and Kingston and Brentford.*

They shone in private theatricals, and after mentioning the co-operation, "by pen, voice, or sympathetic presence," of Fox, Sheridan, and Fitzpatrick, Mr. Torrens adds: —

Another intimate of both ladies, who equally delighted in all that was best in art, and whose great possessions enabled him to become one of its most generous and judicious promoters, was young Lord Egremont. . . . In early life Lord Egremont professed to be no more than a man of pleasure, given to hospitality, fond of the turf, content to be a cause of war among strategic mothers. Rather shy and taciturn, many outshone him in the ball-room, none in the morning ride or garden walk. There was in his voice and manner, say his contemporaries, that fascination for women, and even for men, which neither knew how to resist. At Melbourne House he was a constant guest, and through a long course of years his friendship and sympathy were never wanting.

* Life of Reynolds, vol. i., p. 433.

* Walpole's Letters, vol. vii.

There is a portrait of him at Brocket so wonderfully like Lord Melbourne that it is impossible to help being struck by it. Late in life he was taking Sir Edwin Landseer and another visitor round the grand saloon, when Landseer, coming opposite the portrait, gave a start, and involuntarily turned round to look at him. "Ay," said Lord Melbourne, "you have heard that story, have you? But it's all a d—d lie, for all that."

We may here say, once for all, that no story or anecdote of Lord Melbourne is complete without this now universally condemned expletive. It would be the portrait of Cromwell without the warts. Lord Houghton alludes to Sydney Smith as having "checked the strong, old-fashioned freedom of speech in Lord Melbourne, by suggesting that they should assume everything and everybody to be damned, and come to the subject." We once before expressed a conviction that Sydney Smith never ventured on such a liberty with Lord Melbourne; who, however, certainly carried the old-fashioned freedom to an extent that might have justified a serious remonstrance on the part of a grave divine.

Peniston Lamb, the eldest son, was born May 3, 1773, and died, unmarried, January 24, 1805. William, born March 15, 1779, was therefore brought up with the prospects of a younger son till he was twenty-six. He went to Eton in 1790, where among the most remarkable of his school-fellows were Sumner (afterwards Archbishop of Canterbury), Stewart (afterwards Lord Stuart de Rothesay), Hallam, Brummel (the prince of dandies) and Assheton Smith (the prince of foxhunters). Nothing is recorded of him as an Etonian, except that he left the school not a bad classic. In July, 1796, he was entered a fellow commoner of Trinity College, Cambridge, and went into residence in the October following. He had a strong dislike to mathematics, and followed his own taste in reading, instead of aiming at distinction by pursuing the prescribed studies of the university, except so far as the classic poets and historians were concerned. Being destined for the bar, he was entered at Lincoln's Inn on the 21st of July, 1797, and proceeded to keep his law terms simultaneously with his college terms. It would appear that he had carefully cultivated the art of composition, for in Michaelmas term, 1798, he won the declamation prize by an oration, delivered in the chapel of Trinity, on "The Progressive Improvement of Mankind." This oration received the highest compliment ever paid to a juvenile composition of the sort; a compliment which might help to mitigate Macaulay's sarcasm at prize essays, as having this in common with prize cattle — that the one might furnish materials for making candles and the other for lighting them.

One of the very few speeches which Charles James Fox is said to have reduced to writing before delivery, was the speech in moving a new writ for Tavistock on the death of the Duke of Bedford. It concluded thus: —

I will conclude with applying to the present occasion a beautiful passage from the speech of a very young orator. It may be thought to savor too much of the sanguine views of youth to stand the test of a rigid philosophical inquiry, but it is at least cheering and consolatory; and that, in this instance, it may be exemplified is, I am confident, the sincere wish of every man who hears me. "Crime," says he, "is a curse only to the period in which it is successful; but virtue, whether fortunate or otherwise, blesses not only its own age, but remotest posterity, and is as beneficial by its example as by its immediate effect."

In the course of conversation at Brocket, a visitor told the story of Moore asking Rogers what he did, when people who wanted his autograph requested him to sign a sentence. "Oh, I give them, 'Ill-gotten wealth never prospers;' or 'Virtue is its own reward.'" "Then the more shame for you," Luttrell broke in, "to circulate such delusions." Lord Melbourne laughed, and said, "I am afraid I was as bad as Rogers, when, contrasting virtue with crime, I said that crime was a curse only to the period in which it was successful; and that virtue, whether fortunate or not, is beneficial by its example. Is the conqueror who arrests the march of civilization, or the usurper who destroys the liberties of his country, or the traitor who betrays them, a curse only to his contemporaries? Nor, I fear, is the example of unfortunate virtue so influential as that of prosperous vice."

This was not the first composition of his that attracted attention. It seems to have escaped the biographer that Lord Melbourne was the author of the epistle to the editor of the "Anti-Jacobin," published in the *Morning Chronicle* of January 17, 1798. The beginning shows that the veil of secrecy had been lifted.

Whoe'er ye are, all hail! whether the skill
Of youthful Canning guides the rancorous
quill,

With powers mechanic far above his age
Adapts the paragraph and fills the page —
Or Hammond, leaving his official toil,
O'er this great work consumes the midnight oil.

The lines which attracted most attention were these: —

I swear by all the youths that Malmesbury chose,*
By Ellis, sapient prominence of nose,
By Morpeth's gait, important, proud, and big,
By Leveson-Gower's crop-imitating wig.

The answer by Canning is prefaced by the admission that the "Epistle" is by far the best of all the attacks that the combined wits of the cause have been able to muster against the "Anti-Jacobin." It begins: —

Bard of the borrow'd lyre! to whom belong
The shreds and remnants of each hackney'd song:
Whose verse thy friends in vain for wit explore,
And count but one good line in eighty-four!

The one good line is the one italicized, but the epistle contains many quite as good.

The modern Athens was then in the height of its celebrity, and it was a prevalent belief that a year or two spent at a Scotch university was a necessary supplement to the education of an Englishman destined for public life. Lord Lansdowne, Lord Palmerston, and Lord Russell were placed under professorial tuition at Edinburgh; and William Lamb, after leaving Cambridge, became a resident pupil of Professor Millar at Glasgow, where he spent the winter of 1799 and part of the following winter in sedulous attendance on Millar's lectures on constitutional lore and Mylne's on metaphysics. "In the collegiate debating club he took a constant and brilliant part, being distinguished for aptitude of historic illustration and for caustic humor in reply."

It should be mentioned that, some time prior to his being fixed in London, the house in Piccadilly had been exchanged, to oblige the Duke of York, for his Royal Highness's mansion at Whitehall, since known as Melbourne (now Dover) House. It was here, May 11, 1800, that the Prince of Wales was dining when the news arrived of Hatfield's attempt to assassinate the king in the royal box at Drury Lane with a pistol fired from the pit. The prince, then on bad terms with his father, said it was mere rumor and showed no inclination to move, till Lady Melbourne succeeded in convincing him that the commonest sense of propriety required him to repair immediately to the theatre, where his Majesty had resolved on remaining with the queen as if nothing had occurred. The prince went; and after tendering his congratulations in due form, attended the preliminary inquiry which was conducted in the presence of the culprit.

Before midnight the prince returned to Whitehall to thank his hostess for persuading him to earn for once the praise of filial duty. His young equerry on the occasion was wont to tell the story with humor all his own, making the best of it for his Royal Highness, and dwelling with affectionate emphasis on the promptitude and tact shown by his mother. He was thenceforth more frequently included in the invitations to Carlton House, and became unluckily an early partaker in its revelries.

Another early incident has been left unnoticed by the biographer. When Miss Berry's play, "Fashionable Friends," was represented for the first time in May, 1802, the prologue was written by Robert Spencer, now best remembered through the "Rejected Addresses," and the epilogue by William Lamb; the burden of of which was the advantages of peace. It was not a successful effusion; and the play itself was withdrawn after three nights, although the full strength of fashion was put forth in its support.

Lamb was called to the bar in Michaelmas term, 1804, but his practice was limited to a single attendance at the Lancashire sessions, where, through the recommendation of Scarlett (Lord Abinger), he received a guinea brief. He used to say that the first sight of his name on the back gave him the highest feeling of satisfaction he ever experienced, very far transcending his enjoyment on being appointed prime minister.* He had made up his mind to follow the profession in right earnest, and was taking to it with a zest, when his elder brother died, and visions of briefs were dissipated by the higher aspirations of ambition and the brighter dreams of love. In the course of the following year he had become member for Leominster and the accepted lover

* For his abortive mission to Lille.

* "Lord Melbourne," Hayward's "Essays," First Series, 1858. We have drawn freely on this essay, which is based on personal reminiscences and information supplied by near relatives of Lord Melbourne and others who knew him best. The fault found with it by Lady Palmerston was, that it did not give her brother sufficient credit for the earnestness which, she always maintained, was the essential element of his character.

of Lady Caroline Ponsonby (only daughter of the third Earl of Bessborough), to whom he was married June 3, 1805. To say that it was not a happy marriage is saying little. It blighted the best part of his life, warped his tone of mind, and haunted him with mortifying recollections to his dying day. Yet she possessed many qualities which justified his choice, and she never entirely lost her power of fascinating him. She was personally attractive without being pretty or handsome; rather below the middle height, well-made though thin, with light hair which she was fond of wearing like a boy.

> Her voice was ever soft,
> Gentle, and low: an excellent thing in woman.

She had abundant fancy and feeling, which are amongst the choicest gifts of nature, although they are apt to lead astray and to degenerate into waywardness or willfulness. Her very caprice gave piquancy and variety. She might tease, provoke, and irritate, but she never failed to interest. She was the counterpart of Pope's Calypso: —

> Strange graces still, and stranger flights, she had:
> Was just not ugly, and was just not mad:
> Yet ne'er so sure our passion to create
> As when she touched the brink of all we hate.

We believe it to be perfectly true that when, after one of their serious quarrels, everything was arranged for a separation, and he had gone down to Brocket till the formal documents could be prepared, she followed him, and lay down like a faithful dog at the door of his room, so that he could not come out without treading on her. The next morning when the men of business arrived, they found her sitting on his knee, feeding him with bread and butter.

They got on tolerably well for six or seven years. At all events, there was no outward or visible sign to the contrary. Her craving for excitement was lulled by the pleasures and cares of maternity. She gave birth to a son, August 11, 1807, to whom the prince stood sponsor. Miss Berry sets down: —

> *May* 3, 1808. — Dined at Lady Melbourne's. Went up to the top of the house with Lady Caroline Lamb to see her little boy asleep, who a very few years after was seized with fits and his life despaired of. He is too big of his age — only eight months.

"Life," adds the biographer, "was preserved, but only to himself to prove a burden and to his father a grief incurable."

Lady Caroline gave birth to a daughter, still-born, January 30, 1809, and mention is made of a third child, who died young.

Mr. Torrens is not particular about dates. He does not give that of Lamb's election for Leominster, but leaves us to infer that it was towards the end of 1805 or the beginning of 1806, when the ministry of all the talents had just come into office. They were most of them his personal friends, and he agreed with them in all leading points, especially as regarded Catholic emancipation and a more liberal policy for Ireland. He was an enthusiastic admirer of Fox, and on his death inscribed some tolerable lines upon his pedestal.

On the 19th of December, 1806, Lamb moved the address in reply to the speech from the throne. This appears to have been his maiden effort. His next was when, on the formation of Perceval's cabinet, which was pledged to resist all concession to the Catholics, Mr. Brand moved that it was contrary to the first duty of the confidential servants of the crown to restrain themselves by any pledge, expressed or implied, from offering to the sovereign any advice which the course of circumstances might require. Lamb seconded the motion in a carefully prepared speech, which gives his biographer an occasion for some pointed remarks on what he thinks the inevitable fate of orations written down and got by heart. But all the greatest orators have been in the habit of composing their speeches; and we suspect that nothing first-rate was ever strictly and literally improvised. Perhaps the best course for a debater is to think out the subject, carefully arrange his matter in his mind, or even write down his principal arguments so as to be complete master of them, and trust to the inspiration of the moment for the words. Lamb was at no period of his life an orator. He was at his best in short, pithy, impulsive sentences, or replies on the spur of the occasion. Among the numerous, too numerous, selections from his speeches given by the biographer, there is not one that will pass muster as a specimen of eloquence. But this is no reflection on their effectiveness in debate, for what people are wont to call eloquence is that which gives pleasure or excites emotion independently of the subject or the purpose.

The seizure of the Danish fleet (September 1807) afforded the Whigs an opportunity for what they intended to be a damaging onslaught on the ministry; but the attack was so tamely led by their new

leader, Ponsonby, and so dashingly repelled by Canning, that although Lamb voted with his party, his confidence in their power to achieve anything was daunted, and (adds the biographer) his belief in his own capacity for debate waxed so cold that he did not make any attempt to speak during the session of 1808.

His attendance, like that of Althorp, at this period was desultory, and broken by many intervals devoted to pleasure; but he was generally ready to be in his place when the elders whom he trusted thought it needful or important.

. . . .

In the daily round of refined and luxurious existence, time glided by. The lot had fallen to him in pleasant places. As yet there was no shadow on his path; and if, contrary to the belief of Holland House, the Tories should last forever, he was ready to say with Mr. Fox, "that in the company of witty men and pretty women, with plenty of fresh air, old books, and nothing to do, life was very endurable."

The way of life at Melbourne House may be inferred from an entry in Miss Berry's journal: —

Thursday, April 7, 1808. — I went to Lady Caroline Lamb's. An immense assembly. We came away at half past twelve and walked beyond the Admiralty to the carriage. Many of the company were not away till near three, and the Prince of Wales and a very few persons supped below in Lady Melbourne's apartment and were not gone till past six; Sheridan of the number, who was completely drunk.

Lamb's name does not once occur as a speaker in the "Hansard" of 1809. In 1810 he supported Mr. Fuller's motion to abolish sinecures, Romilly's anti-hanging bills, as they were called, and Brand's motion for an inquiry into the state of the representation.

In October, Mr. Lamb, accompanied by Lady Caroline, met Lord Palmerston at the house of Mr. Conyers, where there was a shooting party, but the woods were so full of traps and spring-guns that the owner "dared not set his foot in any of his plantations lest he should leave it behind him." He shot better than his friend (Lord P.), who tells, in his own characteristic way, how he brought down but one brace of pheasants, owing to the high wind which blew: but Lamb was luckier, and always found the wind lower when he fired, which was a knack he had through life, which stood him in good stead in politics as in sporting.

Lord Palmerston's laying the blame on the wind may recall the foreigner who complained that the English rabbits were too short. It was told of a noble lord (Lord Ashbrook), who never touched a feather during an entire day's shooting at Holkham, that the keeper, by way of consolation, remarked that he had seen people shoot worse than his lordship. "How can that be, when I have missed bird after bird?" "Ay, but your lordship misses them so clean!" This story would nearly fit Lord Palmerston. During his later years, when he was as fond as ever of the sport, he has been known to fire off both barrels at birds a hundred yards off.

Lamb took an active part in the discussion of the Regency Bill in 1810, and was intrusted by his party with the duty of moving an amendment on the resolution for limiting the functions of the prince. He was followed by Canning, who complimented his "young friend, as he was glad in public and in private to call him," on the moderation of tone and the fitness of topics he had relied on. The amendment was defeated, and the consequent position of the crown was pointedly described by the couplet in which the regent, alluding to his royal father's condition, is made to say: —

A strait waistcoat on him, and restrictions on me,
A more limited monarchy scarcely could be.

It may be taken for granted that Lamb shared the disappointment of his friends, when, at the expiration of the restrictions, they were thrown over by the regent, whose disclaimer of "predilections," in a letter to the Duke of York, was so happily paraphrased by Moore: —

You know, my dear Fred, I have no predilections:
My heart is a sieve, in which hopes and affections
Are danced up and down for a moment or two,
And the finer they are the more sure to slip through.

The regent was still anxious to retain some of the old ties, or disinclined to break with Lady Melbourne, for Lord Melbourne was requested to continue lord-in-waiting, and the request was considered a command. The natural opponents of Perceval, the advocates of Catholic emancipation, were weakened by the insurmountable dislike of Lord Grey and Whitbread to Canning; but on March 19th, 1812, Lord Boringdon (afterwards Lord Morley) moved an address to the regent for the formation of an administration independently of parties and creeds. The result is told by Miss Berry: —

Thursday, March 19. — Went to Lady Castlereagh's, where there was an assembly entirely of ladies. There were only three men in the room when we arrived. All the male world was in the House of Lords to hear the motion of Lord Boringdon. Near midnight we went to Melbourne House to Lady Caroline Lamb. They were at supper; fifteen ladies waiting the arrival of the gentlemen from the House. An hour passed before they came. All Opposition *en masse*, and all the Canning party, himself excepted, with a fallen look, after their *cheval de bataille*, Lord Wellesley, had entirely failed them at the hour of need, not having chosen to open his mouth.

At the ensuing dissolution Lamb lost his seat, a victim to the "No Popery" cry, along with many of his friends, and on September 10th, 1812, Brougham writes to Lord Grey: —

Romilly, Tierney, and Lamb being out of Parliament is a great imputation on some of their friends, who must not thereafter talk of the fickleness and wrong-headedness of the people. These professors of party attachments had no sort of scruple to dissolve the regular Whig interest, or leave it with one single leader in the House of Commons, rather than forego the gratification of giving some cousin or toad-eater a power of franking letters!

Lamb remained out of Parliament four years, and, if we may trust his biographer, spent part of the time in melancholy reflections on the bad use he had made of his opportunities:

He had learned by experience that he was no orator, and that plausibility, good taste, coincidence of opinion with many who listen, sound logic, and an occasional dash of sarcasm — not too saucy from a young man on one of the back benches — will not command a hearing, secure a report in the morning papers, or evoke a careless "devilish good," from the chattering critics at the clubs next day. In spite of many advantages of person, voice, address, leisure, acquaintance, connections, and not a few sincere well-wishers, he had as yet accomplished nothing which scores of young men of his class had not accomplished on their way to epicurean obscurity.

We do not agree in this. We do not believe that he despaired of himself, or that his friends despaired of him. The qualities recapitulated — good taste, sound logic, and an occasional dash of sarcasm — if they would not invariably command a hearing, would rescue any man from epicurean obscurity at any time. And Lamb was an epicurean of the high intellectual order — not an *Epicuri de grege porcus*. The only Delilahs that could seduce him from practical politics, or the graver business of life, were books and the refined, cultivated companionship of the fair sex. Unluckily these four years were not permitted to glide away smoothly, leaving no reminiscences but those of well or pleasantly spent hours. They were dashed with agitation and troubled by domestic trials, in which his sense of honor and his feelings of self-respect, as well as his best affections, were involved. Lady Caroline's volatility was arrested and her fancy fixed for a period by the sudden appearance of a dazzling and lurid meteor amongst the stars of fashion. She met Byron when he had just flashed into fame, under circumstances which she thus described to Lady Morgan: —

Lady Westmoreland knew him in Italy. She took on her to present him. The women suffocated him. I heard nothing of him, till one day Rogers (for he, Moore, and Spencer were all my lovers, and wrote me up to the skies — I was in the clouds) — Rogers said, "You should know the new poet," and he offered me the MS. of "Childe Harold" to read. I read it, and that was enough. Rogers said, "He has a club foot, and bites his nails." I said, "If he was ugly as Æsop I must know him." I was one night at Lady Westmoreland's; the women were all throwing their heads at him. Lady Westmoreland led me up to him. I looked earnestly at him, and turned on my heel. My opinion, in my journal, was, "Mad — bad — and dangerous to know." A day or two passed; I was sitting with Lord and Lady Holland, when he was announced. Lady Holland said, "I must present Lord Byron to you." Lord Byron said, "That offer was made to you before; may I ask why you rejected it?" He begged permission to come and see me. He did so the next day. Rogers and Moore were standing by me: I was on the sofa. I had just come in from riding. I was filthy and heated. When Lord Byron was announced, I flew out of the room to wash myself. When I returned, Rogers said, "Lord Byron, you are a happy man. Lady Caroline has been sitting here in all her dirt with us, but when you were announced, she flew to beautify herself." Lord Byron wished to come and see me at eight o'clock, when I was alone; that was my dinner-hour. I said he might. From that moment, for more than nine months, he almost lived at Melbourne House. It was then the centre of all gaiety, at least in appearance.*

Lady Caroline was a wild talker, and Lady Morgan was not the most reliable of diarists. Lord Byron's first manner was not of a nature to make a new acquaintance set him down as "mad, bad, and dangerous to know," or to justify Madame

* Lady Morgan's Memoirs, vol. ii., p. 202.

de Staël's warning when she told Lady Caroline that he was a demon; although to think a man dangerous, or be told that he was a demon, was the likeliest of all ways to make a woman of ill-regulated fancy and sensibility, craving for excitement, fall in love with him. Their passion, or rather fever-fit of gratified vanity, has become historical. It was short-lived, and was converted, at least on one side, into the exact opposite — into something bordering on hate, with exceptional rapidity. There is a maxim of Rochefoucauld, "*Ce qui fait que les amants et les maîtresses ne s'ennuient point d'être ensemble, c'est qu'ils parlent toujours d'eux-mêmes.*" Some one else has defined love as "*égoïsme à deux.*" But the gentleman must talk of the lady and the lady of the gentleman. They will soon feel tired if each only talks of himself or herself, as Byron and Lady Caroline did. They were too much alike to get on well together long; both morbidly self-conscious; both gifted or cursed with imagination and sensibility; both aiming at intellectual distinction. They were rivals as well as lovers: it was diamond cut diamond, instead of diamond outshining pearl and pearl content to be outshone. As Lord Holland was carrying an antique censer, taken from a cabinet, to show some one, he paused before Byron and Lady Caroline, and said to her, "You see I bear you incense." "Offer it to Lord Byron," was the reply, "he is used to it." This was ominous: —

And ruder words will soon rush in
To spread the breach that words begin:
And voices lose the tone that shed
A tenderness round all they said.

A very eminent man of letters, who died not long since, frankly avowed that his *beau ideal* of a mistress or a wife was a pretty woman who would sit on a footstool at his feet, look up fondly in his face, listen to him with rapt attention, and only interrupt him to whisper that he was the handsomest and cleverest creature upon earth. Byron's theory of female perfection was substantially the same. But the part she was required to play did not suit Lady Caroline. Her favorite worship was self-worship; and instead of treating his poetry as the only poetry worthy of the name, she was constantly bringing him verses of her own, which threw him into a state resembling that of Hogarth's enraged musician. The conduct of both was so extravagant as to verge on the comic and recall the parody of "The Stranger:" —

She, seeing him, scream'd and was carried off kicking,
And he banged his head 'gainst the opposite door.

Fashion is lenient to its votaries and its idols —

the few
Or many, for the number's sometimes such,
Whom a good mien, especially if new,
Or name or fame for wit, war, sense or nonsense,
Permits whate'er they please, or did not long suit.

The world, at least in its ordinary mood, instinctively distinguishes between offences against the conventionalities and what is positively or morally wrong. Lady Caroline's imprudence and contempt of form caused ample allowances to be made for her: nobody suspected her of worse than was openly displayed or lay upon the surface. She was like the air, a chartered libertine; her reputation was little if at all affected: and she retained her social position to the last. Besides, she had redeeming bursts of well-directed enthusiasm. At a dinner at Paris, after the occupation in 1815, she suddenly asked one of the party, in the hearing of the rest, whom he supposed *she* thought the most distinguished man she ever knew in mind and person, refinement, cultivation, sensibility, and thought. The person addressed suggested Lord Byron. "No," was the reply, "my own husband, William Lamb."

In public she persevered in monopolizing Byron whenever they met. She has been described to us by an eye-witness as hurrying up to him at Osterley Park the moment she entered the room, seating herself by his side, and showing by look and manners that she would "endure no rival near the" — sofa. The story of her stabbing herself — with scissors or a metal dagger-shaped paper-knife — is confirmed by a document preserved amongst the Byron relics. It is an invitation card, with a memorandum in Byron's handwriting: —

LORD BYRON,
4, Bennet Street,
St. James.

LADY HEATHCOTE,
At home,
Monday, July 5th, 1813.
A small Waltzing Party,
10 o'clock.

This card I keep as a curiosity, since it was at this ball (to which it is an invitation) that Ly. Caroline L. performed ye Dagger Scene — of indifferent memory.

He first got bored, then irritated, then

savage. She one day entered his lodgings when he was out, and finding Beckford's "Vathek" on the table, wrote under his name, on the blank leaf at the beginning, "Remember me." Under this inscription he wrote: —

> Remember thee! remember thee!
> Till Lethe quench life's burning stream,
> Remorse and shame shall cling to thee,
> And haunt thee like a feverish dream.
>
> Remember thee! Ay, doubt it not;
> Thy husband too shall think of thee;
> By neither shalt thou be forgot,
> Thou *false* to him, thou *fiend* to me.*

The husband is commonly the last to hear of that in which he is most deeply interested, and Lamb was so used to his wife's eccentricities, to call them by no harsher name, that an *escapade* more or less did not count. According to Lady Morgan, she said: —

He cared nothing for my morals. I might flirt and go about with what men I pleased. He was privy to my affair with Lord Byron, and laughed at it. His indolence rendered him insensible to everything. When I ride, play, and amuse him, he loves me. In sickness and suffering he deserts me. His violence is as bad as my own.

This is in flat contradiction to her letters, in which she uniformly speaks of him as the kindest and noblest of men. If we may believe her, the last feather that broke the camel's back, the drop that made the cup overflow, was not the affair with Lord Byron but an alleged act of wanton cruelty to her page.

The boy was a little *espiègle*, and would throw detonating balls into the fire. Lord Melbourne always scolded me for this, and I the boy. One day I was playing ball with him, he threw a squib into the fire. I threw the ball at his head, it hit him on the temple, and he bled. He cried out, "Oh, my lady, you have killed me!" Out of my senses, I flew into the hall and screamed, "Oh God, I have murdered the page!" The servants and people in the street caught the sound, and it was soon spread about. William Lamb would live with me no longer.

All his family united in insisting on our separation. Whilst this was going on, and instruments drawing out — that is, in *one month* — I wrote and sent "Glenarvon" to the press. I wrote it, unknown to all (save a governess, Miss Welsh), in the middle of the night. It was necessary to have it copied out. I had heard of a famous copier, an old Mr. Woodhead. I sent to beg he would come to see Lady Caroline Lamb at Melbourne House. I placed Miss Welsh, elegantly dressed, at my harp, and myself at a writing-table, dressed in the page's clothes, looking a boy of fourteen. He addressed Miss Welsh as Lady Caroline. She showed him the author. He would not believe that this schoolboy could write such a thing. He came to me again in a few days, and he found me in my own clothes. I told him William Ormond, the young author, was dead. When the work was printed, I sent it to William Lamb. He was delighted with it; and we became united just as the world thought we were parted forever.

This is simply incredible. "Glenarvon" had no literary merit, and its sole claim to interest or popularity, instead of conciliating her husband, would have revived and embittered the recollection of his wrongs; the hero being meant for the noble poet, and the heroine, Calantha, for herself. Byron writes to Moore, November 17, 1816: —

By the way, I suppose you have seen "Glenarvon." Madame de Staël lent it me to read from Capet last autumn. It seems to me that if the authoress had written the truth and nothing but the truth — the whole truth — the romance would not only have been more *romantic* but more entertaining. As for the likeness, the picture can't be good. *I did not sit long enough.*

It is perfectly clear that the *liaison* did not long survive the dagger scene, July 1813. Lady Caroline told Lady Morgan that her mother took her to Ireland with the view of breaking off the connection, and that it was at Dublin she received the "cruel" letter published in "Glenarvon," which Lord Byron declared to be the only true thing in the book. The copy given by her to Lady Morgan is without a date. Yet Mr. Torrens states that in "this year" (1816) Lord Byron married Miss Milbanke with the advice and approval of Lady Melbourne, and "in spite of many petulant warnings of evil to come" from Lady Caroline.

* "Works" (Murray's complete edition). The identical copy of "Vathek," with the lines in Lord Byron's handwriting, was seen by Lord Stratford de Redcliffe, who carefully committed them to memory, and says that the verse printed second stood first, and that the second ran thus: —

> "Remember thee! yes, yes, till Fate
> In Lethe quench the guilty dream,
> Yet then, e'en then, remorse and hate;
> Shall vainly quaff the vanquish'd stream."

What (he says) helped him to retain a vivid recollection of the lines was a discussion with Lord Glenelg, to whom he repeated them, whether "baffled" would not be better than "vanquished." The book which he saw had been borrowed for him by Mr. Murray from Lord Byron before he left England.

After repeating the verses and stating incidentally (Dec. 28, 1877) that he was in his ninety-second year, Lord Stratford gave a lucid exposition of the manner in which he thought the Eastern question might be settled.

Ere long he (Lord Byron) heard of her complainings at his absence and alienation: and he had the effrontery to address to his peevish and hypochondriacal friend the lines beginning, —

And sayest thou, Cara, etc.,

in which, to excuse the discontinuance of his visits, he tells her that in fact he is thinking of nobody else, and apologizes for conjugal perfidy by the assurance that "falsehood to all else is truth to thee."

Lord Byron was married January 2nd, 1815, and quitted England forever in April, 1816. The verses to Cara (if written by Lord Byron, which we doubt) were certainly not addressed to Lady Caroline. Neither were the lines beginning: "Farewell, if ever fondest prayer," which Mr. Torrens states were addressed to her by Lord Byron "on quitting England." In Murray's edition they are dated 1808. In Mr. Torrens's brief notice of the noble poet, almost everything is wrong. He did not quarrel with Lord Carlisle for not asking him to dinner; he was not Hobhouse's Cambridge "classfellow;" and "Childe Harold" was published only two days after the maiden speech in the House of Lords.

A strong proof that the Byron affair was not the immediate cause of the projected separation was that Lord Byron's friendship with Lady Melbourne remained unbroken till her death, in 1818. There is a French maxim, *La mère a toujours une tendresse pour l'amant de sa fille;* but we never heard that this tenderness extended to the admirer of the daughter-in-law.

November 24th, 1813, Lord Byron sets down in his diary: —

I have had a letter from Lady Melbourne, the best friend I ever had in my life, and the cleverest of women. I write with most pleasure to her, and her answers are so sensible, so *tactique*. I never met with half her talent. If she had been a few years younger, what a fool she would have made of me, had she thought it worth her while, and I should have lost a valuable and most agreeable *friend*.

Mem. A mistress never is or can be a friend. While you agree, you are lovers; and when it is over, anything but friends.

He has versified this *Mem.*, although it is far from universally true: —

No friend like to a woman man discovers,
So that they have not been nor may be lovers.

Long after his mother's death, Lord Melbourne is reported to have said, "Ah, my mother was a most remarkable woman; not merely clever and engaging, but the most sagacious woman I ever knew. She kept me right as long as she lived."

Lamb (as we must still call him) resumed his Parliamentary career in 1816. The biographer is rather obscure upon the point, but we collect that he re-entered the House as member for Portarlington, which he very soon exchanged for Peterborough. He broke ground by a speech in support of an amendment moved by the leader of opposition, Ponsonby; his chief topic being that the military establishments had not been reduced to a peace footing. Canning, in reply, referred to him as one "who never spoke without making a deep impression by his eloquence and ability." These were no words of course. Long before he came decidedly to the front, there prevailed a wide-spread belief in his latent capacity and suppressed power. About this time (or shortly afterwards) he had just left a dinner at Carlton House, when the regent, turning to one of the remaining guests, said with emphasis: "Sligo, mark my words, that man will some time or other be prime minister." *

In the course of a debate on Lord John Russell's annual motion for Reform in 1827, Mr. Hobhouse (Lord Broughton) had made a powerful speech, followed by a pause, when a member rose at a considerable distance from the speaker and made a telling reply of about twenty minutes' duration, almost every sentence of which was received with acclamation. A listener in the gallery (the present writer) turned round and asked a reporter (afterwards a distinguished member of the Irish bar) who it was. "That," was the reply, "is William Lamb; and Lord Castlereagh used to say that he might become prime minister, if he would only shake off his carelessness and set about it."

It was at his instance that his brother George stood for Westminster in 1818, and throwing off his habitual nonchalance he took the lead in organizing a systematic canvas of the constituency. Lady Georgiana Morpeth and Lady Caroline played the parts so efficiently filled by the Duchess of Devonshire in 1784. Desirous of gaining over Godwin, whose name was deemed important to the cause, Lady Caroline opened a correspondence with him, and although she failed in her immediate object, she made the acquaintance of a remarkable man, and the letters to which it led are highly valuable as throwing light on her character and the affectionate terms on which she lived with her husband. In 1821, Godwin wrote to ask

* Our authority is the present Marquis of Sligo; who, without being able to fix the precise date of the incident, is certain that it occurred during the regency.

her aid in promoting a subscription for his benefit, a request with which she readily complies. In the ensuing letter she gives free expression to her feelings and thoughts, betraying in every other sentence her incurable self-consciousness: —

There is nothing marked, sentimental, or interesting in my career. All I know is that I was happy, well, rich, joyful, and surrounded by friends. I have now one faithful, kind friend in William Lamb, two others in my father and brother — but health, spirits and all else, is gone, gone how? Oh, assuredly not by the visitation of God, but slowly and gradually by my own fault.*

. . . .

Pray say a few wise words to me. There is no one more deeply sensible than myself of kindness from persons of high intellect, and at this period of my life I need it. I have nothing to do, I mean necessarily. There is no particular reason why I should exist: it conduces to no one's happiness, and, on the contrary, I stand in the way of many. Besides, I seem to have lived five hundred years, and feel I am neither wiser, better, nor worse than I began. My experience gives me no satisfaction, all my opinions and beliefs and feelings are shaken, as if suffering from frequent little shocks of earthquake.

The author of the book in which these letters appear goes on to say "that one new acquaintance was made by Godwin in 1830, the last of the long series of younger friends. This was Edward Bulwer, known better to this generation as Lord Lytton, who came to sit at the feet of the writer of 'Caleb Williams.'" He was introduced to Godwin by Lady Caroline Lamb in the following letter, which is without date and was certainly written many years before 1830, probably in 1823: —

Mr. Bulwer Lytton, a very young man and an enthusiast, wishes to be introduced to you. He is taking his degree at Cambridge; on his return pray let me make you acquainted with him. . . . Hobhouse came to me last night: how strange it is I love Lord Byron so much now in my old age, in despite of all he is said to have said. But I also love Hobhouse because he so warmly takes his part.

In July, 1824, she was driving in an open carriage, when a funeral came by. She asked whose it was, and the reply was, "Lord Byron's." The biographer states that she never recovered from the shock. At first she lay as one stunned, incapable of exertion and without interest of any kind. She then resumed her pen and pencils, and was occupied with her favorite books and music in a manner to give hopes that the dark cloud had been uplifted. But she speedily relapsed, and indulged in all sorts of caprices and vagaries. It is told of her that one day coming into the dining-room whilst the butler was arranging the decorations for the table, she told him that they wanted feature, expression, and elevation; that the centre-piece in particular was too low; then ordering it to be removed, she stepped into the vacant place and assumed a picturesque attitude to illustrate her idea.

The butler rushed from the room, and finding Lamb in the library, begged him for God's sake to come to the rescue. The moment he saw her he said only in the gentlest tone of expostulation, "Caroline, Caroline!" then took her in his arms and carried her out of doors into the sunshine, talking of some ordinary subject to divert her attention from what had happened. That evening she received her friends with as calm a look and tone as in happier days; but what an ordeal for him to pass through!

What an ordeal indeed! At times it was too much for him. He resolved on separation, and, as regards absence and estrangement, was separated at intervals. But how impute to guilt, or punish as criminal, irregularities which were clearly owing to a disordered intellect and were always bordering on, if they did not actually reach, insanity! If he kept away from Brocket, he left her its undisturbed occupant, and whenever she expressed a wish to see him or his presence was needed to keep her quiet, he was there to soothe and watch over her.

At the same time, he was watching over a son whom he tenderly loved, and trying to read in his fine features the signs of the complete intelligence and mental soundness they were never destined to reflect. If Lord Melbourne occasionally sought distraction in things that were not domestic, let it be remembered what sort of domesticity awaited him in his own home. If he was sometimes cynical or distrustful of mankind and womankind, let it never be forgotten how his best affections had been converted into instruments of torture, how his finest feelings had been turned against him. No wonder that he was fond of repeating one of the "detached thoughts" of Horace Walpole: "To those who think, life is a comedy — to those who feel a tragedy."

"Later in this year (1818) Sheridan died, and William Lamb was among the well-born crowd who followed him to the grave. His admiration was unbounded

Original from CORNELL UNIVERSITY

for his genius." This, combined with his friendship for Tom Sheridan, led (it is added) to his seriously contemplating the biography of the deceased orator and wit.

He went in for a preliminary course of reading in old English comedy from Beaumont to Congreve, and long afterwards he used to excite the wonder of the superficial and the admiration of the learned frequenters of Holland House by reciting whole colloquies from Wycherley and long speeches from Massinger. This was preparatory to writing the earlier portions of his work, and delightful preparation it was. Then there was a course of more laborious study in the orations, English, Irish, French, Roman, Greek. Their differences of style and comparative anatomy had for him a charm that they never had before.

. . . .

Of the earlier Irish school he had little or no means of judging. Fox and Wyndham were the *penates* of his house, and the latter was with him a sort of idol. Canning he could listen to forever; but the man who he always said was the most irresistible in argument he had ever heard was Plunket. By the time he had come to settle conclusions about all these, something of his youthful preference for Sheridan was shaken; for he could not reconcile them with his unbridled freaks of fancy and tendency to over-decoration. This did not cool his biographic zeal, or abate his ambition to be the author of a book that every one would read. After many postponements and changes of design he at length began, and actually wrote the introductory portions of the life of the orator *as we have it now*.

Having got thus far, he began to flag, and shrank away from the drudgery of collecting facts and collating authorities for a consecutive narrative: —

He had got together all the best marbles and bronzes, sacrificial tools and incense-burners for his temple, but to go quarrying for the stones and digging out the rubbish for the foundation, or making the cement and trowelling it into the numberless interstices that must be filled up — heigh-ho! perhaps somebody else would do it better: why not Thomas Moore, an enthusiast by nature, a skilled workman by trade?

There was some hesitation and some demur: the poet, we are told, instinctively knew that, professionally considered, it was not a job that would pay. We should say that he instinctively knew the exact contrary, and it is matter of fact that he got a thousand pounds down at starting. But the hesitation did not last.

Moore was told by everybody he dined with that he was just the man to embalm Sheridan's memory in frankincense and myrrh. The minstrel boy liked the compliments better than the work, and took to it reluctantly. Lamb proffered him all the aid in his power, and sent him his notes and sketches, with the introductory chapters which only were written. *Eventually they made their appearance, with little adaptation, at the beginning of Sheridan's life, accompanied with due acknowledgments.*

Here Mr. Torrens's imagination has fairly run away with him. We cannot take upon ourselves to deny that Lord Melbourne went through the exhaustive course of preparation attributed to him; but when all that we have the means of testing looks like the baseless fabric of a vision, we are justified in being sceptical as to the rest. Sheridan died in 1816, not 1818. Moore did not publish the "Life" till 1825, nine years afterwards, and it was originally meant to accompany his collected edition of the works. There are no introductory chapters. There are no acknowledgments. Lamb's name is not so much as mentioned in the preface, and only once (*à propos* of his marriage) in Moore's "Journals;" where may be read the precise circumstances under which (in 1824) Moore contracted for the "Life." The sole semblance of authority for Mr. Torrens's detailed statement is a note (vol. i., p. 408) in which two paragraphs are quoted from "an unfinished life" by a person unnamed, who, from the description, may be inferred to be Lord Melbourne. This note proves that Moore made no other use whatever of the manuscript.

In November 1818, Lamb, then member for Hertfordshire (it is not stated when he was chosen), supported Lord Althorp's motion for a committee to inquire into the state of the country. In 1819 the next stirring affair in which he was engaged was the renewed contest for Westminster, when he accompanied his brother to the hustings and witnessed his mortifying defeat; Burdett and Hobhouse being returned. Queen Caroline next came upon the scene. Nearly all Lamb's private friends and political connections were against the prosecution, and his votes were mostly given in accordance with their view.

On all Irish questions which, soon after the accession of George IV., began to assume formidable dimensions, he took the Liberal side, but his love of order and his confidence in Lord Wellesley induced him to support the suspension of the Habeas Corpus Act and the passing of the Insurrection Bill in 1822. On September

2, 1825, he intimated his intention not to present himself again as a candidate for the county, stating that he was induced to come to this determination solely by personal and private considerations, having accepted an offer to stand for Hertford, where he was opposed by Mr. T. Duncombe, who fairly frightened him off the course by intimations and insinuations of the most unjustifiable sort. One of the most malignant attacks of this kind (we learn from the biographer) alluded openly to his wife, and was subscribed "Glenarvon." He might have retorted with telling effect against any but a case-hardened adversary. His place was taken, at his suggestion, by Henry Bulwer, "who," Mr. Torrens states, "had already shown that he possessed capability and ambition to win distinction in a different sphere from his elder brother." His elder brother was a quiet country gentleman: Edward, Lord Lytton, was the youngest of the three.

Canning's accession to the premiership was Lamb's real starting-point as a working practical statesman. On the 27th of April, 1827, he was returned for Newport by a small majority. A petition was threatened, but before it could be presented he was appointed chief secretary for Ireland. On Canning's proposing him, the king is reported to have said, "William Lamb, William Lamb — put him anywhere you like." Instead of standing again for Newport, he got elected for Bletchingley, obligingly vacated for him by Mr. William Russell. He started for Ireland early in July, leaving Lady Caroline at Brocket on the plea of ill-health, but taking with him his son, from whom he could not bear to be separated.*

The peculiar duty to which Canning's parting instructions pointed was one for which Lamb was admirably fitted by knowledge of mankind, charm of manner, temper, and tact. He was to pave the way for Catholic emancipation and an entire change of policy by gradual changes of men and measures, bringing the friends of toleration to the front, and transferring some portion of the power which the exclusionists had held so long as almost to regard it as their patrimony. Mr. Torrens, Irish by birth and education, was an Irish official when the traditions of Lamb's secretaryship were fresh; and although (since coming upon the Sheridan episode) we cannot help suspecting that the Irish atmosphere has exercised its prescriptive influence upon his facts,* we see no reason to doubt the substantial accuracy of the animated passages in which he describes the effect of the new secretary's arrival at the castle: —

From the outset he resolved to see and hear for himself everybody and everything. The prescriptive reserve which haunted the secretary's office he put aside with no other notice than a hearty laugh. Peel had encircled the department with an arctic zone of distrust which, save by a few adventurers, was impenetrable: Goulburn was the centre of a mere fog, without light or sound or motion. His successor came to bring brighter and more hopeful weather. The staff of the department viewed his proceedings with surprise at first and then with sorrow. Some hinted doubts as to whether he was quite aware of the sort of persons he consented to see, and inwardly they deplored the obstinacy of his imprudence in seeming to talk to them just as he would to old acquaintances. Old Mr. Gregory groaned; melancholy Mr. Mangin sighed; the sententious attorney-general, Mr. Joy, kept his mind to himself except when asked point-blank for an opinion, and then flavored it with a sneer. The versatile solicitor-general, Mr. Doherty, who had fought for his kinsman the prime minister at Liverpool elections, and hoped that he would now have his reward, was all things to all men; and finding that Lamb loved a joke, plied him with specimens innumerable of Celtic fun. But the secretary went his own way, and kept to it.

. . . .

The messengers of the office used to say long after his time, "When Mr. Lamb was here the only orders were, 'Show him in;'" and though he could not promise to grant one in fifty of their requests, they invariably went away in better humor than they came, and muttering as they passed the sentry at the gate, "Not a bad kind of man that." At the end of an early letter to the Home Office full of details of business he says: "I have a dozen fellows talking to me whilst I write this letter, which will account for its incoherence," in regard to official formalities; for there was none as to substance and sense.

We have neither space nor inclination to follow Mr. Torrens through his detailed account of Lamb's Irish administration, which is clever and spirited, and would be valuable for its information if we could implicitly depend upon it. But after coming on such a statement as that the local taxes of Dublin amounted to 250,000*l.* per annum (they were less than half), we can hardly be expected to take on trust much that he has obviously not paused to verify. We are far from suspecting him

* His son died Nov. 27th, 1836. The only signs of complete intelligence were displayed a few hours before his death.

* It was Mr. Kinglake who said that, when St. Patrick expelled poisonous reptiles from Ireland, he also drove out facts.

of wilful inaccuracy, but his colored, allusive, gushing style is precisely that by which both writer and reader may be misled. Besides, there is a great deal of matter, curious in itself, which has little or no bearing on the immediate subject of the biography. Bulwer, in his "Life of Lord Palmerston," has given an undue preponderance to the foreign policy with which he himself was diplomatically engaged: and Mr. Torrens has been similarly tempted to devote a disproportioned space to the country of his birth, not excepting periods when Lord Melbourne had little or nothing, directly or personally, to do with it.

Canning's death made no ostensible change in Lamb's position till the Duke of Wellington's accession to the premiership, when, in reply to a complimentary letter from the duke requesting him to retain the office he had hitherto filled with so much credit, he wrote that he must postpone his decision till he had conversed with his Grace upon the whole of the intended arrangements. He finally left Ireland on the 23rd of January, 1828, and on his arrival at Melbourne House found Lady Caroline dying. The tone of her letters was habitually so desponding that he had distrusted the accounts she had recently written to him of her real state.

She lingered only a few days longer, for the most part in a state bordering on unconsciousness. Her brother William, who throughout her illness had been unremitting in his care, warmly expressed his sense of the solace which her husband's frequent letters had afforded her, and the tenderness of his demeanor when he came. "William Lamb behaved throughout as I always knew he would."

. . . .

In spite of all her waywardness and folly, Lamb was beyond all doubt passionately fond of his wife. She retained to the last a strong influence over him, and years after her death he used to speak of her with tears, and ask moodily, "Shall we meet in another world?"

He consented to retain his office under the duke until the forced resignation of Huskisson, when Lord Palmerston, Lord Dudley, and Lamb met to resolve upon the course which it was incumbent on them to pursue. Their conference is described by Lord Palmerston in his journal:—

We all left Huskisson (then living in Downing Street) together, and Dudley proposed that we should walk up a little way, our cabriolets following. He was in the middle and said, "Now we are by ourselves in the street, and nobody but the sentry to hear us, let me know, right and left, what is meant to be done—'in' or 'out.'" I said "out," and Lamb echoed "out." "Well," said Dudley, "I am under some embarrassment as to what I shall do." . . . He said that the Colonial Office would be filled by a moderate Tory, a man of promise, a member of a Tory family. Lamb then said that for his part he did not happen to know any young member of a Tory family who was a man of promise, but by Dudley's own showing the character and complexion of the government were to be altered, first by withdrawing Huskisson and then by putting in his place a decided Tory. That this would decide him at all events. . . .

Dudley said that there was something in attaching oneself to so great a man as the duke. "For my part," said Lamb, "I do not happen to think the duke so very great a man; but that's a matter of opinion." I left them, and on my return home wrote to the duke a letter of resignation, which was to be sent to him early the next morning.*

Bulwer (Lord Dalling) adds in a note, that George IV. was very anxious that Lamb should remain.

At least the Duke of Cumberland requested that I would go to him and mention, as the king's particular desire, that he would not quit the government. I gave the message, and carried back a civil answer, but one that left no doubt of Mr. Lamb's determination.†

Mr. Torrens states that, after Lamb's resignation, Jerdan called on him and persuaded him to resume his contributions to the *Literary Gazette.*

They had previously been casual, but now became more frequent, being chiefly criticisms on theological or ethical works. Some of his reviews were of plagiaristic or platitudinarian volumes of sermons, and are spiced with keen, though not irreverent humor.

As these must have been short, it is to be regretted that we have not been treated to a specimen or two. They would have been more to the point than the frequent and discursive views of general politics, able as these are, which occupy so large a portion of the book.

Peniston, the first Lord Melbourne, died on the 22nd of July, 1828, and the accession of William to the title and estates gives occasion to the biographer for philosophizing in his peculiar way on the position and prospects of the new peer. He writes as usual with spirit and vivacity, but he has the Macaulay fondness for effect, and he thinks nothing of rounding a sentence at the expense of a date or a

fact. Twenty-five years sounds better than nineteen, so he begins: —

For five-and-twenty years Lamb had been a member of the House of Commons, a favorite there, seldom refused a hearing, the intimate of its greatest men, and for a season the occupant of a difficult post; yet he had not made a speech worth remembering, and the Cabinet — the crown of Parliamentary strivings — had never been conceded him.

He had made many speeches which the biographer has thought worth quoting, and he had established a reputation which was to place him at the head of the Cabinet in due course.

Half a century spent and gone, and how little to show for it! He would have given a great deal to have had a fervid, even a fantastic faith in anything worth working for. He had been born a Whig, bred a courtier, drawn by conviction into Canningism, and persuaded to retain office under the Duke of Wellington. But Whiggery was said to be worn out. There was no longer a court genial, generous, or gay; Canning was dead, and the great soldier's administration seemed tottering to its fall. Utilitarian levelling like that of Bentham he regarded as nonsense. State parsimony like Joseph Hume's he thought a pettifogging blunder. Radicalism after the manner of Hunt and Cobbett he called mere ragamuffinism. He envied Stanley, *as he said*, the equal pleasure he took in fighting a main of cocks and defending the abuses of the Established Church. He coveted Palmerston's light-heartedness and india-rubber temperament, and Lansdowne's delight in the arts and in the duties of hospitality. Althorp's devotion to his wethers and shorthorns, and Holland's happiness in his great dinners and amusement at my lady's whimsicality, were alike to him marvels of contentedness. He was inactive, yet he was not at ease.

It is difficult to imagine a more erroneous estimate of a character. It would make out an earnest, high-minded man, with a noble career before him and intuitively conscious of it — so much so that his fortune was divined from his bearing — to be like the hero in "*L'Homme Blasé*," better known to the English public as "Used Up." No man had so many objects of interest at all times; and the notion of his envying the lighter qualities or amusements of his distinguished contemporaries is preposterous. Would any one who really knew Lord Holland envy his "happiness in his *great* dinners and *amusement* at my lady's whimsicality"? How did Mr. Torrens become acquainted with all these peculiar reflections and envies of Lord Melbourne fifty years since?

A few pages on, he quotes with approbation an extract from Haydon's diary for November, 1833: —

The scene at the lord mayor's dinner was exquisite; the mischievous air of over-politeness with which Lord Brougham handed in the lady mayoress; the arch looks of Lord Melbourne; the supercilious sneer of Lord Stanley at a City affair, as he calls it. In the ball-room I said to Lord Stanley, "Lord Melbourne enjoys it." "There is nothing Lord Melbourne does not enjoy, said he." Can there be a finer epitaph on a man? It is true of Lord Melbourne, who is all amiability, good-humor, and simplicity of mind.

But Lord Melbourne, it seems, had not given up hope.

He would try again, try on; but how? While he pondered, an unexpected shadow fell upon his path that looked like the realization of hope long deferred. It proved illusory, and vanished into nothing, as out of nothing it almost seemed to come: *but it changed the whole condition of the man*, and served undoubtedly to hasten his advancement to the first rank in his party.

What was this unexpected shadow which, although it proved illusory, changed the whole condition of the man?

Late in August Mr. Greville mentions a party at Stoke, during which he asked the new viscount if the rumor was true that he had been offered the admiralty. "He said he had never heard of it." Yet the rumor had its significance.

The significance was that the Duke of Clarence (soon to be William IV.) had just relinquished the post of lord high admiral, and it was of importance that he should be adequately replaced by a board with a president who would command confidence.

That the ex-secretary for Ireland, who had never been in the Cabinet, should hear himself talked of as a probable first lord of the admiralty in a circle closely associated with the court, could not but sound like an augury of things to come.

The reasons which induced Lord Melbourne to resign office under the duke were still in full force. They had been confirmed rather than shaken. To suppose that he could be tempted by a higher office to abandon his principles and his Canningite friends would have been more likely to be resented as an affront. He had never even heard of the rumor, but the bare mention of it by Greville changed the whole condition of the man, and was hailed as an augury of things to come!

We pass on to the formation of the Reform Cabinet. "Why did he" (Lord

Grey) "regard Melbourne as most fit?" Mr. Torrens's answer to this query recalls the celebrated passage in Madame de Sévigné: "*Je vous le donne en dix: je vous le donne en cent*," etc. After ringing the charges on various items of unfitness, and suggesting that Lord Melbourne (who, according to the same authority, had just been exalted to the seventh heaven by being talked of for the admiralty) would probably have been satisfied with the duchy or the privy seal, the explanation is that his fitness for the place seemed from the first to have struck Lord Holland.

His clear blue eye rested fixedly on Melbourne, and if any doubt had previously existed in the mind of the premier it would have been dispelled by his advice, and the recollection that no one would be more acceptable personally to the king. What, then, were those distinctive qualities which recommended their possessor so irresistibly? William IV. liked him because, as he used to say, "he was a great gentleman;" by which he meant that under all circumstances he felt that he could appeal not only to his sense of honor, but to his generosity and genuine loyalty to the State.

Lord Melbourne was a gentleman in the highest sense of the term, but he was not what is commonly called a great gentleman; he had not the air or manner of a *grand seigneur*. William IV. never liked him, and the words placed in the sailor-king's mouth are wholly unlike what he "used to say."

What has been treated as an important (and turned out in one instance an unlucky) appendage to the new secretary for the home department, was his private secretary, "Tom Young," who was misunderstood by Mr. Charles Greville and is misdescribed by Mr. Torrens: —

Young had been recommended to the home secretary by the Duke of Devonshire as a shrewd, handy sort of man, whom he had found as purser of his yacht more serviceable than men of better breeding. To his surprise, and that of others, Melbourne named him private secretary, and, as he said, made use of him as a weather-guage when nicer instruments were off their balance. Had he checked the habitual bluntness of the man, or winced at his innate vulgarity, he would have been no longer useful. "Through him," he would say, "I am able to look down below; which for me is more important than all I can learn from all the fine gentleman clerks about me." By long sufferance Tom Young grew too familiar, not only with his chief, but with persons who could brook it less good-humoredly. But he was devoted, indefatigable, had a keen discernment of the foibles and oddities of his master; and, save on one occasion, served him sagaciously and well.

Young had been a purser in the royal navy, from which he retired with an independence, travelled, and gained a footing on the outskirts of society. On the occasion of the Duke of Devonshire's special embassy to Russia, the functionary (Mr. Jones, of the victualling office) charged with the outfit was looking about for some one to undertake the general management of the commissariat arrangements during the voyage out and home, when Young was suggested to him and engaged. The duke was pleased with him, invited him to Devonshire House, and recommended him to Lord Melbourne. Although neither refined nor cultivated, he was not vulgar, obtrusive, nor blunt. He had temper, tact, and fair average manners. He was a really good-natured fellow, always anxious to oblige, and eminently what the French call *serviable*. He had a numerous acquaintance, especially among active stirring people just below the upper stratum of society. Thus, he was hail-fellow-well-met with the wire-pullers of the Reform agitation, with Place, Atwood, and Joseph Parkes; as well with Barnes of the *Times*, Black of the *Morning Chronicle*, and Fonblanque of the *Examiner*. The state of affairs was critical, and a man of this kind was invaluable at the Home Office. No doubt Lord Melbourne learnt from him what he could not have learned from "fine gentlemen clerks;" but he had nothing in common with the "*Græculus esuriens*" of Juvenal or the "starving Frenchman" of Johnson; and we are quite sure that Lord Melbourne never sneered or winced at him, never talked of looking down below "through him," and never admitted him to anything approximating to intimacy or companionship so as to encourage undue familiarity. The words which Mr. Charles Greville puts into his mouth, and which Mr. Torrens tacitly adopts, are completely out of keeping with the character.

The only new fact supplied by the biographer — and we presume on authority — touching Lord Melbourne's participation in the Reform Bill, is his saying, "I am for a low figure. Unless we have a large basis to work upon we shall do nothing." In the debate on the second reading he made no attempt to justify his inconsistency: he frankly and fully admitted that he had been opposed to Parliamentary reform, that he had even objected to giving the

franchise to Manchester and Birmingham; but he contended that the declared will of the country left the legislature no alternative.

His brother George, under secretary at the Home Office, was as much given to the use of profane expletives as himself. The late Lord Ossington used to relate that, encountering Lord Melbourne when about to mount his horse at the door of the office, he called his attention to some required modifications in the new Poor Law Bill. Lord Melbourne referred him tc George. "I have been with him," was the reply, "but he d—d me, and d—d the bill, and d—d the paupers." "Well, d—n it, what more could he do?" was the rejoinder. Half the point of this story is lost in Mr. Torrens's version, which makes the under secretary d—n the clauses of an education bill instead of the paupers.

All topics of a private nature are treated with proper feeling and good taste by the biographer — we wish we could add, with accuracy. After tracing the origin of Lord Melbourne's acquaintance with Mrs. Norton — a delicate topic which subsequently became too important to be suppressed — he says that to celebrate her younger brother's birthday she asked to dinner, along with two of her husband's colleagues in the magistracy and some members of her family, Lord Melbourne and the author of "Vivian Grey," "in whom she had recently discovered the son of her father's intimate friend." A man more unlikely to be intimate friend of Tom Sheridan than Disraeli the elder, we can hardly imagine, but let that pass.

Young Disraeli was not long returned from his travels in the East, with traits of which he had interested her on the occasion of their first acquaintance. He had just then been defeated in an attempt to get into Parliament for the borough of Wycombe, *where he attributed his failure to want of support by the Whigs.* Mrs. Norton presented him after dinner to the home secretary, who had the power, she said, of retrieving the disappointment if he chose; and whose frank and open manner led to a long conversation, in which Mr. Disraeli mentioned the circumstances of his late discomfiture, *dwelling on each particular with the emphasis which every young man of ambition since Parliament was invented is sure to lay upon the broken promises and scandalous behavior of his victorious foes.* The minister was attracted more and more as he listened to the *uncommonplace* (just described as commonplace) language and spirit of the youthful politician, and thought to himself he would be well worth serving. Abruptly, but with a certain tone of kindness which took away any air of assumption, he said, "Well now, tell me, — what do you want to be?" The quiet gravity of the reply fairly took him aback — "I want to be prime minister." Melbourne gave a long sigh, and then said very seriously: —

"No chance of that in our time. It is all arranged and settled. Nobody but Lord Grey could perhaps have carried the Reform Bill; but he is an old man, and when he gives up, he will certainly be succeeded by one who has every requisite for the position, in the prime of life and fame, of old blood, high rank, great fortune, and greater ability. Once in power, there is nothing to prevent him holding office as long as Sir Robert Walpole. Nobody can compete with Stanley. I heard him the other night in the Commons, when the party were all divided and breaking away from their ranks, recall them by the mere force of superior will and eloquence: *he rose like a young eagle above them all, and kept hovering over their heads till they were reduced to abject submission.* There is nothing like him. If you are going into politics and mean to stick to it, I dare say you will do very well, for you have ability and enterprise; and if you are careful how you steer, no doubt you will get into some port at last. But you must put all these foolish notions out of your head; they won't do at all. Stanley will be the next prime minister you will see."

The internal improbability, not to say absurdity, of all this must be obvious to any one who has the slightest knowledge of the two principal actors in the scene. It places both of them in a ridiculous light: the youthful aspirant not yet in Parliament gravely replying, "I want to be prime minister;" and the home secretary as gravely explaining to him that the place was bespoken and that he had better think of something else. Can any one believe that Lord Melbourne spoke of Stanley in such terms? Who reported the dialogue to Mr. Torrens? To cap the improbability, Mr. Disraeli had stood as a Tory-Radical against the Whig candidate, Colonel Grey, at Wycombe, and was, as he always has been, the declared enemy of the Whigs. What really took place will be best prefaced by an anecdote in an essay published in 1858, to which Mrs. Norton contributed and which she carefully revised: —

Many years since, a right honorable gentleman, who now holds a conspicuous position before the world, had recently returned from the East, when he was asked to dinner to meet Lord Melbourne, who good-naturedly turned the conversation on the manners and customs of the countries recently visited by this gentleman. "Your lordship," he remarked, "appears to have derived all your notions of Oriental matters from the 'Arabian Nights Entertainments.'" "And a devilish good
