M. L. Smith and A. J. Smith on the right of Morgan. There was heavy skirmishing on the 27th and 28th, the Confederate outposts were driven in, and at night of the 28th the Union troops lay parallel to Chickasaw or Walnut Hills bluff and about 600 yards from its foot. The main assault on the bluff was to be made by Morgan, supported by Steele; while, to make a diversion in favor of Morgan, A. J. Smith, with M. L. Smith's division and one brigade of his own, was to cross a lake, a mile below Morgan, by a narrow sand-bar, and attack. On the extreme right the rest of A. J. Smith's division was to demonstrate on the road to Vicksburg. On the morning of the 29th Morgan represented to Sherman that an attack from his position was impracticable; but Sherman, after an examination, made no change in his disposition, and rode off to his headquarters, whence he sent his adjutant-general to Morgan with this message: "Tell Morgan to give the signal for assault; that we will lose 5,000 men before we take Vicksburg, and may as well lose them here as anywhere else." Morgan replied that Sherman's entire army could not carry the position in his front, but that he would order the assault. De Courcy's brigade of Morgan's division, and the two brigades of Blair and Thayer of Steele's, were formed for the assault. The signal was given by a heavy artillery fire upon the Confederate lines, and at 12 o'clock the three brigades went forward. By some misunderstanding Thayer's brigade, with the exception of the 4th Iowa, diverged too far to the right, but De Courcy, Blair, and Thayer (with the 4th Iowa), about 6,000 men, after clearing the obstruction in front and floundering through deep mire and tangled marsh, under a terrific fire of artillery, finally made a lodgment on the hard table-land at the foot of the bluff, where an abandoned line of works gave shelter, and where some of the men stopped. All formation was broken up, brigades and regiments mixed, but on went the main body, pushed up the bluff, and reached different points of Lee's works, but were met on both flanks by such a withering fire from the rifle-pits that ran diagonally up the slope of the hill, and so severe a cross-fire of shell and canister from the batteries, that the men faltered and, no support being in sight, fell back to the point of starting, leaving about 1,500 killed, wounded, and captured. Lee lost 115. More to the right, where A. J. Smith was to demonstrate, the 6th Missouri gained the levee at the foot of the bluff, but not able to go farther under the hot fire poured upon them from above, the men sought shelter by digging with hands and bayonets into the bank of the levee, where they remained until night covered their withdrawal, after a loss of 57 killed and wounded. Sherman thought of renewing the assault in the morning, but after a personal examination he came to the conclusion that the enemy's centre could not be broken without crippling his army beyond the power to act with any vigor afterward, and proposed to attack Haynes' Bluff, higher up the Yazoo. Preparations were made to assault at 4 o'clock on the morning of 1 Jan. 1863. Admiral Porter, who was to co-operate in this attack, found the fog so dense on the river that he could not move his boats. The attack was deferred and then abandoned, and by sunrise, 2 January, the troops were all re-embarked on transports and sailed

for Milliken's Bend. The Union loss in the assault on Chickasaw Bluffs and in the skirmishing preceding it was 1,213 killed and wounded, and 563 missing. The Confederate loss was 177 killed and wounded, and 10 missing. Consult: 'Official Records,' Vol. XVII.; The Century Company's 'Battles and Leaders of the Civil War,' Vol. III.; F. V. Greene, 'The Mississippi.'

E. A. CARMAN.

Chickasaw, *chik'a-sâ*, the most active and warlike tribe of the great Muskogean (q.v.) Indian stock; a branch of the Choctaw (q.v.), and according to their own tradition, not separated till after the united tribe crossed the Mississippi eastward. They occupied north-eastern Mississippi, and the adjacent part of western Tennessee to the Ohio. Their chief settlements were on the head-waters of the Tombigbee and Yazoo, about the present Pontotoc and Chickasaw counties, and a trail led to them from the site of Memphis, 160 miles off, their principal Mississippi landing. They were first found by De Soto, who reached the village of "Chicaça," with 200 houses, on the west bank of the Yazoo, 17 Dec. 1540, and remained there till March; but when he undertook to impress some of the Indians as porters, he was repeatedly assailed, the village fired, his path barred by a stockade, and he lost many men before he beat them off. English traders penetrated thither in the 17th century. After the French settlement at Mobile, the rivalry of the two nations first set them against the French, and for a time cut off the Mississippi trade from both; but with the French, as the only real colonists in that region, they were in constant and envenomed hostility for many years, and Bienville and D'Artaguet led expeditions against them again and again, not even a nominal peace in 1740 putting an end to their warfare. With Oglethorpe of Georgia they had friendly relations. At this time they had four large contiguous settlements, with the houses in each scattered over a space 1 to 2 miles wide and 4 to 10 long; the chief was called Chookka Pharaah, or Long House. Their sachem was called the *mico*. In 1765 Gov. Johnstone of west Florida induced them and the Choctaws to hold a council with him at Mobile, where a trade tariff was framed; but the white traders among them soon precipitated fresh troubles. After the Revolution, at the great general treaty of Hopewell, 28 Nov. 1785, their *mico* Pio and others made a treaty delimiting their lands from the Ohio River to the Mississippi State line. Their number was then estimated at 800 to 1,200. The reliability of these estimates may be judged from the fact that they are said to have had 10,000 warriors when they crossed the Mississippi, 450 in 1755, 750 in 1764, and 500 in 1768. In 1793 they joined the whites against the Creeks, and continued friendly to the settlers. In 1805, 1816, and 1818, they gradually ceded all lands north of the Mississippi line. About 1800, as the hunting grounds narrowed, the tribe began to migrate west of the Mississippi, as did the Cherokees and others. In 1822 there were in Mississippi 3,625 on a reliable count, with eight towns, and a progressive civilization: they were industrious farmers and cattle-men, marketing live stock among the whites. By the treaty of Pontotoc Creek, 20 Oct. 1822, they made another large cession of

CHICKEN — CHICKEN-SNAKE

lands; and by that of Washington, 24 May 1834, they gave up all the remainder, the two cessions comprising 6,442,400 acres, or over 10,000 square miles, for which they received \$3,646,000. On 17 Jan. 1837 they bought of the Choctaws for \$530,000 a district on the Red River west and south of the Washita (the extreme western part of the present Indian Territory), to be inalienable except with the consent of the Choctaws; relinquished their governmental organization, and became a part of that nation, with proportionate representation in its government. A considerable number, instead of remaining with the tribe, scattered through the Choctaws, buying and taking up lands at pleasure. They lagged behind the Choctaws in progress, however; a smallpox epidemic carried off several hundred; the government annuity made them lazy; and they opened no schools till 1851. Aggrieved at being represented in the Choctaw government only according to numbers, instead of equally as a tribe, they appealed to the President, and on 27 June 1855 were given separate title to their district as the Chickasaw Nation. They organized a government with a council and two-chambered legislature, and advanced rapidly. In the Civil War, as slaveholders, and having southern agents, they joined the Confederate side; lost about one fourth of their people, and were liable to the penalties of treason. By the treaty of Fort Smith, September 1865 they were conditionally restored to their rights. On 28 April 1866 all the old treaties were renewed; but they were forced to sell to the government 7,000,000 acres of land, nearly 11,000 square miles, for \$315,000, the money to go to their former slaves unless they admitted them to full tribal citizenship. They held off for some years, but finally acceded on 10 Jan. 1873. The "nation" in 1900 numbered 5,872, of whom probably two thirds were Chickasaws proper, and they are increasing.

Chicken. See FOWL.

Chicken-flea, the common name of *Sarcophylla gallinacea*, a pest of young chickens in tropical and subtropical regions, and destructive from Florida to Texas. It is smaller and shorter than the cat flea, with the eyes and antennæ in the hinder part of the head, and it does not hop. It abounds mostly in shady places, under old houses, and in earthen floors. It is first observed to infest young chickens and turkeys, and by its number and pertinacity kills young chickens, while being more or less permanently parasites on hens. Consult: Packard, 'Insect Life,' Vol. VII.

Chicken-lice, several species of bird-lice (*Mallophaga*), or louse-like wingless insects, afflicting chickens and hens. Unlike the louse (*Pediculus*), which obtains its nourishment by suction, the bird-lice have free jaws adapted for cutting feathers, though they also draw blood from the skin of their host. The large chicken louse (*Goniocotes abdominalis*) is less common than the lesser chicken-louse (*G. hologaster*); it is only one millimetre long, while the first-named kind is three millimetres long. Quite a different kind is the common hen-louse (*Menopon pallidum*), which is the most abundant and annoying of all. It differs from the others in its light color and greater activity, running among the feathers and from them upon the hands of

persons handling fowls. It is from one to one and a half millimetres long, rather slender, and of a pale straw-yellow color. Fowls should be allowed plenty of ashes and road dust in which to roll. An infested hennery should be well fumigated and whitewashed, and insect-powder should be dusted upon the birds themselves.

Chicken-mite, or **Poultry-tick**, a small mite (*Dermanyssus gallinæ*) which gathers on fowls at night and sucks their blood. It is about one millimeter high, light gray, with dark patches, but red when gorged with blood. It swarms in cracks and corners of the henhouse, and should not be confounded with the bird-tick (*D. avium*).

Chicken-pox, an acute, specific, infectious disease, characterized by a definite incubation period, an eruption of successive crops of vesicles which persist for a certain length of time, and a well-marked clinical course of short duration. It is one of the mildest of the eruptive fevers. The disease is usually epidemic, but sporadic cases do occur. It very frequently accompanies small-pox, and great care must be exercised not to confound mild cases of small-pox with severe cases of chicken-pox. The stage of incubation is usually about eight days, although it may vary from 8 to 18 days. The child may be feverish in some cases, have a slight chill, pain in the back and legs, nausea and vomiting. The eruption usually develops within 24 hours after the first onset. There are first raised red papules which in a few hours are transferred into raised hemispherical vesicles filled with clear serum. At the end of 36 to 48 hours, this clear serum may become purulent, and the vesicles then begin to shrivel, and in from three to four days are changed to dark-brown crusts which fall off and rarely leave a scar. Fresh groups occur during the first two or three days of the illness; as a rule they are not very many in number. In delicate children the number may be large, and gangrene may set in unless great care is taken in the treatment of the vesicles. Chicken-pox is very contagious, but is not dangerous, and the first treatment should be the complete isolation of the patient.

Chicken-snake, a name given in the northern United States to the *Coluber eximius*, *C. quadrivittatus*, or *Ophibolus eximius*. The head is short and the snout rounded; the nostrils are lateral, the eyes large, with a dusky pupil and gray iris; the neck is contracted, the body long but robust, covered with smooth, small, hexagonal scales above, and broad plates below; the tail is short, thick, soon becoming cylindrical, and ending in a horny tip. The color is milky white above, sometimes tinged with red; along the vertebral line is a series of dusky oval spots bordered with black, sometimes giving the appearance of transverse white and black bands. Alternating with these bands on the sides is another series of smaller rounded and blacker spots, and sometimes a third smaller series lower down. The upper lip is milky white; the abdomen is silver white, sometimes yellowish, each plate marked with one or two black, quadrilateral spots, near the centre if single, and near the margins if double, giving a tessellated appearance. It grows to the length of five feet. It is perfectly harmless; from its frequenting houses and dairies it has been called "house

CHICKEN-TICK — CHICORY

snake" and "milk snake." It feeds on frogs, toads, mice, insects, and small birds. It does not appear to be found below lat. 37° N.; westward it extends to the Mississippi. It prefers shady and rocky places. The chicken snake of the south is *Scotophis quadrivittatus*; the body is very long; above, a greenish clay color, with four longitudinal brown bands; yellowish beneath; scales on the back ridged; and on the sides smooth; the head is quite distinct; the tail is one fifth the whole length; body three and a half feet, and tail 10 inches. It is said to attain a length of seven feet. It is found from North Carolina southward, and to the Mississippi; it destroys rats, young chickens, and small animals, but its bite is harmless to man. It is sometimes found on trees.

Chicken-tick, an arachnid of the family *Argasidæ*, and related to the mites, but very much larger. Originally an inhabitant of tropical America, this tick (*Argas miniatus*) has been found to annoy poultry in Texas and Florida. It is about a quarter of an inch long, usually very flat, unless gorged with blood. The surface of the body differs from that of other ticks in having scattered pits with a raised edge; it also differs from ordinary ticks in the head being covered by the body, in the spiracles being placed between the third and fourth pairs of legs, and in having no pulvillum between the claws. It was originally found in Texas among ordinary ticks taken from cattle. The young is six-footed. Of 10 other species of *Argas*, *A. reflexus* of the Old World lives on pigeons and occasionally attacks man; the Persian *Argas* (*A. persicus*) in Persia attacks man and poultry.

Chick'ering, Jonas, American piano maker: b. New Ipswich, N. H., 5 April 1797; d. Boston, Mass., 8 Dec. 1853. The son of a blacksmith, he received only a common school education, and in 1819 entered a piano manufactory in Boston, Mass., conducted by John Osborn, later going into business for himself. At that time the making of a piano was an event of sufficient importance to receive extended public mention, and the first instruments made by Chickering and his contemporaries were works of art. Before his death his Boston factory was turning out 2,000 pianos a year. The firm has been carried on continuously by his sons, and their pianos have a high reputation among musicians everywhere. Some of the most important developments in pianoforte construction have first been introduced in the Chickering piano.

Chick'weed (*Alsino media*), an annual plant abounding throughout the world in ill cultivated or neglected places. It is botanically related to the corn-cockle or *Agrostemma*, belonging, like it, to the natural order of the *Caryophyllacæ*. It grows in waste places throughout North America, and may be used when young as a substitute for spinach and other greens.

Chiclana, chē-klä'nä, Spain, a town in Andalusia, 12 miles southeast of Cadiz. It stands in a plain on both sides of the Lirio, and about a mile northeast of Barrosa, famous for the defeat of the French, under Marshal Victor, by the British under Gen. Graham, in 1811. It consists of well built houses of hewn stone, white as snow, and generally enclosed by gardens. The principal buildings are a magnificent

hospital, two parish churches, and a large and well-decorated theatre. The manufactures consist of linen, starch, earthenware, and other articles, and there is a considerable trade in corn, wine, and fruit. The baths of Chiclana, which have a temperature of 60°, and are said to be very efficacious in cutaneous affections, are much frequented. Pop. 12,348.

Chiclayo, chē-klä'yō, Peru, a city in the northwest on the coast, is near a valuable sugar district, and the shipping of the sugar is its chief occupation. Pop. 14,000.

Chicle-gum, chēkl- or chē'klä-, an elastic gum produced by the bully-tree, naseberry, or sapodilla (*Achras sapota*), a native of South America. It is largely imported into the United States for the purpose of being manufactured into chewing-gum.

Chico (chē'kō) **Series**, the Upper Cretaceous rocks that originally extended in a broad belt from Lower California northward beyond the Queen Charlotte Islands, and covered the region of the Coast and Cascade ranges. The lower portion of the Chico beds comprises sandstones and conglomerates chiefly, and is from 900 to 1,400 feet thick. The upper portion is mostly shale with some sandstone. The greatest thickness of the whole series in Tehama county, Cal., is nearly 4,000 feet. On Vancouver Island the Nanaimo beds of Chico age contain valuable seams of coal. The fossils show a fauna related to that of southern Asia rather than to the interior American continent. See CRETACEOUS SYSTEM.

Chic'opee, Mass., city in Hampden County, on the Connecticut River, at the mouth of the Chicopee, four miles north of Springfield, and on the Boston & Albany, and Boston & Maine R.R.'s. It is connected with Holyoke and Springfield by electric street railway lines. The former villages of Chicopee Falls, Willamamsett, and Fairview are now included in Chicopee city, which has manufactures of cotton, artillery, bronze, bicycles, rifles, swords, paper, etc. Manufacturing power is furnished by the Chicopee River. It contains numerous churches, public and parish schools, national and savings banks. Pop. (1900) 19,167.

Chicopee River, rises in Worcester County, Mass., flows south southwest into Connecticut River. It has an abundance of water power which is utilized for manufacturing by the numerous towns on its banks.

Chic'ory, or **Succory**, a perennial herb (*Cichorium intybus*) of the natural order *Compositæ*. It is a native of Europe which has become naturalized in many parts of the world, having escaped from gardens in which it is often grown as a pot-herb and salad, or for its roots, which, while young, are used like carrots. In many places it has become troublesome as a weed. The plant may be cultivated like other root crops upon rich, deep, well-drained soil. It resembles dandelion in its leaves, but the perennial roots send up a branched flower-stem which bears leaves of various shapes and flowers of various colors, blue predominating, but pink and white not being uncommon. Besides the use of the root leaves in a green state for salads and as a boiled vegetable, the roots are made to produce two important salads,

CHICOUTIME — CHIGI

witloof and *barbe de capucin*. For these they are dug late in autumn and trimmed of their leaves and superfluous branching roots, and buried in sand or soil in a dark cellar. For witloof, or white leaf, they are stood in a vertical position and covered with several inches of fresh manure or tanbark packed hard; for *barbe de capucin*, they are laid horizontally in pyramidal heaps, a layer of soil and one of roots alternating. In both cases the soil is moistened and the temperature kept uniform. In two or three weeks small heads form in the first case, and long white leaves in the second. Chicory is much more widely grown for its roots, which are used as a substitute for and an adulterant of coffee. The roots are dug, washed, sliced, dried in kilns, roasted in coffee-roasters, ground, and marketed in bulk, in packages, and in sticks. Among the foreign-born population chicory is largely used as a beverage, and since American fields do not supply the demand it is imported from Europe, where the use originated during Napoleon's time. As an adulterant chicory is far less used than is popularly supposed. Its presence may be easily detected by placing a little of the suspected article in a glass of water. Chicory will soon sink and stain the water brown; coffee will float for a long time and then scarcely discolor the water.

Chicoutime, shē-koo-te-mē, Dominion of Canada, county of the Quebec province, formed from Saguenay in 1853. Several smaller sheets of water are scattered over its surface, and the Saguenay intersects it, receiving in its course several small tributaries. The surface is rocky, rough, and broken, but near the streams are fertile and cultivated strips. A great deal of lumber is cut and sawed on the small streams emptying into the Saguenay. The Hudson Bay company have several stations in the county. Capital, Chicoutimi. Pop. 23,760.

Chief Justice, the title of the presiding justice of the supreme court of the United States, and of the presiding justice of the several State supreme courts. Various other courts in the United States are also presided over by a chief justice. The following is a list of the persons appointed as chief justice of the supreme court of the United States from its establishment, some of whom, however, being rejected by the Senate, or, declining the position, never served:

John Jay, of New York, appointed by Washington 26 Sept. 1789; resigned 1791.

John Rutledge, of South Carolina, appointed by Washington 1 July 1795; rejected by the Senate 15 Dec. 1795.

William Cushing, of Massachusetts, appointed by Washington 26 Jan. 1796; declined promotion from his associate justiceship.

Oliver Ellsworth, of Connecticut, appointed by Washington 4 March 1796; resigned 1800.

John Jay, of New York, appointed by John Adams 19 Dec. 1800; declined.

John Marshall, of Virginia, appointed by John Adams 31 Jan. 1801; died 6 July 1835.

Roger Brooke Taney, of Maryland, appointed by Jackson 15 March 1836; died 12 Oct. 1864.

Salmon Portland Chase, of Ohio, appointed by Lincoln 6 Dec. 1864; died 7 May 1873.

George H. Williams, of Oregon, appointed by Grant 1873; rejected.

Caleb Cushing, of Massachusetts, appointed by Grant 1873; rejected.

Morrison R. Waite, of Ohio, appointed by Grant 21 Jan. 1874; died 23 March 1888.

Melville W. Fuller, of Illinois, appointed by Cleveland 20 July 1888.

Chief Justice, or **Lord Chief Justice**, in England; the presiding judge in the king's or queen's bench division of the high court of justice, and, in the absence of the lord-chancellor, president of the high court, and also, *ex officio*, one of the judges of the court of appeal. The chief justice of the court of common pleas, previous to 1881, was the presiding judge in the common pleas division of the high court of justice, but the office is now merged in that of the chief justice of England. The title chief justice is also generally given in the various British colonies to the heads of the different judicial establishments, as in Canada, Australia, etc. In Canada there is not only a chief justice at the head of the supreme court of the Dominion, but also chief justices in the separate provinces.

Chief of Staff. See GENERAL STAFF OF THE UNITED STATES ARMY.

Chiemsee, hēm'zā, the largest lake in Bavaria, circle Isar, district Trostberg, 48 miles southeast of Munich; greatest length, 10 miles; greatest breadth, 9 miles; area, 74 square miles; depth, about 480 feet. It is of an irregular shape, very much indented, and contains three pretty islands—Krautinsel, Herrenwörth, and Frauenwörth.

Chieri, kē-ā'rē, Italy, in the province of Turin, eight miles east-southeast of the town of Turin. It is walled and well built, contains the largest Gothic church in Piedmont, with a very ancient baptistery, and at a very early period became celebrated for its manufactures of fustian, which are still flourishing. Pop. 10,000.

Chieti, kē-ā'tē, Italy, capital of province of same name, on a hill near the right bank of the Pescara. It was anciently one of the largest and most important towns in this part of Italy, and was for some centuries in possession of the Greeks, from whom it passed successively to the Romans, Lombards, Franks, and Normans. In 1802 it was taken by the French troops. The modern town, which is well built and adorned with several handsome edifices, is the see of an archbishop and the seat of a superior civil and criminal court, and has manufactures of woollens, and a trade in silk, wine, wheat, and oil. Pop. 12,273.

Chiff-chaff, a small European bird (*Sylvia hippolais* or *Phylloscopus collybita*), of the warbler family (*Sylviidae*), so named from its cry. Its head, back, and upper wings are ashy brown, and its under parts are brownish green dashed with yellow. In length it is between four and five inches, and it frequents woods, hedges, and thickets. Its food consists of the larvæ of various insects and some of the smaller moths.

Chigi, kē'jē, a noble Italian family, founded by AGOSTINO CHIGI (d. 1512) of Siena. He became a patron of the fine arts and banker for the Pope. (See Cugnino's 'Agostino Chigi il Magnifico.') FLAVIO CHIGI (b. 1810) was one

CHIGNECTO — CHIHUAHUA

of the papal guard until 1848, when he was made Bishop of Mira *in partibus*, nuncio at Munich, but was sent to Paris (1873) and later made cardinal, d. 15 Feb. 1885. The head of the family is Prince of Campagnano and Due of Ariccia. He is also hereditary marshal of the conclave.

Chignecto (shĭg-nĕk'tō) **Bay**, an inlet at the head of the Bay of Fundy, in the Dominion of Canada. It separates Nova Scotia from New Brunswick, is 30 miles long and 8 broad, and has an isthmus of only 14 miles in width between it and Northumberland Strait, in the Gulf of St. Lawrence.

In October 1888 work was begun on the construction of a ship railway across the neck of land connecting Nova Scotia with the main land of Canada, under the encouragement of an annual subsidy from the Canadian government. The promoters had spent nearly \$4,000,000 on the work, when in 1890 a financial depression in London prevented them from obtaining further capital. As the subsidy from the Canadian government was to be payable on the completion of the work in a given time, the contractors were unable to secure any aid from that source. In March 1901 the undertaking was revived. The railway was projected to be 18 miles long, and by uniting the Gulf of St. Lawrence with the Bay of Fundy and the waters of the Atlantic Ocean, a run of several hundred miles around the province would be saved.

Chignon, shĕn-yōn, a peculiar arrangement of the hair, worn by women, a knot or mass, natural or artificial, arranged low on the back of the head, at the nape of the neck. It comes from a French word meaning link or chain. This style of hair-dressing was common in the 18th century, but fell into disuse, was revived in the last half of the 19th century, not now in vogue.

Chigoe, chĕ'gō. See JIGGER; SARCOPSYLLA.

Chihuahua, chĕ-wā'wā, Mexico, a state bounded on the north by the United States, on the east by Coahuila, on the south by Durango, and on the west by Sinaloa and Sonora. It is the largest of the Mexican states, having an area of 227,468 square kilometres, or about three times that of the State of New York. The Sierra Madre range traverses the state, and the Sierra de Tarahumares lifts its peaks (Bufo de Cerro Prieto, Jesús y Maria, Mesa de Tabascotes, etc.) to a considerable height; otherwise the surface is an undulating table-land, the elevation of which varies from 3,500 to 7,000 feet above sea-level. The largest of the elevated plains lying between the mountain ranges are the Chilicote, Gigantes, Bolsón de Mapimi, etc. The Rio Grande forms the northern boundary, separating the state from the United States; but this river, which rises in Colorado and flows through New Mexico, is almost dry by the time it reaches Mexican territory, the greater portion of its waters having been utilized for the irrigation of lands in the country of its origin. (See MEXICO—THE STATES OF.)

Chihuahua, Mexico, capital of the state of the same name, the northern border of which forms the dividing line between Mexico and the United States, and one third of the width of the

first named country. Probably the most Americanized city of equal importance in the Republic. Altitude 4,973 feet above sea level. Distance from the United States border at El Paso, Texas, 225 miles and from Mexico city, 999 miles. Is well provided with transportation facilities, being on the lines of the Mexican Central and Kansas City, Mexico & Orient railways, and the initial terminal of the Chihuahua & Pacific railway. Is the centre of one of the most important stock raising and mineral producing districts south of the Rio Grande. Is the first point of importance reached in the journey from the northern boundary of the country to the City of Mexico. It is an important supply point for miners whose properties are situated in the mountain regions to the west and southwest. Among the manufacturing establishments of the city are extensive rolling mills and iron works, a brewery, a soap factory, a manufactory of clothing, broom factory, mineral water factory, manufactory of agricultural implements and various smaller industries. An extensive smelter is being built and a number of other new industries are contemplated. A few miles distant from and connected with the city by railway, are the Santa Eulalia Mineral Springs and health resort, for which great merit is claimed. The principal buildings of a public character are the new Penitentiary; the old Cathedral, completed over two hundred years ago by the contributions of a rich miner, at an outlay of almost \$1,000,000, the recently built Opera House, one of the largest and finest in the republic; the Government Palace, the palatial home of ex-Governor Ahumada; the new Municipal Palace and the Mineral Bank. It was here that the Patriot Hidalgo suffered imprisonment and was executed in 1811. The tower or dungeon in which he was confined is sacredly preserved and will ever be reverently visited by tourists. In the plaza adjoining the Government Palace a splendid monument has been erected in his honor. The Alameda, situated in the business centre, is utilized on Sunday evening of every week by all classes as a promenade, the occasion being always enlivened by excellent music provided by the state government. An aqueduct built over 200 years ago conveys water into the city, and a modern built street railway provides means of local transportation. A museum of minerals recently established by the state has already become one of the city's chief places of interest. Advanced methods of primary education are receiving much attention, both from the state and municipal governments, and higher education is provided by a normal school for young women, a college for young men and a number of clerical and other institutions of advanced instruction. A library connected with the Preparatory School contains 6,000 volumes. The principal scientific organization is devoted to the study of medicine and is known as the "Medica Mutualista." The social advantages include an American club, two Mexican clubs and a number of literary and society organizations. Financially, Chihuahua is one of the best equipped cities in the Republic. It has four local banks,—the Mineral Bank, with a capitalization of \$5,000,000, the Chihuahua Exchange company, the Chihuahua Investment company and the Commercial Bank; besides which there

CHILAN BALAM — CHILD-LABOR

are branches of the National Bank and the Bank of Sonora, and an agency of the Bank of London and Mexico. Pop. (1906), 35,000.

Chilán Balám, chē-lān' bā-lām', **Books of**, a series of Maya writings which have been preserved, supposed to have been written by a Maya priest by the name of Chilán Balám. They concern the life of the people before the arrival of the Spaniards; and it is said that the author prophesied the coming of a strange people.

Chi'law, Ceylon, a town on the west coast, near the mouth of the Dederoo-oya, 45 miles north by west from Colombo. Its proximity to the pearl-fisheries gave it an interest which it did not otherwise possess, and made it repeatedly the object of a keen contest. The Tamils wrested it from the Singhalese in the 14th century, and it afterward passed successively to the Moors, the Portuguese, and the Dutch. From the last it was taken by the British in 1796. In the forest to the east of Chilaw, within a radius of 20 or 30 miles, are contained the ruins of a number of ancient cities. The road leading from Chilaw southward to Negombo passes through almost continuous cocoanut plantations. Pop. 5,000.

Chilblain, or **Frostbite**, a mild or severe inflammatory reaction from the effects of severe cold on the toes, fingers, nose, chin, ears, etc. In mild cases there is swelling only, with an inflammation of the skin. This disappears and the part is apt to be tender. In severe frostbite there is ulceration and sloughing of the part. The treatment of mild chilblain is by slow raising of the temperature of the chilled part to that of the body. Too rapid heating results disastrously. Special clothing may be necessary for the tenderness, particularly of the feet.

Child, Francis James, American scholar and educator: b. Boston, Mass., 1 Feb. 1825; d. Cambridge 11 Sept. 1896. He was professor of rhetoric and oratory at Harvard from 1851 till 1876, when he exchanged for the chair of English literature. His principal work, 'English and Scottish Ballads,' a subject on which he was the highest authority in this country, he improved and enlarged for publication in 1886. Among his other works are 'Four Old Plays' (1848); a collection of 'Poems of Sorrow, Comfort, Counsel, and Aspiration' (edited 1865); and 'War Songs for Freemen' (edited 1862).

Child, Frank Samuel, American Congregational clergyman: b. 20 March 1854. He was educated at Hamilton College, N. Y., and after graduating from Union Theological Seminary in 1878 was ordained to the ministry. Since 1888 he has been pastor of the First Church of Fairfield, Conn. He has published 'An Old New England Town' (1895); 'The Colonial Parson of New England' (1896); 'A Colonial Witch' (1897); 'A Puritan Wooing' (1897); 'The House with 60 Closets' (1899); 'An Unknown Patriot' (1899); 'The Little Dreamer's Adventure' (1900); 'Friend or Foe' (1900).

Child, Sir Josiah, English merchant: b. London 1630; d. there 1699. The work by which he is known is entitled 'Brief Observations Concerning Trade and the Interest of Money, by J. C.' (London 1668). An enlarged edition

was published in 1690, under the name of 'A New Discourse on Trade.' The work has been several times reprinted. It was written in defense of the reduction, by legal enactment, of the rate of interest on money from 8 to 6 per cent, and recommends a further diminution to 4 per cent. He was for some time chairman of the East India Company, and wrote several papers, without signature, in defense of the traffic with the East, arguing, in opposition to those who complained of the drain of coin, that the India trade percolated through other countries with which Britain traded, and thus returned indirectly a surplus in cash. In his essay on trade he advocated the compulsory emigration of paupers to the colonies, and suggested the appointment of corporate officers called "fathers of the poor" to superintend those who were left. He became very wealthy, and his children, by three marriages, allied themselves with the highest nobility. Charles II. made him a baronet. His son became Earl Tylney, but the title is now extinct.

Child, Lydia Maria Francis, American prose writer: b. Medford, Mass., 11 Feb. 1802; d. Wayland, Mass., 20 Oct. 1880. She was married to David Child, a Boston lawyer, in 1828. Her first novel, 'Hobomok,' was written and published in 1821. She was an ardent abolitionist, and published one of the first anti-slavery books, entitled 'Appeal for that Class of Americans Called African,' one immediate result of which was the loss of her former literary popularity in the southern States. From 1841 to 1844 she and her husband edited the 'National Anti-Slavery Standard.' Among her numerous works are 'The First Settlers of New England' (1829); 'Philothea, a romance of Greece in the days of Pericles' (1835); 'Fact and Fiction' (1846); 'Isaac T. Hopper: A True Life' (1853); 'Progress of Religious Ideas' (1855); 'Looking Toward Sunset' (1864); 'Miria: A Romance of the Republic' (1867); and 'Aspirations of the World' (1878). A collection of her letters, with an introduction by John G. Whittier, and an appendix by Wendell Phillips, was published in 1882.

Child-labor. The growth of child-labor is coincident with the introduction of machinery and the development of the factory system. Arkwright obtained his first patent for a machine for spinning cotton yarn in 1769, which immediately resulted in taking the manufactures out of the English cottages and farmhouses. Compton's spinning mule followed in 1775, Cartwright's power loom in 1787, and Eli Whitney's famous cotton-gin in 1793. The sudden displacement of home labor, the rapid development of manufacturing, and the substitution of mere mechanism for the skill of the individual operative, resulted in a demand for cheap child-workers. The employment of children soon became general, and large numbers were crowded together in factories, before the change had attracted much attention. It began with the apprentice system, the children being procured from the poorhouses of London, Birmingham, and southern England.

"Agreements of the most revolting character were often made between the manufacturers and the different parish workhouses for bands of children for a number of years, in which the condition of the children was totally disre-

CHILD-LABOR

garded. Such, for example, were those provisions whereby it was agreed that with every 20 sound children one idiot should be taken." (William F. Willoughby, American Economic Association, March 1890.) In 1784 the magistrates of Lancashire passed a resolution that apprentices should no longer "work in the night or more than 10 hours in the day." No protection was provided for children who were not parish apprentices, and no inspection was established, so that the resolution had no force, and remained a dead letter. In 1802 Sir Robert Peel, Sr., secured the passage of a bill abolishing the apprentice system, so far as the cotton factories were concerned. This mild measure met with bitter opposition from the manufacturers, and was of very little immediate benefit, but it was valuable as the first definite step to awaken public sentiment to the evil. According to Walker (Political Economy): "The beginning of the present (the 19th) century, found children of five and even three years of age in England working in factories and brick-yards; women working underground in mines, harnessed with mules to carts, drawing heavy loads; found the hours of labor whatever the avarice of individual mill-owners might exact."

In 1815 a parliamentary committee was appointed to "inquire into the expediency of extending the Apprenticeship Act to children of every description." During the next three years reports were presented which showed that the children employed were worked to the point of exhaustion, and that their condition was worse than slavery. In 1819 an act was passed forbidding the employment of children under 9, and the hours of labor for those between 9 and 16 were limited to 12 hours a day. In 1833 Lord Ashley, afterward Earl of Shaftsbury, introduced a bill which extended the provisions of former acts, and stipulated that inspectors should be appointed to enforce the law. During the following years until 1878 various progressive steps were taken, under the able championship of such men as Lord Shaftsbury and Robert Owen. The act of 1878 was the culmination, and is still regarded as an admirable code for factory legislation. It prohibits the employment of children under 10, and those under 14 may only be employed half time. Night work is forbidden, and children under 16 must furnish medical certificates of fitness for employment. Weekly certificates must be obtained, showing the required amount of school attendance.

During the first half of the 19th century, every political economist opposed factory legislation, and the employers were practically unanimous in their opposition to any abridgement of their right to employ children. The motives of the early reformers were exclusively humanitarian, and they advocated the necessity of protecting women and children because they are not "free agents." It is, however, generally conceded now that the real grounds of state interference with, and regulation of industry are considerations of the safety and well-being of the community. In accordance with this principle, acts were passed in 1891, 1895, 1898 to regulate home work, to prohibit the employment of women for one month after the birth of a child, to prevent and define overcrowding in future, and to minimize the evils of danger-

ous trades and occupations. A whole code of special rules for each dangerous trade has been formed by the home secretary, to enforce precautions for the protection of the workers, and an arbitration court is provided for the adjustment of protests. According to Thomas Oliver, "Experience shows that there is scarcely a dangerous trade from which, with extreme care and attention to regulations, the dangerous influences cannot be largely removed."

Perhaps the most marked difference between the development of child-labor legislation in Great Britain and in the United States, is this—that in Great Britain, a knowledge of the conditions has always preceded legislation, whereas in many of the American States legislation has been hasty and ill considered, and frequently in advance of public information and public sentiment.

Social legislation which affects industrial interests must be supported by an intelligent public opinion, which has been educated to believe that a state of evil exists, and that the remedies proposed are really necessary. The mere passage of a law may have a certain educational value, but it cannot be enforced without a public conviction of its value. In 1889 Mrs. John Armstrong Chanler offered a prize, through the American Economic Association, for the best essay on child-labor. The prize was divided equally between William F. Willoughby and Miss Clare De Graffenried, both of whom were connected with the Federal Department of Labor, and their essays are still the best general source of information as to the conditions in the United States. Mr. Willoughby says that in England "the regulation of factories and labor is the single duty of the central government, while here it falls to the different State legislatures. As a consequence, while throughout England the laws are uniform, and but one set of statutes and reports, those of Parliament, which are easily accessible, have to be studied; here no two States have the same laws; only a comparatively few have any at all; and information must be obtained through the various bureaus of labor or the reports of the inspectors of factories and workshops. . . . These reports are often unsatisfactory, and are confessedly unreliable. Each department is conducted in its own way. Some, with adequate means, are well organized, and their reports are of the greatest possible value, while others, with very limited resources, can do but feeble work. The law creating them has, in most cases, been inadequate and too timid." He adds that in no case can the statistics of one State be compared with those of another, and that the reports of the State bureaus are in most cases incomplete, "owing to the refusal of the factory owners to make returns or the gross falseness of many of those which were made." At the time Mr. Willoughby wrote (1889), the following States had organized labor bureaus: Massachusetts, 1869; Pennsylvania, 1872; Ohio, 1877; New Jersey, 1878; Illinois and Indiana, 1879; New York, Michigan, Wisconsin, Missouri, and California, 1883; Iowa and Maryland, 1884; Connecticut and Kansas, 1885; Rhode Island, Maine, Colorado, Minnesota, North Carolina, and Nebraska, 1887. In the 14 years which have intervened since Mr. Willoughby wrote, the following States have established bureaus of labor statis-

CHILD-LABOR

tics, or have provided for factory inspection, or have legislated in some way for the regulation of child-labor, namely, Alabama, Arkansas, Kentucky, Louisiana, Montana, North Dakota, Oregon, South Carolina, South Dakota, Tennessee, Texas, Virginia, Washington, and West Virginia; and legislation is now pending in the State of Georgia. There has been a great awakening of public sentiment on the subject of child-labor during the last few years and at the present time the general interest is intense. The governors of seven different States have referred to it during the past year in their annual messages, and in one form or another bills to regulate child-labor or amend former laws have been introduced recently in most of the manufacturing States. Much of this legislation is for the purpose of improving the administration of the departments of inspection, which is almost as lax as it was 14 years ago. Very little progress has been made in the compilation of data on child-labor. The writer has recently examined the reports for 1901 and 1902 of the various State bureaus of labor statistics and factory inspection, and can confirm literally to-day Mr. Willoughby's findings of 14 years ago!

In a number of the manufacturing States child-labor laws were first passed at the instance of the labor organizations, and for the purpose of placating the "labor vote." Many of the States have failed to make adequate provision for the cost of inspection, and only a few of the inspectors have been men of trained observation, or men whose previous experience has been such as to fit them in any way for the exacting duties of their office. In some States the department of factory inspection has simply been the football of politics, and the inspectors have been changed with each administration; while in others, the "spoils" have fallen to local labor leaders, who have been placed in positions of great responsibility, overloaded with diverse duties, and allowed a free hand without any supervision. For some reason or other, the laws for the regulation of child-labor have been fully enforced in a few of the States only, and much of the available data as to the number and ages of the children employed, is still very unreliable. The figures of the 12th census (1900) quoted below, may be taken as a minimum estimate only, since they are based on schedules filled out by the manufacturers themselves, at their own discretion, without any verification of the census taken. In fact, the director of the census says himself:

"The limitations connected with the taking of a great national census preclude proper care upon the question of child employment. There is a great uncertainty as to the accuracy of a mass of information of this character taken by enumerators and special agents, who either do not appreciate the importance of the investigation, or find it impracticable to devote the time to the inquiry necessary to secure good results. Again, the answer to the question, 'average number of children under 16 years of age,' may have been inconsiderately given, or, if considered, answered more as the word 'children' was construed by the individual than according to the interpretation intended by the schedule to be placed upon it. The word 'children' to manufacturers has many meanings, in accordance with the geographical location of their

plants, or the character of the work performed."

According to the census, the average number of children under 16 years of age (evidently including only those in factories) earning wages in 1900 was as follows:

States	No. children	States	No. children
Alabama	3,474	Missouri	4,510
Arizona	38	Montana	112
Arkansas	643	Nebraska	776
California	2,114	Nevada	20
Colorado	243	New Hampshire....	1,651
Connecticut	3,479	New Jersey.....	8,042
Dakota	6	New Mexico.....	29
Delaware	859	New York.....	13,189
District of Columbia	116	North Carolina....	10,377
Florida	374	Ohio	4,369
Georgia	6,373	North Dakota.....	37
Hawaii	40	Oregon	38
Idaho	23	Pennsylvania	33,135
Illinois	10,419	Rhode Island.....	5,036
Indiana	3,618	South Carolina....	8,560
Indian Territory...	16	South Dakota.....	114
Iowa	1,888	Tennessee	2,171
Kansas	860	Texas	1,041
Kentucky	2,687	Utah	218
Louisiana	1,321	Vermont	263
Maine	2,202	Virginia	4,164
Maryland	5,884	Washington	265
Massachusetts	12,556	West Virginia.....	840
Michigan	2,636	Wisconsin	5,679
Minnesota	792	Wyoming	15
Mississippi	1,049	United States.....	168,623

According to the United States agent of the Department of Labor, Mr. Wm. Waudby, there were approximately 860,700 children between the ages of 10 and 15 years employed in various "gainful occupations" in 1880 in the United States; in 1890 that number had grown to 1,750,000!

Miss De Graffenried's essay, referred to above, is still the best available statement of conditions of child-labor in many manufacturing industries, notably corset factories, box factories, packing houses, and tobacco and woolen manufacture. In 1891 she wrote an article (based on personal investigation) dealing with the deplorable conditions of child-labor in the southern cotton mills, which excited violent controversy in the South (Century Magazine, February 1891), but her assertions have been fully confirmed during the past two years by the child-labor committees of Alabama and Georgia. In the same way the statements made by Miss De Graffenried in her prize essay as to the evils of child-labor in the sweat-shops, and in the large department stores and mercantile establishments, have been completely verified by the subsequent investigations of the New York Tenement House Commission and the National Consumers' League. The determined and successful fight waged by the Alabama Child-Labor Committee, under the direction of Mr. Edgar Gardner Murphy of Montgomery, Alabama, for the passage of a law to forbid the employment of very young children, deserves special mention. His printed arguments are a part of the permanent literature of child-labor, and created such a wave of public sentiment, that the organized and powerful opposition of the cotton mill owners was finally overcome and the legislature forced to yield to the popular pressure. The owners of the cotton mills in Georgia put forward the plausible plea that compulsory education laws should precede legislation to prevent employment of children under 12. The effect of this would simply be to postpone action for another generation, since the State cannot afford to provide sufficient schooling

CHILD-LABOR

facilities until its resources increase in value, or its pensioners die off. At present Georgia is burdened with an annual pension tax of nearly \$1,000,000, and the misfortunes of the parents are reflected in the ignorance of their children. In this connection the following deductions from the census of 1900 are interesting:

	White Children of School Age 5 to 20.	White Illiterates of 10 years and over.
Alabama	394,152	104,883
Georgia	457,958	101,264
North Carolina	490,782	175,917
South Carolina	218,323	54,719
Virginia	435,612	98,160

One main cause of the extent of child-labor abuses in the southern cotton mill States is the general lack of vagrancy laws. The "poor white" is shiftless and lazy, and will not work indoors, and in the general exodus of his family to the factory towns, he has been left out of the calculation. His wife and children find their way into the factories, while he exists on the proceeds of their labor. An action for non-support is almost unknown, and not only is there no apparent remedy for the evil, but the State by its failure to prevent the slavery of his children, puts a premium upon the idleness of the parent! Of course the enforcement of compulsory education laws, in conjunction with a simple educational test for children of school age who seek employment, is a powerful aid to the factory inspector. Indeed the State of New Hampshire controls the whole matter by giving its truant officers the right to enter all mechanical, mercantile, and manufacturing establishments, and make a rigid examination; and so far has not found it necessary to employ a factory inspector. But it is reasoned that if, in a community where free schooling is lacking, the factory owners were forbidden to employ children who cannot read and write, the practical result would be to induce the parent to provide for his children's education, in order that they might the sooner qualify as wage-earners.

The child-labor committee of New York has just won a similar victory in securing the passage of laws to license newsboys, and to protect telegraph, messenger, and delivery boys. This movement originated with the social settlement workers, whose daily life brought them into contact with the actual conditions of the "street boy." The report of this committee also is very valuable.

During the past winter the Anthracite Coal Strike Commission developed the fact that large numbers of children under the statutory age were employed in the coal mines and silk and knitting mills of Pennsylvania, under most distressing conditions. As the result of the commission's investigation, bills were introduced to raise the age limit of breaker-boys to 14, and of mine employees to 16, and to abolish the night work of little girls in mills and factories. The first two measures were supported jointly by the coal operators and their employees, and were passed. The other measure failed, but the various women's organizations of Pennsylvania have taken the matter up, and have organized a committee of citizens to fight for legislation and to see that existing laws are rigidly enforced.

The problems of child-labor are now engrossing the attention, not only of the econo-

mists, but of those who are engaged in studying the causes of social disorder, and seeking to prevent pauperism and disease. Charity workers have found that child-labor is wrapped up and interwoven with many of the problems of disease, of crime, and of dependence, and the Thirtieth National Conference of Charities and Correction, which met in Atlanta, Ga., May 1903, devoted two notable sessions to the discussion of 'Child-Labor as a National Problem.' The addresses and discussions will be published in the proceedings of the conference. The sixth annual meeting of the American Academy of Political and Social Science was also largely devoted to the subject, and the annals of the academy for July 1902 contain the papers which were read. The women's clubs are also agitating the subject continually, and the labor men no longer have to fight alone for the passage and enforcement of child-labor laws. In almost every State a strong body of public sentiment is being brought to bear upon the subject, and there is general demand for a thoroughly scientific investigation of existing conditions, and better facilities for regulating the employment of children.

The State of Massachusetts has hitherto supplied the standard of statutory law and administration in this department, but Mrs. Florence Kelley is now heading the forward movement for better methods, and her article in the Annals of May 1903 on 'An Effective Child-Labor Law' may be taken literally, as she suggests, as 'A Problem for the Current Decade.'

A careful study of the status of child-labor in Europe, as made by Miss Edith J. Rich, reveals the fact that "no state is without some protection against this evil, and no state affords a protection even approximately adequate. For a century and a half the separate countries slowly developed a public sentiment against child-labor and formulated laws upon the subject, but harmony of action was not attempted until 1890, when an International Labor Conference was held in Berlin. At this conference it was decided to recommend to every state in Europe the passage of the following law, as a safeguard against industrial decay: That children of either sex not having reached a certain age must be excluded from factories, the age limit to be fixed at 12 years, except for southern countries, where it be fixed at 10. Bald statistics show the following as the present conditions: In Switzerland the age limit is 14; France and Germany, 13; Hungary, Portugal, Holland, Sweden, Russia, Austria, and Belgium, 12; England, 11; Denmark and Spain, 10; Italy, 9.

But these statistics, unqualified, give no conception of the true state of affairs. England is, in reality, far from the bottom of the list in matter of protection, and Switzerland's position at the head would not pass unchallenged. And this for many reasons. In the first place, the age limit itself is invariable in few cases. In Hungary and Portugal, for example, the limit is fixed at 12, but may be reduced to 10 if the applicant has a medical and educational certificate of fitness, which is not at all hard to obtain. In England, on the other hand, the exception has the contrary effect. The limit is fixed at 11, but this is raised to 13 unless a child can show a proper certificate of education. In Ger-

CHILD-LABOR

many, Denmark, Austria, Norway, Sweden, and Russia, the tendency is also upward rather than downward from a given standard.

The next difficulty in the way of estimating European conditions from statistics, lies in the lack of harmony between child-labor laws and those cognate laws without which the former are ineffective. In Germany, for instance, child-labor is prohibited under the age of 13, and even then, unless the primary education is complete; the system of compulsory education is good; the employer is made liable for all risks, and there are special regulations for the dangerous trades; but the definition of a factory is so indefinite that many important industries escape factory jurisdiction entirely; the system of inspection is so incomplete and the penalties for violation so slight and so seldom enforced that a large and growing number of children are employed. It is said that the Saxon mines are full of children, and that in this same province children five and six years old are employed in the "flat-stitch" trade, earning two and one fourth cents an hour, and working from 10 to 12 hours a day.

Belgium shows much the same result from another cause. The laws are good and the system of inspection is almost unequaled, but compulsory education is unpopular there, and, as is always the case when educational laws do not supplement those prohibiting child labor by offering a substitute employment for the child, the effect of legislation is negatived. There both the parent and employer are made liable for a violation of the law, and 45 trades are absolutely forbidden; but it is the custom to grant exemptions, and the census of 1896 showed that out of 671,596 laborers 76,147 were under 16 years of age. And even these startling figures do not include the workers in the domestic workshops, which are the *bête noire* of child-labor reformers.

These domestic workshops are a relic of a dead system in vogue before the rise of factories where labor is concentrated. They remain to-day in almost every country of Europe practically excluded from factory legislation. The line that divides factories from domestic workshops differs in all cases and is usually so drawn as to exclude from factory jurisdiction large and important industries, whose representatives have power enough to influence legislation. This is especially true in Russia, and is also notable in Belgium, where the entire clothing industry is beyond reach of the child-labor laws. In Austria it takes 20 persons to make a factory; in Italy 10 persons or the use of mechanical motors; in Germany the inspector is free to define an industry as it suits his purpose; in Switzerland the definition is as follows:

1. All industrial establishments where more than five persons are employed and use is made of mechanical motors or where persons under 18 are employed or which present unusual danger to the health or lives of employees.

2. All industrial establishments employing more than 10 persons, whether they present foregoing conditions or not.

3. All industrial establishments employing less than six persons and presenting unusual danger to health or lives of employees or those employing less than 11, but presenting plainly the type of factories.

And yet in spite of this inclusive definition the domestic workshops of Switzerland, which form a large part of Swiss industrial establishments, continue to employ children unmolested. The reason is not far to seek.

Among the leading Swiss industries are watch- and clock-making, the making of paper boxes, embroidery, wood-carving, silk- and cotton-weaving. For centuries these industries have been carried on in the provinces in small establishments, seldom employing more than 10 or 12 persons. In many cases the parent is the employer, and the children the only employees; in others apprenticeship is still in vogue, although that system practically died with the death of the trade guilds. The Swiss federal laws are limited to factories and dangerous trades, the cantons reserving to themselves the right of apprenticeship legislation. In the special Swiss industries, a certain deftness, flexibility and agility are required which can, with difficulty, be acquired by a person who has not begun the work in the early years before the joints and the fingers are stiff and the power to learn mechanically is lost. The conditions necessary to progress in these industries have therefore been an effective barrier to the enforcement of the laws militating against child-labor.

These laws, nevertheless, have by no means been void of good. Their presence on the Federal statute books has caused deep study of the methods by which they might be obeyed without injuring the industries of the country. The result has been the establishment of great trade training schools, still in their incipiency, but offering to the student the largest hope for the future. In Berne, schools are already in active and highly successful operation, where a child may learn a given trade while he is receiving his general education. The system employed in these manual training schools must never be confused with the fundamentally opposite system of half-time employment which has proven distinctly unsuccessful in several countries, notably in England. Until such schools are established, however, or until some substitute for them is found, which shall at the same time displace the domestic workshops, there should be, in every country attempting to protect its children, inhibitory laws which shall make the employer responsible, according to the laws provided for factories, for all work from which he receives the profit, whether such work be done with or without pay (to include apprentices) and whether it be done on factory premises or at home; and, further, making the word "factory," as far as child-labor is concerned, cover every possible industry in which a child may engage.

In this connection it is interesting to note a French law, also recently adopted in Belgium, which forbids the employment of children under the age of 13 as actors or at public exhibitions of any kind, and further prohibits those under 16 from becoming acrobats or professional beggars. The Belgian law differs from the French in age restriction. In the former country the prohibition extends to all under 18, unless a parent is the employer, when the age limit is 14.

In the matter of night work and in special regulations against the employment of children in dangerous trades, the outlook is more generally hopeful, both in the matter of statutes

CHILD PSYCHOLOGY — CHILDREN

and of their enforcement. Even in Italy 21 trades are absolutely forbidden to children, in Russia 26, and in Belgium 45. Dangerous trades are of two general kinds—those in which the employment of children implies danger to the community, to risk of fire or accident, and those which are dangerous to the worker himself. The latter class is again sub-divided into those in which the danger is inherent or direct, as in the white lead industry, glass-blowing, phosphorus, etc., and those in which the danger is indirect through length of day, employment under ground, and like causes. A notable example of the last class is the mine, child-labor in which is prohibited in almost every country of Europe.

It is almost impossible to make a comparison of the European and American status of child-labor, because neither stands as a unit, being a composite of conditions in various States. The most suitable basis for future reform is harmonious action founded on a study of the universal principles that underlie this great question. What is needed is the universal minimum age limit of 14, which shall remain invariable and impossible of exemption except for unusual cases; a universally accepted definition of factories which shall include every industry in which it is possible for a child to be at work; a universal system of compulsory education to supplement child-labor laws; better factory inspection; stricter enforcement of penalties, and finally, the establishment of great trade schools the world over."

BIBLIOGRAPHY.—American.—Among the various reports and bulletins may be named the following: 'Bulletins of the Department of Labor,' and 'Eighteenth Annual Report of the Department of Labor,' Carroll D. Wright, Commissioner; 'Report of Commissioner of Education,' W. K. Harris (1901); 'Report of Anthracite Coal Strike Commission' (1903); 'Reports of Child-Labor Committee,' New York (1903); 'Report of Child-Labor Committee,' Alabama (1901); 'Reports of Industrial Commission'; 'Reports of the National Consumers' League'; 'Reports of the Industrial Association of Factory Inspectors.' Childe Harold's Pilgrimage, a narrative poem in Spenserian stanza, written by Lord Byron (q.v.). It describes the impressions of a young man traveling in southern Europe, and is marked by a tone of melancholy and dissatisfaction. Many have supposed that Childe Harold represented the poet himself. The poem was published in four cantos, the first two appearing in 1812 and the others in 1816 and 1818.

Childebert, shēl-dě-bār or chīl'dě-bērt, three kings of the Merovingian dynasty, France.

1. **CHILDEBERT I.**: b. about 495 A.D.; d. 558. On his father's death in 511 he succeeded to the kingdom of Paris; his brother, Clodomir, king of Orleans, having been killed in battle, Childebert and his brother, Clotaire, king of Soissons, determined to seize and divide his dominions, and murdered his two eldest sons and their followers. Childebert afterward quarreled with Clotaire and laid waste his territory.

2. **CHILDEBERT II.**: b. about 570; d. 596. On the death of his father in 575, he was proclaimed king of Austrasia, and subsequently, by the death of his uncle, Gontran, succeeded to the kingdoms of Burgundy, Orleans, and part of that of Paris.

3. **CHILDEBERT III.**, surnamed the Just: b. about 683; d. 711. He was proclaimed king in 695, on the death of his brother, Clovis III. His kingship, however, was merely nominal, the true sovereign being Pepin le Gros or d'Héristal, who, under the title of mayor of the palace, exercised the real authority.

Childermas (chīl'dēr-mas) **Day** (Feast of the "Holy Innocents"), a festival celebrated by the Roman Catholic Church, 28 December, in commemoration of the massacre of the male children by Herod.

Children, Societies for the Prevention of Cruelty to, organizations that had their origin in New York, and have since been adopted in most American and many European cities. Experience has proved that defenseless children, even within the range of our boasted civilization, are not infrequently grossly maltreated by parents or other legal protectors, and that therefore special legislation is necessary to secure their proper treatment. To ameliorate the condition of children has, therefore, entered largely into the scope of modern legislation. The operations of the societies show in the strongest light the necessity for their action, though it is but a few years since this special agency was introduced. Under seven a child is supposed to be incapable of committing felony. Between 7 and 14 it is held to be *doli incapax*, that is, incapable of crime, while above 14 it is *doli capax*, that is, capable of crime. If, however, anything atrocious be done with obvious malice by a child, it may be held that *malitia supplet aetatem*, malice supplies (the want of) age. The age at which a child can be sworn as a witness depends on the education it has received and its apparent comprehension of the nature and obligation of an oath.

CHILDREN IN THE WOOD—CHILE

Children in the Wood, The, or The Babes in the Wood, an old English ballad, telling the story of two children whom their uncle wished to murder and who were left to die in the woods, by the man who was ordered to kill them. The authorship is unknown, and the date uncertain; it appears in the 'Stationers' Register' of 1595, and was probably written about that time. An old play, published in 1601, has a similar plot, and the source of the two is supposed by some critics to be the same.

Children of the Abbey, The, a once famous romance, by Regina Maria Roche, published in 1798. The Earl of Dunreath, marrying a second time, is induced by the machinations of his wife to cast aside her stepdaughter, for a luckless marriage. It is with the children of this marriage that the story deals. The motherless Amanda is the heroine; and she encounters all the vicissitudes befitting the heroine of the three-volume novel. These include the necessity of living under an assumed name, of becoming the innocent victim of slander, of losing a will, refusing the hands of dukes and earls, and finally, with her brother, overcoming her enemies, and living happy in the highest society forever after.

Children of the Ghetto, a noted book by I. Zangwill, published in 1892. It is, as the author says, "intended as a study, through typical figures, of a race whose persistence is the most remarkable fact in the history of the world." The book raises problems that it does not solve; but the masterly and sympathetic exposition of the Jewish temperament invites a better comprehension of that wonderful race.

Children of Gibeon, a popular novel by Walter Besant, published in 1886. Like his 'All Sorts and Conditions of Men,' it deals with society in both the West and East Ends of London, and their relations to each other. The plot is so ingeniously managed that it seems entirely plausible; the studies of London wage-earners and London slums are faithful, without being too repulsive; and the tone of the book is cheerful, while many social problems are touched in the course of an entertaining story.

Children of the Soil, a novel of modern Polish life, by Henryk Sienkiewicz, published in 1894. There are interesting side issues to the story, involving questions of property, of the social order, of marriage. The work as a whole, although realistic, is sane in spirit, genial and broad in its conception of life and character.

Children of the World, a romance by Paul Heyse, published in 1873. It obtained immediate popularity, and caused great controversy over the fearless treatment of the theme. The children of the world are represented by a young doctor of philosophy, a strong, well-balanced character; his younger brother, an almost Christlike idealist; and their circle of friends and fellow-students, who, in spite of mistakes and eccentricities, bear the stamp of true nobility of soul.

Children's Crusade, The, a singular movement in 1212, preached in France by Stephen, a peasant boy, and in Germany the same year by Nicholas, also a peasant boy. Some 90,000 children left their mothers and schoolmasters in the spring "to rescue the Holy Land from the

infidels," and ships were placed at their disposal. The French contingent embarked at Marseilles in August; part perished the same month by shipwreck on the island of San Pietro, and the rest were sold into slavery to Mohammedans. The German contingent reached Genoa in August, and was utterly dispersed by various disasters before the next spring. See CRUSADES.

Childs, George William, American philanthropist and publisher: b. Baltimore, Md., 22 May 1829; d. Philadelphia 3 Feb. 1894. He published the Philadelphia 'Public Ledger,' 1864-94. He gave a Shakespeare memorial fountain to Stratford-on-Avon, a memorial window in Westminster Abbey to Cowper and Herbert, and assisted in establishing a home for printers at Colorado Springs. He published 'Recollections of Gen. Grant' (1885); and 'Personal Recollections' (1889).

Chile, *chil'ē*, or **Chili**, *chil'i* (the Republic of), situated on the western coast of South America, between the Andes Mountains and the Pacific Ocean, is bounded on the east by Argentina and Bolivia, and on the north by Peru. In length it surpasses even the Argentine Republic, for it extends from lat. 55° 59' S. to 17° 57' S., a distance of 2,629 miles, but its average width is only 101 miles. The total area is, therefore, about 265,529 square miles. Besides the Andean range on the east, there is a parallel western coast range, and in the valley between the two ranges, from Santiago, the capital, to the south, are found the best agricultural districts and many of the important towns.

Population.—Compared with the other South American countries, Chile ranks as the seventh in size, the fifth in density of population, and the fourth in the number of its inhabitants. The population of the republic in 1895 was 2,712,145, of which number 1,240,353 resided in cities and towns, and 1,471,792 in the rural districts. There has been a considerable increase during the last few years, and on 1 Jan. 1900, the total population was estimated at 3,110,088. The number of the inhabitants of the principal cities on the date last mentioned was, according to an official publication, as follows: Santiago, 291,725; Valparaiso, 135,674; Concepción, 49,766; Iquique, 42,440; Talca, 40,987; Chillan, 34,994; Antofagasta, 19,482; La Serena, 17,137; Talcahuano, 15,643; Curicó, 14,577; San Felipe, 12,359; Valdivia, 9,819; Copiapó, 9,586.

Climate and Productions.—The northern part of Chile is a hot desert; the southern part, a cold region of almost incessant rains; but between these extremes lies a great extent of territory blest with a temperate and healthful climate. Dividing the republic, for convenience of characterization, into five zones, we may say that in the northernmost zone there is a nearly absolute lack of vegetation, but yet we find here some of the chief sources of the national wealth—the deposits of nitrate of soda, mines, etc. The second zone, continuing toward the south, is less torrid. Rain falls several times in the year; and though mining is the chief industry, small areas are also devoted to agriculture. The third zone, in the centre of the country, has a temperate climate and fairly abundant rains. Cattle-raising, mining, and the cultivation of cereals, vines, and fruits are the leading industries. In the fourth zone, where

CHILE

rains are more abundant and the climate cooler, the chief products are wheat, cattle, lumber, etc. The fifth and most southerly zone, extending to Cape Horn, is a land of bold and rugged features with a cold and rainy climate—a land of shepherds, lumbermen, and fishermen.

National Finances.—The national debt of Chile on 31 Dec. 1901, as shown in the report of the auditor-general of the republic, amounted to 302,672,280.91 pesos (Chilean peso = \$0.365). Of this amount, 227,234,400 pesos were for foreign loans dating from the years between, and including, 1885 and 1894. A reduction of 2,896,607.26 pesos in the national debt was effected in 1901. The message of President Riesco (1 June 1902), shows that the revenue, ordinary and extraordinary, in 1901 amounted to 110,059,496.97 pesos. On 31 Dec. 1900 there remained a surplus of 18,576,829.43 pesos. These two sums make a total of 128,913,989.40 pesos. The total of expenditures in 1901 was 130,913,989.94 pesos. There was consequently a deficit of 2,277,663.54 pesos, which sum was increased by certain payments to 2,809,337.66 pesos. In 1902 the president anticipated a deficit of 29,719,339.31, "which may be reduced by 3,000,000 by certain economies, and almost totally met by the 20,000,000 in gold taken from the conversion fund and the premium paid upon this sum. The conversion fund will be made up again out of the sales of land in Magellan territory and of nitrate grounds." The estimated revenue for 1903 amounts to 107,000,000 pesos, and the estimated expenditure to 105,665,545.79 pesos. This somewhat unsatisfactory condition of the national finances may be traced to political events which will be mentioned under *History*. The foreign trade in 1901 amounted to 300,383,118 gold pesos, which was the largest sum on record. Imports were 139,300,766 gold pesos; exports, 171,844,976 gold pesos, an increase of 10,223,079 gold pesos over 1900. Receipts of the custom-house amounted to 71,998,955 gold pesos, of which sum 27,872,696 gold pesos corresponded to imports and 44,126,259 gold pesos to exports.

Countries Leading in Trade with Chile.—The year 1901 cannot be regarded as normal in the matter of imports, the failure of the Chilean wheat harvest having occasioned an unusually large importation of wheat and flour in that year. Analyzing the figures for a normal year, 1899, we find that the five principal nations having commerce with Chile are:

COUNTRIES	Exports to in pesos	Imports from in pesos
Great Britain.....	110,528,378	44,338,050
Germany	20,921,999	29,748,898
France	9,334,281	5,525,162
United States	7,349,858	8,197,569
Peru	4,248,312	5,185,194

Of the Chilean products, which constituted the commerce of exportation, 84 $\frac{1}{3}$ per cent belonged to mining; 10 $\frac{1}{2}$ per cent to agriculture; 2 $\frac{1}{2}$ per cent to manufactures; and the rest to various products and to coin. The imports of that year were classified as follows: Woolen goods, 29,058,119; raw material, 21,731,717; food-products, 17,696,659; manufactures, 14,032,630; machinery, 12,695,066; beverages and cigars, 1,268,099; sundry articles, 9,778,068.

Exports.—One of the principal exports is nitrate, the quantity and value of which has steadily increased during recent years. Chile, in fact, leads the world in the production of

nitrate of soda, no other country being able to supply this mineral in commercial quantities. The value of the exported nitrate in 1899 was 96,650,282 pesos; in 1900, 109,945,156 pesos; in 1901, 118,860,131 pesos; and in 1902 there was a still more noticeable increase in the amount produced. Copper bullion is also exported in considerable quantities, the amount in 1901 being 24,479,922 kilos, valued at 19,627,114 pesos. A decrease is noted during recent years in the exportation of wheat, flour, and barley. In 1898 wheat to the value of 7,696,460 pesos was exported; in 1899, flour to the value of 996,979 pesos, and barley to the value of 2,246,866 pesos. Chile exported in 1901, honey valued at 1,034,088 pesos, and beeswax valued at 582,045 pesos; hay to the value of 260,815 pesos; wine, 68,344 pesos; and gold and silver coin, 13,150 pesos.

Mining.—Chile is the second largest silver mining country in South America, and the third largest copper producer in the world. In the northern zone, notably in the province of Antofagasta, extensive deposits of calcium borate are being worked. The annual exports from the manganese mines in Coquimbo and Atacama are between 20,000 and 25,000 tons. Other minerals, with amounts produced in the year 1900, are: Coal, 896,000 tons; iodine, 318 tons; and gold, 4,576 pounds. The nitrate of soda produced in that year weighed 1,465,935 tons.

History.—The dominion of the Incas of Peru included the northern and central portions of Chile—at least to lat. 37° S. In 1535 the Spanish conquerors of the Inca empire sent their first expedition southward along the Pacific coast; but the task of adding this territory to the Spanish possessions in Peru and Upper Peru (Bolivia) was not undertaken in earnest until 1541, nor was it brought to a successful conclusion before 1550. The courageous Araucanians offered a stubborn resistance to Valdivia's forces, and even as late as the 18th century they made good their prior claim to a large part of the country below lat. 37° S.

Independence and Adoption of Constitution.—In September 1810 was formed the first national government, to rule the country during the captivity of the king of Spain, whom the French held as a prisoner. From that time forward the design to achieve independence was never relinquished, though the events of the years immediately following were of a character to discourage patriotic aspirations. The Chileans were defeated and compelled to return to a nominal subjection; the final success was won with the help of Argentine troops under Gen. San Martin (see ARGENTINA), and the independence of the country was proclaimed in 1818. A constitution, adopted in 1824, and remodeled in 1828, was given its final shaping—substantially the form which it still retains, though modifications demanded by the progress of the country have been made—in 1833. (See under *Government*.) Independence was recognized by a formal arrangement with Spain, and embodied in the treaty of 1844. In 1865, however, a war broke out between the mother country and Chile and Peru, hostilities continuing until 1869. After an interval of peace, the important "war on the Pacific" began.

The War on the Pacific.—For many years the rights of Bolivia and Chile, respectively, in certain mining lands bordering on the Pacific Ocean remained without definition, but in 1874

CHILE

an agreement was entered into between the two countries which apparently disposed of the questions at issue. The exploitation of these lands by Chileans increasing, Bolivia saw fit to reopen the dispute by imposing an export tax on the nitrate, or "saltpetre," obtained in Bolivian territory. A Chilean company refused to pay the tax, alleging that it contravened the treaty of 1874. The Bolivian government's reply was an order for the sale by auction of the property of the offending company, on 13 Feb. 1879. Thereupon the Chilean government sent a man-of-war to seize the port of Antofagasta. It soon became apparent that Chile would be obliged to deal with Peru also in this matter; and in fact a secret offensive and defensive alliance against Chile had been formed by Bolivia and Peru in 1873. On 5 April 1879 Chile declared war against the latter republic. Tacna and the neighboring port of Arica were occupied by the presidents of Peru and Bolivia with their troops; the defense of Iquique was entrusted to a sufficient force, and at Lima a reserve of about 10,000 men was held in readiness to meet the Chileans at any point that might be attacked. The plans of the allies seemed to be well laid, and some initial successes fell to their share.

Capture of the Huáscar.—Two Chilean warships, the *Esmeralda* and the *Covadonga*, blockading Iquique, were attacked by the Peruvian frigate *Independencia* and the monitor *Huáscar*. The *Esmeralda* was sunk by the *Huáscar*, but the latter vessel on 18 October fell in with the *Cochrane* and *Blanco* of the Chilean navy north of Point Mejillones. A fight of great severity ensued. Only 86 men were left alive on board the *Huáscar*, out of her complement of 216, when she was obliged to surrender. This vessel was repaired and added to the Chilean navy.

Triumph of Chile.—Pisagua was captured from the Bolivians by Chilean warships. On 18 Nov. 1879, the allies were defeated in the battle of San Francisco, but before the close of the same month they scored a dearly bought success against the Chilean forces in the battle of Tarapacá. Chilean divisions commanded by Gen. Baquedano invested the town of Moquegua, and on 23 March 1880 entered Torata. Two months later a decisive contest occurred, the city of Tacna (now the capital of the Chilean province of that name) being taken on 26 May. The troops of the allies, including 5,120 Peruvians and 3,200 Bolivians, commanded by Admiral Montero, and the Bolivian president, Gen. Campero, sustained a crushing defeat. Arica, the port of this district, was attacked by the land and sea forces of Chile in June, and fell after making a desperate resistance. In order to emphasize the defeat and to cripple the more important members of the alliance, the Peruvian coast was laid waste, Mollendo was destroyed, Callao and other ports blockaded, and an expedition under Baguedano's command made ready to proceed to Lima. See PERU.

Acquisition of Territory.—As the fruits of her victory, Chile took from Bolivia the districts of Cobija and Atacamá; from Peru the coast line north of the Bolivian possessions to, and including, conditionally, the province of Tacna. Thus Chile's territory on the Pacific was extended northward from the old boundary, at lat. 24° S. One of the allies was cut off from communication with the outside world by way

of the Pacific Ocean; and a strategic frontier was established against the other ally. A truce, instead of a treaty, was concluded between Bolivia and Chile after the war, the sentiment of the Bolivians being utterly averse to any permanent arrangement which did not give them access to the sea. Renewal of negotiations for a definitive treaty, which should include the concession of a seaport, has been repeatedly urged by Bolivia, but hitherto without effect.

Treaty of Ancon.—Peru, by the terms of the treaty of Ancon (1883), surrendered to Chile absolutely the valuable nitrate district of Tarapacá, but with respect to the Tacna-Arica region a peculiar convention was made. It was agreed that Tacna-Arica should be governed by Chile for a period of 10 years, and that at the end of the decade the vote of the inhabitants should decide whether it would be better for the province to revert to Peru or to be administered by Chile in the future—the country thus rejected by popular vote receiving from the other country \$10,000,000 silver by way of compensation. Nearly 20 years have passed, and the Peruvian government has repeatedly urged fulfilment of the treaty, but the plebiscite has not yet been held.

Balmaceda.—Some of the amendments to the constitution which we have referred to above were adopted before the outbreak of the war with Peru and Bolivia; they embodied the liberal ideas which, in 1874, triumphed over the conservatism of the proprietors of large estates—a class practically dominating the government's policy up to that time. The most forceful of the liberal leaders who effected this important political change was Balmaceda, a member of Congress in 1868, minister to the Argentine Republic at the time of the war with Bolivia and Peru, and, in 1885, elected to the presidency of the republic. The conspicuous success of President Balmaceda in his advocacy of measures relating to internal improvements, a system of popular education, the separation of Church and state, etc., created bitter antagonisms. United in opposition to him were all those who disapproved of his vigorous liberalism on principle, and all who were jealous of his power as an individual. In 1888 his cabinet was overthrown; his unyielding attitude in this crisis provoked an armed revolt; and the country was plunged into civil war, the operations of the forces of the revolutionists being directed by a junta representing Congress, and the president somewhat too readily assuming the powers of a dictator for the defense of his position. Balmaceda was defeated, and died by his own hand on 19 Dec. 1891.

The effect of this civil war upon Chile's foreign credit was deplorable. With characteristic enterprise her people have developed the resources of the country in many new directions, yet the utmost wisdom and firmness in the administration of her government have been required to bring about even such conditions of the national finances as we have stated. On the other hand, the country was fortunate in escaping a serious foreign war.

The Baltimore Incident.—The opinion prevailed in Chile when this conflict was at its height that the United States government, through Minister Patrick Egan, was showing favor to the cause of Balmaceda, and discriminating against the congressional party.

CHILE

The fierce resentment felt by the latter expressed itself in an attack upon sailors of the United States cruiser *Baltimore*, who became involved, while on shore, in a brawl with Chilean sailors. There was a riot of the populace in the streets, and several of the *Baltimore's* men were seriously or mortally wounded. When a report of this indignity reached Washington, suitable representations were made by the authorities there, but unfortunately it was necessary to address such representations to a merely provisional government at Santiago. The latter not only refused the just demand for satisfaction, but also insisted in offensive terms that the men who had been assaulted should be handed over to Chile for trial as criminals. An improvement in this threatening situation occurred when the management of Chilean affairs was entrusted to President Montt, and when the demand of the United States was emphasized by the sending of two additional warships to Chile. The new president tendered apologies for the discourtesy of the provisional government, as well as for the attack upon men wearing the uniform of the United States; and compensation was made to the wounded sailors, or to the families of those who had died.

Arbitration and Limitation of Naval Armaments.—On 28 May 1902, the plenipotentiaries of Chile and the Argentine Republic concluded two important agreements, the first of which provides for the arbitration of all questions not affecting constitutional precepts, or that cannot be settled by direct negotiations. It is entitled a "General Treaty of Arbitration," and the desire is expressed in its introductory clause "to settle by friendly methods whatever questions may arise between the two countries." The second agreement is entitled a "Convention on Naval Armaments," which has "the object of removing all causes of anxiety and suspicion." The two governments "renounce the acquisition of the war vessels they have in construction and the making for the present of any new acquisitions"; agreeing, moreover, to reduce their respective fleets until they arrive at "a prudent equilibrium." In this connection we note that the launching of the first iron steamer built in Chile took place on 24 Nov. 1901 at Valparaiso. The entire ship, from keel to truck, was of domestic construction.

Government.—The national Congress is composed of two chambers: (1) The chamber of senators, with 32 members, elected for a term of six years by direct vote and by provinces, in the proportion of one senator to each three deputies; (2) the chamber of deputies, with 94 members, elected for a term of three years. Congress exerts a certain amount of control over the president of the republic by giving or refusing its confidence to the cabinet ministers appointed by him—as illustrated in the contest with Balmaceda. To represent Congress in the period of its recess, there is a Permanent Committee of 14 members, one-half chosen by each chamber.

The president of the republic holds office for five years, and he cannot be re-elected for the next consecutive period. A council of state, composed of 11 members, some of whom are appointed by the president, and others by the chambers, has the power to intervene in certain appointments, and its consent is necessary for the promulgation of the laws, the granting of

pardons, and some other matters. This council is not to be confused with the cabinet, in which are but six ministers or secretaries, to wit: The minister of the interior; of foreign affairs; Church, and colonization; of justice and public instruction; of war and the navy; of the treasury; of industries and public works.

The judicial branch of the government comprises: The supreme court of justice, located at Santiago, and composed of seven members, with authority over all other tribunals of the republic; the court of appeals, for the great districts of Tacna, Serena, Valparaiso, Santiago, Talca, and Concepción; one or more justices of the peace in each department of the republic; and sub-delegation or minor district judges. Juries exist only for suits involving the question of abuse of the freedom of the press.

For the purposes of political government, Chile is divided into 23 provinces and one territory. The provinces are divided into departments, the departments into sub-delegations, and the latter into districts. For the purposes of local administration, the republic is divided into municipal circumscriptions, or communes, one for each 20,000 inhabitants. A list of the provinces follows, beginning at the north: Tacna, Tarapacá, Antofagasta, Atacama, Coquimbo, Aconcagua, Valparaiso, Santiago, O'Higgins, Colchagua, Curicó, Talca, Linares, Maule, Nuble, Concepción, Bio-bio, Arauco, Malleco, Cautin, Valdivia, Llanquihue, and Chiloé. The territory referred to above is Magallanes, at the southern end of the continent.

Education.—In 1901 there were 1,700 public schools, with 124,265 names of scholars on the books, and an average attendance of 79,666. During the first six months of 1902, there were opened 88 new schools and three new lyceums. The University of Chile in its various departments (including law, engineering, medicine, theology, and the fine arts) has an attendance of 1,300. Other public educational institutions are: The National Institute, with 1,200 pupils; Institute of Pedagogy; about 30 lyceums of secondary instruction for men; and 15 lyceums for girls; 6 normal schools; a Conservatory of Music; a Commercial Institute; also schools of fine arts, agriculture, arts and trades, mining, for the blind and for deaf-mutes, professional schools for girls, and industrial schools. Private educational establishments are numerous and receive pupils from other Latin American countries. The Roman Catholic University has courses of engineering and law. There are several museums of natural history and fine arts; an Astronomical Observatory, and meteorological observatories; botanical gardens, and, in various parts of the country, 41 public libraries, with 240,000 volumes.

Army and Navy.—By the law of 31 Dec. 1896 the maximum strength of the active army was placed at 9,000 men, and in 1899 the effective strength of the active army was stated to be 6,987 men; nevertheless a system of military instruction and drill is enforced which practically renders a much larger number available for military service in an emergency—possibly 10 regiments of infantry, 6 of artillery, 8 of cavalry, and one of military engineers. Establishments for military instruction are the Academy of War, the Military School, and the School for Sergeants and Corporals. The Chilean navy includes nearly 40 vessels of various classes:

CHILE SALTPETRE — CHILIASM

the armor-clad *Capitan Prat*, O'Higgins, and *Almirante Cochrane*; the monitor *Huáscar*; five protected or armored cruisers; five gunboats and torpedo-cruisers; four destroyers; 13 torpedo-boats; a training ship, etc. Naval instruction is given on board the vessel last mentioned, as well as in the academy at Valparaiso.

Railways, Postal Service, etc.—The state railways in operation in 1901 had an extent of 1,420 miles, and private railways 1,430 miles. Including several hundred miles which have been constructed since that time, we may say that there are somewhat more than 3,000 miles of railway in the republic; and the interesting statement is made that, although the government lines transported nearly 6,500,000 passengers and 2,500,000 tons of freight in 1899, "the net product was small, because rates are kept very low, for the purpose of promoting the public wealth by facilitating intercourse and the interchange of products." All the more important cities have street railways.

There are about 740 post-offices, and the total delivery in 1899 was 40,000,000 pieces. Newspapers, reviews, and other periodical publications are circulated free of postal charges, in the interest of the public education. The telegraph service is chiefly performed by the state, the private lines being only about 2,800 miles in extent, out of a total of 14,000 miles. Two lines of underground cables cross the Andes, and there are two submarine cables. Telephone companies have about 15,000 miles of wires in operation in the larger towns.

Agriculture, and Various Industries.—There are approximately 6,200,000 acres under cultivation, while the total area of arable land is probably not less than 25,000,000 acres. The production of wheat in good seasons is about 22,700,000 bushels, and of barley about 4,250,000 bushels. Other grains, fruits, and vegetables are raised in large quantities in the central provinces. The cultivation of the vine has received much attention during a score of years; in fact, this industry ranks next to cattle-raising in certain districts. Even the island of Juan Fernandez (made famous by Defoe's story of 'Robinson Crusoe') is included in the plans for industrial development. This island, lying 600 miles west of Valparaiso, belongs to Chile, and arrangements are being made quite seriously for turning to some good account the interesting little possession.

Milling holds the first position among Chile's manufacturing industries. More than 500 flour mills, supplied with the most modern machinery, are in operation in different parts of the country, especially the provinces lying south of the capital. Wood-working and tanning, and the manufacture of woolen cloth, building materials, and coarse paper are also worthy of mention.

MARRION WILCOX,
Authority on Latin-America.

Chile Saltpetre. See NITRATE OF SODA.

Chi-Li, or Chih-Li, China, one of the 18 provinces into which the country proper is divided. It has an area of 58,949 square miles and is bounded north by Mongolia, east by the gulf called Pe-Chi-Li, and by the province of Shang-Tung, and west by the province of Shan-Hsi. Chi-Li is in many respects the most important of the Chinese provinces, containing as it does the imperial capital, Peking, the treaty port of Tien-Tsin, and the only completed line of railway in the empire. The Great Wall runs across the whole of the northern part of Chi-Li, while on the coast are the forts of Taku, and the nearest approach to a naval station belonging to the Chinese government. The province is mountainous and traversed by important rivers, notably the Pei-Ho, the Lan, the Ho-Kien, and the Hu-to. The Yu-Ho is especially important because of the canal system developed throughout its course in Chi-Li. The provincial administration is in charge of a viceroy (Tsoung-tou) and a Fou-youen or sub-governor. There are numerous towns of the first, or Fu, class, second, or Chou, class, and third, or Hien, class. These towns are surrounded by walls. There are Christian missionaries of many denominations throughout the province. In 1900 the population was estimated at 25,000,000, including a large Manchu element. They are generally engaged in commerce, Chi-Li having much communication with Russia by way of Siberia. The climate is at times severe, the Pei-Ho being generally frozen over from December to March.

Chiliasm, kil'ī-āzm, the belief that Christ will come to earth and rule the world from Jerusalem for 1,000 years. The Latin word millennium means the same thing. The Revelation of John is the chief authority of the Chiliasts. Papias, Justin Martyr, Irenæus, Tertullian, and Lactantius were Chiliasts, but Origen was opposed to the notion. Papias, bishop of Hierapolis, says, in the millennium every vine will bear 10,000 branches, every branch 10,000 shoots, every shoot 10,000 sprigs, every sprig 10,000 bunches, every bunch 10,000 berries, and every berry 36 times 25 gallons of wine; and if a saint comes to pluck a berry it will cry out, "Pluck me, O saint; I am better for being plucked, praise the Lord." The Fifth Monarchy Men were, of course, Chiliasts, only they maintained that the golden age had begun, and that they were of it.

CHILKAT — CHILLINGHAM WHITE CATTLE

Chilkat (chĭl'kăt) **Inlet**, the western arm of Lynn Canal, an inlet in Alaska, in about lat. 50° 7' N.

Chilkat, or **Dalton, Pass**, a route in Alaska traversed by miners in reaching the gold fields of the Klondike. It is an overland trail, which was used for many years by J. Dalton, a trader, as a pack train route and for driving in cattle. It follows a direct course, more or less independent of waterways, from Chilkat Inlet to Fort Selkirk, and is said to be less difficult than the road over Chilkoot Pass.

Chilkoot (chĭl'koot) **Inlet**, the eastern arm of Lynn Canal, an inlet in Alaska. It is again subdivided, its principal arm being called Taig, an inlet which stretches for 15 miles north and south in about long. 135° 20' W.

Chilkoot Pass, a pass over the mountains in the northern part of Alaska, traversed by thousands of gold-seekers in the Klondike gold fields' excitement in 1897-8. By way of the Chilkoot Pass is the most direct route to Dawson City, the principal starting point to the Klondike region. The trail starts from Dyea, along the river of that name, and crosses the Pass at an elevation of 3,500 feet, to the head of Lake Lindeman, a total distance of 28½ miles. From the latter place to Dawson City is 548 miles. The Chilkoot Pass route is the old trail used for generations by the Indians, and for many years was the only one taken by miners and prospectors to reach the interior. It is by far the shortest route to the Yukon. The difficulties and dangers attending this route are many, and the steepness and roughness of the ascent have proved fatal in numerous instances, to those unaccustomed to endure hardships. The summit of the Pass is 13 miles from Dyea, the first six miles being traversed by a good wagon road. Owing to the winding of the Dyea River that stream must be crossed several times by ford or ferry. The trail then enters a narrow cañon with steep, rocky sides, which it follows to Sheep Camp, four and a half miles farther on, which point is the timber line. From Sheep Camp to the summit the rise is from 1,800 feet in three and a half miles, to 1,000 feet in half a mile, and here masses of broken rock make the ascent, which is in some places almost perpendicular, difficult and hazardous. It is at this point that the aerial tramway is built.

Chillan, chĕl-yän', Chile, capital of the province Ñuble, about 75 miles northeast of Concepcion. It consists of an ancient and a modern portion, the former built by the Spanish conquerors, who made it a place of some strength, in which the early settlers often found an asylum when hard pressed by the Araucanians. The old town was founded in 1579, and destroyed by an earthquake in 1835. The new town was built shortly after the latter date. Pop. 29,000.

Chilled Iron, iron cast in metal molds called chills, where, on account of the rapid conducting of the heat, the iron cools more quickly on the surface than it would do if cast in sand. Chilled iron is whiter and has a harder surface than iron cast in any other way. It is used in making axle-boxes, hubs, plowshares, and some hammers and anvils.

Chillianwalla, chĭ-lĭ-an-wāl'a, a village of the Punjab, about five miles from the left bank

of the Jhelum, 85 miles northwest of Lahore, famous for a well-contested battle fought in its vicinity, in 1849, between the British under Lord Gough and the Sikhs, in which the former, though they remained masters of the field, lost 2,269 men. A second battle fought about six weeks after, at Gujerat, nearly annihilated the Sikh force.

Chillianwalla, Battle of, an engagement in India between the Sikh forces in considerable strength, and the British commanded by Lord (afterward Viscount) Gough, fought 13 Jan. 1849. The Sikhs were completely routed, but the loss of the British was very severe: 26 officers were killed and 66 wounded, and 731 rank and file killed, and 1,446 wounded. The Sikh loss was 3,000 killed and 4,000 wounded. On 21 February, Lord Gough attacked the Sikh army, under Shere Singh, in its position at Goojerat, with complete success; and the whole of the enemy's camp fell into the hands of the British.

Chillicothe, chĭl-lĭ-kōth'ě, Mo., a city and county-seat of Livingston County; on the Wabash, the Chicago, Milwaukee & St. P., and the Hannibal and St. J. R.R.'s, 70 miles east of St. Joseph. It is a farming trade centre and has several manufacturing industries. It is the seat of the Chillicothe Normal School, State Hospital, State Industrial School for Girls, and St. Mary's Hospital, and is near the noted health resort, Laurel Mineral Springs. It has several daily and weekly newspapers, electric lights and street railroads, and two national banks. Pop. (1900) 6,905.

Chillicothe, Ohio, city and county-seat of Ross County, on the Scioto River, Paint Creek, the Norfolk & W., the Cincinnati, H. & D., and the Baltimore & O. R.R.'s, and the Ohio & Erie Canal, 50 miles south of Columbus. It is an agricultural and coal-mining region, and has flour mills, foundries and machine shops, daily and weekly newspapers, three national banks, and an assessed property valuation of \$6,000,000. Chillicothe was the first capital of the State. Ohio celebrated in May 1903, her 100th birthday as a State, and it was peculiarly fitting that Chillicothe should have been chosen as the place for the celebration, for all the historic memories of the early years of the State's existence cluster about this city. It was here that Gen. Arthur St. Clair set up his Territorial government, as governor of the Northwest Territory; it was here that the agitation for Statehood gathered momentum, led by a quartet of Chillicothe men—Thomas Worthington, Nathaniel Massie, Edward Tiffin, and Duncan McArthur. It was here, on 29 Nov. 1802, that a constitution for the State was adopted, in compliance with the requirements of the Federal Constitution; and, finally, it was here, in the spring of the succeeding year, that the young State was ushered into being and Edward Tiffin elected her first governor. Pop. (1900) 12,970.

Chil'lies, the fruits of the Capsicum, used to make cayenne pepper, pickles, and chilli vinegar. See CAYENNE PEPPER.

Chil'lingham White Cattle. See WHITE CATTLE.

CHILLINGWORTH — CHILTON

Chil'ingworth, William, English Anglican divine and controversialist: b. Oxford October 1602; d. Chichester, Sussex, 30 Jan. 1644. He was matriculated in Trinity College, Oxford, in 1618, and in 1628 was made a Fellow of the same college. Having been won to the Roman Catholic Church through the arguments of the Jesuit Father Fisher, Chillingworth entered the English College at Douai, where Laud, then bishop of London, by correspondence implanted in his mind doubts regarding the foundation of the Roman Catholic system; and, resolved to make a thorough investigation, Chillingworth returned to England after a few months abroad. The result was that he declared for Protestantism and in 1634 set forth, in a treatise that was not published and is now lost, the grounds of his conclusion. Laud procured his nomination to a church benefice in 1635, but Chillingworth's scruples about subscription to the 39 articles and acceptance of the Athanasian creed was an obstacle that could not then be overcome. In 1637 was published his great work, 'The Religion of Protestants: a Safe Way to Salvation.' In the preface he explained away his former scruple about the 39 articles, and the next year was named chancellor of Sarum with a prebendaryship annexed. When Gibbon in his autobiography explains his own religious experiences, which closely resemble those of Chillingworth, he insinuates that the reconverted convert afterward repudiated privately the cardinal doctrines of the Church of England.

Chillon, shē-yōn or shīl'ōn, a castle, Switzerland, on the Lake of Geneva, 6½ miles southeast of Vevay, once an important stronghold of the counts and dukes of Savoy, and the prison-house of Francis Bonivard, prior of St. Victor, Geneva, from 1530 to 1536. It stands on a rock rising 22 yards from the shore of the lake, and is reached by a bridge. It probably dates from the 9th century. Bonivard was confined in it by the Duke of Savoy because he had assisted the republic of Geneva, with which the Duke was at enmity. Byron's poem, 'The Prisoner of Chillon,' founded on this incident, has made it well known.

Chilo, kī'lō, one of the seven wise men of Greece. See CHILON.

Chiloe, chē-lō-ā', Chile, province of, consists of the island of that name on the west coast, which is separated from the mainland by a narrow strait on the north and by a gulf 30 miles wide on the east, and has a length of 115 miles, and an extreme breadth of 43 miles, and of a number of neighboring islets, mostly uninhabited; total area, 3,995 square miles; almost all Indians living on the principal island. Chiloe proper is hilly in the interior, and everywhere covered, except immediately along the shores, with nearly impassable forest. The climate is mild and not unhealthy, although inordinately wet. The Indians belong to a subdivision of the Araucanian family; they are a gentle and honest race, mostly engaged in fishing and in lumbering, timber being at present the chief export from the island, though immense deposits of coal have been reported. Oysters, which are very

scarce elsewhere in South America, are found in large quantities in the Chiloe Archipelago. The potato here, as in other parts of South America, grows wild. The Spaniards discovered the archipelago as early as 1558. The capital and chief seaport, Ancud, on the north coast, has a good harbor, is the seat of a bishop, and has a population of (1895) 3,182. Pop. of province 82,362.

Chilon, kī'lōn, one of the so-called seven wise men of Greece. He flourished about the beginning of the sixth century B.C., and was a native of Sparta, and one of the Ephori, a body of magistrates which he is even said to have originally introduced. A collection of his sayings may be seen in Orelli's 'Opuscula Græcorum sententiosa' (1819).

Chilopoda, kī-lōp'ō-dā, a group of myriapods represented by the centipede (q.v.). In these animals the body is composed of from a few to between 100 and 200 segments; the body is flattened, and there is but a single pair of legs to each segment. There are three pairs of mouth-appendages,—that is, a pair of jaws succeeded by two pairs of accessory jaws; while the first pair of legs are modified to form the poison fangs, which contain at their base a poison sac, the ducts from which open by a minute pore, out of which the blood oozes when the creature bites. The *Chilopoda* are divided into four families,—*Lithobiidæ*, *Scolopendridæ*, *Geophilidæ*, and *Scutigeraidæ*.

Chilperic, chīl'pě-rīc, two Merovingian kings: 1. CHILPERIC I., king of Soissons: d. 584. He never was acknowledged king of all the Frankish land, but divided the kingdom with his three half-brothers; he had, however, great power throughout their dominions by reason of his influence with the nobles. The murder of his wife, Galswintha, involved him in a war with her brother-in-law, Siegbert of Austrasia. 2. CHILPERIC II., king of Neustria: d. 729. He was several times at war with Charles Martel (q.v.), but was forced to submit to him, and was in 719 made king of the Franks.

Chil'tern Hills, a range of flint and chalk hills in England, extending through Oxford, Hertford, and Buckingham shires; loftiest summit, 905 feet. These hills were anciently covered with forests, and were infested by numerous bands of robbers. The steward of the Chiltern Hundreds is an officer of the Crown, appointed to protect the people of Bucks from the robbers of the Chiltern Hills. This office is now a sinecure, but as a member of Parliament can only resign his seat by accepting office, he accepts this sinecure, which he immediately vacates for the benefit of others. The stewardship of the manors of East Hundred, Northshead, and Hempholme, are other sinecure offices made use of for the same purpose.

Chiltern Hundreds. See CHILTERN HILLS.

Chil'ton, Robert Hall, American soldier: b. London County, Va., 1817; d. Columbus, Ga., 18 Feb. 1879. He graduated at West Point 1837; became captain of the First Dragoons 6 Oct. 1846, and was brevetted major for gallant and meritorious conduct at Buena Vista, Mexico, 23 Feb. 1847. In this battle Jefferson Davis, afterward president of the Southern Confederacy, but then colonel of the First Mississippi

CHIMÆRA — CHIMNEY

Rifles, was severely wounded, and Chilton bore him from the field, a life-long friendship resulting from the event. He became a brigadier-general in the Confederate service 20 Oct. 1862, was chief of staff to Gen. Lee, and inspector-general of the Army of Northern Virginia. After the war he was engaged in business in Columbus, Ga.

Chimæra, kī-mē'ra, in classic mythology, a monster, breathing flames, with the head of a lion, the body of a goat, and the tail of a dragon, which laid waste the fields of Lycia, and was at last destroyed by Bellerophon, with the help of Pegasus. Her form is described by the poets as an unnatural mixture of the most incongruous parts. Therefore the name of chimæra is used for a nondescript, an unnatural production of fancy. According to some Chimæra was a volcano in Lycia, around the top of which dwelt lions, around the middle goats, and at the foot poisonous serpents. Bellerophon is said to have been the first who rendered this mountain habitable.

Chimæroidea, one of the primary divisions of fishes, the equivalent of *Holocephali* (q.v.).

Chimango, shē-män'gō, a carrion hawk of South America (*Ibycter chimango*), closely related to the Caracara (q.v.) The plumage is black, with whitish streaks on neck and breast in the adult, which are lacking in the young. These birds are particularly numerous in the Falkland Islands. Darwin describes them as without fear of man, frequenting inhabited regions and feeding on all kinds of refuse.

Chimborazo, chēm-bō-rä'sō or chīm-bō-rä'zō, Ecuador, a peak of the Andes, in the province of Quito. Though not the loftiest summit of the Andes, it rises 20,700 feet above the sea-level, and its top is covered with perpetual snow. Through the transparent air it presents a magnificent spectacle from the shores of the Pacific. This mountain was ascended in 1802 by Humboldt and Bonpland, who, though they failed to reach the summit, yet mounted to the great height of 19,390 feet, a greater elevation than ever was before attained by man. Their further ascent was prevented by a chasm 500 feet wide. The air was intensely cold and piercing, and owing to its extreme rarity blood oozed from their lips, eyes, and gums, and respiration was difficult. In 1880 the summit was reached for the first time by Mr. E. Whymper.

Chimere, shì-mēr', the upper robe to which the lawn sleeves of a bishop are attached. In the Roman Catholic Church it is of purple silk, and of black satin in the Church of England.

Chimes, music mechanically produced by the strokes of hammers against a series of bells, tuned agreeably to a given musical scale. The hammers are lifted by levers acted upon by metallic pins, or wooden pegs, stuck into a large barrel, which is made to revolve by clock-work, and is so connected with the striking part of the clock mechanism that it is set in motion by it at certain intervals of time, usually every hour, or every quarter of an hour. The music thus produced may consist of a direct succession of the notes constituting an octave, frequently repeated, or it may be a psalm tune or short pop-

ular air in the key to which the bells are tuned. This species of mechanical music most probably had its origin, like clock-work itself, in some of the monastic institutions of Germany, in the Middle Ages. The first apparatus for producing it is said to have been made at Alost, in the Netherlands, in 1487. The chime mechanism may be adapted to act with the large bells of a church steeple, by means of wheel-work strong enough to raise heavy hammers; or a set of bells, of different diameters, may be arranged concentrically, within one another on one common axis, sufficiently small to be introduced into the frame of a clock, or even of a watch. The chime mechanism is sometimes so constructed that it may be played like a piano, but with the fist instead of the fingers. This is covered with leather, that the blow on the key may be applied more forcibly. Difficult as the performance is, some players can execute compositions consisting of three parts, and even produce trills and arpeggios. Burney relates that the chime-player Scheppen, at Louvain, laid a wager with an able performer on the violin that he would execute a difficult solo for the violin with the bells, and won his wager. Pott-hoff, organist and chime-player at Amsterdam, played his bells with the facility of a performer on the pianoforte, although every key in his apparatus required a force equal to a two-pound weight. Burney heard him perform some fugues in 1772. The finest carillons or sets of musical bells are to be found in Belgium, at Bruges, Ghent, Antwerp, Namur, and Mechlin. These consist of from 40 to 50 bells, the largest weighing several tons, the smallest only a few pounds. Instead of bells, sometimes bars, wires, or tubes are used.

Chim'ney, an upright structure of stone, brick, etc., enclosing one or more flues or passages through which smoke and gas from the fire in a stove, furnace, or fireplace may escape into the open air. How far the Greek and Roman architects were acquainted with the construction of chimneys such as we have is a matter of dispute. That kitchens and baths were provided with chimneys appears certain, but how far other apartments were so provided is doubtful. An ancient mosaic found in Algeria, and representing a Roman country mansion, shows chimney stacks projecting above the roof. Of course in southern Europe fires are less necessary than in northern Europe. Chimneys require much attention to make them secure and prevent their smoking, so great an annoyance to domestic comfort. It seems at present to be acknowledged that it is much better to exclude the cold, damp air from the flues, by narrowing the aperture at the top, than to give larger vent to the smoke at the risk of admitting a quantity of air to rush down the flue. For this reason chimney pots are of great use. In Prussia, where the architectural police is strict, great attention is paid to the erection of chimneys, and to the regular sweeping of them, the chimney-sweepers being bound to sweep the chimneys of a certain number of streets within a regular time. The longer a chimney the more perfect is its draft, because the tendency of the smoke to draw upwards is in proportion to the difference of weight between the column of air included in a chimney, and an equal column of external air; and the heated air in the chimney being lighter

CHIMNEY-SWALLOW — CHINA

than the external air, the longer the chimney is the greater is this difference. Short chimneys are liable to smoke, and fireplaces in upper stories are therefore more apt to smoke than those in the lower ones. Two flues in the same chimney should not communicate with each other short of the top. In manufactories tall chimneys are built for the purpose of carrying away the great quantities of smoke, which would otherwise be highly deleterious to the health of those living in the neighborhood. In chemical works, especially, these chimneys are sometimes built to an immense height. Such chimneys are now built from the inside, by which the expense of the scaffolding is saved.

Chimney-swallow, a species of swallow (*Hirundo rustica*) so-called because of its habit of selecting chimneys and similar sites for its nests. The bird covers the whole of Europe and extends into China, and is one of the most common of the bird kingdom throughout the world, for it has relatives in Africa and America, where the chimney-swift is recognized as belonging to the same group. See SWIFTS.

Chimoio, Africa, a town in the Portuguese possessions, near the border of Mashonaland, 118 miles from Beira on the coast. A railway connects it with Fontesvilla, 28 miles northwest of Beira, and is being continued inland to Salisbury.

Chimpanzee, *chīm-păn'zē* or *chīm-păn-zē'*, an anthropoid ape (*Anthropopithecus niger*), native in the equatorial region of Africa. In size it is between the orang and the gorilla, although when seen it exhibits little of its stature, for it rarely stands upright, its habitual attitude being that of a bent creature, supporting itself on its long forearms. As the chimpanzee is arboreal in its habits, its hands and feet are larger, in proportion, than those of other apes, and this enables it to climb to the topmost branches of the great trees for soft fruits and insects, birds' eggs, and similar fare. The appetite for fruits makes the chimpanzee a menace to the plantations, especially when bananas are in edible condition. The natives guard the plantations, and as the animal is timid toward man this usually saves the crop; but when he cannot run away, the chimpanzee at bay is a formidable foe, using his long, sinewy arms and sharp teeth with deadly effect. He is even said to be a match for the leopard.

The habits of chimpanzees are largely nocturnal, and their long-drawn, loud, and terrifying cries may be heard at great distances. In the black recesses of the jungles, these cries would serve as calls to stragglers of the troop, and might also, by their suggestion of large numbers, scare away enemies. The nests whereon the females rest when bringing forth and rearing their young, are platform-like structures, built high in the tree-tops; these are deserted as soon as the young one is able to travel.

Chimpanzees are more nearly human in their action and intelligence than any of the other large apes, and many experiments have been tried in training and teaching them. Indeed, they have been made the subject of careful psychological investigation in various ways. They are playful and amusing, and exhibit none of the facial sombreness and ferocity of the gorilla, which they so closely resemble in structure.

The skin on the face of the chimpanzee is naked, yellowish in color, and surrounded by the long black hair which hangs about the head and shoulders. The body is covered with shorter, but equally shining black hair.

Various records are extant as to the training and habits of famous specimens of this species, kept under observation in various zoological gardens. Consult: Hartmann, 'Anthropoid Apes' and general works on natural history. See APE; GIBBON; GORILLA; ORANG-UTAN.

Chin-fly, a horse bot-fly (*Gastrophilus nasalis*) which has been confused with the horsebot (*G. equi*). This species is smaller than the bot, densely hairy, with the thorax rust-colored. The abdomen is whitish at base and the wings are not spotted. It deposits its white eggs on the hairs about the lips or in the nostrils of equine animals, within easy reach of the tongue, and it is probable that the maggots hatch out more promptly than in the other species. It has been found common and troublesome in Kentucky. Also, in Europe it is a parasite of the ass, mule, and goat. See BOT-FLY; HORSE BOT-FLY.

Chin-Kiang, *chīn-kē-äng'*, or **Chin-Kiang-Foo**, a city of China, in the province of Kiang-Su, on the right bank of the Yang-tse-Kiang, near the junction of the Imperial Canal, 150 miles from Shanghai. In 1861 it was made a treaty port. It is advantageously situated for trade, as the river is navigable for large vessels. Extensive suburbs stretch along the river and the canal. Chin-Kiang forms the key of the empire, as the blockade of the river and canal at this spot would in a great measure prevent all communication between the north and south. The city was formerly fortified, but has been dismantled. In 1842 it was taken by the British after a determined resistance on the part of the Manchu garrison. It was also taken by the Tai-ping in 1853. They defeated the Imperialists here on 1 Jan. 1856, and finally abandoned the city in 1858. Cotton goods form the chief import, and the exports are numerous and valuable. Pop. 200,000.

Chin-Wang, *chīn'wäng'*, a city of China, in the province of Chi-Li. It was declared a treaty port and opened to foreign commerce in 1898. Pop. (1900) estimated 39,000.

China, or **Chinese Empire**, an immense territory, stretching from the centre to the eastern extremities of Asia, and occupying nearly a third of the surface of that continent; between lat. 18° 20' and 56° N., and lon. 73° and 135° E.; bounded north by Siberia; west by Russian Turkestan, the Russian Pamir, Cashmere, etc.; south by India, Burma, Anam, and the China Sea; east by Siberia, Korea, and portions of the North Pacific Ocean (Eastern Sea, and Yellow Sea); greatest length, west to east, about 3,000 miles; greatest breadth, 2,400 miles; area, about 4,300,000 square miles. This vast empire is usually divided into China Proper, which forms its nucleus, and the following Dependencies:

Manchuria (Chinese, *Tung-san-Sheng*) comprises the extreme northeast portion of the Chinese empire. It is bounded on the north by the river Amur and Russian territory, east by the Russian maritime province, west by Mongolia, and south by the Gulf of Liao-Tung and Korea. It is divided into the three provinces

CHINA

Mukden, Hei-lung-Kiang, and Kirin, the respective capitals of which are Mukden, Tsitsihar, and Kirin. The total area is 280,000 square miles. *Mongolia* is the name given to the vast stretch of desert land which, interspersed with infrequent oases, stretches across the greater part of the north of China along the Siberian frontier. A large part of its area of 1,288,000 square miles is taken up by the Gobi desert. The population is almost entirely nomadic. The chief town is Urga. *Eastern or Chinese Turkestan* is a mountainous region lying between the western tract of the Gobi desert and the Pamirs, and enclosed north and south by the ranges of the Tian-Shan and the highlands of Cashmere and Tibet. It possesses an area of 431,000 square miles. The principal towns are Kashgar and Yarkland. *Sungaria or Dzungaria*, the smallest of the tributary states of China, lies to the northwest of Turkestan, on the banks of the Ili River, at the junction of Mongolia, Turkestan, and the Russian province of Semipalatinsk. Its area covers 147,900 square miles, and its population is said to amount to half a million. *Tibet* comprises the mountainous region lying between Turkestan and Nepal and Assam. On the east it adjoins China Proper, and on the west Cashmere. It covers an area of 651,500 square miles. Its capital is Lassa.

The authority exercised by the Chinese over their dependencies is by no means uniform. Some of the dependencies are closely connected with the empire, while others are merely tributary; and Tibet is so independent as to do little more than profess a nominal allegiance to the emperor of China, as the suzerain of the country.

CHINA PROPER (anciently *Cathay*; Chinese, *Chung Kwoh*, "Middle Kingdom") forms the southeastern portion of the empire, and occupies less than a third of its whole extent. Not including the island of Hainan, it lies between lat. 20° 20' and 41° N., and lon. 98° and 123° E. China is bounded, north by one of the most remarkable of human structures, the Great Wall, which proceeds directly over mountain and valley, and for a length of 1,250 miles forms the barrier between China and Mongolia; on the west it is bounded by Tibet; on the south by Burma, Tonkin, and the China Sea; and on the east by the North Pacific Ocean. There are 18 provinces with area and population as follows:

Provinces	Area; English square miles	Population	Population per square mile
Chi-Li (Pe-chi-Li)	115,800	20,937,000	172
Shan-Tung	55,970	38,247,900	683
Shan-Si	81,830	12,200,456	149
Honan	67,940	35,316,800	520
Kiang-Su	38,600	13,980,235	362
Ngan-Hui	54,810	23,670,314	432
Kiang-Si	69,480	26,532,125	382
Che-Kiang	36,670	11,580,692	316
Fu-Kien (Fokien)	46,320	22,876,540	494
Hupei	71,410	35,280,685	492
Hunan	83,380	22,169,673	266
Shen-Si	75,270	8,450,182	111
Kan-Su	125,450	10,385,376	82
Sze-Chuen	218,480	68,724,890	314
Kwang-Tung with Hainan	99,970	31,865,251	319
Kwang-Si	77,200	5,142,330	67
Kwei-Chau	67,160	7,650,282	114
Yünnan	146,680	12,324,574	84
Total	1,532,420	407,253,029	av. 266

Physical Features.—The coast-line, forming an irregular curve of about 2,500 miles, gives about one mile of coast for every 500 miles of area. It is not deeply penetrated by gulfs, the only one of great extent being that of Pe-chi-Li in the northeast, but numerous indentations form safe and capacious roadsteads. With exception of a bold and rocky peninsula in the province of Shan-Tung, the shore from the Gulf of Pe-chi-Li south to the island of Chusan is flat, and in many places so little raised above the sea-level as to be extensively inundated during a continuance of strong winds. From Chusan to the mouth of Canton River it is usually rocky; from this point southwest, flats chiefly prevail. A peninsula of some size juts out in the extreme south from Kwang-Tung province, separated from which by a narrow strait is the large island of Hainan. Chusan Island and archipelago are also of importance, but most of the innumerable islands dotted round the Chinese coast are very small. The large island of Formosa, off the east coast, now belongs to Japan. Many lighthouses have been planted along the coast. Owing to the exclusive policy of the Chinese and their dislike of foreigners, a great part of the interior of the country must be regarded as still almost a *terra incognita*. The surface is mostly mountainous. The general slope is from west to east, and the mountains are a continuation of those of Tibet and Central Asia. Branches of the Kuenlun traverse almost the whole breadth of China. In Western Sze-Chuen, there are peaks reaching the height of 25,000 feet. In the north the Nan-shan branch of the Kuenlun range runs under various names along the northeast of China till it reaches the frontier of Manchuria, north of Peking. A third great mountainous region of China is in the southeast, where extensive chains stretch on the south of the Yangtse-Kiang all the way from the highlands of Yunnan to the eastern seaboard. Between the main mountain systems, and following courses which may be roughly described as parallel, run the two great rivers of China, the Hoang-Ho, and the Yangtse-Kiang. Here lie the central and richest Chinese provinces. On both sides of the lower Hoang-Ho is an immense delta plain, consisting generally of a deep alluvial soil of unparalleled fertility. This great plain has a length of not less than 700 miles, and a width varying from 150 to 500 miles, and probably maintains a denser population than any other portion of the earth's surface of similar extent.

Rivers and Lakes.—No country of the world is better watered than China. The Yangtse-Kiang, which traverses the country centrally from west to east, has a course of some 3,000 miles, and forms a splendid inland waterway up which ocean steamers can sail for 1,100 miles to Ichang, a port opened to foreign trade. The Hoang-Ho, farther north, and next in size, has a course of over 2,600 miles, but is of much less value for commerce, being comparatively shallow, subject to tremendous and disastrous floods, and apt to shift its course. The Grand Canal connects the lower course of the Yangtse with that of the Hoang-Ho, starting from Hang-Chau Bay in the south, and being continued to Tien-Tsin in the north, thus completing what is said to be the most magnificent system of water communication in existence. This great waterway has, however, been greatly

CHINA

neglected, and threatens to become unnavigable, unless the necessary repairs are taken in hand. Besides these rivers and their numerous tributaries, the most deserving of notice are the Si-Kiang in the south, of considerable size but still more commercial importance, having at or near its mouth Canton, Hong Kong, and Macao; and the Pei-Ho, which, though much smaller, forms a waterway between Peking and the Gulf of Pe-chi-Li. The lakes of China, though rather numerous, are not individually of great extent. Perhaps the largest is Tung-Ting, in the province of Hunan, which furnishes an affluent to the Yang-tse-Kiang, and has a circuit of 270 miles. Po-yang, in the province of Kiang-Si, is 90 miles long by 20 broad, abounds in fish, and is remarkable both for the picturesque scenery around it and the numerous beautiful and populous islands which it encloses.

Climate.—The greater part of China belongs to the temperate zone, only a small portion of the south lying within the tropics. It has what is called an excessive climate, and has a far greater range of temperature than is usual within the same parallels of latitude. Peking, the capital, is nearly a degree south of Naples, and yet while the mean temperature of the latter is 63°, that of the former is only 54°. In summer, however, the heat reaches from 90° to 100° in the shade, while the winter is so cold that the rivers usually continue frozen from December to March. At Hong Kong, notwithstanding the influence of the sea in checking extremes, the thermometer in June and July, the hottest months, frequently stands at 90°, and in winter, from December to March, sinks nearly to the freezing-point. At Canton, snow, though rarely, has sometimes fallen. At Shanghai, lat. 31° 20', the range of temperature is still greater, the maximum reaching 100°, and the minimum falling at least 20° below freezing, or 12° F. In the south the climate is of tropical character, the summer heat rising to 120°. Here the southwest and northeast monsoons blow with great regularity, and nearly divide the year. In the north they are more variable. The violent hurricanes known as "typhoons" are not uncommon in the Chinese seas.

Geology.—The geology of China is very imperfectly known, but there is no doubt that all the leading geological formations are found in it. Primary formations are most largely developed in the mountainous regions of the west, where granite, gneiss, and primitive schists prevail. The same formations exist to a more limited extent in the southeast, where bleak mountains of granite give that district a distinguishing feature. The secondary formation, including the carboniferous and cretaceous system, occupies a considerable area, and the coal fields of China are perhaps the most extensive in the world. The Tertiary formation has its largest development in the northeast, and probably underlies the greater part of the alluvium which covers the surface of the Great Plain. A surface feature of a great part of northern China is the earthy deposit known as "loess," which covers an immense area both of mountain and valley, forming a yellowish-brown soil of the utmost fertility.

Mineralogy.—China is well supplied with useful minerals. Gold, though not thought to be very abundant, is obtained by washing the sand of several of the rivers, particularly those of

the upper branch of the Yang-tse, and in the mountainous and almost inaccessible regions of Yunnan. Silver is also found in the same regions. The quantity suffices for a large annual export, chiefly in payment of opium and other goods. Copper, besides forming the ordinary currency in limited mercantile transactions, is worked to a great extent for economical purposes. Mercury or quicksilver, in the form of cinnabar, is of frequent occurrence, and is much used both for coloring and medicine. Its poisonous fumes are even said to be inhaled like opium or tobacco. There is no want of iron either in the form of rich hematite, or in that of the carbonate of the coal-measures, but smelting is not carried on to any considerable extent. Lead, tin, and zinc exist, but owing either to a deficiency in quantity, or ignorance of the method of extracting them economically from the ores, the native product falls short of the consumption. Some authorities reckon the coal-fields of China as equal in value to all the other coal-fields of the world together, and some time they must certainly become of immense economic importance to the country. The area of the coal deposits in the southeastern part of the province of Hunan is about 21,700 square miles. The coal occurs both bituminous and as anthracite, but as most of it is raised without machinery, by the rudest forms of manual labor, the price is necessarily high, and the quantity mined is trifling. Defective means of communication partly account for backward state of coal-mining. Coarse mixtures of culm and earth are used as fuel to some extent, while other still more inefficient and less attractive compounds are employed. Among other mineral substances may be mentioned nitre, alum, gypsum, and more important than all, inexhaustible beds of kaolin or porcelain earth, the early possession of which by the Chinese, and their great skill in working it, has given the name of China to the beautiful ware which so long monopolized the market of Europe. Jade appears to be found in China in its most perfect form, and is there held in the highest estimation, being wrought into trinkets and into ornamental articles of various kinds. Various precious stones also are found, and agates especially are admirably wrought.

Zoology.—China is said to possess about 200 indigenous mammals and over 760 birds, most of which are found in adjacent parts of Asia, and some are also European. Among the *mammalia* are several species of the monkey tribe, one of them being the so-called Cochinchina monkey, marked by a striking variety of stripes and colors. Another is the proboscis monkey. Tigers and leopards were at one time so numerous as to have been regularly hunted in state by the emperors, but these animals have been extirpated except in certain localities, especially in Yunnan and Manchuria. A small species of wild cat is sought for as game, and served at table as a delicacy. Bears are frequently mentioned, and their paws are said to be in high request among Chinese gourmands. Other *carnivora* include the lynx, badger, civet, marten, and weasel. The elephant, rhinoceros, and tapir occur in some localities of the southwest. Both camels and elephants are employed as domestic animals, the former only in the north. Bats are numerous, and one large species is extensively used as food. To the indige-

CHINA

nous animals already mentioned may be added the wild hog, porcupine, raccoon-faced dog or Chinese fox, and several species of rats, more especially one of a yellow color, larger than those of Europe, and much prized for its skin. Several species of deer are met with, one being the musk deer. In birds, as above indicated, China is extremely rich. Pheasants in particular are famous, both for variety and for beauty. Among others are the well-known gold and silver pheasants, the former one of the most gorgeous of the feathered tribe. The peacock is also indigenous, and fowls akin to our common domestic variety. Birds of prey include eagles, falcons, owls, etc. Song birds, such as the nightingale and thrush, are well known and much appreciated. Water-birds of almost every kind abound, such as ducks, geese, swans, pelicans, etc. The mandarin-duck is a Chinese species famed for beauty of plumage. But perhaps the most remarkable water-bird is the fishing cormorant, the training of which forms an important employment, and is so complete, that when a bird has secured a fish which from its size he cannot manage singly, his neighbor darts down and assists him to complete the capture. The reptiles of China include several large serpents not regarded as dangerous, and one species at least which is very venomous. Tortoises are common, and are often kept in gardens and pleasure-grounds. No country is said to possess a greater number and variety of indigenous fishes than China. All its waters—its rivers, lakes, pools, canals, and even ditches—are full of fish. This is partly owing to the artificial means by which the natural supply is vastly increased. Boat-loads of water containing spawn are carried to distant parts and deposited in ponds, where the fry are fed with various species of lentils, or with yolks of eggs.

Botany.—The flora is naturally extensive and varied. In the south it is tropical in character, farther north, sub-tropical, and still farther there are many plants and trees identical or nearly so with those of middle Europe. Among trees commonly found in China the bamboo (if this gigantic grass should be called a tree), as in India, is perhaps the most valuable of all on account of the almost endless uses to which it is applied. Oaks of different species are common, and the economical uses of the various parts—the wood, bark, and galls—are perfectly understood. Even the acorns of some kinds are ground into flour, and converted into a farinaceous paste. Coniferous trees are represented by numerous forms of pine, yew, and cypress, some of them of great economic importance. The tallow and camphor trees abound, as also the mulberry and paper-mulberry. Palms are not abundant, but the coconut flourishes in Hainan and on the adjacent coast. The Pandanus or screw-pine is abundant in the south, but the date-palm is not known. The chestnut, walnut, willow, and hazel are all indigenous. The fruit-trees include the fig, mango, guava, lichi, loquat, orange, peach, pomegranate, quince, nectarine, plum, apricot, etc. Plants producing lacquer or varnish, and medicinal herbs of various kinds (including ginseng), are also well known. Among shrubby plants, the first place is unquestionably due to the tea-plant, of which further mention is made below. The next in importance is the

mulberry, on the leaves of which the silkworm is nourished. Among flowering shrubs or trees are the rose, with its numerous varieties, the hydrangea, the passion-flower, the lagerstrœmia, Indian pride, the Chinese tamarisk, various species of cactus, and the camellia. The Chinese flora is particularly rich in varieties of the azalea. Altogether the abundance of flowering-plants, shrubs, and trees is a feature of the Chinese flora. Dwarfing is a favorite occupation, and the Chinese horticulturists force plants to assume the most fantastic forms.

Agriculture.—This first of arts has always been held in the highest veneration in China. The emperor himself, to do it honor, repairs annually to an appointed spot with a large retinue, and, taking the plow in his hand, draws a furrow and sows some seed. A similar festival is held in the capital of each province. The agriculture of the Chinese has been lauded in high terms by almost all who have had opportunities of witnessing it. In the important processes of stirring the soil, eradicating weeds, economizing manures, and applying them in the form best fitted to nourish the crop and bring it to maturity, they display unwearied industry and no small degree of skill. On account of the dense population, every square foot of land that can be made to raise food is kept in constant service and at the highest point of fertility. Even mountain slopes are terraced and tilled, sometimes to the height of 8,000 feet, wheat or other grains being the usual crop in these places. The farmers slavishly follow a routine which has been handed down without change from untold generations, and not only display no inventive powers themselves, but obstinately refuse to profit by the inventions of other countries. Their implements generally are of the rudest description, and though improved European and American plows have been sent out and urged on their acceptance, they reject them with disdain, preferring a rude shapeless thing drawn by oxen or buffaloes. They appear to have no idea of raising improved breeds of horses and cattle by the arts so well known and practised in other countries. The only animal of which the Chinese can be said to have furnished us with an improved breed is the pig. Their asses and mules are also of good quality. Rice, as the principal food of the people, is the staple crop. The rich alluvial plains which cover a great part of the surface are admirably adapted for its culture, and, by careful management, yield amazing crops—not one merely, but in the south latitudes two crops of rice in the hot season, besides a winter green crop usually plowed in for manure. In the neighborhood of Ningpo, lat. 30°, where the summer is too short to mature two crops in succession, they are still obtained by an ingenious device. The rice is sown in seed-beds, and afterward planted out in drills. A first planting is made about the middle of May, and in two or three weeks after, a second planting is made in the intervals between the previous drills. When the first crop is reaped in August the other is still green, but being stirred and manured, and having plenty of light and air, comes rapidly forward, and is reaped in November. The whole steps of the process are conducted with the greatest care; and the water-wheel, worked by the hand, or by an ox or

CHINA

buffalo, is kept in daily operation from the first planting of the crop till it is nearly ripe. The reaping instrument is not unlike our sickle; and the crop, when not thrashed on the field, as is generally the case, is carried home and built up into stacks, resembling those of Europe. The rice is not always grown on alluvial flats, and there is a variety, known as dry-soil rice, that is cultivated like any ordinary cereal. The sides of the hills are often laid out in a succession of gently sloping terraces, and planted with rice in drills running across the declivity, thus admitting of being irrigated by streams which, retarded at every step, move slowly forward without acquiring any impetus. The same mode of culture is also practised with other crops. In the north the crops principally consist of our ordinary cereals and legumes—wheat, barley, pease, and beans. Vegetables of various kinds are generally grown for household use. Varieties of the cabbage tribe are extensively cultivated for the sake of the oil extracted from the seeds. The raising of green crops to be plowed in as manure is generally common where rice is cultivated. Two kinds of plants are chiefly employed; one of them, a trefoil, grown on ridges similar to those which form the intervals in our celery beds. Among other crops regularly and extensively grown may be mentioned sugarcane, used chiefly in a green state; indigo; the castor-oil plant; and numerous plants grown for their roots. The opium poppy is now so extensively cultivated that there is a much smaller demand for the imported article than formerly. Maize, buckwheat, and tobacco may also be mentioned as cultivated crops. Three other plants of the greatest economical importance, and so extensively grown as to form important branches of Chinese agriculture, deserve a separate notice. The first is the mulberry. Judging from the quantity of raw silk annually exported, and the general use of silk for dress, especially by the wealthier classes of the country, it is evident that a large area must be appropriated to the cultivation of this tree, and millions of persons employed in the different processes connected with it. The plants are not allowed to exceed from four to six feet high, and are planted in rows, often along the banks of canals. The mulberry farms are small, and are generally worked by the farmer and his family. The Chinese silk is much heavier than the Italian, and preferred in fabrics requiring lustre and firmness. Whether it owes its quality to a particular variety of mulberry, or to the climate or soil, has not yet been definitely ascertained. The second plant more particularly deserving of notice is the cotton-plant. That cultivated in China is of the same species as the ordinary American, namely, *Gossypium herbaceum*. The plant producing the yellow cotton used in the manufacture of nankeen appears to be of a more stunted habit than the ordinary cotton. It is chiefly cultivated in a level tract around Shanghai, forming part of the Great Plain, and is the staple summer crop. The culture differs little from that of other cotton countries, more especially the cotton districts of India. The third plant, the tea-plant, is cultivated in two varieties—*Thea bohea* and *Thea viridis*; and though it was long supposed that the former only yielded black and the latter green tea, it is now known that both kinds of tea are obtained

from each. The great tea provinces are Kwang-Tung, Fu-Kien and Che-Kiang. In the first the *Thea bohea* is grown, and the tea is of inferior quality; in the other two the *Thea viridis*, which yields all the finer qualities, and furnishes the greater part of all that is exported to Europe. In these two provinces, where the culture is most extensive and carried to its highest perfection, the tea plantations are usually formed in a deep rich loam, never on the low lands, but on the low hilly slopes. The tea farms, as common throughout China in all kinds of culture, are small, and their management, including not merely all the steps of the culture of the plant, but the preparation of the leaves for market, is almost invariably confined to the farmer and his family. The leaves are gathered thrice—about the middle of April, when the leaf-buds are beginning to unfold; about a fortnight after, in the beginning of May, when the leaves are fully grown; and when the leaves again are newly formed. The first gathering yields the finest and most delicate tea, but with considerable injury to the plants.

Manufactures.—In all the arts necessary to the comfort of life, and in not a few of those conducive to luxury, the Chinese have made considerable progress. One peculiar feature in their processes is the general absence of machinery. Except in a few industries the great moving power is manual labor. The silk stuffs of China have long borne a high name, and in several qualities are still unsurpassed. The loom in common use is worked by two persons, one of whom sits on the top of the frame, where he pulls the treadles and assists in making the various changes which must be made on the machine while in operation. By means of it the workman can imitate almost any pattern. The crapes and flowered satins, and damasks for official dresses, manufactured by the Chinese are particularly excellent. Everybody wears silks. It is the prescribed attire of high officers; soldiers are not considered in full uniform without it. The finer kinds of it form the ordinary dresses of the opulent, while the poorest manage to deck themselves in a coarser quality, at least on gala days. The embroidery of silk is carried on to an amazing extent, the perfection to which it has been brought creating an almost unlimited demand, both domestic and foreign, and employing myriads of the inhabitants. Steam-power has latterly been utilized in the reeling and spinning of silk. In cotton goods the Chinese make good and substantial fabrics, but the cheapness and good appearance of the foreign goods have given rise to a large importation. Nankeen, once so common in Europe, is still produced as before, and continues to form an important branch of domestic manufacture. Cotton mills and factories of the European type have recently been established. Linen seems not to be made in China. Flax is not grown, but a good substitute for it is found in the fibres of two or three plants, especially ramee, from which the beautiful grass-cloth, similar in appearance to linen, is extensively woven. Woolen fabrics are made only to a very limited extent. The consumption of leather in China is not great, and the manufacture of it is very imperfect. The porcelain of China has been famous from the earliest periods. The manufacture of the finest forms of it being long known to the

CHINA

Chinese alone, gave them the monopoly of the world, and though in elegance of shape and design they must now yield the palm to Europe, for quality of material and rich gorgeous coloring they still hold perhaps the foremost place. Paper is an article that has been made in China from an early period and with great success. The manufacture of glass is not carried on to a great extent, and this is one of the few arts which, at least in regard to its finer processes, the Chinese have condescended to learn from Europeans. In beautiful lacquered ware the Chinese continue unsurpassed. Much of its excellence appears to be owing to the fine varnishes which they have learned to extract from native plants. Except in some few articles the Chinese are backward in the manufacture of metal goods; but recently, and under European leading, machinery, small arms and ordnance, warships, etc., are being produced in the country; as well as soap, matches, and other articles. Many small articles made by hand display much finish and delicacy of workmanship. See CHINESE ART.

Trade and Commerce.—The inland trade of China, aided by the unusual facilities which it derives from a system of water communication, ramifying like net-work over all its provinces, is of incalculable magnitude. Its rivers and canals are so covered with junks and barges and swarms of smaller boats, that there does not seem much exaggeration in the estimate which makes the tonnage belonging to the Chinese little short of the combined tonnage of all other nations. The inland commerce, however, is much hampered by the rarity of good roads.

By the opening of the principal ports the foreign commerce has been immensely increased. Till 1842 the trade with foreigners, exclusive of that carried on by the mainland through the town of Kiachta, with the Russians, was jealously restricted to the mouth of Canton River. By the Treaty of Nankin, in the above year, Hong Kong was ceded to Great Britain, and Canton and four other ports were thrown open, namely Amoy, Fu-Chau, Ningpo, and Shanghai. At subsequent dates other ports have been added to the list of treaty-ports for foreign commerce, and about 30 ports are now open, the most northern being Niu-Chwang, in Manchuria, and the farthest inland being Chung-King, on the upper Yang-tse, some 1,500 miles from the river's mouth. Steamers do not go higher at present than Ichang (1,100 miles), the trade above this being carried on by junks or other craft. Several other of the ports are on the Yang-tse. Of all the Chinese ports, Shanghai, at the mouth of the estuary of the Yang-tse, carries on much the largest trade. In 1902 China agreed to open five new treaty ports, Chang-Sha, Ngan-King, Wan-Hsien, Wai-Chau, and Kong-Mun. In 1900 the number of foreigners in all treaty ports was 16,811.

Among the countries which maintain commercial relations with the Chinese the principal are: Great Britain and her dependencies, Hong Kong and India; Japan, the United States, and Russia. The latest trustworthy statistics relating to the foreign commerce of China are set forth in a report for the year 1901 by Mr. J. W. Jamieson, British commercial attaché at Peking. He shows that from 1896, when it amounted to little more than \$270,000,000, it had increased by the close

of 1901 to about \$315,000,000, a gain of nearly \$45,000,000. To this total the imports contributed a little less than \$200,000,000. During that period, however, the imports from the United Kingdom fell off more than \$6,390,000, and the exports thither by nearly \$1,800,000. The trade with Hong Kong and India, on the other hand, increased, but the returns in relation to Hong Kong are deceptive, because large quantities of Chinese produce are sent thither from Canton and other ports in southern China for transshipment to other localities in the Middle Kingdom. Imports from the United States during the period named have increased by \$7,380,000, and the exports from China to the United States by upward of \$3,000,000. The imports from Japan have increased more than \$10,000,000 in five years. Imports from the United States in 1903 were valued at \$18,303,369; exports to the United States from China, \$20,583,068. The Japanese merchants are especially welcome in China. Those Japanese who have most to do with China, study not only the language, but also the ideas derived from Chinese literature. That knowledge of the Chinese educational system and of the ideas inherited through it has a value even in the sphere of commerce, the Russians have already recognized; the same insight and sagacity mark the course of Germany.

The Chinese, in carrying on their extensive dealings, domestic and foreign, have in all 24 weights and measures, but of these only 6 are in common use, namely, the liang or tael = $1\frac{1}{3}$ ounces avoirdupois; kin or catty = $1\frac{1}{3}$ pounds avoirdupois; and picul = $133\frac{1}{3}$ pounds, used in weighing bulky articles; and decimals of a tael, called mace or tsien, candareen or fan, and cash or le, used in reckoning bullion, gems, drugs, etc., 19 cash making 1 candareen, 10 candareens 1 mace. The only native coin now current is the cash, a small piece of thin circular copper about three quarters of an inch diameter, with a square hole in the middle for convenience of stringing. Native silver bullion, called *sycee*, and gold bullion of similar shape, and usually stamped with the names of the banker and workmen, and the year and district in which it is cast, are used in larger transactions. All taxes are paid in *sycee* of 98 per cent fineness. Private bankers are found in all large towns, and some of them pay interest on deposits. They issue paper money, which passes current in the particular districts where they are known. The Mexican dollar has been made a current coin all over the empire. In Shanghai, Tien-Tsin, Han-Kow, and the northern ports, the tael is commonly used.

Railroads.—Railway communication is as yet very limited in extent. The lines actually in working order in 1903 were as follows: Shanghai to Wu-Sung (built in 1898); Kai-Ping to Pe-Tang; from Tien-Tsin to within a short distance of the Great Wall, by way of Chan-Hai-Ouan, and with connection to Peking (built by Li Hung-Chang's advice; length 298 miles). Of lines conceded and projected since 1897, the list is as follows: (a) The Russian line through Manchuria, with branch to Port Arthur and Niu-Chwang (begun in 1897, to be completed in 1904; length of main line 1,200 miles, branch line 600 miles). (b) The German Kiao-Chau line (total length, 621 miles). (c) The Franco-Belgian line from Peking to Han-Kow

CHINA

(the first line to be constructed by imperial decree). In the north, this line has been completed, and is in working order, as far as Pao-Ting-Fu, about 50 miles from Peking; in the direction of the Yang-tse the work has been completed as far as Sin-Yang, 120 miles from Han-Kow. The line will connect with Tai-Yuan-Fu and Singan-Fu. (d) The Anglo-German line from Tien-Tsin to Chin-Kiang with connections to Tsi-Nan; total is about 620 miles. (e) The English line from Tai-Yuan to Fu-Chau (298 miles); and two lines from Shanghai, one in the direction of Su-Chau, Chin-Kiang, and Nankin, the other to Hang-Chau and Ningpo. (f) The Belgium line from Canton to Han-Kow, with a junction at Hong Kong. (g) The French lines from Lavi-Kai to Yunnan-Fu from Lang-Son to Long-Chau and from Nan-ning-Fu to Peking.

People.—The Chinese belong to that variety of the human race which has been called Mongolian, but in them its harsher features, as represented in the genuine Tartars, are considerably softened. They are generally of low stature, have small hands and feet (the last often artificially made so small in the females as to become a deformity), an olive or yellowish complexion, much modified by the degree of its exposure to the open air, prominent cheek-bones, depressed nose, eyes obliquely turned upward at the outer extremities, black hair, scanty beard. In bodily strength they are far inferior to Europeans, but superior to most Asiatics, their great assiduity and patient endurance of fatigue making them highly prized as laborers throughout the Indian Archipelago. Perhaps the finest physical specimens of the race are to be seen among the coolies or porters of Canton. The Chinese are deficient in courage, yet often display great contempt for death. In their moral qualities there is much that is amiable. They are strongly attached to their homes, hold age in respect, toil hard for the support of their families, and in the interior, where the worst kind of foreign intercourse has not debased them, exhibit an unsophisticated and pleasing simplicity of manners. In the great mass these qualities are counterbalanced, or rather supplanted, by numerous vices—treachery, lying, gambling, opium-smoking, etc.

Population.—The Imperial treasury department of China has recently published an official census of China in connection with a readjustment of the imposts that are destined to pay its war indemnities. It appears from this census, that the empire contains 426,000,000 inhabitants, and that China Proper—with its 18 provinces—contains 407,000,000. In the provinces, the number of inhabitants per square mile is greatest in Ho-Nan and least in Kan-Su. In the dependencies the density of population is far less than in China Proper, especially in Mongolia and Turkestan, which are very sparsely populated. The density is 22 times greater in Ho-Nan than in Manchuria. The population of the United States as a whole is about 20 persons per square mile. The population of China Proper is about 300 per square mile. If the whole population of the United States and 40,000,000 more were crowded into the State of Texas the density of population would be about equal to that of the Yangtse Valley and of the plain extending north and south between the lower courses of the Yangtse and

the Hoang rivers. Ngan-Hui but a little larger than New York State has more than three times the population. Che-Kiang province, slightly less in area than Kentucky, has more than 10 times the number of inhabitants, and between Kwan-Tung and Kansas the ratio is 21 to one.

No census figures based upon official returns are obtainable for the dependencies, and the nature of the population in these regions makes even a close estimate difficult. The data for 1903 may be given approximately as follows:

China	407,330,000
Manchuria	8,500,000
Mongolia	2,580,000
Tibet	6,430,000
Sungaria	600,000
East Turkestan	600,000

426,040,000

Language and Literature.—The Chinese language belongs to those Asiatic languages commonly called monosyllabic, because each word is uttered by a single movement of the organs of speech, and expresses in itself a complete idea or thing. All Chinese words in the Peking tongue end either in a vowel, a diphthong (in which, however, each vowel sound is distinctly pronounced, making the word often to appear of more than one syllable), or a nasal. Of such simple words or roots there are about 450. But the accent of many of these words may be varied by the speaker in four or five different ways, so as to produce a corresponding variety in their meaning, by which means the number of simple words or roots amounts to about 1,200. The relations of words are ascertained by their position in a sentence. Hence Chinese grammar is solely syntax. Since many words similar in sound are different in signification, while in writing each idea has its peculiar symbol, the number of words represented by writing, without reckoning those peculiar to certain dialects, is perhaps 10 times greater than those distinguished by the ear. The number, in fact, is reckoned at 50,000. In writing and printing the characters are arranged in perpendicular columns, which follow one another from right to left. In its origin Chinese writing is hieroglyphic or picture-writing, with the addition of a limited number of symbolical and conventional signs; and anyone well acquainted with these symbols has obtained a good introduction to the reading or writing of Chinese. The larger number of Chinese characters are formed by the combination of such hieroglyphs and signs. But as one such character by itself seldom determines the sound, an additional word is conjoined for the purpose; so that the great mass of Chinese written words consists of an ideographic and a phonetic element. Native grammarians divide their characters into six classes.

The confusing variations in the forms used to represent Chinese proper names in English is an almost inevitable result of the characteristics of the former language. Uniformity seems at present almost impossible of attainment, but the practice of compounding geographical names in such a way as to bring into prominence the significance of certain often-used monosyllables has considerable to recommend it. For instance, "Fu" (or "Foo") added to the name of a place, as Ningpo-Fu, indicates a city ruled by an official directly responsible to the head of a pro-

CHINA.

1. A Street in Tungehow.

2. Reception Hall of Temple.

CHINA

vincial government; that is, a city of the first class. In the form Ningpofu, the force of the compound is weakened. "Chau" (or "Chow") indicates a city of the second class; that is, a city subject to the ruler of a greater city; and "Hien" is used for a city of the third class; that is, a city of a dependent province. "Shan," meaning "mountain," is found in the name of the province Shan-Si ("Mountainous West"), Shan-Tung ("Mountain Province"), etc. "Kiang," meaning "stream," is found in the names of rivers, as Yang-tse-Kiang, Min-Kiang, Si-Kiang, etc. (the form Yang-tse-Kiang River being patently incorrect), and in the names of the provinces Kiang-Su, Kiang-Si, etc. In the case of names that have been longest known to the English-speaking world, or most frequently in use, such as Peking, Nankin, Shanghai, Ningpo, etc., although uniformity demands the compound form, the present form has been fixed by constant usage. Among other Chinese terms in general use in referring to places and institutions are the following:

Fu-tai, or Foo-tai, the governor of a province.

Godown, the place for storing goods.

Haikwan, the customs duties.

Hwang, emperor, yellow.

Li, a Chinese mile (equal to one quarter English mile).

Likin, an inland tax on foreign goods in transit.

Nui-Ko, privy council.

Shih, imperial.

Tael, a coin equal to one and a third ounces silver in weight.

Tao-tai, governor of a city.

Ting, a city of a small province.

Tsin, a prince.

Tsin-wang, a prince of the blood.

Tsung, clan, family (sometimes board).

Tsung-li-Yamen, a cabinet council of advisory powers having charge of official relations with foreigners.

Tsung-tuh, viceroy or ruler of more than one province.

Yamen, office (for official business).

The Chinese literature, from a geographical, ethnographical, and historical point of view, is unquestionably the most comprehensive and important of the whole of Asia. The printed catalogue of the Emperor Kien-Lung's library is composed of 122 volumes. In the five canonical or classical books, called 'King' are contained the oldest monuments of Chinese poetry, history, philosophy, and jurisprudence, some portions of which belong, perhaps, to the most ancient writings of the human race. Confucius, in the 6th century B.C., collected them from various sources, and in this collection they have been pretty faithfully handed down. In lyrical poetry the most distinguished names are Li-tai-pe and Tu-Fu, both of whom flourished at the beginning of the 8th century A.D. The romantic poetry of the Chinese, though void of poetic beauty, is valuable for the insight it gives into their domestic life.

The art of making paper is said to have been known in the 1st century, and printing from wooden blocks, in the 7th or 8th century, hundreds of years before these valuable arts were invented in Europe. In China literary eminence is the sure avenue to the highest honors and offices of the state, appointments being

obtained by competitive examination; hence "the *literati* are the gentry, the magistrates, the governors, the negotiators, the ministers of China." Naturally among the more comfortable classes, education of the kind which promises to be best rewarded is almost universal. For the lower classes also every village throughout the empire has its school, but the subjects taught are of the most elementary description; attendance is far from general, and is limited to the male sex. In 1898 an "Imperial University of China" was established at Peking. The first allowance for the building was \$112,000, and an allowance of \$150,000 is annually made for its support. The sciences, arts, and philosophy are included in the curriculum. Dr. William A. P. Martin, an American missionary and educator, was appointed first president of this institution, and three of its professors were from the United States. Students occasionally go abroad for study at foreign universities or technical schools. A few newspapers and periodicals are published in Chinese, especially at Hong Kong.

Religion.—Judging by the multitude of temples and joss-houses seen in every quarter, and the endless number of ritual acts performed on high festivals and in the ordinary intercourse of life, the Chinese are a most religious people. The religion of the state is Confucianism, an ethical system founded by Kong-Fu-Tse or Confucius, about 550 B.C. Another religion is Taoism, introduced about the same time by Lao-tsze, and numbering a good many adherents. (See CONFUCIUS, LAO-TSZE.) Among the great mass of the people a form of Buddhism prevails, or a curious mixture of religious ideas and forms. In the conduct of daily life they are under the dominion of innumerable superstitions, living in dread of demons whom they constantly endeavor to ward off or appease. Their belief in feng-shui, or the influence of "aspects," works against the introduction of railroads and other modern improvements. Attempts to introduce Christianity were made by the Nestorians as early as the 6th century, but the celebrity of the Jesuit missions has thrown all others into shade. The Roman Catholics now claim to have about 1,000,000 adherents among the Chinese. Various Protestant bodies carry on missionary operations in China. There are now probably over 50,000 native Protestants. During the Boxer massacres many native Christians were martyred.

Customs, Manners, Dress, etc.—Among the Chinese, politeness is carried to an extreme. They scrupulously avoid all contradiction in conversation, and are careful not to use any offensive or irritating expressions. From the same source arises the tedious, frivolous, and often absurd etiquette and extravagant compliment for which they are remarkable. But even here a wish to please and gratify is sufficiently evident. An invitation to dinner is written on a slip of red paper, and is sent some days before; it is usually in this style: "On the —— day a trifling entertainment will await the light of your countenance; Tsau Sanwei's compliments." This is followed by another card naming the hour. The dinner itself is sumptuous, wine and spirits are drunk freely, and the whole affair goes off with a great deal of boisterous merriment. Fresh pork, fish, and fowls form the staple articles of food, with vegetables of various kinds. Beef and mutton are rare.

CHINA

Opium and tobacco are in common use. The usual beverage among all classes is tea, of which the Chinese consume enormous quantities.

In ordinary cases, strict separation prevails between the male and female branches of a household. Betrothment is entirely in the hands of the parents, and is conducted through the medium of a class of persons called *mei-jin*, or go-betweens, whose office of matchmaking is considered honorable. The marriage itself is conducted with much ceremony, gay processions, and other convivialities. Besides one wife, strictly so called, a man who can afford it may have several subordinate wives. A wife may be divorced on several grounds that we should deem frivolous. Infanticide is common among the very poor, the female children being almost the only victims.

The return of the new year is an occasion of unbounded festivity and hilarity in China, and New Year's Day is a universal holiday for rich and poor. At this season all accounts are expected to be adjusted, and if this is delayed or neglected the creditor has sometimes recourse to the expedient of carrying off his debtor's door. On New Year's morning all shops are shut, and this usually continues for several days. There are also various festivals throughout the year, but no weekly day of rest. Gambling is universal in China. Porters play by the wayside while waiting for employment; and hardly has the retinue of a great official seen the latter enter the house when they pull out their cards or dice and squat down to a game. Dress, like other things, undergoes its changes in China, and fashions alter there as well as elsewhere; but they are not as rapid or as striking as among European nations. Regarding dress, there are certain restrictive laws in operation. The mandarins or officials have some special peculiarities of dress, and their respective ranks are indicated by the nature of the knob or button they have on the top of their hats. The wearing of the queue or pig-tail is perhaps the most noticeable external peculiarity of the Chinese as regards costume. The headdress of married females is becoming, and even elegant. The copious black hair is bound upon the head in an oval-formed knot. No caps, bonnets, hoods, or veils are worn abroad; a light bamboo hat, or an umbrella, protects from the sun. The extraordinary practice, peculiar to China, of compressing the feet of females (especially those of the better class) into unnatural form and dimensions has been already alluded to.

Dwelling-houses are generally of one story. The common building materials are bricks, sifted earth, matting, or thatch for the walls, stone for the foundation, brick tiling for the roof, and wood for the inner work. The fronts present no opening but the door. The walls are often stuccoed, but not painted, and the bricks are occasionally rubbed smooth with stones, and the interstices pointed with fine cement. The general internal arrangement of a Chinese dwelling of the better sort is that of a series of rooms of different dimensions, separated and lighted by intervening courts, and accessible along a covered corridor, communicating with each, or by side passages leading through the courts. Streets are generally so narrow as to be mere lanes. The most characteristic Chinese structures are the pagodas, built

generally with a number of stories, each marked off from the rest by a peculiar projecting portion.

Government, Laws, Army, and Navy, etc.—The government is an absolute despotism. The emperor unites in his person the attributes of supreme magistrate and sovereign pontiff, and theoretically as "Heaven's Son" is to heaven alone accountable. In practice, however, the rigor of this despotism is considerably softened, and the greatest blot upon the Chinese administration is the corruption which in every form that ingenuity can devise is rampant throughout the empire. The emperor's principal ministers, four in number, two of whom are Manchus and two Chinese, form an interior council chamber, and beneath them are a number of assessors who form the principal council of state. The government business is distributed among seven boards, having cognizance respectively of the conduct of civil officers, of revenue, of rites and ceremonies, of military affairs, of naval affairs, of crime, and of public works. Another board, the Tsung-li-Yamen, has the charge of foreign affairs. There is, besides, an office of censors, 40 or 50 in number, who go out into the empire as imperial inspectors, and are privileged to make any remonstrance to the emperor without endangering their lives. The provinces, either singly or by twos, are under a governor and sub-governor, and each province has also a chief criminal judge and a treasurer. Particular magistrates preside over particular districts and cities, and instead of being permanent are changed about once in three years. The great object aimed at is to maintain a strict surveillance and mutual responsibility among all classes; in other words, to imbue them with fear of the government, and infuse a universal distrust. The chief protection of the people is in a body of laws, called *Ta-Tsing-Liuh-Li*, that is, "statutes and rescripts of the great pure dynasty" which are held in high regard, and agreeably to which, with occasional violations, all public functions are discharged. The new code of laws that is being drawn up for the Chinese empire is to be the work of a Japanese professor of law. The Chinese army has been subjected to a certain amount of reorganization in recent years, and an attempt has been made to introduce improvements from the European countries. In each important town there is a Manchu force, and the total Manchu army is estimated at 270,000 men, with an organization of its own. There is a Chinese army separately organized from this, forming a kind of militia, supposed to include some 800,000 men. A considerable number of the men are now armed with rifles of European pattern, and the European drill has been partially introduced. Li-Hung-Chang, when governor of Pe-chi-Li, organized a corps of instruction drilled and trained on the European model, and this comprises 10,000 men. Numbers of Krupp guns are mounted on the fortifications; and there are arsenals superintended by Europeans. The navy contains several cruisers and other war vessels of the modern type, but the Chinese lost their most powerful ships in the war with the Japanese, and their navy is now of comparatively little strength. Three protected cruisers were built in 1897 in Germany for the Chinese fleet, and several sea-going torpedo boats, ordered before the war, have been also added. The reve-

CHINA

nue of the empire is derived from customs, excise, and the land and salt taxes. Calculating on the basis of statistics for 1901, if the customs duties, including the sum payable in lieu of the *likin* or in land-transit dues, be computed at about 10 per cent, the revenue, if payable in gold, would be about \$20,000,000.

China had a national debt before the war of 1894-5, and at the close of that contest she assumed a new indebtedness of \$187,500,000. The aggregate indemnity which the foreign powers were to receive by way of indemnity for the Boxer outrages in 1900 was \$337,500,000, payable in 39 annual installments. The whole of the Chinese customs revenue, if payable in gold, would be equivalent to about 6 per cent of the indemnity.

History.—The early history of the Chinese is shrouded in fable, but it is certain that civilization had advanced much among them when it was only beginning to dawn on the nations of Europe. The names of numerous dynasties belonging to a period two or three thousand years before Christ are still preserved, but how much, if any, of this early history is authentic, cannot be determined. The Chow dynasty, which was founded by Wu Wang, and lasted from about 1100 B.C. to 255 B.C., is perhaps the earliest that can be regarded as historic, and even of it not much more is historic than the name. Wu Wang is said to have divided the kingdom into 22 feudal states, and the continual internal rivalries which resulted from this policy encouraged Tartar raids and invasions. Under Ling-Wang, one of the sovereigns of this dynasty, Confucius is said to have been born in 551 B.C. During the latter half of the period in which this line of sovereigns held control, there appear to have been a number of rival kings in China, who lived in strife with one another. Chow-siang Wang, who was the founder of the Tsin dynasty, attempted to bring all China under his rule, but he was unsuccessful. His great-grandson, however, a national hero of the Chinese, who was the first to assume the title of "Hoang" (emperor), and henceforth called himself Tsin-She-Hoang-Ti, succeeded in accomplishing this. He ascended the throne at the age of 13 and fixed his capital at what is now Segan-Fu. Besides building a great palace there, he constructed numerous roads, canals, and buildings, throughout the country. He completely defeated several Tartar and other neighboring tribes, and suppressed a revolt in his own country. The Great Wall of China was begun by his command, and it was he who ordered all books treating of the past history of China to be destroyed. The present name of China is derived from the name of this dynasty. The Tsin dynasty ended with Hoang-Ti's grandson, who gave way in 206 B.C. to Lew Pang or Kaou-Te, the founder of the Han dynasty. Toward the end of the 2d century, or soon after the beginning of the 3d century, of the Christian era, the empire was divided into three states, which were again united under one ruler before the end of the 3d century. During the 10th century the right to the throne was disputed, and civil war raged till an adjustment took place by the establishment of the Tsung dynasty under Tae-Tsu 960 A.D. Under this dynasty great progress was made in literature and art. Incursions of Tartar hordes now pressed the Chinese so hard that they called in the aid

of the Mongols or western Tartars, who freed them from their oppressors, but gave them a new master in the celebrated Kublai Khan who founded the Mongol dynasty, and removed the capital from Nankin to Peking. His ninth descendant was driven from the throne and a native dynasty called Ming again succeeded in 1368 in the person of Hungwu. A long period of peace ensued, but was broken about 1618, when the Manchus gained the ascendancy, and after a war of 27 years established the existing Tartar dynasty in the person of Tung-Tchi. According to the Chinese, their dynasties, 26 in number, embrace a period of about 5,000 years, during which between 200 and 300 sovereigns have held the throne. The earliest authentic accounts of China, published in Europe, are those of Marco Polo, who visited the country in the 13th century. The first British intercourse was attempted under Queen Elizabeth in 1596, but the vessel sent did not reach its destination. A trade was subsequently established at Canton by the East India Company, but no direct intercourse between the governments took place till the embassy of Lord Macartney in 1793, which was well received by the Emperor Keen Lung. A second embassy in 1816 by Lord Amherst, was treated with insolence, and returned with a letter from the emperor to the prince regent, bearing among other things, "I have sent thine ambassadors back to their own country without punishing them for the high crime they have committed." The arrogance thus manifested could not fail, sooner or later, to bring on a collision; and accordingly, in 1841, the British, on being refused redress for injuries, partly real and partly alleged, proceeded to hostilities, and after scattering almost without a struggle every force which was opposed to them, were preparing to lay siege to Nankin, when the Chinese found it necessary to sue for peace. A treaty was then concluded, by which the five ports of Canton, Amoy, Fu-Chau, Ningpo, and Shanghai were opened to British merchants, the island of Hong Kong ceded to the British in perpetuity, and the payment of \$21,000,000 agreed to be made by the Chinese. In 1850 an insurrection headed by Hung-seu-Tseuan or Tien-Te, who gave himself out as a descendant of the Ming dynasty, broke out in the provinces adjoining Canton, with the object of expelling the Chinese Tartar dynasty from the throne, as well as of restoring the ancient national religion of Shan-Ti, and of making Tien-Te the founder of a new dynasty, which he called that of Tae-Ping, or Universal Peace. After the capture and execution of Tien-Te his place was taken by Hong-Sin, who identified Shan-Ti with the God of Christianity, and regarded himself as called of God to make the old true religion of China again predominant. For a long period the insurgents succeeded in maintaining their ground against the imperial forces, and it was not till after the lapse of several years that the latter were enabled in some degree to quell the rebellion. Notwithstanding the cruel retaliation by the victorious party, and the wholesale massacres perpetrated on the insurgents, they were unable to stifle the spirit of revolt. In October 1856, the crew of a vessel belonging to Hong Kong were seized by the Chinese on the allegation that they had been concerned in a piratical attack on a Chinese vessel. The men, on the

CHINA

remonstrance of the British authorities, were afterward brought back, but all reparation or apology was refused. The attitude taken up by the Chinese in this matter led to a declaration of war, and in 1857 the Chinese fleet was almost totally destroyed, and Canton was taken by the French and English troops. A treaty was at length concluded with Lord Elgin on behalf of the British, by which important privileges were secured; but an attack on the French and English ambassadors who were on their way to Peking to have the treaty ratified by the emperor led to the renewal of the war. The allied forces marched toward Peking, and after twice defeating the Chinese troops entered the city. This brought the Chinese to their senses, and the treaty was ratified. Meantime the Tai-Ping rebellion had been gaining strength, and the trade of Shanghai and Canton was materially interfered with. The British thereupon decided to assist the Chinese in quelling the insurrection, and the services of a young engineer officer, Capt. Charles Gordon ("Chinese Gordon," afterward so well known in connection with the Sudan), were lent to the government for that purpose. The rebels were gradually driven from their posts, and in July 1864, Nankin, their last stronghold, was taken. But the empire was still disturbed by rebellion in other parts. The Mohammedans in Chinese Turkestan, wishing to take advantage of the weakness to which the Chinese government had been reduced by the Tai-Ping rebellion, revolted almost simultaneously, but apparently independently, with those in the province of Yunnan in the southwest. In both cases the rebellion resulted in the temporary separation of the provinces from the empire. In 1883 hostilities broke out between China and France in consequence of the warlike operations of the latter in Tonkin and her claim to the protectorate of the country; but the matter was arranged early in 1885. In 1894 war broke out with Japan in connection with Chinese misgovernment in Korea, and in this struggle Japan had almost an uninterrupted success both by land and sea, driving the Chinese out of Korea, and invading China at several points. Peace was concluded in 1895, China agreeing to give up Formosa and pay a large indemnity to Japan, to open additional ports to foreign commerce, and to recognize the independence of Korea. In the autumn of 1897 two German missionaries were murdered in the province of Shan-Tung, and the admiral commanding the German squadron on the China station immediately effected a landing in the bay of Kiao-Chau, which, after much discussion, was finally leased to Germany early in January 1898. This acquisition of Chinese territory by Germany attracted much attention among other powers whose interests were likely to be affected, and was followed at brief intervals by the leasing of the town and harbor of Port Arthur in the Liao-Tung Peninsula to Russia, and the leasing of the bay of Wei-hai-Wei to Great Britain. On 22 September, a *coup d'état* was effected by the dowager-empress of China, who had acted as guardian to the Emperor Kwang-Su during his minority, by which the emperor was again placed under her dominion. The prompt remonstrances of the representatives of the powers at Peking served to prevent any extreme procedure on the part of the empress and her advisers, and the emperor afterward nominally regained power,

but early in 1900 was reported to have abdicated.

In September 1899, Secretary Hay instructed the United States representatives in England, France, Germany, Russia, Italy, and Japan to invite from those governments a presentment of their intentions in regard to the treatment of the commerce of foreign powers in the newly acquired spheres of influence, with special reference to the treaties existing between China and the United States, advising that China be regarded as heretofore as an open market for the world's commerce, and that all possible steps be taken to establish much-needed administrative reforms and to preserve and strengthen the imperial government in its integrity. On 20 March 1900, Secretary Hay announced that all the powers concerned had accepted the proposals of the United States, and that he would consider their consent final and irrevocable. In May 1900, a secret society, colloquially known as the "Boxers," rose in the provinces of Shan-Tung and Pe-chi-Li and massacred native Christians and European missionaries. The Boxers were encouraged by the empress-dowager and the palace-party at Peking, who placed themselves at the head of a movement directed against foreigners. The ministers at the European legations in Peking—Sir Claude Macdonald being at the head of the British legation—determined to requisition guards for their protection, and these arrived on 31 May. On 4 June the Boxers destroyed the Peking-Tien-Tsin Railway, and by cutting communications isolated the Europeans in Peking. Soon after the chancellor of the Japanese legation and Baron von Ketteler, the German minister, were murdered in the streets. In hope of relieving the legations, Admiral Seymour put himself at the head of 2,000 European troops and blue-jackets, and set out from Tien-Tsin for Peking, but had to retire. Meanwhile the Chinese had been manning the Taku forts at the mouth of the Pei-Ho, and making preparations for closing the entrance to the river. The commanders of the allied fleets—British, French, Russian, and German—in the Gulf of Pe-chi-Li gave notice to the Chinese to desist. The Celestials in reply opened fire on the European vessels, 17 June, whereupon the allies bombarded and destroyed the forts. The allied forces entered the foreign city of Tien-Tsin on 23 June, and the native portion of the city was taken on 14 July. All this time the legations at Peking were closely besieged and constantly bombarded. The smaller legations having been destroyed or rendered untenable, their occupants, together with a number of native Christians, took refuge in the British legation, which, from its extent and strength, offered a better prospect of protection. The legation was ill supplied with provisions, and the defenders were reduced to extremities, when the relief force of 12,000 men comprising British, American, French, German, Russian, and Japanese troops, captured Peking on 15 August. Before the arrival of this force the empress-dowager and her court, with the Emperor Kwang-Su, had fled from the capital, and it was impossible, with the troops and transport available, to overtake them.

Troops of various nationalities had been despatched from Europe to North China with all possible haste, and Count von Waldersee, the

CHINA

German commander, had been accepted by all the allies as commander-in-chief, but international jealousies soon made themselves apparent, and complications seemed likely to ensue. In October 1900 it was announced that Lord Salisbury had concluded an agreement with Germany by which the two powers bound themselves to the principle of the "open door" in China, to abstain from seeking to obtain for themselves any territorial advantage, and to take such steps as might be agreed on for the protection of their interests, as against any other power seeking territorial aggrandizement. Subsequent military operations consisted chiefly of punitive expeditions to the south and west. Negotiations for peace were at once entered upon. On 4 December the powers sent a joint note to the Chinese peace commissioners, demanding among other acts, the execution of the leaders in the massacre of foreigners and the payment of an indemnity, which in October 1901, was fixed at \$735,000,000. On the ratification of the indemnity agreement, the foreign troops were withdrawn from Peking. Later, through the good offices of the United States, the indemnity was reduced, being fixed at \$337,500,000.

Events of 1902-3.—On 7 Jan. 1902, the imperial court returned to Peking, making a brilliant entry. The Europeans witnessed the pageant from the Chien-Men gate, the privilege being in contrast to the old rule under which no foreigner could see the passage of royalty through the streets. The empress after her return showed marked courtesies to the ladies of the foreign legations, introducing the innovation of receiving them in person. Four important edicts were issued on 10 January, placing political science and western arts among the subjects of study at the Hanlin Academy; creating Chang Po-Hsi minister of education, with instructions to draw up a new scheme of education; appointing Wang-Wen-Shao director of the board of railways and mines, and nominating Yuan-Shih-Kai director-general of the Peking-Shan-hai-Kwan Railway. Among other edicts was one urging the abandonment of foot-binding. On 12 February there was made public an Anglo-Japanese agreement. Its aim was the maintenance of the independence of China and Korea, and the prevention of territorial dismemberment. In a note sent to the other powers, by France and Russia, the two allied governments reserved "the right to consider, eventually, means of ensuring the defense of their own interests." The Manchurian convention between China and Russia was signed 8 April. Manchuria was therein acknowledged as an integral part of China, the right of sovereignty and of administration was restored (as before Russian occupation), and the period of the evacuation was reduced to 18 months, the withdrawal to be in six months after signature of the convention, and to be completed in successive removals from three specified portions of Manchuria. Russia also consented to restore conditionally the Shan-hai-Kwan, Niu-Chwang & Sin-min-Ting Railway. A rebellion in the south of China caused much disturbance, in the aim of founding a Chinese dynasty, in lieu of the present Manchu rule. The conflict between political and railway interests among the various powers concerned with concessions continued during the

summer. On 15 August, Tien-Tsin was formally restored to China. The protocol tariff agreed to by the powers was signed 29 August, and a scheme for abolishing "likin" (q.v.) throughout the empire was embodied in a commercial treaty with Great Britain, signed 5 September. On 8 October the Russians restored, but in form rather than in reality, the first portion of Manchuria named in the Manchurian Convention. In December it transpired that the German government had imposed upon China, as a condition of the former's consent to evacuate Shanghai, the promise not to grant any preferential rights opposed to the principle of the "open door," and also a stipulation that the forces of all the powers should evacuate the port simultaneously. The government of the United States had in November invited the powers to submit to The Hague tribunal the settlement of the question whether the war indemnity should be paid on a gold or on a silver basis, our State department alone, of all China's foreign creditors, showing disposition to relieve China from the additional burden imposed by any fall in the market value of silver, and the arrival of the period for the payment of the first installment of the indemnity, 1 Jan. 1903, made the question a serious one for the Chinese government. The final payments will be made in 1941. The delay of Russia in carrying out the convention provision regarding the evacuation of Manchuria became in the spring of 1903 a cause of international uneasiness, and the policy outlined by the czar's government regarding relations with China gave rise to so much inquiry and protest that an attempt was made by Russia to explain away her demands. The still occupied portions of Mukden and Kirin were, by the convention, to be evacuated in April, and the final and complete withdrawal from the province was to occur in July; but in spite of Admiral Alexieff's proclamation announcing that there had been a removal of troops on 23 April, an incessant activity after that date in railway development and transportation of supplies and ammunition, the building of barracks, and other signs of permanent occupation, tended to keep up the general distrust of Russia's intentions. The rebellious state of certain portions of the Chinese provinces during 1903, gave cause of serious anxiety to the viceroys, and their fear of anti-dynastic movements even led to the discountenancing of public meetings in Shanghai, called to urge government resistance to Russia's demands. The increased intercourse which has been manifested during the past few years between China and the western powers has tended to bring the vast population into closer touch with western ideas, and the question of to-day is no longer whether the Chinese will tolerate the presence of the foreigner, but which particular nation shall obtain the greatest privileges within the Celestial empire. The rivalry of the different powers concerned in the opening up of China is very keen, and the issue is yet undetermined. Great Britain desires to see the empire freely opened to all traders irrespective of nationality, while Russia and France aim at the acquisition of portions of Chinese territory for their own exclusive advantage. It is this conflict between a partition of China into spheres of influence and the maintenance of the empire in its full integrity,

CHINA AND JAPAN

while opening it up to foreign trade that occupies the attention of diplomats.

Chinese in America.—It is estimated that there are about 100,000 Chinese in the United States, and that 30,000 of them are in San Francisco. There is a considerable Chinese colony in New York, and there are small colonies in Philadelphia, Boston, and Chicago. Though they do not belong to the educated classes, 95 per cent. of them can read and write. A daily paper in the Chinese language is published in San Francisco and another in New York.

Nearly all the Chinese in the United States come from the single province of Kwang Tung, the most populous of the eighteen provinces of the Chinese Empire. Its capital is Canton. Six counties of this province send out most of the emigrants to the United States. In 1900 an educated Chinese from the province of Shan Tung said that beside himself there were only two Chinese in the United States that came from any province in China other than Kwang Tung. The inhabitants of this province have for centuries been more adventurous and fonder of traveling than the rest of their fellow-countrymen, and they are always ready to face danger if there is a good chance of profit.

China and Japan. When in 1823 in response to the Russian ukase claiming exclusive possession of the Pacific coast of North America to the 51st parallel, John Adams told the Czar's minister, Baron de Tuyl, that "we should contest the right of Russia to any territorial establishment on this continent, and that we should assume distinctly the principle that the American continents are no longer subjects for any new European colonial establishments," he not only gave the first clear expression in action to the Monroe Doctrine (q.v.), but he unconsciously perhaps dictated the future history of the Pacific Ocean and in large measure the peaceful progress of China and Japan through American influences. Thus ushered into the world's politics, the United States, after resisting the Czar's demand and by diplomacy alone forcing it back to parallel No. 55, prevented the Russian advance southward in America, and

later gained California, Alaska and the Aleutians with a vast front on the Pacific, then whitened by our whaling and trading ships. Once California and Oregon ours, the incentive was quickly given to tap the markets of Asia and awaken the hermit nations to commerce. After Monroe, Fillmore. The latter, on the day that Mutsuhito, the present emperor of Japan, was born, 3 Nov. 1852, ordered Commodore M. C. Perry (q.v.) to proceed, by the shortest route—around the Cape of Good Hope—to Yedo Bay to negotiate a treaty. Perry's triumph was a "brain victory," won by tact, patience, and consummate knowledge of human nature and especially the Japanese variety of it. He opened a new era in the treatment of Oriental nations, showing how, apart from force, the door of international brotherhood might be opened. On the spot at Kurihama, where, in 1853, stood the pavilion for the reception of the President's letter, rises to-day in Perry Park the memorial monolith inscribed in gold by Marquis Ito (q.v.), to the erection of which the Mikado, leading his people, subscribed. At Yokohama, where the conferences of Commodore Perry and Professor Hayashi were held to discuss ethics, humanity, and treaty business, and the first industrial exhibition in Japan of American tools, inventions, and products was held, the United States consulate and the Union Church have been upreared. Thus led forward, the hermit Japan entered the school of experience whence she was to emerge as the pupil of the Anglo-Saxon nations and the champion of their principles in Asia, and the teacher of China and the middle term between the civilizations of the Orient and the Occident. After her own political commotions, consequent upon the clash of old and new ideas, Japan from 1870 engaged the service of hundreds, yes even thousands, of Yatoi (hired specialists) from America and Europe, to rebuild the foundations of the empire, and for 30 years besides sending thousands of her sons abroad, put herself under the tuition of an army of teachers from western countries who were active in every department. Yet what has been in phenomena true of Japan has been in the working of leaven true of China also, only her larger mass hindering the visibility of real progress. Perry's success with Japan really opened a new era in the whole Chinese world of eastern Asia. The spirit of America's commerce, education, diplomacy, missions, and the political policy of the United States have been the greatest factors not only in the awakening of China, but in influencing and regulating the policies of the aggressive European nations in their dealings with China and the neighbor nations of the Far East. Japan, contrary to popular notions, is a very young nation, being, according to the unanimous verdict of critical scholarship and all the evidence in hand, no older than the Germanic nations, coming to national self-consciousness in the 5th century of the Christian era. Naturally then she has taken quickly to western culture in the 19th, as in the 5th and 15th century. The Chinese, being an old race, with all the limitations of senility are more slow in their mental movements than the Japanese, who show all the peculiarities of a young race. Yet in both empires progress, through the combination of old and new forces, has been real.

Surveying the past fifty years and especially

CHINA AND JAPAN

what has been done within the 20th century, it is well to show still further wherein the Chinese and Japanese are alike or different from each other, and also wherever they have human traits in common and systems in harmony with or in contrast to the nations of the West. We may appraise changes actually wrought and see how far these movements or evolutions are to be attributed to agencies within or without these countries. There are those who consider Japan almost wholly a self-reformed nation, while others think that all transforming agencies have come from without. The truth lies in the golden mean between these extremes of opinion. China's vastness of area and density of population prevent even keen western observers and students and certainly the average Occidental, from any clear perception of leavening principles and transmuting elements within so large and venerable body politic. They may note what is phenomenal, while they are usually blind to the psychic changes in the Far East. Hence, for example, the real energies of the native secret societies and sects within the Chinese empire cannot be definitely gauged, yet that they have been for centuries a real force, frequently showing themselves in both bloodless and bloody manifestations, the last being the so-called Boxer insurrection of 1900, can be demonstrated. That these sects yet exist in great potency is certain. Until Western diplomatists discern that China, equally with Turkey or Russia, and what survives of old Japan, is a church nation, with a fixed creed upheld by the government and maintained by force, and that China always has been, and is still, a persecuting nation, there can be no sound diplomacy. Failure to see this adds mystery to the Chinese problem and accounts largely for the discreditable surprise at the Boxer outbreak in 1900, foreseen by the missionaries, but to the approach of which so many diplomatists in Peking were blind. This politico-ecclesiasticism based on the Confucian writings and philosophy, is the foundation of a social system that has survived the fall of over 30 imperial dynasties, and is still at once the most potent check upon and the choicest weapon of government, whether by pure Chinese or alien rulers like the present Manchus. Hence to attack that dogmatic system is treason in a native, a horrible offense in a foreign missionary, and only tolerable in the Mahometans because they are so numerous and powerful. The maintenance of this dogma by the sword of the normal magistrate, himself *ex officio* an orthodox Confucian, has been the cause of persecutions during the ages with bloodshed abundant. This is the real reason of so many reactions, and of repeated disappointments. China has again and again raised hopes among Occidental people that she was about to modernize her laws and people, only to dash the expectation of optimists to the ground. Even in this 20th century she has, after founding schools and universities, apparently on modern ideas, even appointing American and European officers and teachers, cast these persons aside, and neutralized their methods, ostensibly because natives or Japanese were preferred, but in reality to maintain her dogma of Confucian orthodoxy, because the decrees from Peking demand adherence to Confucianism. Whatever modifications China has made in her system are

as yet simply external, nor will there be any real progress in the western sense of the word until Chinese bigotry and persecution are abandoned and the union of church and state given up. The plea of China is that innovators under the pretext of progress are seditious and that reforms by natives mean republicanism and thus destruction of the dynasty. But this is only another phase of that Chinese indirection of mind, which Dr. Arthur Smith in his book on 'Chinese Characteristics' has so exposed with such masterly skill. The certainty of the Chinese union of church and state, the instances of bigotry and bloody persecution, and the great slaughter of Chinese in the name of orthodoxy during past ages, making the Chinese government a shedder of blood for opinion's sake, quite equal to Russia or the mediæval states of Christendom, are shown by that life-long scholar of Chinese, J. J. M. DeGroot of Leyden, in his monograph, 'Sectarianism and Religious Persecution in China.' In weight of scholarship based on original research this work outweighs all that has thus far been written on the subject of China's politico-religious status. In the future these sects will doubtless play a very important part, and probably with more effect on China's internal structure, than either the Tai Ping rebels or the "Boxers" (q.v.). Such possibilities must exist as long as China represses thought and opinion for conscience' sake by her absolutism in religious matters. Nor is it likely that she will find any better solvent for her problems than the complete separation of church and state and the granting, not only of academic freedom, but of perfect liberty of conscience to her people. So long as she refuses to grant such liberty, both in the school and to the masses, there will be no end to internal disorders and to foreign complications. In this matter of self-reformation, as the past has already proved, the elements tending to reconstruction and the evolution of the Chinese into the modern man are most likely to arise from among the natives who have been educated or helped by the teachers from foreign countries. The overwhelming majority of such men of modern mind are Christian, though others are far from lacking. Almost all the knowledge of China by the Western world comes from aliens, who have studied, surveyed, and described the country, and who in addition to propagating their dogmas have given the Chinese pretty nearly all the exact science they possess. One cannot ignore the services of those physicians, engineers, advisers, financiers, customs officers, who, with or without Chinese pay, have for a century or more served China's people. It was an American, Ward, who showed the possibilities of the Chinaman as a soldier. What other Americans have done in China is set forth in the book 'America in the East.' It was an American, S. R. Brown, "A Maker of the New Orient," for example, who established the first (Protestant) Christian school in China, brought the first Chinese students to America, and demonstrated the ability of the Chinese youth to absorb Western learning and methods. Among his pupils was Yung Wing, who, after graduating with honors from Yale College, brought to the United States under government patronage, six score Chinese lads as students, one of whom was Sir Liang Chang, the present Chinese envoy at Washing-

CHINA AND JAPAN

ton. In a word the efforts of the lay and clerical teachers, helpers, and healers of the Chinese, especially since the opening of the ports, and within the last 60 years, reveal a force that has, in the peaceful American, rather than the conquering Russian way, helped to give credibility to the prophecy of one of the greatest of China's foreign teachers, S. Wells Williams: "The regeneration of China will be accomplished like the operation of leaven in meal, without shivering the vessel."

The Japanese are not compacted wholly of Oriental stuff. They differ from the Chinese physically and psychically. Though they form a race having in it many elements, Tartar, Korean, Malay, Nigrito, etc., their basic aboriginal stock, the Aino, is very probably a branch of the Aryan family of humanity, and the Japanese are thus allied in some measure with the "white" races. In mind and temperament they differ from the Chinese, not only as insular people dwelling on volcanic soil constantly shaken by earthquakes, may be supposed to differ from continentals inhabiting stable lands in river valleys, but also in culture and aims. The Chinese are ethical, the Japanese esthetical. In China filial piety is the cornerstone of civilization, in Japan it is loyalty. The archipelago produced the samurai—soldier and scholar in one. The mainland generated the literati who despise the soldier. In Japan the centre and abiding element of all is the dynasty, one and unbroken during written history, for fifteen hundred years. In China the binding force is the social system, independent of figureheads in the capital, abiding through many changes of rulers but ever crowned by a religious system that tolerates no other and looking on all other cults as alien and dangerous. Even in old Japan we discern a church nation. Religion and politics though not nominally united were practically one, and bloody persecutions were far from unknown. Even yet the germs of fanaticism and persecution are not wholly eradicated though perhaps nearly so, nor can they be so long as academic freedom is curtailed or religion is in any way made an official engine of government. In the early ages of unwritten history the conquest of the primeval tribes of similar ethnic stock and of the Ainos in Japan was by the force of the dogmas of Shintoism (the primitive religion or Divine Way) as well as by superior arms and valor. The Mikado was the regent and deputy of the gods of heaven and earth, and church and state were one. When Buddhism with its superior refining and elevating forces came to civilize the Japanese barbarians, this Aryan cult overshadowed Shinto, but was none the less the great breeder of action and reaction in the life of the nation. When its missionary activities ceased and the nation was Buddhaized, Buddhism became itself the superior influence in politics, reducing the Mikado to a shadow, thus paralyzing the central authority, making the throne a mystery instead of a power. Buddhist monks organized as armies and not only overawed the emperor, but among warring feudal lords decided questions at issue even on the battlefield. Smitten down by Nobunaga (1533-82) and its power for a time curtailed, Buddhism was again patronized by Iyeyasu (1542-1616) in 1600 and made the popular religion, and its priests sent as sleuth hounds to

hunt down Christian believers. Roman Christianity was thus suppressed by the sword and ever vigilant inquisition. While the people were ruled by the bell of the bonze, the gentry and scholars who studied Confucianism and made it into a code of ethics, a philosophy and a creed, were given to understand that no departure from the official orthodoxy approved in Yedo would be tolerated. As matter of fact scores of executions of good men under the Yedo bureaucracy were brought about because of philosophical heterodoxy whenever and wherever associated with alleged sedition. It was in the name of the government, also, that imprisonment and death were denounced upon all who should believe in the "evil sect," or Christianity. When in 1868 the Mikado's government assumed supreme control of the empire (one of the powerful elements of the revolution being the revival of the ancient Shinto dogmas and ritual), the old death-dealing anti-Christian edicts were once more republished and enforced. Thousands of suspected Christians near Nagasaki were imprisoned and distributed all over the country. Under strong diplomatic pressure these prisoners were released. When the Japanese embassy in America and Europe saw themselves abhorred as uncivilized because of their persecuting tendencies, the edict boards were taken down. The natives were left free to organize churches and publicly propagate their Christian tenets and steady progress was made until in the constitution of 1889, full freedom of conscience was granted in the famous Article No. XXVIII.: "Japanese subjects shall, within limits not prejudicial to peace and order, and not antagonistic to their duties as subjects, enjoy freedom of religious belief." In his commentary on this article, the Marquis Ito, called the "Father of the Constitution," writes, "Freedom of conscience concerns the inner part of man and lies beyond the sphere of interference by the laws of the state."

Nevertheless, since there is no real liberty when conscience is bound or scholarship fettered, it is not yet true in Japan that perfect freedom of belief, writing and publication is openly allowed to any one in government pay. When in recent years a learned professor, examining the ancient literature showed that the use of Shinto (which was never formulated into a system or given its name until after the introduction of Buddhism) as an engine of government was not justified, and that the claims of the Mikado to a divine origin rested on very slender foundation, because lacking documentary proof, and that the whole system of ancestor worship was not a part of original Shinto, but was borrowed from China, he was punished by being put out of his position and retired on half pay. Yet, though academic and religious freedom is not absolute in Japan, it is relatively so full and generous, that it must serve as an increasingly powerful example to China, nor will China be rid of her manifold complicated difficulties with both natives and foreigners until such religious freedom, as is guaranteed to the Japanese in the fundamental law of the empire, be made the privilege of the Chinese also.

In so far as freedom in the deepest things affecting man is won and guaranteed, does other freedom follow. China's conceit of her theo-

CHINA AND JAPAN

retical perfection of government and of her own long supremacy among pupil nations prevented her from that recognition of the rights and privileges not only of other nations but of her own people. When a Chinese subject left the frontiers of his own country, he was ignored by his government and what happened to him abroad bred no concern at Peking. The Chinese rulers, to whom China's golden age was in the past, had no suspicion of any civilization superior to their own or knowledge of progress in other lands. To her court for ages had come only vassals or pupils, but in our day economic pressure from the outside, the Western men's desire for trade, the wars and aggressions of foreign countries compelled her to recognize merit and even superiority elsewhere, and gradually China began sending commissioners and embassies to other countries, the first modern instance being the appointment as Chinese envoy to the United States and European powers of the American, Anson Burlingame, who had won the confidence of the government at Peking. Much that was expected of this embassy failed to come to pass because the Western nations were probably as sturdy in their conceit as the Orientals and expected all changes in Asia to come by imitation of Western ideas and methods, whereas genuine international progress comes only by mutual influence. In 1868 the first real treaty made by China, in which the principles of the world's international law received recognition by the Chinese government was negotiated, when reciprocal privileges were granted to the two contracting powers, China and the United States. Mr. Burlingame negotiated other important treaties with Denmark, Sweden, Holland, and Prussia, but died in 1870, while arranging the terms of a treaty with Russia. We say "the world's" international law, for, so far from the name or the thing having originated in Europe, there was for centuries an international law in the Chinese world or orbit of influence in eastern Asia, governing the relations between the great central empire which occupied a position among subject and neighbor lands which the old Roman empire did in the western part of the Eurasian continent. The experience of this Far Eastern international law included such situations and episodes as the frequent despatch and reception of envoys of various grades and for many purposes, concerning which there was a fixed etiquette and a code of rules, the growth of centuries. Among the questions treated in these international communications are those of a "protected state," intervention, defensive and offensive alliances, treaties of peace, naturalization, the treatment of prisoners of war, rules in regard to pillage, even of places taken by assault, the protection or destruction of private or public property, the protection of exempted persons, especially women and priests, the guarding of the edifices of religion, art, and science, the respect due to messengers and bearers of flags of truce and concerning the instruments of war and means of destruction. One may thus easily see that Japan's hearty adoption of the modern laws of nations is no mere borrowing or imitation of things unknown, but that the diplomatic discipline of centuries enables her easily to keep equal step with the most highly civilized nations in those cour-

tesies and proprieties of which Christianity is the informing spirit. To these humane customs and usages Chinese, Japanese, and Korean history bears witness in hundreds of instances, but modern international law as formulated in the West received its initial recognition in China in 1868 under Burlingame. The epochal year of 1868 was the same in which Japan signed the treaties made with the Yedo shogun in the Mikado's name. Perry and Harris had treated with one who was only the Mikado's lieutenant at Yedo, but taught in the new school of international law by the American envoys the men who made the new government at Kioto formally adopted the principles of the laws of nations, and in frank acceptance of these principles began to relay the foundations of the empire, besides adopting representative government and civilized customs generally. When therefore the first great occasion arose between the two Asiatic states and always jealous nations, Japan and China, a still further development took place. Especially in the classic instances of the Peruvian ship *Maria Luz* in 1872, and the invasion of Formosa by the Japanese in 1873, was this seen. The Japanese government, having made inquiry into a cargo consigned to Callao, which was a human freight of Chinese laborers from Macao and held against their will, released the coolies and shipped them to China, a favor which was gratefully acknowledged by the Peking government. The so-called pagan nation of Japan achieved a great moral victory in breaking up a certain kind of slave trade which by euphemism was called the coolie traffic, while the very act shamed China into taking better care of her people. The results were soon manifest. For the first time China sent out commissioners to look after her own subjects in foreign lands, and her envoy going to Cuba and Peru refused to enter into treaty obligations with any South American state as long as a single Chinaman remained in the country against his will. Despite all protests of foreign consuls and ministers the Japanese persevered. Having freed their own *eta* or *pariahs*, they liberated the Chinese slaves in their own waters. This was the beginning of the establishment of Chinese consulates and legations throughout the world. To-day we find the Chinese increasingly social. The once hermit is in the world's market-place. The Middle Kingdom is represented in the Universal Expositions. Whereas it has been the rigid rule that a prince of the imperial blood must never spend a night outside Peking, we find, in 1904, the heir apparent to the throne, Prince Pu Lun, traveling in America. In 1874 after the wreck of a Riu Kiu junk on the coast of Formosa and the killing of the crew by the head-hunters, Soyeshima, the Mikado's minister, went to Peking and received audience with the Chinese emperor, standing upright though dressed in Western costume. He obtained from the Tsung-li Yamen the disavowal of responsibility over Eastern Formosa to which China laid no claim, and from the maps of which country it was omitted. Nevertheless after the interview, and when 1,300 Japanese soldiers had occupied Formosa for six months and chastised the savages, the mandarins of the capital, incited by foreign influence in Peking, awoke in wrath and shame, declared the Japanese intruders and menaced the island empire with

CHINA AND JAPAN

hostilities. Okubo (q.v.), sent by the Mikado to Peking, refused to treat in the matter except on the basis of international law. By this, war was averted and henceforth the world's legal standard was appealed to in all matters relating to Riu Kiu, Korea, and other questions in dispute, but with a tendency on the part of China to relapse into old tradition and custom, not being able to forget that she was no longer the "Middle" Kingdom. For example, the Chinese emperor Shunchi (1644-61) had written, "But now all lands both Middle (that is, China itself) and foreign, have become united into one vast empire, so that the whole earth has become one family and all the people of foreign countries are my children." When, therefore, Japan in 1870 occupied the Riu Kiu Islands and abolished their dual sovereignty, China protested, though not until 1874, and then in language of an exceedingly undiplomatic nature. After a long and somewhat acrid diplomatic correspondence, the controversy reached a dead-lock, when in the summer of 1879 Gen. U. S. Grant visited Peking. Prince Kung placing the matter before the American ex-President, bespoke the latter's assistance. This eminent American refused to pronounce any opinion on the merits of the case, but on his arrival in Japan, proposed unofficially to the Mikado's ministers a solution, and advised the Chinese government to withdraw their offensive despatches and appoint special commissions with full power to settle the matter. This proposal was accepted. An imperial commission was created by the Mikado's proclamation, and Mr. Shishido was appointed plenipotentiary commissioner to treat with Prince Kung and the ministers of the Tsung-li Yamen, the conference beginning its sittings on 15 Aug. 1880. The draft of the treaty was finished on 2 October, but the caprices of Chinese statesmanship were then beyond the range of ordinary prudence, and the action of the Peking government showed that they did not yet understand fully the meaning of the term "plenipotentiary commissioners." After 26 days' delay, 16 of them being after the date fixed for the signatures to the treaty, the matter was taken out of the hands of the high commissioners and transferred to the northern and southern superintendents of trade. This action turned the whole affair into mockery and began in the Japanese that sense of outrage which made them prepare for the possibilities of war, especially as the question of Korea (q.v.) was still unsettled.

In 1876, three years before, Japan had made a treaty with Korea as an independent state, which precedent, curious as it may seem, China assisted the United States, through Admiral Shufelt to follow, looking complacently on also while other nations, England, France, etc., did the same, each treating Korea as a sovereign and independent state. Nevertheless, while the notion of a vassal state's acknowledgment of dual sovereignty was unknown in the West, it still existed in the Chinese mind and the Middle Kingdom gave no sign of yielding her hold upon Korea as a vassal state. There seems little doubt then, that by 1880, the intelligent statesmen of Japan foresaw and the Japanese military men prepared for a war with China. Events and experiences in Korea during the next 14 years served but to change a suspicion into a determination.

When in 1894, this war broke out, it was evident that both nations had made vast progress in both material civilization, and in those gains which are associated with the triumph of mind in law and morals, revealing clearly by startling contrast both the homogeneousness and thoroughness of the progress of the smaller and the looseness of organization in the larger country. Japan, quickly responsive to a central will, seemed like an athlete in possession of all his powers, while on the other hand there was with "the boneless giant" progress only in lines and spots, the work of partially modernizing China having been chiefly that of a few resolute men, while the great body politic seemed to be insensitive, and vigorous for offence and defence only in portions. Strictly speaking, there never was any war between Japan and China, but only a war between all Japan and a few of the maritime provinces of China. The American, Ward, and the Englishman, Gordon, had shown what the average Chinaman could make of himself as a soldier, when properly drilled, commanded and influenced by example. Under these men, Li Hung Chang (q.v.) was converted to the value of the material forces in Western civilization. Adopting these, and being viceroy of provinces nearest to the capital, he organized an army drilled by German officers, and had the promontories of Wei-hai-wei and Port Arthur, guarding the sea gates of the capital, fortified and the Taku forts commanding the Pei-ho River rebuilt according to modern principles of defence and engineering. Gradually an efficient fleet of battleships, cruisers, and gunboats was organized. A beginning had also been made in China of railways and steamship lines. One part of China's vast system of revenue, "the imperial customs" of the empire, elaborated since 1863 under the British Sir Robert Hart, and honestly administered, has given China her surest source of cash income for general purposes and the purchase of foreign equipment of every sort. For an individual or government service to be free from bribery and routine corruption seems to the normal Chinaman something unearthly, and the imperial customs under Sir Robert Hart have won unbounded admiration from the Chinese. In 1894, when the war broke out which did so much to prick the bubble of Chinese prestige of greatness and mass, and which, paradoxical as it may seem, evoked mutual respect and drew the Chinese and Japanese more closely together in reciprocal understanding, China had, in addition to her military mobs in the various provinces, the beginnings of scientific military system. This in time might have become national. Even then as seen to undiscerning foreigners China appeared from a military point of view invincible. On the humane side of provision for sick and wounded soldiers and in the nobler features of civilization, China was woefully deficient. As soon as hostilities broke out the vast difference between the two nations was manifest. China went to war without surgeons, hospitals, nurses, or the manifold apparatus of civilization for protecting non-combatants, saving life and mitigating the horrors of war. China had not yet become a signatory to any of those conventions of nations in the interests of mercy, nor was there a Red Cross organization within her borders. Her recognition of the international code of war was

CHINA AND JAPAN

slow and her acceptance of it slight. On the contrary Japan, having her object lessons given by Christian missionaries had provided hospitals, surgeons, Red Cross Society and equipments for surgery, healing and hygiene, and these were in splendid condition, while 1,400 trained nurses were ready for work. Japan had in 1887 signed the Geneva and other conventions and had diligently educated her army officers in the commentaries and usages of the signatory nations, while her naval commanders were well versed in the laws of search and capture. When in 1894 her fleets and armies went forth into Korea, Manchuria, and China proper, there was with each field-marshal, besides a hospital corps ready to minister to friend or foe, an expert lawyer, versed in international law, who went as adviser to see that nothing was done by the Japanese which should infringe the laws of nations. Two notable books, 'International Law During the Chino-Japanese War,' by S. Takahashi, and 'La Guerre Sino-Japonaise au Point du Vue du Droit Internationale,' by Professor N. Ariga, the one from the military and the other from the naval college in Tokio, are the literary monuments of this habit of the Japanese, which, in 1904, has developed into a college of five international law experts. These, after being consulted at all points during the progress of the negotiations of 1903-4, have gone upon deck and field with the military and naval men into Manchuria to insure, in every detail, harmony with the laws of nations.

The war of 1894-5, which wrought such great results for the world at large, is worth reviewing in its main outlines, since it blew to pieces and forever China's doctrine of Whang-ti, or world-sovereignty, the tenacious adherence to which over Korea had brought on the war. After being again served by China as they had been in the Riu Kiu matter, the Japanese determined to take no further chances with her rulers. In Korea, after the bloody struggle in Seoul between the native Liberals and Reactionaries in 1884, followed by the armed conflict between the Japanese and Chinese troops, a convention was made dated 7 May 1885 between Li Hung Chang and the Marquis Ito, that both governments withdrawing their troops, would not again land soldiers in Korea without mutual agreement. For awhile there was peace in the Land of Morning Calm, but when the Tong Hak uprising took place, the soldiers from Seoul were overcome and the whole kingdom seemed to be in danger of anarchy, the pro-Chinese faction at court asked for aid from Peking to put down the rebels. Then to the amazement of the world the Chinese government violated the treaty of 1885 by first forwarding troops and then notifying the Japanese minister in Peking, using the words "our tributary state" concerning Korea. China thus reasserted her ancient claim of suzerainty over Korea as a vassal state, notwithstanding that Korea had been recognized as sovereign and independent by Japan and other nations. The government in Tokio interpreting this as a direct insult, on 12 June 1894 announced the despatch of a body of troops under strict discipline to Seoul and five days later invited China to undertake with Japan financial and administrative reforms in Korea in order to preserve the peace of the Far East. The Peking government

curtly refused and demanded the recall of the Japanese troops. The reply from Tokio was that pending an amicable settlement of questions in dispute, any further despatch of Chinese forces into Korea would mean war. China had already ordered her soldiers in Manchuria to cross the Yalu River, and having chartered the British ship Kow-Shing despatched 1,100 soldiers to reinforce the Chinese camp at Asan in Korea.

What follows the world knows. With astonishing secrecy and celerity, the armies of Japan occupied Korea and after the decisive battle of Ping Yang drove the Chinese out of the peninsula, crossed the Yalu and in Manchuria conquered an area larger than their own empire, while her navies wiped the Chinese fleet off the ocean and captured the great fortresses of Port Arthur and Wei-hai-wei. After annihilating nearly all the drilled troops of China at Ping Yang, the Japanese fought military mobs, making war chiefly with the forces of only a portion of the empire. During the war the majority of the Chinese people scarcely knew that there was any real hostilities adverse to their empire, nor did they learn for years afterward just what had happened, but the military success of Japan opened the eyes of Europe and enlightened some of the Chinese mandarins and scholars. To-day we find China with a new army, formed on modern principles and drilled chiefly by Japanese officers, while in June 1904, having become a signatory to the Geneva and other conventions made to mitigate the horrors of war, she has entered still the pale of civilization, which means the world in brotherhood.

The Japanese stung to the quick, because neither China nor Western nations had recognized them as highly civilized people, were confirmed in their pride and resolve to make the so-called white race understand and appreciate them, when Russia, France, and Germany joining to deprive them of the lawful fruits of conquest, forcibly compelled them to be satisfied with the cession of Formosa and indemnity in money. Had the Japanese been possessed of four battleships, they would in 1895 have declared war against Russia. As it was, they who never forgive an insult, resolved to nurse their wrath, keep it hot by buying battleships, and in cool science and unwearied perseverance began to invent explosive powders, perfect munitions and equipments and enlarge an army and a fleet that should some day wipe out the insult, and show that the Japanese count none on earth as their superiors. Meanwhile China, profiting by her fresh experience in humiliation, began to inquire more earnestly into the secrets of Western power. A tremendous impetus was given to the reading of all kinds of information about Japan and the Western nations, to the building of railroads and to the renovation of educational methods. The ferment of ideas caused something like a great reform movement in 1897, which, led by progressive literati and apparently sanctioned and even controlled by the young emperor, seemed apparently about to sweep over the whole empire. New schools and universities were planned and a newspaper called 'Chinese Progress' was published. The purchase and sale of official rank was to be abolished. The stirring and patriotic brochure "China's Only Hope," recommended

CHINA AND JAPAN

by the emperor, fed the flaming zeal of the reformers who were led by Kang Yu Wei. Even the abolition of the queue, the changing of the Chinese national dress, the adoption of the Christian religion, the calling of a national parliament and a journey of the emperor and empress dowager to Japan to see for themselves the pitiful condition of China were advocated in memorials. Reform seemed to be ready to spread like a prairie fire, when suddenly in September, Li Hung Chang was dismissed from office and the emperor virtually dethroned by the Empress Dowager. This act "carried within itself the fruitful seeds of the Boxer outbreak." Yet although the missionaries felt what was in the air, the diplomatists looked on the episode as a "Manchu family quarrel," and ignored the warnings of those living close to the masses of the people.

Meanwhile the disturbing influence of American prosperity and expansion were felt in both Europe and Asia. Within a year after Pittsburg achieved the supremacy of the world in the making of cheap steel, Russia, Germany and Great Britain "precipitated themselves upon the shore of the Yellow Sea, grasping at the positions which had been conquered by Japan and for the same reason,"—to obtain possession of the rich coal and iron deposits in Shansi, said to be "worth ten Pennsylvanias." Germany seized Kiao Chau, Russia Port Arthur and Great Britain Wei-hai-wei, in readiness for the supposed impending "Break-up of China" and its expected partition. The torpedo that sunk the *Maine* in Havana harbor interrupted the European programme, postponed the partition of China, and united the British, Americans and Japanese in the determination to keep China intact and the door of commerce open. In 1900 the United States, now a world power, was in Asia with force and had a policy—the policy of freedom and uplift—which for a century or more, the Americans in Asia, as traders, teachers, healers, and apostles of democracy and fair play had been steadily developing. Meanwhile in China the old territorial integrity could not be so ruthlessly violated nor the ancient social systems invaded without protest. The introduction of railways had thrown thousands of men out of old methods of employment. The tremendous commercial intrusions, which disarranged old customs and made the problem of livelihood to millions so very serious, brought on a fierce reaction both of the scholars and the people and especially of the Buddhist priests, creating an atmosphere and environment most favorable for the outbreak of another of those sectarian revolts against the official orthodoxy of China, to put down which the Chinese have shed more blood perhaps, than all the religious wars and inquisitions of Europe. This time the heresy was joined with and the cry raised in the name of patriotism. The heretics became the people called "Boxers" or the Fists of United Harmony. The triple pressure of hunger, superstition and patriotic revolt at the territorial incursions of the foreigner at last burst out into a storm, which in blind wrath against everything alien, smote first the railways and foreign workmen and then the teachers of the foreign religion and their converts. The mob reached Peking and surrounded the legations, which were hastily isolated, fortified and for months

successfully defended. The foreign powers hastily made preparation to defend and then succor their nationals, but the United States seemed to be the only one that beside its prompt despatch of a military force had a definite policy, which was in recognition of the sovereignty of China to relieve its own citizens and then withdraw its military from Chinese soil. It is absurd to suppose any real harmony or co-operation between the orthodox Chinese government and the heretical Boxers. Whatever be one's opinions on the subject or the form of the encouragement alleged to have been given directly by the Empress Dowager, it is a fact that no hostile shot was fired by a Chinese regular soldier or sailor, until the seven allied nations, in which the Americans were not included, had made war on China by firing on the Taku forts, 17 June 1900. Against this unwarranted proceeding and overt act of war the American Admiral Lewis Kempff protested, and in the crime of attacking peaceful Chinese he refused to participate, his conduct becoming the basis of the triumphal diplomatic policy of the United States government. Briefly stated, the situation was this: A riot of fanatical sectarians, moved by economic and patriotic motives, rose in rebellion against the government already impoverished and weakened by foreign aggression. When unable to put down the uprising in Shan-si, the Pei-ho valley and the vice-royalty from which Li Hung Chang had been removed—though the whole Boxer movement was wisely handled and thoroughly suppressed by able viceroys in the central and southern parts of China—the seven allied nations made war on China in the bombardment of the Chinese forts. When also the Chinese, of course, attacked their enemies in Siberia, the Russians perpetrated the massacre at Blagovestchenk and then marched their soldiers to Peking. The combined relieving force fought the opposing Chinese. The Japanese, having the largest and best furnished of the contingents, led the van. The Russians as very slow marchers came next, so that the American and British contingents had to march during the hottest hours of the day. It is certain that the celerity, character and discipline of the Japanese soldiery on this expedition excited the surprise and admiration of military critics of every nation represented, while on the other hand the familiarity of the men of Nippon with those of Muscovy bred contempt of Russian slowness, heaviness and low grade of intelligence in the *mujik* or common soldier of the czar.

After the capture of Tientsin 14 July, the Japanese or Americans alone could then have pressed on and relieved Peking within a fortnight, but jealousies and unnecessary delays kept the relieving column idle until 4 August. The unspeakable robberies, violation of women, brutalities and generally barbarous conduct of the most of the European troops, by the way and in the capital, demonstrated the hypocrisy of the claim to be called Christian and in contrast to the conduct of the Japanese proved that the terms "Oriental" and "Occidental," as applied to morals, are purely traditional and destined soon to pass away. The Imperial city was captured on 15 August, the Chinese court escaping to the westward and remaining away from Peking until January 1902. On 28 August bodies of soldiers, representative of the

CHINA AND JAPAN

eight allied nations, marched through the Forbidden City as a token of China's humiliation. Li Hung Chang was recalled to office and with Prince Chang commissioned to treat with the Powers, only one of whom, the United States, seemed to have a definite policy. During the "peace" negotiations, the Europeans kept up a series of attacks and massacres of Chinese called "punitive expeditions" which in general character were a disgrace to civilization. An indemnity equal to \$330,000,000 was imposed on the Chinese government in expiation of the Boxer outrages, and for her self defence in the war following the attack on the Taku forts. Various safeguards for the legations were arranged and agreed to, the importation of arms and ammunition prohibited, and the Tsung-li Yamen was transformed into the Ministry of Foreign Affairs which was to take precedence of the other ministries. Except legation guards, the foreign troops were to be withdrawn in September 1901. The Imperial edict of February 1901 accepted the terms imposed. On 9 April 1902, the Manchurian convention between China and Russia received the imperial seal. The Russians were to evacuate Manchuria within eighteen months, but to retain control over the railroads.

It was after this Boxer uprising that what we have called the Russian and the American foreign policies and systems of diplomacy had by contrast their most signal illustration. As soon as order was restored and the preliminary diplomatic arrangements made, the United States recalled all its military force, except a small legation guard, asked no favors in return for what had been done, and not only emphasized her recognition of China as a sovereign Power, but set a commendable example to the other governments by dealing justly with the Chinese in the matter and method of payment of the indemnity, thus illustrating again the fixed American policy of helping rather than taking advantage of Asiatic nations. Russians, on the contrary, demanding the right to occupy Manchuria with her troops and to make Port Arthur the terminal of her Siberian railway, began thenceforth the military possession of Manchuria, the building of the city of Dalny (q.v.), and the making of Port Arthur (q.v.) both a city and an impregnable fortress, and initiated various other enterprises on a vast scale, costing hundreds of millions of roubles, all of which suggested a prospective ownership in fee simple, rather than temporary occupation, notwithstanding that she solemnly covenanted to evacuate on the 8th of October 1903. The United States believing in the good faith of the Muscovite government and in accordance with her policy of recognizing China's sovereignty, appointed consuls for the three cities in Manchuria which by treaty agreement were to be thrown open to the trade of the United States. When the appointed time drew near, there was no indication of any purpose on the part of Russia to keep her agreement. As early as 28 July 1903, the Japanese government expressed to Russia its alarm at the Manchurian situation. When Russia formulated new demands at Peking and seemed to consolidate rather than relax her hold on Manchuria, showing also increased activity along the Korean frontier, doubts were raised in Tokio as to the limits of Russia's ambition. Through his minister in

Tokio, Baron Komura and his envoy, Mr. Kurino in Saint Petersburg, the Mikado notified the Czar through Count Lamsdorff that wishing to remove every cause of future misunderstanding he desired to enter "upon examination of the condition of affairs in the Extreme East, where their interests meet, with a view to a definition of their respective special interests in those regions." Negotiations were opened and after long delay on the part of Russia the Czar announced that while willing to respect the independence and territorial integrity of Korea, Russia declined to extend the same engagement to China and requested Japan to acknowledge Manchuria and its littoral as entirely outside her sphere of interest. The Czar furthermore requested the limitation of Japanese control in Korea, even proposing a mutual zone covering all Korean territory north of the 39th parallel. Other negotiations, followed by exasperating delays in Saint Petersburg, took place, Russia meanwhile heavily reinforcing both her army in Manchuria and her fleet in eastern seas, purchasing and transporting also large stores of ammunition and coal to Port Arthur. On the 5th of February, Japan telegraphed the termination of her negotiations, severing diplomatic relations with Russia and withdrawing her legation. Then followed hostilities, begun simultaneously, both parties claiming that the other had fired the first hostile shot. In the war that followed, the Japanese surprised Europe with the rapidity and brilliancy of their victories on land and sea, China remaining neutral except to take precautions against the violation of her frontiers. At the request of the German Emperor, the American secretary of state urged upon three of the nations most interested, the limitation of the area of hostilities, to which they promptly responded. From the side of the Japanese it must be remembered that they were smarting under the sense of long-continued Russian aggression in Saghalien and the Kuriles, begun very early in the 19th century. In 1861 a Russian man-of-war proceeded to the island of Tsushima, on which the Russian flag was hoisted and a settlement was made (though not until Japanese blood had been shed in resistance), which would have constituted a title of ownership had not Great Britain interfered. The Russians were finally compelled through British intervention to abandon their claim and leave. By the usual plan of "joint occupation," which in the Ussuri province of the Chinese empire had ended in China's loss of a territory as large as France and its incorporation into the Russian empire, the Russians gained complete possession of Saghalien. After the restoration of the Empire in 1868 it was foreseen by the Japanese statesmen that Russia would be their chief danger, for already signs of her movement in Korea were menacing. This fact was the strongest determining element in the creation in 1871, in place of the old clan contingents, of a powerful army and navy for national defence.

It is more than probable, as history has clearly shown in the past and as the racial constitutions intimate, that progress in Japan and China will proceed from varying levels and in different channels. In the island Empire the centre of national life is in the one unchanging dynasty and national amelioration has issued from the government downward. Any sure advance for Japan in the future will be from the

CHINA DECORATION

same source and in a similar direction. On the contrary among the Chinese people, to whom the existence of this or that dynasty makes no vital difference, reform will arise in and proceed through their social system and not from throne or court. In China real and permanent progress has been less through anything done in Peking than directly traceable to the work of men who rose from the people and who had been instructed by foreign diplomatists, teachers or missionaries. These men have trained the people through the schools, the press, the churches and the hospitals, reaching all parts of the empire by means of the printed word, book, tract, newspaper, or by personal influence upon China's leading men, whether in or out of office. In Japan before Perry's advent there were hundreds of men already enlightened, keeping eye on European aggression in Asia, and moving for the unification and reform of the nation. The great motive supplying the force of their lives came from no foreigner but from their own inborn patriotism and self sacrifice. Nevertheless, when fullest credit is given to the propulsive power of her Bushido, or the Knightly Code, it must be remembered that Japan, after her first contact with Europe, never was truly a hermit nation. For two hundred years or more the Dutch at Nagasaki fertilized the Japanese mind, keeping open not only the door of outlook on and information from Europe, but nourishing the Japanese intellect with exact science, varied knowledge and the applications of occidental methods especially in medicine and the mechanical arts. In 1853 it was strenuously charged by the Conservatives who wished the country kept shut that only the native "Dutch scholars" wanted the empire opened to commerce and western influences. In 1868 when the men rich in Dutch culture and the "Mikado-reverencers" gained possession of the imperial person in Kioto, they began to relay the foundations of the empire by seeking for knowledge in every part of the world. Teachers, advisers, engineers and experts of all sorts were imported by the hundreds, who during thirty-five years have literally taken off their coats and, by example and teaching, re-draft and handicraft have shown the Japanese how to do those very things which they are now doing so well. The configuration of the Japanese Islands has fitted them to profit to an extraordinary degree by the adoption of the forces of steam and electric communication at a time most needed, that is, immediately after the abolition of feudalism and in the transit to industrialism helping to unify them politically and consolidate them into a marvelously compact nation. In China, railways will re-distribute into wholesome evenness of proportions of tableland and littoral, the population now congested in the river valleys and alluvial plains, will develop and distribute the wealth of the mines, will abolish the almost periodical famines, and by adding healthy movement and contact of the inhabitants of distant provinces develop in the Chinese that patriotism (as distinct from race pride which is already so intense), the lack of which has been the cause of China's many woes, and will give that middle term of a large intelligent and practical body of men of affairs between the throne and the masses, so notable in Japan and which China so sadly needs. The progress in both Japan and China has neces-

sarily been thus far mostly of the material, educational, and economic sort, for neither the Chinese nor the Japanese take kindly to the abstract thought or science of the West. It is an exceptional thing to get a Japanese or Chinese to listen patiently to the presentation of even the outlines of a metaphysical or abstract argument or proposition. Hence, therefore, in its doctrinal form, Christianity has made but slight progress, and the chief experience noted by foreigners in the reception of an Occidental creed of any historic name by Chinese or Japanese has been its simplification. It seems quite certain that Christianity as known and practised by the countries of the Extreme Orient is to a very hopeful degree expressed in practical forms or in reform. Nor is it at all likely that in accepting what Jesus taught these peoples will ever receive or assimilate also that Greek philosophy, Roman tradition and doctrinal achievement, and the ethnic peculiarities which form so large a part of popular Christianity in America and Europe.

The chief role which the Japanese are to play in the future—with probably the development of reserves of power greater than the average Occidental suspects in them—will be as the teachers of the Chinese, who number one fourth of the population of the world, by interpreting to the sons of Han the civilization and systems of the West, themselves acting as the middle term between Occident and Orient.

This article does not pretend to picture or set forth in detail the external progress which Japan and China have made in revenue or development of natural resources, or to tabulate by statistics the possession of the material forces of the West as seen in railways, steamships, lighthouses, telephones, etc., and the manifold application to the comforts and conveniences of life of western inventions. So long as the ideas bred by a rigid Confucianism or the hardening of those ancient Chinese and Japanese traditions and dogmas which once were living forces of progress, but which have long since become obstacles to growth, prevailed in these lands, there could be no real progress. All changes which seemed progressive would be mere surface efflorescence rather than organic and vital growths. With the adoption of universal principles of truth, as formulated in science and illustrated in the lives and work of good men and women, the old mists of superstition pass away, the matted growths of tradition are plowed up, and the mental soil of the Chinese and Japanese lies open to receive the seeds of new and perennial progress. Those who look beneath the surface have every reason to believe that the progress of the past fifty years in China and Japan has been as genuine, and will be as fruitful for the good of the race as that made in the western world.

WM. ELLIOT GRIFFIS,
Author of 'The Mikado's Empire' and 'America in the East.'

China Decoration. The decoration of china, and, indeed, of all kinds of clay wares, falls into two groups: (1) Controlled by method, and (2) controlled by producer. The former group deals with the fact that a decoration can be introduced at any stage of the manufacture; the latter concerns itself with the various handicrafts employed.

CHINA, GREAT WALL OF

Decorations may be used under the glaze, either on the unburned or burned clay; in the glaze, as a natural coloring; on the glaze, after the hard-glaze fire.

Decorations on the clay usually take the form of *sgraffito* (incising); inlaying, or *pâte-sur-pâte*; or painting with diluted clay. In the two latter it is important that the inlaid or overlaid clay should be similar in composition to the main body, or the fire will cause them to separate. The body piece, formed either in a mold or upon the wheel (see POTTERY), is kept quite damp, and the design, lightly sketched in India ink, is carefully followed. In inlaid work a channel is tooled out of the body, and filled in with clay of a different color. In *pâte-sur-pâte* no cutting out is necessary, but usually the background is stained a dark color and the design is laid on in white. The beautiful works of M. Solon are of this class.

On the burned ware under-glaze decoration may be either painted or printed. Most of the modern hotel and restaurant ware is printed under the glaze.

For some classes of work a coloring added to the glaze itself is very effective. By this means are produced the flowing and flashed effects much followed by the Japanese and by many French ceramists. In America the Dedham Pottery has worked in this direction.

For work over the glaze a lower fire is employed, many more colors are available, and the processes of decoration include painting, gilding, printing, and ground-laying.

Ceramic colors are made from certain metallic oxides with which are blended a fusible flux, so that the mixture may melt and attach itself to the glaze. Various fluxes are in use. They are composed of red lead, borax, and quartz sand in varying proportions. These ingredients are melted together, and the resulting glass is finely ground. For blues the oxide of cobalt is used; for greens, those of copper and chromium; for yellows, antimony and lead; for reds and browns, iron; for dark brown, manganese; and for grays, nickel and iridium. Gold produces rose color and purple, and a pink is also made from tin oxide and chromic acid. In some cases the colorant and the flux are melted together; sometimes they are united only in the grinding-mill. For under-glaze work, as well as for the coloring of clays and glazes, the list is not so full. Some of the oxides fail under the higher temperature, and must therefore be confined to over-glaze use.

In the second group, decoration is considered as a handicraft. Division of labor is the rule in a manufactory, and thus a piece of china may pass successively through the hands of the ground-layer, the painter, the printer, and the gilder, together with those of many minor operators. To the ground-layer falls the task of distributing an even tint over the whole piece or upon some part of the design. Using a stiff oil,—linseed boiled with litharge or lead acetate.—he dilutes it with turpentine, and brushes a thin coating over the china. This coating he dabs with a soft linen pad, and then spreads the color, which is a fine dry powder. A certain quantity adheres to the oil, and a smooth tint is the result. If only part of a design is to be covered, the free portions are painted with a water-color mixed with molasses. The work is oiled and dusted as before, and is then immersed in water,

when the water-color is washed up, taking with it any of the ground color which may have settled upon it.

The painting of china scarcely needs a description. The colors are as already explained, and the painting depends upon the personal skill put forth. The colors are mixed in turpentine and fat oil just as the painter pleases, for each artist mixes his own palette. The colors change somewhat in the fire, but not as much as is often supposed. The main difference is a great gain of brilliance.

The gilder is mainly employed to embellish the work of others. He uses pure gold, as pure as it can be purchased. This is received in the form known as "coffee gold," a brown granular mass. Mercury is added of about the same weight as the gold and the whole is ground perfectly fine. When mixed with the proper oil this can be used freely as a paint, and the oil and mercury are driven off in the fire. Gold thus prepared needs to be burnished after firing; but there is another form of gold, known as bright or liquid gold, which is much cheaper, and therefore largely used on common wares. In this case the gold is dissolved and the solution is mixed with certain oils. The fire removes everything but the metal, which is left as a brilliant film on the china.

Printing from copper plates has been in use ever since 1756, but for many years has taken an inferior position. At first it was employed for fine engravings and decorative subjects, but lately only for borders and outlines. The pattern is engraved upon a plate of planished copper, and the printer makes this plate quite hot upon his stove. The color, mixed in a very stiff oil, is also kept hot, and with this the engraving is charged. An impression is taken upon thin paper, and this print is handed to a woman who cuts away the superfluous paper and presses the print on to the china. A bath of cold water removes the paper, and the color, rendered hard by the low temperature, remains firmly fixed. The fire completes the process.

Lithographic printing is now very popular in china decoration. The process was introduced from France some 12 years ago, and for a long period the prints were made abroad, but recently the more successful manufacturers have established their own lithographic departments. The prints are made in the usual way from stone, except that no color is applied to the stone itself. The impression is taken in varnish, and the color is dusted on the printed paper. On account of the transfer the order of impression is reversed, the print which is first on the paper becoming uppermost when the impression is transferred to the china. The paper used is double, consisting of a sheet of tissue paper cemented on to a stiff backing. The stiffness is necessary to withstand the pressure of the machine, and when printed the tissue is stripped from the sheet and proves flexible enough to accommodate itself to the surface of the ware. The printing is done in vitrifiable colors, of course, and the finished china is fired in the usual way.

China, Great Wall of, the largest artificial structure on the face of the earth, a barrier extending for about 1,500 miles in the north of China Proper, of which it partly forms the boundary. Its western end is in the deserts of

CHINA INK—CHINCHILLA

central Asia, its eastern reaches the sea to the northeast of Peking. It was erected as a barrier against the inroads of the barbarous tribes, and dates from about 214 B.C. It is carried over height and hollow, and avoids no inequality of the ground, reaching in one place the height of over 5,000 feet above the level of the sea. Earth, gravel, brick, and stone were used in its construction, and in some places it is much more substantial than in others. Its greatest height, including the parapet on its top, is about 50 feet, and it is strengthened by towers at regular distances.

China Ink, or Indian Ink, a black solid substance, which, when rubbed down with water, forms a very pure black indelible ink. It has been used in China from time immemorial, and both there and in Japan is employed for writing, small brushes being the implements made use of. In Europe it is used by draftsmen, artists, etc. It is manufactured in various ways and from various materials, but consists essentially of fine lampblack incorporated with a gluey substance, the whole being dried and consolidated into cakes and sticks. Some kinds are made with animal or ivory black, others with lampblack got from camphor or oil of sesame. There is generally added some perfume—a little musk or camphor. Many attempts have been made to imitate Chinese ink, some of which have been tolerably successful. Almost all the imitations consist of carbon ground up with gum, gelatine, or fish-glue, but the quality and tint may vary according to the special carbon employed and the process of manufacture. Good Chinese ink should have a velvety black appearance, with a gloss which becomes very conspicuous on rubbing. The color it gives on paper should be pure black and homogeneous, and if water be passed over it it should not run or become streaky. See **INK**.

China Root, the root or rhizome of *Smilax china*, a climbing shrubby plant closely allied to sarsaparilla, for which it is sometimes used. *Vitis sicyoides*, a species of vine, is known by this name in Jamaica.

China Rose, the name given to a number of varieties of garden rose chiefly derived from *Rosa indica* and *R. semperflorens*, both natives of China. The name is also given to *Hibiscus rosa-sinensis*, one of the mallow tribe, common in China and the East Indies, and an ornament in greenhouses.

China Sea, that part of the North Pacific Ocean bounded on the north by Formosa, on the northwest by China, on the west by Anam and the Malay Peninsula, on the southeast by Borneo, and on the east by the Philippines. It contains numerous islands, receives several considerable rivers, and forms the important gulfs of Siam and Tongking. The currents in this sea are very mutable, depending much upon local circumstances.

China-tree, Wild, a common name for the soapberry-tree (*Sapindus marginatus*). It is a handsome tree, sometimes growing as high as 60 feet. The flowers are white and the oval berries are very saponaceous. It grows from Florida westward to Arizona and northern Mexico, and in southern Kansas. The wood is very hard, and heavy, weighing nearly 60 pounds to the cubic foot.

China-ware, the name given to porcelain made in the Chinese empire and imported as "China ware," now chiefly confined to the soft porcelain made in England, of which bone-ash is the characteristic ingredient. This class of ware is called "bone china" by the potters and dealers of America.

Bone-ash was used at Bow and at Chelsea, near London, as early as 1750 and has been extensively employed ever since. Bone china consists of kaolin, pigmatite, or Cornwall stone, and bone-ash. The clay and rock are found in Cornwall, England; the bone is largely imported from America.

The proportions in a dry mix are about as follows: Kaolin, 40; stone, 20; bone-ash, 40. The heat at which the kilns are burned ranges from 2,300° to 2,400° F. Bone china is not made to any great extent in America, though some few manufacturers have put it forth as a side line. The particular merits of this ware lie in its snowy whiteness, and in the soft glaze which makes it possible to produce very beautiful decorations over the glaze. For rich services this class of china is unrivaled. See **PORCELAIN**.

China Wax. See **WAX**.

Chinandega, chē-nān-dā'gā, Nicaragua, a town 26 miles northwest of Leon, and 10 miles from the port of Corinto on the Pacific, with which and with Managua it is connected by rail. It is a place of considerable trade. Pop. about 11,000.

Chinch, the popular name of certain fetid American insects of the family *Lygaeidae*, genus *Rhyparochromus*, resembling the bed-bug, very destructive to wheat, maize, etc., in the southern and western States. The name is also applied to the common bed-bug (*Cimex lectularius*).

Chincha (Chēn'chā) Islands, a group of small islands off the coast of Peru; lat. 13° 38' S.; lon. 76° 28' W. They are granitic, arid, and destitute of vegetation, and the coasts bold and difficult of access. Immense deposits of guano used to exist here, but after being exported for 34 years the supply became exhausted in 1874.

Chinchaycocha, chēn-chī-kō'chā, a lake of Peru, in the department of Junin, 13,330 feet above the level of the sea; 36 miles long and 7 broad, with an area of about 300 square miles. It is the source of the river Jauga, and abounds in fish and wild fowl.

Chinchilla, chīn-chēl'yā, Spain, a city in Murcia, in the province of Albacete, 10 miles southeast of the city of that name; situated on a rocky eminence. It is surrounded by a wall and commanded by a castle. Its handsome parish church has three naves, and a lofty tower containing six bells; the interior is richly decorated and contains pictures and other works of art. Quarries of granite, alabaster, gypsum, and limestone are wrought in the vicinity. Pop. 6,500.

Chinchilla, chīn-chī'l'la, a genus of South American herbivorous rodents allied to the cavies, which they resemble in the general shape of the body, in the limbs being longer behind than before, in the conformation of the rootless molars, and by the nature of the fur, which is more woolly than silky. *C. lanigera*, the only species, is about 15 inches long from the muzzle to the tip of the tail, and is covered with a beautiful pearly-gray fur, which is highly

CHINCHOLLE — CHINESE ARCHITECTURE AND ART

esteemed as stuff for muffs, pelisses, linings, etc. The chinchilla lives gregariously in the mountains of western South America, and makes numerous and very deep burrows. It is gentle and sportive, loses none of its gaiety in captivity, and is very cleanly. This genus gives its name to the family *Chinchillidæ*, which contains two other genera, one (*Lagidium*), including a large chinchilla-like rodent of the Andes; and the other (*Lagostomus*), containing that large numerous burrower of the pampas called vizcacha (q.v.).

Chincholle, shǎn shōl, **Charles Henri Hippolyte**, ip-pō-lēt, French novelist: b. Chauny, France, 16 July 1845; d. Paris 21 Aug. 1902. In the earlier portion of his career he was secretary to the elder Dumas, with whom he occasionally collaborated, and from 1872 was a member of the staff of 'Figaro.' He was an extremely versatile writer, but his style is wanting in finish. Beside his one-act farce, 'Oncle Margotin,' which ran 300 nights in 1870, and 'Le Mari de Jeanne' and other plays, his romances and other works include 'La Plume au Vent' (1865); 'Alexandre Dumas Aujourd'hui' (1867); 'Les Pensées de tout le Monde' (1868); 'Dans l'Ombre' (1871); 'Le Lendemain de l'Amour' (1880); 'Le Catalogue de l'Amour' (1881); 'Paula, Histoire d'une Neurosée' (1882); 'La Ceinture de las Survivants de la Commune' (1884); 'Le Vieux Général' (1886); 'Femmes et Pois' (1886); 'La Grande Prêtresse' (1887); 'Biographe du Général Boulanger' (1889).

Chinchon, chēn-chōn', Spain, a town 25 miles southeast of Madrid. After a Countess of Chinchon, wife of the governor of Peru in 1638.

Peruvian bark was named "chinchona," now habitually misspelled "cinchona."

Chinde, Africa, a town on the only navigable mouth of the Zambezi. Here the inland steamers meet the ocean steamers of various European companies; and here, too, Great Britain has obtained from Portugal a small piece of land called the "British Concession," for commercial purposes, and a residential district called the "Extra Concession."

Chinese Arrowroot. See NELUMBIVM.

Chinese Architecture and Art. The fine arts in China are as varied in character and as rich and tasteful in design as those of the peoples most successful in art; but they are known to Europeans in a very unequal fashion. Thus the architecture of the vast country, contained in the old provinces of China, as large as the United States west of the 100th parallel, and as diversified in soil and climate, is so little known that the essays on the art written even by former residents in China deal obviously with certain very limited places only—the neighborhood of a certain city, the borders of a certain river, and the like—and are, moreover, the studies of men not conversant with the construction or with the decorative buildings of any part of the world. The history of this architecture is yet to be written. The photographs now obtainable, having been made during the years since 1890, open up a new world of architectural art. It is enough to say here that there exist two systems of building; the one being a framed construction, usually of wood and capable of

great elaboration, the other a solid masonry construction carried out in brick or stone according to the resources of the neighborhood and the cost of the building. The framed system of building is closely akin to that used in Japan; and it is there that we can best study the wooden temple-tower and the wood-framed hall of reception. As for the masonry buildings, they are often large and massive, as is well known to all who have observed the walls and gateways of the great fortified cities and the famous "Great Wall" which protected Peking and its neighborhood from northern invasion. In the way of more decorative buildings less is known of the system of design, but several peculiarities may be mentioned. Thus there is a marked preference for the octagonal form in towers, and everywhere throughout the central provinces these buildings, called by the Europeans pagodas, rise above the hills and show over the groups of houses. The often cited use of the polygonal arch, that is, one with the intrados at least many-sided instead of curved, is to be noted as indicating how much that is attractive we have still to discover. The decorative gateways (pailoo) corresponding nearly to the *torii* of Japan and to those edifices called *toran* in the peninsula of India, are often admirable designs in the way of purely decorative architecture, monumental architecture, having no direct utility. The dwellings of the Chinese, even the palaces of the princes, do not seem to include many-storied and ponderous structures, but cover immense tracts of ground with gardens, among which stand buildings of no great height, but of a singular beauty of construction, especially in the roofs, and very richly decorated within. The dwelling-houses of the people are generally walled with brick and are not striking in their external appearance. The roof is an especial feature in Chinese art. It is commonly built with a hollow upward curve, the result of a very interesting system of construction, with light wood-work. This slightly concave surface covered with glazed ridge-and-furrow tiles richly colored, is an important feature in Chinese architectural composition. Painting in strong pure colors is a recognized element of external design; and it has been truly said that the special and distinguishing feature of Chinese exteriors is gaiety. Even the slightly-built one-story shops of the great towns are bright with vermilion and green; and the signs, painted with the very ornamental Chinese ideographs, help in this effect.

Chinese painting reached a great development as early as the 8th century A.D.; and there is every probability that it had then been a great school for several centuries. Landscape was one of its especially favored branches. While in Europe no one dreamed of landscape art for its own sake, the Chinese impressionist designers were producing admirable studies, both in color and in monochrome. Some few of these are in European museums, their authors and dates having been fixed by careful comparison, but the much more modern Japanese landscapes, in painting, monochrome, and wood-cut, are the best material from which to gain a general idea of that ancient landscape art. A highly religious art was developed in the 12th century A.D. At that time Buddhist religious feeling was strongly expressed in the art of some painters, while others affected rather a kind of decorative realism, that

CHINESE BIBLE — CHINESE IMMIGRATION

is to say, a close observation of natural objects used to inspire and to influence a highly decorative system of design. These paintings have been little known to Europe, because they are preserved in temples and almost inaccessible palaces; and again it is Japan which has opened to us, through her own art, a knowledge of the older arts of China. A few ancient paintings known to Europeans are of surprising interest; and they open up to us a whole system of design in form and color on the flat surface, which the West is now studying, much to its own advantage. The paintings best known to us are of some purely decorative character, those on porcelain having attracted the attention of Europe ever since the 16th century. These paintings are closely connected with the system of inlay which in the form of cloisonné enamel (see ENAMEL) is another of the great art industries of China. The porcelains affect a more close and careful study of the natural forms in flowers, trees, costume of figures and the like, whereas the enamels are more severe and are confined more closely to the making of admirable patterns; but the two systems differ only as one and the same artist might change his style according to the material and the demands upon him. A similar method of decoration by the free use of natural forms, conventionalized but still retaining much of their character, is seen in the splendid embroideries which have been little known to the West until within a few years. The textile fabrics of China — silks, brocades and velvets — have been known to collectors for many years, but very few national museums have provided themselves with any number of them: they present an inexhaustible treasure of beautiful design in strong and positive colors. It may be stated here that brilliant color is a specialty of the Chinese artist. Where, as in a fine cloisonné enamel, a Japanese artist works in dark and sombre colors, the Chinese will use a sky-blue ground, upon which an elaborate pattern is carried out in deep ultra-marine blue, violet, reddish-gray, dark green, apple green, vermilion, bright yellow, and white, with dividing lines of gilded metal, and many passages of gradation from one color to another. No people have equaled the Chinese in the decorative use of bright, pure colors.

Sculpture in the sense of a grand and permanent art of form is less the business of the Asiatic artist than painting, or than decoration properly so-called. Sculpture in the form of carving in ivory and wood and bronze figures of small size, has always attracted great attention in China and has reached an extraordinary state of excellence in spirit, movement, and skilful composition. Thus, a bronze figure will express perfectly the character and the sentiment of the occasion, while yet losing nothing of its sculptural value; and a group of "The Seven Wise Men" seated around the trunk of a bamboo will be rendered in cheap glazed pottery or in minutely carved ivory with equal skill and at a price proportionate to the labor expended and the prime cost of the material.

The ivory group may have cost, when new, a hundred times as much as the piece molded in clay, fired and then glazed and painted, but it is not on that account a finer design, the characters are not more perfectly expressed nor the attitudes of the figures more forcible or

more harmonious with each other. This is a great evidence of an old traditional skill of sculpture excelling in the larger as well as in the smaller scale of work. Relief sculptures, especially those in wood, in soft stone and in the surface of lacquer, which has generally a wooden background prepared to receive the impressed and sculptured coat of the viscous material, are as effective for their decorative purpose as are the sculptures in the round. Finally there must be mentioned the lapidary's art, in which the Chinese have always excelled, for the most marvellous carvings in agate, jade and rock crystal, that is to say, in the hardest materials known, are unmatched in the world, and they are as artistically perfect as the carvings in the softer stones; their essential characteristics perfectly understood and always observed. The conventional way of rendering in hard material the most delicate leafage and sprays of twig and blossom is perfectly maintained; and the brilliant polish which is one of the beauties of these carvings is carried through beneath those delicate undercut sprays.

RUSSELL STURGIS,

Author of 'Dictionary of Architecture.'

Chinese Bible, The, a work compiled and partly composed by Confucius, divided into five books:

1. Called the 'Yih-King,' a treatise on cosmogony.
2. Called the 'Shu-King,' the acts and maxims of Yaou, Shun, and other ancient kings held in religious veneration.
3. Called the 'Shi-King,' which contains 311 sacred poems.
4. Called the 'Ee-King,' or book of rites, containing maxims and directions for everyday life and all conditions of men.
5. Called the 'Chun-t sien,' a history of Confucius' own times.

Chinese Cæsar, The, Kao-hoangti, founder of the Han dynasty, one of the most illustrious that ever occupied the Chinese throne. Dynasty lasted 202 B.C.—226 A.D.

Chinese Empire. See CHINA.

Chinese-fire, a pyrotechnic composition, consisting of gunpowder, 16; niter, 8; charcoal, 3; sulphur, 3; cast-iron borings (small), 10.

Chinese Glue, a superior glue and varnish, obtained from a species of *Alga* which abounds on the shores of China. When once dried it resists the action of water, and is used by the Chinese to fill up the lozenge-shaped interstices in the network of bamboos, of which their windows are frequently constructed, as well as to strengthen and varnish the paper of their lanterns.

Chinese Gordon. See GORDON, CHARLES GEORGE.

Chinese Hemp. See CORCHORUS.

Chinese Immigration. Until the California gold discoveries of 1848 there were literally no Chinese laborers in the United States; nor was there then, or for years afterward, the least prejudice against their coming — the one objection to the Chinese being that they kept foreigners out of their own country, not that they infested others. From 1840 to 1850, according

CHINESE ART.

1. Enameled copper plate. 2. Porcelain vase (Siwen-te, 1426-1436). 3. Painted screen. 4. Porcelain vase (Ming, 1368-1644). 5. Snuff-jar of green paste. 6. The War-God, Kwan-ti, in porcelain. 7. Tea-pot of terra-cotta. 8. Embroidered altar-cloth. 9. Silk embroidery. 10. Hair-pin.

CHINESE IMMIGRATION

to the records of immigration, only 35 came over, and those all in the year from June 1849 to June 1850. The treaties of 1844 and 1858 with China expressly aimed at securing a freer interchange both of commodities and citizens. The current "buncombe," even in California (the surest indication of public feeling, because its one aim is to please the unreflecting) was to proclaim America the asylum for the poor and oppressed without exception; and San Francisco business men welcomed the early Chinese comers, publicly fraternized with their traders, and made speeches of mutual compliment, with no objection from any source. During the next decade 1850-60, 41,397 Chinese came to the port of San Francisco, of whom about 6,500 returned to China, leaving the net Chinese population in 1860 34,933, nearly all in California. For some years the general feeling continued to be favorable, as labor was dear and domestic service almost impossible to obtain; and the Chinese laborer, and above all, the Chinese house servant, seemed to make industrial progress and lives of refined leisure possible. In the latter half of the decade some uneasiness began to be felt, but mainly from the belief that Chinese criminals were being deported here. The first restrictive legislation, not specifying Chinese, was to prohibit this. In 1855 an act was passed, said to have been aimed against the Chinese, fining any shipmaster \$50 who landed passengers incapable of becoming citizens of California under its Constitution and laws, and ordering commissioners of immigration to obtain certificates of identity; but this, too, must have referred to criminals alone, for there was at this time no bar to Chinese citizenship. In 1858 the Reed Treaty was negotiated, after the Chinese war of that year, and no restriction was placed on immigration. In 1862 the California legislature appointed an investigating committee on the subject; but it was still felt to be only a local nuisance, not calling for any hasty or severe measures. Even as late as 1868 the Burlingame Treaty with China, though reprobating enforced immigration (coolies under contract), asserted the right of migration to be inherent in the human race; and on 27 July 1868, a special resolution of Congress, in response to anti-immigration measures in the East, repeated this assertion as to the right of human beings to expatriate themselves, and declared that its restriction was contrary to the fundamental principles of the republic. This meant European immigration, and caused a painful "straddle" in later political campaigns when California votes were needed; but it proves that even then the Chinese question had not become acute enough locally to force California politicians into making it a national touchstone. Within a few years after this, however, it was not only the burning issue of the Pacific Slope, but had emerged into the national arena. Bret Harte's 'Heathen Chinee' shows that "Chinese cheap labor" had become a popular local catchword; and the attempt of Eastern manufacturers about this time to use the Chinese for strike-breakers made the question of national notoriety.

This hostility was partly due to the Chinese as such—as extreme aliens with social and religious customs marking a permanent separation; but mainly to the special character of the immigration. Except a few merchants, it consisted almost wholly of the lowest class of coolies

about Canton, and it was firmly believed that it was not voluntary and self-selected immigration, like that from Europe, but a system of exploited serfage—the coolies being collected in gangs by a Chinese corporation called the Six Companies, and shipped under rigid contract to work for a period of years under terms fixed by their masters. Their low standard of comfort was believed to affect the market and wage-rate for white labor unfavorably, and to build up great corporations without building up a corresponding class of civilized citizens; their sections of the cities were plague-spots of overcrowding and filth, besides being Alsatias where law did not run; they brought no wives, intending no permanent residence, and supplied the places of wives with hundreds of imported Chinese prostitutes; and their iron-barred opium joints, tempting not Chinese alone, were a still greater danger. Lastly, those who saw the excessive strain placed on democratic institutions by ignorant European immigrants, ultimately assimilable, were appalled at the prospect of operating them among a huge unassimilable and purchasable brute-vote on the Pacific Slope. If they were made voters, they would force a permanent political division on the lines of race; and if not, would form a dangerous anomaly and nuisance in the republic. Thus, white industry, order, sanitation, public morals, and statesman-like forecast united in the conviction that this class of immigration must be prohibited or severely restrained. These valid objections and fears were reinforced by others, unsound or exaggerated. The numbers arriving were vastly swollen in popular imagination, and the departures suppressed; except that when a point was made of their worthlessness to the country, it was asserted that all returned to China and so "drained the country" of their wages—which, if true, of course nullified the permanent danger from them, and involved an economic fallacy. The actual number of Chinese in the United States in 1870 was 62,376, an increase of some 27,000 in 10 years; 69,298 had come over within 10 years, and 34,850, or over one half, had gone back. But it was generally stated at 150,000 to 175,000; and the rate of increase at fully 25,000 a year. The population of China was estimated at 400,000,000 (pure guesswork), and it was assumed that the immigration represented a tendency diffused through this entire mass, who could and probably would pour 100,000,000 of its people into America in a short time, and swamp the European element utterly. As a matter of fact, the entire immigration came from within 40 miles of Canton, and the mass of Chinese will not emigrate, even to countries where they have full civil rights. It may be mentioned that in such places as Java and Hong Kong, they live and die with the same permanency as others; so that the argument which rests at once on the danger of their remaining and the financial loss of their not remaining must lose the latter clause. It was also asserted that there were more Chinese males in California than voters; but in fact they were under one sixth. But after all deductions, it was certain that the Chinese population in no long time would form a grave and apparently insoluble problem, a social and political menace, on the Pacific coast, and that the State could better afford a slower industrial growth, than a rapid

CHINESE LANGUAGE — CHINESE SWALLOWS' NESTS

one based on a proletariat and a body almost equally dangerous as citizen or aliens.

After attempts at restriction by local legislation, which were invalidated by the federal courts as in violation of United States treaties, California appealed to Congress for a national law; but that body evaded the question till 1876. Then the exigencies of the Hayes-Tilden campaign compelled both parties to bid for California's electoral vote by anti-Chinese planks in their platforms; and Congress (the House, 6 July, the Senate 17 July), appointed a joint special committee to investigate the subject. It met at San Francisco 18 October, heard a mass of testimony, and made a very voluminous report, taking the strongest ground in favor of a restrictive law (Senate report 689, 44th Congress, second session, 27 Feb. 1877). At this time the Chinese population was about 100,000. Nevertheless, the party pledges were not redeemed in Congress till 1879, when on 20 March such a bill was passed; but it was vetoed by President Hayes as being in conflict with the Burlingame Treaty. In 1880 a commission was sent to Peking to negotiate a new treaty permitting the restriction. This treaty, signed 17 Nov. 1880, ratified by the Senate in March 1881, gave the United States the power to "regulate, limit, or suspend" the immigration of new Chinese laborers, but not to prohibit it altogether; permitted laborers already in the country to remain and travel to and from it at will; and allowed Chinese merchants, students, teachers, or travelers, to exercise their functions without molestation, each class to have all the privileges and advantages of the most favored nation. (The Chinese population here in 1880 was 105,465.) Under guise of giving effect to this treaty, Congress, in March 1882, passed an act suspending Chinese immigration altogether for 20 years. This was vetoed by President Arthur on the ground that so long a suspension was virtually absolute prohibition, and not in accord with the spirit of the treaty. On 6 May another bill was passed to meet this objection, suspending fresh immigration for 10 years, both of skilled and unskilled laborers, permitting those already here to remain, but forbidding their naturalization. The provisions of this act were minutely severe. The exempted Chinese must have certificates of identity issued by the Chinese government and vided by the United States consul or diplomatic representative at the port of departure; departing Chinese laborers must take out return certificates, with heavy penalties for forgery or false personation; a master of a vessel who landed any unauthorized Chinese was subject to fine and imprisonment and the confiscation of his vessel; no Chinese passengers could be landed until the collector of the port had received the lists of the passengers and compared them with the persons, etc. The only Chinese laborers who could be permitted to return after once departing were those who had a living wife, parent, or child here, or \$1,000 worth of property, which was made answerable for their default.

This was "amended" on 1 Oct. 1888 by the Scott Act, striking out all permission to return for any purpose, forbidding the issue of return certificates, and declaring all that were issued void,—in a word, absolutely barring America to any Chinese workman once outside it. A treaty

was at this time pending between the United States and China by which the Chinese government was to prohibit the emigration of laborers, and the United States was to protect those in the country from violence, which it had shamefully failed to, but the Scott Act enraged the former government, and it refused to ratify the treaty. It may be mentioned that the supreme court in 1883, October term, decided that Congress can abrogate a treaty. On the expiration of the 1882 act in 1892, the "Geary law" of 5 May, extended it for another 10 years, with further severities, not called for by any dangers at hand; chief of these, that any Chinaman found in this country unlawfully should be imprisoned for a year at hard labor. On 3 Nov. 1893, on complaint that Chinese are so much alike to Western eyes that certificates of identification are not sufficient, an act was passed that each certificate must include the holder's photograph in duplicate. On 7 Dec. 1894, a convention with China restored the conditions of return to the status of 1882. On 3 March 1901, it was enacted that a Chinaman can only be arrested under these acts on sworn complaint of certain specified United States officers. In 1902 the exclusion was re-enacted for another decade. With the general intent of these acts, there is little difficulty in concurring; but some of the provisions, and the petty acridity of their execution, exhibit a spirit of panic which is neither dignified nor sensible. The volume of the immigration is the very essence of the danger; if it is insignificant it is harmless. Hence, the groundless harrying of innocent travelers or students, as if the mere presence of a single Chinaman constituted a grave national danger, is unmanly and irrational. The Chinese population in 1890 was 107,488; in 1900, 89,863—a falling off of nearly 20,000 in 10 years. Consult: George F. Seward, 'Chinese Immigration' (1881); Mayo Smith, 'Emigration and Immigration' (1895); and the congressional report above cited.

Chinese Language, Literature and Writing. See CHINA.

Chinese Lantern, a lantern made of thin paper, usually variously colored and much used in illuminations.

Chinese Olive, the fruit of *Canarium commune*, order *Amyridaceæ*, a tree of the Asiatic archipelago yielding an oil which is used as a condiment and for lamps.

Chinese Pavilion, a semi-musical instrument composed of a pole with several transverse brass plates of some crescent or fantastic form, generally terminating at top with a conical pavilion or hat. On all these parts are hung small bells, which the performer causes to jingle by shaking the instrument held vertically up and down. It is employed only in military bands, and is more for show than use.

Chinese Swallows' Nests, curious productions, which sell at a high price in China, though they have no special points of recommendation beyond many other gelatinous ingredients in soups. They were formerly supposed to be made of some species of the rose-spored *Algæ*, as *Sphærococcus lichenoides*; but this is now ascertained to be a mistake, and it is known that they are formed of dried saliva from the mouth of the bird itself. The nests are the production of certain

CHINESE TARTARY — CHINOOK WIND

species of swifts (not swallows) of the genus *Callocalia* which breed in caves on islands of the tropical Pacific and Indian oceans. All species of swifts secrete an abundant mucous saliva which is utilized along with other materials in constructing the nests; but species of *Callocalia* only form their nests of saliva exclusively.

Chinese Tartary, an old name of Eastern or Chinese Turkestan.

Chinese Terms. See CHINA.

Chinese White, a pigment prepared from the white oxide of zinc (ZnO), introduced into the arts in the latter part of the 18th century as a substitute for the preparations of white lead. Its color is not changed by exposure to the air.

Chinese Windlass, a differential windlass, in which the cord winds off one part of the barrel and on to the other, the amount of absolute lift being governed by the difference in the diameters of the respective portions. It is a good contrivance in the respect that great power may be attained without making the axle so small as to be too weak for its work.

Ching, Chinese prince: b. Peking about 1840. He is related to the Chinese imperial family and has held important civil and military posts, although he boasts that he has never been outside of Peking. He was at the head of the Tsung-li-Yamen, but was deposed in 1900 for his efforts to protect the legations in Peking, during which he attacked the Boxers (q.v.).

Ching-Hai, chīng'-hī', or **Chin-Hai**, China, a seaport in the province of Che-Kiang, about 11 miles from Ningpo. Ching-Hai has no foreign commerce of its own, not being a treaty port; but is a resort for native traders from the Chusan Archipelago, and from here Chinese merchandise is sent to Ningpo. There is a missionary station and a native academy for students who compete in the civil service examinations at Ningpo. Pop. (1900) estimated 150,000, mostly Chinese.

Ching-Tu, chīng-too', China, city, capital of the province of Sze-Chuen, situated on the Min River, 150 miles from its junction with the Yang-tse-Kiang, and 175 miles from the treaty port Chung-King. Ching-Tu is in one of the largest fertile plains of China, and is surrounded by mountains rich in the minerals of commerce. By way of the Min River and canals nearby, trade is carried on with the places in the valley of the Yang-tse-Kiang. The walls around the city are 12 miles in extent. The houses and streets indicate wealth. Telegraphic communications have been established with Hankow. It has an arsenal with modern equipment, and goods of European manufacture are found in some shops. Pop. about 9,000,000.

Chingleput, chīng-glě-pūt', or **Chengalpat**, or **The Jaghire**, India, a coast district in the province of Madras, area 2,842 square miles, surface rocky, water scarce, crops scanty. In the fertile localities grain and fruits are raised which are shipped to the Madras markets. Some manufacturing of cloth is carried on. The chief towns are Conjeveram, St. Thomas'

Mount, Saidapet, Tiruvotiyur, and Chingleput. This tract of country was obtained in 1760 and 1763, by the East India Company, from the Nabob of Arcot. It was invaded by Hyder Ali in 1768, and again in 1780, when it was nearly depopulated by famine and emigration. Pop. 1,136,928.

Chingleput, or **Chingalpat**, India, town in the district of the same name, 15 miles west from the Bay of Bengal, 35 miles southwest of Madras, situated in a valley surrounded by hills. In 1751 it was taken by the French, retaken the following year by the British under Clive. A railroad enters the town. It has Roman Catholic and Protestant missions, hospital, jail, civil and criminal courts, and a dilapidated fortress which at one time was of considerable extent and well fortified. Pop. 7,000.

Chin'iot, India, town in the Jhang district of the Punjab, near the Chenab. It is famed for wood-carving, and has manufactures of coarse cloth. Its trade is also of considerable importance. Pop. 13,476.

Chiniquy, shē-nē-kē, **Charles Paschal Telesphore**, Canadian clergyman: b. Kamouraska, Que., 30 July 1809; d. Montreal 16 Jan. 1899. He was a Roman Catholic priest from 1833 to 1858, when he abandoned the Roman Catholic and joined the Canadian Presbyterian Church. He lectured in England in 1860, 1874, and 1882, and in Australia 1878-80. He wrote 'The Priest, the Woman, and the Confessional' (1874), a work that has had an enormous circulation in English-speaking countries, and has been translated into French, Italian, Spanish, and Dutch; 'Fifty Years in the Church of Rome' (1886; 5th ed. 1886); 'Papal Idolatry: Exposure of the Doctrine of Transubstantiation' (1887).

Chinkara, the common gazelle of India, sometimes called the "ravine deer." See GAZELLE.

Chinoline, kīn'ō līn. See QUINOLINE.

Chinon, shē-nôn', France, an antique town in the department of Indre-et-Loire, beautifully situated on the Vienne, 31 miles southwest of Tours. Crowning a lofty rock are the ruins of its vast old castle, the French Windsor of the Plantagenets, the death-place of Henry II., and later the residence of several French sovereigns, where, in 1429, Joan of Arc revealed her mission to the Dauphin. A farmhouse across the Vienne is pointed out as Rabelais' birthplace. Pop. (1901) 4,200.

Chinook (chī-nūk') **Wind**, a warm dry wind that often blows from the Rocky Mountains over the plains that stretch from their eastern base. The moisture-laden winds from the Pacific Ocean striking the lofty barriers of the Cascade and Rocky Mountains are forced to precipitate their moisture as rain and snow. When the ranges are crossed the winds are cold and dry. Descending the eastern slopes of the mountains the winds become warmer, because in descending the air is condensed, the atmospheric pressure at the base of the mountains being much greater than at the summit. The winds are, however, still dry, all their moisture having been precipitated in crossing the mountains. In the de-

CHINOOKS — CHIOS

scent of 10,000 feet or so to the plains of Montana and the prairie province of Canada, the winds become so warmed by the increased pressure that they give a mild climate to regions far north. It is on account of these winds that cattle on the prairies of Alberta can graze in the fields all winter, a snowfall of a foot or more disappearing in a few hours before the warm, dry breath of the Chinook. Not all the warm winds of Montana and the regions north and south have their origin west of the Rockies. Various causes contribute to the formation of descending air, and when the descent is a number of thousands of feet, the winds resulting are always warm. Such winds blow over prairie regions west of the Missouri, but not always adjacent to the Rockies. Similar warm winds are known in other parts of the world, as in Switzerland, where they are called Föhn winds.

Chinooks, *chī-nūks'*, a tribe of Indians, now nearly extinct, on the Columbia River, or in Oregon. Their language is very difficult to learn and to pronounce, and this led to the formation of the Chinook jargon, a trader's *lingua Franca*, consisting of words from French, English, and Hawaiian, as well as from Chinook and other Indian tongues.

Chinquapin, *ching'ka-pīn*, a dwarf chestnut (*Castanea pumila*), a native of South America, but growing wild in the Southern States as far north as Pennsylvania and westward as far as Texas. It is a shrub four or five feet high, but sometimes grows to the height of 30 or 40 feet.

Chins, a savage tribe living in the mountainous region between Lower Bengal and Upper Burma, of very primitive habits.

Chinsura, *chīn-soorä*, British India, a town beautifully situated on the Hugli, and now included in the town of Hugli, 20 miles north of Calcutta. It is a military station, was formerly a Dutch settlement, and contains many neat houses in the Dutch style. It is celebrated for the manufacture of cheroots, and has several schools, among them some belonging to the Free Church of Scotland.

Chintreul, Antoine, *än twän shän-trél*, French landscape painter: b. Pont-de-Vaux, France, 15 May 1816; d. Septeuil 13 Aug. 1873. He was a pupil of Corot, obtained a medal at the Paris Exhibition, 1867, and that of the Legion of Honor in 1870. His sunlight effects have been greatly admired. The Luxembourg Gallery contains his 'Thicket With Deer' (1873).

Chintz, a cotton cloth gaily printed with designs of flowers, etc., in five or six different colors. It was a favorite in the time of Queen Anne, long before cotton prints became cheap. The name, being highly respectable, has since been applied to goods lacking the graceful and artistic character of the genuine article. The Chintzes of the Coromandel coast were celebrated in the time of Marco Polo, 13th century. They are mentioned also by Odoardo Barbosa, a Portuguese, who visited India soon after the passage of the Cape of Good Hope by Vasco de Gama: "Great quantities of cotton cloths admirably painted, also some white and some striped, are held in the highest estimation."

Chio, *kē'ō*. See CHIOS.

Chiob'be, a town in China, province Fokien, 15 miles southwest of Amoy. It is situated on a river bearing different names, navigable by junks of 400 tons, and is defended by a citadel and numerous other fortifications. It is the great emporium for common china-ware, and has important fisheries. The rearing of silk-worms forms an important occupation. Pop. estimated, 300,000.

Chiococca, *kī-ō-kök'a*, a genus of tropical plants of the natural order *Rubiaceæ*, consisting of small, often climbing, shrubs, with opposite stipulate leaves and bell-shaped or funnel-shaped, yellowish flowers in axillary clusters. The fruit is a white berry with two seeds. The bark of the root of *C. anguifuga* is a violent emetic and purgative. The root of *C. densifolia*, a woody bush, is considered a remedy for snake bites by the people of Brazil.

Chioggia, *kē-ōd'-jä*, or **Chiozza**, an important seaport town of northern Italy, 15 miles southwest of Venice, on an island at the southern end of the Venetian Lagoon, connected with the mainland by a stone bridge of 43 arches. It is founded on piles, has a beautiful cathedral; its harbor, the deepest in the lagoon, is guarded by forts and batteries. It is one of the strongest places in the Venetian lagoons. Many of the people are engaged in the coasting trade, lace-making, weaving, ship-building, and fishing. Pop. 25,100.

Chione, *kī-ō'nē*, the daughter of Dædalion, who was killed by Diana for boasting of her beauty.

Chios, *kī'ös* (now called by the natives *Chio*, Italianized into *Scio*), one of the most beautiful and fertile islands in the Ægean Sea, belonging to Turkey, seven miles off the coast of Asia Minor, at the entrance to the Gulf of Smyrna; about 30 miles long from north to south, by 8 to 15 miles broad, with a coastline of about 110 miles, an area of 320 square miles, and a population of about 70,000, almost all Greeks. The northern part is more mountainous than the southern part. The climate is delightful. Earthquakes are common, and one in 1881 caused the death of 3,558 persons, and the destruction of property to the value of over \$15,000,000. The wine produced on the northwest coast, the *Vinum Arvisium* of ancient times, is still esteemed. Other products are figs, also noted in classical days; mastic, silk, lemons, oranges, and olives. Goats' skins are also exported. The capital, Chios, about the middle of the east coast, contains about 13,000 inhabitants, and has a harbor touched by various services of steamers, and doing a good trade. On the west coast is a rich monastery, Nea-Moni, founded in the 11th century. In ancient times excellent marble and potter's clay were quarried in the mountains, and recently pits of antimony and ochre have been worked.

Chios is one of the places which contended for the honor of giving birth to Homer. It formed in early times one of the most flourishing of the Ionian states, and contributed 100 ships to the Greek force defeated by the Persians in the sea-fight off Miletus (494 B.C.).

CHINQUAPIN.

CHIPMAN — CHIPPAWA

After the Persian victory the town and temples of Chios were burnt and many of the people enslaved. In more recent times the island was taken by the Genoese (1346), and by the Turks (1566), in whose hands it has since remained, except for a short interval. It was conferred as a private property on the sultana. After a long period of prosperity, Chios suffered a terrible blow during the war of Greek independence. A number of the Chioters having in 1821 joined the revolted Samians, a Turkish fleet and army, in 1822, inflicted dreadful vengeance; 25,000 Chioters fell by the sword, 47,000 were sold into slavery, and only some 5,000 escaped. A second rising in 1827 was likewise unsuccessful. The island has since been prospering.

Chip'man, Nathaniel, American jurist: b. Salisbury, Conn., 15 Nov. 1752; d. Middlebury, Vt., 15 Feb. 1843. He was an officer in the American army for a part of the Revolutionary War, and was admitted to the bar in 1779. He then removed to Tinmouth, Vt., where he commenced practice, and served as State's attorney for four years. In 1786 he was elected assistant judge of the supreme court, being the first lawyer who had been placed upon the bench in Vermont. In 1789 he was elected chief justice, and held that office until October 1791. In 1789 he was also appointed one of the commissioners to adjust the differences between Vermont and New York. In 1791 he was a member of the convention called to decide the question whether Vermont should accede to the Union. On 18 Jan. 1791 he was appointed a joint commissioner with Lewis R. Morris to attend Congress and negotiate for the admission of Vermont into the Union. In 1793 he published a small work entitled 'Sketches of the Principles of Government,' and a volume of 'Reports and Dissertations.' In 1796 he was again elected chief justice of the supreme court. In 1796 he was appointed one of a committee to revise a code of statute laws for Vermont, and the revised laws of 1797 were written by him. He was a United States senator in 1798-1803. In 1813 he was again elected chief justice of the supreme court, and continued in office two years. From 1816 to 1843 he was professor of law in Middlebury College. In 1833 he published 'Principles of Government: a Treatise on Free Institutions, Including the Constitution of the United States,' containing portions of his former treatise.

Chip'man, Ward, Canadian jurist: b. St. John, New Brunswick, 10 July 1787; d. there 26 Dec. 1851. He was the son of Ward Chipman (1754-1824), a Massachusetts loyalist who went to New Brunswick after the American Revolution. He graduated at Harvard in 1805, and succeeded his father as agent for the crown in determining the northwest angle of Nova Scotia. After holding minor legal offices he became puisne judge of the supreme court 1825, and chief justice of New Brunswick 1834, president of the legislative council, and speaker of the assembly.

Chip'munk, an American ground-squirrel, a small animal of the genus *Tamias*, about six inches long, with a slender furred tail, nearly

as long as its body, and a coat of reddish-brown fur, striped with white on the back; from the marking it is called *Tamias striatus*. The eastern species has two white stripes, and the western chipmunk, *Tamias quadrivittatus*, which is exceedingly common all over the Rocky Mountain region, bears four stripes. The ground color also is extremely variable according to habitat. This little creature is often found frisking along stone walls, stopping now and again to sit erect and dart sharp glances at moving objects. It is generally shy in the presence of man, and escapes with great rapidity, when need arises, into some hiding-place. Its home is a burrow in some woodland place, tunnel-like in structure, sometimes fully 20 feet long, and always deep enough to be below the frost-line. It is enlarged into chambers at intervals. One of these, supplied with dried leaves, grass, and like material for bedding, is the sleeping apartment; the others are store-houses. In them the chipmunk stores his winter supplies of small nuts and acorns, especially the sweet beech-nuts. These he carries home, often several at a time, in his distensible cheek pouches. They are his chief food; but he will eat, also, buds, mushrooms, and insects. The breeding season is in May; and the young are usually from four to six in number. The chief enemies of the chipmunk are the fox and the weasel. The former is dangerous only in the open, as he is too large to disturb the chipmunk at home. But the weasel can attack him in his burrow; and, to escape him, the chipmunk makes an opening for possible escape, at the far end of his burrow. For consideration of the various species of *Tamias*, consult J. A. Allen, 'Bulletin of the American Museum of Natural History,' Vol. III.

Chippawa, *chīp'a wā*, Canada, a village in the province of Ontario. It is situated at the confluence of the Chippawa and Niagara rivers, two miles above the Falls, and contains an extensive steam-engine manufactory, and one of the largest factories of stoves in the province. On 5 July 1814 the battle of Chippawa (q.v.) was fought here between the Americans and the British.

Chippawa, Battle of, 5 July 1814, an action in the War of 1812, remarkable for the defeat of a force of British regulars by an inferior number of Americans, in pitched battle on an open plain, without advantage of position, and with weaker artillery. Maj.-Gen. Riall, commanding the British forces, had about 1,500 line infantry—the King's regiment, the 100th, and the Royal Scots, with dragoons and artillerymen, and 600 skirmishers—north of the Chippawa River, which enters Niagara on the Canada side just above the rapids; the bridge from Chippawa village crossed it near its mouth. Joseph Brown's American force lay to the south beyond Streeter's Creek, and Brown started on the morning of the 5th to build another bridge across the Chippawa, to outflank Riall, whose skirmishers crossed the river and harassed the work and the camp from the woods on the west, and Peter B. Porter's militia brigade was sent to drive them out. As it approached the river, Riall's army

CHIPPENDALE — CHIQUINQUIRA

crossed the bridge on its right flank, and it fled in panic, about 5 p.m. Riall thereupon deployed his force and advanced on the plain toward Brown. Scott's brigade of 1,300 was about crossing the creek bridge for a Fourth of July parade and, the creek being lined with woods, only learned of the danger at the last moment. Each side had three guns; but the British were two 24's and a 5½-inch howitzer, against the American three 12's. Scott's troops crossed the bridge under fire from the 24's, and coolly deployed beyond; while Scott threw his wings forward to avoid being out-flanked, the left wing reaching into the woods. Both sides advanced, with pauses to load and fire, till the flanks touched and the centres were 200 feet off; when the British, unable to endure the deadly musket-fire in front and the artillery now sweeping diagonally through the ranks, broke and ran for the Chippawa. The battle lasted less than an hour; and when Ripley's brigade came to Scott's help the plain was deserted by the enemy. Riall lost 137 killed and 305 wounded of the regulars, nearly a third of his entire force, besides 73 skirmishers; Scott, 48 killed and 227 wounded; and Porter, 22 more. The victory was won by superior musketry and artillery fire, as shown by the enormous disparity in killed; and by a leader under whom every private was a hero. Consult Henry Adams, 'History of the United States,' Vol. VIII., ch. 2.

Chip'pendale, Thomas, English cabinet-maker. He is supposed to have gone to London from Worcestershire before 1750. The style of furniture named from him was less heavy and severe than that of his successors, and was elaborate, delicate, and baroque, with classical tendencies. He wrote a 'Cabinet-maker's Director' (1752).

Chip'penham, England, a municipal borough of Wiltshire, 12½ miles northeast of Bath, on the Avon, here crossed by an ancient stone bridge of 22 arches. It consists of one principal street, with others diverging from it. It contains two large parish churches with lofty spires, an old and a new town-hall, etc. The station of the Great Western Railway here is a very large one. The town is an important mart for cheese, and contains a woolen factory, a silk factory, large condensed-milk factory, railway works, boot factories, etc. Pop. (1901) 5,074.

Chippewa, chīp'pē-wā. 1. Michigan, an eastern county of the upper peninsula, bordering on lakes Superior and Huron, and bounded east by the river St. Mary. The surface is hilly and partly covered with forests of pine. Capital, Sault Ste. Marie. 2. Wisconsin, a county in the northwestern about 50 miles from the Mississippi River, traversed by the Chippewa and several affluents; area, about 4,300 square miles. Sandstone is abundant, and much of the surface is well wooded. Capital, Chippewa Falls.

Chippewa, a river of Wisconsin, which has its rise in the north of the State, and after receiving several tributaries flows southwest into Lake Pepin, an expansion of the Mississippi.

Chippewa Falls, Wis., town and county-seat of Chippewa County. It is on the Chippewa River, and the Chicago, M. & St. P., the Chicago, St. P., Minneapolis & O., and the Wiscon-

sin Cent. R.R.'s; 12 miles northeast of Eau Claire. It contains the County Insane Asylum, the State Home for the Feeble-Minded, and has important manufactures, large water power from the river, electric lights, and street railways, daily and weekly newspapers, two national banks, and an assessed property valuation of \$2,000,000. Pop. (1900) 8,094.

Chippeways, chīp'pē-wāz, or **Ojibways**, a tribe of North American Indians in the United States and Canada. They are distributed in bands round both sides of the basin of Lake Superior, where they once owned vast tracts. They are of the Algonquin stock, tall, active, and well formed, subsist chiefly by hunting and fishing, and number about 18,000.

Chip'ping Spar'row (*Spizella socialis*), a common North American migratory bird allied to the chaffinch, some five or six inches long, whose song consists of about half a dozen notes uttered in quick succession. It is also called chipping bird, and chippy. It is also known as the hair-bird from its habit of lining its nest with horse-hair. In the nest, which is built in low trees or shrubs, are laid four or five blue eggs slightly speckled with brown. Two or three broods are raised during the season. The bird is naturally an eater of seeds, and has sometimes been known to destroy insects, but the evidence in favor of the contention that it is the friend of the farmer and gardener is hardly enough to warrant the encomiums of some writers.

Chips from a German Workshop, by F. Max Müller (5 vols). A collection of special studies incidental to the author's editing of a library of the 'Sacred Books of the East.' The several volumes cover various fields, as follows: (1) 'The Science of Religion'; (2) 'Mythology, Traditions, and Customs'; (3) 'Literature, Biography, and Antiquities'; (4) 'Chiefly the Science of Language'; (5) 'Miscellaneous' and later topics. Although they are the result of "occasional work," their wealth of material and thoroughness of treatment, and the importance of the views presented, give them not only interest but permanent value. On many of the points treated, discussion is still open, and some of the views advanced by Prof. Müller may come into doubt; but his contributions to a great study will not soon lose their value.

Chiquichiqui (chē'kē-chē'kē) **Palm**, a native of Brazil, where it is called piassaba. It grows in swamps and along low river banks. Its leaves are used for thatching, and it is the source of a fibre which is used for making brushes.

Chiquimula, chē-kē-moo'lā, Guatemala, Central America, a small town in the east of Guatemala, 55 miles northeast of the city of New Guatemala. It is in a mountainous region, valuable mineral deposits near, and a delightful climate. Pop. 6,500.

Chiquinquirá, chē-kēn-kē-rā', Colombia, South America, the largest town in the department of Boyacá, near the Suarez, 42 miles west of Tunja; was an Indian place of pilgrimage before the conquest. In one of the churches is a miraculous picture of the Virgin. Where it is preserved is now visited annually by some 60,000 pilgrims. Pop. 12,800.

CHIQUITOS — CHIROPODY

Chiquitos, chē-kē'tōz, a race or stem of Indians inhabiting western Bolivia. The chief occupation of the people when first discovered by the whites, was agriculture. They rejected Spanish rule and European customs until 1691, when the Jesuits established a mission among them. The soil here is rich, growing vanilla, indigo, cotton, sugar, etc.; but for want of markets there is little cultivation. The policy of the Jesuit missionaries has made the Chiquito language the predominant one among the natives. It is copious, and is said to have a separate vocabulary for female use. The size and decorations of the churches, and the perfection of the church music in which the natives take a part, are a curious monument of the perseverance of the Jesuit missionaries, which has succeeded in implanting in the midst of these solitudes a fragment of European civilization. In the year 1767 the Jesuits were expelled from the place, by Spanish authority. Since then the Chiquitos have not prospered, and their numbers have decreased. They still cultivate the soil, which is fertile, growing vanilla, indigo, cotton, sugar, etc.; but for want of markets there is little ambition to raise large crops. The native population is about 22,000, distributed among 10 missions.

Chiretta, chī-rēt'ta. See CHIRATA.

Chiriqui, chē-rē-kē', Panama, formerly one of the administrative divisions of Colombia, adjoining Costa Rica; area, 6,500 square miles. It is well wooded, and has rich pasturage, especially on the Atlantic coast, where the climate is very moist. The Cordilleras that occupy the interior reach their highest point in the volcano of Chiriqui (11,265 feet). Chief town, David. On the north coast is a spacious lagoon with a depth of water for the largest ships. Pop. 45,000.

Chirogale, kī'rō-gāl, or MOUSE-LEMUR, a small lemur of the genus *Chirogale*, native exclusively to Madagascar, especially *C. Coquereli*. It lives in trees and at the approach of the dry season curls up in a hollow place in a tree and sleeps until the rainless time is over. Like hibernating animals of cold regions, it accumulates a large deposit of fat before becoming torpid; and when it wakes it has regained its normal condition. It feeds on fruits and insects, and builds a nest somewhat like a bird's. Four other species are known whose habits are similar, generally, to those of the lemurs (q.v.), especially the galagos, to which they are closely allied.

Chiromancy, kī'rō-mān-sī. See PALMISTRY.

Chiron, kī'rōn, in Greek mythology, the son of Kronos (Saturn) and Philyra. Kronos assumed the shape of a horse, in this amour, to deceive his wife, Rhea. The shape of Chiron, therefore, was half that of a man, half that of a horse. In point of fact, Chiron was one of the people called Centaurs. He was celebrated through all Greece for his wisdom and acquirements; and the greatest princes and heroes of the time were represented as his pupils. He was particularly skilled in surgery. When Hercules drove the Centaurs from Mount Pelion, they took refuge with Chiron in Malea; but their enemy pursued them even into this retreat, and unfortunately wounded his old teacher with a misdirected arrow. The speedy operation of

the poison in which the arrow had been dipped rendered remedies useless; and Chiron suffered the severest torments. The gods at his prayer put an end to his life, though his nature was immortal by reason of his descent from Kronos. After his death he was placed among the stars, and became the constellation Sagittarius.

Chiropody, the treatment by experts, male and female, of hand and human foot diseases and malformations, first became definitely known to science in the latter part of the 18th century. In 1785 a publication appeared in London under the title 'Chiropodologia,' treating in a scientific manner the causes of corns, warts, bunions, etc., with a detail of the most successful methods of removing all deformities of the nails and of preserving or restoring to the feet and hands their natural soundness and beauty.

When this and subsequent announcements of a similar nature first became known, the name was made the subject of much jesting and adverse criticism. In a magazine then current the name was condemned as "new-fangled." This evidently did not discourage the cultivators or patrons of the science, for during the same year, or early in 1786, a "chiropodist" opened his establishment in the English capital and did a thriving business.

By degrees the idea of having special care taken of the hands and feet spread throughout Great Britain. One hundred years after the establishment of a "Chiropodical Establishment" in London, a novelist in a magazine story referred to a lady who had "finished her chiropodistry," and in the same year a popular London weekly, by referring to the operations of chiropodists as "chiropody," gave the stamp of authority to that name as expressive of the craft specialty.

During the past 10 years chiropody has made vast strides in popular estimation as a useful if not essential factor in the acquisition of perfect personal comfort and cleanliness. In all large cities the list of operators in this line includes many men and women highly skilled in the proper treatment of diseased and malformed hands and feet. This is particularly true of the United States, notably New York city, where all barber shops of any pretensions now have a lady in attendance who undertakes to cleanse and purify the hands of customers while they are under the soothing influence of razor and lather brush.

Latterly there has been a clear distinction drawn between the specialists who, like the ladies who have their headquarters in the palaces of tonsorial artists, attend only to the hands, and others, mostly men, who give their attention principally to the feet. The former announce themselves to be "manicures," the latter "chiropodists." The chiropodist, as a rule, is fully qualified in both divisions of the work.

The service of chiropodists and manicures has become so essential and elaborate that it now embraces an extended vocabulary of its own. Surgical instrument makers have a special department for implements used by chiropodical operators. The skill with which these implements, many of them of razor-like keenness, are manipulated by competent operators is little short of marvelous. Holding the hand or foot of the subject gently, yet with a vise-like grip, they deftly turn their wrists to bring the instru-

CHIROPTERA — CHITIN

ments exactly to the required position around or beneath each nail, and, although the slightest error in movement may mean the crippling of the person under treatment, accidents of any kind are very rare indeed. See BUNION; CORN; NAIL; WART.

Chirop'tera. See CHEIROPTERA.

Chiru, chí'roo, a large antelope (*Pantholops hodgsoni*) native to the plateau of Tibet, especially in pine forests. It is about 32 inches tall, and pale in color. The buck has a black face, and long horns like those of the gazelle. It is wary to a degree that makes the autumnal hunts of the natives a matter of patience as well as of skill. This fine antelope is related to the saiga of Eastern Russia.

Chisel, an edged tool for cutting wood, iron, or stone. It is operated by striking its upper end with a hammer or mallet, or by pressure. It is one of the most ancient of tools. Chisels of sharp flint have always been used by savages to cut wood, and in very early times bronze ones were made which would cut the hardest stone. The ancient Egyptians carved most of their granite monuments with copper or bronze chisels, which are said to have cut as well as the best steel chisels of the present day. Chisels are now made in many different forms and for many kinds of work. Those used by sculptors, masons, and other workers in stone are merely short pieces of steel with sharp edges. The tool is held in the left hand and is made to cut by striking it on the end with a broad hammer called a mallet, made usually of wood. Blacksmiths, and other iron-workers use chisels much like those of stone-cutters, for cutting off bars of iron and like work. Carpenters and joiners' chisels are much finer tools, and usually have handles. They are made out of bar iron by forging, or hammering it while hot, and the edge of tool steel, is put in in the same way as the edge of an axe. Such chisels are made of many sizes, from an eighth of an inch up to several inches in width, and are used for different kinds of wood-cutting and -carving. Dovetails, mortises, and other such work are usually cut with chisels. A kind of chisel with a rounded blade, used for cutting grooves and round places in wood, is called a gouge.

Chis'elmouth. See CHUB.

Chisholm, William Wallace, American official: b. Morgan County, Ga., 6 Dec. 1830; d. De Kalb, Miss., 13 May 1877. In 1847 his family removed to Kemper County, Miss., and between 1858 and 1867 he was a justice of the peace and probate judge. During the Civil War he was a union man, but was continued in office, although regarded with suspicion by the Confederate authorities. After the war, a fusion of white unionists and negroes elected him sheriff. In 1877 a long standing personal and political feud between Chisholm and an opposing faction, led by John W. Gully, came to a head. On 26 April Gully was waylaid and murdered. His friends accused Chisholm and his party of being instrumental in bringing about the crime. Chisholm and four others were arrested on the morning of 29 April; a mob entered the village and insisted that Chisholm, who was in his own house in the custody of the sheriff, should be lodged in the jail. His wife,

daughter, and son, accompanied him there; the jail was shortly after attacked by the mob; Chisholm and his daughter receiving wounds that later proved fatal, while the son was killed in his father's arms by a shot from one of the leaders of the assailants. One of the other prisoners, Gilmer, had previously been killed by the mob. As there was no evidence to prove that Judge Chisholm had been implicated in the plot to kill Gully, the massacre was probably due to the animosity of the Democrats of the district, who, because Chisholm was enabled to control Republican favors, refused to abide by the existing conditions. In December 1877, Walter Riley, a negro, confessed that he had murdered Gully, and denied any knowledge or complicity on the part of Judge Chisholm or the latter's associates. See Wells, 'Chisholm Massacre' (1878). 'Kemper County Vindicated' gives the Democratic side of the affair.

Chisholm v. Georgia, in the United States supreme court, the case which led the several States to protect themselves from legal responsibility to individuals, while retaining legal powers of aggression. The Constitution provides (Art. iii., sec. 2): "The judicial power shall extend to all cases — between a State and citizens of another State." Under this provision Maryland was sued soon after the adoption of the Constitution, and acknowledged process by her attorney-general; but the case was compromised, and the question of jurisdiction did not come up. On 11 July 1792, Alexander Chisholm of South Carolina, as legatee in an inheritance case, served a process on the governor and attorney-general of Georgia to appear before the August term of the supreme court. Georgia instructed its attorney-general not to appear, and its counsel to enter a denial that States could be sued by individuals, or that the supreme court had jurisdiction in such cases, but not to argue the case. Chief Justice Jay and all the court except Iredell of North Carolina, found that the court had such jurisdiction; and a writ of inquiry was issued, but not served because Georgia passed an act making service of it a capital offense. Virginia was as angry as Georgia; and the Eleventh Amendment to the Constitution was introduced into Congress, passed by two thirds of both Houses 5 March 1794, ratified by the States, and declared in force, 8 Jan. 1798. It reads: "The judicial power of the United States shall not be construed to extend to any suit in law or equity, commenced or prosecuted against one of the United States by citizens of another State, or by citizens or subjects of any foreign state." This leaves the constitutional provision hanging in the air, unless construed as meaning "between a State as *plaintiff* and citizens of another State"; and thus the southern Confederacy made the corresponding article of its constitution read.

Chitin, or **Chitine,** kí'tin ($C_{15}H_{26}N_2O_{10}$), the horny substance which gives firmness to the tegumentary system and other parts of the *Crustacea*, *Arachnida* and insects; probably also the carapace of the *Rotatoria* consists of it. It is left when the above structures are exhausted successively with alcohol, ether, water, acetic acid, and alkalies. It is colorless and amorphous,

CHITON — CHITTENDEN

and is usually classed a proteid. It is dissolved by concentrated mineral acids without the production of color. It is not dissolved by solution of potash, even when boiling; neither does it give the characteristic reactions with Milton's or Schultze's tests.

Chiton, kī'tōn, a genus of *Mollusca* and the common name of the same, the shells of which are boat-shaped, and consist of a median series of symmetrical plates, folding over each other, and implanted in the mantle, the marginal zone of which is studded with spicules. It is the typical genus of the family *Chitonidae* of the class *Amphineura*.

This class is remarkable among the *Mollusca* in having certain of the organs distinctly segmented. The body is sole-shaped, symmetrical, and without distinct head or tentacles, but with a lateral fringe of gills. No eyes corresponding to those of snails are present, but very numerous eyes are scattered all over the back. The alimentary canal is much like that of a snail, being much convoluted, and provided at the anterior end with a muscular tongue and toothed radula. On the other hand the nervous system is unique in consisting of two pairs of longitudinal ganglionated cords, one of which, the pedal pair, is provided with transverse connective at intervals.

The chitons cling firmly to rocks, etc., by means of the powerful foot, many of them resisting the heaviest beat of the surf. Only very small species (*Chætopleura*, etc.) are found on the eastern Atlantic coast, but larger species occur in Florida and the Gulf of Mexico, while California has the giants of eight or ten inches of the genus *Cryptochiton*. Consult Hubrecht, 'Quarterly Journal of Microscopical Science,' 1882.

Chiton, kī'tōn, the undergarment of the ancient Greeks. In the earliest times it was worn by the men only; in later times there were two forms, and the chiton was worn by both sexes. The Dorian chiton was sleeveless, reaching about to the knees, and usually left more or less open on the right side. The Ionian was a long tunic reaching to the feet, closed on the sides, sometimes sleeveless, but often with short or long sleeves. Both forms were usually worn belted in at the waist.

Chit'or, or **Chittore**, India, a town and fort of Hindustan, in the native state of Oodeypore, Rajputana, on the Gamneri River, about 70 miles northeast of the town of Oodeypore. The town was for several centuries capital of Oodeypore, and was far more prosperous and wealthy than it is at present. It still contains many temples and other well-constructed buildings. The fort, formerly considered one of the strongest in India, stands upon a high rock overlooking the town. Pop. 11,000.

Chitra. See **AXIS**.

Chitral, chīt-rāl', British India, a native state, having Yasin and Gilgit on the east, Swat, Dir, and Bajaur on the south, Kafiristan on the southwest, and the Hindu Kush mountains on the north and northwest. Through it flows in a southwest direction the Chitral or Kunar or Kashkar River, a tributary of the Kabul, and on it, in about lat. 36° N., stands the town of Chitral at a height of more than 5,000 feet above sea-level. The people are Moslems, but

mostly speak a language closely akin to that of their pagan neighbors in Kafiristan. Upper Chitral, with its capital Mastuj, is closely connected with Gilgit. Lower Chitral enjoyed till recent times undisturbed independence; but in 1894 an English resident and small body of troops were surrounded and besieged in Chitral, the consequence of which was that in March 1895 an expedition was sent (the main body by the Swat valley, the other from Gilgit), which after some sharp fighting advanced triumphantly through extremely difficult country, relieved the besieged, and annihilated all opposition.

Chittagong, chīt-ta-gōng', India, district in the presidency of Bengal, Hindustan. The district has Tipperah on the north, the Chittagong Hill Tracts on the east, Arracan on the south, and the Bay of Bengal on the west. Its area is 2,563 square miles, and it has a population of about 1,300,000. The Blue Mountains, on the northeast, attain a height of 5,600 feet. The principal river is the Karnaphuli, or Chittagong. The level lands, chiefly on the coast, and the valleys are very fertile. The principal exports are timber, canvas, coarse cloths, and elephants. A considerable majority of the inhabitants are Mohammedans. The city of Chittagong, the capital of the district, is situated on the right bank of the Karnaphuli, 12 miles from its mouth and 220 miles east of Calcutta, and is the second port of Bengal. It consists of a series of detached houses on little hills. Although its climate is unhealthful, it is an important industrial and trade centre, among its exports being rice, jute, jute manufactures, and tea. Pop. 25,000.

Chittagong Wood, the wood of several Indian trees, especially of *Chickrassia tabularis*. It is a light-colored beautifully grained wood used by cabinet-makers. It is light in weight but does not wear well in changeable climates, as it warps in dry weather. The wood of *Cedrela Toona* receives the same name.

Chit'tam-wood, or **American Smoke-tree** (*Continus cotinoides*), belongs to the sumac family. It is a small tree with wide spreading branches growing to the height of about 40 feet. It flourishes during the months of April and May in Tennessee and Alabama and westward to Missouri and Indian Territory. A rich dye for commercial use is extracted from the orange-yellow wood, which weighs about 40 pounds to the cubic foot.

Chit'tenden, **Hiram Martin**, American military engineer: b. New York 25 Oct. 1858. He has supervised engineering government works in the Yellowstone National Park and elsewhere, and has published 'The Yellowstone National Park: Historical and Descriptive' (1893); 'Reservoirs in the Arid Regions' (1897); 'Reservoir System of the Great Lakes' (1898); 'The American Fur Trade of the Far West' (1901).

Chittenden, **Russel Henry**, American educator: b. New Haven, Conn., 18 Feb. 1856. He was graduated at Yale in 1875, and took a course at Heidelberg. He became professor of physiological chemistry at Yale in 1882, and since 1896 has been director of the Sheffield Scientific School. He has written 'Digestive Proteolysis'; 'Studies in Physiological Chemistry,' and similar works.

Chittenden, Thomas, American colonial and State governor: b. East Guilford, Conn., 6 Jan. 1730; d. Williston, Vt., 24 Aug. 1797. He was one of the pioneers of Vermont, settling upon the New Hampshire grants in 1774, and acquiring a fortune from his lands. In 1778 he became Governor of Vermont, before its formal separation from New York was recognized. During the Revolutionary War the English and the Continental Congress receiver overtures from him, his terms being recognition of Vermont's statehood. He retired from public life in 1796.

Chittim. See **KITTIM**.

Chittoor, chit-toor', or **Chittur**, India, a town, capital of North Arcot district, Madras. It contains courts and public offices, an English church and a Roman Catholic chapel. Pop. 10,000. There is a town of the same name in the state of Cochin, Madras, with about the same population.

Chit'ty, Joseph, English lawyer and legal writer: b. 1776; d. London 17 Feb. 1841. He acquired great reputation by his legal text-books. These comprise a 'Treatise on Bills of Exchange' (1799); 'Treatise on the Parties to Actions and to Pleadings' (1808); 'Treatise on the Law of Nations Relative to the Legal Effects of War on the Commerce of Belligerents and Neutrals' (1812); 'A Practical Treatise on the Criminal Law, Adapted to the Use of the Profession, Magistrates, and Private Gentlemen' (1816); 'Treatise on Commercial Law' (1818); 'Collection of the Statutes of Practical Utility' (1829-37); 'Treatise on Medical Jurisprudence' (1834).

Chiusi, kē-oo'sä, Italy, a town in the province of Sienna, 102 miles north-northwest of Rome, on an olive-clad eminence in the Val di Chiana, not far from the small Lago di Chiusi. In ancient times, under the name of Ciusium, it was one of the 12 republics of Etruria, and the residence of Porsenna. When Italy was overrun by the barbarians, it fell into decay, the whole valley was depopulated, and became the pestilential pool described by Dante. Since the improvement of the course of the Chiana, Chiusi has begun to flourish again along with the whole district. It is in connection with the discovery of Etruscan antiquities, however, that the place is chiefly heard of. During the 19th century immense quantities of these remains were found in the neighborhood in the grottoes that served the ancient Etruscans as tombs. They consist chiefly of sun-dried black earthenware vases, ornaments, relievos, and carved stonework, and are preserved in the museums at Chiusi and Florence.

Chiv'alry (Fr. *chevalerie*, from *cheval*, Lat. *caballus*, "a horse"), a term which indicates strictly the organization of knighthood as it existed in the Middle Ages, and in a general sense the spirit and aims which distinguished the knights of those times. The chief characteristics of the chivalric ages were a warlike spirit, a lofty devotion to the female sex, a love of adventure, and a thirst for glory.

To explain the nature and origin of chivalry we must consider the character of the ancient German tribes. The warlike spirit was common to them with other barbarous nations; but there were certain traits in their character pe-

culiarly their own. Among these was their esteem for women. This is dwelt upon by Tacitus, and is sufficiently apparent from the early native German historians. This regard for the female sex was diffused by them through every country into which they spread, though with considerable difference in the forms in which it developed itself. In France it became that refined gallantry for which the nation has been so long conspicuous; in Spain it assumed a more romantic and glowing character, displaying much of the fire of Oriental feeling; in Germany itself it became faithful and tender attachment to the wedded wife. Engrafted upon this primitive regard for woman amongst the Germanic tribes, the moral and æsthetic principles of the Christian Religion, its ideals of chastity, marriage and loyalty, and in particular the widespread veneration paid to the Virgin Mother of Christ, powerfully contributed to the development of the institutions of chivalry. We may be told, in answer to our claim of the peculiar regard for the female as a characteristic of the Teutonic tribes, that women were held in high esteem by the Romans. It is true that wives and mothers were treated with great regard by the Romans, and the history of no nation affords more numerous instances of female nobleness; but this esteem was rendered to them, not as females, but as the faithful companions and patriotic mothers of citizens. It had somewhat of a political cast. But this was not the case with the Germans. There is another trait of the German character which deserves to be considered in this connection, which is very apparent in their literature, and the lives of many individuals; we mean that indefinite thirst for something superior to the realities of life, that *sehnen*, to use their own word, which hardly admits of translation, which has produced among them at the same time so much excellence and so much extravagance. These three traits of the Teutonic race, their warlike spirit, their esteem for women, and their indefinable thirst for superhuman greatness, together with the influence of the feudal system and of the Roman Catholic religion, afford an explanation of the spirit of chivalry — an institution which, to many observers, appears like an isolated phenomenon in history, and leaves them in doubt whether to despise it as foolish or admire it as sublime. The feudal system divided the Christian Teutonic tribes into masses, the members of which were united, indeed, by some political ties, but had little of that intimate connection which bound men together in the communities of antiquity, and which has produced like effects in our own and a few preceding ages. They still preserved, in a great measure, the independence of barbarians. There was, however, one strong bond of union which gave consistency to the whole aggregate; we mean the Roman Catholic religion. The influence of a common religion was of great service to mankind, during the ages of turbulence and violence, in giving coherency to the links of the social chain, which were continually in danger of parting. To this cause is to be ascribed the great uniformity of character which prevailed during the ages of chivalry. The feudal system, besides, enabled the gentry to live on the labors of the oppressed peasants without the necessity of providing for their own support, and to indulge the love of adventure incident to their warlike and ambitious

CHIVASSO

character. If we now combine the characteristics which we have been considering — a warlike spirit, a lofty devotion to the female sex, an undefinable thirst for glory, connected with feudal independence, elevation above the drudgery of daily toil, and a uniformity of character and purpose, inspired by the influence of a common religion — we obtain a tolerable view of the chivalric character. This character had not yet quite developed itself in the age of Charlemagne. The courage exhibited by the warriors of his age was rather the courage of individuals in bodies. The independence, the individuality of character, which distinguished the errant knight who sought far and wide for adventures to be achieved by his single arm, was the growth of a later period. The use of the war-horse, which formed so essential an instrument of the son of chivalry, was not common among the Germans until the time of their wars with the Huns. They were, indeed, acquainted with it before, and Tacitus mentions it in his account of Germany; but it was not in common use among them till the period we have mentioned. After it was introduced, cavalry was considered among them, as among all nations in the early stages of their progress, much superior to infantry, which was, in fact, despised, until the successes of the Swiss demonstrated its superiority. In the 11th century knighthood had become an established and well-defined institution; but it was not till the 14th that its honors were confined exclusively to the nobility. The Crusades gave a more religious turn to the spirit of chivalry, and made the knights of all Christian nations known to each other, so that a great uniformity is thenceforward to be perceived among them throughout Europe. Then arose the religious orders of knights, the knights of St. John, the Templars, the Teutonic knights, etc. The whole establishment of knighthood assumed continually a more formal character, and, degenerating, like every human institution, sank at last into quixotic extravagances, or frittered away its spirit amid the forms and punctilios springing from the pride and the distinctions of the privileged orders of society. It merged, in fact, among the abuses which it has been one of the great labors of our age to overthrow. The decline of chivalry might be traced through the different forms which it assumed in different nations as distinctly as its development — a task too extensive for this work.

The education of a knight was briefly as follows: The young and noble stripling, generally about his 12th year, was sent to the court of some baron or noble knight, where he spent his time chiefly in attending on the ladies and acquiring skill in the use of arms, in riding, etc. This duty of waiting about the persons of the ladies became, in the sequel, as injurious to the morals of the page as it may have been salutary in the beginning. When advancing age and experience in the use of arms had qualified the page for war, he became an *escuyer* (esquire or squire). This word is generally supposed to be derived from *escu* or *scudo* (shield, *scutum*), because among other offices it was the squire's business to carry the shield of the knight whom he served. The third and highest rank of chivalry was that of knighthood, which was not conferred before the 21st year, except in the case of distinguished birth or great achievements. The individual prepared himself by confessing,

fasting, etc.; religious rites were performed; and then, after promising to be faithful, to protect ladies and orphans, never to lie or utter slander, to live in harmony with his equals, etc. (in France there were 20 vows of knighthood), he received the *accolade*, a slight blow on the neck with the flat of the sword from the person who dubbed him knight, who at the same time pronounced a formula to this effect: "I dub thee knight, in the name of God and St. Michael (or in the name of the Father, Son, and Holy Ghost). Be faithful, bold, and fortunate." This was often done on the eve of battle, to stimulate the new knight to deeds of valor, or after the combat, to reward signal bravery.

Though no man of any reflection would wish for the return of the age of chivalry, yet we must remember that chivalry exercised, in many respects, a salutary influence at a time when governments were unsettled and laws little regarded. Though chivalry often carried the feelings of love and honor to a fanatical excess, yet the reverence paid to them contributed to prevent mankind, at this period of lawless violence, from relapsing into barbarism; and as the feudal system was unavoidable, it is well that its evils were somewhat alleviated by the spirit of chivalry. The influence which chivalry had on poetry was very great. The *troubadours* in the south of France, the *trouvères* in the north of the same country, the "minstrels" in Great Britain, the *minnesinger* in Germany, sang the achievements of the knights who received them hospitably. In Provence arose the "Courts of Love," which decided the poetical contests of the knights. At these, amorous songs (*chansons*), duets (*tensons*), pastoral songs (*pastourelles*), and poetical colloquies (*sirventes*), were performed. In Germany the chivalric spirit produced one of the most noble epics, the 'Nibelungenlied' (q.v.). It was the spirit of chivalry which led to the Crusades, and from the intercourse with the East which grew up during this period the wonders of Oriental enchantment were introduced into the romantic or chivalric poetry, and European literature received a great stimulus. Chivalric poetry, however, existed apart from any influence of this kind, and really begins with the mythological cyclus of King Arthur's round table and the feats of his knights, which furnished materials that found poetic treatment in various European countries. A second cyclus is that of Charlemagne and his paladins, his 12 peers, which remained a poetical foundation of chivalric poetry for many centuries. Alexander the Great also became a great hero of chivalric poetry. The cyclus of Amadis, which belongs, perhaps, exclusively to Spain, does not rest on any historical ground. For further information see the essay on chivalry written by Sir Walter Scott; Heeren's 'Essay on the Influence of the Crusades'; 'Mémoires sur l'Ancienne Chevalerie, par Lacurne de Sainte-Palaye' (2 vols., with engravings); Gautier's 'La Chevalerie'; Henne am Rhyn's 'Geschichte des Rittertums'; Gautier, 'La Chevalerie'; and 'Don Quixote.' See also DUELING; MIDDLE AGES; TOURNAMENT.

Chivasso, kē-vās'sō, Italy, a town on the Po, 14 miles northeast of Turin. It was formerly strongly fortified, and contained the residence of the dukes of Montferrat. Pop. 10,000.

CHIVE — CHLORAL

Chive, or **Cive**, a perennial herb (*Allium Schœnoprasum*), of the natural order *Liliaceæ*. It is a native of Europe, Asia, and the northern parts of North America, but has been introduced in temperate climates as a vegetable. It has small, flat, clustered bulbs which multiply laterally to form clumps. The leaves, which grow in dense profusion, are tubular, five to eight inches long; and the flowers, which are borne in umbels, are purplish, pinkish, or violet. Aside from the use of the leaves as a flavoring for soups, stews, salads, etc., the plants are frequently used for ornamental purposes, since they make excellent edgings for flower-beds. They are readily propagated by division, a process that should be performed as soon as the clumps become very dense. The plants do well in any good garden soil with no attention except weeding, and they may be clipped for use frequently during the growing season. Their flavor resembles that of onions.

Chizerots (shē-zè-rō) and **Burins**, bū-răn, one of those peculiar races in France that live isolated in the midst of the rest of the population, and are despised and hated by their neighbors. They are found in the arrondissement of Bourgen-Bresse, in the department of Ain; and the communes of Sermoyer, Arbigny, Boz, and Ozan belong to them. According to tradition, they are descended from the Saracens. Though industrious and prosperous, they are held in the utmost contempt and detestation by their peasant neighbors, often themselves indolent and destitute. They are looked upon as covetous and malicious, and scarcely would the daughter of a small farmer or well-to-do day-laborer become the wife of one of them, so that they mostly marry among themselves. From time immemorial, they have been field-laborers, cattle-dealers, butchers, and the like. Many of them are very good-looking, the young women in particular being handsome and clear-complexioned, with large black eyes.

Chladni, hlād'nē, **Ernst Florens Friedrich**, German physicist, one of the founders of the science of acoustics: b. Wittenberg 30 Nov. 1756; d. Breslau 4 April 1827. He adopted the profession of jurisprudence, which he practised first in his native town, and afterward at Leipsic, but his natural taste led him to study music, and to devote his leisure to physical science. The backward state of the theory of music compared with the other physical sciences early opened up to him a neglected mine of scientific discovery; and at the age of 19 he set himself resolutely to investigate it. By covering plates of glass with fine sand, and causing them to vibrate, he discovered the fundamental fact in the science of acoustics, that the communication of vibrations in material bodies is subject to constant mathematical laws. See SOUND. His scientific investigations led him to travel through the principal countries of Europe and visit its principal capitals. He invented the euphone about 1789 and clavicylinder 1800, instruments more curious than useful, in which musical sounds are produced by friction, and by the revolution of a glass cylinder causing the vibration of chords. His scientific works are of quite a different value. The first of them, 'Entdeckungen über die Theorie des Klanges,' appeared in 1787; 'Acoustics' (which he himself translated into French, 1809), in 1802; 'Neue

Beiträge zur Akustik,' (1817); 'Ueber Feuermeteore,' (1820).

Chladni Figures. See SOUND.

Chlamydosaurus, klām-ī-dō-sâ'rūs. See FRINGED DRAGON.

Chlamyphorus, a genus of armadillos, containing the pichiciago. See ARMADILLO.

Chlamys, klā'mīs. (1) In ancient Greek costume, a light and freely flowing scarf or plaid, worn as an outer garment. It was oblong in shape, generally twice as long as its width, and was worn, according to taste or circumstances, in different ways. The chlamys of the youth was probably of a yellow color, while that of the soldier was scarlet. It was also carried by hunters and travelers, and some Romans are recorded as having adopted it. (2) In zoology, the name of a genus of coleopterous insects, belonging to the sub-tribe *Cyclica*, and the family *Chrysomelidæ*. There are but few North American species, and none of large size.

Chloasma, klō-az'mā, a peculiar pigmentation of the skin, of a yellowish, brownish to blackish shade, and due to a number of causes: (1) mechanical; (2) chemical; (3) thermal; (4) parasitic. Scratching is one of the most frequent mechanical causes. The irritants of mustard plasters, capsicum, cantharides,—all may cause an abnormal skin pigmentation. Sunburn is a frequent cause, a bringing out of the spots with greater vividness. Parasitic fungi have been known to cause it. In addition there are a large number of miscellaneous conditions associated with these liver spots. Pregnancy, menstruation, constipation,—one or all may emphasize their characters. Certain diseases, such as syphilis, Addison's disease (q.v.) in particular, and forms of anæmia are associated with excessive pigmentation. In only a small proportion of the cases has the liver anything to do with the condition.

Chlopicki, hlō-pīt'skē, **Joseph**, Polish general: b. Galicia 24 March 1772; d. Cracow 30 Sept. 1854. He served under Kosciuszko, during the first revolt of the Poles (1794), and then engaged in Napoleon's service, under whom he took part in the battles of Eylau, Friedland, Smolensk, and Moskowa. After the fall of Paris in 1814, he conducted back to Poland the débris of the Polish-French contingent, and was created general of division by the czar. On the outbreak of the Polish revolution of 1830, he was elected dictator, but soon resigned that office, fought at Grochow and Wavre, and after the cessation of hostilities, retired into private life.

Chlo'ral, a chemical substance resembling aldehyde in many of its properties, and obtainable from aldehyde by the action of chlorine gas. In its practical manufacture, however, it is formed by passing chlorine through cold absolute alcohol; a crystalline alcoholate of chloral is thereby formed, from which the chloral itself is afterward set free by the action of sulphuric acid. Chloral is a colorless liquid at ordinary temperatures, having the formula CCl_3CHO . It freezes at about -100°F ., and boils at 208°F . It combines directly with water, forming chloral hydrate (q.v.), $\text{CCl}_3\text{CH}(\text{OH})_2$, which is the substance commonly but incorrectly called "chloral."

CHLORAL HYDRATE — CHLORINE

Chloral Hydrate, a crystalline solid composed of trichloral aldehyde with one molecule of water. The crystals are single, colorless, and transparent rhomboids with an aromatic penetrating and smarting taste and slightly acrid odor. They are freely soluble in water, alcohol, and ether. Chloral hydrate is a powerful germicide but is rarely used as such save to preserve anatomical preparations. It is a vesicant and a local analgesic. In small doses it causes burning sensations of the stomach, but little general action. Full medicinal doses, 5 to 15 grains, cause a slowing of the pulse, dilatation of the arterioles, lowering of blood pressure, and slowing of the respiration. On the nervous system it acts as a depressant, causing sleep by direct action on the brain cells. Large doses cause poisoning with symptoms of collapse, coma with a feeble, thready pulse, lowering of temperature, cyanosis or lividity, cold perspiration, dilated pupils, and loss of reflexes. Death results from respiratory and cardiac paralysis. Treatment of poisoning is by rousing patient to maintain respiratory centre, artificial heat, artificial respiration, hot coffee by mouth or rectum, and cardiac stimulants. Chloral is particularly valuable in insomnia from overwork and in many of the convulsive disorders, titany, myoclonus, status epilepticus, and delirium tremens. Its action is possibly due to the formation of chloroform in the general circulation, by the action of the alkalis contained in the blood, in accordance with the equation $\text{CCl}_3\text{CH}(\text{OH})_2 + \text{KOH} = \text{CHCl}_3 + \text{H}_2\text{O} + \text{CHO.OK}$, the last formula in this equation being that of potassium formate. It is also useful in states associated with high arterial tension if the heart is not weakened. Within recent years a large number of allied drugs have been introduced. They have similar actions but are more palatable or are thought to cause less heart depression. Among these may be mentioned, chloralamid, chloretone, chloralose, and urethan.

Chloralamide, klō-rāl'a-mīd, or **Chloral For'mamide**, fōr'ma-mīd, a substance formed by the action of formamide upon chloral, and usually obtained in lustrous, colorless crystals with a slightly bitter taste. It has the chemical formula $\text{CCl}_3\text{CH} \begin{matrix} \text{OH} \\ \diagup \\ \text{NH} \end{matrix} \text{CHO}$ melts at 240°F. , and is soluble in 26 parts of water and in a much smaller quantity of alcohol. It is not decomposed by dilute acids, but is decomposed by alkalis, and also by water at temperatures above 140°F. See also CHLORAL.

Chloralimide, klō-rāl'ī-mīd, a substance occurring in long, colorless, needle-like crystals, with the formula $\text{CCl}_3\text{CH}:\text{NH}$. It is insoluble in water, but dissolves readily in alcohol, ether, and chloroform. It is used in medicine as an antipyretic and analgesic, and must not be confounded with chloralamide (q.v.).

Chlorastrolite, klō-ras'-trō-līt, a mineral found in the form of rounded pebbles on the shores of Isle Royale, Lake Superior, and derived from the trap rock in the vicinity. It is bluish-green in color, with a hardness of 5.5 and a specific gravity of 3.18. According to Hawes it is an impure variety of prehnite, but for optical reasons Lacroix classes it under thomsonite. Its name is from the Greek and signifies "green star," in allusion to its color and its stellated structure.

Chlo'rates. See CHLORIC ACID.

Chlo'ric Acid, a colorless, strongly acid liquid, having the formula HClO_3 and a specific gravity of 1.28. It combines with bases to produce the salts known as chlorates. Potassium chlorate is formed directly when chlorine gas is passed through a warm, concentrated solution of caustic potash. By treating this salt with sulphate of ammonia and adding barium hydrate, barium chlorate, $\text{Ba}(\text{ClO}_3)_2$, is formed, from which chloric acid is set free by the action of sulphuric acid. Chloric acid has powerful bleaching properties, owing to the facility with which it parts with its oxygen. Paper that is dipped into a strong solution of the acid takes fire spontaneously upon drying. The most important salt of chloric acid is potassium chlorate, which is largely used in the preparation of oxygen gas, in the manufacture of matches, and in medicine. It crystallizes in monoclinic plates having a specific gravity of 2.35.

Chlo'ric Ether, a name given (1) to spirits of chloroform, a liquid consisting of one part of chloroform to nine of alcohol, and (2) to chloride of ethyl, $\text{C}_2\text{H}_5\text{Cl}$, which is obtained by passing dry hydrochloric acid gas through alcohol.

Chlorides. See HYDROCHLORIC ACID.

Chlorim'etry, the art of estimating the quantity of chlorine present in bleaching-powder or any other hypochlorite. Several methods are employed, depending for their success upon the oxidizing power of chlorine. See CHEMICAL ANALYSIS.

Chlorine, klō'rīn, a gaseous element, discovered in 1774 by Scheele, who named it dephlogisticated marine acid. The term "dephlogisticated" had exactly the same import as "oxygenated," which was soon afterward introduced by Lavoisier. Davy showed that the substance is not a compound of oxygen, but a simple body or element, and from its peculiar yellowish-green color the name "chlorine" was given to it. Chlorine gas is obtained by heating a mixture of hydrochloric acid and finely powdered peroxide of manganese, and may be collected either in bottles over warm water in the pneumatic trough, or by simply leading the delivery-tube to the bottom of the collecting-bottle, and allowing the chlorine to displace the air. The reaction is

Deacon's process for the commercial manufacture of chlorine consists in passing a mixture of hydrochloric acid gas and hydrogen over tiles that are soaked in a copper salt, and then dried and heated to a temperature of about 700° to 750°F. At this temperature the hydrochloric acid gas is decomposed with the formation of water and liberation of chlorine; the copper salt being apparently unaffected by the action. Chlorine is now largely (and perhaps chiefly) manufactured by the electrolysis of a solution of chloride of sodium (common salt).

Under ordinary atmospheric conditions chlorine is gaseous, but it condenses into a mobile yellow liquid at a pressure of about four atmospheres. It also liquefies at the ordinary atmospheric pressure at about 28°F. below zero. It has the chemical symbol Cl , and its atomic weight is usually given as approximately 35.4 for $\text{H} = 1$. It is two and a half times heavier

CHLORINE

than atmospheric air, and has an insupportable suffocating odor. When pure it occasions immediate death to an animal immersed in it; but even when largely diluted with common air it cannot be respired with safety. It occasions a severe sense of stricture at the breast, which renders it impossible to make a full inspiration. Chlorine is somewhat soluble in water, the solution having the color and odor of the gas. If the solution be cooled, long yellow crystalline needles deposit, consisting of a hydrate of chlorine. When exposed to sunlight the solution gradually loses its color, oxygen is liberated, and the water contains hydrochloric acid in solution. The great affinity of chlorine for hydrogen is one of its most characteristic properties, and is exhibited in a number of reactions. If equal volumes of hydrogen and chlorine gas be mixed in the dark and then exposed to diffused daylight, gradual combination takes place; and if the mixture be exposed to direct sunlight the gases combine at once with an explosion and produce hydrochloric acid. This is the only compound these substances form with each other, and it is one of the most important of the acids. When a lighted taper is immersed in a jar of chlorine, it burns with a smoky flame; this is due to the combination of the chlorine with the hydrogen only, and the liberation of the carbon. Similarly, when hydro-carbons like turpentine and olefiant gas are mixed with chlorine and a light applied, a ruddy flame with a copious deposition of carbon shows that the hydrogen and chlorine are alone combining. Several of the elements catch fire when immersed in chlorine, for instance, phosphorus, arsenic, antimony, and copper; while others combine with it at a higher temperature, sometimes with vivid combustion as in the case of potassium. The binary compounds of chlorine with the other elements are termed chlorides, and next to the oxides they are the most abundant and widely distributed substances in the earth, many of them being also of great importance for manufactures. Common salt, the chloride of sodium, is the most plentiful of all, and forms large rock masses in various parts of Europe, and occurs dissolved in the waters of the ocean and of many salt lakes. It is the ultimate source of all the hydrochloric acid and chlorine of commerce. Other chlorides, as of potassium, calcium, etc., are met with, but in no case nearly so abundantly as common salt. As a class, the metallic chlorides are crystallizable salts, readily soluble in water, some being even deliquescent. The chloride of silver, the subchloride of mercury, and one or two others are, however, insoluble in water, while a few are decomposed by water. From its wide affinities and great activity in the free state, chlorine is one of the most useful and powerful instruments with which the chemist deals. By it such metals as platinum and gold are attacked and made soluble in water, while its power over organic substances is very great, and has resulted in the formation not only of a number of compounds by simple union with it, but of a great number into which the chlorine has entered more intimately and produced what are called substitution compounds.

Chlorine is largely consumed in the arts. Thus it is used in the manufacture of potassic chlorate, in the conversion of the yellow to the red prussiate of potash, in the preparation of chloride of sulphur for vulcanizing, and above all

as a bleaching and disinfecting agent. This last property is exercised by chlorine by virtue of its power of decomposing water by combining with the hydrogen and liberating oxygen, which latter substance is the true agent in the operation, and which converts the coloring matter into colorless compounds. Berthollet was the first to apply chlorine to the process of bleaching. The method of using it has been successively improved. It consisted at first in subjecting the thread or cloth to be bleached to the action of the gas itself; but the effect in this way was unequally produced, and the texture was sometimes injured. It was then applied in a dilute aqueous solution. The thread or cloth was prepared as in the old method of bleaching, by boiling first in water and then in alkaline lye; it was then immersed in the diluted chlorine, and this alternate application of alkali and chlorine was continued until the color was discharged. The offensive suffocating odor of the gas rendered this mode of using it, however, scarcely practicable; but the odor was found to be removed by a weak solution of potash; lime immersed in water, being more economical, was afterward substituted. Later a compound of chlorine and lime was employed, prepared by exposing slaked lye to chlorine gas; the gas is quickly absorbed by the lime, and the chloride of lime, or bleaching-powder, as it is called, being dissolved in water, forms the bleaching-liquor now generally employed. (See BLEACHING-POWDER.) In using it the cloth is first commonly steeped in warm water to clean it, and is then repeatedly washed with an alkaline solution so diluted that it cannot injure the texture of the cloth; the cloth is then washed and steeped in a very weak solution of chloride of lime, again washed, acted on by a boiling lye as before, and again steeped in the solution; and these operations are performed alternately several times. The cloth is lastly immersed in very dilute acid, which reacts on the bleaching-powder and liberates chlorine; this then attacks the coloring matter, and the cloth soon acquires a pure white color. It is next repeatedly washed with water to remove the last traces of the lime salts, and then it is exposed to the action of a hyposulphite in order to render inoperative any chlorine that may remain. (See ANTI-CHLOR.) The cloth is finally washed, dried, and dressed. When sulphuric acid is used to liberate the chlorine it is found more difficult, in the subsequent washing, to remove the calcic sulphate formed, on account of its sparing solubility in water. To avoid this, chloride of magnesia has been substituted for the chloride of lime. It is easily prepared by adding sulphate of magnesium to a solution of chloride of lime and straining off the clear fluid. It has the same bleaching power, is easily removed by washing, and is said to leave the cloth in a more supple state than when ordinary bleaching-solution has been employed. Another important application of chlorine gas and of bleaching-powder is to the destruction of disease germs. Acid vapors, sulphurous acid in particular, under the form of the fumes of burning sulphur, are often employed for that purpose; but chlorine is superior to any other agent, and is now widely employed for the purposes of fumigation and disinfection.

In medicine, chlorine gas dissolved in water is used extensively for bactericidal purposes. It is employed as a mouth-wash and for bathing

CHLORIS — CHLOROPHYLL

purposes, being both a deodorant and a bactericide; and internally has been used for its germicidal properties, particularly in typhoid fever.

Chloris, klō'ris. (1) The Greek goddess of flowers and the wife of Zephyrus, identical with the Flora of the Romans. (2) The daughter of the Orchomenian Amphion, the wife of Neleus and the mother of Nestor. (3) The daughter of the Theban Amphion and of Niobe. When the children of Niobe was killed she alone escaped along with Amyclas, and became so pale from terror that her former name of Melibœa was exchanged for that of Chloris.

Chlo'ris, or **Prairie Chloris** (*Chloris verticillata*), a genus of grasses, of which there are some 60 or more species, mostly natives of warm, dry countries. About 10 of these species are found on the prairies, from Kansas to Texas. *Chloris radiata* is a pretty annual grass frequently cultivated in greenhouses for the sake of its ornamental and curious appearance.

Chlo'rite Group, in mineralogy, a group of minerals crystallizing in the monoclinic system, exhibiting a green color from the presence of ferrous iron, and chemically definable as hydrous silicates of aluminum, ferrous iron and magnesium. They are usually secondary minerals, derived from pyroxene, amphibole, and other forms. They exhibit a marked basal cleavage suggestive of mica; but they differ from mica and its allies by not containing any considerable amounts of calcium or of the alkalis.

Chlorite Schist, shīst. As chlorite is a general name for green secondary hydrated silicates, containing alumina and iron, derived particularly from augite, hornblende, and biotite, so chlorite is used as a prefix to various names of rocks that contain such silicates, for example, chlorite schist. In the wide belt of Algonkian and Archæan rocks stretching from Labrador to the west end of Lake Superior are great areas of chlorite schists resulting from the alteration of sedimentary as well as igneous rocks.

Chlorodyne, klō'rō-dīn or -dēn, a proprietary mixture of uncertain composition, and best represented by the National Formulary formula, which is a mixture of chloroform, cannabis indica, morphine, and tincture of capsicum. Practically all of the chlorodynes on the market contain morphine, and hence are dangerous poisons. Their sale should not be permitted save on a physician's prescription.

Chlor'ofom (CHCl_3 , trichloromethane, methenyl chloride, terchloride of formyl), a heavy, clear, colorless, mobile, and diffusible liquid of a sweet burning taste and characteristic ethereal odor formed by the action of the sun's rays on a mixture of chlorine and marsh gas; also by the action of caustic potash on chloral or chloracetic acid, or by the action of nascent hydrogen on tetrachloride of carbon. It is prepared on a large scale by distilling water and alcohol with bleaching powder. Its vapor density is four times that of air. Its specific gravity should not be below 1.49, and it should be soluble in 200 volumes of cold water, and in all proportions in alcohol, ether, benzol, benzine, and fixed and volatile oils. It is volatile, even at low temperatures, boils at 140°F . and freezes at -94°F . It should not be exposed to the light, as it is liable to decomposition with the liberation of hydrochloric acid and chlorine.

As used in medicine it is a liquid consisting of 99 to 99.4 per cent by weight of absolute chloroform and 1 to 0.6 per cent of alcohol. It is not inflammable, but its vapor burns with a greenish flame. It is an excellent solvent for a variety of substances, as caoutchouc, resins, fats, alkaloids, etc. Medicinally it is used as an aqua, emulsion, liniment, spiritus, and pure U. S. P. chloroform. Its physiological action is allied to the alcohols, but it is much more energetic. Externally chloroform is an irritant, and if confined on the skin it can cause blistering. It is irritant to mucous membranes, and, taken into the stomach, causes a sense of warmth and burning with increased production of gastric secretions. In large doses it causes violent gastro-enteritis.

Its chief use in medicine is as a general anæsthetic, for which purpose it was first used by Simpson, of Edinburgh, in 1848. As an anæsthetic its vapor is inhaled; it thus enters the circulation through the blood circulating in the lungs. When so administered the stages of anæsthesia closely resemble those induced by others of the alcohol series, but in chloroform the anæsthesia is very rapid. There is first a stage of excitement, with heightened cerebral activities. This is soon followed by a gradual dissolution of the mental faculties, usually in an order the reverse of their complexity. Thus the highest faculties of judgment, memory, etc., are attacked first, then unconsciousness gradually sets in. The spinal cord centres are then affected; there may be some temporary irritation, which is followed by paralysis, and then by loss of sensation and of the reflexes. The automatic centres of breathing and the heart-beat are only slightly affected. There may be some lessening of heart action, following an initial stimulation, and similar respiratory changes. The patient thus in complete anæsthesia is motionless and senseless, unable to feel or move, his automatic functions of most vital importance to life-maintenance alone functioning. It is in this stage that operations are performed, although minor operations may be performed in the early stages of primary anæsthesia.

When the administration of chloroform is pushed too far, or there is a peculiar susceptibility to its effects, as in some individuals, poisoning results. It is usually rapid in onset, is attended with cyanosis, weak, trembling pulse, and reduction of blood pressure. The vaso-motor system seems to be paralyzed, and death is due perhaps to this alone, although other factors seem to be involved at times. Following chloroform anæsthesia, nausea and vomiting are apt to occur. Chloroform is a safe anæsthetic, deaths to the proportion of 1:3,000 or 1:4,000 are said to occur; hence ether, which has a proportion of 1:16,000 is preferred by many. This is so particularly in America, whereas in Europe chloroform is preferred. See ANÆSTHETICS; ETHER.

Chlo'rophane, in mineralogy, a variety of fluorspar, or fluorite, which, when heated, shines with a green phosphorescent light. It is found at Trumbull, Conn., and in the mica mines of Amelia County, Va.

Chlorophyll, klō'rō-fīl, the green coloring matter of plants. It plays an important part in the life of the plant, as it breaks up the carbonic

CHLOROPHYLLITE — CHOATE

acid gas taken in by the stomata of the leaves into its two elements, carbon and oxygen, returning the oxygen to the air, and converting the carbon with the water obtained from the roots into starch. Light is indispensable to the formation of chlorophyll, and hence arises the etiolation or blanching of plants by privation of light, either by the art of the gardener or from accidental causes.

Chlorophyllite, klō-rō-fil'it, an alteration product of the mineral iolite (q.v.). The only difference in composition is a larger percentage of water, but there is a marked decrease in hardness, from 7 to from 1.5 to 3, and also in transparency. The characteristic blue color of iolite is changed to a dull green, while a basal cleavage is highly developed. Its specific gravity is 2.7. It is found at Unity, Me.

Chloro'sis, an anæmia occurring in young girls about the period of puberty and characterized by a low percentage of hemoglobin in the blood. It is common in blondes, and in ill-fed and house-confined individuals. The chief symptoms are sickly greenish pallor, hence the name green-sickness, marked debility, breathlessness, palpitation, and tendency to fainting. There is frequently mental depression, irritability, and often perversion of the appetite. The most characteristic changes are in the blood. Here the number of red cells may be normal or slightly diminished, but the percentage of hemoglobin is reduced one half or even more. There is no marked leucocytosis. Gastro-intestinal symptoms may be present. Constipation is the rule. There may be anæmic heart murmurs; the pulse is soft and full; and in many cases there is a low persistent fever. Headaches, neuralgias, and cold hands and feet are prevalent. The treatment is by means of open air, exercise, iron, arsenic, full diet, and pleasant occupation.

Chlorosis is also one of the most formidable diseases to which plants are liable, often admitting of no remedy. It consists in a pallid condition of the plant, in which the tissues are weak and unable to contend against severe changes, and the cells are more or less destitute of chlorophyll. It is distinct from blanching, because it may exist in plants exposed to direct light on a south border, but is often produced or aggravated by cold, ungenial weather and bad drainage. The most promising remedy is watering them with a very weak solution of sulphate of iron. Many forms of the disease exist, of which those of clover, onions, cucumbers, and melons are best known.

Chlorostoma, in zoology, a genus of *Mollusca* of the family *Throcidæ*. The shell is deeply umbilicated almost to the top of the spire; the inner lip forms a semi-margin to the umbilicus, while the outer lip is angulated at the base.

Chlorotylum, a plant belonging to the genus *Confervoid Alga*, of the family *Chatophoraceæ*. The filaments are jointed, are repeatedly dichotomous, and parallel; the joints are of two kinds, some being elongated and colorless, while others are swollen, abbreviated, and have green endochrones.

Chloroxylon (Greek, *χλωρός*, green and *ξύλον*, wood), a genus of plants of the order *Cadrelaceæ* (q.v.), generically differing in the fact that the fruit has only three cells and is

split into three instead of five parts. The satin-wood tree of India, *Chloroxylon Swietenia*, sometimes grows to a height of 50 or 60 feet, and is a native of Ceylon and the Coromandel coast. The wood is hard and light-colored, having a satin-like lustre, and is sometimes mottled or curled, somewhat resembling box-wood but deeper in color. It is mainly used for articles of turnery, for the backs of brushes and often as veneering for cabinet-work.

Chmelnizkij, Nikolaj Ivanovich, nē'ko-lī ē-vān'ō-vīch чмѣл-нїт'скѣ, Russian writer: b. 1789; d. 1846. He contributed largely to the reformation and elevation of the Russian stage. Among his comedies are: 'The Babblers'; 'Air Castles'; 'The Waverer.'

Chmielnicki, чмѣ-ѣл-нїт'скѣ, **Bogdan**, Cossack chief: b. 1593; d. 25 Aug. 1657. He was the son of a Polish nobleman, who settled among the Cossacks of the Ukraine. This people, who had long defended the eastern boundaries of Poland against the Tartars and Russians, were at that time subjected to grievous oppression. Their religion was persecuted, their freedom circumscribed, and the castle of Kudak, called the curb of the Cossacks, was built to restrain them. Thus exasperated, they seized Kudak and massacred the garrison, but were soon subdued. After their defeat at Kumejki, Bogdan was sent to the Polish court, where he was favorably received, but suspicion soon drove him forth, and finally made him a scourge of Poland. Availing himself of the hatred and prejudices of the Cossacks, he entered upon a conspiracy against the Poles, and sought the alliance of the khan of the Tartars. Chmielnicki became master of the Ukraine, and carried terror, devastation, and death as far as Lemberg and Zamosc. Under the new king, John Casimir, the war was continued with equal cruelty on both sides. Chmielnicki put himself under the protection of Turkey, of Russia (1654), and again under that of Poland (1656).

Choate, Joseph Hodges, American lawyer and diplomat: b. Salem, Mass., 24 Jan. 1832. He was graduated at Harvard University in 1852, and at the Harvard Law School two years later. After practising law in Boston for a year he went to New York city, where he achieved remarkable success as a lawyer, becoming in 1884 a member of the famous legal firm of Evarts, Choate and Beaman. He won great distinction as a trial lawyer, conducting many celebrated cases in State and Federal Courts and International tribunals. He successfully defended General Fitz John Porter, prosecuted the infamous Tweed Ring, appeared in the Tilden Will contest, the Chinese Exclusion cases, the Income Tax cases of 1894, and represented the Canadian government in the Bering Sea dispute. In 1856, he became active as a republican in supporting John C. Fremont. In 1894 he was president of the New York State Constitutional Convention. In 1896 he was a candidate for United States Senator but was defeated by T. C. Platt. President McKinley appointed him in 1899 to succeed John Hay as ambassador to the court of Saint James, in which capacity he served till 1905. He was elected a "Master of the Bench of the Middle Temple" of England on 10 April 1905. This is the most distinguished honor conferrable by English lawyers on an outsider, and he is the first

JOSEPH HODGES CHOATE.

CHOATE—CHOCTAW

American so honored since the five signers of the Declaration of Independence were elected members. Mr. Choate is famous as an orator and shares with Chauncey M. Depew the title of leading humorous after-dinner speaker of this country. Consult Clemens, 'Choate Story Book' (1900).

Choate, Rufus, American lawyer: b. Essex, Mass., 1 Oct. 1799; d. Halifax, N. S., 13 July 1858. He was graduated at Dartmouth College in 1819; was admitted to the bar and began practice in Danvers in 1823; removed to Salem in 1828; and was a member of Congress in 1830-4, resigning in the latter year. Removing to Boston in 1834, he rapidly acquired a large practice. He was successor of Daniel Webster in the United States Senate in 1841-5; resuming his legal practice in Boston at the expiration of his senatorial term. He traveled in Europe in 1850, and was a delegate to the Whig National Convention in Baltimore in 1852. After Webster's death Mr. Choate was acknowledged the leader of the Massachusetts bar. He made many political speeches, the most brilliant, while a United States senator, including those on the Oregon Boundary, the Tariff, the Fiscal Bank Bill, the Smithsonian Institution, and the Annexation of Texas. His style is peculiar and characteristic, but hardly to be commended as a model for imitation; it is rich, vivid and glowing, instinct with passion, and colored with all the hues of fancy, but sometimes, it must be admitted, a little extravagant and exaggerated. The most remarkable quality, however, in his written compositions, is the structure of his periods. These are not the short and compact statements, involving but a single proposition, in which most writers of our times express their thoughts; but they recall and renew the continuous sweep and long-resounding march of the prose writers of the 16th century. They are often of breathless length, containing clause after clause, modifying, enlarging, or limiting the leading idea. His 'Addresses and Orations' appeared in a sixth edition in 1891. Consult Brown, 'Life of Rufus Choate' (1870); Neilson, 'Memories of Rufus Choate' (1884); Whipple, 'Recollections of Eminent Men' (1886).

Chocks, pieces of wood employed on ship-board as wedges to support various articles liable to be displaced by the motion of the vessel. They receive different names according to the purposes for which they are used, as "anchor-chocks" to support the anchor; "rudder-chocks" to keep the rudder immovable, in the event of accident rendering it unmanageable. Chocks are also used to support casks, boats, and other curved objects.

Choc'olate. See CACAO.

Choc'taw (properly **Cha'hta**, the chief "Chactas" in Chateaubriand's 'Atala' is an eponym of the tribe), one of the largest tribes of the great Muskogean (q.v.) stock, and before its deportation the most advanced in husbandry and general culture of any except the Creeks. They were called "Flatheads" by the French (not to be confused with the northwestern tribe of that name), from a habit of flattening their children's skulls with bags of sand; and they had a burial custom of disinterring the corpses after a few days, cleaning the bones, and preserving them. They are rather short,

stout, and slow, compared to the taller and more active Chickasaw (q.v.); and were nicknamed "tubbies," though not on that ground, but from the customary final word of their war-chiefs' names, meaning "killer." The Chickasaw was one of their subdivisions, or perhaps merely the more warlike and adventurous portion, till after the whole had crossed the Mississippi; and while using a dialectic language of their own for common service, still employed Choctaw for oratory. The Choctaw occupied central and southern Mississippi and western Alabama in three divisions, west of the Muskogee; and in the 18th century their chief towns lay in two groups, one some 200 miles north of New Orleans (about the present Choctaw County, Miss.), and the other about half way from the Chickasaw to Mobile. These villages a century earlier had been numerous and widely distributed; they are stated at 40, and the tribe as having 2,500 warriors. It was first found by De Soto in his expedition of 1540. At their town of Mavila (Mobile, probably Choctaw Bluff, Clarke County, Ala., on the north bank of the Alabama), was fought perhaps the bloodiest and most destructive single battle ever known between red and white men on the continent. The village was burned, 20 of De Soto's men killed and 150 wounded, and many hundreds of Indians slain—the Spanish chroniclers say 2,500 to 3,000, which may be discounted. Tristan de Luna met them again in 1560. The French, in settling this region about 1700, came immediately in contact with them, and established friendly relations with them, contrasting strongly with the permanent hostility of the Chickasaw, against whom and the Natchez the Choctaw aided the French. The latter planted forts in their country, and sent missionaries among them. In the final struggle between France and England, however, the English won over a part of them, including the chief Red Shoes. After the Revolution, the Choctaw shared with the other Indians in the general treaty of Hopewell 28 Nov. 1785, by which the sovereignty of the United States was recognized, a portion of the Choctaw lands ceded, and they were "guaranteed" the possession of the rest. By 1800 some 500 of them had migrated to the Arkansas (Indian Territory), and it is said that the rest were much less unwilling to go than the Cherokees and Creeks. They did good service to the Americans in the Creek war 1813-14. In 1820, by the treaty of Doak's Stand, they ceded part of their lands for an equivalent amount on the Arkansas; and in 1830, by that of Dancing Rabbit Creek, they gave up the rest—19,000,000 acres, or nearly 30,000 square miles, in the two cessions, for 20,000,000 acres in Indian Territory and \$2,225,000 in money and goods. In 1837 they removed with the Chickasaw to their new lands, between the Arkansas and Canadian rivers on the north and the Red River on the south. How the Chickasaw first amalgamated with and then separated from them is told under CHICKASAW. They made good progress, received the missionaries of the American board and several Church denominations, were given a well-diffused school system, and established a government consisting of a head chief, a council of 40 chiefs, a two-chambered legislature, and a regular judiciary system with trial by jury. Like all the southern tribes, they were slaveholders, and in 1860 had some 5,000 negro

slaves. Their superintendent and agents were Southerners, and they joined the Confederate side in the Civil War. Though their land was not overrun, their progress was brought to a standstill, and their population reduced by a third; and after the War, they were for a time deprived of their rights. On being restored, they had to part with a section of their lands to the government, which settled other tribes there. For a time, a territorial government was formed, with the superintendent as governor; and they had to make heavy allowances to their emancipated slaves. In 1900 there were 10,321 Choctaws proper in the Territory, besides those who had taken up lands in severalty; and some hundreds still remaining in Mississippi. A grammar of their difficult language was published in 1870.

Choczim, *hō'tsīm* (properly **Khotin**), Russia, a fortified town, on the right bank of the Dniester, opposite to Kaminiec, in Bessarabia. In 1718 the Turks caused it to be regularly fortified by French engineers; but it was taken by the Russians in 1730, 1769, and 1788. As it is completely commanded by the hills which surround it, its value as a fortress is now small. Its chief importance is as a military station. Pop. 16,000.

Chodat, *shō-dä*, R., Swiss botanist: b. Moutier-Grandval, Jura-bernois, 6 April 1865. In 1889 he became a professor of botany in Geneva University and has been *doyen* of the Faculté des Sciences there, from 1898. He has contributed numerous professional papers to botanical journals, and has published many important monographs.

Chodkiewicz, *hōd-kē-ā'vich*, **Jan Karol**, Polish general: b. Lithuania 1560; d. Chocim 27 Sept. 1621. He served against the Cossacks, defeated Charles IX. of Sweden in 1605, and afterward served against the Russians and the Turks.

Chodowiecki, *hō-dō-vē-ěts'kē*, **Daniel Nicolaus**, German designer and engraver: b. Dantzic 16 Oct. 1726; d. Berlin 7 Feb. 1801. He was instructed in miniature painting by his father, and subsequently painted snuff boxes. He was encouraged to study enameling, and soon attracted attention by the beauty and finish of his productions, some of which came under the notice of the academy of Berlin, and procured him a commission to make a set of designs for their almanac. The manner in which he executed these established his reputation. He thenceforth devoted himself almost exclusively to designing and engraving; he produced the plates for Klopstock's 'Messiah,' 'Don Quixote,' Lavater's 'Physiognomy,' editions of Shakespeare, Voltaire, La Fontaine, and many other works.

Chodzko, *kōdz'kō*, **Jacob Leonard**, Polish scholar: b. Oborek 6 Nov. 1800; d. 1871. Having traveled as secretary of Prince Oginski through nearly all Europe, he established himself in 1826 at Paris, where he published a memoir of the prince, with an introduction entitled 'Observations sur la Pologne et les Polonais' (Paris 1827), and commenced collecting materials for a history of his country from the death of Augustus III. Afterward he published the 'History of the Polish Legions in Italy, Under the Command of Gen. Dombrowski' (1829). During the revolution of July

1830, Lafayette appointed him his aide-de-camp; and after the outbreak of 29 November of the same year in Warsaw, he acted as agent of the revolutionary government in France. He was an active member of the French-Polish and American-Polish committees, and after the failure of the revolution, as member of the national Polish committee of France.

Chœnix, *kē nīks*, a measure of capacity among the ancient Greeks. Its size is variously given, and it is probable that it actually differed in the different states of Greece. Some accounts represent it as containing three cotylæ, or about 1.487 pints English; others make it equal to 1.982 pints; and still others give it as equal to 3.964 pints.

Chœrilus, *kē'rī-lūs*, the name of several Greek poets, among whom Chœrilus of Samos is the best known. He lived in the 5th century B.C., was the contemporary and friend of Herodotus, and composed an epic poem, entitled 'Perseis,' celebrating the victory of the Greeks over Xerxes. The fragments of the poem still extant have been collected and explained by Näke (Leipsic 1817). Another Chœrilus, of Iasus, in Caria, is mentioned by Horace as an example of an extremely bad poet. He formed part of the train of literary men who were selected to accompany Alexander the Great on his expedition to the East.

Choir. 1. In religious worship, an organized body of singers. In ceremonial Christian religions, and more particularly in the ordering of services in the Church of England, the minor canons, vicars choral, and choristers, or other singers taken collectively, are spoken of as the choir. The choral body in the latter Church is usually divided into two sets of voices, the one sitting on the north and the other on the south side of the chancel, and are known by the respective titles of Cantoris and Decani from their nearness to the Cantor (or Precentor) and to the Decanus (or Dean). In most cathedrals and collegiate chapels, the Decani side is held to be the side of honor, the best voices are placed there, and all the verses or soli parts, if not otherwise directed, are sung by that side, which is also considered the "first choir" (*coro primo*) in eighth-part music. 2. In architecture, the eastern limb of a cruciform church or the eastern portion of any church. In the latter case it is more commonly styled the chancel (*q.v.*), and is frequently constructionally lower and narrower than the main part of the building. The ordinary daily services in a cathedral or collegiate church are held in the choir. While architecturally the term choir is applied to the entire portion of the church east of the crossing, the eastern limb is itself divided into three portions: (1) the "ritual choir," containing the stalls for the singers and comprising the western portion of the architectural choir; (2) the presbytery, next east of this, containing seats for the laity (a term sometimes applied to all of the choir east of the "ritual choir"); (3) the sanctuary, containing the altar and sedilia, and divided from the remainder by a low railing. In certain cases there is even a fourth division called the retro-choir, comprising one or more bays east of the sanctuary. These are sometimes, as at Lincoln, Truro, and York, of the same roof elevation as the rest of the choir, but more commonly parts of a lower

CHOIR INVISIBLE — CHOKE-CHERRY

structure, as at Hereford, Winchester, and Salisbury. It should be noted that the "ritual choir," or place for the singers, does not invariably correspond with the architectural choir. Sometimes, as Winchester, Norwich, and Gloucester cathedrals, it includes the crossing and one or more bays of the nave, or again, as at Westminster Abbey, and in Spanish cathedrals generally, it is entirely in the nave, from the remaining portion of which it is separated by a massive wall or screen. In buildings where the ritual choir is entirely east of the crossing, the choir screen is placed between the eastern piers of the crossing. At Gloucester, Exeter, Lincoln, York, Southwell, and several other cathedrals, the organ is placed upon the choir screen. In several English cathedrals the choir is quite as long as the nave, and in some parish churches even longer, but the usual proportion of choir to nave is as one to three. In French churches the choir frequently terminates polygonally with encircling chapels and this termination is known as a chevet, but in England the square east end is the most common in Gothic churches, although in Norman ones the semi-circular apse is not infrequent. In the Middle Ages, the choir, as the most indispensable portion of the church, was erected first, the nave, regarded practically as a stately approach to the choir, was built later, a century or more sometimes intervening between the completion of the choir and that of the nave. At the present time the cathedral of Saint John the Divine in New York is being erected after the mediæval custom, the intention being to wait for some years after the completion of the choir before beginning work upon the nave.

Choir Invisible, The, a novel by James Lane Allen, published in 1897. It is one of his most popular and pleasing stories, and was enlarged from an earlier story called 'John Gray.' Its scene is the Kentucky of 100 years ago, and the fresh picturesque descriptions of pioneer life in Kentucky give the tale historical value.

Choiseul-Amboise, Étienne François, ā'tē-en frāñ swā shwā-zēl-āñ-bwāz, DUC DE, French statesman: b. 28 June 1719; d. Paris 7 May 1785. He entered the army in early life, and after distinguishing himself on various occasions in the Austrian War of Succession, returned to Paris, where his marriage with the daughter of the financier, Crozat, gave him the command of great wealth, and his intimacy with Madame de Pompadour furnished the means of gratifying his ambition. After having been ambassador at Rome, where he obtained from the Pope, Benedict XIV., the celebrated encyclical letter intended to appease the disputes which had arisen on the bull Unigenitus, and at Vienna, where he concluded with Maria Theresa the treaty of alliance against Prussia, he became in 1758 minister of foreign affairs. At the same time he was made a duke. He succeeded the marshal of Belle-Isle as minister of war in 1761, and the same year he became also minister of marine. His administration was distinguished by many useful reforms. He reorganized the army and navy, which the disasters of previous wars and the neglect of previous administrations had suffered to fall into decay; negotiated the famous Family Compact which reunited the various members of the Bourbon family, and restored Corsica to France.

His fall was brought about in 1770 by a court intrigue, supported by Madame du Barry, the new favorite of the king. He was recalled to court on the accession of Louis XVI. in 1774, but not again intrusted with power.

Choiseul-Gouffier, goo-fē-ā, Marie Gabriel Florent Auguste de, COUNT OF, French antiquarian: b. Paris 27 Sept. 1752; d. Aix-la-Chapelle 20 June 1817. He early displayed a particular interest in everything relating to Greece. His wish to visit this country was gratified in 1776, and in 1782 appeared the first volume of 'Voyage Pittoresque en Grèce,' which attracted much attention and procured him a seat in the French Academy in 1784. The two other volumes appeared in 1809 and 1820. The first was entirely revised by him before his death. The same year he was appointed ambassador to Constantinople, where he remained till 1791. The appointment of ambassador to London was then offered to him, but he remained at Constantinople and sent his official correspondence to the exiled French princes. This correspondence having fallen into the hands of the republicans the convention gave orders for his arrest, but he escaped by taking refuge in St. Petersburg, where Paul I. made him a privy-councilor, director of the Academy of Arts, and superintendent of the imperial libraries. He returned to France in 1802 and resumed his seat in the Academy. In 1814 he was made a peer of the realm. His antiquarian researches were chiefly inserted in the memoirs of the National Institute, and his very valuable collection of antiquities is now in the museum of the Louvre.

Choiseul-Praslin, prä-lāñ, Eugène Antoine (è zhāñ āñ twāñ) **Horace de**, French statesman: b. 23 Feb. 1837. He was first elected to the National Assembly in 1871, and has been several times a member of the chamber of deputies. He is considered one of the leaders of the Republicans. In 1871 he was minister plenipotentiary to Italy; in 1880 he became secretary of state in the ministry of foreign affairs; and in 1887 was sent on a botanical expedition to Ceylon and the United States.

Choisy-le-Roi, shwā-zē-lè-rwā, or Choisy-sur-Seine, France, a town in the department of Seine, seven miles south of Paris, on the left bank of the Seine. Its broad, straight streets, elegant houses, and fine avenues, with the proximity of the Seine, contribute to render it one of the most agreeable towns in the vicinity of Paris. In its cemetery is the tomb of Rouget de l'Isle, author of the 'Marseillaise.' It has manufactures of wax cloth, soap, chemical stuffs, glass, morocco leather, earthen-ware, porcelain, and vinegar, and some trade in wine, vinegar, coal, etc. Pop. 11,281.

Choke-cherry (*Prunus virginia*), so called from the astringent nature of the fruit, a shrub from 2 to 10 feet high, rarely a small tree, belonging to the natural order *Drupaceæ*. For commercial uses the wild black cherry (*Prunus serotina*), which is closely allied to *P. virginiana*, is valuable. Its wood is one of the best American woods for cabinet-making. The bark has medicinal properties as a pectoral tonic, and febrifuge. The range of choke-cherry is wide, flourishing along river banks and in rocky situations, from Canada to Florida, and west to Colorado and Texas.

CHOKE-DAMP — CHOLERA

Choke-damp, the name given by miners to the fire-damp resulting from an explosion of gas in mines. The following diagram is illustrative of the combustion of fire-damp, or carburetted hydrogen, of which the product is choke-damp, called also after-damp and black-damp:

Before Combustion. <i>Wght.</i>	Elementary Mixture. <i>Atoms.</i>	<i>Wght.</i>	Products of Combustion. <i>Wght.</i>
8 carburetted hydrogen...	{ 1 carbon 1 hydrogen 1 hydrogen	6 1 1	22 carbonic acid. 9 steam. 9 steam.
144 atmosph'ic air.....	{ 1 oxygen 1 oxygen 1 oxygen 8 nitrogen	8 8 8 8 112	112 uncombin'd nit
152		152	152 choke-damp.

Choking, a stoppage caused by a morsel of food, a drop of liquid, etc., passing into the larynx or upper opening of the windpipe, instead of the gullet, or an obstruction of the œsophagus itself. It is usually followed by a violent fit of coughing which lasts, in slight cases, till the offending substance is expelled. Sometimes, however, a larger mass—for example, a half-chewed piece of meat—is drawn into the opening of the windpipe, completely blocking it, and arresting respiration altogether. This condition is one of extreme danger; the sufferer becomes purple in the face, and if not at once relieved will certainly and quickly die of suffocation. The obstructing substance is usually within reach, and may often be dislodged if a by-stander promptly pushes his forefinger to the back of the throat and attempts to draw the obstruction forward. A child may sometimes be saved by holding it up by the heels and shaking it, or slapping its back. If these measures fail relief may be obtained by means of a sharp-pointed knife promptly pushed into the windpipe to admit air to it below the obstruction. In the case of an animal, remove the obstruction with the hand when possible. Cause the animal to swallow the obstructing substance, if possible, by giving it water, oil or belladonna solution. Carefully push the obstruction down by a probang, if it is possible to effect this, and if withdrawal by the mouth is impracticable. In some cases the gullet has to be cut into by a surgeon.

Cholagogue, kōl'a-gōg, a remedy that increases the flow of bile, as distinguished from an hepatic stimulant, which increases the production of bile. Most of the cathartics that stimulate peristalsis affect the gall bladder, causing it to empty itself more energetically. These may be classed in general as cholagogues. See CATHARTICS.

Cholera, kōl'ér-a, an acute, infectious disease, endemic in some localities and epidemic in others, characterized by vomiting and purging of a peculiar rice-water-like fluid, and a stage of collapse.

Etiology.—The prime cause of cholera is one of the most perplexing questions with which scientists have had to deal, and even at this advanced period of scientific investigation it is not definitely known. The claim that it is caused by a germ is not accepted by all. Disease germs, which, according to their form, are known as cocci, bacteria, bacilli, vibriones, and

spirilla, are among the smallest units of life; 30,000,000 of them, according to Prof. Max von Pettenkofer, of Munich, weighing only one milligram. In 1884 Dr. Koch claimed that the comma-shaped bacillus was the true cause of the disease, and this theory seems to have met with considerable favor, though it is not yet admitted as a scientific truth. In fact Dr. Koch himself, in an address delivered before the Imperial German Board of Health at Berlin, 30 Aug. 1884, admits that the true cause of cholera is not precisely known, though he invariably found it to exist. Dr. H. Vandyke Carter of London says that the real cholera germ, if such a thing truly exists, has yet to be found. He, too, says he found an organism resembling a vibrio rather than a bacillus, and this he did not find in all cases. He also claims that it would be irrational to suppose that an everywhere widely distributed organism like *Vibrio frugula* can alone be the essential cause of Asiatic cholera. His investigations were all in India, and he did not see an authentic specimen of this organism. Others assert that it is a specific disease originating in India, and the assertion is also made that cholera can arise spontaneously in other countries and is not dependent on a specific cause.

Dr. Koch says that the comma bacilli grow extremely rapidly and reach a maximum in two days; after that they commence to die, and other bacteria form in their place. Temperature has very little to do with their lives, however. They are said to live at temperatures ranging from -15° to 104° F. These bacilli are located solely in the intestines, as, according to Dr. Koch, none have been found to exist in the blood or in any of the other organs. In the lower section of the lower intestines they are found in greatest abundance, also in the dejecta, but not often in the vomit. It is said that the bacilli cannot live in the stomach, and the reason that most deaths occur on Monday and Tuesday is because those days succeed the one in which over-eating and -drinking is usually indulged in, and the bacillus is conveyed into the intestines by the undigested mass of food that passes into them.

How Bacteria Kill.—The question then arises, How is it that this bacterial vegetation in the intestines can kill a man? Bacteria not only consume substances, but also produce others of various kinds, many of which are of a very peculiar nature. Some are of a transient nature and emit an intense smell; others produce coloring matter or some poisonous substance. In the putrefaction of albuminous liquids blood poisons are formed which must be products of vital changes of these bacteria, as putrefaction is only a consequence of bacterial vegetation.

It is asserted that these comma bacilli destroy the blood corpuscles within a pretty wide range, and it is fair to conclude that they also destroy more or less of the surrounding tissues. Mr. Richards, a physician at Goalundo, in India, says that sometimes one can feed the dejecta to animals and do no harm; at other times the dejecta prove fatal and the animals die in cramps. The time required for such animals to die after eating the dejecta is from 15 minutes to two and a half hours.

This reasoning does not go to show that these animals die from a species of bacteria, but

CHOLERA INFANTUM — CHOLET

from a poison of some peculiar nature generated from the cholera dejecta, and why this action does not occur in all cases is more than can be explained, unless it is influenced by the contents of the stomach. Some pathologists claim that death is produced by paralysis; others say by mortification of the epithelium and mucous membrane; and again it is said to be due to inspissation of the blood, produced by loss of water. It would seem, however, that death is caused, in many cases at least, by irritation of the nerve centres, and consequently by some peculiar brain lesion.

Dr. Koch concludes that the only way known at present to get rid of the infectious matter of cholera is to dry it, and thus kill the germ. A more important matter, granting the comma bacillus to be the true cause of cholera, would seem to be to learn how to dispose of it in the human stomach before it goes farther and terminates life, which it must surely do when it enters the intestine.

Cholera originated in the East Indies and was not known to migrate for 1,000 years. The oldest Sanskrit writings show that it was known many hundred years before the birth of Christ. In the 17th and 18th centuries there are abundant proofs of epidemics, but it did not spread into Europe until 1830. The Russians took it from India through couriers and stage-coaches. Another peculiarity of this disease is that when it was in Marseilles it broke out in Paris, jumping Lyons, the second largest town in France, notwithstanding the fact that quarantines were in full force.

A Miasmatic Disease.—The cholera germ, like the malaria bacillus, depends greatly upon a moist soil, and if it does not depend upon this, and is not a miasmatic disease, how can it be explained that in India, the home of cholera, it seldom, if ever, occurs on the mountain-tops, proving conclusively that it at least often occurs as a miasmatic disease and may be wholly independent of human intercourse. It must be remembered that in India the inhabitants drink the same water that they wash in, and, as a rule, are exceedingly careless, so it is easy to believe that cleanliness has a great influence in preventing the disease.

'The Lancet' of 15 Jan. 1885 says that a special commission was sent out from England to India to inquire into the cause of cholera, with particular reference to the theory of Prof. Koch that the comma bacillus is the true seed of the disease. The commissioners were Dr. E. Klein and Dr. Heneage Gibbs, both medical men of distinction and accomplished in physiological research. The result of their labors in the very home of cholera is tersely stated by Dr. J. N. Cunningham, the Sanitary Commissioner of the government of British India, when he says that their conclusions "are altogether subversive of the statements advanced by Prof. Koch as to the so-called comma bacillus being the cause of cholera."

Pathological Anatomy of Cholera.—After death the stomach contains more or less of the whey-like albuminous fluid and is full of cast-off epithelium. The small intestines usually contain a large quantity of the whey-like fluid and epithelium. The glands of Brunner, the solitary and agminated patches, are thickened and very prominent. The solitary glands of the large intestines are also infiltrated and swollen.

The liver is more or less advanced in fatty degeneration. The kidneys have a pale, white appearance, due to the epithelium blocking the tubes. The bladder is empty and contracted. The lungs are congested. The right cavities of the heart are distended with blood, while the left cavities are empty and contracted.

Cholera is usually ushered in by vomiting, purging, and griping pains in the stomach, and death follows in from 1 to 24 hours. If life is retained longer than this time the patient may possibly recover. A large percentage of the cases die.

Treatment.—Opium, quinine, whiskey, sulphuric acid, camphor, chloroform, chlorodyne, carbolic acid, bismuth, hydrocyanic acid, chloral, and atropia are the favorite remedies. Brown Sequard says the most efficient remedy is the hypodermic injection of morphia with atropia. He, too, says this treatment will prevent an attack of cholera.

H. H. BIEDLER, M.D.

Dean, Baltimore University School of Medicine.

Cholera Infan'tum, an acute infectious disease of infants, due in large part to a definite micro-organism, the *Bacillus shiga*, or allied species, characterized by acute gastro-enteric inflammation, with nausea, vomiting, diarrhœa, temperature, wasting, and prostration. Death may result in a very short time. The child may be attacked suddenly, but it is more liable to occur in children who have been somewhat run down from a mild diarrhœa of indigestion. The child is then taken with the cholera-like diarrhœa, passing thin serous- or rice-water discharges, 10 to 20 a day. The temperature rises abruptly to from 103° to 105° F. and there is constant vomiting. There is rapid emaciation and prostration, the child having strength only to moan or cry with a sharp irritable sound. Dullness, stupor, and at times convulsions precede death. Treatment should be prompt and requires skilled medical attendance. Acute summer diarrhœa of infants is not necessarily cholera infantum. In fact cholera infantum is not a common disease, whereas the acute diarrhœas of children, resulting from tainted foodstuffs, is very common. Every case of summer diarrhœa, however, should receive vigorous treatment, because it offers an opportunity for the *Bacillus shiga* to develop cholera infantum.

Cholesterin, kō les'tēr-īn (C₂₆H₄₄O), a substance found in bile, blood, etc., which may be obtained in the form of beautiful pearly crystalline scales, without taste or odor. It is widely distributed in the animal economy, being essential to the brain and nerve substance, and having been found in milk and many portions of the body, both as a normal and as a pathological constituent. Cholesterin was first obtained by Conradi, in 1755, from human gall-stones, in which it is often present in large quantities. It melts at 297° F. It is the chief constituent of lanolin (q.v.), a highly important oily substance that is obtained from the grease of sheep's wool.

Cholet, shō-lā, France, a town in the department of Maine-et-Loire, on the right bank of the Moine, 32 miles southwest of Angers. It has a tribunal of commerce, consulting chamber of manufactures, and communal college. Its manufactures include handkerchiefs and cotton goods, called *cholettes*, flannels, and woolen

CHOLIAMBUS — CHONDROPTERYGII

stuffs. There are also wool and cotton spinning-mills, bleachfields, dyeworks, and tanneries. There is also a great trade in cattle, the markets for which are attended by a large concourse of buyers from other parts. Pop. 15,000.

Choliambus, kō-lī-ām'būs (Greek, *choliambos*, the lame iambus; also called *skazon*, from *skazo*, to halt; or *versus Hipponacticus*, because the satirist Hipponax of Ephesus made use of it, or perhaps invented it), an iambic trimeter, the last foot of which, instead of being an iambus, is a trochee or spondee, which gives it a lame motion, as, for instance, Martial, l. i. pray. v. 3.

Cur in theatrum, Cato severe, venisti?
An ideo tantum veneras, ut exires?

We perceive, from the construction of the choliambus, that it may be applied with advantage to produce a comic effect. The Germans have happily imitated this verse, as well as all other ancient metres. An instance of a German choliambus is —

Der Choliambe scheint ein Vers für Kunstrichter.

Cholic (kōl'ik) **Acid** (C₂₄H₄₀O₅), a non-nitrogenous acid produced by decomposing the true biliary acids with an alkali. It does not exist in bile ready formed. It is crystalline, sparingly soluble in water, but readily soluble in alcohol and ether. The cholates are rather obscurely crystalline; they are not very soluble in water, but rather more so in spirit. Both the acid and salts have a bitter taste.

Choline, kōl'in, a basic body found in both plants and animals. In animals it is apparently one of the reduction compounds of proteids, being a trimethyl oxyethyl ammonium hydroxide. It is of interest in medicine chiefly because of its close affinities to two very poisonous compounds, into either of which it may be converted. By oxidation it builds neurine, a highly poisonous body; and by hydration it becomes an alkaloid-like body closely resembling the plant alkaloid muscarine, from the poisonous mushroom *Amanita muscaria*. Thus choline may be one of the auto-intoxicating substances that may be developed in the human body if its normal metabolism is disturbed. It may also be a factor in the so-called ptomaine poisoning.

Cholmondeley, chūm'li, **Mary**, English novelist. Her fictions have been extremely popular and include 'The Danvers Jewels'; 'Sir Charles Danvers'; 'Diana Tempest'; 'A Devotee'; 'Red Pottage'; 'Love In Extremis.'

Cholochrome, kōl'ō-krōm, or **Cholophæin**, the brown coloring matter contained in bile and in the intestines, and the substance coloring the fæces and the skin in jaundice.

Cholophæin, kōl'ō-fē'in. See CHOLOCHROME.

Cholos, shō'lōz, in Peru, the name for those who are partly of white, partly of Indian parentage, the most numerous class of the community.

Cholula, chō-loo'lä, Mexico, a city in the state of Puebla. It is 12 miles west of La Puebla, 60 miles southeast of the city of Mexico. The streets are regular and spacious, the houses mostly of one story, and flat-roofed. Though fallen from the importance it had attained in the early part of the 16th century,

it still exhibits traces of its former greatness. Under the name of Chunultecol it was once the capital of an independent district, and the seat of the religion of the ancient Mexicans. It was the great centre of the Aztec worship. At that time it contained, it is said, 40,000 houses and more than 400 temples; one of these temples still remains, though in ruins. It is described by Humboldt as being built in the form of a pyramid, of four stories of equal height, in alternate layers of clay and sun-burned bricks; each side of its base measuring 1,440 feet, and its height in all 164 feet. At the present day it is so altered that it looks at a distance like a natural hill. On one of its highest platforms a chapel has been constructed, in the form of a cross, 90 feet long, with two towers and a cupola. Since the introduction of Christianity, this and other of its temples have been used for Christian worship. Pop. 10,000.

Chondrine, kōn'drīn, a substance containing carbon, hydrogen, nitrogen, oxygen, and sulphur, obtained from rib-cartilage by continuous boiling with water, exhausting with ether to remove fat, and drying. Its composition varies slightly according to the material made use of; it contains about 0.4 per cent of sulphur. It is a diaphanous horny mass, insoluble in alcohol, but softening and dissolving in hot water. From this solution it is thrown down as a bulky precipitate by acids, and by the salts of several heavy metals. By boiling with sulphuric acid it is decomposed into leucine, and with hydrochloric acid into a sugar-like body called chondroglycose. Nothing definite is known about its origin or function in the body. It has a marked general resemblance to gelatine, but it is distinguished by giving the precipitates just mentioned with the acids and salts. Infusion of nut-galls precipitates both.

Chondro'ma. See TUMORS.

Chon'dro-sarco'ma. See TUMORS.

Chondropterygii, kōn-drōp-tēr-ij'ē-ī. Under this name were included by Cuvier the sturgeons, sharks, rays, lampreys, mud-fish, and lancelet, an assemblage of fishes so unnatural that the possession of fins and gills sums up nearly all they have in common. The term was adopted to give prominence to what seemed a fact of cardinal importance, namely, that the skeleton of the limbs was cartilaginous. In modern systems the *Amphioxus*, or lancelet, is the sole example of an order — *Leptocardii* (Müller) or *Pharyngobranchii* (Huxley) — in which the cranium is purely membranous and scarcely larger than the spinal canal; the spinal marrow is enclosed in a sheath, with only traces of division into vertebræ; and a heart is wanting, the circulation being maintained by the contractility of the blood-vessels. The glutinous hag (*Myxine*), the river lamprey (*Petromyzon*) and its larva (*Ammocætes branchialis*), represent the order *Cyclostomata*, known also as *Marsipobranchii*, the gills being lodged in pouches. These two groups should, in the opinion of some, form two distinct classes of equal value with the remainder of the fishes, which are divided into the ganoids, or *Ganoidei*; the osseous fishes, or *Teleostei*; the *Selachii*, including the sharks and rays; and the *Dipnoi*, represented by the mud-fish (*Lepidosiren*). The last-named group comes under the *Chondrop-*

CHONDROSTEI — CHOPIN

terygii of Cuvier, but it is now known to rank very high in the scale among fishes, and to be closely related to the amphibians or to the reptiles, inasmuch as its heart has two auricles, the other fishes having only one, and true lungs co-exist with gills. Again, while the skeleton of the sturgeon is nearly wholly cartilaginous, that of the other ganoids is well ossified, while the structure of the heart and sense organs removes the *Selachii* very far from the lancelet and the cyclostomatous fishes. The cartilaginous or embryonic condition of the skeleton may persist through life among the fishes in association with the highest as well as the lowest development in other respects. The Cuvierian group is therefore now distributed according to the sum of the characters, and the fishes included in it are not massed together simply because one point of structure is common to all.

Chondrostei, kŏn-drŏs-tē-i, an order of bony fishes of lowly and degenerate organization, formerly classed as cartilaginous ganoids. The internal skeleton is but little ossified, the vertebræ and most of the skull remaining in a stage of pure cartilage; but the skull is enclosed by close-fitting dermal bony plates, which are peculiar in having a median in addition to paired series. The notochord is largely persistent. The mouth is small, and ventral in position; and the jaws very weak and toothless, or provided with minute teeth. In the gill-cover the opercular bones are reduced in number, and the branchiostegal rays absent or wanting. There are no true scales, but a small number of longitudinal rows of large bony plates, with granules on the intervening skin. The intestine is provided, as in the sharks, with a spiral valve. The elongated snout, stout body, large fins, and strongly heterocercal tail complete the aspect of these survivors of a once dominant race. There are two families, the *Acipenseridæ*, or sturgeons (q.v.), and the *Polyodontidæ*, or paddle-fishes (q.v.).

Chondrus, kŏn'drŭs, the genus of seaweeds to which carrageen or Irish moss belongs.

Chonos (chŏ'nŏs) **Archipelago**, or **Guaytecas Islands**, a group of islands belonging to the Chilean province of Chiloe, lying off the west coast of Patagonia, mostly between lats. 44° and 46° S., and lon. 74° and 75° W. Two are large, but they are all barren and scantily inhabited. Magdalena is the largest island.

Chop-sticks (Chinese, *kwai-tsz*, "nimble or diligent lads"), two smooth sticks, about the thickness of a quill, of bamboo, wood, or ivory, which are used by the Chinese for conveying meat or vegetables, particularly rice, to the mouth. The chop-sticks are used in various manners, serving partially the purposes of a fork and a spoon. The most curious mode of using the chop-sticks is when a bowl of rice is brought close to the lips, the mouth held wide open, and the grain dexterously dashed into it with the chop-sticks, held one on each side of the forefinger, and plied with a rapid motion quite suggestive of the Chinese title.

Chopin (François), Frédéric, Polish pianist and composer: b. Zelazowa Wola (near Warsaw), 1 March 1809; d. Paris, 17 Oct. 1849. Chopin, in the words of Saint-Saëns, "revolu-

tionized the divine art and paved the way for all modern music"—certainly for all pianoforte music. His father, Nicholas Chopin, was born in 1770, at Nancy, Lorraine, and emigrated to Warsaw, in 1787, where he was at first a bookkeeper, and subsequently a professor of French in the Lyceum. He was reputed to have Polish blood in his veins, and, in 1806, he married a Polish girl, Justina Krzyzanowska, the daughter of "poor but noble parents," who bore him three girls beside Frédéric, who inherited from her the intense love of his native country and its art, which is one of his most striking characteristics. He got his first lessons on the pianoforte from a Bohemian composer named Zywyny, and made such rapid progress that he was able to play a concerto in public before he was 9 years old. Three years later he entered the Lyceum and also took lessons in counterpoint and harmony of the head of the Warsaw Conservatory, Joseph Elsner, who, while teaching him the value of hard work, had sense enough to recognize his genius and to allow his striking individuality free play. While a student at the Lyceum, he wrote a one-act comedy with his sister, and otherwise showed such an interest in the stage that it seems strange he did not, in subsequent years, write an opera. (A few years ago an Italian composer tried—with little success, of course—to atone for this omission by composing an opera with melodies borrowed from Chopin's works.)

The earliest compositions of Chopin were national dances (mazurkas, polonaises, waltzes, a krakowiak, etc.) Some of these were played at the public concerts he gave at Vienna, in August, 1829, and again the following year, on which occasions the critics put their fingers on some of the most marked peculiarities of his style—the unconventional accents in his phrasing, and the "melancholy tints in the style of his shading." In March 1830, having made up his mind to visit Paris and London, he gave a farewell concert at Warsaw, which was so successful that two more had to be given. In November, he became a traveling virtuoso, visiting Breslau, Dresden, Prague, Vienna, Munich, and Stuttgart. This trip was financially a failure, and he had to write home for money to pay his fare to Paris. He was 22 years old when he reached that city, which was thenceforth to be his home. At Stuttgart he had heard of the capture of Warsaw by the Russians. There was much sympathy for unfortunate Poland in Paris, and Chopin profited by it socially. He soon became a favorite of the aristocracy, and a friend of the men and women of genius who at that time made Paris their permanent or temporary abode; Meyerbeer, Liszt, Berlioz, Mendelssohn, Heine, George Sand, the Countess L'Agoult, Cherubini, Bellini, Balzac, and others. Among these his genius found sympathetic appreciation, but the musical world in general never suspected that he was an epoch-making composer, even after he had lived in the French capital for 18 years. "He is underestimated," wrote George Sand, and Liszt said: "Whoever could read in his face could see how often he felt convinced that among all these handsome, well-dressed gentlemen, among all the perfumed, elegant ladies, not one understood him." Had his contemporaries even suspected his real greatness he might have lived in luxury from

CHOPIN

the sales of his compositions (which have since his death enriched many publishers), or from a few public concerts. As it was, his concerts grew fewer and fewer, and he had to support himself by giving lessons. As a teacher he was much in demand.

Worshipped by women, Chopin had a mind most susceptible to feminine charms. One of the young ladies he fell in love with, Constantia Gladkowska, assisted him at his farewell concert at Warsaw. She wore his engagement ring, but married another man. The adagio of the F minor concerto is an echo of his transient infatuation. In 1836 he proposed to Maria, the daughter of Count Wodzinski, but she refused him. In the following year, Liszt introduced him to the brilliant novelist, Mme. Dudevant, known to the world as George Sand. At first, Chopin did not feel attracted to her, but she knew how to overcome his coyness and ensnare his affections. A French writer says of her that 'when she was writing she would often ask Chopin to sit down by the piano and improvise, and inspired by his playing, she wrote some of her finest novels.' For a time, no doubt, her vivid imagination and her sympathy and appreciation of his music stimulated his genius, too. A romantic episode in his life is the four months he spent with George Sand and her son and daughter on the island of Majorca in quest of health. It was during this sojourn (1838) that he wrote the most marvelously inspired of his works, the Preludes, as is proved by his letters and George Sand's 'Histoire de Ma Vie.' The natives, on discovering that he was suffering from consumption, shunned him as if he had the plague, and he found it difficult to secure satisfactory lodgings. This, combined with the rainy weather, aggravated his illness. George Sand found him "a detestable invalid," whereas his pupils declared, after his death (his friendship with the novelist terminated nine years after the return from Majorca) that she had killed him by her fickleness and cruelty. He visited England in 1848, but was already so weak that he usually had to be carried upstairs. His last days were made comfortable through a gift of \$5,000 from a noble Scotchwoman and pupil of his, Miss Jane Stirling. Mozart's Requiem was sung at his funeral, and he was interred near the graves of Bellini and Cherubini in the cemetery of Père-la-Chaise.

Music is, as Rubinstein remarked, the most aristocratic of the arts, and Chopin was the most aristocratic of musicians. No other composer equals him in the elegance and polish of style, which resembles that of the best Parisian literature. This is the French side of his genius. Equally fascinating, and much more vital, is its Polish side. Chopin contributed a new national element to the world language of music (as did the Hungarian Liszt in his day, the Bohemian Dvorák and the Norwegian Grieg afterward). This Polish element characterizes all his works more or less, but particularly the songs, mazurkas, and polonaises. Of the songs there are 17; they are simple in structure, but delightfully melodious, and several of them are as realistic reflections in music of the moods of the poems as are the best songs of Germany. The mazurkas, of which there are 56, are like as many orchids; no two are alike, yet all resemble one another. They are in three-four time,

graceful, melancholy, tender. To most pianists they are music of the future; only those can properly interpret them who have mastered the Polish "zal" and the Polish "rubato." The zal is a "compound of pain, sadness, secret, rancor, revolt," such as naturally characterizes a nation with a tragic history like that of Poland. The tempo rubato is misrepresented in the biographies of Chopin, the writers of which have attached too much importance to Chopin's alleged injunction to his pupils that the left hand must keep strict time, while the right hand melody fluctuates freely. Berlioz attested, on the contrary, that Chopin "could not play strictly in time." There can be no doubt that in his playing, as in Liszt's, Rubinstein's, and Paderewski's, both hands frequently retarded and accelerated, scorning the metronomic regularity of the dance hall. The mazurkas have the *varium et mutabile*, the coquettish quality, of woman; they represent the feminine side of Chopin's genius, as do the dainty, graceful, lively waltzes (13 in number) which have been called "dances of the soul and not of the body;" and the 19 nocturnes, with their sweet melodies and dreamy, languorous harmonies. It is no longer permissible, however, to exaggerate this feminine side of Chopin's genius. The refinement of his style and the exaggerated accounts of his ill-health and feebleness (before his last illness) have distorted his image. He really had the "soul of a lion;" many of his works betray a strength, a virility, not surpassed by any other master.

To this class of his works belong his 15 polonaises, his four scherzos, four ballades, three impromptus, four fantasias, three sonatas, and most of the 27 etudes, and 25 preludes. The polonaises represent the chivalrous, martial side of Chopin's and Poland's genius. The scherzos are of marvellous originality, with a strong undercurrent of sadness—hallmark of Poland. The ballades are a creation of Chopin's genius, in form as well as in content; they are legends without words. The impromptus, also, apart from their contents, give evidence, like the ballades, the scherzos and the fantasias, of Chopin's skill in creating new patterns of musical form. The sonatas contain some of his best inspirations; they have been criticised for lack of coherence, but, as a matter of fact, there is quite as much coherence between the movements as in the sonatas of Beethoven. The etudes are infinitely more than technical studies; they include some of Chopin's most poetic pieces. The preludes Rubinstein considered the pearls of Chopin's work, and it may be asserted safely that, page for page, they contain more of the essence of musical genius than the same number of pages by any other master. Like many of the other works, they reveal Chopin as one of the three or four greatest creators of new melodies, harmonies, modulations, and rhythmic variations and combinations in the whole realm of music. He started out with what he called the "perhaps bold but noble determination to create a new epoch in art," and he succeeded. Schumann pronounced him "the boldest and proudest poetic spirit of the time" and called the G minor nocturne "a terrible declaration of war against a whole musical past." Chopin revolutionized the art of writing pianoforte pieces as thoroughly as Wagner did the method of writing operas. Liszt and all other subsequent pianists followed in his footsteps. By the use of the

CHOPIN — CHORAL

sustaining pedal to unite the tones of scattered chords he marvellously enriched the harmonic capacities of the pianoforte, and at the same time added countless new tints and shades to its color scheme. He was "the soul of the pianoforte," as Rubinstein called him, the most idiomatic of all writers for that instrument.

All of his works are for or with pianoforte. Beside those named, mention must be made of two concertos; a trio with violin and 'cello; a 'cello sonata; an introduction and polonaise for the same instrument; several fantasias and sets of variations; three ecossaises; a berceuse; a bolero; a baracole; a tarantelle; three rondos. Of the books on Chopin the best is Huneker's, which also contains analyses of all the pieces and a complete bibliography. Nieck's work in two vols. is more elaborate, but less commendable in its judgments. Liszt's book on Chopin is not always reliable, but contains valuable hints. Other books and essays are by Karasowski, Kleczynski, Janotha, Willeby, Bennett, Schucht, Niggli, Hadow, Ehlert, Lenz, Jonson, Finck. The different editions of Chopin's works are excellently discussed by Huneker; see also the essay on the 'Greater Chopin' in his 'Metzotints in Music.'

HENRY T. FINCK,

Musical Editor (New York Evening Post.)

Chopin, shō-pān, **Kate O'Flaherty**, American writer: b. St. Louis, Mo., 8 Feb. 1851; married Oscar Chopin, a New Orleans cotton factor, in 1870. Since his death she has lived in her native city. She has published 'At Fault' (1891); 'Bayou Folk' (1894); 'A Night in Acadie' (1897); 'The Awakening' (1899).

Chopin, chōp'in, a Scotch liquid measure containing two imperial pints. The chopin, in name at least, was derived from the French, with whom a similar measure was in use till the introduction of the metric system. The French *chopine* was not a uniform measure, but varied according to localities. That of Paris was a little over four fifths of an imperial pint.

Chopine, chō-pēn', an elevated shoe or clog, introduced into England from Venice in the reign of Queen Elizabeth, and which became the fashionable wear of court ladies during that reign. The Venetian chopines were made of wood covered with leather of sundry colors, white, red, yellow, and sometimes gilt. Some were of great height, the height of the chopine being regarded as a mark of the rank of the wearer. To such a degree of extravagance was this carried that women of rank could not walk without being supported. This silly fashion does not seem to have been carried to the same excess in England. Hamlet (act ii., scene 2) addresses one of the players, "Your ladyship is nearer to heaven than when I saw you last by the altitude of a chopine."

Choptank River rises in Kent County, Del., flows southwest into Maryland, and near the south extremity of Talbot County spreads into an estuary several miles wide and nearly 20 miles long, through which it empties into Chesapeake Bay; total course, 100 miles. It is navigable for sloops to the mouth of Tuckahoe River, a distance of about 50 miles.

Chopunnish, chō-pūn'ish, or **Nez Perce**, a tribe of North American Indians, also known as Nimapu, or Sahaptin, the principal tribe of the Sahaptian confederation, who now live on

the Nez Percé reservation, in Idaho, and number 1,515. The name Nez Percé originated from the custom formerly followed of piercing the nose. In the Nez Percé war the tribe was under the control of Chief Joseph, who forbade his men to interfere with any white non-combatants. See SAHAPTIAN INDIANS.

Choragic (kō-rāj'ik) **Monument**, in ancient Greece, a monument erected in honor of one who had gained a prize as "choragus," or organizer of the play and chorus. The remains of two very fine monuments of this sort are still to be seen at Athens, namely, those of Thrasyllus and of Lysicrates, the last popularly called the Lantern of Demosthenes.

Choragus, kō-rā'gūs, or **Choregus**, among the ancient Greeks, the musician who directed each of the choruses furnished by the 10 Attic tribes for the public festivals; also the citizens who defrayed the expense of each chorus. The person of the choragus was inviolable, as well as those of the members of the chorus. The choragus who was adjudged to have performed his duty best received an ornamental tripod, engraved by a skilful artist, and bearing the name of the tribe which had gained the victory, of the citizen who had paid the expense, and of the master who had trained the choir. These tripods were set up as public monuments on pillars or other structures. A street in Athens which contained a great number of such monuments was called the Street of the Tripods. The most remarkable of these monuments yet remaining is the choragic monument of Lysicrates. See CHORAGIC MONUMENT; CHORUS.

Choral or **chorale** (Ger. **choral** and **corale**). This form of melody, to which sacred songs or hymns are sung by the congregation in unison, may almost be said to belong exclusively to the German Protestant Church, this style of music having been introduced by Luther in the early part of the 16th century. These hymns were written by Luther in the vernacular, founded on the simpler tunes, and arranged to music which was more rhythmic than that in general use. This change appealed to the people and brought out the wonderful power of music to kindle religious passion. This change also had a great effect upon church music throughout Germany, and within a short time after its introduction a literature of remarkable dignity, simplicity, and earnestness was produced. During the 16th and 17th centuries many excellent examples of chorales were brought forth, probably the most important, though not the first, of the early collections being the 'Enchiridion,' or hand-book, published by Luther and his friend Walther, at Erfurt, in 1524. This book contained a preface by Luther himself, and was undoubtedly the foundation for the extensive number of collections which continued to appear till the latter part of the 17th century, but which, for many reasons, religious as well as political, shortly after that time ceased to be popular. Chorales were generally accompanied on the organ, and this custom, together with that of playing and writing so-called figured chorales, soon led to a greater development of harmony and counterpoint, so that the art of playing became of first importance to the successful singing of the chorale.

Many of the chorales were original, many

CHORAL SERVICE—CHORAL SOCIETIES

were revisions of old church tunes, and some were adapted from altogether secular sources. Of these latter, the most famous collection was that of Claude Goudimel, published in Paris in 1565, the majority of which were soon incorporated into the German collections, and one of which, 'Old Hundredth,' became very popular in England. Others taken from secular sources are 'Herr Christ der einig' Gott's Sohn,' taken from 'Ich hört ein Fräulein klagen,' and 'Herzlich thut mich verlangen,' which appears several times in Bach's 'Matthäus-Passion,' taken from 'Mein Gemuth ist Mir verwirret.' On the other hand, there are many based upon church tunes, such as 'Der Du bist drei,' taken from 'O beata lux Trinitatis,' and Mendelssohn's 'Allein Gott under Höh sei Ehr.'

The authorship of many chorales is, however, obscure and uncertain, such as the 'Es is gewisslich,' generally attributed in England to Luther. But of his authorship of the famous 'Ein' feste Burg ist unser Gott' there is but little doubt, and it has been incorporated into the compositions of Meyerbeer in 'The Huguenots,' of Mendelssohn in his 'Reformation Symphony,' of Wagner in his 'Kaiser Marsch,' and of Bach in one of his cantatas. One of Johann Crüger's chorales, 'Mon danket alle Gott,' became well known in England from its incorporation in Mendelssohn's 'Lobgesang.' See GREGORIAN CHANT.

Cho'ral Service, a service with intoned responses, and the use of music throughout wherever it is authorized. The service is said to be partly choral when only canticles, hymns, etc., are sung; wholly choral, when, in addition to these, the versicles, responses, etc., are sung.

Choral Societies. A choral society is a body of amateur singers formed for the purpose of studying and performing large choral works. Formerly all chorus singers were professional musicians, and the chorus that took part in the production of an oratorio did not usually number over 40, while the orchestra was frequently larger than this.

To-day all choral societies consist of amateurs and are much larger than their professional predecessors, while the orchestra is only slightly increased in size. An average chorus numbers 150 to 200 voices, while the orchestra varies from 35 to 60 men. It is possible that the magnificent effect of the chorus formed to celebrate the centenary of Handel's birth by performances given in Westminster Abbey and the Pantheon in London in 1784 may have been a great factor in the formation of choral societies in England. This chorus was the largest that had ever been formed up to that time. It numbered 274 and the orchestra 251. At a subsequent festival in 1791 the chorus and orchestra were said to have numbered over 1,000, while for the Handel Festival held in the Crystal Palace in London in 1874 the chorus numbered 3,200 and the orchestra over 500.

It is very doubtful, however, whether such a large body of singers and players is very materially more effective than a smaller one. The impression on first hearing an enormous chorus is nearly always one of disappointment at the volume of sound. The explanation is made that the large hall necessary for such a large chorus and audience causes a loss of quantity of tone,

but this is disproved by comparisons made at a Saengerfest held in Philadelphia, Pa. Here the effect of the entire mass chorus of 5,000 male voices was not much greater than that of a single society of 250 voices. There was a difference, of course, but the volume was not 20 times greater, not even twice as great.

A well-balanced chorus of from 200 to 500 voices is now generally acknowledged to be more effective and much easier to command than the overgrown chorus gotten together for a festival. Choruses of this size are very numerous in the United States, Germany, and England, where choral work, both religious and secular, is highly appreciated and supported; it is remarkable that France and Italy, both musical countries and more devoted to vocal than to instrumental music, do not cultivate choral music more generally. Even Berlioz in writing out his list of an ideal musical force to have at command makes his orchestra almost equal in numbers with his chorus, showing that he had a professional chorus in mind, and that therefore in his time (died 1869) a choral society of amateurs was perhaps unknown.

The Berlin Singakademie, still in existence and world renowned, was the first permanent choral society. Founded in 1791 with 27 members it now numbers 600. Mendelssohn was at one time its conductor.

In the United States the first choral society was the Stoughton (Mass.) Musical Society (1786), the outgrowth of a "sacred singing school" founded in 1724. The Handel and Haydn of Boston (1815) was of much greater importance, however, and is to-day one of the most important choral societies in the New World. Until 1847 the president of the society was its conductor, but with the increase of musical ability and criticism it was felt that the time-honored custom would have to be given up. Under Bergman (1852) and Zerrahn (1854) it increased in numbers and ability. Within the last few years under Mollenhauer (1901) a thorough reorganization took place and the society has recovered the position which it had to some extent lost.

The Cecilia Society, founded in 1900, under the direction of B. J. Lang, has done good work in the field of choral music.

In New York a number of choral societies, the Handel and Haydn, the New York Choral Society and the New York Sacred Music Society, dating from 1819 to 1849, fostered the taste for choral music. After this for more than 20 years no long-continued effort was made to carry on the work, until in 1873 Dr. Leopold Damrosch founded the Oratorio Society which, beginning with about 50 members, now numbers nearly 300. Walter Damrosch, son of Dr. Leopold Damrosch, succeeded him as conductor, and Frank Damrosch, another son, is the present conductor. The latter is also conductor of the Musical Art Society, devoted to the performance of older church music, and the People's Choral Union of 2,000 voices drawn from the laboring classes.

Philadelphia has had several notable choral societies, the Handel and Haydn, the Beethoven, the Cecilian and the Philadelphia Chorus, conducted by Henry G. Thunder, Michael H. Cross, Chas. M. Schmitz, and W. W. Gilchrist. These have all passed away, but in their stead is a new and vigorous chorus of 300 voices, founded in

CHORALE — CHOREA

1897 and conducted by Henry Gordon Thunder, son of Henry G. Thunder.

In Baltimore the Oratorio Society under Pache, and in Washington the Choral Society under Kaspar, are presenting standard works in an adequate manner.

In Chicago the Apollo Club (1872) under Harrison M. Wild, and in St. Louis the Choral Symphony Society (1870) under Ernst, are bending public taste toward the great choral works.

While the giving of music festivals involves the forming of a large chorus in conjunction with orchestra and soloists, it does not appear that such bodies of voices are appropriately styled choral societies in the strict sense; hence only passing mention is here made of the Springfield, Worcester, and Cincinnati festivals, all of which have large and efficient choruses conducted by Chadwick, Goodrich, and Theodore Thomas.

A difference, however, must be made between these choruses and the Bach Choir of Bethlehem, Pa. This unique organization of about 100 voices under the direction of J. Fred Wolle has devoted itself to the presentation of the works of John Sebastian Bach, and in the three festivals held in 1900, 1901, and 1903 has achieved a national reputation for itself. It produced the great Mass in B minor for the first time in America, besides giving the Matthew Passion, the Christmas Oratorio and other works in a most impressive manner. To some extent this was no doubt due to the unusual and reverential surroundings, the old Moravian town, the venerable church in which the performances were held, the announcement of the performance by a choir of trombones in the belfry. All these details no doubt helped greatly to create an atmosphere of simplicity and sincerity that affected the audiences that gathered from far and wide, but the real effect was the chorus work, which was done with an earnestness and devotion that were most impressive and caused the often inadequate solo and orchestra work to be forgotten.

HENRY GORDON THUNDER.

Conductor Philadelphia Chorus.

Cho'rale. See CHORAL; CHORAL SERVICE; CHORAL SOCIETIES; MUSIC; GREGORIAN CHANT; etc.

Chorazin, kō-rā'zīn, Palestine, one of the cities in which Christ's mighty works were done, but named only in his denunciation (Matt. xi. 21; Luke x. 13). It was known to St. Jerome, who describes it as on the shore of the lake, two miles from Capernaum. Robinson locates it at the modern Tell-hūn, three miles northeast of Capernaum, but this location is doubtful. Though the town was evidently of some importance, judging from the extensive ruins to be seen there, it has received little or no attention in ancient writings, the only mention of it being in the New Testament. It has been identified with the modern Kerazeb.

Chord, (from the Greek word *chordē*, a string of gut). 1. In music, the simultaneous and harmonious union of different sounds, at first intuitively recognized by the ear, and afterward reduced to a science by the invention of the laws or rules of harmony. Chords may consist of from two to five parts. Absolute chords of two parts are produced only by thirds or sevenths. Chords of more than two parts are either fundamental chords or inversions of

them, and are divided into concords and discords. The union of sounds in all chords will be found, on analyzing their component parts, to be an admixture of major and minor thirds. The common chord of *Trias harmonica perfecta*, is the basis of all harmony, and consists of a base note, or prime, with its third and fifth above. These three sounds are the distance of a third from each other. When the lowest third is the greater third, as above, the chord is a major chord; but when the lowest third is the lesser, the chord is called a minor chord. A chord of two minor thirds combined is called diminished, as the interval from the lowest note to the highest is less than a perfect fifth, the common chord admits of two inversions, according as one or other of its notes is made the base, or lowest note of the chord.

By adding another third above the common chord, a chord of four parts is produced, which is called the chord of the seventh, because the highest note is a seventh above the bass. When the chord of the seventh is produced on the fifth of the scale it is then called the dominant seventh, which is the most perfect species of the chord. It then consists of a major third, perfect fifth, and seventh, the minor, which is the next harmonic produced by nature above the fifth. The chord of the seventh may be formed also on any of the notes of the major or minor scale taken as a bass note, which produces the varieties of major, minor, and diminished seventh. The chord of the seventh admits of three inversions, according as the notes above the fundamental note are used as bass notes. From its nature, it requires a resolution, and is therefore always followed by a common chord, whose fundamental bass is a fifth below that of the seventh.

2. In geometry, a chord is the straight line which joins the two extremities of the arc of a curve; so called from the resemblance which the arc and chord together have to a bow and its string, the chord representing the string. The chord of a circular arc is obtained by multiplying the radius by twice the sine of half the angle which the arc subtends at the centre.

Chordata, kōr-dā'ta, the most advanced in development of the phyla, or branches, of the animal kingdom, the phylum which is characterized by the presence of a notochord (q.v.), and in its higher classes by the presence of a backbone and spinal cord. It includes all the vertebrates (mammals, birds, amphibians, reptiles, and fishes), and also *Amphioxus*, the ascidians, and *Balanoglossus* (qq.v.). Compare ADELOCHORDA.

Chorea, or **St. Vitus' Dance**, an acute convulsive disorder of childhood, characterized by sudden onset, irregular convulsive, non-rhythmical movements of the limbs or of the body and by a recovery usually spontaneous. There are many diverse conditions that have been called chorea in the past. There are strong reasons to believe that true chorea, however, is due to the action of some micro-organism; and, in view of the close relation it bears to rheumatic invasions in the same individual, the inference has been drawn by many serious students that chorea is a toxic disorder due probably to the same organism that causes acute articular rheumatism (Poynton & Payne). It occurs most frequently in the spring months.

CHORION — CHOSROES

in children from 5 to 15 years of age, and a nervous temperament seems necessary. The symptoms may be very slight, consisting of a grimace, or a sudden movement of the arms, causing the patient to drop anything held in the hands at the time. Or it may involve a large part of the musculature, especially the muscles of the extremities. It is non-symmetrical, the movements are sudden and jerky and non-purposeful, not representing any usual co-ordinated muscular act; hence the difficulty there is in imitating the movements. The attacks may begin in a few muscles, remain there, or spread widely. There may be slight or grave constitutional disturbances; some patients even die, although death is not a usual result in this country. In England, where rheumatic disorders seem to be more common, the disease seems to be more prevalent and more severe. The usual course of the disease is from four weeks to three months, but it may persist longer and even become chronic, although the chronic cases are probable forms of spasmodic tics. Treatment is very satisfactory. Rest, open air, nutritious diet, and some form of arsenic, are the general lines of treatment. Medical assistance is imperative, however, in view of the possible existence of heart lesions and other grave accompaniments of this affection. For hereditary chorea see HUNTINGDON'S DISEASE.

Chorion, kō'ri-on, the outermost of the membranes that surround the embryo. It is a most important structure in its developmental history as it comes into close contact with the decidua and is incorporated into the placenta, constituting the foetal part.

Chorley, chōr'li, **Henry Fothergill**, English critic and miscellaneous writer: b. Blackley Hurst, Lancashire, 15 Dec. 1808; d. London 15 Feb. 1872. His criticisms appeared mostly in the 'Athenæum' of London, displaying fine perception and exquisite taste in matters connected with literature and music. His novels, however ('Conti'; 'The Prodigy'; and 'The Lion'), are failures from the popular point of view, although finely written; and his plays, with the exception of 'Old Love and New Fortune,' are weak.

Chorley, a municipal borough and market town of England, in Lancashire, on the Chor, 20 miles northwest of Manchester. It consists of spacious well-built streets, and contains an ancient parish church, various other churches and chapels of modern date, together with a spacious town-hall, several large schools, club-houses, theatres, etc. The principal manufacture is that of cotton goods, but there are also bleaching, calico-printing, and dye-wood works, floor-cloth works, and iron foundries. In the vicinity are coal, lead, and iron mines, and millstone quarries. Pop. (1901) 26,850.

Choron, Alexandre Étienne, ä-lëks-ändr ä-të-ën shō-rôn, French musician: b. Caen 21 Oct. 1772; d. Paris 29 June 1834. He labored assiduously to promote musical education in France, founding his famous "Conservatory" in 1818. He wrote 'Principes de Composition des écoles d'Italie' (1808), and other valuable textbooks on music.

Cho'rus, originally a special feature in the Greek drama. During the most flourishing period of Attic tragedy the chorus was a troop of male performers, wearing masks, and repre-

senting male or female characters, who, during the whole representation, were spectators of the action. In the intervals of the action the chorus chanted songs, which related to the subject of the performance, and were intended either to augment the impression or to express the feeling of the audience on the course of the action. Sometimes it even took a direct part in the action by observations on the conduct of the dramatic characters, by advice, consolation, exhortation, or dissuasion. It usually represented a part, generally the oldest portion of the people, where the action happened, sometimes the counselors of the king, etc. The chorus was an indispensable part of the representation. In the beginning it consisted of a great number of persons, sometimes as many as 50; but the number of the tragic chorus was afterward limited to 15; while the chorus in comedy numbered 24. The exhibition of a chorus was in Athens an honorable civil charge, and was called choragy. (See CHORAGUS.) The leader or chief of a chorus was called coryphæus, who spoke in the name of the rest when the chorus participated in the action. The chorus was often divided into two parts, who sung alternately. The divisions of the chorus were not stationary, but moved from one side of the stage to the other; from which circumstance the names of the portions of verse which they recited, *strophe*, *anti-strophe*, and *epode*, are derived. But it cannot be determined in what manner the chorus sung. It is probable that it was in a sort of solemn recitative, and that their melodies, if we may call them so, consisted in unisons and octaves, and were very simple. They were accompanied by flutes. With the decline of ancient tragedy the chorus was omitted. Some modern tragedians, as Racine in France and Schiller in Germany, have attempted, with more or less success, to imitate or revive the Greek chorus. Shakespeare has employed devices founded on it.

Chorus, in modern music, is that part of a composite vocal performance which is executed by the whole body of the singers, in contradistinction to the solo airs and concerted pieces for selected voices. The singers themselves are also called the chorus.

Chose, shōz, a thing, a chattel, a piece of property; the subject-matter of an action. Chose is used in divers senses, of which the four following are the most important: Chose local, a thing annexed to a place, as a mill; chose transitory, that which is movable, and may be taken away or carried from place to place; chose in action, otherwise called chose in suspense, a thing of which a man has not the possession or actual enjoyment, but has a right to demand by action or other proceeding; chose in possession, a thing which a person has not only the right to enjoy, but also its actual enjoyment.

Chosroes (kōs'rō-ēz) I., King of Persia: d. 579. He succeeded to the throne in 531, and his memory is still venerated in the East, where his virtues obtained him the titles of the Magnanimous and the Just. At his accession Persia was involved in a war with Justinian, which Chosroes terminated successfully, obliging Justinian to purchase peace by the payment of a large sum of money. In 540, however, jealous of the victories of Belisarius, the great general

CHOSROES II.—CHOWCHOW

of the empire, Chosroes violated the peace, invaded Syria, laid Antioch in ashes, and returned home laden with spoils. The war continued till 562, when the emperor again purchased peace by an annual tribute of 30,000 pieces of gold. The peace continued for 10 years, when the war was renewed with Justin, the successor of Justinian, when Chosroes was again successful. His zeal for the administration of justice sometimes led him to acts of cruelty; but he encouraged the arts, founded academies, and made a considerable proficiency in philosophy himself. His reputation obtained him a visit from seven sages of Greece, who still adhered to the Pagan religion; and in a treaty with Justinian he required that they should be exempt from the penalties enacted against those who continued to favor Paganism. It was in the reign of Chosroes that the Turks first became known to Europeans, first as friends, afterward as enemies, of the Persian king.

Chosroes II., king of Persia, grandson of the preceding. He ascended the throne in 591, on the deposition of his father. He was assisted by the Emperor Mauricius, and on the assassination of the latter by Phocas (602) he took up arms against the empire, and refused to make peace at the solicitation of Heraclius, the succeeding emperor. By a long series of successes he raised the Persian power to the highest point, and reduced the empire to extremity. Heraclius, however, taking courage from despair, succeeded in a series of brilliant campaigns in recovering his lost provinces, 622-7. Chosroes, repeatedly defeated, was completely overthrown in the great battle of Nineveh. He fled with his favorite wife Sira, but after witnessing the massacre of his numerous sons he was thrown into a dungeon and assassinated by command of his son Siroes.

Chota Nagpur, or **Chota Nagpore**, chō tā nāg-poor', British India, a division of Bengal, a commissionership which is divided into the districts of Lohardaga, Hazaribagh, Singhbhum, Palamau, and Manbhum; area 26,966 square miles. It consists for the most part of an undulating plateau about 3,000 feet above the sea, and rising occasionally into ridges of hills which stretch from east to west. The drainage is received chiefly by numerous tributaries of the Subarna-rekha in the northeast, and by the north and south Coel and other streams in the south and west. Much of the surface is overrun with jungle, or covered with forests containing teak and other kinds of valuable timber. The soil in the plains consists of a red loam, and where under cultivation, produces excellent crops of wheat, barley, rice, pulse, cotton, and sugarcane. Coal occurs in various localities, and is worked in the Karharbari coal-fields in Hazaribagh. The trade, hampered by imperfect means of conveyance, is limited, and is nearly confined to grain, lac, coarse silk, oil-seeds, and other agricultural products. Pop. (1891) 4,628,792.

Chouans, shoo-än, a name given to the royalist peasantry of Brittany and lower Maine, who carried on a petty warfare against the republican government from an early period of the French Revolution. The name Chouan was finally extended to all the Vendéans. The name was derived from the first chief of the Chouans, Jean Cottereau, who with his three

brothers organized these bands in 1792, under the inspiration of the Marquis de la Rouarie, an ardent leader of the Royalists. Cottereau was the son and grandson of persons engaged in the manufacture of wooden shoes. He had joined a band of dealers in contraband salt, and acquired the surname Chouan from the cry of the screech-owl (*chat-huant*), which he used as a signal with his companions. He was killed in an engagement with the Republican troops, 28 July 1794. After the death of Jean Cottereau, the Chouans became quite lawless, engaging in guerrilla warfare and highway robbery. About 1800 they ceased to rob and terrorize, and, although, in 1815 an effort was made to revive the insurrection, they were suppressed by Gen. La Marque.

Chouans, The, a romance by Balzac, the novelist's first important work. The title, when it appeared in 1829, was 'The Last Chouan; or, Bretagne in 1800.' In 1846 it was rearranged in its present form. The author made a profound study of the scenery of Bretagne, and the manners of its people, before he wrote his romance; and his pictures of both scenery and people have the stamp of reality and truth.

Chough, chūf, a bird (*Fregilus graculus*), belonging to the sub-order *Fregilinæ* of the crow family, and particularly the Cornish chough. The name is derived from the cawing of the bird. It is widely distributed over Europe, India, and northern Africa, living in great colonies in the faces of precipitous cliffs. The bill is long and slightly curved; feathers black; the claws long and hooked, enabling it to cling to the slight projections of rocks and stone walls. It is often tamed and kept as a household pet, but is now disappearing, giving place to the jackdaw.

Chousinga, chow'sin-ga, a gazelle-like Indian antelope, remarkable for the fact that the buck has four horns. See FOUR-HORNED ANTELOPE.

Chouteau, shoo-tō, **Auguste**, American pioneer: b. New Orleans, La., 1739; d. St. Louis, Mo., 24 Feb. 1829. He was from his early youth a fur trader, and in 1763 set out with his brother Pierre Chouteau (q.v.) to establish trading stations in the regions west of the Mississippi. On this trip they founded the city of St. Louis in 1764.

Chouteau, Pierre, pē-är, American pioneer: b. New Orleans 1749; d. St. Louis 9 July 1849. He had few early advantages, but, becoming a fur trader, decided, in 1763, to extend his operations to the region beyond the Mississippi. With his brother, Auguste, he set out in 1763, joining a government expedition. He stopped in the heart of an unsettled country and founded, with his brother, the city of St. Louis.

Chouteau, Pierre, Jr., American fur trader, son of the preceding: b. St. Louis 19 Jan. 1789; d. St. Louis 8 Sept. 1865. He worked for his father and began trading in fur early in life. After establishing posts for the sale of skins throughout the trans-Mississippi region he purchased the fur-trading interests of John Jacob Astor.

Chowchow, a diminutive breed of Siberian sledge-dogs, improved and developed in China, whence they began to be imported into Europe and America at the beginning of the 20th cen-

CHOW-CHOW — CHRIST

ture. These dogs have the form and coat of their useful progenitors, and are very compact and sturdy of frame, and lively in disposition. The tail is carried tightly curled over the back. In color they are either all black, even to the tongue and inside of the mouth, or all white, blue, red, or yellow. This breed was not recognized in American bench-shows until 1902.

Chow-chow, a Chinese or pidgin English word meaning chopped up or broken and mixed. It is applied to a confection of mixed fruits made in China; to a mustard pickle of assorted ingredients made in India; and in the United States and Great Britain to a similar pickle usually compounded of chopped cabbage, green tomatoes, green or red peppers, spices, vinegar, mustard-seed, cucumbers, etc.

Chow'der (French *chaudière*, "a kettle"), a dish of French origin, composed chiefly of vegetables, pork, and fish or shell-fish, boiled together. Perhaps the most common form of chowder is that made from clams, either from the soft-shelled variety or the hard-shelled round clam or quahog. Chowder is a favorite dish on the New England coast and among the Newfoundland fishermen. A fish chowder is made as follows: Salt pork cut into small strips or dice is cooked for a few minutes in a deep iron kettle. Sliced or chopped onions are slightly browned in the pork fat, and onions and pork are then removed. A layer of sliced potatoes is laid in the kettle, then a layer of fish (small ones entire or large fish in slices), a layer of salt pork, one of onions, and so on alternately to the requisite amount. The fried salt pork and onions are also distributed through the mass, which should be seasoned throughout with salt, pepper, thyme, and savory. A very common ingredient is ship-bread or other hard crackers laid in between the other layers. A small quantity of water or of milk, or of both, is poured into the kettle, and the whole is boiled, without stirring, until cooked through. In adding the water or milk it must be remembered that chowder is a stew,—not a soup. Foreign cooks make a soup of clams, potatoes, onions, and tomatoes, which passes under the name of clam chowder. Genuine chowder is never disturbed until it is served, and in camps is portioned out, in layers, direct from the kettle.

Chrétien de Troyes, krā-tē-ën dè trwä, French trouvère: b. Troyes about 1150; d. about the end of the 12th or beginning of the 13th century. He translated Ovid's 'Ars Amandi' into French, and probably wrote some works based on the classics, but his fame rests upon the still extant romances of Arthur and the Knights of the Round Table, the materials for which were obtained from Geoffrey of Monmouth's rather credulous 'History of Britain.' They are entitled 'Iric et Guide'; 'Perceval le Gallois'; 'Le Chevalier au Lion'; 'Cliget'; 'Chevalier de la Table Ronde'; 'Lancelot du Lac'; and 'Guillaume d'Angleterre'; but the authorship of the last named is doubtful. Other two of his works, 'Tristan, ou le Roi Marc et la Reine Yseult' and 'Le Chevalier à l'Épée,' have been apparently lost. His language and versification were models for troubadours and romancers for a long time; and from him the Arthurian poets to the end of the 13th century borrowed episodes, themes, situations, charac-

ters, and all manner of poet's devices. Chrétien was a master of invention, fashioned for himself a competent literary vehicle, and made most effective use of his large knowledge of men and manners. See Förster, 'Christian von Troyes sämtliche erhaltene Werke' (1884).

Chriemhild, krēm-hilt. See KRIEMHILD.

Chrism, krīzm, a mixture of olive oil with balm (*opobalsamum*), which, being blessed by the bishop, is used in the Roman Catholic Church in the administration of the sacraments of baptism, confirmation, holy orders, and extreme unction, and in certain rites; as in consecrating the instruments of the divine service, as the sacred vessels, church edifices, altar stones. The chrism of the Greek Church is compounded of olive oil and a great variety of spices. In the Roman Catholic Church the holy oils are blessed by the bishop on the Thursday of Holy Week.

Chrisom, krīz'òm, the name of the white linen cloth laid by the priest on the child in Roman Catholic baptism, to signify its innocence. By olden usage it was generally presented by the mother as an offering to the Church, but if the child died before the mother was churched, it was used as a shroud. By a common abuse of words, Chrisom came to mean the child itself, being first applied in the old bills of mortality to denote such children as died within the month of birth.

Christ (Greek *Christos*, the anointed; *Messiah*, from the Hebrew, has the same signification). See CHRISTIANITY; JESUS.

Christ, Disciples of, a denomination of Christians in the United States commonly known as the Christian Church, or Church of Christ, and sometimes called Campbellites. In September 1809, Thomas Campbell, a Scotch minister of the seceders' branch of the Presbyterian Church, then living in western Pennsylvania, issued a "Declaration and Address," deploring the divided state of the Church, and urging as the only remedy a complete restoration of apostolic Christianity and the rejection of all human creeds and confessions of faith. The Christian Association of Washington, Pa., was formed for the purpose of promoting the principles set forth in this declaration. Mr. Campbell's son, Alexander, just from Glasgow University, Scotland, at once gave his splendid ability and learning to this new movement. It was not the intention of the Campbells to form a distinct religious body, but to effect the proposed reforms in the churches. Their plea was so opposed that they were compelled to act independently, and the first church in the new movement was organized at Brush Run on 4 May 1811. The Disciples maintained that having accepted the Bible as their only rule of faith and practice, and the only divine basis for the union of all Christians, they were led to reject infant baptism and adopt believers' immersion only. They observe the Lord's Supper each first day of the week, and heartily and practically accept and exalt the doctrine of the divinity of Christ. Their church policy is congregational, though they frequently hold conventions in the interest of world-wide missions, but not for legislative purposes. In 1900 the denomination had 6,528 ministers, 10,528 churches, and 1,149,982 communicants, besides

CHRIST — CHRISTEN

several universities and colleges of high rank, and a number of religious publications.

Christ, or Criss-Cross Row. See HORN-BOOK.

Christ in Art. The representations of the person of the Saviour which for a succession of ages have constituted one of the most important subjects of Christian art, and have occupied the highest genius, especially of Roman Catholic artists, are all evidently ideal. The attempt to represent the personal appearance of the Saviour can hardly be traced back further than the age of Constantine. The origin of Christian art, indeed, has been traced successfully to the catacombs of Rome, and is not to be considered as springing directly from Pagan art, although the great Italian masters of the Middle Ages may have derived much instruction from classical models; but the painting and sculpture of the early Christians were chiefly allegorical, representing the moral of the gospel parables, or similar symbolic representations of Christian doctrine, without regard to historical accuracy of portraiture. At a later period legends were invented of various likenesses of the Saviour having been preserved by miraculous or other remarkable means, but these stories are intrinsically weak and improbable, and are entirely destitute of external evidence. They are of such a nature as that King Abgarus of Edessa had a napkin sent him by the Saviour himself, in which he had caused his likeness to be miraculously impressed by placing his face in it. A portrait is said to have been similarly impressed on a handkerchief of St. Veronica, and St. Luke is said to have taken one himself. An apocryphal letter of Lentulus, the predecessor of Pilate, addressed to the Roman senate, contains a description of the person of Jesus. One of the earliest professed portraits of the Saviour is in the Calixtine Catacomb near Rome. He is represented with the hair parted on the forehead, and falling over the shoulders in long waving locks. In regard to this common notion it may be observed that when St. Paul wrote his first epistle to the Corinthians there were probably many Christians scattered over the world who remembered the personal appearance of the Saviour, and if this representation of it had been correct he would hardly have written to a Christian church that it was contrary to nature and a shame for a man to have long hair. The great painters of the Middle Ages, to whom we owe the ideal representation of Christ, probably founded somewhat upon these early notions. A Christ of the 4th century with an oval face, Oriental features, parted hair, and a short straight beard, is said to have been the model of the Byzantine and Italian painters till the time of Michael Angelo and Raphael. Consult Kraus, 'History of Christian Art' (Freiburg 1903).

Christ, Order of, on the abolition of the Templars by Clement V., in 1312, King Dionysius of Portugal preserved the order in his dominions, but changed its title to that of The Knights of Christ, or The Order of Our Lord Jesus Christ. This arrangement was sanctioned by Pope John XXI. or XXII., in 1319. The seat of the order was transferred from Castro-Marino to Thomar in 1366. The new order afterward attained such power that King John III. was obliged to obtain an edict from Pope Hadrian VI., in 1522, by which the grand-

mastership of the order became vested in the kings of Portugal.

Christ Church, College of, a notable institution in Oxford, England. In 1526 Wolsey obtained from Clement VII. a bull for the suppression of 22 monasteries, the site of one of which he chose for a new college, to be called Cardinal College, and which he intended to endow beyond that of any other in Oxford. On the fall of Wolsey, in 1529, the establishment came into the hands of King Henry VIII. In 1532 that prince founded it under the name of King Henry VIII.'s College, and in 1546 he once more re-established the college under the name of "Christ Church Cathedral in Oxford, or the Foundation of King Henry VIII., with a dean and canons, 60 students, 40 schoolboys, clerks, choristers," etc. The foundation is now subsisting, though it has undergone considerable modifications. According to the present statutes, which came into force in 1882, the students, who are equivalent to fellows, are divided into two classes, and are in number about 30, besides honorary students. There is also a body of scholars, over 40 in number, some of whom are elected annually from Westminster School, while others are chosen by open competition for proficiency in mathematics, physical science, or history. The students are appointed in the first instance for two years, but this term may be prolonged. There are also many exhibitioners.

Christadelphians, a religious body that originated during the American Civil War, their founder being Dr. J. Thomas. They believe that God will raise all who love him to an endless life in this world, but that those who do not shall absolutely perish in death; that Christ is the Son of God, inheriting moral perfection from the Deity, our human nature from his mother; and that there is no personal devil. Their chief newspaper in Great Britain is *The Christadelphian*, published in Birmingham. The works of Dr. Thomas and 'Christendom Astray' by Robert Roberts contain expositions of their religious views.

Christ'church, England, municipal borough in Hampshire, situated at the confluence of the Avon and Stour, about one mile from the sea. It is famous for its great priory church, dating in part from the early part of the 12th century. The church is over 300 feet long and contains a magnificent altar-screen. Fusee chains for watches used to be manufactured in Christchurch. Pop. (1901) 4,204.

Christchurch, New Zealand, a town, capital of the province of Canterbury, and the see of the primate of New Zealand, situated on the Avon River, seven miles from the sea, and is the terminus of the Great Northern and Southern Railway. A railway tunneled through the Lyttelton Hills connects it with Lyttelton, the nearest port. It contains a number of handsome buildings, including a fine cathedral, the government offices, St. Michael's church, the supreme court, hospital, museum, town library, lunatic asylum, convent, theatre, banks, club-house, and college, and has a flourishing trade and manufactures. Pop. (1901) 57,041.

Christen, krě'stĕn, **Ada.** See BREDEN, CHRISTINE.

CHRISTIAN I.—CHRISTIAN VII.

Christian I., king of Denmark and Norway: b. 1426; d. Copenhagen 21 May 1481. He reigned from 1448 to 1481, and in 1479 founded the University of Denmark.

Christian II., king of Denmark, Norway and Sweden: b. Nyborg, Fünen, 2 July 1481; d. Kallundborg, Zealand, 25 Jan. 1559. He was grandson of Christian I. In 1501 he was named successor to the crown, and took part in the government of Norway, which he conducted with great severity.

On his accession to the throne in 1513 he signed a capitulation in favor of the privileges of the lay and clerical aristocracy in his dominions, including the independent administration of justice; but all his efforts were bent toward strengthening the royal power, particularly in Sweden, which refused to acknowledge him. To strengthen himself against Steen Sture, the administrator of Sweden, who had set himself in opposition to the union of Calmar formed in 1397 between Norway, Sweden, and Denmark, he married Isabella, sister of Charles V. of Germany, in 1515. He had already a mistress called Dyveke, the daughter of a Dutch woman who kept an inn in Bergen, Norway. She exercised a great influence over the king, and by her liberal spirit and knowledge of the institutions of Holland tended greatly to improve the administration of his government. She became a sort of prime minister, and had great influence in originating those wise laws which gained for this king the love of his subjects. But she incurred the hatred of the nobility, and in 1517 died of poison.

Soon after war broke out with Sweden, and making all the preparations and alliances in his power, Christian sent an army into Sweden commanded by Otto Krumpen, who defeated the Swedes in the decisive battle of Bogesund (Ulrikehamn), 19 Jan. 1520, in which Steen Sture, the administrator, was killed. Stockholm, under the command of the widow of Sture, stood a siege of four months, and on 4 November, Christian was crowned king of Sweden.

Subsequently Sweden revolted under Gustavus Vasa, who had expelled the Danish garrisons and been proclaimed administrator. To find the means of defense Christian convoked the Diet toward the close of 1522. Instead of attending it the nobles and prelates assembled at Wiborg in Jutland, proclaimed the deposition of Christian, and called his uncle, Frederick, to the throne. Christian fled to the Netherlands to claim the succor of his brother-in-law, Charles V. Gustavus, already master of Sweden, put an end to the union of Calmar in 1523, and was proclaimed king. Christian remained nine years in exile without obtaining aid from Charles, and then visited England and Germany, and adopted the Reformed faith. At length, with the assistance of Charles, he equipped a fleet in Holland, landed in Norway in 1531, and was proclaimed king by the Norwegian Diet, which had refused to recognize Frederick. The commander of the Danish fleet, a bishop, having offered him a safe conduct, he repaired to Copenhagen to negotiate with Frederick, who disavowed the admiral, and retained him prisoner. He was confined for 12 years in the Castle of Sonderburg, island of Alsen, in a dungeon of which the door was walled up, the only

access being by the window, and his only attendant a Norwegian dwarf. In 1544 Christian III. somewhat relaxed the rigor of his confinement, and in 1549, on renouncing his right to the crown, he was permitted to reside in the Castle of Kallundborg in Zealand, where he was subjected to a less severe surveillance, until his death in 1559. His misfortunes were chiefly due to the enmity excited by his reforms, and his violation of the capitulation entered into at his coronation. See Behrmann, 'Kong Christiern II., Historie' (1815).

Christian III., king of Denmark and Norway: b. 1502; d. Kolding, Denmark, 1 Jan. 1559. He succeeded his father, Frederic I., and introduced the Reformed faith into Norway and Denmark. In his reign Norway was reduced to the status of a province.

Christian IV., king of Denmark: b. Frederiksborg, Zealand, 12 April 1577; d. Copenhagen 28 Feb. 1648. He was the son of Frederick II. and succeeded to the throne as a minor in 1588. He early gave numerous proofs of a sincere love of religion and justice, and a high esteem for science and art. He made his celebrated voyage to the North Cape to learn the boundaries of his kingdom and protect the rights of his subjects in that remote region from any foreign interference with their coasting trade. He was afterward, in consequence of the claims advanced by Sweden to Lapland, engaged in what is called the Calmar war with Charles IX. and his successor, Adolphus, and terminated it by an advantageous peace, in which he stipulated for the free navigation of the Baltic. In the Thirty Years' war he was beaten by Tilly at Lutteram-Barenberge in 1626, but afterward, in conjunction with Gustavus Adolphus, obtained the Treaty of Lübeck 1629. He has the merit of having laid the foundation of the Danish navy, extended the trade of his subjects to the East Indies, introduced a judicious system of finance, and fitted out several expeditions for the discovery of a northwest passage. He was succeeded by his son, Frederick III.

Christian V., king of Denmark and Norway: b. 15 April 1646; d. Copenhagen 25 Aug. 1699. He succeeded his father, Frederick III., in 1670, and carried on a long and fruitless war against Sweden.

Christian VI., king of Denmark and Norway: b. 30 Nov. 1699; d. 6 Aug. 1746. He succeeded his father, Frederick IV., in 1730.

Christian VII., king of Denmark and Norway: b. Copenhagen 29 Jan. 1749; d. Rendsburg, Holstein, 13 March 1808. He was the son of Frederick V., whom he succeeded in 1766. In the same year he married Caroline Matilda, sister of the British monarch, George III. He afterward traveled for three years in England, Germany, Holland, and France, and became a member of several learned academies. Youthful indulgences, however, had weakened his intellect, and obliged him to confide the charge of public business to his ministers, and more especially, it is said, to his favorite physician, Struensee, who, though he had gained the affections of Christian and his young bride, was very unpopular as a statesman, and made innovations which provoked the hostility both of the nobility and the army. Notwithstanding the unfortunate circumstances of Christian's reign,

several important improvements took place under it. Serfdom was abolished in the duchies, trade and commerce promoted, the Schleswig-Holstein Canal constructed, and excellent roads formed throughout the kingdom. Christian was succeeded by his son, Frederick VI.

Christian VIII., king of Denmark, and Duke of Schleswig-Holstein and Lauenburg: b. Copenhagen 18 Sept. 1786; d. there 20 Jan. 1848. He was chosen king of Norway in 1814, but, unable to hold it against Bernadotte, he abdicated in October of the same year. His reign was comparatively unimportant, the most notable event being the king's proclamation in 1846 that Schleswig and Holstein were inseparably united to Denmark. He was succeeded by his son, Frederick VII.

Christian IX., king of Denmark: b. 18 April 1818; d. Copenhagen 29 Jan. 1906. He was the fourth son of the Duke of Schleswig-Holstein-Sonderburg-Glücksburg, and succeeded Frederick VII., 15 Nov. 1863. His second son was, in 1863, elected king of Greece, and his two eldest daughters married heirs-apparent of the crowns of Great Britain and Russia.

Christian, German prelate: b. early part of the 17th century; d. Tusculum, Italy, 25 Aug. 1183. He was made archbishop of Mainz in 1165. He was chiefly celebrated for his military exploits under Frederick Barbarossa, for whom he opened the way to Italy. He fell in battle endeavoring to rescue Pope Lucius III. from a hostile Roman army.

Christian, Edward, English jurist: b. London 1774; d. Cambridge 1823. He was chief justice of the Isle of Ely, and law professor of Downing College, Cambridge. He was the author of various works, among which are treatises on the bankrupt laws, and on the game laws. He also edited an edition of Blackstone, to which he added numerous notes.

Christian, The, a novel by Hall Caine, published in 1897. For the most part the scene is laid in the London of to-day. The details of London life are spectacular, and the object of the book seems to be to show the inadequacy of London churches to save the city.

Christian Archæology, that department of archæological science which, through the study of inscriptions, monuments, frescoes, household and ecclesiastical utensils, seeks to throw light upon the ideas, customs, and events of the early Christian communities. It may be said to have a beginning in the days of peace following the Diocletian persecutions. The Acts of the Martyrs were collected and critically examined, but in the 5th century the reading of some of these Acts was forbidden in the Roman Church by Pope Gelasius because of the mixture of legend and fact they contained. The Acts written between the 8th and 10th centuries have very little critical value, although they contain an element of truth, as the name of the martyr, the date of his death, the name of the judge of the trial, above all his place of burial, for the Catacombs were still visited. Le Blant, in his 'Supplement to the Acta Sincera Martyrum of Ruinart,' has shown how it is possible to separate the facts in these Acts from their setting of rhetoric and legend.

From very early times it was the custom to mark in the local calendar, the Church feasts celebrated each year. Each Church had its own calendar. The most ancient that have come down to us are those of Rome, Tours, and Carthage. Later, calendars of the principal Churches were united and called martyrologies. The 'Martyrology of Jerome,' made in Italy about the middle of the 5th century and revised at Auxerre, in France, toward the end of the 6th century, is the source from which are derived existing manuscripts. Other martyrologies are those of Saint Bede, in the 8th century, of Rabanus Maurus, of Adon, bishop of Vienne, in the 9th century, and of Usuard, compiled about the year 875. The Roman Martyrology was revised by Cardinal Baronius in 1598.

In addition to the martyrologies there is also the 'Liberian Calendar,' so called from Pope Liberius, in whose pontificate it was compiled. It contains a list of the Roman consuls and the Roman prefects from 254 to 354, the epoch of Pope Liberius, the date of the death of the bishops of Rome during the same period, and also the date of the death of many martyrs, together with the names of the places where they suffered martyrdom and where they were buried. It also mentions the principal feasts of the Roman Church: Christmas, Easter, the Chair of Peter, and some of the more solemn feasts of the martyrs.

The 'Book of the Popes' ('Liber Pontificalis') is a collection of biographies of the Popes from Saint Peter to Stephen VI. (891). Until recent years its authorship was assigned to Anastasius, the librarian, who lived in the 9th century.

Duchesne and Mommsen both agree that the collection as we have it is a second edition, and that it is an expansion of certain primitive catalogues of the Popes, some of which date as far back as the 2d century.

In the opinion of Duchesne, the biographies of the Popes from the 6th to the 9th centuries were written by contemporaries. The 'Book of Popes' has been edited in the 17th century by Fabrotti (Paris 1647), by Bianchini (Rome 1718), by Muratori and by Migne in the 19th. The text may now be said to be fixed by the edition of the Abbe L. Duchesne (Paris 1886-92).

Of great importance in determining the topography of the Catacombs and the churches and shrines of the early Church are the guide books written by the pilgrims of the Middle Ages. The earliest of these is the 'Itinerarium' of John the Priest, which belongs to the end of the 6th century. John was sent by Theodelinda, queen of the Lombards, to Gregory the Great to obtain relics of the martyrs. These he did not obtain, but he brought back with him oil from the lamps that burned before their tombs. On each phial he inscribed the name of the martyr and the place of his burial. The original catalogue written by John is still preserved in the treasury in Monza.

The best known guide book is that of William of Malmsbury, compiled in the 12th century, perhaps for the use of the Crusaders. Other guide books are those preserved in the monasteries at Einsiedeln and Salzburg. They throw much light on the topography of the

CHRISTIAN ARCHITECTURE

Catacombs. To these same pilgrims and to the monks of the 8th century we owe many collections of inscriptions, that have since perished. The 'Codex Palatinus' of Heidelberg contains more than a hundred, some of them in metre, taken from the papal tombs of the 4th, 5th, and 6th centuries. Other collections of inscriptions from Rome, Ravenna, Milan, France, and Switzerland are preserved in Saint Gall, in Switzerland, in Verdun, and Würzburg.

During the Middle Ages the study of ancient Christian monuments was neglected, the Catacombs were well nigh forgotten, but interest in them was revived at the time of the Renaissance and rediscoveries in the 16th century made possible scientific examination. Anthony Bosio, *charge d'affaires* of the Order of Malta, spent 30 years in the Roman Catacombs, reproducing mural paintings, deciphering and copying inscriptions. He has been called the "Founder of Christian Archæology," but this title belongs by better right to John Baptist de Rossi, who, by his explorations and writings, has given to the study the character of an exact science. He was a Roman, who, at the age of 24, began the study in 1842 under the direction of Padre Marchi, and his 50 years' labor accomplished much in reconstructing the artistic, doctrinal, and family life of the Christian community of early Rome. He died in 1899, leaving his work to be carried on by Armellini, Marucchi, Wilpert, and Stevenson. His classic 'Roma Sotteranea' has been translated in part into English by Northcote and Bronlow.

Bibliography.—Armellini, 'Archeologia Christiana' and 'Le Chiese di Roma'; Marucchi, 'Elements d'Archeologie Chretienne'; Lanciani, 'Pagan and Christian Rome'; Smith, 'A Dictionary of Christian Antiquities'; Duchesne, 'Christian Worship, Its Origin and Evolution'; Wilpert, 'Principienfragen der Chrislichen Archaologie'; Mommsen, 'Romische Geschichte.' REV. WILLIAM J. WHITE, D.D.,
Brooklyn, N. Y.

Christian Architecture, that of the schools which have grown up among the peoples generally Christian in belief; but more especially the architecture of churches and their dependencies. The term is used commonly in both senses. Thus, at the time of the Gothic revival in England (most active between 1850 and 1870) the term "Christian architecture" was used especially to denote Gothic art and Gothic and Romanesque art taken together; and this because it was assumed that those styles were peculiarly the creation of the Christian organization, as distinguished from the neo-classical styles of the Renaissance and later epochs, which had obviously been developed from the study of ancient Greco-Roman architecture.

Styles which are in a strict sense Christian are (1) the Latin style, identified with the basilicas of the Western church built from the 4th to the 9th century, and most numerous in Italy, especially in Rome and Ravenna. The Christian basilicas are extremely simple in structure and design. The entrance is generally from a square peristyle, like a cloister; though the narthex or vestibule often replaces it. A nave from 30 to 50 feet wide is divided from two aisles by rows of columns often taken from classical buildings. These col-

umns carry the clear-story wall which rises above the aisle roofs and between the windows of the clear-story, and above and below the windows there are large flat surfaces commonly filled with pictures and decorative scroll-work in mosaic. There are sometimes two additional aisles. The aisles and the nave all stop against the transept, which is often higher and generally wider than the nave and is the most striking part of the buildings, but in many of the smaller basilicas no transept exists. Beyond the transept, that is, farther from the entrance doors, an apse projects, and this originally contained the seats of the bishop and his clergy. The high altar had different places at different periods, but the middle of the transept, on the axis of the great nave, was the more usual place, and a baldachino or permanent canopy was built over it—a feature which was preserved in later Italian churches; (2) the Byzantine style, finding its great central monument in the Church of St. Sophia, Constantinople, and spread over the Balkan Peninsula, parts of Asia Minor, and Syria, with offshoots in Egypt and Persia, and with more recent developments among the churches of Russia (this is described under ARCHITECTURE); (3) the Romanesque style of western Europe, developed from the attempt of the church builders to roof their naves and aisles, choirs and apses, with vaulting, copied at first from the imperial Roman examples, which were numerous throughout western Europe, but always with inferior materials and skill; then developing into a more florid style, taking different characteristic forms according as it was influenced more or less by Eastern intercourse, and spreading over Europe from Hungary to Scotland and Spain (see ARCHITECTURE and ROMANESQUE ARCHITECTURE); (4) the Gothic style, which is the Romanesque style carried to its legitimate sequence in the way of vaulting, but greatly changed by the very perfection of that constructive process, the buildings growing larger and lighter, more open, and with a constant tendency of the walls to disappear until the building becomes a stone roof supported on light uprights, with no wall surface except under the great windows; the windows themselves very rich in colored glass, and filling large parts of the upright screen or enclosure of the buildings. (See ARCHITECTURE and GOTHIC ARCHITECTURE.) These are the four great divisions of Christian architecture in the strictest sense; all these styles are treated in the general article Architecture (q.v.).

There are exceptional forms, less important but very interesting, hardly to be classified under the above general divisions. Thus, there exists in Syria a style of building which was entirely unknown until the explorations of the Comte de Vogüé (about 1860-5) and which has been studied since by an American expedition. This is a Romanesque of singular simplicity and consistency of design, the buildings being entirely of stone, roofed and fitted in every part with solid stone, and the whole style growing out of imperial Roman construction as adapted to a country where stone was the material most easily procured. The resulting style was, however, generally unrestrained by Greco-Roman traditions. The general design and the sculptured detail alike were singularly

CHRISTIAN BROTHERS — CHRISTIAN CHURCH

free, original, logical, inevitable, in their conception. It has been pointed out by French critics that the quality of clearness and original thought in design is present in all the earlier and finer buildings. The Christian symbolism, which, in its more elaborate forms, is shown most perfectly in the mosaics of central Italy (see the Latin style above), is seen in its simplest form carved on the lintels and wall-panels of these churches. The cross in its many forms, the sacred monograms and ciphers, the vine and other plants identified with the Christian teaching of the East, are used with marked success in these carvings, both as symbolism and as decoration. The churches of Syria are of singular simplicity and charm. Again, although the Gothic architecture of Europe reached its culmination at the close of the 13th century, and was less energetic, less fruitful of new thought during the 14th century, this was followed by an independent and most attractive style in the 15th century, which on the Continent we call generally the Florid Gothic or Flamboyant style, whereas in England it took the shape of the formal and rigid Perpendicular, and passed into the Tudor style with its fan vaulting. (See VAULT.) Yet again, as the Italians never understood Gothic architecture nor sympathized with it, there are only a few monuments which are strictly Gothic, but the great cathedrals of Orvieto, Siena, and Florence, and churches throughout the peninsula and in Sicily, are Gothic in detail, and are adorned by a magnificent system of sculptured and colored decoration. It is to be noted that from the beginning of the 15th century onward the artistic design is less and less dependent on church buildings; the important dwellings of the nobles in the country, and of citizens in the towns, modifying greatly the style of the day and sometimes taking the lead away from ecclesiastical structures. It is entirely a matter of private judgment how far this change tends to remove those later styles from the field of Christian architecture. RUSSELL STURGIS,

Author 'Dictionary of Architecture.'

Christian Brothers. See BRETHREN OF THE CHRISTIAN SCHOOLS.

Christian Brothers, College of, situated in Saint Louis, Mo. In 1855 it was established and incorporated with power to confer degrees. The modern language department is given special attention, the pupils being required to converse and write in French, German, and Spanish. Practical engineering, mechanical and scientific draughting and designing are emphasized in the scientific department. Literary and musical courses are aided by the various organizations which contribute to the development of good taste. The graduates of this college are among the distinguished men of the country.

Christian Church, The. The purpose of this article shall be to regard the Church as a divine institution, and to take a rapid glance at some of the leading events of its history.

In considering the first point, the attempt may be made to find the source and significance of its name. This comes to us from the Greek, but along two differing lines of derivation. The English word church comes from the Anglo-Saxon *cyrc*, or *cyric*; in the Scotch it is *kirk*, and in the German *kirche*. But the Anglo-

Saxons obtained it from the Goths, who were the first of the barbarian tribes of the north to accept Christianity. They, in turn, had taken their name for church from the Greek Christians of Constantinople, or *κυριακόν*, meaning "House of the Lord."

The second source of information concerning the term church is found in the New Testament Greek, where the inspired writers use the word *ekklesia*, which, in our language, is translated church. This has reference to the assemblies of the Lord's people. The original meaning of *ekklesia* is an assembly of people called together for any purpose, and not necessarily religious. The word is even applied to that disorderly and tumultuous crowd of which we read (Acts xix. 32, 39, 41). But ordinarily it means a meeting for religious purposes, and, save for this instance, it is used for the assemblies of God's people. The word *'ekklesiá*, therefore, is a fitting word to express the nature and purposes of a Christian assembly or body. It is derived from two Greek words, the preposition *'ek*, meaning out, from, and *kalein*, to call. The word, then, means to call out, to call from, and hence is descriptive of an assembly of saints called out of or from the world to be God's people. Furthermore, the word is used to designate a local assembly of Christians or portions of the whole Church, and this is employed also in the plural. It is used of the Church universal. It is likewise employed in reference to the whole number of the redeemed in heaven and on earth, the *Church militant* and the *Church triumphant*.

The Church is also spoken of under a number of significant figures or symbols, which, in their several ways, indicate some of its properties and characteristics. It is called a flock or fold, of which Christ is the supreme Shepherd. It is the bride of Christ. It is likened to the human body, with its various members and functions, and hence the Church is called the "Body of Christ," and we are "members of his body, of his flesh, and his bones." This is Paul's favorite figure. Again, the Church is spoken of as *visible* and *invisible*. These characteristics are early spoken of in the Church as making an important distinction in its temporal constitution and relations. The Donatists, Novatians, Montanists, ancient Puritans, insisted that, in order to the purity of the Church, it must not allow any in its membership that were not holy, else it were not "the holy catholic Church." Against this extreme and impossible condition for the Church, in its present earthly state, Augustine contended for the distinction of the Church as both an invisible and a visible body, composed partly of those who were sanctified, and partly of those who were unholy. The Church is still "the Body of Christ," though, like the human body, all its parts and members be not in perfect soundness, like the field in which there is a mixture of wheat and tares. If this distinction were not allowed, then we could not be sure of the validity of the Church's ordinances, for if they are vitiated by the administration of unholy men, then no one could know whether he was properly baptized or had received the Lord's Supper. Moreover, God alone, who knows the heart, can tell the regenerate from the unregenerate, for the graces of the Spirit are not the subjects of

CHRISTIAN CHURCH

observation and therefore not of physical demonstration. The result is that the Church as an *organism*, created by the Holy Ghost in "the clean heart and right spirit," is invisible; but as an *organization*, with living members, sacraments, and Word, politics and worship, it is visible.

These distinctions are also indicated in the Scriptures by the use of different terms in describing the collective people of God. The terms kingdom of God, kingdom of heaven, kingdom of Christ are used more than 100 times in the gospels, while the word Church is used only twice (Matt. xvi. 18; xviii. 17). The purpose of Christ was not to organize but to create a condition for organization by pouring the fullness of his life and spirit into the hearts of his disciples who, under his divine Headship and the guidance of the Holy Spirit, should constitute the outward form and order of his earthly kingdom. Hence, we read: "The law was given by Moses, but grace and truth came by Jesus Christ. And of his fulness have we all received, and grace for grace" (John i. 14-17.) Acting under the instruction of the "Great Commission" (Matt. xxviii. 19, 20), the disciples, by baptizing and teaching in his name, would need all the requisites of a constituted Church. Hence it is that in the gospels, which record the discourses of Christ, little is said of the Church as an institution, while in the Acts and Epistles we read much of the Church, its order, privileges, and work.

The kingdom of God, which consists not in meat and drink, or any other merely outward observance, is internal and subjective (Rom. xiv. 17), while the Church is objective, is like a city set upon a hill, a light upon a candlestick, is salt in the earth, and realizes all of the many metaphorical descriptions employed to set forth its outward manifestations. Aside from these scriptural representations, the definitions and affirmations, which the Creeds and Dogmaticians have recorded concerning the Church, furnish the basis of its historic position in relation to other world institutions.

In the earliest, most generally received, and least controverted of all the creeds of Christendom, "The Apostles' Creed," we read: "I believe in the holy, catholic Church; the communion of saints." This accepted definition has received various expansions and discriminations in the symbols of the Church and from eminent men, which serve to part some of the professors of the faith of Christ, into communions of greater or less extent. Taking some of the more ancient and numerous bodies of Christians as representative and illustrative, we may note the deliverances of the Roman Catholic Church. This body has defined (Catechism of Trent) "The Church as one, because there is one Lord, one faith, one baptism; but more especially because it has one invisible Ruler, Christ, and one visible, namely, the occupant for the time being of the chair of Saint Peter at Rome," etc. The eminent Bellarmine, speaking for the same Church says: "It is a society of men united by a profession of the same Christian faith and a participation of the same sacraments, under the government of lawful pastors, and especially the one vicar of Christ on earth, the Roman Pontiff." The catechism of the Greek Church gives the following definition: "The

Church is a divinely instituted community of men, united by the orthodox faith, the law of God, the hierarchy and the sacraments." (Full catechism of the Orthodox, Catholic, Eastern Church, Moscow, 1839.) The Lutheran Church defines the Church to be "A congregation of saints, in which the Gospel is purely preached and the sacraments are rightly administered" (Augsburg Conf., Art. 7). The Church of England (Art. 19) gives the following: "A congregation of faithful men, in which the pure Word of God is preached, and the sacraments are duly administered, according to Christ's ordinance in all those things that are of necessity requisite to the same." The same definition is given by the Methodist Episcopal Church. The Scottish Confession (Art. 16) defines the Church to be "A society of the elect of all ages and countries, of both Jews and Gentiles; this is the catholic or universal Church." The Confession of the Polish Churches (*Declaratio Thoruniensis*) says: "There are particular Churches and the Church universal. The true universal Church is composed of the community of all believers, dispersed throughout the world, who are and remain one catholic Church so long as they are united by subjection to one head, Christ, by the indwelling of one Spirit and the profession of the same faith; and this, though they be not associated in one common, external polity, but as regards external fellowship and ecclesiastical regimen, be not in communion with each other." Dr. Gerhart, speaking for the German Reformed Church of America, says: "The Christian Church is a divine-human institution in time and space; divine as to its ultimate ground and interior life, and human as to its form; brought into existence by the miraculous working of the Holy Ghost on the day of Pentecost, who is sent by Christ as the bearer of his incarnate life, in order to continue and develop this life and salvation, according to the law of his Spirit, in its membership, down to the end of time uninterruptedly. As such, it is not a collection of units, but an objective organism that has a principle of unity, a law, organs and resources of power and grace which are in it and its own absolutely." (*Bibliotheca Sacra*, 1863, pp. 53, 54.)

From these definitions, scriptural and theological alike, it becomes apparent that a distinction exists between the Roman Catholic and the Protestant ideas of the Christian Church. This distinction must necessarily be vital and discriminating, because, in the one case, the genius of that idea finds its dominant expression in the authority of the Christian body represented by it, and in the other, the ground for its existence and Christian name finds place in the attitude man assumes toward the truth; or, as the whole matter may be put, the authority of the Catholic Church rests upon its declarative position, as defined by the Council of Trent, which says "it is contained in the written books and the unwritten traditions which, received by the Apostles from the mouth of Christ himself and from the Apostles themselves, the Holy Ghost dictating, have come down even unto us." Here the ways of the Roman Catholic and the Protestant bodies part; the one choosing the scriptural and traditional basis for its infallible authority, the other resting its power of life upon the Scriptures alone as the only infallible rule of faith.

CHRISTIAN CHURCH

and practice. From such a position the presentation of the truth to men for their salvation could be through some form of an institutional method, while with Protestant nations, concerning the foundations of faith, the authority of the Church must be in the democracy of regenerated individuals.

Now, in the application and expansion of these separative and contrastive principles, consideration must be given by the Christian denominations themselves to their particular forms of belief and government. For after all, the distinguishing marks between them are their credal statements and their modes of organized service toward humanity. These differences may be briefly noted in the following manner: The theological system of the Roman Catholic body is, and has always been, Tridentine, and is singularly and consistently characteristic in its emphatic declarations respecting the Scriptures, private judgment in their interpretation, the essential doctrines of salvation, sin and justification, the merits of works and penance, the divine nature of the Church, with its seven precious sacraments, its consecrated priesthood, and the administration of its secular and spiritual affairs, through recognized channels of official authority; supervisory rights of the clergy, the residential control of bishops in dioceses, and the immediate and vicarious power of the great Head of the Church, the Pope. The Protestant bodies, on the other hand, taking also for their basal symbol the Nicæno-Constantinopolitan creed, have enlarged their conceptions and opinions of it in the various creeds which are their theological foundations. But in these declarations they have been for themselves no less definite and authoritative than the Catholics, though, of course, in many of the statements regarding the essential doctrines of salvation their evangelical character is very manifest; while in the politics of the many denominations representing multiplied forms of Christian work, the quality of government is measured by the integrity and organized efficiency of each one's own rules without ecclesiastical absolutism or personal authority. These are the principles, in sum, that set apart the Roman Catholic and Protestant bodies.

The second part of this article includes a brief review of the history of the Church from its inception to the present day. There are three chief periods to be noted: I. The Ancient Period, extending from the days of Christ and his apostles to 750 A.D. II. The Mediæval Period, from 750 A.D. to the Reformation, 1517 A.D. III. The Modern Period, from 1517 A.D. to the present day. Of these great periods minor epochs may be noted, as follows: First, from the days of the apostles to the death of the last of their number, about 100 A.D.; the progress of Christianity until Constantine, 313 A.D.; the supremacy of the Church in the Roman world to 590 A.D., or the age of Gregory I.; the founding of the Church among the Germanic nations to 800 A.D.; the growth of the papacy to the pontificate of Gregory VII., 1073; the full sway of the papacy in western Europe to the accession of Pope Boniface VIII., 1294 A.D.; the revolt from the papacy and movements toward reform to the posting of the Theses by Luther, 1517 A.D.; the Reformation and the conflicts of the different Christian bodies to the Peace of West-

phalia, 1648 A.D.; the changes and conflicts consequent on a new era in culture and philosophy to the French Revolution, 1789 A.D.; the era of the present from the French Revolution, the era of science, social reform, and missionary enterprise until this day.

The Ancient Period, 33-750 A. D.—After the ascension of the Saviour, and prior to Pentecost, the number of the disciples who gathered in the upper room at Jerusalem, as commanded by the Lord, was 120 souls (Acts i. 15). Immediately after this latter event we read of an accession of 3,000, consequent upon the outpouring of the Holy Ghost, according to the promise of Christ to send a Comforter to be with his Church forever and to guide his disciples into all truth. Following the Pentecostal outpouring, "the Lord added to the Church daily those that were being saved." In a short time the number of the disciples at Jerusalem was given as being about 5,000 (Acts ii. 47; iv. 4; John xiv. 16, 17, 26; xv. 26; xvi. 7, 14). After the persecution that arose about Stephen, the first Christian martyr, we read that the disciples were scattered abroad and "went everywhere preaching the word." Going throughout Judea, Galilee, and Samaria, they established churches, which rapidly grew and multiplied into a very great number. A powerful and influential church was established at Antioch, at which the disciples were first called Christians. From this church there went out the first missionaries, Paul and Barnabas, who entered Asia Minor and preached the Word so successfully that a number of churches were established. This was the beginning of a great world-wide diffusion of the Gospel, which has been going on and extending to this very day. Important centres were established, but the Gospel was largely confined to the lower and middle classes. Controversies arose between the Jewish and Gentile Christians, but the wisdom and moderation of the Apostles were sufficient to harmonize the dissidents and preserve peace. The prevalence of Oriental philosophy, in the form of Gnosticism, produced many heresies in this age, but they were of limited influence and of transient duration. Many able and earnest Christian apologists arose for the defense of the faith; some of these may be mentioned, as Aristides, Justin Martyr, Melito, Tatian, Hermas, etc. The early ages of the Church were tried by repeated and cruel persecutions, 10 in all. The most serious of these were under Nero, Domitian, Diocletian, Decius. The Scriptures were reduced to a canon, and the Church triumphed in spite of all hindrances, from within and without. Some of the more important writers were Ignatius, Irenæus, Origen, Tertullian, Clement of Alexandria. The more serious schisms were produced through Felisimus, Novatus, and Miletus. The doctrinal controversies related chiefly to eschatology, human depravity, and the divinity of Christ. The Council of Nice (325 A.D.) was a great triumph for orthodoxy. It declared the essential Trinity of the Godhead, and settled for all time the divinity of Christ as a fundamental doctrine of Christian faith. The heresy of Arius was condemned. Persecution ceased, through the sympathy of the Emperor Constantine, who, in 313, removed all disabilities from Christians, and in 323 made Christianity the state religion of the Roman empire. Monasti-

CHRISTIAN CHURCH

cism increased rapidly. Julian the Apostate endeavored to revive paganism, but without avail. Pope Leo the Great greatly extended the authority of the Western Church. Mohammedanism paralyzed the Eastern Church for a time. Mohammed was born in Mecca, Arabia, 570; declared himself a prophet in 609; founded a new religion, based upon the Koran; conquered Arabia, and died in 632. He was succeeded by the caliphs, who conquered all north Africa, western Asia, and gained a foothold in Spain and the south of France. Mohammedanism was arrested in western Europe by Charles Martel, by the victory of Tours, in 732. The most important recent defeat of Mohammedanism in Europe has been the triumph of Russia over Turkey in the war of 1877, and the practical disruption of Turkey in Europe, and the liberation of the Christian provinces. Pope Gregory the Great ruled from 590 to 604. He organized orders, elaborated the Church festivals, and established a mission among the Anglo-Saxons. Christian art was patronized liberally by the Roman pontiffs. The close of the ancient period found the Latin Church vigorous, but the Eastern Church in a stagnant condition.

Mediæval Period, 750-1517 A.D.—The Middle Ages were the transition from the ancient to the modern period. The most important political events, all of which had a bearing on the Church, were the end of the Greek exarchate in Italy; the destruction of the Lombard kingdom, the organization of the Frank empire under Pepin, rise of the new Germanic Church, division of the Mohammedan caliphate, decline of the Greek empire, and development of the new Roman empire in the West. Charlemagne was the greatest mediæval ruler. He was victorious over many northern tribes, and increased the territory of the Church to vast proportions. He was a liberal patron of learning, and authorized a Latin version of the Scriptures. Alfred the Great of England reigned from 871 to 901, and was as distinguished for learning as for his power to rule. The Russian monarchy was founded by Ruric in the middle of the 9th century. The Hungarians, Bulgarians, Bohemians, Moravians, Wends, and Scandinavians accepted Christianity. Great disorders and corruptions appeared in the Church at this time. The violent rule of the Mohammedans over Palestine excited the wrath of western Europe, and crusades were organized for the rescue of the country from the Moslems. There were seven crusades, extending from 1096 to 1272. Christian Europe failed, finally, to hold the country, but the general effect of the crusades was beneficial in the development of commerce, introduction of Oriental thought, and the knowledge of various Oriental sciences. Pre-Reformation movements were inaugurated through the Waldenses (1170); Wyclif (1324); John Huss (1373); the Moravian Brethren (1417). Mysticism greatly developed at this period through Tauler, Suso, Ruysbroek, Groot, Thomas à Kempis, and Savonarola (1480-97). Mendicant orders were established. The Inquisition was established in 1215.

The Modern Period, 1517 to the Present.—In the first quarter of the 16th century began the religious movement called the Reformation. Martin Luther, born in 1483, a priest and Au-

gustinian monk, began an agitation against the authority of the Pope. He published 95 theses, preached sermons, and in various ways sought to change the conditions which existed. He translated the Scriptures, and gained the cooperation of the German princes. Melancthon was the chief doctrinal writer of the Reformation. Erasmus labored in the department of New Testament criticism. The leading Swiss reformers were Zwingli in eastern Switzerland, and the learned Calvin in the western. Farel stood next to Calvin in Geneva. The English Reformation had King Henry VIII. on its side, through no pious motives, but because the Pope would not sanction his divorce from Catharine of Aragon. Protestantism grew rapidly, but received a set-back in Queen Mary's reign. Under Elizabeth the Reformation was placed on a firm foundation. The Puritans were a reaction against the old faith and practices in the Church of England. Arminius, born in 1560, in Holland, opposed the chief tenets of Calvinism. The Synod of Dort resulted in the political triumph of the Calvinists, and the expulsion of the Remonstrants, until the death of Maurice (1630). The Thirty Years' war (1618-48) was confined to the continent, and established the territorial boundaries of the Protestant and Catholic nations. The Huguenots were the representatives of Protestantism in France. The Jesuits, organized by Ignatius Loyola, 1540, were established as an offset to the aggression of Protestantism. Deism prevailed to an alarming extent in England, its chief promoters being Hobbes, Herbert, Shaftesbury, Tindal, Bolingbroke, Hume, and Gibbon. They had strong antagonists (Baxter, Cudworth, Taylor, Waterland, Leland, Butler, Paley). Methodism, begun by John Wesley, born 1703, was a fervent religious movement. Charles Wesley, Whitefield, John Fletcher, Joseph Benson, and Adam Clarke were strong coadjutors. German Rationalism arose in 1750, through the teachings of Wolfe, Semler, and the example of the Prussian court. It is now in decline, through the labors of Tholuck, Neander, Hengstenberg, Ullman, and others. The Evangelical Alliance (1846) sought to promote the unity of Protestant Christians in all parts of the world, and, to a corresponding degree, the victory over skepticism. The Old Catholics, a Roman Catholic reaction against the Vatican Council of 1869, were organized into a Church in 1870; Döllinger, Huber, and Friedrich were at their head.

The American Church.—The colonization of North America in some parts sprang from religious motives. The colonists sought freedom here because of the oppressions at home. Periods of American Church history: (1) From 1607-60, revival and progress. (2) 1660-1720, trial, disputes with Great Britain, religious decline. (3) From 1720-50, great revivals. (4) From 1750-83, political agitation, freedom from British rule. (5) From 1783 to the present, extensive revivals, separation of Church and state, abolition of slavery, evangelization. The Protestant Episcopal Church was founded by the James River Colony (1607); its first General Convention was in 1785; it ratified the 39 Articles in 1832. The Puritan Pilgrims landed at Plymouth in 1620, and began the development of Congregationalism. The Cambridge Platform was established in 1648. The Reformed

CHRISTIAN CHURCH

(Dutch) Church was established in 1628 in New Amsterdam (New York). The first independent organization was in 1771. The Baptists began in Providence, R. I., in 1639, through Roger Williams. The Reformed (German) Church was organized in 1741. The Lutherans were established first in New York in 1669; the first Synod was held in 1748. The Presbyterians were organized at the close of the 17th century. The first Presbytery was established in Philadelphia in 1706, and the first General Assembly in 1789. The first Methodist Society in the United States was established in New York in 1766, and the first Conference was held in Philadelphia in 1771. The Reformed Episcopal Church was organized in New York in 1873, under Bishop Cummins. The Roman Catholic Church in the United States was first established in Maryland through immigration in 1632. The Episcopal see of Baltimore was established in 1789. See CHRISTIANITY.

Bibliography.—General Church Histories: Giessler's 'Ecclesiastical History' (5 vols.); Kurtz's 'Church History' (3 vols.); 'The Universal Church History' of Alzog is the best of all Roman Catholic Histories (2 vols., 9th ed); Hergenröther (3d ed., 2 vols., 1885) is of the same Church and is standard; Ritter's work (6th ed., 1862) is valuable; Döllinger's 'Handbook of Christian Church History' (2 vols.) and his 'Manual of Church History to the 15th Century' are high authority; Prof. Fisher's 'History of the Christian Church,' like his 'Universal History,' is a repertory of facts clearly and concisely stated. Bishop Hurst's 'History of the Christian Church' (2 vols.) is standard. Neander's 'Church History,' though in some respects out of date, must always remain a masterpiece of genius, learning, and piety. Schaff, 'The History of the Christian Church,' is the most elaborate that has appeared in America. It covers the history from the beginning to the end of the Swiss Reformation. Moeller's 'History of the Christian Church' (3 vols.) is among the best despite its obscurity of style. The 'Outlines of Church History' by Rudolf Sohm is full and clear. Among many recent and brief compends the following are admirable: Zeno's 'Compendium of Church History'; Jennings's 'Manual of Church History'; Crook's 'Story of the Christian Church'; J. W. Moncrief's 'A Short History of the Christian Church'; Guggenberger, 'General History of Christian Era'; Nicolas, 'Philosophical Studies'; Pastor, 'History of the Popes'; Hettinger, 'Apologetica'; R. Parsons, 'Studies'; Junemann, 'Dissertationes.'

Ancient Church History (4 B.C.—590 A.D.).—Farrar, 'Lives of the Fathers'; Bauer, 'Church History in the First Three Centuries'; Hatch, 'The Organization of the Early Christian Church'; Uhlhorn, 'The Conflict of Christianity and Heathenism'; 'Early Church History to A.D. 430' (a course of 15 lectures by as many distinguished Churchmen); Vedder, 'The Dawn of Christianity'; Thebaud, 'Gentilism'; Champagny, 'Les Césars'; Allies, 'Formation of Christendom'; Fouart, 'Saint Peter'; Cardinal Newman, 'Historical Sketches'; Ozanam, 'History of Civilization in 5th Century.'

Mediæval Church History.—Emerton, 'Introduction to the Study of the Middle Ages, and Mediæval Europe' (2 vols); The University of Pennsylvania, 'Translations and Reprints from

the Original Sources of European History' (6 vols.); Bryce, 'Holy Roman Empire'; Fisher, 'Mediæval Europe' (2 vols.); Milman, 'History of Latin Christianity'; Moeller, 'History of the Christian Church'; Workman, 'The Church of the West in the Middle Ages.'

Period of the Reformation (1517—1648).—Seebohm, 'The Era of the Protestant Reformation'; Lindsay, 'The Reformation' (see latter 2 vols); Walker, 'The Reformation, in Ten Epochs'; Fisher, 'History of the Reformation'; Döllinger, 'Die Reformation, ihre innere Entwicklung und ihre Wirkungen'; Janssen, 'Geschichte des Deutschen Volkes seit dem Ausgang des Mittelalters' (8 vols., an attempt to show the utter failure of the Reformation. See Julius Kostlin in review. For complete bibliography see Schaff (Vol. VII.) and Hurst, 'A History of the Christian Church' (Vol. II.); Hagenbach's 'Lectures'; Hardwick's 'History of the Reformation'; Ch. Beard, 'The Reformation of the 16th Century in Its Relation to Modern Thought and Knowledge'; Cunningham, 'The Reformers and the Reformation' (1862); Gasquet, 'Eve of the Reformation'; Denifle, 'Luther and Lutheranism.'

Modern Era (1648—1905).—Rapin, 'Histoire de Jansenisme'; Neal, 'History of the So-called Jansenist Church in Holland'; Beard, 'Port Royal' (2 vols.); Paschal, 'Provincial Letters'; Molinos, 'The Spiritual Guide'; Good, 'History of Reformed Churches in Germany'; 'The Papacy in the 19th Century'; Stephens, 'The French Revolution'; Sloane, 'The French Revolution and Religious Reform'; Andrews, 'History of the United States'; Carroll, 'The Religious Forces of the United States'; Walker, 'A History of the Congregational Churches of the United States'; Dorchester, 'Christianity in the United States.'

JOEL SWARTZ,
Sometime Professor of Church History, Wittenberg Theological Seminary.

Christian Church, The (in no way ecclesiastically connected with the "Disciples of Christ"*), a denomination in the United States and Canada, with missions in Japan and Porto Rico, desiring as individual believers to be known only by the name Christian, and as a collective body only as the Christian Church. In thus refusing all party, or sectarian names, they disclaim any thought of arrogating to themselves exclusive rights in the use of the name Christian, or any intimation that such as wear other names are not Christians. On the contrary, they welcome to their fellowship all the

* These two denominations are frequently mistaken, the one for the other, in many places the Disciples of Christ being called The Christian Church. This is due to an incident of the long ago. In 1833, or near that date, Rev. Barton W. Stone of the Christian Church and Rev. A. Campbell of the Disciples of Christ held a council, seeking to unite the two bodies. Finding it impracticable, they abandoned the effort, but the impression went out that union had been accomplished, and many of the Christian Churches accepted membership with Mr. Campbell's people, but would not give up the name Christian. Hence, where the original Disciples have established churches, they are called Disciples of Christ, and where the proselyted body has spread, they are called The Christian Church. For example, in Norfolk, Va., they are called Disciples of Christ, while in Richmond, Va., the same denomination is called The Christian Church, but they have no ecclesiastical affiliation whatever with the people represented in this paper. Some years later Mr. Stone united with the Disciples as an individual minister, but the two bodies have ever remained separate.—B.

CHRISTIAN CHURCH

children of God of whatever name. Horace Mann once said: "They call themselves Christians, not invidiously, but devoutly."

The origin of the Christian Church, as a modern organization, is at once most unique and without a parallel in ecclesiastical movements. It was born in the throes and upheavals of religious thought in the latter part of the 18th and the beginning of the 19th centuries, springing into existence in rather a spontaneous manner in three different sections of the United States, and in each section from a different school of religious thought, as follows:

1. *In the South, from the Methodists.*—At the Baltimore Conference, 1 Nov. 1792, now so famous in Methodist history, James O'Kelly, feeling aggrieved on account of the autocratic power exercised by the bishop over the ministers, led in a revolt, and was followed by 30 other ministers and a number of churches. Their action was primarily designed as a protest against this prelatic oppression. They therefore called themselves "Republican Methodists," as indicating the ecclesiastical liberty for which they were contending.

Facing the gravity of the situation, a general meeting was called to assemble with the Lebanon church in Surry County, Virginia, 4 Aug. 1794, for conference. A new organization was deemed a necessity under existing conditions. On motion of Rev. Rice Haggard the name Christian was chosen to the exclusion of all party or sectarian names. To this name, without a prefix or a suffix, they have steadfastly held to this day. Deprecating the evils of human creeds, they determined to take the Bible as their only confession of faith, with Christian character under the new birth, as their only test of church membership and Christian fellowship, giving to each individual the right of private judgment in all matters of mere opinion in theological discussion, not clearly fundamental in the Christian faith.

2. *In the East, from the Baptists.*—Human creeds, with power to bind the individual conscience, fettering religious thought, had greatly disturbed the Baptists of New England. There was a craving for religious liberty, and this was backed by enthusiastic and frequent outbursts of a determination to have it. Discussion led to disruption. Rev. Abner Jones, of Vermont, a man of much ability, led the movement. They organized their first church at Lyndon, Vt., 1 Sept. 1800. The new organization adopted the name Christian and practically the same principles as had already been adopted by the seceding Methodists in the South. Their Scriptural views and the unsectarian character of the movement drew to its support a number of the leading Baptist ministers of New England. The enthusiasm spread quickly through the East, then swept over Michigan and passed over the line into Canada. Great revivals followed their preaching, new converts were added to the faith and many churches were established. The new organization flourished.

3. *In the West, from the Presbyterians.*—In 1800-1, about the time of the Cane Ridge revival, decided doctrinal differences arose among the Presbyterians of Kentucky and adjoining States. Controversy and bitterness prevailed. Long settled doctrinal views were mercilessly

dissected. Barton W. Stone, a Presbyterian minister of ability, easily became the leader of the movement in the West. With him were associated many strong men and devout women. They, too, chose the name Christian and the Bible as their only rule of faith and practice. Their work spread rapidly through a number of the Western States.

The unique feature of this triple movement is the fact that each section, widely separated, both geographically and theologically, without a knowledge of what the other was doing, adopted the same name and practically the same principles, so that early in the 19th century, when they did learn, the one of the other, they came together as one body in Christ. The united body gave to the world what has become known in their history as their Five Cardinal Principles, as follows:

1. The Lord Jesus Christ is the only head of the Church.

2. The name *Christian* is the only appellation needed or received by the Church.

3. The Holy Bible, or the Scriptures of the Old and New Testaments, is a sufficient, and should be the only, rule of faith and practice.

4. Christian character, or vital piety, is a just, and should be the only, test of membership, or fellowship, in the Church of Christ.

5. The right of private judgment and the liberty of conscience is a right and a privilege that should be accorded to and exercised by all.

Under these principles they contend for the oneness of Christians and the blessings of orthodox truth in a wholesome evangelical toleration. Thus the "Presbyterians went into the water without becoming Baptists; the Baptists continued baptism without exclusiveness, and the Methodists fellowshipped both without becoming Calvinists." Conflicting elements were harmonized in the spirit of brotherly love, and the body speedily became one in Christ. It came, as if by magic, without apparent cause, without any concert of action, and without any human planning.

In the United States and Canada the Christian Church now has 72 annual conferences, with 1,500 ministers and 122,000 members, working under a congregational form of government. Their highest ecclesiastical body is the American Christian Convention, meeting quadrennially, composed of representatives from the 72 conferences. To this people belong the distinction of having published the first religious newspaper ever issued in the United States. Their new publishing house is located at Dayton, Ohio, where their oldest paper, 'The Herald of Gospel Liberty,' is yet published. They also publish 'The Christian Sun' at Elon College, N. C.; 'The Christian Messenger' at New Bedford, Mass.; 'The Christian Vanguard' at Kingston, Ontario, Canada; 'The Christian Missionary,' Dayton, Ohio; and 'The Christian Messenger,' Japan, besides a number of smaller periodicals and many books of permanent value.

The Christian Church was also the first to open their colleges to both sexes with equal privileges. They have colleges in Ohio, Indiana, Iowa, Kansas, Missouri, North Carolina, and New York. Their theological seminary, The Christian Biblical Institute, is located at Stanfordville, N. Y.

CHRISTIAN ENDEAVOR — CHRISTIAN KNOWLEDGE

They have missionaries in Japan and Porto Rico, together with many home missionaries in a number of States of the Union, and also in Canada. Their Mission rooms are located at Dayton, Ohio.

The Christian Church was divided over the issues of the Civil War. Separation took place in the National Convention held at Cincinnati, Ohio, in October 1854. The reunion was effected at Marion, Ind., in October 1890. After 36 years of separation they came together without a jar. They work under the motto: "*In Essentials, Unity; In Non-Essentials, Liberty; In All Things, Charity.*"

The general trend of the Christian Church in the fundamental doctrines of Christianity is Arminian. They believe in the Divinity of Christ, in the vicarious atonement, in the lost condition of the unregenerate, and in salvation through Christ. They believe in the Personality of the Holy Spirit, and in his endowment as the highest qualification for Christian service. There is an element in the Church which does not agree to this view in full. They hold to the Divinity of Christ, but deny that he is equal with the Father; they reject the vicarious atonement, but believe that the atonement is the reconciliation of the sinner to God through the death of his Son. "By his stripes we are healed, that is, reconciled — atoned." They hold that the death of Christ was not to make judicial satisfaction, but to secure the sinner's salvation and a ratification of the New Covenant, that it is moral in its nature, rather than propitiatory. This wing of the church denies the personality of the Holy Spirit, teaching that he is an influence proceeding from the Father and the Son for the convincing of the world of sin, of righteousness and of judgment. They as much depend upon the presence and power of the Holy Spirit to make their labors effective as do their brethren who accept his personality. The Spirit is thus honored in their lives and service.

As a whole the church stands for the divine inspiration of the Scriptures, and they recognize their authority as final in all matters of faith, practice, and doctrine. Baptism by immersion is largely practised among them, but pouring and sprinkling are also practised, and gaining in favor, rather than losing. They are open communion in the administration of the Lord's Supper. They steadfastly maintain that the Bible is their only creed, allowing absolutely nothing in the way of human expression of doctrine to displace this idea.

J. PRESSLEY BARRETT,

Member American Christian Convention Mission Board.

Christian Endeavor, Young People's Society of, a society distinctly religious in all its features; organized 2 Feb. 1881 in Williston Church, Portland, Maine, by the Rev. Francis E. Clark, D.D. From one small association it has expanded into over 57,000 societies, in all parts of the world, with an aggregate membership (1900) of 3,500,000. In addition to the main organizations in the United States it has been found necessary to form branches, among which are the Juniors, organized 27 March 1884, at Tabor, Iowa, by the Rev. J. W. Cowan and Miss Belle Smith; the Intermediate, organized by the Rev. A. Z. Conrad of Worcester, Mass.;

and the Mothers', suggested by Mrs. Amanda B. Fellows of Chicago, and organized in April 1893 at Topeka, Kan., by Mr. F. C. Barton. Among other special branches are the Life Savers', instituted by the Rev. S. Edward Young at the United States Life-Saving Station at Asbury Park, N. J.; the Travelers' Christian Endeavor Union, organized at Philadelphia, 14 Nov. 1892, for work among commercial travelers; the Floating societies for work in the United States navy and among seamen generally; and various other organizations whose fields of labor lie among the Chinese, the Indians, convicts in prison, etc. The first Christian Endeavor Society in England was organized in 1887, and was followed by similar ones in other countries, and the constitution has been printed in over 30 different languages. The movement is not a denominational one. Any society belonging to an evangelical Church, which adopts the leading principles as set forth in the constitution, including the prayer-meeting pledge, and which guarantees these principles by the name Christian Endeavor either alone or in connection with a denominational name is admitted to all the privileges of the organization. In the United States the Presbyterian Church has the largest number of societies; in England the Baptists lead; while in some parts of Canada and Australia the Methodists are in advance of all others. In some of the American States, the Disciples of Christ, and in others the Congregationalists, claim the largest number.

The distinctive features in the Christian Endeavor movement are its work among the young people, leading them to consecrate their lives to the active service of God; the weekly prayer-meetings, which each member takes a solemn pledge to attend regularly (unless unavoidably detained), and to take part in; and the reconsecration meetings held once a month, at which special efforts are made to see if each one has been faithful to his pledges. The amount of good accomplished in training the young people in the practical work of Christianity and fitting them to take up the work of those dropping out of active service can never be fully estimated. The World's Union of Christian Endeavor held its first triennial convention at Washington, D. C., in July 1896, which was attended by representatives from all over the world. Rev. Dr. Clark was elected president, and Rev. W. J. L. Closs of Australia was made the first secretary of the new organization. The United Society of Christian Endeavor is a bureau of information, which simply seeks to spread the idea of the movement throughout the world. Its headquarters are in Boston, and John Willis Baer is the secretary. FRANCIS E. CLARK.

Christian Era, the era or epoch introduced by the birth of Christ. It was calculated back about the year 532, by a monk, Dionysius Exiguus, a resident of Syria. It is thought that he fixed the advent too late by four years, and that consequently Jesus was born, if the contradiction in terms can be permitted, in 4 B.C. J. W. Bosanquet considers that it was in 3 B.C. The Christian Era is sometimes called the Dionysian era.

Christian Knowledge, Society for the Promotion of, the oldest and greatest of the great religious associations connected with the Church of England. It is popularly referred to as the

CHRISTIAN MISSIONARY ALLIANCE — CHRISTIAN REFORMED CHURCH

"S. P. C. K." It was founded in 1698, although it did not receive its present name till 1701; and had for its objects:

"1. To promote and encourage the erection of charity schools in all parts of England and Wales; 2. To disperse, both at home and abroad, Bibles and tracts of religion; and, in general, to advance the honour of God, and the good of mankind, by promoting Christian knowledge both at home and in other parts of the world by the best methods that should offer." These objects it has never ceased to pursue, chiefly directing its efforts to Great Britain and the colonies; partaking at once of the nature of an educational association, a missionary society, a Bible society, a religious tract society, and an emigrants' spiritual aid society; and notwithstanding the operations of other great societies in these several departments of Christian benevolence, its revenue amounts to above \$250,000 a year. The publishing and bookselling business shows in some years total sales of \$450,000; the works published being in very various departments of literature, and including several admirable series on Early Britain, Diocesan Histories, Ancient History from the Monuments, Early Chroniclers, etc.

The Protestant missionaries who labored in the south of India in the 18th century were supported chiefly by this society, and it is now chiefly engaged in supplying to the mission-field throughout the world needful religious literature in the vernacular. Besides translations of the Bible and Prayer-book, it provides for pioneer missionaries, grammars, dictionaries, reading-books, and general literature, to instruct them in the languages which they will have to use. In Scotland a similar society was organized in 1709, and in 1902 had an annual expenditure of \$25,000.

Christian Missionary Alliance. The Christian Missionary Alliance was the title adopted when the Christian Alliance, which had been founded in 1887, and the International Missionary Alliance combined in 1897. All who have made open profession of belief in Christ may become members by subscribing to the principles of the order and enrolling their names. The objects of the Alliance are "Wide diffusion of the Gospel in its fulness, the promotion of a deeper and higher Christian life and the work of evangelization, especially among the neglected classes in distant and especially heathen countries." Connected with the Alliance are the Missionary Training Institute, Institute for the Training of Home Workers, Berachah Home and Berachah Orphanage.

Christian Missions, Statistics of. At the close of the last century the world's evangelical foreign missions were reported as follows: Foreign missionary societies, 558; income, \$20,079,698; missionaries, 18,682; native workers, 79,396; stations occupied, 30,536; churches, 14,364; communicants, 1,550,729; Christian community, 4,523,564. There were 94 universities and colleges, with 35,539 pupils; 375 theological and training schools, with 11,965 pupils; 179 industrial schools, with 9,074 pupils; 18,742 elementary schools, with 904,442 pupils; making a grand total of 20,458 schools with 1,051,466 scholars. There were 159 mission presses and publishing houses, printing and publishing 379

magazines and papers, having a circulation of over 250,000 copies. The medical record reported 711 physicians, 379 hospitals, 783 dispensaries, and 2,347,780 patients; there were 247 orphanages, 100 leper homes, 30 schools for the blind and the deaf, 156 refuges for insane, opium-eaters, etc., and 118 societies for social reform. See MISSIONS, PROTESTANT FOREIGN; MISSIONS, PROTESTANT HOME; MISSIONS, ROMAN CATHOLIC CHURCH, HOME and FOREIGN.

Christian Reformed Church in North America, The. This Church is largely the result of three secession movements out of the Reformed (Dutch) Church (q.v.). The first of these movements took place in 1822 in the States of New Jersey and New York. Its leader was Rev. Solomon Froeligh, D.D., assistant professor of theology in the Dutch Church. The reasons advanced for seceding from the old denomination were: its laxness in disciplining offending members, indiscriminate administration of sealing ordinances, and toleration of Hopkinsian teachings. In 1827 the seceders, calling themselves the "True Reformed Dutch Church," numbered 25 congregations and 12 ministers. Their number dwindled slowly but surely until 1890, when they formed a union with the main part of the present Christian Reformed Church.

This main part was composed largely of Hollanders who, in 1847 and the decade following, had settled in Michigan, Wisconsin, Iowa, and other northwestern States. In 1849 these people — all staunch Calvinists — had united themselves with the (Dutch) Reformed Church. From the very beginning, however, some were dissatisfied with the union on account of difference in language, neglect of catechetical preaching and teaching, too much fraternizing with un-Calvinistic denominations, the singing of hymns, and laxity of doctrine. Objections were also made against allowing freemasons to be church members. In 1857 this dissatisfaction led to an open disruption. Under the leadership of the Rev. K. Vanden Bosch, about half a dozen churches in Michigan withdrew and styled themselves the "True Dutch Reformed Church." In 1876 they opened a theological school in Grand Rapids, Mich., the denominational stronghold.

This True Dutch Reformed Church was much strengthened, numerically and morally, by a third movement of secession which took place in the early '80's. This movement was the result of anti-Masonic agitation, the General Synod of the Reformed Church refusing to take such decided action as the complainants desired. In 1882 the seceding congregations, about half a dozen, led by Rev. L. J. Hulst, united formally with the Church which had withdrawn in 1857.

After this union the numerical increase of the denomination, which was slow at first, became quite rapid. The statistics for 1905 give 164 congregations, 119 ministers, 594 elders, 548 deacons, 12,209 families, 21,817 communicants, 21,229 catechism scholars, 16,309 Sabbath-school scholars; a total of 62,836 souls. These congregations are located in 18 States, from the Atlantic to the Pacific, from Canada to the Gulf of Mexico. The different local churches are joined in 10 "classes" or presbyteries. Six delegates of each of the latter, three ministers and three elders, constitute the Synod, the highest

CHRISTIAN SCHOOLS — CHRISTIAN SCIENCE

Church court of the denomination, meeting biennially (in even years), the third Wednesday in June. The theological school, including both a literary and a theological department, numbers about 150 students. The faculty is composed of 10 professors. The Christian Reformed Church is very zealous in home mission efforts. This is one of the main causes of its rapid growth; continual immigration from the Netherlands and the formation of new settlements supplying the material for the increase.

The denomination also carries on mission work among the Navaho and Zūni Indians in New Mexico. Near Gallup, N. M., "Rehoboth Mission," a promising boarding school for Navaho children, has been opened. Something is also done for Jewish missions. Four periodicals are issued in the interests of the denomination: one weekly, two monthlies, and one bi-weekly, the latter in English, 'The Banner of Truth,' published in Holland, Mich. Most of the Christian Reformed congregations are as yet using the Holland language in their religious exercises. Half a dozen conduct their worship in German, 18 are English-speaking churches, and the near future promises many more as a result of Americanizing forces. Fraternal relations are established with the stricter Calvinistic Churches of the United States and South Africa, and especially with the Reformed Churches of Holland. In creed and government the Christian Reformed Church is like all reformed denominations of Holland origin throughout the world, its creed consisting of the Heidelberg Catechism, the Belgic Confession, and the Five Articles against the Remonstrants, usually called the "Canons of Dordrecht." The Church is marked for its conservative spirit, and contends earnestly for Calvinistic tenets. It lays much stress on catechetical training of its young people. The Psalms are used almost exclusively in public worship. The name Holland Christian Reformed was adopted in 1880, and 10 years later the official name became "Christian Reformed Church."

REV. HENRY BEETS, S. C.

Christian Schools, Brothers of the.

Christian Science. For a definition of Christian Science it is sufficient to quote one that has frequently been used and which will be acceptable to Christian Scientists generally: "The foundational truths of Christian Science are the reality and allness of God, the unreality and nothingness of matter, the spirituality of man and the universe, the omnipotence of good, the impotence of evil. The demonstrative actuality of Christian Science essentially distinguishes it from all other religions of the age." As presented in 'Science and Health with Key to the Scriptures,' by Mary Baker G. Eddy: "The physical healing of Christian Science results now, as in Jesus' time, from the operation of divine Principle, before which sin and disease lose their reality in human consciousness, and so disappear as naturally and as necessarily as darkness gives place to light, and sin to reformation. Now, as then, his mighty works are not supernatural, but supremely natural. They are the sign of Immanuel, or 'God with us'—a divine influence ever present in human consciousness, and repeating itself, coming now again, as was promised aforetime,

To preach deliverance to the captives (of sense),
And recovering of sight to the blind,
To set at liberty them that are bruised."

(Preface, p. xi.)

Its purpose is not to supplant primitive Christianity, but to render our understanding of it more practical. It is the claim of Christian Scientists that Jesus proved what man may do through absolute reliance upon God, and Mrs. Eddy teaches how it may be done.

The principal mission of Christian Science is to give an enlarged spiritual explanation of the infinite personality of God as Spirit, to define the very nature and essence of God, and thereby increase mortals' faith and trust in Him. Christian Scientists believe that God should be recognized in all the affairs of men.

The history of Christian Science dates back to 1866, the year of Mrs. Eddy's discovery, and the growth of the movement during subsequent years has been so rapid that the denomination now commands a position of wide influence and power. Mrs. Eddy, the recognized discoverer and founder of Christian Science, began to win followers in 1867. In 1875 she published 'Science and Health with Key to the Scriptures,' the text-book of Christian Science, which has passed through more than 290 editions of 1,000 copies each. In 1879 she founded the first Christian Science Church, and in 1881 she opened a college for the teaching of Christian Science, called the Massachusetts Metaphysical College, where she personally taught about 5,000 students, who passed through this college. In 1883 she established the first denominational periodical and became its editor.

In Mrs. Eddy's personal history there is nothing mysterious or concealed. She has never made any miraculous claims. Her life has been simple, her girlhood, save for its eager religious questioning, not unusual. She was born in a little village in New Hampshire, sheltered by the hills that rose to the soft blue skies, and sentineled by oak and pine and hemlock.

She comes of that mixed English and Scotch Puritan ancestry which formed so much of the best of New England's stock. Some of her forefathers were men of mark in war and statesmanship. Gen. Knox, of Revolutionary fame, was a relative of her father, and among others of her ancestors were Sir John Macneil, who fought at Lundy's Lane. Mary Baker's father was a man of sturdy piety and strict probity. Of Mrs. Eddy's mother the little that has been recorded leaves the impression of one of those New England mothers whose strict notions of propriety were tempered by an innate sweetness of temperament. From her brother, Hon. Albert Baker, who was nominated for a congressman by the largest vote ever polled in New Hampshire (dying, however, before his election), Mrs. Eddy derived her knowledge of Greek, Hebrew, and Latin. Charity and benevolence ruled the household. Mrs. Eddy speaks of her childhood's home as "one with the open hand, where the needy were ever welcome." From such a family, and such a home, full of the beautiful simplicity of the rural life of early New England, came the only woman in history who has ever founded a great religious denomination.

Doctrinal questions early engaged her eager

CHRISTIAN SCIENCE

and active mind. In her book, 'Retrospection and Introspection,' she has described how she cast from her the doctrine of predestination, in which belief she had been carefully nurtured by her Calvinistic parents. Her soul revolted from what she regarded as the inhumanity of extreme Calvinism, and before the meeting, where she applied for church membership, she bravely disavowed a belief in those tenets. Thereafter she was active in church work, engaging in much speaking and writing. Three years she spent in Scripture study in the preparation of her work, 'Science and Health.'

Of this period she writes: "For three years after my discovery I sought the solution of this problem of mind-healing; searched the Scriptures, read little else; kept aloof from society, and devoted time and energies to discovering a positive rule. The search was sweet, calm, and buoyant with hope, not selfish nor depressing. I knew the principle of all harmonious mind-action to be God, and that cures were produced, in primitive Christian healing, by holy, uplifting faith; but I must know its science, and I won my way to absolute conclusions, through divine revelation, reason, and demonstration. The revelation of truth in the understanding came to me gradually, and apparently through divine power." ('Science and Health,' p. 109.)

The love in which Mrs. Eddy is held by Christian Scientists — and there is no mistaking the reality or genuineness of the affection — is called forth by what she has wrought, and goes out to her as the bearer of a great spiritual message. This is expressed in the speech and writings of Christian Scientists and is a constant tribute to the wisdom and success of her leadership. It is true that they regard her as the greatest woman of her time; considered in her relation to religious truth, the greatest of all time. But this is very different from fulsome adulation, or from the vulgar attribution of miraculous powers.

The total number of Christian Science churches and societies, here and abroad, in June 1903, was 769, showing the remarkable increase of 228 in three years. Greater New York has nine Christian Science churches; Chicago, six; Minneapolis, four; Milwaukee, three. The doctrines of Christian Science have secured a firm foothold in Great Britain and Germany, and the present indications are that the growth of the denomination in those conservative countries will be as rapid as in the United States and Canada. The directory of practitioners published in a recent issue of the official organ of the denomination includes the names of persons in 49 States and Territories of the United States, including Hawaii, the Philippine Islands, and Porto Rico; England, Ireland, Scotland, Wales, Canada, France, Germany, Italy, Switzerland, Australia, Mexico, China, and the Bahamas. Besides the churches there are many free reading-rooms — more than 450 in the United States alone. These reading-rooms are a feature of the denomination, and are to be found in many of the cities abroad where Christian Science has found lodgment.

The First Church of Christ, Scientist, in Boston, Mass., was finished in 1894 at an expense of over \$250,000 and was dedicated free of debt, in fact it was necessary to issue notice that no more contributions would be received. It is known as the "Mother Church," all the

other churches being branches of this one. This was the first church devoted to the uses of the denomination, and all the others have, therefore, been built within nine years, a very remarkable growth.

In recent years the growth of the congregation in attendance at the Mother Church has been so great that branch churches have been established in Roxbury, Cambridge, and Chelsea, but the relief thus gained has not been sufficient, and work has recently been commenced upon a larger building which will have a seating capacity of 5,000 and will cost over \$1,000,000.

The denomination, numerically, is very evenly distributed. The "Directory of Christian Science Practitioners" in 'The Christian Science Journal' shows that there is hardly a city in the Union but contains within it one or more adherents of the faith who devote their entire time to healing the sick. Then, too, the Board of Lectureship, comprising well-known and representative men and women, is a growing and efficient means of spreading a knowledge of the new doctrines.

The Mother Church in Boston included in June 1903, according to official figures, 27,796 members, 3,696 of whom had been added since the preceding June. Membership in this church is not confined to Christian Scientists residing in Boston.

The growth of the denomination has not been due to any effort on the part of Christian Scientists to proselyte from or misrepresent other denominations, but rather to the fact that the practical application of the teachings of Christian Science has proved beyond contention to thinking people who have investigated the subject that salvation is possible and within the reach of all who faithfully and earnestly strive for it. It is not the purpose of Christian Scientists to interfere with those who are satisfied with their religious beliefs, nor do they seek to force their views upon those who do not agree with them.

The nine years succeeding the building of the Mother Church have constituted a period of great activity and growth, especially in the way of church-building, and in many of the smaller cities and towns, as well as in the larger cities of the country, large and in some instances quite expensive edifices have been erected. It is an unwritten law of the denomination that a church building shall not be dedicated until it is paid for. Some congregations have built chapels to which they propose to add churches as the need arises; others have purchased old churches or family mansions, which they have remodeled and refurnished to meet their requirements, while a number have bought sites on which building operations will shortly be begun. In all this activity there is evidence of the great outlay of time, services, and money, which are given not only cheerfully, but eagerly; and all this has gone on at a steadily increasing pace, to which one can as yet see no probability of interruption. Early in 1904 there was in course of construction in Concord, N. H., a fine church edifice which represents a gift of \$120,000 by Mrs. Eddy to the Christian Scientists of her home city.

Organized Christian Science is perhaps less than seven years old in England. From 1894 to 1897 its meetings in London were confined to drawing-rooms, but in the latter year a regular meeting-place was engaged. But it was not until

CHRISTIAN UNION CHURCHES — CHRISTIANA CASE

1899 that First Church of Christ, Scientist, in London, was formed, followed later by Second Church of Christ, Scientist.

In Germany there has been some progress. Berlin has a church organized some time ago with the permission of the authorities, as is usual in such cases. In that city is a Christian Science reading-room maintained by the church organization. The question of the new faith came up in the Reichstag, and the imperial secretary of state then said: "I warn earnestly against using the power of the state against such things."

Wherever established, the Church numbers among its adherents men and women of distinguished intellectual ability. There as here, they are largely recruited from the professional ranks — judges, lawyers, doctors. Critics of the new denomination have frequently noted that the membership of the Church represents the "upper classes" — the classes which socially are near the apex, but while this is in some measure true, it is not to be understood that the Christian Science Church is "a rich man's church." On the contrary it is most democratic, and its members have been drawn from almost every rank and condition of society.

Practically all the adherents of Christian Science have been healed of severe and chronic sickness which in past years impoverished many of them or rendered the transaction of business and the earning of more than a meagre livelihood a physical impossibility. These people, now being restored, through the recovery of their health, to their legitimate place in the business and social world, give an air of prosperity to the congregations of which they are members.

A distinctive feature of the religious services of the denomination is the "Wednesday evening meeting" at which testimony is given by those who have been healed of physical disease or reformed from the practice of sinful habits, through the operation and practice of Christian Science. It is proverbial that every religious reformer has had to overcome prejudice and opposition, and in this regard the founder and leader of Christian Science is not an exception.

It should be remembered that there are no personal pastors in the Christian Science churches. This rule is observed with a view to the emphasizing of truth rather than personality. The place occupied in other churches by pastors is filled by trained and educated leaders called readers.

In the early years of Mrs. Eddy's work she met much opposition from those to whom it seemed impossible that the healing work of Jesus and the apostles should be revived, but this opposition and the prejudice from which it sprang is becoming less and less each year until Christian Science has now taken its place as a practical and beneficent religion, and it is so regarded by a constantly increasing and ever loyal constituency.

Certainly few teachings have made greater progress in the world than the faith to which the name of Mrs. Eddy is linked. Christian Science is no mere exclusive tenet, held by a small knot of believers. It is a growing and important faith, ranking in the number of its adherents with the great established denominations of Protestantism. Entertain what views its critics may of the basic doctrine advanced under the name of

Christian Science, certainly the charge of fanaticism cannot be in any way successfully maintained.

In a quiet, undemonstrative way its adherents have gone about their task; there has been no proselyting, in the usual sense of that term; there have been no sensational sermons, such as attract vast metropolitan audiences. With none of these adventitious aids to the spread of its doctrines, Christian Science has made extraordinary progress. It has moved like an army and, ere the world was aware of it, the great host had taken its place among the foremost of the established religious orders of the universe. Consult the works of Mrs. Eddy and the 'Christian Science Journal' (Boston).

ARCHIBALD McLELLAN,
Editor Christian Science Journal.

Christian Union Churches, an American denominational union, organized in 1865, composed of members of all varieties of orthodox belief. Their creed is simple, covering the headship of Christ, sufficiency of the Bible, and right of local Church government. They have a membership of about 30,000 and fully 150,000 adherents, and are located chiefly in the older western States. In 1899 they had approximately 183 ministers, and 294 churches. They are in affiliation with the Christians.

Christian University, a co-educational institution in Canton, Mo.; organized in 1853, under the auspices of the Disciples of Christ; reported at the end of 1905: Professors and instructors, 14; students, 183; volumes in the library, 2,800; grounds and buildings valued at \$40,000; productive funds, \$20,000; benefactions, \$3,000; income, \$5,000; number of graduates, 287.

Christian Woman, A, a novel by Emilia Pardo-Bazán. In this interesting tale the author presents a very realistic picture of modern Spanish life, into which are introduced many current social and political questions.

Christian Year, The, by John Keble, an English divine. The book is a small volume of religious poems, which first appeared in 1827. It contains a thought or thoughts, expressed in poetic form, for each day of the year. The poems have all the polish and simplicity which come from classical study and artistic workmanship. The book, at once, became popular, and has held favor ever since. Cardinal Newman said of this work: "It was the most soothing, tranquilizing, subduing work of the day. If poems can be found to enliven in dejection and to comfort in anxiety, to cool the over-sanguine, to refresh the weary, and to awe the worldly, to instill resignation into the impatient and calmness into the fearful and agitated, they are these." See KEBLE, JOHN.

Christiana Case. On 11 Sept. 1851, Edward Gorsuch of Maryland, his son, a party of friends, and a United States deputy marshal, having secured a warrant from a Philadelphia commissioner for the arrest of a fugitive slave (alleged to have been Gorsuch's own son), came to Christiana, Lancaster County, Pa., approached the house where the fugitive had taken refuge, and demanded possession of him, firing two shots at the house. The neighborhood was aroused, and several armed colored men appeared on the scene, as also did Castner

CHRISTIANCY — CHRISTIANITY

Hanway and Elijah Lewis, Quakers, who tried to persuade both parties to disperse. The deputy marshal ordered them to join his posse; they urged him to withdraw for his own sake; Gorsuch and two of his party fired on the colored men, who returned the fire, killed Gorsuch and his son, and forced the rest to fly. The fugitive slave escaped. The two Quakers were indicted for treason; the grand jury found bills against them; and they were tried 24 November before Justice Grier of the supreme court. Among the counsel for their defense were Thaddeus Stevens and T. L. Cuyler; the chief argument was by J. M. Read. The absurdity of the accusation was so great that the Democratic judge charged emphatically for the prisoners, and the jury acquitted them without leaving the box.

Christiency, Isaac Peckham, American editor and diplomatist: b. Johnstown (now Bleeker), N. Y., 12 March 1812; d. Lansing, Mich., 8 Sept. 1890. He was one of the founders of the Republican party and espoused its cause as editor of the 'Monroe Commercial.' In 1875 he was chosen United States senator from Michigan, and in 1879 became minister to Peru.

Christiania, krēs-tē-ä'nē-ā, Norway, capital, city and port, province Aggershuus or Christiania, at the head of the long narrow inlet called Christiania Fjord, about 60 miles from the open sea or Skager Rack. High hills rise around it on all sides, excepting toward the bay, but at considerable distances, particularly on the north. The most interesting building in the town is the fine old castle of Akershus (built about 1300), with its church and planted ramparts, crowning a point jutting out into the fjord, and commanding a fine view, but of no military value. On a gentle elevation, and in the midst of a beautiful park stands the royal palace—a massive square building, without any architectural ornament, but commanding delightful views of the fjord and its beautifully winding shores. The hall in which the Storthing holds its sittings is a very plain building. The other public edifices are the military academy, cathedral, university, etc. Attached to the university is a museum, containing a fine collection of antiquities. The climate of Christiania is delightful. It is screened from violent winds; and even in winter, though the cold is severe, the weather is seldom variable, but bright and settled, and free from damp and fog. In summer it is warm but not sultry, with a light and buoyant atmosphere. The few manufactures of the city consist of woolen cloth, iron-ware, tobacco, paper, leather, soap, spirits, glass, etc. There are also some extensive breweries. The exports are principally timber, deal planks, and iron. The environs of the city are exceedingly beautiful, the approach to it by the magnificent fjord, at the head of which it is situated, exciting the admiration of all visitors. The fjord is frozen for upward of two months in the year, for about 20 miles from Christiania to the sea; and the harbor is generally locked up for three or four months. Pop. 203,337.

Christianity. Christianity is a name for the religion which was founded by Jesus Christ. At first it was regarded as an heretical sect of Judaism, and, in appearance, it was little more.

Its Founder was a Jew who always spoke with respect of his ancestral religion, attended upon its worship, and revered its sacred books. Its earliest adherents were Jews who were devotedly attached to the traditions and customs of their people and who were far from supposing that in becoming disciples of Christ they were taking a step which would, at length, separate them from the religion of their fathers.

It is, indeed, a matter of dispute whether Jesus himself contemplated such a result. Some believe that he hoped to do the work of a reformer and to induce the Jewish people to adopt his religious ideals without separating himself or his disciples from the congregation of Israel. In all the circumstances this supposition seems improbable. The ritualism and traditionalism of late Judaism and the radical ethicism of Jesus were too diverse to admit of reconciliation. As he himself expressed it, his countrymen who were accustomed to the old wine of Jewish thought and custom would not straightway desire new, and his teaching was new wine which could not be confined in the old wineskins of Judaism (Luke v. 37-39). Accordingly, the separation which Jesus' experience at the hands of his countrymen had betokened, became more and more complete as time went on. The teaching of men who discerned and emphasized the contrast between Judaism and Christianity—especially that of the apostle Paul—the intense missionary spirit of the early Christians and the downfall of the Jewish state in 70 A.D., were among the circumstances which completed the separation of the two forms of faith and started Christianity on its career as one of the great world religions.

In speaking of the religion of Christ, we must refer primarily to his own teaching and that of his early disciples. This we may more properly do since all Christians agree that for obtaining a knowledge of the principles of their religion recourse must be had to the writings of the New Testament as being, in some sense, primary and normative. Despite the differences of opinion which have obtained in the Christian world, there are certain great, general convictions which Christians share in common and which may be said to underlie or constitute the claims of the Christian religion on its own behalf.

Chief among these claims is this, that the unique personality, teaching, and influence of Jesus Christ give to him a supreme place among the religious teachers of the world. All Christians would assert the incomparable elevation and excellence of the morality which he taught and illustrated, and would maintain that the influence of his example upon the life of the world has been most salutary. They would agree that a revelation of God is to be seen in the person and lifework of Jesus, however widely they might differ as to the method, nature, and scope of that revelation. It is a general Christian conviction that the moral effects of Christianity in the world have been such, on the whole, as to constitute an evidence of its divine origin and character. These introductory considerations must now be further elaborated.

Christianity and Christ.—How did Christ become the Founder of a new religion? We must answer: By the personal influence and inspiration which he exercised upon those who asso-

CHRISTIANITY

ciated themselves with him. He did not adopt the methods of the political organizer. He created no party; led no uprising; elaborated no formal programme. Other founders of religions have generally been the authors of elaborate books of rules and doctrines; Jesus wrote nothing. He was not an organizer or an aggressive leader of men. He advocated no revolution, except the moral revolution of the inner life. He moved quietly about along the highways and among the villages of Galilee and Judea, speaking to men about God and life and duty, and thus initiating a movement which has transformed the world.

The secret of this movement doubtless is that in his teaching and life Jesus touched the deepest chords in human nature. He sounded the profoundest depths of man's moral and spiritual being. The conception of God which he portrayed, the ideals of life which he illustrated, were the highest and truest of which men can conceive. Such has been the conviction which he has inspired. However far men might fall below the morality of Christ, however much they might deny his principles in practice, they have still been haunted by the feeling that his words were true. In the depths of their hearts men, despite their cruel selfishness, have recognized in the voice of Jesus the tone of absolute truth.

Our most primitive sources of information assure us that Jesus taught something regarding himself, as well as something regarding God and man. The Gospels assume that this latter aspect of his teaching is inseparable from the former. He assumed to speak to men about the fatherhood of God out of a sense of his own unique sonship to him. He told men what God was and required because he claimed to possess an incomparable knowledge of God's nature and will. If we can trust the earliest reports of his teaching, we must say that he never separated his message from his personal claims as the bearer of it. However unwarranted the historic theories of Christ's person may have been, they sprang from a legitimate impulse. The Christian religion implies and necessitates some theoretic estimate of Christ.

Christianity and Scripture.—Christianity has sometimes been described as the religion of a book. It would be more correct to say that it is a religion with a book. It is certainly not a book-religion in the sense in which Mohammedanism or Confucianism is. It does not appear, as it were, ready-made in the writings of any single sage or prophet. Its sacred books are its products, not its cause. Its programme was not first elaborated in a book and then carried out in life and action. Christianity did not begin with a body of rules or laws. It is, or, at any rate, originally was, a religion in which motives and principles are primary and whose nature it is to create its own externals.

Nevertheless, the conception that the religion of Christ had its chief source and warrant in a book has often been maintained, and still has a wide popular acceptance. A similar view prevailed in Judaism concerning the religion of Israel. The Mosaic law was believed to have had its origin in heaven and to have prescribed, by divine authority, the complete religious duty of man. This law was the antecedent warrant for all that was to be believed and practised. This conception of an authoritative book in

which the laws and principles of the system were incorporated in advance, was transferred to the earliest Christian writings and became the popular working theory of the subject.

Nothing is plainer, however, than that such a view, alike of the Hebrew and of the Christian Scriptures, is quite unhistorical. The Mosaic law was a comparatively late codification of rules and maxims which were developed and collated through a long period of time. In its present form it was later than the preaching of the great prophets whose teaching represents the high-water mark in Israel's religion. In like manner the writings which compose our New Testament were produced after Christianity had been, for a considerable period, a vigorous force in the thought and life of the world. Its oldest books, the earlier letters of Paul, were incidental products of his missionary activity. They were addressed to individuals, particular congregations, or groups of congregations, and deal largely with local conditions. They could not have been written with the remotest thought, on the part of the apostle, that he was contributing to an authoritative canon of Scripture. They were doubtless highly prized and carefully preserved by their recipients, yet not carefully enough to prevent several of them from being lost. At first they were not thought of as sacred Scripture—they were not placed on a level with the Old Testament, for example; that character they acquired only afterward when they became available in various controversies for the refutation of heresy.

We have reason to believe that the words of Jesus were sacredly treasured from the first and the various early efforts to preserve them in writing were the germs of the New Testament canon. They were probably preserved for a generation or more in oral tradition only and after various redactions and compilations took form in our present Gospels toward the end of the first century. Speaking broadly, then, we may say that the New Testament is the earliest available literary product and record of primitive Christianity and possesses unequalled historical and practical value because it acquaints us most closely with Christ and with the first effects of his work in the world. The New Testament contains the original documents of the Christian religion.

Its Theological Basis.—Christianity is one of the great monotheistic religions. In general, its theistic presuppositions were derived from Judaism on whose soil it took its rise. By its monotheism it is differentiated, at once from polytheistic religions, such as those of ancient Greece and Rome, and from pantheistic systems, such as Brahmanism and Buddhism. In common with Judaism Christianity rests upon the conviction of the personality of God. All those vague and infra-personal descriptions of the source and ground of all things which have been advanced as essentially equivalent to the Jewish and Christian ideas of God, such as "a power not ourselves" and a "stream of tendency," fall utterly short of the idea of God portrayed in the Old and New Testaments. Such philosophical terms as "ultimate reality" and "ground of the world" are useful, but noncommittal on the point of prime importance. Christians believe that the fundamental reality is Spirit; that the ground of the world is personal.

So far all Christians would theoretically

CHRISTIANITY

agree. When, however, we proceed to inquire as to the moral character of God, Christian speculation illustrates wide diversities of view. Men necessarily represent God to themselves by means of analogies drawn from their own life and experience. Hence in different ages, with their differing ideals and standards of life, various human analogies have been used to picture forth the nature and attributes of Deity. The Christian idea of the one personal God, at once gracious and holy, has, accordingly, varied in its form from age to age or within the same age among people of differing inheritance and culture. Now one aspect or attribute of his nature has been magnified, now another. But amidst all such divergences of emphasis, there has been a continuous and constant effort to conceive the character of God according to the highest ethical standards, and to represent him as embodying in himself all possible moral perfections.

Many modern Christian divines hold that the truest and most satisfying analogy with which to describe God is that which Jesus chiefly employed, namely, that of fatherhood. His favorite name for God was, the Father. The descriptions which he gave of the nature and action of the Father show that for him fatherhood meant original, self-imparting, all-embracing love. Hence the apostolic summary of the Christian doctrine of God: "God is love," is true to the thought of Jesus. The kindred formulæ: "God is spirit," that is, of a spiritual nature, as opposed to what is material and local, and: "God is light," that is, perfect purity and beneficence, emphasize special aspects of God as fatherly love. The specifically Christian idea of God is best expressed by saying: God is Father; God is love.

Christianity and Judaism.—Historically speaking, Christianity arose out of Judaism. Jesus declared that he had not come to destroy, but to fulfil, the law and the prophets. According to the Fourth Gospel he summarized the relations of his work and teaching to the religion of Israel by saying: "The (Messianic) salvation is from the Jews." There is no fundamental doctrine of Christianity the germs of which are not found in Judaism. Christianity presupposes the ethical monotheism, the views of the world and man and the ideals of righteousness which underlay the preaching of Israel's greatest religious teachers, the prophets. The New Testament uniformly regards the gospel as an unfolding, a development from the Jewish religion, and this view is amply justified by a critical study of both religions.

But are they, then, two different religions? Are they not merely two branches growing on the same stem? The differences appear by considering how much in Judaism Christianity discards. In Israel Church and State were one. The state had no existence except in and through its religious constitution. Israel's great peculiarity was that it conceived itself to be a theocracy, a people whose real king was Jehovah. Now Christ, in his teaching, entirely disregarded this civic organization of the forces of religion. His teaching was wholly ethical and spiritual. He framed no constitution, enacted no laws; he did not even formally provide for any outward organization. Many Christians, indeed, hold that the creation of a closely compacted organization, a new kind of theocracy, was implicit in the principles of Jesus and was

the legitimate and necessary outgrowth of his work; but however that may be, it cannot be shown that, in any direct way, he concerned himself with matters of outward organization and polity.

To the ritualistic system which was so prominent a feature of Judaism, Jesus only incidentally referred. As we have seen, he made no violent break with this system; it is a fair inference that he continued to attend upon the temple worship. But he laid no stress upon a ritual which had acquired increasing importance in the later history of Judaism, and even depreciated it. Like the Old Testament prophets, he does not commend sacrifices, but teaches that the most commonplace moral duty is more important. The most sacred rite of all, the badge of Israel's separation from the rest of the world, circumcision, he never even mentions. From such considerations it is evident that the gospel of Jesus is no mere reproduction of Judaism.

There are many other differences kindred to those which have been mentioned or growing out of them. Christianity is not, in the view of its Founder, a legal religion. It is a dispensation of inner, not of outer, law. In this respect its closest analogue in Hebraism is the teaching of the prophets. The New Testament writers see in the gospel the fulfilment of the prophecy that the new covenant should not be like the old; that the chief mark of the Messianic era should be that God would write his law on the heart. Hence Christianity finds its norm not in statutes, but in a personal life in which it beholds all its motives operative and all its principles illustrated.

The Relation of Christianity to Other Religions.—The principle which the Founder of Christianity announced when he said that he had not come to destroy but to fulfil, was not applicable solely to Judaism. Jesus recognized goodness and truth under whatever form of religious belief or practice it might be found. While it is true that he saw in Israel's life and history a unique revelation of God and recognized in the Jewish Scriptures the product and record of that revelation, it is also true that he found a revealing and saving activity of God outside Judaism. He could see in the nobility and generosity of a heathen soldier a faith not matched in all Israel. He had other sheep who were not of the Jewish fold whom he would bring into the one flock. In the opinion of many interpreters the judgment parable in Matthew xxv. is intended to describe the testing of the heathen, many of whom are accepted because they have shown the spirit of love and service; having done kindness to Jesus' fellowmen, they are regarded as having done it unto him.

The primitive Church more or less fully apprehended this conception of the relation of the gospel to other forms of religion. Raul declared that God had not left himself without a witness among any people; that he had made of one blood all nations of men; that the Greeks had been seeking after God and that there was a law of God written on the hearts of all men. The apostle recognized elements of truth in the crude beliefs and worship of the heathen. Despite their ignorance, he saw in their more than ordinary religiousness an evidence of a sincere aspiration after God and in their devotions and moral judgments a proof of their native kinship to him.

CHRISTIANITY

These views obviously rest upon the conception that, in some real sense, revelation is universal. God's eternal power and divinity are known to mankind, says Paul, because God has made these truths known to them. Other New Testament writers teach the same in other terms. In the Fourth Gospel Christ is identified with the Logos of Greek speculation. Accordingly in his preincarnate activity he is conceived as the medium of a universal revelation. Like an eternal sun he has been shining down into the world's darkness and sin, enlightening the mind of every man. He was operative in the life of Israel of old, however blind this favored people may have been to his presence. Paul expresses allegorically the same thought when he says that the spiritual rock of which the Israelites drank in the wilderness was Christ. But this action of the pre-existent Christ was not exceptional. He was the light of men universally. "His writing is upon the wall, whether of the Indian fane, or of the porticos of Greece" (J. H. Newman). From these various forms of thought and of expression it is seen that Christ and the early Christian teachers recognized truth in other religions than Judaism and Christianity and regarded the teaching and work of the Founder of the Christian religion as a clarification and completion of such truth. Christianity builds on the constitutional religiousness of man, upon his native and persistent sense of God, which it aims to enlighten and to quicken into a rational, moral faith.

The Doctrinal Contents of Christianity.—What has been said concerning the early history of Christianity, its monotheism, and its estimate of Christ, may serve as a point of beginning for a somewhat fuller illustrative statement of its doctrinal contents. As we have seen, Christianity inherited the monotheism of Israel, but gradually developed it by the elaboration of the doctrine of the Trinity. The motives to this development were chiefly two: (1) the primitive Christian estimate of the person of Christ, and (2) the Biblical teaching regarding the Spirit of God. Instead of conceiving of God as a simple, distinctionless essence, speculative thought began to analyze the divine nature until in the 4th century an elaborate theory of a threefoldness in God appears. In this Nicene or Athanasian form of thought God is said to consist of three persons, Father, Son, and Holy Spirit, all equally eternal, powerful, and glorious. It was held that this tri-personality of God is not inconsistent with monotheism, since the Father is the *fons et origo* of Deity from whom the Son and Spirit are derived by an eternal process of generation, and because the divine Essence is one. The doctrine thus included these three elements: (1) the co-equal eternity of the three persons; (2) the subordination and derivation of the Second and Third from the First; and (3) the consequent oneness of the divine Nature in which all three persons alike partake.

It would carry us beyond the purpose of this article to dwell upon the various arguments and analogies by which it was sought to illustrate the nature of this tri-unity in God, or to describe the varying types of theory which were elaborated in subsequent theological discussion. Those who desire to pursue the subject further can do so by the aid of such standard treatises

as Neander's or Milman's 'History of the Church,' or Fisher's 'History of Christian Doctrine.' The various forms of Trinitarian belief are sketched and discussed in Prof. L. L. Paine's 'Evolution of Trinitarianism.'

The orthodox doctrine of incarnation was that the Son, the second person of the Trinity, united himself with "human nature"—sometimes defined as impersonal, sometimes as personal. "Two whole, complete natures in one person," was the formula. In modern times these definitions have been modified or rejected by those who have adopted a different philosophy of the Trinity from that on which the definitions proceed.

Amidst the many diversities of opinion and theory the great common conviction of all Christians is that Jesus Christ is the supreme Revealer of God and the Saviour of men. The manner in which he effects their salvation has been variously explained and illustrated according to the conceptions entertained at different times of the ethical character of God. But whether Christ was believed to have paid a debt of honor to God or to have experienced a vicarious punishment for us, or to have safeguarded the divine government, or to have furnished a supreme example and incentive to goodness—in all these and other theories of atonement he is recognized as the Way to the Father.

These few statements respecting three great doctrinal topics may serve as illustrations of the historic theories which have been, in some cases, sanctioned by ecclesiastical authority, and, in others, rendered almost equally binding by tradition, and of their modification by the application to them of modern historical and philosophical methods of investigation and thought.

Its Ethical Character and Requirements.—While, officially considered, Christianity has had the character of a doctrinal system, with its authorized theories and binding beliefs, practically its chief value and power have lain in its ethical teachings and influence. Theologians have placed great stress upon the various formulas and definitions which have been elaborated from time to time, but of these the vast mass of Christians have never had more than the vaguest knowledge. Dogmatists have often held that Christianity was primarily a body of officially defined doctrines, but for most believers it has certainly not been such but rather a series of moral duties and requirements—a certain line of action or kind of life.

This view of Christianity is more germane to the teaching of Jesus than the dogmatic view. He promulgated no creed, elaborated no system, championed no set of formulas. His teaching was doctrinal in the sense that there underlay it certain conceptions of the moral nature of God and man and a certain view of their relations. But Jesus advanced no such technical theories on these subjects as were developed in later Christian thought. Metaphysics, in general, was foreign to the Jewish mind. Hence the teaching of Jesus naturally moved wholly in the ethical sphere. His teaching about God concerned itself almost wholly with the moral character and disposition of God. This character he illustrated by practical, human analogies.

Jesus' favorite name for God, as we have seen, was "Father"; that is, original, creative,

CHRISTIANITY

and sustaining love. In that conception of God the whole ethical character of his religion is rooted. The Father delights to give, to serve, to bless. He bestows his benefits upon all, even the evil and unthankful. He freely forgives, upon repentance, not only "until seventy times," but "until seventy times seven." Now, the primary requirement of Christianity is that men should be like God; or, as Jesus expressed it, that they should be sons of their Father; that is, morally kindred to him in spirit and action. Jesus represented himself as having come into the world to reveal God in this character and perfectly to illustrate in himself the Godlike type of life. He would be servant of all; he came to minister and to give his life for others. His followers must do the same. They must take up his cross of sacrifice and self-renunciation and follow after him. As he laid down his life for men, so must they lay down their lives for one another.

With all its faults and failures, despite its divisions and bitter enmities, Christianity has done much to leaven the world with the spirit which its Founder thus described and enjoined. It has cared for the sick and the poor, instructed the ignorant and sheltered the helpless. To education, to literature, and to art the Christian religion has imparted a powerful impulse. No impartial student of history can question the great contribution which Christianity has made to human progress in culture and philanthropy.

Its Various Forms.—The theological controversies of the early Christian centuries, together with the political rivalries of Rome and Constantinople, finally rent the Church into two divisions, the Western or Latin, with the Bishop of Rome as its head, and the Eastern, in which the Patriarch of Constantinople was the chief dignitary. Out of the same controversies also grew a number of sects and national Churches which still survive, such as the Coptic, Ethiopic, and Armenian. Down to the Protestant Reformation in the 16th century the two chief forms of Christianity were the Oriental, now represented by the Greek and Russian Churches, and the Roman Catholic. In the West the claims of the papacy were gradually increased until the pope rivaled in political power the greatest European emperors. There was no corresponding development in the East, where the Church became more and more dependent upon and subservient to the states with which it was allied. The Eastern Church was differenced from the Western by a more speculative and less practical tendency, the favorite themes in the theology of the former centring in the doctrine of the Trinity, those of the latter having more largely to do with sin and salvation. Both developed an elaborate ceremonial of which the mass is the central feature.

At the Reformation, or in consequence of its influence, the various divisions of Protestantism arose. Some of these, for example, the English Church, continued in alliance with the state; others repudiated any such connection. The Church of England retained the Episcopal system and laid increasing stress upon its continuity in organization with the Church of apostolic days. Most Protestant communions rejected this order along with other features of the Roman organization, and attached no importance to the question of so-called tactual

succession. Among these the greatest variety of belief and practice prevails.

It is quite impossible adequately to characterize in a brief statement the various forms of belief and life which the Churches and creeds of Christendom illustrate. In general, it may be said that the Roman type represents a highly elaborated authoritative system. The decrees of popes and councils are binding, and, indeed, within certain limits, infallible. There is a highly developed and minutely defined system of dogma and an elaborate ritual. Great stress is laid upon the prescribed rites of the Church and upon priestly mediation. Salvation is mediated through the sacraments, which are seven in number. In the English Church we see an intermediate form. Its head is not the pöpe, but the king. In general, it highly esteems the decrees of the early councils and lays great stress upon the (two) sacraments, but, in practice, does not compel the unquestioning acceptance of the former, nor regard the latter as essential to salvation. Most other Protestant bodies, such as Baptists, Congregationalists, Methodists, and Presbyterians, permit and exercise a larger liberty regarding traditional beliefs and rites, some of them, as the two former, having no general authoritative creed, others, as the two latter, allowing considerable liberty in the interpretation of their official articles of belief. In general, it may be said that in Protestantism the prevailing tendency of thought is to regard Christianity as not being a system which can be embodied in rules and enforced by laws, but as a religion whose nature it is to attest itself to reason and conscience by its moral appeal to the human mind and heart.

The Essential and the Transient in Christianity.—What facts and truths constitute the essence, the permanent substance of Christianity? That is a difficult question and one which Christian thinkers would answer in the most various ways. Certain it is that in its long history Christianity has undergone many transformations, been influenced by a great variety of foreign forces and taken up into itself many incongruous elements. In its Roman Catholic form it blended with the Roman imperial idea. In its most elaborate developments of dogma it wrought in close alliance with Greek philosophy. Some of its doctrines have been examples of a Christianized Platonism. Are these features of historical Christianity essential to it?

The same question meets us if we go back to the Church of the first age. The common view has been that every idea which is found in the New Testament is of the essence of Christianity; but this supposition is not without its difficulties, and was probably never consistently carried out in practice. Were the apocalyptic expectations of the first Christian century valid and essential—the universal belief in Christ's speedy personal return to earth to judge the world, the confident anticipation of Rome's early destruction, and the like? A close study of early Christian history reveals the fact that the admixture of foreign elements with primitive Christian teaching was not limited to the later ages of the Church. Christian doctrine had already undergone a considerable development within the New Testament period. Greek ideas and, especially, late Jewish theories and speculations, must be taken into account in interpreting

CHRISTIANS — CHRISTIE

and estimating apostolic and post-apostolic teaching and tradition.

If Christianity be regarded as a certain kind of life—if it be conceived as sonship to God, membership in the kingdom of the Godlike—then we cannot say that any one particular form of church organization is essential to it. True Christianity is formed within all these forms of organization. Except in some purely human, arbitrary definition of it, it cannot be truly said that divine grace is the special prerogative of any one of them. Nor can any theory or practice concerning the sacraments, or other rites, be essential. A vast range of speculative dogma, though often insisted upon as essential to salvation, can hardly be a constituent part of Christianity, since the vastly greater part of the Christian world knows nothing of it.

Christ never emphasized organization or ceremonies, or dogmas. His great words were love, righteousness, sonship to God, and the like. He said that all ritual observances were trifling in comparison with judgment, mercy, and the love of God; that he who had wronged a brother might better leave his sacrifice unoffered and go and right the wrong; that love to God and man was the substance of all laws and commandments; and his life was the perfect commentary on these sayings. It was that of an obedient, trustful son of God. His one chief concern was to found and foster the kingdom of God; that is, the reign of love among men. For this end he labored, suffered, and died, and taught that his followers must follow him on this path of service and sacrifice. To live the kind of life he lived is the essence of Christianity. See CHRISTIAN CHURCH.

GEORGE BARKER STEVENS,

Professor of Systematic Theology, Yale University.

Christians of St. Thomas, the name of a sect of Christians on the coast of Malabar, in southern India, to which region the apostle St. Thomas is said (by a tradition that has little to justify it) to have carried the gospel. The facts of their history are not well made out. They originally belonged probably to a body of Christians who, in the year 499, united to form a Syrian and Chaldaic Church in eastern Asia,

and who were adherents of the doctrines taught by the heretic Nestorius. At an early date (7th century) the Persian Church had adopted the name of Christians of St. Thomas, and the Christians of Malabar received bishops from Persia. Latterly the Christians of St. Thomas gained the position of a military caste which locally had considerable power. When the Portuguese gained a position in Malabar these Christians were forced to join the Roman Catholic Church (1599). But in 1653 many of them renounced this union, and having in 1665 received a bishop sent by the patriarch of Antioch, they have since belonged to the Jacobite body of eastern Christians. The Church is now under seven bishops with a patriarch at the head; and the adherents number about 300,000. They give communion in both kinds, and in some other matters differ from the Roman Catholic Church. They allow the consecration of a married layman or deacon to the office of priest. Their churches contain no symbols nor pictures except the cross. Their liturgy is similar to the Syrian, and the Syrian language is used in it. At present they are, under the British government, free from any ecclesiastical restraint, and form among themselves a kind of spiritual republic, in which the priests and elders administer justice, using excommunication as a means of punishment. See 'The Indian Empire,' by Sir W. W. Hunter.

Christiansand, krīs'tē-än-sänd, Norway, a city in the southern part of the country, situated on a sandy plain. It was built by Christian IV. in 1641; and has been the capital of its province or stift since 1684. It has several dockyards, a good harbor, much used for refuge, and a considerable trade in timber, pitch, stockfish (salted cod), fish-oil for curriers, salmon, mackerel, and lobsters, the latter chiefly for the London market. Shipbuilding is a considerable industry. Christiansand has a cathedral and grammar-school, and is the residence of a bishop. The streets are wide, straight, and regular; the houses are built of wood and detached, presenting altogether a remarkable colonial appearance. Pop. 13,000.

Christianstedt, krīs'tī-an-stēt, Danish West Indies, a seaport in the island of Santa Cruz, situated on the north shore. The harbor is difficult of access, being encumbered with many shoals, one of which stretches out nearly two miles to seaward in a northeasterly direction. This city is the capital of the Danish West Indies. Pop. 9,600.

Christiansund, Norway, a seaport on the northwestern coast, capital of the bailiwick of Romsdal, 82 miles southwest of Trondhjem, on three islands, which enclose its beautiful landlocked harbor. The trade of the place is considerable, and the principal export is dried cod, chiefly for the Spanish and Italian markets. The town was founded in 1734 by Christian VI. of Denmark. Pop. (1900) 12,050.

Christie, James, English clergyman: b. Otterburn, Northumberland, 14 July 1837. He was the son of a Presbyterian pastor at Otterburn, whom he succeeded in the pastorate in 1862, and since 1870 has been pastor of the Fisher Street Presbyterian Church at Carlisle. He has held several important professional posts.

CHRISTIE — CHRISTINA

being moderator of the Presbyterian Church of England in 1901, and has published 'Men and Things Russian'; 'Northumberland'; 'The Moderator's Wander-Jahr.'

Christie, James Elder, Scottish artist: b. Guardbridge, Fifeshire, 5 Jan. 1847. He received an art training at South Kensington, and the Royal Academy. He was awarded a gold medal at South Kensington in 1875, and another from the Academy in 1877 for historical painting. Among important works by him are 'Tam O'Shanter' (1879); 'Pied Piper of Hamelin' (1881); 'A Lion in the Path' (1888); 'The Four Maries' (1889); 'The Red Fisherman' (1893); 'Gather Ye Rosebuds.'

Christie, Richard Copley, English scholar: b. Lenton 22 July 1830; d. Ribsden 9 Jan. 1901. He was educated at Oxford, studied law and practised his profession 1857-77. He was professor of political economy at Owens College, Manchester, 1854-66, and was chancellor of the diocese of Manchester 1872-94. After retiring from his profession he gave much time to bibliographical research, and besides contributing to the 'Dictionary of National Biography' he published 'Étienne Dolet, the Martyr of the Renaissance' (1880); 'Old Church and School Libraries of Lancashire' (1885); 'Letters of Sir Thomas Copley.' He gave to Owens College the Christie Library, opened in 1898, and at his death bequeathed his library of 75,000 volumes to the same institution. See 'The Athenæum,' 19 Jan. 1901.

Christie, William Henry Mahoney, English astronomer: b. Woolwich 1 Oct. 1845. He was a graduate of Trinity College, Cambridge, and for a long time assistant in the Royal Observatory of Greenwich. On the retirement of Airy (q.v.) as astronomer royal in 1881, Christie was appointed his successor, a position which he still holds. He has written a 'Manual of Elementary Astronomy' (1875), but is best known for his spectroscopic work with the Greenwich Equatorial, especially that relating to the motion of stars in the line of sight.

Christie Johnstone, a story by Charles Reade, published in 1855. The story, by turns pathetic and humorous, abounds in vivid and dramatic scenes of Scotch life by the sea.

Christina, krīs-tē'na, queen of Sweden: b. Stockholm 9 Dec. 1626; d. Rome 19 April 1689. She was a daughter of Gustavus Adolphus, and her education was conducted in a masculine manner. After the death of Gustavus in 1632 the States-General appointed guardians to the Queen Christina, then but six years old. These were the five highest officers of the crown, who were intrusted at the same time with the administration of the kingdom. The education of Christina was continued according to the plan of Gustavus Adolphus. She learned the ancient languages, history, geography, politics, and renounced the pleasures of her age in order to devote herself entirely to study. In 1644 she took upon herself the government. A great talent for business, and great firmness of purpose, distinguished her first steps. She terminated the war with Denmark, and obtained several provinces by the treaty concluded at Brömsebro in 1645. She then, contrary to the advice of Oxenstiern, who hoped to gain, by the continuance of the war, still greater advan-

tages for Sweden, labored to re-establish peace in Germany, in order to be able to devote herself uninterruptedly to the sciences and the arts of peace. France, Spain, Holland, and England sought her friendship. She promoted commerce by wise legislation, and patronized the learned and literary institutions. She declined to marry her cousin, Charles Gustavus, but induced the States-General in 1649 to designate him for her successor. In 1650 she caused herself to be crowned with great pomp, and with the title of king. From that time she neglected her ancient ministers, and listened to the advice of ambitious favorites. The public treasure was squandered with extravagant profusion. Distinctions were conferred upon the undeserving, and jealousy produced murmurs, complaints, and factions. In this state of confusion the queen declared her intention of abdicating the crown. The old ministers remonstrated with so much energy that the queen desisted from her resolution. She now grasped with more firmness the reins of government, and occupied herself again with study, bought paintings, medals, manuscripts, books, maintained a correspondence with many learned men, and invited several to her court. Descartes, Grotius, Salmasius, Bochart, Huet, Chevreau, Naudé, Vossius, Conring, Meibom, appeared in Stockholm, and the queen conversed familiarly with them on literary and philosophical subjects. But new troubles occurred; and Christina, who loved whatever was uncommon, resumed her determination to resign the crown.

In 1654 she assembled the States-General at Upsal, and in their presence laid aside the insignia of royalty to surrender them into the hands of Prince Charles Gustavus. She reserved to herself a certain income, entire independence, and full power over her suite and household. A few days after she left Sweden, and went to Brussels, where she made a secret profession of the Roman Catholic religion, which she afterward publicly confirmed in Innsbruck. From here she went to Rome, which she entered on horseback in the costume of an Amazon, with great pomp. When the Pope Alexander VII. confirmed her she adopted the surname of ALEXANDRA. In 1656 she visited France, where her dress and manners produced an unfavorable impression, but her talents and knowledge were generally admired. She offered to mediate between France and Spain; but Mazarin declined the offer, and succeeded in accelerating her departure from France under various pretexts. After the death of Charles Gustavus in 1660, the queen made a visit to Sweden, under pretence of wishing to arrange her private affairs; but it was soon perceived that she had other views. As the crown-prince was very young, she declared that in case of his death she should lay claim to the throne. This project was unfavorably received and she was compelled to sign a formal act of abdication. About this time she aspired to the Polish crown, but the Poles took no notice of her wishes. Finally she returned to Rome, where she passed the remainder of her life in the cultivation of the arts and sciences, giving way at times to fits of sensual indulgence. She was interred in the Church of St. Peter, and the Pope erected a monument to her with a long inscription. She had asked only for these few words: *Vixit Christina annos LXIII.*

CHRISTINA — CHRISTMAS ISLAND

Christina, Maria, queen of Spain, daughter of Francis I., king of the Two Sicilies, and mother of Isabella II., the dethroned queen of Spain: b. Naples 27 April 1806; d. Havre 22 Aug. 1878. She was married to Ferdinand VII. in 1829, and took an active part in the affairs of Spain from 1830 to 1854. As queen-regent she governed arbitrarily, and in 1854 she abdicated.

Chris'tison, Sir Robert, Scottish physician and toxicologist: b. Edinburgh 18 July 1797; d. 23 Jan. 1882. He was graduated in medicine at Edinburgh University in 1819, and subsequently studied in London and Paris. He was appointed to the chair of medical jurisprudence in Edinburgh in 1822, shortly after his return to Scotland, and in 1832 was promoted to those of materia medica and clinical medicine, but resigned them in 1877 and 1855, respectively. He was twice president of the Royal College of Physicians, president of the Royal Society of Scotland, and ordinary physician to the queen in Scotland. He was created a baronet in 1871. The most important of his published works is his 'Treatise on Poisons' (1829); but he also wrote 'Granular Degeneration of the Kidneys' (1839); and a commentary on the 'Pharmacopœias of Great Britain' (1842).

Christlieb, Theodor, German theologian: b. Bukenfeld, Württemberg, 7 March 1833; d. Bonn 15 Aug. 1889. He studied at Tübingen, after which he taught for some time in France. Upon his return to England, in 1858, he began preaching in London, where his famous lectures on 'Modern Doubt and Christian Belief' were later published. After a stay of seven years in London, in 1865 he returned to Germany, and subsequently, in 1868, became professor of theology at Bonn. In 1873 he was sent to the United States as a delegate to the Evangelical Christian Alliance, then convened in New York, and delivered a lecture before that body on rationalism. Prominent among his publications are: 'Leben und Lehre des Johannes Scotus Erigena' (1860); 'Modern Doubt and Christian Belief' (1874); 'Protestant Foreign Missions: Their Present State' (1880); etc.

Christmas, the feast of Christ's birth, observed by the Christian Church annually on the 25th of December. It was, according to many authorities, not celebrated in the first centuries of the Christian Church, as the Christian usage in general was to celebrate the death of remarkable persons rather than their birth. The death of the martyr Stephen, and the massacre of the innocents at Bethlehem, had been already long celebrated, when, perhaps in opposition to the doctrine of the Manichæans respecting the birth of the Saviour, a feast was established in memory of this event in the 4th century. In the 5th century the Western Church ordered it to be celebrated forever on the day of the old Roman feast of the birth of Sol, though no certain knowledge of the day of Christ's birth existed. Among the German and Celtic tribes the winter solstice was considered an important point of the year, and they held their chief festival of Yule to commemorate the return of the burning-wheel. The holly, the mistletoe, the Yule log, and the wassail bowl relate more to paganism than to Christianity. In the East Christmas was celebrated on 6 January. As

told in the Gospel of St. Luke, Christ was born during the night, and therefore divine service was performed in the night of 24-25 December, from which circumstance Christmas is called in German *Weihnachten*, a contraction of the old German *ze wih nahten*, on the holy or consecrated nights. The feasts of the martyr Stephen and the evangelist St. John were united with it, and a feast of three days' continuance was thus formed. In the ecclesiastical year this festival gives name to a period extending from the first Sunday of Advent to the feast of Epiphany, 6 January. In the Roman Catholic Church priests are allowed to celebrate three masses against the rule which prevails every other day in the year. In the Greek and Roman Catholic churches the manger, the holy family, etc., are sometimes represented at large. Most Christian churches celebrate this great festival in some way, and practically the entire community in Christian countries, including Jews and non-churchgoing people nominally classed with Christian populations, join in its social observance. In the United States, England, and other countries business is commonly suspended, although in Scotland this is only partially the case. The custom of making presents at Christmas is derived from an old heathen usage; but it has become consecrated by ages, and contributes greatly to make this festival an interesting event to families. The sending of Christmas cards by way of friendly greeting and remembrance has grown up within a period of some 50 years. The Christmas-tree has been traced back to the Romans. It went from Germany to Great Britain, and is almost universal in the United States, where the customs of so many nationalities meet and gradually blend into common usage.

Christmas-box, a box containing a present at Christmas; hence a Christmas gift. The custom of bestowing Christmas-boxes arose in the early days of the Church, when boxes were placed in the churches for the reception of offerings; these boxes were opened on Christmas Day, and their contents distributed by the priests on the morrow. In England the giving of Christmas-boxes led to the popular observance of what is called *Boxing-day*; that is, the first day after Christmas, when presents are made by the well-to-do to servants, messengers, and persons of humble condition.

Christmas Carol, a song in celebration of Christ's birth, sung especially at Christmas-time. Such carols, as well as many of a more secular but always joyous nature, have been long popular among the people of many nations. In France they are known as *noëls*, and various good collections of them have been published from time to time. Consult: Sandys, 'Christmas Carols, Ancient and Modern.'

Christmas Island, the name given to three oceanic islands, of which the most important is situated about 250 miles south by east of the western extremity of Java. This island, which is supposed to have been originally a coral atoll, and to have been raised by volcanic forces, rises to the height of nearly 1,600 feet, and is in shape an irregular quadrilateral of about 30 miles in circumference, having an area of about 20 square miles. It was annexed by Great Brit-

CHRISTOLOGY

ain in 1888, and a settlement has been formed on it for the purpose of developing beds of phosphate.

Christology is that branch of Revealed Theology which treats of the Person of Jesus Christ, giving specific consideration to his Deity, his Humanity, and their Union in their relation to the redemption of the world. The scope of the subject embraces the individual features of his pre-existent life, his creative genius, his manifest interest in theocratic times, his incarnation, his subjective position in his salvatory work, and his immediate personal supervision over and presence with the Christian Church of to-day. In following these different correlative details as they enter into an outline of Christology, it is most convenient to separate them into three general divisions: I. The Biblical; II. The Historical; III. The Ethico-Practical.

I. BIBLICAL CHRISTOLOGY.

Biblical Christology begins with the two thousand or more direct prophetic statements of the Old Testament, running as far back as the earliest Mosaic records in Genesis, continuing throughout the history of the Jewish nation within the range of its civil and religious life as promulgated in theistic utterances, direct covenantal relations, manifestations of power, legislative enactments, and ritualistic observances; and finding judicious and unimpeachable endorsement in the prophecies of the great seers who proclaimed, in unison, *Yahveh—He who will be*—whose identity with the New Testament Christ is no longer a disputed fact.

In the New Testament writings, the doctrine of Christ's Person has infallible expression. Both the Synoptic and Johannine books declare that Jesus was born with divine-human natures. Paul's epistles support this view with the unequivocal arguments of sense and with the logic of metaphysical truth. But the first basic facts of the four Gospels are the statements of Jesus respecting his own person. He applies to himself two phrases which reveal the true character of his divinity and humanity and their related position in view of his life and work; the Son of God and the Son of Man.

The term Son of Man, found about 75 times in the Gospels, has been variously interpreted. Many scholars have regarded it as an expression borrowed from the Old Testament, presumably from Daniel, and used by Christ for the purpose of proving his identity with the human race; while others of equal ability have held to the idea that it indicated his true humanity in an ideal form, as the representative type of all men and as the absolutely perfect and sinless one for the world's study and imitation.

In closest connection with the preceding facts, Jesus is called the Son of God, in a sense that admittedly implies a peculiar position and power in the kingdom of heaven. The term is undoubtedly also taken from the Old Testament, and has a continual messianic significance throughout the whole of the apostolic writings. But in the narrative of the four Gospels and in the affirmative doctrines of the Pauline epistles, where frequent explanatory and synonymous phrases are used, the aim of the inspired writers seems to have been to give Christ a distinction of Person which would attach to him essential Deity. In every instance, they contended that he was, by nature, God's Son—"The Only Begot-

ten Son"—from all eternity, and that by virtue of his divine authority he became the revealer of the Father, the Godhead, and the teacher and exemplifier of the doctrine of the brotherhood of man. In proof of these declarations, they cited the exclusive claims which he made, of a heavenly origin; declaring himself the founder of an eternal kingdom of love, with a knowledge of men's sins and with the power to forgive them; and presenting, in his miraculous efforts, a potential individual self-consciousness dependent upon itself alone for being and capable anon of living in defiance of death and beyond the grave. With this sublime, unparalleled, and self-sustaining heritage of truth conferred upon his co-workers, he, the Divine Nazarene, vanished, for awhile, from earth, to sit upon his Intercessorial Throne, until he shall come again, in final triumph over the powers of evil.

II. HISTORICAL CHRISTOLOGY.

And while such most briefly stated is the Biblical doctrine of the person of Christ, the facts of its *Historical Development*, have become matters of the greatest importance to the Christian Church, because of their philosophic value in demonstrating the wonderful drama of redemption; because of the vital elements of faith, love, devotion, and sacrifice, in the progress of true Christianity, and because of the radical indifferentism of the age with its reinforcements of humanitarian and materialistic tendencies.

The consecutive ecclesiastical epochs of a complete Christology very naturally extend themselves from the first century of the Christian Era to the Council of Nice, 325 A.D., and from that date to the Chalcedonian Statement of 451 A.D., including the subsequent ecumenical controversies and decisions, up to the time of the adoption of the Protestant Confessions of Faith, such as the Lutheran, Anglican, and Calvinistic. During the years 1530-1700, the doctrine of Christ's Person, received the highest theological development, among the Christian bodies, and within the schools of liberal thought. After this period to the present time, Christological truth, has had numerous expositors, with every shade of opinion, ranging from Socinianism, through Unitarianism and Rationalism, to the Kenosis theory which has found some modification in the doctrine of a progressive incarnation.

The *Ante-Nicene Christology* began with variant interpretations of the confession of Peter and John's statement concerning the incarnate Logos. The first critical analysts of these sentences were the Ebionites, who held to a human Christ, and the Gnostics, who, like the Docetæ, regarded his humanity as a "mere vision" or "phantasm of a body," but magnified the supernatural elements in his appearance. Following after these, there came a triple-headed heresy under the names, Dynamic, Patripassian, and Sabellian Unitarianism, which respectively denied his divinity but admitted his supernatural generation by the Holy Spirit, and affirmed it, but made it one with the Father's essence, thus denying the independent personality of Christ.

Against these errors, the Church set the dogma of his divine-human person as embodied in the Nicene and Chalcedonian creeds, although many speculative theological opinions concerning

CHRISTOLOGY

his person, were bandied by such teachers as Justin Martyr, Clement, Origen, Irenæus, Tertullian, and others, who each, in order, considered the Logos as presentative of phases of the Godhead, under limitations, but within the radius of ideal and absolute power. Their ideas of the Son, in the most abbreviated form, were expressed by such terms as a hypostatical being, the ultimate principle of existence, the eternally generated Son, the visible of the Father, the part of the divine Substance, and the subordinate Son.

These discussions were finally reduced to two kinds of Christological truth, under the Arian heresy and the Athanasian defense. Arius took an extreme view of the person of Christ, by denying his deity, and by placing him in a subordinate position, with a different essence from God, though of pre-existent form, which, in time, became incarnated in man for the world's salvation. Semi-Arianism qualified this view by using the term *similarity of essence* against *difference* or *equality of essence*. Athanasius, the "Great Orthodox Father" and Bishop of Alexandria, vigorously combated the unorthodox position of the Arian and Semi-Arian party, throughout his whole life. He enforced the opinion that Christ, while a being inferior to God, is eternally begotten and of essential oneness with the Father. The stress of his logic was laid upon the word, *homo-ousia*,—equality of essence. His able defense was endorsed by three Cappadocian bishops—Basil, Gregory of Nazianzen and Gregory of Nyssa, whose trinitarian ideas were afterward incorporated in the Nicæno-Constantinopolitan creed of 381 A.D.

We believe . . . in one Lord Jesus Christ, the only-begotten Son of God, begotten of the Father before all worlds [God of God], Light of Light, very God of very God, begotten, not made, being of one substance with the Father; by whom all things were made; who for us men and for our salvation came down from heaven, and was incarnate by the Holy Ghost, of the Virgin Mary, and was made man.

After these reassertions of orthodoxy, there arose other heretical influences within the Church, through Appollinaris, who conceived Christ's person to be possessed of a human body and an animal soul, but without reason. In this case the Logos was united with an imperfect humanity. Nestorius, on the other hand, admitted that Christ had true deity and true humanity, but the union of the two natures was merely on a sympathetic basis. The Nestorian Christ is two persons—one divine, and one human. His scheme failed in distinguishing between nature and person. Directly opposed to him, was Eutyches, who strongly asserted the unity of the two natures, but sacrificed their individuality in the process of the incarnation wherein the human was absorbed by the divine, resulting in one person and one nature.

The Nicæno-Constantinopolitan statement of 381 failed to harmonize the different schools of Christological thought, as could be seen in the antagonistic debates of the men who sat in the Councils of Ephesus 431 and 449 A.D. And so, in the year 451, the Council of Chalcedon, at which Leo. I. of Rome exercised such a potent influence, made an attempt to define in clear and exact terms, the doctrine of Christ's Person. But this effort only brought more discussion under the specious forms of Monophysitism and

Monothelism. The former affirmed that Christ had but one composite nature, the divine. His humanity is a mere accident of the divine life. The latter taught that he has one will and one energy and that both are divine.

After nearly a century of furious controversy over these adverse opinions, the Sixth Constantinopolitan Council formulated supplemental statements concerning Christ's natures and will, which, while defective in many essential points, brought to the Greek and Latin Churches, for a time, a settled theological condition, but furnished afterward for the rationalistic thinkers of the 17-18th centuries an immense fund of Christological material for speculation and criticism, as it will hereinafter be seen.

Chalcedonian Christology teaches that "Jesus Christ is perfect as respects godhood, and perfect as respects manhood; that he is truly God, and truly a man consisting of a rational soul and a body; that he is consubstantial with the Father as to his divinity and consubstantial with us as to his humanity, and like us in all respects, sin excepted. He was begotten of the Father, before creation, as to his deity; but in these last days he was born of Mary, the mother of God, as to his humanity. He is one Christ existing in two natures without mixture, without change, without division, without separation—the diversity of the two natures not being at all destroyed by their union in the person, but the peculiar properties of each nature being preserved, and concurring to one person and one subsistence."

It will be noticed that the leading thoughts of this declaration, are that the Person of Christ has two natures and that they are set in their true relation to each other.

1. His incarnation as expressly taught by John's doctrine of the Logos, gives him the place of the second person in the Godhead, with deity before his birth and with the same after he has assumed full humanity. The union of the two into a personality does not change their individual properties or essence. The human is not transmuted into the divine, nor the divine into the human, neither is there a compounded result or *tertium quid*, by mixing the two, but he is one person, both divine and human, a theanthropic being, the God-man.

2. The Person of Christ is distinguished from the natures that compose it. Nature as defined by Leo the Great expresses the quality of a being, while person is the distinct self-asserting and acting conscious ego of the subject. For example, Man is composed of two natures—the material and the spiritual. The material on the one side, does not constitute man, nor does the spiritual on the other, make man. But their union gives man his individuality, his self-conscious personality. In this union the material remains unchanged and so likewise the spiritual. In the Person of Christ, the Logos took up a human nature, but in the act, the divine nature did not change its essence nor its properties, nor did the slightest alteration occur in his humanity.

3. While the Council of Chalcedon emphasized the duality of natures, it also taught that the qualities of both natures may be attributed to one person, but not those of the one to the other. The two natures are complete and each one has everything essential to divinity or humanity. But the divine remains the divine and

CHRISTOLOGY

the human ever human, and yet the two are imbued with one common life and are inseparable.

4. A consequential idea came from this in relation to Christ's suffering and death. He suffered in his human nature, but not in his divine. He actually endured death on the cross, but only in his human nature, which he had assumed in order to suffer and die for man. His sacrifice was infinite because his person is infinite, although the nature through which the person suffered is finite.

5. Another important consideration may be drawn from the Chalcedonian dogma of Christ's Person. "The incarnation is the humanizing of deity and not the deification of humanity. The second subsistence in the divine essence assumes human nature to itself, so that it is the Godhood and not the manhood" which determines the process of redemption.

6. According to the Chalcedonian doctrine the work of Christ was accomplished by his person and not by either one of his natures. The divine-human person established his kingdom, wrought his miracles, and gave infallible truth of salvation, through his divine nature, while his real human nature entered into all the infirmities of mankind.

Protestant and Catholic Christology as represented in the Confessions of Faith of the Reformation, derived its inspiration and form from the combined results of the discussions over the Apostles' and Ecumenical Creeds, and the Catholic doctrines of the Trinity and of the Person of Christ. The errors and defects which had crept into the patristic symbols, through materialistic influences, theological antagonisms, and Hellenistic philosophy, were either studiously avoided or expressed in a negative manner, by the reformers, as warnings and protests against the repetition of the heresies of the early Christian Church. The confessions of the Protestant bodies, such as the Lutheran, Anglican, and Calvinistic, have each their distinctive statements, though slightly differing from each other, concerning Christ's Person, upon evangelical bases. While some of their declarations have been as confusing and speculative as those of the Church Fathers, in the Ante-Nicene period, for the most part, they have aided the understanding of modern Christian scholarship in the interpretation of the cardinal doctrines of redemption as they centre in Jesus Christ.

Of the six great Confessions of Faith, the Augsburg (1530), the First Helvetic (1536), the Heidelberg Catechism (1563), the *Canones et Decreta Concilii Tridentini* (1564), the Thirty-nine Articles (1562-77), and the Westminster (1643), the Lutheran Symbol is undoubtedly the most important of them all.

Lutheran Christology.—In the third and tenth articles of the Augsburg Confession, the Christological position of the Lutheran denomination is clearly set forth. These items, referring as they do, to the divine-human Person of Christ, in his redemptive work, and to his presence in his supper, were drawn from the Nicene and Athanasian creeds. And in order to be doubly fortified against misconstruction of the Lutheran idea, even while it was based upon those ancient symbols, the *Formula Concordiæ* (1580), including the *Apologia Confessionis*, the *Confessio Saxonica*, the *Confessio Wurtembergica*, the *Articles of Smalcald*, and

Luther's *two Catechisms*, *Major* and *Minor*, was given to the world, as a fuller and more scientific presentation of that Christological conception. But in both of the symbols, the Augsburg Confession and the Book of Concord, the doctrine of Christ's Person is defined within the metaphysical term, *Communicatio Idiomatum*, which is subdivided into four other explanatory phrases: (1) The *genus idiomaticum*, having reference to the transference of the properties of one nature to the whole person; (2) the *genus apotelesmaticum*, indicating how the functions of the whole person may be assumed by one or the other nature; (3) the *genus majesticum*, showing in what manner his humanity may be clothed upon by the attributes of his divinity; and (4) the *genus kenoticum*, implying the humiliation of the divine nature to the level of the human. Each one of these phrases implies the fact of Christ's two natures, the divine and human, their inseparable union, and their individual properties and attributes as they operate separately or conjointly in his redemptive presence and power. The third *genus*, however, carries the additional implication of an intenser sphere of personal action, by ascribing to his body, a ubiquitous presence under special or general circumstances, and in the Eucharist. Here the Lutheran Church is not far removed from the Roman Catholic view of Christ's presence in the celebration of the mass—*transubstantiation*—though the dogmatic basis of that very materialistic conception of his body and blood, was modified by it, with the casuistic word *Consubstantiation*, which teaches the *realis presentia* of Christ, in the sacramental elements, "in, with, and under" the bread and wine.

But Lutheran Christological thought reached wider dimensions than mere definitions of Christ's two natures and their union into one person. Its creedal triumph embraced also the doctrine of his two states—his humiliation and his exaltation. The first of these referred solely to his human nature within the circle of his earthly experiences, to the time of his death and burial, while the second included the assumption, by his human nature, of the divine glory after his redemptory work was completed.

Anglican Christology.—The Christology of the Established Church of England and of the Protestant Episcopal Body of America, as outlined in the Thirty-nine Articles, had its original ideas taken from the Chalcedonian Creeds, although the formularies of these churches, had a successive growth from radical and changeable theological conceptions to the present fixed standards of belief found in the 'Book of Common Prayer.' This is clearly indicated in the fact, that the doctrine of Christ's Person, as shown in the first Ten Articles (1536), was a spasmodic attempt to combine the Lutheran and Roman Catholic tenets. After the result of this combination was obtained, the defenders of the faith discovered that their dogma of the Real Presence was as Romanizing in its meaning as the Catholic statement of transubstantiation. This produced much dissatisfaction, especially so, in the South, where Protestantism had many strong supporters. In consequence, this creed soon fell into disuse, and with its practical discontinuance, a conference between Henry VIII. and a Lutheran embassy was called at which a new statement of Articles was drawn up, incorporating Cranmer's 'Thirteen Latin Articles.

CHRISTOLOGY

of Faith.' In these there was a close adherence to the Lutheran doctrine of the two natures of Christ and their unified life in one person, though afterward, at a disputation, held in London, in 1548, the Lutheran idea was repudiated by declarations of sympathy with the reformed doctrine, while at the same time, the ubiquity of Christ's body also received an absolute denial. After the revision of the Forty-nine Articles of Religion, adopted in 1552, during the early reign of the erratic Elizabeth, who was a Lutheran at heart, final statements were made, in the second and twenty-eighth of the Thirty-nine Articles and authorized by the Uniformity Act of 1662, concerning Christ's Person, which were strictly Calvinistic. As such they stand in the creedal structure of the present Anglican and Protestant Episcopal churches, and read as follows:

The Logos, which is the Word of the Father, begotten from everlasting of the Father, the very and eternal God, and of one substance with the Father, took man's nature in the womb of the blessed Virgin, of her substance: so that two whole and perfect natures, that is to say, the Godhead and Manhood, were joined together in one Person, never to be divided, whereof is one Christ, very God and very Man; who truly suffered, was crucified, dead, and buried, to reconcile his Father to us, and to be a sacrifice, not only for original guilt, but also for actual sins of men.

The Supper of the Lord . . . is a Sacrament of our redemption by Christ's death; insomuch that to such as rightly, worthily, and with faith, receive the same, the Bread which we break is a partaking of the Body of Christ; and likewise the Cup of Blessing is a partaking of the Blood of Christ.

Transubstantiation (or the change of the substance of Bread and Wine) in the Supper of the Lord, cannot be proved by Holy Writ, but is repugnant to the plain words of Scripture, overthroweth the nature of a Sacrament, and hath given occasion to many superstitions.

The Body of Christ is given, taken, and eaten, in the Supper, only after an heavenly and spiritual manner. And the means whereby the Body of Christ is received and eaten in the Supper is Faith.

Calvinistic Christology.—While the Anglican churches have adhered to a strict form of Calvinism in their Christological teachings, the numerous Confessions of the Reformed Church have assumed a more ultra-theological position in their interpretation of the Chalcedonian Symbols. They did not overlook Christ's essential deity, but they placed greater emphasis upon the dignity of his human nature. In this respect the Calvinistic reformers exerted a powerful influence upon the development of the doctrine of the Person of Christ from the anthropotheistic side. How apparent this has been, can be seen in some of the formidable confessional documents handed down by the Protestant churches.

The Confessio Tetropolitana (1530), Zwingli's Fidei Ratio (1523), The Second Helvetic Confession (1566), the Palatinate Catechism (1563), The Belgic Confession (1561), The Canons of the Synod of Dort (1619), and The Westminster Confession of Faith (1647).

In each one of these, and particularly so, in the great Westminster Confession, one or more articles expressly assert the doctrine of the full integrity of Christ's divine and human natures and their properties. The question of the interchange or communication of their qualities, is not so much the point at issue, as the absolute independence of each nature in their mediate union without "conversion, composition, or confusion." But the union of the two natures, according to the Article VII., 'De Christo Mediatore,' in the sixth part, is hypostatic or personal

—an affinity of the Logos — personality with the human. The paragraph declares that:

The Son of God, the second person in the Trinity, being very and eternal God, of one substance, and equal with the Father, did, when the fullness of time was come, take upon him man's nature, with all the essential properties and common infirmities thereof, yet without sin — being conceived by the power of the Holy Ghost in the womb of the Virgin Mary, of her substance. So that two whole, perfect, and distinct natures, the Godhead and the Manhood, were inseparably joined together in one person, without conversion, composition, or confusion. Which person is very God and very man, yet one Christ, the only mediator between God and man.

This section, when taken with five others under the same title, clearly affirms three phases of the hypostatic union of Christ's two natures: (1) the communion of natures; (2) the offices of prophet, priest, and king; (3) the state of humiliation and exaltation.

1. The communion of natures is manifested in three distinct ways: (1) By the transference of the properties of each nature to Christ's person; (2) by the concurrent operations of the two natures in his mediatorial work; (3) by the contributions of the Logos toward the human nature, of honor, knowledge, and power, and especially of sinlessness, without interrupting the growth of his humanity in his earthly efforts to save man. In the first and second conclusions, the Calvinistic teachers agree with the Lutheran theologians. But they do not hold to the theory that the properties of one nature may be given to another, nor do they teach that the attributes of the divine nature can be transferred to the human, because the human nature is finite and incapable of the divine; neither can the attributes of the human be communicated to the divine, because the divine nature is not subject to changes, nor capable of imperfections. With these logical deductions, the rejection of the ubiquity of the body of Christ, naturally had to follow. For the reformers believed that Christ's humanity was necessarily limited and hence it could not possibly assume omnipresence.

2. The offices of prophet, priest, and king. (a) In nine *special* instances Jesus is called a prophet. But he has that designation throughout all the Scriptures. Moses spoke of him as such, and beyond all doubt the God — Jahveh — of the Old Testament, was the God-man of the new dispensation of salvation. As a prophet he had a particular office to fulfill; to disclose the will of Jahveh; to reveal his love in his covenants with his people; and to outline the plan of salvation in his life-work through his miracles, death, resurrection, and his second coming.

(b) As a priest Jesus sustained to the redemption of mankind the singular position of a superior and consecrated subject of God, for the express purpose of becoming the once-for-all sacrifice for sin and the eternal intercessorial representative of man before the throne of heaven.

(c) As a king of a kingdom whose end can never be, Jesus exercised his sway within men's hearts. There he is to reign. There his triumphs are to occur. And there he is to hold dominion forever as the Lord of Lords, and the Crowned King of Kings.

3. The state of humiliation and exaltation.—The former embraces every step of the Person of Christ, wherein his divine nature emptied itself temporarily of glory, for the accomplish-

CHRISTOLOGY

ment of his redemptory work on earth among men. It includes his birth, his self-denying life, his death, and descent into Hades. The latter explains his relinquishment of human qualities for his glorification. It comprises his resurrection, his ascension, his intercessory office, and his final second appearance. Upon these two states, the Lutheran and Reformed Christologies practically agree, except on the minor points of Christ's specialized humiliation and his descent into Hades. Calvinism holds that not only was Christ's divine nature humiliated, but his human also, whereas Lutheran Christology ascribes the two states only to his human nature. Calvinistic thought makes Christ's descent into Hades the end of his humiliation, while Lutheran faith regards that as the beginning of his exaltation.

Catholic Christology.—The transcendent importance and consistency of Roman Catholic Christology has always been vested in a recognition of the Nicæno-Constantinopolitan Symbols, and in a subscription to the Seven Sacraments of the Church, since their official sanction by the Council of Florence in 1439. It is through them that salvation is obtained. How the benefits of Christ's passion in particular are applied to men is explained in the doctrine of his Supper, by the term transubstantiation. Here is the central approach to the inner love and life of Jesus Christ. For in this Sacrament of the Altar, Jesus gives his body to the souls of men, and this act imparts to them, continually, new, divine, and everlasting life, the climactic result of salvation.

The doctrine is outlined in the following words, under questions and answers, from Goffine's 'Manual':

What is the Holy Sacrament of the Altar?

It is that sacrament in which, after the words of its institution have been spoken by the priest, Jesus Christ is present whole and entire, in his Godhead and in his Manhood, under the appearance of bread and wine.

What takes place at the words of consecration?

The Bread and Wine are changed into the Body and Blood of Jesus Christ.

How is Jesus present in the Most Holy Sacrament?

He is truly, really, and substantially present, in his Divinity and Humanity, in flesh and blood, in body and soul.

Modern Christology.—The reactionary period in Christological thought was bound to come in modern times, as was often the case in the early ages of the progress of the Church. The leaders of liberalistic movements were not satisfied with the conservatism of Protestant and Catholic theology, in its exegesis of the doctrine of Christ's Person. The metaphysical aspect of his life and work needed a reconstruction. To this end two classes of Christologists have appeared in these days of radical biblical criticism: The Rationalistic School and the Mystics. To the first belong the Socinian, Unitarian, and extreme Rationalistic Christologies, and to the second, the Swedenborgian, the Kenotic Theory, and the Gradual Incarnation Idea.

Socinian Christology.—Socinianism has its fundamental basis in a denial of the Trinity, and in a belief that Christ was merely a man. According to the Racovian Catechism of Schmalz, published in 1605, Jesus Christ had no pre-existence previous to his conception. Nevertheless after his birth he became divine and the Son of God, because of his sinless life, and character, his miracles, his resurrection and ascension.

Unitarian Christology.—This form of Christological thinking came as a logical sequence to Socinian influence. It rejects the doctrine of the Trinity and the divinity of Christ. He is the highest revelation of God and the ideal of humanity.

Extreme Rationalistic Christology.—This school of Christology had some of the most brilliant intellects of the world, among whom were such men as Kant, Hegel, Schelling, Schleiermacher, Rothe, Strauss, and Keim. Every one of these, with perhaps one possible exception, swung away from the orthodox conception of Christ's Person, to a philosophy of Idealistic Pantheism, which combined in its teachings the effort, on the one hand, to place Christ upon a humanistic plain, and the desire on the other to give him the pre-eminence over men within the circle of ideal humanity. Foremost among these was Kant, who believed that Jesus was the Son of God, but as such the ideal of the perfect man. Both Hegel and Schelling looked favorably upon the doctrines of the Trinity and the Person of Christ, but they applied to them the leveling process of materialistic pantheism, thus making Christ a man who is simply conscious of his being with the Absolute, but a representative of what every other man is who belongs to the human race. Strauss practically held to this view in his 'Life of Jesus' (1864). In that book he modified his opinions of the miraculous element in the New Testament, but still held to the idea that Christ was divine so far as he entered into humanity as a collective body. Withal, for Strauss, "he remained the highest model of religion within the reach of thought, and no perfect piety is possible without his presence in the heart." Keim bore stronger testimony to this phase of Christ by declaring that his person is the greatest work of God—a specific revelation of God: God's image, his best beloved object in the universe, his noblest ideal. Rothe, who was largely influenced by Schleiermacher's philosophy, developed his idea of Christ by setting him forth as the self-realization of God. The first step in this realization became apparent in the incarnation when Christ found an ethical union between God and man. But this ethical union could only become an ethical fact through the divinity of Christ. And while he was born of a woman, his ethical advance was real, because God dwelled in him. The great work to which he set himself, after he realized his fellowship with God, was to offer his all to God and to men in his sacrifice and death. Herein was the culmination of his vicarious service,—perfect union to God and union to men. His love could go no farther than this in saving the world. Schleiermacher, who was Rothe's master, and the master philosophic theologian since Calvin's time, started with the humanity of Christ, which he regarded as passive. But beyond this, he found a supernatural element in the person he loved, the moral miracle of God. Christ has perfection and sinlessness, with God ever dwelling in him. Through this enduring affinity with God, he accomplishes his atoning work among men, by creating in them the desire to take upon themselves his holy and blessed life.

Swedenborgian Christology.—In direct opposition to the Rationalistic theories, there came the fanciful and mystical theology of Swedenborg who claimed special illumination as to the

whole universe, and its Creator. Throughout his treatises he declares that God is one person, and that the one person is Jesus Christ. In him is the Trinity. That Trinity is the essential divinity—the Father; the Divine Humanity, the Son; and the Divine Operation, the Holy Spirit, one true God, Creator and Redeemer.

The Kenotic Theory.—After all the different theories concerning Christ's Person had been thoroughly reviewed by both liberal and conservative scholarship—some to be accepted and others to be rejected—modern Christological efforts, as supported by the exponents of a scientific theology, have been directed to a solution of the mystery of his person in connection with his active work on earth, by reducing the whole matter to what is known as *The Kenotic Theory*. This term derives its significance from a famous passage in Philippians, chapter ii. 7, where the Greek expression is used—*ἀλλ' ἑαυτὸν ἐκένωσε*, which literally translated means—“But he emptied or divested himself of prerogatives or functions.” The three parties who held to the different interpretations of this phrase, substantially agreed as to the essential fact involved in Christ's self-exiniation or self-evacuation. But they respectively asserted that while his human nature had full possession of divine attributes, from the time of his incarnation, they could not agree upon the common ground of the use to which he put them. Hence three theories were suggested, as to the use of his divine nature during his humiliation. First, he simply concealed his divine functions during his active life among men. This idea was taught by the Tübingen divines in the 17th century against that of the Giessen theologians whose leader was Chemnitz. Second, Christ in becoming incarnate, reduced himself to humanity by the *non-use* or by the *abandonment* of his divine attributes, in the state of his humiliation. Third, he had only a divine ideal existence before the incarnation, and at that time, the Logos did not assume flesh, but actually *became* flesh, with human limitations. This, therefore, implied a growth of the divine in the human form and a gradual unfolding of the idea of the divine consciousness, a metaphysical evolution of the Godhood of Christ.

The Gradual Incarnation Idea.—The last view brings out another phase of modern Christological speculation—the theory that the Logos became flesh by a gradual descent of the divine consciousness to his humanity, and by an ascent of the human consciousness to his divine nature. Christ, according to Luke i. 80 and ii. 52, developed into a divine being through periods of human experience, although his supernatural origin was an undeniable fact, but the capabilities of his Person were limited to the expansive power of his divine life.

III. THE ETHICO-PRACTICAL CHRISTOLOGY.

There now remains for the Christian Church the task of reconstructing, or rather of re-emphasizing the doctrine of Christ's Person in his real personal intercourse with men, in the expression of his passion and power, and in the mighty influences of his truth. The natural features of his Person have been exploited, such as his humanity and divinity and their unified operative qualities, in their active

and passive relations to God, the Father, and the Cosmical Universe. But the essential *forces* which eternally spring from him, need a new setting in a *Science of Christology* whose domain shall be an accurate investigation of *facts* in their historic order and bearing and the unfolding of the *ethical* principles involved in them. This, therefore, must include the two possible fields for intellectual effort which have recently been opened: *Sociology* and *Christ's Own Ethics*. The former can never be a distinct science without a recognition of Jesus Christ as *the only true Exemplifier* of the Social Idea; and the latter is unquestionably the final affirmation of God to man, and Christ, in turn, the last full explanation of his redemptive motive, love, and plan, through which the world may be saved!

In what order these sciences shall eventually be combined with the historical Christological thought of Christendom, is perhaps an unknown matter at this time. But this one thing is *known* that He Who was the Jehovah of the Old Testament and the God-man of the New Testament, is now the answer to every problem of the human race!

W. FRANCIS BERGER,
Presbyterian Clergyman.

Christophe, Henri, òn-rē krēs-tōf, king of Haiti: b. Grenada, West Indies, 1767; d. 8 Oct. 1820. He was an African slave who received his freedom, as a reward of faithful service. On the outbreak of the negro insurrection in St. Domingo, 1801, he became one of its leaders, and

attracted by his energy and ability the attention of Toussaint l'Ouverture, who conferred upon him a divisional military command. After the deposition of Toussaint, Christophe served under his successor, Dessalines, and waged a war of increasing ferocity against the French, who, in 1803, were compelled to evacuate the island. In 1811 Christophe obtained undisputed possession of a portion of the island, and had himself proclaimed as Henri I., king of Haiti. His reign was that of a sanguinary despot, occasioning ultimately a successful revolt of his black subjects, whereupon he committed suicide.

Chris'topher, Saint, a saint whose name and feast are celebrated, but whose history is little known. He is reported to have been a native of Syria or Cilicia, who was baptized by Saint Babylas, bishop of Antioch, and received the crown of martyrdom in Asia Minor about the middle of the 3d century. Relics of him are found in several places, principally in Spain. The Eastern Church celebrates his festival on 9 May; the Western on 25 July. His intercession was particularly sought in the time of the plague. Christopher literally means "bearer of Christ." He is represented as a giant, bearing the child Jesus upon his shoulders over a stream, which refers to a legend of this saint.

Christopher North, pseudonym of John Wilson, the Scotch author (q.v.).

Christopher's, St. (commonly called St. Kitt's), West Indies, an island of the Lesser Antilles, 100 miles northwest of Guadeloupe, discovered by Columbus in 1493, 23 miles in length, averaging about five miles in breadth, and having an area of 65 square miles. It produces sugar, potatoes, tomatoes, yams, onions, and other vegetables, as well as pineapples, bananas, custard-apples, cocoanuts, and various other fruits. Mount Misery, the highest elevation, rises 4,100 feet. The flora and fauna are similar to those of the West Indies generally, among the latter being a species of small monkey. The climate is considered to be very healthy. This island is divided into nine parishes, Basseterre being the capital. It was colonized by the English in 1623. Pop. 31,000.

Christop'ulos, Athana'sios, Greek lyric poet: b. Kastoria, Macedonia, 1772; d. Wallachia 29 Jan. 1847. He studied medicine, and the sciences at Budapest, and finally settled at Hermannstadt in Transylvania. An epicurean in every sense of the word, and unconcerned for the fate of his country, he lived only for the gratification of his appetites and celebrated sensual indulgences in his 'Erotika and Bacchika,' or 'Love and Drinking Songs,' which have been several times collected and printed under the title of 'Lyrika.' Though partly modeled upon Anacreon and the songs of Piron, Desaugiers, and other French authors, they display so much ease and simplicity, tenderness and grace, as to give their author a high place among the poets of his nation, and entitle him to the name of the modern Anacreon.

Christ's Hospital (generally called the Blue-coat School, from the costume of the pupils), a school in London, founded by Edward VI., for supporting poor orphans. There used to be from 1,000 to 1,200 boys and girls at this establishment receiving instruction, board and clothing, the girls being comparatively few

in number. The ages varied from 8 or 10 to 15 or 16, five of the best scholars being sent each year to Oxford and Cambridge. An entirely new scheme of management came into operation in 1891, according to which the preparatory school (established in 1683 at Hertford) has 120 pupils, the boarding-school for boys 700, and the girls' school 350; a day-school for 600 boys, and another for 400 girls, being also provided for. New hospital buildings are being erected at Horsham. Entrance to the Hospital Schools is partly by nomination or presentation, partly by competition; and in regard to two thirds of the scholars, fees ranging from £10 to £20 may be charged if the parents or relatives are judged to be able to contribute to the child's education and maintenance. Numerous exhibitions and prizes still remain, including exhibitions to the universities. The great hall at Christ's Hospital is a splendid room of great size, and remarkable for some very fine pictures. Camden, Stillingfleet, Coleridge, Charles Lamb, and other distinguished men received their education at Christ's Hospital.

Christ's Thorn, a small thorny shrub of the order *Rhamnaceæ*, or buckthorn family. It is common in the southeast of Europe and Asia Minor, especially in Palestine. The fruit has a singular appearance, resembling a head with a broad-rimmed hat. The spines are long and sharp, growing on slender vine-like branches which are easily plaited, the flowers rose-shaped. The plant derives its name from its being believed by many to be the plant from which the crown of thorns was made which was placed on the head of our Saviour. The fruit is called jujube.

Christy, kris'ti, Charles, American minstrel: b. New York 1828; d. Kansas City, Mo., 13 Feb. 1897. He was an actor from boyhood, supporting Forrest and Macready as well as singing on the minstrel stage.

Christy, Howard Chandler, American illustrator: b. Morgan County, Ohio, 10 Jan. 1873. He was educated in the public schools of Duncan's Falls, Ohio; went to New York in 1893 and since then has been continuously engaged in illustrating for the leading periodicals, 'Scribner's Magazine,' and 'Harper's Magazine' especially.

Chrodegang, or Godegrand, SAINT, bishop of Metz: b. about 700; d. Metz 6 March 766. He was a native of Hosbania (Belgian Limburg), and was a descendant of a distinguished family among the Repuarian Franks. Pepin the Short, in 742, appointed him bishop of Metz; in 753 he conducted the Pope on a journey from Rome to Gaul; and in 764 brought from Rome the relics presented by the Pope to the churches and monasteries of Gaul. He was the author of the rule 'Vita Canonica.'

Chro'mates. See CHROMIUM.

Chromat'ic, in music, a succession of semitones, ascending or descending. The chromatic semitone is the interval between any given note and that same note raised by a sharp or lowered by a flat. The chromatic scale consists of 13 tones, the 8 scale tones and the 5 intermediate. It is believed by some that the term chromatic was adopted because the Greeks were in the habit of designating the intermediate tones by characters of various colors.

CHROMATIN — CHROMIUM

Chromatin, krō'ma-tin, a substance in the nucleus of a cell which is readily stained by certain reagents, such as carmine, hæmatoxylin, and suffranin, so as to be distinguished from the other substance called achromatin or linin. This chromatin is made up of minute spherical or rod-like particles called "chromosomes." The latter bodies in the course of cell-division are of equal size in the same cell, and their number is the same in all the cells of all the tissues of the same species. The chromatin particles are of especial interest because they are supposed to be the bearers of heredity, and are thus supposed to form the physical basis of this unknown property of organic life. See HEREDITY.

Chromatophore, krō'ma-tō-fōr, a pigment cell. The possibility of change of color in the chameleon, frogs, the squid, etc., is due to certain cells in the cutis which are filled with pigment. These pigment-cells are called chromatophores, and under the stimulus of light may expand or contract. When expanded they are highly ramified, and when contracted are roundish. The pigment differs in different individuals and in different parts of the body, being yellow, brown, black, and at times even red or green. In the goby (a fish), the chromatophores, which are yellow or greenish-yellow when distended, become orange when contracted; while the orange or red ones, when shrunk, become brown or even black. In the same fish a still different kind of chromatophores are filled with iridescent crystals of marvelous delicacy, which in expansion become visible as spots of metallic sheen. It is on the distribution and different depth in the skin of the chromatophores that the pattern of markings of the skin of changeable animals depend. The common squid is very beautifully tinted, and under the microscope the chromatophores can be seen dilating and contracting, giving off a remarkable play of all the colors of the rainbow. The value of this power, which is under control, is that it gives the animal means of concealment by adapting its color to that of its surroundings.

Chromatope, krō'ma-trōp, or **Chromotrope**, -mō-, a toy consisting of a disk painted with arcs of circles in brilliant colors in such a manner that when the disk is revolved centrifugal or centripetal streams of color seem to flow through it. The term is also applied to an attachment for a magic lantern, by which, on the revolution of two painted disks of glass, kaleidoscopic effects are projected onto the screen.

Chro'matype, a photographic picture in which the paper employed has been sensitized by some of the salts of chromium.

Chrome Green, the green oxide or sesquioxide of chromium, forming a green pigment used by enamelers. It is also employed by dyers and calico-printers as a mordant. A hydrated variety, $\text{Cr}_2\text{O}_3 \cdot 2\text{H}_2\text{O}$, used for the same purposes, is known as "Guignet's green" or "emerald green." "Arnaudon's green" contains some phosphoric acid in addition. These are now used instead of the poisonous greens prepared from arsenic as a base. See CHROMIUM.

Chrome Iron Ore. See CHROMITE.

Chromic Acid. See CHROMIUM.

Chromite, or **Chromic Iron**, the only important ore of the metal chromium and the source of all of the chromium salts. Chemically considered, it is a chromate of ferrous iron FeCr_2O_4 , but it is usually classified by mineralogists among the oxides of the spinel group as a compound of iron protoxide, with chromium sesquioxide, having the formula $\text{FeO} \cdot \text{Cr}_2\text{O}_3$. The metals are often in part replaced by magnesium, aluminum, and ferric iron, as in the variety magnochromite from Silesia and mitchellite from Webster, N. C. The composition of the mineral thus approaches the chromiferous variety of spinel, picotite. Chromite has a hardness of 5.5 and a specific gravity of 4.32 to 4.57. It is usually a granular-massive, black, opaque, metallic mineral, much resembling magnetite. It has, however, a dark-brown streak and is readily distinguished from all black minerals by fusing it with borax and salt of phosphorus, the bead thus obtained assuming an emerald-green color on cooling. It is further identified by its invariable occurrence in serpentine or olivine rocks. It is often disseminated in grains, or rarely in small octahedral crystals, and thus upon the disintegration of the rock the grains are washed into the streams and adjoining bottom-lands. Prior to 1884 it was extensively mined near Baltimore, also at Texas, Pa., and in California, but the domestic production in 1902 fell to \$4,567, while ore to the value of \$582,597 was imported into the United States in 1902, chiefly from Asia Minor. The large deposits in Quebec, Yancey County, N. C., and in many other localities will no doubt be important sources of supply in the future.

Chromium, krō'mī-ŭm (Gr. χρώμα, "color," in allusion to the colors exhibited by its compounds), a metallic element discovered in 1797 by Vauquelin, in the native chromate of lead of Siberia, and afterward found combined with iron. The metal itself has never been prepared in large quantities, but it can be obtained by the reduction of the oxide by carbon in the electric furnace. It is also obtained by heating the anhydrous sesquichloride of chromium with zinc, potassium, or sodium. Chromium is extremely hard, of a grayish-white color, and less fusible than platinum. Its chemical symbol is Cr, and its atomic weight is 52.1 if $\text{O} = 16$, and 51.7 if $\text{H} = 1$. Its specific gravity is from 6.5 to 6.8, and its specific heat is about 0.1, though the latter constant has not been determined with precision. Once separated from oxygen, it does not readily combine with it again. It oxidizes superficially, however, upon being heated in air, and it decomposes steam at a red heat.

Chromium forms four different oxides, whose formulæ are respectively CrO (chromium monoxide); Cr_2O_3 (chromium sesquioxide); $\text{CrO} \cdot \text{Cr}_2\text{O}_3$ (chromo-chromic oxide); and CrO_3 (chromium trioxide). Of these the first two act as bases, each yielding a series of salts with various acids. Those salts that are derived from the monoxide, CrO, are called "chromous" compounds; while those that are derived from the sesquioxide, Cr_2O_3 , are called "chromic" compounds. Chromium sulphate, $\text{Cr}_2(\text{SO}_4)_3$, forms a series of alums with the sulphates of potassium and ammonium, the element behaving in this respect like aluminum. (See ALUM.) Chromo-chromic oxide is not chemically active. Chromium trioxide, CrO_3 , dissolves in water with the formation of an acid, H_2CrO_4 , which is called

CHROMIUM — CHROMOSPHERE

“chromic acid,” and is of great interest to the chemist. Chromic acid forms a series of definite salts that are known as “chromates.” One of the best known of these is chromate of lead, PbCrO_4 , which is used as a pigment under the name of “chrome yellow,” and is formed by precipitating chromate of potassium by a soluble salt of lead. Potassium bichromate, $\text{K}_2\text{Cr}_2\text{O}_7$, or $\text{K}_2\text{CrO}_4\text{CrO}_3$, is another extremely important salt of chromic acid; it is used as a depolarizer in electric batteries, as a bleaching and oxidizing agent, and as a convenient starting-point in the manufacture of many of the chromium compounds. It possesses the peculiar property of rendering gelatine insoluble upon exposure to light, and for this reason it is used in various photographic processes.

Chromium is used to some extent in the manufacture of steel, as it is found that the addition of less than 1 per cent of chromium materially increases the strength, hardness, and elasticity of the product.

In medicine chromic acid and potassium bichromate are used. The acid is employed as a caustic; the bichromate is now rarely employed because of its irritant properties.

Poisoning by chromium compounds is similar to that caused by other metallic poisons. The drinking of battery fluid is the usual mode. There is severe gastro-enteritis, nausea, vomiting of yellowish bloody matter, diarrhoea, pain, colic, tenesmus, great prostration, muscular cramps, rapid and feeble pulse, bloody urine (perhaps suppression of this secretion), feeble and irregular breathing, with coma or convulsions preceding death. A fatal ending may occur in from 4 to 15 hours. At times this result may be delayed, and symptoms referable to degenerative processes in the liver and kidneys appear. Treatment is by prompt and continued washing of the stomach. Bismuth subnitrate is indicated in the after treatment, which is symptomatic.

Chromium, or Chrome Steel. See CHROMIUM.

Chromo-lithography, a method of producing a colored or tinted lithographic picture, by using various stones having different portions of the picture drawn upon them with inks of various colors and so arranged as to blend into a complete picture. Sometimes as many as 20 different colors are employed. It was invented by Alois Senefelder, of Prague, between 1796 and 1800. An outline drawing is first traced, and then transferred to the various stones, one for each color. The artist puts in the colors, with soap, of the tints required. Next the slab is put upon a press and carefully damped with a sponge, after which the oil color is applied with a leather roller. The parts of the slab which contain no drawing, being wet, resist the ink, while the drawing itself, being oily, repels the water while retaining the color. In printing, the lighter shades are printed off first and the darkest last. See LITHOGRAPHY.

Chromotype See CHROMATYPE.

Chro'mosphere, the gaseous envelope which exists round the body of the sun, through which the light of the photosphere, an inner envelope of incandescent matter, passes. During total eclipses it is observed that a red-colored envelope surrounds the sun, and shoots up to

great distances from the surface. It seems to have been first recognized by Secchi; and the projecting portions of it are commonly described as “red-colored protuberances” and “red flames.” To this red envelope the name “chromosphere” was given by Lockyer. The light from it is much fainter than that from the photosphere; and till 1868, when M. Janssen and Mr. Lockyer almost simultaneously pointed out a method of viewing it, it was never seen except during eclipses. See SUN.

The spectrum of the chromosphere was first observed in 1868 during the Indian total eclipse, and it was found to consist of a number of bright lines, and conspicuous among them those of hydrogen. The light of the chromosphere was thus proved to be due to vast flames or masses of incandescent vapor or gas, hydrogen forming a large part of the whole.

Since the invention of the Janssen-Lockyer method of observing, as it is called, very remarkable advances have been made in our knowledge of solar physics, discoveries quite unthought-of having followed. The observations are made by means of a combined telescope and spectroscope. A spectroscope is substituted for the eye-piece of the telescope, the slit of the spectroscope being placed at the principal focus of the object-glass of the telescope. The slit is capable of being moved in such a way that any particular band of the image formed by the object-glass of the telescope may be examined by the spectroscope. The spectroscope employed for the purpose of examining the chromosphere must have the greatest possible dispersive power, and requires for this purpose a very long train of prisms.

As was mentioned above, the spectrum of the chromosphere consists of a series of bright lines. The breadth of a bright line of the spectrum is not sensibly increased by increasing the dispersive power of the spectroscope, but the contrary is the case with a continuous spectrum, which is extended by dispersion. Thus the latter becomes weakened, while the former maintain their brightness and become more visible in comparison with the others. The slit of the spectroscope being arranged so as to take in a band, either tangential or radial, close to the edge of the image of the sun formed by the object-glass of the telescope, it is found that the bright lines of the chromosphere are perfectly visible, in spite of the light of the continuous spectrum proceeding from the inner portion of the disk. Further, it has been found possible, by using a spectroscope of the very highest dispersive power, and by opening the slit sufficiently wide, to see the whole of one of the protuberances at once, and by this means to watch its motions and its changes. To understand this the reader must consult the article SPECTROSCOPE. He must recollect that a continuous spectrum consists of an enormous number of images of the slit, placed side by side, and in ordinary cases slightly overlapping each other. If we could employ an infinitely narrow slit we should have an infinite number of infinitely narrow images, and no overlapping whatever. But suppose a light to consist of only two or three colors, say light from a source capable only of giving the two bright lines C and F, that is, one in the red and another in the blue part of the spectrum. It is

CHRONIC — CHRONICLE

easy, even with a slit of sensible width, to keep the two from overlapping, and we shall see without any confusion the two bright lines or bands at different parts of the spectrum, darkness intervening. Now imagine a flame or tongue of fire starting up from the sun's surface, and let the spectroscope be directed on its image in the telescope; there will be only portions of the slit illuminated by it, portions corresponding to the shape of the flame, and if the flame contain only light of the bright line C and F, there will be seen two images of the flame at the points of the spectrum belonging to these colors. The observations of these flames by Mr. Lockyer has furnished us with what may be considered at present as a very complete knowledge of the atmosphere of the sun, though doubtless there is yet much to be discovered by the daily observation of them that is now carried on; and the same method applied to the sun's spots has proved not less fruitful. We can give only a few of the results here, but the reader will find an account full of interest in Mr. Lockyer's papers communicated to the Royal Society, and printed in abstracts in the Royal Society's 'Proceedings' for 1869 and 1870. He will also find in the 'Proceedings' for the same date an account of the experiments of Frankland and Lockyer on gaseous spectra, undertaken with the view of determining some questions of great importance relating to phenomena observed in the course of the researches under consideration. Latterly, by methods specially devised, excellent photographs of the protuberances or flames have been obtained.

The chromosphere and its prominences, when examined with the telespectroscope (as the instrument just described is called) exhibits, as we have said, a spectrum of bright lines, due to incandescent gases. The most elevated portions consist entirely, or almost entirely, of hydrogen, the lightest of the gases. Lower down are found the gases or vapors of the heavier metals,—of sodium, magnesium, barium, iron, and others. The lower the layer of the chromosphere examined, the more dense is the spectrum filled with lines of metals, and in the prominences the red hydrogen flames tower high above all.

From minute displacements of well-known lines in the spectrum (see SPECTRUM ANALYSIS) motions are inferred of the incandescent bodies from which these lines are proceeding. On this principle motions of the fixed stars have been determined. Thus Sirius is approaching us at the rate of 10 miles per second, and Arcturus is approaching us at the rate of 5 miles per second. The principle applied to the results of the spectroscopic examination of the prominences of the chromosphere shows that they are due to enormous outbursts of gases and vapors from the sun. These gases are projected outward with extraordinary velocity, and in their neighborhood vast cyclones are observable. It is also proved by applying the same principle that the spots on the sun's surface are due to, or at least are accompanied by, vast up-rushes and down-rushes of gaseous matter.

Chron'ic (Gr. *Χρόνος*, "time"), a term applied to diseases which are of long duration,

and mostly without fever. It is used in opposition to the term "acute," which is applied both to a pungent pain and to a disease which is attended with violent symptoms, terminates in a few days, and is attended with danger. On the other hand, a "chronic" disease is slow in its progress and not so generally dangerous.

Chron'icle, a history recounting in order of time all details which observation or tradition has furnished the author. It may be a universal history, or may deal with a single epoch, nation, city, or individual. Some chronicles have been preserved from early ages; the Old Testament Chronicles (q.v.) are a type of such. An important ancient chronicle, discovered on the island of Paros in 1627, and known as the 'Chronicle of Paros,' is an outline of Greek history, originally covering the period from the reign of the legendary Cecrops, king of Athens (1582 B.C.) to 264 B.C. The last part, from 355 B.C., is now lost. It omits many important political and military events, and deals more fully with the art and festivities of the people. In the early Christian ages, ecclesiastics were generally the authors of the chronicles; for example, Eusebius, bishop of Cæsarea, collected from other historical works his 'Chronicle of Ancient History.' Hieronymus of Stridon translated it into Latin in the 4th century, and other continued it. Many historical works of the Byzantine historians are also chronicles. Most of the mediæval chronicles were by monks, especially by the Benedictines, who usually began their story with the creation of the world, and gave an abridged history of the events from the first chapter of Genesis to the immediate subject of their narrative. In their statement of facts they in general knew little distinction between fabulous and true history, were not inclined to question much either visions or miracles, and were accustomed to dwell as long on unimportant as on momentous events. Chronicles are valuable for determining historical facts when, like that of Eusebius, they contain materials from older works which are now lost, or when they relate events contemporary with a writer, and of which he was a witness; and they are always valuable as an illustration of the spirit of an age and the sentiments of a people. It is through them that nearly all the history of the Middle Ages has been preserved. Every European people has numerous mediæval chronicles.

Among the German chronicles may be mentioned that of Regino, abbot of a monastery in the forest of Ardennes, whose work extends from the Christian era to 907; that of Hermannus Contractus, entitled 'A Chronicle of the Six Ages of the World,' to the year 1054; that of Lambert von Aschaffenburg, which recounts the period from the beginning of the world to 1050 in brief, and from 1050 to 1077 in detail; that of Godfrey of Viterbo, giving a universal history to the year 1186, written partly in prose and partly in verse, and entitled 'Pantheon'; and a chronicle found in the collection of Pistorius, composed by an Augustinian monk, which extends from the Christian era to 1474. These were written in Latin and, with many other Latin chronicles, were col-

CHRONICLE OF THE KINGS OF ENGLAND — CHRONOGRAM

lected and published at Hanover in a series of volumes entitled 'Monumenta Germaniæ Historica.' The oldest historical book in the German language is a rhyming chronicle, consisting of 83,000 verses, written by Ottokar von Horneck, in the 13th century, and of nearly the same antiquity are the chronicles of Rudolf von Ems and Jansen Enekel, both having the form of poems, and furnished with notes by their authors. France is rich in chronicles, universal and particular, written in Latin, French, and various provincial dialects. It was the fancy of the earliest chroniclers to give to France a Trojan origin. Eginhard, the son-in-law of Charlemagne, chronicled the deeds and talents of that emperor in his 'History of Charlemagne.' The first of the chroniclers who wrote in the popular language of France was Geoffroi de Ville-Hardouin, who lived in the 12th century, and was an actor in the events which he describes. The 'Chronicles' of Froissart (q.v.) embrace the events occurring from 1325 to 1400 in England, Scotland, France, Spain, Brittany, and the Low Countries, setting forth in detail the feasts, spectacles, and all the pageantry, of feudal times, and enlivened throughout by Froissart's shrewd comments and observations. Of the strictly English chronicles, the earliest is that by Geoffrey of Monmouth, a monk of the 12th century, tracing the history of Britain through a series of imaginary kings, from Brutus, a son of the Trojan Æneas, who founded the British state many centuries before the Christian era, to Cadwallader, who was said to have lived 689 A.D. There is also the 'Anglo-Saxon Chronicle,' extending from the beginning of the Christian era to the death of King Stephen (see **ANGLO-SAXON LITERATURE**). The collection of chronicles edited by Holinshed in 1577 embraces a history of England to that year, a history and description of Ireland by Stanishurst, and a history of Scotland translated by Hector Boethius. 'The Chronicle of the Kings of England,' by Sir Richard Baker, published in 1643, is a history of England from Roman times to the death of King James I. It was a very popular work, and was afterward continued to the death of George I., but is not now considered accurate history.

Chronicle of the Kings of England. See **CHRONICLE**.

Chronicle of Paros. See **CHRONICLE**.

Chronicles, Books of, the last of the historical books of the Old Testament, forming only one book in the Hebrew canon. Its arrangement after the Books of Kings, and its division into two parts, is the work of the Septuagint (q.v.). The Hebrew name means "words," or, rather, "acts of the days," and is thus much the same as our "journals" or "annals." The title given to it by the Seventy was "Paraleipomena," meaning either "remains" (of other historical works), or "things omitted." The usual and very appropriate name "Chronicles" was given to it by Jerome. According to its contents the book forms three great parts: (1) Genealogical tables interspersed with geographical, historical, and other remarks (1 Chr. i.-ix.). (2) The history of the reigns of David and Solomon (1 Chr. x.-2 Chr. ix.). (3) The history of the kingdom of Judah — excluding that of Israel — from

the separation under Rehoboam to the destruction of the Jewish state by the Chaldæans (2 Chr. x.-xxxvi.), with a notice in the last two verses of the permission granted by Cyrus to the exiles to return home and rebuild their temple. The Chronicles accordingly traverse nearly the whole field of Old Testament history, and present many points of contact with the earlier scriptures, historical and prophetic, more especially, however, with the books of Samuel and of Kings. How far the author of the Chronicles may have made use of these books cannot be determined, but that he did not solely rely upon them is evident from the number of titles of books referred to by him as authorities, sometimes on matter not contained in Samuel and Kings, or, if mentioned in them, yet with greater brevity than in the Chronicles. A considerable portion of the matter contained in the Chronicles is much the same as that in Samuel and Kings, but many particulars recorded in these books are entirely passed over, while others are more fully related in the Chronicles. A certain quantity of matter also is peculiar to the Chronicles. That these books form one of the latest compositions of the Old Testament cannot admit of doubt. Its reference, already mentioned, to the decree of Cyrus respecting the restoration is sufficient evidence of this. With regard to the author there is not the same certainty, but strong arguments can be adduced to prove that Chronicles and the Book of Ezra are by one hand, and a common opinion is that Ezra was the author of both.

Consult Movers' 'Kritische Untersuchungen über die Biblische Chronik'; Keil, 'Apologetischer Versuch über die Chronik'; and the commentaries of the German writers, Bleek-Wellhausen, König, Wildeboer, etc.

Chronicles of the Canongate, a collection of Sir Walter Scott's stories published in two series. The first series (1827) contains 'The Highland Widow,' 'Two Drovers,' and 'The Surgeon's Daughter'; the second series (1828) contains 'The Fair Maid of Perth.'

Chronicles of Clovernook, a story by Douglas Jerrold, published in 1846. Clovernook is a "hamlet wherein fancy has loitered away a truant hour"; and under the guidance of the "Hermit of Bellyfulle" the author explores Clovernook, and discourses of it. The book charms by its quiet humor, the grace of its fancy, and the benevolence which characterizes even its satire.

Chronicles of Froissart. See **CHRONICLES**.

Chronicles of the Schönberg-Cotta (shèn'-bërg kôt'tä) **Family,** a novel by Mrs. Elizabeth Charles, published in 1863. It is the story of a family during the period of the Reformation in Germany, as told chiefly by Friedrich and Else, the oldest children. The book is written with an effort after the archaic style, and has much of the simplicity and directness of the old chronicles. It is interesting and has proved a great favorite, though accurate scholarship finds fault with its history.

Chron'ogram, a device by which a date is given in Roman numerals by printing certain letters of an inscription larger than the others; as in a motto of a medal struck by Gustavus Adolphus in 1632: ChrIstVs DVX; ergo trIVMphVs. The value of C and the other capitals equals 1632, MDCXVVVVII.

CHRONOGRAPH — CHRONOLOGY

Chronograph, *krön'ō gräf*, the name given to various devices for measuring and registering very minute portions of time with extreme precision. Benson's chronograph is, in principle, a lever watch with a double seconds hand, the one superimposed on the other. The outer end of the lowermost hand has a small cup filled with a black viscid fluid, with a minute hole at the bottom, while the corresponding end of the uppermost is bent down so as just to reach the hole. When in operation a string is pulled, whereupon the bent end of the upper hand passes through the hole and makes a black mark on the dial, instantly rebounding. This chronograph, which is sometimes called a stop-watch or a split-second fly-back watch, registers to one tenth of a second. The chronograph for astronomical use is connected by electricity with the pendulum of an astronomical clock, which makes a mark on a sheet of paper at the beginning and end of each swing. By touching a spring on the appearance (say) of a particular star on the field of a telescope, an intermediate dot is made, and by measuring the distance of this from either of the extremes, the exact time can be ascertained to 1-100 of a second. The first chronograph used was invented by Prof. Locke of Cincinnati, about 1850, and was only a slight modification of the Morse telegraphic instrument.

Chronol'ogy, the science of dates, or of arranging events in order of time. Two steps in human progress were requisite for its existence: the invention of material records, since memory would not transmit exact sequences of events on any considerable scale; and the adoption of some recurrent astronomical period, neither too short nor too long, as a measure of time. The pictograph, developed into a system of writing, and the Peruvian quipu, or knotted cord, are the chief of the former. The fixing of the year by the Babylonian astronomers was the only feasible specimen of the latter: the month being too short for a measure of long periods, and even the year becoming too formidable in numbers for the limited counting power of the ancients. Between the creation of these raw materials, however, and the construction of a simple and universally applicable system for even one country, thousands of years elapsed in which the chaos of unsystematic systems is still the difficulty and often the despair of antiquarians.

For a satisfactory chronology there is a third requisite,—a fixed epoch to count from, no matter what: as in Babylonia the accession of Nabonassar; in Greece the hypothetical institution of the Olympian games; in Rome the imaginary foundation of the city; in Christendom the arbitrarily fixed birth of Christ; with the Mohammedans the Hegira of the Prophet, etc. But, obvious as this seems, it is in fact a very late device of civilization. Herodotus and Thucydides, in the most splendid intellectual age of Greece, wrote history without a date, or any apparent recognition that one was needed. The sequence of events was preserved; but that these need be related to an arbitrary point in the past is an artificial conception, created by the accumulation of practical inconveniences. These would seem to have differed in each country which independently invented it: the scientific and business ones in Assyria, historical in Greece, administrative in Rome. Others bor-

rowed the system when its utility was manifest; but older societies were satisfied with a ruder scheme. Their science and business was alike undeveloped; their historical sense was satisfied with a few dramatic episodes, and even the order of events was heroically confounded; and when it became necessary to keep public records, their unit was a reign, or they dispensed with units altogether and dated by some notorious event. Thus the Babylonians dated their business and official tablets "the year he brought Nannar of Nippur into a house," "the year he overran Karkhar," "the year he overran Karkhar a second time," "the year divine Bur Sin became king, etc.; on exactly the same principle as a modern mother dates events in the year the second child had the measles. Dating by the year of a certain king's reign is a natural system, still preserved in English statutes: they are not the laws of 1663 or 1860, but "4th Car. II.," "24th Victoria," etc.

In Assyria, as early as the 14th century B.C., a system was begun of dating by "eponyms," or the names of the chief officers of state, in annual succession, with the chief events in the year; each new king's name being entered on his accession. Thus: "Edsur-sarabe governor of Gozan. Revolt in city of Ashur. In month Sivan sun was eclipsed." (Three intervening entries.) "Pan-ashur-lamur governor of Arbela. Revolt in city of Gozan. Pestilence." In Rome, it was "in the consulate of" certain persons; in Athens, "in the archonship of"; and so on. Obviously, if the regular succession of functionaries is preserved for a long time, as in Assyria it was for centuries, it will furnish a perfect chronology provided one date can be fixed in the series. This has been done in several cases, and the chronology of some sections of ancient history has been accurately reconstructed over long periods. The most certain authentication is by some astronomical phenomenon whose date can be fixed by calculation; and several of these priceless data are casually mentioned by old records or historians. Thus, the mention by an Egyptian papyrus of a rising of Sirius, in connection with the overflow of the Nile, fixes the accession of Usertes III., fifth king of the 12th dynasty, between 1876 and 1873 B.C.; the oldest certain year-date or approximate date in history yet discovered, and by a happy chance, in a country the most empty of chronological data. (The accuracy of Naram-Sin's date as near 3750 B.C. is still a battleground.) The most usual of these phenomena recorded are eclipses of the sun, from the terror inspired by the darkening of the sky; fortunately for history, as the mention of them has furnished several invaluable dates. The Assyrian eponym canon for several centuries has been fitted with accurate dates by the eclipse recorded in the first entry above, 763 B.C.; the same one is mentioned in the Bible (Amos viii. 9) as occurring in the reign of Jeroboam II. Even when we cannot be certain by itself which eclipse was meant, it is rare that other synchronisms do not fix the limit. Thus, an important date in the kingdom of Lydia is determined by an eclipse which was either 610 or 585 B.C., and other circumstances make the latter date probable.

When positive evidences fail, the only method of research is by *synchronism*, or fixing the date of an event by its connection with some

CHRONOLOGY

other event or person of known date. Fortunately, the records afford considerable help in this, if less than could be wished: they mention international battles, captures, treaties, appeals, threats, correspondence, etc., where one date must apply to both. Noted examples of this are the biblical records as to relations of Palestine with Assyria, Egypt, Tyre, etc.: sometimes confusing events and dates, occasionally confounding persons, and needing correction from other sources, but still of extreme value. Another specimen is the Assyrian "synchronous history" of the relations between Assyria and Babylonia, a tablet of about 800 B.C. When we come down to classic times, these synchronisms are the very basis of historical work on those periods. There is also a synchronism of arts, products exchanged between countries, systems of writing, etc., and even to some extent of institutions; which, though demanding expert knowledge and careful judgment, is often of the first value. On this basis much of the Homeric and pre-Homeric history of Greece is taking shape, and even the origins of China can perhaps be related to Babylonia.

The chronological sense of different races presents extreme diversities; but it is fairly accurate to say that none of the older ones had any appreciable amount except the Babylonians, and that in them and their pupils, the Assyrians, it was early and remarkably developed. Their dated records (in the primitive fashion above) go back to the third millennium B.C. at least; the Assyrians eponym canon antedates by many centuries any similar attempt elsewhere; and the Babylonians were much the first to adopt an epoch. On the other hand, their co-founders of the earliest civilization, the Egyptians, were utterly destitute of it; and the dates in their history back of the time of close contact with Babylonia, where synchronism can be utilized, are almost pure guesswork. Beyond 2000 B.C. the divergences of estimated Egyptian dates among the most authoritative scholars vary from 500 to 1,500 years, and even down to 1500 B.C. there is often 100 or 200 years' difference; and only the vaguest inferential proof is available. The Hindus, the Chinese, the Jews, the Greeks, were nearly as devoid of chronological instinct. The case of the great Greek historians has been mentioned; and the vague Jewish "forty years," for a generation or an indefinite long time is familiar and not conducive to accurate chronology.

The obscurity due to lack of dates in general was of course enhanced by the fact that each state counted from its own events or persons, so that in place of one problem, the historical antiquary has scores. The chief method—for many ages the only one—by which this Babel of chronologies was finally reduced to uniformity over large areas was political absorption and the disuse of provincial systems. Even when fixed epochs came to be adopted, though the continuity of history was assured, the international confusion was not lessened nor comparative chronology made easier, as each selected a different epoch; and the same remedy only was operative here. Nor, indeed, for some time did even the individual system become the accurate instrument of research it is now; for the succession was not at first of years, but of annual magistrates, as with the Assyrians, Athenians, and Romans, sometimes more vaguely of kings

and priests. Moreover, with one dubious exception the date of the epoch was not that of its adoption, but centuries back; and the dates affixed by the new system to former events were often wildly fanciful, as was that of the very event which furnished the starting point. The first epoch ever used, so far as known, was the accession of Nabonassar of Babylonia 747 B.C.; it is generally believed to have been used from the beginning, but this is less probable now than formerly. The Roman era was the foundation of Rome, somewhere about 750 B.C. according to Roman writers; it is not known when it was first adopted, but probably not before the 2d century B.C. The Greek reckoning was from the alleged foundation of the Olympic games in 776 B.C., quite as apocryphal as the other; it was first used as a basis of calculation by Timæus of Sicily in the 3d century B.C. It furnishes a scientific one when the year of the Olympiad is mentioned, which is not always, so that a margin of three years is left. Note the curious fact that all three epochs begin within a quarter century or so of each other, though the last two are merely guesswork. It seems incredible that the year, apparently the most simple and obvious of natural units, was first suggested and used in 194 B.C. by Eratosthenes, the great Greek editor, mathematician, geographer, and chronographer. Of course it had been employed for thousands of years as a unit within other units, such as reigns, but not alone in sequence from a fixed epoch. The Olympiad, however, for reasons given below, held its own till the middle of the 5th century. Even after the official adoption of the Christian era,—which, like its predecessors, antedated its use by centuries,—centuries elapsed still before it was employed to the exclusion of other systems. Many other methods of dating, local or ecclesiastical, flourished beside it, and made nearly as much labor necessary in modern as in ancient times to synchronize dates. An acquaintance with these is indispensable to the study of the chronicles, charters, and other legal and Church documents of the Middle Ages.

Still another cause of the imperfection of early chronological methods was the difficulty found by the masses in grasping large numbers. Hence, it became the practice to divide the time into cycles of a small number of years, and number by the years in a cycle. The Olympiad was a refined form of this. Our own system of reckoning by centuries is another, only by its decimal form it expresses both ideas at once. Instead of saying "the 3d year of the 20th century," as "the 3d year of the 40th Olympiad," we say a term of addition, and say "nineteen hundred(s) and three." The Chaldæans had their saros of $6,585\frac{1}{3}$ days, or 18 years; the Romans, their indiction of 15; and the Chinese and other Asiatic nations still use a cycle of 60. The European cycles, however, as the metonic of 19 years still used for computing Easter, were mostly used to regulate the calendar rather than to compute dates; but they are often extremely useful as an additional method of verifying these.

Babylonian: Era of Nabonassar.—This prince seems for a very brief time to have thrown off the Assyrian yoke and restored Babylonian independence. It was almost immediately lost; but he succeeded in imposing a new dating system which convenience main-

CHRONOLOGY

tained, or else later gratitude looked back to him, under the glories of Nabopolassar and Nebuchadrezzar, as the pioneer of Neo-Babylonian greatness. At any rate, the era is fixed at 26 Feb. 747, from astronomical data collected in Chaldæa by Callisthenes, a general of Alexander the Great. It is the basis of the once famous Canon of Kings, or Mathematical Canon, preserved in Ptolemy's works, and previous to the era of archæology our one source of Mesopotamian history. The Alexandrian Greeks also used this era till their adoption of Julius Cæsar's reformed calendar, 25 B.C. The Babylonian year was different in length from the Julian of $365\frac{1}{4}$ days, and the conversion of Nabonassar years into years B.C. is a matter of delicacy, necessitating a knowledge of the month and day for certainty. Tables have been drawn up for this purpose.

Olympiads.—It is now pretty generally admitted that the early lists of victors in the Olympic games are fictitious, and that the foundation of the games cannot be assigned a date, our first authentic knowledge beginning with the 6th century B.C.; but this is indifferent to the method of calculation which assumes a beginning in 776 B.C. They were celebrated every fourth year in the summer solstice; and as the Olympic year began sometimes with the full moon before and sometimes with the one after the solstice, to save trouble and perpetual recomputation it was reckoned as beginning the 1st of July. Hence, the Olympic years cannot be synchronized with ours year by year; the second half of the one corresponds with the first half of the other, and the month must be known for accurate conversion. Therefore, in years before Christ, when the event happened between January and June, inclusive, subtract the number of the Olympic year from 776. Thus: the oligarchy of the Four Hundred was deposed in June Ol. xcii. 1: $4 \times 91 + 1 = 365$; $776 - 365 = 411$ B.C. Socrates was executed in May Ol. xcv. 1: $4 \times 94 + 1 = 377$; $776 - 377 = 379$ B.C. If it took place in the latter part of the year (as did the immense majority of the familiar incidents in Greek history—all the great battles, for physical reasons, the deaths of Pericles and Cleon, etc.), subtract the sum as aforesaid from 777. Thus, the battle of Plataea was fought in September Ol. lxxv. 2: $4 \times 74 + 2 = 298$; $777 - 298 = 479$ B.C. If the year is after Christ, subtract the number of the Olympic year from 776 in the first case, from 777 in the second. The Olympiad was only used by historians; it is never found on coins or inscriptions. A new Olympiad was instituted by the Roman emperors, beginning with 131 A.D., and is used on some coins and inscriptions, but struck no deep root.

Macedonian Era, or Era of the Seleucidæ: also called by the Jews *Era of Contracts*, because their Syrian governors compelled them to use it in civil business, and styled by the writers of the Books of Maccabees the *Era of Kings*.—This epoch dates from the foundation of the Syro-Mesopotamian monarchy by Seleucus Nicator, Alexander's general; assumed to begin with his occupation of Babylon 311 B.C., 12 years after Alexander's death. It was used not only in the Seleucid empire, but by the Greek states on the east coast of the Mediterranean generally; was followed by the Jews till the 15th century, and is said to be in use by some Arabians even yet. It was the great

Eastern date for many centuries; but it is one of the most difficult to convert into terms of Christian years, from the astonishing variety in the beginnings of the year (which in different countries and among different sects varied from the vernal equinox to 28 October), and from the variation in length of year, some using the Egyptian year of 365 days, some the Julian of $365\frac{1}{4}$. The usual computation is to place the beginning of 312 Seleucid on 1 September in the Julian year preceding the first of our era. Therefore, to reduce a Seleucid date to ours, subtract 311 years 11 months.

Era of Alexander.—This is used by some Greek historians, dating from his death 325 B.C.

Era of Tyre.—This begins 19 Oct. 126 B.C. To reduce it to our era, subtract it from 126 if B.C., subtract 125 from it if A.D. This date is used only on medals and in the acts of some councils.

Era of Rome.—The date of the foundation of Rome, as related to the Olympiad epoch, is differently assigned by different authors: by Fabius Pictor at Ol. viii. 1, autumn (747 B.C.); by Polybius at Ol. vii. 2 (750); by M. Porcius Cato at Ol. vii. 1 (751); by Verrius Flaccus at Ol. vi. 4 (752); by Terentius Varro at Ol. vi. (753). As all the dates were figments, each Roman writer followed which he chose, and sometimes varied from one to another. Livy generally follows Cato, sometimes Fabius Pictor; Cicero follows Varro, as does Pliny, in general; Dionysius of Halicarnassus follows Cato. The modern writers usually follow Varro, supported by Censorinus, who specifically says the festival of the Palilia in April was the anniversary of the foundation. The Romans had two kinds of year: one for business, public or private; and the consular year, which their annalists follow. The former began with the calends of January. The latter had no fixed time of beginning, but commenced with the installation of the consuls, which happened as chance and politics dictated; it is the one generally used by the Latin and Greek historians down to the 6th century A.D., however. But in the computations of the Roman era the year begins with 21 April. After Cæsar's regulation of the calendar, the year began with January, much to the disgust of the Roman poets, who thought the spring was the real beginning, as, of course, it is.

Cæsarean Eras.—Several attempts were made to establish time eras from actions of Cæsar and Augustus, one of them very successful. The *Cæsarean Era of Antioch* commemorated Cæsar's victory at Pharsalia 48 B.C.; it was used by Evagrius in his 'Ecclesiastical History.' The Syrians and Greeks, however, placed its beginning 11 months apart. The Julian Era began 1 Jan. 45 B.C., and commemorated the reformation of the calendar by Cæsar. The *Era of Spain* or *of the Cæsars* commemorated the completion of the conquest of Spain by Augustus, and began 1 Jan. 40 B.C.; for many centuries it was the one era of Spain and Portugal, and generally of the Roman provinces subdued by the Visigoths, not only in the Iberian peninsula, but in southern France and in Africa. Several of the councils of Carthage, and that of Arles, also dated from this, though after the 9th century the year of the Incarnation was usually joined with it. It was not disused in Castile till 1382, and in Portugal not altogether till 1422 or later. The calendar being Julian,

CHRONOLOGY

all its dates are reduced to ours by merely subtracting 38. There was an *Era of Actium*, commemorating that battle, fought 3 Sept. 31 B.C. The Romans began it 1 Jan. 16 Julian (30 B.C.); the Egyptians, 29 August; the Eastern Greeks (who used it till the 9th century), 2 September. The latter called it the *Era of Antioch* (not the one mentioned later), and that city struck medals with it. There was also an *Augustan Era*, beginning 27 B.C., the year in which Augustus received that title.

Jewish Eras.—The Jews came under foreign rule before they had invented an epoch, or even developed periodic magistrates; and their annals, except for synchronisms, are nearly as baffling as the Egyptian. Their first internal chronology is after the Macedonian era was forced on them by the Seleucid officials; their religious matters, however, were regulated by their own calendar, in which the civil and sabbatical year began (as now) about the autumnal equinox, the ecclesiastical and legal year about the spring equinox. They also made computations of the time from the Creation (see paragraph below), but their dates do not depend on it till modern times. After the Dispersion they were obliged to conform to the periods of other nations, in order to have their festivals celebrated uniformly; and they adopted a cycle of 84 years (a transformed Greek cycle). The time of its beginning is not certain, one author placing it at 162, and another at 291 B.C. In 46 B.C. the Christians adopted it, and used it partially till the Council of Nice; they then, and the Jews in 360 A.D., substituted the metonic cycle of 19 years, which the latter still employ. Till the 15th century they continued to date from the Macedonian era; since then they have adopted a Creation era, which they date 3,760 years 3 months B.C. Their dates cannot be reduced to ours without expert knowledge of their involved calendar.

Creation Eras.—To emphasize their separation from paganism, and avoid participation in pagan observances connected with the calendar, the Christians early began to reckon time from the supposed date of the creation of Adam according to the Jewish Scriptures. Aside from its resting only on the adding up of impossible and inconsistent genealogies, the problem was further confused by there being three texts of equal authority to work from,—Hebrew, Samaritan, and Septuagint,—all irreconcilably variant. One author collects 120 different computations of the true date; another says he has collected over 200; and 300 have been reckoned; and the estimates vary over 3,500 years, from 3,483 to 6,984 years before the Christian era. None of them have any scientific standing, but for two centuries the Christian world generally accepted as a working hypothesis Archbishop Usher's (1650) figure of 4004 B.C., which is still used in some Bible appendices and similar works. Several earlier ones, however, obtained considerable footing, and two of them are not yet disused. It is of course as useful as any other arbitrary point, like the Olympic Games or the foundation of Rome; and has the advantage of requiring only one continuous figure, in place of a break in the centre like the Christian era. But its controversial character, and the satisfaction of marking off the time after Christ's coming as the beginning of a new era, have caused the latter system to supplant it. Of

the others, the chief are: (1) *Era of Constantinople*, still employed in the Greek Church, and used by the Russians till the time of Peter the Great. This begins 5,508 years 4 months before the Christian era. The civil year begins 1 September; the Church year on the spring equinox or 1 April. To find the current year corresponding to a Constantinople year, if the event took place before 1 September, subtract 5,508 from the date; if later in the year, subtract 5,509. (2) *Era of Alexandria*. This was adopted by the Christians of Alexandria on the computation of Julius Africanus, who reckoned 5,500 years from the creation of Adam to the birth of Christ, but placed the latter three years earlier than the current reckoning, so that our era would begin 5503 Alexandrian. After the accession of Diocletian in 284, however, they dropped 10 years, both from the year since the Creation and since the Incarnation, making in fact two eras instead of one. To convert this era into our own, in the first 8 months of the year subtract 5,502 up to and including 5786 Alexandrian, after that date, 5,492; in the last 4 months, 5,503 and 5,493, respectively. This era was used by the Coptic Church till the 15th century, and is still retained in the Abyssinian. (3) *Era of Antioch*. The Syrian Christians, early in the 4th century, adopted Julius Africanus' reckoning as above, but dropped 10 years from it as the Alexandrians had already done; placing the Incarnation, however, as in our own era, three years later than the Alexandrian. As regards the Creation, therefore, the two eras are seven years apart up to Diocletian's time, and then coincide; as regards the Incarnation, the Antioch is three years less before that time and seven years later after it. Dates in this system are reduced to ours, as in the reformed Alexandrian calendar above.

Era of Diocletian, subsequently named Era of Martyrs.—At the same time that the Alexandrians changed their Creation era as above, they established a new and shorter one from the accession of Diocletian, 29 August (first of the Egyptian year) 284. The second name given implies that an attempt was made to start it from 303, the date of Diocletian's edict of persecution, but if so it was unsuccessful, as indeed a mere perpetuation of a strife was likely to be. The era is still used by the Copts of Egypt and the Abyssinians. The change from the Egyptian to the Julian calendar, and the peculiar complications it has introduced into the conversion from that era to ours, are too intricate to detail here. To make the change, add to their date 283 years 240 days in common years; if the date is between 30 August and the end of the year in the one before leap year, add 283 years 241 days. But the Ethiopians do not reckon the years continuously from the beginning: at the end of each 532 years (that is, 28×19 , or the solar and lunar cycles multiplied together) they begin again with 1.

The Christian Era.—It is not generally realized how modern this epoch is in general use. It was introduced into Italy 533 A.D. by Dionysius Exiguus ("the lean"), a Roman abbot; was not introduced into Gaul (France) till the 8th, and not in current use there till the 9th; and came into use in England only in the latter part of the 8th. In Latin countries the current scheme before that was the cycle of indiction (below). Any uniform date is so useful that

CHRONOMETER

its defects may be overlooked. That of having a double set of numbers, forward and back, is not serious. Perhaps the chief inconvenience in calculating backward is that of calling the year preceding the era 1 B.C. instead of 0; thereby making the leap years on the backward series fall on the odd years, 1, 5, etc., or else making 7 years between the first one previous and the first one after. Astronomers rectify this by calling the first year previous 0. For the different dates on which the beginning of the year has been placed, see CALENDAR. Dionysius fixed the birth of Christ in 754 of the Roman Era, but he began the year 1 with the Annunciation, 25 March of the year preceding. In ecclesiastical and common usage it has begun at Christmas, Easter, 1 March, and other dates. In England from the 7th to the 13th century it was on Christmas; in the 12th the Annunciation began to be used as well, and from the 13th till 1752 remained paramount. The different beginnings of the year must be carefully taken into account in studying mediæval history.

Cycle of Indiction.—This was a period of 15 years, whose object has been already explained. It was generally used in the Western or Latin empire for several centuries before the Christian Era became general. It began in the year 313, or was referred to that year as a start. There were three, differing only as to the beginning of the year: (1) The Constantinopolitan, beginning in September, like the Greek year; generally used in the Eastern or Greek empire, and sometimes in France. (2) The Imperial or Constantinian, attributed to Constantine the Great, called also the Cæsarean. It began 24 September, and was used by old French and English chroniclers. (3) The Roman or Pontifical, beginning on Christmas or 1 January as custom varied; often used in papal bulls, and sometimes in old French writers. To find the number of any year in the Indiction, add 3 to the date (our era), divide by 15, and the remainder is the number. If the remainder is 0, the year is the fifteenth or last of the cycle.

Armenian Era.—This starts from the Council of Tiben, 9 July 552, when the Armenian schism began by condemnation of the acts of the Council of Chalcedon. The Armenian civil year is the Egyptian year of 365 days, out of all measure with others; their ecclesiastical year begins 11 August, and has the Julian calendar. They also use the Creation Era of Constantinople along with their own, dating documents with both on occasion. In business with Europeans they employ our era and our year. To convert their civil dates to our era, multiply the number of Armenian years by 365; add the number of days from 1 January to the given date; subtract 176; the remainder will be the number of days from 1 Jan. 553 to the given date; reduce this to Julian years, add 552, and this gives the date in the Julian year, old style. Add the requisite number in the Gregorian calendar if desired. In ecclesiastical reckonings, add 551 years 223 days. In leap years, if the date is between 1 March and 10 August, subtract one day from the above.

Mohammedan Era.—This commemorates the Hijra or Hegira (flight) of the Prophet from Mecca to Medina, 622 A.D. It does not, however, date from the flight, but from 68 days previous, 16 July, or as some have it, 15 July. The methods of computation are too complicated and uncertain to be given here: Mohammedan chro-

nology is one of the most treacherous of subjects, and even experts disagree and go astray.

Persian or Gelalcan Era.—This begins with the accession of Yezdegird III. to the throne of Persia, 16 June 632. Till 1079 the Persian had the random Egyptian year, 365 days without intercalation; it was then reformed by Omar Khayyam, the great poet and astronomer, under Malek Shah, to a degree almost as accurate as the Gregorian. There were seven successive leap years once in four years, but the eighth was deferred till the fifth year. This method was once universal in Persia, and is still followed by the Parsees of India. Owing to the days of error accumulated by the old year, the day of beginning is thrown back, so that the Persian year can be converted into ours by adding 631.

Hindu Eras.—The philosophers divided the duration of the world into four *yugs* or ages, of which three are past, and the present corrupt one, the *kali-yug*, is alone historical. It begins 3101 B.C. and includes several others in use. The Era of Vikramaditya, from a Hindu Augustus who may or may not be historical, is reckoned from 57 B.C. This monarch is generally attributed to the 5th or 6th century if real, and the epoch is thought a sidereal one. The Era of Salivahana is 78 A.D. This is used in southern India, and commemorates an equally dubious ruler. The Fusli Era, used in revenue transactions all over India, is not uniform, but the most usual begins 590 A.D.; it seems to be a Mohammedan one, and to correspond roughly to the Hegira. The Bengali Era is another of the sort, and is set at 631. There are also others which are used in different provinces. The 60-year cycle is employed, its date being variously set.

Chinese Chronology.—This rests on cycles of 60 years, the mathematical tribunal fixing their start at 2277 B.C. But since 163 B.C. the Chinese writers have used periods called Nienhao, each beginning with the accession of some emperor, and named after him, as with English laws, and ending when he or some successor chooses to begin a new period. Tables of Nienhao are therefore needed to identify the years.

FORREST MORGAN,

Connecticut Historical Society.

Chronom'eter (Gr. *χρόνος*, "time" + *μέτρον*, "measure" = "time-measurer"), an instrument designed to measure time with great accuracy, and much used in scientific work and for the determination of longitude at sea. The marine chronometer bears a strong superficial resemblance to a watch, except that it is larger and is mounted upon gimbals, so that the motion of the ship may affect it as little as possible. In its mechanism it differs from a watch chiefly in the design of its escapement and balance-wheel. The usual form of escapement, as invented by Le Roy about 1765 and greatly improved by Earnshaw and Arnold some 15 years later, is shown in Fig. 1.

In the ordinary watch the balance-wheel is in connection with the train of wheels leading from the mainspring continuously, or nearly so; but in the chronometer it is free from these during the greater part of the time, so that its natural period of vibration is more nearly realized. A is the escape-wheel, which is in gear with the other wheels of the instrument and is prevented from free rotation by means of the locking-pallet, D. B is a disk (technically

CHRONOMETER

known as the "impulse-roller") secured to the same staff, or axis, as the balance-wheel. F is the "detent spring," which serves to return the light frame, G, and the locking-pallet, D, to the position they have in the illustration, after the detent has been tripped by the balance-wheel. A set screw is provided for preventing the locking-pallet, D, from being drawn too far into the escape-wheel, but this has been omitted in the illustration for the sake of greater clearness.

When the mechanism is in the state shown, the balance-spring should be free from strain; but the balance-wheel is moving with its maximum velocity in the direction (let it be supposed) of the arrow, so that in another instant the discharging-pallet, H, will trip the detent by momentarily withdrawing the locking-pallet, D. The escape-wheel, A, is then free to rotate until again arrested by the locking-pallet, D; but as it does so it engages the impulse-pallet, C, and accelerates the balance-wheel. After the escape-wheel has been arrested by the locking-pallet, the balance-wheel continues its excursion until the energy of its motion has all been expended in winding up the balance-spring. The balance-spring then preponderates, and the wheel returns to the opposite extreme of its swing without disturbing the locking-pallet, D; the discharging-pallet, H, merely raising the light gold spring, E, as it passes the detent. In most chronometers the balance-spring is made in the form of a helix instead of a flat spiral.

The balance-wheel is also compensated for change of temperature, though this feature can hardly be said to constitute a point of difference between a chronometer and a watch, since practically all of the better grades of watches are now similarly compensated. The effect of an increase of temperature upon the rate of a chronometer (or watch) is of a dual nature. If the instrument keeps correct time at one temperature, then, unless some mode of compensation is provided, it will lose time at all higher

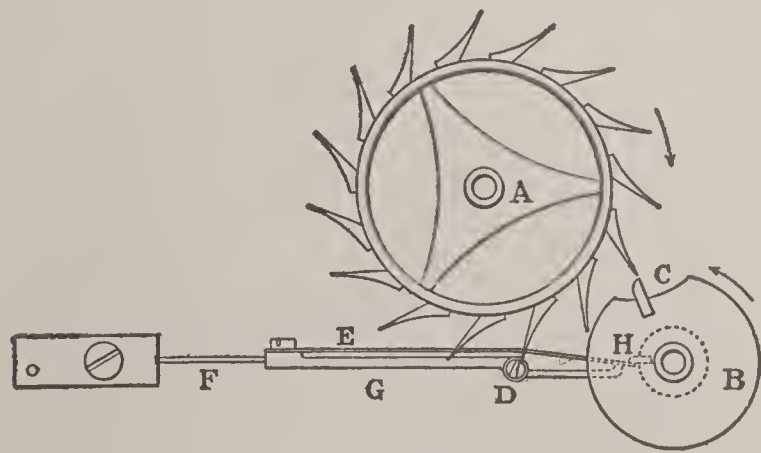

FIG. 1.—Chronometer Escapement.

temperatures, because (1) the strength of the balance-spring is less at higher temperatures, and (2) the wheel itself is greater in diameter on account of its natural expansion, so that it has a greater moment of inertia, and hence responds more sluggishly to the action of the balance-spring. To counteract these effects as far as possible, certain weights are provided along the rim of the wheel, and the wheel is so designed that as the temperature rises these weights are automatically thrown nearer to the axis of rotation. The moment of inertia of the wheel is thereby reduced, and the wheel is

caused to respond to the weakened spring with precisely the same readiness as before. The essential parts of the balance-wheel of a marine chronometer are shown in Fig. 2. The rim is

FIG. 2.—Balance Wheel of Marine Chronometer.

divided by transverse cuts into two equal, semi-circular segments, each of which is supported near one end; and it is built up of two concentric metal strips, of which the inner is steel, while the outer (which is twice as thick) is of brass. As the temperature rises the brass expands more than the steel, so that the rim-segments are deflected inward, and the weights, AA, are caused to approach the axis (or "staff") of the wheel. The two masses AA must always be opposite one another, in order that the balance may not be thrown out of poise; but they are slotted so that they may be slid along the rim. If a chronometer keeps correct time at one temperature, but loses at a higher temperature, the compensation is not sufficient, and the masses AA must be shifted toward the free ends of the rim-segments. If it gains at the higher temperature it is over-compensated, and the masses AA must be shifted toward the fixed ends of the rim-segments. In practice it is found to be impossible to adjust the masses so that the instrument shall be perfectly compensated at all temperatures. In fact, the theory of the balance shows that there are only two temperatures at which the chronometer can be expected to keep correct time, though these two may be selected arbitrarily, and the instrument adjusted accordingly. In marine chronometers the temperatures so selected are usually 45° and 90° F., and at intermediate temperatures the instruments will gain. Hartnup, the director of the Liverpool Observatory, concluded, as the result of experiments upon 1,000 chronometers, that the error in rate from imperfect compensation may amount to 1.5 seconds per 24 hours at temperatures 15° F. above or below either of the points at which the balance is standardized, when the balance-spring is of steel. With palladium springs the error is smaller. When the

balance has been compensated for temperature as accurately as possible, the moment of inertia of the wheel is adjusted so that the chronometer will keep correct time at the standard temperatures, by means of the slotted nuts BB. These turn upon screw-threads that are secured to the rim near the central arm, where their positions will not be sensibly affected by changes of temperature. If they are caused to approach the rim, the moment of inertia of the wheel is lessened, and the chronometer runs faster; and *vice-versa*. The slots in BB are provided so that the nuts may grasp their screws spring-tight, and so avoid backlash. (For full information on these matters and many others connected with time-pieces, consult F. J. Britten's 'Watch and Clockmakers' Handbook.')

Chronoscope, krõn'õ-skõp, an ingenious instrument, due to Sir Charles Wheatstone, for the purpose of estimating the duration of certain luminous phenomena, such as the electric spark, which according to ordinary means of measurement, appear absolutely instantaneous. It is founded on what is known as persistence of the impression on the retina of the eye. When a burning stick is whirled rapidly through the air a line of light is seen, the impression that the eye receives from the bright point in one position remaining long after the point has moved to a new position. Wheatstone views the electric spark in a small steel mirror revolving with enormous, but measured, velocity, and having a motion arranged, so that, were the light permanent, the object would appear to describe a complete circle. If then the phenomenon be instantaneous, a mere point of the circle will be seen, but if it have a duration shorter than the time of a revolution of the mirror, but still not infinitely short, the image will stretch out into an arc of the circle proportionate in length to the duration. The principle has been employed to show the discontinuity of certain flames which from persistence of vision appear continuous. These, when viewed in a mirror revolving rapidly, appear as a number of points or streaks of light arranged at intervals along the circle.

Chrosperma, krõ-spër'ma, a monotypic genus of plants of the natural order *Melanthaceæ*; the bunch-flower. The single species (*Muscatoxicum*) is commonly known as fly-poison, so called from its deadly effect on flies and similar insects. It abounds in dry sheltered soil from Arkansas and Tennessee eastward along the seaboard of the United States, in some sections reaching high altitudes.

Chrudim, hrõo'dëm, Austro-Hungary, a town and capital of a circle of the same name of Bohemia, situated 62 miles southeast of Prague on the river Chrudinka. It is a walled town and contains an old church and a Capuchin convent. It has manufactures of cloth; and the horse markets held here are the most important in the empire. Pop. 13,000.

Chrysal (krĩs al) or the **Adventures of a Guinea**, a satirical novel by Charles Johnstone, published in 1760. Chrysal, the spirit inhabiting a guinea, passes through many hands, from the prince's to the beggar's, and tells its own story, which is chiefly the adventures of those in whose possession it is for the time being.

Chrysalis, krĩs'a-lĩs, the pupa stage in butterflies, succeeding the caterpillar. During this time the insect eats no food, living upon the fat stored up by the larva. (See PUPA.) The chrysalids of butterflies differ from the pupæ of moths in being often ornamented with brilliant golden spots which have given origin to the name "chrysalis" or "aurelia." Also the body is often strengthened or protected by tubercles situated on the head, back, and sides. They are either suspended head downward by the tail, or rest horizontally, with a thread passing around them to hold them securely. Many, if not most, chrysalids are protected from observation by their colors, which harmonize with the color of the object to which they are attached. Thus, the chrysalis of the milkweed butterfly (*Anosia archippus*) which is suspended among the pale-green leaves of the milkweed and does not hibernate, is of a pale-green tint; while those of *Papilio turnus*, or of *Pieris*, are gray, and so spotted with light and dark marks as to harmonize with the neutral tints of the boards or fence to which they are attached. These colors and markings are apparently due to the effects of light and shade. These tints are determined at the period when the caterpillar is about to pupate, or become a chrysalis, when the integument is soft and moist. Poulton found, by subjecting the partly formed chrysalis to artificial surroundings of different colors, that the breeding boxes, when lined with black paper, produced dark chrysalids; when lined with white, light-colored, or green ones, or when lined with gilt, they produced chrysalids of a distinctly golden color, more completely so than occurs in nature.

Certain chrysalids have been found to exhibit negative phototropism (q.v.); that is, are directly sensitive to light. They will, while suspended by the tail, change their position if sunlight strikes them, and move so as to keep in the shade, from a pendant to a horizontal position, through an angle varying in different species of from 45° to 70° or even 90°. Too much light, especially direct sunlight, seems to be injurious to them, and the movement is one of protection.

Chrysanthemum, krĩ-săn'the-mũm, a genus of herbs and sub-shrubs of the natural order *Compositæ*. The very numerous species are natives mostly of the cooler parts of the northern hemisphere, but some have become introduced and established in the southern hemisphere as weeds, having escaped from gardens. They are generally hardy, white or yellow-flowered, annual or perennial, and of easy cultivation. Except *C. cinerariæfolium* and *C. coccineum*, the flowers of which are used to make insect powder (q.v.), the species have small economic use, though some, notably *C. leucanthemum*, the ox-eye daisy, is a troublesome weed upon badly managed land in the United States. *C. segetum*, the corn-marigold, and *C. frutescens*, the marguerite, are cultivated for ornament, especially in Europe, where they are native.

But the most important species are *C. indicum* and *C. morifolium* (*C. sinense* of some botanists). These are the parents of the popular autumn flowers known as "mums" and chrysanthemums, the varieties of which in Europe and America are numbered by thousands, and vary greatly in size, form, and color. So great is the

CHRYSAROBIN — CHRYSOCOLLA

diversity that fanciers speak of the varieties as belonging to certain types, of which 11 are recognized: Single, double, large, small, few-flowered, many-flowered, anemone-flowered, and various forms of the ray flowers, such as incurved, reflexed, etc. The size ranges from the "pompon," which may be less than an inch in diameter, to the "show," which may exceed eight inches in diameter. But with all this range of form and color the varieties are almost scentless, or have a somewhat disagreeable odor. These varieties are mainly cultivated under glass, since they do not reach perfection in the open air. They are propagated almost wholly from cuttings, which are taken from the parent plant after it has flowered. The cuttings are grown in a cool greenhouse until spring, when the young plants, then in pots, are placed in partial shade for the summer and kept as stocky as possible. In autumn they are forwarded until they blossom, after which they are destroyed, new cuttings having been taken.

For exhibition purposes the plants are watched and tended with the most minute attention, the superfluous buds and stems being removed while still tiny. Sandy or clayey soil is found useful by various growers, but whatever its character it must be rich and rather porous. Attention to fertilization, watering and cultivation are essential. For out-door culture the large-flowered varieties are unsuited, but the hardy pompons, which are usually free-flowering, are more satisfactory. Though the season of the indoor chrysanthemum is only about six weeks long, this flower ranks fourth in importance in the United States as a commercial flower, about \$500,000 worth being used annually.

The literature dealing with this flower is voluminous, probably ranking next in extent to that dealing with the rose. Eighty-three books are listed by C. Harman Payne in the 'Catalogue' of the National Chrysanthemum Society (1896). Other references to literature are given under the title Chrysanthemum in Bailey's 'Cyclopedia of American Horticulture,' which should be consulted for descriptions of various species, types, etc., and for methods of propagation, cultivation, and management. Consult also: Scott, 'The Show Chrysanthemum and Its Cultivation'; and Bulletins 112, 136, and 147 (1896-8), of the Cornell University Agricultural Experiment Station.

Chrysarobin, krī-să'rō-bīn, a neutral principle extracted from goa-powder, a substance found deposited in the heart wood of *Vouacapa-poua araroba*. It is an extremely irritating substance and is not used internally. Externally, combined with an ointment base, it is useful in a number of chronic skin affections.

Chryseis, the daughter of Chryses, a priest of Apollo. She was captured by the Greeks in the Trojan war, and became the portion of Agamemnon. When he refused to restore the daughter at the request of her father, Apollo listened to the prayer of his priest, and sent by his arrows pestilence and death into the Greek camp. Agamemnon found himself obliged to yield up the maiden, but then robbed Achilles of the fair Briseis. Hence arose the dissension between these heroes which so long delayed the conquest of Troy, and with which the story of the Iliad opens.

Chryselephantine, krīs''ēl-ē-fān'tin, in Greek art, statues which were overlaid with ivory and gold. The frame or body of the statue upon which the ivory plates were fastened was usually of wood, and the gold was used for the garments and hair. The most celebrated of these statues were the colossal works of Phidias, of which the largest was the Pallas of the Parthenon, 26 cubits high, representing the goddess in armor covered with a long robe.

Chryses, a name appearing several times in Grecian legend: (1) a priest of Apollo, who, according to Homer, came to the Grecian camp to ransom his daughter Chryseis, who had become the prize of Agamemnon. (2) The son of Neptune and Chrysogeneia, and the father of Minyas. (3) Was the son of Minos and the nymph Pareia. He lived on the island of Paros with his brothers Eurymedon, Napholeon, and Philolaus, and was put to death by Hercules because he had, in concert with them, murdered two of his companions. (4) A son borne by Chryseis to Agamemnon after her return to her father, but alleged by her to be the son of Apollo. He assisted his step-brother and step-sister, Orestes and Iphigenia, in murdering King Thoas.

Chrysippus, Greek Stoic philosopher of Cilicia: d. about 206 B.C. He was distinguished for his skill in debate. He was the principal opponent of the Epicureans, and is said to have written 700 different works, mostly of a dialectical character; but of these no complete work is extant. He died at a great age.

Chrysis, a priestess of Juno, who by falling asleep suffered the sacred fire to destroy the temple of her goddess, and was at last burned herself.

Chrysobalanæ, krīs-ō-bāl'a-nae, a plant family closely allied to the *Rosaceæ*, of which it is sometimes considered a sub-order, comprising 12 genera, with 180 species, all trees or shrubs. Many of them, as the cocoa-plum, produce edible fruits. So do several species of west Africa, the seeds of which are sometimes substituted for or used to adulterate sweet almonds, which they resemble in taste and appearance. From the seeds of a member of the family growing in the Himalayas an oil is extracted.

Chrysoberyl, krīs-ō-bēr'īl (Gr. χρυσοβήρυλλος, "golden beryl"), a native aluminate of glucinum (or beryllium), having the formula $GlO.Al_2O_3$, and crystallizing in the orthorhombic system. It is transparent or translucent, with a vitreous lustre and a green or yellow color. The variety alexandrite (q.v.) is green by daylight and columbine-red by artificial light. The finer varieties are used as gems. It has a hardness of 8.5 and a specific gravity of from 3.5 to 3.84. Chrysoberyl occurs in Brazil, in Ceylon, in the Urals, and in Ireland; and in the United States it has been found in Maine, Connecticut, and New York. See also CAT'S-EYE.

Chrysocolla, krīs-ō-kōl'la, a hydrated silicate of copper, having the formula $CuSiO_3 + 2H_2O$. It is cryptocrystalline and usually occurs in opal-like or earthy masses, or as incrustations, or not infrequently with botryoidal surface. When pure it is translucent and of sky-blue color, but when impure it is often opaque and dull green, brown or black. Its hardness varies

CHRYSANTHEMUM.

CHRYSOGONUM — CHRYSOSTOM

with its composition, from 2 to 4, and its specific gravity from 2 to 2.2. Its lustre varies from vitreous and shining in the pure mineral to dull and earthy. It is found in copper mines in all parts of the world, especially in Cornwall, England, Australia, and Arizona. The chryso-colla of the ancients, meaning "gold glue," was apparently a body used to facilitate soldering. The name is still applied to borax which is thus used. Malachite, the green carbonate of copper, was doubtless confused with chryso-colla.

Chrysogonum, krīs-ō-gō'nūm, a monotypic genus of the natural order *Compositæ*. It is found throughout the eastern seaboard of the United States, in dry soil, from southern Pennsylvania to Florida, blossoming in April and July. It is a perennial herb with large heads of tubular and radiate flowers.

Chrysolite, krīs'ō-līt (Gr. κρυσόλιθος "bright yellow stone"), a native silicate magnesium and iron, sometimes also containing titanium, nickel, or tin. It occurs massive and granular, and also in orthorhombic crystals. It is transparent or translucent, and usually green or yellow in color, with a vitreous lustre. It has a specific gravity of from 3.27 to 3.57 (according to its composition), and a hardness of from 6.5 to 7. Chrysolite occurs in volcanic rocks, as in basalt and basaltic lavas, and it is also found in dolomite and in certain varieties of limestone. The finest crystals of the mineral come from Brazil and Egypt, and are known as "precious chrysolite." They are used to a certain extent as gems, and are sometimes confused with the emerald. Chrysolite readily passes by alteration into serpentine, and numerous large beds of the latter mineral are known to have originated in this manner. It is abundant in crystalline grains in some meteoric irons and stones. Peridot and olivine (qq.v.) are names frequently used for varieties of chrysolite.

Chrysoloras, Manuel, Greek scholar: b. about 1355; d. Constance, Germany, 15 April 1415. He was the first who, in modern times, transplanted Greek literature into Italy. The Emperor John Palæologus sent him in 1391 to Italy and England to ask for assistance against the Turks. Having thus become known in Italy he returned there about the year 1395, and was appointed professor of Greek literature at Florence, where he collected around him a great number of scholars of all ages and ranks, and excited universal enthusiasm as much by his dignity and the grace of his elocution as by the extent of his learning. From his school proceeded Leonardo Bruno, Poggius, Francis Philéplus, and other distinguished revivers of classical studies. He afterward taught with equal success at Milan, also at Pavia and Venice, and lastly at Rome. Pope Gregory XII. employed him in public affairs, and sent him with others to the Council of Constance, where he died in 1415. He should not be confounded with his nephew and companion in Italy, John Chrysoloras.

Chrysomelidæ, krīs-ō-měl'ī-dē, an extensive family of small beetles which have a hemispherical or ovate form, small, sunken head, and antennæ widely separated. All, and especially the typical genus *Chrysomela*, are very gaily colored,—blue, green, golden, or a mixture of brilliant tints. The most elegant American spe-

cies (*C. scalaris*) has the head, thorax, and under side dark green, while the wing-covers are silvery white, ornamented with small green spots on the sides and a broad irregular stripe down the middle of the back; the legs and antennæ are rust-red, and the wings rose-colored. These beetles inhabit trees, bushes, and plants, feeding, in their larval state, on the leaves. They include many species, as the potato-bug and the elm-leaf beetle, which do vast damage. Their eggs are laid on the leaves, and the grubs, which as a rule are protected by disagreeable odors and exudations, go into the ground to transform, and there spend their pupal life. The family is a very large one and is spread all over the world. See LEAF-BEETLES.

Chrysophanic (krīs-ō-fän'ik) Acid, the yellow coloring matter of rhubarb. It can be obtained direct from rhubarb by exhausting with benzol and purifying the crude product. It crystallizes in fine yellow tables. It is hardly soluble in water, but dissolves in ether, benzol, etc. With potash it gives a fine purple solution, and thus affords a delicate test for the presence of alkalis. It is also soluble, without decomposition, in strong sulphuric acid. Its acid properties are rather obscure.

Chrysophyllum, krīs-ō-fil'ūm, a genus of the sapadillo family (*Sapotacæ*), consisting of trees with milky juice, alternate leaves with numerous transverse closely aggregated ribs, and golden hairs on the under surface. In the West Indies the fruit (*cainito*) is esteemed a delicacy under the name of star-apple, which is fleshy, with several one-sided cells, or by abortion, with one. Seeds nut-like. Natives chiefly of southern United States, Africa, and India.

Chrysoprase, krīs'ō-prāz, a variety of chalcidony, colored apple-green by nickel oxide and prized as a semi-precious stone. It became popular a few years ago because of Queen Victoria's fondness for it. Silesia and Siberia long furnished a small supply, but recent discoveries in California have made it abundant and cheap. It also occurs in Oregon and North Carolina.

Chrysopsis, krī-söp'sis (from the Greek, signifying "of a golden aspect"), a genus of about 20 species of the natural order *Compositæ*, comprising nearly 30 species, natives of North America and Mexico. Commonly known as the golden aster.

Chrysostom, Dion (surnamed COCCEIANUS), Greek orator: b. Prusa in Bithynia about 99 A.D. He was first a Sophist, then a Stoic, and rose into high repute as an orator under Domitian. That tyrant, however, took offense at his freedom of speech, and he was obliged to save himself by flight. He was afterward highly esteemed by Nerva and Trajan. About 80 of his orations are still extant. They are written in an affected style, but notwithstanding form a valuable contribution to our knowledge of ancient philosophy. They appeared first in a collected form at Milan in 1476.

Chrysostom, krīs'ōs-tóm or krīs-ōs'tóm, John, Saint, archbishop of Constantinople, greatest of the Greek Fathers of the Church: b. Antioch, the capital of Syria, about 347. His cognomen, the golden-mouthed (*chrysostomos*), he owes to his extraordinarily rich, fervid, and persuasive eloquence. In his youth

CHRYSOTILE — CHRYSTLER'S FARM

he attended the school of Libanius, a celebrated Pagan sophist, was his favorite disciple, and would have been his successor had he not been won for the service of the Church by his pious mother Anthusa. In accordance with the general usage of that time, he did not receive baptism till he had attained maturity, and then he lived devoted in religious contemplation and studious seclusion in a desert place for six years. There the austerities he practised undermined his strength, and being called back to Antioch by the bishop, he was ordained deacon in 381 and presbyter in 386. By his zeal, his urbanity, and his eloquence, he won to the Church, heretics, pagans, and Jews in great numbers; and his fame spreading to the capital city of the Eastern empire, he was, with the approval of the Emperor Arcadius chosen to be archbishop of Constantinople in 397. Here he led in the episcopal palace the life of an ascetic, eschewing the pomp and luxury of his predecessors, and out of the revenues of the see maintained numerous charities. Meanwhile his homilies or pulpit discourses, which are still extant, were even a stronger attraction for the masses than the shows of the amphitheatre. But he had many rivals, who left no means untried to blacken his character, his reputation for piety, zeal, disinterestedness, and for orthodoxy, and his life was accordingly full of trials and vicissitudes. His enforcement of the Church's laws regarding the relations between ecclesiastics and the female inmates of their households; his deposition of bishops for simony and licentiousness; the restraints he put upon the vagrant habits of the monks, called forth a host of enemies, who brought against him the charge of sympathizing with heretical monks of the Nubian desert who had been excommunicated by their ecclesiastical superior, Theophilus, patriarch of Alexandria. Theophilus now added himself to the malcontents of Constantinople, and he called a synod of bishops to be held in the imperial city to judge Chrysostom. But because of the menacing attitude of the common people, who were to a man loyal to their archbishop, the synod had to be held in the neighboring city of Chalcedon. To this synod Chrysostom was four times summoned, to reply to the charges that were to be made against him, but he ignored the summons, and was declared guilty of favoring the heresies of Origen. By order of the emperor Arcadius he was exiled to Nicæa in Bithynia; but so great was the commotion of the common people in Constantinople when the decree of banishment was published, that the emperor, alarmed, ordered his recall. The re-entry of Chrysostom to the city was attended with all the pomp of a Roman triumphal procession, and he abated no jot of his zeal for the repression of the evils of Church and state. His language was, as it had ever been, sufficiently emphatic, sufficiently plain-spoken, but his enemies put in circulation a spurious version of the opening passage of his first discourse after his return: he was reported by them to have commenced his address with these words in denunciation of the empress Eudoxia: "Herodias is again furious; Herodias again dances; she once more demands the head of John." The report was false, but the fate of Chrysostom was sealed. Barbarian troops were

brought into the city to overawe the commons while another synod was in session in the city: it confirmed the decree of the synod of Chalcedon. By decree of the emperor, Chrysostom was banished to Cucusus, a place in Mt. Taurus. The people of Constantinople, not to be restrained by the garrison of Gothic mercenaries in the city, set fire to the cathedral and the senate house on the day the decree was published; and Chrysostom, though absent, was a more formidable power than ever: his correspondence with bishops, both in the East and West arrayed the whole Catholic Church against Theophilus and the court of Arcadius. Indignant at the contumacy of the exiled archbishop, Arcadius ordered his transfer to a more inhospitable region still, the desert of Pityos: he died on the way thither at Comana, in Pontus, 14 Sept. 407, being then in his 60th year. His day in the calendar of the Greek Church is 13 November; in that of the Latin Church, 27 January. His last words are reported to have been "God be in all things praised." His works consist of homilies or discourses suggested by or illustrating passages of Scripture; commentaries on the sacred books; epistles, and treatises on the truths of religion, virtues and vices, etc. Consult: Martin, 'Saint Jean Chrysostome, ses œuvres et son siècle'; Perthes, 'Life of Saint John Chrysostom and His Biographers'; Tauscher, 'Life'; both in German; and a biography by Aime Puech, in English.

Chrysotile, kris'-ō-tīl, a variety of the mineral serpentine, occurring in silky fibres that are flexible and easily separated. It is commonly greenish in color. Its specific gravity is about 2.22, which is sensibly less than that of ordinary serpentine. It occurs abundantly in Canada, where it is known as "bostonite" and "asbestos." See ASBESTOS.

Chrystler's Farm, Battle of, the most discreditable American defeat, as Chippewa was the most brilliant victory, of the War of 1812, was fought 11 Nov. 1813. The expedition prepared in the summer and fall of 1813 at Sackett's Harbor, on Lake Ontario, to descend the St. Lawrence and capture Montreal, started 17 October under bad auspices. Aside from insufficient resources and the lateness of the season, the personnel was hopeless. The commander-in-chief alone would have ruined it. This was Maj.-Gen. James Wilkinson, termed by Scott, "an unprincipled imbecile," a mere cunning jobber, of neither military talent, firmness, nor even character to be respected, and despised by all the other officers. He had been appointed for the curious reason that New Orleans was not thought safe in his hands. Furthermore, he was prostrated with lake fever, as was his second in command, Morgan Lewis. Boyd, the third, was so incompetent that Jacob Brown, the one able fighting general, had threatened to leave the army rather than serve under him. Men cannot fight without leaders. The flotilla, battered by contrary winds, began the descent of the river 5 November. From this on, the British made progress slow and dangerous. Capt. Mulcaster, an able and daring naval officer, with several gunboats, harassed the rear, and 800 regular infantry co-operated with him, pouring musketry and artillery fire on the expedition from the opposite bank whenever possible, besides the batteries at Prescott. Brown's and

CHU-HI — CHUBUT

Macomb's brigades were landed on that side to clear the road; and by 10 November the flotilla had reached the Long Saut, and anchored for the night at Chrystler's Farm on the Canadian side. The next morning Brown marched down beside the rapids with his brigade, and Boyd was ordered to take the rest of the troops, some 2,000, with six field pieces, and guard the rear. Brown reported all clear, and the fleet was about to run the rapids when Boyd reported that the enemy was advancing in order of battle. Wilkinson was sick in bed and could give no orders; so was Lewis; and Boyd was left to fight his own battle. He did it as a weak commander usually does, by detachments, which the British crushed in detail, though they had but 800 against 2,000. The battle lasted from about 2.30 to 4.30, when Gen. Covington was killed and his brigade driven back in disorder. Then the whole American line gave way and retreated in haste. Wilkinson reported 102 killed and 237 wounded, and the British claim to 100 American prisoners is more likely to be true than Wilkinson's report of none. The British reported 22 killed, 148 wounded, and 12 missing. The American troops hurriedly re-embarked; the next morning the flotilla ran the rapids to Cornwall. There Wilkinson learned that his colleague, Wade Hampton, had ended operations for the season (see CHATEAUGAY), and at once went into winter quarters. Consult Henry Adams, 'History of the United States,' Vol. VII., chap. 8.

Chu-Hi, choo-hē', Chinese scholar and philosopher: b. 1130; d. 1200. As a student of the Chinese classics, he became widely known through his interpretation of the doctrines of Confucius, and became one of the founders of the Chinese school of speculative philosophy. He had a large number of disciples among the scholars, and they, under his direction, compiled a history of China in 59 books, which is still a standard work.

Chu-Kiang, choo-ke-äng', or **Canton River**, the "Pearl River" of the Chinese, is the lower part of the Pe-Kiang, and has a navigable channel of about 300 miles. Opposite Canton it is about one fourth mile wide, and is crowded with shipping up to 1,000 tons burden; larger vessels must tie up at a point 15 miles below. About 40 miles below Canton it is called "Boca Tigris," or "The Bogue."

Chub, a name given to various species of fishes of the family *Cyprinidæ* (q.v.), of which the river chub (*Hybopsis kentuckiensis*) and the creek chub (*Semotilus atromaculatus*) are the most important in the United States. The name is also sometimes applied to the roach (q.v.), and more rarely to certain marine fishes, as the rudder-fish. The river chub is abundant in rivers and creeks throughout the eastern United States, and may be known by its orange-colored fins and the tuberculate head of the males in spring. It reaches a length of 10 to 12 inches, and is a favorite with the less ambitious anglers in certain regions. The creek chub, or horned dace, is even more widely distributed, and inhabits brooks rather than rivers. It resembles the roach, but has a black spot in front of the dorsal fin and does not exceed a foot in length. The large black chub (*Acrocheilus alutaceus*), of the Pacific coast rivers, is known locally as chiselmouth, squaremouth, and hard-

mouth. The English chub (*Squalius cephalus*) is a much larger fish, attaining a length of two feet and a weight of eight pounds, and lives in mountain brooks as well as in rivers. It is a game fish of considerable importance.

Chub-mackerel, a fish (*Scomber colias*), found in immense numbers in the Mediterranean Sea. It is the "Spanish mackerel" of England.

Chubb, Thomas, English controversialist: b. East Harnham, near Salisbury, 29 Sept. 1679; d. Salisbury 7 Feb. 1747. He was a mechanic who employed his leisure in the acquisition of knowledge from the best English books which he could procure. In 1715 he published 'The Supremacy of the Father Asserted,' the perspicuity and argumentative skill of which obtained for it much notice. Of course a production assailing the orthodox faith did not pass without reply, and a controversial warfare commenced which lasted as long as his life. In 1730 he offered to the world his thoughts on a variety of topics, moral and theological, in thirty-four tracts, collected in a 4to volume, of which book Pope in a letter to Gay speaks with great respect. Various publications followed, for example, 'A Discourse Concerning Reason'; 'The True Gospel of Jesus Christ Asserted'; 'Inquiry into the Ground and Foundation of Religion,' etc.

Chubb Lock (so called from the name of the inventor), one of the most intricate of the many-tumbler locks which were first made in England by Barron in 1774. The locks of Chubb have obtained their celebrity partly from their superior workmanship, having more tumblers than usual, with the addition of a lever called the "detector," which is so fixed that, while it does not act under the ordinary application of the key, it cannot fail to move if any one of the tumblers be lifted a little too high, as must be the case in any attempt at picking. The bolt becomes immovably fixed, and thus, while rendering all further attempts at picking useless, gives notice that such an attempt has been made on the next application of the proper key. To draw the bolt after it has been tampered with, it is necessary only to turn the key a little farther forward, as in the process of overlocking; this pushes up a tooth at the end of the detector, restoring the lock to its original position, and the key is then free to turn in the ordinary way. These locks, which were patented as far back as 1818, maintained the reputation of being invincible until the celebrated locksmith Hobbs, of the United States, in 1851 succeeded in picking the most intricate locks of English workmanship, such as Chubbs, Bramahs, and Cotterills.

Chubut, choo-boot', Argentina, a territory in the northern part of Patagonia, so named from a river which drains a large part of the surface. Its area is about 90,000 square miles. Its principal interest lies in its Welsh settlement, which has remained almost wholly Welsh-speaking. The first settlers, 151, arrived in July 1865. Epochs in its history have been the abandonment of the colony in 1867; the subsequent return from New Bay; a 20 months' nearly complete isolation from the outer world, terminated in 1871. The principal town, Rawson, is situated about five miles from the Atlantic Ocean, and has a population of a few hundreds. English grain and roots are produced, and salt of good quality is found.

CHUCK-WILL'S-WIDOW — CHURCH

Chuck'-Will's-Wid'ow, a large, nocturnal bird (*Antrostomus carolinensis*) related to the whippoorwill, common in the Southern States of the Union. The name is an attempt to reproduce the note of the bird. It is fully 12 inches in length, and is one of the largest of American song-birds, and when uttering its call, opens its mouth enormously. The eggs are laid upon the ground, little or no attempt being made to form a nest. The bird is a voracious eater of insects, its large bristled mouth fitting it for catching flying objects.

Chuckwal'la. See LIZARD.

Chufa, choo'fa. See NUT-GRASS.

Chu'kor, or **Chicore**, a partridge (*Caccabis chukor*), the favorite game-bird of the foothills of the Himalayas.

Chumbul', a large river of Hindustan. It rises in Malwa, in the Vindhya Mountains, about 50 miles south of Oojein, flows north, enters Rajpootana, through which it runs northeast, and falls into the Jumna about 90 miles southeast of Agra, after a course of over 650 miles.

Chunam', in India, a name given to a very fine kind of quicklime made from calcined shells or from very pure limestone, and used for chewing with betel (q.v.). It is also used for plaster, being mixed with fine sand by wetting, and sometimes with various other materials added. It makes a plaster of great durability, capable of being highly polished, and suitable for decorative work.

Chunar-Ghur, chün-är'gër, India, a town, fortress, and invalid station in Hindustan, 17 miles southwest of Benares, on the Ganges. The fortress stands on a lofty rock rising abruptly from the river. Chunar was stormed by the British in 1764, and formally ceded to the East India Company in 1768. Pop. 12,000.

Chung-King, chüŋ-këŋ', China, a city in Szechuen, on the Yang-tze-Kiang, at its junction with the Kia-ling. It was declared open in 1890, and has acquired a thriving trade. There was a rebellion of the natives here in 1896-8, which checked progress. A railroad to centre at Chung-King is projected, and valuable coal-mines are to be worked. Pop. about 125,000.

Chuprah, chüp-rä', or **Chaprah**, India, a town of Hindustan, in Bengal, on the Gogra, near its junction with the Ganges, 32 miles west-northwest of Patna. It is narrow, but extends along the river for four miles. It has government courts and offices, government English school, and is a station of the German Lutheran Mission. Pop. (1901) 45,400.

Chuquisaca, choo-kë-sä'ka, Bolivia, a department in the southeastern part of the country, bounded on the north by the department of Santa Cruz, on the east by Brazil, on the south by the department of Tarija, and on the west by the departments of Oruro and Potosi. Its area is variously estimated at from 40,000 to 73,000 square miles, the southern boundary of Bolivia not having been definitely determined. The eastern portion is mostly level, the mountainous parts being in the west. There are large forests and grazing lands, and the soil, where cultivated, is found good for agriculture. Mineral deposits exist, the most valuable being silver,

of which some is mined. Among the other productions are wheat, coffee, sugarcane, and cacao. The capital of the department, and also of the republic, is Sucre (q.v.). The population is about 285,000, embracing 80,000 civilized Indians and 8,000 whites, the rest being wild Indians.

Church, Albert E., American mathematician and military officer: b. Salisbury, Conn., 1807; d. West Point, N. Y., 30 March 1878. He was educated at West Point and was professor of mathematics there 1834-78. His mathematical works include 'Elements of Differential and Integral Calculus' (1842); 'Elements of Analytical Geometry' (1851); 'Analytical Trigonometry' (1857); 'Elements of Descriptive Geometry' (1865).

Church, Alfred John, English translator and author: b. London 29 Jan. 1829. He was educated at Lincoln College, Oxford; was ordained in the English Church in 1853, and after holding several head masterships, was professor of Latin in University College, London, 1880-8; and rector of Ashley, Gloucestershire, 1892-7. Beside publishing translations of Tacitus and Livy, he is the author of 'Stories from Homer' (1877); 'Stories from Virgil' (1878); 'A Traveler's True Tale, after Lucian' (1879); 'Stories from the Greek Tragedians' (1879); 'Stories from the East' (1880); 'The Story of Jerusalem' (1880); 'The Story of the Persian War' (1881); 'Stories from Livy' (1882); 'Roman Life in the Days of Cicero' (1883); 'The Chantry Priest of Barnet' (1884); 'With the King at Oxford' (1885); 'Two Thousand Years Ago, or the Adventures of a Roman Boy' (1885); 'Carthage' (1887); 'The Count of the Saxon Shore' (1887); 'Three Greek Children' (1888); 'To the Lions' (1889); 'Burning of Rome' (1891); 'Pictures of Roman Life and Story' (1892); 'Early Britain'; 'Bacon'; 'Callias'; 'Heroes of Chivalry'; 'Lords of the World'; 'Helmet and Spear'; 'Spencer'; etc. His books have been widely read in America.

Church, Arthur Herbert, English chemist: b. London 2 June 1834. He was educated at King's College, London, the Royal College of Chemistry, and Lincoln College, Oxford. He was professor of chemistry in the Royal Agricultural College, Cirencester, 1863-79; and has filled the same position in the Royal Academy of Arts from 1879. He is the discoverer of the animal pigment known as turacin, and of churchite, a native cerium phosphate, and has published 'Precious Stones' (1883); 'English Earthenware' (1884); 'The Laboratory Guide' (7th ed. 1894); 'Food' (16th thousand, 1901); 'Josiah Wedgewood' (1894); 'Color'; 'Guide to Corinium Museum.'

Church, Benjamin, American soldier: b. Duxbury, Mass., March 1639; d. Little Compton, R. I., 17 Jan. 1718. He commanded forces with distinction in King Philip's war and in the famous battle of 1675 with the Narragansetts won renown. He captured and executed King Philip in 1676. 'Entertaining Passages Relating to King Philip's War' were compiled from his notes by his son Thomas.

Church, Benjamin, American physician: b. Massachusetts about 1710; d. 1776. He was graduated at Harvard; became noted for his patriotic writings during the decade preceding

CHURCH

the Revolutionary War, and was a leader in the "Boston tea-party." He secretly corresponded in cipher with the British, and, being detected, failed to exculpate himself. He was lost at sea while on a voyage to the West Indies.

Church, Francis Pharcellus, American editor: b. Rochester, N. Y., 22 Feb. 1839; d. New York City, 11 April 1906. He was the first publisher and editor of the 'Army and Navy Journal'; afterward, with his brother, he established and edited the 'Galaxy' magazine. He was a leading editorial writer on the New York *Sun*, and till his death was a proprietor of the 'Army and Navy Journal.' He published 'Life of Ulysses S. Grant' (1899); and 'Life of John Ericsson' (1891).

Church, Frederick Edwin, American landscape painter: b. Hartford, Conn., 4 May 1826; d. New York 7 April 1900. His earliest productions were views of the Catskill Mountains, among which he resided, and a view of East Rock, near New Haven, which attracted very favorable notice. In 1855 he visited South America, and found in the magnificent scenery of that country materials for several of his most admired pictures. After his return he executed his 'View of Niagara Falls from the Canadian Shore,' regarded by many as the most successful representation of the great cataract. Among his other works are 'The Heart of the Andes'; 'Cotopaxi'; 'Morning on the Cordilleras'; 'Under Niagara'; 'The Icebergs'; and 'Sunrise on Mount Desert Island.' After a visit to the Holy Land in 1868 he painted 'Damascus' (1869); 'Jerusalem' (1870); 'The Parthenon' (1871).

Church, Frederick Stuart, American artist: b. Grand Rapids, Mich., 1842. He studied at the National Academy of Design, and since 1885 has been a full member thereof. He has achieved note as a realist and is well known as a painter of figures and animals.

Church, George Earl, American soldier, engineer and explorer: b. New Bedford, Mass., 7 Dec. 1835. He was a member of the Scientific Exploring Expedition in South America in 1858; served in the Army of the Potomac 1862-5; and was war correspondent in Mexico for the New York *Herald* 1866-7. He made explorations in South America 1868-72; was United States commissioner to visit and report on Ecuador 1880; represented American Society of Civil Engineers at London Congress of Hygiene and Demography in 1891, and was president of the Geographical Society of the British Association in 1898. He is now resident in London where he is vice-president of the Royal Geographical Society.

Church, Irving Porter, American civil engineer: b. Ansonia, Conn., 22 July 1851. He was educated at Cornell University and has been professor of applied mechanics and hydraulics in the College of Civil Engineering there, from 1892. He has published 'Statics and Dynamics for Engineering Students' (1886); 'Mechanics of Materials' (1887); 'Hydraulics and Pneumatics' (1890); 'Notes and Examples in Mechanics' (1892).

Church, John Adams, American mining engineer: b. Rochester, N. Y., 5 April 1843. He was graduated from the Columbia School of

Mines in 1867, was professor of metallurgy in Ohio State University 1878-81, and was four years in the service of Li Hung Chang in Mongolia, engaged in developing silver mines. He has published 'Notes on a Metallurgical Journey in Europe'; 'The Comstock Lode'; 'Report on Artesian Wells in Arizona.'

Church, Richard William, English clergyman: b. Lisbon 25 April 1815; d. London 9 Dec. 1890. He took a first-class at Oxford in 1836, and soon after was elected to a fellowship at Oriel. From 1853 to 1871 he held the rectory of Whatley, near Frome. In 1871 he became dean of St. Paul's Cathedral, London. In 1854 he published 'Essays and Reviews,' and thereby took rank almost at once as one of the most graceful and scholarly writers of the day. His university sermons 'Human Life and its Conditions' (1878); 'The Gifts of Civilization' (1880); and 'The Discipline of the Christian Character' (1885), are profound contributions to religious thought. Other works by him are 'Life of Anselm' (1871); 'The Beginning of the Middle Ages' (1877); 'Dante: an Essay' (1878); 'Spenser' (1879); 'Bacon' (1879); 'The Oxford Movement' (1891); 'Miscellaneous Essays'; 'Occasional Essays.' See 'Life and Letters of,' (1896).

Church, Samuel Harden, American writer: b. Caldwell County, Mo., 24 Jan. 1858. He is a railway official in Pittsburg, Pa., and has written 'Oliver Cromwell: a History' (1874); 'John Mannaduke,' a romance (1897); 'Corporate History of the Pennsylvania Lines West of Pittsburg' (1898-1900).

Church, William Conant, American journalist: b. Rochester, N. Y., 11 Aug. 1836. He became the publisher of the New York *Sun* in 1860, and was war correspondent of the *Times* (1861-2). In conjunction with his brother Francis (q.v.) he established the 'Army and Navy Journal' (1863), and the 'Galaxy' magazine (1866), and has been a contributor to the 'Century' and other periodicals.

Church. This word probably comes from the Greek *kyriakos*, dedicated to the Lord; the Scottish *kirk* and German *kirche* are forms of the same word. It has various meanings; in its widest sense it denotes the whole community of Christians, and was thus used by the New Testament writers. In more restricted significations it denotes a particular section of the Christian community differing in doctrinal matters from the remainder, as the Roman Catholic Church, the Protestant Church, etc.; or to designate the recognized leading church of a nation, as the English, Scotch, or French Church. It is applied in a sense which is manifestly too narrow, when it denotes merely the officers of the church, or clergy. In yet another sense it signifies the building in which Christians assemble for the worship of God, and, referring the reader to the separate articles on the sects into which the community is divided, we shall confine ourselves here to a few remarks, historical and descriptive, on *church* as denoting the edifice appropriated to Christian worship. When in the time of Constantine the persecuted Christians emerged from their meeting-places in upper rooms and in the Roman catacombs to bask in the sunshine of imperial favor, no buildings could be found fitter for their purposes than the

CHURCH — CHURCH AND STATE

basilicas of Rome. The basilica was generally in the form of a parallelogram, with a semi-circular apse at one end, which was raised, being approached by a semicircular range of steps. In the centre of this apse was the raised seat of the quæstor or other presiding magistrate; on each side, upon the steps, were places for the assessors, or those engaged on the business being transacted. In front of the apse was placed an altar, where sacrifice was performed before undertaking public business of any importance. The area of the building was divided by two rows of columns, the central division or nave being by far the broadest; over the two smaller divisions or aisles a gallery was often raised. In the small dark and Pagan temple there was neither room nor light enough to conduct Christian worship, but in such a building as above described, the whole congregation of the faithful could meet and take part in the act of worship. The bishop naturally took the place of the quæstor, the priests that of the assessors. The altar on which the pious Pagan poured his libations at the commencement of important business served equally well for the celebration of Christian rites. When in course of time the separation between laity and clergy became complete, the apse was railed off and appropriated to the use of the clergy, then the raised part on which the altar stood was separated by pillars called *calcelli*, and not allowed to be profaned by the multitude. Another change was the introduction of a choir, or enclosed space in the centre of the nave, round three sides of which the faithful congregated to hear the gospel read from two pulpits built into its inclosure on either side, or to hear the services read or sung by the inferior clergy, who occupied its precincts. As time wore on other modifications were introduced; on the erection of new buildings, the symbolic form of the cross was generally adopted as the most suitable for a Christian building; the arms of the cross (the transept) were railed off by rows of columns as the main building had been; at the point of intersection of the transept with the nave a tower was raised, which was at times surmounted by a small spire; frequently two towers were placed at the angles of the entrance end of the edifice. Over the greater part of Europe the style which came to be usually adopted for ecclesiastical buildings was the pointed Gothic, as lending itself more readily to a more majestic and ornamental treatment than the graceful Greek with its columned portico and rounded tower. Circular churches, which were popular at an early date, have found little imitation. The structures which are among the most notable in point of size or historic interest are alluded to in the article on CATHEDRALS. The ordinary churches are generally long rectangular buildings, without transepts, and the tower is placed so as to form the principal entrance, or at one of the angles of that end of the church. Of late years a taste for a superior style of building to that hitherto prevalent has sprung up, even among the dissenting bodies in England, and the Presbyterians of Scotland. See ARCHITECTURE.

Church, an Organization of Christians. As understood to-day there are two widely different opinions regarding the meaning of a church, and both claim the New Testament as

authority, (1) that Jesus Christ established a definite Church with a code of laws pertaining to belief and government; (2) that he gave us only moral instruction and no definite laws of belief or discipline. Under (1) may be classed those who claim that Jesus Christ established only one Church, and that the churches mentioned by Paul and others of the early missionaries as recorded in the New Testament, were all parts of the one Church. Still others hold that the Christian Churches of the New Testament were each separate and distinct in government, but one faith. The Roman Catholic, Greek, Church of England, and all Christian organizations with any generally recognized form of government, whether by presbyters or by the congregation, may be classed under (1). Under (2) will come all who hold that to observe the moral code as taught by Jesus Christ is all sufficient, hence this division need not be treated under the head Church.

The Roman Catholic definition of Church is: "The congregation of all the faithful, who being baptized, profess the same doctrines, partake of the same sacraments, and are governed by their lawful pastors under one visible head on earth, the Bishop of Rome." This implies unity of faith, morals, and government. The Greek definition is the same except they do not recognize as the visible head the Bishop of Rome. The Church of England definition is: "A congregation of faithful men, in which the pure word of God is preached, and the sacraments be duly administered in all those things that are of necessity requisite to the same." In the further authorized explanation of this definition it is shown that the government is given to the bishops without any authoritative head. The same definition is in general use by all other Christian Churches, but in some the government is vested in presbyters, elders, or officers acting as elders; in others the government rests in the congregation or members of the church.

Under the names of the various Christian denominations may be found further information regarding particular doctrines and forms of government. See CHRISTIAN CHURCH; CHRISTIANITY.

Church-ale, formerly a church festival in England at which ale was drunk liberally; also the ale brewed for such a festival. The name is obviously compounded like bridal = bride-ale, scot-ale, clerk-ale, bid-ale, etc. The church-ales were usually held upon Whitsuntide, and two persons were chosen beforehand to preside over the feast, and divide out the victuals and drink voluntarily contributed by the parishioners. Sometimes the drink which had been brewed from malt given by the parishioners was sold about Whitsunday at the church for the support of orphans and poor, the repair of the church, and similar objects. The practice of holding church-ales with the corresponding games was denounced by the Puritans, and is not overlooked in Stubbs' 'Anatomie of Abuses.'

Church and State. Between these two institutions, in modern times, there has rarely, if ever, existed perfect harmony. This struggle, so long protracted, bids fair, unless some astonishing upheaval occurs, to last for all time. It has been a bitter one. It has involved large interests and brought to the forefront momentous

CHURCH AND STATE

discussions. It has fomented uprisings of all kinds and originated a literature of vituperation without parallel outside of political strife. It has been, not seldom, mere political contention. There has been much confusion of issues, yet the lines of division are visible throughout. The question has its historical side and its doctrinal features. In contemporaneous events it is reduced, practically, to a battle between one important Church and not a few of the civil powers. In Italy the recognition of that Church has reached the irreducible minimum. France has at last snapped the only link which, since the days of the Directory, constituted after all but a semblance of union. Everywhere at present we find ourselves confronted with a State using its power against a Church, or a State Church, or Church and State going their own ways, very little mindful of each other. Summarized, the history of the contest is that before the coming of Christ there was no Church in the sense in which it has been presented by Christianity in its many forms. The religions of antiquity, with the exception of that of the Jews, were for the most part unsystematized beliefs and a ceremonial which was either identified with the State or was a mere function thereof, dependent in a large measure on civil rulers. This is found to be the case in the great religions of the ancient world. The religions of the Egyptians, of the Assyrians and Babylonians, of the Iranians, of the early Sanscritic Indians, of the Phœnicians and Carthaginians, of the Etruscans, and of the ancient Greeks and Romans (Rawlinson). The religion of the Jews, as is sufficiently well known to all educated persons, was the essential element in their theocratic form of government. While this lasted friction was hardly possible. In captivity the Jews, as religionists, were more or less hampered by their conquerors. They were sometimes persecuted, sometimes unmolested. In general, a goodly amount of religious liberty was accorded them. The historic struggle for Church supremacy and independence began with Christianity. It met with opposition from the start. The antagonism germinated the day when Herod, his court, and all Jerusalem were troubled, because wise men came from the East and asked where is He that is born King of the Jews. It became more accentuated when Christ began to teach in public and more intensified when his disciples set out upon their missionary journeys. In the commencement of the 2d century the Roman empire, which was the whole known world, was agitated, and for 200 years thereafter the imperial State used all its powerful machinery to crush the Church out of existence. It is to be noted that whenever the State pressed heavily against the Church, the reason put forward was the weal of the State. This has always been the war cry. Under Constantine the Church entered the arena of universal activity as a collaborator in the task of civilizing the peoples. Acknowledged as the spiritual ruler, it gradually acquired a local habitation and a name as a temporal potentate. It became a world power. This success was the beginning of all the many disasters of the Church. Some say this external grandeur was the cause, others that it was merely the occasion, of every calamity by which the Church has been visited. Emperors granted her immunities

and promulgated laws in her favor. The wealth and position which she acquired (legitimately or not, according to the spirit of her founder or not, is still a problem for many) was a basis for her of independent action. From the preaching of Christianity at Rome, to the conversion of Constantine, the State persecuted the Church and refused to recognize the divine authority it claimed to possess. From Constantine to Charlemagne the civil power, while giving legal recognition to the Church, interfered in its government. From Charlemagne to a period approaching that of the Reformation, Church and State were closely united and there was a generally acknowledged subordination of the civil to the spiritual authority. During this last division of history, the Church was in possession to a very marked degree of the prize which she has lost, though still fights for; that is, she was admitted to have an independent sphere of action, a supremacy in all spiritual matters, and an undisputed title to the territory which in one or other way she had acquired and enlarged. She has been accused of greed and tyranny in her management of her temporal rights. In every age many foreswore their allegiance to her. Deserters from her camp counted peasants and princes. These either used or invoked the secular arm against her. The Arians and other dissenters did this. Modern nations were formed and the idea of individual independence became stronger and more general. The Eastern schism was open rebellion against the parent Church. The Orient went its own way through many vicissitudes and much bickering, until it was finally absorbed by the State. In that large portion of Europe there was no longer conflict, for ecclesiastical rule was swallowed up in that State Church which Peter the Great established and which he denominated the Orthodox. Constantinople had drawn Russia into the schism. From 1700 A.D. onward, Peter no longer appointed any one to the office of patriarch, but decreed a directing synod at St. Petersburg and placed himself at its head (1721). The secession of Martin Luther and his adherents revolutionized the condition of things. His doctrines and his alliances with princes brought about rupture after rupture with the old Church (1530). The followers of Luther discarded all Roman authority whether in temporal or spiritual matters. The Roman empire gradually split into fragments. Princes introduced the new creed into their respective States. The opposition to Rome grew apace. It ran like a tidal wave over Europe. The British Isles were drawn into the vortex. Henry VIII. declared himself head of the English Church. In France Gallicanism propagated a spirit hostile to the Church. Voltaire and the Revolution abolished every vestige of papal authority. A reaction began with Napoleon, who aimed at subordinating the supreme ruler at Rome to himself and to his power. There was a protest on the part of the pontiff. He was thrown into prison. At last a concordat was agreed upon between the consul and himself. Barring the revolutionary changes, the attitude of France has remained the same. The concordat was more or less religiously adhered to until these later times, when the French government violated nearly all its agreements and very recently annulled it, thus completely separating State from Church. The

CHURCH AND STATE

Chamber of Deputies has passed the bill effecting the separation of Church and State in France. Will it pass the higher house remains to be seen. The principles involved in the measure are destructive of all union between the two powers. The State neither recognizes nor salaries any form of worship. The exercise of worship is free under certain restrictions. French citizens, ecclesiastical as well as lay, are not all at one in their views regarding the nullification of the concordat. Some see in it a beginning of better days for religion just as not a few Catholics, the world over, are against any kind of a union anywhere between Church and State and think that the Roman pontiff is much better circumstanced now that he has no temporal rule, for the welfare of the Church and its mission. They hold that the Church won spiritually during the three first centuries—a period when the popes never dreamed of becoming civil sovereigns. Whether or not this view can be considered an orthodox Catholic view may be decided by a reference to recent papal utterances on the matter. It would appear that since the Reformation the only Church which maintains what it considers its prerogatives in relation to the State is that of Rome. Practically every other Church is a State one, or claims no rights as against civil government, and as a consequence is ignored by secular constitutions, or is an instrument more or less passive, of the kingdoms or principalities or republics of which it is a territorial part, or is so limited numerically and has so small a voice in general affairs that its demands challenge neither notice, nor censure, nor opposition, on the part of the State. Thus the struggle which for so many centuries shook the world is narrowed down to an antagonism between governments and Rome. The old Roman Church power has dwindled down to a very small area, without kingdom or weapons of defense. Its isolation is complete and absolute. As this Church holds views on the status of Church and State, as she still maintains the principles which for no short period directed national movements, her position demands investigation. What does this Church claim? What is the basis of that claim? To these two questions the Catholic Church has given an answer which goes back very far. The answer is found in all the papal documents in which the popes have touched on this subject. The reply has been very diligently elaborated by the great doctors and theologians and has introduced into what may be termed, without any implied reproach, Catholic Casuistry, a series of discussions which contain minutiae of argumentation exceeding the possibilities of this notice to compass. The following condensation will bring forward the very large outlines only. Civil power as well as ecclesiastical authority are of divine origin. Both aim at the welfare of humanity, the one in a higher, the other in an inferior degree. As both agencies are necessary for the betterment of the race, there must be union and not separation. Not only is union demanded by the nature of the common purpose, but subordination also, and in that subordination the place of supremacy must be ceded to the Church. Each power is distinct, yet each is to help the other. The duty of the State is to protect all the rights of every man, to provide for all a quiet and regulated ex-

istence, and, where necessary, to co-operate with the Church, whose divine character it is bound to recognize in the leading of all men to salvation. The Church has the right to require from the secular ruler, as from the individual Catholic, that he should receive from her hands the divine law and act in conformity with her interpretation of its precepts. The Church strengthens civil authority by imposing upon all her subjects that State power is of divine right, that secular governors are the anointed of the Lord. According to this view, in many ages the pope was looked upon as the head of the immense Christian family scattered throughout the earth. He cited before his tribunal both sovereigns and subjects, composed quarrels, inflicted spiritual penalties upon scandalous princes, and deprived of their dignities and rights those who refused obstinately to change their line of conduct. The pope was then regarded as the natural head and father of Christendom. Kings stood in need of the Church for things religious and the Church was protected by the laws of the State. If the warning voice of the Church failed to deter the evil-doer, the sword of the civil power was drawn in her behalf. The Church asserts her right, in virtue of her divine commission, to require of every one submission to her doctrine. "Each power remains sovereign in its own sphere, each is confined within limits perfectly defined and traced in conformity with its nature and special purpose. There is therefore a circumscribed sphere within which each of them exercises its own action, *jure proprio*, through its own right. Yet, as their authority is wielded over the same subject, it may happen that one and the same thing, though from a different cause, may be under the judgment and jurisdiction of both powers." This position the Church bases on the fact that to St. Peter, according to her view of Scripture and tradition, and to his successors, Jesus Christ confided the government of His Church; secondly, on the more exalted nature of her appointed end; thirdly, on the conduct of Christ and the apostles who never asked leave from civil rulers to evangelize and whose principle (Acts v.) was: "We ought to obey God rather than man." The Church declares that she proclaims the independence of secular power and she herself cannot interfere as long as State action does not infringe upon the laws of God and the rights of the Church and the spiritual interests and chief end of man are not endangered by legislation. In case of conflict, that is to say, when in mixed questions, the two authorities impose upon their subjects, who are the same persons, contradictory obligations, the State should yield to the Church. The foregoing are the principles affirmed by the Church and are the Catholic view of the relations which should exist between both. This doctrine is her doctrine to-day. A stand so peremptory and so unmistakable has not met with universal approval. Within the last 300 years it has been denied *in toto*. The opponents say the foundation on Scripture and tradition is insecure, that such a relation as Rome calls for is inadmissible, because the history of the past proves that it was always controverted in theory and practice, that it led to the denationalizing of peoples, that it incited to the worst of crimes, that it extinguished every spark of patriotism, that it called

CHURCH AND STATE IN THE UNITED STATES

for the universal empire of the Church, that it spoke for greed and tyranny and self-aggrandizement merely, that it crushed intelligence and battered down all the props of individual and collective freedom, that it fettered thought and clipped the wings of science, that it deflected nations on their march toward progress, and that it was a benighted doctrine and to be fought and execrated wherever it showed its head. Statesmen have scoffed at it and expelled its votaries as they would drive out anarchists and criminals. Laws in the most enlightened countries have been made to prevent, if not its existence, at least its logical effects. The widespread theory held by the powers to-day is either: no Church or absorption of Church by State or the subserviency of the Church to the State. It has assuredly gone hard with Catholics in many ages and under many governments. No one upholding the doctrine of Rome could be a citizen, was the expressed opinion of multitudes in America and everywhere. The Roman Catholic teaching on this point has angered governments because of two special questions, that of education and that of divorce. In recent times the Church has not been silent regarding the family and her protests have irritated many, while it has also been confirmed by the approval of men outside her pale. As the pope is now an isolated individual, stripped of all temporal power, the question of Church and State has become purely academic. It must not be lost sight of that, though no civil ruler, his spiritual legislation extends over some 250,000,000 subjects, who are more or less obedient to his commands, and that therefore the States not only now but as long as the papacy lasts will have to reckon with his influence and cannot afford to consider him as at any time a negligible quantity, and hence the question of Church and State is one which, concerning essential features, is not yet to be considered beyond discussion or likely to be closed. See FRANCE.

Bibliography.—Hooker, 'Ecclesiastical Polity'; Balmes, 'European Civilization'; Hallam, 'Middle Ages'; Gladstone, 'Essays'; Macaulay, 'History of England'; Taparelli, 'Diritto Naturale'; Philipps, 'Kirchenrecht'; papal encyclicals. This question is treated in nearly all dogmatic theologies of any note, and they are many, as well as in ecclesiastical histories.

P. A. HALPIN,

Saint Thomas' Rectory, New York.

Church and State in the United States.

That an indispensable function of any government is the conservation of public morals, and that an indispensable method of achieving it is to enforce the public exercise of some religious forms, seemed axiomatic to most people in the 17th century. The tenet that religion is best promoted by leaving it to individual discretion was first evolved, naturally, by groups whose best hope was immunity, not establishment. These differing circumstances in the English colonies, with change of views from experience and change of policy from gain or loss of power, resulted in four chief attitudes of the colonial governments toward religion: (1) the establishment of a specific Church, and the taxation of the entire community to support it; (2) restriction of suffrage to church-members, without specifying the church—"theocracy"; (3) requirement of some church form and steady

parish service in communities, without establishment of a specific church or disfranchising individuals; (4) entire religious liberty.

The first type is found in the chief Southern colonies and New England. Virginia came first, then Carolina before its division, the "Fundamental Constitutions" (see CAROLINA, ORIGINAL CONSTITUTION OF) merely shaping in this respect the provisions of Charles II.'s charter; lastly Maryland in 1691, after overthrowing the tolerant proprietary government. Each, from the nature of the case, established the Church of England. In New England the form of establishment was peculiar and *quasi-casual*; it was not statutory nor specific, but rested on local taxation to support a church which, owing to circumstances, was at first always the Calvinistic Congregational Church. When other church bodies began to grow, this taxation was remitted to all who supported a church of their own; those who were not thus *bona fide* contributing members to another church paid their cess to the Congregational as before. The second type is represented exclusively by the early Massachusetts Bay and New Haven colonies. The former, 18 May 1631, when as yet there was no popular representation in the colony, enacted "that no man should be admitted to this body politic but such as are members of some of the churches within the limits of the same." This restricted suffrage to one fourth the adult males, and was repealed 3 Aug. 1664. The latter, 4 June 1639, agreed "that church members only shall be free burgesses, and they only shall choose among themselves magistrates and officers" for public business. This, of course, perished with the absorption of the New Haven into the Connecticut colony, in 1662. The third type has but one representative, New York, including the Jerseys. This was "the Duke's" (afterward James II.) constitution, and is not the only ground for a less harsh judgment on him than prevails. The fourth type includes Rhode Island, the product of a quarrel with Massachusetts theology and politics, in which the founder's views developed by force of circumstances as he went on; Maryland, founded by a Roman Catholic who would not have been allowed to establish his own religion; Pennsylvania, equally limited to seeking immunity from persecution; and Georgia, founded late by an enlightened philanthropist.

The Revolution swept away all vestiges of establishment. The Constitution of 1787 provided against a danger not likely to recur. Article VI. enacts: "No religious test shall ever be required as a qualification to any office or public trust under the United States." This, however, did not touch the real likelihood if bigoted sectarians should control the government; the State conventions held to ratify the Constitution, urged a clause to guarantee full religious liberty; therefore the First Amendment begins: "Congress shall make no law respecting an establishment of religion, or prohibiting the free exercise thereof." Even this does not in the least debar individual States from doing it; but most of their constitutions decisively prevent that, not only by direct prohibition, but by enacting that no appropriation of public money shall be made to sectarian institutions. The stability of this provision, the impossibility of evading it, and its incalculable public value, have been proved many times over in the past half cen-

CHURCH CALENDAR—CHURCH OF THE NEW JERUSALEM

ture. In the early years of the Union, efforts were occasionally made to have the legislatures enact some test to confine the government to Christians, for fear of atheistic or Jewish control; or to Protestants, in fear of Catholic supremacy; but the absurdity of the first two, and the impolicy of the last, as well as the improbability of its need, have prevented any approach to success. The only serious problem that has arisen on this point is due to Mormonism, where the claim to free exercise of their religion and its dictates is complicated by one of its ostensible revelations enjoining polygamy. In 1882 Congress prohibited polygamy under severe penalties; and the supreme court held this not in conflict with the constitutional provision above cited.

Church Calendar. A systematic method of arrangement of the feasts of the Christian Church has long been in use, and the record of the time of these feasts is called the Church Calendar. Many of the feasts of the Church occur on a fixed day of the month, as Christmas, 25 December; All Saints', 1 November; Assumption, 15 August, and the feasts of the saints. The "movable" feasts are regulated from the feast of Easter Sunday. (For Easter see CALENDAR.) The fiftieth day after Easter Sunday is "Pentecost"; the eighth day after "Pentecost," "Trinity Sunday," etc. The fasts, except those of Lent, are regulated by the feasts, the records of which are found in the calendar. See also CALENDAR.

Church Discipline, the practice of the Christian Church in dealing with such of its office-bearers and members as have by public scandal caused hindrance to its common spiritual life. Its Scripture authority, resting on such passages as Matt. xvi. 19; xviii. 15 (*et seq.*), is further enforced in Paul's epistles and in the gospel and epistles of John. Discipline, in the ecclesiastical sense, means the laws which are intended to govern the subjects of the Church in their conduct, as distinct from dogmas or articles of faith, which affect their belief. These laws may be based upon the Scripture and tradition or they may be the outgrowth of the condition of the times.

Church of England. See ENGLAND, CHURCH OF.

Church, Fathers of the (*patres ecclesie*), teachers and writers of the ancient Church, who flourished after the time of the apostles and apostolic fathers (the immediate disciples of the apostles), from the 2d to the 6th century. This name is also sometimes given to the teachers and writers of the following centuries, down to the schoolmen, who begin with the 12th century. A large number of their writings have been preserved, and have been published by modern scholars. The fathers of the Church are divided into two chief classes—Latin and Greek. The most celebrated among the Greek fathers are Clement of Alexandria, Origen, Eusebius, Athanasius, and Chrysostom. The most distinguished among the Latin fathers are Tertullian, Augustine, Ambrose, and Jerome.

Church of God, an American Christian sect which originated in Harrisburg, Pa., 1830, in a movement in which John Winebrenner, previously a minister in the German Reformed Church, was most prominent. A new society was

organized by him, and others who accepted his views, which took the name of the Church of God. It exists principally in Pennsylvania and the Western States. The government of the Church of God is Congregational, with a supervising Church Council, composed of the preachers in charge, the elders, and deacons. Associations, or conferences of Churches, called Elderships, meet annually, and a General Eldership meets every three years. The church holds the doctrines of the Evangelical churches, with baptism by immersion only, subsequent to faith; it practices feet-washing; the administration of the Lord's Supper in the evening; all the instrumentalities of revivals. In 1900 there were 460 ministers, 580 church edifices, and 38,000 communicants. The church property was valued in the same year at about \$750,000. The denomination publishes several newspapers, and sustains a college at Findlay, Ohio. (See WINEBRENNER.) Consult: Bardenhemer, 'Manual of Patrology' (2d ed., trans. by Rev. T. J. Shahan, 1905); Schmid, 'Manual of Patrology' (5th ed., 1903).

Church of God in Christ, a recognized body of Mennonites, one of the 12 sects in the United States, about 500 in number. See MENNONITES.

Church Government, the regulation and ordering of spiritual matters, or those pertaining to the discipline and work of the Church. Four leading views are at present entertained regarding church government. The first three agree that the rudiments of a scheme of church government are laid down in the New Testament. They differ, however, as to what that scheme is, much the greater number believing it to be Episcopacy, though one large minority are in favor of Presbyterianism, and another in favor of Congregationalism. The fourth view, which has not a large number of advocates, is that no scheme of government was laid down in the New Testament, applicable to all times and places, but that the church has the power of adapting its government to the special circumstances in which it finds itself at any particular time. See CHURCH, AN ORGANIZATION OF CHRISTIANS.

Church of the New Jerusalem, the name taken by a body of Christians who base their belief on the teachings of Emanuel Swedenborg. This sect was founded in 1787, 12 years after the death of Swedenborg, by 15 of his ardent disciples. The founders of the church claim that Swedenborg had a special revelation which authorized him to teach,—as real a command to go forth as was given to the apostles. The system of Christian Doctrine held by this church differs in distinctive points from that held by other Christian churches. They believe of God that he is the creator of all things, that Jesus Christ is God, and that God is all truth, all beauty, all good. The Scriptures are held to be revelations from God through man; and the teachings regarding the future life, are direct revelations from persons of the other world to Swedenborg himself.

The church was established first in England, then the United States, Canada, and in a few places in other parts of the world. In the United States and Canada there are 107 societies, 95 ministers, and about 6,500 members. The active members of the church claim that in

CHURCH HISTORY — CHURCH, STATES OF THE

the United States and Canada there are altogether about 12,000 believers. For a fuller account see **NEW JERUSALEM CHURCH**; see also **SWEDENBORG, EMANUEL**.

Church History, the history of any church, but especially of the Christian Church. Church history naturally divides itself into four periods: From the advent of Christ to the time of Constantine; from Constantine to Mohammed, or by the arrangement of Mosheim and others, to Charlemagne; from Mohammed, or alternately from Charlemagne to the Reformation; from the Reformation to the present time. This division of the subject is not always followed; some authors regard the great periods in Church history, as: Foundation, Persecution; Extension; Reformation. See **CHRISTIAN CHURCH, THE**.

Church-rate, in England, a rate raised for the purpose of repairing and sustaining the church, churchyard, and for similar objects. It was made by the churchwardens with consent of the parishioners, who fixed the amount, but could not refuse it altogether, as in that event the churchwardens were empowered to levy a rate for necessary purposes. The rate, though applicable for repairs to parish churches only, was requirable from parishioners of all religious denominations. This often gave rise to complaints, and these led to repeated proposals for its commutation or entire abolition. This last, so far as the rate was compulsory, was effected in 1868.

Church, States of the, the Pope's dominions in Italy. They arose with the grant of Pepin, king of the Franks, in 754, who bestowed on Pope Stephen II. some districts which the Lombards, against whom Stephen II. solicited Pepin's assistance, had taken from the Exarchate of Ravenna. Charlemagne confirmed this grant in 774, and in return received the title of Roman Emperor from Leo III. in 800. The wise policy of the Popes in conferring favors on the Normans in Lower Italy secured to them in these vassals staunch protectors of the holy see. The structure of the papal power was fully completed in 1075 under Gregory VII. The dominions of Matilda of Tuscany were added to the states of the Church by her request, and the Popes maintained possession of them against all the claims of the German emperors. The papacy removed a dangerous neighbor belonging to the house of Hohenstaufen by raising the house of Anjou to the throne of Naples in the year 1265. The frequent revolutions of the Romans and the influence of the French led the Popes of the 14th century to transfer their residence, from 1305 till 1376, to Avignon, which Clement VI. bought of Joanna, queen of Naples and countess of Provence, in 1348. As this change of residence was made, it was charged under the influence of the king of France, it never obtained the full assent of the Romans and Germans, and anti-popes were sometimes elected by the opposing factions, and the welfare of the Church as well as of the state suffered by their mutual hostilities. After 20 years of exile the Popes returned to Rome. Julius II. added Bologna to the papal dominions in 1513, and Ancona in 1532. The Venetians were obliged to restore Ravenna. Ferrara was also recovered from Modena in 1598, and Urbino was bequeathed to the papal chair in 1626 by its

last duke, Francis Maria, of the house of Rovera. The wise administration of Sextus V. restored internal order toward the end of the 16th century; but the extravagance and family partialities of some of his successors created fresh disorder. Subsequently Naples renounced her feudal obligations to the papal chair. After the successes of the French in Italy the Pope was forced at the Peace of Tolentino, 13 Feb. 1797, to cede Avignon to France, and Romagna, Bologna, and Ferrara to the Cisalpine republic. An insurrection in Rome against the French, 28 Dec. 1797, caused the annexation of the states of the Church to the Roman republic. Pius VI. died in France. The victories of the Russians and Austrians in Italy favored the election of Pope Pius VII., 14 March 1800, who, under the protection of Austrian troops, took possession of Rome. By the concordat concluded in 1801 with the First Consul of the French republic the Pope again lost a great part of his temporal dominions. In 1807 France again declared war, and the provinces of Ancona, Urbino, Macerata, and Camerino were added to the kingdom of Italy. The possessions of the Church beyond the Apennines were all that remained to the Pope. On 2 Feb. 1808, a French corps of 8,000 men entered Rome; the remainder of the papal states were added to France, and a pension of 2,000,000 francs settled on the Pope, whose ecclesiastical power was guaranteed by Napoleon. The decree of 17 May 1809 put an end for the time being to the ecclesiastical state. The Pope was held a prisoner in France until the events of 1814 again permitted him to take possession of his states. Pius VII. was succeeded by Leo XII., who reigned from 1823 till 1829. He was succeeded by Pius VIII., who, in his turn, was succeeded by Pius IX. in 1846. The first acts of this Pope were characterized by such a liberal spirit that diplomatic Europe was surprised. The events of 1848 caused the Pope to pause in his advanced policy, which so dissatisfied the extreme liberal party that they drove Pius IX. from Rome, and the reins of government fell into the hands of Garibaldi, Mazzini, and Avezzano (1849). Some few months afterward the French government, resolving to restore the papal authority, sent Gen. Oudinot with an army against Rome. Defeated in their first attack on the city, the French began a siege in regular form, and in a month's time were masters of it. Pope Pius did not return to Rome, however, until the following year.

After the Austro-Italian war of 1859 the papal see was stripped of the greatest part of its territorial possessions. Embracing before that date an area of 17,218 square miles, with 3,124,668 inhabitants, the Roman territory was then reduced to 4,891 square miles, and 692,106 inhabitants. Of the former legations and delegations into which it was subdivided only five remained, namely — Rome and the Comarca, Viterbo, Civita Vecchia, Velletri, and Frosinone. From 1860 to 1866 the papal government was sustained by the presence of a French army, which was withdrawn in 1866 upon the King of Italy binding himself by treaty to respect the integrity of the Roman states. In 1867, however, revolutionists numbering 15,000, belonging to the Italian party of action, entered the papal territory, headed by Menotti Garibaldi. They made but

CHURCH TEMPERANCE SOCIETY — CHURCHING OF WOMEN

little progress until the elder Garibaldi placed himself at their head. Napoleon III., at the earnest prayer of the Pope, sent an army to protect the city against the violence of the revolutionists, who had now surrounded it. On 28 October the French entered Rome, and Garibaldi, beginning to perceive that he would be hemmed in by the regular Italian forces under Cialdini, thought of retreating. An advanced section of the papal troops came in contact with the Garibaldians (3 November), and were likely to have suffered severely had not two French battalions, armed with the Chassepot rifle, come speedily to their aid. Garibaldi, with 4,000 men, retreated into the Italian territory, where they were disarmed. A strong force of French troops were left in occupation of Civita Vecchia after peace was restored, and the Pope seemed as secure as ever. But the outbreak of the Franco-German war changed the aspect of affairs. The French army of occupation left Rome on 30 July 1870, and the Pope was at the mercy of his powerful neighbor, Victor Emmanuel, king of Italy, who, seizing the opportunity, marched upon Rome and took it by force of arms. In September the Italian troops occupied Rome. In October the states of the Church were incorporated with the kingdom of Italy, a plebiscite was held under bayonet-rule, the count of which resulted in 133,681 in favor of the Sardinian occupation and 1,807 against it. In the beginning of July 1871, Rome became the seat of the Italian government and the residence of the court.

Church Temperance Society, a national organization of the Anglican Church in the United States. It was founded in New York in the year 1881, and its object is to promote temperance by means of high license. It seeks to influence state legislators and municipal authorities, and it has done most effective work in providing substitutes for the saloon. The organization in the United States follows, in a measure, the methods used for several years by the Church of England Temperance Society.

Churchwarden, one of two Episcopalian parochial officers chosen annually at the Easter vestries. In Anglican Churches in the United States the wardens are usually elected by the parishes; in England the custom prevails of the rector appointing one warden and the parish the other. Their duties are to protect the building of the church and its appurtenances, to superintend the ceremonies of divine worship, and the proper distribution of alms, etc.; to form and execute parochial regulations, and generally to act as the legal representatives of the parish. They usually attend to the secular affairs of the parish.

The term "churchwarden" is also given to a long-stemmed clay tobacco-pipe much used in Great Britain. A famous "make" of this class of pipes is located in the town of Broseley, in Shropshire.

Church'ill, Charles, English satirical poet: b. Westminster, February 1731; d. Boulogne, France, 4 Nov. 1764. He took orders in the Established Church, but reflected very little credit upon his clerical profession. He won his fame with 'The Rosciad,' a satire upon the actors of the time, in which only Garrick and some few popular actresses are praised. His

capacity for ridicule was so great that 'The Ghost,' 'The Farewell,' 'The Conference,' 'The Author,' and 'The Prophecy of Famine,' proved exceedingly popular. He is almost without a peer in his special field.

Churchill, John, Duke of Marlborough. See MARLBOROUGH.

Churchill, Randolph Henry Spencer, LORD, English statesman, third son of the 7th Duke of Marlborough: b. 13 Feb. 1849; d. London 24 Jan. 1895. He was educated at Merton College, Oxford, and having entered Parliament in 1874 as member for Woodstock, by 1884 he had risen to the position of a recognized leader of the Conservative party, and in 1885 became Indian secretary in Lord Salisbury's government. His tenure of this office was rendered notable by the annexation of Upper Burma. On the defeat of Gladstone's Irish bill in 1886 Churchill became leader of the House of Commons and Chancellor of the Exchequer, posts which he unexpectedly resigned in December 1886. He was a brilliant though at times rather violent personality in British politics. His opinions were mainly Conservative, but he often found himself in opposition to the official leaders of that party; and for some time he acted as the leader of what was known as the Fourth Party, consisting of four members who adopted a somewhat independent position. He married in 1874 Jennie Jerome, a daughter of Leonard Jerome, of New York. In July 1900, Lady Randolph Churchill married George Cornwallis West.

Churchill, Winston, American novelist: b. St. Louis, Mo., 10 Nov. 1871. He was graduated from the United States Naval Academy in 1894, and became an editor of the 'Army and Navy Journal' the same year. After serving as managing editor of the 'Cosmopolitan' magazine, he turned his attention to fiction. He has written: 'The Celebrity' (1898); 'Richard Carvel' (1899); 'The Crisis' (1901); 'Mr. Keegan's Elopement'; 'The Crossing' (1904).

Churchill, Winston Leonard Spencer, English soldier and author: b. 30 Nov. 1874. He was educated at Harrow and Sandhurst Military College. He served with the Spanish forces in Cuba, and in the English army during a part of the Boer war 1899-1900. In 1905 he became Under Secretary for the colonies and in 1907 privy councillor. He has published 'The Story of the Malakand Field Force' (1898); 'The River War' (1899); 'Savrola' (1900); 'London to Ladysmith, via Pretoria' (1900); 'Ian Hamilton's March' (1900.)

Churchill River, a river of the Northwest Territories of Canada, which rises in La Crosse Lake, forms or passes through various lakes or lake-like expansions, the largest being Big or Indian Lake, and enters Hudson Bay near Fort Churchill, after a northeasterly course of about 800 miles. It is called also Missinnippi, English and Beaver. Except by means of frequent portage, it is not navigable.

Churching of Women, a rite founded on the Mosaic injunction found in Levit. xii. 6-8, and as practised in some denominations, is now a giving of thanks for the birth of a child. The first mention of the subject as a usage in the Christian Church is found in the pseudo-nicene Arabic Canon, but no prescribed form is given.

CHURCHUS — CHURUBUSCO

In the Greek Church the presentation of the child is made on the 40th day after birth, according to Luke ii. 22. The Roman Catholic Church imposes no obligation upon its members in this respect, but recommends it as a laudable and pious custom. The form is prescribed by the Roman Catholic ritual. The priest sprinkles with holy water the woman who kneels at the altar-railing and holds a lighted candle, and having recited the 23d Psalm, he puts the end of his stole into her hand and says: "Come into the temple of God; adore the Son of the Blessed Virgin Mary, who has given thee fruitfulness in child-bearing." The priest then says a prayer of thanksgiving, blesses her, and sprinkles her with holy water in the form of a cross. The rubric of the Roman Catholic ritual reserves this rite for women who have children born in wedlock. The Anglican Church provides in the prayer book a prescribed form for the ceremony. The Congregational, Presbyterian and other churches either ignore, or declare that there is no scriptural warrant for the rite.

Churchus, a deity worshipped by the ancient Prussians. It presided over food and drink.

Churl, *chērl* (Saxon *ceorl*) in modern usage, a rude, boorish person, but in Saxon England, the term denoted a common freeman. The rank of the churl, or *ceorl*, steadily declined until finally the only important distinction between churl and serf was that the former might choose his own master. The better class of churls sometimes found their way into the class of *theyns*, or *thanes*, corresponding to the knights of post-Conquest times, while the others became the villains of the Norman feudal organization. 'Domesday Book' makes no mention of the word *ceorl*.

Churn, a vessel in which cream is agitated to separate its buttery globules in a solid mass from the fluid portions. The length of time usually occupied by this process, and the fatigue consequent upon working those machines by hand, have caused the ingenious to produce numerous modifications in form and size. Some may be worked by dogs in the way a squirrel-wheel is driven; others may be worked by horse-power; and in some cases steam is the motive power. The ordinary plunge-churn, with its cylindrical box, its straight rod projecting downward through the cover and attached below to the dasher, has been greatly improved by an arrangement by which the air is introduced into the cylinder at every stroke by a tube run right along the handle, with a valve at its end which opens as the dasher rises and closes as it sinks. The air is thus dashed through the cream, separating it into innumerable small particles, and throwing it into a state of foam. A box form of churn, with dashers attached to a rod passing horizontally through the box, and driven by a winch, is frequently used. Less common kinds are those in which the whole body of the machine is set in motion, such as the rocking-churn and the barrel-churn. A churn on the centrifugal principle has been introduced into Sweden. Though the rapid completion of the process of butter-making is the principal end in view, it is a well-known fact that butter suffers seriously by too rapid a process. When butter forms in about 45 minutes it is sure to be good; when it appears sooner it is soft; when later, strong-tasted. See BUTTER; DAIRY.

Churrus, *chūr'rūs*, the resinous exudation of the leaves and flowers of Indian hemp, *Cannabis indica*. It is used by the natives of India as an intoxicating drug. According to Jaffur Shurreef, a man covers himself with a blanket and runs through a field of hemp early in the morning; the dew and gum of the plant naturally adhering to it are first scraped off and the blanket afterward washed and wrung. Both products are boiled together and an electuary formed. The smoking of five grains of it will produce intoxication.

Churubusco, *choo-roo-boos'kō*, **Battle of**, one of the principal engagements of the Mexican war, took place 20 Aug. 1847. Contreras (q.v.) was won in the early morning, Churubusco in the forenoon and early afternoon, of that day, but they are quite distinct battles. The main road north to the city of Mexico, via San Augustin and San Antonio, an elevated paved causeway, converges with that on the west from Contreras and Coyoacan at Churubusco, a village six miles south of the capital and a mile northeast of Coyoacan. Just north of it runs east and west the little stream called Rio Churubusco, crossed by the main road at a bridge fortified with a bridge-head; there was a strong bastion 75 to 100 yards on a side, with embrasures sweeping the San Antonio road. Along the sides were cornfields, maguey plantations, hedges and thickets, and irrigating ditches full of water. In the western part of the village, southwest of the bridge-head, on the Coyoacan road, was the Convent of San Pablo, a massive building with walls so thick that field-pieces could make no impression on them, defended on two sides by strongly built bastions with six or eight heavy guns, and the building itself an impregnable cover for musket-fire. Around it was a flooded moat, in front were cornfields and thickets. The two points to be carried were the convent and the bridge-head; and since, after the rout at Contreras, this was the last place where the Mexicans could make a stand short of the city of Mexico, the resistance was likely to be desperate. The wreckage of Contreras was being pursued by Pillow and Twiggs along the Coyoacan road; and Worth, having turned the works at San Antonio on the main road, had captured a considerable body of the enemy, and was advancing along the causeway. Santa Anna threw a battalion into the convent, placed five guns and a heavy body of troops at the bridge-head, and posted several regiments along the north bank of the stream. The first assault was made on the convent. Bennet Riley's and Persifor F. Smith's brigades, Dimick's and Taylor's batteries, attacking it from the west and south, were received with a storm of shot and shell from the guns in embrasures and barrette; and as they struggled out of the cover they were swept by the musket-fire from the building itself, with heavy loss. Seizing a line of adobe buildings 60 yards from the convent, they opened fire under that protection and held it till the time for advance. Meantime Worth's division, with Pillow, Cadwalader, Garland, Clarke, and others, had charged down the causeway, blocked for several hundred yards with loaded wagons, and through the fields to the bridge-head. Broken into irregular fragments by the hedges and ditches, they were twice repulsed with tremendous loss by the

CHUSAN ARCHIPELAGO — CIAMPI

plunging fire of the Mexican guns; but Shields had moved north from Coyoacan and, after a fierce combat, which nearly overwhelmed him, he was reinforced by Lee and Sumner, carried the river line, and moved east against the rear of the bridge. In danger of having their retreat from the capital cut off, the Mexicans lost nerve, and a third charge from the Americans carried the head with a rush. Thence they turned southwest against the convent; the American artillery was still battering it on the other side; a sally from the garrison was driven back and, as the fire slackened, both divisions of the Americans entered it from opposite sides at the same time. The American forces in this battle numbered a little over 7,300; the Mexican numbers are uncertain, but probably about 25,000. The American losses at Contreras and Churubusco together were 1,053, not over 100 at Contreras. The Mexican loss was 2,637 prisoners at both, and probably 2,000 at least killed and wounded at Churubusco. Consult Wilcox, 'History of the Mexican War' (1892.)

Chusan (choo'san) **Archipelago**, a group of islands off the east coast of China, the largest being the island of the same name, which is about 21 miles long, and from 6 to 11 broad, with a population of about 200,000. Its surface is finely diversified by hill and dale. The rocks are evidently volcanic; and the soil, often very fertile, is under good cultivation, for the most part by spade husbandry. On the same slope may be seen, in different stages of their growth, wheat, tea, sweet potatoes, cotton, and tobacco. There are several towns on the island; the capital is Ting-hae, a walled town of about two miles in circumference. From its situation near the mouths of the Yang-tse-kiang, which forms the great channel of communication with the heart of the empire, Chusan is considered as the key of southern China, and was accordingly taken possession of by the British on two occasions during the first Chinese war. Notwithstanding the great mortality among the British troops during their occupation of the island, the climate is still considered healthy.

Chutia Nagpur, choo'tē-ā nāg-poor'. See CHOTA NAGPUR.

Chutney, chūt'nī, a condiment compounded of sweets and acids, much used in the East Indies, and thence introduced into England and the United States. Ripe fruit, raisins, spices, herbs, chillies or cayenne, lemon-juice, vinegar, etc., are the ordinary components, which are pounded, well boiled together, and then bottled for use. It is much eaten in India with curries, stews, etc.

Chuz'zlewit, Martin, the principal character in Charles Dickens' novel of that name.

Chyle, kīl, the liquid mixture of food-stuffs taken up by the lacteals from the intestine in the course of digestion. It is not a definite substance, its composition varying very widely according to the character of the ingested food. See DIGESTION; LACTEALS.

Chyme, kīm, a pulpy mass into which food in the stomach is resolved by the action of the gastric juice and by the contraction of the stomach. This mass is grayish in color, and the previous texture or nature of the aliment can be no longer distinguished. It passes by the

pylorus into the intestinal canal, where it is mixed with the pancreatic juice and the bile. The thinner parts of it are absorbed by the slender tubes termed "lacteals." The liquor thus absorbed, which is called "chyle," (q.v.), is of a white color; it passes through the glands of the mesentery, then enters the thoracic duct, and is conveyed by it into the blood at the junction of the left jugular with the left subclavian vein. Chyle is an opaque milky fluid, mild to the taste. By standing for some time one part of it coagulates, another portion is coagulated by heat. The chyle, after mixing with the lymph conveyed by the absorbent vessels, is received into the blood, which has returned from the extreme vessels before this passes to the heart. All traces of it are very soon lost in the blood, as it mixes perfectly with that fluid. It is probable, however, that its nature is not immediately completely altered. The blood passing from the heart is conveyed to the lungs, where it circulates over a very extensive surface presented to the atmospheric air, with the intervention of a very thin membrane, which does not prevent their mutual action. During this circulation the blood loses a considerable quantity of carbon, part of which, it is probable, is derived from the imperfectly assimilated chyle, as this, originating in part from vegetable matter, must contain carbon in larger proportion than even the blood itself. See DIGESTION; LYMPH; NUTRITION.

Cialdini, Enrico, ěn-rē'kō chāl-dē'nē, Italian military officer: b. Castelvetro, Modena, 10 Aug. 1811; d. Leghorn 9 Sept. 1892. By his share in the insurrection of 1831 was forced to escape to France, and in 1835 passing over to the Spanish service, he fought against the Carlists and was made colonel. When Charles Albert headed the Italian rising in 1848, he was employed by the Sardinian government to reduce the volunteers to discipline, and fought at the head of his new regiment in the brief campaign of 1849. In the Crimea he commanded a division of the Sardinian contingent; and on his return was appointed aide-de-camp to the king. He was intrusted by Cavour with the formation of the famous Cacciatori delle Alpi. In the war of 1859 the victory at Palestro was his chief exploit. In 1860 he defeated the papal army at Castelfidardo; in 1861 Gaeta and Messina yielded to him. Created Duke of Gaeta, and for a few months governor of Naples, he had to act against Garibaldi in the second Sicilian expedition (1862). In 1864 he became a senator; and in the war of 1866 occupied Venice almost without a blow. In 1876 he was sent as ambassador to Paris, but he retired in 1881, and received the post of one of the two generals of the army.

Ciampi, chām'pē, Ignazio, Italian poet and historian: b. Rome 1824; d. 1880. From 1874 till his death he was professor of modern history in the University of Rome. Among his poetical works are some imitations of the Russian Pushkin; an epic, 'Stella'; and two volumes of 'Various Poems.' He wrote several works on the history of literature, also biographies and histories of special periods. His principal work appeared posthumously: 'Modern History,' from 1492 to the Peace of Westphalia.

Ciampi, Sebastiano, Italian scholar: b. Pistoia 30 Oct. 1769; d. Florence 14 Dec. 1847.

Ordained as a priest in 1793, he was appointed professor at the University of Pisa in 1803; owing to some misunderstanding with his colleagues, he accepted in 1818 a professorship at Warsaw, and returned to Italy in 1822, a prebend having been conferred on him in Poland, which enabled him to devote himself to literary studies at Florence. His principal works treat of Italian literature and art, of ancient literature, of the Latin literature of the Middle Ages, and of the history of Poland.

Ciampoli, Domenico, dō-mā'nē-kō chām-pō'lē, Italian novelist: b. Atezza in Abruzzi 25 Aug. 1855. His stories and romances are to a great extent pictures of life among the peasantry and mountain folk of southern Italy. He has also written romances of a less local character: 'Diana'; 'The Unknown.' He has devoted special study to Slavic literature, and published several volumes on that subject.

Cibao, se-bā'ō, a mountain range in the central part of Santo Domingo; length about 20 miles. When Columbus discovered the island, he was told by the natives that there was gold in the Cibao and he thought it to be a part of Japan. Gold was found there in 1494, by Ojeda.

Cibber, sīb'bēr, Caius Gabriel, Danish sculptor: b. Flensburg, Holstein, 1630; d. London 1700. He visited England during the protectorate of Cromwell, and met with such encouragement as to induce him to settle there. He was employed to execute the bas-reliefs on the pedestal of the London Monument. The work, however, by which he is principally known are his figures of Raving and Melancholy Madness, formerly erected above the gate of the old Bethlehem Hospital, and now in the new hospital, St. George's Fields. He was the father of Colley Cibber (q.v.)

Cibber, Colley, English dramatist and actor: b. London 6 Nov. 1671; d. there 12 Dec. 1757. He was a son of C. G. Cibber (q.v.) and the sculptor's second wife, Jane Colley. He made his appearance at Drury Lane Theatre in 1689. In 1695 appeared his first comedy, 'Love's Last Shift,' which met with great success. In this piece he played the part of Novelty, a fashionable fop. This character is found in most of his pieces, and in the representation of it he was likewise distinguished. His dramatic celebrity is founded chiefly on the 'Careless Husband,' which even obtained the approbation of his declared enemy, Pope. This piece, though without novelty in the characters, and without invention in the plot, is a good picture of the manners and follies of the time. His comedy, the 'Non-juror,' an imitation of Molière's 'Tartufe,' adapted to English manners, appeared in 1717, and was directed against the Jacobites. It was very successful, but drew upon him many enemies, whose number he increased by his conduct as director of Drury Lane Theatre, from 1711. His appointment as poet-laureate in 1730 gave full play to the railery of his enemies. Cibber had the good sense to join in the laugh against his own verses. Pope, however, did not cease to ridicule him on every opportunity. Besides writing original works for the stage, he adapted a great number of others, the acted Richard III. being one of those that have passed through his hands. In 1750 he quitted the theatre, and published the

'Apology for the Life of Colley Cibber,' written with spirit and candor, and containing many entertaining anecdotes and judicious remarks.

Cibber, Susannah Maria (ARNE), English actress: b. London February 1714; d. there 30 Jan. 1766. She was the sister of the celebrated Thomas Arne (composer of 'Rule Britannia'), who taught her music, and introduced her in one of his operas at the Haymarket Theatre. She was so much of a favorite with Handel, that he composed pieces expressly adapted to her voice, and used to instruct her in singing them. In 1734 she married Theophilus Cibber (q.v.), but was soon after separated from him. She subsequently made her appearance in tragedy. Her beauty and her talents gained her universal admiration. Garrick is said to have exclaimed when informed that she was dead, "Then tragedy has expired with her." She is buried in Westminster Abbey.

Cibber, Theophilus, English actor and dramatist: b. 26 Nov. 1703; d. Oct. 1758. He was the son of Colley Cibber (q.v.). Among his plays are: 'The Lover' (1730); 'Patie and Peggy' (1730); 'The Auction.' The 'Biography of English and Irish Poets,' which appeared under his name, was from the pen of Robert Shiels, a Scotsman, who purchased for 10 guineas the right of prefixing to the work the name of Cibber, then in prison for debt.

Cibol, sīb'ōl, a perennial plant (*Allium fistulosum*) of the onion genus, a native of Siberia, with hollow stems larger than those of the chive. It was formerly cultivated in Great Britain for culinary use, but it has been superseded by more palatable species. See ONION.

Ciborium, sī-bō'rī-um, the sacred vessel, of silver or gold or silver-gilt, and often incrustated with precious stones, in which the sacred host is reserved. Its liturgical name is pyx. In the language of architecture, ciborium is the name of the canopy which overhangs the high altar of a church.

Cibrario, Luigi, loo-ē'jē chē-brā'rē-ō, Italian historian and politician: b. Turin 23 Feb. 1802; d. Salo 1 Oct. 1870. He studied law, entered the service of the State, and soon distinguished himself by his historical investigations. In 1848, when Italy rose against the Austrians, Charles Albert appointed him commissioner at Venice and a senator of Sardinia. In 1852 he was made minister of public instruction, and ultimately, in 1855, minister of foreign affairs. In 1839 he published his 'Della Economia Politica del Medio Evo'; in 1840, his 'Storia della Monarchia di Savoia'; and in 1847, his 'Storia di Torino.' He published numerous other works on history, numismatics, and miscellaneous subjects.

Cicacole, sīk-ā-kōl'. See CHICACOLE.

Cicada, sī-kā'da, a large insect of the order *Hemiptera*, sub-order *Homoptera*, and family *Cicadidæ*, known by its broad head, protuberant eyes, sucking beak, and a well-developed ovipositor. The male cicada makes a shrill noise by means of a special apparatus at the base of the abdomen or hind-body. The loud, piercing notes issue from a pair of structures or cavities on the under side of the body, which act somewhat as two kettle-drums or "timbals," each cavity being covered by a tense membrane which is rapidly vibrated by means of two special mus-

CICATRIZATION — CICERO

cles within. The sound is variously modified by adjacent smaller disk-like sounding-boards, which increase and transmit the sound vibrations caused by the movement of the membrane. The sound is modified by the semicircular disks, one on each side projecting from the metathorax over the "mirrors," cover-plates, or sounding-boards, one on each side, and which, when closed, deaden the sound, or, if open, allow it to escape in greater volume. This apparatus appears to be homologous with the "ears" of the locusts or common grasshoppers. Cicadae have an incomplete metamorphosis, the young (nymphs) being like the parents, but without wings; they live attached by their beaks to the roots of trees, etc. The female deposits her long, slender, cylindrical eggs in gashes in twigs made by her saw-like ovipositor. From 400 to 600 eggs are laid, the process requiring about 45 minutes. The 17-year cicada (wrongly called 17-year locust) is the longest-lived of any known insect, as the grub or nymph lives for over 16 years sucking the roots of forest trees, often several feet below the surface; in the late spring it finishes its transformations, and usually at the last of May or the beginning of June, issues in enormous numbers from the ground. This appearance of a 17-year brood in a given area has been recorded as far back as 1633. At the present time each year has its brood or broods, each limited, as a rule, to a well-defined district. Of such broods there are 30, occurring over a large area in the Atlantic and Central States. In southern New England a brood periodically appears near Fall River and on Martha's Vineyard, as well as in Connecticut, while in Rhode Island its first appearance known in history was in the first week in June 1903, in the town of Coventry, near Tiogue reservoir. The southern limits are northern Georgia and the western limits are eastern Nebraska and Kansas. Besides this 17-year brood there is a 13-year brood, which is more southern, the dividing line being about latitude 38°; this appears to be a temperate variety. The male is very short-lived and takes no food. The females live for several weeks and deposit their eggs about the middle of June in New York and West Virginia. The young hatch, dropping to the ground about six weeks after the eggs are laid; it then burrows into the soil and begins to pierce the rootlets of trees. The nymph molts about once a year or oftener, and Riley estimates the number of molts at from 25 to 30, while there are six stages of growth before the imago or winged state is assumed. Consult: Riley, 'The Periodical Cicada' ('Bulletin 8 U. S. Department of Agriculture'); Marlatt, 'The Periodical Cicada' (Ibid. 14).

Cicatrization, sik''a-trī-zā'shōn, the process of healing in the skin of an ulcer or a wound. Where a solution of continuity of the skin is made the blood is thrown out into the gap, the edges of the wound are gummed together by serum, and, springing from both sides of the wound, new connective tissue is formed. This new connective tissue gradually fills the wound with a white glistening mass, the cicatrix. This contracts, and all that may be left of the wound is a white shiny strip of new connective tissue.

Cicely, Sweet, a plant of the United States belonging to the natural order *Umbellifer*, a

perennial herb growing from fleshy, clustered, thickish roots. There are about 15 species in North America, western South America, and eastern Asia, grouped into the genus *Washingtonia*, so named in honor of George Washington. Eleven of the 15 are natives of the western United States. They are related to chevрил (q.v.) on one side, and to *Scandix* on the other. The smoother sweet cicely (*W. longistylus*) grows in the woods of southern Canada, through Dakota, eastward to North Carolina, southward to Tennessee and Alabama, and westward to Kansas, and on elevations to the height of 4,200 feet. The roots have a rich spicy taste and odor, resembling anise. The sweet cicely of England (*Myrrhis odorata*), although common about buildings, is an imported plant, probably from central Asia. It is fragrant, and its odor is supposed to be particularly agreeable to bees, therefore hives are rubbed with the herb to attract them.

Cicer, sī'sēr, a genus of the natural order *Leguminosæ*, of the tribe *Viciæ*, of which the chick-pea (q.v.) is a representative.

Cicero, Marcus Tullius, Roman orator and public man and the greatest master of Latin prose style.

Cicero was born in 106 B.C. in Arpinum, the birthplace also of Marius. His father was a knight of good social position and the son was well educated in preparation for the bar and for public life. While still a young man he served a campaign under the elder Pompey. He first appeared as a lawyer in 81 and again in 80, and in the latter case was brought into direct collision with a favorite of Sulla, at that time perpetual dictator. It was perhaps in consequence of this that he withdrew for a time from Rome and spent the years 79-77 in Greece and Asia Minor, occupying himself with the further study of oratory. In 75 he began his political career by serving as quæstor in Sicily and in 70 he gave evidence of the closeness of his relation to that province by prosecuting Verres for mal-administration as governor there. In 69 he was Curule Ædile and in 66 Prætor Urbanus, following the usual course of offices; in the latter year he made his first distinctively political speech in support of a proposal by the tribune Manilius to give to Pompey the command of the war against Mithridates. Though the distinction between parties was then less sharp than it is now, he had thus far been connected with the democratic party, but in the canvass for the consulship for 63 that party had already two candidates in the field, Catiline and Antonius, while the Optimates had no candidate of special promise. As Catiline belonged to the radical wing of the democrats, the senatorial party, desiring his defeat, threw its influence in Cicero's favor. He was thus elected as a representative of the Optimates and continued to act with that party during the rest of his life. His constitutional instincts were further strengthened by the outbreak during his consulship (63) of the so-called conspiracy of Catiline, an attempt by the radicals under the leadership of this reckless noble to seize the government by violent means. This attempt Cicero put down with considerable vigor; Catiline was killed in battle and several of his associates were condemned to death by a vote of the senate and executed under Cicero's orders. The

CICERO

execution, however, was of questionable legality, since it set aside the right of the accused to an appeal to the popular assembly, and Cicero was at once attacked by members of the democratic party for his responsibility in the transaction. Upon the formation, in 60, of the coalition between Cæsar, Pompey and Crassus called the First Triumvirate, by which the democrats came into control of the government, Cicero was banished from Rome and left Italy (April 58). The years preceding his exile had been years of great professional activity and some of the best of his speeches belong to this period, but he had not yet acquired the habit of literary production and the year of his absence was unfruitful except in letters. His return to Italy in 57 was made the occasion of a great party demonstration and was to some degree a personal triumph, and he engaged himself at once in suits for the recovery of his property and in the party struggles with the Triumvirate. During this period he also took up again his early studies in rhetoric and wrote the 'De Oratore,' one of his most finished and authoritative works. He had not up to this time followed the usual custom of taking the proconsular governorship of a province, but in 51, in compliance with a new law, though much against his will, he went as governor to Cilicia. He spent here exactly the year required of him, from 31 July 51 to 30 July 50, but impatient as he was of the enforced absence from Rome his governorship was highly creditable to him; he showed, in particular, the most honorable scrupulousness in abstaining from even the customary exactions from the provincials. When he returned to Rome, he found all parties absorbed in the agitations which preceded the civil war. Early in 49 Cæsar marched upon Rome and Pompey withdrew to Dyrrachium. During these months Cicero remained away from the city in great uncertainty as to his duty and his interests. Cæsar asked of him only that he should remain neutral, and his own forebodings as to the outcome of the struggle inclined him toward this course, but his party connections, his constitutional prejudices and opinions and his lifelong respect for Pompey took him finally to the camp at Dyrrachium. After the victory of Cæsar at Pharsalus in August 48, he returned to Italy and spent a year in Brundisium, awaiting Cæsar's permission to go to Rome. From the summer of 47 to March 44 the domination of Cæsar put an end to free discussion and action in the state and Cicero made only a few speeches, addressed to Cæsar, with whom he had always been on terms of friendship, on behalf of persons desiring amnesty. But the enforced political inactivity he put to use in literature and to this period belong almost all his greatest writings, the ripe fruits of a life of intellectual interests. In March 44 the assassination of Cæsar aroused in Cicero, though he was not cognizant of the plot, a renewed hope that the senate might recover control of the state. But for the first few months events turned against his party; popular feeling did not approve the death of Cæsar, Antony was unexpectedly active and successful, and Cicero for a time thought of joining Brutus and Cassius in the East. As the confusion began to clear, however, and the old issue between constitutional government and the rule of a dictator took form, Cicero's indecision came to

an end and he threw himself unreservedly into the contest of the senate with Antony. The 14 Philippics, delivered between September 44 and March 43 are unmatched among his speeches. When Antony and Octavianus (the later Augustus) were reconciled and formed with Lepidus the Second Triumvirate, Cicero's name was placed upon the list of the proscribed and he was killed at his villa near Formiæ, 7 Dec. 43.

The literary work of Cicero is in amount much greater than the extant work of any other Latin writer and in value is second only to the poems of Vergil. It consists of orations, rhetorical works, philosophical essays and collections of letters, and will be taken up in that order.

Of the orations we possess 57 in nearly complete form and the titles of some fifty more are known. The extant orations are about equally divided between speeches to the senate or the people on public questions and legal pleas. Cicero spoke by preference on the side of the defence in both civil and criminal trials, sometimes making a close legal argument, but not infrequently using also political and even literary discussions to relieve the formal argument. The public orations are to a considerable extent invectives, especially the four orations against Catiline and the 14 Philippics against Antony, and these are at times bitter to a degree that modern taste would condemn, even in the most excited political struggles. But the wit, the fire, the humor and breadth, the easy handling of complex argument and the perfection of stylistic form are such that no critic, either ancient or modern, has seriously questioned Cicero's supremacy in Roman oratory.

The rhetorical works deal chiefly with oratory; several are text-books on the theory and practice of public speaking, one is a history of Roman oratory and one is a discussion of the ideal in oratory. While Cicero did not attempt a wholly novel treatment of these subjects, there is in the works much of the ripe judgment of the practised speaker who was interested also in the theory of his life work, and they contain some of his most finished and delightful writing.

The philosophical works are constitutional and ethical essays in dialogue form. Cicero himself regarded them as useful means of making educated Romans better acquainted with Greek philosophy, especially of the Academic and Stoic schools, and made for them no claim to originality of thought.

We possess also a collection of nearly 800 letters by Cicero, with nearly 100 more from his correspondents. They begin with the year 68 and with some breaks continue down to the year of his death. About half of them are addressed to his intimate friend, T. Pomponius Atticus, the rest to various persons, including almost all the eminent men of his time. Some few of them are formal and guarded in expression, but the majority, especially those addressed to Atticus, are extremely intimate and confidential, written without thought of publication. They give a most interesting picture of the progress of events and changes of opinion during a critical period of Roman history and they also reveal some of the weaknesses of Cicero's character and have furnished the ma-

CICERO — CICUTA

terial upon which the harsher judgments of his conduct have been founded.

The uncertainty of the judgment of posterity—to which appeal is often made as if it were always precise and infallible—was never better illustrated than in the history of opinion in regard to Cicero. During the earlier centuries after the Revival of Learning, when attention was fixed upon correct and elegant Latinity, the judgment which scholars formed in regard to Cicero's public career was really determined by their just admiration for his Latin style. And most scholars up to the beginning of the 19th century continued to occupy the uncritical position. But with the rise of historical science a revision of opinion was inevitable. This found expression in Drumann's history of Rome and later in Mommsen's history; in both of these writers, however, the extravagant and passionate discrediting of Cicero was as marked as the earlier unquestioning worship had been. The influence of Mommsen's authority is still to be seen in popular and school histories, though scholars have long understood its inaccuracy. But though opinion varies within narrower limits, it still varies somewhat, for reasons which are to be found partly in the character of Cicero and partly in the nature of the constitutional and political questions that are connected with his career. Cicero was, as most orators are, a man in whose temperament emotion and sensibility were more controlling than intellect or will. Such a man is always liable to the charge of inconsistency and his conduct is certain to show extremes of weakness and of strength. On three occasions, in the trial of Roscius, in the affair with Catiline and in the struggle with Antony, he showed the hot courage of attack, but in the trial of Milo he failed to exhibit the cool and steady courage required to face mob violence. At the outbreak of the Civil War he hesitated long—not wholly without reason—and after the death of Cæsar his vacillation amounted to weakness, but taken as a whole his public life was a consistent expression of his patriotic feeling. His depression during his exile was great, but not greater than his cheerfulness during the unhappy years preceding 44. His vanity—of which Mommsen makes much—is indeed repellant to our taste, but it was a foible of his race; Cæsar, not in general a vain man, wrote the extraordinary dispatch, *Veni, vidi, vici*, and Horace, certainly a modest man, wrote the *Exegi monumentum*. A character in which an instinctive artistic perception and a trained intelligence are directed by the emotional temperament of the orator is not to be summarized in a formula.

The political situation, also, when an old constitution was giving way to personal rule, is of a kind about which men will always differ; half the discussion in regard to the character of Cicero is fundamentally an expression of opinion or feeling about such constitutional crises. The severest critics of Cicero have been German scholars, eminent indeed, but accustomed to feudal traditions and inexperienced in the workings of a free constitution. The judgment of English scholars, though not unanimous, has been more intelligent.

Literature.—The best edition is C. F. W. Müller's 'Teubner' (Leipsic, 9 vols.), text without commentary. Halm's editions of the ora-

tions have excellent German introductions and notes; the 'Letters' are well edited by Tyrrell (London). There are 'Lives' by Middleton (1741), Forsyth and Anthony Trollope; also 'Cicéron et ses Amis,' by Boissier.

EDWARD PARMELEE MORRIS,
Professor of Latin Language and Literature,
Yale University.

Cicero, Quintus Tullius, Roman general and brother of Marcus Tullius Cicero (q.v.): b. about 102 B.C.; put to death by the messengers of Antonius 43 B.C. He was prætor in 62 B.C. and governor of Asia 61–58 B.C. In 55 B.C. he was legate to Cæsar, accompanied him to Britain, and in 54 commanded a legion in Gaul. In 51 he was a legate to his brother, Marcus Tullius, in Cilicia, and in the civil war fought with Pompeius against Cæsar, but in 57 made peace with him. He was proscribed by the triumvirs and killed.

Cicerone, sīs-ē-rō'nē, one who, in Italy, and particularly in Rome, shows and explains to strangers curiosities and antiquities; hence, in general, a guide. The talkativeness of such attendants procured them the name *ciceroni*, in jocular allusion to Cicero. This term is falling into disuse, the official designation, *servitore di piazza*, or simply *guida* (guide), being used instead.

Cicisbeo, chē-chēs-bā'ō, a name given since the 17th century in Italy to the professed gallant of a married lady. It was the fashion among the higher ranks in Italy for the husband, from the day of marriage, to associate with his wife in his own house only. In society or places of public amusement she was accompanied by the *cicisbeo*, who even attended at her toilet, to receive her commands for the day. The custom is the more extraordinary, from the natural jealousy of the Italian, who seemed to change his character completely after marriage.

Cicognara, Leopoldo, COUNT DA, Italian antiquarian, diplomatist and writer on art subjects: b. Ferrera 17 Nov. 1767; d. Venice 5 March 1834. He studied at Modena and the Academy of San Luca, and was later appointed ambassador to Turin, and councillor of state. In 1808 he became president of the Academy of Fine Arts in Venice. His most important work was a 'History of Sculpture from the Renaissance of that Art to the Present Century' (3 vols., 1813–18). He also wrote a 'Life of Canova' (1823).

Ciconia, sī-kō'nī-a, the genus of birds to which belongs the common stork, the type genus of the family *Ciconiidae*.

Cicuta, sī-kū'ta, a poisonous genus of umbelliferous plants commonly known as water-hemlock or cowbane. The plant is a dangerous poison, said to be fatal to cattle that eat it. Persons are known to have died from eating the root, which is white and fleshy. It may be the *koneion* (hemlock) of the Greeks, which Socrates and others condemned to death were required to drink. The common or tree hemlock, *Conium maculatum*, a poisonous umbellifer, has a stem from two to four feet high, hollow, striated, and spotted with purple; leaves large, much divided, and fetid when bruised; and with unilateral partial involucre, marks by which

CID — CIDER

the common hemlock is readily distinguished from the water-hemlock, and from any other species of the *Umbelliferae*. It is indigenous in most temperate climates, and is extensively used in medicine, being given internally as a sedative, and applied externally to sores, **ulcers, etc.**, in the form of a poultice or ointment. The Latin *cicuta* was the true hemlock. See **HEMLOCK**; **WATER-HEMLOCK**.

Cid, **El**, *āl thīd* or *ēl sīd*, the popular name of a Spanish national hero, Rodrigo (or Ruy) Diaz: b. Bivar about 1040; d. 1099. Legend and tradition have somewhat obscured the character of the historical Cid, but the main facts of his life are well established by Spanish and Arabic records. He first appears in national history when Sancho, the eldest son of Ferdinand I., and king of Castile, was at war with his brother, Alfonso; at this time he was already known as the *Campcador* (the champion), a name which he won probably by vanquishing in single combat the champion of Sancho of Navarre. In the war with Alfonso Sancho was victorious, and this success was owing to the Cid, to whom he had given the command of his forces. Alfonso was taken prisoner, and it remained only to overcome the obstinate resistance of Zamora, where Sancho's sister, Urraca, ruled. Before the walls of this city Sancho was assassinated, and Alfonso was called to the throne. It is asserted—but the historical evidence here is not complete—that before recognizing Alfonso's authority the Castilian nobles required of him an oath that he had no part in his brother's murder, and that it was the Cid who administered this oath, in 1073. Whatever the facts, Alfonso must have thought it wise to conciliate the good-will of the Castilian grandees until at least his own position became secure, as he gave his cousin Jimena (or Ximena), daughter of the Count of Ovideo, to the Cid in marriage. The marriage contract, dated 1074, is preserved at Burgos. Later the king, taking advantage of a pretext that the Cid had attacked the Moors without obtaining the royal consent, banished him. Old wrongs which the king still remembered probably furnished the real motive. Then began that career of "soldier of fortune," which, idealized by tradition, has made the Cid the perfect cavalier of Spain. He first offered his services to the Christian Count of Barcelona, and, when refused by him, to the Moorish king of Saragossa, who accepted the offer. The Cid remained in Saragossa till 1088, fighting against Moors and Christians alike, and rising to unusual distinction and power. In 1088 the attention of Mostain, the king of Saragossa, was drawn to the city of Valencia, then under the protection of King Alfonso. The Almoravides, a new Moslem sect from northern Africa, defeated Alfonso in battle, and caused him to withdraw his protection from Valencia, and the governor of the city appealed to Saragossa for help. The Cid was sent to the aid of the city in command of an expedition which proved successful, and he established himself in Valencian territory. As the recognized protector of the lawful king, in reality, the suzerain of Valencia, he received a generous tribute; but it is clear that he had already resolved, when opportunity offered, to secure the city for himself. Meanwhile he skilfully held off, now by force, now by ruse, all other competitors, Christian and

Moslem alike: including among these King Alfonso, whose territories he once wasted with fire and sword. As head of an independent army, he made successful forays in all directions; despoiling, levying tribute, garrisoning strongholds, and strengthening his position in every way, and in 1094 finally became master of Valencia itself. He successfully held the city till 1099, when the troops he had sent against the Almoravides were utterly routed, few escaping, and he already enfeebled in health, died, it is said, of grief and shame. His widow held Valencia for two years longer.

The Cid very soon became the favorite hero of popular songs. It is probable that these songs were at first short stories in rude metrical form; and that the epic poems, dating from about 1200, used them as sources. The earliest of the epic poems is 'The Poem of My Cid,' based upon history, but with a large amount of legendary matter. Its date is probably about 1200. It is one of the best of mediæval folk epics, its characters being drawn with clearness and simplicity. Another poem of about the same date, 'The Legend or Chronicle of the Youth of Rodrigo,' is of inferior merit, though not without fine passages. Two centuries and more after these poems we meet with the 'Romances' or 'Ballads of the Cid.' The earliest of these do not in their present form far antedate 1500. These ballads are derived from all sources, but chiefly from the Cid legend, which is here treated in a lyric, and popular tone.

These ballads make Jimena (or Ximena) Gomez the wife of the Cid, and tell the legendary story of her father (Don Gomez), insulting the Cid's father, of the Cid's revenge by killing Don Gomez, of Jimena's pursuit of the Cid demanding justice of King Ferdinand, and the final reconciliation through marriage. De Castro, in his drama, 'The Youth of the Cid,' drew his material from the ballads, but added love and the conflict between affection and the claims of honor in the mind of both Jimena and the Cid. Corneille, based his drama, 'The Cid,' upon that of Castro, using the same plot and the same struggle between love and duty on the part of the hero and heroine. Corneille condensed De Castro's 'The Cid,' gave it dramatic unity, and added greater dignity and nobility to the verse. His drama, when first put on the stage in France (1636), met with immediate success.

Ci'der, the expressed juice of apples; a beverage, the quality of which depends principally on the following particulars: Kind of fruit, condition of the fruit when ground, manner of grinding and pressing, method of producing fermentation, and precautions to be taken against its excess.

The Kind of Fruit.—The characteristics of a good cider apple are a red skin, yellow and often tough and fibrous pulp, astringency, dryness, and ripeness at the cider-making season. When the rind and pulp are green, the cider will always be thin, weak, and colorless; and when these are deeply tinged with yellow, it will, however manufactured, or in whatever soil the fruit may have grown, almost always possess color and either strength or richness. The most certain indications of the ripeness of apples are the fragrance of their smell and their spontaneously dropping from the trees. When they are in this

CIENFUEGOS

state of maturity on a dry day (all the better if the weather is cool and bracing), the limbs may be slightly shaken and partly disburdened of their golden store; thus taking such apples only as are ripe, and leaving the unripe longer on the trees, that they also may acquire due maturity. They must be carefully gathered to avoid bruising, as mold rapidly fixes upon the edges of every wound of a fruit gathered in autumn, and communicates a disgusting flavor to the juice. The only artificial criterion for ascertaining the quality of an apple for cider is the specific gravity of its must, or unfermented juice; or the weight compared with that of water. This indicates with very considerable accuracy the strength of the future cider. Its weight and consequent value are supposed to be increased in the ratio of the increase of saccharine matter. The strongest and most highly flavored cider which has been obtained from the apple was produced from fruit growing on a shallow loam, on a limestone basis. All the writers on the subject seem to agree that calcareous earth should form a component part of the soil of a cider orchard. A dry and somewhat loose soil is preferred.

Condition of the Fruit.—Fruit should be used when it has attained full maturity, and before it begins to decay. Each kind of apple should be manufactured separately, or at least those kinds only should be mixed which ripen about the same time. The longer the fruit remains on the tree without decay or being injured by frost the better, for not only is the perfect maturity of the juice an important consideration, but the colder the weather, short of actual frost, the more quiet and equable will be the fermentation. When gathered the apples should be carefully stored in some shady, cool room, and placed in heaps to undergo a further ripening, and acquire more saccharine matter while losing a considerable quantity of watery juice.

Grinding, etc.—This operation should be deferred till December, if possible. It is absolutely essential that the weather should be cold, even slightly frosty, to counteract the tendency to rapid fermentation. The apples should be reduced by the mill as nearly as possible to a uniform mass, in which the rind and seeds are scarcely discoverable, and the pomace should be exposed to the air. It has been ascertained that, by exposing the reduced pulp to the operation of the atmosphere for a few hours, the specific gravity of the juice increases from 1.064 to 1.078. For fine cider the fruit should be ground and pressed imperfectly, and the pulp then exposed 24 hours to the air, being spread and once or twice turned, to facilitate the absorption of oxygen; it should be then ground again, and the expressed juice added to it before it is again pressed. The best method of grinding the apples is to employ cylindrical rollers placed so near each other as to crush them. They are fed from a hopper above them, from which the apples pass between a pair of fluted or toothed cylinders, by which they are torn and partially crushed before reaching the more perfectly crushing apparatus below. The mass is then powerfully pressed, and the cider is run into casks.

Fermentation.—The vinous fermentation commences and terminates at different periods, according to the condition and quality of the fruit and the state of the weather. The best

thing whereby to judge of the proper moment to draw the liquor from the scum and sediment is the brightness of the liquid which appears after the discharge of fixed air has ceased and a thick crust has collected on the surface. The clear liquor should then be drawn off into another cask. If it remains bright and quiet, nothing more need be done to it till the succeeding spring; but if a scum collects on the surface it must immediately be racked off again, as this would produce bad effects if suffered to sink. Among the precautions used to prevent excessive fermentation is stumming, which is fuming the cask with burning sulphur. This is done by burning a rag impregnated with sulphur in the cask in which the liquid is to be decanted, after it has been partly filled, and rolling it so as to incorporate the liquid with the gas.

Cienfuegos, thē-ān''foo-ā'gōs, **Nicasio Alvarez de**, ä'l'bä-rēth dā, Spanish poet: b. Madrid 14 Dec. 1764; d. Orthez, France, July 1809. He studied at Salamanca at the time when the modern school of Spanish poetry was founded there by Cadalso and Melendez. He attached himself to this school, and in 1798 laid the foundation of his literary fame by the publication of a collection of poems. Shortly after he became editor of the government newspapers, *La Gaceta* and *El Mercurio*, and was appointed to the department of foreign affairs. He was in possession of this office when the war of Independence broke out. Madrid was occupied by the French, and Cienfuegos, having both offended Murat by an article in *La Gaceta* and taken part in the insurrection of May 1808, was brought to trial and condemned to death. At the intercession of some influential friends the sentence was commuted to banishment to France. His tragedy, 'Pitaco,' had procured his admission to the Spanish Academy. He also wrote the tragedy of 'Idomeneo,' and the comedy of the 'Magnanimous Sisters.' His tragedies are considered his best works.

Cienfuegos, thē-ān''foo-ā'gōs, Cuba, a city in the province of Santa Clara, on the south side of the island. Its harbor, which is one of the finest in the West Indies, was visited by Columbus on his first voyage, and was surveyed by Ocampo in 1508. The town was settled by refugees from Santo Domingo in 1819. Here the revolutionist Narciso Lopez planned to make his first demonstration on 4 July 1847. In recent years its commercial progress has been rapid, and it is now the second seaport of Cuba. Some of the sugar estates in the neighborhood are very large, and conducted on the most approved modern plan; in fact, Cienfuegos is the centre of the sugar trade on the Caribbean coast. It is a city of attractive, well-shaded streets, and substantially built houses. One of its plazas is the largest in Cuba. Among the principal buildings are the governor's house, market, railroad station, and military and government hospitals. Water from the aqueduct is supplied to 42 per cent of the dwellings; from wells, to 47 per cent; from cisterns, to 7 per cent. There are social clubs, a theatre, etc. The city is lighted by gas and electricity. The climate from May to November cannot be highly commended, the air having an excess of moisture, and the temperature ranging from 75° to 98° F. The winter months, however, are very agreeable, winds from the north prevailing, and

CIEZA — CIGAR

the temperature ranging from 60° to 78° F. during the day, with cooler nights. Cienfuegos is connected by rail with Sagua la Grande, on the opposite coast; with Santa Clara, the western terminus of the Cuba Company's main line to Santiago; with Havana, etc. By steamer it is in regular communication with New York, as well as with ports of the southern coast of Cuba from Santiago to Batabano. The population (United States War Department census, 1899) is 30,038. Occupied dwellings number 4,967. Number of inhabitants engaged in trade and transportation, 3,065; in agriculture, fisheries, and mining, 901; in personal service, 4,004; in manufactures and mechanical industries, 3,221; in professional service, 294; without gainful occupation, 18,553. Total school attendance 3,832. Number of persons able to read 18,052, or 60 per cent — a higher percentage in this respect being found among Cuban cities only in Havana (66 per cent) and Puerto Principe (62 per cent). Foreign-born are 11.6 per cent of the city's population. The white people number 19,220; negroes, 3,068; mixed, 7,401; and Chinese, 349. For a time during the Spanish-American war the harbor of Cienfuegos was blockaded by Admiral Schley.

Cieza, thē-ā'thā, Spain, a town in the province of Murcia, and 24 miles northwest of the city of Murcia, on an eminence near the right bank of the Segura. It has spacious streets, a large church and ancient tower, manufactures of linen and hempen fabrics, and a trade in corn, wine, oil, and silk. Pop. 14,000.

Cigar (of uncertain etymology; it cannot be connected with any West Indian speech, and the derivation at present most common among scholars is from Sp. *cigarra*, cicada, in allusion to a similarity of outline; Sp. *cigarro*. Also incorrectly spelled *Segar*), a compact roll of tobacco, for smoking. This form was borrowed by the Spanish invaders from the Indians of Cuba. When the Spaniards found that tobacco would grow elsewhere, they transplanted it to their possessions in the Philippines and in other localities. The Manila cheroot is the common method of smoking tobacco in the Far East. This cheroot is cut off evenly at both ends and is shorter than American cigars. Rolling tobacco into cigars was not generally practised in Virginia and the Carolinas for a long time after the settlement of those sections by the English, for there the Indians invariably smoked their tobacco in pipes, but finally the convenience and superior flavor these rolls possessed made their use quite common some years before the Declaration of Independence of the American colonies. In Cuba, Mexico, and Central America and, in fact, in all Spanish-speaking countries, the use of a pipe to this day is a rarity, the inevitable *cigarro* or *cigarette* ("little cigar") being found constantly in use.

The moist climate, the character of the soil, and the peculiar preservative qualities of the air make Cuba the true home of the perfect cigar. There are but half a dozen valleys, mostly in the western end of the island, where the finest cigar tobacco is grown and cured, the most important being the Vuelta Abajo district. Perhaps the next best comes from Porto Rico. The removal of the duty on manufactured cigars from that island in 1903 flooded

the United States with cigars from there, many of them very inferior. In order to avoid paying the high duties on Cuban-made cigars, the device was early tried of bringing the tobacco over to the small island of Key West, a part of the State of Florida, separated from Cuba by only an 80-mile-wide strait. It was thought that the climatic conditions there would be so similar to those of Cuba that an equally fine cigar could be made there, while the importation of the tobacco in bulk cut down the duties very materially. The "Key West" cigar is much cheaper than the one made in Cuba, but the flavor, for some reason, is inferior. The manufacturers even brought cigarmakers from Cuba to Key West, so that so far as possible the product might be the same as the original, but in vain. It has been discovered by experts of the department that in Ohio and Texas are certain areas which possess a soil so similar to that of the celebrated Vuelta Abajo district of Cuba that it is possible to raise tobacco there that will equal the Cuban. Samples of the leaf grown there and submitted to dealers in New York and Philadelphia, who were not told where it came from, proved to be so similar to that of Cuba that it was pronounced pure Havana leaf of the best quality. The pioneer in the manufacture of Key West cigars was Gen. J. H. Gregory, who gained his military title in the first war for Cuban independence, and was familiar with the internal resources of Cuba.

Tobacco comes to the cigar manufactories in bundles, that intended for wrappers being kept separate. The best tobacco for wrappers is grown in Sumatra. Connecticut wrappers are also much used, being supple and tough. The best cigars made within the limits of the United States are undoubtedly those of Cuban tobacco manufactured in Key West, with a Connecticut wrapper. Those with Virginia, Carolina, Pennsylvania, and other tobaccos as a filler, with the Connecticut wrapper, are of inferior quality, but sell in large quantities, because of their cheapness. The operative spreads the filler leaf on his bench, with a small quantity of the wrapper beside him. He rolls the filler into the proper shape and firmness, then deftly cuts a portion of leaf to form a wrapper, winds the wrapper about the filler, and secures the ends with paste. This is the standard method. Some poorer grades are made by machinery, but the results are not satisfactory and hand-made cigars are still the best and most expensive. Scattered throughout the United States are thousands of large and small factories for the manufacture of cigars, many of them using little machinery. In 1901 there were 6,914,639,012 cigars and 2,728,153,697 cigarettes made in this country. The production of cigarettes has decreased since 1896, when it was 4,967,444,232, the greatest number ever made, and exceeding the number of cigars for that year by over 900,000,000. The reason for this is the persistent fight constantly waged against the cigarette as injurious, most States having stringent laws regulating its sale. The value of this finished cigar product to the makers is probably about \$250,000,000 annually, the consumer paying about \$750,000,000 for it. This does not include the imported article, about 75,000,000 coming from Cuba (1903) and 125,000,000 from Porto Rico and the Philippines. There are some few thousands

CIGARETTE — CIMABUE

of cigarettes imported from Egypt and Turkey, though most of those called so are made in this country from American tobacco. Altogether the number of cigars and cigarettes made or brought into the United States at present is about 13,000,000,000. For further details, including the preparation of tobacco-leaf, see the article TOBACCO.

Cigarette. See CIGAR.

Cignani, chēn-yä'nē, **Carlo**, Italian painter: b. Bologna 15 May 1628; d. Forli 6 Sept. 1719. He was a pupil of Albano. He knew how to compose, like the Caracci, and to distribute his figures in such a way that his paintings appear larger than they really are. His finest fresco paintings are at St. Michael in Bosco, at Bologna, in ovals supported by angels, and in the saloon of the Farnese Palace, where he represented Francis I. of France touching for the king's evil. In his painting of the Assumption, at Forli, he has imitated the beautiful Michael of Guido in the cupola at Ravenna, and other fine conceptions of this painter; but in other pieces he made Correggio his model. He does not so often introduce foreshortenings as the Lombards; and in his outlines and drapery he possesses a finish peculiar to himself. His pencil is powerful, and his coloring lively. Clement XI. conferred on him several marks of distinction. His paintings have been engraved by various artists.

Cignaroli, **Giovanni Bettino**, jō-vän'nē bēt-tē'no chēn-yä-rō'lē, Italian painter: b. Salo, near Verona, 1706; d. Verona 1 Dec. 1770. His best works are in the cathedrals of Pisa, Bergamo, Mantua, and in the churches of his native city and of Ferrara. He educated a numerous school at Verona, and received several invitations to visit foreign courts, which he invariably declined. In style he resembled Carlo Maratti, but formed himself on the works of Guido and Correggio. He was a man of literary culture, and wrote with discrimination and taste on various subjects.

Cilia, sīl'ī-a (Latin, "eyelashes"), small, generally microscopic, hair-like organs or appendages, averaging $\frac{1}{3000}$ inch in length, found on the surface of the tissues of most animals, and in some vegetable organisms (as algæ), chiefly on tissues which are in contact with water, or which produce fluid secretions. They are constantly in a state of active movement, and communicate to the fluid with which they are in contact a corresponding motion. This is called vibratile or ciliary motion. In most of the lower aquatic animals the respiratory function is aided by means of the vibratile cilia; many animalcules move by a similar mechanism; and in the highest classes of animals cilia have a share in the performance of some important functions.

Ciliata, sīl-ī-ā'ta, a group of *Protozoa*, and to which belong most of the *Infusoria* (q.v.). The body is covered with cilia, and it is either free or stalked and attached to submerged plants, etc. The group comprises the most specialized *Protozoa*, including the trumpet-animalcule (*Stentor*), the bell-animalcules (*Vorticella* and *Epistylis*). In these one-celled animals there is for the first time in the animal kingdom, as we ascend from the simplest organ-

isms, a permanent aperture (cytostome) corresponding to the mouth of the higher animals, and an œsophagus (cytopharynx), and the undigested or waste portions of the food are cast out at a fixed point or opening (cytopyge), usually not detected when not used. There is also in the *stentor*, etc., a definite spiral muscle, while netting bodies (trichocyst), like minute rods, in rare cases occur, and are supposed to be defensive in their nature. The ciliate infusoria reproduce by fission, budding, and also by conjugation, molting in the origin of spores or embryos. Certain forms are parasitic; thus the skin disease called eczema has been attributed to the presence of parasitic *vorticellæ*, and a flattened oval free form occurs in the large intestines of men ill with diarrhœa.

Cilicia, sī-līsh'ī-a, in ancient geography the region between Pamphylia and Syria, lying south of Mount Taurus. The inhabitants of the coasts were formidable as pirates, and even disturbed the Ægean and Ionian seas. The inhabitants of the northern portion lived in part a nomadic life; those in the east were devoted to agriculture. Alexander made Cilicia a Macedonian province; it then passed to the Syrians. Pompey subdued its piratical inhabitants. The mountainous parts were left in the hands of the native princes; the rest, in 67-6 B.C., was constituted a Roman province, of which Cicero was proconsul in 51-50 B.C.

Cimabue, **Giovanni**, jō-vän'nē chē-mä-boo'ā, Italian artist: b. Florence 1240; d. there about 1302. Two Greek artists, who were invited to Florence by the senate to paint a chapel in the church of Santa Maria Novella, were his first masters. Although these artists handled the pencil awkwardly, they however taught him, according to ancient tradition, the proportions which the Greek artists had observed in their imitations of the human figure. Attentive to their instructions, Cimabue studied principally the fine antique statues. He was the first to point out to succeeding painters the elements of the *beau idéal*, the memory of which had been extinguished during several centuries of disorder. It is true the paintings of Cimabue do not exhibit that harmonious distribution of light and shade which forms the chiaroscuro. His coloring is dry, flat, and cold; the outlines of his figures intersect each other on a blue, green, or yellow ground, according to the effect which he had in view. He had no idea of linear and aerial perspective. His paintings are, properly speaking, only monochromes. But these faults, which are to be attributed to the infancy of the art, are compensated for by beauties of a high order—a grand style, accurate drawing, natural expression, noble grouping, and a fine disposition of his drapery. His best paintings are in the church of Santa Maria Novello at Florence, and in the Sacro Convento at Assisi. He may be considered the link between the ancient and modern schools of painting. Cimabue evinced a generous appreciation of Giotto, whom tradition says he discovered drawing figures on the smooth surface of a rock while tending his sheep, and whom he took with him to Florence, and instructed with such success that the pupil soon excelled his master. It should be added that there is very little corroborating testimony regarding the works

CIMAROSA — CIMMERIANS

attributed to him by Vasari, and a recent destructive critic has written in the 'Nineteenth Century' for March 1903, "All, then, that we know about this Cenni di Pepi is that he was a distinguished Florentine artist; that he was nicknamed Cimabue; that he flourished in the closing years of the 13th century and the early years of the 14th, and that he executed a mosaic and an altar-piece at Pisa, of which the latter has disappeared and the former has been entirely renewed."

Cimarosa, Domenico, dō-mā-nē'kō chē mā rō zā, Italian composer: b. Aversa, near Naples, 17 Dec. 1749; d. Venice 11 Jan. 1801. He received his first musical instruction from Sacchini, entered the conservatory of Loretto, where he imbibed the principles of the school of Durante, and studied with great assiduity. He soon displayed his superiority in the 'Sacrificio di Abramo,' the 'Olimpiade,' and other compositions. At the age of 25 he had already gained the applause of the principal theatres of Italy. He was invited to St. Petersburg (where he remained four years) and to several German courts to compose heroic and comic operas. In the latter he particularly distinguished himself by the novelty, warmth, humor, and liveliness of his ideas, and by a thorough acquaintance with stage effects. Among his 120 operas the most celebrated are: 'Penelope'; 'Gli Orazj e Curiazj'; and 'Artaserse,' among the *opere serie*; and among the *opere buffe*, 'L'Italiano in Londra'; 'L'Amor Costante'; 'Il Pittore Carigino'; and many others. His comic opera, 'Il Matrimonio Segreto,' excited general enthusiasm, and received the signal honor of being performed twice on the same evening, at the desire of the Emperor Leopold. From Vienna he went to Naples, and became involved there in the revolutionary commotions. He died from the effects of the ill treatment which he had been subjected to in prison. His bust, by Canova, was placed in the Pantheon at Rome in 1816 by the side of those of Sacchini and Paesiello.

Cimbri, sīm'brī, a tribe which inhabited Jutland (the Chersonesus Cimbrica), whence they sallied, together with the Teutones, and became among the most formidable of the enemies of Rome. In the year 114 B.C., when the Romans were already masters of a part of the eastern Alps, in the present Carniola, Istria, etc., and had established themselves in Dalmatia and Illyria, along the coast, immense bodies of barbarians suddenly made their appearance, who overcame the consul Papirius Carbo in the country now called Styria; but instead of entering Italy they proceeded to the north, and soon after, jointly with the Tigurians, entered the territory of the Allobroges. The Romans sent two armies, commanded by the consuls L. Cassius and M. Aurelius Scaurus, to oppose them, but both were defeated—the former by the Tigurians, the latter by the Cimbri. Even after this success the victors did not enter Italy, but overran Gaul with three bodies, consisting of Teutones, Cimbri, and Ambrones. Two new armies, with which the consul C. Manlius and the proconsul Q. Servilius Cæpio hastened to oppose them, were likewise defeated beyond the Rhodanus. The Romans lost, according to Aetius, 80,000 men. While Rome placed her last hope in Marius, the barbarians

overran the other western countries of Europe. Gaul suffered severely, but the Iberians and Belgians repulsed the invaders. Upon this they resolved to descend into Italy. The Teutones and Ambrones were to enter on the western side of the Alps, the Cimbri and Tigurians on the east. After Marius had waited the approach of the first during three entire years, and had accustomed his troops to their appearance, he routed them completely (102 B.C.) in two days—on the first day the Ambrones, on the second the Teutones—at Aix in Provence. The Cimbri, on the other hand, who had driven back the consul Catallus on the Adige, and had spread themselves along the Po, demanded land of the Romans, but were totally routed by Marius at Vercelli 101 B.C. About a century after this the Cimbri sent (from the Cimbrian Chersonesus) an embassy to the Roman emperor Augustus, to offer him presents and to ask pardon for what they had previously done against the Romans. The nationality of the Cimbri is a disputed point. Similarity of name led the ancients to identify them with the Cimmerians, but this view is no longer held. Some authorities believe them to have been of Germanic, others of Celtic race. Their name certainly has a great resemblance to that of the Celtic Kymri; and their armor and customs, according to Plutarch and Strabo, were very different from those of the Germans. "All these circumstances," says Schmitz, in Smith's 'Dictionary of Greek and Roman Geography,' "render it in the highest degree probable that the Cimbri were a Celtic or Gallic and not a Germanic nation."

Cim'brian Panic, The, a Roman panic after the annihilation of five armies by the Cimbrians 105 B.C. This panic rose to its climax after the terrible defeat of Cæpio, the consul in Gallia Narbonensis.

Cimburgis Lip, The, often called the "Austrian Lip" (q.v.). It came from Kaiser Maximilian I., and was inherited from his grandmother Cimburgis, a Polish princess, who married Kaiser Friedrich III.

Cimex Lectularius, sī'měks lēc-tū-lār'ē-ūs. See BEDBUG.

Cimicifuga, sī-mī-sīf'ū-ga, from the Latin, "to drive away," so named because certain species are used to drive away bugs and other insects. The plant is a genus of the crow-foot family, comprising about 20 species, natives of North America, Asia, and Europe. The best known American species, because of their medicinal properties are the bugbane (*Cimicifuga americana*) (q.v.) and the black-snakeroot or black cohosh (*C. racemosa*), supposed to be an antidote for the venom of serpents.

In medicine cimicifuga is used largely by the eclectics as a digestant, cardiac tonic, and uterine stimulant. Its active principles have never been thoroughly determined and little is known of its physiological action as determined by exact pharmacological experiment.

Cimmerian (sī-mē-rī'an) **Bos'phorus**, an ancient name for the Strait of Kaffa.

Cimmerians, sī-mē-rī-anz, a tribe half-mythical, half-historical, described first in the Odyssey as dwelling beyond the ocean-stream, in thickest gloom, unvisited by Helios. Hence the term, "Cimmerian gloom." From Herodotus we learn that they originally inhabited the coun-

CIMOLIAN EARTH — CINCHONACEÆ

try between the Borysthenes and the Tanais, but expelled by the Scythians, they traveled along the shores of the Euxine, passed through Colchis and over the Halys, and entered Asia to the west of that river. Against this it is urged that the route by the Euxine would be impassable for a nomadic people, the Caucasus running down to the very shores of that sea. The sum of our certain knowledge respecting this people is, that they seem to have been the chief occupants of the Tauric Chersonesus (the Crimea), where they had a large city, near which were fortifications enclosing the isthmus by an earthen wall.

Cimolian (sī-mō'li-ăn) **Earth**, or **Cimolite**, sīm'ō-līt or kīm'ō-līt (from Kimolos, one of the Cyclades, in the Ægean Sea, where it is still to be found), a hydrated silicate of aluminum, apparently formed by the decomposition of augite. It is of a light color, compact, and somewhat slaty. Water soon splits it up; when ground with water it forms a thick cream. In classical times it was used as a soap for cleaning delicate fabrics, and by the bath-keepers. It is mentioned by Aristophanes in this connection. It is used in the island as a detergent.

Cimon, Athenian general and statesman: b. about 502 B.C.; d. Citium, Cyprus, 449 B.C. He was a son of the great Miltiades. He fought against the Persians in the battle of Salamis 480 B.C., and shared with Aristides the chief command of the fleet sent to Asia to deliver the Greek colonies from the Persian yoke. The return of Aristides to Athens soon after left Cimon at the head of the whole naval force of Greece. He conquered the pirate-island of Scyros, subdued all the cities on the coast of Asia Minor, pursued the Persian fleet up the Eurymedon, destroyed more than 200 of their ships, and then, having landed, on the same day entirely defeated their army 469 B.C. He employed the spoil which he had taken in the embellishment of Athens, and in 463 reduced the revolted Thasians; but the popular leaders, beginning to fear his power, charged him on his return with having been corrupted by the king of Macedon. The charge was dropped, but when Cimon's policy of friendship to the Lacedæmonians ended in the latter insulting the troops sent by Athens to their aid, his opponents secured his banishment. He retired into Bœotia, and his request to be allowed to fight with the Athenians against the Lacedæmonians in 457 at Tanagra was refused. Eventually Cimon was recalled at the instance of Pericles to conclude a peace with Lacedæmon. He died while besieging Citium in Cyprus. His 'Life' was written by Cornelius Nepos.

Cinapusen, sē-nā-poo'sän, or **Cinapuran Islands**, a cluster of 10 islands of the Tawi group, Sulu Archipelago, lying southwest of the island of Sulu; area 13 square miles. The islands are covered with tropical vegetation, and are mostly resorted to for fishing by natives of neighboring islands. Tabawan, the largest of the cluster is, however, thickly populated; the inhabitants carry on a considerable pearl fishery. They were at one time notorious pirates, but since the destruction of their settlements by a Spanish fleet, have been harmless

and inoffensive. The islands now belong to the United States and are a part of the Military Department of Mindanao.

Cinchona Bark, the bark of several species of *Cinchonaceæ* (q.v.). The following are the most important: *Chinchona flava cortex*, yellow cinchona bark, which occurs as quills covered with a brown epidermis, mottled with whitish yellow lichens, and also in flat cinnamon-colored pieces. They break with a fibrous fracture and the escape of a powder. Yellow bark is rich in quinine, and 100 grains should yield not less than two grains of alkaloid. It is derived from *C. calisaya*, which grows in the peculiar cloudy regions of the Andes. *C. pallidæ cortex*, pale cinchona bark, from *C. condaminea*. It occurs always in quills covered with crustaceous lichens. Its fracture is short and not fibrous. It contains chiefly cinchonine. Two hundred grains of the bark yield about one grain of alkaloid. *C. succirubra* appears to thrive in India. The bark occurs in flattened rough-fibrous, dark-brown red pieces, which are covered with a brown-red epidermis. It breaks with a red fibrous fracture. It contains about equal quantities of cinchonine and quinine, and 100 grains of the powdered bark should yield not less than 1½ grains of alkaloid. The yellow bark is used in the form of decoction, extract, infusion, and tincture. The pale bark is contained in *tinctura cinchonæ composita* and in *mixtura ferri aromatica*. The cinchona barks contain, besides the alkaloids, certain acids having astringent properties, and are valuable as tonics in cases of great debility. Cinchona barks rich in quinine generally contain much lime, and their solutions are precipitated by sodium sulphate. See QUININE.

Cinchonaceæ, sīn-kō-nā'sē-ē, a well-marked order of plants, almost exclusively found within the tropics. Its leaves are simple, entire, opposite, with interpetiolar stipules. The flowers are usually arranged in panicles or corymbs. The calyx is adherent, with a definite number of divisions or none. The corolla is superior, tubular, and regular, with a definite number of divisions. The stamens arise from the corolla, all on the same line, and alternate with its segments. The ovary is inferior, surmounted by a disk, usually two-celled, occasionally with several cells; the style is single, inserted, sometimes partly divided; the stigma usually simple, sometimes divided into a number of parts. The fruit is inferior, dividing into halves, or not dividing, and dry or succulent; sometimes it is many-celled. Many of the species of this order are of considerable importance, being largely used in medicine, acting as tonics, febrifuges, emetics, and purgatives. The species of *Chinchona* yield Peruvian bark. An extract, with some sweetness and a more astringent taste than terra japonica, and called by the Malays gambier, is obtained from the *Uncaria gambir*. Ipecacuanha is the root of *Cephælis ipecacuanha*, a little, creeping-rooted, semi-herbaceous plant, found in the damp forests of Brazil. Coffee is the seeds of a plant of this order, the *Coffea arabica*. A few species bear an edible fruit, such as the genipap of South America, the nahil peach of Sierra Leone, and the voa-vanga, a good dessert fruit in Madagascar. Among dyeing plants there is the

CINCINNATI

Oldenlandia umbellata, whose roots are the chay-root (q.v.) of commerce.

Cincinnati, Ohio, county-seat of Hamilton County, in the extreme southwest of the State, one of the great commercial and manufacturing centres of the Union, tenth in nominal rank, and seventh or eighth in fact. It is situated on the north bank of the Ohio River, almost exactly half way from its origin at Pittsburg to its mouth at Cairo, Ill., about 465 miles by water from each and 315 by rail from the former, and 369 from the latter; and is a station on every trunk line of railroad in the Middle West, being the main terminal of the Cincinnati Southern, Cincinnati, Hamilton & Dayton, Chesapeake & Ohio, and a number of others. It is 138 miles by water from Louisville, and 1,631 from New Orleans, against 114 miles and 1,210, respectively, by rail; 764 miles by rail from New York, and 270 miles from Chicago.

Topography.—Cincinnati occupies the northern half of a circular amphitheatre of hills about two and a half miles in diameter, bisected east and west by the Ohio River—which here makes a great southward sweep. In the southern half, bisected north and south by the Licking, lie its Kentucky suburbs, respectable cities themselves. The northern semicircle rises from the river in two great terraces, sloping northward to a third level at the summit; originally quite distinct, now much confused by grading. The lower platform is a bluff about 65 feet above low water, the second 50 to 100 feet higher, the crest-hills 150 to 300 feet higher yet, or about 475 feet at the summits—Mount Adams, Mount Lookout, Mount Auburn, Fairview Heights, etc.—giving a noble prospect of river and country. Four of these hills can be reached by inclined plane cable railways used in the main for the lifting of the electric cars. They are cut by ravines, and much of the heavy original woods has been left intact, while the remaining ground has been occupied by miles of the finest residence streets in America, parked with shrubbery, lawns, and flower gardens. On the western side of the city from north to south runs Mill Creek, the remains of a once huge glacial stream, whose gently sloping valley half a mile or more wide, forms an easy path into the heart of the city, and was an indispensable factor in determining its position; highways, canals, and railroads come through it, and the city's growth has pushed much farther up this valley than in other directions. The railroad stock yards are on its eastern slope. Cincinnati extends for about 14 miles along the river front, to a width of about five in an irregular block north from it, but attains a width of six or seven miles at the extreme point along the creek valley. The total area thus far in the city limits is 42½ square miles; much more is legitimately a part of it.

Municipal Conditions.—The site of the city is a glacial moraine of gravel and boulders, cut through by the Ohio; there is therefore little bottom land, and has been from the first little of the malaria which was long such a scourge and reproach to western settlements; and this, with the moderate climate, averaging about 75° in summer and 34° in winter, and the easy sewerage down the slopes into the Ohio and away from the city, has given it excellent sanitary conditions, its death-rate falling from 21 per 1,000

in 1890 to 19 in 1900, and 18 at present. The city owns its own waterworks and 449 miles of mains. The water is pumped from the Ohio River into reservoirs in Eden and Third Street Parks, having a capacity of 106,000,000 gallons, the daily consumption being about 44,000,000 gallons. The system is now being extended at an approximate cost of \$10,000,000, and will when completed draw its supply from the Kentucky side of the Ohio opposite California about eight miles up the river and beyond all contaminating sources. The extension includes a complete mechanical filtration plant at the new reservoirs, which will have a capacity of 350,000,000 gallons. With the completion of the new waterworks perfectly pure water will be delivered direct to the consumer. The city has 641 miles of streets, of which 391 miles are paved with macadam, granite, asphalt, etc.

Interior, Suburbs, etc.—The bottom level below the bluffs, along the riverside, is of course the seat of the river shipping business, and has as well the usual fringe of low quarters; it is paved and there is a broad "public landing" fronted by floating docks, wharf-boats, etc. Above are the wholesale and then the retail business streets, with great extent and variety of fine business architecture, and gridironed with electric roads, of which there are some 225 miles within the city limits. The principal lines converge at or near Fountain Square (see below), and connect with a ring of beautiful suburbs, within and without the city limits, unsurpassed in America. To the north are Clifton, Avondale, Mount Auburn, Vernonville, College Hill, Winton Place, Linwood, Elmwood, Hartwell, Lockland, Glendale, Norwood, Oakley, Walnut Hills, Mount Lookout, etc.; across the river, over which, on three bridges, the electric lines run, are numerous cities and towns, including Covington, Ludlow, and Milldale to the west of the Licking, and Newport, Bellevue, Dayton, and, far beyond, to the east, Fort Thomas, a leading army post. The section lying to the north and east of the canal which intersects the plateau at the foot of the suburban hills is largely occupied by Germans, from which circumstance it is frequently referred to as "over the Rhine." The river is crossed by five bridges, each more than half a mile long, one exclusively for railway traffic, two for highway, and two for both; the truss-bridge of the Cincinnati Southern to Ludlow—costing \$3,348,675, with one of the longest spans in the world—the cantilever of the Chesapeake & Ohio to West Covington; the great wire suspension bridge to Covington, designed by John A. Roebling, and completed in 1867 at a cost of \$1,800,000, and two wrought-iron bridges to Newport, one of them used by the Louisville & Nashville R.R.

The original town was laid out as a checker-board, with streets four rods wide, the conventional form of the artificial American town; but the irregular surface and individual tastes have given them greater variety since, and no city has a finer field for picturesque architecture. The older residence streets were monotonous rows of low brick houses, but the newer ones have a remarkable variety both of form and material. A local freestone and blue limestone are much used in building, as well as brick with steel framing. The most notable public buildings, besides churches mentioned below, are the gov-

CINCINNATI

ernment building (post-office, custom-house, etc.) of brick and iron with sawed freestone facing, 180 feet by 50, and costing \$5,200,000; the county court-house (Romanesque), replacing the one destroyed by the mob in 1884, with the jail in the rear, the whole occupying an entire square; the beautiful city-hall, completed in 1893 at a cost of \$1,266,956.10; the city hospital, of eight buildings around a central court, occupying a square of nearly four acres, and costing over \$700,000 exclusive of grounds; the city work-house, the university buildings, the Chamber of Commerce, one of H. H. Richardson's last designs; the magnificent Music Hall, the gift of Reuben R. Springer and others; the Romanesque public library, costing \$675,000; the Masonic Temple (Byzantine), Odd Fellows' Temple, Y. M. C. A. Building, Art Museum, the Queen City, Cincinnati and Phoenix clubs, Lafayette and Third National Bank buildings, Rookwood Pottery, St. Francis Xavier's College, a splendid structure; the Central Union depot, the city markets, and the sky-scrappers of 15 to 20 stories, one of which, the Ingalls Building, is the tallest concrete structure in the world, as well as smaller but admirable bank and other business buildings. Of public monuments, by far the most artistic is the Tyler-Davidson Fountain, with a surrounding esplanade, on Fifth Street, between Vine and Walnut, in Fountain Square, the centre of most of the street car lines. It was presented to the city by Henry Probasco in 1871, having been cast at the Royal Foundry in Munich at a cost of \$200,000, and is regarded as the finest fountain in the world, and one of the world's chief art treasures. The equestrian statue of President William Henry Harrison (first governor of Ohio), the statues of Garfield, Lincoln, Hecker and McCook, and the Fort Washington monument also adorn the city.

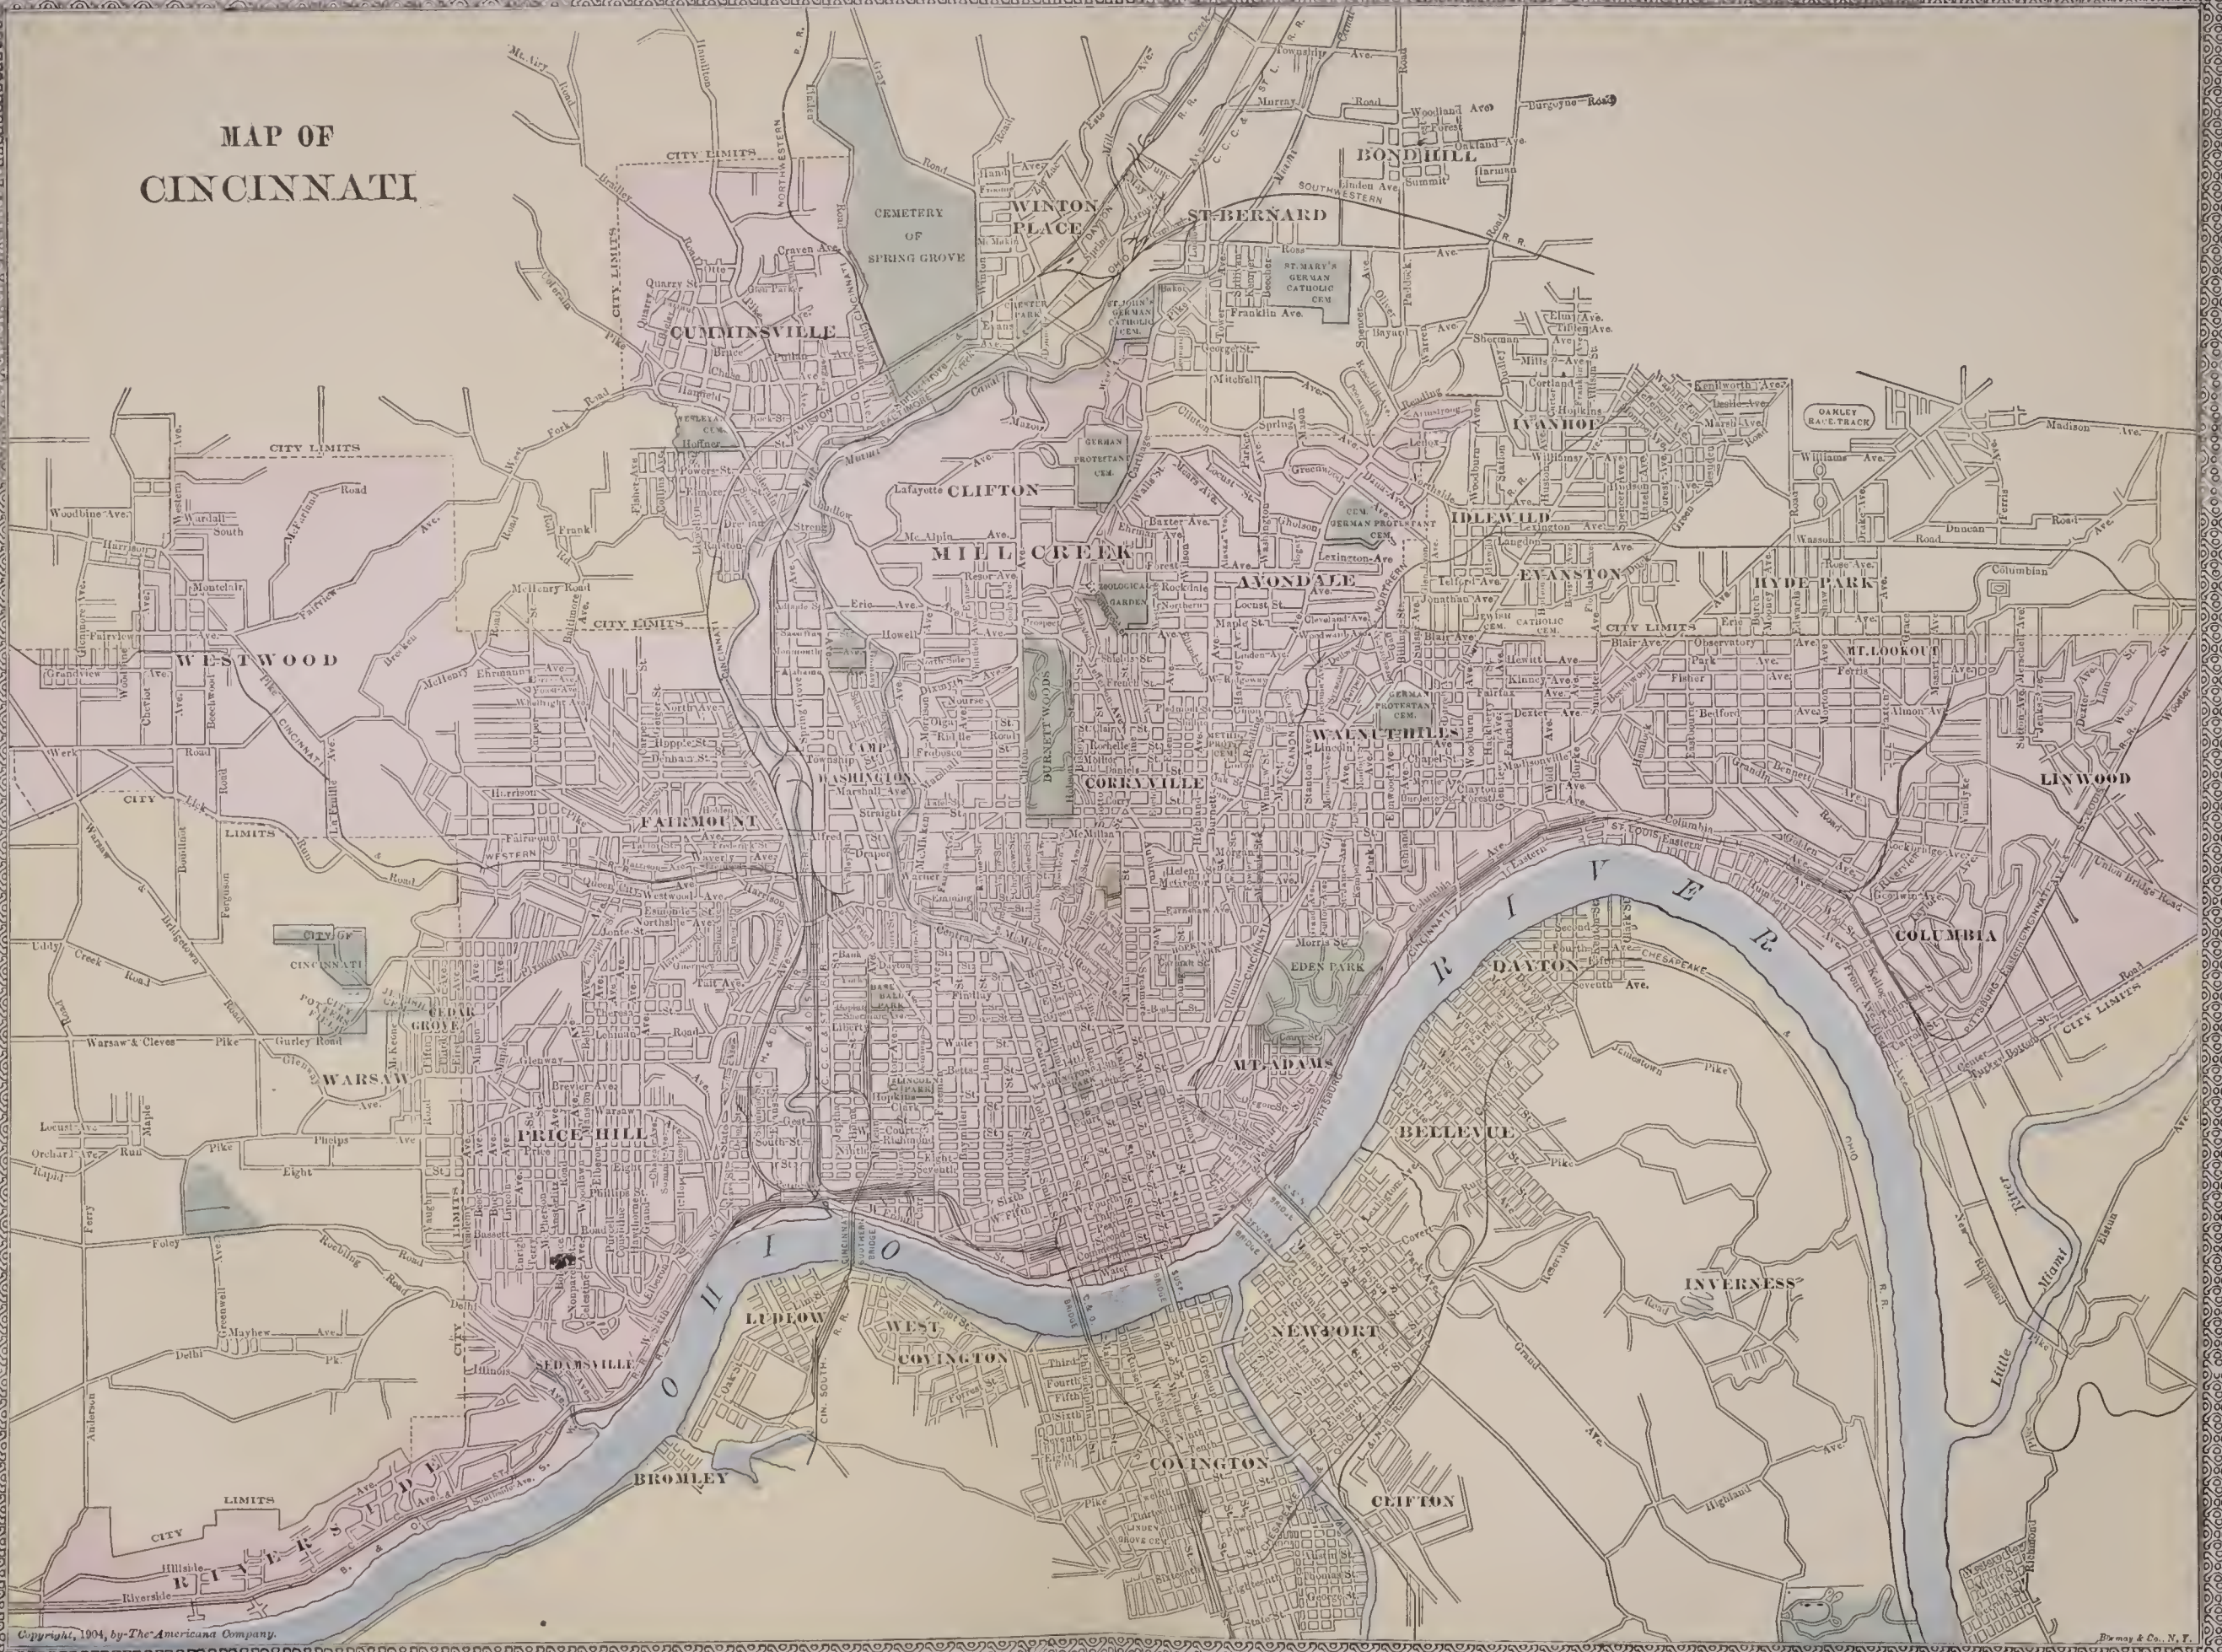

Parks, Cemeteries, etc.—The park system comprises 540 acres, in three large bodies on the hills and seven smaller ones. The largest is the superb Eden Park, containing 210 acres, on Mount Adams in the northeast centre, containing the two main city reservoirs made to look like lovely natural lakes; there is also a high water tower with steps to the top, commanding a matchless prospect. The Art Museum and Art School, the gift of C. W. West, Joseph Longworth, David Sinton, R. R. Springer, and others, two beautiful buildings costing \$450,000, is within the grounds, which are entered by a mediæval gateway, Elsinore, much admired. The next largest park, and equally picturesque, is Burnet Woods in the north centre, with about 160 acres; it contains the grounds, 30 acres in extent, of the University of Cincinnati (q.v.), and another exquisite lake. The zoological gardens, northeast of Burnet Woods, with 60 acres of wild natural beauty, is the home of a varied collection of wild animals and birds, regarded as the best in the country. Lincoln, Washington, and Hopkins are the finest of the smaller parks. Most of the 20 cemeteries are in the northeast, though one or two are in the extreme southwest; but the one superb burial ground, one of the largest and most charming in the country, is Spring Grove Cemetery, about six miles north on the western slope of Mill Creek Valley, with 600 acres of fine landscape gardening and native beauty, and reached by an avenue 100 feet wide. It has a bronze statue as a soldiers' monument,

and a number of magnificent and costly mausoleums.

Amusements, Clubs, etc.—Cincinnati's large German population, with the healthy taste of that element both for recreation and music, has given it a foremost place in these lines. Music is cultivated in a number of well patronized institutions, the College of Music and the various conservatories, and the biennial May festivals are an indispensable part of the city's higher life and are known throughout the world. Other important features of the musical life are the permanent symphony orchestra, the Apollo and Orpheus clubs and a large number of German singing societies. The grand Music Hall is a monument of the munificence of Reuben Springer, who founded it and gave part of its endowment; it is 500 feet by 300, has a seating capacity of over 4,000, and its organ is one of the largest in the country. There are also the Grand, Robinson's, and Heuck's Opera houses; the Walnut Street, Columbia, Lyceum, and People's theatres, the Auditorium, College and Greenwood halls, the Turner and Arbeiter halls, etc. The chief clubs are the Queen City, Business Men's, Phoenix, Cincinnati, Cuvier, Country, Commercial, and Literary. The Cincinnati Gymnasium has extensive suburban athletic grounds and owns a fine city building. There are two favorite summer resorts on the Ohio, one on the Kentucky shore called the Lagoon, and Coney Island, some miles up the river. Chester Park, near Spring Grove Cemetery, is also a well-equipped resort.

Business Interests.—The position of Cincinnati as a midway port on the great central channel of one of the most fertile districts of the world, added to its location on a platform above the floods which washed away its rivals, was the origin of its greatness; but that river traffic has greatly declined since the advent of railroads. Even yet, however, it is invaluable for the transportation of bulky freight—coal, ore, iron, lumber, salt, etc.—to manufactories, and the distribution of its products to the Ohio and Mississippi and their tributaries. A number of regular packet lines still run to Louisville and the Mississippi ports as far as New Orleans, up the Ohio to Pittsburg, to the Big Sandy, Cumberland, Tennessee, and Green, the Red, White, Arkansas, Yazoo, etc., covering 1,200 miles of the Ohio, 850 of the Mississippi, and 2,000 of tributaries. About 100 vessels a year register for this inland commerce, with a tonnage of some 18,000; but there is a much greater commerce than this indicates, as one towboat will push many barges in front of it, a method peculiar to western rivers. The government improvements, dredging and lighting the channel, have greatly aided to keep this navigation alive. Furthermore, by the Miami Canal to Lake Erie at Toledo, much heavy raw material is still brought in at rates the railroads cannot meet. The immense railroad business has already been referred to. Sixteen roads enter Cincinnati; the passengers of most of them come into the Central Union Depot at Central Avenue and Third Street; but a few, of which the Pennsylvania, and Cincinnati, Hamilton & Dayton are chief, have separate stations. The Cincinnati Southern road, 338 miles long, was built and is still owned by the city, and is operated by the Queen & Crescent route under lease.

MAP OF CINCINNATI

CINCINNATI

The trade and manufacturing interests of the city are enormous, even beyond the proportion of its size. It has 13 national banks, clearings aggregated \$1,154,647,600 for 1903. It has also a number of State and private banks. The building and loan associations, which had grown to number 309 in 1902, are being largely absorbed by new and strong trust companies and savings banks. The slaughtering and packing of meats, especially pork, has long been and is still one of the leading branches of commerce, the city packing more than half the meat product of the State. Cincinnati holds the first position in this country in sales of pig-iron, the total yearly receipts and sales for direct shipment amounting annually to nearly \$50,000,000. The number of industrial establishments is about 8,000, employing a capital of about \$135,000,000, and 110,000 workmen, and occupying real estate valued at \$65,000,000, with an annual product of \$315,000,000. The value of commodities received (latest estimate of Chamber of Commerce) was \$545,000,000, while the value of the principal commodities shipped was \$505,061,615. According to the census of 1900, the greatest single branch is iron work, including pig, castings, foundry and machine-shop products, and architectural iron work, \$12,384,848; others, men's clothing (factory-made), \$11,950,648; slaughtering and meat packing, wholesale, \$9,532,057; distilled liquors, \$9,419,687; factory-made boots and shoes, \$8,788,424; carriages and wagons, and their material, \$7,233,048; tobacco products, \$6,768,467; malt liquors, \$6,387,383. Other great products are leather and leather goods; furniture, lumber, timber, and woodworking products; coffee and spices, roasted and ground; saddlery and harness; pickles and preserves; undertakers' goods; musical instruments; soap and candles; electrical supplies; flour and grist; plumbers' supplies; patent medicines; and society regalia, costumes, banners, etc., in which Cincinnati heads the United States. Other products number hundreds, many curious and interesting.

Educational Institutions, Libraries, Newspapers, etc.—Cincinnati has a thorough system of public schools, with 52 grammar schools (including one for deaf-mutes), and three public high schools, the Hughes, Walnut Hills, and Woodward; with about 850 teachers; and 15 private academies and secondary schools, besides several score of Catholic parochial schools. For higher education, the chief is the University of Cincinnati, expanded from the old McMicken University, the capstone of the system of public instruction, with affiliated law, medical, and dental departments, and in connection the famous observatory now located on Mount Lookout—one of the earliest in the United States, with an 16-inch refractor and a new meridian circle, and with a notable record in the investigation of double stars. The university buildings are in a 30-acre space set off by the city in Burnet Woods Park. The Ohio Mechanics' Institute, one of the most important educational forces in the city, has a large, thoroughly equipped building and library, and maintains both day and night schools, attended by hundreds, in which regular classical, literary, and scientific instruction and courses of lectures are given. There are also half a dozen medical and surgical schools, besides training schools for nurses in the hospitals; two other dental colleges; a night law school; sev-

eral business colleges and schools of expression; Lane Theological Seminary at Walnut Hills (1832), famous for Lyman Beecher and Calvin E. Stowe, and for its slavery dissensions; two Roman Catholic colleges, St. Francis Xavier (1840), and St. Joseph's (1873); 5 Catholic seminaries for the education of priests, and 6 Catholic female academies and seminaries, leading to orders; the Hebrew Union College for educating rabbis, the chief one in the United States; the Art Museum and Art School founded by Cincinnati ladies on the model of South Kensington, with two large buildings and several hundred students, and a valuable collection of works of art. The Cincinnati Society of Natural History has a museum of valuable and interesting relics open to the public. Of the libraries, the chief is the free Public Library, handsomely housed on Vine Street. (with over 300,000 volumes and pamphlets), and various suburban branches. There are 16 others, subscription and institutional, of which the chief are the Young Men's Mercantile, the Law Library, that of the Mechanics' Institute, the library of St. Xavier's College, Lloyd Library and Museum, the University Library, and the Historical and Philosophical Society has the finest collection in existence of original manuscripts, pamphlets, and bound volumes, pertaining to the history of Cincinnati and the State of Ohio, and ranks among the first institutions of the kind in the country. There are in 1904, 19 daily newspapers, 12 English, 6 German, and one Italian; 70 English and 13 German weeklies; 79 monthlies, 23 quarterlies, and 14 of various other kinds, 229 periodicals in all.

Churches and Charities.—Cincinnati in 1903 had 269 church bodies, 60 Roman Catholic (besides five convents), 180 Protestant of various denominations, 12 Jewish synagogues, and 17 unclassified, including Christian Science, Spiritualist, etc. The city is the seat of a Roman Catholic archbishop and a Protestant Episcopal bishop, with cathedrals of both. The finest church building in Cincinnati is the cathedral of the former (St. Peter's), in pure Grecian style, 180 feet by 60 and 90, with a spire 224 feet high. Other prominent churches are the First Presbyterian, with a tower and spire 285 feet high, the loftiest in the West, surmounted by a gilt hand pointing upward; the Second Presbyterian; St. Francis Xavier and the St. Francis de Sales (Roman Catholic) on Walnut Hills (with the largest swinging bell in the world); the Hebrew Synagogue and the Temple; Christ's and St. Paul's Protestant Episcopal, and St. Paul's Methodist Episcopal; the Ninth Street Baptist; the Unitarian; and the Church of the New Jerusalem (Swedenborgian).

There are 53 benevolent associations in the city, covering every class and grade of alleviable human misfortune; an infirmary; a house of refuge for irreclaimable children; and a workhouse, with workshops and work grounds. Prominent among the 17 hospitals, public and private, are the large city hospital, the Jewish Hospital, Good Samaritan, St. Mary's (both Catholic), Longview Asylum, United States Marine, Bethesda, the Ohio Hospital for Women and Children, the Presbyterian, the Elizabeth Gamble Deaconess Home and Christ Hospital, and the Laura McDonald Memorial. There are also numerous homes for the aged and infirm, for

CINCINNATI

orphans, for incurables, and the friendless, non-sectarian, and denominational, all splendidly equipped, and a fresh-air fund and farm.

Government, Finances, etc.—The government is "federal"; there is a two-years' mayor, who appoints non-partisan election, supervisory, and public safety boards (in control of the fire and police departments); a (legislative) council of one from each ward; other boards and officers elected by the people, including an administrative board of public service, and a board of education. The city debt is about \$25,000,000, but \$18,000,000 of this is for the Cincinnati Southern line, which returns \$1,000,000 a year rental. The tax-rate is \$22.70 per \$1,000. The yearly disbursements are about \$7,000,000, of which over \$1,000,000 is for schools.

Population.—In 1800, 750; 1810, 2,540; 1820, 9,642; 1830, 24,831; 1840, 46,338; 1850, 115,435; 1860, 161,044; 1870, 216,239; 1880, 255,139; 1890, 296,908; 1900, 325,902. The census bureau estimate for 1904 is 332,934, which obviously does not include the territory annexed to the city in March 1904. This does not convey accurate information, however, without supplemental figures based on the position of the city with nearly a third of its business population resident across the river in another State, as well as several populous suburbs in other townships to the north. Newport, Bellevue, and Dayton, Ky., east of the Licking, contained in 1900 40,761; Covington and Ludlow, west of it, 49,989, or 90,750 in Kentucky; while Mill Creek and Columbia on the north had 34,629—a grand total of 451,281.

History.—The site of Cincinnati at the time it first came under the eye of the white man was covered with "ancient works," monuments of a prehistoric race. Traces of many of these "works" still abound in the neighborhood, which is a centre of the so-called "Mound Builders" remains. Here, too, ran the old Indian trail leading from the British trading post at Detroit to the Licking River, and into the section south of the Ohio. Numerous bands of savages swept through the valley of the Miamis, subsequently called the "Miami Slaughter House," on their marauding expeditions against the Kentucky pioneers. It was in pursuing one of these bands of "horse thieves" that Benjamin Stites first noticed the fertility of the section and its desirability for settlement. As a result of his efforts came the "Miami Purchase."

John Cleves Symmes, with other members of Congress who had been interested by Stites, in 1787 began negotiations with the government for the land lying between the Miamis, which resulted in a conditional purchase that on survey proved to be some 600,000 acres, of which he ultimately received about half. Early in 1788 he sold 740 acres opposite the mouth of the Licking to Matthias Denman and others, with whom he visited the spot later and selected it as the site for a city, to be called Losantiville—a combination of Latin and French, meaning "town opposite the mouth of the Licking." After some shiftings of ownership, a firm consisting of Israel Ludlow, a surveyor, and two others, took possession 28 Dec. 1788, and Ludlow laid out a village with the present Central Avenue and Broadway, about three quarters of a mile apart, for east and west boundaries, and Seventh Street, about as far from the river, for

northern, blazing the street lines on the trees. Three or four log-cabins were built, and the flooding out of several Ohio River town sites about this time left Cincinnati the chief survivor. The building of Fort Washington by the government in the summer of 1789, just east of Broadway, still further confirmed its primacy, for the Indians were a terrible menace until long after. In January 1790, General Arthur St. Clair, newly appointed governor of Northwest Territory, arrived, laid out Hamilton County (named after Alexander Hamilton), and made its seat the new town, whose name he changed to Cincinnati (Symmes, who professes to have suggested the change, was tenacious for Cincinnati), after the famous society of Revolutionary officers, of which he was a member. By the end of 1790, it had some 40 log-houses. The defeats of Harmar (1790) and St. Clair (1791) nearly caused its abandonment in a panic, but the importance of the fort kept the settlement alive. In 1792 as many as 354 lots had been taken for building; and so important a centre of commerce had it become even then that 34 of its buildings were warehouses well stocked with goods. It had some 900 inhabitants, but many of them were floaters. A visiting missionary reported that the people resembled those of Sodom, and the town, like others on the north bank of the Ohio, was thronged with frontier idlers and lawless ruffians who took refuge in Kentucky when brought to book; but as the first church (Presbyterian) was built this year, and the first school (pay) opened with 30 scholars, perhaps some of this language was "common form." Also as settlers were compelled by law to take their loaded guns to church for protection against Indians, it was no place for the tamer sort. In 1793, the 'Centinel of the Northwest Territory,' the first newspaper published north of the Ohio, appeared, and a year later the first through mail to Pittsburg was started in a canoe, and a packet line of keel boats to Pittsburg was organized. Wayne's crushing defeat of the savages at Fallen Timbers, bringing peace to the frontier, was in one sense disastrous to Fort Washington, as settlers swarmed all over Ohio, and it ceased to be the one centre. This defeat, however, assured the permanency of Cincinnati, which increased slowly but surely until in 1800 its population was 750, a growth of 50 per cent since 1795. In December 1801 the seat of territorial government was removed to Chillicothe. But its 12 years' primacy, the army post making it a depot for supplies, and its frontier position, had given it a safe start. In 1802 Cincinnati was incorporated as a town. A well-known picture of the town also dates from this year, in which, too, a "Young Ladies' School" was started, indicating a superior grade of population; and from February to May 1802 over 4,400 barrels of flour were exported, showing its development as a distributing port. The first bank, that of the Miami Exporting Company, was started in 1803. In 1805 the town had 960 people and 172 buildings. But immigration set in much more strongly a year later, and the names show an extraordinary intellectual calibre in the settlers it was attracting. In 1810 it had 2,300 inhabitants, and was the largest town in the State, the centre of immigration to Ohio, and with a great commerce along the river, and was contemplating a university. The first book de-

CINCINNATI

scriptive of the place appeared this year written by the celebrated Dr. Drake. In October 1811 the New Orleans (steamboat) passed the town on her first trip from Pittsburg to Louisville. A stone steam mill 110 feet high of nine stories and with foundation walls 10 feet thick, dates from 1812. In 1814 Lancaster Academy, afterward Cincinnati College, was founded. In 1819 the town received a city charter, having according to the first directory, published this year, 9,873 inhabitants, mostly from the Northern and Middle States, but also many foreigners, so that it was "not uncommon to hear three or four languages spoken in the streets." Another little book descriptive of the city published in 1826 was republished in England and, translated into German, circulated on the continent and attracted a large number of immigrants, especially Germans, who by 1840 numbered one fourth of the population. But its great development came with the opening of the Miami Canal, the most important single influence in the history of the city, for which ground was broken in 1825 at Middletown, and which was completed to Cincinnati in 1827. This not only developed commerce, but furnished great waterpower for manufacturing. The first railroad, the Little Miami, was chartered in 1836, but was not opened till 1846, the first section not till 1843. Even before this the growth was very rapid, population nearly trebling 1820-30, and nearly doubling 1830-40; but the next decade showed the tremendous leap from 46,000 to 115,000. From 1840 the immense immigration of Germans increased so rapidly as to make it for years the typical German city, and this element still constitutes a large proportion of the population. The Germans took great interest in grape culture, and "the banks of the beautiful river" were festooned with vines and the city for some years was a great wine market. It was the great German population that caused the first Saengerfest of the North American Saengerbund to be held here in 1849, a great stimulus to the musical activity of a city since so famed in the musical world. Several times the city was fearfully ravaged by the cholera, beginning with 1832-4; in 1849 and 1850 over 9,000 souls, or nearly 8 per cent of the entire population, perished of it. Yellow fever came in 1878. Floods have also risen over its platform several times and laid the lower section under water; those of 1832 ("the year of flood, fire, pestilence, and famine"), 1883, 1884, having been especially high and destructive. In 1838 the new and beautiful steamer Moselle exploded in front of the landing with a loss of almost a hundred and forty lives, one of the most terrible river disasters of the country. Two years later the city was the centre of the "log-cabin" campaign, which sent a favorite son, William Henry Harrison, to the White House. At a later time Hayes, whose previous active life had been spent in this city, occupied the Presidential position, and Salmon P. Chase, another famous Cincinnati, was Chief Justice of the United States. A continuous excitement of the city was its fury over the race question and later the abolition movement. The vast Northern interest in Southern trade was everywhere a powerful restraining influence on this; but Cincinnati, on the border, and with its daily bread dependent on this trade, besides having a considerable percentage of its people of Southern birth

and detesting the movement on general principles, felt menaced with entire industrial ruin if the agitation were not put down by force. Lane Seminary was threatened with fire, and its faculty with lynching if the students were not prohibited from discussing slavery; and in 1836 and 1841 James G. Birney's Philanthropist press was wrecked by the mob. In fact anti-negro riots were frequent and arose upon the slightest provocation. The trouble was later aggravated by the fact that Cincinnati, being a border city, was a chief station on the "Underground Railroad"; one Quaker citizen boasted of aiding 3,000 fugitive slaves to escape, and in all several times that number must have been smuggled across. Here, too, were tried the celebrated "fugitive slave cases," the Rosetta and Margaret Garner cases. In 1856 Buchanan was nominated for the presidency in Cincinnati; later nominees of Cincinnati conventions were Greeley in 1872, Hayes in 1876, and Hancock in 1880. When the war broke out, however, it became a strong Union city, and its record is noble. In 1862 the fear of an assault by the Confederate, Kirby Smith, caused it to be put under martial law for awhile; a somewhat similar experience came in 1864 at the time of the John Morgan raid. Another war incident was the Vallandigham case. Cincinnati sent its citizen, George B. McClellan, to command the armies of the North. The decade prior to the war had not been one of great progress, but in spite of the decay of trade with the South, the city leaped forward with the resumption of peace. The desire to renew the relations with its old business associates induced it to enter upon the construction of the Cincinnati Southern Railway to Chattanooga, which was built by the city itself, an extreme instance of municipal ownership. The celebrated "Bible" case in 1869 resulted in the abolition of religious instruction from the public schools and gave national fame to the bar that included such lawyers as those who argued the case. In 1869 began a series of annexations, which in a few years increased the city area from 7 square miles (3 when incorporated in 1819) to 24 square miles. Annexations in 1895 and 1903-4 have brought the area to 42½ square miles. The most notorious event in its later history is the "Cincinnati Riot" of 28-31 March 1884. As usual in modern times, the law had protected the criminal against the community till the criminal law was felt to be a farce; some murderers had received absurdly light sentences, and the patience of the lower orders gave way; they attempted to break into the jail and lynch the prisoners; foiled in this, they assaulted the court-house, and burned it, as well as its records and other buildings adjoining; the State militia had to be called in, and in the fray that ensued 45 persons were killed and 145 wounded. In 1888 the centenary of the settlement of the State and city was celebrated by a Centennial Exposition of the Ohio Valley, the culmination of a series of industrial expositions that had attracted the attention of the country and given a director-general to the Centennial at Philadelphia in 1876.

Ex-Attorney-General United States.

Cincinnati Anticline. In the period of disturbance which marked the close of Ordovician time in North America, the limestones deposited during the Trenton Epoch in the interior sea that covered most of what is now the Mississippi Valley were forced up, on a line running through southern Ohio, Kentucky, and Tennessee, in a low, broad arch. This arch is called the Cincinnati Anticline. It has been of much economic importance from its having contained great reservoirs of petroleum and natural gas, the latter now approaching exhaustion. See ORDOVICIAN SYSTEM; TRENTON EPOCH.

Cincinnati, Society of the (as having left the plow, like Cincinnatus, for their country's service, and returning to it when the need was over): a memorial society organized by the officers of the American Revolutionary army, 13 May 1783, just before their final dispersion, from the camp on the Hudson near Fishkill. The first meeting was in the Verplanck House, Steuben's headquarters. A society was organized for each State, besides the general society of which Washington was elected president. Membership was confined to officers of the Continental army who had served with honor three years, or been honorably discharged for disability, whether native or foreign, and to their direct male descendants in order of birth, through females in default of males, and then to collaterals if judged acceptable to the society. Partly as including several European nobles (Lafayette, Steuben, etc.), this was considered the beginning of an aristocratic order on European models, obnoxious to popular liberties. Of course it could only become such by government recognition, but the principle of heredity is *per se* un-American. With more show of reason, it was regarded as a military conspiracy to appropriate all the offices under the new government; a sign that the officers did not intend to be Cincinnatuses if they could help it. It was regarded by high and low as a grave public danger; and all the Revolutionary chiefs who had not been in the army, and were ineligible,—Franklin, Adams, Jefferson, etc.—distrusted its possibilities if not its motives. The legislatures of Massachusetts, Rhode Island, and Pennsylvania adopted resolutions censuring it as dangerous to the liberty and safety of the country; the governor of South Carolina denounced it in his message to the legislature; and the Irish chief justice of the same State, Ædanus Burke, wrote a pamphlet signed "Cassius," proving that it would subvert everything gained by the Revolution. This pamphlet was translated into French, and used by Mirabeau some years later. At the first general meeting, 7 May 1784, Washington persuaded them, in view of this public excitement, to abolish this hereditary feature. This, however, did not wholly conciliate popular feeling; and in 1789 the Tammany Society was

founded in New York in avowed opposition, as a body where true equality should govern, and private advantage should not prevail over disinterested public spirit.

In 1787 Washington was elected president-general, and re-elected till his death; Alexander Hamilton succeeded him. Most of the State societies soon died, and the general society languished. When Lafayette visited this country in 1824, he was the only surviving major-general. The old hero's reappearance galvanized it into new life for a short time, but it sank out of sight again, and for many years was virtually dead, its chief function being an annual dinner in New York. Even a nominal organization was retained only in three or four States. The last survivor of the original association was Robert Burnet of New York, who died in 1854. In 1893 the general society began a successful effort to induce the States to revive or re-form their branches, and Connecticut first (1893) and Georgia last (1902) fill up the roll of the 13. Some of them issue publications.

The president-generals of the society have been: George Washington, Alexander Hamilton, Charles Cotesworth Pinckney, Thomas Pinckney, Aaron Ogden, Morgan Lewis, William Popham, H. A. S. Dearborn, Hamilton Fish, William Wayne, and Winslow Warren.

The emblem of the society, adopted at the outset, was a bald eagle suspended by a dark-blue ribbon with white borders, symbolizing the union of France and America. On the eagle's breast is Cincinnatus receiving a sword and other military insignia from the senate; in the background, his wife stands at the door of their cottage, with the plow and other agricultural implements near; round the whole are the words, *Omnia reliquit servare rempublicam* ("He left all to serve the commonwealth"). On the reverse, Fame is crowning Cincinnatus with a wreath, inscribed *Virtutis Præmium*; in the background, a seaport city with gates opened and vessels entering; below this are joined hands supporting a heart inscribed *Esto Perpetua* ("Be thou perpetual").

Cincinnati, University of. The University of Cincinnati owes its existence primarily to a bequest of Charles McMicken, who, in 1858, left \$1,000,000 worth of property to the city of Cincinnati to found and maintain a college. One half of this property consisting of real estate in the State of Louisiana was lost in 1860 by a decree of the Supreme Court of the United States, annulling that section of McMicken's will giving this property to the university on the ground that the testator could not bequeath real estate in Louisiana to a foreign corporation. The university receives support from the city to the extent of $\frac{3}{10}$ of a mill on the total city tax. Other gifts have been utilized to contract buildings and to increase the endowment fund. The total value of the property and endowment was \$2,260,761 in 1904. From 1858 to 1874 the income from McMicken's estate not being sufficient to support a college or university, the trustees decided to wait until a fund should accumulate or until additional support could be gained. Thus the present University of Cincinnati was not founded until 1874, although three departments of the university are much older, namely, the Astronomical Department, founded in 1842;

CINCINNATI.

1. Fountain Square: Tyler-Davidson Fountain.

2. University of Cincinnati Buildings.

CINCINNATUS — CINEMATOGRAPH

the Medical Department, founded in 1819; the Law Department, founded in 1819 (Cincinnati College). Until 1899 the University was composed of the following departments: Medical (founded 1819); Law (1819); Astronomical (1842); Academic (1874). Since 1899 the following departments have been added: the College of Engineering, offering courses in civil, electrical, chemical, architectural, and hydraulic engineering; the University Summer School; the University Library; the Teachers' College; the University Press; and the Technical School, which furnishes the shops to the Engineering Department, and is an integral part of the Teachers' College. The reorganization was effected under the presidency of Howard Ayers, LL.D. The Dental Department and the Clinical and Pathological School are only affiliated with the University of Cincinnati, having no financial or other connection with the University. The following scholarships are awarded to students of this university according to merit: the C. G. Comegys scholarship with an annual stipend of \$50; five University scholarships with an annual stipend of \$75; five McMicken honorary scholarships; twelve Thoms scholarships; the D. A. R. fellowship in American History established by the local chapter of D. A. R., with an annual stipend of \$200. No tuition is charged to residents of the city of Cincinnati who enter the university as students. All others who enter the Academic Department are charged a tuition of \$75 per year. The professional schools charge from \$75 to \$125 annual tuition. The University of Cincinnati possesses a beautiful location in Burnet Woods Park, away from the noise and dirt of the city. Its government is by a board of directors appointed for six years by the mayor of Cincinnati. The intellectual life of the University finds expression in the publication of many memoirs, and monographs on literary and scientific subjects through the very important department of the University that has been recently established, namely, the University Press. These contributions to knowledge in the form of an annual volume of university bulletins are distributed by exchange all over the world. The total number of laboratories in the University is 35 in 1904; the total number of volumes in the University Library, including pamphlets, is 143,463. The teaching corps numbers 156, and the students 1,360.

HOWARD AYERS, LL.D.,

President of the University of Cincinnati.

Cincinnatus, *sĭn-sĭn-nā'tŭs*, **Lucius Quinctius**, a patrician belonging to the earliest period of the Roman republic: b. about 519 B.C. The legend which makes him the beau-ideal of the virtuous Roman is as follows: The Romans of his day were weakened by dissensions between the patricians and plebeians; the warlike Æquians, after making harassing incursions into their territory, succeeded at last in surrounding the Roman army under the consul Minucius in the wooded grounds of Mount Algidus. In despair the Roman senators went to Cincinnatus, offering him the dictatorship. The messengers found him at the plow. Reluctantly he accepted the office. He succeeded in rescuing the army from its perilous position, and marched to Rome laden with the spoils of victory. He then returned to his farm, whence

he was again called at the age of 80, to resume the dictatorship, to oppose the machinations of Spurius Mælius, and prevent a civil war between the upper and lower classes, which he succeeded in doing.

Cinematograph, *sĭn-ĕ-măt'ō-grăf* (Gr. *κίνημα*, "movement," from *κινῆν*, "to move"), an ingenious instrument introduced about 1895 by two brothers Lumière of Lyons, and founded on the same principle as Edison's kinetoscope. The most important part of the instrument is a sensitive photographic film or band about an inch and a quarter broad and about 50 feet long. This band passes over a drum of moderate size, then down and round a small one, which deflects it upward toward another small drum, and after passing over this one it winds round another large drum in the centre of the instrument proper. Each portion of the film in the course of its motion passes vertically close behind an opening situated above the last three drums, but below the first one. This opening does not communicate directly with the outside, but is placed in the partition dividing the part of the apparatus containing the last three drums from an adjacent part situated below that containing the first drum. Facing this aperture, and fixed in the opposite wall of that box which does not contain the three drums, is an objective through which light passes into the interior. Thus, by means of a peculiar arrangement of eccentrics which secures that each portion of the film shall be stopped for an instant before the opening, about 15 photographs per second can be received on the film, each representing the photographed group at a different instant from the others. In order to transform these negatives into positives, the negative film is rolled back on to the first drum, and on a second similar drum below it in the same compartment of the apparatus another film is rolled. The two films are then unrolled simultaneously, and thus the light entering through the objective and the aperture imprints on the new film a positive impression of the scenes represented on the other one. The positive film is made to wrap itself round the drum in the lower part of the apparatus, while the negative one is made to pass off through the bottom. The positive film is now wound back onto the first drum, and the instrument is then ready to project the representations on a screen at some distance. To do this, lantern accessories are necessary, but beyond that all that is required is to unwind the positive film by means of the same mechanism as performed the previous operations. The screen receives enlarged representations of the successive film-photographs in the same order as that of taking, and separated by such small intervals of time as to cause the whole to blend and form apparently a continuous representation of a moving group during a fairly long period of time. The advantages of this mode of photographing and throwing pictures on a screen over the older methods are obvious. Movements too rapid to be analyzed by the eye can, by controlling the rate of working while they are being represented on the screen, be made slow enough to permit of their true nature being observed; and, similarly, movements too slow for comprehension or rapid observation may often be, as it were, quickened.

CINERARY URNS — CINNAMON

Cinerary (sīn'ē-rā-rī) **Urns**, urns in which the ashes of the dead were deposited after the body was burned. Many Greek and Roman urns are in a high style of art, and are formed of bronze, marble, glass, or pottery ware. See BURIAL.

Cingalese. See SINGHALESE.

Cinna, sīn'ā, **Lucius Cornelius**, Roman patrician, associate of Marius, and leader of the popular party, during the absence of Sulla in the East. In 86 B.C. he was elected consul along with Octavius, and in violation of his oath to Sulla, he attempted to overpower the senate and to procure the recall of Marius and his party from banishment. In the contest which ensued, he was defeated by his colleague and driven from the city. His office thus became vacant, and the senate appointed another consul in his stead. He soon returned, however, along with Marius, and laid siege to Rome. The senate was forced to capitulate; but while the votes of the people were being taken for the repeal of the sentence against Marius, he broke into the city, massacred the friends of Sulla, and allowed his partisans to commit frightful excesses. He was consul for the next three years; but Sulla, having brought the Mithridatic war to a close, resolved (84 B.C.) to return to Italy to inflict condign punishment on his enemies. Cinna prepared to resist him by force of arms, but was prematurely slain by a mutiny among his own troops.

Cinnabar, sīn'nā-bār, red sulphide of mercury, HgS. The native cinnabar occurs in earthy, granular, and massive forms, and also in crystals belonging to the rhombohedral system. It is red, not infrequently with a brownish or leaden cast. Its hardness is from 2 to 2.5, and its specific gravity from 8.0 to 8.2. Artificial cinnabar, formed by subliming a mixture of sulphur and mercury, is brighter in color than the native mineral, probably on account of its greater purity, and is known in commerce as "vermilion." Cinnabar is the principal ore of mercury, and large deposits of it occur at Almaden, Spain, at Idria in Carniola, at New Almaden, Cal., and in certain parts of China and Japan. When it is roasted the sulphur burns away, and metallic mercury distils off and is condensed in earthenware vessels. (For a discussion of various ancient references to cinnabar, see 'Engineering and Mining Journal,' 16 May 1903, p. 747.)

Cinnamic (sīn'ā-mīk) **Acid**, an acid which exists in the free state in the balsams of tolu and Peru, in liquid storax, and in gum benzoin. When oil of cinnamon is exposed to the air it absorbs oxygen and deposits crystals of cinnamic acid, which are colorless, and readily soluble in alcohol, ether, and boiling water, but sparingly soluble in cold water. It is not of any importance in the arts and is chiefly interesting as being the acid corresponding to oil of cinnamon. This oil is the aldehyde of cinnamic acid, and is represented by the formula $C_9H_8O_2$. Though isomeric with oil of cassia it has a slightly different flavor, and is much more expensive. Both of these oils are employed in medicine as aromatic stimulants, but chiefly as pleasant adjuncts to disguise the taste of nauseous drugs. From a chemical point of view, the cinnamic acid and oil of cinnamon are related to benzoic

acid and oil of bitter almonds; and cinnamic acid may be converted into benzoic acid by oxidation.

Cinnamic acid is one of the active principles in many of the balsams and enjoys an excellent reputation in the treatment of tuberculosis and chronic ulcerative processes. It is a marked stimulant to the skin and mucous membranes, and has been very widely used in the form of an emulsion for the treatment of joint tuberculosis. Extravagant claims were made for it years ago, but these have been shown to be premature, although at the present time the drug is very widely used.

Cin'namon, the bark of the under branches of a species of laurel (*Cinnamomum zeylanicum*), which is chiefly found in Ceylon, but grows also in Malabar and other parts of the East Indies. The tree attains a height of 20 or 30 feet. Its leaves are oval, the flowers are of a pale yellow color, and the fruit is shaped somewhat like an acorn. There are two principal seasons of the year in which the Ceylonese bark the cinnamon-trees. The first of these commences in April, and the last in November; the former being that in which the great crop is obtained. In this operation the branches of three years' growth are cut down, and the outside pellicle of the bark is scraped away. The twigs are then ripped up lengthwise with a knife, and the bark is gradually loosened till it can be entirely taken off. It is then cut into slices, and on being exposed to the sun curls up in drying. The smaller pieces, or "quills," as they are called, are inserted into the larger ones, and these are afterward tied into bundles. Cinnamon is examined and arranged according to its quality by persons who, for this purpose, are obliged to taste and chew it. This is a very troublesome and disagreeable office, few persons being able to hold out more than two or three days successively. After this examination, the bundles are made up to a length of about four feet, and a weight of about 88 pounds each. From the roots of the trees numerous offsets shoot up. These, when they have attained the height of about 10 feet, are cut down and barked, being then about the thickness of a common walking-stick. The cinnamon which they yield is much finer than any other. In Ceylon the cinnamon-trees are said to be so common as to be used for fuel and other domestic purposes. The smell of cinnamon, particularly of the thinnest pieces, is delightfully fragrant, and its taste pungent and aromatic, with considerable sweetness and astringency. If infused in boiling water in a covered vessel it gives out much of its grateful flavor and forms an agreeable liquid. An oil is extracted from cinnamon, which is heavier than water. This is prepared in Ceylon, and almost wholly from the small and broken pieces. It is made, however, in such small quantity that the oil of cassia is generally substituted for it: indeed, the cassia bark is often substituted for cinnamon, to which it has some resemblance, although in its qualities it is much weaker. The leaves, the fruit and the root of the cinnamon plant all yield oil of considerable value. That from the fruit is highly fragrant, of thick consistence, and at Ceylon was formerly made into candles for the sole use of the king.

The oil of cinnamon consists mainly of cinnamic aldehyde, C_9H_8O , which, when pure, is

CINNAMON FERN — CINTRA

colorless. By exposure to air it absorbs oxygen and is converted into cinnamic acid (q.v.).

Various forms of cinnamon have been used for many years in medicine as flavoring agents and as carminatives. As cinnamon is rich in volatile oils, the action of the drug resembles the action of the oil of cinnamon, which is closely allied to other volatile oils (q.v.). The active principle in the oil is an aldehyde of cinnamic acid, and its antiseptic and antispasmodic action is due in large part to the cinnamic aldehyde.

Cinnamon Fern, a species (*O. cinnamomea*) of royal fern (*Osmunda*), so called from the cinnamon color of the sporanges. The plant has been known to reach the height of 11½ feet. It is frequent in boggy places during May and June in Florida and Mexico, and as far north as Minnesota and Nova Scotia. See OSMUNDA.

Cinnamon Oil, an essential oil distilled from cinnamon bark. It is of a bright yellow color, which gradually darkens. It consists chiefly of cinnamic aldehyde. When exposed to the air, it gradually absorbs oxygen and forms a resin and cinnamic acid.

Cinnamon-stone, or **Essonite**, a variety of grossularite garnet, usually of a beautiful cinnamon-brown, yellowish, or brownish-red color. It is a silicate of aluminum and calcium. Its name essonite is derived from the Greek *esson*, inferior, and refers to its hardness, 7, being inferior to that of hyacinth, which it often resembles. It occurs in isometric crystals, usually in rhombic dodecahedrons. Cinnamon-stone from Ceylon is the finest known, and has long been cut into gems. Beautiful specimens are also found at Piedmont, Ala., and Phippsburg, Me.

Cinnamomum, *sīn-a-mō'mūm*, a tropical genus of plants of the laurel family, natives of Asia and the Pacific islands. The genus numbers upward of 50 species, all possessing aromatic volatile oils, that make them valuable articles of commerce. Cinnamon proper is the prepared bark of *C. zeylanicum*; Culiwan bark comes from the *C. culiwan*, and cassia bark from *C. cassia*. The best-known American relative, although not of the same genus, is sassafras. See CASSIA; CINNAMON; LAURACEÆ.

Cino da Pistoia, *chē'nō da pēs-tō'yā*, Italian jurisconsult and poet: b. Pistoia 1270; d. there 24 Dec. 1336. He ranks among the best of the early Italian poets, and resembles Petrarcha more than any of the other predecessors of this poet. His poems were first published at Rome in 1558 by Pilli. They afterward appeared at Venice increased by a second volume, which, however, was not considered genuine. The most complete edition is that of Ciampi (1812). He published a commentary on the first nine books of the 'Codex Justinianus' in 1314.

Cinquefoil, *sīnk'foil*. 1. In botany, a species of the genus *Potentilla* of the Rose family, closely allied to the strawberry. There are upward of 150 species, chiefly natives of the temperate regions of the northern hemisphere, 60 of them occurring in North America, being found in Greenland, south to New Jersey, to northern Mexico, and in all the territory of the western and northwestern part of America to Alaska. In northern New England the shrubby

cinquefoil (*P. fruticosa*) is a troublesome weed. The name of the genus is from Latin *potens* (powerful), from the supposed powerful medicinal virtues of some of the species.

2. In architecture, an ornament in the Gothic style, consisting of five foliated divisions, often seen in circular windows. In heraldry, it means a five-petalled corolla borne without a stalk and full-faced.

Cinq-Mars, Henri Coiffier de Ruze, *ōn-rè kwā-fē-yā dè rü-zā sän-mär*, MARQUIS DE, French courtier: b. 1620; d. Lyons 12 Sept. 1642. At the age of 18 he was presented at court by Cardinal de Richelieu, and soon obtained the favor of Louis XIII., to whom he became master of the horse. Chafing at the restraint under which Richelieu held him, and ambitious of political power, he framed a conspiracy to overthrow the cardinal, of which the king himself, and his brother Gaston, Duke d'Orleans, were members. But Louis was weak and fickle, Gaston perfidious, and Richelieu not the man to be put down by a youth just turned of 20. Cinq-Mars was delivered up to the cardinal, and beheaded at Lyons with his friend, the councilor De Thou.

Cinq-Mars, a historical romance by Alfred de Vigny, published 1826. The subject is the conspiracy of Cinq-Mars and De Thou against Richelieu, its detection, and the execution of the offenders at Lyons in 1642. The work is modeled after the Waverley novels.

Cinque Pace, *sīnk-pās*, a kind of grave, stately dance, in which the steps were regulated by the number 5.

Cinque Ports, *sīnk-pōrts*, seven ports of England, on the coasts of Kent and Sussex—Dover, Sandwich, Hastings, Hythe, Romney, Winchelsea, and Rye. They were originally only five, the two latter having been declared ports subsequent to the first institution; hence the name *cinque*, five. The precise designation of these seven localities is "The Cinque Ports and the Two Ancient Towns," the last named being Winchelsea and Rye. They were granted special privileges by the later Saxon and earlier Norman kings, on condition of providing a certain number of ships during war, there being no permanent English navy previous to the reign of Henry VII. The ports are, collectively, in the jurisdiction of a lord warden, whose office, though the salary is £3,000 a year, is little more than a sinecure. See Burrows, 'The Cinque Ports' in Historic Towns series.

Cinquecento, *chīng-kwē-chēn'tō*, in Italian, 500, an abbreviation for *mille cinquecento*, or 1,500. The term is used to designate the art styles of the 16th century, or such as were developed about, or after, 1500. In like manner the terms *trecento* and *quattrocento* denote art of the 14th and 15th centuries. The Cinquecento is the period of the highest perfection of the arts of the Revival or Renaissance.

Cintra, *sēn'trā*, Portugal, a town in the province Estremadura, 15 miles northwest of Lisbon, on the slope of the Sierra de Cintra. The country around is extremely beautiful, and the climate mild and agreeable. On these accounts it is much resorted to by the wealthier inhabitants of Lisbon, who have here their *quintas* or country houses. The kings of Portugal have a palace at Cintra, with fine gardens

ornamented with fountains. Cintra is celebrated for the convention entered into there in 1808, by which the French, after their defeat at Vimera, were not only permitted to leave Portugal, but were conveyed to France with their arms, artillery, and property. Pop. 4,846.

Cinura, sī-nū'ra, a name proposed by Packard for a subdivision of the *Synaptera* under *Thysanura*. It includes the bristle-tails (q.v.) See Packard, 'Entomology for Beginners.'

Ciotat, sē-ō-tā, La, France, a seaport, department of Bouches-du-Rhône, on the Mediterranean, 15 miles southeast of Marseilles. It has a safe and commodious harbor, and carries on a considerable trade in the productions of the district. The yards and workshops of the Messageries Maritimes Company employ about 3,000 hands. The town, surrounded by its old ramparts, consists of well-built houses and spacious well-paved streets. The surrounding district yields wine, oil, oranges, etc. Pop. 11,300.

Cipher, a kind of monogram, in which the initials of a person or persons are intertwined with each other.

Cipher Despatches. On the meeting of Congress in December 1876, owing to the disputed presidential election returns, each chamber instituted an inquiry into the alleged frauds; the Senate (Republican) through its committee on privileges and elections; the House (Democratic) by a select committee on Louisiana affairs, popularly known as the Morrison Committee, from its chairman, William R. Morrison (q.v.). Each committee subpoenaed the Western Union Telegraph Company for the political despatches of that period in its possession; and portions of these, which the company had gathered from its various offices and forwarded to New York, were sent to each. A large number of these were in cipher; their political nature being inferred from the names and locations of senders and addressees. The Senate, though calling for telegrams from all portions of the country, devoted themselves mainly to Oregon where, it was alleged, from the translation of Democratic cipher telegrams, \$8,000 had been devoted to securing the legislature's recognition of a Tilden elector. (These telegrams and translations were published in Senate Miscellaneous Document No. 44, 44th Congress, 2d session.) These despatches, after the investigation closed, were ostensibly returned to the Western Union; those from the Morrison Committee apparently were all returned. But the cipher despatches before the Senate committee were sorted over and the Republican ones nearly all destroyed (by Senator O. P. Morton, as said); while certain packages of the Democratic ones were preserved (by the same hands), and came into possession of Thomas J. Brady, the second assistant postmaster-general, William E. Chandler, afterward secretary of the navy, then lawyer and political manager, and Frank Hiscock, representative from New York. By these, in the summer of 1878, they were sent to White-law Reid, editor of the *New York Tribune*, who published them serially, including the cipher despatches and professed translations. These were made by John R. G. Hassard and Col. William M. Grosvenor, of the *Tribune* staff, partly on suggestions of Prof. E. S. Holden of Washington; involved the use of several

different ciphers, and different applications of the same cipher; and left some words illegible. As printed, they referred to offers of the disreputable "returning boards," then supreme in South Carolina and Florida, to sell their vote to Tilden for large sums in cash, \$80,000 to \$200,000; and negotiations of Democratic managers with them, closed by Tilden's refusal to make the bargain, and the transfer of the votes to Hayes. Tilden himself denied all knowledge of the telegrams or their subject matter, and the managers denied the accuracy of the translations. Their moral defense in the public mind was that they were submitting to blackmail to obtain what they believed legally and equitably theirs already, and that the Republican telegrams, if published, would have left that party in no better case. On 21 Jan. 1879 the new House appointed a "select committee on the alleged frauds in the election of 1876," avowedly to investigate the cipher despatches. It received from Benjamin F. Butler of Massachusetts another package of the telegrams, partly unpublished, given him by Mr. Chandler, and took a mass of testimony—published in House Miscellaneous Documents, 45th Congress, 3d session, Vol. V., with the telegrams and the translations, except those already published in the Senate document above cited.

Ciphers, signs for numbers (see NOTATION). They are either borrowed signs, as letters, with which the Greeks and several tribes of the north of Europe designated their numbers; or peculiar characters, as the modern or Arabic ones. The ciphers, such as they are at present, 1, 2, 3, 4, 5, 6, 7, 8, 9, 0, did not attain their present character till a pretty late period. We have them from the Arabians, who derived them from Hindustan. It seems probable that the Egyptians were acquainted with the present system of ciphers, at least in its principles. As early as the 9th century ciphers were used, though seldom, in France. Not until the 11th century did their use become common in Europe.

Cipher Writing, a method of sending important intelligence in a manner so effectually disguised that only those for whom the news is intended can understand the meaning of what is written. Till comparatively recent years diplomats, statesmen, and military or naval commanders were the principal persons compelled by circumstances to keep their affairs or their intended movements shrouded in secrecy. So long as there was not regular postal service important letters were sent by courier, and thus the weightiest secrets were often at the mercy of any one inclined to be dishonest. Before the spread of education, and at a time when few possessed a knowledge of any other language than their own, to indite a letter or despatch in a foreign tongue was usually ample protection against a surreptitious prying into its contents. But it is now many years since this safeguard was broken down, and it became necessary for all who did not want their correspondence known to interested parties to contrive some means of communicating with the pen that would defy scrutiny.

Hence there came into extensive use the art of writing in cipher, called also cryptography, from the Greek words *κρυπτός*, "secret," and *γράφειν*, "to write." Under this term are in-

CIPPUS — CIRCARS

cluded all private alphabets or systems of characters for the safe transmission of secrets. As fast as one device was discovered human ingenuity contrived another still more intricate. A cipher sufficiently perplexing for all ordinary purposes is found by using the alphabet in any language in an inverted order, taking Z for A, Y for B, X for C, and so on. When it is only desired to write a cryptogram, and not print it, such other characters may be used as are mutually agreed upon by correspondents, or the alphabet may be transposed in other ways. A figured cipher is one in which the letters of the alphabet are numbered, and these numbers compose the cryptogram. To insure secrecy it is, of course, necessary that the particular series of numbers chosen shall be known only to those who use the cipher. Another plan consists in choosing a certain book—a dictionary appears to have been the favorite—and by a simple citation of the number of the page, of the column, and of the line, sentences were constructed, the key to which was extremely difficult of discovery by one not in the secret.

As the number of different dictionaries was necessarily limited, however, the mystery could usually be solved by any one willing to devote time and patience to hunting up the particular one adopted. Various other books have been similarly used, such as spelling-books, and even the Bible; but these systems were cumbersome, and were all more or less open to detection. From a few rules, as for instance, that in English *e* is the letter which most frequently occurs, and *the* the most common word, the whole might generally be deduced. The task of detecting cipher methods is rendered much more difficult when false characters, which are not to be counted, have been interspersed throughout the cipher. A curious explanation of the process of unraveling a cipher is given in Poe's story of the 'Gold-Bug.' Still, with devices such as these, more or less ingenious, the world was fain to be content until about 40 years ago, when a scientific discovery was made that indirectly converted cryptography into a recognized calling, requiring thought, labor, and inventive ability.

The opening years of the second half of the 19th century found the world in amazement over the then recent invention of telegraphy. Immediately a new want made itself felt. Secrecy had been sacrificed at the shrine of speed. If the mail was slow, it afforded privacy, but the contents of a telegraphic message are of necessity known to others besides the sender and the receiver. So the minister, the banker, and the merchant soon began to send cipher despatches. It was quickly discovered, however, that existing methods of cipher writing were unadapted to telegraphy; the costliness of the new invention necessitated brevity; and thus it was not long before there went whirling over the wire messages of 10 words that, properly deciphered, included from 30 to 50.

A great proportion of commercial messages—orders to buy and sell and the like—are similar in their terms, and hence it is that a single word representing three or four words in frequent use is the plan on which our present cable ciphers are based, whereby there is annually a large saving in expense. Then, too, as trade increased and competition became fierce, every firm wanted its own cipher system, dis-

tinct from any used by other houses in the same business; and reflection will enable us to appreciate the vast number of separate ciphers in use in a great commercial centre like New York. Therefore, in course of time, the preparation of cipher systems for merchants and others using the telegraph largely came to be a regular calling, and in every large city the sign "Cable Codes" is to be seen.

At one of these offices a person may be accommodated with a code of from 50 to 5,000 words. Most of these codes are alphabetically arranged in parallel columns, like shipping signals—the English words and phrases in one column, and their cipher equivalents in another. To such magnitude has this business grown that all languages are ransacked for suitable cryptographic codes, and every day sees their preparation growing more complicated and costly. The modern telegraphic signals and our various systems of short-hand may be called examples of cipher writing, though in these cases, of course, speed and brevity are aimed at, not secrecy.

The cipher codes of the State Department at Washington are frequently changed. The special code is entrusted to the personal custody of diplomatic officials embarking on a mission, who retain possession of it and destroy it if their lives are endangered. The imprisonment of the United States Minister Conger, in Peking, in 1900, caused the cipher to figure conspicuously in international relations. China objected to the transmission of cipher despatches, but subsequently withdrew her objection. She was accused of having obtained surreptitious possession of a copy of the United States cipher code.

Cippus, sip'ūs, a low column generally rectangular and sculptured, and often bearing an inscription, used by the Romans for various purposes. Cippi served as sepulchral monuments, as milestones and boundaries, and in some cases to receive the inscribed decrees of the senate. They were frequently or usually adorned with rams' heads supporting festoons of flowers, figures of sphinxes, and various mythological subjects. Those serving as tombstones bore the epitaph of the deceased, including his name, the date of his birth, death, etc.

Cipriani, Giambattista, jām-bāt-tēs'tä chē-pre-ä'nē, Italian painter and engraver: b. Pistoia 1732; d. London 1785. He was one of the first Fellows of the Royal Academy. His drawing is correct, his heads have grace and loveliness, his coloring is harmonious, and the general impression of his composition good. Many fine engravings of Bartolozzi are from the designs of Cipriani.

Circars, sēr-kärz', **The Five Northern**, an ancient division of the Madras presidency, on the east coast of Hindustan. The northern Circars were formerly Chicacole, Rajahmundry, Ellore, Condapilly, and Guntur; but the districts that now correspond most nearly with them are those of Ganjam, Vizagapatam, Godavari, and part of Krishna. They were among the earliest of the territorial possessions of the East India Company, which acquired four of them in 1765, from Mogul Shah Allum, who bestowed them on the company as a free gift.

CIRCASSIA

The fifth, Guntur, came into the possession of Great Britain in 1788.

Circassia, *sir-kāsh'ī-a*, a region in the southeast of European Russia, lying chiefly on the north slope of the Caucasus, partly also on the south, and bounded on the west by the Black Sea. It forms part of the government of the Caucasus, including a great portion of the territory of the Kuban and the districts of Sukhum and Tchernomore, but is not itself an official division; and, indeed, the name is now much less seldom heard than formerly, since the country has been entirely incorporated with the rest of the Russian possessions in this quarter, and has no longer a separate political existence. The whole region is mountainous, and is composed of the northern masses or western offshoots of the great chain of the Caucasus, the culminating heights of which are those of Mount Elbruz. The mountains are intersected everywhere with precipitous ravines, in the deepest hollows of which flow rock-impeded streams that occasionally become raging torrents. The chief rivers are tributaries of the Kuban and the Terek, the first of which bounds the territory on the northeast and east sides, while the Terek skirts the Circassian limits on the southeast side. Circassia is a beautiful, though rugged, country. The sides of the mountains are often clothed with thick forests. Its climate is temperate, its inhabitants healthy and long-lived. There are few manufactures and little trade.

When Russia took possession of this region the exodus of the inhabitants left but comparatively few Circassians proper, and those who remained have now to a large extent lost their national peculiarities. The people call themselves Adighé; the Tartar word *Tchertkess* being a slanderous name applied to them as "robbers." The Circassians were divided into several tribes, having three distinct languages, or more. Each tribe included five ranks of men, namely, princes or chiefs (*pshat*); nobles (*vork*); middle class (*thlofokl* or *tokavs*); serfs, or retainers of the nobles; and slaves—the latter being prisoners taken in war, or the descendants of such. All classes except the slaves were united into fraternities, for mutual support; and this union formed the real groundwork of the government of the country, which was altogether peculiar, being patriarchal in nature, with a great amount of freedom. Hereditary feud, once prevalent, was latterly almost extirpated, and pecuniary compensation, including a mulct upon manslaughter for the benefit of the deceased's fraternity, was substituted. Crimes of all degrees, and civil causes, were judged either in general or local councils; and petty offenses by district judges and assessors.

The religion of the country was chiefly Moslem; but in many cases it formed a jumble of Christian, Jewish, and heathen traditions and ceremonies. In no case was it very strict; although most of the chief Mohammedan feasts and fasts were pretty well observed. The morals of the people were nevertheless respectable. Great crimes were rare; and such as have their source in poverty with one class, and avarice in the other, were not common, for property was little coveted, and money was scarcely known. The commerce of presents was universal; few or none were very rich, and

there were no miserably poor at all. There was no tenure of land in Circassia except what immediate possession, for the purposes of cultivation, gives.

Agriculture here is still in a rude state, but the produce of the tilled lands is considerable, and exceeds local wants. The forests yield great quantities of fine wood, including, oak, and all our own best species of timber trees, with (in the southern regions) boxwood, etc. The chief grain is millet; but barley, oats, and a little wheat are also raised. There are great numbers of goats, sheep, and oxen.

The Circassians, male and female, are a well-formed and handsome race. The males are highly prized as warriors by the Russians, and the females as mistresses by the Turks, a position generally envied by the women themselves. The men are among the finest equestrians in the world; and their horses, though small, are of good make, hardy, and intelligent.

The early history of the Circassians is obscure. They have no annals; but their minstrels, in their martial and genealogical strains, preserve traditional accounts of the deeds and lineage of their dead heroes and existing tribes. Between the 10th and 13th centuries this country formed a portion of the empire of Georgia, and it is said the Georgian queen Tamar subjected and for a time Christianized them. During the Middle Ages the Genoese had several trading stations on the coast, of which some memorials yet exist. In 1424 the Circassians were an independent people, and at war with the Tartars of the Crimea, etc., to whose khans, however, it is understood some were occasionally tributary. In 1555 the Muscovite czar, Ivan Vasilievitch, came to their aid against the Tartars, and married a Circassian princess. But the stay of the Russian forces was short, and after their withdrawal the belligerents kept up a struggle with varying results till 1705, when the Tartars were finally defeated in a decisive battle. Shortly after the territorial encroachments of Russia on the Caucasian regions began. From that time she advanced by steps slow and stealthy, and in 1781 obtained a frontier line on the right bank of the Kuban, the left banks of which formed the national limit of Circassia. In 1784 the Turks founded Anapa, near the northeast corner of the Black Sea, as a place of trade for their commerce and that of the Circassians; this was the only territorial settlement they as yet had in or near the country, and the place was a mere factory. In 1807 the Russians took Anapa from the Turks; but in terms of the Treaty of Bucharest, in 1812, it was restored. In 1829 it was once more taken by the Russians, and finally ceded to them by the Treaty of Adrianople, along with the whole of Circassia—as they interpreted the words of that cunningly ambiguous document; the fact being that not an inch of the territory of Circassia proper had ever been in the possession of either Turks or Russians. Many of the Circassians were, indeed, Mussulmans, and all such recognized the padisha (sultan) as their spiritual head, but nothing more. As the "hated Muscovites" (*fana Moscov*) immediately proceeded to act upon the pretended cession, a struggle commenced which was continued over a long series of years. The spirit of resistance to Russia became stronger than ever; and a bold leader, Schamyl, who united

CIRCE — CIRCLE OF CURVATURE

in his person the imputed sanctity of the hierarch with the daring courage and prudent conduct of a great warrior, with his heroic band beat off or baffled the whole disciplined forces that Russia was able to send against him. But at length the protracted resistance of the people terminated in the triumph of the more powerful of the two foes, and the Circassians with their leader surrendered. Large numbers of them, as many it is said as 500,000, were deported into the Turkish provinces in 1864, and were settled both in Asia Minor and in Bulgaria and Servia. A considerable portion of their former country was thus almost denuded of inhabitants.

Circe, sēr'sē, in classical mythology, a sorceress on the island of Aea. Ulysses in his wanderings landed on her island, and sent out Eurylochus with a party to explore the country. They arrived at the palace of Circe, who gave them food and wine, and with her magic wand changed them into swine. Eurylochus only, by cautiously abstaining from the magical potion, escaped the transformation, and informed Ulysses of the event. He immediately proceeded himself into the country to free his companions. On the way Hermes (Mercury) met and advised him. Following the advice of Hermes he then ran upon her with his drawn sword, threatening her with death, and compelled her to bind herself by an oath to do him no injury, and deliver his companions. Ulysses then remained with her a whole year. Before his departure she told him that in order to secure a safe return to his country he must visit the infernal regions and ask advice of Tiresias. This he did, and again visited Circe on his way back.

Circinus, sēr'sī-nūs ("the Pair of Compasses"), one of the 14 southern constellations added to the heavens by Lacaille in connection with his work at the Cape of Good Hope in 1751-2. It is surrounded by Apus, Musca, Centaurus, Lupus, Norma, and Triangulum Australe.

Circle, in geometry, a plane figure contained by one line, which is called the "circumference" and is such that all straight lines drawn from a certain point (the "centre") within the figure to the circumference are equal to one another. According to this definition of Euclid, which is remarkable for its perspicuity and precision, the circle is the space enclosed, while the circumference is the line that bounds it. The circumference is, however, frequently called the circle. Still no confusion ever arises from this usage.

The properties of the circle are investigated in books on geometry and trigonometry. Properly the curve belongs to the class of conic sections, and is a curve of the second order.

The celebrated problem of "squaring the circle" has given rise to extraordinary geometrical labors, and even now there are to be found, as in the case of the problem of perpetual motion, those who profess to have solved it. The question is to find a square whose area shall be equal to the area of a circle. It is not possible to do so. All that can be done is to express approximately the ratio of the length of the circumference of the circle to the diameter, and to deduce the area of the figure from this approximation. This ratio has, however, been determined to a degree of exactness

more than sufficient for all practical purposes. If the diameter be called unity, the length of the circumference of the circle is 3.1415926535...; and the area of the circle is found by multiplying this number by the square of the radius. Thus the area of a circle of 2 feet radius is 3.14159×4 , or 12.56636 square feet, approximately.

For trigonometrical calculations the whole circumference of the circle is divided into 360 equal parts or arcs, called degrees; each degree is divided into 60 minutes, and each minute into 60 seconds. The angles subtended at the centre by these arcs are called respectively degrees, minutes, and seconds of angle.

In practical astronomy, metallic circles accurately divided are used to measure angles. The general principle is to have a telescope moving in a given plane, while a divided circle, situated in a parallel plane, measures the angle through which the telescope moves. Verniers or microscopes are used to read the graduated circle with great precision.

The term "meridian circle" is applied to an instrument in which the telescope revolves in the plane of the meridian, and a divided circle measures angles in this plane.

In logic, a circle is the fault of an argument that assumes the principle it should prove, and afterward proves the principle by the thing which it seemed to have proved. The same fault takes place in definitions when an idea is defined by others which suppose the knowledge of the first. Arguing in a circle is a fault into which men are very liable to fall, particularly in theological discussions.

In astronomy, the heavens being considered as a spherical surface drawn round the earth as centre, an imaginary line drawn round the heavens so as to lie in one plane is a circle of the sphere. It is a "great circle" if the plane of it passes through the centre; thus the celestial equator and the ecliptic are great circles; if the plane of the circle does not pass through the centre it is called a "small circle"; all parallels of declination are small circles.

Circle of Curvature. When a point in motion is tracing out any curved path, the direction of motion changes from point to point of the curve, and the path is said to be more or less curved according as the direction of the motion of the point changes more or less rapidly. The curvature at any point is measured by the rate of this change at the point per unit length of the curve.

In the case of the circle the curvature is the same at every point; and it is easy to show that the curvature measured as above is equal to the reciprocal of the radius of the circle.

If we consider any small portion of any curve whatever, it may be approximately taken as an arc of a circle, the approximation being closer and closer to the truth as the portion considered is smaller and smaller, and by taking it small enough we may make the approximation as close as we please. The curvature is then the reciprocal of the radius of this circle.

The circle which coincides more nearly than any other with an infinitely small arc at any point of any given curve is generally found by means of the methods of the differential calculus. Such a circle is called the circle of curva-

CIRCLE — CIRCULAR POLARIZATION OF LIGHT

ture, and sometimes the osculating circle. The radius of it is called the radius of curvature of the curve at the point considered; and the centre of this circle is called the centre of curvature.

Circle, Magic, a space in which sorcerers were wont to protect themselves from the fury of the evil spirits they had raised. This circle was usually formed on a piece of ground about nine feet square (in the East seven feet appears to have been considered sufficient), in the midst of some dark forest, churchyard, vault, or other lonely and dismal spot. It was described at midnight in certain conditions of the moon and weather. Inside the outer circle was another somewhat less, in the centre of which the sorcerer had his seat. The spaces between the circles, as well as between the parallel lines which enclosed the larger one, were filled with all the holy names of God, and a variety of other characters supposed to be potent against the powers of evil. Without the protection of this circle, the magician, it was believed, would have been carried off by spirits. Another figure which, described upon the ground, could bar the passage of a demon, was the pentagram.

Cir'cleville, Ohio, a city and county-seat of Pickaway County, on the Scioto River, the Ohio Canal, and the Cincinnati & M. V. and the Norfolk & W. R.R.'s, 28 miles south of Columbus. It derives its name from a circular earthwork built by some ancient people, and which is the site of the present city. It has numerous churches, several daily and weekly newspapers, three banks, and manufactures flour and meal; agricultural implements, furniture, canned goods, etc., and a large pork-packing industry. Pop. (1900) 6,991.

Circuit Court. See COURTS.

Circular Motion. A body in motion, which is continually impelled by some power toward a fixed point out of its original direction, is obliged to describe a curvilinear path round this point. A stone slung round by a string moves in a circle, because it is drawn toward the hand in every point of its path. The moon moves in a circle round the earth, because it gravitates toward the earth, and is thus drawn from the rectilinear direction which it would otherwise pursue. In such cases the point to which the body constantly tends is called the centre of the forces; the force itself, by which it is impelled, is called the centripetal force; that by which it strives to fly from the centre is called the centrifugal force; and the motion which is produced by these two forces, the circular motion. All the planets in the solar system are carried round the sun, and the satellites round their planets, by these forces. (See CENTRAL FORCES.) The theory of circular motion is a subject of celestial mechanics, on which Newton composed his 'Philosophiæ Naturalis Principia Mathematica'; and Laplace, his 'Mecanique Celeste,' etc.

Cir'cular Notes, in commerce, notes or letters of credit furnished by bankers to persons about to travel abroad. Along with the notes the traveler receives a "letter of indication" bearing the names of certain foreign bankers who will cash such notes on presentation, in which letter the traveler must write his name. On presentation the foreign banker can de-

mand to see the letter of indication, and by causing the presenter to write his name, can compare the signature thus made with that in the letter, and so far satisfy himself as to the identity of the person presenting the note.

Circular Numbers, numbers whose powers end on the same figure as they do themselves: such are numbers ending in 0, 1, 5, 6.

Circular Parts, Napier's Rule for, a rule invented by Baron Napier of Merchiston, near Edinburgh, for the solution of all cases of right-angled spherical triangles, eminent for its comprehensiveness and utility in extensive surveys, navigation and practical astronomy. See TRIGONOMETRY.

Circular Polarization of Light. Plane-polarized light is altered into circularly polarized light by passing in a particular direction through a Fresnel's rhomb. This is a parallelepiped of glass with its faces set at certain angles depending on the refractive power of the glass. The light entering one base of the rhomb is twice internally reflected before it emerges at the opposite base; and while common unpolarized light passes through the rhomb without suffering alteration plane-polarized light has its properties in general completely altered. The final result depends on the inclination of the plane of polarization of the incident light to the plane of the internal reflections. In two cases, namely, when this angle is 0° or 90° , the emerging light is still plane polarized; when the angle is 45° the light is circularly polarized; in every other case it is elliptically polarized. In the first case, as will be understood from consulting the article on POLARIZATION OF LIGHT, the analyzer, on being applied to test the beam, shows in one position bright light, and on being turned round the principal axis through 90° , total darkness. In the last case—that of elliptic polarization—the analyzer shows, on being turned round, a beam of varying intensity, but never complete extinction. In the case of circularly polarized light the analyzer, on being turned round, shows a beam of the same intensity in every position of the analyzer, and, in fact, does not at first sight differ from ordinary unpolarized light. When, however, it is examined—not with a Nichol's prism direct, but after a second Fresnel's rhomb has been interposed—it is found to differ very remarkably from unpolarized light. The latter is, as we have remarked, unaffected by the rhomb; the circularly polarized light emerges from the second rhomb plane polarized. It is thus shown how to produce and how to recognize circularly polarized light. We now give a few of its most remarkable properties.

The light as we have said, that emerges from the second Fresnel's rhomb is again plane polarized, but it does not emerge precisely as it entered. For, except in one particular position of the two Fresnel's rhombs, the light that emerges from the second rhomb has its plane of polarization changed; the plane is turned round, in fact, through an angle depending on the positions of the two rhombs with regard to the original plane of polarization; and it may be turned round either in a right-handed direction, as it is called (see below), or in a left-handed direction. We might arrange a set of pairs of Fresnel's rhombs, it is evident, in such positions that each pair should give the plane of polariza-

CIRCULAR SAILING — CIRCULATION

tion of the ray passing through it a farther twist in the same direction, and we might turn it thus through any angle whatever. Such a power as we have imagined in a set of Fresnel's rhombs is possessed by quartz and by a considerable number of solutions of organic bodies, and it is known as a power of rotating the plane of polarization. When a beam of homogeneous light has passed through the polarizer, and the analyzer is placed in the position of total extinction of the ray (see POLARIZATION OF LIGHT), on introducing a plate of quartz the light reappears; but on turning the analyzer round, either in a right-handed direction or in a left-handed direction (whence the names), extinction is again obtained. Quartz is named right-handed quartz or left-handed quartz according to the direction in which the analyzer must be turned. The amount of the angle through which it must be turned depends on the thickness of the plate of quartz.

If, instead of using homogeneous light, as we have been supposing, plane-polarized white light is employed, it is found that the different rays are differently deviated. The effect on the more refrangible rays is greater than on the less refrangible, and the plane of polarization of the blue rays will thus be turned through a greater angle than that of the red rays. It will be perceived from this, that having arranged the polarizer and analyzer, and inserted a plate of quartz, as described above, on rotating the analyzer in the direction, right-handed or left-handed, that corresponds to the nature of the plate of quartz, we shall not arrive at a position of total extinction, but we shall see a most beautiful play of colors changing in order from red to yellow, then to orange, green, and blue. These phenomena are among the most beautiful and most striking of all the marvelous phenomena of light.

It has been remarked above that certain organic liquids and solutions have this rotatory power. Among these may be mentioned turpentine, some essential oils, solutions of sugar, and solutions of tartaric acid. This fact is taken advantage of in Soleil's saccharometer (q.v.), an instrument for determining the value of cane-sugar in a liquid.

We have spoken above of the right-handed and left-handed properties of quartz; a discovery of Haüy leads us here to the very threshold of the molecular structure of crystals. We may yet hope for discoveries in this direction. On comparing crystals of quartz that give us right-handed and left-handed polarization, it is found that a very remarkable property connects their forms. The crystals that give right-handed and left-handed polarization are of an unsymmetrical construction, such that either viewed in a looking-glass gives an image of the same form as the other. Pasteur, examining the crystals of the two varieties of tartaric acid whose solutions have opposite rotational powers, but whose chemical properties are very nearly the same, showed that the same law holds for them; and, having crystallized what is known as neutral tartaric acid, was able, by picking out the crystals by hand, to separate it into equal portions of lævo tartaric acid and dextro tartaric acid. But we must refer the reader to the special articles on the chemistry of this substance.

One of Faraday's most brilliant discoveries was the rotatory power of glass under the action of a powerful magnet. The reader is referred for an account of it to the article POLARIZED LIGHT.

Circulating Medium. See MONEY.

Circulation, in animals, the passage of blood in circuit through the body; in vegetables, a similar circuit of sap.

Circulation of the Blood.—This process is widely distributed throughout the animal kingdom, even the irregular movement of blood in the lowest animals being termed a circulation. Properly speaking, however, only fishes, birds, and mammals may be said to have a distinct circulation. In the lower animals, such as the lobster or crab, there is no continuous vascular system, the arteries ending in lymph spaces. In birds and mammals, however, a particle of blood starting at any given point in the system makes a complete circuit and repasses its point of starting.

History.—In the chapter on anatomy the point was reached where the important discoveries of Harvey had revealed the secret of the circulation and that the study of human physiology was set on a secure basis, but in the matter of the circulation all the credit of discovery is not due to Harvey alone. It will be recalled that the authority of Galen persisted for over 1,000 years, and that the opening of the 16th century found a number of enthusiastic anatomists who founded a school of their own, and the new Vesalian anatomy replaced the old Galenic anatomy, but unfortunately not Galen's physiology. The old doctrine of Galen as applied to the circulation may be summed up as follows (Foster, 'History of Physiology'):

"The parts of the food absorbed from the alimentary canal are carried by the portal vein to the liver, and by the influence of that great organ are converted into blood. The blood thus enriched by the food is by the same great organ endued with the nutritive properties summed up in the phrase 'natural spirits.' But blood thus endowed with natural spirits is still crude blood, unfitted for the higher purposes of the blood in the body. Carried from the liver by the vena cava to the right side of the heart, some of it passes from the right ventricle through innumerable invisible pores in the septum to the left ventricle. As the heart expands it draws from the lungs, through the vein-like artery (or, as we now call it, the pulmonary vein), air into the left ventricle. And in that left cavity the blood which has come through the septum is mixed with the air thus drawn in, and by the help of that heat which is innate in the heart, which was placed there as the source of the heat of the body by God in the beginning of life, and which remains there until death, is imbued with further qualities, is laden with vital spirits and so fitted for its higher duties. The air thus drawn into the left heart by the pulmonary vein, at the same time tempers the innate heat of the heart and prevents it from becoming excessive. Thus from the right side of the heart there is sent to the body generally along the great veins, and to the lungs along the artery-like vein (the pulmonary artery), a flow, followed by an ebb, of crude blood endued with natural spirits only, blood serving the lower stages of nutrition. Blood flows through the artery-like vein to the lungs for the nourishment of the lungs, just as it flows through the other veins for the nourishment of the rest of the body; in both cases there is an ebb as well as a flow along the same channel. From the left side, on the other hand, there takes place along the arteries to all parts of the body a flow, followed also by an ebb, of blood endued with vital spirits, and so capable of giving power to the several tissues to exercise their vital functions. As this blood passes from the left heart along the vein-like artery to the lungs, it carries with it the various fuliginous vapors which, in the fermenting activity giving rise to the vital spirits, have been extracted from the crude blood,

CIRCULATION

and discharges these vapors into the pulmonary passages. Arterial blood, that is, blood laden with vital spirits, reaching the brain, there generates the animal spirits, which, pure and unmixed with blood, existing apart from blood, are carried along the nerves to bring about movements and to carry on the higher functions of the body."

This is the outline of the crude Galenic doctrine, and Vesalius, brilliant anatomist that he was, was content to accept it, although there are evidences that he was very skeptical regarding much of Galen's physiological teaching. It was particularly from the anatomical side that he was most skeptical; namely, the lack of tangible holes between the two sides of the heart, which were so important to the Galenists. His skepticism was taken up by his pupils, and was also felt by others, one of them, Michael Servetus, who published a remarkable book, the 'Restitutio Christianismi,' in which a much truer conception of the circulation of the blood was taught. This was as early as 1553. He rejected entirely the ancient doctrines, and had grasped the true doctrine of the pulmonary circulation, the passage of the blood from the right side through the lungs to the left side. Servetus, however, was a theologian more than a physician, and his early death probably prevented his further studies. Realdus Columbus, of Cremona, must be regarded as another link in the chain that led up to the final solution. He is thought to have been a tricky man, however, and one who would not hesitate to poach on another's preserves, and there are indications of his copying much from Vesalius' works and claiming them as his own. He was vain and ignorant, but in his book, 'De Re Anatomica' (1559), he described correctly the pulmonary circulation, but he was unable to draw from it the lessons that it implied. This, by many historians, is taken as evidence that he was only a copier, and that probably the work of Servetus had been seen by him and he had claimed the discovery as his own. Cæsalpinus, a noted botanist, was the first to appreciate the fact that at the contraction of the ventricles (systole) the blood was thrown into the aorta and into the pulmonary artery, and at its diastole it received the blood from the vena cava and the pulmonary vein. He also seemed to have grasped the fact of the flow of the blood from the arteries to the veins, and of the flow along the veins to the heart. This was in 1571 and 1593. Thus Cæsalpinus had a true suggestion of the idea both of the pulmonary and systemic circulations. But Cæsalpinus' work seems to have been lost sight of, and another, Hieronymus Fabricius, had the honor to open the next door that led to Harvey's triumph. Fabricius called renewed attention to the valves in the veins, but missed their real function, and, although he was Harvey's teacher, he was more of a Galenist than a modern.

It is to William Harvey's credit, not so much that he was the discoverer of the physiology of circulation,—this, it can be seen from this brief recital, was of gradual accretion,—but that he was the first demonstrator of the process. He was the first physiological experimenter, and his work on the living animal has opened up to the world most of its priceless gifts in the field of medicine. It was by the faithful and prolonged study of many hearts of many animals that showed him that —

"the motion of the heart consists in a certain universal tension, both of contraction in the line of its

fibres, and constriction in every sense, that when the heart contracts it is emptied, that the motion which is in general regarded as the diastole of the heart is in truth its systole";

—that the true work of the heart is not that it sucked blood in, but that it drove blood out. Cæsalpinus guessed at this, or may be knew it, but Harvey proved it, and, what is more, read the consequences. He saw clearly, then, the real function of the auricles and the ventricles and of their valves, and he applied the lessons of the lesser, or pulmonary circulation, to the greater, or systemic circulation, and thus rounded out the true natural history of the process. In his own words:

"I frequently and seriously bethought me, and long revolved in my mind, what might be the quantity of blood which was transmitted, in how short a time its passage might be effected, and the like; and, not finding it possible that this could be supplied by the juices of the ingested aliment without the veins on the one hand becoming drained, and the arteries on the other hand becoming ruptured through the excessive charge of blood, unless the blood should somehow find its way from the arteries into the veins, and so return to the right side of the heart, I began to think might there not be a motion, as it were in a circle. Now this I afterward found to be true; and I finally saw that the blood, forced by the action of the left ventricle into the arteries, was distributed to the body at large, and its several parts, in the same manner as it is sent to the lungs, impelled by the right ventricle into the pulmonary artery, and that it then passed through the veins and along the vena cava, and so round to the left ventricle in the manner already indicated, which motion we may be allowed to call circular."

Thus clearly and forcefully he set forth in 1616 — although his work did not appear until 1628 — the true doctrine, and it is of interest to record that he lived to see it adopted practically by all scientists. Malphigi, in 1661, demonstrated, by means of the microscope, the capillaries, thus filling out the last link in the chain of evidence.

Mechanics of Circulation.—Harvey's work established the mechanical character of the heart's action, and, as it is now regarded, the heart is the pump which beats about 72 times a minute, thus forcing the blood with considerable velocity and force through the arteries. It is a double pump, as it were, both sides working simultaneously, the pulse-beat being the wave of the systolic contraction of the left ventricle. Each half of the heart consists of a smaller, less muscular portion, the auricles, and a larger, stronger portion, the ventricles, the left ventricle being much more powerful than the right. Leading into the heart and away from it are the aorta, pulmonary vessels, artery, and vein, and the vena cava. Between the auricles and ventricles are valves,—the mitral between the left auricle and left ventricle; the tricuspid corresponding on the right side; and the pulmonary and aortic valves. Starting with the spent blood that is collected from the entire body in the veins, this is carried, by pressure of the walls of the veins, through the vena cava, and emptied into the right auricle; this contracts, the valve at the orifice of the vena cava closes, the tricuspid valve opens, and the blood is forced into the right ventricle. It remains here a small fraction of a second, and this ventricle contracts, the tricuspid valve closes, and the blood is forced through the pulmonary artery into the lungs. Here it is spread out, mesh-like, in millions of capillaries, is oxygenated, and brought back to the left auricle by the pulmonary vein. The contraction of the left auricle forces the blood into the left ven-

CIRCULATION IN PLANTS — CIRCUMCISION

tricle through the mitral orifice, the valves behind closing, and finally the great throb of the heart is caused by the ventricular systole, the mitral valve closes tight, preventing regurgitation, and the blood bounds out into the arteries, the aortic semilunar valves closing as soon as the ventricle commences to expand to get its next supply. Thus this cycle goes on 72 times a minute on the average, night and day, until death quiets the heart's action. In actual operation the right and left sides are working simultaneously, and when one listens to the heart-beat one hears only the "lub-dup," "lub-dup," of the closing auriculo-ventricular valves, and the closing aortic and pulmonary tricuspid. From the arteries the blood goes to every structure in the body in the capillaries, and returns in the veins, whose valves prevent venous congestion, and once more into the vena cava. The whole cycle is complete in about 22 seconds, one thirteenth of the entire weight of the body in blood has been thus sent round the circuit, with an initial force of the ventricular contractions of about 4.5 foot pounds at an initial velocity of about 20 inches a second. In 24 hours thus the heart's energy would lift 124 tons in weight one foot. The vital or nervous mechanism that keeps the heart in motion consists in the main of three factors, the irritability of the heart muscle itself, the action of the cardiac nervous ganglia of the sympathetic, and the cardiac regulator nerve, the pneumogastric. If a salt solution of 0.6 percentage composition is passed through the fresh heart of many of the lower animals, the heart will commence to beat, thus showing that if the heart muscle is supplied with proper liquid it must beat, hence the irritability of the heart muscle is the first and most important factor in the phenomenon of circulation. The blood salts, notably calcium and potassium, supply the irritant, and muscular contraction results, but if the heart muscle alone is beating it does so rhythmically, but the different parts do not work in efficient unison, hence the need of a regulating mechanism other than the auricle "pace-maker." This is supplied by the cardiac ganglia, their irritation causes the heart to beat more rapidly, but not in unison. The chief regulator and steadier of the heart-beat, as well as the great trophic nerve, is the tenth nerve, the pneumogastric or vagus, coming from the medulla. This nerve brings complete order and system into the heart mechanism as adjusted to other conditions in the body. Its stimulation slows the action of the heart; its paralysis causes the heart to run away, given over to the ganglia and the muscle. Another important feature in the circulation is the elasticity of the blood vessels, or vessel tone. This is maintained by the sympathetic nervous system, which raises or lowers vessel tone in accordance with the needs of the cells of the body. A regular condition of blood-vessel tonus is essential to the life of the cells of the body, muscular as well as nervous.

Circulation in the Lower Animal Forms.—The motion of a limpid fluid can be rendered perceptible only by the presence of the corpuscles which it carries. In the blood it is rendered apparent in the capillary vessels by means of its globules. In infusorial animalcules the movement of the fluids of the body is maintained by that of the animal itself and by the disturbing influence of nutritive absorption. In the *Polypi* the movement receives aid besides from the ac-

tion of cilia on the inner walls of the body. The *annelids*, as the earth-worm, possess contractile vessels traversing the length of the body. The insects, crustaceans, myriapods, and spiders have a dorsal tube which in the common crab and the spider is much shortened and broadened, but in the others remains tubular, the blood regaining its cavity through slits in the sides as well as by the openings of the trunks which the heart gives off. In these animals the circulation is incomplete, that is, the blood does not flow through canals with definite walls, but in the interstices of the tissues. The *Mollusca* have the heart provided with an auricle and a ventricle, as in the snail and whelk; two auricles, one on either side of the ventricle, as in the fresh-water mussel, or two auricles and two ventricles as in the ark shells. Among the ascidians, which stand low in that division of animals to which the mollusks belong, the remarkable phenomenon is encountered of an alternating current, which is rhythmically propelled for equal periods in opposite directions. All vertebrated animals (except *Amphioxus*) have a heart which in most fishes consists of an auricle and ventricle, but in the mud-fishes (*Lepidosiren*) there are two auricles and one ventricle; and this trilocular heart is found in the amphibians, and in most reptiles except the crocodiles, which, like birds and mammals, have a four-chambered organ consisting of two auricles and two ventricles. In these two last-named classes the venous and arterial blood are kept apart; in the trilocular hearts the two currents are mixed in the ventricle.

Circulation in Plants. See SAP.

Circumcellions, sēr-kūm-sēl'ī-ōnz, **Circumcellio'nes**, or **Circelliones**, members of bands probably of fanatic monks, partisans of Donatus (q.v.) and the Donatists in Numidia and Mauritania who, avenging the condemnation of Donatus by the Synod of Arles (314) and the Council of Nicæa (325) and the condemnation of Donatus and his followers by Constantine and Constantius, roamed throughout those provinces pillaging and wrecking the churches and other religious establishments of the Roman Catholics and proclaiming the downfall of the empire itself. Their name probably is formed from *circum*, round about, and *cella*, cell, a monk's cell: if the derivation is correct these Circumcellions are of the same class of vagabond monks complained of by the father of western monachism, St. Benedict as *gyrovagi*, circulating vagabonds.

Circumcision, an amputation of a portion of the human organs of generation; principally performed on males, but sometimes on females. It has been practised in all ages, and by both civilized and savage races, as Arabs, certain African tribes, Christian Abyssinians, Australian "blacks," Malays, some North American Indians, Aztecs, Mayas, Caribs, South American Indians, Jews, Mohammedans, Fijians, and Samoans.

CIRCUMFERENCE — CIRCUMSTANTIAL EVIDENCE

In the male, the operation consists in removing a section of the prepuce. Doubtless the original object was cleanliness, a safeguard against venereal infection, or the moderation of the sexual passion, which are said to be results of the operation, but among the Jews it has always been a religious rite, for they regard it as the sign of the covenant made by Jahwé with Abraham and his posterity. The institution of the rite is recorded in Gen. xvii. Here it is stated that Abraham, then 99 years old, was himself circumcised, with his son Ishmael, 13 years old, "and all that were born in his house, and all that were bought with his money, every male among the men of Abraham's house." But by the terms of the covenant every man-child among the Hebrews was to be circumcised on the eighth day after birth, and this rule, peculiar to the race, is adhered to with such rigor that even the Sabbath observances are not allowed to interfere with the ceremony. Other Eastern nations have practised circumcision on various days,—the Arabs 7, 14, 21, or 28 days after birth, though Josephus states that in his day the Arabs circumcised after the age of 13 on account of the circumcision of Ishmael, their progenitor, taking place at that age; the Mohammedans of Persia circumcise in the third or fourth year; Fijians and Samoans in the seventh year; the Christian Abyssinians in the sixth, seventh, or eighth year; while some of the African tribes that practise the rite follow the Jewish rule; others, again, performing the ceremony between 30 and 60 days after birth.

Circumcision is universally practised by Mohammedans, not on the authority of the Koran, which does not enjoin it, but as following the example of Mohammed. It seems to be doubtful whether Mohammed's omission to prescribe the rite was due to his deeming such a rule valueless where custom already decreed it, or because he attached only a physiological and not a religious importance to the ceremony. It is, however, now recognized as a religious obligation just as strongly as if it had been ordained by the founder of Islam. Circumcision among Mohammedans may be practised seven days after birth, but it is customary to postpone the ceremony to some time between the 7th and 12th year.

Christianity recognizes no religious significance in the rite, substituting for it, according to St. Paul (Rom. ii. 25-29) "circumcision of the heart." The Church, however, celebrates as a festival the first of January, as being the day of the circumcision of its founder.

Circumcision of proselytes to the Jewish or Mohammedan faith is insisted on by the orthodox, and previous circumcision for surgical reasons is not accepted as sufficient compliance with the requirements of religion. Among some "reformed" Jews, however, the circumcision of adults has lately been abandoned. Among many savage tribes the rite is undergone at the age of puberty, and is perhaps in such instances more of a sociological than a religious ceremony, being akin to other mystic rites which mark the entrance of the young into full tribal fellowship.

The circumcision of women is effected by the removal of a portion or the whole of the clitoris. It is perhaps practised more in

Arabia than elsewhere, but has never prevailed among Jews.

Circumcision is much favored by physicians and surgeons of the present day as a hygienic measure irrespective of any religious associations.

ELFORD E. TREFFRY.

Circum'ference, or **Periphery**, the curve which encloses a circle, ellipse, or other plane figure. In figures bounded by straight lines, as the triangle, square, and polygon, the term perimeter is employed to designate the sum of all the bounding lines taken together. The length of the circumference depends partly on the nature of the curve; thus, that of the circle = $2\pi r = \pi d$ and that of the ellipse =

$$2\pi a \left\{ 1 - \left(\frac{1}{2}\right)^2 \frac{e^2}{1} - \left(\frac{1.3}{2.4}\right)^2 \frac{e^4}{3} - \left(\frac{1.3.5}{2.4.6}\right)^2 \frac{e^6}{5}, \text{etc.} \right\}$$

where a is the semi-axis major, and e the eccentricity.

Cir'cumflex, in grammar, one of the three accents, formed by the union of the other two, thus, $\overset{\wedge}{\sim}$. It originally denoted a rising and falling of the tone in the pronunciation of the syllable. It is not used in English, and in French is usually a sign of the elision of a letter, and therefore indicates a prolonged sound.

Cir''cumlocu'tion Office, a name used by Dickens, in 'Little Dorrit'; he applies it to the delay and slowness of British officialism and especially when dealing with poor and friendless persons, imprisoned for petty offenses.

Cir''cumnuta'tion, the continuous motion of every growing part of a plant, in which it describes irregular elliptical or oval figures. The apex of the stem, for instance, after pointing in one direction, moves round till it points in the opposite direction, and so on continuously. The term circumnutation was first used by Darwin.

Circumpo'lar Stars, stars near the Pole that appear to move around it, and perform their circles without setting. A star whose polar distance is less than the latitude of a place will never set at that place. They are constantly used by astronomers in connection with meridian work for determining the correction to be applied to transit observations to free them from the errors due to the slight departure of the line of collimation of the instrument from the plane of the meridian as it revolves on its axis. The pole-star Polaris or Alpha Ursæ Minoris, usually known as the North Star, is the most used for that purpose.

Circumstantial Evidence, evidence which tends to prove a particular fact by the proof of other facts, from which it is concluded that the particular fact must have happened. It is the natural and reasonable inference resulting from facts which have been established.

If A is on trial for the murder of B, and a witness testifies that he saw A shoot B, and a few minutes later B died, that would be direct evidence; whereas if the witness testified that B had been shot, and the bullet found in the body of B was of a particular make only used by A, and that A was in the neighborhood at the time of the shooting, the jury might infer that A was guilty; but if A could

CIRCUMVALLATION — CIRCUS

prove that his pistol had been stolen from him shortly before the shooting, and he had not recovered it at the time of the shooting, it would be a complete defense, and the verdict would depend on the credibility of the witnesses.

Circumstantial evidence is of two kinds: that from which a certain conclusion necessarily follows, and that from which a certain conclusion is only probable or likely. If the body of a man is found with a bloody right hand impression on a part of his body where it is impossible for him to put his right hand, the presumption is that some one was present at or since the time the person was hurt; but if that is all of the evidence, it is impossible to tell whether the bloody impression was made by the person at the time of the assault, or by some one after the assault had been committed. In civil cases the jury may decide according to the weight of the evidence; but to convict a person of a crime the evidence must be such as to leave no reasonable doubt as to his innocence. See **LAW, CRIMINAL**.

Cir'cumvalla'tion, a fortification consisting of a parapet of earth and a trench, constructed by a besieging army around its camp, to guard against attempts to relieve the place besieged.

Circus, a word which has come down to us from the Latin without change, meaning "circle," and used by the Romans to indicate the place in each city where chariot races, gladiatorial contests, and feats of skill were held. The circus building in Roman times was without a roof, rectangular in shape, except that one short side formed a half-circle; on both sides, and on the semicircular end, were the seats of the spectators, rising gradually one above another, like steps. The largest of these buildings in Rome was the Circus Maximus, 1,875 feet long and 625 feet wide, and capable, according to Pliny, of containing 260,000 spectators. At present but few vestiges remain, and the circus of Maxentius is in a better state of preservation. Grown great through conquest of other peoples, the Romans of 2,500 years ago (and for 10 centuries later) encouraged all forms of pleasure which would develop to its highest pitch the fighting instinct in their soldiery. Among the circus games were chariot races, a favorite sport of the Romans; athletic contests; the Trojan games, contests on horseback; and combats with wild beasts in which beasts fought beasts, or beasts with men (either criminals or volunteers). The prizes given to the victors were often valuable, and the honors great. In the decadence of Rome came a decline of the circus, and it was frequently debased by revolting spectacles, in which Christians or others temporarily hated by the government were given over to wild beasts, or crucified. Julius Cæsar dug ditches around the circus and filled them with water. This served the double purpose of protecting the spectators from the sudden swerving of a chariot or spring of a tiger, and of making possible the novelty of feats of skill on the water. Most of the vessels then were propelled entirely by banks of oars, and Cæsar held rowing-races, swimming-races, etc. Most of our grotesque picnic-games, like swimming in a barrel or running in a sack, are relics

of his fertile inventions to please his restless, turbulent people. There was no charge to see these entertainments, as a rule, the circus being used as a pacifier by the emperor.

America has taken the lead in the reproduction of the Circus Maximus. This is probably because the American people are of a similar strenuous, contest-loving, restless disposition. It was his acute perception of this disposition in his countrymen that led Phineas Taylor Barnum (q.v.) a Connecticut Yankee, to devote his life to entertaining his countrymen by giving them a real circus. He first started the American Museum at the corner of Broadway and Ann street, New York, a site now occupied by the 20-story St. Paul Building. Soon he began to exploit all kinds of freaks and curious human beings, "Tom Thumb" and other dwarfs being among his features. He saw the greed of the public for odd, grotesque things. "The public loves to be humbugged," was one of his frequent declarations. Yet Barnum always gave the people what he promised, and soon had on the road the beginning of what has since become perhaps the largest "show" on earth. From Barnum's death till 1906 the circus was directed by Mr. Bailey, his partner for some years previous to that event. The magnitude of the Barnum & Bailey circus and menagerie can scarcely be described. It is usually formed by making three immense rings, three different performances being given simultaneously. With 1,000 performing horses, 2,000 horses to haul the tents and equipment from town to town, hundreds of wild beasts in a menagerie, 500 performers, bare-back riders (both sexes), clowns, aërialists, tumblers, etc.—1,200 other employees to care for the animals and erect the tents (seating 25,000), put up show-bills, etc., advance agents, cashiers, managers, and other attachés, bringing up the total to about 3,000 people employed during the season, the conducting of such a circus requires consummate ability and great pecuniary resources. A dozen trains of cars are necessary to carry this exhibition, and a whole ship is used when it visits Europe, as it often does, successfully. The capital invested in this and other circuses in America is enormous, being not under \$100,000,000. There are 8 or 10 of the very large circuses, and 20 more smaller ones at work in America at present (1903). The admission price to the common seats was primarily fixed by Barnum at 50 cts., and this has never been varied from since. The better seats, near the centre, are \$1.00. These seats correspond to those of the Roman emperor and his court in the old Circus Maximus. Vast crowds attend these exhibitions, particularly in the rural districts, where "circus day" is as much of a holiday as 4th July. Unless a continuous season of rainy weather is encountered, the profits accruing to the proprietors of these circuses at the end of the season (about October) are usually 100 per cent or more.

Since about 1890 there has developed a peculiar American form of circus which is worthy of mention. This is a reproduction in the ring of the habits and customs of the "cowboy" and pioneer of our own western plains. The exhibition is termed a "Wild West" show. It was originated, practically, by William F. Cody (q.v.), known on the plains as "Buffalo Bill."

He was a former government scout, and thus became familiar with many Indian tribes. With the aid of "Nate" Salisbury he organized an exhibition of frontier and Indian life which rivals Barnum & Bailey's in point of interest and profit. He has a hundred western cattle-herders, who give marvelous illustrations of the perfect horsemanship of the plains; he has many American Indians from a score of tribes, who give their war-dances and weird chants; he has Mexican lariat-throwers, who perform wonderful feats with a swirling rope; he has "rough riders" from many lands. Altogether, this makes a "show" which appeals powerfully to both the young and the old American. Several less important "Wild West" have also been organized.

Some American college youth have recently endeavored to revive interest in the ancient Grecian Olympic games. Delegations went to Athens in 1902 and 1906 to compete with the modern Greeks and other national champions. These efforts may eventually rehabilitate the hippodrome and Circus Maximus in the lands which gave them birth. See HIPPODROME.

Cirencester, sis'ĕ-tĕr, England, a town in the county of Gloucester, on the river Churn, 18 miles southeast of the city of Gloucester. The chief industries are malting, brewing, and cutlery manufacture; it also has a large wool trade. The town contains the remains of the gateway of an abbey founded in 1177; and several churches of interest. In the environs is the well-known Royal Agricultural College, with a large number of students coming from all parts of the world. Cirencester was founded by the ancient Britons, and later, under the name of Corinium, became a Roman station. Various Roman remains, including those of an amphitheatre, have been discovered in it, and numerous relics belonging to this period of its history have from time to time been found and placed in the local museum. It was the scene of engagements during the civil war of the 17th century. Pop. (1901) 7,530.

Cirillo, Domenico, dō-mā-nĕ'ko chĕ-rĕl'lo, Italian republican and naturalist: b. Grugno, Naples, 1734; d. Naples August 1799. He officiated in early life as professor of botany, afterward accompanied Lady Walpole to France and England, became a Fellow of the royal society of London, a friend of Buffon, D'Alembert, and Diderot, and on his return to Naples was appointed physician of the court. After the proclamation of the republic by the French, he was chosen representative of the Neapolitan people, and member of the legislative commission (1799); and on the re-establishment of royalty suffered death on the scaffold, rather than take the oath of allegiance or ask a pardon from King Ferdinand. His principal writings are: 'Fundamenta Botanica' (1787); and 'Entomologiæ Neapolitanæ Specimen' (1787); folio.

Cirl-Bunting, sĕrl'bun'ting, a small and very handsome European bunting (*Emberiza cir-lus*), rare and local in England, often kept as a cage-bird, though its song is slight.

Cirpan, cher'pān, a town of eastern Rumania, Bulgaria, on the tributary of the Maritza, 30 miles east of Philippopolis. It is situated in a fertile, fruit-producing region and is noted for its mineral springs. Pop. 11,069.

Cirque, sĕrk, the name applied to basins occurring in mountainous regions at the head of narrow stream valleys and gorges. They are characterized by precipitous walls, which curve around in a semicircle, forming a natural amphitheatre. Their origin may be traced to the erosive action of converging glaciers and streamlets.

Cirrhosis, sĭ-rō'sis, a process of chronic, inflammatory reaction in an organ, due to some form of constant irritation. It is characterized by the excessive production of connective tissue in the part, which increase of connective tissue gradually encroaches upon the blood-vessels of the organ and slowly invades its essential portions. Cirrhosis may occur in almost any portion of the body, but it is characteristically present in only those organs which are rich in functioning parenchyma, such as the kidney, liver, spleen, pancreas, and brain. In each of these organs it produces a very definite form of lesion, with a clearly defined clinical course and history. Thus, in the kidneys, cirrhosis constitutes one of the forms of Bright's disease or chronic nephritis (q.v.). Cirrhosis of the liver results in a well-defined form of liver-disease, or chronic cirrhotic hepatitis (q.v.). Cirrhosis of the spleen, and cirrhosis of the pancreas also occur, and there is a well-known form of cirrhosis of the brain associated with degeneration. (See GENERAL PARESIS.) These different forms of cirrhosis will be discussed under their separate headings.

Cirripe'dia, an order of entomostracous *Crustacea* (barnacles), sometimes ranked as a sub-class, always fixed in the adult stage, but with free-swimming larvæ having three pairs of appendages (*nauplius*) like other *Crustacea*. The typical barnacles have the body enclosed in a reduplication of the skin which secretes a calcareous shell, on which account they were classed with the *Mollusca* until the discovery of their free-swimming larvæ led to a closer investigation of their structure. Owing to adaptation to a sedentary life segmentation of the body has become obscure, and the six pairs of jointed biramous appendages are mere fringed scoops for creating currents in the water. The eyes and other sense organs have likewise degenerated, and most species are hermaphroditic. The barnacles are exclusively marine, and a great many are parasitic.

Four sub-orders are distinguished: (1) *Thoracica*, including the typical, free-living, shelled barnacles of which the sessile forms (*Balanidæ*, *Coronulidæ*, etc.), are well known as rock and ship barnacles in which the animal is protected by a conical shell formed of several pieces, with a multivalve conical movable lid, having an opening through which several pairs of long, many-jointed, hairy appendages are thrust, thus creating a current which sets in toward the mouth. The young have oval bodies, with a single eye, a pair of antennæ, with three pairs of legs. After swimming about for some time it attaches itself by its antennæ to some object, and now a strange backward metamorphosis begins. The body becomes enclosed by two valves, the stalk by which it is anchored grows larger, the feet become more numerous, and eventually the barnacle shape is attained. The goose-barnacle (*Lepas*) is not sessile, but is flat and triangular, and attached to floating bits

CIRRUS — CISSAMPELOS

of wood or seaweed by a long, large, soft stalk. (2) *Abdominalia*, parasitic barnacles, in which the sexes are separate and very unequal in size. In this group is presented the remarkable phenomenon of dwarfed complementary males discovered by Darwin. The females live in burrows in the shells of mollusks and other barnacles, while the males are minute, lack mouth, digestive canal, and appendages, and live, often several together, permanently attached to the female. (3) The *Apoda*, whose body is maggot-shaped, are hermaphrodite and parasitic in other barnacles. (4) *Rhizocephala*: This group presents perhaps the most extreme cases of degeneration, through parasitism, known among animals. *Sacculina*, which attaches itself to the abdomen of the crab, is little more than a bag of genital organs which draws its nourishment from the tissues of its host by means of branching root-like processes which penetrate to every part of its body. Consult Darwin, 'Monograph of Cirripedia.'

Cirrus. See CLOUD.

Cir'rus, in botany, the tendril by means of which certain plants climb, usually a modified leaf or the prolongation of a midrib.

Cirta, sîr'tâ, a city of northern Africa, the capital of the Numidian prince Syphax, and an important fortress of Masinissa and his successors. Later it became a flourishing Roman colony. It was much injured by the troops of **Masentius** in 310 A.D., but was restored by **Constantine** and named Constantina. The modern Constantine occupies its site.

Cisal'pine Republic, Italy, a former State in the northern part. After the battle of Lodi, May 1796, Gen. Bonaparte proceeded to organize two states — one on the south of the Po, the Cispadane Republic, and one on the north, the Transpadane. These two were on 9 July 1797, united into one under the title of the Cisalpine Republic, which embraced Lombardy, Mantua, Bergamo, Brescia, Cremona, Verona, and Rovigo, the duchy of Modena, the principalities of Massa and Carrara, and the three legations of Bologna, Ferrara, and the Romagna. The republic had an area of more than 16,000 square miles, and a population of 3,500,000. The seat of the government or Directory was Milan. The army consisted of 20,000 French troops, paid by the republic. The republic was dissolved for a time in 1799 by the victories of the Russians and Austrians, but was restored by Bonaparte after the victory of Marengo, and some modifications of constitution were made and the area was increased. In 1802 it took the name of the Italian Republic, and chose Bonaparte for its president. In 1805 the republic sent a deputation to Napoleon, with authority to give him the title of King of Italy. The territory was known as the kingdom of Italy until 1814. In 1815 it became a part of Austria. It is now a part of the Italian kingdom.

Cisco, sîs kō, a local name, probably from the Indian language, applied to several species of fresh-water fishes of the family *Salmonidae* (q.v.) and closely allied to the white-fishes (q.v.), with which they are sometimes placed in the genus *Coregonus*, or separated under the name *Argyrosomus*. They are distinguished from the true white-fishes by having the lower

margin of the premaxillary bone horizontal instead of vertical, and by the larger mouth. Nine or ten species have been described from North America, most of them belonging to the waters of particular lakes or lake systems. The most important is *A. artedi*, which is found in the Great Lakes and adjoining regions, being represented in the small lakes of Indiana and Wisconsin by a slightly modified race. Under the name of lake herring it is the object of an extensive fishery on the lakes, second in value only to that of the true white-fish. It is a voracious fish, swimming in large schools, frequenting deep waters during most of the year, but spawning in the shallows during the winter. The other species inhabit various lakes and the river systems of Alaska, etc. Similar species also occur in Europe and Asia.

Cisleithan (sîs-lî'thân) **Provinces**, Austria proper or Austria west of the river Leitha, which partly forms the boundary between it and Hungary. This portion of the Austro-Hungarian monarchy contains about 115,850 square miles. Pop. (1900) 26,107,304.

Cisleithania, a river on the boundary line between Austria and Hungary.

Cisneros-Betancourt, thēs-nā'rōs bē-tōn-kōor', **Salvador**, Cuban patriot: b. Puerto Principe 1832. He was a descendant of one of the best families of Spanish nobility, and possessed the hereditary title of Marquis of Santa Lucia. During the revolution of 1868-78, he was president of the Cuban House of Representatives, and during a part of the time president of the Cuban republic. In 1895 he was re-elected president of the new Cuban republic. His niece, Evangelina Cosío Cisneros, was imprisoned by the Spaniards for aiding the insurgents during the insurrection in 1896-7, and made a sensational escape, coming to the United States, where she became a protégé of Mrs. Gen. John A. Logan. His daughter tendered her services to the United States as an army nurse during the war with Spain in 1898.

Cispadane (sîs-pā'dān) **Republic**, Italy, a republican state established by Napoleon in 1796, after the battle of Lodi. It comprised Bologna, Modena, Ferrara, and Reggio. In 1797 it was united with the Cisalpine Republic (q.v.).

Cisplatine (sîs plā'tîn) **Republic** (Lat. *cis*, on this side, and Sp. *Plata*, name of the river on the boundary between Uruguay and Argentina). The Republic of Uruguay was called by this name from 1828 to 1831. Previous to becoming an independent state it had belonged to Brazil, and was called Cisplatine Province.

Cisrhenish Republic, or **Cisrhenam Republic**, several towns on the Rhine, particularly Cologne, Aix-la-Chapelle, and Bonn, at the time when so many republics were created, declared themselves independent, under French protection, and took the title of *Cisrhenish Republic* in September 1797. But at the Peace of Campo-Formio (17 Oct. 1797), the left bank of the Rhine, including the Cisrhenish Republic, was ceded to France by a secret article, and the confederation bearing this name is in consequence hardly known.

Cissampelos, a tropical genus of climbing shrubs of the natural order *Menispermaceæ*,

CISSEY — CISTERN

whose growth is similar to that of an ivy vine. The plant is of great commercial value because of its medicinal qualities, especially the velvet-leaf of Brazil, (*Cissampelos pareira*), the root of which supplies the spurious pariera brava, abuta root, used in medicine as a tonic. Other species growing in nearly all tropical countries are used for emetics and cathartics, and an East Indian species (*C. obtecta*) yields an intoxicating spirit.

Cissey, sē'sā, **Ernest Louis Octave Courtet**, French general: b. Paris 1811; d. there 1882. He was educated at the military school of St. Cyr and having served with distinction in Algeria and the Crimea, he was promoted in 1863 to be general of a division. He fought in the Franco-Prussian war, and in the contest against the Commune of 1871. He was elected to the National Assembly in February 1871, and was minister of war from 1871 to 1873, and in 1874-6. He was elected life senator in 1875.

Cis'soid, a curve in geometry, the locus of the vertex of a parabola rolling upon an equal parabola. If pairs of equal ordinates be drawn to the diameter of a circle, and through one extremity of this diameter and the point in the circumference through which one of the ordinates is let fall, a line be drawn, the locus of the intersection of this line and the equal ordinate is known as the cissoid. This curve was discovered by Diocles while he was seeking the solution of the celebrated problem of the duplication of the cube.

Cist, **Henry Martyn**, American soldier: b. Cincinnati, Ohio, 20 Feb. 1839; d. Rome, Italy, 17 Dec. 1902. He graduated at Belmont College 1858, and began the study of law, but enlisted as a private in the Sixth Ohio Regiment 21 April 1861, attaining, before his resignation 4 Jan. 1864, the brevet rank of brigadier-general. He was post-adjutant of Camp Chase during the imprisonment of the Confederates captured at Fort Donelson, assistant adjutant-general of the Army of the Cumberland, and later, on the staff of Gens. Rosecrans and Thomas. After the war he practised law in Cincinnati, was twice mayor of College Hill, originated the project that resulted in the conversion of the Chickamauga battlefield into a national park, and was a contributor of military articles to the magazines. He wrote 'The Army of the Cumberland' (1882); and collaborated with Donn Piatt in a 'Life of General George H. Thomas.'

Cist, a place of interment of an early or prehistoric period, consisting of a rectangular stone chest or inclosure formed of rows of stones set upright, and covered by similar flat stones. Such cists are found in barrows or mounds, enclosing bones. In rocky districts cists were sometimes hewn in the rock itself. See BURIAL; BURYING PLACES.

Cistaceæ, sīs-tā'se-ē. See CISTUS.

Cistercians, sīs-tēr'shē-āns, a monastic order in the Roman Catholic Church founded in 1098 by St. Robert of Molesme, a Benedictine monk of Cluny (q.v.) at Cistercium, near Dijon in France. After a year Robert of Molesme was succeeded as abbot by the monk Alberic and he in turn by St. Stephen Harding, an Englishman, who ruled the order during 25 years with great wisdom and who is regarded as its

second founder and lawgiver: his day in the Church calendar is 17 April. The Cistercian order in his time grew to be the most considerable monastic order in the Church, and to him in great part is due the founding of the four greatest Cistercian monasteries of France, next after Citeaux, namely, La Ferté, Pontigny, Clairvaux, and Morimond. By the middle of the 12th century Citeaux had affiliated to it 500 abbeys and priories, and early in the 13th their number was 1,500, of which very many were convents or priories of Cistercian nuns. For 200 years the austere rule of St. Benedict as reinforced by St. Stephen Harding was maintained throughout the order: there was the chanting of matins and lauds at midnight throughout the year in the abbey or priory church; there was a strict fast on one slender meal from 14 September to Easter; there was abstinence at all times (cases of sickness excepted) from all animal food, save that very rarely milk was allowed. The austerity of the Cistercian rule extended even to the churches of the order: simplicity was sought in everything; there was no fatuous display of ornamentation, either of the edifice or of the vestments, or of the sacred vessels; the copes and chasubles employed in the church services were of white linen instead of silk or cloth of gold; the chalices and the pyxes, instead of being of gold incrustated with precious stones, were of plain silver. But the church schisms and the wars and civil commotions of the 14th century led to the plundering of the abbeys and priories, and the monastic discipline was greatly relaxed, so that on the one hand it became necessary for the see of Rome to sanction in some respects this relaxation, while on the other hand there arose zealous upholders of the ancient rules who brought back the primitive observance in all its rigor. Among the most notable of these revivers of the ancient rule was the abbot De Rancé of the monastery of La Trappe (q.v.) in the 17th century. At the dissolution of the English monasteries by Henry VIII. there were in England and Wales 115 Cistercian houses, of which 25 were for nuns. In the period of the French Revolution most of the Cistercian Cenobia, not only in France, but throughout the continent of Europe, were suppressed. In the United States there are two Cistercian abbeys, namely, that of La Trappe at Gethsemane in Kentucky, and that of New Melleray, near Dubuque, in Iowa. The most noted English Cistercian's houses were the abbeys of Furness, Fountains Rievaulx, Tintern, Kirkstall, and Woburn. A modern English Cistercian abbey is situated at Mount Saint Bernard, not far from Leicester. See JANAUSCHEK, 'Origines Cistercienses' (1877); Guignard, 'Monuments primitifs de la règle Cistercienne' (1877); Sharpe, 'Architecture of the Cistercians' (1874); Lefroy, 'Ruined Abbeys of Yorkshire' (1889); Eulart, 'Origines de l'architecture Gothique en Italie' (1893).

Cistern, a tank for holding water. Cisterns differ from wells in that they do not get their water from natural sources, such as springs, but through channels made by the hand of man. In hot countries, where the supply of water is not regular, or where rain water is used, cisterns are necessary for storing up water for future use. They are also largely used for the

CISTUS — CITIZEN

supply of locomotive boilers at railroad stations. Cistern water used for drinking is usually filtered.

Cistus, the typical genus of the rock rose family (*Cistaceæ*), a family having four genera, and about 160 species, of which two at most are found outside the northern hemisphere. The American representatives of the family belong to the genera *Helianthemum*, *Hudsonia*, and *Lechea*, most of the species being pestiferous plants, such as the frost-weed or Canadian rock rose (*H. canadense*), poverty-grass (*Hudsonia ericoides*), and the pin-weeds (*Lechea*). *Cistus* does not grow wild in America, but some species are cultivated in greenhouses and the warmer regions for the beauty of their large wild roselike flowers, which are often of two colors. This genus, which is a native of the countries of Europe, is generally a beautiful evergreen flowering shrub, ornamental in gardens or shrubberies. Gum ladanum is obtained from *C. creticus*, and *C. ladaniferus*. This gum was formerly used as an external stimulant in plasters, but is now almost obsolete in medical practice.

Cit'adel (from the Italian *cittadella*, a diminutive of *città*, city; signifying little city), in fortification, a kind of fort, consisting of four, five, or six sides, with bastions, commonly joined to towns, and sometimes erected on commanding eminences within them. It is distinguished from a castle by having bastions.

Citation, a summons or official notice given to a person to appear in a court as a party to a cause. A writ issued out of a court of competent jurisdiction, commanding a person therein named to appear on a day named and do something therein mentioned, or show cause why he should not. Proctor, Prac.

In cases in which a citation issues it is generally the writ commencing the action, the same as a summons in trespass or a bill in equity. The citation is used by courts having control over the estates of the dead.

Cithæron, sī-thē'rōn, or **Elatea**, a range of mountains in Greece, which stretches northwest, separating Bœotia from Megaris and Attica. The loftiest summit rises 4,620 feet above the sea, and is the subject of numerous fables and classical allusions. On its northern slope stood the city of Plataea, the circuit of whose walls may still be traced. Its modern name, Elatea, from *elatē*, a fir, is derived from the pine forests which are abundant on its sides and summit.

Cithara, sīth'a-ra, a guitar-like musical instrument, said to have been invented by Apollo. The strings, usually five or six in number, were struck with a plectrum, or picked with the fingers. It was the forerunner of the banjo, guitar, zither, and similar instruments. See LYRE.

Cities, Water Supply of. See WATER SUPPLY.

Cities of the Plain, Sodom and Gomorrah, chief of the five cities which were destroyed by fire from heaven, and their sites overwhelmed by the waters of the Dead Sea.

Cities of Refuge, according to the law of Moses six out of the 48 cities which the Israelites were directed to give to the tribe of Levi, in the division of the land of Canaan among their tribes, were to be set apart as cities of

refuge for the manslayer or accidental homicide. The right of avenging murder belonged to the next-of-kin of the murdered man; but the slayer fleeing to one of these cities, three of which were to be on either side of Jordan, the avenger of blood was forbidden to touch him till he stood before the congregation in judgment, when, if he were found to have acted without premeditation or malice, he had a residence appointed him in the city of refuge until the death of the high priest, and was then permitted to return to his inheritance. If the slayer violated this regulation by leaving the city of refuge before the death of the high priest, the avenger of blood might kill him with impunity. The six cities of refuge appointed in accordance with this law were Kedesh, Shechem, and Hebron on the west side of Jordan; and Bezer, Ramoth-Gilead, and Golan on the east. This law of refuge seems to have been favored by the Levites, to whom it gave a measure of political influence, much in the same way as the privilege of sanctuary did to the monks, abbots, and other dignitaries of the Roman Catholic Church; it was consequently interpreted by them in the most liberal way. Maimonides says that all the 48 cities of the Levites had the right of refuge, although only the six were obliged to receive and lodge the slayer gratuitously.

Citizen, originally, a member of the body of freemen entitled to share in the government of a *civitas*, or city-state of the ancient type; as the Roman state gradually broadened into the entire ancient world, the citizenship was extended piecemeal for political reasons, till Justinian made it coextensive with personal freedom, and the attribute of all residents of the empire except slaves. With the rise of the miscellaneous modern community, where flux of population permanent and temporary is going on, and the mass of people share in the government to a varying extent, the question of its limitations and the privileges it confers have become acute, and that of its legal definition has furnished one of the grounds of a civil war. The definition varies in different countries. In monarchies it is commonly used only of a resident's relation to his municipality, the term "subject" expressing the relation to the state; in republics generally it means a regular member of the community, subject to its ordinances, obligated to its support and defense, and entitled to its protection. In the United States, a complication is introduced by the federal structure of the government, there being a citizenship of each distinguished from that of the other. The questions arising in this country are therefore: (1) What constitutes citizenship; (2) What rights it confers; (3) How it is acquired; (4) How it can be lost; (5) What are the respective obligations to State and nation.

I. A citizen has been legally defined as "one who owes to the government allegiance, service, and money by way of taxation, to whom the government in turn grants and guarantees liberty of person and of conscience, right of acquiring and possessing property, . . . suit and defense, security in person, estate, and reputation." In a word, the citizen is one whose lot is cast in with his society, for all social purposes according to his status and means, to fight or pay unless he is a dependent member of a group which fights, pays, etc. This includes

CITIZEN KING — CITIZENS' INDUSTRIAL ASSOCIATION

women, children, defectives, and criminals; and excludes alien residents (see, however, section 3), and Indians living in tribal relations, who are "dependent subjects." It should be added, however, that for jurisdictional purposes resident aliens are regarded as citizens, and in commercial and business legislation "citizen" is equivalent to "resident."

2. Citizenship implies civil but not necessarily political rights. The former are one for all, and are the primary obligation of a government to secure to its members; political rights are endlessly varied and within the discretion of the government. The right of direct share in government is everywhere withheld from minors, convicts, and the insane or idiotic, nearly always from paupers, and most generally from women; but these do not cease to be citizens. On the other hand, voting has occasionally been permitted in this as in foreign countries to persons not citizens of a State or municipality, for holdings of property, and could be so again. It was on this distinction that the minority in the Dred Scott case based their dissenting opinion that a slave's lack of political rights did not prevent his being a citizen with a right to sue in the courts; and the government by the Fourteenth Amendment ratified this view, and definitely dissociated civil from political rights.

3. Citizenship may be acquired by birth, every child born on the soil or within the jurisdiction of the United States,—even of resident aliens, except of foreign official representatives, whose residences are assumed to be part of their country's territory,—or of citizen parents traveling abroad, or of its officials resident abroad, being a citizen; or by naturalization; or by succession to a parent's or husband's rights,—the wife of an alien becomes a citizen by his naturalization, or after his death before naturalization if he had previously declared his intention of becoming so; and the children inherit similar rights.

4. It may be lost by formal renunciation, but the abandonment will not be presumed without it, even from a lifetime of residence abroad; but the government, with most civilized governments at present, recognizes full right to change allegiance at will. This was one of the issues in the War of 1812, Great Britain firmly refusing to recognize it; and it was not till 1870 that that country formally admitted that right.

5. Dual allegiance. The nature of the obligations is different: any one may be a citizen of the United States, yet not of any particular State, but not *vice versa*; and as the citizenship of the nation is the more universal, so it is of the higher sanction. The two could not in fact come into conflict except through an act of secession, which must be fought out, so that the question is academic, as short of that the whole matter would involve a case in the supreme court, pending which the question would be in abeyance; but in case of forcible resistance of a State to a decree of the nation, the citizen's first allegiance is to the latter. Further than this, however, the national government cannot go beyond the scope of its reserved powers; and a State can go very far in the direction of abolishing even the civil rights of its citizens under the shelter of this flexible permission. It should be noted that the right of citizenship is

totally unconnected in essence with the right of suffrage or the elective franchise. The former is an elemental right of all born among, or who have cast in their lot with, a civil society; the right to the protection of its laws and its strength, to a share in its benefits and its charities. The latter, a right to share in the governmental management of a society, is a mere question of the best machinery of management, and dependent on the fitness or power of individuals or classes to help guide that machinery. The unfit or weak are just as much citizens as the fit or the strong, by natural right; women and minors, defectives and criminals, have the fullest right to claim the protection of the laws, by themselves or their natural or appointed guardians. The suffrage is only a substitute for a battle, assuming that the larger body could outfight the smaller; and admission to it lies in the discretion of the fighting body.

Citizen King, The, a title applied to Louis Philippe, king of the French, 1830-48.

Citizen of the World, the signature of Oliver Goldsmith's 'Letters from a Chinese Philosopher residing in London, to his friends in the East.' The work was published in 1762.

Citizens' Industrial Association of America, The, a national federation of local employers' associations, citizens' alliances, and State and national organizations representative of business interests, organized as the culminating step in the movement for the organization of employers in 1903. Nearly all the large cities, and scores of the smaller ones, during the months following the anthracite strike of 1902, became the centres of considerable agitation on the labor question, and from 400 to 500 local associations sprung into existence for the purpose of combating what was termed the lawless aggressions of organized labor. The membership of some of these associations was confined to employers, while others, which adopted the general name of alliances, admitted professional men, and even employees, into their ranks. In cities like Chicago, Saint Paul, Omaha, Kansas City, Saint Louis, Detroit, Cincinnati, Louisville, and New York employers' associations were formed, while in Denver and all over Colorado and many other parts of the West, as well, also, in the smaller towns of the Central States, the alliance was the most popular form of organization. In response to a call issued by a number of the prominent leaders in the employers' movement, a convention was held in Chicago, 29-30 Oct. 1903, which was attended by nearly 300 delegates, who came from all parts of the United States and Canada, cities as far apart as San Francisco, New Orleans, Montreal, and Minneapolis being represented. The name of the Citizens' Industrial Association was considered as being inclusive in meaning of both employers' associations and citizens' alliances, and was selected by the convention for the new organization. The purposes, as set forth in the constitution adopted, were those of law enforcement, the maintenance of individual liberty, the securing of industrial peace, and the perpetuation of free competitive conditions in industry. The organization stands for the open shop, and no restriction of output. Its work is largely confined to that of educational propaganda, and it maintains a publication bureau for this purpose.

CITIZEN — CITTADELLA

It does not interfere in any respect with the internal government of its constituent associations, and the action of its convention or executive committee is advisory and not obligatory upon its members. The association forms a central source of information for its members and a directing agency in matters of national legislation in which the associations generally are interested. In the contest in the present Congress over the eight-hour and anti-injunction bills, which are fathered by organized labor, the Citizens' Industrial Association is taking an active part. The National Association of Manufacturers is a member and one of the principal elements of support in the new organization. Its president in 1904, David M. Parry, was chosen by the Chicago convention as the first president of the association. The secretary, chosen by the executive committee, was A. C. Marshall, of the Dayton Employers' Association, Dayton, Ohio. Vice-presidents were J. C. Craig, of the Denver Citizens' Alliance, and J. T. Hoile, of the New York Manufacturers' Association, with offices in Brooklyn. The treasurer in 1904 was Major A. C. Rosencranz, of the Evansville Alliance.

DAVID M. PARRY,

President Citizens' Industrial Association.

Citizen, The a comedy by Arthur Murphy, performed 2 July 1761, at the Drury Lane Theatre, and printed in 1763. It is founded in part on Destouche's 'Fausse Agnès.'

Citric Acid ($C_6H_8O_7 \cdot H_2O$), a very widely distributed acid, present in most common fruits, such as gooseberries, currants, lemons, citrons, cherries, and many others. It was first separated and distinguished by Scheele in 1784. It is generally prepared from lemon juice, the dark treacle-like fluid imported from Sicily, by fermenting it, filtering, and neutralizing with chalk and quicklime, by which citrate of calcium is precipitated. This, by decomposition with sulphuric acid, gives the acid, which is then purified by repeated crystallization. Several improvements have of late been introduced, both in preparing the crude lemon juice for exportation and in the subsequent purification and crystallization of the acid. Citric acid is white when pure; it crystallizes in two forms, one belonging to the trimetric system is the common form, and in it the acid contains one molecule of water, as indicated in the formula given above. The other form contains half the quantity of water. The ordinary crystals effloresce in the air in a warm room. Citric acid has a pleasant sour taste. It dissolves very readily in water, and is soluble in alcohol, but insoluble in ether. When heated it undergoes decomposition, and yields aconite, itaconic, and citraconic acids, along with other products. It is acted on by nitric and sulphuric acids, and by other reagents, yielding a variety of decompositions and derivatives.

Citric acid combines with the metals, forming citrates. They are crystalline salts, and many of them are soluble in water. Crude citric acid is largely employed by the calico-printer as a resist and as a discharge.

Citric acid and the citrates are used in medicine as cooling drinks, as antidotes to alkalies, and for the purpose of rendering the urine alkaline, thus overcoming too great an acidity. Citrates of magnesium are used as laxatives and cathartics, and are among the most effi-

cient and pleasant of this class, being particularly adapted to children.

Citron (*Citrus Medica*, var. *genuina*), a bush or small tree of the natural order *Rutaceæ*. It bears reddish or purplish slender branches; smooth, oblong leaves; externally reddish flowers; and large, warted or furrowed, oblong or ovate fruits with a very thick, tender, aromatic rind, which is candied or preserved and used in cakes or confectionery. The mildly acid juice of the pulp is used to some extent with sugar and water as a drink like lemonade, or for mixing with and flavoring various liquors. From India, where the tree is native, the citron has been introduced into many warm climates throughout the world. It is sparingly cultivated in California and southern Florida, but more generally in the West Indies more as a home than an orchard fruit. Most of the candied citron on the American market comes from the Mediterranean region of Europe, where the trees are extensively cultivated. All the varieties, which vary considerably, probably on account of hybridizing with other species, are very susceptible to injuries by frost. They may be propagated by layerage, graftage, or cuttage, the first producing trees inferior in form to those derived by the other two methods. The orchards should be located on well-drained land well exposed to sun and air, which aid in preventing the attacks of insects and fungi. Clean cultivation, liberal fertilization, and the use of cover crops during the hot months, are the three leading factors in the cultivation of this crop in Florida. In the United States, the name is also popularly applied to a variety of watermelon with an edible flesh and generally red seeds. This citron is frequently grown in northern private gardens and to a small extent commercially for its rind, which is used for preserving in various ways. See LEMON; LIME; WATERMELON.

Citron-melon. See WATERMELON.

Citronel'la Oil, an oil obtained from a kind of grass (*Andropogon nardus*), cultivated at Singapore and in Ceylon. It is used for scenting soaps. Other species of the same genus and some other allied genera also yield essential oils.

Citronelle, sīt-rō-něl', Ala., a village in Mobile County, where on 4 May 1865 the last Confederate army east of the Mississippi surrendered to the Federal troops under Gen. Canby.

Citronwood, or **Citrus-wood**, the most costly furniture wood of Roman antiquity, usually regarded as derived from *Biota* (*Thuja*) *orientalis*, or possibly from *Callitris quadrivalvis*, allied coniferous trees, both popularly known as *Arbor vitæ* (Oriental and African). Cicero is said to have paid an enormous sum for a table of this wood.

Città Vecchia, vĕk'kĕ-ä, or **Civita Vecchia**, a fortified city of Malta, near the centre, and almost on the highest point of the island, seven miles southwest of Valetta. Pop. 7,000.

Cittadella, chĕ-tä-dĕl'lä, Italy, city in province of Padua, compartimento of Venetia; 30 miles northwest of Venice. Portions of its ancient walls still remain. It contains beautiful churches and botanical gardens. Its mod-

CITY

ern industries are the manufacture of paper and linen. Pop. 9,850.

City (Latin *civitas*). The Greeks and Romans distinguished a city from a town, or mere assemblage of people living together under municipal laws, as an independent community or state possessing sovereign authority, and including any portion of the surrounding territory the inhabitants of which possessed the rights of citizenship, but excluding conquered or dependent territories. Thus, Athens, Rome, and Carthage were all both towns and cities in different senses. In Europe the word city came to have two meanings, the one civil, the other ecclesiastical. The civil meaning corresponded with the Roman sense, in which the great Italian republics and the German free cities during the period of their independence corresponded with it. The fluctuations in the fate of such cities must necessarily have caused the word to lose the sense of territorial independence, and this change would be promoted by the rise of rivals to them in other respects having no such claim, so that in modern times a city has come to signify merely a town holding from extent of population, favorable situation, or other causes, a leading place in the community in which it is situated. The ecclesiastical sense of the term city is a town which is the see of a bishop. This seems to be the historical use of the term in England, and still possesses some authority there, but in general use it has been superseded by the wider one. In our historical retrospect we take the term in its least restricted sense. The origin of cities belongs to the earliest period of history. According to Moses Cain was the first founder of a city, and Nimrod built three, among which Babylon was the most important. The Jews imagine that Shem erected the first city after the deluge. At the commencement of society the form of government was patriarchal. The ruler was the head of the family or clan. Relationship, the innate wish of men to live in society, and more, perhaps, than both these causes, the necessity of providing means of defense against more powerful clans, brought together separate families into one spot. The fertility of the East also afforded facilities for men to give up the rambling life of nomads and to form permanent settlements. These settlers began to barter with those tribes who continued to wander with their herds from place to place. Thus cities sprung up. These were soon surrounded with walls to prevent the inroads of the wandering tribes. The bond of connection between their inhabitants thus became closer, and their organization more complete. As by degrees the chiefs of these family-states died away, the citizens began to elect the most able or most popular men for magistrates, without respect to birth or descent. Thus political institutions began to assume a systematic character. The earliest forms of government succeeding the patriarchal state was probably monarchical. In this the religious, paternal, and political authority remained rudely mingled. When conquest extended the limits of these early kingdoms the authority of the king was weakened, his connection with the different parts of his dominions became imperfect, and the progress of civilization was promoted almost solely by the growth of the cities. These

gave rise to the division of labor, the refinements of social intercourse, the development of laws caused by the conflicting interests of many people living close together, the idea of equality of rights, the diminution of awe for a distant monarch, the growth of patriotism, springing from the sense of advantages enjoyed and the exertions necessary to maintain them. These were the salutary consequences of the establishment of cities. Under the mild sky of Asia, Africa, Greece, and Italy cities were built first, and in the greatest number. The Phœnicians and Egyptians particularly distinguished themselves by the erection of cities, which soon attained a high degree of wealth, and consequently of civilization. The Egyptians considered their city of Thebes older than any of the Greek cities; and Pliny says that Cecropia, said to have been erected in Attica by Cecrops, 1582 B.C., and afterward called "Athens," was the oldest city of Greece. Heeren justly remarks that the rise of cities was the most important source of the republicanism of antiquity. This is particularly true of Greece. In fact cities are, by their very nature, of a democratic tendency. Several confederations of cities existed in the ancient world; for instance, the Phœnician, consisting of the cities of Tyre, Sidon, etc., and the Achæan league, formed by the most important cities of Greece, in order to strengthen themselves against the power of Macedon. Under Augustus and his successors the Romans began to establish colonial cities in Germany, having done the same long before in Gaul, Spain, Africa, etc. In Switzerland they first erected cities about 70 A.D., which, however, were mostly laid waste by the Alemanni, and subsequently rebuilt under the government of the Franks (496 A.D.). The Germans, accustomed to a wild, rambling life, did not show any disposition to live in cities until Charlemagne labored to collect them together in settled abodes from his desire to civilize them. Henry I. distinguished himself particularly in this way, and on this account has been called by some "Henry the City-builder" (*der Stadterbauer*). He gave the cities great privileges, in order to induce his subjects to live in them, and thus laid the foundation of that power which at a future period contributed most to break down the feudal system. In many cities imperial castles were erected to protect the inhabitants, and the insupportable oppressions and even cruelties exercised by the feudal lords upon their peasants, or by the wandering knights and robbers, drove many people into the cities. The attacks of the neighboring lords gave firmness to their union, and compelled them to cultivate their resources. Commerce and the various arts and trades were soon cultivated within their walls, and their wealth and respectability increased. They soon became sensible of the want of a better system of laws and political administration than prevailed around them, and the principle of equal rights and laws was quickly developed.

One of the most important remnants, if not the most important, of the great fabric of ancient civilization, was the cities of Italy. In spite of their bloody contests with each other, and the vices of an oligarchical government, Europe is mainly indebted to them for the cultivation of the commercial spirit, together with the toleration and love of liberty, which, under

CITY

the most unfavorable circumstances, it tends to foster, and for that ardor in the cultivation of arts, science, and literature, which has always distinguished the best periods of Italian history, and from which the general revival of learning in Europe, called the Renaissance, took its rise. Under the reign of Conrad III. (1138-52) the cities of Lombardy, and particularly Milan, which stood at their head, had acquired a high degree of wealth and power, and had formed themselves into a confederation. The struggles between the emperors and these cities form one of the most important portions of the history of the German empire and of Italy. Frederick I. in vain demolished the powerful city of Milan. It was soon rebuilt, and the cities of Lombardy, in alliance with the Pope, obliged the emperor to conclude with them a very disadvantageous peace at Constance. Two other confederations of cities, highly important, were formed during the interregnum of the German empire, between 1256 and 1272. One of them was the powerful Hansa, or Hanseatic League (q.v.), the other the confederacy of the High German and Rhenish cities, from the foot of the Alps to the mouth of the Main, established by Walpode of Mentz in 1255. A similar confederacy, and a very important one, was that of the Suabian cities, instituted in 1488 to repel the outrages of the feudal lords and knights. The cities of the Netherlands, from their central position between France and Germany, exercised a powerful influence on the growth of civilization and political liberty in Europe. Their favorable situation and the enterprise of their inhabitants early gave them great wealth and power. The democratic spirit, ultimately carried to the greatest height in Holland, was earliest manifested in the towns of Belgium, which began in the 12th century to manifest a turbulent disposition, and by frequently leaguering themselves with the enemies of their feudal superiors extended their political privileges, and acquired at times a premature independence, which, though ultimately extinguished in the spirit of nationality, contributed not a little to the breaking up of the feudal system (q.v.). In Spain municipalities were established at an early date. Leon received a charter in 1020, Sepulveda, Lograno, Sahagun, and Salamanca followed soon after. The constitution of the Spanish towns approached more nearly to the ancient idea of a city than was common in other large states of Europe, in this resembling the Italian cities. Their constitution was extremely democratic, and they ruled over a large extent of surrounding territory, which they were bound to defend. Deputies from the towns were admitted to the cortes in the 12th century (1167 and 1188). The love of liberty rose high in these ancient Spanish cities, but from the isolation of the Iberian Peninsula they exercised little influence in Europe, and they soon lost their power and importance, most of them by the end of the 15th century having ceased to send their representatives to the cortes. By degrees the cities acquired in the different countries of Europe the right of representation in the legislative bodies; and wealth, industry, knowledge, and equal laws spread from them through Europe. But the cities of Lombardy, though still flourishing and wealthy, had fallen, for the most part, under the rule of single families; their republican gov-

ernments vanished, and their confederation was dissolved. The associations of German cities experienced a similar fate. By the Peace of Westphalia the princes of the German empire were declared sovereign powers, and the more their authority increased the more did the relative weight of the cities diminish. These had formerly suffered from the oppressions of the feudal lords. They were now the victims of the policy of the neighboring princes, whom envy often led to adopt the most unwarrantable measures against the cities, many of which had lost their independence before Napoleon dissolved the German empire. He took away the privileges of those which remained free; and the Congress of Vienna restored freedom to Lübeck, Hamburg, Bremen, and Frankfort, only because the different powers could not agree to whom they should be assigned. At the same time Cracow was declared an independent city, with a republican form of government.

Cities, as we have seen, naturally develop the democratic principle, and on this and several other accounts are to be considered among the firmest supports of liberty. Well-organized municipal institutions, in which the government is in the hands of the citizens, afford continual nourishment to the spirit of freedom throughout a country.

In the United States a city is an incorporated municipality, usually governed by a mayor, alderman, and common council. In many of the States, especially the eastern, the number of inhabitants required for legal municipal incorporation is 10,000. In several of the western States a much fewer number is required. A village or town of 10,000 or more inhabitants is not obliged to become a city, and in several cases places of 20,000 and 30,000 have preferred, for local reasons, to remain under village government. In the United States cities are generally the outgrowth of villages, one village expands into a town with population sufficient to assume the duties of a city; but in several instances, villages near each other have united to form a city, and sometimes cities nearby have united in one municipality.

Much has been said and written upon the immorality of large cities, and it cannot be denied that they have vices peculiar to themselves; but it must be considered, on the other hand, that they are free from many of those of petty towns, and even of rural districts. The association of men in masses, when due surveillance is exercised, has an influence distinctly favorable to the maintenance of social order, the impartial administration of justice, and, above all, the suppression of all petty and local tyrannies, and the maintenance of individual liberties. It is by the influence of cities alone that a sufficient organization for the support of education and the means of enlightenment is obtained, even though that organization often fails to penetrate the entire mass of the cities themselves. It is to them that many of the facilities for progress in art and science are due. It is in them that public opinion is formed, and so organized as to act upon the administration, and, even independently of direct representation, upon the legislation of a country; and although the individual freedom enjoyed in great cities may often tend to license, its general influence in an otherwise healthy community is highly beneficial to the moral tone of the whole. It must, however, be

CITY-MAKING

admitted that the democratic spirit in cities is liable to be carried too far, and that an excessive growth of large towns might thus prove dangerous to the State.

As regards mortality, New York compares favorably with most of the larger European cities, of which St. Petersburg and Moscow have the highest death-rate (29 or 30). Cities in Great Britain and Canada seem to be much on a par with those of the United States. Asiatic cities stand much higher. See MORTALITY.

City-making.—Although in the history of the world, cities have occasionally sprung up by fiat and have thus been deliberately planned, giving scattered examples of practical city-making on a large scale and more or less satisfactory in character, the rule remains that most have usually grown by extension and accretion from smaller communities, and their growth has had no other law than the requirements of the moment and the unorganized practical and æsthetic impulses of individuals and corporations. The units of a community have always, indeed, united for common ends, but rarely with a conscious regard for a civic ensemble, and still more rarely with regard to the necessity of preserving to the community the means of further extension on lines foreseen toward a larger whole, of which the existing city should be a concrete and vitally related part. The surge of the population toward the great centres which has marked the rise of the industrial spirit and the enormous growth of the cities in the United States and Germany has brought the subject into clear prominence, and for the first time in history science has seized on this field and endeavored to trace the natural laws and phenomena of civic life and civic growth, and to point out to the practical worker the condition of his problem.

The modern science of city-making, then, has sprung up in answer to a manifold need in the cities of to-day. From the reorganization of the entire plan of a city like that being undertaken by the city of Washington, D. C., to matters of the discipline of the street in one form or another, its principles are becoming more and more clearly recognized in the minds of the people, and in the laws and regulations that are its outcome.

In the extension and widening of streets which, as originally planned, were too narrow for the traffic that has surpassed the hopes of the early founders, and in the parking treatments by which we try to counterbalance the aridity of the unbroken stone and brick, we have one of its fields which is most obvious. Another is seen in the growing sentiment that the fixtures on our streets must not be merely functionally suitable, but should also be at least neat in design and quiet in color, if they cannot have positive ornamental value. Along this line may also be mentioned the desire, on æsthetic, as well as practical grounds, for the burying of wires and the clearing of our streets of the forest of poles so destructive to the architectural beauty of a city. In the improved disposal of garbage and in street cleaning, a somewhat stronger position has been early assumed from the direct practical necessities of the case. It is in spacing and the insuring of breathing spots in our cities that a haphazard and unscientific method, one, indeed,

almost of accident, is to be clearly observed. No city of any importance is without its parks, but few have a park system, and in few cases is there evidence of anything but chance in their location. The science of city-making touches on questions of the control of private action at a number of important points. For instance, in Massachusetts, the trees along the sidewalk are considered so far a public benefit that the public interest in them is held to exceed that of the owner, and he may not remove or injure them except by official permission. In the attempt to restrain the voiding of immense clouds of bituminous smoke into the atmosphere, we have another example in point. The municipal oversight of architectural designs in this country, chiefly restricted to constructional features, is in foreign countries extended to a municipal oversight of designs from the architectural standpoint, and this which might, in certain cases, prove a source of tyranny, has, like all similar regulations, a counterbalancing advantage to the community. In the municipal control of posters and signs we again see the same readiness to defend the citizen on grounds of morality or from the danger of falling signs, but we must still look abroad, except in a few isolated cases, for an official expression of the growing conviction that on artistic grounds, as well as for the good of the general neatness and dignity of the city, there should be restraint on artistic grounds also. In functional matters, in the disposal of sewage, in all matters of construction, there is little need for other than a more exact and logical application of principles already well thought out, but in the employment to advantage of the city's physical opportunities, and in the expression of a municipal pride at all commensurate with the pride which every citizen feels in his own personal domain, we are yet in the early stages of development. How far we have still to go can best be judged by the advance that has already been made at isolated points. Governmental and municipal buildings are being more monumentally handled. They are being protected in some measure from private encroachment. Water supply systems have in more than one instance given handsome buildings, and in at least one case ornamental reservoir lakes.

In municipal pageantry our cities have taken a great step forward in the last 10 years. The various local celebrations that took place at the close of the Spanish war are an example in point, and while we have not yet the extensive paraphernalia such as belongs to almost every considerable city on the other side of the ocean, our cities at least own the nucleus of a collection of civic ornaments for use on occasions of public festivity. Hygiene, on the other hand, has been a powerful appeal. Our regard for it has opened up breathing spots like that at Mulberry Bend in New York, and it is natural that moral and ethical grounds should have taken precedence over the æsthetic.

The history of the modern movement as a conscious scientific effort begins with the work of Louis Napoleon and George Eugene Haussmann in Paris, who, a year after the proclamation of the second empire, decided on the first great and comprehensive scheme of modern city-making. In the following years a scheme of urban development was carried out in Paris which still remains an unsurpassed object les-

CITY MAKING.

PLAN AND BIRD'S EYE VIEW OF A PROPOSED ARRANGEMENT FOR WASHINGTON, D. C.

CITY-MAKING

son. Under Haussmann's administration the movement achieved remarkable results, and being in a position to assume title to the improved areas, the increase in values was in large measure preserved to the community and a clear demonstration was made of the fact that such gigantic civic improvements, far from being costly luxuries, could be made paying investments. As prefect of the Seine he transformed a congested and unorganized centre into the most splendid capital of modern times and created a new profession in which his name yet remains the most eminently distinguished.

It was not until many years after that the Germans began to consider the symmetrical development of cities along equally broad lines, though once their attention was turned to the subject, with customary thoroughness they developed a system entirely their own, so that now nearly every German city of over 25,000 inhabitants has a department in its municipal government devoted to city expansion where all problems of extension and improvement are regulated.

George E. Hooker writes on this subject as follows: "Indeed, the great widening of municipal action in the cities of the fatherland respecting education, recreation, charity, hygiene, and 'municipal trading' is less significant than the attempt to give proper shape, both for economic and æsthetic ends, to the entire physical organization of those cities. The authorities have set up the ideal of a city which, in arrangement and structure, should be a rational unity; and while the results achieved have naturally been limited, they are in many respects surprising.

"Hamburg, for example, could displace 30,000 people in order to obtain a proper location for new docks. Nuremburg, while developing into a modern industrial town, has studiously perpetuated its delightful architectural spirit, and any German city which should to-day lay out or permit to be laid out, a new quarter on the easy and wearisome checkerboard plan would be laughed at. There have actually developed in Germany—and in Austria, too—especially during the last dozen years, the rudiments of a real science of city-building, with a limited but distinctive literature of its own."

The appearance of Dr. Albert Shaw's books on municipal government in 1895 gave a distinct impetus to the municipal improvement movement in this country. His painstaking accounts of organic development in many foreign cities and the methods by which they were brought about, created widespread interest, starting a wave of popular enthusiasm and activity, which is evinced by the numerous associations with large and influential membership to be found in almost all progressive centres in the United States.

Among the pioneers in the work was the elder Olmsted, who did much to reclaim numbers of bare spots in American cities and might be considered the father of American parks, although he never carried his work so far as did one of his disciples, the late Charles Eliot. It was Mr. Eliot who blazed the way toward metropolitan development by utilizing the barren and squalid outer zones about Boston for a regular chain of parks, and actually, before his untimely death, establishing in and about Boston the most comprehensive system of public

reservations that any city can boast of, including the redeeming of nearly all water fronts both inland and along the sea. Indeed, the extent of the advantages of these reservations to future generations is not to be estimated, as they ensure a certain amount of openness and verdure for all time, notwithstanding the greatest possible increase in population. Boston, thanks to his foresight, is far ahead of any other municipality in the United States in matters of public recreation and health, and has that which no foreign city can rival. Her water supply, including that of over a score of contiguous communities, is protected from pollution by including the entire eastern watershed of Massachusetts, and for the first time reservoirs have been made to do double duty by becoming ornamental lakes, and as such, spots of much interest in the metropolitan system.

The Boston metropolitan park system was not brought about without much agitation, and to Mr. Sylvester Baxter must be attributed much of the success of the undertaking. His far-sighted articles appeared with great regularity and did much to mold public opinion in favor of the undertaking, and as secretary of the first metropolitan park board, he was able to still further assist in the work.

Since that awakening other writers have come to the front, and prominent among them are the names of Mr. Charles Mulford Robinson and Prof. Charles Zueblin. The former's book, 'The Improvement of Towns and Cities,' is a hand-book which has been endorsed by many improvement societies and which, owing to its concise and business-like presentation, is just what is needed by those interested in the development of backward communities. 'American Municipal Progress' by Prof. Zueblin, goes rather into the sociological side and outlines with surprising interest what an awakening has taken place in the United States during recent years, and what unexpected results this awakening has brought forth along lines of physical development.

Among other of the forces that must be recognized as responsible for the force of the movement are the American League for Civic Improvement and the American Park and Outdoor Art Association. The latter is the older, and through the indefatigable efforts of Mr. Warren H. Manning, the landscape architect, it is well established, and by bringing park superintendents together from many cities it has become a real force and has extended its work beyond the province suggested by its title.

The American League for Civic Improvement, not being restricted either in name or endeavor to a group of professional workers, has carried on a broader campaign and through many local organizations all over the country is doing good work.

The first great object lesson of symmetrical development was exemplified by the Chicago Exhibition, where a comprehensive plan was prepared and adhered to. The height of all main cornices was established at an equal level and certain uniform rules applied to the development of the grounds, the buildings and all architectural accessories. Since then more or less successful efforts along similar lines have helped to educate the public at Omaha, Charlestown, Buffalo, and St. Louis.

The Omaha, Charlestown, and Buffalo exhi-

CITY-MAKING

bitions, and particularly the Louisiana Purchase Exposition at St. Louis, with its Municipal Improvement Section, popularly known as the "Model City," the first of its sort to be held in America, have swelled the current. This latter exhibit, under the direction of the writer, brought together results that had proven the nucleus of interest in municipal subjects at the Paris Exposition of 1900 and the Exposition by Municipalities at Dresden in 1903, as well as the exhibits from the United States.

Nevertheless, the recognition of the need for immediate and radical work toward civic betterment finds the nation better provided with

permitted to run the streets at large, and this fact alone hints at others which are not creditable to the sense of civic pride in these communities. It is interesting to note, however, that almost every educational institution has recognized the importance of the movement, and that municipal governments have also been forced to take note of its growth by the extension of those bureaus of administration, the work of which relates to the care and development of the civic domain, and by the appointment of additional officers, such as city architects, foresters, etc., in addition to the engineering force. Moreover, Boston has added a

true-hearted soldiers, anxious to work in the ranks, than with enough good leaders to point the way toward the much-coveted ideal, or even any steps toward it. In a recent article in one of the leading magazines, Mr. J. Horace McFarland gives extracts from letters all over the country, the tenor of which was,—“there is much to do and many who stand ready to do the work, but we need leaders.”

The primitive character of some of the needs proclaimed by the organizers of societies for municipal reform would be amusing, if it did not mirror a state of affairs almost incredible. From several towns we learn that the hogs are

municipal nursery to its civic departments, and thus its verdure has become a matter of as much public concern as the water supply. New York has an architect on bridges, and many park boards now properly insist on having all designs for contemplated improvements prepared by an expert commission, including a landscape architect, an architect, and an engineer.

The plan for the embellishment of the city of Washington, prepared by the Park Board Commission, of which Daniel H. Burnham was chairman and Charles F. McKim, Frederick Law Olmsted, Jr., and Augustus St. Gaudens the other members, is at the present writing the

CITY-MAKING

best illustration of organic city-making actually under way in the country, though other cities, notably Cleveland with its group plan, are following suit.

Two of our illustrations show this plan for the regeneration of Washington, in which, by means of a number of monumental avenues, a series of vistas will be opened up, each with notable foci, such as large public buildings or monuments, by which the city will be given unity of plan and will outrank most cities in ease of access from part to part, and in the magnificence of its public ways. The chief of these avenues will be the new Mall, and it is only proper to add that this is a return to the ideal of the original designer of the city plan, developed on a more magnificent scale and glorified by memorials and architectural masterpieces that have come as the expression of national growth and history.

Another illustration, Figure 3, shows the work that has been done in the neighborhood of Boston, and may be taken as the type of the highest accomplished result in the development of an extended park system in and about a large municipality. The feature of this plan which distinguishes it from all others is the attention given to the future. By acquiring all water fronts, inland and seashore, Boston is gradually extending its park system and improving its waterways for all time. The city as a unit a hundred years hence is being arranged for. In the meantime a metropolitan system of scattered units is rapidly crystallizing.

Other illustrations exhibit in diagrammatic form the possibility which has at more than one point become an accomplished reality, of governing the character of the natural waterways. A river or any water front, whether now given up exclusively to commerce or whether it shows a broad, unhealthy mud-flat on either side, can be easily redeemed. According to the exigencies of the occasion the treatment must vary, but taking the most demanding conditions, it will be seen that the requirements of traffic by rail and water may be much better met if the problem is comprehensively studied, that the logical arrangement of the various structures is economical in every sense, and gives the opportunity to bring the beauty of shaded drives where formerly the conflict of the various enterprises made only confusion and barrenness. Moreover, the river being now confined within vertical banks, the current scours its own bed and the railway and canal are, moreover, protected from inundation. Thus, natural force and inventive planning combine to improve the salubrity, beauty, and revenue yielding power of an area in which private and public interests being at conflict have lost all trace of the beauty that once belonged to them, and which could again be theirs by conciliation of purposes and the expressed sense of interdependence between the various needs of society.

Figs. 5 and 6 are a project for the grouping together of public conveniences, a problem of the utmost importance in the congested portions of cities. In this drawing an attempt has been made to show how, instead of a number of scattered and unsightly units which have no excuse but their utility, the same ends may be efficiently served, while adding to the city a focal point of beauty.

Moreover, such centres, no matter what

form their superstructure may take, should be points from which to thread pipes and wires radiating in all directions, and thus making unnecessary the greater part of the outrageous tearing up of streets, now of so frequent occurrence. Here again can be laid stress on the principal aim of municipal science, which is to replace the haphazard and accidental arrangement of cities with its incalculable waste of time, money, comfort, and beauty by a logical system and arrangement by which the needs can be at least as well met for a city as they now are for even the most complex of single buildings, and in which the various public and semi-public buildings can be so grouped with mutual economy. The transportation facilities of our cities are inadequate and yet wasteful of space, and without due regard to the convenience of the public; yet at no greater cost, by well considered arrangement at the outset, a system of stations and subways could lead to terminal facilities of sufficient capacity and in more direct relation to the requirements of business.

In this connection are to be mentioned the terminal warehouses in St. Louis, where a private company has united the depots of many independent railroads, thus forming a great freight centre, which has proven an isolated but striking lesson in economy. At Algiers, in North Africa, a similar combination exists between the steamship companies and the railroads. The dryness of the climate has here made it possible to use for this purpose huge vaults, above which passes the magnificent Boulevard de la Republic, a combination of utility, economy, and beauty, which should prove a spur to nations which pride themselves on their superiority in other matters.

Mankind has been so long accustomed to the economy gained by uniting for common ends that it seems more remarkable that the question of location, in its relation to the functions assumed by society, has not been more carefully studied. We have municipal hospitals, theatres, libraries, school houses, public baths, and gymnasias, and recreation grounds, from the sand-courts for the smallest children to the ball parks for men, but instead of being made centres of improvement which, as functional centres they should normally be, they are too often ill placed and inadequately arranged.

With regard to school houses this is especially true. There these buildings, so essential to our democratic system, have been erected with regard to an outward appearance befitting their functional character, and have been given that amount of yard space per child which should be made an invariable requirement, as it now is in some places; they have become the centres of local pride and local improvement, and have raised the value of neighboring properties and gone far to reduce local jealousies caused by the placing of those large public works which, unlike school houses, are not the necessity of every ward.

Resolved to its final analysis, the science of city-making appears under the heads of circulation, hygiene, and beauty, and concerns itself with the uniting of these three problems in a scheme of urban life and development in which they shall be fused in a perfection of interdependent and co-related response to the universal needs of man. The conditions of the age, the

CITY GOVERNMENT — CIUDAD JUAREZ

climate and the location, if rightly interpreted, will give it the expression of a perfect and model city in the terms of the given land and people.

ALBERT KELSEY,
Civic Architect.

City Government. See MUNICIPAL GOVERNMENT.

City Point, a village in Prince George County, Va., 10 miles northeast of Petersburg; on the James River and on the Norfolk & W. R.R. It has a trade in brick, lumber, and phosphates, and is of considerable historical interest. Here, in 1864, Gen. Grant made his headquarters, and in his subsequent operations the city was used by the Federal army as its principal landing-place and depot for supplies. Pop. about 1,000.

City Politiques, pŏl'ī-tēks', a satirical comedy, probably printed for the first time in 1683, and produced at the King's Theatre, London, the same year. It was a sharp attack on the contemporary Whig faction, especially on Oates. Only the king's protection kept it from being suppressed by the victims of the satire.

City of Brotherly Love (Gr. *φιλadelphía*, *philadelphia*, *φίλος* *philos*, dear, and *ἀδελφός*, *adelphos*, brother). William Penn gave the English rendering of the two words as the name, Philadelphia, to the city in Pennsylvania. The common rendering into English of the name of the city is "City of Brotherly Love."

City of Churches, a name given to Brooklyn, N. Y., because of the large number of churches in proportion to the population.

City of David, Bethlehem (modern Beit-Lahm, house of bread), supposed to be the birth-place of David, the place where his descendants had to go for the enrollment, when the census was taken by order of the Roman emperor. Jerusalem is sometimes called the "City of David" because he captured it from the Jebusites and made it the capital of his kingdom.

City of Destruction, The. In Bunyan's 'Pilgrim's Progress' Christian begins his journey at this city and journeys to the Celestial City. The place of beginning represents the world with its temptations, and the place of ending, Heaven with its joys.

City of Dreadful Night, The, a poem by James Thompson. In this poem one is supposed to have gone to a city whose inhabitants are gloomy, hopeless, despairing. The hopeless darkness is as the night — oppressive and dreadful.

City of Elms. The large and ancient elm trees which adorn the Green and many of the older streets of New Haven, Conn., have caused this city to be called "City of the Elms."

City of God, The, a noted work by St. Augustine. This, the most important of all the saint's writings, was begun in 413, three years after the capture and pillage of Rome by the Visigoths under Alaric. The pagans had endeavored to show that this calamity was the natural consequence of the spread of the Christian religion, and the main purpose of Augustine is to refute them. The work was finished about 426.

City of Homes, a name bestowed on Philadelphia, from the large number of dwellings inhabited by the owners.

City of a Hundred Towers, a name given to Pavia, Italy, from the many towers and steeples which first greet the traveler.

City of Magnificent Distances, The, a name given to Washington, D. C. When the city was planned, the last of the 18th century, the long and broad streets, with here and there small parks, almost all of which was out long distances in broad fields, caused this name to be given to it in derision. Now its citizens are proud of the title.

City of Oaks, a name given to Raleigh, N. C., from the size and beauty of some of the oak trees which adorn its streets.

City of Palaces, a name applied to Calcutta, India, from the numerous palace-like edifices.

City of the Plague, The, the name of a poem written by John Wilson (Christopher North), published in 1816. It is said to have been founded on the 'Journal of the Plague in London,' by Defoe.

City of the Prophet, a name given to Medina, in Hedjaz, Arabia; the second holy city of the Mohammedans; the place where Mohammed took refuge, in 622, when he fled from Mecca, and the city where he died.

City of the Straits, often applied to Detroit, Mich., from its position. It is situated on that part of Detroit River between Lake St. Clair and Lake Erie.

City of the Sun, a name given to Baalbec, an ancient city of Syria, built on the ruins of the Greek city, Heliopolis, "The Sun City."

City of the Violet Crown, The, a name applied to Athens.

City of Victory, a translation of the Arabic name for Cairo, the capital of Egypt.

City Water Supply. See WATER SUPPLY OF CITIES.

Ciudad, thē-oo-däd' or sē-oo-däd', in geography, the Spanish word for city, from the Latin *civitas*, appears in many names of Spanish places, as Ciudad-Rodrigo, Ciudad-Real, etc.

Ciudad, thē-oo-däd' or sē-oo-däd', in Venezuela, capital of the state of Bolivar, on the Orinoco. Although about 245 miles from the mouth of the Orinoco, it is one of the chief ports of Venezuela. The handsome dwellings, beautiful cathedral, theatre, monuments, and plazas make it a pleasant city. Its chief exports are sugar, coffee, rubber, cattle, hides, asphalt, and cabinet woods. The city was founded in 1764 and was called Angostura. The name was changed in 1819 to its present one in honor of Simon Bolivar. Pop. 12,000.

Ciudad De Cura, dā koo'rä, or **Cura**, Venezuela, in the state of Guzman Blanco, southwest of the city of Caracas, about 20 miles east of Lake Valencia. It is a 17th century city, but many of its new buildings are modern in style and beautiful in architecture. The streets are broad, many small parks adorn the city, and the inhabitants are justly proud of their library. Pop. 12,200.

Ciudad Juarez, hoo-ä'reth (formerly EL PASO DEL NORTE), Mexico, state of Chihuahua. It is on the Rio Grande River, opposite El Paso,

CIUDAD PORFIRIO DIAZ — CIVIC CROWN

Texas, on the Mexican Central R.R., about 210 miles north of Chihuahua, the capital of the state. Altitude about 3,800 feet, country around fertile and producing fruit, grains, and vegetables. Cattle are shipped to various parts of the United States. It has a Mexican custom-house and an army post. A United States consul is stationed here. Pop. 7,200.

Ciudad Porfirio Diaz, pōr-fē'rē ō dē'āth, Mexico, town in the state of Coahuila, on the Rio Grande, opposite Eagle Pass, Texas, on the Mexican International R.R., and is the Mexican terminal of the international bridge across the Rio Grande. It has a custom-house, army post, large cattle markets, and but poor buildings for the storage of fruits or grains. It is situated in an agricultural region, and its trade with the United States consists chiefly in exporting grains, fruit and cattle, and in importing manufactured articles. Coal beds near are of value and may cause the establishing of manufactories. It was founded in 1849. Pop. 5,200.

Ciudad Real, thē-oo-dād' rā-āl', the name of a province of Spain, occupying the south extremity of New Castile, and of its capital. The area of the province is 7,620 square miles. The surface in general is bare-looking, immense plains stretching from the mountains of Toledo to the Sierra Morena. The mountains of Ciudad Real abound in minerals: iron, silver, copper, lead, antimony, cinnabar, and coal; also in quarries of marble, jasper, quartzite, granite, etc. Medicinal and mineral springs, both hot and cold, are abundant. The climate is dry, and in the heat of summer very oppressive. The plains and valleys are productive in the vicinity of the rivers; in favorable seasons good crops of cereals are obtained. Cattle, sheep, mules, etc., are reared. Woolen, linen, and other fabrics, hardware, earthenware, esparto, etc., are manufactured; brandy, wine, and oil of good quality are made. Metals, manufactured goods, brandy, wine, and oil, horses, mules, and cattle are exported. The city of Ciudad Real is situated on a low plain near the Guadiana, 100 miles south of Madrid. The walls are in many parts ruinous. The principal edifices are the Church of Santa Maria del Prado, consisting only of a single nave, but so grand and lofty that no other in Spain, except the cathedral of Coria, equals it; the hospital; the institute, with a good laboratory and botanic garden. The manufactures and the trade are of little importance—the former in woolen and linen cloths, the latter in grain, wheat, wine, etc. Pop. about 15,000. Pop. of the province (1900) 321,580.

Ciudad Rodrigo, rōd-rē'gō, Spain, a fortified town in Leon, on the river Agueda, about 55 miles south-southwest of Salamanca. There is a castle dating from the 13th century. The cathedral was begun in 1190 and contains many interesting features. Ciudad Rodrigo was a place of considerable importance in early Spanish history as a frontier fortress. It was taken by the English in 1706 during the war of the Spanish Succession, and recovered by the Spaniards in 1707. The fort was surrendered to the French under Masséna, 10 July 1810, having been bombarded 25 days; and 19 Jan. 1812, it was taken by storm by the British under Wellington, after a siege of 11 days. The Cortes bestowed upon Wellington the title of Duke of Ciudad Rodrigo. Pop. 8,000.

Ciudad Victoria, sē-oo-dād' vīk-tō'rē-ā, Mexico, capital of the state of Tamaulipas, on the main line of railroad which runs from Tampico to Monterey, about 100 miles from the Gulf coast. It is in a sugar and fruit-growing region, but the sugar only is exported. It is an episcopal see and the residence of a consular agent of the United States. The city was founded in about 1750. Pop. 14,800.

Ciudadela, thē-oo-dā-dā'la, Spain, a city and seaport on the island of Minorca, at the west side. It is surrounded by walls and a ditch, and has a cathedral, municipal buildings, hospital, cemetery, and several convents. The inhabitants are engaged in weaving woolen fabrics, expressing oil and wine, and in husbandry. Pop. 8,447.

Civets, a family of small carnivorous mammals, the *Viverridæ*, related to both the hyenas and the cats. Their alliance to the former appears when the fossil history of the family is traced back to the early Tertiary, where the ancestry of both converges. The comparatively coarse hair, erectile mane, possessed by some species, and dentition, are still hyena-like; while the slender, elongated form, long tail, and especially the fact that the claws are semi-retractile, exhibit the inborn likeness to the cats. The civets vary from two to three feet in length, and most of the species are strongly marked in black and white stripes and spots, sometimes prettily disposed. They are distributed throughout the warmer parts of the Old World, abounding in Africa and the Malayan Islands, but are absent from the Australian region. The family is divisible into two groups, one of which includes the typical civets; the African genets (q.v.), one species of which also inhabits Spain and Italy; the linsangs and other Oriental spotted forms, and the paradoxures. The second group includes the mungoos and other ichneumons, suricates, and the like. These various forms will be found described elsewhere under their separate names.

Civets feed upon smaller mammals, birds' eggs, lizards, and snakes, and are considered beneficial because of their appetite for crocodile eggs, which they devour in great quantities along the Nile. They are characterized by, and chiefly valued for, an odorous, fatty substance, contained in a pouch connected with the sexual organs, in both sexes. This substance is used for compounding perfumes, and is ready for use after it has been drained, washed and dried. It is called "civet." A dram is obtained at a time from each animal, from which it is taken at intervals of a few days. Many thousand ounces are annually imported into London. Pure civet is valued at about \$10 an ounce. The American "civet-cat" is the cacomistle (q.v.), which is not a true civet, but nearly related to the raccoons.

Civic Crown, among the Romans, the highest military reward assigned to him who had preserved the life of a citizen in battle. It bore the inscription *Ob civem servatum*, that is, "for saving a citizen," and was made of oak leaves. He who was rescued offered it, at the command of his leader, to his preserver, whom he was bound to honor afterward as a father. Under the emperors it was bestowed only by them. The person who received the crown wore it in the theatre, and sat next the senators.

When he came in all the assembly rose up as a mark of respect. The senate granted to Augustus, as a particular mark of honor, that a civic crown should be placed on the pediment of his house, between two wreaths of laurel, as a sign that he was the constant preserver of his fellow-citizens and the conqueror of his enemies. Similar honors were also granted to the Emperor Claudius.

Civics, the science which deals with the theoretical and practical aspects of citizenship; the duties of citizens to each other as fellow members of a body politic, and to the government. In its broadest aspects it includes civil law, political economy, and finance, as well as social ethics, governmental methods, and the history of social and political development; but the first three are counted as separate sciences from their extent and specialty, and civics proper is concerned with the last three. This is becoming a recognized study in the schools and colleges of the United States.

Cividale, chē-ve-dä'lā, Italy (the ancient FORUM JULII), a town of Venetia, in a basin of the Julian Alps, eight miles east-northeast of Udine. It consists of the town proper, surrounded by walls and ditches, and of fine suburbs; and has among its edifices a large cathedral of the 15th century, with three Gothic portals, a curious baptismal font, and several fine paintings; a museum of antiquities, and a record office with some very ancient charters. The neighborhood abounds in interesting antiquities. Pop. about 9,000.

Civil Action, an action brought in the civil courts for the recovery or protection of private or civil rights, or damages for their breach. The two great classes into which actions are divided are civil and criminal. In civil actions either a government or a private individual may be plaintiff or defendant; while criminal actions are always brought in the name of the government.

Civil Damage Acts, legislative acts passed in several of the States, giving to husbands, wives, children, parents, guardians, employers, and others who have sustained injury in person or property or means of support, by an intoxicated person in consequence of such intoxication, the right of action against the person who sold or gave away the liquor which caused such intoxication. Such acts have been held to be constitutional. In some cases the right of action has been extended to the owner of the premises where such intoxicating liquor has been obtained.

Civil Death is where a person, although possessing natural life, is on account of some crime for which he has been convicted, sentenced to life imprisonment, and thereby lost all his civil right, is considered in law, dead. In some jurisdictions a person convicted of murder and sentenced to life imprisonment is considered in law as dead.

Civil Engineering. See ENGINEERING, CIVIL.

Civil Law, The. 1. *Introduction*.—The term Civil Law (*Jus Civile*) is commonly and popularly used in several distinct senses. Thus we distinguish it on the one hand from the *Jus Gentium* and on the other hand from the *Jus Naturale*. Again our municipal law is called the civil law, and further we distinguish between

civil and criminal law on the one hand and civil and canon law on the other. But it is here used as referring to the whole body of Roman law (the *Corpus Juris Civilis*), having its proper origin contemporaneously with the genesis of the Roman state, and coming down in ordinary generation, from century to century, through the regal period, the republic, and the empire to the codification of Justinian and Napoleon.

When we speak thus of the Civil Law we mean the whole system of usages and rules of private law adopted by the Roman people; their *jus privatum* as opposed to their *jus publicum* (including criminal and sacred law). The *Corpus Juris Civilis* as left by Justinian was the result of a gradual modification and enlargement of the code of the XII Tables under three great influences—the Jurisconsults, the Prætors, and Legislation. The institutional definition of the *jus civile* as the peculiar law of Rome, in contrast with the *jus naturale* and the *jus gentium* is a mere philosophical flourish; by late writers *jus civile* was confined to the *responsa prudentium* alone; what the Roman jurists had chiefly before their mind when they used the expression was the old law of the XII Tables, as contrasted generally with the newer development of the *jus honorarium* (Hunter, Roman Law, 24).

Thus the Roman law presents two aspects, each perhaps equally deserving the attention of the student of jurisprudence. From one point of view it furnishes the sound and scientific basis of the greater part of the modern law of all civilized mankind, and has long proved an inexhaustible storehouse of legal principles. On the other hand, it forms a connecting link between the institutions of our Aryan ancestors and the complex organizations of modern society. In its ancient records it takes us back to the very inception of civil jurisdiction, and tracing it down for more than 2,500 years from the Rome of Romulus and Servius Tullius, we see it constitute a legal development not matched in the history of the law of any other people. The oldest fragments of the Roman law that have come down to us are ascribed to the period of the kings, but these are essentially traditional and practically insignificant, and we take the XII Tables as the first solid ground in the history of the Civil Law.

2. *The Law of the XII Tables*.—About the year 450 B.C. a commission from Rome visited Greece for the purpose of collecting information necessary to draw up a written code of laws. This fact suggests a foreign or Greek extraction for at least a part of the oldest body of Roman law, although it must of course be conceded that the XII Tables undoubtedly contained much law of indigenous growth. Three centuries had intervened between the founding of the city and the promulgation of the law of the XII Tables. During this period a certain body of local, customary law had inevitably developed, some part of which must have been incorporated into this first written code. Until the time of Diocletian (245–313 A.D.) professional lawyers, strictly so called, were not known in Rome. The business of practising law, so to speak, had been up to that time regarded as a public office, which each citizen might be called upon to undertake; but about that time there began to grow up in Rome a class of men among the patricians who made it their busi-

CIVIL LAW

ness to know the law. Pomponius in his history of the Roman law, written about the middle of the 2d century A.D., informs us that the custody of the XII Tables, the exclusive knowledge of the forms of procedure and the right of interpreting the law belonged originally to the College of Pontiffs, a patrician order, at the head of which was an officer known as the Pontifex Maximus, from which office it may be remarked in passing, indirectly and by a strange and circuitous devolution has come down to our day the office of the Pope in the Roman Catholic Church. Only a small part of the language of the substantive law of the XII Tables has been transmitted to our time. Some learned attempts have been made to patch out the substance of each table, but it is by no means certain that the exact fragments of any part of the XII Tables have come down to us in their precise original form and expression. The language has probably been essentially modified by the subsequent Latin usage and by repeated transcription; and the fragments have had to be picked out and pieced together from numerous references in the later literature, as for example from Cicero, Dionysius and Gaius; so that, as matter of fact, what passes for the substance of the XII Tables is probably largely a speculative patch-work, and in its content and significance certainly more or less misleading.

3. *The Jurisconsults and the Prætors.*—The Jurisconsults, a professional class of jurists or legal writers dating from the century before Christ, were given by Augustus an authority and standing which they had not theretofore possessed, and from his time much weight is to be attached to the opinions and writings of the more eminent of them. In 426 A.D. Valentinian enacted a law, commonly called "the Law of Citation," providing that the writings of only five jurists,—Papinian, Paul, Gaius, Ulpian, and Modestinus, should be quoted as authorities. If a majority of these held one opinion, that was to bind the judge; if they were equally divided, the opinion of Papinian was to be adopted. The great bulk of Roman law as it has come down to us, and all that is most valuable in it, is due to the jurisconsults. The Prætor stood in Roman law midway between the jurisconsults and the legislature. At first there was but a single Prætor, but later a Prætor-Urbanus and a Prætor-Peregrinus (when the empire extended beyond Italy, the number being increased to 18), dividing the jurisdiction among them generally either along the line suggested by their names, or territorially. The Prætor exercised a qualified or limited legislative power. His right to alter the law was conceded, but it was not unlimited. He was in some sort the Chancellor, the keeper of the conscience of the Roman people, or the person who was to determine in what cases the strict law was to give way to natural justice (*naturalis æquitas*).

4. *Legislation.* — To give an adequate account of Roman legislation would be to write the constitutional history of Rome, something quite beside the purpose of this article. It is important, however, to state that during the republic the popular assembly was the foundation of legislation. During the earlier part of the empire the function of the popular assembly was gradually usurped by the Senate, acting more and more as the mere mouth-piece of the emperor. Finally even this form was dropped, and

all enactments were made directly by the emperor. During the republic three assemblies of the Roman people existed,—the *Comitia Curiata*, a patrician body, the *Comitia Centuriata*, composed both of plebeians and patricians—the franchise being on the basis of a property qualification—and the *Comitia Tributa*, which was based on a local division of the people of the city—the vote being given territorially, as if by arrondissements, cantons, or wards. The sovereign power was exercised by the emperors in three ways,—(1) by direct legislation (*edicta, constitutiones*); (2) by judgments in their capacity as supreme judge (*decreta*); and (3) by *epistolæ* or *rescripta*, giving instruction on questions of law in answer to applications from the judges.

5. *Codification.*—The earliest collection of law in Rome was the *Jus Papirianum* of the regal period (*temp.* Tarquinius Superbus), and it was not until 304 B.C. that the full knowledge of the law was wrested from the patricians. The constitutions of the emperors were collected at different times and constituted the first codes. The oldest collection in the form of a code is the *Codex Gregorianus et Hermogenianus*, which covers a period of 200 years from Hadrian to Constantine. Only fragments of it remain. Next we have the *Codex Theodosianus*, made about the year 435 A.D. The Theodosian Code has small pretensions to scientific classification, but it runs to 16 books and has come down to us almost complete. The reign of Justinian (527–565 A.D.) marks the culminating period of Roman law. In collaboration with Tribonian, he prepared, or caused to be prepared, a complete codification of the whole body of the law, first appointing a commission of 10 members to draw up a Code along the general lines of the Theodosian Code. This is called the *Codex Vetus*, which was speedily superseded by a later edition and has been entirely lost. Next, about the year 530 A.D., Justinian created a commission of 16 members to collaborate with Tribonian in a codification of the vast accumulation of law that had grown up under the hands of the Jurisconsults and the Prætors. The commission had to deal with the works of 39 jurists, consisting of 2,000 books and 3,000,000 verses. This matter was finally sifted and reduced to 50 divisions or books, and constitutes what we know as the Digest and the Pandects. For the purpose of providing an elementary or preparatory text-book of the law, a commission was further constituted by Justinian, which prepared the Institutes of Justinian, which are in some sort a little more than a revision or a new edition of the Institutes of Gaius. After publishing the Pandects and the Institutes in 534 A.D., a commission was appointed to revise the old code and to incorporate the new constitutions and decisions. This revision was completed in the same year, and promulgated on 16 Nov. 534 A.D. Laws of a permanent character, subsequent to Justinian's codification, were collected from time to time and called Novels.

6. *The Justinian Law in the West.*—Upon the fall of the Western Empire and the subsequent local disorder and social disintegration throughout western Europe, the civil law fell into disuse in the West, and during the Middle Age was largely lost sight of; but in the 12th century the study of the Civil Law was revived at Bologna and spread thence throughout Italy

CIVIL LAW

and into France. In 1453, about nine centuries after Justinian, Constantinople was taken by the Turks and the Eastern Empire was overthrown. During some five centuries, or more than half of the existence of the Eastern Empire after Justinian, the law nominally remained as settled by Justinian's legislation, modified indeed by subsequent novels of the emperors; but about the end of the 11th century the Justinian Code fell into abeyance without special abrogation. The great causes of its decay were the change of language from Latin to Greek, the accumulation of fresh law and of commentaries, the authorized readjusting of the whole by several of the later emperors, and the overpowering influence of the ecclesiastical or the canon law. The revival of the study of Roman law and the rise of the Bologna school, were formerly erroneously attributed to the alleged discovery of a manuscript of the Pandects at the sack of Amalfi by the Pisans in 1137; but it has recently transpired that the study of the Roman law had begun to be pursued with ardor at Bologna and elsewhere in Italy long before that time. However, the manuscript in question, now called the *Pandectæ Florentinæ*, taken to Florence on the conquest of Pisa in 1406, is well known; it is a very ancient and valuable copy of the entire Pandects, being also the only one in existence that dates before the age of the Glossators. The fame of the school at Bologna spread throughout Europe, attracting crowds of students from all quarters and reviving a vivid interest in the Civil Law.

About 1135, or a little earlier, the code of Justinian was translated into French, and by the 13th century many French translations had been made of the Digest, the Institutes, and the Code. By the 12th century ecclesiastical councils had begun to forbid ecclesiastics to study the secular law (Rheims, 1131; the Lateran, 1139; Tours, 1162). This ecclesiastical inhibition served somewhat to check the study of the Civil Law at Paris—then as now the chief university town of Europe—and was favorable to the continued predominance of Bologna as the seat and centre of civil law study, to the growth of the Montpellier School, and to the establishment of new schools, the chief of which were at Toulouse and at Orleans. All these great schools in France—except Paris—and the numerous schools that sprung up in the succeeding centuries, taught the Civil Law on the basis of the Justinian text. After the spread of the scientific study of Justinian's works from Bologna to Montpellier and other parts of France, the Justinian law in the 12th and 13th centuries gradually replaced the ante-Justinian, as being the more perfect form of the Roman law. In 1250 France was still divided under two laws; in the south (*pays de droit écrit*) the Roman law obtained, modified by local customs; in the north (*pays de coutume*) local customs prevailed, slightly modified by Roman law, which, however, was taught in the northern schools and left numerous traces in the legal works of the period. A Dutch school of jurists arose toward the end of the 16th century at the University of Leyden. So, too, in Germany some progress was made in the study of the Justinian law. Like the jurists of other countries, those of Germany were impressed by the superiority of the Roman law to their native law, both in form and substance, and their

admiration induced them by degrees to put it forward in practice. The influence of the Bologna revival extended into Spain, where a crude codification was effected as early as 1263, called *Siete Partidas*, but not generally adopted throughout the kingdom until about the reign of Alonzo XI. in 1348. The Roman law worked its way into Scotland by way of France. From the close alliance that so long subsisted with France, Scotland, besides borrowing many of its institutions from that country, also "imported a large portion of Roman jurisprudence to make up the deficiencies of a municipal law, long crude and imperfect, and which had made little progress as a national system till some time after the establishment of the Court of Session in 1532 by James V., after the model of the Parliament of Paris. . . . Properly speaking, the teaching of the civil law commenced in Scotland at the Reformation in 1560"; after which date, as well as before it, the more ambitious students of the civil law also availed themselves of the best professional teaching of the continental universities. "In Scotland a knowledge of the Roman law has always been regarded as the best introduction to the study of the municipal law. . . . All the best writers on the law of Scotland, such as Stair, Bankton, Erskine, and Bell, were able civilians; and though they have not produced separate treatises on the subject, their works abound with admirable illustrations of the Roman law, evincing great learning and research, and a familiar acquaintance with the writings of the continental jurists." (Mackenzie, *Studies in Roman Law*, 40-1).

The influence of Roman law on the English common law has been very differently estimated by different writers. Mr. Stubbs stands at one pole of the controversy with his eyes shut, saying, "England has inherited no portion of the Roman legislation except in the form of scientific or professional axioms, introduced at a late period, and through the ecclesiastical or scholastic or international university studies. Her common law is, to a far greater extent than is commonly recognized, based on usages anterior to the influx of frudality,—that is on strictly primitive custom." (Stubbs *Const. Hist. of England*, I., 10 § 8.) This is perfectly insular and manifestly untrue. The other and sounder view as here taken is presented in Reeves' 'History of the English Law,' following Guizot and Mackintosh, and more recently an equally enlightened view has been taken by Pollock & Maitland in their 'History of English Law.' The definite traces of Roman law surviving the Roman domination of the island are exceedingly slight. Selden states that the Roman law wholly disappeared in England until it was re-introduced from Bologna in the 12th century. A little before the middle of the 12th century, Vacarius, a Lombard, went over to England with Archbishop Theobald and lectured on the Civil Law at Oxford with success. Even Stubbs admits that before the end of the reign of Henry II. the procedure of the Roman civil law had become well known by the English Canonists. Henry of Bracton was the first really scientific commentator on the law of England, and the greater and more important part of his work is little more than a transcript of the Roman law. He shows everywhere close familiarity with the *Corpus*

CIVIL LAW

Juris. The Novels are not quoted, but the Institutes are referred to, and there are many quotations from the Digest and the Code, while a very large number of passages are incorporated bodily into the text itself and into the tissue of the author's commentary without any statement as to their source. From Bracton and Glanvill to Pollock & Maitland, the predominating influence of the Roman law in English jurisprudence is everywhere traceable and evident. "The English system of equity and the ecclesiastical law have been formed more or less extensively on the Roman law or on the Roman through the Canon law." (Mackenzie, 'Studies in Roman Law,' 40.)

Both in England and in Germany the influence of the Roman law was resisted and its predominance looked upon with disfavor, but it nevertheless made its way *pari passu* with advancing civilization in each country, becoming in fact and effect the substantial *corpus juris* of the one country directly and of the other indirectly. Many causes combined to open the way both in Germany and in England for the practical application of Roman law. Among them, especially in England, were the impulse given by the universities and the Oxford School of Civil Law, the recognition of the Roman law in the clerical courts, whose jurisdiction extended over a class of civil matters, and the personal influence of the higher judges, who mostly belonged to the clergy, and were therefore versed in the Roman law. Above all, however, was the necessity of supplying the defects of the common law, which had become manifest from the growth of trade, the increase of intercourse, and the greater importance of movable property; for the common law had expended its best energies in the completion of the legal constitution of the feudal system, and had showed no tendency toward creating an original commercial law. To these causes must also be added the scientific superiority of the foreign law with its completeness, over the domestic law with its want of theoretical development. Even at an earlier period it is not improbable that the Roman law had been used as an assistant and complementary authority in the Curia Regis, upon which court it was incumbent to instruct the inferior judges in regard to the law in doubtful and omitted cases. A legal principle enunciated by that court had authority beyond the particular case in which it was laid down, and became, by means of its actual use, part of the *jus non scriptum, consuetudinarium*. As Roman legal matter obtained reception, although the written sources of the Roman law were not at all received as having a legislative authority, Bracton properly included the former among the *leges et consuetudines Angliæ*. (Prof. Dr. Güterbock, *Henricus de Bracton*, etc., translated by Brinton Coxe, 60-2).

7. *Code Napoleon*.—Some steps were taken during the reign of Louis XIV. looking to a codification of the French law. Little, however, was accomplished, and the French people owe to the constructive genius of Napoleon the present scheme of codification, which was undertaken during the consulate at his dictation, and finally completed, one code at a time, shortly after the end of his reign. The Civil Code, which was the first, was enacted and became the law of the land 21 March 1804. It was prepared by a council of jurists assigned by the First

Consul to the work; but he himself took great personal interest in it, attending many of the sessions of the Commission and contributing much by his acute suggestions to the form and content of the law. With some fitness he is reported to have said, "I shall go down to posterity with the Code in my hand." This code, called at first the Code Napoleon, but now the Code Civil, has to do with the law of obligations, of persons, of personal status, and of property. It contains 2,281 sections, many of them of only a line or two in length, and is comprised in a volume of less than 350 pages. The whole body of law in France at present, substantive and adjective, civil and criminal, is comprised in eight codes, as follows: *Le Code Civil; Le Code de Procédure Civile; Le Code de Commerce, Le Code Pénal; Le Code d'Instruction Criminelle; Le Code Forestier; Les Codes de Justice Militaire*. The scope and purpose of each of these codes is generally and sufficiently disclosed by its title. This codification is supplemented by the *Lois Usuelles*. The sources of the codified law of France are: (a) the ancient laws of the realm theretofore in force, consisting of local customs (custom of Normandy, custom of Paris, custom of Brittany, etc.); (b) the written or Roman law; (c) such legislative enactments of the National Assembly, the Legislative Assembly, and the Convention, and such of the Decrees of the Consuls and of the Directory, between 17 June 1789 and 15 March 1803, as were thought by the codifiers to be of permanent value; and (d) such general laws as have been enacted since 21 March 1804. The Roman law constitutes the foundation and groundwork of the structure, the other constituent elements indicated being merely subordinate or ancillary.

8. *The Extent of the Civil Law Throughout the World*.—The civil law in its modernized form and substantially as enacted in the Code Napoleon has, within a century past, become the law of more than three quarters of civilized mankind. To be more exact, it is thus the law not only of France and of all her colonies, but also of Italy, Greece, Switzerland, and all the minor countries of southeastern Europe, of Spain and Portugal, Belgium, Holland, and her colonies, of Austria-Hungary, Germany, Norway and Sweden, Denmark, Russia, Mexico, together with all the countries of Central and South America—all of the Western Hemisphere from the Texas border to Cape Horn—of Scotland and the Philippine Islands, the West Indies, and Louisiana, of Egypt, of all the other civilized parts of Africa, and of a majority of the more important British colonies, to-wit: Quebec, Ceylon, British Guinea and other English possessions in Africa, and Australasia. It is also working its way into Turkey and her dependencies. The German empire in 1900 adopted for the empire the Prussian Code, which is a Germanized version of the Code Napoleon; and Japan, as part and parcel of her scheme of civilization, has within recent years enacted a code of law on French lines, following closely even its minor details, thus writing the law of Rome—the Codes of Justinian and of Napoleon—into the jurisprudence of the remote islands of the sea.

9. *Resemblance Between the Civil Law and American Law*.—Aside from matters of procedure and minor detail, the actual differences be-

CIVIL LAW

tween the living Civil Law as it exists throughout the world and the English common law, as refined and modified in this country and now administered here, are not great, certainly not greater than we should reasonably expect, having regard to the controlling influence,—conscious and unconscious—of the Civil Law, upon the growth and development of the common law in England, and having in mind the fact that many English judges, notably Mansfield and Holt, and several of the chancellors for the past 200 years at least, have professedly drawn copiously from the great reservoir of Roman jurisprudence, whenever occasions have arisen for modifying or extending common law principles or for applying them to new conditions of fact and circumstance. The so-called Common Law of England, certainly from the 11th century, is, in reality, largely the Custom of Normandy and the Custom of Paris, as imported at the Conquest in 1066 A.D. Its scientific terminology and its exact legal language even in its present form are essentially French. Chief Justice Holt nearly 200 years ago said: "Inasmuch as the laws of all nations are doubtless raised out of the ruins of the civil law, as all governments are sprung out of the Roman empire, it must be owned that the principles of our law are borrowed from the civil law, and, therefore, grounded upon the same reason in many things." (12 Mod. Rep. 482.) Sir William Jones, writing during the Revolutionary War, said: "With all of its imperfections, the Digest is a most valuable mine of judicial knowledge; it gives law at this hour to the greatest part of Europe, and though few English lawyers dare make such an acknowledgment, it is the source of nearly all our English laws that are not of feudal origin." And Mr. Hornblower, addressing the New York State Bar Association (1902), has just said: "It is also well for us votaries of the common law to remember that there is another jurisprudence founded upon the Roman or the Civil Law, and prevailing throughout the greater part of continental Europe, from which we have ourselves borrowed many of the most important legal principles." If we eliminate from the law of England as it obtains in this country, our technical rules of evidence, which have grown up about our system of trial by jury, our pleading and the peculiarities connected with the tenure, transmission, and devolution of real estate (which are each of them, for the most part, little more than an antiquated mass of ignorance and rubbish, of which it is the modern tendency of our American jurisprudence to relieve us), the rest of our system is not very different, at least in its elements, from modern Civil Law. The following subjects in American law may be mentioned, which have been largely influenced by the Civil Law, and resemble that system in many important elementary principles, namely, the subject of probate, of succession to personal property and testamentary capacity; the law of admiralty; the law merchant, largely of continental origin; the law of equity and trusts; the law of corporations as juridical persons distinct from the incorporators; the law of *res judicata*, fully expounded in the Digest of Justinian; the theory and practice of *habeas corpus*, the leading principles of which are found in the same compilation; the law of alluvion, of accession, and of

wild animals; and finally the great subject of obligations in general as arising from contract, *quasi* contract, tort, neglect, and the operation of law, the logical arrangement of which by the civilians becomes more and more useful in legal analysis and discussion. To these we may add the general doctrines of public and private international law which are mainly of continental origin. (Howe, Roman and Civil Law in America, 16 Harv. Law Rev. 342.)

10. *The Importance of the Civil Law in America.*—The present practical importance of the Civil Law to us consists in the fact that about one sixth part of the present population of the United States and its dependencies—or, to put it in figures, more than 12,000,000 of our population—live under the civil law, and are governed in their personal and property rights by some form of it. Thus Louisiana, with a population of 1,400,000, Porto Rico, with a population of 1,000,000, the Hawaiian Islands, with a population of 150,000, the Philippine Islands, with a population of 8,000,000, and Cuba (if indeed it may be included), with a population of 1,600,000, are governed by the civil law. Not only, therefore, must our judges and lawyers acquire familiarity with it and facility in working in it, but our commercial and trading classes are finding it constantly of more and more consequence to them in their business. Not only is much of our law derived from it, but many millions of our people live and must continue to live under it. It is a curious fact that the Custom of Paris was in force in Michigan and Wisconsin down to the year 1810, when it was formally abolished, in Michigan at least, by the legislature of that State. (18 Wis. 158; 8 Mich. 25.) All the French colonies established in the 17th and early part of the 18th century in North America were governed by the Custom of Paris, which still remains in Quebec the basis of the codified law of that province. By a royal ordinance the laws, edicts, and ordinances of France and the Custom of Paris were extended to Louisiana, and that system of law thus introduced prevailed there until 1763, when France ceded the country to Spain. That introduced the Spanish law into Louisiana, which was, however, only another form of the Civil Law. In 1808 a Civil Code was adopted by the Territory of Orleans based to a considerable extent on the Code Napoleon, and, as revised in 1825 and subsequently, constitutes the present Louisiana Code. We probably owe to the study of Blackstone's Commentaries much of the unreasoning prejudice which has hitherto existed to some extent in this country against the study of the Civil Law. Blackstone began to be read by law students in America about 140 years ago, and from then to now has been for the most part the initial text-book for all lawyers and law schools. He writes bitterly in his first lecture about the civil law. But it is manifest that he wrote without knowledge and under the influence of a set of political prejudices, and with a bias and prepossession with which we in the United States may well have little sympathy. Abstractly, there is no more reason why Americans should entertain a prejudice against the Civil Law than against the law of gravitation, and there are cogent reasons, practical as well as scientific, why we should—now at least when it has become a matter of real personal

CIVIL LIST — CIVIL RIGHTS BILLS

concern to so considerable a part of our people — give serious attention to modern Civil Law.

CHARLES F. BEACH, JR.,

Professor of American Law, University of Paris.

Civil List, a term signifying in the United States, (1) a list of the entire expenses of the civil government, (2) the revenue appropriated to support the civil government, (3) the officers of the civil government who are paid from the public treasury.

In England the meaning of the term formerly represented the whole expenses of the government with the exception of those of the army, navy, and other military departments. It is now limited to the expenses proper to the maintenance of the household of the sovereign. It was once a principle in England, as in other Teutonic nations, that the monarch was to pay all the expenses of government, even including those of the army, from the possessions of the crown, the domains, and that the subjects were not obliged to contribute anything more than they voluntarily engaged to. From this principle, which is proved by the history of the origin of the domains, it appears that the crown lands in general cannot be considered the private property of the ruling family. On the contrary, they are, in general, the property of the state, and have been given to the prince to defray the expenses of government. Until the Restoration the whole expenses of the government continued to be defrayed out of the royal revenue. The first Parliament of Charles II. fixed on £1,200,000 (\$6,000,000) as the ordinary revenue of the crown in time of peace. For this they provided by taxation, which ultimately produced more than the amount of the grant. The same taxes were continued during the reign of James, and produced on average £1,500,000 (\$7,500,000), besides which he received extraordinary grants. At the commencement of the reign of William, the Commons made still further restriction on the royal control of the revenue. They voted £1,200,000 (\$6,000,000), as the revenue of the crown in time of peace, one half of which was appropriated to the maintenance of the king's government and the royal family, the other to public and contingent expenditure. The outbreak of war prevented this arrangement from being exactly carried out, but the Commons maintained

the principle of separating the regular and domestic expenses of the king from the public expenditure, and establishing a systematic and periodical control over the latter. The amount actually voted to the king for life in 1697 was £700,000 (\$3,500,000) and the same vote was made at the commencement of the reign of Queen Anne and George I. On the accession of George II. £830,000 (\$4,150,000) was voted. Besides the regular vote, grants had been frequently made to defray debts incurred in the expenditure of the sovereign. On the accession of George III. the civil list was fixed at £800,000 (\$4,000,000), but instead of being paid out of appropriated revenues in which the crown lands were included, these were surrendered, and it was charged on the ordinary taxation. Large extra grants had to be made during this reign. At the commencement of the reign of Victoria a civil list of £385,000 (\$1,925,000) per annum was settled on her majesty for life for the support of the royal household, and the maintenance of the dignity of the crown, £60,000 (\$300,000) being allotted to the privy purse. In 1901 the civil list of King Edward VII. was raised to £470,000, (\$2,350,000); £110,000 of this being for the privy purse. Many continental states have a fixed civil list; that of Russia is equivalent to \$7,050,000; of Turkey, \$4,600,000; of Austria, \$3,650,000; of Prussia, \$4,500,000.

Civil Procedure. See COURT.

Civil Rights Bills. 1. An act to carry out the intention of the Thirteenth Amendment, prohibiting slavery — which it was alleged the Southern States were attempting to nullify by public and private action — and secure the political equality of the ex-slaves with the whites. It provided that all persons born in the United States and not subject to any foreign power, excluding Indians not taxed, were citizens of the United States, and entitled to the same immunities, irrespective of race or color, or previous condition of servitude, except as punishment for crime; punished as a misdemeanor any deprivation of such right under color of State law; transferred cognizance of such cases from the State to the Federal courts; intrusted the execution of the act to national officers only, and fined them for refusal; punished resistance to the officers; provided for fees; empowered the President to send officers to any district where the act was likely to be violated, and to call out the national forces to execute it; but permitted an appeal to the supreme court. Significantly, it employed somewhat the same means to emancipate the negro which the Fugitive Slave Law did to re-enslave him, especially in over-riding or supplanting State officers; and for the same reason — they could not be trusted in the sections where it was to be enforced. The bill was passed in the Senate 2 Feb. 1866, 33 to 12; in the House 13 March 111 to 38. Andrew Johnson vetoed it 27 March, and it was passed by the requisite two thirds over his veto, in the Senate 6 April and in the House 9 April. Even so, the debate had brought out two grave doubts of its constitutionality; that the protection of civil rights under the Constitution belonged not to Congress but to the States, and that under the Dred Scott decision (which stood as a precedent for the supreme court until reversed), negroes could not become citizens even by emancipation. This led to the proposal of the Fourteenth

CIVIL RIGHTS CASES — CIVIL SERVICE

Amendment (see CONSTITUTION, *Amendments*), which passed both Houses in June.

2. An act extending the foregoing to the exclusion of negroes from juries, and from equal privileges in schools, public conveyances, hotels, theatres, etc. This had been persistently urged by Charles Sumner, for some years before his death; was offered as an amendment to the Amnesty Bill of 1872, and lost by only one vote; again introduced into the House in December, and referred to a committee; on 30 April 1874, a few weeks after Sumner's death, it passed the Senate, but the House rejected it; it finally passed both Houses in February 1875 and was signed 1 March. For an account of its partial invalidation, see next article.

Civil Rights Cases. These were five test cases in the United States supreme court of the constitutionality of sections 1 and 2 of the second Civil Rights Bill, described above; decided in one group, October term, 1893, and reported and cited under the title above. All came up from circuit courts; three on certificates of division of opinion, two on appeal for error; and while the decision on the act was adverse to all, and the first three were found for defendant, the error was admitted and the decision given for plaintiff in the last two. Two of them were for hotel discrimination, two for theatre discrimination, one for railroad discrimination; the first four submitted 7 Nov. 1882, the last one 29 March 1883. The cases were: *U. S. v. Murray Stanley*, from the Kansas district: hotel case. *U. S. v. Michael Ryan*, California district; refusing a negro a seat in the dress circle of Maguire's Theatre, San Francisco. *U. S. v. Samuel Nichols*, Western Missouri district: hotel case. *U. S. v. Samuel D. Singleton*, southern New York district; refusing a negro a seat in the Grand Opera House, New York. *Richard A. Robinson, and Sallie A. Robinson his wife, against the Memphis & Charleston R.R. Co.*: refusal to allow the wife a seat in the ladies' car from Grand Junction, Tenn., to Lynchburg, Va. The decision of the court was given by Justice Bradley, Harlan dissenting. The terms of the first section of the act are that "All persons within the jurisdiction of the United States shall be entitled to the full and equal enjoyment of the accommodations, etc., of inns, public conveyances by land or water, theatres, and other places of public amusement," and that laws must be "applicable alike to citizens of every race and color, regardless of previous condition of servitude." The second section affixes penalties. The court held that these two sections are unconstitutional as applied to the States, not being founded on either the Thirteenth or Fourteenth Amendment (see CONSTITUTION, *Amendments*): the former merely prohibits slavery, which is not constituted by a denial of civil equality; the latter is prohibitory merely on the States, not on individuals, and it was not alleged that the discrimination was made under State laws. Congressional legislation for enforcing the latter amendment is not direct legislation, but corrective, counteracting or redressing State legislation of a sort forbidden by the amendment. For private injury from discriminations, the remedy must be sought in State laws — to withdraw it from which was the precise object of the act.

Civil Service, that branch of the public service which includes all executive offices not connected with the army or navy. The term is not applied to the direct representatives of the people, as the President of the United States or the governor of a State. Owing to the complexity of modern government and the variety of its functions, the civil service has become very complex, and the problem of its effective administration a difficult one.

In Great Britain the service comprises various departments, such as the home office, the foreign office, the war office, admiralty, post-office, customs, excise, etc. Formerly, appointments to the civil service in Great Britain were the gift of the executive government, and were obtained by influence, while the bestowal of them was used as a means of gaining parliamentary support on behalf of the government. Those appointed were not generally called upon to show whether they were competent or not. In 1855 examinations were instituted to test the efficiency of all candidates for subordinate posts; but for some time candidates were specially nominated for those posts. As more than one might be nominated for a post, competition was gradually introduced, and in 1870, it was directed that appointments in the civil service should (with certain exceptions) be filled by open competition, as was already the case with appointments in the Indian civil service. The appointments to what are known as clerkships in the civil service are divided into two classes or divisions, with different age limits and salaries. In the higher division, while the examinations are more severe, the salaries are much better; the two divisions are kept quite distinct; and it is rare for a person to be promoted from the lower to the higher. For a number of appointments open to competition special qualifications, scientific or technical, are necessary, while there is also a special limit of age. A large number of subordinate appointments in the postal and telegraph service, the excise, etc., are on a different footing from the clerkships just mentioned, and are not so well paid. All persons who have served in an established capacity in the permanent civil service are given a pension, varying with the length of service, at the time of retirement. The total expenditure of the civil service of Great Britain is about \$90,000,000.

In the United States the Federal civil service numbers over 100,000 officials in the various administrative departments. The Constitution provides that the President, "with the advice and consent of the Senate," shall appoint all officers of the United States whose appointments are not otherwise provided for by the Constitution. This gives the chief executive power to choose the heads of departments, as well as their subordinates. In the separate States the appointive power of the chief executive is much more limited. The heads of the State departments such as the attorney-general and comptroller, etc., are elected by the people, and usually have the constitutional right to select most of their own subordinates. The governor therefore appoints only his own secretaries, etc., members of commissions, heads of bureaus, and the like. With the development of party government in the United States, the patronage placed in the hands of elected officers through their power of appointment, has led to

CIVIL SERVICE REFORM

the giving of offices as a reward for party service (the spoils system), and to considerable inefficiency and unnecessary expense in public administration. A reform is being brought about by the appointment of officials according to merit in public examinations. See CIVIL SERVICE REFORM.

Civil Service Reform, the improvement of the civil service in methods of appointment, rules of conduct, etc.; in the United States, the movement for the appointment of public servants according to their fitness for their work, rather than their services to the party in power.

In the year 1835 a debate took place in the Senate of the United States on the condition of the civil service, and especially on the abuse of the power of appointment and removal to serve party ends instead of public ends. Among the senators who took part in the debate were the three whom history has judged the strongest in that famous body, Daniel Webster of Massachusetts, Henry Clay of Kentucky, and John C. Calhoun, of South Carolina. Differing widely in their views of party policy and rivals in ambition, they were of one mind as to the true nature of the public service, and as to the errors and evils that had crept into it. Mr. Webster, then in the prime of his young manhood, had already won the title of the "Great Expounder of the Constitution." He thus stated the idea in which the others heartily joined: "The theory of our institutions is plain; it is that government is an agency created for the good of the people, and that every person in office is the agent and servant of the people. Offices are created, not for the benefit of those who are to fill them, but for the public convenience."

There is no doubt that this is indeed the true theory of our institutions. It is to be found in all the early writings of the men who formed the government. It is the basis of the Declaration of Independence, that "governments are instituted among men" to secure the rights of "the governed" from whose consent "they derive their just powers." When our national government was founded it was the only one in which offices were not a privilege, but a trust, imposed by the choice of the people and for their sole interest. Neither birth nor rank, nor wealth gave any title to them. Each of the men who held them was intended to be, in the words of Webster, "the agent and the servant of the people."

This theory had grown out of the needs of the American people, and fitted them closely. As colonists they had had to work and fight hard for the right to live and the means to live as free men in a wild land, far from the homes of their fathers, amid many perils and hardships. There was no ruling class among them. To attend to the common business of each little settlement, they were led to choose among their own number the agents best fitted for the task. These in the early days were, as in the towns of New England they still are, "select-men," "trustees." The name shows what was expected of them, and what was their title to employment. As the towns were grouped in counties and the counties in States, the public business grew, became more complex, and required a larger number of agents with different duties and powers, but the idea held. They were still agents, selected men, trustees. From the most modest

unpaid village or town officer to the President of the United States, the Commander-in-Chief of the army and navy of the nation and its representative in the eyes of the world, no man in the public service in this country is anything but the agent, the trustee of the people.

One result of the growth of the public business has been that only a small part of the agents for doing this business are chosen directly by the people. Those thus chosen are entrusted with the employment or appointment of a very large number of others. The chief difference between the two classes is that those elected are expected to carry on the public business in a way that the majority of the voters are in general agreed upon. They are the choice of the majority party and, so far as the rights of all permit, they are the agents of that party. When the views and wishes of the majority change, these agents are usually changed also. But the far greater number of agents for doing the public business are appointed or employed. The duties of nearly all these are the same no matter what may be the policy of the majority party. In the national government, for instance, the main work for those in office, except the highest, is the collection and expenditure of the taxes. The taxes are collected on goods brought into this country for sale or on goods made here for sale; in other words, customs, duties, and internal revenue taxes. Parties differ widely as to which class of taxes should be the higher, and as to how high the custom duties should be. But all parties agree that the taxes of all sorts should be collected according to law, honestly and fairly, that the money should be carefully accounted for, and none of it stolen or wasted. Agents for this purpose need to be good business men of character and ability; they do not need to be of one party or another. Again, the Post-office Department does a great part of the business of the government. It collects mail matter of all kinds, transports it, delivers it at home or abroad, makes large payments on money orders, and sells the stamps by which the cost of its work is paid. As to this work, there is no difference at all between parties, and there has never been. The agents engaged in it need only to be honest and efficient. They do not need to be of one party or another. In all offices where the duties are of this sort, it is plain that those engaged in them should be selected for merit only, promoted as the service requires, and removed only for failure or incapacity to do their work in the best manner.

Such a policy would answer to Webster's statement of the theory of our institutions, and to the practice of the early Presidents. Washington declared: "In every nomination to office I have endeavored, so far as my own knowledge extended or information could be obtained, to make fitness of character my primary object." In the first 39 years of the history of the government the six Presidents made only 112 removals. A few years later, when Webster had to define anew the true theory of the public service, a very different practice had grown up. It was frankly described in that same debate by Mr. Marcy, a senator from New York. He said: "The politicians of the United States are not so fastidious as some gentlemen are as to disclosing the principles on which they act. They see nothing wrong in the rule that to the victor belongs

CIVIL SERVICE REFORM

the spoils of the enemy." This theory is plainly the opposite of the true one. Under it elections do not merely settle the policy of the country, as to which parties may unselfishly differ. They become contests for spoils as well, and tend to become more and more contests for spoils and less disputes as to principle. The spoils are the offices, the places of trust, and these tend to be given not to those best fitted to perform their duties, but to those who have claims on the party. The service is hurt by putting out tried men and putting in untried men, and since the untried men are chosen for other reasons than fitness, they are apt to be poorer officers. Since they owe their employment to party favor, and do not get it on their merits, they are likely to be less faithful and less honest. They are liable to be turned out at the next election, and they are tempted to make all they can from their places. The offices tend to be regarded as created not "for the public convenience" but "for the benefit of those who fill them." The service tends to become poorer, less honest, more costly. Any large private business conducted in this way would surely come to disaster. So would the business of the government if it had not the pockets of the taxpayers to draw on.

The Spoils System.—The spoils system prevailed in the service of the United States government for about a half-century after 1830. It also prevailed in greater or less degree in the service of the several States and of the larger cities. It was not confined to any one party. All were more or less corrupted by it. The effect on the politics of the country was very bad. The pressure for public employment, always strong, became extreme. Probably the election of 1860 was as largely decided by moral conviction as any in the history of the country. Yet, one month after he took office, President Lincoln groaned under the burden of this pressure. "I wish," he wrote, in his simple phrase, "I could get time to attend to the Southern question. I think I know what is wanted, and believe I could do something toward quieting the rising discontent, but the office-seekers demand all my time. I am like a man so busy letting rooms in one end of his house that he cannot stop to put out the fire that is burning in the other." In the crisis of the war for the Union he was visited by a committee of New York politicians, intent on patronage. The chairman opened his address with a reference to the "awful burden of the nation's fate weighing on the president." "Gentlemen," interrupted Mr. Lincoln, "it is not the fate of the nation that worries me most just now; it is your pesky post-office." These incidents throw a strong light on the waste of time, of money and of strength imposed by the spoils system. The degradation and pollution of politics were even worse effects. The office-holders, living on the spoils of the place, and greedy for more, seized the organization of their party, whichever it happened to be, and made the free exercise of honest preference among the voters difficult and often impossible. The scramble between factions in the party in possession became as intense as between opposing parties. In the Custom House in New York, five collectors of the same party made 1,878 removals in a period of 1,565 business days, and the service grew steadily worse. In 1881, Guiteau, an office-seeker from

New York, where a bitter factional fight had long been raging, half-crazed with disappointed greed, assassinated President Garfield, to whom he charged his failure.

The Merit System.—This proved the turning point. At the next session of Congress bills were introduced for the establishment of the merit system, and a law was passed in January 1883. It was entitled "An Act to Regulate and Improve the Civil Service of the United States." The object of the law was to secure appointment and promotion in the service for fitness. For this purpose appointments were to be made from those graded highest as the results of open competitive examinations, the appointments being made final only after a period of probation or trial. This system was to be extended throughout the service as fast and as far as the President should direct. When any part of the service was to be brought under the system, it was to be arranged in classes by order of the President; hence the term "classified service" means, under the law, the part of the service in which the merit system is applied. Within the classified service, the examinations for appointment and for promotion are chiefly competitive; that is to say a list, called an "eligible list," is made of all applicants passing a fixed grade, in the order of their standing, and a selection is made by the appointing officer from the three highest on this list. This selection is for the period of probation or trial, six months, at the end of which term, if his conduct and capacity are satisfactory, the probationer is absolutely appointed; if not, he is discharged. Non-competitive examinations are held according to the rules laid down by the President. In these all applicants passing a fixed grade are eligible to appointment without regard to their relative standing. The rule as to probation is the same as in the other cases. The law requires that all "examinations shall be practical in their character, and as far as may be shall relate to those matters which will fairly test the relative capacity and fitness of the persons examined to discharge the duties of the service into which they seek to be appointed." Close attention is paid to this requirement. In the first place, weight is given to the experience of the candidates in the kind of work they seek, when such experience can definitely be known. Then each class is tested as to the knowledge and skill particularly needed. For clerks and accountants, weight is given to accuracy and quickness in figures, to clearness and rapidity in writing, and to familiarity with the principles and methods of book-keeping. Examinations are generally for entrance to the lower grades of the service, and actual excellence in the performance of work counts in promotion. For places requiring special knowledge, trained examiners are employed. For instance, the examiners who set the questions and rated the answers in the case of the supervising architect were prominent architects from various parts of the country. They were able, from the records of the candidates, to test not only professional knowledge, but business capacity. In all cases the examiners are selected from those who are well informed as to the work to be done. The application of this law is to be carried out and watched by a commission, known as the United States Civil Service Commission, made up of three members,

CIVIL SERVICE REFORM

appointed by the President with the advice and consent of the Senate. This commission aids the President in the formation of the rules under the law, and, with the aid of examiners, sets and conducts the examinations. All appointing officers are required to report to it all changes in the classified service, of which the commission keeps a full record, as well as of its own examinations and other proceedings. All officers of the service are required to aid in the performance of the duties of the commission.

One of the worst evils of the spoils system was the fact that public employees were made to pay a large fraction of their salaries to party funds, and another was that these employees were forced to work for the party in power in order to keep their places. Both these practices are now forbidden by law in the service of the United States. No one in the service is allowed to use his official authority or influence to coerce the political action of others. All persons in the service are forbidden to ask or receive political contributions from others in the service. Such contributions cannot be solicited in any place or building used by the government. By the rules, which have the force of law, no question can be asked of candidates for appointment as to their political or religious opinions; no disclosures of such opinions can be considered; no change of rank or pay can be made because of such opinions. Under the spoils system, the office-holder got his place from his party and was taxed heavily by his party managers. The law intends to put a stop to that; it holds the officer bound only to earn his pay by honest work, and free to spend it as he chooses. The law further holds him without fear of harm or hope of aid from outside, to do his duty to his employers, the whole people of the United States. It aims to put the people and those who work for them on the same footing that is maintained in honorable private business between employers and employed.

The merit system has been greatly extended since the passage of the law. Under President Arthur, who signed the law in 1883, some 16,000 places were brought within its provisions. The number is now over 80,000. This is nearly a half of all the places in the executive service, while the salaries paid in these places are nearly three fourths of all paid in the service. While this advance has been made there have been more frequent changes of party in the government of the country than in any like period in our history. In the five elections since 1883, four have resulted in a change of party. Each succeeding President until the present has, in the discretion which the law confides to the President only, added to the number of places removed from the spoils system. President McKinley withdrew a considerable number of places from the merit system for reasons urged upon him by the heads of some departments. The effect has been unfortunate. On the other hand, the merit system has been extended to the service in the Philippine Islands in a way that promises to make the work of governing there clean, efficient, and fair to a degree that could hardly have been looked for. In this region the bond of trusteeship rests upon our government with a peculiar and solemn obligation. The United States have taken control of the affairs of the people of these islands as the result of a war with Spain, without the assent of the peo-

ple in the first instance, and against resistance by a portion of them which was overcome by arms. It would be a sore disgrace, if their affairs were not managed honestly and purely and for the interest of the governed. The merit system on the lines of the Civil Service Law has been established there, under the general guidance of an experienced and skilled examiner from Washington. As many natives as practicable are being employed. It is still too early to judge of the final outcome, but the beginning is promising.

The chief aim of the merit system is, on the one hand, to get the best service for the government—that is, for the people—and, on the other hand, to remove from the party contests of the country the corrupting influence of the vast number of business places offered as spoils to the victors. The methods of competition and probation are not perfect, and, like all other human methods, are liable to mismanagement. But they are the best that have ever been tried, and they are very effective. The test of competitive examination is shown to be thorough and practical by the fact that only a very small number of those who pass that test are dropped after probation or trial. Another proof is the much larger amount of work done by persons so selected. During 10 years before the adoption of the merit system in the departments at Washington the number of clerks increased from 3,300 to 5,523, or more than two thirds. In the 13 years after the system was adopted the number actually fell off 211, or three per cent, while the work of the departments had largely increased. Another proof of the efficiency of the system is the small number of changes that take place in it compared with those that take place in the branches of the service where the system is not yet applied.

Two facts are noteworthy with regard to the effect of the use of the merit system on partisan contests in politics. The total cost of the executive service is over \$100,000,000. Of this nearly \$75,000,000, or three fourths, is now paid to those employees who are under the merit system. This very large sum is no longer held out as prizes for partisan activity, or treated as the "spoils of the enemy." The other fact is that the feeling of the people that the government is theirs, and does not belong to the party in power for the time being, is greatly strengthened. The entrance examinations are held in all parts of the land, and men and women are selected for the departments at Washington with no regard whatever for their party views or the influence of politicians. This has been of great effect in laying to rest the passions bred by the Civil War, and giving to the dwellers in the South a sense of their common rights and duties as citizens of the nation. It is a great and lasting gain.

In 1884, laws for the introduction of the merit system were enacted in New York and Massachusetts, and later laws authorize the system in the service of cities in Wisconsin and Illinois. In Massachusetts and in New York the system has made much progress and the results have been good in proportion as the system has been extended and honestly and faithfully applied. But the evils of the spoils system still prevail almost without check in the service of the cities and the States throughout the country. The enormous number of

CIVIL WAR IN AMERICA

places involved are still almost wholly the prizes of party contests. The place-holders, many times more numerous than the present army of the United States, are in greater part enlisted for party rather than for public service. Efficiency, industry, and economy in the public work are hard to secure. The suppression of vice and the decent administration of the affairs of cities and States are made more difficult.

Clearly it is best that the merit system should be applied to all that portion of the civil service in which the duties are of a business nature and in which the office-holders are not called on to fix the policy of the government. There is no Democratic or Republican or Populist way of being honest and industrious and intelligent which all Americans may not use. To these qualities in their service the people have a right, and no party can claim a monopoly of them. Much remains to be done to complete the work so well begun. The men in all parties who look on public employment, not as a trust, but as the spoils of party victory, resist all advance and seek to undo what has been done. They cannot succeed if the true nature of the merit system is understood, its honesty and fairness, its high utility, and its fidelity to the fundamental principle of the free institutions of the American republic.

EDWARD CARY,
Associate Editor New York Times.

Civil War in America. The number of engagements entered in the government's 'Chronological List of Battles' exceeds 2,200. An alphabetical list of battles compiled at the bureau of pensions, including such minor actions and skirmishes as seemed worthy of incorporation, contains over 6,800 separate affairs. It is therefore clear that, even in a comprehensive narrative of the War, a large number of the lesser engagements must be ignored. Merely to state strength and losses for the battles mentioned would form a lengthy statistical article. For these figures the student is referred to the separate accounts in this work of the various battles herein treated.

The Civil War of 1861-5 was inaugurated by the determination of seven Southern States to withdraw from the Union. South Carolina led by passing an ordinance of secession 20 Dec. 1860, followed by Mississippi, 9 Jan. 1861; Florida, 10 January; Alabama, 11 January; Georgia, 19 January; Louisiana, 26 January; and Texas, 1 February. On 7 February the Choctaw Nation declared its adherence to the Confederacy.

During the autumn of 1860 and the early spring of 1861 the forts, arsenals, custom-houses, and other government property in those States, with few exceptions, had been seized by State troops, and large sums were voted for arming the States, Georgia leading in November 1861, by appropriating \$1,000,000. Major Robert Anderson, a Federal officer, who held Fort Moultrie on the inner line of Charleston harbor, becoming aware of active preparations for capturing that work, withdrew, on the night of 26 December to Fort Sumter in the centre of the harbor. This move hastened results. Immediate preparations were made for bombarding the fort. The first firing upon the flag was 9 January by the batteries erected against Fort Sumter, the inciting cause being the appearance of the *Star of the West* off the harbor. This vessel had

been sent from New York with provisions for Sumter, and with the accompanying fleet withdrawn without replying to the fire.

Delegates from the seceded States met at Montgomery, Ala., 4 February, and 8 February adopted a provisional government, "The Confederate States of America," and the next day elected Jefferson Davis of Mississippi President, and Alexander H. Stephens of Georgia Vice-President of the Confederacy.

On 1 March Gen. P. G. T. Beauregard, appointed by the Confederate government, was sent to Charleston and took charge of the preparations for reducing Fort Sumter. On 4 March Abraham Lincoln was inaugurated as President of the United States. On 10 April Beauregard was instructed to demand the surrender of the fort, and, in case of refusal, to reduce it. The next day Anderson received and promptly declined a demand to evacuate, and at daylight 12 April, the Confederate batteries opened upon Fort Sumter, compelling its surrender on the 14th. The expectation of a relieving fleet probably hastened this attack.

With the news of the attack and surrender the country received President Lincoln's proclamation calling for 75,000 volunteers, and summoning Congress to meet on 4 July. In an instant discussions over the power to coerce States, the discussions of peace conventions and movements, and all similar perplexing questions were brushed aside, and the North responded with intense enthusiasm, the predominating sentiment being the preservation of the Union. The South was equally aflame, rallying under the banner of State rights.

On 8 April President Davis had called for 20,000 volunteers, and the day following President Lincoln's proclamation he asked for 34,000. Two days later the Confederate Congress authorized the raising of 100,000 men. Three days after the surrender of Sumter Virginia seceded, followed 6 May by Arkansas and Tennessee, and 20 May by North Carolina, the belief being then general that a policy of coercion had been decided upon. The border States of Kentucky and Missouri were held to the Union by their loyal element, and Maryland was held at first by the direct power of the national government, and later by its own loyalty. The first two were represented in the Confederate Congress throughout the War. The movement to take Missouri into the Confederacy was thwarted by Gen. Nathaniel Lyon, who captured Camp Jackson near St. Louis 10 May, and on 17 June, having already taken the State capital, in a brief engagement dispersed a force which Governor Jackson had gathered at Booneville. This resulted in relieving the capital from those plotting secession. Kentucky at first declared for neutrality, but at the election for members of Congress, 20 June, it was made clear that the State was lost to the Confederacy. In May the Confederate capital was moved from Montgomery, Ala., to Richmond, Va., where troops from all parts of the Confederacy were rapidly assembling. In like manner, the Northern States were pouring troops into the national capital, and Washington soon became a vast military camp. The Union forces crossed into Virginia 24 May and encamped opposite Washington.

For a brief time Baltimore resisted the passage of troops to the capital. Four hundred Pennsylvanians reached Washington 18 April,

CIVIL WAR IN AMERICA

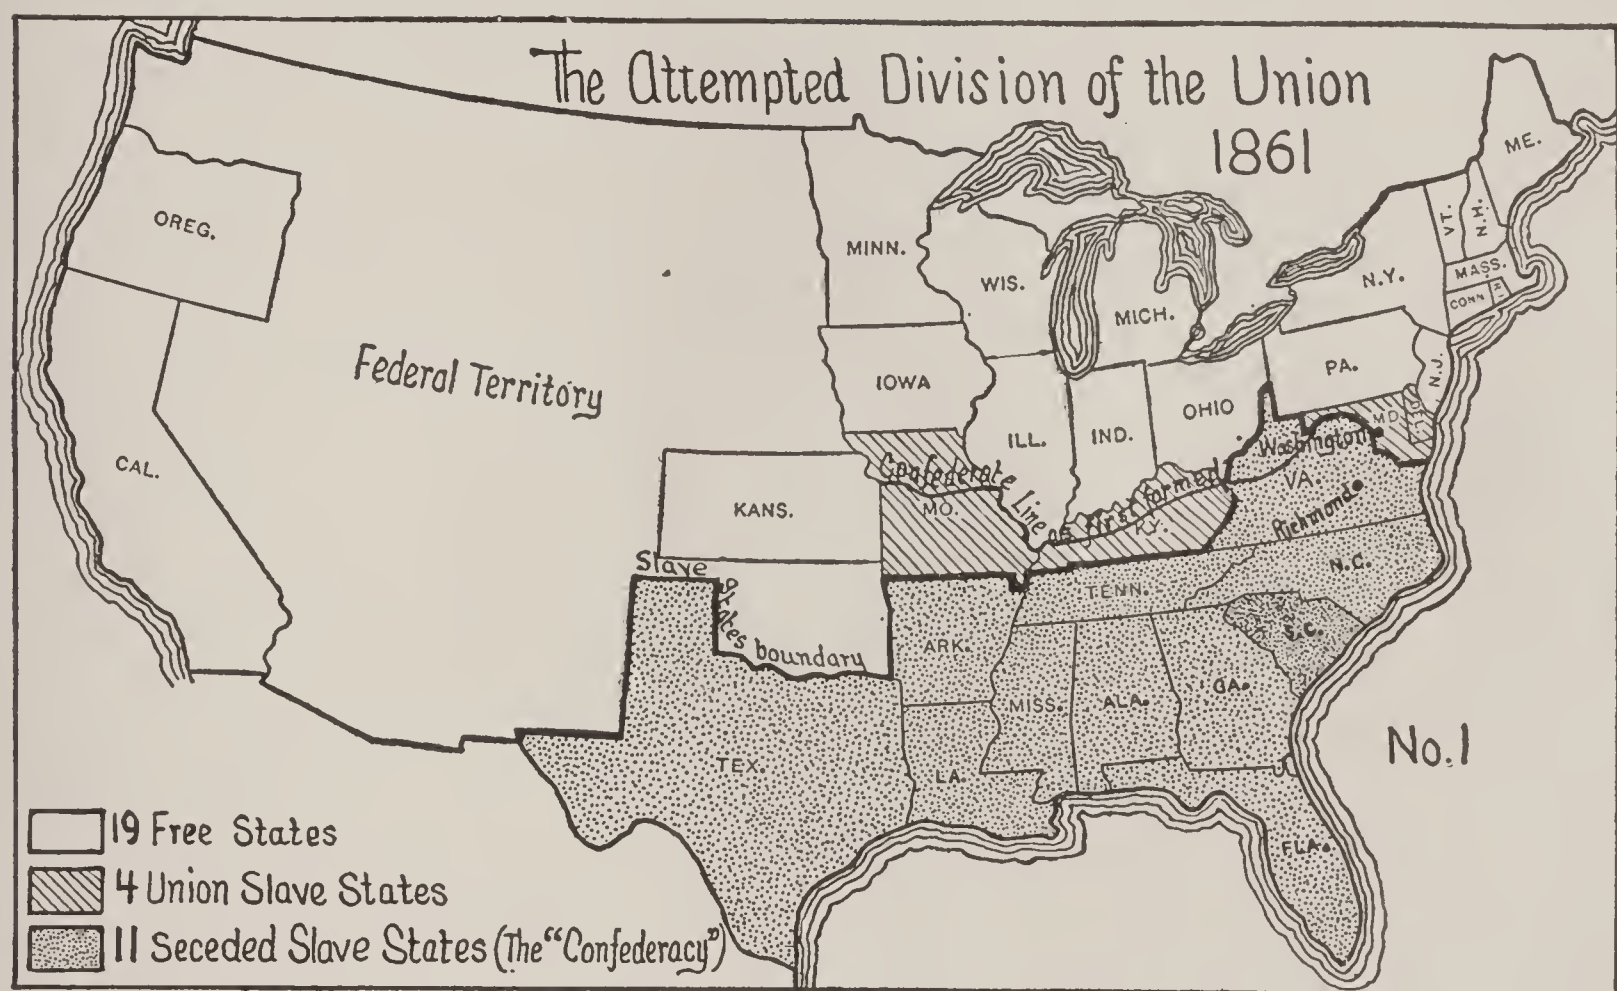

but the 6th Massachusetts regiment was attacked in Baltimore 19 April. The 7th New York reached Washington 25 April from Annapolis. Brig.-Gen. B. F. Butler, with the 8th Massachusetts, had reached Annapolis on the 20th, and on the 22d had proceeded to the Relay House. On the night of 13 May he occupied Baltimore, and thereafter the route to Washington was unobstructed. Harper's Ferry, with its arsenal and machinery for manufacturing small arms partially destroyed, was seized by the Confederates 19 April, and Gosport Navy-Yard, near Norfolk, 20 April, with guns, stores, ships, and machinery of immense value.

On 20 May Gen. Butler, having been made a major-general of United States volunteers, was assigned to the command of the Department of Virginia and North Carolina, with headquarters at Fort Monroe. On 10 June he moved against a force under Gen. J. B. Magruder at Big Bethel and was defeated. While it was comparatively a small affair, like another about

Congress met in special session 4 July. It legalized all President Lincoln's acts with respect to the army and navy, and authorized a further call for 500,000 men, a national loan of \$250,000,000, and an increase of the navy to render effective the blockade of the Southern ports which had been declared 19 April by President Lincoln.

Following the Philippi defeat, the Confederates sent Gen. Henry A. Wise to the Kanawha Valley, and Gen. Robert S. Garnett to Beverly. Gen. William S. Rosecrans, who was commissioned brigadier-general in the regular army 16 May, joined Gen. McClellan from Ohio, and 11 July defeated the Confederate forces under Col. Pegram at Rich Mountain. On 13 July Gen. Garnett, during the retreat of his column, was killed at Carrick's Ford. His command escaped, leaving Gen. McClellan in control of northwestern Virginia.

The latter part of July, upon hearing of the arrival of Gen. J. D. Cox of Ohio in the

the same time at Vienna in front of Washington, both caused widespread dissatisfaction and mortification at the North.

Under President Lincoln's call Ohio promptly organized 13 regiments, and 23 April Capt. George B. McClellan was appointed major-general of Ohio militia. On 14 May he was commissioned major-general in the regular army and assigned to the Department of the Ohio, embracing that State, Indiana, Illinois, and, later, West Virginia. In May the Confederate government had despatched a small force to Grafton, W. Va., under Col. Porterfield, with the purpose of breaking the Baltimore & Ohio R.R. On 26 May Gen. McClellan threw troops from Ohio and Indiana into the State, defeating Porterfield at Philippi, 3 June. West Virginia seceded from Confederate Virginia 17 June, and set up a State government which was recognized by President Lincoln on the 26th. On 9 July United States senators were elected, and on the 13th they took their seats at Washington.

Kanawha Valley, Gen. Robert E. Lee was ordered to the command of West Virginia. The campaign for regaining the State failed, and by November the Confederate authorities decided to abandon the plan of occupying it. Gen. Lee was ordered to the command of the Department of South Carolina, Georgia, and Florida.

Early in July the army in front of Washington under Gen. Irwin McDowell prepared to move against the main Confederate army under Gen. Beauregard in front of Manassas. The flanks of each army toward the Shenandoah were protected by strong forces, Gen. Robert Patterson commanding on the Union side, and confronting Gen. Joseph E. Johnston.

The Union advance was hastened by an almost universal cry in the North of "On to Richmond!" Gen. McDowell left his camps on the Virginia side of the Potomac on the afternoon of 16 July with five divisions, encountering an advance brigade of Beauregard's army at Fairfax Court-House. This, with two other

CIVIL WAR IN AMERICA

brigades, withdrew with light skirmishing to the main lines, which had been established behind Bull Run, its right at the crossing of the railroad from Manassas to Alexandria, and its left at the crossing of the Warrenton turnpike from Alexandria. McDowell's forces were concentrated about Centreville on the 18th, and one brigade had quite an affair on that date at Blackburn's Ford. On the 20th Gen. Johnston arrived with all except one brigade of his army and assumed command. On the 21st McDowell, feinting in front, turned the Confederate left, and maintained a successful battle until near four o'clock, when the last brigade (three regiments) of Johnston's army arrived with a battery on the Union right and checked its advance. A brigade of Gen. Beauregard's troops moving farther to the left and more directly on the Union flank, changed this check into a retreat, which soon became a panic, and the entire Union army left the field in disordered haste. There was slight pursuit, but the panic increased, and only ended when the army was inside the fortifications of Washington. The North was astounded at the result, and the South correspondingly elated. Both sections immediately redoubled their efforts to prepare for vigorous war. Gen. McClellan was summoned from West Virginia and given command of the Department of the Potomac, and began to organize the troops pouring in from all parts of the North. On 20 August he took command of the Army of the Potomac, then for the first time organized under that title, and 1 November he was made commander-in-chief of the armies of the United States in place of Gen. Winfield Scott, who had asked to be retired on account of failing health. In the rapid organization going forward in both sections, the South had the advantage of the services of the majority of regular officers from that section who resigned their commissions and went with their States.

After Bull Run there was little heavy fighting during the remainder of 1861, both sides devoting their chief attention to establishing their lines. On 15 August Jefferson Davis ordered all Northern men to leave the South within 40 days; and the next day President Lincoln proclaimed the seceded States in insurrection and prohibited all intercourse. On the Union side, Gen. Butler in command of a joint expedition of land and naval forces, sailed from Fort Monroe, and 29 August captured the forts guarding Hatteras Inlet, opening the way to Pamlico Sound. On the lines of the Army of the Potomac the Union forces under Col. E. D. Baker, senator from California, were defeated at Ball's Bluff, 21 October, Col. Baker being killed. On 7 November a joint expedition from Annapolis, under Gen. Thomas West Sherman and Admiral S. F. Dupont, captured Port Royal, thus securing one of the most important harbors on the Southern coast. Gen. E. O. C. Ord, with a Union brigade, defeated a brigade under J. E. B. Stuart at Dranesville, 20 December. Gen. N. P. Banks succeeded Gen. Patterson in the Shenandoah; Gen. Rosecrans commanded in West Virginia.

On 29 Nov. 1861 Gen. Quincy A. Gillmore was ordered to reconnoiter Fort Pulaski, at the mouth of the Savannah River. On 1 December he reported that it could be reduced with batteries at 1,700 yards' distance, a third greater than foreign authorities laid down as practicable

against permanent works. His batteries opened 10 April 1862, breached the walls within 24 hours, and the fort surrendered 11 April.

Gen. Robert Anderson was assigned to the Department of Kentucky 28 May. His headquarters were fixed at Cincinnati on account of the position of Kentucky in regard to neutrality, but on 1 September his headquarters were moved to Louisville. On 8 October Gen. Anderson's health failing, Gen. W. T. Sherman succeeded to the command of the Department of the Cumberland. On 9 November this Department was discontinued, and under the title of the Department of the Ohio, embracing the States of Ohio, Michigan, Indiana, and most of Kentucky and Tennessee, Gen. D. C. Buell was assigned to the command, which he assumed 15 November. Gen. Ulysses S. Grant was ordered to the District of Southeastern Missouri with headquarters at Cairo, Ill., which he reached 4 September. On the 6th he seized Paducah at the mouth of the Tennessee, and 7 November was defeated in an expedition to Belmont. Gen. J. C. Frémont was ordered to Missouri, and assumed command 25 July. Before his arrival Gen. Lyon had moved against forces under Gen. Sterling Price with which ex-Governor Jackson was seeking to regain the State, and in the battle of Wilson Creek, 10 August, where Gen. Ben McCulloch commanded, Lyon was killed and Price occupied southern Missouri. Frémont, upon assuming command, advanced against Price, and occupied Springfield. Gen. H. W. Halleck succeeded Frémont, assuming command 19 November. Gen. David Hunter then in command at Springfield withdrew under orders, leaving the Confederates in possession of southern Missouri for the rest of the year.

On the Confederate side, Gen. Joseph E. Johnston commanded the Army of Northern Virginia, "Stonewall" Jackson was in the Shenandoah, Gen. Robert E. Lee in West Virginia until November, Gen. Humphrey Marshall and Gen. G. B. Crittenden in eastern Kentucky, Gen. A. Sidney Johnston at Bowling Green, Gens. G. J. Pillow, J. B. Floyd, Simon B. Buckner, and N. B. Forrest at Fort Donelson, Gen. Leonidas Polk at Columbus, Ky., and Gen. Price in Missouri. Thus stood the opposing lines at the close of 1861. Half the year had been spent in establishing them. The campaigns of 1862 began early and were prosecuted with the greatest vigor on both sides.

From January to April Gen. H. H. Sibley, with Texas forces, was engaged in attempting to secure New Mexico to the Confederacy. He inflicted much loss on Union posts and commands under Gen. E. R. S. Canby, but abandoned his purpose the middle of April and retired to Fort Bliss.

On 6-8 March a severe battle occurred at Pea Ridge, or Elkhorn Tavern, Ark., between the forces of Generals S. R. Curtis and Earl Van Dorn, resulting in the retreat of the latter.

As Gen. George H. Thomas was concentrating to attack Gen. Crittenden at Beech Grove, Ky., opposite Mill Springs on the Cumberland River, the latter marched at night from his entrenchments and attacked Thomas at Logan's cross roads the morning of 19 January. The Confederates were defeated, pursued to the river, and dispersed. This, with Gen. J. A. Garfield's movement up the Big Sandy, and his defeat of

CIVIL WAR IN AMERICA

Humphrey Marshall at Prestonburgh, 10 January, broke the right of the Confederate line through Kentucky. On 6 February Admiral Foote's fleet, supported by Grant's forces, captured Fort Henry on the Tennessee, and Grant's army, moving at once to Fort Donelson on the Cumberland, forced its surrender on the 16th, with about 15,000 men. Gen. A. Sidney Johnston then evacuated Bowling Green 15 February, and Gen. Leonidas Polk withdrew from Columbus 3 March, the movements of the latter being hastened by Gen. John Pope's advance on New Madrid and Island No. 10. This latter was captured 7 April. The Confederate forces in Kentucky and Tennessee then withdrew to the line of the Memphis & Charleston R.R., Gen. Johnston establishing his headquarters at Corinth. Gen. Buell, moving rapidly from Kentucky, occupied Nashville, 25 November. Gen. Johnston, learning that Buell was to join Grant, whose army had been brought from Fort Donelson to Pittsburg Landing, and was

found that the Confederates had already evacuated the place. After a short pursuit, under Pope and Buell, as far as Blackland, the Union army was concentrated at Corinth, and extensive fortifications were erected. The army was soon divided, and Buell with the Army of the Ohio was sent toward Chattanooga, with orders to repair the railroad as he advanced. Gen. Braxton Bragg, who had succeeded Beauregard, proceeding to Chattanooga by way of Mobile and moving rapidly north behind the Cumberlands, compelled Buell to withdraw to the Ohio River to protect his department, which included Indiana, Ohio, and Michigan. Gen. E. Kirby Smith, at the same time, invaded Kentucky by way of Cumberland Gap, defeated Union forces at Richmond, 30 August, and threatened Cincinnati. Buell, upon reaching Louisville, advanced upon Bragg. On 8 October resulted the battle of Perryville, by which Bragg was compelled to abandon Kentucky. Passing through Cumberland Gap, he retired to Chattanooga,

camped there awaiting Buell, marched from Corinth to attack Grant before the junction could take place. The Union army was unexpectedly attacked 6 April at Shiloh Church, two miles and a half in front of Pittsburg Landing and forced back to the immediate vicinity of the landing. The advance of Buell arrived about sundown, and during the night four divisions, three of Buell's army and Lew Wallace's of Grant's, reached the field. The next day the Confederates under Gen. Beauregard, being largely outnumbered, were defeated and returned to Corinth. Gen. A. Sidney Johnston was killed near the close of the first day's fight.

Gen. Halleck arrived from St. Louis 11 April and took command. Gen. Pope's army was brought from Island No. 10. On 30 April an advance began on Corinth by slow approaches. The Confederates brought Price and Van Dorn from west of the Mississippi. On 30 May Gen. Halleck's lines were close to the city, and an attack was meditated, when it was

whence he advanced to Murfreesboro in central Tennessee, and went into winter quarters.

During the operations at Pittsburg Landing and Corinth Gen. O. M. Mitchell advanced with a division from Murfreesboro 5 April, reached Huntsville 11 April, and seized the Memphis & Charleston R.R. from Decatur to Bridgeport. Gen. J. S. Negley's brigade crossed the mountains and bombarded Chattanooga 7 June. Mitchell's operations drew Gen. E. Kirby Smith from east Tennessee, and left the way open for Gen. G. W. Morgan at Cumberland Ford, Ky., to seize Cumberland Gap.

In September Price and Van Dorn, who had previously joined Beauregard from beyond the Mississippi, moved against Grant and Rosecrans in the region of Corinth. Price was defeated by Rosecrans 19 September, at Iuka, and Van Dorn, supported by Price, 4 October, at Corinth. From this campaign Rosecrans was sent to relieve Buell in command of the Army of the Cumberland, then styled the Fourteenth

CIVIL WAR IN AMERICA

corps. On 30 October Gen. Rosecrans relieved Gen. Buell, and concentrated his army at Nashville. On 26 December he moved toward Murfreesboro to attack Bragg. The battle began on the last day of the year, and continued during the days of 1-2 Jan. 1863. Gen. Bragg retreated the night of 3 January, eventually taking up positions at Shelbyville, Tullahoma and Wartrace. Gen. Rosecrans occupied Murfreesboro. The respective armies remained on these lines until Rosecrans' advance in June 1863.

While Rosecrans was succeeding at Murfreesboro, there was a noted Confederate victory at Galveston. Gen. Magruder, with a fleet of ordinary river boats, protected with hay and cotton bales, captured the Harriet Lane 1 January, sunk the gunboat Westfield, and received the surrender of the forces holding the city. The Confederate Alabama, arriving shortly after, captured the gunboat Hatteras.

Both river fleets of armored and unarmored gunboats, mortar-boats, and rams were actively engaged on the western rivers. The Union fleet, Commodore A. H. Foote, was composed of 45 vessels of various classes, and 38 mortar-boats. The Confederate fleet, Commodore Montgomery, was somewhat less, but contained several formidable vessels. Commodore Foote's gunboats captured Fort Henry on the Tennessee, and played an important part at Fort Donelson, Pittsburg Landing, and New Madrid. Commodore Montgomery awaited Foote's fleet, now under the command of Commodore C. H. Davis, before Memphis. The Union fleet was made up of 5 gunboats with 68 guns, and 4 rams; the Confederates of 8 gunboats with 28 guns. After a desperate battle, 6 June, against great odds, the Confederate flotilla was destroyed, and Memphis surrendered to the fleet. Davis left Memphis 29 June, and 1 July reached Young's Point, where he joined Admiral David G. Farragut's fleet from New Orleans, which had run the Vicksburg batteries.

The year 1862 opened at the east with very general dissatisfaction over the long inaction of Gen. McClellan. Gen. Joseph E. Johnston was at Manassas and Centreville with some 50,000 men, but Gen. McClellan, misled by his secret service, continually insisted that there were three times that number. The Army of the Potomac numbered fully 150,000 present for duty. The Potomac was blockaded, and the Confederate flag floated on Munson's Hill in sight of Washington. On 31 January President Lincoln gave McClellan a peremptory order to move on Manassas not later than 22 February. McClellan asked leave to present a plan of his own for a movement down the Potomac, up the Rappahannock, across to York, and thence to Richmond. While he was discussing it, Johnston, placing "Quaker guns" in his embrasures at Centreville, withdrew unmolested behind the Rappahannock to a line of works and field depot already prepared.

Just as his movement began occurred the ominous attack, 8 March, of the Confederate ironclad Merrimac, Flag Officer Franklin Buchanan, which suddenly moved out from Norfolk and attacked the Union fleet in Hampton Roads, sinking the frigate Cumberland, capturing and destroying the frigate Congress, doing much other damage, and startling the entire eastern coast. On resuming operations the next

day the Merrimac was met and foiled by the Monitor, Lieut. John L. Worden, which had just arrived. The Merrimac then retired to Norfolk, being blown up when the Confederates evacuated that city, 9 May.

McClellan was allowed to undertake his Peninsula campaign. On 11 March he was relieved from the general command of the armies. The Army of the Potomac was transported to Fort Monroe, and the movement up the peninsula toward Yorktown began 4 April. Heavy rains caused delays from the start. It was found at Washington that the designated number of men had not been left for the proper defense of the capital. McDowell's corps was therefore retained. Arriving before Yorktown with about three times the strength of the enemy, he concluded to lay regular siege to the position. Parallels were therefore opened, nearly 100 heavy siege guns were brought up, and at the end of a month, as his batteries were about to open, Gen. J. E. Johnston evacuated the place 3 May and withdrew toward Richmond. He halted at Williamsburg, where on the 5th an unsupported attack was made upon his lines, and at night he withdrew toward Richmond. McClellan followed to the Chickahominy. On 15 May the Union fleet in the James made an unsuccessful attack on Drewry's Bluff, eight miles below Richmond. On 20 May the right of his army crossed the Chickahominy and advanced to Seven Pines, or Fair Oaks, about five miles from Richmond, where he was attacked by Gen. Johnston 31 May. The prompt advance of Sumner's corps from the other side of the Chickahominy prevented serious disaster. At the close of the day Gen. Johnston was badly wounded and carried from the field. Gen. Gustavus W. Smith commanded temporarily, and was succeeded 2 June by Gen. Robert E. Lee, who continued in command of the Army of Northern Virginia until Appomattox. On 1 June the battle was renewed by the Confederates, the troops regained their lost ground, and Lee withdrew to the fortifications of Richmond.

On 16 June the Union forces on James Island in Charleston harbor, under Gen. Benham, met with a severe repulse at Secessionville. Gen. "Stonewall" Jackson, by a brilliant campaign in the Valley, had prevented the most of McDowell's corps, then in the vicinity of Fredericksburg, from reinforcing McClellan. By moving rapidly down the Valley he defeated Banks at Winchester and forced him across the Potomac, 26 May. Returning, he defeated Gen. J. C. Frémont at Cross Keys, 8 June, on one flank, and Gen. James Shields at Port Republic, 9 June, on the other, and after a week spent in deceiving Gen. Frémont into the belief that he was about to advance down the valley, by a rapid and unsuspected movement he appeared 25 June at Ashland on the flank of McClellan's army in front of Richmond. Then followed the Seven Days' battles, beginning with Mechanicsville 26 June, and ending at Malvern Hill 2 July, whence the Army of the Potomac withdrew to Harrison's Landing on the James. The only victories of the series were the first and last battles. The Peninsula campaign had ended as a disastrous failure. Gen. McClellan had been relieved from the command of all the armies 11 March, retaining that of the Army of

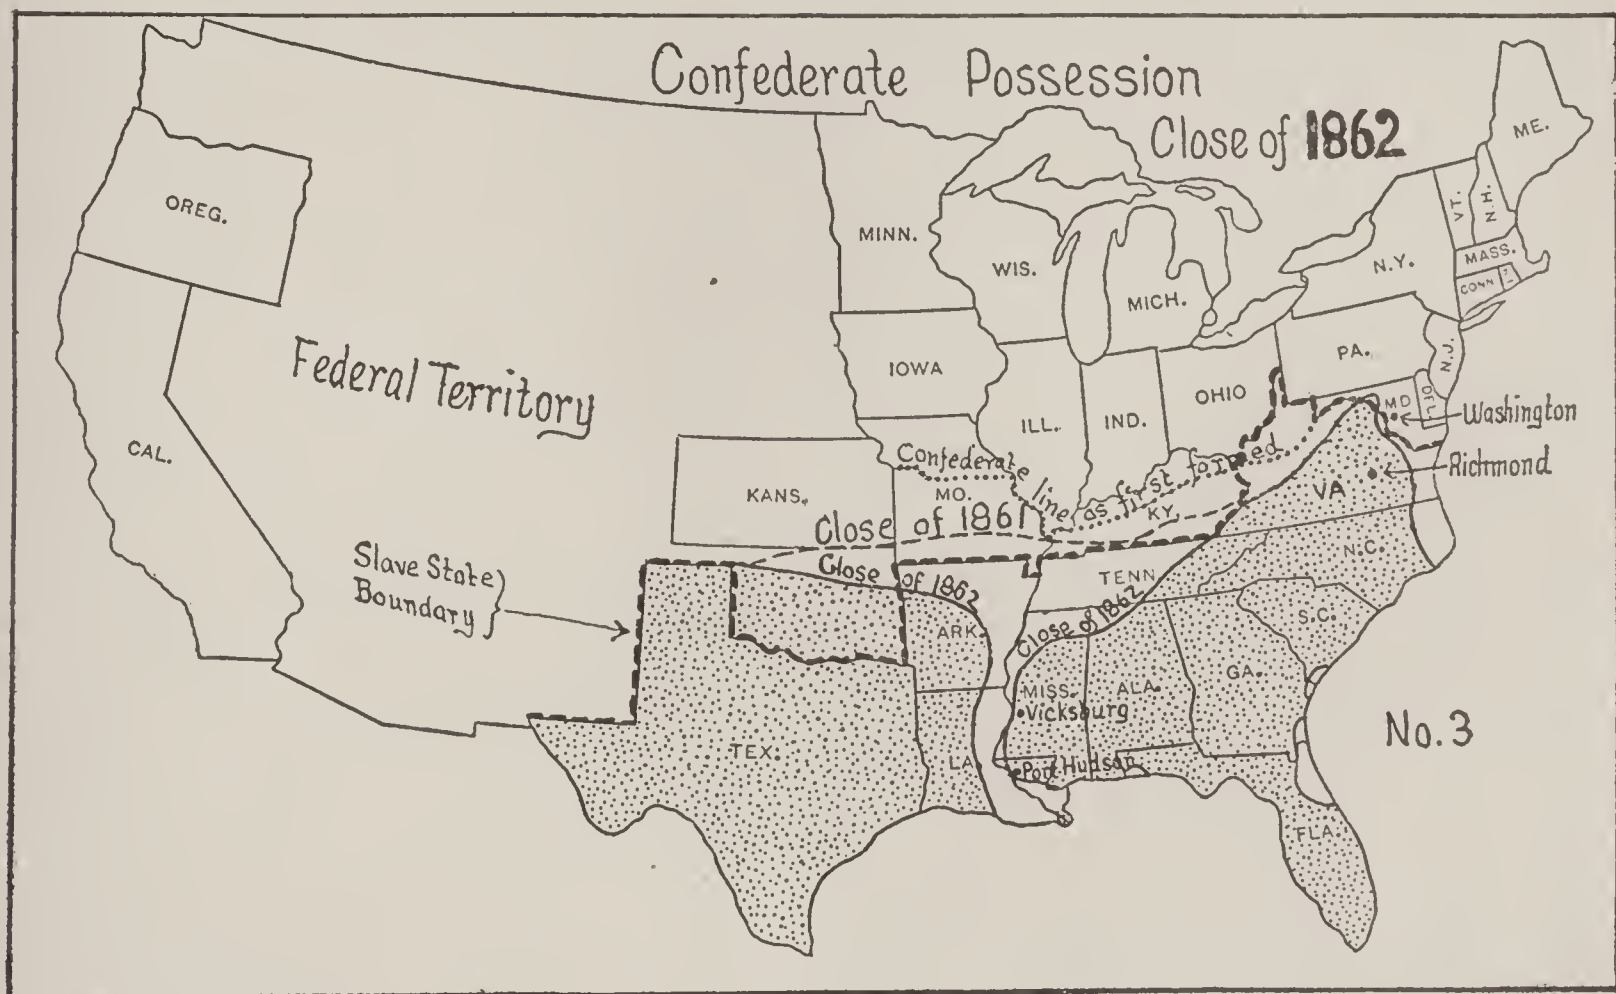

CIVIL WAR IN AMERICA

the Potomac, and Halleck assumed the chief command 23 July.

Against McClellan's protest, it was decided to withdraw his army from the Peninsula to the vicinity of Washington. To cover this movement, and protect Washington, Gen. John Pope was given command of the Army of Virginia, organized with the corps of McDowell, Banks, and Frémont. Pope concentrated his army north of Culpeper, and began with his cavalry to operate toward Lee's railroad communications at Gordonsville. Lee, though McClellan's army was still within striking distance of Richmond, at once sent a portion of Jackson's and Gen. James Longstreet's corps to Gordonsville. Pope took the field 29 July, and threatened Gordonsville again. "Stonewall" Jackson advanced on the 7th, reaching Cedar Mountain on the 9th. Here Banks attacked and was defeated. Jackson retired beyond the Rapidan, and upon Lee, with Longstreet, coming up, Pope retired behind the Rappahannock. By a long

battle of Chantilly. Pope then, under orders, 2 September, withdrew his army to the fortifications of Washington.

Pope was then relieved; his forces were added to the Army of the Potomac, and McClellan took command of the combined army. The first Confederate invasion of the North followed. On 3 September Lee put his army in motion from Chantilly toward the Potomac. The crossing was accomplished in the vicinity of Leesburg on the 5th, the army moving forward to Frederick, where, on the 7th, Lee issued a proclamation setting forth that his army had come to help them regain the rights of which they had been despoiled. This was coldly received. Upon learning that the garrison of Harper's Ferry had not withdrawn, he detached forces which invested and captured that place with its garrison of 11,000 men and over 70 guns. Lee, who, with Longstreet's command, had marched to Hagerstown, turned back to hold Turner's Gap in South Mountain, but was

detour, by way of Salem and Thoroughfare Gap, Jackson moved rapidly around Pope's right and 26 July destroyed his stores at Bristoe Station and Manassas in his rear, retiring to the former battlefield of Bull Run. On the 23d Reynolds' division from the Army of the Potomac joined McDowell, and on the 25th Gen. S. P. Heintzelman's corps, two divisions, arrived, and the next day Fitz-John Porter's corps of two divisions reached Pope. The battle of Gainesville followed on the 28th, resulting in the retirement of two of McDowell's divisions. At Groveton on the 29th the head of Longstreet's forces reached the field and took part in the closing fight. All the battles of the campaign had been desperately fought by both sides. On the 30th occurred the second battle of Bull Run. Pope was defeated, but withdrew unmolested to Centreville beyond Bull Run. Here he was joined by the strong corps of Sumner and Franklin from McClellan's army. A flank movement by Jackson led to the

defeated on the 14th and fell back to Sharpsburg, where he was subsequently joined by the forces detached against Harper's Ferry.

McClellan advanced from Washington 5 September toward Frederick, Md., the right wing and centre passing through that place on the 13th, the right moving to Turner's and the left to Crampton's Gap. Both these positions were carried on the 14th after sharp fighting. On the 15th Lee took position on the high ground beyond Antietam Creek, and in front of Sharpsburg. Gen. Joseph Hooker's corps attacked his left toward evening of the 16th, the fighting continuing until after dark. The general engagement began at daylight on the 17th, lasting for 14 hours, the losses being greater than for any one day's fighting of the War. The advantages were with the Union army, though Lee maintained his lines during the 18th, but at night withdrew and crossed the Potomac, ending the first invasion of the North. Lee remained a month about Winches-

CIVIL WAR IN AMERICA

ter, and upon the Union Army's crossing into Virginia and moving toward Winchester he took position behind the Rappahannock.

Near Warrenton, 7 November, McClellan was superseded by Gen. Ambrose E. Burnside, under an order dated 5 November. The latter took position opposite Fredericksburg 19 November, and, 13 December, forced a crossing into the city and below it. After great slaughter, largely incurred in assaults on Marye's Heights, he was repulsed and obliged to recross the river. The next month he attempted to cross above Fredericksburg and turn Lee's left. An unusual storm made advance impossible, the army finding itself actually stalled, the movement becoming known as the great Mud March. After this failure Burnside was relieved by Hooker 26 Jan. 1863.

The navy was active and effective throughout 1862. The blockade became exceedingly stringent for the Confederacy; warlike and commercial supplies alike were very difficult to obtain. On 11 January Gen. Burnside and Commodore L. M. Goldsborough sailed from Fort Monroe, capturing Roanoke Island 5 February, Newbern, 14 March, and taking Fort Macon with its garrison 26 April.

Gen. Butler and Admiral Farragut sailed from Fort Monroe 25 February for a move against New Orleans. After a terrific engagement, participated in by Commander D. D. Porter with his mortar-boats, and in which the Confederates exhibited great endurance, the chain across the river below forts St. Philip and Jackson was cut, and 24 April Farragut forced his fleet past the forts, and after terrific fighting, during which the *Varuna* was sunk by the fire of the forts, appeared before New Orleans on the 25th, Gen. Lovell, who held the city with a small force, some 3,000, retiring. Gen. Butler arrived with his troops 1 May, and took full possession, taking Baton Rouge 9 May, and Natchez on the 13th, neither being fortified. Farragut's fleet then ascended the Mississippi. He ran past the batteries at Vicksburg and joined Commodore Foote's (Davis') fleet from Memphis at Young's Point. Retiring to New Orleans, thus running the Vicksburg batteries a second time, he found letters from Washington urging him to clear the Mississippi. On 25 June his fleet, with Porter's mortar fleet, was assembled at Vicksburg, and on the 28th, after a short engagement, two ships and five gunboats ran the batteries and again joined Davis' fleet above the city. On 15 July the Confederate ironclad *Arkansas* came out of the Yazoo, ran directly through the Union fleet, none of its vessels having steam up, and gained the shelter of the Vicksburg batteries. Farragut ran the batteries that night, and attempted to destroy the *Arkansas* while passing the city wharves, but failed. On 20 July his fleet was ordered to New Orleans, where it arrived on the 29th.

Grant, from Corinth, 1 November, began his first move against Vicksburg, by ordering his troops forward to Grand Junction, purposing to move along the railroad by way of Holly Springs and Grenada to the rear of the city, while Sherman should co-operate from Memphis. A raid by Forrest destroyed long reaches of railroad above Jackson, and the destruction of the depot of supplies with its immense stores at Holly Springs, 20 December, by Van Dorn,

effectually paralyzed Grant's advance toward Vicksburg.

During Forrest's and Van Dorn's operations east of the Mississippi Gen. T. C. Hindman, in Arkansas, attacked Gens. F. J. Herron and J. G. Blunt at Prairie Grove, but retreated after a severe engagement. On 16 December Gen. N. P. Banks relieved Gen. Butler at New Orleans.

Sherman was then sent, 20 December, from Memphis down the Mississippi to ascend the Yazoo and attempt the capture of the left flank of the defenses of the city at Haines' Bluff. He assaulted at Chickasaw Bayou, 29 December, with disastrous results, and returned to the mouth of the Yazoo, where he was met by Gen. J. A. McClernand with orders to assume general command. This officer at once moved up the Arkansas River with Porter's gunboat fleet and Sherman's and G. W. Morgan's corps, captured Fort Hindman 11 January, and returned to Young's Point. From this position the Vicksburg campaign of 1863 began, which opened the Union operations of that year.

The first attempt was to cut a canal across the peninsula opposite Vicksburg, which would allow the army to move below Vicksburg. After working on this from 22 January to 7 March, a flood destroyed it. Efforts were next made to open a way through Lake Providence to the Red River, making a circuit of 350 miles to a point below the city. Both this plan and one for the east side through the Yazoo pass leading to the rear of the city, being actively opposed by the Confederates, and found otherwise exceedingly difficult, were abandoned.

A way was finally found from Milliken's Bend by way of New Carthage to a point on the river opposite Bruinsburg. On the night of 16 April the memorable running of the Vicksburg batteries by the fleet of Admiral Porter, convoying transports, was successfully accomplished. The means of ferrying his forces over the Mississippi being thus secured, the advance of the army crossed 30 April. Port Gibson was captured 1 May, after a stubborn and most gallant defense against a greatly superior force by Gens. Bowen, Baldwin, and Cockrell. Grant was then on solid ground in rear of Vicksburg.

He moved at once to intervene between Pemberton at Vicksburg and Johnston, who was seeking a junction with Pemberton. Johnston was forced out of Jackson by Sherman's and Gen. James B. McPherson's troops 14 May. Grant then turned toward Pemberton, advancing from Vicksburg, defeated him at Champion's Hill on the 16th, again at Big Black Bridge on the 18th, whence Pemberton withdrew into Vicksburg, followed by Grant. On the 19th Grant ordered an assault, which was repulsed, and again on the 22d, with the same result. A regular siege was then undertaken, and Pemberton's army was starved out and surrendered 4 July.

On 24 May 1863, Gen. J. M. Schofield, who had been active and prominent in Missouri from the first, relieved Gen. Curtis in command of the Department of the Missouri. During the Vicksburg campaign he sent all troops that could be spared to Grant. Upon their return he was able to advance Gen. Steele to the line of the Arkansas and hold it thereafter. During 8-14 June Grant received a division from Gen. S. A. Hurlbut's command, under Gen. Sooy

CIVIL WAR IN AMERICA

Smith, one from the Department of the Missouri, under Gen. Herron, and two divisions of the Ninth corps under Gen. J. G. Parke. During the operations of Gen. Grant about Vicksburg Gen. Banks was active in Louisiana. After three unsuccessful attempts against Port Hudson, which he twice assaulted, it finally surrendered, 8 July, upon hearing of the capture of Vicksburg.

In January, February, and March 1863, the Union ironclads under Admiral Dupont made unsuccessful attacks upon Fort McAllister in the Ogeechee River, but in one of them destroyed the noted blockade-runner Nashville. The Confederates were active on the North Carolina coast early in 1863, Gen. Hoke capturing Plymouth 20 April.

The campaign of the year in the Army of the Potomac was opened by Hooker. On 28 April Gen. John Sedgwick's corps was thrown across the Rappahannock at Fredericksburg, the rest of his army crossing above at Kelly's

forced further to the rear. The 4th passed without an engagement, as Lee, with the greater part of his army, was at Salem Church. The night of the 5th Hooker, thoroughly defeated, recrossed the river, and his army was reassembled at Falmouth.

On 3 June Lee, from Fredericksburg, began his second invasion of the North, Longstreet's troops leading. After minor engagements in the Valley, Gen. R. S. Ewell's advance crossed the Potomac at Williamsport 15-16 June, moved forward to Chambersburg, and had reached the vicinity of Harrisburg and Columbia on the Susquehanna, and captured York 28 June, when recalled to Gettysburg, where Lee's army was concentrating.

Meantime, the Army of the Potomac under Hooker reached the vicinity of Frederick, when Hooker, not being allowed to order the garrison of Harper's Ferry, over 10,000 strong, to join him, asked to be relieved, and Gen. George G. Meade succeeded him. The two armies met

ford, and thence advancing across the Rapidan at Germanna and Ely's fords, to and beyond Chancellorsville. His force was fully twice that of Lee. On 1 May Hooker's advance fell back to Chancellorsville. On 2 May "Stonewall" Jackson's corps of three divisions was descried at different times during the day from several points of the Union line moving toward its right. No preparations were made to guard against a flank attack, though orders to that effect were early given. At 6 P.M., while the troops of the Eleventh corps holding the right were at supper, Jackson's solid columns burst upon them and disastrously routed the Union right. On the 3d Sedgwick's corps advanced from Fredericksburg to Salem Church, was defeated that afternoon, and recrossed the river on the night of the 4th. The night of the 2d Jackson, reconnoitering in front of his pickets, was mistakenly fired on by them and mortally wounded. On the 3d, by hot fighting, Hooker's lines were

at Gettysburg 1 July. A three days' battle followed. Lee retreated the night of the 3d, but succeeded in recrossing the Potomac without a battle, and after a month's rest in the Shenandoah, resumed his former lines behind the Rappahannock. (See GETTYSBURG, BATTLE OF.) Meade followed later to that stream. With the exception of the Mine Run campaign, 26 November to 2 December, inaugurated by Gen. Meade, but without important results, both armies remained in their camps until the spring of 1864.

The campaign of the Army of the Cumberland for 1863 began 23 June, the objective being the recovery of middle Tennessee. The Union army under Rosecrans held the line of Stone's River, headquarters at Murfreesboro; the Confederates under Gen. Bragg, the general line of Duck River, with headquarters at Tullahoma. By feinting against Bragg's left at Shelbyville and turning his right, both flanks being established in entrenched camps, Bragg was

CIVIL WAR IN AMERICA

forced out of his lines and retreated over the Cumberlands and across the Tennessee to Chattanooga. It was chiefly a strategic campaign, carried on in continuous rains of most unusual severity, occupying nine days, and involving a total loss of only 560 killed, wounded and missing. The Union line advanced to the western base of the Cumberland Mountains.

The succeeding campaign, having Chattanooga for its objective, required extensive repairs to the railroad and an accumulation of supplies sufficient for leaving a base for a month, and moving in a mountainous region largely barren. The movement began 16 August. Bragg was at Chattanooga. Rosecrans' army lay along the western base of the Cumberlands from Winchester to McMinnville. Rosecrans feinted with his left corps, Gen. T. L. Crittenden's, by throwing it from McMinnville over the mountains, its advance being into the valley of the Tennessee above Chattanooga. This led to the belief that a junction was to be formed with Burnside from Knoxville, or an attack made upon the city from that quarter. Bragg, as a result, fixed his attention upon this move. Meantime the centre corps, Thomas', and the right, Gen. A. McD. McCook's, crossed the Cumberlands and the Tennessee River some 30 miles below Chattanooga, continued over the Sand Mountains, and ascended the Lookout range—all bold mountains with palisaded summits crossed only by very difficult and widely separated mountain trails. When Rosecrans' columns were ascertained to be on Lookout, Bragg, 7 and 8 September, withdrew from Chattanooga, the heads of the Union columns having in the meantime descended into McLemore's Cove, south of Chattanooga. Upon Bragg's reaching Lafayette, 26 miles south of Chattanooga, he awaited Longstreet's arrival from Virginia, meantime unsuccessfully demonstrating against Rosecrans' centre and left east of Lookout in the valley of the Chickamauga. Crittenden's corps, after having accomplished its diversion, had crossed the Tennessee, left one brigade in Chattanooga, 9 September, and moved south through Rossville to a position on Rosecrans' left at Lee and Gordon's Mill on the Chickamauga. Bragg, strengthened by Longstreet, started back 17 September toward Chattanooga, seeking to interpose between Rosecrans and that city. Rosecrans, by a night march, 18 September, proceeded toward Chattanooga, formed his lines between Bragg and the city, nine miles south of it, at Chickamauga. A two days' battle, 19 and 20 September, ensued for the possession of the roads to Chattanooga. At noon of the second day Longstreet broke through a gap at the centre of the Union lines, cut off two divisions of the right wing, and forced them with fragments of other divisions from the field, Rosecrans, McCook, and Crittenden being caught in the break. Gen. Thomas, with the greater part of seven divisions, held the field, and at night withdrew to Rossville and there reformed the army between Bragg and the city, thus securing its possession without further fighting. Bragg advanced on the 22d, and formed his lines in front of the city, which Rosecrans soon rendered impregnable by heavy earthworks. Bragg's lines embraced Lookout Mountain and Missionary Ridge, heights overlooking the city, the mountain position closing the river line of supplies. The sit-

uation of the Union army soon became precarious for want of food and forage. Hooker, with the Eleventh and Twelfth corps was ordered from the Army of the Potomac, reaching Bridgeport 30 September; and Sherman, with four divisions from the vicinity of Vicksburg. Grant was assigned to general command, arriving 23 October. Rosecrans was replaced by Gen. George H. Thomas 19 October. The river line of supplies was opened 28 October upon a plan devised by Gen. Rosecrans and executed by Gen. W. F. Smith, Hooker being brought forward to Lookout Valley, and troops from Chattanooga forming a junction with him. The battle of Chattanooga occupied three days. On 23 November Thomas, in the centre, threw forward one division, supported by four, and captured the advanced line of Bragg. The night of the 23d Sherman crossed the river six miles above the city and seized an unoccupied range overlooking the north end of Missionary Ridge. On 24 November Hooker carried the western and northern slopes of Lookout Mountain, and the next day moved against the south end of Missionary Ridge. The afternoon of 25 November Thomas, at the centre, assaulted Missionary Ridge, his storming line being two and a half miles front, carried the earthworks at the foot of the ridge, and next the ridge itself, capturing 37 guns on the summit, and forcing a general retreat. From this time Chattanooga remained in Union control to the close of the war. (See CHATTANOOGA, BATTLE OF; CHICKAMAUGA, BATTLE OF.)

The same day that Rosecrans started from Winchester, Tenn., for Chattanooga, Burnside with the Army of the Ohio (Twenty-third corps) left Lexington, Ky., for Knoxville, Tenn., his Ninth corps being still with Grant near Vicksburg. He reached Knoxville 2 September. Being ordered to assist Rosecrans at Chattanooga, he was held by demonstrations of a small force from making the junction. On 4 November Bragg despatched Longstreet's corps from Chattanooga to besiege Knoxville. On the 29th he assaulted Fort Saunders and was repulsed with serious loss. Sherman, who was sent by Grant from Chattanooga after the success there, now approaching, Longstreet retreated to Virginia. On 16 December Burnside was relieved and ordered to recruit the Ninth corps, which was assembled at Annapolis.

Throughout these operations both Union and Confederate forces in Charleston harbor had been engaged in formidable attack and most stubborn and brilliant defense. Gen. Gillmore, who had reached Charleston 12 June, immediately undertook engineering and siege work of unprecedented character as to success at long ranges; and finally, after several severe repulses, forced the evacuation of Fort Wagner 7 September, and soon shells reached the city from his long-range guns. While some of these fell in Charleston 31 August, the regular bombardment began 16 November.

On 28 Jan. 1864, Gen. Rosecrans was ordered to relieve Gen. John M. Schofield in Missouri, the latter being assigned a little later to the command of the Department and Army of the Ohio at Knoxville. Gen. Rosecrans repulsed the invasion of Gen. Price, and then sent troops not needed to Gen. Thomas at Nashville. On 20 February an expedition sent from Charleston to Florida by Gen. Gillmore under

CIVIL WAR IN AMERICA

Gen. Seymour, was disastrously defeated by Gen. Finegan at Olustee. From February to December 1864, Gen. Forrest was active throughout west Tennessee and northern Mississippi and Alabama, performing much brilliant cavalry service, to the continued disturbance of all Union commands in those regions.

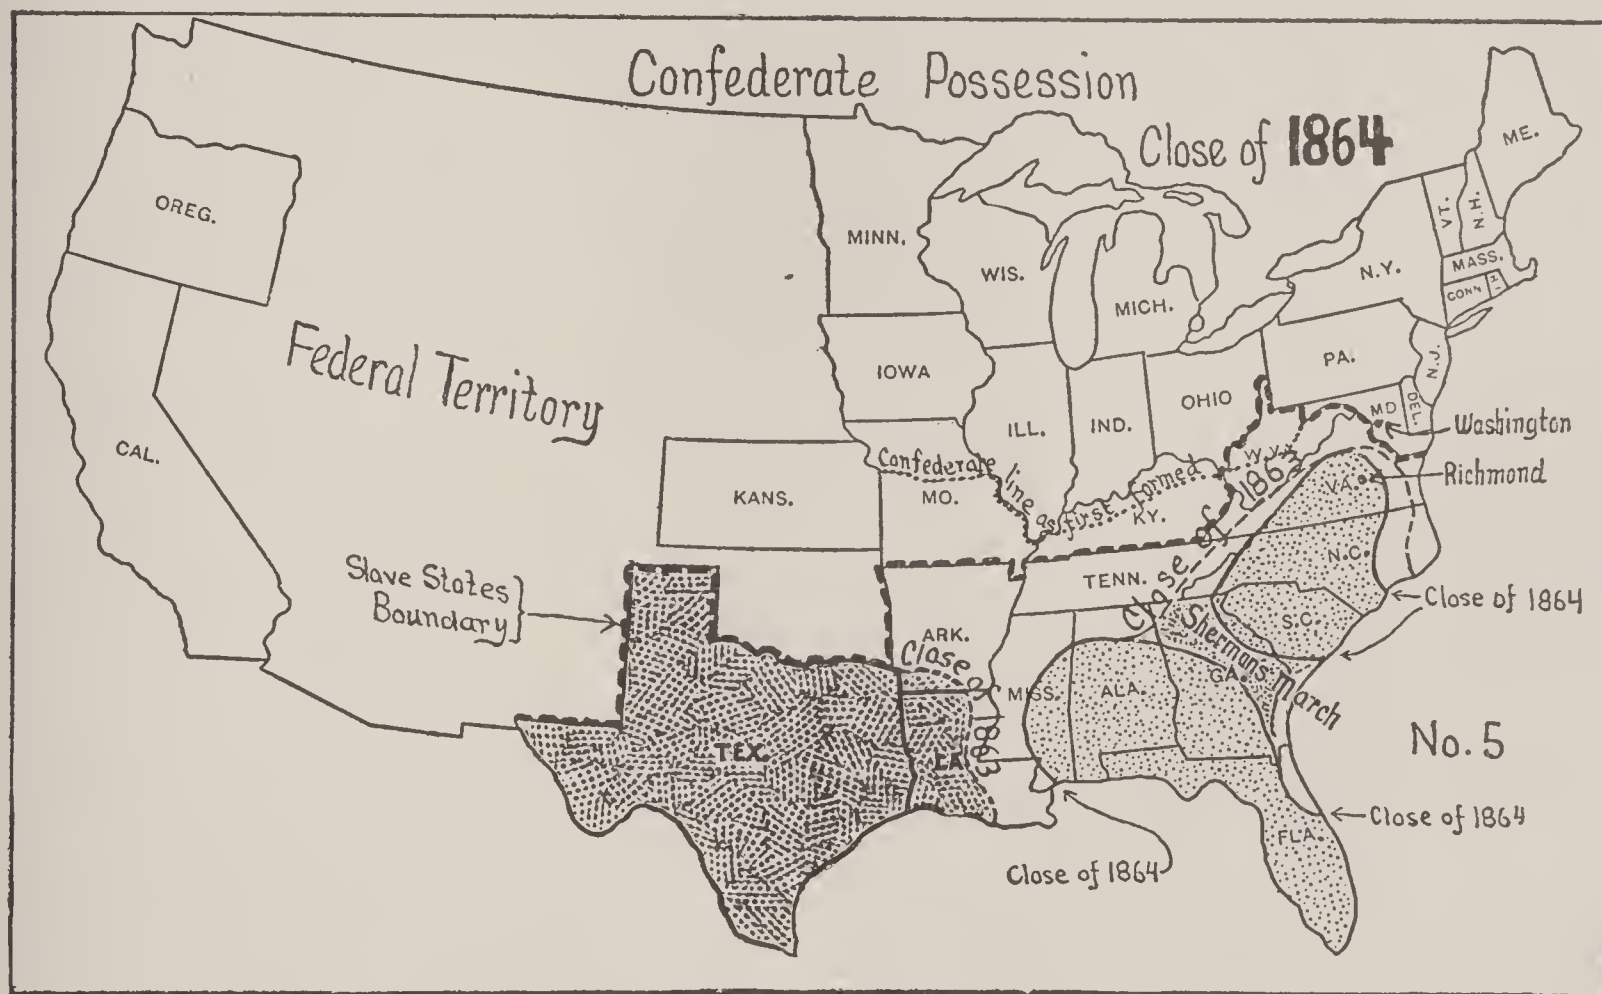

Early in the spring of 1864 Banks, supported by Admiral Porter's fleet, was ordered to advance up the Red River. At Sabine Crossroads 8 April, he was defeated and driven back to Pleasant Grove, and thence to Pleasant Hill 13 April, where A. J. Smith, from Sherman's army, re-enforced him. The fleet narrowly escaped capture by the falling of the river, and altogether the campaign was a decided failure. The defeat of Banks enabled the Confederate general, J. F. Fagan, to force Gen. Frederick Steele, who was advancing to co-operate with Banks, back to Little Rock. Banks was relieved 12 May by Gen. E. R. S. Canby.

On 12 March 1864, Gen. Grant, who had

mond by Lee's right. Sherman, with three armies, the Cumberland, under George H. Thomas, the Tennessee, under McPherson, and the Ohio, under Schofield, aggregating nearly 100,000 men, was to move against Johnston's army at Dalton and follow it. Banks was to leave the Red River country to Steele and the navy, abandon Texas, and move against Mobile with his 25,000 men, re-enforced by 5,000 from Missouri.

Grant established his headquarters with the Army of the Potomac, Meade having the full direction of the army under Grant's general orders. The Army of the Potomac moved toward the Rapidan in the early morning of 4 May, and by night all the troops had crossed.

Grant's force was about 119,000, and Lee's about 62,000. Lee pushed rapidly to his right and struck Grant's advance in the Wilderness 5 May. Terrific fighting followed till the night of the 6th. Lee pushed on to Spottsylvania, reaching it in advance of Grant and interposing on the

been commissioned lieutenant-general, that grade having been revived by Congress, was placed in command of all the armies. Early in April he had formed a plan for a combined movement of the armies to begin toward the last of the month, and had communicated the same to Meade with the Army of the Potomac, Butler at Fort Monroe, Sherman at Chattanooga, and Banks at New Orleans. The main Confederate armies were those of Lee, at Orange, with Longstreet at Gordonsville, confronting Meade in the vicinity of Culpeper, and Johnston at Dalton, Ga., facing Sherman in the vicinity of Chattanooga.

Grant's general plan was for Gillmore, from South Carolina, with 10,000 men, to join Butler at Fort Monroe, giving him 23,000 troops for a move up the James to capture City Point, threatening Petersburg and the rear of Richmond. Burnside, with 25,000 men assembling at Annapolis, was to join Meade, and the Army of the Potomac was to advance toward Rich-

line to Richmond. Both armies entrenched, and from the 8th there was bitter fighting until the night of the 20th, when Grant started for North Anna. From Spottsylvania 8 May, Sheridan, commanding Grant's cavalry, made a raid around Lee's army, encountering and defeating J. E. B. Stuart at Yellow Tavern 11 May, where Stuart was killed. Sheridan spent a day within the outer defenses of Richmond, and joined Butler on the James. Grant proceeded to move to his left, everywhere opposed by Lee, fighting heavily at North Anna and Bethesda Church, reaching Cold Harbor 2 June. On the 3d Grant assaulted along his whole line, to meet in an hour with terrible slaughter and repulse, so serious that an order for a second assault was not carried out. Grant had failed to interpose between Lee and Richmond. From Cold Harbor he sent Sheridan with his cavalry to occupy the attention of Fitzhugh Lee's and Hampton's cavalry while he withdrew to the James. Sheridan defeated both at Trevilian's Station. Grant

CIVIL WAR IN AMERICA

then moved without interruption to the James, reaching it 13 June, and crossing it in the vicinity of City Point and Bermuda Hundred. Gen. Butler had occupied these points 5 May. On the 14th Butler carried the outer defenses of Drewry's Bluff, but was thence driven back by Beauregard's troops, who had arrived from the south, and his contemplated movement toward Petersburg and the rear of Richmond was defeated. Lee occupied the Petersburg lines. Grant attacked the works several times unsuccessfully from 15 to 18 June. On 30 July an attempt on the works was made by exploding a mine. The explosion was a great success, but the assault to follow it was a failure. This was the battle of The Crater.

From the establishment of Grant's lines before Petersburg frequent and heavy fighting continued until about 1 November, but with little permanent impression on Gen. Lee's lines. The Union left, however, was extended across the Weldon R.R. On 28 September Gen. Butler, with two corps, crossed to the north side of the James and captured Fort Harrison, a position from which Richmond was seriously threatened. On 16 November Butler, supported by Porter's fleet, was sent to capture Fort Fisher, but failed. During the winter the lines of each army were greatly strengthened. On 7 December Grant had extended his left 20 miles to Hicksford on the Weldon R.R. On 22 June Gen. James H. Wilson, with two divisions of cavalry, moved against the railroads south of Richmond, destroying nearly 50 miles of track, and inflicting much other serious damage. His return route was blocked, but he brought his forces in with some loss of both artillery and trains. He had severed all railroad connections with Richmond, and they were not fully restored for several weeks. Gen. Franz Sigel's campaign began 1 May. On the 15th he moved up the Shenandoah to New Market, and was defeated, cadets from the Virginia Military Institute taking prominent part. At Grant's request Sigel was suspended and Gen. David Hunter assigned. The latter pushed on to Lynchburg, but was compelled by Gen. Jubal A. Early to retreat from that point by way of the Kanawha and Ohio rivers to Parkersburg, and thence by rail to the east. Gen. George Crook's wing of Sigel's column from the Kanawha penetrated to the Tennessee and Virginia R.R. at Wytheville.

On 6 May Gen. Sherman moved from the vicinity of Chattanooga against Gen. Johnston at Dalton. The Union army had in round numbers 100,000, the Confederates being about half as strong. After vainly attacking the gaps and ranges in front of Dalton for several days, Sherman passed his army through Snake Creek Gap leading to the rear of Dalton. This compelled Gen. Johnston to retire from his camps, and he was defeated at Resaca. Johnston resisted stubbornly at every step, but he was successively flanked out of every new position until he reached Atlanta. Fighting had been in progress at some points of the line from May till September. Johnston was succeeded by Hood 18 July, and on the 20th Hood attacked at Peach Tree Creek, and was repulsed with great loss. He then moved out of Atlanta and attacked, and was again defeated. Gen. McPherson, commanding the Army of the Tennessee, was killed. The next attack was at Ezra

Church 28 July, upon the Army of the Tennessee, this also being repulsed after three hours' severe fighting, with much loss.

On 2 September Sherman occupied Atlanta, which was evacuated as a result of his moving to the rear of the city on Jonesborough. Hood first raided Sherman's railroad communications, fighting heavily at Allatoona 5 October, and soon after moved northward. Gen. Thomas was sent to resist his movement if he invaded Tennessee, and Sherman started 15 November on his March to the Sea. While it was originally intended by Gen. Grant that he should move from Atlanta to Mobile, the harbor there having been captured 5-23 August by Farragut and Canby, he decided upon the alternative which Grant had suggested before the campaign opened, and started for Savannah.

The fight of Farragut's fleet in the harbor of Mobile, which decided Sherman's march to Savannah, was one of the most brilliant in naval warfare. The Confederate fleet was destroyed, including the far-famed ironclad ram Tennessee. Sherman reached Savannah with slight opposition. On 17 December he summoned Hardee to surrender. The latter refused, and on the night of the 20th retired with his force of 10,000 without molestation. The next morning the Union army entered.

Meantime Hood had invaded Tennessee with the entire army with which Sherman's three armies had been confronted from May till September. Gen. Thomas left with two small but excellent corps, by great exertion organized an army to oppose Hood. On 30 November Gen. Schofield, commanding in the field in front of Hood, inflicted a nearly fatal blow upon him at Franklin. After Gen. Thomas' forces were united at Nashville 15-16 December, he attacked Hood's entrenchments in front of the city and dispersed and practically annihilated his army.

The forced retreat of Hunter from Lynchburg over the mountains of West Virginia left the Shenandoah unprotected. Gen. Early entered it, drove Sigel across the Potomac, then on 9 July defeated Wallace, who was in small force at Monocacy, Md., threatened Baltimore and appeared before Washington 11 July. Here he was met by veterans of the Sixth and Nineteenth corps, Army of the Potomac, hurried to Washington by Grant, and forced into rapid retreat. Upon the withdrawal of the troops from the Army of the Potomac Early again sent a force under Gen. John McCausland, into Pennsylvania, and these invaders burned Chambersburg 30 July. Sheridan, being assigned to command, forced Early beyond Staunton; and devastating the Valley, he withdrew to Cedar Creek. While Sheridan was absent Early attacked and drove the army out of its camps. Gen. H. G. Wright, however, rallied the troops near Middletown and restored the battle. Sheridan arriving, the army advanced, and Early was so seriously defeated as to close the campaign in the Valley.

The first movement of the final campaigns of 1865 began 2 January in Tennessee, when Gen. Schofield with the Twenty-third corps left Columbia, Tenn., for Clifton on the river bound for the east. The corps left Alexandria on transports soon after 1 February, and landed at the mouth of Cape Fear River 9 February,

CIVIL WAR IN AMERICA

where the Tenth corps was established, which, under Gen. Alfred H. Terry, had captured Fort Fisher, that had been most stubbornly and gallantly defended against the army and the fleet by Gen. W. H. C. Whiting. Fort Anderson was attacked by army and fleet, and abandoned 19 February; the position of Town Creek was carried 20 February, and Wilmington was taken 22 February. Operating next by way of Newbern, Gen. R. F. Hoke was defeated at Kingston 10 March. Goldsboro was occupied by Gen. Schofield on the 21st. Sherman's army joined Schofield here on the 23d. On 26 January Gen. Terry had been despatched to co-operate with Admiral Porter in reducing Fort Fisher at the mouth of Cape Fear River. A previous expedition under Gen. Butler, 13-16 December, had failed, but the fleet had remained, and Porter had appealed to Grant to send another force. Terry's troops effected a landing above the fort 13 January. The next morning he was entrenched across the penin-

whelmed his left wing before the right wing, which was widely separated from the left, could reach it. On the 21st Johnston was defeated after sharp fighting, and Sherman marched for Goldsboro, which he reached 23 March.

On 2 March Sheridan advanced up the Valley, defeated Early at Waynesboro, and proceeded through Charlottesville and along the Richmond & L. R.R., destroying roads and stores, and joined Grant at Petersburg. Gen. James H. Wilson, operating under Gen. George H. Thomas, crossed the Tennessee 22 March with a thoroughly equipped mounted force of 12,500, and 1,500 dismounted to follow until horses could be captured. His first objective was Selma, Ala. A portion of Forrest's cavalry was encountered and defeated at Montevallo 30 March. The fortifications of Selma were carried against Forrest 2 April, and immense war supplies and plants for the manufacture of war materials destroyed. Montgomery surrendered 12 April; West Point was captured 15 April,

sula. Early on the 15th the fleet opened a terrific bombardment, which was continued until a force of marines was landed in the afternoon to co-operate in the assault of the army. This was delivered at 3.30 in the afternoon, the flank of the work next the river being carried. Then followed severe fighting for each succeeding traverse. It was not until 10 o'clock at night that the fort was finally carried. Sherman started northward from Savannah 1 February. Marching through swamps, and crossing all streams at flood, he was before Columbia on the 16th. It was surrendered without fighting the next day. Charleston, being cut off from interior communications, was evacuated by Gen. W. J. Hardee 18 February. Fayetteville, N. C., was reached 11 March. The first opposition stronger than skirmishing was at Averasboro 16 March, where Gen. Hardee made a brief stand. On 19 March Johnston's army, which had been collected on Sherman's front at Bentonville, checked his advance and nearly over-

after sharp fighting; Columbus was carried by a night assault 16 April; Macon surrendered 20 April. Here Wilson received notice of the Sherman-Johnston truce. An expedition, sent out 7 May by Wilson from Macon, under Col. Pritchard, Fourth Michigan, captured Jefferson Davis, 10 May, at Irwinsville, Ga. On 6 February the Confederates made a heavy attack at Hatcher's Run on Grant's left, but were finally repulsed with a Union loss of about 1,500. The night of 24 March Gen. J. B. Gordon made a daring and most successful assault upon the right of Grant's lines at Petersburg, capturing Fort Stedman and three strong works. These were recaptured the next day.

The Army of the Potomac was the last to move in the opening campaigns of 1865. It had occupied its lines before Petersburg without general movement from November till the last of March. The general movement, which was to the left, began on the 29th, and brought on

CIVIL WARS OF ROME — CIVILIS

the battle of Dinwiddie Court House and White Oak Road on the 31st, and the battle of Five Forks on April 1st, in which latter engagement the Confederates were defeated. On 2 April the Confederate entrenchments were carried, and Gen. Lee abandoned his lines during the night, having notified President Davis during the forenoon that he would begin a retreat on Amelia Court House that night. Jefferson Davis received this dispatch in church. He and his Cabinet immediately collected personal effects and Confederate archives, and left Richmond on a special train. Gen. Godfrey Weitzel received the surrender of the city on 3 April.

Gen. Lee's army was assembled at Amelia Court House 5 April, and continued its retreat at night. On the 6th Gen. Meade advanced on Amelia Court House, but, finding that Gen. Lee had left, he moved toward Deatonville (Sailor's Creek), where the most of Ewell's corps, the rear of Lee's army, was captured 6 April. About the same time some 10,000 men of the divisions of Anderson, Pickett, and Bushrod Johnson, were captured. Lee continued his retreat and reached Farmville on the morning of the 7th. Here his troops received their first rations since the retreat began. At 11 o'clock, Union troops appearing, the march was renewed, his men being greatly exhausted with loss of sleep, hunger, and hard marching. On this day the correspondence began between Gens. Grant and Lee, which, on the 9th, resulted in the surrender of Lee's remaining forces at Appomattox. The number paroled was 28,231 officers and men, extra duty men, and detailed men of every description, this remnant being all that was left within the control of Gen. Lee of his magnificent fighting machine, the Army of Northern Virginia.

In North Carolina Sherman and Schofield moved against Johnston, occupying Raleigh 13 April. On the 14th Johnston asked for a conference, and on the 18th terms of surrender were agreed upon, subject to the approval of the President of the United States. These, being deemed in part political, were disapproved, and Gen. Grant was sent to Raleigh to insist upon the same terms made with Lee. These Gen. Sherman demanded of and received from Gen. Johnston 26 April, and the War was over, though small independent forces were in the field for a short time thereafter, Gen. Dick Taylor, in Alabama, not surrendering to Gen. Canby till 4 May.

President Lincoln made nine calls for troops during the War. Under these about 2,800,000 men of all classes were enlisted, including emergency men of a few weeks, three, six, and nine months' men, two and three years' men, conscripts and substitutes. There were 52,000 drafted men held to service; 75,000 conscripts who sent substitutes; and 42,000 men who sent substitutes, although not themselves drafted.

The Confederate records are very deficient, having been largely destroyed. The best estimate from the data in the possession of the war department places the Confederate strength at something over 1,000,000. After Mr. Davis' calls of the first year a general conscription act was passed 16 April 1862, including all white men between the ages of 18 and 35 for the term of 3 years. On 27 Sept. 1862, this act was extended to include those of 45 years. On 17

Feb. 1864, the law was extended to those between 17 and 50, the term to be for the war.

According to the latest compilation of the record and pension office of the War Department, the total number of deaths from all causes in the Union army during the War was 359,528. As many records are incomplete, the actual number must be somewhat larger. On the basis of the figures given, there were killed in action, 67,058; died of wounds received in action, 43,012; died of disease, 224,586. The Confederate losses were quite as severe in proportion to strength, but the records are wanting to such an extent as to make definite estimates of little value.

H. V. BOYNTON.

Civil Wars of Rome, The, in their widest extent began with Tiberius Gracchus, and terminated with the election of Octavius Augustus to the empire, 133-131 B.C. In a more limited sense they mean the contest between Caius Marius and Cornelius Sylla, or Sulla (88-78 B.C.). The original cause of the civil war was the struggle between the oligarchy and the democracy of Rome. This struggle lasted till Sylla restored the senate to sovereignty; but this sovereignty was soon disturbed by Julius Cæsar (q.v.).

Civilian, in common speech a word denoting a person whose employments are wholly of a civil character as distinguished from one who belongs to the army or navy, while in legal acceptation it designates one who is learned in civil or Roman law.

Civi'lis, Germanic leader of the Batavi in their revolt against the Romans, 69-70 A.D. At one time he held a command in the Roman army, but being more than once charged with treason he escaped and roused the Batavians, his countrymen, to rebellion. Pretending to espouse the cause of Vespasian against Vitellius, he raised a powerful army, and inflicted severe defeats on the Romans. An imposing force sent against him he routed and shut up in the military station, Vetera Castra, which after a long siege capitulated, on which all its defenders were slaughtered. Fortune at last for-

CIVILIZATION — CIVILIZATION IN EUROPE

sook him, and he had to negotiate with the Romans, the Batavians returning to their allegiance. His fate is unknown.

Civiliza'tion (from the Latin *civilis*, "like a citizen" (*civis*), that is, having the virtues or qualities of a citizen), a term that may mean many things, but is commonly applied to the upward movements of peoples toward higher intellectual, moral, social, and industrial altitudes. "Whatever," says John Stuart Mill, "be the characteristics of savage life, the contrary of these, or the qualities which society puts on as it throws off these, constitutes civilization." The word means, therefore, social progress, the improvement or perfecting of the laws, both written and unwritten, which make for security and peace, and the harmonious development of individual life. The word is often used relatively, meaning the dominant influences of the present period, as when we speak of "our civilization." The most eminent writers who have dealt with this subject have chosen to treat it in different ways. Guizot in his history writes of political or institutional progress, and thus his definition of civilization differs from that of Buckle, who, minimizing institutions as resultant forces, treats the individual as paramount. Many are the influences that determine the character of civilization. Among these Buckle places climate, soil, food, and what he terms the "General Aspect of Nature." To these influences he attaches, perhaps, undue importance, inclining to the minimizing of those innate or inherited qualities in the different races of mankind. His history is written from the view-point of a necessitarian. His theory that moral truths are stationary, intellectual truths alone progressive, and that religion has done more harm by its persecutions than good by its moral and spiritual ministrations, must be taken as showing the bias of an otherwise valuable work, the chief merit of which is its assertion of the claims of the individual against interference in the name of authority. Not all writers hold to the view that our present civilization is a development from primitive rude conditions, but, on the contrary, contend that it was the original state of mankind from which the savage races have in reality descended, and that our present civilization is therefore an artificial approximation to conditions prevailing before the descent. But the other view—namely, that civilization is a development out of barbarous beginnings—is the one commonly held.

A kind of civilization may exist based upon laws and customs which constitute a survival of barbarism, and which are working for the overthrow of institutional civilization which other forces are laboriously building up. Thus ancient civilizations, the democracies of Sparta and Athens, were based upon slavery—the civilization of much of Europe, upon a burdensome militarism that saps its strength. It is hard to say what constitutes a true civilization judged by its fruits, but it may be said to be based primarily upon respect for human rights. Wherever a society exists in which classes are deprived of the fullest participation in its opportunities, there, it may be said, true civilization cannot flourish, however brilliant may seem its achievements, however pleasing its outward countenance, however gracious its aristocracy. **Civilization is progress** (Guizot's definition)

only as society moves forward as a whole. Nor is it in its arms and powers of conquest, but in its domestic virtues that its greatness consists. Augustus did more to make lasting the greatness of imperial Rome when he strove to promote her domestic life and her civic virtues than did the long line of emperors who sought the destruction of her rival cities. Civilization is not a chain in which every link is apparent, though doubtless such links there are. With the age of Charlemagne, the old civilization receded, and the new was born. But this was so only in appearance, since the race is forever in process of development; it is at no one minute what it was the minute before. Every period marks as stupendous if invisible a change from the old to the new. The ancient bonds are not broken; they loosen and fall off. The spectacle of nations rising to greatness from small beginnings, and then slowly sinking, the prey to conquerors from without and internal forces from within, has constituted the perpetual enigma to those who have written histories of civilizations. Yet some later science of history will make the secrets of their decay and death as obvious as the methods by which in their beginnings they rose to greatness and power. The reasons will be found in the denial of natural justice and natural equality among men. From the past it may be predicted with tolerable safety that there will be progress on the whole; that the progress will be intermitted and interrupted; and that it will never, perhaps at the best, be quite as satisfactory as it might be.

Bibliography.—Buckle, 'History of Civilization'; Guizot, 'History of Civilization'; Mackinnon, 'History of Civilization'; Kidd, 'Principles of Western Civilization'; Draper, 'Intellectual Development of Europe'; Maine, 'Village Communities in the East and West'; Tylor, 'Researches into the Early History of Mankind'; Tylor, 'Primitive Culture'; Wachsmuth, 'Allgemeine Kulbgeschichte.'

Civiliza'tion, An Introduction to the History of, a noted work by Henry Thomas Buckle, published 1857-61. Although the progress of science has uncovered facts that prove the weakness of an occasional principle in the 'History of Civilization,' the work remains one of the greatest popular contributions of modern times to the new aspect of history, as a human document, to be read by the light of scientific discovery. No book of its time was more influential in turning the direction of men's thoughts to the phenomena of social and political science.

Civilization in Europe, a history, by François Guizot. In this work Guizot begins with the fall of the Roman empire, and ends with the opening of the French Revolution. Although he analyzes all the important facts of history between the great landmark of 476 and the convocation of the States-General in 1789, he is far more anxious to grasp their import than to give a vivid relation of them; and therefore, facts in themselves play but a small part in his exposition. They are simply a help in his effort to discover the great laws that direct the evolution of humanity, and to show its development in the individual and in society. His investigations are limited to purely social development, and he does not touch upon the intellectual side of the question.

CIVITA-DI-PENNE — CLAFLIN

Civita-di-Penne, chē-vē'tā dē pěn'nā, Italy (the ancient PINNA-VESTINA), a small town in the province of Teramo, Naples, built on two hills, 29 miles east by north of Aquila. It was formerly a place of importance. The Normans, under Roger I., made it the capital of their kingdom.

Civita-Vecchia, chē've-tā vĕk'kē-ä. See CITTA VICCHIA.

Civitali, Matteo, mät-tā'ō chē-vē-tā'lē, Italian sculptor and architect: b. Lucca 1435; d. 1501. He followed the occupation of a barber until about 1470, when he suddenly rose to the highest rank among the sculptors of his time. His first important work was the mausoleum erected in the cathedral at Lucca to Pietro de Noceto, secretary to Pope Nicholas V. His greatest works are six statues of white marble in the same church, representing personages of the Old Testament. Among his architectural works is the Bernardini palace at Lucca, of simple style, and also the little temple which contains the miraculous crucifix in the church of St. Martino. He also executed a monument to Saint Romanus in the Church of San Romano. The Uffizi Gallery at Florence contains Civitali's statue of 'Faith.'

Clackmannanshire, klāk-măn'an shēr, Scotland, the smallest county, being only about nine miles long, seven wide, and comprising an area of about 35,160 acres or 55 square miles. By the recent readjustment of county and parish boundaries the parish of Alva, formerly a detached portion of Stirlingshire, was added to the county, increasing its area by over 5,000 acres. It lies on the north side of the Forth, by which it is bounded southwest. On all the other sides it is enclosed by the counties of Perth, Fife, and Stirling. The north part of the county is occupied by the Ochil Hills, but the other portions are comparatively level, and in general are exceedingly fertile, yielding large crops of oats, barley, wheat, and beans, turnips, and other green crops. The minerals are valuable, especially coal, which abounds. There are ironworks, breweries, and distilleries, woolen manufactures, tanning, glass-works, etc. The principal towns are Alloa (the largest), Alva, Tillicoultry, Dollar, and Clackmannan; the last is nominally the county town. It is rather poorly built, but has an interesting old tower and an old market-cross. Pop. (1901) 32,019.

Clacton-on-Sea, England, a popular watering-place on the coast of Essex, 15 miles southeast of Colchester, with admirable facilities for sea-bathing, and of easy access from London both by railway and steamboat. It stands on cliffs over 40 feet high, and has a town-hall, a church in the early English style; a long ocean pier, etc. Pop. (1901) 7,453.

Cladel, Léon, lā-ōñ klä-dĕl, French roman-cist: b. Montauban 1855; d. 1902. He rose suddenly into prominence with his story, 'The Ridiculous Martyrs' (1862), a satirical description of the lower walks of literature in Paris. This first success was repeated with the later novels: 'Eral the Tamer'; 'One Qouael'; the 'My Peasants' series; 'Barefoot'; 'A Woman Under Ban,' for which he suffered four weeks' imprisonment; and many others.

Cladium, klä'dī-ŭm, a genus of plants of the sedge family (*Cyperaceæ*), with about 30

species natives of tropical or temperate climes. There are only three species found in America, of which the most common is the twig-rush (*C. mariscoides*), found in marshes from Minnesota eastward to Nova Scotia, and southward to Florida. This plant is very common in certain of the fenny districts of England, where it is used for thatching.

Cladocera, klā-dōs'e-ra, a group of *Crustacea* forming a sub-order of the order *Branchiopoda*, and by some authors regarded as an independent order. It is represented by the little water-flea, *Daphnia*, in which the body, consisting of few segments, is protected by a bivalvular shell, though the head, with its antennæ, is uncovered. The legs are short and leaf-like. It lays summer and winter eggs, the latter enveloped in a peculiar shell, the "ephippium," and the young develop in a space between the shell and the back of the animal, which forms a brood-pouch.

Cladrastis, klā-drās'tis, a genus of the pea family, with two species, one in Manchuria, the other (*C. lutea*) in eastern United States. The American or Kentucky yellow-wood is a species with smooth bark, and sometimes grows above 50 feet in the rich soils of Kentucky and Tennessee. The wood, which weighs about 40 pounds to the cubic foot, is strong and hard, and of a bright yellow color. It produces a dye of considerable commercial value.

Clafin, Horace Brigham, American merchant: b. Milford, Mass., 18 Dec. 1811; d. Fordham, N. Y., 14 Nov. 1885. He received a common school education, worked in his father's store until he was of age, when he went to Worcester, Mass., and in partnership with his brother-in-law, engaged in the dry goods business on a large scale. In 1843 he established in New York the firm of Bulkley & Clafin, importers and jobbers of dry goods; in 1851 it became Clafin, Mellin & Company, and in 1864 H. B. Clafin & Company, by which it is best known. Mr. Clafin conducted an enormous business extending all over the country, and since 1864 it has been the largest mercantile business in the United States, its sales in a single year having reached \$72,000,000. Its financial strength, and the money markets' firm confidence in Mr. Clafin's methods and integrity, enabled the firm to pass safely through most of the financial crises of the last 40 years. In 1861 and in 1873 it had to ask for slight extensions of time in which to settle accounts, but all were paid with interest before maturity. Mr. Clafin was a man of domestic tastes, fond of books and horses, an attendant of Plymouth Church, Brooklyn, and an intimate friend of Henry Ward Beecher.

Clafin, Mary Bucklin, American prose writer: b. Hopkinton, Mass., July 1825; d. Whitinsville, Mass., 13 June 1896. She was the second wife of William Clafin (q.v.). For 18 years she was a trustee of Boston University; and of Wellesley College from its foundation till her death. Among her publications are: 'Brampton Sketches'; 'Recollections of Whittier'; and 'Under the Elms.'

Clafin, William, American governor: b. Milford, Mass., 6 March 1818; d. 5 Jan. 1905. He was educated in the public schools and at Brown University. For many years he was engaged in the shoe and leather busi-

CLAFLIN UNIVERSITY — CLAIM

ness in Saint Louis, Mo., but later settled in Boston, Mass. He was elected to the State House of Representatives 1849-52; to the Senate 1860 and 1861; was a member of the Republican National Committee 1864-75; lieutenant-governor of Massachusetts 1866-9; and governor 1870-2. From 1877 to 1881 he was a Republican member of Congress. The degree of LL.D. was conferred on him by Harvard and Wesleyan universities.

Claflin University, a co-educational institution in Orangeburg, S. C.; organized in 1869, under the auspices of the Methodist Episcopal Church, exclusively for the colored race. Professors and instructors, 31; students, 713; volumes in the library, 5,600; grounds and buildings valued at \$150,000; income, \$14,000; president, L. M. Dunton, A.M., D.D.

Claghorn, Kate Holladay, American writer: b. Aurora, Ill., 12 Dec. 1863. She was educated at Bryn Mawr College, and has been engaged in research work for the United States Industrial Commission. Besides contributions to periodicals, she has published 'College Training for Women' (1897).

Claiborne, klā'bōrn, or Clayborne, William, American colonial adventurer: b. Westmoreland, England, about 1589; d. about 1676. He was of good family and became surveyor of the Virginia plantations for the London Company in 1621; settled at James City, and acquired 45,000 acres of land. In 1625 he was commissioned by Charles I. a member of the colony's council, and its secretary of state. In 1628-31 he received commissions, and in 1631 a royal patent, for discoveries and trade with the Indians; and about 1631 discovered and partially planted Kent Island in Chesapeake Bay, which settlement was accorded a burgess in the Virginia Assembly. In 1632 Lord Baltimore was given his Maryland charter, saving the rights of previous settlement; and his first colony arrived in March 1634. Finding Claiborne's island within his limits, he at once claimed title to and sovereignty over it, alleging that Claiborne's patent was only a trading right, giving neither title to soil nor political rights. Claiborne, however, claimed both ownership and independence, in which Virginia sustained him. He was at this time carrying on an extensive Indian trade in partnership with a London house in armed vessels, and he endeavored to prejudice the Indians against the new colony. Capt. Cornwallis of the latter retaliated in 1635 by assailing and capturing one of his vessels, in a fight in which several lives were lost. This misfortune, and the burning of his warehouse, aroused the suspicions of his partners, who sent out an investigating agent, to whom he turned over the Kent Island property and went to England. There he was sued for account, and indicted for rebellion; but this seems not to have been pressed. Meantime the agent seized all Claiborne's Virginia property, and acknowledged Baltimore's title and sovereignty in Kent Island. Claiborne then bought Palmer's Island at the head of Chesapeake Bay, supposing it beyond Baltimore's grant, and asked the king for an injunction to restrain Baltimore from interfering with him, and for a grant of lands along the Susquehanna. The king referred it to the commissioners of plantations, who ignored the purchase, refused the grant, and sent him to

the courts for the injunction. Claiborne's party in Kent Island continuing insubordinate, Gov. Calvert reduced it and seized Palmer's Island also. Ousted from all his settlements, Claiborne petitioned for a grant of some island he might discover *within* the company's patent. This, too, was refused, but Charles made him treasurer of Virginia for life. He at once became a leading political director. During the English civil war that followed, Virginia clung to the royal cause, while Baltimore trimmed sail, and in 1644 Claiborne attempted to raise Kent Island against the proprietary government, as Roman Catholics and hostile to the king. He failed, but in 1645 an English captain, professing a parliamentary commission, overturned the Baltimore government altogether for a time. On the execution of Charles I., Virginia and Maryland, through its royalist deputy, proclaimed Charles II. Claiborne now joined the party of Parliament and was accordingly commissioned to reduce Virginia and Maryland to obedience. In 1652, accordingly, his expedition deposed Gov. Berkeley of Virginia, appointed a new governor, with Claiborne secretary of State, and forced Gov. Stone of Maryland to swear allegiance to Parliament. When Parliament was turned out by Cromwell, Stone repudiated the oath, whereupon Claiborne marched on Maryland with an armed force, deposed Stone, and appointed a Puritan administration, which at once disfranchised all the Roman Catholics. Cromwell intervened in their favor in 1654, and Stone undertook to recover his position by force, but was defeated and captured. Claiborne held his advantage till 1658, when Baltimore had his province restored to him. On the Restoration, in 1660, Claiborne was dismissed from the council and secretaryship of State. In 1675, on Cecilius Calvert's death, he petitioned the king for redress of his wrongs from the Baltimores, but no attention was paid to his request. His descendants in the South numbered many able and distinguished men, and are commemorated in town and county nomenclature. He was a man of enormous energy, resource, and pertinacity, a true type of the English adventurers who have overrun the world; but too inconsiderate and personal in policy for the largest success.

Claiborne, William Charles Cole, American senator: b. Sussex County, Va., 1775; d. New Orleans, La., 23 Nov. 1817. He received a good education, studied law, and engaged in its practice in Nashville, Tenn. He assisted in forming the constitution of Tennessee, and represented that State in Congress 1797-1801. In 1801 he was appointed governor of Mississippi Territory, and in 1804 of Louisiana. When the latter became a State and adopted its constitution, he was elected governor 1812-16. He was later elected United States senator, but died before taking his seat in that body.

Claiborne Stage, in American geology, the rocks, principally shales and limestones laid down in Middle Eocene time along the Carolinas and the Gulf States and around an arm of the sea that reached northward to the present mouth of the Ohio River. See EOCENE SERIES; TERTIARY SYSTEM.

Claim, a challenge of ownership of a thing which is wrongfully withheld from the possession of the claimant. The assertion of

CLAIMS — CLAIRVOYANCE

liability of some one, to the party making it, to do some service or pay a sum of money. The possession of a settler upon lands owned by a government which is not used for any particular purpose, and from which no benefit is derived. When a new section of country is opened up, the government gives to each settler a certain amount of land on condition that he will live there, and improve and cultivate the soil for a definite time. The land taken is called a claim, and the settler receives an absolute title to the property when the conditions have been complied with. The ground must be staked out so that the particular claim may be identified. Mining claims are of this nature. Generally it is required that they be staked out, that a description of the claim be filed, and that a certain amount of work be done within a specified time. These claims are considered personal property until the conditions are complied with, and are subject to sale and transfer, it being necessary for all but the original settler to be able to show how and through whom he acquired title, in order to get a complete and absolute title from the government, as it is necessary to show that the land has been used, and in what manner, for a definite length of time, before the settler acquires his title from the government.

There are claims for labor and wages by mechanics for work done, by material-men for material furnished, or by pilots for pilotage. When filed of record these claims become liens against the property which has been benefited by the work, material, or care bestowed upon it.

Claims, when filed in the name of a municipal corporation for improvements, such as opening or widening a street, laying sewers, or any municipal improvement, are liens against the property benefited.

Claims, Court of. See COURTS.

Clairac, klā-rāk, France, a town in department Lot-et-Garonne, on the Lot. It was the first town in the south of France to declare in favor of the Reformation. Pop. 2,388.

Clairaut, klā-rō, **Alexis Claude**, klōd, French mathematician: b. Paris 13 May 1713; d. there 17 May 1765. In his 11th year he composed a treatise on the four curves of the third order, which, with his subsequent 'Researches on Curves of Double Curvature' (1731), procured him a seat in the Academy at the age of 18. He accompanied Maupertuis to Lapland, to assist in measuring an arc of the meridian, and obtained the materials for his work 'On the Shape of the Earth.' In 1752 he published his 'Theory of the Moon,' and in 1759 calculated the return of Halley's comet. A brother, who died at the age of 12, published in his ninth year a treatise entitled 'Divers Quadratures of Circular Elliptics.'

Clairin, George Jules Victor, zhōrzh zhül vĕk-tōr klā-rāñ, French portrait painter: b. Paris 11 Sept. 1843. He studied in Paris under Picot and Pils, and obtained a second class medal at the Paris Exposition in 1889, and the Legion of Honor medal in 1888. Beside portraits he has painted several brilliant scenes from Spanish history.

Clairvaux, klār-vō' (*clara vallis*, lightsome vale), a village of France on the river Aube, 10 miles southeast of Bar Sur-Aube, noted as the site of the celebrated abbey of Cistercian monks, founded in 1115 by Saint Bernard, who was

its abbot till his death in 1153. It was a vast establishment, comprising within its enclosure a large population both of monks professed, lay brothers, laborers and artisans employed in various industries. There was a large and magnificent church; four cloisters surrounded by buildings for housing the monks, *conversi* or lay brothers, the novices and the superannuated members of the order; the abbots' hall with the guest house adjoining it, the kitchen, refectory, infirmary, scriptorium, etc.; all these were grouped in one portion of the monastic domain. In another portion were the fish tanks, the wine press, slaughter house, barns and stables, saw-mill, grist-mill, oil-mill, tannery, tile works, etc., producing all necessary supplies for the use of the inmates. At the Revolution the monks were turned out, and the lands and buildings, except the church which was destroyed by fire, were occupied for public uses: the buildings are now used as a penitentiary and workhouse.

Clairville, Louis François, loo-ē frāñ-swä klār-vĕl, French writer of light comedy: b. Lyons 1811; d. 1879. He was the author of more than 220 comedies, farces, and comic-opera libretti. Among his most successful operettas are: 'Daphnis and Chloe' (1849); 'Mme. Angot's Daughter' (1873); among his vaudevilles: 'Property Is Robbery' (1848); 'Antoinette's Temptations' (1850); 'Cinderella' (1866).

Clairvoy'ance, defined as the power of perceiving without the use of the organ of vision or under conditions in which the organ of vision with its natural powers alone would be useless. It comprises the sight of things past, present, or future. Various methods of clairvoyance are recounted; by direct vision of things at a distance (opaque substances being no hindrance); by looking into a black surface; by looking into water, into a crystal, etc.; or by laying the object to be described on the forehead or chest of the clairvoyant; but clairvoyants now usually represent the cerebral region as the seat of illumination. From remote antiquity the possession of such powers by favored individuals has been believed. In the Old Testament (2 Kings vi. 15-17) is an account of the opening of the inner vision in the case of the servant of Elisha in answer to the prayer of the prophet.

Clairvoyant powers were claimed for the Pythia at Delphi. Apollonius of Tyana and Diodorus Siculus testify to the clairvoyance of the Indian sages. Macrobius gives an instance of clairvoyance on the part of the oracle of the Heliopolitan god when consulted by the Emperor Trajan. Tertullian speaks of a seeress who could prophesy and prescribe for the sick. Clairvoyance was known among the nations of antiquity, and is still generally accepted as an undoubted fact among Eastern nations. As instances of clairvoyants in later times may be mentioned Jacob Böhme (1575-1624) and Emanuel Swedenborg (1688-1772), the Swedish scientist and founder of the religious body called "The Church of the New Jerusalem."

The phenomena of clairvoyance have been carefully observed. The clairvoyant state seems to be intimately connected with the mesmeric, the somnambulistic, and the so-called "biological." Mesmeric somnambulism and clairvoyance were first brought to notice by Puysegur in 1784. The clairvoyant is usually in a state of trance, which may be induced by mesmeric

CLAM — CLAOSAURUS

passes. In this state he is sometimes conscious only of his mesmerizer; in others, his clairvoyance is unrestricted; but the clairvoyant may enter the trance state spontaneously, or he may even be in possession of his ordinary faculties, both of which characteristics are to be found in Zschokke, the German novelist. In "second-sight," as found in Denmark, parts of Germany, and especially in the Highlands of Scotland, the seer is not in a state of trance similar to that in other forms of clairvoyance. Some modern scientists claim that the discovery of the X-rays, by Röntgen, in 1895, has solved a number of the questions raised by clairvoyance.

Clam. While the vernacular name clam is indiscriminately applied to any large edible bivalve, it is generally given to the northern "long" or soft-shelled clam (*Mya arenaria*), in distinction from the round clam, hard-shell clam, or quahog (*Venus mercenaria*), which extends from Cape Cod southward, though occasionally found as far north as the Maine coast (Casco Bay) and the Gulf of St. Lawrence at Shediac.

The long or soft-shelled clam occurs throughout the north Atlantic coast from New York to Greenland, and on the British shores, and is everywhere on the American coast a valuable article of food. The so-called black "head" is the siphon, which is very extensible and divided by a fleshy partition into two passages, opening out by two orifices surrounded by a circle of delicate sensitive tentacles; into the lower opening passes the sea-water, carrying minute animals, young and old, and diatoms, around to the mouth, which is in the larger end of the body; through the other or upper opening of the siphon the excrementitious matter is expelled. The clam has a tongue-shaped "foot," by which it burrows into the mud or sand to a depth of several inches.

The clam may be of either sex, male or female; it is very prolific, extruding an inconceivable number of eggs into the sea, where they are fertilized. The young larvæ (veligers) swim at the surface, where they are borne in all directions, until in a few days, the shells becoming heavier, they sink to the bottom, and, resting on the seaweed or stones at the bottom, the "spat" become attached by a few byssus threads. Clams begin to spawn by the end of the first year of their life, and in Narragansett Bay are sexually mature and the eggs become ripe when the animal is only an inch long. The breeding season begins in May, reaches its height in June, ending in July. Of course clams cannot feed when the tide is out, hence they grow more slowly when living near high-tide line. When the young begin to burrow, and they dig very rapidly during the first two months of their life, when one quarter to one half inch in length, they are attacked by crabs, eels, and starfish (q.v.). In Rhode Island attempts at restocking clam beds and raising clams artificially have met with success and promise valuable results in clam-culture. Clams have been taken five and three quarters inches long, and weighing 15 ounces. Attempts have been made to plant the clam on the Pacific coast.

The round, or little-necked clam, or quahog, as it is called in New England, lives in the sand from Cape Cod to Texas, just below low-

water mark, and abounds at the mouth of estuaries. The shell is heart-shaped, the valves very thick and heavy. This bivalve is fished by means of long rakes and tongs, or is dredged like oysters. It has a very large "foot," and plows through the sand, but does not burrow deeply.

The beach, surf, or hen clam is *Spisula* (formerly *Macra*) *solidissima*. The large edible species of the southern coast is the painted clam (*Callista gigantea*). Several large Pacific coast bivalves are edible and known as clams, being species of *Taper*, *Laxidomus*, and *Glycimens*. Very unlike any edible clam is the "giant clam" (*Tridacna gigas*) of the coral reefs of the Pacific Ocean, whose shell often weighs upward of 400 pounds. Consult: Mead, '30-33d Annual Reports of the Commissioners of Inland Fisheries of Rhode Island.'

Clamecy, klä-më-së, France, a town in the department Nièvre, 38 miles northeast of Nevers, left bank Yonne, at the mouth of the Beuvron. It was formerly surrounded by enormous walls, and defended by a castle, which commanded the town and environs. One of its suburbs, situated on the opposite side of the Yonne, was the seat of a bishopric *in partibus*, known as the bishopric of Bethlehem, founded in 1180 for the bishop of that place, who had been expelled by the Saracens. Wood-rafts for the supply of Paris with fire-wood are made up here, and floated down the Yonne and Seine. The parish church, founded in 1497, is remarkable for its tower and for some fine sculptures. Clamecy carries on several industries, the chief being that of tanning. Pop. 4,800.

Clan, a tribe or number of families, bearing the same surname, claiming to be descended from the same ancestor and united under a chieftain representing that ancestor. The clan system is essentially the same as that existing among the Arabs, the Tartars, and tribes similarly situated. From ancient times the "clans" existed in Ireland. The system is said to have sprung up in Scotland about 1008, while Malcolm II. was reigning, but it may have been of greater antiquity. In 1747 the legal authority of the chiefs over their followers was abolished as a punishment for the part which the former had taken in the insurrection which ended in 1745 at Culloden. While the clans flourished they were divided into two, the clans of the borders and those of the highlands.

Clan-Na-Gael, klän-na-gäl, Irish secret society, founded in the United States for the purpose of aiding in securing "Home Rule" for Ireland. The society has been charged with some grave crimes, said to have been perpetrated for the purpose of intimidating the British government; but so little is really known about the workings of the organization, nothing positive can be asserted.

Claosaurus, klā-ō-sôr'us, **Trachadon**, trāk'-a-dōn, or **Trachodon**, a genus of duck-billed dinosaurs (see DINOSAURIA) of the Cretaceous Period. This dinosaur was bipedal, herbivorous, resembling the hadrosaurus (q.v.), but the bill was not so broad. Its remains are found in the Upper Cretaceous formations of North America. A mounted skeleton possessed by Yale University is 30 feet long and stands 14 feet high.

CLAP — CLARE

Clap, Roger, American pioneer: b. Salcomb, Devonshire, England, 6 April 1609; d. Boston, Mass., 2 Feb. 1691. He came to America in 1630, and with other colonists settled the present Dorchester, Mass. In the course of his life he held several military and civil offices, being captain of Castle William 1665-86, and representative in the general court 1652-6. His 'Memoirs,' written for the instruction and benefit of his children, were originally published by Rev. Thos. Prince (1731). Other editions are: 'Memoirs of Roger Clap; Relating Some of God's Remarkable Providences to Him in Bringing Him Into New England' (Boston 1807; Pittsfield 1824; and an edition with preface, etc., printed by the Dorchester Antiquarian and Historical Society, Boston 1844).

Clap, Thomas, American clergyman: b. Scituate, Mass., 26 June 1703; d. New Haven 7 Jan. 1767. He was settled as a minister at Windham, Conn., in 1727, and in 1739 was elected president of Yale College. He contributed much to improve that institution, and was the means of building a college edifice and chapel. He was a man of extensive erudition, gave great attention to mathematics and astronomy, and constructed the first orrery made in this country. He published a 'History of Yale College' (1766); 'Nature and Foundation of Moral Virtue and Obligation' (1765); 'Nature and Motion of Meteors' (1781); etc.; and had made collections for a history of Connecticut; but most of his manuscripts were plundered in the expedition against New Haven, under Gen. Tryon. He had a controversy with President Edwards respecting Whitefield, and opposed the latter, not so much upon religious grounds as from a misapprehension of Whitefield's designs.

Clapboard, klăp'bōrd, colloq. klăb'ōrd, a thin, narrow board commonly used for covering the sides of wooden buildings. Clapboards are usually of white pine, and are made much thinner on one edge than on the other, so that when nailed on to each other one can lap a little over the one next below it. This makes the covering of the building much tighter than if the boards were only set together one above the other, and keeps the rain from driving in. Clapboards are sawn out of solid logs, not by sawing them clear through, as in making common boards, but by sawing from the outside to the middle or heart of the log. They are thus made thicker on the outside than on the inside. They are afterward smoothed in a planing machine.

Clapham, klăp'am, a southwest suburb of London, lying a mile south of the Thames. Clapham Common is still an open common of 200 acres. Clapham Junction, in Battersea parish, is one of the busiest and most perplexing railway junctions in the world.

Clapham Sect, a name given by Sydney Smith to the Evangelical Party in the Church of England; the Rev. Henry Venn was the vicar of Clapham, and some of the most eminent Evangelicals — Zachary Macaulay, Wilberforce, and the Rev. W. Romaine — lived there. Thackeray's 'Newcomes' has made the phrase familiar to a later generation.

Clapnet, a ground net used by bird catchers, consisting of two equal parts about 12 yards long by 2½ wide, and each having a

slight frame. They are placed about four yards apart, and are pulled over by a string so as to enclose any birds on the intervening space.

Clapp, Henry Austin, American dramatic critic: b. Dorchester, Mass., 17 July 1841; d. there 19 Feb. 1904. He was for many years clerk of the supreme judicial court of Massachusetts, and a well-known dramatic critic on the Boston press. He also lectured extensively on Shakespeare. He published 'Reminiscences of a Dramatic Critic' (1902).

Clapperton, Hugh, Scottish explorer: b. Annan, Dumfriesshire, Scotland, 1788; d. near Soccato, central Africa, 13 April 1827. He entered the merchant service, but was impressed into the navy, in which he became a lieutenant in 1816. He then went to Africa, where he remained till 1825, returning with valuable information, though the disputed question of the course of the Niger was left undecided. On his return to England Clapperton received the rank of captain, and immediately engaged in a second expedition, to start from the Bight of Benin. Leaving Badagry in December 1825, he penetrated to Katunga, within 30 miles of the Quorra or Niger, but was not permitted to visit it. At Soccato the Sultan Bello refused to allow him to proceed to Bornu, and detained him a long time in his capital. He was the first European who traversed the whole of central Africa from the Bight of Benin to the Mediterranean. See Landor, 'Records of Captain Clapperton's Last Expedition' (1830).

Claque, klăk, a body of paid applauders at a public performance, according to tradition, an invention of Nero's. At the present time the claque is a recognized feature of theatrical management in Paris, and although said to be employed in London and New York, the use of such artifices is not recognized as legitimate outside of the French capital.

Clare, Saint, or **Saint Clara**, Italian nun: b. Assisi 11 July 1194; d. 12 Aug. 1253. When very young she was attracted by the accounts of the work being done by Saint Francis (q.v.), a young man of her native place. At an early age she decided to give her life wholly to God and to work for him in poverty. She sought and received the advice of Saint Francis, and when only 18 years of age, gave up the world, and began to devote herself wholly to charity. Other pious young women soon joined her and in time a recognized religious order was founded. For some years they had no special rule, but in 1218 they adopted the rule of Saint Benedict. Later (1224) Saint Francis gave them a rule, mitigating the rigors of the fast, but recognizing holy poverty in the extreme. Two years after her death she was canonized by Alexander IV. The order which she founded is known throughout the world as "Poor Clares"; but several branches of the order have been established as "Order of Saint Clara," "Capuchin Poor Clares," and the name by which first known, "Order of Poor Ladies." Another and a correct title is "Second Order of Saint Francis." The differences in the branches are the rules of poverty. Saint Clare allowed none of her nuns nor herself to hold property individually nor as a body. She followed the practice of Jesus Christ. They did not own the houses in which they lived. Some of the branches, as a body, have corporate rights of

CLARE — CLARENCE

property. Saint Clare is known by the name, "Princess of Poverty."

Clare, Saint, Order of. See CLARE, SAINT.

Clare, Israel Smith, American historical writer: b. Lancaster County, Pa., 24 Nov. 1847. He has published: 'Illustrated Universal History' (1876); 'Complete Historical Compendium' (1884); 'Library of Universal History' (1890); 'History of British Boer War' (1900).

Clare, John, English peasant poet: b. Helpstone, Northamptonshire, 13 July 1793; d. Northampton 20 May 1864. He led a rambling, unsteady life until 1818, when he was obliged to accept parish relief. In 1821 his 'Poems Descriptive of Rural Life and Scenery,' met with a favorable reception, and the issue of his 'Village Minstrel' later in the same year won him many friends. A subscription furnishing him with £45 annually was, however, dissipated by 1823, and his 'Shepherd's Calendar' (1827), which he hawked himself, was not a success. He brought out a new work, the 'Rural Muse,' in 1835, but became insane shortly afterward, and the remainder of his life, from 1837 to 1864, was passed in the Northampton Lunatic Asylum. Clare was a genuine poet, and his pictures of rural life are eminently truthful and pleasing.

Clare, Ireland, a county in the province of Munster; boundaries north and east, Galway Bay and county; east and south, the Shannon separating it from Tipperary, Limerick, and Kerry; west, the Atlantic. Area, 827,994 acres, nearly three fourths of which is under cultivation or in use as pasturage, and the remaining portion is in bog, mountain, or under water. The surface is irregular, rising in many places into mountains of considerable elevation, particularly in the east and west and northwest districts. The grazing lands are excellent; the chief minerals are limestone, lead, and slate, and in the southwest coal; but owing to the laws regarding mining, the mineral deposits remain almost undeveloped. The chief crops are oats and potatoes. Sheep and cattle on the hillsides, salmon in Clonderlaw Bay, the rivers Shannon and Fergus and at Dunbeg are sources of income. There are oyster beds near Ballyvaughan and along the shores of Burren. Frieze and hosiery are manufactured. The chief town is Ennis. Pop. (1901) 112,100.

Clare College, University of Cambridge, founded in 1326, and first called "University Hall." In 1336 its patronage was given, by Richard de Baden, then chancellor of the university, to Elizabeth de Burgh, sister of the Earl of Clare. Her object in giving of her riches to this college was to educate young men who would become priests, in order to replace the many clergymen who died from the plague. The college has not continued to educate men for the purpose intended by its first patron. Many noted men have been educated in this school. At first there were a master, eight senior, and seven junior fellows, besides scholars and students. Now the 15 fellowships are open to B.A.'s or persons of a higher degree, without restriction as to marriage. A fellowship becomes vacant in five years and 11 months from the time of election, unless the holder occupies at the same time the post of professor, public

crator, etc., in the university, or the post of tutor, dean, bursar, or lecturer in the college. The master and fellows elect to the vacant fellowships, and the master is elected by the fellows. The foundation scholarships are eight of not less than £60, eight of not less than £40, eight of £20, four of £50 per annum each; three of about £60 per annum, tenable for three years, with preference to clergymen's sons; with several minor scholarships. At present there are 18 fellows, 24 residents, and two non-resident scholars, and several undergraduates.

Claremont, Cal., village in Los Angeles County, on the Atchison, T. & S. Fé R.R., 38 miles east of Los Angeles. This is the centre of a large fruit growing and raisin making region, and large crops of oranges and lemons are raised here. It is the seat of Pomona College, a Congregational institution, founded in 1888. Pop. (1902) 1,200.

Claremont, N. H., town in Sullivan County, on the Boston & Maine Railroad, 50 miles north of Concord. The cotton- and woolen-mills obtain their power from the Sugar River. There are also paper-mills, shoe factories, and lumber, granite, brick, and marble yards. There are two national banks with a combined capital of \$200,000; Stevens High School, and the Fiske Free Library, founded in 1873 and containing 8,000 volumes, are located there, and the town has six churches. The town was first settled in 1767, the predominating nationality in the population now being French Canadian. Pop. (1900) 5,498.

GEORGE I. PUTNAM,
Editor 'Advocate.'

Clarence, George, DUKE OF, English prince: d. London 18 Feb. 1478. He is chiefly celebrated for his tragical end, and for the use made of his name and history by Shakespeare. He was the son of Richard, Duke of York, and brother of Edward IV., king of England, and on his brother's accession to the crown in 1461 he was, as the reward of his assistance, created Duke of Clarence, and in 1462, lord-lieutenant of Ireland. When the Earl of Warwick deserted the cause of Edward, Clarence entered into alliance with him, married his daughter in 1469, retired with him to France, and afterward landed with him at Dartmouth in September 1470, and in a parliament held at Westminster by the Lancastrians had the crown settled on him, failing the issue of Henry VI. Clarence had already meditated a double treachery before leaving France, and at Coventry, on 30 March 1471, he left the party he had espoused on the field of an imminent battle, and joined his brother Edward. Clarence's wife having died in 1476, he offered himself, on the death of Charles the Bold, to Mary, heiress of the estates of Burgundy, but the king opposed his suit, which hardly needed his opposition to cause it to miscarry. Some of his servants were about the same time hurriedly put to death on an accusation of magic. Clarence appeared in the council to complain of the injustice of their sentence. For this interference with justice he was committed to the Tower. A parliament was summoned, which condemned him to death; and on 18 Feb. 1478 he was found dead in the Tower.

CLARENCE — CLARENDON

Clarence, Duke of, a title sometimes bestowed upon a younger member of the royal family of Great Britain. The title is variously derived from Clare or Clarence (Lat. *Clarentia*) in Suffolk, from Clarenza, in the Morea, over which an English knight ruled during the Crusades, etc. The title was first given to Lionel, son of Edward III. It was last conferred upon Albert Victor (b. 8 Jan. 1864; d. 14 Jan. 1892), eldest son of King Edward VII.

Clarence Harbor, a bay on the west coast of Alaska, about 50 miles southeast of Cape Prince of Wales. An Eskimo village, Port Clarence, has long been situated on the northeast shore. Here in May 1892 Dr. Sheldon Jackson, the commissioner of education for Alaska, established the Teller Reindeer Station, as an industrial school for instructing the natives in the management and propagation of the domestic reindeer. With the aid of a government appropriation deer were brought from eastern Siberia, and in 1893 a colony of Lapps was settled here to give the necessary instruction. The natives have taken readily to the new occupation, the herd has been augmented by further importation and by natural increase, other stations have been established, and these far northern citizens, formerly in a half-starved condition from the invasion of their hunting-grounds, given a new industry and a new source of food and clothing.

Clarence Island, (1) An island south of South America and west of Tierra del Fuego; lat. 54° 10' S.; lon. 71° 20' W. (2) An island in the Pacific Ocean, north of Navigator Island; lat. 8° 10' S.; lon. 172° 10' W.

Clarence River, a large river of Australia, rising in the McPherson Mountains and flowing eastward for about 250 miles through a fertile valley into Shoal Bay, New South Wales. It is navigable for 50 miles, to Grafton for vessels of 10 feet draught, and small steamers ply to Moleville, 30 miles farther up.

Clarence Strait, (1) In the Persian Gulf, between the island of Kishm and the mainland. It is from 3 to 13 miles broad and has many islands. (2) In Alaska, between the Prince of Wales Archipelago and Duke of York Island. (3) In Australia, the channel between Melville Island and the northwest coast, communicating with Van Diemen's Gulf.

Clarencieux, or **Clarenceux**, klar'ën-shōō, an officer of the English heraldic college. The jurisdiction of this king of arms includes England south of the Trent; that of Norroy, the second king of arms, the territory north of that river. The duties of the office include the granting and survey of arms, the registry of descent and marriages, etc.

Clar'endon, Edward Hyde, EARL OF, English statesman: b. Dinton, Wiltshire, 18 Feb. 1608; d. Rouen, France, 9 Dec. 1674. He commenced his political career in 1640, when he was returned to Parliament. In this Parliament he argued in favor of a grant to the king, which was successfully opposed by Hampden. He was returned to the Long Parliament (November 1640) by the borough of Saltash, and laid aside his legal business to devote himself to his parliamentary duties. At first he acted with the

more moderate of the popular party, but soon found reason to change his course. A dread of democracy seems first to have led him to oppose his former friends, but his speeches and votes soon attracted the notice of the court, into the favor of which he passed. He was offered the solicitor-generalship, which he declined, but agreed, at the king's request, to consult with his regular advisers, Falkland and Colepepper. Hyde was an honest and independent supporter of the royal authority, disposed to make moderate concessions to the popular demands, and in no way responsible for the rash measures of the king, which were often taken without consulting any of his advisers. Upon the breaking out of the civil war he attached himself to the king's party, became chancellor of the exchequer and member of the privy-council; and after vainly attempting to bring about a reconciliation between the contending parties, was appointed by the king to wait upon the Prince of Wales, who was first sent with an army to the west. Afterward, on the continued ill success of the royal party, he retired to Jersey. Here he remained for two years, while the prince was in France, and during that time began his 'History of the Rebellion.' He likewise composed at Jersey the various writings which appeared in the king's name as answers to the manifestoes of the Parliament. On the capture of the king, Hyde received orders to rejoin the Prince of Wales, but was becalmed and taken prisoner by pirates from Ostend. In September 1649 he rejoined Charles at The Hague, who sent him to Madrid to see if any assistance could be obtained from the Spanish court. On the failure of this negotiation he retired to Antwerp, but soon resumed the business of the exiled court, of which he continued to be the most trusted adviser, first at Paris, and afterward at The Hague, where Charles II. appointed him lord-chancellor of England in 1657. After Cromwell's death Edward Hyde contributed more than any other man to the success of the measures which placed Charles II. on the throne. He subsequently possessed the entire confidence of the king, who loaded him with favors. In 1661 he was made peer, and Baron Hyde, Viscount Cornbury, and Earl of Clarendon. Many events occurred to disquiet him in the licentious court of Charles II.; among these was the marriage of the Duke of York, the king's brother, to his daughter. The Duke, while at Breda, the residence of his sister, the Princess of Orange, became acquainted with Anne Hyde, Clarendon's eldest daughter, maid of honor to the princess, and married her secretly 3 Sept. 1660 to legitimize their first child, born on 22 October. Anne was acknowledged as Duchess of York in December 1660, and two daughters, Anne and Mary, were the fruit of this marriage, both of whom ascended the British throne. In 1663 Lord Bristol made an attempt to impeach the chancellor in Parliament, which, though some of the acts of Clarendon's administration were questionable, proved unsuccessful. The Duke of Buckingham, moreover, was continually laboring to make the chancellor ridiculous in the eyes of the king, and his station as prime minister made the nation regard him as answerable for all the faults of the administration. The ill success of the war against Holland, the

CLARENDON

sale of Dunkirk, and other events, excited public indignation. The king's displeasure was changed into hatred when he saw his plan of repudiating his wife and marrying Lady Stuart defeated by Clarendon, who effected a marriage between this lady and the Duke of Richmond. The king deprived him of his offices, and an impeachment for high treason was commenced against him. The lords refused to imprison him on a general accusation by the Commons. This gave rise to a dispute between the two houses, to end which Clarendon retired to Calais, leaving an exculpatory letter to the lords, which they communicated to the Commons, who ordered it to be burned by the common hangman. The lords still refused to join in his attainder, but agreed with the Commons in an act of banishment and incapacity. The hatred of the nation pursued him even to the Continent. At Evreux he was attacked by some British sailors, dangerously wounded, and with difficulty rescued from their hands. He lived six years at Montpellier, Moulins, and Rouen, at which latter place he died. His remains were afterward carried to England, and buried in Westminster Abbey. Lord Clarendon, as long as he was minister, was the friend and supporter of the king against the factious, and the defender of his country's freedom against the abuse of the royal power. Ingratitude and prejudice the more easily ruined him, as his stern and proud character prevented his gaining friends. Among his many writings, the most important is the 'History of the Rebellion, from 1641 Down to the Restoration of Charles II.' It is a very able work, although not free from prejudices. Consult Lister, 'Life of Lord Clarendon' (1838).

Clarendon, George William Frederick Villiers, 4TH EARL OF, English statesman: b. 12 Jan. 1800; d. 27 June 1870. By his mother Lord Clarendon was indirectly related to the Hydes, the family of the great Earl of Clarendon, author of the 'History of the Rebellion.' He was educated at Cambridge, entered the civil service at an early age, and in 1833 was appointed minister-plenipotentiary to the court of Madrid. He was instrumental in negotiating a treaty, signed in 1834, called the Quadruple Alliance, in which the four contracting parties—England, France, Spain, and Portugal—agreed to unite in expelling Don Carlos and Don Miguel, pretenders to the Spanish and Portuguese crowns, from the peninsula, and was subsequently much consulted by the Spanish government.

In 1839 Lord Clarendon, having succeeded during the previous year to his uncle's title, returned home to take his seat in the House of Lords. In January 1840 he was appointed lord privy-seal; and was lord-lieutenant of Ireland from May 1847 to February 1852. The most notable events of the period were the great Irish famine, and the rebellion headed by Smith O'Brien, M.P., which ended in the defeat of the rebels by the police, after months of threatening and systematic publication of sedition in the newspapers which espoused their cause. Lord Clarendon's administration in regard to both of these difficulties has been deemed by dispassionate observers both firm and philanthropic; but his early popularity somewhat declined in Ireland, which was perhaps due to his impartiality in declining to favor the zealots either of the

Roman Catholic or the Orange party. He became secretary of foreign affairs in 1853, retaining office until 1858. During this period the Russian war was brought to a successful termination, and Lord Clarendon, in conjunction with Lord Cowley, the British ambassador at Paris, conducted the peace negotiations at Paris as joint-plenipotentiary of Great Britain, and signed the Treaty of Paris 30 March.

In 1861 Lord Clarendon was sent as ambassador-extraordinary to the coronation of the king of Prussia; in 1868 was sent on a special mission to the Pope and the king of Italy. In the ministry of Mr. Gladstone, which succeeded Mr. Disraeli's, Lord Clarendon again occupied the post of foreign secretary, and continued in office till his death.

For the office of foreign secretary, which he held so long, Lord Clarendon was generally admitted to possess high qualifications; but it was complained, even by his admirers, that he adhered too long to the tradition of secrecy attaching to the foreign office. As a statesman he was remarkable rather for a liberality and large-heartedness, which gave a conciliatory tone to his negotiations with foreign powers, and for the undeviating rectitude of his conduct, than for any commanding qualities of intellect.

Clarendon, Ark., town, county-seat of Monroe County, situated on the White River, on the St. Louis & S., and the Arkansas M. R.R.'s, 58 miles southeast of Little Rock. It is a trade centre for lumber and agricultural products. The manufacturing of wagons, staves, and other articles of wood supplies the local demands. Pop. 2,000.

Clarendon, England, a lodge in Wiltshire, near Salisbury. It is noted chiefly for being the place where were written, in 1164, the 'Constitutions of Clarendon,' defining the limits between the jurisdiction of the civil and ecclesiastical courts. Henry II. called together the bishops and barons of his kingdom, and they held council at Clarendon.

Clarendon, Vt., a town in Rutland County, on the Rutland R.R., noted for its medicinal springs, the waters of which are of value in the treatment of kidney, liver, and skin diseases. Its industries are fruit-raising, dairying, and maple-sugar making. Pop. (1900) 911.

Clarendon, Colony of. This title represents a repeated effort to found the settlement near the mouth of Cape Fear River, N. C., later flourishing as Wilmington. If successful from the outset, it would have been a counterpart of Albemarle (N. C.), and Ashley River (S. C.), and very likely given us a State of Middle Carolina under some name. The first colony was of New Englanders, in 1660: they had trouble with the Indians and abandoned the place by 1663, leaving a post with a placard on it highly disparaging to the region. Early in October 1653, however, the river was explored for 150 miles by Sir John Yeamans, a Cavalier adventurer from Barbadoes. He was delighted with the country, cared nothing for other people's opinions of it, and asked the lords proprietors of Carolina for a grant. They gave it, made him governor of it, and in May 1665 he returned with several hundred settlers from Barbadoes. But Yeamans had wider interests, and could not stay with the colony—from 1672 to 1674 he was governor of Carolina; trade was insufficient

CLARENDON — CLARETIE

for more than the northernmost and southernmost settlements; and Clarendon (so named from the famous Lord Clarendon, one of the proprietors) was gradually abandoned, ending with 1690.

Clarendon, Constitutions of, a code of laws adopted in the 10th year of Henry II. (1164), at a council of prelates and barons held at the village of Clarendon, in Wiltshire, in January of that year. These laws, finally digested into 16 articles, were brought forward by the king as "the ancient customs of the realm," and were enacted as such by the council. They consisted, however, partly at least, of reforms introduced by the king himself. Ten of the articles were condemned, and six allowed by Pope Alexander III. The six articles approved of were of comparatively slight importance, mostly confirming the privileges of the ecclesiastical order; among the condemned articles the most important were the first, providing that disputes between laymen and ecclesiastics as to advowsons should be tried in the king's court; third, that ecclesiastics accused of any offense against justice should be answerable to the civil courts for the civil offense, and to the ecclesiastical courts for the ecclesiastical offense; fourth, that ecclesiastical dignitaries should not go out of the kingdom without the king's leave; eighth, that appeals should be made from the court of the archbishop to the king's court, and should not go further (that is, to the Pope) without the king's consent; ninth, that in the event of a dispute between a layman and an ecclesiastic as to whether the civil or ecclesiastical court should have jurisdiction in certain cases of tenure of property, the tribunal should be determined by the king's chief justice upon a recognition of 12 lawful men; 12th, that pleas of debt should belong to the king's jurisdiction. Notwithstanding the entreaties of the other prelates, and in defiance of the king, Becket, after a momentary appearance of yielding, peremptorily refused his signature to the articles. After the murder of the archbishop, the king, on his reconciliation with the Pope in 1172, was compelled to promise the abolition of all laws and customs hostile to the clergy; and at the Council of Northampton in 1176 the constitutions of Clarendon were materially modified in favor of the ecclesiastical order.

Clarendon Press, Oxford, the name by which the press of the University of Oxford is distinguished. In January 1586 delegates *de impressione librorum* were appointed by the Convocation of the University. About this time Joseph Barnes was styled "Printer to the University," and others bore the title after him. In 1633 Archbishop Laud procured letters patent granting a large license in printing to the university, with a view to the publication of manuscripts from the Bodleian Library. The work was carried on from 1713 to 1830 in the building known as the Clarendon, the cost of which was defrayed partly from the sale of Lord Chancellor Clarendon's 'History of the Rebellion,' the copyright of which was given to the university. The management of the printing-office is committed to a board consisting of the vice-chancellor and 10 other members of Convocation, nominated by the vice-chancellor and proctors, as vacancies occur. Five are perpetual delegates, and five are nominated for a term of

seven years. The south side of the present building (the additional accommodation required and opened) is appropriated to the printing of Bibles and prayer-books. The north, called the "learned" or "classical" side is assigned for the printing of university documents, books printed by authority of the delegates, and those sent in by private authors and publishers. Those printed for the university itself (but no others) bear on the imprint "E Typographeo Clarendoniano," or "At the Clarendon Press." Some admirable specimens of typography have been produced by the Clarendon Press.

Clarens, klä-rän, Switzerland, in the canton of Vaud, on the northeastern coast of Lake Geneva, about 50 miles from Geneva. The healthfulness of the climate, and the beauty of the place make it a resort for invalids. It is the scene of Rousseau's 'Nouvelle Héloïse.'

Clares, Poor. See CLARE, SAINT; ORDERS, RELIGIOUS.

Claret, a name originally given to wines of a light-red color, but now applied to the red wines imported from France, chiefly from Bordeaux. These wines vary in composition according to the locality, season, and age, but the produce of each vineyard usually retains its own peculiar characteristics. The most esteemed are those produced at the vineyards of Lafitte, Latour, Chateau Margaux, and others. Many of the clarets formerly sold in the United States were nothing more than the *vin ordinaire* used by the French peasants and working classes, but since the development of the California grape industry as good domestic claret can be obtained here as anywhere. A genuine claret should contain from 10 to 12 per cent of proof spirit.

Fictitious clarets were sometimes prepared by mixing a rough cider with a cheap French wine, and coloring with cochineal, logwood, elderberry, hollyhock, indigo, litmus, red cabbage, beet-root, or ros-aniline. To detect these coloring matters the following method may be adopted: Make a jelly by dissolving five grams of gelatine in 100 cubic centimeters of warm water, and pour it into a square flat mold. From this cake of jelly cubes about three fourths of an inch square are cut with a sharp, wet knife, and are immersed in the wine; they are taken out after 24 to 48 hours, washed slightly, and sections cut in order to see how far the coloring matter has penetrated. If the wine is pure, the color will be confined to the edges of the slice, or will not have penetrated more than an eighth of an inch. The coloring matters mentioned above permeate rapidly, and color the jelly.

Claretie, Arsène Arnaud, är-sän är-nō klär tē, called **Jules**, zhül, French novelist and dramatist: b. Limoges 3 Dec. 1840. He has written a long series of very successful novels, the most noteworthy of them being: 'Madeleine Bertin' (1868); 'The Million' (1882); 'Monsieur the Minister' (1882); 'Noris, Manners of the Time' (1883); 'The American Woman' (1892). He wrote also some striking chapters of contemporary history, as 'The Revolution of 1870-1'; 'Paris Besieged'; 'Five Years After: Alsace and Lorraine Since Annexation.' His dramatic compositions relate mostly to the time of the great Revolution. He

CLARIBEL — CLARK

became administrator of the Comédie Française in 1885, and was chosen member of the Academy in 1888.

Clar'ibel. (1) The bride of Phaon, as told in Spenser's 'Faerie Queene.' Philemon endeavors to injure her by false stories to which Phaon gives credit and kills Claribel. When he learns the deception he murders Philemon. (2) A poem by Tennyson.

Claribel, Sir, a knight who figures in Spenser's 'Faerie Queene.' One of four knights who fight for the false Florimel. Bretomart enters the combat with them; Arthur ends the fray, or it is "stinted" by him.

Clarification, the separation of the insoluble particles that prevent a liquid from being transparent. It may be performed by depuration, filtration, or coagulation. In the first of these operations the liquid is permitted to subside, without being in the least disturbed, until all the particles which were in suspension are precipitated; it is then decanted. This mode of clarification can be used only when the substance operated on is in a large quantity, or is of a nature not to be altered during the time necessary to complete the operation, and when its specific gravity is less than that of the particles which render it turbid. Filtration is a process by which a liquid is strained through a body, the interstices of which are small enough to stop the solid particles contained in it. Filters of wool, linen, paper, powdered glass, sand, or charcoal, may be used, according as the liquid is more or less dense, or of a nature to operate upon any one of these bodies. Clarification by coagulation is performed with the assistance of albumen (as isinglass or white of eggs) added to the liquor for this purpose, which, by the action of heat, of acids, etc., becomes solid, forms a mass, and precipitates the extraneous substances. Clarification is also now commonly effected by centrifugal machines.

Clarinda, Iowa, city, county-seat of Page County; situated on the Nodaway River, and the Chicago, B. & Q. R.R.; and is 45 miles east of the Missouri River. It is surrounded by an agricultural and stock-raising country, and contains carriage factories, brick works, flour-mills, iron works, and two banks. Valuable coal beds are near the city; also a State asylum for the insane. Pop. (1900) 3,500.

Clarinet, or Clarionet, a wind-instrument of the reed kind, with a trumpet-formed mouth, and played by holes and keys. Its scale, though including every semitone within its extremes, is virtually defective. Its lowest note is E below the F clef, from which it is capable, in the hands of good performers, of ascending more than three octaves. Its powers through this compass are not everywhere equal; the player, therefore, has not a free choice in his keys, being generally confined to those of C and F, which indeed are the only keys in which the clarinet is heard to advantage. The music for this instrument is therefore usually written in those keys. There are, however, B flat clarinets, A clarinets, D clarinets, B clarinets, and G clarinets; the three latter are not ordinarily used.

Clarion, a musical instrument of the trumpet kind, with a narrower tube and a higher and shriller tone than the common trumpet.

Clarissa Furiosa, a story by W. E. Norris, first published in 1896. It may be regarded in the light of a satire on the "New Woman," and is perhaps the least successful of the clever author's novels. The most of the story is taken up with the semi-public life to which the heroine devotes herself after she has separated from her husband. The workmanship is good, but the writer's want of genuine interest in his characters is felt.

Clarissa Harlowe, a novel by Samuel Richardson, published in 1751. It is a story of a noble-minded young woman, whose good reputation is compromised by her lover, Lovelace. The scene is laid in rural England of the first half of the 18th century. The story is largely told by letters exchanged between Clarissa and her confidante Miss Howe, and between Lovelace and his friend Belford. To the present-day reader, the tale seems slow and prolix; but it is a truthful picture of the conventions and ideals of its period, while it possesses a perennial life because it deals with some of the elemental interests and passions.

Clark, Abraham, American patriot: b. Elizabethtown, N. J., 15 Feb. 1726; d. Rahway, N. J., 15 Sept. 1794. He studied for the bar and practised in his native State with success. After serving as sheriff of Essex County, he was chosen a delegate to the Continental Congress in 1776 and signed the Declaration of Independence. He was a member of the Constitutional Convention of 1789, and aided in framing the Constitution of the United States.

Clark, Alexander, American clergyman and writer: b. Jefferson County, Ohio, 10 March 1834; d. Georgia 6 July 1879. He was editor of the 'Methodist Recorder' (1870-9). He wrote: 'The Old Log Schoolhouse' (1864); 'Workaday Christianity' (1870); 'Rambles in Europe' (1877); 'Ripples on the River,' verse.

Clark, Alonzo, American physician: b. Vermont 1 March 1807; d. New York 1887. He graduated at Williams College 1828, and at the College of Physicians and Surgeons, New York, 1835, entering at once upon the practice of his profession, of which he became an eminent member. He was professor of the theory and practice of medicine in the University of Vermont, of anatomy and pathology in the University of the City of New York, of pathology and practical medicine in Columbia University 1860-87, and dean of its medical faculty 1875-84. He was also president of the College of Physicians and Surgeons, and filled various offices in the societies and associations of which he was a member. Besides many contributions to medical periodicals, he published 'Presidential Address Before the New York State Medical Society' (1853); 'Lectures on Diseases of the Heart' (1884).

Clark, Alonzo Howard, American scientist: b. Boston 13 April 1850. He left his studies at Wesleyan University to enter the service of the United States Fish Commission, making a thorough study of the work. He has written: 'History of Fishery Industries of the United States'; 'Whales and Sea Fisheries'; 'History of the Mackerel Fisheries'; 'Food Industries of

CLARK

the World.' Since 1881 he has been connected with the Smithsonian Institution.

Clark, Alvan, American astronomical-instrument maker: b. Ashfield, Mass., 8 March 1808; d. Cambridge, Mass., 19 Aug. 1887. He was at one time a portrait painter in Boston; but in 1844 his attention was turned to telescope making. Two years later he definitely adopted the business of astronomical-instrument making, and in time achieved a world-wide reputation. His famous telescopes include the Chicago 18½-inch, the Washington 26-inch, the Russian 30-inch, and the California 36-inch.

Clark, Alvan Graham, American astronomer: b. Fall River, Mass., 10 July 1832; d. Cambridge, Mass., 9 June 1897. He was a son of Alvan Clark (q.v.), and became associated with him under the firm name of Alvan Clark & Sons. In 1859 they began work on an object glass with an aperture of 18½ inches, which ultimately became the property of the Astronomical Society of Chicago. With this instrument Clark discovered the companion of Sirius, for which the French Academy awarded him the Lalande medal. Other telescopes constructed largely under his supervision were: that for the Naval Observatory, a 26-inch instrument with which Prof. Asaph Hall discovered the two satellites of Mars; the McCormick telescope for the University of Virginia; the great 30-inch one for the St. Petersburg Imperial Observatory; the powerful Lick telescope, with an aperture of 36 inches, at Mount Hamilton, Cal. (1886), with which Jupiter's fifth satellite was discovered; and finally, the greatest of his achievements as a maker, the wonderful Yerkes lens of 40 inches, the gift of C. T. Yerkes to the University of Chicago, and installed in the observatory at Lake Geneva, Wis. As an astronomer he made several discoveries of double stars.

Clark, Sir Andrew, Scotch physician: b. Aberdeen 28 Oct. 1826; d. London 6 Nov. 1893. He was educated at Aberdeen and Edinburgh. After an unusually brilliant career as a student of medicine at Edinburgh, he assisted Dr. Hughes Bennett and Dr. Robert Knox, the anatomist, and next had charge for four years of the pathological department at the Haslar Naval Hospital. After graduating at Aberdeen in 1854, he settled in London. He will live in remembrance as the "beloved physician" of George Eliot.

Clark, Anson Luman, American eclectic physician and surgeon; b. Clarksburg, Mass. 12 Oct. 1836. In 1858 he graduated as B.A. in Lombard University, and as A.M. in 1868 in medicine, at the Eclectic Medical Institute of Cincinnati, Ohio, in 1861. He served during the Civil War as assistant surgeon, and was a member of the House of Representatives of the 27th General Assembly of Illinois. Since 1868 he has filled the chair of Diseases of Women and Obstetrics in the Bennett Medical College of Chicago, Ill. He wrote 'Clark's Diseases of Women' (1878).

Clark, Champ, American politician: b. Anderson County, Ky., 7 March 1850. He was graduated at Bethany College and Cincinnati Law School, and in 1873-4, was president of Marshall College, W. Va. He has attained dis-

tingtion as a Democratic campaign speaker, and since 1893 has been, with an intermission of one term, a member of Congress from Missouri.

Clark, Charles Dickson, American jurist: b. Laurel Cove, Tenn., 7 Oct. 1847. He was graduated at Cumberland University in 1875, and practised as a lawyer in his native State until 1895, when he was appointed judge of the United States court for the eastern and middle districts of Tennessee.

Clark, Charles Edgar, American naval officer: b. Bradford, Vt., 10 Aug. 1843. He entered the naval service in 1860; took part in the battle of Mobile Bay and in the bombardment of Fort Morgan; and was promoted captain in 1896. In March 1898 he took command of the battleship Oregon at the Mare Island navy yard, San Francisco, and when war with Spain was deemed inevitable, received orders to proceed to Key West, Fla., with all haste. After a voyage of over 14,000 miles, he joined the American fleet in Cuban waters on 26 May, and on 3 July commanded his ship at the battle of Santiago. In March 1899 he was assigned to duty at the League Island navy yard; was promoted rear-admiral 16 June 1902, and retired 9 Aug. 1905.

Clark, Charles Heber ("MAX ADELER"), American journalist: b. Berlin, Md., 11 July 1841. He is the editor of the 'Textile Record' in Philadelphia, and has written much on economic themes, but is best known to the general public as a humorist under the pseudonym MAX ADELER. He has published: 'Out of the Hurly Burly'; 'Elbow Room'; 'The Fortunate Island'; 'Capt. Bluit' (1902).

Clark, Daniel, Canadian pathologist: b. Granton, Scotland, 29 Aug. 1836. He went to Canada when a child; was graduated at Victoria University in 1858; and practised medicine in Ontario with great success. He has paid especial attention to mental diseases and the care of the insane. Since 1875 he has been at the head of the Provincial Asylum for the Insane at Toronto, and was later made professor of psychology and mental diseases in Toronto University. He was also twice elected president of the College of Physicians and Surgeons of Ontario. He has written 'Pen Photographs' (1873); 'Josiah Garth,' a novel.

Clark, Edson Lyman, American Congregational clergyman: b. Easthampton, Mass., 1 April 1827. He was graduated from Yale in 1853, and from Union Theological Seminary in 1858, and has filled several Congregational pastorates in New England. He has published: 'The Arabs and the Turks'; 'The Races of European Turkey'; 'Fundamental Questions, Chiefly Relating to the Early Hebrew Scriptures.'

Clark, Edward, American architect: b. Philadelphia 1822; d. Washington, D. C., 6 Jan. 1902. He studied architecture under Thomas W. Walter, and after serving as assistant, was made chief architect of the United States capitol in 1864, serving continuously till his death. He was a member of the leading architectural commissions of the national government, including that for the completion of the Washington monument.

Clark, Edwin Charles, English jurist: b. Yorkshire, England, 5 Nov. 1835. He was educated at Shrewsbury School and Trinity College, Cambridge, where he became scholar and Fellow.

CLARK

He practised for a short time as a conveyancer in London, being called to the bar at Lincoln's Inn 1860. In 1873 he was appointed regius professor of civil law at Cambridge, where he is also a professional fellow of St. John's College. His books are: 'Early Roman Law: Regal Period' (1872); 'Analysis of Criminal Liability' (1880); 'Practical Jurisprudence: a Comment on Austin' (1883); 'Cambridge Legal Studies' (1888).

Clark, Francis Edward, American clergyman: b. Aylmer, Quebec, 12 Sept. 1851. He was graduated from Dartmouth College in 1873, and continued his studies at Andover Theological Seminary. He became pastor of a Congregational church at Portland, Maine, and there organized the first Young People's Society of Christian Endeavor 2 Feb. 1881. He was pastor of the Phillips Congregational Church in South Boston, Mass., 1883-7, and in 1887 was made president of the United Society of Christian Endeavor and also became editor of the 'Golden Rule,' the official organ of the society.

Clark, Frederick Thickstun, American novelist: b. Pennsylvania 1858. He has published: 'A Mexican Girl'; 'In the Valley of Havilah'; 'On Cloud Mountain'; 'The Mistress of the Ranch.'

Clark, George Hunt, American poet: b. Northampton, Mass., 1809; d. Hartford, Conn., 20 Aug. 1881. He was a frequent contributor to 'Putnam's,' 'Knickerbocker,' and other journals. His published poems include 'Now and Then'; 'The News'; and a collection of humorous and sentimental pieces, entitled 'Undertow of a Trade-Wind Surf.'

Clark, George Rogers, American pioneer: b. Monticello, Va., 19 Nov. 1752; d. near Louisville, Ky., 18 Feb. 1818. He studied surveying, and at 20 settled in Ohio, serving in the Indian wars of that time and region. He removed to Kentucky in 1775, procuring the organization of that Territory. On the outbreak of the Revolutionary War he led the patriot army on the frontier, campaigning vigorously against the British throughout Illinois, Ohio, and Kentucky. His success in this saved much territory to the colonies in the final treaty of peace with Great Britain. He subsequently supported the cause of the French of the Mississippi valley against the Spaniards. He fell into penury in his latter years, and died in neglect. See CLARK, WILLIAM (1770-1838).

Clark, Henry James, American naturalist and prose-writer: b. Easton, Mass., 22 June 1826; d. Amherst, Mass., 1 July 1873. He was associated in work with Agassiz for several years; and was professor in several leading colleges and universities. Among his many contributions to literature are 'Mind in Nature, or the Origin of Life' (1863); 'Mode of Development of Animals' (1865); 'Claims for Scientific Property.'

Clark, Imogen, American novelist: b. New York. She has published: 'Will Shakespeare's Little Lad' (1897); 'The Victory of Ezry Gardner' (1897); 'The Heresy of Parson Medlicott' (1900); 'God's Puppets' (1901).

Clark, J. Scott, American educator: b. Copenhagen, N. Y., 23 Sept. 1854. He was graduated from Syracuse University in 1877, was professor of rhetoric there, 1882-92, and has

been professor of English in Northwestern University, Evanston, Ill., from 1892. He has published: 'A Practical Rhetoric' (1886); 'The Art of Reading Aloud' (1892); 'A Study of English Prose-Writers' (1898); 'A Study of English and American Poets' (1900).

Clark, Sir James, Scottish physician: b. Findlater, Banffshire, 14 Dec. 1788; d. Bagshot Park 29 June 1870. He studied medicine at the University of Edinburgh, and entered the navy as assistant-surgeon in 1809, and continued in the service till 1815, when he returned to Edinburgh. After devoting some time to foreign travel, he settled in Rome, where he continued to practise from 1818 to 1826. He returned to England in 1826, and became physician to the Duchess of Kent in 1835, and on the accession of Queen Victoria was appointed first physician in ordinary to the queen, and shortly afterward made a baronet. He retired from practice several years before his death, but continued till near the close of his life to act as consulting physician to the royal family.

Soon after his return to England Sir James Clark published, as a result of his continental observations, a work 'On the Sanative Influence of Climate' (1829), and in 1835 a 'Treatise on Pulmonary Consumption and Scrofula.'

Clark, James Gowdy, American balladist: b. Constantia, N. Y., 28 June 1830; d. Pasadena, Cal., September 1897. He was well known as a concert singer and song writer, and among his most popular songs are: 'Star of My Soul'; 'The Awakening'; 'The Beautiful Hills'; 'The Children of the Battlefield'; 'Freedom's Battle Hymn'; 'The Evergreen Mountains of Life'; and 'The Old Mountain Tree.'

Clark, John Bates, American economist: b. Providence, R. I., 26 Jan. 1847. He was graduated at Amherst in 1872, and has been prominent as a political economist since the publication of his 'Philosophy of Wealth'; 'Wages'; 'Capital and Its Earnings'; and 'The Distribution of Wealth.' In 1895 he became professor of political economy at Columbia University.

Clark, John Emory, American scientist: b. Northampton, N. Y., 8 Aug. 1832. He was graduated at the University of Michigan in 1856, and studied at Heidelberg. After serving in the Civil War as captain and colonel, he became professor of astronomy at Antioch College. Since 1873 he has been professor of mathematics at the Sheffield Scientific School of Yale University.

Clark, John Willis, English writer, registrar of the University of Cambridge from 1891. He is the author of 'Cambridge' (1880); 'Architectural History of the University and Colleges of Cambridge' (1882); 'Libraries in the Mediæval and Renaissance Periods' (1894); 'Augustinian Priory Observances' (1897); 'Old Friends at Cambridge and Elsewhere' (1900); 'The Care of Books' (1901).

Clark, Jonas Gilman, American philanthropist: b. Hubbardston, Mass., 1 Feb. 1815; d. Worcester, Mass., 23 May 1900. He began life as a carriage maker and acquired a fortune in business and real estate investments. He is noted as the founder of Clark University (q.v.), at Worcester, Mass., which he endowed with \$2,000,000 in 1887. He also conferred gifts on his native town. He bequeathed \$200,000 to

CLARK

Clark University outright and \$1,000,000 and the residue of his estate conditionally.

Clark, Joseph, English painter: b. Cerne Abbas, Dorsetshire, 4 July 1834. He was educated by "The Dorset Poet," William Barnes (q.v.), went to London at 18 and became a student at the Royal Academy. He first exhibited at the Royal Academy in 1857, and has exhibited there nearly every year since. Among well-known pictures by him are: 'The Return of the Runaway'; 'Hagar and Ishmael'; 'Three Little Kittens.'

Clark, Lewis Gaylord, American journalist and humorous writer: b. Otisco, N. Y., 5 March 1810; d. Piermont, 3 Nov. 1873. In 1834 he became editor of the 'Knickerbocker Magazine,' and with Irving, Bryant, Longfellow, Halleck, and Willis, as contributors, made it the foremost literary publication of that time, and an inspiration to a higher standard of periodical literature. The 'Editor's Table,' written by him, overflowed with amusing stories and witty sayings. The 'Knickerbocker Sketch-Book' (1850), and 'Knick-Knacks from an Editor's Table' (1853), are his only publications in book form.

Clark, Lewis George, American slave and freedman: b. about 1811; d. Lexington, Ky., 16 Dec. 1897. He was reared a slave, but escaping, lectured for emancipation in 1841-50. He claimed to be the original of "Uncle Tom" in Mrs Stowe's novel, but this the authoress denied.

Clark, Theodore Minot, American architect: b. Boston, Mass., 20 Aug. 1845. He was graduated from Harvard in 1866, and has been professor of architecture in the Massachusetts Institute of Technology in Boston for many years. He has published 'Building Superintendence'; 'Owner and Builder Before the Law'; 'Rural School Architecture.'

Clark, Thomas March, American Protestant Episcopal bishop: b. Newburyport, Mass., 4 July 1812; d. 7 Sept. 1903. He was graduated at Yale in 1831, and four years later entered the Presbyterian ministry, but in 1836 took orders in the Episcopal Church. He was successively rector of Grace Church, Boston, 1836-43; St. Andrew's, Philadelphia, 1844-7; Trinity Church, Boston, 1847-51; and Christ Church, Hartford, Conn., 1851-4. In the year last named he was consecrated bishop of Rhode Island. From 1899-1903 he was the presiding bishop of the Episcopal Church. He has written: 'Formation of Character'; 'The Efficient Sunday-school Teacher'; 'The Dew of Youth'; 'Early Discipline and Culture'; 'Reminiscences' (1895).

Clark, Walter, American jurist: b. Halifax, N. C., 19 Aug. 1846. He was graduated at the University of North Carolina in 1864; became a lawyer in 1868, judge of the superior court in 1885, of the supreme court 1889-1903 and has been chief justice since 1 Jan. 1903. He is a contributor to leading magazines on current topics and a law writer of authority, his best known work being 'Overruled Cases' (1884). Other works by him are: 'Annotated Code of Civil Procedure'; 'Laws for Business Men.' In 1896 the North Carolina Democratic convention indorsed him as a candidate for the vice presidency, and in 1903 Mr. William J. Bryan expressed his preference for him.

Clark, William, American explorer; brother of George Rogers Clark (q.v.): b. Virginia 1 Aug. 1770; d. St. Louis, Mo., 1 Sept. 1838. He emigrated with his family at the age of 14 to the falls of the Ohio, in Kentucky, on the present site of Louisville. In 1808 he was appointed in conjunction with Capt. Meriwether Lewis to the command of an expedition designed to explore the northwest territory lying between the Mississippi and the Pacific Ocean. He acquitted himself with consummate ability in this hazardous employment, which required the combination of military and scientific skill. His journal and the account kept by him of the astronomical observations made by him and Capt. Lewis have been published. He was appointed in 1813 governor of the Northwest Territory and superintendent of Indian affairs, which offices he retained till 1820, when Missouri was created a State. Two years afterward he was again appointed commissioner and superintendent of Indian affairs.

Clark, William, American thread manufacturer: b. Paisley, Scotland, 1841; d. Portland, England, 7 July 1902. Entering the Scottish thread mills established by his family, he made himself conversant with all details of the business and in 1860 came to the United States. Here he joined his brother, George A. Clark, who had preceded him by four years, and established at Newark, N. J., a small branch of the Scottish business. From this was built up in time the great Clark thread mills of Newark. After the death of George Clark, in 1873, the business was solely managed by his brother William. At the latter's death he left bequests of \$10,000 to each of three Newark benevolent institutions, \$6,000 to a fourth, and \$10,000 to Rutgers College.

Clark, William Andrews, American politician: b. near Connellsville, Pa., 8 Jan. 1839, of Protestant Irish farmer stock. His preparation for college was interrupted by the removal of his family to Iowa, where he attended an academy at Birmingham and studied law two years, but never practised. He taught school in Missouri 1859-60; was a miner in Colorado 1862-3; and in 1863 migrated to Idaho, where he set up in trade, and was soon one of the chief merchants in the Territory. In 1867 he contracted for a Star Route in Montana; and in 1868 formed a copartnership for a mercantile and banking business there. To qualify for the mining business, he took a complete course at Columbia School of Mines 1872-3. Since then he has been identified with mining interests in every mining region of the West, and has for many years been the largest individual metal producer of the world, besides having interests in manufacturing, railroading, mercantile business, etc. He was State orator to represent Montana at the Philadelphia Centennial of 1876, and a commissioner of the New Orleans Exposition of 1884; was Masonic Grand Master of Montana in 1877; in 1878 was major in the Nez Percé war against Chief Joseph; and was president of the constitutional convention when Montana was admitted to the Union. In 1898 he was elected to the Senate from Montana, but a protest was filed and an investigation ordered; before a report was made he resigned, returned to Montana, and was re-elected for the term 1901-7. He has been placed on many of

CLARK — CLARKE

the most important senatorial committees, including that on foreign relations.

Clark, William Bullock, American scientist; b. Brattleboro, Vt., 15 Dec. 1860. He was graduated at Amherst College in 1884. After a course of European study he became instructor in geology at Johns Hopkins University in 1887, and since 1894 has been professor of geology there. In 1891 he was appointed director of the Maryland Weather Service.

Clark, William George, English scholar: b. March 1821; d. York 6 Nov. 1878. He was educated at Trinity College, Cambridge, took orders in the Established Church but gave up his orders in 1869, explaining his reasons therefor in a pamphlet 'The Present Dangers of the Church of England' (1870). He assisted in founding the 'Journal of Philology' in 1868, but is best known for his editorship with William Aldis Wright (q.v.) of the noted 'Cambridge Shakespeare' (1863-6). The 'Globe Shakespeare' (1864) was also edited by Clark and Wright. Clark published also 'Lectures on the Middle Ages and the Revival of Learning' as well as lesser works.

Clark, Willis Gaylord, American poet, twin brother of Lewis Gaylord Clark (q.v.): b. Otisco, N. Y., 5 March 1810; d. Philadelphia, Pa., 12 June 1841. He became associate editor of the *Columbian Star*, a religious weekly paper (1830), but resigned shortly after to take charge of the *Philadelphia Gazette*. His longest poem is 'The Spirit of Life' (1833). A complete edition of his poems, edited by his brother, appeared in 1847.

Clark River (named after Capt. William Clark), a river of the United States, rising in the Rocky Mountains in western Montana, about lat. 45° 30' N. After a winding northwest course of about 650 miles between the Missouri and Bitter Root ranges, during which it expands into an extensive lake, it falls into the Columbia, in the State of Washington, lat. 48° 50' N., lon. 117° 50' W. It is also called Clark Fork of the Columbia River.

Clark University, a co-educational institution in Atlanta, Ga.; organized in 1870 under the auspices of the Methodist Episcopal Church; reported at the end of 1902: Professors and instructors, 20; students, 580; number of volumes in library, 1,000; value of property, \$250,000; president, Charles M. Melden, D.D.

Clark University, Worcester, Mass., founded in 1887 by the gift of Jonas G. Clark (q.v.), and the work of instruction began in 1889. At first the institution was devoted wholly to post-graduate work, those only were admitted as students who had taken a first degree and who gave promise of high attainment in some department of science. No entrance examination was required. The design and organization of the university were intrusted to G. Stanley Hall (q.v.) formerly a professor of philosophy at Johns Hopkins University, Baltimore, and for years a close observer of schools and school methods in America and Europe.

But few departments have been organized, namely, mathematics, physics, anthropology, biology, philosophy, and psychology. Pedagogy (1899) was made one of the sub-departments of psychology. One of the characteristic features

in the design is that professors and students should meet on the same plane, the professors to be as older students, the students to lecture occasionally on special subjects. Original work is encouraged and demanded, and a number of fellowships and scholarships have been founded so that worthy students of limited means might devote themselves to research along special lines, and not be hindered or hampered by doing outside work for the purpose of continuing their studies. No attempt has been made to secure large numbers of students; in such a school a small number is desirable. In 1892-3 there were 53 students; in 1896-7, 38; in 1898-9, 48.

There are 11 professors, 16 fellowships, and 16 scholarships. In the library are 18,000 volumes, and the following publications are issued by the university, but not officially: 'American Journal of Psychology'; 'Pedagogical Seminary'; 'Mathematical Review.'

In 1902 a collegiate department was opened with Carroll D. Wright as president. G. Stanley Hall is president of the university. See HALL, G. STANLEY.

Clarke, Adam, Methodist clergyman and scholar: b. Moybeg, County Londonderry, Ireland, 1762; d. London 26 Aug. 1832. He became an itinerant Methodist preacher in 1782, and continued to travel in various circuits till 1805, when he took up his residence in London, where he passed a considerable part of his subsequent life. He was learned in the Oriental languages, and published a commentary on the Scriptures (1810-26), and various other works, among the rest a 'Bibliographical Dictionary' (1802).

Clarke, Annie, American actress: b. Boston, Mass., 1845; d. Chicago 22 May 1902. Her first appearance was at the Boston Museum in 1853 as the Duke of York in *Richard III*. For several years she acted in juvenile parts in various places, but from 1861 till 1892 was a member of the stock company at the Boston Museum, soon becoming the leading actress there. She was a general favorite, but until 1892 was seldom seen outside of Boston. After that date she played in Chicago and other cities.

Clarke, Augustus Peck, American physician: b. Pawtucket, R. I., 24 Sept. 1833. He was graduated at Brown University in 1861, and at the Harvard Medical School in 1863. He was an army surgeon during part of the Civil War, and subsequently entered private practice. He has been sent to every International Medical Congress since 1887, and since 1894 has been dean of the College of Physicians and Surgeons in Boston. He has attained special eminence in the domain of obstetrics and gynecology.

Clarke, Benjamin Franklin, American educator: b. Newport, Maine, 14 July 1831. He was graduated at Brown University in 1863, and subsequently became professor of mechanical engineering there. In 1898-9 he was acting president of the university.

Clarke, Charles Cowden, English writer: b. Enfield, Middlesex, 15 Dec. 1787; d. Genoa, Italy, 13 March 1877. His father kept a small school and had John Keats as one of his pupils; but in 1810 gave it up and removed to Ramsgate. The son frequently went up to London,

CLARKE

where he came into contact with Leigh Hunt, Shelley, Hazlitt, the Lambs, and Vincent Novello, and in 1828 he married Mary, the eldest daughter of Novello. He engaged for some time in business as a bookseller and a music publisher, and from 1834 till 1856 lectured throughout the country, mainly on poets and poetry. His publications include his 'Hundred Wonders' (1814); 'Adam the Gardener' (1834); 'Shakespeare Characters,' chiefly those subordinate (1863); and 'Molière Characters' (1865), the two last being collections of some of his lectures. He is best known, however, by the edition of Shakespeare which he annotated in conjunction with his wife, and by the 'Shakespeare Key' (1879).

Clarke, Creston, American actor: b. Philadelphia 20 Aug. 1865. He is a son of John Sleeper Clarke (q.v.), and was educated at academies in Paris and London with a view to the stage, and made his début in London 1882. He has attained success in tragic roles, and has written 'The Last of His Race' and other plays.

Clarke, Edith Emily, American librarian: b. Syracuse, N. Y., 5 Nov. 1859. She was graduated at Syracuse University in 1881, and after teaching school some years, took up library work. Having served as cataloguer at Columbia University Library and at the Newberry Library in Chicago, she became chief cataloguer of public documents for the National Government in 1895, and librarian of the University of Vermont in 1898.

Clarke, Edward Daniel, English traveler: b. Willington, Sussex, 1769; d. London 9 March 1822. In 1799 he started on an extensive and laborious tour through Denmark, Sweden, Lapland, Finland, Russia, Tartary, Circassia, Asia Minor, Syria, Palestine, Egypt, Greece, and Turkey, returning in 1802 through Germany and France. On his return he obtained from Cambridge University the honorary degree of LL.D., in consideration of the services rendered to its public libraries and institutions by his liberal contributions, among which the greatest, perhaps, in value is the celebrated manuscript of Plato's works, with nearly 100 others, and a colossal statue from Eleusis, believed by him to be that of Demeter (Ceres). To him also the British nation is indebted for the acquisition of the famous sarcophagus of Alexander the Great, which he discovered in the possession of the French troops in Egypt, and which was by his means surrendered to the British army. In 1807 he commenced a course of lectures on mineralogy at Cambridge, and in 1808 a professorship of mineralogy was instituted there in his favor. He himself had made a splendid collection of mineralogical specimens, which was purchased after his death by Cambridge University. In 1805 he became vicar of Harlton, and in 1809 rector of Yeldham, Essex. In 1817 he was appointed librarian of Cambridge University. A complete edition of his travels appeared in 6 volumes (1810-23), and another in 11 volumes (1816-24), under the title of 'Travels in Various Countries of Europe, Asia, and Africa.' His 'Travels,' which are the most popular of his works, are attractive from the enthusiasm of the writer and his prolific imagination.

Clarke, Sir Edward George, English legal writer: b. London 15 Feb. 1841. He was admitted a barrister of Lincoln Inn in 1864, and was solicitor-general 1886-92. He sat in the House of Commons for Southwark in 1880, and for Plymouth 1880-1900. He has published 'Treatise on the Law of Extradition' (1866, 3d ed. 1888), and three collections of 'Public Speeches.'

Clarke, Frank Wigglesworth, American chemist: b. Boston, Mass., 19 March 1847. He was graduated from the Scientific School of Harvard University in 1867, was instructor at Cornell 1869, professor in Howard University 1873-4, and professor of chemistry and physics, University of Cincinnati 1874-83. He has been chief chemist of United States Geological Survey and honorary curator of minerals, United States National Museum, since 1883. He is a member of many American and foreign scientific societies, and was a member of the International Jury of Awards at the Paris Exposition of 1900, and received from the French government the decoration of the Legion of Honor. He has published: 'Weights, Measures and Money of All Nations'; 'Elements of Chemistry'; 'A Report on the Teaching of Chemistry and Physics in the United States'; the Smithsonian 'Constants of Nature,' and various official bulletins. He is also author of more than a hundred scientific essays and memoirs published in magazines and scientific journals. His most important contributions to science have been his 'Revaluation of Atomic Weights,' and his investigations upon the constitution of the natural silicates. He is joint author with L. M. Dennis of two recent works, 'Elementary Chemistry' and 'A Laboratory Manual.'

Clarke, Sir George Sydenham, English soldier and colonial governor: b. Lincolnshire 4 July 1848. After being educated at Haileybury College he entered the Royal Engineers' service and served in the Egyptian expedition in 1882, in the Sudan expedition 1885, at Suakin and elsewhere, and was knighted in 1893. Since 1901 he has been governor of Victoria, Australia. He has published: 'Practical Geometry and Engineering Drawing'; 'The Principles of Graphic Statics'; 'Plevna'; 'Fortification: Past, Present, and Future'; 'The Last Great Naval War'; 'The Navy and the Nation'; 'Imperial Defense'; 'Russia's Sea Power.'

Clarke, Helen Archibald, American writer: b. Philadelphia. She graduated from the musical department of the University of Pennsylvania 1884; began writing literary articles for the magazines in 1887, and in 1889, with Charlotte Porter, founded 'Poet Lore,' a journal devoted to the study of literature, and to literary criticism, which has maintained a high degree of excellence under her editorship. She has devoted herself especially to the study of Browning, and has edited several editions of his works in part or as a whole, and written a score of interpretative articles on the man and his work. She has composed considerable piano music, and contributed frequently to the various musical journals. Her work has appeared in 'Shakespeareana,' the 'Browning Society Papers,' 'Open Court,' 'Popular Science Monthly,' 'The Conservator,' 'Philadelphia American,' 'Music Review,' etc.

CLARKE

Clarke, Hyde, English philologist: b. London 1815; d. there 1 March 1895. In diplomacy, civil engineering, and scholarship he was equally at home, his versatility being conspicuous in 'Theory of Railway Investment', 'Colonization in our Indian Empire' (1857), 'Comparative Philology' (1858), and 'Examination of the Legend of Atlantis' (1886); 'Early History of the Mediterranean Populations,' etc. He also compiled a useful abridged English Dictionary.

Clarke, James Freeman, American Unitarian clergyman and author: b. Hanover, N. H., 4 April 1810; d. Boston, Mass., 8 June 1888. His first pastorate was at Louisville, Ky., 1833-40. He then settled in Boston in 1841; and was pastor of the Church of the Disciples which was organized especially for him, and of which he had charge till his death. He was a clear thinker and a leader in all reform and educational movements. From 1867-71 he was professor of natural religion and Christian doctrine in Harvard University. Together with Emerson and William H. Channing, he prepared the 'Memoirs of Margaret Fuller d'Ossoli.' His chief work was 'Ten Great Religions.' Among others were: 'Service Hymn-book and Hymn-book of the Church of the Disciples'; 'Christian Doctrine of Prayer'; 'The Hour Which Cometh'; 'Orthodoxy: Its Truths and Errors'; 'Steps of Belief'; 'Events and Epochs in Religious History'; 'The Ideas of the Apostle Paul'; 'Self-Culture'; 'Anti-Slavery Days'; 'Every-Day Religion'; and 'Vexed Questions.'

Clarke, John, American clergyman: b. Suffolk, England, 8 Oct. 1609; d. Newport, R. I., 26 April 1676. He was a physician in London, and came to Massachusetts soon after its first settlement; but being one of the friends of Anne Hutchinson, was obliged to flee with her and her associates from that colony. Proceeding to the south, they were welcomed by Roger Williams to his vicinity, formed themselves into an organization, and obtained from the Indians a district to which they gave the name of the Isle of Rhodes or Rhode Island. The settlement commenced in 1638, at Pocasset, and Clarke began to employ himself as a preacher. In 1644 he founded at Newport the second Baptist Church in America, and became its pastor. Venturing a few years later to preach in the vicinity of Boston, he was arrested by an officer of the government, was called first before a parish meeting and then before the court, and was condemned for what were adjudged false teachings, to pay a fine of 20 pounds or be publicly whipped. In 1651 he was sent to England in company with Roger Williams as an agent of the colony of Rhode Island, and published there a book entitled 'Ill News from New England, or a Narrative of New England's Persecution.' He succeeded in obtaining a revocation of Mr. Coddington's commission as governor, and remained in England after the return of Williams, till at the end of a 12 years' mission he had procured a second charter for the colony, which secured to every person at all times his own judgment and conscience in matters of religious concernment. Bancroft alludes to him in his history as "the modest and virtuous Clarke, the persevering and disinterested envoy." Upon his return in 1663

he resumed the pastorate of his church at Newport, which he retained till his death. In his will he left his farm for charitable purposes, the income of it only to be expended; and it has since produced annually about \$200.

Clarke, John Mason, American scientist: b. Canandaigua, N. Y., 15 April 1857. He studied at Amherst and Göttingen and from 1881 to 1884 was professor of geology at Smith College. He subsequently became State palæontologist of New York, and has written numerous pamphlets and papers on geology and palæontology.

Clarke, John Sleeper, American actor: b. Baltimore, Md., 3 Sept. 1833; d. London, Eng., 14 Sept. 1899. He began his stage career in childhood and played comedy parts with success from 1851 to 1869. He then became a theatrical manager and with his brother-in-law, Edwin Booth, made paying ventures in various houses of amusement in the United States and England.

Clarke, Joseph Ignatius Constantine, American journalist and playwright: b. Kingstown, Ireland, 31 July 1846. He emigrated to the United States in 1868, and was on the editorial staff of the New York *Herald* 1870-83; edited New York *Journal* 1883-95; and the 'Criterion' 1898-1900. His plays include: 'Heartsease'; 'For Bonnie Prince Charlie'; 'The First Violin'; 'Her Majesty'; and he has also published 'Robert Emmet,' a tragedy in blank verse (1888); 'Malmorda, a Metrical Romance' (1893).

Clarke, McDonald, American poet: b. Bath, Maine, 18 June 1798; d. New York 5 March 1842. He was an eccentric character, familiarly known as "the mad poet"; and was the subject of an amusing poem by Halleck, called 'The Discarded.' The subjects of Clarke's verses were usually the belles of the city and topics of the day. His works include: 'Poetic Sketches' (1826); and 'The Belles of Broadway' (1833). One of his poems was 'Now Twilight Lets Her Curtain Down.'

Clarke, Marcus Andrew Hyslop, Australian novelist: b. London 24 April 1846; d. Melbourne, Australia, 2 Aug. 1881. He went to the island in his 24th year, took up journalism and acquired the experience of bush life and the knowledge of antipodean men and things of which such brilliant use is made in 'His Natural Life,' a striking convict story; 'Holiday Peak'; 'Old Tales of a New Country,' and other vivid fictions.

Clarke, Mary Bayard, American author: b. Raleigh, N. C., about 1830. While living in Cuba, she published verses signed "Tenella" in the periodicals. After her return in 1855 she wrote 'Reminiscences of Cuba' for the 'Southern Literary Messenger.' Among her works are war lyrics and translations from Victor Hugo; also prose articles signed "Stuart Leigh." In 1870 was published her poem, 'Clytie and Zenobia, or the Lily and the Palm,' and 'Wood Notes,' a compilation of North Carolina verse.

Clarke, Mary Victoria Novello Cowden, English story-writer, essayist, and Shakespearian scholar: b. London 22 June 1809; d. Genoa, Italy, 12 Jan. 1898. She married in 1828 Charles Cowden Clarke, with whom she wrote the 'Shakespeare Key' and compiled an edition

CLARKE — CLARKSON

of Shakespeare's plays. Her best known work is her 'Concordance to Shakespeare,' published in 1845, which cost 16 years' labor. Other works from her pen are: 'The Girlhood of Shakespeare's Heroines' (1850); 'World-noted Women' (1857); 'The Trust and Remittance' (1873); 'A Rambling Story' (1874).

Clarke, Rebecca Sophia ("SOPHIE MAY"), American novelist: b. Norridgewock, Maine, 22 Feb. 1833; d. there, 16 Aug. 1906. She wrote 'The Dotty Dimple,' 'Flaxie Frizzle' stories, etc., for children; and the novels, 'Her Friend's Lover'; 'The Asbury Twins'; 'Quinnebasset Girls,' etc.

Clarke, Richard Henry, American author: b. Washington, D. C., 3 July 1827. He became president of the Society of American Authors in 1891. He has written 'The New Crusade of the Nineteenth Century,' relating to the Church and slavery; 'Socialism in America'; 'Biography of Commodore John Barry, Founder of the American Navy'; 'Father Sebastian Rale,' an answer to Gladstone on 'Maryland Toleration'; an 'Illustrated History of the Catholic Church in the United States'; 'Lives of the American Catholic Bishops'; and 'Old and New Lights on Columbus.'

Clarke, Samuel, English theological and philosophical writer: b. Norwich, 11 Oct. 1675; d. London 17 May 1729. He became chaplain to Dr. More, bishop of Norwich, and between 1699 and 1701 published 'Essays on Baptism, Confirmation and Repentance,' replied to Toland's 'Amyntor,' and issued a paraphrase of the Gospels. He was then presented with two livings, and in 1704 and 1705 twice delivered the Boyle lectures at Oxford on 'The Being and Attributes of God,' and on 'The Evidences of Natural and Revealed Religion.' In 1706 he published 'Immortality of the Soul,' and a Latin version of Newton's 'Optics.' He was then appointed rector of St. Bennet's, London, and shortly afterward rector of St. James' and chaplain to Queen Anne. In 1712 he edited Cæsar's 'Commentaries,' and published his 'Scripture Doctrine of the Trinity,' which became a subject of much controversy and of complaint in the Lower House of Convocation. His later productions were his discussions with Leibnitz and Collins on the 'Freedom of the Will,' and his Latin version of part of the 'Iliad.'

Clarke, William Horatio, American organist: b. West Newton, Mass., 1840. He filled positions as organist in Dedham, Boston, and Woburn; was for some years superintendent of schools at Dayton, Ohio; was organist of Tremont Temple, Boston, Mass., 1878-87, when he retired to Reading, Mass., where he built the fine four-manual organ in Clarigold Hall. He has published: 'New Method for Reed Organs' (1869), and 'Outline of the Structure of the Pipe Organ' (1877).

Clarke, William Newton, American Baptist clergyman: b. Cazenovia, N. Y., 2 Dec. 1841. He graduated at Colgate University 1861, and at Hamilton Theological Seminary 1863. He filled Baptist pastorates at Keene, N. H., Newton Centre, Mass., Montreal, and Hamilton, N. Y., 1863-90, and was a professor in Toronto Baptist College 1883-7. Since 1890

he has been professor of Christian theology at Colgate University, Hamilton, N. Y. He has written: 'Commentary on Mark' (1881); 'Outline of Theology' (1897); 'What Shall We Think of Christianity?' (1899); 'A Study of Christian Missions' (1900).

Clarksburg, W. Va., city and county-seat of Harrison County, situated in the north central part of the State, on the West Fork River, a branch of the Monongahela, and on the Parkersburg branch of the Baltimore & Ohio Railroad, 22 miles west of Grafton. The Short Line, the Monongahela, and the West Virginia and Pittsburg divisions of the Baltimore & Ohio Railroad also enter the city.

Industries.—The city lies in a section abounding in natural resources, natural gas, coal, and oil being plentiful; and the farm, grazing, and timber lands very valuable. Clarksburg is called the "Fuel City of the Fuel State." The manufactures are many and varied, there being glass, art pottery, chair, and cigar factories, chemical and carbon works, wood-working plants, machine shops, foundries, bottling works, a brewery, and a grain elevator with a capacity of 80,000 bushels. There are five newspapers, daily and weekly combined.

Banks, Public Institutions, etc.—There are five banks in the city with a combined capital of \$675,000, and doing an annual business of \$90,000,000. Among the notable public institutions are the City, the Kesler, and the Harrison County hospitals.

Educational Institutions, Churches, etc.—There is an excellent free school system with a public high school, supplemented by Broadus Classical and Scientific Institute, Saint Joseph's Academy, and Elliot Commercial College. The city has nine church edifices.

History, Government and Population.—The city was first settled in 1772, became a borough in 1785, and was incorporated as a city in 1899. The city is proud of having been the birthplace of the famous "Stonewall" Jackson. Its municipal affairs are administered by a mayor, recorder, chief of police, and a council of 10 members, one half of whom are elected each year. Pop. (1905) 10,000.

F. L. BURDETTE,
Superintendent of Schools.

Clarkson, Matthew, American soldier and philanthropist: b. New York 17 Oct. 1758; d. there 25 April 1825. Both his father and grandfather were prominent colonial officials. He was with the Northern army in 1777; was wounded at Fort Edward; at Saratoga acted as aide-de-camp to Gen. Benedict Arnold, and was present at Burgoyne's surrender. He also took part in the campaigns in the Carolinas 1781, and was aide to Gen. Benjamin Lincoln at Yorktown. He was brevetted a lieutenant-colonel, and for 14 years was major-general of the New York militia and a member of the State legislature.

Clarkson, Thomas, English philanthropist and emancipationist: b. Wisbeach, Cambridgeshire, 28 March 1760; d. Playford Hall, near Ipswich, 26 Sept. 1846. He was originally intended for the Church, and studied at Saint John's College, Cambridge. He formed a connection with a Quaker

CLARKSVILLE — CLASSICAL GREEK POETRY

association for the suppression of negro slavery, and was introduced to Mr. Wilberforce and other distinguished individuals. While the latter advocated the cause of abolition in Parliament, Mr. Clarkson was indefatigable in obtaining information and evidence on the subject, in attending meetings in different parts of the country, and generally conducting the agitation throughout England for the suppression of the slave traffic. In 1788 a committee of the privy council made an inquiry into the state of the African trade, and in that year a bill mitigating some of the worst cruelties of the traffic was passed. In 1791 a motion by Wilberforce in favor of putting an end to the traffic was lost by 163 to 88; but his labors, and those of his party, were at last successful in England, the slave-trade being abolished by a bill passed 25 March 1807. This point gained, their next effort was to procure the total abolition of slavery in the British colonies, and in this also, after a long struggle, they succeeded, by the passing of the emancipation act in 1833. He published, 'A Portraiture of Quakerism' (1806); 'History of the Abolition of the African Slave-trade' (1808); 'Memoirs of the Private and Public Life of William Penn' (1813); 'Researches, Antediluvian, Patriarchal, and Historical' (1836).

Clarksville, Tenn., a city and county-seat of Montgomery County, situated on the Louisville & N. R.R. near the junction of the Red and Cumberland rivers. It is the trade centre of a large tobacco-growing district, and has a number of tobacco factories, being one of the 10 leading cities of the United States in the manufacture of snuff. It has also lumber and flour mills. It is the seat of the Southwestern Presbyterian University, and of a Methodist school for girls. Pop. (1900) 9,431.

Clarksville, Tex., the county-seat of Red River County, on the Texas & P. R.R., about 15 miles south of the Red River, and 100 miles northwest from Dallas. It is the centre of a fertile cotton country, and its industries are such as are related to the raising and marketing of this staple, with some traffic in grain, hides, and live stock. Pop. (1900) 2,069.

Clary, klā'ri, the name of several species of the genus *Salvia*, of the mint family (*Labiatae*). The plants are natives of countries bordering on the eastern Mediterranean, but are common in all civilized countries, and are cultivated for their aromatic or medicinal qualities. The wild clary, or wild sage, (*S. verbenaca*), is found wild in waste places imported from Europe. Clary, clear-eye, or sea-bright (*S. sclarea*), a native of Europe, is a common plant in Pennsylvania, where it has escaped from cultivation. It receives its common names from the employment of its mucilaginous seeds to remove specks from the eyes. In Europe the plant is used for flavoring soups and confectionery. Its flowers were formerly used with brandy, sugar, cinnamon, and a little ambergris, to make clary-water, regarded as a cardiac to help digestion.

Class, Classifying, Classification. When the domain of a science comprehends a very great number of objects which it is necessary to describe, or whose analogies and differences require to be assigned, it is always useful, and sometimes indispensable, to make a methodical

distribution of these objects, to group those which present the greatest number of common characters, to form with these groups new assemblages, continuing the process till a limit is reached where this mode of generalizing may be stopped. The highest assemblage in this ascending series is a "class" (though this term may not be technically applied to it); the procedure necessary in forming it is "classifying," and the result, extending over some entire branch of natural science, is a "classification." We do not begin to classify till we feel the need of it, for the task requires analysis, multiplied comparisons, and researches as to the means of generalizing the particular and isolated notions which we had previously been contented to amass without regular arrangement. It is only, however, after the revision necessary for such arrangement has been undertaken that science can be said to have begun. The first attempts at generalization and classification often exercise a very important influence on the future progress of any science, and may even extend to the period when it seems to be approaching its perfection. A science consists principally in the relations of the facts observed, or knowledge acquired in connection with it. If the relations thus established are founded on accurate observations, they become in fact laws of nature. the most important and most prolific truths which human reason is able to discover. But if the imagination has been allowed to take part in the work, if it has either furnished the materials or directed the construction of the edifice, it must sooner or later be demolished, and rebuilt with better selected materials and on more solid foundations. In modern times geology commenced with faults of this description, and still seems to have difficulty in avoiding them. Natural history, to which a good classification is so essential, was not very fortunate in its first combinations: systems took possession of it, and too often blinded the inquirer to great truths which otherwise he could hardly have failed to discover. Influenced by this love of system, many, instead of submitting to the laborious investigation of facts, have come forward with some new fanciful combination, and made it almost their sole business to secure the credit of their particular classifications by overthrowing those of their predecessors or rivals. In a subject so comprehensive as natural history it seems vain to hope for a perfect classification until the resources of embryology are exhausted. Zoology is gradually tending toward a consistent system of classification, the basis of which is the resemblances of animals at various periods of their growth. The impulse to this line of research was given by Darwin. Being a strictly natural method, inasmuch as the affinities by common descent are sought after to the neglect of mere outward resemblances at a later period of life, the arrangements suggested by it to different naturalists show a considerable amount of harmony, and even those who oppose Darwin acknowledge the simplicity and consistency of embryological or genealogical classification. For the classification of the animal kingdom See ANATOMY, COMPARATIVE.

Classical Greek Poetry, The Growth and Influence of, a work by Prof. Richard C. Jebb (1893). Delivered originally as lectures at Johns Hopkins University, these chapters compose a brilliant sketch of the history and character of Greek poetry.

CLASSICAL LITERATURE

Classical Literature. The term "Classical Literature" usually embraces the literatures of Greece and Rome, though separate periods of these and other literatures are often called classical.

GREEK LITERATURE.

Greek Literature may be conveniently divided into four periods, as follows: (1) Ancient or Classical, from Homer to Demosthenes (c. 700 to 300 B.C.); (2) Alexandrian, from 300 B.C. to the subjugation of Greece by Rome in 146 B.C.; (3) Græco-Roman, from 146 B.C. to the division of the empire in 330 A.D.; (4) Byzantine, from 330 A.D. to the capture of Constantinople in 1453 A.D.

I. THE CLASSICAL PERIOD.—The literature of the classical period is not artificial, but was developed naturally and in orderly succession, each branch of the race. Ionian, Æolian, Dorian, contributing its part, till the whole culminated in the glorious Attic, which is still the admiration of the educated world. We have no remains of Greek poetry before the Homeric poems, but the highly developed art shown in them as well as the smoothness of the metres shows that some form of poetry must have been cultivated before such a state of perfection could have been reached. As forerunners then we may mention the Linus song and the songs of Ialemus and of Hylas, also hymns to the gods, marriage hymns, dirges, all which must have attained considerable artistic form before the Homeric poems were composed. During this mythic period from which we receive barely the names, such as Orpheus, Musæus, and Eumolpus, to mention the best known, were developing metrical form, appropriate epithets, fixed phrases, which became the professional stock of later periods.

1. *Epic Poetry.*—The only remains of this early period are the Homeric poems, the 'Iliad' and the 'Odyssey.' The 'Iliad,' poem of Ilium or Troy, has for its subject the wrath of Achilles, about which is grouped in the most artistic way the development of the events during the 10 years' siege. It consists of 24 books and more than 15,000 lines. The 'Odyssey,' poem of Odysseus or Ulysses, tells of the wanderings and homecoming of Odysseus after the capture of Troy, into which are woven many beautiful myths giving light and shade to the dangers and trials through which the hero passed till he reached his home in Ithaca. This also consists of 24 books, but with only a little over 12,000 lines. Down to the end of the last century all the world believed that these poems were the work of one man, Homer, when Wolfe's 'Prolegomena ad Homerum' appeared in 1795. It is true that the ancients as early as 170 A.D. contended that Homer was the author of the 'Iliad,' though not of the 'Odyssey,' but this was as far as they went, and even then there was great opposition to this view of the "Separatists," as they were called. Vico, of Naples, about 1700, had suggested that Homer was a myth, but it remained for Wolfe to bring forward plausible proofs of his contention that the poems were not originally one composition, but made up of several shorter poems put together without common plan. Wolfe based his arguments on the belief that writing did not exist before 600 B.C., and that the poems were first collected and written down by order of Pisistratus and that poems of such length could not be

handed down by oral recitation. Following Wolfe, Lachmann and other scholars divided the poems into lays, which they believed were collected by a school of singers, called Homeridæ, and later put into their present form by order of Pisistratus. The question is still discussed, but scholars now generally accept the view that the two poems belong to separate periods, and that each is a growth from two or three smaller poems. The poems are probably Ionic in origin, though Fick has tried to show that they are Æolic. As epic lays must have existed in abundance before the 'Iliad' and 'Odyssey' were reduced to form, it is only natural that we should find many remains of epic songs, which along with a number of hymns were all credited to Homer, but which are now described as the Epic Cycle, which has come down to us from Proclus, probably the grammarian of the 2d century after Christ. These poems lack the unity of the 'Iliad' and 'Odyssey' and were far inferior to them. Among the most important were the 'Oedipodeia,' 'Thebaid,' and 'Epigoni,' all dealing with Thebes; the 'Ethiopid' and the 'Capture of Troy,' probably originally one poem, and the 'Little Iliad' were a continuation of the 'Iliad,' while the Cyprian lays were an introduction to it; the 'Nosti,' containing the story of the Greek heroes after the fall of Troy, and 'Telegony,' dealing with the death of Odysseus by his son Telegonus, fitted in with the 'Odyssey.'

2. *Didactic.*—Closely following epic poetry is the didactic, which is like epic in form and metre. Its origin is also obscure, but we must also here suppose that some forms existed before Hesiod (c. 800 B.C.), its great representative. His poem, 'Works and Days,' treats of the arts of husbandry with an attached calendar of 60 verses. The poem is a pessimistic complaint of life, with a high moral tone, filled with saws, maxims, allegories, etc., with occasional flashes of genius. The 'Theogony,' formerly attributed to Hesiod though probably not by him, treats of the origin of things and the genealogy of the gods. Other works ascribed to Hesiod are the 'Catalogue,' the 'Eoia,' the 'Ægimius,' and the 'Shield of Heracles.'

3. *Lyric.*—As epic was dying, lyric, which had lain dormant during this brilliant period, and which also has its origin in the above mentioned pre-historic hymns, dirges, etc., began to be artistically cultivated. This is a natural development, for when men began to look less to their overlord and to think more of their own concerns, this change of feeling was reflected in their poetry, and thus the new personal lyric sprang up in the place of the old impersonal epic that dealt with kings and their doings. Lyric may be subdivided into the Iambic and Elegiac, which are only partially lyric, and the melic, the true lyric type, which is itself subdivided into Æolic (or monodic) and Dorian (or choral) lyric. Preceding both these subdivisions is the nome, cultivated by Terpander and Olympus, of which only fragments remain.

(a) *Elegiac.*—This was used at first in threnodies and funeral lamentations, but by the 7th century its sphere was greatly extended and it was now employed to describe all sorts of personal reflections, especially of a didactic or moral nature. The metre is a distich consisting of an hexameter verse followed by the so-called pentameter, which is really a verse composed of two

CLASSICAL LITERATURE

catalectic dactylic trimeters. It was recited, not sung, and was very energetic and lively, being early used as a means of conveying personal reproach. Side by side and almost at the same time with the Elegiac was developed the Iambic, which was probably connected with the worship of Demeter. It early acquired a satyric turn, to which its lively tripping metre especially adapted it. It was an entirely different type from the Elegiac, but became early associated with it, because it had many characteristics in common, and the two types were often cultivated by the same poet. Like the Elegiac, the Iambic also soon gave up musical accompaniment. Among the masters in this department, may be mentioned Callinus (730 B.C.?) of Ephesus, who wrote martial elegies and was probably the first elegiac poet, though this honor is also claimed for Archilochus. Archilochus (700 B.C.) of Paros, who wrote some elegies, is mostly famed as the most illustrious wielder of iambic verse, which he is said to have invented and of which he is the earliest writer. Semonides (693 B.C.) of Amorgus, who has little originality, but is not without some elegance, is chiefly known by his satyric poem in iambic verse on women. Tyrtaeus (650 B.C.), the fabled lame schoolmaster of Athens, like Callinus, wrote martial elegies. Mimnermus (630 B.C.) of Colophon, the sweet-voiced singer, was the first to use elegy for the expression of love. Solon (594 B.C.) of Athens, the soldier and patriot, wrote elegies of a martial and political nature. Theognis (544 B.C.) of Megara was a sharp and poignant writer of gnomic elegy. Phocylides (540 B.C.) of Miletus was another gnomic writer, and finally comes Hipponax (546 B.C.) of Ephesus, best known as the inventor of the scazon, choliambic (or halting verse), which is an iambic trimeter that ends with a spondee, and thus produces a sort of shock, often humorous in effect. Here may also be mentioned the epigram, the literary form of which was the elegiac distich. It was cultivated by Archilochus to some extent, but the most distinguished writer of epigram was the lyric poet, Simonides of Ceos.

(b) *Melic.*—Unlike the preceding, the melic type was musical throughout. It was especially adapted to religious chants and held its sway in every realm of human passion. It is highly valuable, not only from a literary but also from an historical standpoint. The Æolian type, which was not only monodic, but also choral, is much simpler, less ornate, less involved than the Dorian, which was generally choral. Alcæus (606 B.C.) of Mitylene was a vigorous, graceful, passionate writer of songs of love, scholia, politics, and some hymns. Sappho (611 B.C.), also of Mitylene, though probably born at Eresos, the greatest of women poets, wrote love songs of the most passionate character, full of subtle charm and exquisite grace. She also wrote epithalamia. Both these poets used the highly colored Lesbian dialect and both were often imitated by Horace. Closely allied to these in form and content, though differing from them in dialect, was Anacreon (540 B.C.) of Teos, an Ionian city, who was a writer of love songs and hymns, and while not possessing the genius or passion of either Alcæus or Sappho, yet wrote graceful verse, with an occasional vein of humorous satire. The poems called 'Anacreontics' are imitations of the Alexandrian age, and are not

altogether bad, some possessing considerable merit. The Dorian type, much more ornate and more highly involved in structure and metre than the Lesbian, dealt mostly with matters of religion and of public interests, taking as its subjects the mythical traditions of the Dorians, and was sung at festivals in honor of the gods and heroes or in commemoration of some athletic victory or the founding of some city. The dialect is Dorian of an artistic literary type, and the form varied from the simple narrative to the highly artistic dialogue. The most important forms in the order of their development were the Pæan, a hymn of joyous thanksgiving to Apollo, the Hyporchema, also a hymn to Apollo, accompanied by dancing; the Parthenion, a sort of processional song, sung by a chorus of young girls; the Dithyramb, in honor of Dionysus, of a wild and passionate nature, sung by a chorus encircling an altar; also march songs, marriage songs, and such like. Thaletas (700 B.C.?) of Crete is mentioned as developing the Pæan, and Hyporchema, the metre of which he brought from his native land to Sparta. Alcman (650 B.C.) of Sardis wrote hymns, pæans, hyporchemata, and scholia, and especially gave artistic form to the Parthenion. His poetry is easy, graceful, and often tender. Arion (650 B.C.?) of Methymna is especially noted as the founder of the artistic dithyramb. Stesichorus (611 B.C.) of Himera in Sicily treated epic subjects in lyric form and is famous for adding the epode to the strophe and antistrophe, of choral song, whence he gets his name, his real name being Tisias. Ibycus (560 B.C.) of Rhegium in Italy, somewhat like Stesichorus in form and content, wrote both hymns and love songs. But the great masters of choral lyric arose after the Persian wars, which had a tendency to unite the widely scattered Greeks into one people and brought into prominence Athens, which then became the literary centre of the known world. Simonides (556 B.C.) of Ceos, an Ionian, of keen observation and philosophic temperament, gave his genius to the cultivation of the Dorian lyric and achieved the highest fame. He was also distinguished in other departments of poetry, notably the elegy and the epigram, hymns to the gods, pæans, dirges, odes of victory, etc. Simonides is also remarkable as being, so-to-speak, the first national poet, for he was an Ionian by birth, wrote in the Dorian dialect, and at Athens, the future world power. Next may be mentioned his nephew, Bacchylides (470 B.C.), of whom 20 poems practically complete and several long fragments were discovered in 1897, which give us a much higher opinion of this smooth and graceful poet. Greatest of all the lyric poets was Pindar (521 B.C.) of Thebes, who was a contemporary of Bacchylides and contended with him for prizes, but was by no means a rival, for Pindar is brilliant, lofty in diction and in thought, full of religious reverence, deeply in earnest, abounding in poetic imagery, of an independent genius, always grand. His extant works consist of 45 complete odes of victory, written in honor of the victors at the great national games, besides many fragments representing almost every species of lyric composition.

4. *Drama.*—As its name implies, drama is distinguished from epic by action, and grew out of the cult of Dionysus, which was deeply tinged with religion. The people of one section would

CLASSICAL LITERATURE

gather together and worship Dionysus, the god of wine, at vintage time. When in time, the chorus leader impersonating Dionysus told of some adventure, the chorus would burst into song suited to the feelings aroused by the story, which might be sad and dirge-like or joyous and hilarious. Later this story of adventure and the chorus singing developed into a dialogue, and when such dialogue was repeated several times during a festival and then extended to other myths, drama was begun. In time costumes were improved and masks were added; from the simple dialogue noted above, dialogue was now carried on between the chorus leader and one member of the chorus instead of the entire chorus, so that the number of actors was increased to two and later to three. The chorus was at the same time reduced to 12 or 15 (in comedy to 24), and thus became less prominent. When the drama developed, special actors were demanded and these were paid by the state. There was no theatre at first, though soon seats of wood were erected, and later of stone, cut out of the rock on the slope of a hill, with a capacity of 20,000 people; there was no covering. At the front of the seats was the orchestra or circular dancing place, in which was an altar, about which the chorus performed its evolutions. At the rear of the altar was a wall for the scenery and behind this was some rude machinery, such as the noted eccyclema, a sort of rolling platform; there was likely no stage. Dramatic representation was under the care of the state and consisted of a contest among three poets, each of whom contended with three pieces and a satyric drama. The drama was divided into tragedy and comedy, which grew up side by side, though tragedy was first to attain artistic form.

(a) *Tragedy*.—Passing by Thespis, Phrynichus and others who were helping to develop tragedy, we come to the masters. Æschylus, Sophocles, Euripides, in whose hands tragedy reached its greatest height. Æschylus (525-456 B.C.) was a stern, proud, deeply religious man, with a vigorous imagination, and gifted with the power of seeing the grand and terrible in nature. His plays show vigor and subtlety of thought rather than grace and delicacy. He is believed to have composed about 70 dramas and 20 satyr dramas, of which only seven have come down to us, the best being the 'Agamemnon' and the 'Prometheus Bound.' Sophocles (495-406 B.C.), the greatest of the three tragic writers, was a man of charming personality, endowed with brilliant poetic talent; his imagination was haply not so vigorous as Æschylus's, but more spontaneous and versatile, and he had a very keen insight into and appreciation of human nature. His plays exhibit deep reflection and serious thought combined with the most exquisite grace and perfection of form. Of about 120 plays only seven are extant, of which the best are the 'Antigone,' 'Electra,' and 'Œdipus Tyrannus,' the last being perhaps the greatest tragedy ever written. Euripides (480-406 B.C.), though a great poet, did not maintain the lofty standard set by Æschylus and Sophocles. He was a man of keen sensibility, with a highly impressionable and sympathetic nature, a glowing imagination, but thoroughly impregnated with the sophistry of his time. His plays have much grace and beauty, but lack the power of Æschy-

lus and the perfection of Sophocles. There are often passages of brilliant effect, and he rises to his greatest height in the portrayal of the innermost feelings of the heart. He was not so popular in his lifetime as he became later, and so of his 75 or 90 plays, only 18 are preserved, exclusive of the 'Rhesus,' which is certainly spurious. The best plays are perhaps the 'Medea,' the 'Iphigeneia at Aulis,' and the 'Ion.'

(b) *Comedy*.—From *comus*, which was a rustic procession bearing an emblem of fecundity and singing phallic chants at the country Dionysiac festivals, with which comedy was closely associated. When comedy became important it was taken under the care of the authorities at Athens and the competitions were held especially at the Lenæa, about the end of winter. Comedy is usually divided into the "Old," "Middle," and "New." Old comedy, which held sway from about 480 to 400 B.C., usually dealt with some political or moral subject, and was characterized by the wildest extravagance of fancy and indulgence of keen personal satire accompanied with brilliant and too often coarse wit. Like tragedy, it had a structure of its own which varied little in the different plays. The *Parabasis*, consisting of songs and spoken passages, is a relic of the old *comus* and was used to present the personal views of the poet. The language is the spoken Attic in its highest purity. The chief representatives of the old comedy are Cratinus, Crates, Pherecrates, Aristophanes, Eupolis, of whom Aristophanes (450 B.C.) is far the greatest. Eleven of his plays are extant showing the characteristics of old comedy, couched in elegant language and with the most exquisite grace. Middle comedy (400-330 B.C.) which arose at the end of the Peloponnesian War, loses the vivacity and extravagance of the old and has to do with character sketches and everyday life rather than with political satire. Its chief representatives were Antiphanes (425 B.C.?) and Alexis (390 B.C.). New comedy lost the chorus, and giving up the artificiality of the former period, came nearer to real life, taking its subjects from everyday experience, of which love is the enduring type. This is the prototype of the Latin comedians, Plautus and Terence, and was cultivated by Diphilus, Apollodorus, Philemon, Menander, Posidippus and others, of whom Menander (324 B.C.) was the greatest. No plays of these writers are extant, but the fragments abundantly testify to the loss we have sustained. Earlier than Attic comedy is Sicilian, which was cultivated chiefly by Epicharmus and Sophron.

5. *History*.—While poetry was at its highest point of development, Greek prose was coming into life in Ionia and now became the medium of philosophical writings, which had earlier used the almost prose Iambic verse. The beginnings of history were made by the compilers of ancient myths and legends, records of events, genealogies, etc., mostly of a local nature, and later they extended their sphere to foreign countries, when some geography and description were added, but wholly of an uncritical kind. Among these early writers of history may be mentioned Hecataeus of Miletus (c. 500 B.C.), Pherecydes of Leros (450 B.C.) and Hellanicus of Mitylene (450 B.C.). But the only one whose works are now extant is Herodotus of Halicarnassus (484-406 B.C.?), called the "Father of

CLASSICAL LITERATURE

History.) In the earlier part of his life he was a great traveller and visited nearly every part of the then known world, making researches for his future work. His history consists of nine books named after the Muses, of which the first part treats of the Persian empire, its rise and power, while the latter half deals with the Persian invasion of Europe. He weaves into his work much geographical and social material. He uses the Ionic dialect and is really the first writer of artistic prose. His style is simple, graceful, and charming. We cannot doubt his sincere search after truth, but his love for the marvellous and his great skill as a story-teller led him into exaggeration and caused him to bring in many side issues, which raise suspicion as to his credibility. Thucydides of Athens (471-400 B.C.), the greatest historian of Greece and one of the greatest of the world, wrote in eight books a history of the Peloponnesian wars, using the Attic dialect, and is justly styled the first philosophical historian, inasmuch as he not only gives the events, but also seeks the causes and the political and moral lessons to be drawn from them. Banished, probably for failure in a naval battle, he watched the progress of the war from the outside, but he was absolutely impartial. The speeches, largely imaginary, serve to convey his philosophical ideas of the causes of events. His style is exceedingly forceful and intense, but often involved and obscure, due in large measure to his striving after brevity, for every sentence is overcharged with thought. Xenophon (434-355 B.C.), also of Athens, continued the work of Thucydides in the first two books of his 'Hellenica,' which consists of seven books and is a very dry history, full of moralizings and with strong predispositions in favor of Sparta. His greatest work is the 'Anabasis,' in seven books, which is a very vivid account of the march of the ten thousand Greek mercenaries with Cyrus the Younger, when he tried to wrest the kingdom from his brother Artaxerxes. Xenophon was himself a member of the expedition, at first as an onlooker, but later as a leader, so that he gives us a vivid and interesting personal account of it. Among other works are 'Cyrædia' (or Education of Cyrus), a sort of historical romance, in eight books, the 'Memorabilia of Socrates,' a vindication of the great philosopher, the 'Œconomicus,' 'Hiero,' 'Convivium,' 'Agesilaus,' and other essays, some probably spurious. Other historians of whom only fragments are extant are Ctesias (415 B.C.) of Cnidus, physician at the court of Artaxerxes; Mnemon, who wrote, in Ionic Greek, histories of Persia and India. Philistus of Syracuse, Ephorus of Cyme, Theopompus of Chius, the last two from the school of Isocrates, and the authors of the Atthids, collections of historical and archæological material.

6. *Philosophy*.—Although philosophy had its beginnings in Ionia at the same time with history, we have no literature extant before Plato. Thales, Anaximander, and Anaximenes were the first to seek the causes of things and busied themselves with the physical world. Then came Heraclitus (335-475 B.C.) of Ephesus, whose work on nature, of which some fragments are extant, is among the oldest Greek prose, and Pythagoras (c. 540 B.C.) of Samos, who first used the name "philosophia," founded an independent school, and brought philosophy into closer touch

with everyday life. Xenophanes (c. 570 B.C.) of Colophon, the father of pantheism, founded the Eleatic School. He was followed by Parmenides (510 B.C.) of Elea, his disciple, and by Empedocles (492) of Agrigentum. Anaximenes (510 B.C.) of Clazomenæ was one of the deepest thinkers and carried philosophy to Athens, where it received its highest perfection in Socrates (469-399 B.C.), who, though he wrote nothing, gave the mightiest impetus to his disciples. First and foremost is Plato (438-348 B.C.) of Athens, who founded the Academic School. Plato, of a highly sensitive and poetic temperament, received the best possible education, which he enriched with extensive travel. He wrote much in every department of philosophy, ethics, metaphysics, politics, using the dialogue with Socrates as the central figure. The vivid imagination and dramatic style which are seen in all his writings, render them ever fresh and attractive. Forty-two dialogues are extant, of which about 25 are genuine, the best known being the 'Apology,' 'Crito,' 'Phædo,' with the longer works of the 'Republic' and the 'Laws.' Only fragments remain of Heraclides Ponticus, the scholar of Plato. Aristotle (384-322 B.C.) of Stagira was the most distinguished pupil of Plato and founded the Peripatetic School. He was a "practical" man, wholly unlike the idealist Plato. He ranged over the entire world of knowledge, treating everything from the practical standpoint, as opposed to the idealistic and speculative. His works, written in the common dialect, in a clear and precise, though often bald style, are very numerous, as he wrote on every department of knowledge, literature, philosophy, and science. His greatest works are perhaps the 'Logic,' the 'Nicomachean Ethics,' and the 'Politics.' Highly valuable also is the 'Athenian Constitution,' which was discovered in 1891.

7. *Rhetoric and Oratory*.—Real Greek prose began at Athens between 430 and 410 B.C. The great orators of the early period, Themistocles and Pericles, did not write their speeches, as did the later orators, of whom only ten were deemed worthy of a place in the Alexandrian canon. First in order comes Antiphon (480 B.C.), whose style, elaborate and rugged, exhibits a fondness for antithesis somewhat like that of Thucydides. Fifteen speeches are extant. Andocides (440 B.C.), of whom we have four speeches, is not a stylist, though he shows much force and vividness in description. These two cultivated judicial oratory. Lysias (440 B.C.) was an almost perfect stylist and greatly advanced Attic prose. Thirty speeches, composed in plain but graceful style, are extant. Isocrates (436 B.C.), of whose speeches 21 are preserved and who wrote speeches to be read rather than delivered, is famous for his smoothness of diction and periodic structure, a style which has been transmitted through Cicero to all the modern literatures. Isæus (420 B.C.), of whom we have 11 speeches and a fragment of a 12th, resembles Lysias in style, but is much more vigorous. Demosthenes (384 B.C.), who was a pupil of Isæus, carried oratory to its highest pitch. He was an indefatigable worker, and while his speeches may seem somewhat elaborated, as is charged, they are sincere, vigorous, and intense, showing purity of diction and perfection of form. Famous is the oration 'On the Crown' in reply to his contemporary, Æschines

CLASSICAL LITERATURE

(389 B.C.), himself a distinguished orator. Æschines has left us three speeches in good fluent style, but lacking in sincerity. Two other contemporaries were good orators, but far inferior, Lycurgus (390 B.C.) and Hypereides (389 B.C.).

8. *Medicine*.—The only works extant are those of Hippocrates (460 B.C.) of Cos, who was the founder of medicine. These are written in the Ionic dialect in plain language and without any pretensions to style.

II. ALEXANDRIAN PERIOD (300-30 B.C.)—In this age the spontaneous production of literature ceases and in its stead arise science and criticism, for the enlargement of the Greek world by the conquests of Alexander rendered the appeal to the learned few rather than to the masses inevitable. Prose becomes now more important than poetry, which is mostly learned and highly artificial. Ideality and art are gone; imitation and science have come in. Alexandria as a centre of literary activity rivals Athens. The following departments were cultivated:

1. *Poetry*.—Besides the new comedy, the most important is the pastoral poetry, the only new style, cultivated by Theocritus (270 B.C.) of Syracuse. His poems, called idylls, deal with the rustic life. The dialect is Dorian and the metre is hexameter. Theocritus is largely artificial and conventional, but exhibits true emotion and a deep feeling for nature. Thirty-one idylls are extant besides some epigrams and fragments. Bion (260 B.C.) of Ionia, and Moschus (c. 150 B.C.) of Syracuse, also cultivated pastoral poetry with considerable success. Here may also be mentioned Herondas (250 B.C.), whose recently discovered poems, called 'Mimiambi' (sketches of daily life), were published in 1891. Learned poetry was represented by Callimachus (260 B.C.), of whom we have six hymns and some epigrams, but only fragments of his elegies. Apollonius Rhodius (194 B.C.), a grammarian, wrote an epic on Jason, called 'Argonautica,' in imitation of Homer, but it is highly artificial. Lycophron (260 B.C.) cultivated tragedy. In didactic poetry Aratus (270 B.C.) wrote a poem on astronomy, which has little merit, and Nicander (150 B.C.) wrote a medical treatise in verse. Nicander also wrote 'Georgics,' which had some influence on Vergil, and 'Metamorphoses,' which were used by Ovid. Parody and satire also flourished in the hands of Timon (280 B.C.) of Phlius, whose satiric poems are called 'Silloi.'

2. *Philosophy*.—The old philosophy was gone and in its stead we find Stoicism and Epicureanism (qq.v.). Here may be mentioned Theophrastus (374-287 B.C.), whose work on 'Characters' is still extant, and Chrysippus, the Stoic.

3. *Philology and Criticism*.—The establishment of the Museum by Ptolemy I. gave great impetus to philological and critical study. Zenodotus (280 B.C.), who began the work of revising and explaining the Greek poets, wrote memoirs and lists of rare words and phrases. Aristophanes (200 B.C.) of Byzantium, who introduced the signs used to mark accents, and Aristarchus (150 B.C.), the text critic, were the greatest of the Alexandrian scholars. The science of grammar was now established. Apollodorus (140 B.C.) wrote a work on Mythology. Dionysius Thrax (110 B.C.) wrote the first grammar, which was used as a text-book as late as the 12th century.

4. *Science*.—Some advance had been made in

astronomy, mathematics, and geography, when Euclid (300 B.C.) gave to the world his 'Elements of Geometry,' which is still a famous work. Archimedes (d. 212 B.C.), who invented the screw, was a distinguished scientist, as was also Apollonius. Eratosthenes (d. 194 B.C.) founded scientific geography and chronology. Here we may mention Hipparchus (160 B.C.), the founder of scientific astronomy, and also the Athenian philosophers, especially the Peripatetics, who busied themselves with science.

5. *History*.—History was but sparingly cultivated, its greatest representative being Polybius (204-122 B.C.). His work was a record of Roman conquests in 40 books, of which we have the first five entire and fragments of the remaining.

III. ROMAN PERIOD.—In this period Greek literature spread over the civilized world. Incipient universities sprang up in different places and with them the striving after form and style, especially in prose, poetry being practically neglected.

1. *History* was cultivated in the early part of this period by Diodorus Siculus (b. 40 B.C.), who wrote a history of the world in 40 books, of which only books I-V and XI-XX with some fragments are preserved. Dionysius of Halicarnassus (d. 7 B.C.), of whose Archæology (or Roman History) books I-X have reached us, is much better known by his rhetorical works and critical essays on the classic prose writers. We may also mention in this department Josephus (37 A.D.), who wrote a history of the Jews, Arrian (100 A.D.), who wrote the history of Alexander's expedition and of India, and Dio Cassius, Appian, and Herodian, who wrote histories of Rome.

2. *Biography* was especially cultivated by Plutarch (40 A.D.), whose 'Parallel Lives' and ethical works have come down to us. Diogenes Laërtius, Flavius Philostratus, and Apollonius of Tyana, were also composers of lives.

3. *Geography* was represented by Strabo (18 A.D.) in 17 books, and Pausanias (160 A.D.), whose description of Greece is of the highest value. We may also mention Ptolemy (160 A.D.) of Alexandria, whose geography, based on mathematical and astronomical principles, held its own till replaced by the Copernican System.

4. *Learning* was studied by Julius Pollux, and Phrynichus, the Atticists, and by the grammarians Apollonius Dyscolus and his son Herodian. Athenæus (190 A.D.) is especially known for his 'Deipnosophistæ,' or 'Table Talk,' which is very dry, but has a wide range and contains valuable material. Galen (160 A.D.), besides his medical work, wrote on Plato and Hippocrates. Polyænus (170 A.D.) and Ælian (220 A.D.) have left us collections of anecdotes.

5. *Rhetoric* was systematized by Hermogenes (170 A.D.). It was also cultivated by Longinus (c. 213 A.D.), to whom is ascribed the work 'On the Sublime,' Dio Chrysostom (c. 50 A.D.), and others. Especially worthy of mention is Lucian (160 A.D.), the satirist and rhetorician, whose works are of varied interest and constitute the best prose since the decline.

6. *Philosophy* was little cultivated. We may mention Epictetus and Marcus Aurelius, the Stoics and Moralists, Plotinus and Porphyry, the Neo-Platonists, and Sextus Empiricus, the skeptic.

CLASSICAL LITERATURE

7. *Poetry* was practically neglected. The only name worthy of mention is Babrius (40 A.D.), who put the fables ascribed to Æsop into choliambic verse.

8. Here may also be mentioned the Christian writers, Justin Martyr (c. 105 A.D.), Clement of Alexandria (c. 150 A.D.) and his pupil, Origen (c. 185 A.D.), who wrote in the Greek spirit for the advancement of Christian truth.

IV. BYZANTINE PERIOD.—There is little to notice here. Poetry and Rhetoric are still cultivated slightly, but there is no creative faculty. Even the learning of the former age is dying out. It is the age of compilations, selections, anthologies. We have the novelist Heliodorus (390 A.D.) with his followers, Achilles Tatius and Chariton. In poetry only Nonnus's (c. 400 A.D.?) 'The Adventures of Dionysus' and Quintus Smyrnaeus's 'Sequel to the Iliad' are worth mentioning. Well known is Stobæus's 'Florilegium and Eclogæ' and the 'Anthology of Cephalas,' now called 'Palatine.' Libanius gives some interesting features of university life. Learning is represented by Chærobiscus, the grammarian, Eustathius, the commentator of Homer, Photius, Hesychius and Suidas, the lexicographers. Zosimus, Procopius, and Zonaras cultivated history. The most important of the Christian writers are Eusebius, Gregory, and Chrysostom.

ROMAN LITERATURE.

The Romans were an intensely practical people, endowed with less imagination and less creative power than the Greeks, and also lacked their fine feeling for the beautiful. Hence their literature does not have the same freshness and originality, though it is not less important, for through Cicero the prose style of Isocrates was transmitted to modern literature, and their laws live in many modern constitutions. The literary activity of the Romans may be divided into five periods: (1) Pre-Historic; (2) Archaic from Livius Andronicus to Cicero (240-70 B.C.); (3) The Golden or Classical (70 B.C. to 14 A.D.), embracing the Ciceronian and Augustan Periods; (4) The Silver Age (14-117 A.D.); (5) The Period of Decline (117-500 A.D.).

I. THE PRE-HISTORIC PERIOD.—The beginnings of Roman Literature were poetic and we find here carmina or songs on historical subjects, hymns to the dead, sacred songs, etc., composed in the Saturnian metre, and some epitaphs. The beginnings of drama are seen in the farce plays, 'Fescennini,' 'Satura,' 'Atellana.' Prose was confined to treaties, annals, laws, of which latter we may mention the 'Leges XII Tabularum,' which were committed to memory as the commandments. The only prose writer of this period was Appius Claudius Cæcus, whose speech against Pyrrhus was long extant.

II. THE ARCHAIC PERIOD.—Historic Roman Literature begins with Livius Andronicus (284-204 B.C.), who besides making a dull and dry translation of the 'Odyssey,' wrote comedies and tragedies based on the Greek. Cn. Nævius (264-194 B.C.) also wrote plays and an epic poem on the First Punic War, still using the Saturnian metre but showing more skill and originality than Livius Andronicus. The most important comedian of all is T. Maccius Plautus (254-184 B.C.), to whom about 130 plays are ascribed. Of these Varro selected about 31 as genuine and probably 19 others are genuine. Of the plays selected by Varro as genuine, 20 are still extant

and considerable fragments of the 21st, the 'Vidularia.' Plautus's plays are all based on the Greek. He shows great ability in working out the plots, handles his metres freely, but skilfully, and is a perfect master of the popular speech. His dialogue is bright and lively, full of rude wit and keen humor. His plays were long exhibited on the stage and studied in the schools and have been widely imitated in modern times. P. Terentius (185-159 B.C.) was brought as a slave to Rome, where he was liberated. His intimacy with Scipio Africanus and Caius Lælius gave rise to the belief that Scipio was the author of his plays. Six plays are extant, which are mostly imitated from Menander. Terence has neither the luxuriant genius nor the creative ability of Plautus, and lacks his pungent wit, but he is more reflective, more melodious, more artistic. His language is that of the best cultivated circles, and possesses elegance and grace. He was greatly admired by later Romans, and like Plautus has been a model for modern dramatists. Here may also be mentioned Statius Cæcilius, who imitated the new comedy of the Greeks, and Luscius Lanuvinus, the enemy and rival of Terence. The Fabula Togata or national comedy found its chief representative in L. Afranius (c. 150 B.C.), a man of considerable ability. Tragedy was cultivated especially by M. Pacuvius (220-132 B.C.), of whose 13 plays we have only fragments, and L. Accius (170-94 B.C.), who wrote about 40 tragedies. He was greatly admired by Cicero, Horace, and others. Besides Livius Andronicus and Cn. Nævius, already mentioned, the epic was treated by Q. Ennius (239-169 B.C.), who far outshone the others and may be called with Horace "Father Ennius," as the real founder of Latin poetry. His great work, besides comedies, tragedies, saturæ, was the 'Annales' in 18 books, of which only fragments are preserved. His verse is often rude and forced, but he was a man of talent, possessing a vivid imagination and great skill in handling the language. He introduced the hexameter verse to take the place of the Saturnian, and his work marks an epoch in the language changes produced. He was greatly admired by Cicero, who was fond of quoting him. Ennius also wrote Saturæ, but he was surpassed in this by C. Lucilius (150-103 B.C.), whose verse was rude and unfinished, but full of keen wit and searching criticism of public men and public affairs. Lucilius deserves special mention for giving the satura the nature of an invective poem. About 900 fragments are preserved.

Before prose was sufficiently developed, the early historians, especially Q. Fabius Pictor (c. 210 B.C.) and L. Cinnius Alimentus (c. 209 B.C.), used the Greek tongue. The real founder of Latin prose is M. Porcius Cato (234-149 B.C.), a voluminous writer on many subjects. His works comprise 'Origines' in seven books, on the rise and growth of Rome and the origin of Italian cities, 'De Re Rustica,' still extant, and many speeches. Among other historians may be mentioned S. Cornelius Sisenna (119-67 B.C.), Claudius Quadrigarius, Velerius Antias, and Licinius Macer, whose work was much used by Livy. In oratory, besides Cato, we find S. Sulpicius Galba, C. Gracchus, M. Antonius, L. Crassus, Q. Fabius Maximus, M. Cornelius Cethegus, and Q. Hortensius (114-50 B.C.), who was the bridge between these orators and

CLASSICAL LITERATURE

Cicero. Also worthy of mention are S. Ælius Pætus, who wrote the first law book, 'Tripertita,' and L. Ælius Stilo, the first philologist. The 'Rhetorica ad Herennium,' in four books, an important work on rhetoric, also belongs to this period. Its author is unknown, but it does not belong to Cicero or Cornificius, to each of whom it has been ascribed.

III. GOLDEN OR CLASSICAL PERIOD.—This period contains the best of Roman literature and may for convenience be divided into the Ciceronian and Augustan ages, the former being characterized by the highest development of prose, the latter of poetry.

(a) *The Ciceronian Period.*—The first great writer of this age is M. Terentius Varro (116-28 B.C.), of ancient family and high rank, who was the most learned man and most extensive writer of ancient Rome. In his works, 74 in number, in more than 600 volumes, he treated almost every conceivable subject, literature, oratory, history, philosophy, grammar, jurisprudence, geography, agriculture, etc. Of especial importance are his *Saturæ Menippeæ*, in which he used both prose and verse form to satirize the condition of his times. By far the greatest name in Roman literature is M. Tullius Cicero (106-43 B.C.), the son of a Roman knight, born near Arpinum in Latium. He was remarkably endowed both physically and mentally. He was tall and commanding in appearance, possessed of a fine memory, vivid imagination, quick and ready wit, intense feeling, and a kindly, generous disposition. To these natural gifts he brought the most untiring energy in his eager acquirement of knowledge of every kind and enjoyed the instruction of the very best masters. He was an intense and honest patriot, but lacked political sagacity and the courage of his convictions. His appreciation of the beautiful, supplemented by his study of the Greek writers, led him to reproduce their thoughts in Latin, and thus he became the founder of the finest prose that ever was known to the Romans. His highest achievement was in oratory, and his speeches, both political and legal, are among the finest remains of Roman literature. His correspondence was prolific and is of immense value from an historical as well as from a linguistic point of view. In his later years, when the party of Cæsar was in the ascendancy, he retired to private life and composed his philosophical works, largely as a solace for his troubles, but also to acquaint his people with the best systems of the Greeks. Of over 100 speeches we have 57 complete, and fragments of about 70 others, while the rest are known to us only by tradition. The greatest speeches are the four against Catiline, one for Milo, one against Verres, and the second against Antony, one of the most powerful invectives in any language. His rhetorical works are an outgrowth of his preparation for oratory. In this work his aim was to modify and fit existing systems to Roman needs. The rhetorical works are as follows: 'De Inventione,' in two books, very crude and immature; 'De Oratore,' in three books, in dialogue form, with the two great orators, L. Crassus and M. Antonius, as the chief speakers, a splendid work, full of vivacity and eloquence and composed in magnificent style; 'Brutus, sive de Claris Oratoribus,' also in dialogue form, a history of Roman oratory. In the 'Orator ad M. Brutum,'

Cicero paints his ideal orator. In the 'Partitiones Oratoriæ,' didactic in nature, Cicero quizzes his son on rhetorical matters. 'Topica ad C. Trebatium' is an explanation from memory of Aristotle's 'Topica.' 'De Optimo Genere Oratorum' is a discourse on the Asiatic and Attic styles of oratory, being an introduction to his translation of the two famous speeches of Æschines and Demosthenes 'On the Crown,' which translation is, however, unfortunately lost. Philosophy was not kindly received at Rome, and while Ennius and others had treated it slightly, it remained for Cicero to transplant it and settle it firmly on Roman soil. In philosophy Cicero was an eclectic, being almost wholly dependent on the Greek thinkers, so that his philosophical works are important more for their elegance of composition and beautiful style than for their matter, though this is important too, as it often deals with systems of philosophy otherwise unknown to us. His philosophical works are: 'De Republica,' a treatise on government in six books, of which only about a third is preserved; 'De Legibus,' also incomplete and probably originally in six books; it is a treatise on church and state law; 'Paradoxa' is an explanation of Stoic principles; 'Consolatio,' of which only fragments exist, was occasioned by his daughter's death; 'Hortensius,' also fragmentary, recommends the study of philosophy; 'De Finibus Bonorum et Malorum,' in five books, is an exposition and criticism of the Highest Good and Evil as taught by the Greek philosophers; 'Academica,' in two editions, of which the first, Lucullus, is extant, the last, Varro, only in fragments, is an exposition of the doctrines of the Academy; 'Tusculanæ Disputationes,' in five books, discusses matters pertaining to a happy life; 'Timæus,' a fragment, is a free translation of Plato's dialogue of the same name; 'De Natura Deorum,' in three books, deals with the Deity and his relation to the world; 'De Divinatione,' in two books, on the doctrine of soothsaying, with arguments against it; 'Cato Maior, sive De Senectute,' a delightful essay on old age, containing an outline of Cato's character, cheerful in tone and finished in style; 'De Fato,' a fragment, against the Stoic doctrine of Fate; 'Lælius, sive De Amicitia,' another charming essay on Friendship, written in vivid style and choice language; 'De Officiis,' in three books, is a system of ethics addressed to his son; 'De Gloria,' 'De Virtutibus,' and 'De Auguriis,' with translations from Xenophon and Plato are now lost. Cicero also wrote 'De Iure' and composed the history of his consulship, which are also lost. His two poetic efforts, 'De suo Consulatu' and 'De Temporibus Suis' were very unfortunate and subjected him to considerable ridicule. Cicero greatly dignified the art of letter-writing, and his letters, written in a graceful, conversational style, are a perfect storehouse of information for the history of his times. We possess in all 864 letters (including 90 addressed to Cicero) distributed as follows: 'Ad Familiares,' 16 books; 'Ad Atticum,' 16 books; 'Ad Quintum Fratrem,' 3 books; 'Ad Brutum,' 2 books, the genuineness of the latter being vigorously disputed and defended by many scholars. Coequal with Cicero as a writer was the great Julius Cæsar (100-44 B.C.), a man distinguished in many departments of life, being a great statesman, general, orator, historian, and grammarian.

CLASSICAL LITERATURE

His chief literary works that have reached us are: 'Commentarii de Bello Gallico,' in 7 books, and 'De Bello Civili,' in 3 books, written in elegant, simple, and clear style. The eighth book 'de Bello Gallico' was written by A. Hirtius as was the 'Bellum Alexandrinum,' but the 'Bellum Africum' and the 'Bellum Hispaniense' are by unknown hands. Cornelius Nepos (99-24 B.C.), the friend of Catullus, Cicero, and Atticus, was the author of many works, of which only a part of the 'De Illustribus Viris' is extant, written in an easy, but often monotonous and impure style. Caius Sallustius Crispus (86-34 B.C.), the enemy of Cicero and Pompey, was the first to treat historical writing as an art, and took for his model Thucydides. Of his works, the 'De Coniuratione Catilinæ' and the 'Bellum Iugurthinum' have reached us entire, but of the histories, in five books, we have only fragments. Sallust's style is very concise and his language is artificial and archaic, and, though sometimes obscure, it is extremely forcible and vivid. Poetry in this period was cultivated by T. Lucretius Carus (96-55 B.C.), who wrote a didactic poem in six books, 'De Rerum Natura,' in which he tried to free the mind from all kinds of superstition by a rational study of nature, basing his work on the philosophy of Epicurus. Lucretius was a masterful genius with great poetic instinct and independent spirit. On account of the poverty of the language in philosophical expression, the archaic style of the poem, and the dry and abstruse subject-matter, it is often difficult to understand. Horace and Ovid were greatly influenced by him. The greatest poet of the period, and perhaps the greatest Rome ever produced, was C. Valerius Catullus (87-53 B.C.), the lyricist, from whom we have 116 poems on various subjects in various and sometimes rare metres. Catullus, impulsive and frank by nature, is pre-eminently the poet of passion, showing his best work in his short love songs, which are written in splendid, but simple and chaste style.

(b) *The Augustan Period.*—P. Vergilius Maro (70-19 B.C.), the greatest epic writer of Rome, enjoyed the highest educational advantages, was gentle and pure, amiable, bashful, not a genius, but a slow, laborious worker, carefully polishing all he wrote. His extant poems are: 'Bucolics,' or 'Eclogæ,' 10 in number, which are imitations of Theocritus; 'Georgica,' in four books, in which he followed Hesiod, Aratus, and others as models, though great independence is shown, as the subject was congenial to his personal taste and experience. The warmth and vividness, skilful use of language and pleasing arrangement of the episodes make these the most artistically perfect of all the Roman poems that have reached us. The 'Æneis,' in 12 books, never received the poet's finishing touch, so that he wished it to be destroyed. This masterly poem, one of the greatest epics of the world, treats of the adventures of Æneas, the 'Odyssey' being the model for the first six books, the 'Iliad' for the last six. The language is elegant and at times sublime, but it lacks the simplicity of the Homeric poems. Besides these, several minor poems are perhaps wrongly attributed to Vergil. Q. Horatius Flaccus (65-8 B.C.), the most popular poet of Rome, brought the satire to its highest perfection. We have two books of satire, the former containing ten, the latter, eight poems, of which the subject-

matter is varied, the tone good-natured, though at times sharp, and the style easy and conversational. At about the same time and in like tone, were produced the Epodes, which, like the Odes in form, are like the Satires in contents, though more specific and less generous. The Odes, by which Horace is probably best known, and which are based on Greek models, especially Alcæus, Sappho, and Anacreon, though not wholly dependent on them, are elaborately wrought out, showing much warmth of feeling, but little of passion and imagination. The skilfully handled metres, the well chosen language as well as the artistic and happy setting, make the Odes the delight of all. In his later years, he produced the Epistles in two books, of which the first has twenty, the latter, three poems. These are of the same general character with the Satires, but show greater care and better style. Especially famous is the third epistle of the second book, called by Quintilian "Liber de Arte Poetica," in which Horace discusses with fine taste a series of literary questions. Albius Tibullus (c. 54-19 B.C.), the Roman elegiac poet, was passionate in nature, warm and sympathetic. Four books of elegies are ascribed to him, of which the third and part of the fourth are spurious. They show a refined taste, great felicity of expression, and smoothness of metre. Sextus Propertius (c. 50-15 B.C.), a younger contemporary of Tibullus, also wrote elegies, of which we have five books. He was sensuous and passionate by nature, full of fire and originality, but often obscure and difficult on account of the multitude of mythological allusions. P. Ovidius Naso (48 B.C.-17 A.D.) was a man of vivid imagination and high poetic temperament, but frivolous and self-indulgent. He was a wonderful story-teller, and the elegance and grace of expression combined with the easy and skilful handling of the metres constitute Ovid's peculiar charm, but these very gifts of nature prevent him from taking the highest rank, for the labor of polishing was irksome to him. We have the following poems: 'Epistolæ' (or 'Heroides'), 21 imaginary love letters by men and women in the heroic age, in elegiac metre; 'Amores,' in three books, chiefly erotic; 'Ars Amatoria,' in three books, and the 'Remedia Amoris,' in two books, its counterpart; 'Medicamina faciei,' only partly extant; 'Metamorphoseon Libri XV,' in hexameter verse, treats of various myths and their sources after Greek models; 'Fastorum Libri VI' is a calendar, with an account of the origin of Roman festivals; 'Tristium Libri V' recounts the troubles of his journey and his wretched plight in a strange land; 'Epistularum ex Ponto Libri IV' are of a like nature and the 'Ibis,' a very abusive poem against some unknown enemy, and finally the 'Halieutica,' a didactic poem, in hexameters, of which only 132 lines are preserved, treating of the fish in the Black Sea. Here may also be mentioned Græcius Faliscus, whose 'Cynegetica' is in a very imperfect state, and Manilius, whose work on astronomy (or better astrology) is dry but not without interest. The greatest prose writer of this age was T. Livius (59 B.C.-17 A.D.) of Patavium, a man of vivid imagination, generous feelings, possessed with a love of truth, and gifted with fine oratorical powers. His language, graceful and elegant, is made more charming by the archaisms and poetic coloring. Livy is a fine

CLASSICAL LITERATURE

master in the portrayal of character and is perhaps the greatest stylist of the Romans. The charge of provincialism is hardly if at all discernible to us. Besides his philosophical and rhetorical works, which are now lost, he wrote the history of Rome in 142 books, 'Ab Urbe Condita,' of which books I-X and XXI-XLV are preserved, while of the rest we have epitomæ, a very unsatisfactory substitute. Other prose writers of this period are Annæus Seneca (c. 54 B.C.-36 A.D.), a writer on rhetorical subjects, Pomponius Trogus, who wrote a universal history in 44 books, of which a compendium was made by Justinus, and Vitruvius Pollio, from whom we have 'De Architectura Libri X.' In law, we may mention S. Sulpicius Rufus, A. Ofilius, M. Antonius Labes and C. Ateius Capito. In grammar and philology, P. Nigidius Figulus, who, besides his work on theology and natural sciences, wrote 30 books, 'Commentarii Grammatici;' M. Verrius Flaccus author of 'Fasti' and 'De Verborum Significatu,' and Iulius Hyginus, who wrote on history, geography, agriculture, astronomy, etc., commentaries on Vergil and 277 fables.

IV. SILVER AGE.—C. Velleius Paterculus (18 B.C.-31 A.D.), the court historian under Tiberius, wrote an 'Abridgment of Roman History,' in two books, classical in vocabulary, but exaggerated and artificial in style. Valerius Maximus (fl. A.D. 26) was not an historian, but a compiler, and his 'Factorum et Dictorum Memorabilium Libri IX,' without taste and sometimes without sense, seems to be a collection of models for rhetoricians. Much more important is A. Cornelius Celsus (fl. A.D. 50), the scientist, of whose encyclopædia we have still extant the eight books on medicine. Here also belongs Phædrus, whose 92 fables in imitation of Æsop are good both as to metre and style. By far the most important writer of this time is L. Annæus Seneca (4 B.C.-65 A.D.), poet and philosopher, who wrote on numerous subjects in a striking and brilliant, but highly artificial style. Besides many works known only by name, we have 'Dialogi XII,' on various topics; 'De Beneficiis,' in four books; 'Naturales Quæstiones,' in seven books; 'De Clementia,' in two books, and 'Apolocynosis,' a bitter satire on the emperor Claudius, and 'Epistolæ Morales ad Lucilium,' 124 letters on moral subjects, abounding in saws and maxims. The correspondence with Saint Paul is spurious, but there is now little doubt that the tragedies ascribed to him are genuine. Q. Curtius Rufus (fl. A.D. 50) wrote 'Historiæ Alexandri Magni Libri X,' of which books I and II are lost, not a great work, though at times vivid and dramatic, resembling Livy in the words and phraseology, but Seneca in the form of the sentences. Here may also be mentioned M. Columella, whose work, 'De Re Rustica Libri XII,' shows considerable technical knowledge and good taste, and Pomponius Mela, whose 'De Situ Urbis,' in three books, reflects Seneca's style. A. Persius Flaccus (34-62 A.D.), the Stoic, whose six satires have been much admired on account of their ethical value. M. Annæus Lucanus (39-65 A.D.) wrote numerous poems, of which only 10 books of the 'Pharsalia' have reached us. This work has some fine passages, but the style is highly artificial like Seneca's, his uncle. To Petronius Arbiter is ascribed the satirical novel, originally in 20 books, of which only fragments

are now extant, and of these the 'Cena Trimalchionis,' a coarse, but witty description of a banquet given by a rich upstart. C. Plinius Secundus, Pliny the Elder (23-79 A.D.), a naval officer, wrote on history, tactics, grammar, rhetoric, etc., but the only work that we have is his 'Naturalis Historia,' in 37 books, which is a compilation from numerous works, rich in learning, but dry and often crude in style. C. Valerius Flaccus, under Vespasian, wrote 'Argonautica,' in eight books, after the manner of Apollonius Rhodius, in a highly artificial and rhetorical style, which is often obscure. C. Silius Italicus (25-101 A.D.), under Domitian, wrote 'Punica,' in 17 books, on the Second Punic War, imitating Livy in matter and Vergil in style. From P. Papinius Statius (45-96 A.D.) we have the incomplete poem, 'Achilleis,' in one and a half books, 'Thebais,' in a highly florid and artificial style, rich in mythological lore, and the 'Silvæ,' in five books, consisting of 32 pieces, in various metres, and of much greater interest than the two preceding poems. Of M. Valerius Martialis (c. 40-120 A.D.) we have 1,555 epigrams, in various metres, full of wit and scathing sarcasm, but often coarse and obscene. M. Fabius Quintilianus (35-95 A.D.), the great teacher of rhetoric, has always enjoyed a wide reputation. The only work that has come to us is his 'Institutio Oratoria,' in 12 books, outlining the complete course for instructing an orator, making an interesting and valuable book. Quintilian's aim was to bring back the old style, especially Cicero's, and though he condemns in vigorous language the artificial style of his day, especially of Seneca, the philosopher, he was unable to free himself entirely from the stylistic defects of his age. Sextus Iulius Frontinus (40-103 A.D.) was a distinguished mathematical writer, of whose work on 'Surveying' only extracts are extant; we also have his 'Strategemata,' in three books, and 'De Aquis Urbis Romæ,' valuable for the information it contains. The greatest poet of the period is Dec. Iunius Iuvenalis (56-140 A.D.), of whom we have 16 satires in five books, in which he satirizes the hideous vices of his time in a most interesting and realistic manner. His language is forcible and drastic, though often obscure. The most distinguished prose writer of the decline is P. Cornelius Tacitus (55-119 A.D.), whose extant works are as follows: 'Dialogus de Oratoribus,' considered doubtful by some on account of its diffuse and florid style; 'Agricola,' a very valuable and sympathetic biography of his father-in-law, in rhetorical style; 'Germania,' an historical monograph, also in rhetorical style, a valuable contribution to our knowledge of the ancient Germans; 'Historiæ,' originally in 14 books of which only I-IV and the first part of V are extant, contains an account of the Flavian dynasty; 'Annales,' or more correctly 'Ab Excessu Divi Augusti Liber,' originally in 16 books, of which only I-IV and XII-XV are extant entire, and parts of V, VI, XI, and XVI, which treat of the Julian dynasty. Tacitus was an earnest and conscientious historian, a careful student of his authorities, and tried to be impartial. He shows the influence of Cicero and Sallust in his style, which is now grave and compact, now sonorous and grand, very irregular at times, but always energetic. A charming writer of this time is C. Plinius Cæcilius Secundus (62-113 A.D.), Pliny the

CLASSICAL LITERATURE—CLAUDE LORRAINE

Younger, nephew and adopted son of Pliny the Elder. He was a distinguished advocate and speaker of his day. Of his speeches we have the 'Panegyricus,' in which he thanks Trajan for the consulship. Far more delightful and interesting are his 'Epistolæ,' in nine books, written with a view to publication and so lacking the freshness of Cicero's letters, but forming a valuable help to understanding the temper and condition of his times; a tenth book contains the correspondence between Pliny and Trajan, when Pliny was governor of Bithynia. The style is smooth, equable, and fluent.

V. PERIOD OF DECLINE.—The most important writer of this age is Suetonius, whose 'Lives of the Twelve Cæsars' and some fragments of his other works have come down to us. Here also belongs Florus, with his tasteless 'Epitome of Roman History,' the grammarian Terentius Scaurus, Fronto, the rhetorician; the jurists Ulpian, Marcellus, and Gaius, Aulus Gellius, whose 'Noctes Atticæ' contain valuable material; Apuleius, a voluminous writer of prose and verse, whose 'Metamorphoseon Libri XI' is best known; the Christian writers Minucius Felix, who imitated Cicero and Seneca, and Tertullianus, author of the 'Apologeticus,' and the grammarians, Acron and Porphyrius, authors of commentaries on the classic poets, and Terentianus Maurus, the metrician. In the 3d century we find Ulpianus and Paulus, the jurists, Cyprianus, Arnobius, and Lactantius, the Christian writers, of whom the last is the Cicero of the Christian writers; and Nonius Marcellus, the lexicographer. In the 4th century worthy of mention are the grammarians and commentators, Victorinus, Donatus, and Servius, Eutropius and Ammianus Marcellinus, the historians; the poets, Ausonius and Prudentius, a Christian poet; Damasus and Ambrosius, writers of Christian hymns, and Claudius, a brilliant poet for his time; and the Christian writers, Hieronymus (Saint Jerome), who translated the Bible, and Augustinus (Saint Augustine), the best of the late Christian writers. With these it is perhaps best to close this sketch of Roman literature, though the writing of Latin continued for many centuries after these.

CHARLES W. BAIN,
*Professor of Ancient Languages and Literature,
University of South Carolina.*

Claude, Jean, zhõn klõd, French Protestant theologian: b. La Sauvetat, near Agen, 1619; d. The Hague 13 Jan. 1687. He officiated as pastor at Nîmes and Montpellier, but owing to his opposition to the government scheme for the reunion of the Protestants and Roman Catholics, was interdicted from preaching. The controversial abilities of Claude rendered him formidable and obnoxious to the Catholic party. On the very morning on which the revocation of the edict of Nantes was registered at Paris, he was ordered to leave France within 24 hours. He retired to Holland, where he was received by the Prince of Orange, who settled a pension upon him. The most important of his works is his 'Défense de la réformation' (1673). He also published a well-known 'Essay on the Composition of a Sermon.' He wrote against Arnauld and Nicole on the doctrine of transubstantiation, and in 1678 held a discussion with Bossuet in presence of Mlle. de Duras, a Protestant lady connected with the court, and niece of Turenne, who wished to review the grounds of her faith by hearing their arguments. Bossuet published an account of the conference, which was answered by Claude.

Claude Lorraine, klõd lõr räñ, or **Lorrain,** so-called, French landscape painter: b. Chamagne, Vosges, France, 1600; d. Rome 21 Nov. 1682. His real name was CLAUDE GELLÉE: he was called *Lorraine* from the province of this name, where he was born. When 12 years old it is said he went to live with his brother, an engraver in wood, at Freiburg. Afterward a relation of his took him to Rome, where the sight of some paintings of Gottfried Wals enchanted him so much that he traveled to Naples to study with the artist. Returning to Rome after two years, he was employed by the landscape-painter Agostino Tassi, as a color-grinder and otherwise. He is next said to have studied, in Lombardy, the paintings of Giorgione and Titian, whereby his coloring and chiaroscuro were greatly improved. After making a journey into his native country, and residing for some time at Nancy, he settled in 1627 in Rome. Here he attracted the notice of Cardinal Bentivoglio, and was introduced by him to Pope Urban VIII., who gave him orders for four paintings. His position being now assured, he had many other eminent patrons, and was enabled to live much at his ease. The

CLAUDIAN — CLAUDIUS

principal galleries of England, France, Spain, Russia, and Germany are adorned with his productions. The public and private galleries of England are richest in these works, a number being in the National Gallery, others at Dulwich, at Windsor Castle, and elsewhere. Claude possessed the greatest power of invention, by which he gave an inexhaustible variety to his paintings, united with an ardent and persevering study of nature. The truth with which he portrays the effect of the sun in every part of the day, soft breezes playing through the tops of the trees, and all the delicate beauties of nature, is surprising; and all his rivals fell far short of equalling the dewy humidity which he threw over dark, shadowy places. His figures are poor, and he used to say — "I sell my landscapes, and give my figures into the bargain." In a great number of his paintings the figures are the work of other artists. Claude most frequently chooses views in which the eye loses itself in agreeable prospects, without being able to define their limits. He often introduces grand architectural structures, and makes his landscapes the scenes of mythological and historical events. Claude himself made a collection of some 200 drawings of his pictures. This record, now in the collection of the Duke of Devonshire, is known as the 'Liber Veritatis.' Consult Lady Dilke, 'Claude Lorrain, sa Vie et ses Œuvres' (1884); Dullea, 'Claude Gellée, le Lorrain' (1887).

Claudian. See CLAUDIANUS.

Claudianus, klâ-dī-ā'nūs, **Claudius** (commonly known as **Claudian**), Roman poet: b. Alexandria about 365 A.D.; d. about 408. He went to Rome in 395 A.D., where his poems gained him such renown that a statue was erected to his honor in the forum of Trajan. Besides several panegyric poems on Honorius, Stilicho, and others, we possess his epic, the 'Rape of Proserpine,' an unfinished Gigantomachia, idyls, epigrams, epistles, and occasional poems. Claudian, whose native tongue was Greek, possessed a remarkable command of the Latin language, and displays poetic powers of a high character, brilliancy of diction, truth of description, and richness of illustration. The best editions of his works are those of Gesner (1759); Burmann (1760); Jeep (1876-9); Koch (1893). There is a metrical translation of his works by A. Hawkins (1817).

Clau'dius, klâ'dī-ūs, the name of a distinguished Roman family which under its head, Attus Clausus, a Sabine, settled at Rome about 504 B.C., and soon branched off into a patrician and a plebeian stock. Attus, admitted among the patricians, changed his name to Appius Claudius. The patrician Claudii were characterized throughout their whole history by their haughty and tyrannical bearing, displayed particularly toward the plebeians; while the plebeian branch were equally distinguished for the resolute assertion of the rights of their order. The patrician Claudii counted among their members 28 consuls, 5 dictators, 7 censors, etc. The plebeian form of the name was Clodius, and the most distinguished members of the plebeian branch bore the cognomen of Marcellus.

Clau'dius, or in full, **Tiberius Claudius Drusus Nero Germanicus**, 4th Roman emperor: b. Lyons, 10 B.C.; d. 54 A.D. He was the youngest son of the elder Claudius Drusus Nero

and Antonia the younger, the daughter of Augustus' sister. His early education was left to women and slaves; owing to his ill health it was thought he would never become a robust man. He lived as an unimportant private man, and occupied himself with literature. Among other works he wrote a Roman history, embracing the period from the death of Cæsar to his own time, in 43 volumes, and also his own life. After the murder of Caligula, the body-guard, who were ransacking the palace, discovered him secreted in a corner, dragged him out, and proclaimed him emperor (41 A.D.). The senate, who had determined on the restoration of the republic, were forced to confirm the appointment. Claudius, suddenly transferred from retirement and oppression to uncontrolled power, distinguished the beginning of his reign by some praiseworthy acts; he recalled the exiles and restored their estates to them; embellished Rome and erected several large buildings for the public good. He made Mauritania a Roman province; his armies fought successfully against the Germans, and kept possession of several strong places in Britain. But he sank into debauchery and voluptuousness; and his wives, particularly the infamous Messalina, together with his freedmen, administered the government, sold offices and places of honor, and committed the greatest atrocities unpunished. He died of poison administered by his fourth wife, Agrippina (mother of Nero), at the age of 63, 54 A.D. His deification was the cause of Seneca's pasquinade entitled 'Apocolocyntosis.'

Claudius II. (MARCUS AURELIUS FLAVIUS), surnamed GOTHICUS, Roman emperor: b. Illyria; d. 270 A.D. He was raised to the throne on the death of Gallienus, in 268, and by his virtues as well as his splendid victories over the Goths, he proved himself worthy of his exalted station.

Claudius, Appius, surnamed **Cæcus** ("the blind"), an ancient Roman, elected censor in 312 B.C., in which office he made himself notorious by his arbitrary proceedings, for the purpose of weakening the influence of the plebeians, by admitting into their number the sons and grandsons of freedmen, and others of the lowest of the people. He performed an important service, however, by the construction of the road and the aqueduct which bear his name, though he is said to have procured the removal of his colleagues from office that he might be able to appropriate the whole honor of these works to himself. Selfish ambition was the distinguishing feature in his character. In his old age he became blind; but when Cineas, the deputy of Pyrrhus (280 B.C.), had gained over the senate, which was on the point of accepting peace on the terms offered by him, Appius caused himself to be led into the senate-house, and in a celebrated speech, of which Cicero speaks in the highest terms, succeeded in persuading the senate to resolve that they would listen to no proposals of peace in which the evacuation of Italy was not made an essential condition. From his two sons spring the two best known branches of the Claudian family, the one distinguished by the surname of Pulcher, and the other by that of Nero.

Claudius, Matthias, mat-tē'äs klow'dī-ūs, German poet: b. Rheinfeld 15 Aug. 1740; d. Hamburg 21 Jan. 1815. His prose and poetry bear a peculiar stamp of humor, frankness, and

CLAUSEL — CLAVICLE

cordiality. In 1775 he made a collection of his compositions, which had appeared in the 'Wandsbeck Messenger' and other periodicals, with the addition of some which had not been printed, and gave the collection the title 'Asmus omnia sua Secum Portans,' or 'Complete Works of the Wandsbeck Messenger.' All his works are written in a natural, intelligible, and often humorous style, and support the cause of good morals, benevolence, patriotism, and piety, while they attack folly and vice with the weapons of ridicule and scorn. Many of his songs have been set to music by the first composers, and have become a part of the national melodies. He occupied several public offices. In the latter part of his life he became a convert to religious mysticism.

Clausel, Bertrand, bër-trän klō-zël, France, a marshal: b. Mirepoix 1773; d. 1842. After gaining a high reputation by his services on the Pyrenees, in Haiti, Italy, and Dalmatia, he accompanied Junot and Massena to Spain in 1810. He laid siege to Ciudad Rodrigo, and was wounded at Salamanca. By his skill and conduct the army of Portugal was preserved and led into Spain. In 1813 Napoleon rewarded his valor by conferring on him the chief command of the forces in the north of Spain. On the restoration of the Bourbons he came to the United States, and lived here for a long time in retirement, but when Charles X. was overthrown in 1830 he received from Louis Philippe the command of the French troops in Algeria, which he retained till 1836, when he resigned in consequence of the defeat he had sustained at Constantine.

Clausen, klow'sën, George, English artist: b. London 1852. After studying at South Kensington 1867-73, he was for some time in Paris under Bouguereau and Fleury and subsequently visited Holland and Belgium, exhibiting at the Royal Academy in 1876, 'High Mass at a Zuyder Zee Village.' Besides many paintings of Dutch themes he has painted among other works: 'Laborers at Dinner'; 'Brown Eyes'; 'Evening Song'; 'Turning the Plow.'

Clausewitz, klow'zë vīts, Karl von, Prussian military officer: b. Burg 1 June 1780; d. Breslau 16 Nov. 1831. He served with distinction in several campaigns in the Prussian and Russian services in 1815, became chief of a Prussian army corps, and was ultimately director of the army school, and inspector of artillery. Of his works the best known are his great book 'Of War' (3 vols.), and his life of Scharnhorst.

Clausius, klow'zë-üs, Rudolf, German physicist: b. Köslin, Pomerania, 2 Jan. 1822; d. Bonn 24 Aug. 1888. He studied at Berlin and afterward lectured on natural philosophy as *privat-docent* at Berlin, and as professor at the Zürich Polytechnic School. In 1869 he was appointed to the chair of Natural Philosophy at Bonn. He was elected a foreign member of the Royal Society in 1868, and in 1879 was given its highest honor, the Copley medal. His scientific labors cover parts of the field of optics and of electricity, but his especial work was his contribution to the science of thermo-dynamics, the honor of establishing which on a scientific basis he divides with Rankine and Thomson. His mathematical methods he also applied to the theory of the steam-engine, the dynamical or

kinetic theory of gases, and to electricity and electro-dynamics. His great work is his 'Theory of Thermo-Dynamics.'

Clausthal, klow's'täl, Prussia, a mining district and town in the province of Hanover. It is situated on the Zellerbach, 26 miles northeast of Göttingen. It stands in a bleak district, on the top and slopes of a hill, about 1,800 feet above the sea. It is regularly laid out, having been frequently burned down and rebuilt, but the houses are generally of wood. It contains a government mining school, with a good collection of models of mines and minerals, a library of 30,000 volumes, a mint at which 14,000 silver dollars are coined weekly, and over 600 gold ducats yearly, and it has also a church, court-house, and gymnasium. One of the mines reaches 500 feet below the level of the Baltic, and is drained by a tunnel cut through the mountain to a distance of six miles. The machinery of the mines is worked by water power, and every stream in the vicinity is carefully appropriated to this purpose; the various canals, which extend from mill to mill throughout the mines, have an aggregate length of 125 miles. These mines have been worked since the 11th century. The mines furnish employment to the men, and a number of knitting mills give employment to the women. Pop. 9,200.

Clava Coronæ, klā'va kō-rō'nē ("the Key of the Crown"), one of the names given to the star Alpha Coronæ Borealis, the brightest in the Northern Crown. The more common name is that of Arabic derivation, Alphecca.

Clavaria, klā-vā'rī a, a genus of fungi, many of them edible. Some of the species are branched, some club-shaped. One species (*C. botrytis*), growing in Germany, is a common article of food. It has a sweetish taste, and is said by Liebig to contain mannite (q.v.). Another species (*C. flava*) is used in the same way. Another species is the goat's-beard fungus.

Claverack, klāv'er-āk, N. Y., a town in Columbia County, on the Boston & A. R.R., about 28 miles south of Albany. The town was settled in 1660, and has a church building dating from 1767, and a court-house erected in 1784. The town is the seat of a well-known school called the Hudson River Institute, established in 1854. Pop. (1900) 4,416.

Claverhouse, klāv'er ūs. See GRAHAM, JOHN.

Clav'erings, The, a novel of contemporary English life, by Anthony Trollope, published 1867.

Clav'ichord, a keyed musical instrument, now out of use, somewhat in the form of a spinet, the strings of which are supported by five bridges. One distinction in the clavichord is that the strings are covered with pieces of cloth, which render the sound sweeter, and at the same time deaden it, so as to prevent its being heard at any considerable distance. On this account it was formerly much used by the nuns, who could practise on it without disturbing the dormitory. It is sometimes called the "dumb spinet." See PIANOFORTE.

Clav'icle, or Collar-bone, a bone situated immediately above the first rib, stretching from the upper border of the manubrium of the sternum, outward and backward to the acromium

process of the scapula or shoulder-blade. It connects the upper limb, the arm, with the trunk, and is so fastened that while its inner end rests on the sternum and cartilage of the first rib the outer end is associated with the scapula, supporting it firmly in its varied positions and preventing it from falling forward from the chest. The clavicle is a long bone, and in men is much heavier than in women. It is absent or imperfectly developed in those animals which do not use lateral movements of the fore-limbs and is very much exaggerated or modified in animals such as birds, that exercise the arms very extensively. The clavicle is very frequently broken in children from the results of a direct fall, and as it does not always occasion a marked deformity the diagnosis is at times difficult. Consult Morris, 'Human Anatomy,' 3d ed.; Gerrish, 'Text-Book of Anatomy by American Authors,' 2d ed.; Spalteholz, 'Anatomy.' See SHOULDER-JOINT.

Clavigero, Francisco Xavier Saverio, frän-thēs'kō hä-vē-ār' sä-vā-rē'ō klä-vē-hā'rō, Mexican historian: b. Vera Cruz, Mexico, about 1720; d. Cesena, Italy, 1787. He was educated as an ecclesiastic, and resided 36 years in the provinces of New Spain, where he acquired the languages of the Mexicans and other indigenous nations, collected many of their traditions, and studied their historical paintings and other monuments of antiquity. The first of his researches was a 'History of Mexico,' written in Italian, of which an English translation was published in 1787. This is a most comprehensive work, affording a great deal of information relative to the natural and civil history, antiquities, and religion of Mexico; but it displays more industry than judgment on the part of the author. On the suppression of the Jesuits by the Spanish government in 1767 Clavigero went to Italy, the Pope assigning him a residence in Cesena.

Clavijo y Fajardo, José, hō-sā' klä-vē'hō ē fä-här'dō, Spanish scholar: d. 1806. He lived in Madrid, where he had the reputation of an intelligent scholar, and had published a journal, 'El Pensador,' and other useful works, when his connection with the sister of Beaumarchais, whom he had loved and then forsaken, gave rise to an affair of honor between him and the brother of the lady, who was formidable for talent rather than courage. This affair, in which he narrowly escaped with his life, deprived him of his office and the good opinion of his fellow-citizens. He passed the remainder of his days under a kind of dishonor, which the representations of his adversary had brought upon him. For more than 20 years he superintended the publication of the 'Mercurio Histórico y Politico de Madrid,' with which he had been intrusted as early as 1773. He likewise translated Buffon's 'Natural History' into Spanish (1785-90). He was vice-director of the Cabinet of Natural History, and director of the Theatre de los Sitios, when he died. Far from resembling the detestable portrait which Beaumarchais draws of him, Clavijo was of a mild disposition, pleasing manners, and a clear understanding. Goethe founded his tragedy 'Clavijo' on Beaumarchais' story.

Clavis, klä'vis (Lat. "key"), a drawing, index, etc., which serves as a guide to the understanding of another work; for instance, *clavis Ciceronia*, *clavis Homerica*, etc.

Claws, sharp hardenings of the skin at the end of the limbs of animals. The term is often applied to the chelæ and similar structures at the end of arthropod limbs, but is best restricted to the horny nails found at the end of the digits in most reptiles, on the toes, and often on the thumb and first finger of birds, and seen in perfection in many mammals, such as the carnivores, insectivores, rodents, edentates, and others, where the nails are sharp and serve for scratching and clinging. See HOOF; HORN; NAIL.

Claxton, Alexander, American commodore: b. Maryland about 1790; d. Talcahuana, Chile, 7 March 1841. He entered the navy as midshipman in 1806, was promoted to a lieutenancy in 1813, and served in the sloop of war Wasp in her action with the British sloop of war Frolic, on 18 Oct. 1812. He was promoted to the rank of master commandant in March 1820, and to that of captain in 1831, performing much active service in both grades. He died while in command of the squadron in the Pacific Ocean.

Claxton, Kate (Stevenson), American actress: b. New York 1850. She was the daughter of Spencer Wallace Cone, and was married to Charles Stevenson in 1878. She made her début at Daly's Theatre before she was out of her teens, but her success dates from 1873, when she acted Mathilda in 'Led Astray.' As Louise in 'The Two Orphans' she attained great celebrity. She was playing the part at the Brooklyn Theatre when, on the night of 5 Dec. 1876, that structure was destroyed by fire with great loss of life. Since 1896 she has been touring the country in emotional plays.

Clay, Cassius Marcellus, American diplomatist: b. Madison County, Ky., 19 Oct. 1810; d. 21 July 1903. He graduated at Yale 1832, and three years later was elected to the legislature of Kentucky. The improved jury system and the common school system of Kentucky are in large measure due to his efforts while in the legislature. He denounced the scheme of Texan annexation as designed for the extension of slavery, and in 1844 traversed the northern States, addressing immense audiences in favor of the Whig presidential candidate. On 3 June 1845 he issued in Lexington, Ky., the first number of the 'True American' a weekly newspaper, devoted to the overthrow of slavery in that State. It aroused indignant opposition, and in August following his press was seized by a mob and sent to Cincinnati. He was threatened by public resolution with assassination, but revived his paper, printing it in Cincinnati and publishing it in Lexington. Public sentiment came gradually to support the principle of the freedom of the press, and Clay was able to keep an anti-slavery journal in the field, first at Lexington, and afterward at Louisville. He served in the Mexican war, was an opponent of slavery, and supported Lincoln for the presidency. From 1862 to 1869 he was minister to Russia. In 1886 he published his speeches, edited by Horace Greeley. In 1896 he supported the "gold" Democratic ticket.

Clay, Clermont Claiborne, American senator: b. Huntsville, Ala., 1819; d. there 3 Jan. 1882. He graduated at the University of Alabama in 1835, and after studying law in the University of Virginia, was admitted to the bar in 1840. He was elected to the Alabama legis-

CLAY

lature, 1842, 1844, and 1845; was judge of the Madison County court 1846-8. He was chosen United States Senator in 1853, and re-elected in 1859, receiving every vote in the legislature. In the Senate he supported the admission of Kansas under the Lecompton resolution, and was an ardent advocate of the State sovereignty doctrine. He was formally expelled in 1861, and became a senator in the Confederate Congress. In 1864 he was a secret agent of the Confederacy in Canada, but in May 1865 gave himself up to the United States authorities and was a fellow prisoner of Jefferson Davis at Fort Monroe. After his release in April 1866 he returned to the practice of law in Huntsville.

Clay, Frederic, English composer: b. Paris 3 Aug. 1840; d. London 27 Nov. 1889. He studied music at Paris, and settled in London as a composer for the stage, his most successful production being 'The Black Crook.' He composed several popular songs, the best known being 'She Wandered Down the Mountain Side.'

Clay, Green, American soldier: b. Powhatan County, Va., 1757; d. Kentucky 31 Oct. 1826. He was a cousin of Henry Clay (q.v.). He went to Kentucky early in life and there acquired a fortune as a surveyor. He filled many local offices, was a member of the convention that ratified the Federal constitution, of the Kentucky Constitutional Convention of 1799, and served for many years in the State legislature. On 16 March 1813, Gov. Shelby commissioned him a brigadier-general, and in May of that year, when Gen. Harrison was besieged by the British at Fort Meigs, on the Maumee River, Clay came to his relief with 3,000 volunteers. He was left in command of the fort and successfully defended it against a combined attack of British and Indians under Gen. Proctor and Tecumseh.

Clay, Henry, American statesman: b. Hanover County, Va., 12 April 1777; d. Washington, D. C., 29 June 1852. He was the son of a Baptist preacher who died in 1782, leaving but a small property to his widow and children. His early education was of a very limited character, and at 15 he was placed in a small retail store in Richmond. In a short time, however, he secured employment as a lawyer's clerk and after becoming a student of law was licensed to practice at the Virginia bar before he was 21 years of age. In less than a year later he removed to Lexington, Ky., and there began the practice of his profession, securing a lucrative business almost immediately. His success at this period is sometimes explained by reference to his frank, cordial, attractive manners, but no doubt his signal abilities had quite as much to do with it. In boyhood he had acquired the art of ready speech by solitary practice in the forest, barn, or cornfield, and the easy self-confidence which this had produced now stood him in good stead. In 1800 he was sent as representative to the Kentucky legislature and in 1806 was for a year United States senator to fill the unexpired term of Gen. Adair, who had resigned. He returned to the State legislature in 1807 and the next year, as the outcome of a dispute between himself and another member, Humphrey Marshall, challenged his opponent to a duel in which both were slightly wounded. In 1809 he was a second time chosen to fill a vacancy in the

national Senate, remaining there two years, making his first speech at this time in favor of protection. In 1811 he was elected to the House of Representatives and on his appearance there was chosen speaker by a large majority, a post which he retained till 1814. During this period Clay took an active part in the congressional debates respecting the second war with England, vigorously sustaining the war measures of the administration by his eloquence. In January 1814 Clay resigned his speakership, having been appointed one of the commissioners to negotiate a peace with England at Ghent, in Belgium. In this matter he was instrumental in securing to the United States the free navigation of the Mississippi. After the signing of the treaty he spent some time in Paris, and also in London, where he was cordially received, returning to America in September 1815. He was again elected to Congress and again chosen speaker, and at this time was a strenuous advocate of the independence of the Spanish-American republics, as well as of the stimulation of American industries by a protective tariff. Slavery was now becoming one of the most important of political questions as regarded its limitation or extension, and the admission of Missouri into the Union brought controversy to a white heat, the contention being whether or not it should be admitted as slave or free territory. Clay, if not the author of the celebrated "Missouri Compromise," establishing the line of 36° 30' as the northern limit of slave-holding territory, was its most earnest supporter. In 1824 he was a candidate for the presidency, in opposition to John Quincy Adams, Andrew Jackson, and William Crawford, and the Electoral College failing to make a choice, the election devolved upon the House of Representatives. On this occasion the election was secured for Adams through Clay and his friends voting in his favor. He was subsequently charged with bargaining by his enemies, in respect to his attitude at this time, but there is no evidence sustaining such a claim. John Randolph was the most persistent of Clay's defamers and after he had termed Clay's course in securing Adams' election as a "coalition of Puritan with blackleg" he was challenged to a duel by the other. During Adams' administration Clay was secretary of state, filling that office to general satisfaction, and in 1831 entered the Senate, where he led in the opposition to President Jackson's administrative policy, and attempted to prevent the removal of the deposits from the United States Bank. Largely through his influence the "Compromise Bill" was carried through Congress, which closed debate on the nullification question, through its partial reversal of the protective tariff. In 1832 Clay was for the second time a presidential candidate, but the popularity of Gen. Jackson was so great at this time that any other candidate had small chances of success, Clay receiving the votes only of Massachusetts, Rhode Island, Connecticut, Delaware, Maryland, and Kentucky. In March 1842 he resigned from the Senate and retired to private life, permanently, as he hoped. He was, however, in 1844, nominated a third time for the presidency and defeated after an intensely exciting political contest. The numerical majority was very small and his defeat was attributable in some degree to the influence of the administration. The primary cause, nevertheless, was the annex-

CLAY CENTER — CLAY

ation of Texas, a measure to which Clay had been opposed. After spending several years in retirement on his estate of Ashland, near Lexington, Ky., he was returned to the Senate in 1849, where he took an active part in the dispute between the slave-holding power and its opponents on the question of the admission of California, and devised the "Compromise of 1850," which terminated the long and bitter struggle. It has been sometimes urged against him as a reproach that he was always ready with a compromise in political emergencies, but in these matters he may have been wiser than his critics. For the greater part of his life he wielded a great political influence, acquired partly by his eloquence as an orator, partly by the fact that he never left his position in doubt on questions of national moment. By throwing the entire weight of his talents and influence in favor of a *via media* he more than once ended the violence of party strife which had reached so high a pitch as to endanger the national peace and the continuance of the government. In the crucial matter of slavery his counsels were moderate and his policy always pacificatory. In his latest years, however, this question had become too overwhelmingly important to be handled in any but the most resolute fashion and although the "Compromise of 1850" served its immediate turn, the day for compromises was nearly over, and this the great Kentuckian may have realized. This was his latest political effort and his death resulted, in effect, from the exhaustion induced by the controversy at this time. His political career extended over half a century and for much of that period he ranked as one of the foremost orators of the time. He was the subject of much adulation as well as of bitter slander. The latter was certainly undeserved, and if he does not bulk so largely in the minds of men at present as his admirers fondly anticipated, a juster estimate than any of which they were capable may find in him a truer greatness than they recognized. There were serious limitations in his character: He reflected the violence of his time, the tendency to unrestrained invective, once common among public men, but he also reflected much of its nobility, and his devotion to the real interests of his country can scarcely be doubted. Consult Cotton, 'Life and Times of Henry Clay'; Schurz, 'Henry Clay' (1887); Parton, 'Famous Americans.'

OSCAR FAY ADAMS.

Clay Center, Kan., the county-seat of Clay County, is situated on the Union P., and Chicago, R. I. & P. R.R.'s, and on the Republican River, which supplies ample water-power. The principal industries are the manufacture of foundry and machine-shop products and flour, and the cultivation of nursery stock. The city is somewhat noted for its greenhouses. Pop. (1900) 3,069.

Clay, any aluminous silicate having plasticity: that is, which can be molded, when moist, into forms which become stone hard after exposure to a red heat or higher temperature. Plasticity is a physical quality, apparently having little relation to chemical composition, and the exact reason why one clay is more plastic than another is even yet largely a matter of speculation. In a broad way clays may be divided into: (1) Pure clays, mostly

silica and alumina, with small amounts of iron, lime, magnesia, soda, and potash; (2) sandy clays or loams, comprising much of the arable soil of the world; and (3) limy clays or marls, clays containing a high per cent of lime. Clays are also given a great variety of names, according to special characteristics and economic use. The important divisions, based on use in the arts are: Kaolin, or China clay, pottery clay, fire clay, and brick clay.

Origin of Clay.—The base of all clays is the mineral kaolinite, having the formula $Al_2O_3 \cdot 2SiO_2 + 2H_2O$, giving silica 46.3 per cent; alumina, 39.8 per cent; water, 13.9 per cent. It is made up of minute hexagonal plates. It results from the decay of feldspathic rocks, particularly granites and gneisses. Surface waters percolating through such rocks leach out the potash in the feldspar; some silica is also leached out and left in a hydrated state. Kaolinite results from the union of the broken-down alumina of the feldspar with the hydrated silica. Thus were formed in place the kaolin deposits of Cornwall, England, and some of the kaolin of North Carolina and Pennsylvania. By the erosion of the land the kaolin and other products of rock decay are carried away and deposited as silts in lakes or in the ocean. Also, under the grinding of glaciers, rocks are reduced to a fine rock flour, forming glacial clays (boulder clay or till). The beds of clay laid down in the ocean may be buried deeply under other deposits, and by heat and pressure be changed to shale. When the sea bottom is elevated and the new land surface eroded, the shale may disintegrate into clay again, or the shale itself may be mined by man, ground, and used as clay.

Varieties of Clay.—Pure kaolin or China clay is rare. It is pure white and almost free from iron salts. The common chemical impurities in the crude material are silica, iron, lime, alkalis, magnesia, and titanium, and the common mineral impurities are quartz, feldspar, mica, calcite, magnetite, limonite, and pyrite. If the product is white, contains very little iron, and is low in alkalis it passes in the trade as kaolin. Kaolin has little plasticity, and in making pottery other clays are often added to give this quality. It may occur as residual kaolin in the position of the original feldspar body, a vein or dike, or, if transported by streams and deposited at a distance in beds, as sedimentary kaolin. Residual kaolin is apt to be of better quality than sedimentary, containing less iron and other impurities.

The United States imported about 130,000 tons of kaolin in 1902, the production for 1901 having been 97,253 short tons. Kaolin is mined in De Kalb and Jefferson counties, Ala.; at Hockessin, Del.; in Taylor County, Ga.; at Blandford, Mass.; in Macon, Jackson, and Montgomery counties, N. C.; in Chester and Delaware counties, and in the South Mountain region, Pa.; in Aiken County, S. C.; and in Lake County, Fla.; and there are deposits in Missouri, Tennessee, and several other States.

Besides being used in making pottery and white tiling and brick, kaolin is largely employed in the manufacture of paper, for weighting the paper and giving a better surface. The largest pottery manufactures in the United States are at Trenton, N. J., and East Liverpool, Ohio. Nearly all the Chester County, Pa., kaolin goes

HENRY CLAY.

CLAY

to those places. The South Carolina kaolin is nearly all used in paper-making.

ANALYSIS OF VARIOUS CLAYS.

	Si O ₂	Al ₂ O ₃	H ₂ O	Fe ₂ O ₃	Ca O	MgO	Na ₂ O K ₂ O	Ti O ₂

1. Crude kaolin, West's Hill, N. C. 2. Refined kaolin, Mt. Holly, Pa. 3. Fire clay, Bolivar, Pa. 4. Pottery clay, Zanesville, O. 5. Paving brick clay, Bloomington, Ill. 6. Front brick clay, Sayreville, N. J. 7. Brick clay, Milwaukee, Wis. 8. Terra-cotta clay, Glens Falls, N. Y.

Fire Clays differ much in color, hardness, texture, and composition, and some clays used in making fire brick are not particularly refractory, but are used for their high plasticity. Strictly a fire clay is a nearly pure mixture of sand and clay with only traces of iron, lime, and magnesia, and hence makes white or light colored bricks which can stand very high temperatures. According to Ries a clay should not be considered refractory unless its fusing point is above 2,700° F. Fire clays are divided into plastic and flint, the former, if hard when dug, becoming plastic when ground and mixed with water; the latter, though sometimes having nearly the same composition, do not become plastic when similarly treated. Fire clays, like kaolins, are sometimes residual products of the decay of feldspar veins, but most are of sedimentary origin. Some form the underclay of coal seams, but all such underclays are not refractory. The underclays of the Michigan coal beds are not. Fire clays in the United States are found in rocks of many geological periods, but chiefly in the Carboniferous and Cretaceous. Workable deposits are known in 18 States; important deposits being in western Pennsylvania; in the coal-mining region of Ohio; in a belt across New Jersey from Perth Amboy to Trenton; in Cecil, Garrett, and Allegany counties, Md.; near St. Louis, Mo.; near Woodstock and Aniston, Ala.; and near Golden, Colo.

Potters' Clay.—Clays for potters' use, apart from the materials used in accessory work, such as fire-brick, saggers, etc., are divided into two classes, kaolins and ball clays. The former term is derived from the Chinese Kao-ling, meaning lofty hill. The Chinese porcelain clay was found in quantities in a hill thus named, and the term applied to the clay served to define it. The word kaolin is now applied by common consent to a residual clay which remains white after burning. A residual clay is one which lies as it was formed. Masses of feldspar have been decomposed, the contained potash has been gradually dissolved by carbonated waters, and the residue of silica and alumina has been left. There is usually more or less undecomposed feldspar and grains of quartz associated with the clay, and hence most kaolins are washed before being put on the market.

Kaolin is well known as forming one of the

ingredients in Oriental porcelain, the other ingredient being a quartzose feldspathic rock called in China *petuntze*. For Sèvres porcelain kaolin is obtained from Limoges.

Ball clay,—probably corrupted from bowl clay,—is a sedimentary clay, having been washed up and redeposited. It is valued for a high plasticity which kaolin does not possess. The purest ball clay is found in Florida and is sold under the name of "plastic kaolin." Most of these clays burn to a cream or almost a stone color. They are mined in New Jersey, Kentucky, Missouri, and Colorado, in addition to the Florida clay already mentioned. Ball clays are not usually washed before use.

Pure clay is a hydrated silicate of alumina containing about 46 per cent silica, 39 per cent alumina, and 14 per cent water. There is no clay known, however, which contains more than 98 per cent of this silicate, even after washing.

Brick Clays are mixtures of sand and pure clay with lime, magnesia, iron, potash, and soda; in fact, bricks are often made from sandy mixtures which are not properly clay. A mixture with considerable iron burns red, from the oxidation of the iron. Carbonate of lime, or magnesia, by forming light-colored silicates, counteracts this red color. Thus the red clays of Wisconsin, which sometimes contain 20 per cent of lime, make the cream-colored Milwaukee brick. The sedimentary glacial clays are largely used for brick-making in the northern States, sedimentary surface clays and loams in the western States, and residual clays in the southern States. All that is required is that the brick shall be of good color, dense, hard, and of regular form. Brick material of good quality is found in nearly every State of the Union.

For making paving-brick a clay or shale should be relatively high in lime, iron, and the alkalis, that it may vitrify well in burning. When ground and mixed the clay or shale should be fine-grained and plastic, and should shrink but little when burned. Of the western States Illinois leads in the production of paving-brick, with Missouri second.

The very plastic clay known as gumbo in the southern States, besides other clays, are burnt in small lumps and used as ballast by a number of railroads.

Terra cotta, used in fire-proof construction and for decoration, may be made of any clay that will make good, strong brick, and contains no excess of soluble salts that will "whitewash" on weathering.

Methods of Mining.—The clay, if it lies at or near the surface, is first stripped of soil or sand and gravel; sometimes as much as 30 feet being removed. In New Jersey the clay is often dug in pits as deep as the thickness of the bed by hand labor. Usually clay beds are worked either by digging the clay entirely from the base of the bank, by working the bank on an incline of about 30° or, where the bank is over 30 feet high, by working in benches six to eight feet wide and seven to nine feet high. Steam shovels are sometimes used. Where the clay is tough it is often worked by undermining several feet and then breaking a foot or more from the face by wedges. Blasting is used in very tough clay and in shale. If the clay lies at some depth, drifts large enough for a man and a wheelbarrow are driven in to the bank side by side.

CLAY IRON-STONE — CLAY-WORKING MACHINERY

Sometimes a shaft is sunk and drifts driven from the base, this method being used in Pennsylvania and Ohio and in the fire-clay beds of Missouri.

Egyptianized Clay.—A discovery which gives good promise of affecting the clay industry and its various branches has been made by Mr. E. G. Acheson of Niagara Falls. While experimenting in crucible manufacture, Mr. Acheson had occasion to search for a clay possessing certain qualities. After a series of experiments the account of Egyptian brick-making given in the fifth chapter of Exodus attracted his attention, and conceiving the idea that some property in the straw used in brick-making in Egypt might give him the result he sought, he boiled a quantity of straw, obtaining a dark-red liquid which he used in the treatment of clay, finding it excellent for increasing its plasticity. He sought out the principle, and determined that the agent was tannin. He treated other clays with water in which tannin was in solution, and realized that he had made an important discovery.

The name given by Mr. Acheson to clay treated by his process is "Egyptianized clay." He has discovered that it is practicable so to treat clay and other earthy materials as to ensure greater strength in the products made therefrom, also to greatly reduce the shrinkage and warping in the process of drying and baking, and to increase the solubility and the plasticity of the material. By his process, non-plastic clays may be rendered plastic, and plastic clays made more plastic by treatment with tannin or an agent having the astringent principles of tannin.

It has been found by experts of the highest standing that clay so treated is changed in a remarkable manner. Even one half of 1 per cent of tannin develops a wonderful effect, requiring 13 per cent less water to make the clay soft. The maximum effect of the process and treatment, however, seems to be obtained by the use of 2 per cent of tannin in a 10-day treatment, consisting in keeping the clay wet, so that the tannin is dissolved. In the burned form the strength of the clay is increased 50 per cent, while in the sun-dried form it is increased in tensile strength 350 per cent. It is also observed that the Acheson treatment removes the crackling tendencies of many clays. In cases where clay articles are to be made of a certain size, they can be made more exact by the Acheson process, as there is less shrinkage. All parts intended to carry loads may be greatly increased in strength, while there is decreased porosity. Many of the plastic clays are off color, but non-plastic clays of desired color will be brought into service by the Acheson process. In making glass pots it now takes months to "age" or temper the clay, while with the Acheson process the maximum effect is obtained in a 10-day treatment. It is told of the Chinese that the people of one generation prepare the clay for the use of the next, all of which time is spent in making the clay plastic. Under the Acheson process the results are said to be more pronounced in 10 days than obtained by old methods in years.

The following States in 1901 manufactured clay products to the value of \$3,000,000 or over. The figures are from 'The Mineral Industry':

STATE	Brick and Tile	Pottery	Total
Ohio.....	\$11,526,424	\$10,048,561	\$21,574,985
Pennsylvania.....	13,656,730	1,665,012	15,321,742
New Jersey.....	5,781,805	5,900,073	11,681,878
Illinois.....	8,960,041	682,449	9,642,490
New York.....	7,214,358	1,077,360	8,291,718
Missouri.....	4,409,906	64,647	4,474,553
Indiana.....	3,935,083	531,371	4,466,454

The total value of the clay products made in the United States in 1901 was \$87,747,727, classified as follows:

Common brick.....	\$45,503,076
Front brick.....	4,709,737
Fire brick.....	9,870,421
Paving and vitrified brick.....	5,484,134
Sewer and drain tile.....	6,736,969
Crude clay and various manufactures.....	15,443,390

Clay Iron-Stone, oxide of iron (hematite) mixed with clay or sand, an iron ore of importance in England. It is hard and red to brownish-black in color. The name is also given to the argillaceous carbonate of iron occurring in nodules and beds in the coal regions of Pennsylvania, Ohio, and other States. When intimately mixed with coal, as in Scotland ("black-band iron-stone"), it is of importance as an iron ore (q.v.).

Clay-working Machinery. They constitute a great variety of machines designed for the proper preparation of clay which is subsequently used in the manufacture of bricks, tiles, pipes, etc., in the production of which the importance of this proper preparation of the clay can scarcely be overestimated. A great many of the subsequent difficulties, imperfections, and the amount of waste product in the manufacture of articles from clay may be traced directly to negligence in the proper treatment of the clay prior to its use in the molding machines. Among the principal machines of this class are the

Fig. 1, bevel-gear clay granulator and feeder, designed to work on a horizontal plane, and reduce lumpy clay into a mass of uniform texture before it is fed into the molding machines. It consists of a tub the sides of which may be made either flared or vertical, within which is rotated a main shaft nine inches in diameter, carrying 40 forged-steel knives. The driving and counter pinions are of steel, and all gears are journaled in an iron frame bolted to 12 x 12-inch hardwood timbers. The friction-clutch pulley is 40 inches in diameter, with

CLAY-WORKING MACHINERY

12-inch face, and the length of frame 19 feet, with a width of 5 feet 6 inches. Height from bottom frame to top of flared hopper, 3 feet. It weighs about 14,000 pounds, and granulates clay that may be dumped into it by the car-

FIG. 1.—Bevel-gear Clay Granulator and Feeder.

load, and in lumps as dug out by a steam-shovel. The object of the double shaft construction may be illustrated in the case of bricks made from a mixture of two kinds of clay—one very strong and the other very weak. The strong clay is dumped by the cartload into one tub, and the weak clay into the other, without regard to proportion. The knives and bars of the pug-shaft are each given a relative set representing the proportions desired, and as both shafts make the same number of revolutions per minute, the mill discharges into a common receptacle a granulated mass of material made up of each kind of clay in exact proportions. The knives being made of carefully tempered steel of great strength, will shave the large lumps of clay, clean it from stones, and feed uniformly any desired quantity. These machines are frequently used to feed into disintegrators, or some form of crushing rolls used for fine grinding, affording the advantage of having such crushers fed uniformly instead of being alternately overloaded or empty.

FIG. 2.—Mixing and Pugging Machine.

Fig. 2 is an example of the mixing and pugging machines, designed to mix two or more ingredients, or dry and wet materials, and to deliver a thoroughly mixed, well-pugged mass, in uniform quantity. It is especially valuable as a mixer of "grog" or ground calcined material with plastic clay, ground shale with tough clays, and other finely ground or granular material with plastic binders. This machine combines the features of the double shaft mill for mixing different materials, with the long inclosed case containing a single shaft only, for pugging stiff plastic clays. The main pug-shaft is of hammered steel, seven inches in diameter, and is fitted with steel-faced tempering knives, which may be adjusted to any desired position. Situated immediately over the shaft and extending to about one half the length of the pug chamber, is an independent mixing

shaft equipped with four rows of steel bars so placed that they just clear the tempering knives of the main shaft, the distance between the two shafts only slightly exceeding the length of the tempering knives. The action of these shafts, together with the close passage of the knives and bars, produces a thorough mixture of the different components of the material worked before it reaches that part of the chamber in which the pugging process is completed. The rear portion of the pug chamber being open at the top, gives an ample opportunity for the examination of the material, and the regulation of the water supply while the mixed and moistened mass of material is slowly and continuously fed into the enclosed portion of the pug chamber, where it is thoroughly pugged under pressure and discharged by means of a short, double-bitted, hard auger through a circular orifice, the size of which may be changed at will. The entire machine is about 19 feet in length, is strongly built, and mounted on channel-iron framing, with driving-gear journaled in one solid casting. The driving-belt is fitted with an outer bearing and with a friction-clutch pulley 48 inches diameter by 12-inch face.

FIG. 3.—All-iron single-shaft pug-mill with direct connected engine.

Fig. 3 shows an all-iron single-shaft pug-mill of the open-top horizontal type. It may be used, however, with the front end elevated, and is designed for making concrete and cement mixtures, or for making stiff clay puddle for reservoir beds. It may be equipped with spur-gears, is about 10 feet long, of very simple construction, and operates a single shaft carrying 40 forged-steel knives so secured that they may be set at any desired angle with the shaft. Puddle-making machines used in the preparation of concrete are of a similar character. They are especially adapted for mixing clay and stones and working them into a stiff puddle suitable for lining reservoir beds and other similar work. They may be arranged to be driven by belting, or for direct connection with an engine or electric motor.

Another important class of clay-working machines are the grinders, stone extractors, and the crushers.

Fig. 4 shows an all-iron and steel dry-pan, which is probably the most useful machine for grinding shale, such as are generally used in the manufacture of street-paving bricks, and in fact all of the ordinary brick clays when dried sufficiently to pass through a screen. The machine consists essentially of a pair of heavy iron rollers which rotate vertically and grind against iron sectional plates rotating horizontally. In the machine illustrated, the grinding rollers are 48 inches in diameter by 12-inch face, their combined weight, together with that of their shafts and boxes, being about 13,000

CLAY-WORKING MACHINERY

pounds. The sectional grinding plates are 3 inches thick, and are made with babbitted pockets attached to their under sides to insure their setting perfectly true and level. The plows or scrapers run close to the screens, and are so constructed that the portions subject to wear

FIG. 4.—Dry-Pan.

are easily and cheaply renewable. The inner side of the heavy iron curb has an angle-iron rim riveted to its upper edge to strengthen it, and to prevent the overflow of fine material. The capacity of this machine depends entirely upon the nature of the material ground, the amount of moisture contained in that material, and the size and pattern of the screen openings. The total weight of the machine is about 40,000 pounds, and it is fitted with a friction-clutch pulley 48 x 12 inches, on a 3-inch driving shaft.

FIG. 5.—Wet-Pan.

Fig. 5 shows a type of wet-pan especially valuable for grinding stony or pebbly clays so as to reduce the stones and amalgamate them with the clay. It is a thorough pugger and mixer for all kinds of clay. The mullers or grinding rollers have hard-chilled faces, are 46 inches in diameter, with 8-inch faces, and their centres are bulged heavily to give additional weight.

Fig. 6 shows a form of the clay disintegrators employed to work plastic clays in which flint

stone and gravel are imbedded. It consists of two rollers, one of which is driven at a high rate of speed—700 revolutions per minute—while the other is run at a rate varying from 50 to 100 revolutions per minute and acts merely as a feed roll. The fast-running roll is equipped with one or more continuous steel bars which project slightly beyond its face and act with a chipping action against lumps of strong, tough

FIG. 6.—Clay Disintegrator.

clays, and also throw out the larger stones against which they come in contact, while the pebbles are crushed and ground up with the clay. It has a broad, heavy iron bedplate. The parting strain between the two cylinders is borne by two heavy through-bolts which pass from one journal box to the other, and also enables the regulating of the distance between the centres so as to prepare clay of any desired degree of fineness.

FIG. 7.—Four-roll Combination Crusher.

Fig. 7 shows a four-roll combination crusher. Compound clay-crushing rolls are made in a great variety of patterns. The machine illustrated combines the features of a disintegrator and a smooth-roll crusher, and is especially useful for the working of clays that require an extra amount of preparation, or those having a limited amount of small stones, or of a lumpy nature. The upper section is made of two rolls running at variable speed. Similar to that of the disintegrator, the small or high-speed roll has projecting lugs of hardened steel, or it may be studded with steel bolts set staggered so as to form corrugations. The large roll operates at a slower speed. The effect of the combined motions of these rolls is to shred or separate the material and prepare it for the further action of the lower section, which is composed of two large chilled-face rolls also run at differ-

CLAY MARL — CLAYPOLE

ential speed. The lower rolls may be adjusted close to each other and thus act as fine grinders of the material partially prepared by the upper set.

Of the various machines and appliances employed in the working of clay, other than those already described, Fig. 8 shows a type of belt-

FIG. 8.—Belt-Conveyor.

conveyor; Fig. 9 a bucket elevator, and Fig. 10 a steam-shovel. When it is necessary to dig a quantity of clay sufficient for an output of 50,000 bricks per day, the steam-shovel can be used profitably; while for an output of 100,000

FIG. 9.—Bucket-Elevator.

or more bricks per day, the cost per 1,000, to dig and haul clay with the aid of the steam-shovel and suitable dump cars, is fully one half less than to dig by hand and haul with horses and carts. These machines can be practically

FIG. 10.—Steam Shovel.

and profitably used to work clay-banks ranging from 5 to 25 feet, depth of face, and will dig a width ranging from 35 to 38 feet. They have capacities ranging from 300 to 500 yards per day.

One of the latest inventions in clay-working machines is the hollow-ware machine shown in

Fig. 11. It is particularly adapted for the manufacture of all kinds of hollow-ware, fire-proofing, and a great variety of other shapes from plastic material. It is built with a telescoping or adjustable front by which the relative dis-

FIG. 11.—Hollow-ware Machine.

tance between the forming-die and the auger can be changed at will, thus adapting it to any pattern of die, or any kind of material. See BRICK; BRICK-MAKING MACHINERY; PIPES.

Clayberg, John Bertrand, American lawyer: b. in Cuba, Ill., 8 Oct. 1853. He received his early education in the schools of Cuba, and later entered the law department of the University of Michigan, from which he was graduated in 1875. He was admitted to the bar in 1875 and was employed by Judge Thomas M. Cooley in works on 'Taxations' and 'Torts.' He moved to Montana in 1884, and in 1889 was elected attorney-general of the State. Since 1891 he has been a non-resident lecturer on mining law in the University of Michigan, and has been a large contributor to the law journals of the Northwest. On 7 March 1903 he was appointed chief commissioner of the supreme court of Montana.

Clayden, Peter William, English Unitarian clergyman and author: b. Wallingford, Eng., 20 Oct. 1827; d. London 19 Feb. 1902. After being pastor of Unitarian congregations at Boston, Lincolnshire, 1855-9; Rochdale 1860; and Nottingham 1860-8, he became one of the staff of the London *Daily News*, on which he remained till 1896, in the meantime establishing the *Reading Observer* in 1873, remaining its proprietor for six years. He published: 'The Religious Value of the Doctrine of Continuity' (1866); 'Scientific Men and Religious Teachers' (1874); 'England Under Beaconsfield' (1880); 'Samuel Sharpe, Egyptologist' (1883); 'The Early Life of Samuel Rogers' (1887); 'Rogers and His Contemporaries' (1889); 'England Under the Coalition' (1892).

Clayite, a mineral from Peru, occurring crystallized and as a crust on quartz, a sulpharsenite of copper with sulph-antimonites of copper and lead. Has a hardness of 2.5.

Clay'more, formerly the large two-handed, double-edged sword of the Scotch Highlanders; now the name is given to a basket-hilted, double-edged broadsword.

Claypole, Edward Waller, American geologist: b. England 1 June 1835; d. Long Beach, Cal., 17 Aug. 1901. He was graduated at the University of London in 1862; was professor of geology and biology in the California Polytech-

CLAYPOLE — CLAYTON-BULWER TREATY

nic Institute in Pasadena, and for a time was on the geological survey of Pennsylvania. He was the author of numerous reports on the geology of Perry County, Pa., and of papers and essays on geological and biological subjects. He was a member of a number of geological societies in London, Edinburgh, and America, and of the American Association for the Advancement of Sciences.

Claypole, Noah, the sneaking, cowardly apprentice in Dickens' 'Oliver Twist,' who robs his master's till, joins Fagin in London, and by turning state's evidence insures the conviction of Bill Sykes for the murder of Nancy.

Clayton, Augustine Smith, American lawyer: b. Fredericksburg, Va., 27 Nov. 1783; d. Athens, Ga., 21 June 1839. He graduated at the University of Georgia 1804; was admitted to the bar, and practised with eminent success. He served in the State legislature; was judge of the superior court 1819-25 and 1828-31; and a representative in Congress from 1831 to 1835. In Congress he opposed the tariff and United States bank measures. He is said to be the author of the political pamphlet 'Crockett's Life of Van Buren.' He compiled 'The Laws of Georgia, 1800-10' (1812).

Clayton, Estelle Evesson, American actress and dramatist: b. New York State; married to Charles W. Durant in 1888. She began her stage career in 1878, playing Agnes Wickfield in 'Wilkins Micawber.' She has played Nora in 'Esmeralda,' and Constance in 'Young Mrs. Winthrop' with conspicuous success. In 1885 she wrote and produced at Madison Square Theatre, New York, 'Tric-o-Trin,' and in 1888 dramatized Amelie Rives' famous novel, 'The Quick or the Dead,' and played it with great success throughout the southern States. She wrote the text for the operas 'Paulita' (1890), and 'The Viking' (1895), and a comedy, 'A Puritan Romance' (1897), which was produced in London with success.

Clayton, John, American botanist: b. Fulham, England, 1686; d. Virginia 15 Dec. 1773. In 1705 his family came to Virginia, where his father became attorney-general, and took up their residence near Williamsburg. He entered the office of Peter Beverly, clerk of Gloucester County, succeeded him, and held the office for 51 years. He was an enthusiastic botanist, and throughout his long life delighted in exploring and describing the plants of his region. Gronovius and Linnæus published an account of specimens of Virginia flora sent them by Clayton (Leyden 1739-43), and Gronovius' son named a genus of herbaceous plants *Claytonia* in his honor. Clayton's studies of Virginia natural history were published in the 'Philosophical Transactions' of the London Royal Society, and his descriptions of some new species of plants are to be found in the third volume of Peter Force's 'Tracts.' Two folio volumes of manuscript, almost ready for the press, were burned with the records of New Kent County during the Revolutionary War.

Clayton, John Middleton, American statesman: b. Sussex County, Del., 24 July 1796; d. Dover, Del., 9 Nov. 1856. He was elected United States senator in 1829, and held office till the close of 1836, when he resigned. He was then appointed chief justice of his native State, and continued on the bench for nearly

three years. In 1845 he was again sent to the Senate, and remained there till March 1849, when he became secretary of state under Gen. Taylor. In this capacity he negotiated the Clayton-Bulwer Treaty (q.v.), adjusting the respective claims of Great Britain and this country in Central America. Clayton resigned office on Gen. Taylor's death in 1850, but remained in the Senate till his death. He was a zealous Whig, an able debater, and a statesman of high talent and upright character.

Clayton, Powell, American soldier and diplomatist: b. Bethel, Pa., 7 Aug. 1833. He received an academic education in Bristol, Pa.; later studied civil engineering, and went to Leavenworth, Kan., as engineer and surveyor in 1859. When the Civil War broke out he entered the Union army as captain of the 1st Kansas Infantry. In May 1863 he led a successful expedition against a band of guerrillas on the White River, Ark., and also to destroy Confederate stores; and in 1864 was promoted brigadier-general of volunteers. At the close of the war he settled in Arkansas; was elected governor in 1868; United States senator in 1871-7; appointed minister to Mexico in 1897, and raised to rank of ambassador in 1899.

Clayton-Bulwer Treaty, a treaty existing from 1850 to 1901 between the United States and Great Britain. It was an agreement designed to prevent either country from securing exclusive rights over any interoceanic canal across Nicaragua (See ISTHMIAN CANALS, AMERICAN). Its origin represented a supposed mutual withdrawal from positions rapidly generating war. Its lifetime has two opposite phases: (1) That in which the United States, wishing no such exclusive rights, held it and appealed to it as a bulwark against British encroachments, opposing only an injurious interpretation of it; (2) that in which the same power did wish such privileges, endeavored first to gain British assent to its abrogation, and after long and fruitless struggles and repeated threats of abrogating it without such assent, was only withheld from the abrogation by a compromise treaty which replaced the old. The three periods were as follows:

1. The English colony at Belize (now British Honduras), for a century or more had strengthened their position against the Spaniards by a vague protectorate over the Mosquito Indians, occupying the northeast coast of Nicaragua. They termed their chiefs "kings," and upheld their dominion over "Mosquitia," usually called the Mosquito Coast. In 1815 they crowned one of them at Belize and, when the Spaniards lost control of Central America in 1822, had him set up a claim to boundaries reaching down into Costa Rica, and so including the banks of the San Juan River, where the canal would run if built. In 1841 this sovereignty was enforced by raiding San Juan del Norte at the mouth of the river, and carrying off the commandant; in 1847 the "king" announced to Nicaragua that on the first of January next he should "reassume his lawful control" over the San Juan, and early in the year the English seized the town and renamed it Greytown. A new English treaty was then made with Nicaragua, recognizing this occupation. This roused great excitement in the United States, as equally a blow at the Monroe Doctrine and against American control of the

CLAYTON-BULWER TREATY

canal; and an over-zealous Nicaragua chargé of the fire-eating Polk administration drafted a treaty for United States fortification of the canal, and a guarantee of Nicaragua's sovereignty over all the territory she claimed. This, if we made its provisions active, meant war with England. The pacific Taylor administration then in power framed a milder treaty for a right of way merely, allowing Nicaragua to make similar ones with other nations. This still left Greytown as an apple of discord, and conflicted with the English treaty. Both England and America were on edge with suspicion: the former (whom events justified) that American expansion would end in a claim to entire control of the canal, which would prejudice British colonial interests; the United States, that the English recognition of a fictitious and swollen sovereignty by a tribe of savages over the Atlantic end of the canal foreshadowed the total exclusion of the United States. Each party in fact wanted only to bar the other's monopoly. John M. Clayton (q.v.), secretary of state, opened negotiations with the English minister, Sir Henry Bulwer (q.v.), in January 1850, for a joint control. Meantime Great Britain, to secure the Pacific end, sent an expedition to occupy an island in the Gulf of Fonseca (then supposed to be the natural western terminal); our then Nicaraguan representative, E. G. Squier (q.v.), obtained a temporary cession to us of Tigre Island, the nearest one to Nicaragua, to block this scheme, pending a formal treaty; shortly afterward the British expedition arrived, and seized Tigre "for debt." Clayton, in great fear lest the popular indignation should force his hand, pushed the treaty through without sufficient insistence on clear definition of the points at issue. It was signed 19 April, and passed the Senate, 42 to 11. Its provisions were that (1) neither power was to have exclusive control over the proposed canal; (2) neither was to fortify the canal or its vicinity; (3) neither was to occupy, fortify, colonize, or have dominion over any part of Central America, either directly or through any "alliance or protection, intimacy, connection, or influence" in or over it; (4) the two powers should mutually guard the safety and neutrality of the canal, and invite all other nations to do the same; (5) they should aid and protect any authorized and reasonably operated canal company; (6) the fifth article (to establish a general principle) should extend also to any other means of isthmic transit.

England did not formally withdraw her Mosquito protectorate, but with the neutralization of the canal it ceased to have any object, and was thought sure to drop. Before the ratifications were exchanged, however, Lord Palmerston wrote to Bulwer that the British government would interpret the treaty as not applying to Honduras "or its dependencies." This could include Mosquitia, and it was Clayton's duty to settle that point before proceeding; but in fear of having his statesmanlike plan wrecked, and confident of no practical evil resulting, he assumed that it referred only to the islands, did not press Bulwer for assent to this construction, concealed the three quoted words from the Senate and the attorney-general, and the ratifications were exchanged 4 July. Great Britain had won a distinct diplomatic victory; she had secured a pledge from the United

States not to occupy any position in Central America, while herself retaining the entire eastern coast of Nicaragua.

2. The ambiguous interpretation of the treaty satisfying neither power, Daniel Webster (q.v.), who succeeded Clayton in 1850, undertook negotiations with Bulwer to modify it; but what each side most desired was what the other would not grant — recognition or abandonment of the bogus Mosquito claim to the mouth of the river. In 1851, to clear up the meaning of the word "dependency," Great Britain occupied Greytown; proclaimed afresh the Mosquito protectorate; and in November one of her men-of-war fired on the American vessel Prometheus for refusing to pay port dues at Greytown. England disavowed this, but the question which Clayton had shirked must be settled. About this time the English had started a project to build a ship railroad across Honduras; and to hold the approaches, their government reoccupied (August 1852) a group of islands off the northern coast, called the Bay Islands, formerly part of Belize. American suspicion once more became hot; and the new Pierce Senate in December ordered an investigation into the way the treaty had been kept, called for the papers, and for the first time found how they had been tricked — not, however, by the English diplomat, but their own. In great wrath, they denounced the occupation of the islands and the Mosquito protectorate as an infraction at once of the treaty and the Monroe Doctrine, and Marcy, now secretary of state, instructed Buchanan, minister to England, to insist on the British evacuation of all English territory in Central America except Belize. Lord Clarendon replied that Belize was not a part of Central America as understood by the treaty; that the Bay Islands were a part of Belize; that the treaty did not refer to Mosquitia, but only prohibited further colonization; and that the Monroe Doctrine was no part of international law. Just then a quarrel between the Mosquito Indians and the American settlement south of Greytown led to a United States gunboat bombing and burning the latter. Then William Walker (q.v.), with the aid of a Nicaraguan faction, became for a time the master of the state, ostensibly in the interest of the United States, whose slaveholding government at last received a representative from his; and the British believed that this country intended to retain possession of Nicaragua. On the other hand, Costa Rican action against Nicaragua was laid to English incitement. Walker continued to make mischief till shot in 1860. Dallas, who succeeded Buchanan, drew up with Clarendon a treaty of 7 Oct 1856, which came to grief on the question of the Bay Islands. In 1857 Buchanan became President, and supported his secretary of state, Lewis Cass, in making a preferential canal treaty with Nicaragua; to which Great Britain objected as violating the Clayton-Bulwer Treaty, and it was not ratified. In the fall of that year, Buchanan announced his intention of proposing an entire abrogation of the treaty and arranging a new one on a satisfactory basis. Lord Napier, now British minister, proposed three alternatives: a mutual abandonment of the treaty and return to the *status quo ante*; submission of the question to arbitration; and the awaiting the issue of treaties pending between Great Britain and the

CLAYTON-BULWER TREATY

Central American states. The last was accepted, and the results were satisfactory enough to prevent further trouble for more than 20 years. The Bay Islands were retroceded to Honduras on condition of not parting with them to any other nation; the Mosquito protectorate was abandoned, and a reservation set up for the Indians by Nicaragua, which was to pay them \$5,000 a year or else the rights reverted to Great Britain; and Greytown became a free port under Nicaraguan sovereignty. The conditional clauses of the renunciation were not pleasing to the United States, and in fact the money was never paid, partly because Nicaragua expected the United States to back its refusal; but on the whole the settlement was accepted as a happy ending to the wrangle. Up to 1880, though the growing sentiment in favor of exclusive United States control of the canal sometimes fretted against the treaty, a host of treaties and other international actions were based upon its validity, and it was more than once appealed to when British acts (as the erection of Belize into the colony of "British Honduras" in 1862) were assumed to violate it.

3. The latent feeling in favor of exclusive control was stirred into active life by the French canal at Panama, and the fear that it would give that nation the military control of Central America. In March 1880 President Hayes sent a special message to Congress enunciating the policy of "an American canal under American control," expanded later into the claim that the banks of the Nicaragua Canal would be a continuation of the United States shoreline. As a result, Congress passed several resolutions recommending the abrogation of the Clayton-Bulwer Treaty. Garfield in his inaugural of 4 March 1881, spoke (though less strongly) in the same strain; the project of a joint European neutralization of the Panama Canal was arousing much American feeling. J. G. Blaine (q.v.), then secretary of state, opened the attempt at an outright repudiation of the treaty. In a circular to the European powers, 24 June 1881, he declared that the United States would in future allow no foreign interference in the control of any isthmian canal, whose neutrality we would ourselves guarantee; and that any European action toward sharing in such guaranty would be held equivalent to an alliance against the United States. Lord Granville, for Great Britain, replied briefly that this matter was already settled by the Clayton-Bulwer Treaty, and his government relied on its observance. Meantime and afterward, 19 and 29 Nov. 1881, Secretary Blaine sent two long arguments of his position to James Russell Lowell, then minister to England. He did not, however, allege that the treaty was null, or commit the country to an open repudiation of it, but complained of it as so contradictory of interpretation, and mutually vexatious, that it ought to be no longer binding under new circumstances. He also asserted that the joint control would be virtually controlled by England, from her superior naval strength. In fact, however, the treaty provided not for a joint control, but a joint refraining from control, and prevention of any other power gaining control. Lord Granville replied by two dispatches of 7 and 14 Jan. 1882, traversing the logical and historical arguments adduced. Garfield's murder led shortly to Blaine's retirement, and F. T. Frelinghuy-

sen's accession to his place. The outcome of further correspondence was, that England would not give up the treaty, and declared that the United States was estopped by its own acts from interfering with it, and that the Monroe Doctrine was a mere assertion of force, having no standing in international law, and had the same place in diplomatic argument as a list of the military or naval forces. Congress and the President (Arthur) were much dissatisfied with this result; and the latter proceeded to draw up a treaty with Nicaragua in flat defiance of the Clayton-Bulwer Treaty. It formed a perpetual alliance between the United States and Nicaragua, whose territorial integrity this country guaranteed; save that the United States was to build a canal and have exclusive control over it, and own in fee simple a strip on each side. The Senate shrunk from this direct repudiation, without stronger cause than yet existed, and refused, 32 to 23, to ratify the new treaty. Mr. Cleveland's accession put a stop to the agitation for many years, as he disapproved of the new movement, preferring a union of the nations in a common protection of what was for their common interest. So far from any attempt being made under his administrations to repudiate the treaty, on two important occasions it was appealed to in protest against acts of Great Britain. The first revival of the feeling of 1880-4 in practical form was in President McKinley's second annual message, December 1898, favoring a canal under American control; and few then doubted that it must be through Nicaragua. The acquisition of new territory and the increase of the navy led many who had been opposed to the movement to change their minds, and favor a canal through which the United States at all times could pass its war vessels, and from which it could exclude its enemies. Others continued to argue that if the country were not superior in naval force it could not maintain that privilege against its enemies, and if it were, could enforce it against them in any event, and that an exclusive control only made the canal the instant mark of our enemies. But the dominant feeling was strongly against the treaty; congressional resolutions declared it void; the press denounced it; and the sentiment was in favor of President Arthur's old scheme of acquiring a strip of land along the canal outright. The British feeling was by no means strong for the treaty, but it preferred a modification by decent diplomatic forms rather than a violent abrogation. To take the movement out of the hands of newspapers and demagogues, the American and British governments hastened to devise a new arrangement which should not throw all old principles to the winds, and a treaty was negotiated by Secretary John Hay on our side and Sir Julian Pauncefote on the other, known as the first Hay-Pauncefote Treaty, signed 5 Feb. 1900, and sent to the Senate. The majority were astonished and indignant, as the new treaty not only did not abolish the old, but proclaimed it in force and binding; adhered to its principles of neutralizing the canal, which were what the growing sentiment wished to reverse; and was in fact only the Clayton-Bulwer Treaty in new and tighter form, in all the points which had become most obnoxious. The "Davis Amendment," proposed in committee, practically nullified the neutrality feature, but neither it nor the main treaty had

CLAYTONIA — CLEARING-HOUSE

been acted upon when the Senate adjourned in June. The period for ratification was extended to 5 March 1901; but the platforms of both parties insisted on exclusive American control. The amendments added to it in the following session of Congress made it unacceptable to Great Britain, which refused to ratify it, and it expired by its own limitation. The two statesmen, however, drew up another, less satisfactory in some respects than the old, and which specifically abrogated the Clayton-Bulwer Treaty, but succeeded in saving its general principles of neutralization (see HAY-PAUNCEFOTE TREATY); and it was ratified 16 Dec. 1901. By the irony of fate, this question of the control of a Nicaragua canal, so burning for half a century, and menacing war more than once, seems to have been dealing with a contingency never to happen, as the entire subject-matter is apparently set aside in favor of the Panama canal.

Clayto'nia, a genus of plants of the purslane family (*Portulacaceæ*), so named in honor of the American botanist John Clayton (q.v.). It is among the earliest and most beautiful of the American wild-flowers, these two qualities giving it its common name of spring beauty. There are at least 25 species, most of them natives of North America. The plants grow in damp woods and wet places, and are found at all elevations up to 5,000 feet, in the region of Nova Scotia, south to the Gulf, and westward to the Pacific coast. *C. perfoliata*, Spanish lettuce, common from British Columbia to Mexico, is used as an anti-scorbutic in household medicine. *C. tuborasa*, a native of Siberia, supplies a root that is eaten by the natives.

Cleanthes, klē-än'thēz, Greek Stoic philosopher of the 3d century B.C. He was a native of Assus, in Lydia, but, visiting Athens, became a zealous disciple of Zeno. In order to attend on that master in the day, he was accustomed to labor by night. His mental and his bodily strength were immense, and despite all obstacles, he studied so successfully as to become Zeno's successor, 263 B.C. Of his writings only some fragments remain, among which is his noble 'Hymn to Zeus.'

Clear, Cape. See CAPE CLEAR.

Clear Lake, a body of water lying in a picturesque region in Lake County, Cal.; 110 miles north of San Francisco. It is 25 miles long, and from two to six miles wide.

Clearance of Vessels, the examination of them by the proper custom-house officers, and the giving of a certificate that the regulations have been duly complied with. Vessels are said to clear inward or outward according as they arrive or depart.

Clearchus, klē-är'kūs, Spartan general who commanded about 13,000 Greeks in the army of Cyrus the Younger when that Persian prince tried to wrest the throne of Persia from his brother, Artaxerxes II. When Cyrus was defeated at Cunaxa (401 B.C.), Clearchus and his chief officers were seized by treachery and put to death.

Clear'field, Pa., the county-seat of Clearfield County, on the Susquehanna River (west branch), and on the Pennsylvania R.R. It is situated in the west-central part of the State, and is surrounded by a rich agricultural region, underlying which are deposits of coal,

fire-clay, and limestone. Its manufactories include flour-mills, tanneries, foundries, and lumber mills. Pop. (1900) 5,081.

Clearing-house, an institution for balancing daily the mutual obligations of a number of banks in a single city, with the least possible transfer of actual cash from "debtor" to "creditor" banks. At a central office the various accounts are canceled against each other on the blanks of the clearing-house, which is thus made the one debtor and creditor of all; and each settles the day's transactions by giving or receiving in a single payment the balance due. Some clearing-houses do not even require cash in the settlement: in London it is made by transfers on the banks' accounts with the Bank of England (which is not a member of the clearing-house); in Philadelphia by United States or clearing-house gold certificates. In one shape or another, however, the final payments must represent gold; this has been so from the foundation of the system, and in every country and every State of the United States. The institution as developed has come to serve other purposes more valuable even than its primary ones; but those relieved a situation vexatious then, and quite incompatible with the volume and character of banking at present. Indeed, in America for many years the need of it was indefinitely greater than where and when it originated — Great Britain, in the latter part of the 18th century. Each bank sent a messenger daily to each of the others, to collect its checks on them and bills payable at them; and the amounts were paid by each to each in cash — Bank of England notes — which the messengers carried back through the streets. This was not only costly and wasteful of time, but involved danger of accident or robbery in transit. In Edinburgh, which claims priority in the clearing-house device, a still more curious reason is alleged: that rival banks accumulated a mass of each others' obligations and presented them in a lump, to break each other. (Something like this actually was done about 1850 by Overend, Gurney & Company to the Bank of England — accumulating a great deposit and withdrawing it all at once — not to bankrupt it, but to frighten it into rescinding a rule not to lend to brokers except at certain seasons.) Hence it was agreed to adjust their claims to date twice a week only. But the first historical appearance of the system is in London. About 1770 the clerks evolved the idea (perhaps from the custom among French merchants of making their bills payable at the annual fair of Lyons, where they mostly canceled each other) of economizing their time and labor by meeting daily in a room and exchanging obligations, settling only for the balance. This obviously enabled on an average one half of the clerks to dispense with their errands, and reduced the needful stock of real money. Many years later a great English bank reduced its reserve of daily cash from £150,000 to nearly nothing by admission to the clearing-house; and the ratio of balances in money to the total obligations in American clearing-houses has varied all the way from 20 per cent down to 3.9 per cent (in New York, where it has never risen to 7). In 1775 a special building in Lombard Street, London, was assigned to this department; at first it was merely a meeting-place of the clerks for ex-

CLEARING-HOUSE

change; but shortly the further step was taken of appointing paid clerks to receive and balance checks and bills. In 1858, on the suggestion of Sir John Lubbock, the system was extended to include the country banks of Great Britain, by means of their London correspondents.

The New York clearing-house was not established till 11 Oct. 1853. The conditions were so bad previous to this, that it is scarcely intelligible how they could have been endured so long. There were 52 banks, each sending messengers back and forth; there was no national currency, and balances had to be paid in gold coin; the labor of counting and carrying this was so onerous that actual transfers of cash were made but once a week, though the accounts were balanced on the pass-books and the bills exchanged daily; and the bags of coin were so heavy and precious that they were often transported in wagons guarded by militia. The average daily clearings for the first year of the New York establishment were \$19,104,594.94, which would have weighed over 70,000 pounds avoirdupois, or 35 tons; in other words, a week's settlements would have demanded 422,486 pounds of coin, or 211 tons. The actual payments in gold were \$988,078.06, a little over 5 per cent. If all the average daily clearings of the United States in 1902 (\$381,650,000) can be imagined paid in coin according to the practice prior to 1853, it would need 1,406,653 pounds, over 700 tons; or if settled weekly, 4,220 tons. Further, the formation of the clearing-house enabled the banks to close 2,500 regular ledger accounts, to be posted up daily. Since then the system has spread to every part of the Union, all the large cities and several minor ones having clearing-houses, and all the leading States having at least one; while the more sparsely settled ones, or those with slightly developed industrial systems, utilize those in the nearest centre. But nearly two thirds of all the clearings in the United States are done in New York, that being the most convenient settling-place of cities with cities. In 1905 the total clearings of the United States were \$140,501,841,957, of which \$91,879,318,369 was in New York, a daily average of \$302,234,600. The balances settled in money were \$3,953,875,975, or 4.33 per cent. The next highest clearings, in order of volume, were in Chicago, Boston, Philadelphia, St. Louis, San Francisco, Baltimore, and Kansas City, Mo., each over \$1,000,000,000 except the last, which was just below it. In 1902 the New York clearing-house had 60 members, besides the assistant treasurer of the United States; and 79 banks and trust companies in the city or vicinity not members used its members as agents.

The methods in different countries and centres are not exactly alike; but the differences in detail are matters of interest to bankers rather than to the public. It is interesting, however, to know that an English expert pronounced the American (New York) system the best. In brief, it is as follows: each bank, before the day's work begins, must have prepared and ready to hand in—first, its checks for collection, made up in as many packages in envelopes as there are bank members of the clearing-house; second, a schedule of its amount due from each; third, a debit ticket to be given to each; fourth, a schedule of its aggregate claim on all the members together for the day, which

goes to the manager or the proof clerk. Each sends two clerks to the clearing-house, a delivery and a settling clerk. The latter sit at desks in rows, the former in front of them, and they assemble at about 9.50. At 9.58 a bell is struck, and any clerk not in place is fined \$2. At 10 it strikes again, and each delivery clerk begins handing his envelopes of checks to the settling clerks in succession as he passes along, at the same time dropping the corresponding debit ticket into a slit in the desk. This takes about 10 minutes; and the proof clerk at his desk enters the claims of each bank against the clearing-house on a "proof sheet," which must show a total the same as that of all the debit tickets put into the desk slits. Next, the settling clerks set down the sums on these tickets, foot them, and pass the total to the proof clerk, who arranges them on his proof sheet with each bank's debit opposite its credit; the difference being the sum due to or from the clearing-house in each case. This takes about half an hour. If accurately computed, the debit and credit columns must foot alike in both cases, as to bank claims and as to clearing-house claims. The manager reads off the balances due, and the settling clerks write them down. At 10.45 the work must be completed, and if errors in the footings prevent the proof being correct, the culprit is fined, with the fines doubled after 11.15 and quadrupled after noon. The balances are paid with gold coin, gold certificates (either of the United States treasury or of the clearing-house against gold in its vaults), or legal-tender notes. In Boston balances are borrowed and lent by members at call, being transferred by a written order on the manager; more than half of them are thus employed, the clearing-house rate of interest being a regular stock quotation. If a bank denies liability on any check presented to it by another member, the clearing-house takes no cognizance of the denial, that being a matter between the banks, to be settled outside. But the clearing-house determines the class of claims to be accepted, and different clearing-houses have different rules.

The strength and the comity of these associations, however, have given them both the power and the disposition to accomplish ends much more momentous than saving money and time in doing business. The power of disciplining their members and deciding on their qualifications is inherent: a majority of the members can expel a member, the Standing Committee can suspend without notice, and the moral power exercised is very great. A fraudulent return to the United States internal revenue commissioner caused the expulsion of one bank; and a watchful lookout is kept on the financial condition of all. The New York clearing-house requires a weekly, the Philadelphia a daily, report on their standing. There is usually an arbitration committee to settle disputes between members. But far more important is the financial strength given by the union of the banks, when they are willing to act together, in checking or preventing "runs" and tiding over panics. That a run on one bank may precipitate runs on others, and in the mad fright thus started pull down a series of perfectly sound banks, is not more obvious now than ever; but for many years there was not sufficient unity of purpose, or confidence in the strength of the others, to enable the stronger or the unimpaired to help the others; and still

CLEARING-NUT — CLEAVELAND

more, it was not seen how this could be done and the others be secured for their advances. Of late years, however, the clearing-houses have acted in this matter with signal success, by means of clearing-house loan certificates. The method is to allow a member bank to turn in its bills receivable or other securities approved by the Loan Committee, with its own note for sums loaned, and be granted in exchange certificates for a large portion of the face value, which shall be accepted as cash in paying clearing-house balances. These bear the highest legal rate of interest, 6 per cent, to operate as a restraint on borrowing more money or retaining it longer than is absolutely needed; and they can be used for no other purpose. The reserves of the member banks are thus made a common treasury; and not only is all the cash at the service of whoever needs it most, but the fact that this is known breaks nine runs out of ten, because people do not wish to take out their money, but only to know that it is safe. The last panic in the United States in which there was a general suspension of the banks was in 1857; and the five panics since then have been prevented from resulting in this largely by the use of these loan certificates; of which in the last panic, that of 1893, over \$40,000,000 were issued. A further use of this combined credit is to aid government action in critical places. The Union would have been repeatedly in most intense embarrassments to maintain its credit but for the banks of the New York clearing-house, which floated its loans and advanced money, and probably prevented a collapse for a time of apparent financial resource.

The clearing-house system is also applied to other business than banking. In England there is a general railway clearing-house, which pools traffic facilities, and the shares of each of the railway companies in through business; has weekly reports of the passenger tickets taken up, and the weight, destination, and payment of through freight; and arbitrates between companies on claims for damages or disputes over liability. In London also there is a stock exchange clearing-house.

Consult: Cannon, 'Clearing-Houses' (1900); White, 'Money and Banking' (1902).

WILLIAM SHERER,
Manager New York Clearing-House.

Clearing-nut, a small tree (*Strychnos potatorum*) of the same genus as the *nux vomica*, the seeds of which are used in India for settling or clearing muddy water. The seeds are rubbed upon the inside of the water-vessel, and within a few minutes after the water has been introduced it becomes clear, the sediment and non-soluble ingredients having sunk to the bottom. The wood is very hard and heavy, and is used for cabinet-making and house-building.

Clearstory. See CLERESTORY.

Clearwing, a small moth with transparent wings, the caterpillars of which are the borers that destroy peach-trees and fruit-bushes. Although common in America they are mostly importations from Europe or Asia.

Cleary, James Vincent, Canadian clergyman: b. Waterford, Ireland, 18 Sept. 1828. He was educated at Royal College, Maynooth, and ordained to the Roman Catholic priesthood in 1851. He became president of St. John's Col-

lege, Waterford, in 1873, and in 1880 was appointed bishop of Kingston, Canada, the see being made an archbishopric in 1889. In 1896 he reopened the Theological Seminary of Regiopolis College in Kingston.

Cleavage, in mineralogy and geology, the mode in which any body may most readily be, or naturally tends to be, split up into fragments. The regular structure of most crystallized bodies becomes manifest as soon as they are broken. Each fragment presents the form of a small polyhedron, and the very dust appears under the microscope an assemblage of minute solids, regularly terminated. In this process common salt and galena break up into small cubes, fluor-spar and the diamond into octahedrons, sulphate of barytes and the topaz into rhomboidal prisms, calcite and other related mineral carbonates into rhombohedrons, etc. The directions in which all those bodies thus break up are called their planes of cleavage. It must not be supposed, however, that all inorganic crystallized substances possess this property. Several of them break up only into irregular fragments, as the rock-crystal, the garnet, the emerald, etc. In others the cleavage is only in two directions, and sometimes only in one, and consequently produces no regular solid. Cleavage often indicates the different bodies which belong to the same system of crystallization, or distinguishes between those which belong to different systems, even when their external forms happen from any cause to be disguised or destroyed. The term is employed by geologists in a somewhat different sense, and applied to non-crystallized bodies, as clay-slate. In this sense it means the tendency of rocks to split along planes which either coincide with the original plane of stratification or may cross it at any angle up to a right angle. This tendency is the consequence of the readjustment (by pressure and heat) of the components of rocks. See PHYSICAL CRYSTALLOGRAPHY: MINERALOGY.

Cleaveland, klēv'land, **Moses**, American pioneer: b. Canterbury, Conn., 29 Jan 1754; d. there 16 Nov. 1806. He was graduated at Yale in 1777, and began the practice of law in his home town, being several times elected to the legislature, and in 1796 commissioned a brigadier-general of militia. He was a leading shareholder in the Connecticut Land Company which had bought for \$1,200,000 the land in northeastern Ohio reserved to Connecticut by Congress, and subsequently known as the Western Reserve. In 1796 Cleaveland went out with a party of 50 to survey the tract and arrange for its settlement by white emigrants. After successfully negotiating with the Indians who claimed certain rights to the region, the party arrived at the present site of Cleveland, 22 July 1796. Cleaveland immediately chose it as a place for his settlement, surveyed it into town lots, and the members of the party named it Cleaveland in his honor. In 1830, when the *Cleveland Advertiser* was founded, the headline was found too long for the form, the editor therefore dropped the letter "a" in the first syllable of the city's name, and the new spelling of Cleveland was soon generally adopted.

Cleaveland, Parker, American mineralogist: b. Rowley, Mass., 15 Jan. 1780; d. Brunswick, Me., 15 Oct. 1858. He graduated at Harvard 1799, and was appointed tutor there 1803.

CLEAVERS — CLEFT PALATE

In 1805 he was chosen first professor of mathematics and natural philosophy at Bowdoin College. Applying himself with energy to the new sciences of chemistry and mineralogy, his studies resulted in a treatise on 'Mineralogy and Geology' (1816; 2d ed. 1822; 3d ed. 1856), which brought him the offer of the chair of mineralogy in Harvard, which he declined, as he likewise did the presidency of Bowdoin in 1839. He stood first in his subject in this country, was a popular and lucid lecturer, an enthusiastic and inspiring teacher. When the medical school was founded at Bowdoin in 1820 he was made its dean and librarian.

Cleavers, one of the 70 common names applied to certain species of goose-grass (q.v.), of the madder family, occurring throughout the whole United States; troublesome weeds, probably naturalized from Europe. Other names by which they are known are catchweed, beggarlice, burhead, clover-grass, cling-rascal, scratch-grass, wild hedge-burs, stick-a-back or stickle-back, gosling-grass, gosling-weed, turkey-grass, pigtail, grip or grip-grass, loveman, and sweet-hearts. They are as common in Europe as in America, and seem to be useless except in Sweden, where for many years their prickly stems have been used as strainers for milk. Cleavers was formerly of repute in household medicine as a diuretic, but is now so used only in the most remote settlements.

Cle'burne, Patrick Ronayne, American soldier: b. Cork County, Ireland, 17 March 1828; d. Franklin, Tenn., 30 Nov. 1864. While a student at Trinity College, Dublin, he ran away and enlisted in the English army, in which he served for three years. He came to America, settled in Helena, Ark., studied law, and practised successfully until the Civil War. Joining the Confederate army as a private, he rose rapidly to a brigadier-generalship, commanded a brigade at Shiloh, was wounded at Perryville, and commissioned major-general, December 1862. He distinguished himself greatly in many fierce engagements, notably at Murfreesboro, Chickamauga, Ringgold Gap, and Missionary Ridge, receiving the thanks of the Confederate Congress. He was killed at the battle of Franklin, after carrying two lines of Union works, and shortly after saying to Gen. Hood: "I have more hope in the final success of our cause than at any time since the first gun was fired." He was a soldier of quick perception and strong character, and early and boldly advocated freeing the slaves, and the enlistment of the young and able-bodied negroes in the Confederate service. He was called the "Stonewall of the West," and instituted the Order of the Southern Cross.

Cle'burne, Texas, the county-seat of Johnson County, on the Gulf, C. & S. F. R.R., whose division offices and shops are located in the town. It is a distributing centre for a large agricultural region, and has flour-mills, machine-shops, and cotton-gins. Pop. (1900) 7,493, being more than double that of 1890, when it had a population of 3,278.

Cleckheaton, klĕk'hĕ'-tūn, England, a town in the county of York, West Riding, situated on a declivity in the Spen Valley, 10 miles west of Leeds. It is well built, lighted with gas, and has a technical institution, handsome premises belonging to the co-operative association, a fine town-hall, and three large and

beautiful churches. The industries include the worsted and machine-card trades, machine-making, engineering works, etc., and coal is mined in the neighborhood. Pop. (1901) 12,523.

Cleef, klāf. 1. **Joost (yoost-) VAN**, called Zotte (crazy) Cleef: b. Antwerp 1480; d. 1529. He was one of the most celebrated painters of his time, and in regard to beauty of coloring may challenge comparison with the most distinguished Italian masters. His excessive vanity and eccentricity caused him to be described as "mad." 2. **JAN (yān) VAN**, a painter: b. Venloo, Guelderland, 1646; d. Ghent 1716. He was a pupil of De Cræyer, and belongs to the Flemish school, of which he is one of the most eminent masters. His works, which resemble those of Poussin, are particularly remarkable for beauty of design and coloring. The churches of Ghent are adorned with many of his paintings, in which the heads of children and the countenances of women are very beautiful.

Cleeve, Lucas, English author; daughter of Sir Henry Wolff, and wife of Col. Howard Kingscote. She has traveled widely and has published: 'Tales of the Sun'; 'English Baby in India'; 'Life of Eugenie Berni'; 'In the Ricefields'; 'Woman Who Wouldn't' (1895); 'Lazarus'; 'Epicures' (1896); 'Water Finder'; 'The Monks of the Holy Tear' (1898); 'Plato's Hand-Maiden'; 'The Real Christian' (1901); 'Blue Lilies' (1902); 'Anglo-Americans' (1903).

Clef (Fr. for key), a character placed at the beginning of a staff to show the elevation of that particular staff in the general claviary or system, and to determine the names of the notes according to their positions on the staff. There are three Clefs; the G Clef, generally known as the treble Clef, which is placed on the second line of the treble staff; the C Clef, which is used either as the alto, tenor, or (rarely), soprano Clef, according to its posi-

tion on the third, fourth, or first line of the staff; and the F Clef, which is either base or baritone (rare) Clef, according to its position on the fourth or third line of the staff.

Cleft Palate, a fissure of greater or less extent existing in the roof of the mouth, extending in some instances through the jaw, the hard and the soft palate, even to the end of the uvula. Both congenital and acquired forms of cleft palate are known, but the congenital variety preponderates. It seems to be a family trait, and is much more common in Hebrews than in other peoples. Cleft palate is due to a lack of union of the intermaxillary and the supramaxillary bones. These normally join to make the bony roof of the mouth, but they sometimes fail to unite on either side of the middle line. If such failure to unite occurs on one side only, unilateral cleft palate and hare-lip results; if the developmental failure occurs on both sides bilateral cleft palate and hare-lip are produced. Very often there is only a slight depression on the edge of

CLEISHBOTHAM — CLEMENS

the lip, showing that the soft parts have not united as they should. This constitutes the simplest form of hare-lip and is not associated with cleft palate. In cases of severe cleft palate food regurgitates through the nose, and swallowing is impossible. In these cases, children are apt to die of inanition unless surgical procedures are used to repair the defect. Modern surgery has evolved a number of plastic operations with a view to obviate these congenital mal-developments, and treatment is very satisfactory. Consult 'American Text Book of Surgery' (Phila., 1903).

Cleishbotham, klēsh'bōth-am, **Jedediah**, a character in Scott's 'Tales of My Landlord,' who is represented to have collected the stories, of which Peter Pattieson is the imaginary writer.

Cleisthenes, klīs'thē-nēz, or **Clisthenes**, an Athenian politician who flourished about 500 B.C. He was the grandson of Cleisthenes of Sicyon, and the son of Megacles, and at the end of the rule of the Pisistratidæ (510 B.C.) was a leader of their enemies. When, with the assistance of the Delphian oracle and the Spartans, Hippias was banished from Athens, Cleisthenes, in order to secure his ascendancy over his rival Isagoras, chose to defend the cause of the people and succeeded in introducing some important changes in the ancient constitution of Athens; among others, the division of Attica into 10 instead of 4 tribes, each consisting of several *demi*, under demarchs; the increase of the number of the senators from 400 to 500, 50 of each tribe; and, as some say, the law of ostracism (q.v.), so remarkable in the history of that state. Cleisthenes, being suspected of the desire of tyrannical power, was himself banished, but afterward returned and triumphed over his enemies.

Clélie, klā-lē, a romance in 10 volumes by Mademoiselle de Scudéry, published in 1656. The subject is the siege of Rome after the expulsion of Tarquin the Proud, and the heroine is the young Roman girl who was a hostage of Porsena, and swam across the Tiber to escape from him. The manners and language assigned the Roman characters in the romance are utterly ridiculous and grotesque, but if we consider the Romans as disguises for the fashionable people of the 17th century, the pictures of life are true to nature.

Clemanges, **Mathieu Nicolas**, mā-tè-è nīk-ō-lā klā-mānzh, French theologian: b. Clemanges 1360; d. about 1430. He studied at Paris under Pierre d'Aille and Gerson. In 1391 he was professor of theology at the University of Paris, and in 1393 became rector there. In the hope of helping to heal the Papal Schism of the time, he accepted the position of private secretary to Benedict XIII., the anti-pope at Avignon; but when Benedict excommunicated the French king in 1407 Clemanges resigned his office and lived in voluntary exile with the Carthusian monks. Here he devoted himself to his studies and writing, endeavoring to correct abuses in the Church, and seeking to place the study of theology upon a wider basis: his writings had much influence on the deliberations of the Council of Constance. In 1425 he went back to the University of Paris, where he continued to lecture until his death. His works were collected and published by Lydius (1613).

Clematis, a genus of climbing vines or ascending herbs, of the crowfoot family (*Ranunculaceæ*). It numbers upward of 100 species, and is widely distributed throughout the temperate regions of the world. In the United States between 20 and 25 species are recognized. The best known is the virgin's-bower (*C. virginiana*), a vine that climbs over shrubs and along fences, from Nova Scotia to Georgia, and west to Kansas and Manitoba, its sprays of white flowers making a showy appearance from July through September. Other species are found west of the Mississippi River, extending to the Pacific coast, and south to the Gulf of Mexico. The only English species is called traveler's joy (*C. vitalba*). Rare foreign species are to be found in gardens, and culture and hybridizing have produced varieties that, escaping from gardens, add new species to the wild representatives of the genus.

Clémenceau, **Eugène**, è-zhān klā-mōñ-sō, French politician: b. Moulleron-en-Pareds 28 Sept. 1841. He studied medicine at Paris, and began the practice of his profession there. He became active in politics, joining the radical party, and in September 1870 was elected mayor of the 18th Arrondissement (Montmartre). Not being an extreme radical, he tried to bring about a reconciliation between the Commune and National Assembly, but failing in this, resigned his office as mayor. In 1871 he was a member of the Municipal Council; in 1876 he was elected to the Chamber of Deputies, and became the leader of the Radical Republicans. He was implicated in the Panama Canal scandals in 1892, and failed of re-election in 1893. He is editor of the radical journal 'La Justice.' In 1902 he was elected to the Senate, later became Minister of the Interior, and in 1906 Premier.

Clemens, **Jeremiah**, American politician: b. Huntsville, Ala., 28 Dec., 1814; d. there 21 May 1865. He graduated at the University of Alabama 1833, studied law at Transylvania University, Ky., and was admitted to the bar, 1834. He was United States attorney for the northern district of Alabama 1838; a member of the State legislature 1839-41, 1843-4; in 1842 raised a company of volunteer troops and went to Texas, having been appointed lieutenant-colonel, and subsequently held the same rank in the regular service. In 1848 he was governor of the civil and military department of purchase in Mexico, holding the position until the end of the war. He was a United States senator 1849-53, and held high rank as an able and eloquent debater. He took part in the Alabama secession convention, and though protesting against its action, subsequently yielded and held office under the Confederacy. In 1864 he advocated Lincoln's re-election. He wrote several novels which were popular in their day: 'Bernard Lyle' (1853); 'Mustang Gray' (1857); 'The Rivals: a Tale of the Times of Aaron Burr and Alexander Hamilton' (1859); 'Tobias Wilson' (1865), a story of the Confederacy. He left in manuscript an unfinished history of the war in northern Alabama.

Clemens, **Samuel Langhorne**, American humorist; more generally known by his pseudonym MARK TWAIN: b. Florida, Mo., 30 Nov. 1835. He received only a scanty school educa-

CLEMENT

tion, and in 1848 became apprentice to a printer, subsequently working at this trade in Philadelphia, New York, and elsewhere. He afterward learned the business of pilot on the Mississippi, but left this occupation to become secretary to his brother, who had been appointed secretary of Nevada Territory. He then tried his fortune at the Nevada mines. In 1862 he became local editor of a newspaper in Virginia City, but soon went to San Francisco, where he was for some time a reporter. After meeting with slight success in the Calaveras gold-diggings he returned to journalism in San Francisco. In 1866 he went to the Sandwich Islands, and on his return commenced his lecturing career. A trip to the Mediterranean, Egypt, and Palestine followed. He edited for a time a newspaper in Buffalo, and soon after married and settled in Hartford, Conn. He has traveled widely, and many of the scenes and incidents in his works are drawn from his journeys. He lost heavily through the failure of a publishing house which he founded in 1884.

Among his chief books are 'The Jumping Frog' (1867); 'The Innocents Abroad' (1869); 'Roughing It' (1873); 'The Gilded Age' (with Warner) (1873); 'Adventures of Tom Sawyer' (1876); 'A Tramp Abroad' (1880); 'Life on the Mississippi' (1883); 'Huckleberry Finn' (1885); 'A Yankee at the Court of King Arthur' (1889); 'The American Claimant' (1892); 'Tom Sawyer Abroad' (1894); 'Puddinhead Wilson' (1894); 'Joan of Arc' (1896); 'More Tramps Abroad' (1897); 'The Man That Corrupted Hadleyburg' (1900); 'Following the Equator' (1901).

Clemens, Will M., American author: b. Paris, O., 16 Jan. 1860. Educated at Buchtel college; entered journalism at 16 and for 20 years was engaged on the leading newspapers of New York and San Francisco. Among his published works are 'Depew Story Book' (1898); 'Life of Theo. Roosevelt' (1899); 'A Ken of Kipling' (1899); 'Life of Admiral Dewey' (1900); 'Hasty Pudding Poems' (1901); 'The Gilded Lady', a novel (1903).

Clem'ent I. (CLEMENS ROMANUS), Pope and martyr and one of the apostolic fathers. By Irenæus he is reckoned the third in the line of the bishops of Rome, and Origen holds him to be the same Clement who is named by the Apostle Paul in his letter to the Philippians, iv. 3. Tradition declares that he suffered martyrdom in the reign of Trajan and that his term of episcopate extended from 93 to 101; his day in the Roman calendar is 23 November. There is extant a letter from the Church of Rome to the Church of Corinth now generally accepted as having been written by this Clement: A bishop of Corinth, Dionysius, writing about 166 to a later Pope mentions Clemens Romanus as its writer.

Clement II., Pope. He was a native of Saxony and succeeded to the papal chair in 1046 on the abdication of Gregory VI. He was the earliest of the six German pontiffs.

Clement III., Pope: b. Rome; d. March 1191. He was elected pope in 1187, and preached the third crusade against the Saracens. There was an anti-pope with this title, who died in 1100.

Clement IV. (GUY FOULQUES, gē fook), Pope: b. St. Gilles, France; d. Viterbo 29 Nov. 1268. He became pope in 1265, succeeding Urban IV., and was the friend and protector of Roger Bacon.

Clement V. (BERTRAND D AGOUST, bër-trän dä-goost), Pope: b. Bordeaux 1264; d. Roquemaure, Languedoc, 20 April 1314. He became pope in 1305 and at the time of his election was archbishop of Bordeaux. He transferred his see from Rome to Avignon, and thus commenced "the Babylonish captivity" of the Church, which lasted about three quarters of a century. Another memorable event of his reign was his bull suppressing the order of the Knights Templar, 1311.

Clement VI. (PIERRE ROGER, pēär rō-zhā,) Pope: b. near Limoges, France, 1292; d. Ville-neuve d'Avignon December 1352. He succeeded Benedict XII. in 1342 and made an attempt to bring about a reunion of the Latin and Greek churches.

Clement VII. (GIULIO DE MEDICI, joo'-lē-ō dā mā'dē-chē), Pope: b. Florence about 1475; d. Rome September 1534. He succeeded Adrian VI. in 1523. Having by his joining in league with the French king incurred the hostility of the Emperor Charles V., the constable Bourbon, with the connivance of the emperor, invaded the papal territory with an army and sacked the holy city and held the Pope a prisoner for six months.

Clement VIII. (IPPOLITO ALDOBRANDINI, ip-pōl'ē-tō ä-l-dō-brän'dēn), Pope: b. Fano, Italy, 1536; d. 5 March 1605. Succeeded Innocent IX, 1592, reconciled Henry IV. to the Church and ordered the execution of Giordano Bruno. The anti-pope Clement VIII resigned, 1429 but did not close the the western schism.

Clement IX. (GIULIO ROSPIGLIOSI, joo-lē'ō rōs-pē-lē-ō'sē), Pope: b. Pistoia 1600; d. 9 Dec. 1669. He followed Alexander VII. to the papal chair in 1667. In his pontificate was arranged the "Pax Clementina," which for a time closed the Jansenist controversy.

Clement X. (EMILIO ALTIERI, ā-mēl'ē-o ä-l-tē-ā'rē), Pope: b. Rome 13 July 1590; d. 22 July 1676. At nearly 80 he succeeded Clement IX. and during his pontificate a notable controversy arose with Louis XIV. relating to the enjoyment, during vacancy, of episcopal revenues and the right of filling such vacancies.

Clement XI. (GIOVANNI FRANCESCO ALBANI, jō-vän'nē frän-chēs'kō ä-l-bā'nē), Pope: b. Pesaro, Italy, 22 July 1649; d. 19 March 1721. He was elected successor of Innocent III. in 1700, and in 1713 sent forth the celebrated bull 'Unigenitus' in condemnation of Quesnel's treatise on Grace and Predestination. The bull was opposed by the Jansenists, but approved by the Jesuits. The pretender in his efforts to obtain the English crown in 1715 was supported to some extent by Clement. See Lafiteau, 'Vie de Clément XI.' (1752).

Clement XII. (LORENZO CORSINI, lō-rënd'-zō kōr-sē'nē), Pope: b. Florence 1652; d. 6 Feb. 1740. He was the successor of Benedict XIII. in 1730, and was the first pontiff to oppose Freemasonry.

CLEMENT — CLEMENTINES

Clement XIII. (CARLO DELLA TORRE REZZONICO, kār'lō dēl-lā tōr'rā rēt-sō-nē'kō), Pope: b. Venice March 1693; d. February 1769. He succeeded Benedict XIV. in 1758. He published a bull in behalf of the Jesuits after their expulsion from France and Spain in 1767.

Clement XIV. (GIOVANNI VINCENZO ANTONIO GANGANELLI, jō-vān'nē vēn-chēnd'zō āntō'nē-o gān-gā-nē'l'lē), Pope: b. Saint Arcangelo, near Rimini, Italy, 31 Oct. 1705; d. 22 Sept. 1774. He was a Franciscan friar, a man of great piety and worth; the friend and confidant of Benedict XIV. He was elected Pope in 1769 after a struggle in the conclave in which cardinals influenced by various of the Catholic powers made interest in favor of the suppression of the Society of Jesus. When the new Pope showed an unwillingness to do the will of the powers the charge was made that he had received the support of many members of the conclave upon his promise to suppress the order; but this charge has been conclusively proved to be without foundation in fact; yet such was the urgency of the powers, he felt himself constrained in the interest of peace and of the Church to disband the Jesuit order which he did in the apostolic brief *Dominus ac Redemptor* which declares the Society of Jesus dissolved forever. The fact that the brief had been drawn up and completed in November 1772, but was not published till July 1773 is proof that he was loth to publish so severe a decree against the order. After its issue he fell into a rapid decline, presumably from remorse, and though all his life he had been exceedingly vigorous, died little more than 12 months after the brief was published. It was this pontiff who founded the Clementine Museum in Rome. See Caraccioli, 'Vie de Clément XIV.' (1775); Theiner, 'Geschichte des Pontificats Clements XIV.' (1853).

Clément, Jacques, zhāk klā-môn, French assassin: b. Sorbon, France, about 1565; d. Saint Cloud, 1 Aug. 1589. He was a Dominican monk, and the fanatical tool of the Dukes of Mayenne and Aumale and the Duchess Montpensier. Having fatally stabbed the king, Henry III., he was at once killed by the courtiers.

Clem'ent, William Henry Pope, Canadian lawyer: b. Vienna, Ont., 13 May 1858. He was graduated at Toronto University in 1878, and became a lawyer in 1880, practising with success in Toronto. He has written: 'The Law of the Canadian Constitution' (1892), a work that was made a text-book in the principal colleges and universities of the Dominion.

Clement of Alexandria, Saint (CLEMENS ALEXANDRINUS), Greek theologian, one of the most eminent and learned of the fathers of the Church. Very little, almost nothing, is known regarding his life. The first mention of him by a writer living in or near his time is made by Eusebius of Cæsarea and by Photius; they give his name as Flavius Titus Clemens, and later writers add to the name the designation Alexandrinus, "of Alexandria." From his names and surname one might infer that he was of Latin race; but he wrote in Greek, and his writings do not indicate any special acquaintance with Roman life or thought. Whether he was a native of Alexandria or of some Grecian city cannot be decided.

He was a convert from paganism and had an intimate acquaintance with the literature of Grecian philosophy, but of the circumstances of his conversion to Christianity, we know nothing. He was supposably a disciple of Pantænus, director of the Catechetical school of Alexandria and became his successor, and had among his pupils Origen, who in turn succeeded him. Further, Clement was a priest of the church of Alexandria. A list of his writings is given by Eusebius, St. Jerome, and Photius. It contains the titles of ten separate works, namely: 'Hortatory to the Greeks'; 'The Tutor'; 'The Stromates' (usually called *Stromata*): this as its title indicates is a patch-work or collection of miscellaneous observations; 'Who is the Rich Man that is Saved?' These four works have come down to us complete or nearly so. The remaining six titles are of works that have been lost: 'Outlines'; 'On the Passover'; 'On Fasting'; 'On Slander'; 'Exhortation to Patience'; 'The Church Rule.' The 'Hortatory to the Greeks' exposes the absurdities and immoralities of the pagan religions; but the Grecian philosophers and poets had a notion of the true author of the universe. 'The Tutor' sets forth the rule of Christian living. 'The Stromates' is a miscellany but it consists of the author's own studies of questions and problems in philosophy, literature, history, etc., not of passages taken from other authors. The treatise on the Rich Man is a very judicious exposition of the passage in the Gospel of Mark x. 17-31.

Clementi, Muzio, moot'sē-ō klā-mēn'tē, Italian pianist and composer: b. Rome 1752; d. Evesham, England, 10 March 1832. As early as his 12th year he wrote a successful mass for four voices, and had made such progress in the pianoforte that an Englishman, Mr. Beckford, took him to England to complete his studies. He was then engaged as director of the orchestra of the opera in London, and his fame having rapidly increased, he went in 1780 to Paris, and in 1781 to Vienna, where he played with Mozart before the emperor. In 1784 he repeated his visit to Paris, but after that remained in England till 1802, when he went back to the Continent. He returned in 1810 to England, where he settled down as superintendent of one of the principal musical establishments in London. His most important compositions were his 60 sonatas for the pianoforte and the great collection of studies known as the "*Gradus ad Parnassum*," a work of high educative value. He represented perhaps the highest point of technique of his day, and his influence on modern execution has led to his being characterized as "the father of pianoforte playing." He was interred in Westminster Abbey.

Clem'entines, so named after Pope Clement V., who during his pontificate (1305-14) had compiled the canons of the Church, chiefly out of the canons of the 15th Council of the Church, Vienne (1311). The Clementines are one of five great collections of Church laws, examined and decided upon according to the methods employed by ecclesiastical authority. The five collections are known as: The Decretals (1234); the Sext (1298); the Clementines (1313); the Extravagantes of John XXII.; and the Extravagantes Communes (containing Decretals of 25 popes) (1484). Out of these five the 'Corpus Juris Ecclesiastici' is made up.

CLEMSON AGRICULTURAL COLLEGE — CLEOPATRA

Clemson Agricultural College, an educational (non-sectarian) institution in Clemson College Station, S. C.; organized in 1890; reported at the end of 1905: Professors and instructors, 43; students, 673; volumes in the library, 11,380; productive funds, \$154,439; income, \$150,549; number of graduates, 335; president, Patrick Hughes Mell, Ph.D.

Cleobis (klē'ō-bīs) and **Biton**, bī'tōn, two Grecian youths, the sons of Cydippe, chief-priestess of Hera (Juno) at Argos. At the *Heraia*, a feast in honor of the goddess, it was customary for the chief-priestess to be drawn by two white oxen. Herodotus relates that on one occasion the procession had already begun to move, and the oxen had not arrived, upon which Cleobis and Biton drew the chariot of their mother for a distance of 45 stadia, up the mountain where the Temple of Hera stood. The people applauded, and the mother was so affected by this instance of filial affection that she begged the goddess to grant her sons the best gift which could be conferred on mortals. While the youths were yet in the temple a soft sleep fell upon them, and they never awoke. The Argives placed the statues of Cleobis and Biton in the temple at Delphi, and in a temple at Argolis they were represented drawing a chariot of their mother.

Cleobulus, klē-ō-bū'lūs, one of the Seven Wise Men of Greece. He was a native of Lindus, or according to some, of Caria, and flourished 560 B.C. He traveled to Egypt to learn wisdom, like many of the sages of Greece. He was king of Rhodes, and was succeeded on the throne by his daughter Cleobulina. Several of his sayings are extant.

Cleombrotus, klē-ōm'brō-tūs, an ancient Greek military leader, son of Pausanias, king of Sparta. During his reign began the Theban war, in which he commanded the Spartans against Epaminondas and Pelopidas. He was killed in the battle of Leuctra, which happened 8 July 371 B.C., according to the Julian calendar. See EPAMINONDAS.

Cleome, klē-ō'mē, a genus of plants, herbs, and shrubs of the caper family, (*Capparidaceæ*), comprising about 75 species, natives of tropical America and Africa. Less than ten species are found in the United States, most of them adventitious additions from South America, escaped from gardens. The native varieties belong to the Rocky Mountain region, and when found to westward are naturalized specimens. Pink cleome (*C. serrulata*) has a stem from two to three feet in height, the pinkish-white flowers very showy and attractive. Its native location is the Rocky Mountain region from Canada to Arizona and Mexico, but it extends eastward to Lake Michigan. The spider flower (*C. spinosa*) of the eastern seaboard, from New Jersey to Florida, is a South American species escaped from culture.

Cleomedes, klē-ō-mē'dēz, ancient Greek author. He wrote a treatise, in two books, 'On the Circular Theory of the Heavenly Bodies,' which sets forth the Stoic theory of the universe, and which is remarkable as containing, amid much error and ignorance, several truths of modern science — such as the spherical shape of the earth. Nothing is known definitely regarding his life, but it seems most probable that he flourished in the 2d century A.D.

Cleomenes, klē-ōm'ē-nēz, the name of three kings of Sparta, the most distinguished of whom is Cleomenes III., king from 236 to 220 B.C. He distinguished himself in a war against the Achæans. Returning to Sparta he put to death the ephori, made a new division of lands, introduced again the old Spartan system of education, and bestowed the full franchise upon many who had not before had it. He lived very simply, was just and friendly, and treated his enemies with generosity. He showed himself an able general in a war against the Macedonians and Achæans united, but at last lost the important battle of Sellasia (222 B.C.). He fled to Egypt, where he attempted to raise an insurrection, but finding no supporters committed suicide. With Cleomenes expired the race of the Heraclidæ which had sat on the throne of Sparta.

Cleomenes, or The Spartan Hero, a play by Dryden, acted in 1692.

Cleon, klē'ōn, Athenian demagogue, killed at Amphipolis, Macedon, 422 B.C. He was a tanner by trade, but became well known in public affairs before the death of Pericles. By the year 427 he was high in favor with the people, and distinguished himself by the atrocious proposal that all the adult males of the revolted Mytileneans should be put to death, and the women and children sold for slaves. In 425 he took prisoners those Spartans who had been blockaded by an Athenian force in the island of Sphacteria. The next year Aristophanes attacked him in his comedy of the 'Knights' — as he did also in the 'Wasps' in 422 — satirizing his venality, rapacity, ignorance, violence, and cowardice. The portrait was probably correct in the main. In 422 he was sent to Chalcidice against Brasidas, who was capturing the Athenian tributary cities there. He was taken unawares by a sally of Brasidas, and was slain.

Cleopatra, klē-ō-pā'trā, the name of several Egyptian princesses, of whom the most renowned was the eldest daughter of Ptolemy Auletes: b. 69 B.C.; d. 30 B.C. With her eldest brother Ptolemy she shared the throne of Egypt. Both were minors at the death of their father, and were placed under the guardianship of Pothinus and Achillas, who deprived Cleopatra of her share in the government 49 B.C. She went to Syria, and was forming plans for obtaining her rights by force, when Cæsar came to Alexandria, and captivated with her charms, successfully seconded her claims. Pothinus stirred up a second revolt, upon which the Alexandrian war commenced, in which the elder Ptolemy lost his life. Cæsar proclaimed Cleopatra queen of Egypt; but she was compelled to take her brother, the younger Ptolemy, who was only 11 years old, as her nominal husband and colleague on the throne. Cæsar continued some time at Cleopatra's court. The queen subsequently made a journey to Rome, where Cæsar received her magnificently, and erected a statue to her next to the statue of Venus, in the temple consecrated to that deity. Cleopatra remained in Rome from 46 B.C. to 44 B.C., returning to Egypt after Cæsar's death. She had by Cæsar a son, Cæsarion, afterward put to death by Augustus. When her brother, at the age of 14, demanded his share in the government Cleopatra poisoned him, and re-

CLEOPATRA'S NEEDLES

mained sole possessor of the regal power. During the civil war in Rome she took the part of the triumvirs, and after the battle of Philippi she sailed to join Antony at Tarsus. She was then 25 years old, and combined with extraordinary beauty, great wit and the highest elegance of manners. She appeared in a magnificently decorated ship, under a golden canopy, arrayed as Venus, surrounded by beautiful boys and girls, who represented Cupids and Graces. Her meeting with Antony was attended by the most splendid festivals. After having accompanied him to Tyre she returned to Egypt. Antony followed her, and gave himself up to the most extravagant pleasures. She accompanied him on his march against the Parthians, and when he parted from her on the Euphrates he bestowed Cyrene, Cyprus, Cœlosyria, Phœnicia, Cilicia, and Crete on her, to which he added part of Judea and Arabia at her request. On her account he divorced his wife Octavia. After this Antony conquered Armenia, returned triumphantly to Egypt, and made his three sons by Cleopatra, and also Cæsarion, kings.

Now commenced the war between Augustus and Antony, but instead of acting promptly against his adversary, Antony lost a whole year in festivals and amusements with Cleopatra at Ephesus, Samos, and Athens, and at last determined to decide the contest by a naval battle. At Actium the fleets met. Cleopatra, who had brought Antony a reinforcement of 60 vessels, suddenly took to flight, and thus caused the defeat of her party; for Antony, as if under the influence of frenzy, immediately followed her. They fled to Egypt, and declared to Augustus that if Egypt were left to Cleopatra's children they would thenceforth live in retirement, but Augustus demanded Antony's death, and advanced toward Alexandria, which Antony hastened to defend. Cleopatra determined to burn herself with all her treasures, but Augustus pacified her by private messages. These communications, however, did not remain concealed from Antony, who, supposing Cleopatra treacherous, hastened to her, to avenge himself by her death. She, however, escaped and took refuge in the mausoleum which she had erected near the Temple of Isis, and caused the report of her suicide to be circulated. Antony now threw himself upon his sword; but before he expired was informed that Cleopatra was still living, upon which he caused himself to be carried into her presence, and breathed his last in her arms. Augustus succeeded in getting Cleopatra into his power. She still hoped to subdue him by her charms, but her arts were unavailing, and becoming aware that her life was spared only that she might grace the conqueror's triumph, she determined to escape this ignominy by a voluntary death. According to the generally received account of her death she ordered a splendid feast to be prepared, desired her attendants to leave her, and put an asp, which a faithful servant had brought her, concealed amongst flowers, on her arm, the bite of which caused her death almost immediately. There is, however, some doubt as to the exact method by which she took her life. Her body was interred near that of Antony. At the time of her death she had reigned 22 years.

Cleopatra's Needles, two obelisks, formerly at Alexandria, one of which is now in New York, the other in London. They are made of the rose-red granite of Syene, and were originally erected by the Egyptian king Thothmes III., the most celebrated king of the 18th dynasty, in front of the portico of the great temple of Heliopolis, the On of the Scriptures, and the place where Moses was born and brought up. From Heliopolis the two obelisks were removed to Alexandria not long before the commencement of the Christian era, but not, so far as we can now tell, during the lifetime of Cleopatra. We are at least informed by an inscription on the bronze supports of one of them, that they were not erected at Alexandria till the eighth year of the reign of Augustus Cæsar, and accordingly seven years after the death of Cleopatra. How, then, they came to be called Cleopatra's Needles is not apparent; but it may be conjectured that they had been removed by her order some time before they were set up on their second site, or that their removal was the carrying out of an intention formed by Cleopatra. Mr. (afterward Sir) Erasmus Wilson, to whom the credit may be awarded of having been chiefly instrumental in getting the British obelisk conveyed to London, assumes that the association of Cleopatra's name with the two obelisks represents the popularity of the queen and the affectionate regard of her subjects, rather than any participation of herself in their transport or erection. The obelisk now at London lay for a long time prostrate in the sand. In 1820 it was presented by Mehemet Ali to the British nation, but the British government, in spite of many appeals made to them on the subject, never did anything for its removal, which was at last effected solely through the public spirit of several private individuals, the obelisk being erected on the Thames Embankment in 1878. The other obelisk was presented to the United States by the Khedive of Egypt, and was transported to Central Park, New York, where it was erected in 1881. It stands upon four bronze crabs, reproductions of the original crabs upon which the obelisk formerly stood. The originals are now in the Metropolitan Museum, New York. The one in London is somewhat the taller of the two, being 68 feet 5½ inches in height, as against 67 feet 2 inches, the height of the other. The lateral measurements at the base are, in the British obelisk, 7 feet 5 inches in one pair of opposite sides, and 7 feet 10½ inches in the other pair; in the one in New York, 7 feet 9¾ inches, and 8 feet 2¼ inches. The weight of the British obelisk is rather more than 186 tons, and its mass 2,529 cubic feet. Both obelisks are inscribed with hieroglyphs, engraved to a depth of several inches and carefully polished. The hieroglyphs are inscribed in vertical columns, which are read from the top downward; and in each case the middle column is in honor of Thothmes, by whom the obelisks were first erected, and the side columns in honor of Rameses II., the most celebrated king of the succeeding dynasty, who reigned at least 200 years after Thothmes. On each side of the pyramidion, or small pyramidal top of the obelisk, is a bas-relief representing the sun-god, protector of the city of Heliopolis, receiving gifts from Thothmes.

CLEPSYDRA — CLERKE

Clepsydra, klĕp-sī'drā, or **Water-clock**, an instrument for the measurement of time by the escape of water from a vessel through an orifice. Its origin is extremely ancient, and has generally been attributed to the Egyptians. Two descriptions of clepsydræ have been employed — one in which the water merely escapes through the orifice, the other in which the same level is constantly maintained by the introduction of a fresh supply of water, and a uniformity of efflux secured by retaining throughout an equal amount of pressure on the fluid as it issues from the bottom of the vessel. In one kind of water-clock the measure of time is registered on a dial-plate by means of a hydraulic apparatus acted on by the efflux of water from a cistern. These instruments are now scarcely ever constructed.

Clerc, Laurent, lō-rōñ klār, French deaf mute: b. La Balme, Isère, France, 26 Dec. 1785; d. Hartford, Conn., 18 July 1869. At the age of 12 years his uncle took him to Paris, and placed him in the institution for the deaf and dumb. The abbé Sicard, though nominally its director, was then in prison for his alleged hostility to the republic; but Jean Massieu, himself a deaf mute, became his teacher till the release of Sicard, when he became a favorite pupil of the abbé. His intellectual condition, like that of most of the uninstructed deaf mutes, was at this time deplorable. "I had," he says, "a mind, but it did not think; I had a heart, but it did not feel. My mother had endeavored to show me the heavens, and make me know God, but her attempts were vain; I could comprehend nothing. I believed that God was a tall, big, and strong man, and that Jesus Christ, having come to kill us, had been killed by us, and placed on a cross as one of our triumphs." Under the skilful instruction of the abbé Sicard, he made rapid proficiency, and in 1805, after passing eight years in the institution, he was appointed tutor, and in 1806 a salaried teacher. His aptitude for teaching was such that in a few years the abbé confided to his charge the highest class in the institution. In 1815 while on a visit to England, Clerc formed the acquaintance of Gallaudet, who had gone thither in the hope of obtaining such instruction as would enable him to teach the deaf and dumb in this country. Failing in this, he subsequently visited France, and received instruction in the language of signs from the abbé Sicard and Clerc, and after spending some months under their tuition, persuaded the latter to accompany him to this country, here to lay the foundation of deaf mute instruction. Several months were spent by them in visiting the principal cities of the northern States, and soliciting aid for the establishment of the institution, since known as the American asylum for the deaf and dumb, at Hartford. On 15 April 1817 the asylum was opened with seven pupils, and Messrs. Gallaudet and Clerc installed as teachers. Much of the early success of the asylum is due to his patient and assiduous labors, and the greater part of the teachers sent to other institutions for the deaf and dumb, from this mother asylum received their training at his hands.

Clerc, Sébastien le, French designer and engraver: b. Metz, Lorraine, 1637; d. 1714. He acquired the elements of design from his father,

a goldsmith, and by the advice of Le Brun devoted himself to engraving, in which he became so distinguished that at the suggestion of Colbert he was appointed engraver in ordinary to Louis XIV. Pope Clement XI. also conferred upon him the honor of knighthood. He formed his style on that of Le Brun, improving it, however, by a careful study of Raphael; and in his published works, which number between 3,000 and 4,000, and embrace every variety of subject he has exhibited a singularly correct and elegant execution. He also published treatises on geometry, architecture, and perspective.

Clerestory, klēr'stō-rī, or **Clearstory**, the upper part of the nave in churches, above the triforium where a triforium is present, and formed by walls supported on the arches of the nave, and rising above the roof of the side aisles. In these walls windows are inserted for the purpose of increasing the light in the nave. In Norman architecture the three stories of pier arcade, triforium, and clerestory are of nearly equal height, but in Gothic the clerestory becomes relatively of greater significance and in late Gothic work is often very lofty.

Clergy, in the Christian Church, that portion of the faithful which is set apart for the ministry of religion. In the Roman Catholic Church there are eight grades or distinctions of clergy, namely, that of the simple cleric, those of the four minor orders and those of the three sacred orders of subdeacon, deacon and priest. The last three are regarded as being of divine institution. The simple cleric is one who has received the ecclesiastical tonsure; by that rite he is made a clerk or cleric, and as such is entitled to certain rights, privileges and immunities, and assumes certain obligations not incumbent on the laity. See HOLY ORDERS.

Clerk, John, Scottish naval tactician: b. Elden, near Edinburgh, 1728; d. 10 May 1812. For him is claimed the invention of the manœuvre "of breaking the enemy's line," put forth in an essay on 'Naval Tactics,' published in 1790, afterward employed with signal effect by Howe, St. Vincent, Duncan, and Nelson.

Clerk-Maxwell, James, Scottish physicist: b. Edinburgh 13 Nov. 1831; d. 5 Nov. 1879. He was a professor of natural philosophy in Marischal College, Aberdeen, in 1856-60; of physics and astronomy in King's College, London, in 1860-5; and of experimental physics in the University of Cambridge in 1871. Among his most important works are 'Essay on the Stability of Motion of Saturn's Rings'; 'Theory of Heat'; 'Electricity and Magnetism'; and 'Matter and Motion.'

Clerk, one who has charge of an office or department, subject to a higher authority as a board, corporation, etc.; a secretary, as, the clerk of the House of Representatives or Senate, clerks of the various courts, etc. In England a parish officer, a layman, whose business used to be to lead the responses in the church services and to perform other duties connected with the parish; a parish clerk

Clerke, Agnes Mary, English astronomer: b. Ireland 10 Feb. 1842. She began contributing to the Edinburgh 'Review' in 1877, and in 1888 made astronomical observations at the

CLEOPATRA'S NEEDLE, CENTRAL PARK, NEW YORK

CLERKE — CLEVEDON

Royal Observatory, Cape of Good Hope. She has published 'A Popular History of Astronomy During the 19th Century' (1885); 'The System of the Stars' (1890); 'Familiar Studies in Homer' (1892); 'The Herschels and Modern Astronomy' (1895); 'Astronomy' (1898); 'Problems in Astrophysics' (1902). In 1893 she received the Actonian prize of 100 guineas for her writings on astronomy.

Clerke, Ellen Mary, English writer: b. Ireland. She is a sister of Agnes Mary Clerke (q.v.) and has contributed extensively to English and Italian periodicals. She has published 'The Flying Dutchman,' a book of verse; 'Jupiter and His System'; 'The Planet Venus'; 'Flowers of Fire' (1902).

Clerkenwell, England, a parish of London inhabited by the better class of workingmen in the metal trades, being noted for its output of watches, optical instruments, and articles of gold and silver. The name comes from the well around which the parish clerks of London used to meet. The attempt of the Irish agitators to destroy the Clerkenwell prison was made on 13 Dec. 1867.

Clermont, The, the name given by Robert Fulton to the steamboat in which he made his first trip from New York to Albany, 11 Aug. 1807. The speed attained was only five miles per hour.

Clermont - Ferrand, klär - môn - fěr - rän, France, a town in the department of Puy-de-Dôme, of which it is the capital. It is situated on a hill at the foot of the volcanic range in which the summit of the Puy is conspicuous. It was originally the capital of the Arverni, possessed considerable importance under the Romans, and became a bishop's see in 250. It was afterward sacked by the northern hordes, but soon recovered, and was selected in 1095 for the meeting of the great council in which the crusades originated. In 1556 it became the capital of the duchy of Auvergne. Among its natives are Gregory of Tours, Pascal, and General Dessaix. The most remarkable edifices are the Gothic cathedral, a huge, irregular, gloomy pile, begun in 1248, and recently completed by the construction of the west front and two towers; the Church of Notre Dame, founded in 580, and incrustated externally with rude mosaics; the townhouse, courthouse, theatre, general hospital, etc. There are also a medical and a theological college, technical schools, observatory, public library, botanic garden, and museums of natural history and antiques. The manufactures consist chiefly of chemicals, animal oils, table-linen, nails, hats, machinery, etc. It is an important centre of trade. Near it there are two mineral springs. Pop. 40,000.

Clermont-Tonnerre, tō-nār, the name of a distinguished ancient family of counts in Dauphiny. One of the most celebrated is Count Stanislas: b. 1757; d. 1792. At the breaking out of the Revolution in 1789 he took his place in the States-General as deputy of the nobility. He maintained the doctrine of a constitutional monarchy, and incurred the displeasure of both the aristocratic and republican parties. As a counterpoise to the influence of the Jacobins, he, in concert with Malouet and other friends of monarchy, founded the Monarchical Club; and along with Fontanes started the *Journal*

des Impartiaux. The club having been denounced by Barnave as a band of conspirators, was dissolved, and the journal was suppressed after an existence of only two months. In 1791 he was arrested on the charge of having aided the king in his attempt to escape, but regained his liberty on taking an oath of fidelity to the National Assembly. The next year he was dragged by a mob before the section. As no sufficient ground of detention appeared, he was dismissed, but was pursued and murdered.

Cléry, Jean Baptiste, zhõn bāp-těst klā-rē, a French royal attendant: b. near Versailles 11 May 1759; d. near Vienna 27 May 1809. When in 1792 the royal family of France were imprisoned in the Temple, Cléry was one of the few servants permitted to accompany them. Louis XVI., a few days before his death, divided a loaf of bread with this faithful companion of his misfortune, the only proof of his regard which he was able to show him. After the king's death, Cléry was devoted to the dauphin. He wrote a journal of what passed in the Temple from the captivity of Louis XVI. until the death of the dauphin; it has been several times republished.

Clésinger, Jean Baptiste Auguste, zhõn bāp-těst ô-güst klā-zän-zhā, French sculptor: b. Besançon 22 Oct. 1814; d. Paris 7 Jan. 1883. He obtained considerable reputation for busts of distinguished persons, and also executed statues and historical groups. His colossal bust of 'Liberty,' and his statues of 'Fraternity,' 'Woman Bitten by a Serpent,' 'The Gipsy Girl,' and of Rachael and Cruvelli in some of their principal parts, are among his best known works. He was commissioned by the French government to execute an equestrian statue of Francis I. He married a daughter of Madame Dudevant (George Sand).

Clesse, Antoine, än-twän klēs'ë, Belgian popular poet: b. The Hague 1816; d. 1889. To the day of his death he followed his trade of armorer. His first ballad, 'Godfrey de Bouillon,' won for him a gold medal. His popular songs 'Beer' and 'The Family Name' (meaning Belgian, including Fleming, Walloon, etc.), came into great favor with the people. He wrote also a comedy, 'A Poet.' Two volumes of 'Songs' (1866-88) contain all his popular ballads, with the music.

Clethra, klēth'ra, the typical genus of the natural order *Clethraceæ*, or white-alder family. The family has but this single genus, which numbers about 30 species, indigenous to Japan, Mexico, South America, and the eastern seaboard of North America. The United States species are the sweet-pepperbush or white-alder *C. alnifolia*, found near the coast from Florida to Maine, and the mountain sweet-pepperbush (*C. acuminata*), a shrub or small tree growing in the mountain woods of Virginia, the Carolinas, and Georgia.

Clevedon, England, a watering-place on the Bristol Channel, about 15 miles southwest of Bristol. It is the burial-place of Hallam, the historian, and of his son Arthur, whom Tennyson's 'In Memoriam' made famous. Here Coleridge lived in 1795. Clevedon Court is the Castlewood of Thackeray's 'Henry Esmond.' Pop. (1901) 5,898.

CLEVELAND

Cleveland, Chauncey F., American lawyer and politician: b. Hampton, Conn., Feb. 16, 1799; d. there June 6, 1887. He was admitted to the bar in 1819, became active in local politics as a Democrat, and in 1826 was elected to the State legislature, where he served four consecutive terms. He was subsequently re-elected several times, serving twelve terms in all; and was speaker of the lower house in 1836, 1838, and 1863. He was appointed attorney-general of Connecticut in 1832; and was elected governor in 1842 and 1843; in both years the popular vote was indecisive and he was chosen by the legislature. In 1849 and 1851 he was elected to Congress. He was one of the leaders in the organization of the Republican party; in 1860 was a presidential elector; and in 1861 was a delegate to the Peace Congress.

Cleveland, Grover, twenty-second President of the United States: b. Caldwell, N. J., 18 March 1837. Grover Cleveland was the fifth of nine children born to Rev. Richard F. Cleveland, a graduate of Yale (1824) and Presbyterian clergyman, and Ann Neal, the daughter of a Baltimore merchant of Irish descent. He received a common school and academic education at Fayetteville and Clinton, N. Y., the successive residences of the family after leaving Caldwell, and was preparing for college when his father's sudden death (1853) changed his prospects entirely. To support himself and to aid in providing for the rest of the family he secured a clerical position in the New York Institution for the Blind, where his older brother William was a teacher. In 1855 he started west, but on his way stopped at Buffalo to visit an uncle, Lewis F. Allen, a stock breeder and publisher of 'The Herd-Book of American Short-Horn Cattle.' His uncle advised him to stay in Buffalo, and employed him in the preparation of the 'Herd-Book,' until a position as clerk and copyist was secured in a law office, August 1855. He at once set to work with perseverance and industry to make himself useful and master the rudiments of the law, with the result that in 1859 he was made managing clerk of the firm at a salary of \$600 (increased to \$1,000 in 1863), and admitted to the bar. During the war, his two brothers being in the Union army, the support of his mother and sisters fell upon him. Unable to enlist, he borrowed money to pay for a substitute. In 1863 he was appointed assistant district attorney of Erie County, serving with zeal and energy. He attended every one of the 12 grand juries which met during each of the three years of his term, and presented in full a majority of the cases. As the Democratic candidate for district attorney in 1865 he was defeated by his friend Lyman K. Bass. In 1869 he became a member of the law firm of Lanning, Cleveland and Folsom. Elected sheriff of Erie County (1870), he performed his duties faithfully and used his leisure in prosecuting further professional studies. At the end of his term, (1873) he joined the firm of Bass, Cleveland, and Bissell, acquired increasing success in practice, and took a higher position at the bar than ever before. In 1881 the citizens of Buffalo determined to check the flagrant corruption in the city government. Cleveland was elected mayor on the Democratic ticket by a majority

of 3,500, though the Republican state ticket received an average majority there of 1,600. As mayor, he displayed a thorough knowledge of the laws, a clear perception of the needs and rights of the city, and how to secure them. He insisted upon placing public interests above party claims; saved the city over \$1,000,000 by preventing corrupt schemes and bargains; and won the gratitude of people and press irrespective of party. On 22 Sept. 1882 he was nominated for governor against the Republican candidate, Charles J. Folger, and elected by the unprecedented majority of over 192,000 votes. As governor, he conducted a thoroughly business-like administration, making frequent use of his veto power, but his vetoes were always clearly sustained by his duty under the law. His record as mayor and governor won for him the Democratic nomination for president, 10 July 1884. The ensuing campaign was unusually bitter, and political issues were lost sight of in the disgraceful attacks made upon the character and personality of the two leading candidates. At the election Cleveland received 219 electoral votes to 182 cast for his Republican opponent, James G. Blaine, and was inaugurated president 4 March 1885, having resigned his governorship on 6 January. Only the briefest mention can indicate the important and difficult questions that crowded his administrations. His first message recommended a reduction of the tariff, the extension of civil service reform, regulation of the Presidential succession, and the settlement of the fisheries dispute with Great Britain. His removals from non-political offices were less sweeping than those of any president since Jackson; of 987 bills passed by Congress up to 5 Aug. 1886 he vetoed 102, chiefly private pension bills; he won a sharp contest with the Senate over suspensions and nominations; and devoted his 1887 message entirely to the existing tariff, denouncing it as vicious and unnecessary and demanding the abolition of duties on raw materials. Defeated for re-election in 1888, he retired to the practice of law in New York city (1889-93). Re-elected in 1892, he took office in 1893 in the midst of threatening currency and financial conditions. His inaugural declared that "so far as the executive branch of the government can intervene, none of the powers with which it is invested will be withheld when their exercise is deemed necessary to maintain our national credit or avert financial disaster." Accordingly he forced the repeal of the Sherman Silver Purchase Act, killed the bill for coining the seignorage, maintained the treasury's gold reserve by the successive issue of government bonds, and saved its credit throughout the world, despite furious opposition by large sections of his own and the Republican party favoring the free coinage of silver. He repudiated the Hawaiian annexation treaty made by President Harrison, enforced the neutrality laws during the troubles in Cuba, while firmly supporting American interests there, and compelled Great Britain to arbitrate her dispute with Venezuela. During the Chicago strike in 1894, he effectively asserted the executive's right to interfere in state affairs in the interest of law and order. At the close of his term he settled in Princeton, N. J., where he has since resided. He has delivered an annual series of lectures on public affairs at Princeton University, and written a

GROVER CLEVELAND,

TWENTY-SECOND AND TWENTY-FOURTH PRESIDENT OF THE UNITED STATES.

CLEVELAND

number of periodical articles on important questions with which he was required to deal while president. In 1904 he was much talked of as a candidate for a third term, but emphatically declined to be so considered.

Bibliography.—Campaign lives of Cleveland by Thos. W. Handford, Wm. Dorsheimer, Pendleton King, and Deshler Welch appeared in 1884; of these Handford's is the fullest and most authentic; 'Grover Cleveland,' by J. L. Whittle (1896), is useful. President Cleveland's messages and other public papers will be found in Richardson's 'Messages and Papers of the Presidents, 1789-1897' (Vols. 8, 9, Washington, 1898). A collection of his magazine articles has appeared in book form (1904) under the title 'Presidential Problems.'

W. N. C. CARLTON,

Librarian Trinity College, Hartford, Conn.

Cleveland, John, English poet: b. Loughborough June 1613; d. 29 April 1658. He was an adherent of the Royalist party during the civil war, and severely satirized the opposite party. He was arrested and imprisoned in 1655, but was released by Cromwell.

Cleveland, Rose Elizabeth, American prose writer: b. Fayetteville, N. Y., 1846. She is the sister of Grover Cleveland (q.v.), and after the inauguration of her brother (1885) she became the "mistress of the White House," remaining there until 1886. She published a book of essays and lectures entitled 'George Eliot's Poetry, and Other Studies' (1885); and 'The Long Run,' a novel (1886).

Cleveland, England, a hilly district in the North Riding of Yorkshire, about 28 miles long and 15 broad, between the Tees and the coast at Whitby, forming one of the parliamentary divisions of the county. It has developed enormously since the discovery of its extensive deposits of iron ore, which is smelted chiefly at Middlesbrough.

Cleveland, Ohio, "the Forest City," city and county-seat of Cuyahoga County; largest city in the State, second on the Great Lakes, and seventh in the United States; on Lake Erie at the mouth of the Cuyahoga River, 357 miles by rail east of Chicago and 183 west of Buffalo; 38 northeast of Columbus, 263 northeast of Cincinnati, 140 northwest of Pittsburg, 623 from New York against less than 500 overland, the Alleghanies forcing a long detour. For its great number of railroad and steamer connections, see *Commerce and Transportation*, below. Pop. (1900) 381,768.

Cleveland is on the edge of the great plateau of northern Ohio, sloping gradually from the lake to a ridge 115 feet above it and 689 above sea-level, rising much higher to the east. It extends about 10 miles along the lake, and a maximum of 6 miles back, with an area of some 33 square miles — its annexations of Brooklyn southwest and Newburg southeast of the Cuyahoga carrying its wings south beyond the centre. About three fourths of it, and the main business part, lies east of that river, a small crooked stream with the last few miles 200 or 300 feet wide and of some depth, lined with docks for five or six miles out of an available wharfage of 16. Its valley half a mile wide, the sunken bed of a much greater stream, is filled with car tracks and car shops, lumber,

coal, and ore sheds, ship-yards, etc., largely hidden from the city; and is spanned by two immense viaducts, uniting the east side with the west or south as the river runs. The lower viaduct connects Superior Street, the main business avenue, with Detroit Street west, making a sharp turn southwest west of the river; is of stone and iron, 3,211 feet long, 64 wide, and 68 above average water, with a 322-foot draw; and was completed 1878, at a cost of \$1,715,000 besides \$536,000 right of way. The Central Viaduct is from Ohio Street east to Jennings Avenue south, where it connects at an angle with one westward across Walworth Run, a brook running into the Cuyahoga 1½ miles above its mouth; the two have a total length of 3,931 feet (with approaches, 5,229), width 56, height 101; completed 1888, cost \$675,000. Entirely on the east side is one 834 feet long, 48 wide, and 87 high, across Kingsbury Run, a brook emptying into the Cuyahoga, a mile above Walworth on the other side. There are several other municipal and railroad bridges across the latter river.

Streets.—The focus of the city, the heart of the business quarter and the centre of the street-railway lines, is Monumental Square, about half a mile from lake and from river; and from this or near it radiate a fan of streets at every angle from northeast (parallel to the lake front) to southeast (toward Newburg). Two miles east, the long Willson Avenue runs north and south from near the lake to Broadway, the old Newburg highway; so that the older city is a rough triangle with the vertex at the square, the base Willson Avenue, one side the lake, and the other the river and Kingsbury Run. The rest of the city plan is largely haphazard: East Cleveland and old Brooklyn generally east and west by north and south, along Broadway a mass of short streets at right angles to it, the West Side based on the lake line and the river curves; but accidental or surface variations are endless. Monumental Square, originally a 10-acre park, is now divided into four sections by two broad avenues intersecting at right angles. Superior 132 feet (eight rods) wide, Ontario 99 feet (six rods). Superior runs from the river parallel with the lake front for two miles or so, then sheers off east; it is the great business street, the large stores extending along it from the square to the river and as far east. Ontario runs to the lake, as does Seneca along the west side of the square; St. Clair is parallel to Superior nearer the lake; Water Street runs from Superior near the river to the Union depot, as does Seneca to the other end. From the southeast corner of the square starts the world-famed Euclid Avenue, once said by travelers to be the most beautiful street in the world; named from the town of Euclid on the east, to which it is the highway, and as a lake road extending to Erie, Pa., 95 miles. It widens from 80 to 99 feet, and beyond the business portion is lined with splendid and costly stone mansions set from 200 to 400 feet back from the street, amid superb grounds, "estates" rather than mere dwellings. It turns east along a low ridge, but beyond Wade Park again turns northeast. Both Superior and Euclid run to the city limits; parallel to the latter on the south is the only less fine Prospect Street, extending to Willson Avenue, itself a notable residence Street, as are Case Avenue west of Willson from the lake to Kingsbury Run, East

CLEVELAND

Madison a mile east of Willson and parallel to it, and a number of shorter streets. On the South Side (Brooklyn), Jennings Avenue, reached by the Central Viaduct, is the chief residence street. The streets in general are wide, and so heavily shaded with great trees as to have given Cleveland the name of the "Forest City." The houses are nearly all detached, either tenements for the poor or flats for the richer being still comparatively few.

Municipal Conditions.—The light porous soil makes excellent drainage, and there is a good sewerage system. The death rate in 1902 was 17.1. The waterworks are owned by the city, and have cost to date above \$10,000,000, which extensions under way will largely increase; there are two pumping stations and two standpipes, the water coming from a crib 8,642 feet out in the lake, through two tunnels 90 feet below the surface, to two reservoirs on the East Side, with a daily delivery capacity of 117,000,000 gallons. A new crib and tunnel 26,000 feet into the lake, or about five miles, are under construction. Of the 600 miles of streets, toward 200 are paved, largely with Medina dressed stone, also with asphalt, vitrified brick, and macadam. The street- and suburban-railway system is very extensive: not only are there over 200 miles of track in the city, but some of the longest suburban and through lines in the country start from the square,—to Akron, 39 miles, to Painesville, 29 miles, to Elyria, 25 miles, etc. They carry package freight also. The city has four public markets. The police force in 1902 consisted of 295 patrolmen, 29 lieutenants, 16 sergeants, 12 detectives. The fire department has 28 steam-engine companies, 9 hook and ladder companies, and 3 hose companies.

Buildings, etc.—Monumental Square contains a bronze statue of the city's founder, Gen. Moses Cleaveland, and the elaborate Soldiers and Sailors' Monument to the dead of the Civil War; the marble statue of Perry, formerly here, has been removed to Wade Park. The frontage on the square is occupied by the government building, one of the two court-houses, the "Old Stone Church" (First Presbyterian), the Society for Savings, the Chamber of Commerce, a hotel, etc. The public buildings are to be replaced by a new and splendid set, grouped in a quadrangle a fourth of a mile square near the centre of the city, enclosing a park. The government has authorized its new post-office building to cost \$2,500,000, and a court-house costing at least \$3,000,000 is assured. The entire "Group Plan" improvement is estimated at \$16,000,000. The Arcade office building just east of the square, erected 1889 for \$850,000, is a prominent feature: it consists of a great interior court open to the top, surrounded by tiers of offices with balconies in front, entirely around it. The Colonial Arcade, built as a companion in 1898, is near by. The Sheriff Street market is one of the largest in the country, and the stone Union Station was such when built, and is still notable,—it is on the lake a little east of the river. Of others may be noted the Central Armory, the Caxton Building housing the Case Library, the Garfield, Hickox, New England, Perry-Payne, Cuyahoga, Lennox, Rose, and Williamson buildings; besides institutional buildings,—the beautiful one of the Cleveland Medical College, the Y. M. C. A., the House of Correction, the Northern Ohio Insane Asylum,

Adelbert College, and the Case School of Applied Science southeast of Wade Park, etc.; besides churches mentioned later.

Amusements and Clubs.—The chief places of public amusement are the Central Armory, the Grays' Armory, the Opera House, the Lyceum Theatre, the Colonial Theatre, the Empire Theatre, and the Star Theatre. The chief clubs, several owning their own club-houses, are the Colonial, Country (on the lake front east of Gordon Park), Excelsior, Roadside, University, Rowfant, Tavern, and Union.

Parks.—Cleveland has one of the finest park systems in the country, with 22 parks containing 1,326 acres, on which over \$3,000,000 has already been spent in improvements, and authority has been granted to spend another million. The most desired improvement—to make the lake front, now occupied by the Lake Shore tracks, a boulevard—is difficult of attainment; but it would complete the chief of the park plans. Four or five miles east of the Cuyahoga, Doan Brook flows into the lake, through a valley of considerable breadth. At its mouth is the beautiful Gordon Park of 122 acres, formerly a private estate bequeathed to the city. Two miles back is Wade Park of 62 acres, on an elevation overlooking the lake,—an exquisite place, with groves of magnificent trees, a boating lake, a zoological garden, etc.; and containing also the marble monument to Commodore Perry, hero of the battle of Lake Erie, removed from Monumental Square. The whole Doan Valley between and beyond them has now been purchased and presented to the city by John D. Rockefeller and others, and turned into a broad ribbon of park three or four miles long. If the lake boulevard is ultimately built, it will connect with Lakeview Park, already extending 2,500 feet along the lake front, from Erie Street to the Union Station, and the little Clinton Park, east of it, making some eight miles of continuous park drive, with Euclid avenue as the third side. Of the large number of other parks, the chief are—on the East Side, Newburg in the south, of 160 acres; Woodland Hills, southeast of Wade Park; Forest City, between Willson Avenue and the river, at the city line; Garfield Park; on the west, Edgewater of 89 acres at the lake, with a bathing and boating beach and full summer equipment; Brooklyn of 139 acres in the south; Brookside in the southwest; and small but pretty ones like "The Circle" on Franklin Avenue, with a fountain; South Side, of nine acres, on Jennings Avenue, etc.

Cemeteries.—Of the numerous cemeteries, the finest is Lakeview, at the extreme northeast of the city six miles out, off Euclid Avenue,—one of the most beautiful in the country for site and development. It is on the crest of the ridge, rising to 250 feet above the lake; on this height stands the Garfield Memorial of Ohio sandstone, 165 feet high, with a balcony around the top commanding an immense prospect of lake and land; the lower portion is a chapel containing panels and reliefs of scenes in his life, and beneath is his tomb in the crypt. Woodland of about 60 acres lies between Willson and East Madison, a mile south of Euclid; Riverside of 120 acres is in Brooklyn, southwest of the river.

Churches.—Cleveland is the seat of a Roman Catholic bishop; and in 1902 had 319 church

CLEVELAND

societies of all denominations,—including a few mission branches, and Christian Science and Spiritualist denominations. The chief were—Roman Catholic, 43, including one Italian and one Polish, besides a monastery and five convents; Methodist Episcopal, 37, including five German, one Swedish, and one Welsh; 24 Congregationalist, including two Bohemian, one Polish, one Welsh, and one colored; 22 Baptist, including three German, one Swedish, and one Welsh; 22 Protestant Episcopal, besides three parish houses; 21 German Evangelical Lutheran; 20 Presbyterian, including one Welsh; 14 German United Evangelical; 14 Hebrew synagogues; 12 Reformed Church in the United States (Bohemian Moravian); 12 Disciples; 6 Friends; 5 United Brethren; 1 Swedenborgian, etc., showing the enormous complexity of this polyglot city. The most important church edifices are the cathedral; St. Paul's and Trinity, Episcopal; First Presbyterian ("Old Stone"), Woodland Avenue Presbyterian, with the largest Sunday-school in the city; Calvary, Second and Third Presbyterian; First and Plymouth Congregational; First Methodist; and Euclid Avenue Baptist.

Charities.—Cleveland takes one of the highest places in charitable work. The most important of recent foundations is the social settlement called Goodrich House, founded in 1897, with a splendid \$80,000 building; one of the best equipped and managed in the country, with library, reading-room, parlors, and clubs, gymnasium, baths, public laundry, sewing-rooms, kindergartens, etc. Of the others, the Northern Ohio Insane Asylum, founded in 1855, has accommodations for 900 patients, with a fine building and 112 acres of ground on a slightly spot. There are 16 hospitals, with dispensaries and maternity wards, several of them having training schools for nurses; the largest is the City Infirmary and Hospital, with an average of 1,000 patients a year, and an outdoor relief department; others are the Cleveland General, Cleveland Homœopathic, Lakeside, Charity (St. Vincent's, founded 1866), St. Alexis, St. Clair, St. John, etc. There are Protestant, Roman Catholic, and Jewish orphanages, children's aid societies, homes for working women and the aged poor, an inebriate asylum, a "reformatory home for unfortunate women and girls," a Bethel home for sailors, and scores of societies for relieving every relievable distress, besides a workhouse for incorrigibles.

Educational Institutions.—The Cleveland public-school system, with 70 grammar schools, six manual-training, and one deaf-mute, one normal, and five public high schools, and about 1,300 teachers, costs about \$2,000,000 a year. It was reorganized in 1892; a director of schools and a school board of seven are elected by the people and elect a superintendent of schools who appoints the teachers. It is managed on the now well-known "Cleveland plan," in some respects an advanced step in accordance with irresistible modern drift, in others a reversion to an older type. The root idea is to abolish routine and automatic methods: there are no regular examinations and no punishments, and the teacher promotes scholars on a general judgment of capacity; while manual and domestic training are made a part of all grades. Besides these are a mass of private and parochial schools. Of secondary schools, besides the high

schools, are the University School; two for girls, the Mittleberger School and the Hathaway-Brown School; and the Ursuline Academy.

The chief seat of higher education is Western Reserve University, an institution formed by affiliating older schools and colleges and adding new; Adelbert College, till 1882 Western Reserve College at Hudson, Ohio, founded 1826; the Cleveland Medical College, with a fine museum and library, founded 1843; the College for Women, founded 1888 by the trustees of the university, as a part of it,—not an "annex," as the university confers the degrees; the School of Law, founded 1892; and the Dental College, 1893. It had in 1902, 800 students. The Case School of Applied Science, founded in 1881, and in 1887 endowed with \$2,000,000 by Leonard Case, is a highly flourishing and valuable school of technology. There are also two other law schools, that of Baldwin University (Berea, Ohio), and the Cleveland College of Law; three medical schools, the Cleveland College of Physicians and Surgeons (of Ohio Wesleyan, at Delaware, Ohio), Cleveland Homœopathic Medical College (1849), and the Cleveland School of Pharmacy; and two Roman Catholic colleges, St. Ignatius (1886), and St. Mary's Theological Seminary.

Libraries.—The chief library of Cleveland is the Public, of nearly 200,000 volumes, opened 1869; next is the Case Library (subscription), with over 50,000. The library of the Western Reserve Historical Society contains toward 25,000 volumes and pamphlets, very rich in historical value; it has also an interesting collection of historical curios. Western Reserve University has a library of 45,000 volumes. There is also a law library of some 15,000 volumes, founded 1870; and medical libraries.

Commerce and Transportation.—The violent storms of the Great Lakes made every safe harborage in the mouth of a small river a potential port of importance; and every great lake city is so located, except Detroit, on a strait off the open water. Cleveland's river gave it the first hold; but it was of little consequence till the Ohio Canal tapped the State's agriculture and made it a terminal of inter-State traffic. After railroads came, the canal gradually went out of use, and in 1879 its terminal facilities were given to the Valley R.R. (now the Baltimore & Ohio); but meanwhile the city had become of supreme importance as the nearest large lake port to the iron, coal, and petroleum of western Pennsylvania and northern Ohio (as will appear by a glance at the map), and of course as convenient for sending to them the iron and copper ore of Lake Superior. Hence it has become the greatest ore market in the world, receiving about 4,000,000 tons a year; a leading coal port, its receipts being about 6,000,000 tons a year and its shipments nearly half that; one of the chief markets for grain, lumber, and petroleum; and the greatest in the United States for fresh-water fish. Its lake traffic is enormous: 48 steamship, steamboat, and barge lines operate from here, to every port on the Great Lakes, from Duluth to Buffalo, and through the Welland Canal to Toronto and the St. Lawrence. Its clearances of vessels have been over 7,200 in one year, with a gross tonnage of nearly 9,000,000. All these lines of business have doubled since 1890. Its railroad

CLEVELAND

communications are through all the great Eastern trunk lines, and others west and south: the New York Central and its feeder the Lake Shore by Buffalo, the Pennsylvania by Pittsburgh, the Baltimore & Ohio by the Valley, the Erie through Akron, the Cleveland, Cincinnati, Chicago & St. Louis, the New York, Chicago & St. Louis (Nickel Plate), the Wheeling & Lake Erie, the Cleveland, Akron & Columbus.

The natural advantages of Cleveland have been improved by the municipality and the federal government till it forms one of the finest of harbors. The lower course of the river has been widened and deepened, and near the mouth given a uniform width of 325 feet, in place of a minimum of 150; and at each side of the mouth a stone pier 1,500 feet long has been built out into the lake, affording a channel 16 feet deep. The public dock frontage on river and lake amounts to over a mile, about half of which has been improved. A western arm of the river, about a mile long, parallel to the lake shore a little way in, has been dredged to a large ship canal, with railway docks. But still more important is the great government breakwater, begun in 1879, and \$8,000,000 already spent on it. Starting opposite the mouth of the western arm, it runs about 3,000 feet into the lake, then 4,000 feet northeast parallel to the shore till opposite the main mouth, then with a break of 500 feet runs for another 2,000 feet to opposite the Union Station, forming a sheltered basin of some 300 acres west of the mouth. An extension of the eastern arm 4,000 feet farther is now under way, making nearly two miles of outer wall.

Manufactures.—Cleveland is the second largest manufacturing place on the lakes, and second in the State; and in the manufacture of iron and steel and the goods made from them, is among the foremost in the country, owing to its proximity to Pennsylvania iron, Ohio coal, and limestone from the Lake Erie islands, and its being the place of receipt of Lake Superior iron. It is the centre of the malleable-iron trade of the country; first in the United States for wire and wire nails, and second in hardware: the first of lake ports in iron and steel shipbuilding, as formerly in wooden shipbuilding,—the actual number of vessels turned out being greater than in any other United States city, and some of them reaching 380 feet long and a cost of half a million dollars,—and forges a large part of the steel shafts and stern-posts of the vessels built on the Atlantic coast. The variety of its industries in this kind is almost endless,—as bridge castings and forgings, rails, car wheels, engines and boilers, cranes for unloading vessels, railway machinery of all sorts, printing presses and sewing machines, oil and gas stoves, etc. The five groups alone of “iron and steel,” “bolts, nuts, washers, and rivets,” “forgings,” “iron work, architectural and ornamental,” and “foundry and machine-shop products,” aggregate over \$45,000,000 a year; and electrical apparatus, over \$3,500,000 more. Besides these, there is a remarkable and most valuable variety of small specialties demanding highly skilled labor, often performed by independent workmen not compacted in shops, as optical instruments, and other scientific work of delicate accuracy. The next greatest industry is that of slaughtering and meat packing, which amounted in 1900 to \$7,514,470, second only to Cincinnati in the

State. Men’s and women’s clothing, malt liquors, petroleum refining, paints, and chemicals are also of great importance and volume. The total product of its industries in 1900 was \$139,849,806, employing 64,220 workmen and officials, with wages and salaries amounting to \$33,624,834 yearly.

Finances and Government.—The assessed value in 1900 was \$142,768,280, against \$99,614,055 in 1890; the net debt (there being a sinking fund of \$2,607,000), \$14,121,530; tax rate, \$30 per \$1,000, of which slightly over one third was for schools. The expenditures are about \$6,000,000 a year, with large special outlays for improvements, of which the great public-building scheme is chief. The government is by the new city code of 1903, which went into effect in May of that year, and differs materially from the former federal plan of separating executive from legislative powers, which for more than a decade was in force. The new plan comprehends a two-years’ mayor; an elected Board of Public Service; a Board of Public Safety, appointed by the mayor, and a council of 32 members in a single chamber, which makes all appropriations; and the chief school and court officials and the city treasurer are elected by the people.

Banks.—In 1902 there were 71 banks of all denominations operating in the city, including 14 national banks, with combined capital of about \$11,000,000, and deposits of over \$50,000,000, against \$15,000,000 in 1890. The savings banks have upward of \$100,000,000 on deposit, against \$37,000,000 in 1890.

Population.—1820, 606; 1830, 1,076; 1840, 6,071; 1850, 17,034; 1860, 43,417; 1870, 92,829; 1880, 160,146; 1890, 261,353; 1900, 381,768, of whom 124,631 were foreign-born, and 163,570 native-born of foreign parentage,—288,201 in all; and 87,740, or 23 per cent, were native Americans. An analysis of this influx, however, makes not quite so extreme a showing. Of these foreigners, 47,566 were Germans, 18,460 English of Great Britain or Canada, 13,579 Bohemians, 13,120 Irish, 9,558 Hungarians, 7,696 Poles, 3,607 Russian Jews, 3,065 Italians, 2,179 South Americans, 1,490 Welsh, 1,000 Swedes, etc. The immigration 1880–90 being roughly on the same lines, and assuming one third the Irish immigration to be from the North and therefore practically English, the people of English stock would be raised to 140,000, or toward 37 per cent in place of 23.

History.—For the claim of Connecticut to the territory from lat. 41° to 42° 1' N., and 120 miles west of the Pennsylvania line, see WESTERN RESERVE. That State conveyed its title to the Connecticut Land Company, which in 1796 sent out Moses Cleaveland to survey the land and establish “New Connecticut”; and his party, having surveyed 60 miles, ran the line north to the Cuyahoga and followed it to the lake, reaching the latter 22 July. Cleaveland at once fixed on the plateau as the capital of the new State, and had it laid out, with the square and its two main streets (not intersecting) as now, with the same names, but Euclid (then called Middle Highway) only starting from Huron Street; it was not cut through to the square till 1815. The settlement was given Cleaveland’s name, but not his chosen spelling, the first survey map bearing “Cleveland”; usage fluctuated, but was fixed in 1831

CLEVELAND — CLEVELAND, CINCINNATI, CHICAGO & ST. LOUIS RY. CO.

by the adoption of the shorter form by a newspaper, it is said because the "a" would not go into a headline. The soil being poor, most immigrants went on into the interior; early commerce was on the Ohio, and for a decade Cleveland remained a hamlet with a few dozens at most, those mainly Connecticut people. It became a part of Jefferson County in 1797, of Trumbull County in 1800,—the United States having assumed administration over the Western Reserve,—and of Geauga County, its county-seat in 1805, just after it had become a port of entry; in 1810 Cuyahoga County was formed, with Cleveland for its seat, probably having about 100 inhabitants. They must have been of good quality, however, as a library was started in 1811. In 1814 Newburg was set off, and for many years was the more important of the two, from its water power. On 1 June 1815 Cleveland was incorporated as a village; and in 1816 the first bank was started. In 1818 the first newspaper was issued, the *Cleveland Gazette and Commercial Register*. In 1820 it had grown to over 600. In 1824 the first steam vessel was launched. But two great events happened to it near the end of the decade. In 1827 the Ohio Canal was opened to Akron, and in 1832 to the mouth of the Scioto at Portsmouth; and in 1828 the cutting of a channel across the bar at the river mouth, giving it 10 feet of water, was completed. These were its making, and with about 1,000 in 1830, the town had grown to over 6,000 in 1840. In 1836 with about 4,000 people it received a city charter, two days after its neighbor Brooklyn across the river had received one as "the City of Ohio," which lasted till 1853, and was then annexed to Cleveland. In 1834 a horse railroad with wooden rails was built to Newburg.

The same year five steam railroads were chartered from Cleveland to everywhere, and the Ohio R.R. to the Maumee sold a good deal of stock; but the panic of 1837 ended such speculations, and it was not till 1846 that more were even chartered, and about five years later before the first one was built. The advantage was immense, and it leaped from 17,000 to 43,000 within a few years. About the time of the war the iron industry began to take root, and the manufacture of iron products for the government during the war crowded its manufactories, as did that of clothing. Since then its history is mainly that of an enormously expanding industrial city, but one that has never forgotten to keep its intellectual growth and the spirit of culture abreast of its material development. In 1872 it annexed East Cleveland; in 1873 Newburg; in 1893 West Cleveland and Brooklyn. In 1896 it celebrated its centennial.

Cleveland began the new century with no abatement of its remarkable increase in population and with many evidences of expansion in a material way. The additions to the water-works and sewerage systems, the improvement of the lake front and the river channel, the establishment of the colossal group plan of public buildings, the increase of street paving, and the continued extensions of the park and boulevard systems, indicate that Cleveland is in the midst of an era of progressive activity with which no previous period in its history can bear any comparison.

W. R. ROSE,

Associate Editor Cleveland Plain Dealer.

Cleveland, Tenn., a city and county-seat of Bradley County, about 30 miles from Chattanooga, on the Southern R.R. In addition to the usual industries of a town in an agricultural region, it has stove-works and woolen and flour mills. It is the site of Centenary Female College. Pop. (1900) 3,858.

Cleveland, Cincinnati, Chicago & Saint Louis Railway Company, The. This road, better known as the "Big Four Route," is 2,600 miles in length. The first road completed in the State of Indiana, which is now a part of the Big Four system, was that from Madison to Indianapolis, and, although a charter for it had been granted as early as 1831, the actual work of construction was not commenced until 1836, and it was 1 Oct. 1847, before it was completed to Indianapolis.

A railroad from Indianapolis to Union City was next projected. In the winter of 1850 the road was extended to Pendleton, a distance of 28 miles, and in 1852 cars were running to Union City, 64 miles away. In 1859 it was consolidated with the Ohio Line, and, in 1868, with a line from Cleveland to Cincinnati, when it became known as the "Bee Line."

In 1853 a road was opened from Indianapolis to the Ohio River, at Lawrenceburg, and, in 1854, this line was extended to Cincinnati. In 1856 the charter was granted for a road from Indianapolis to La Fayette, and, in 1866, this road was consolidated with the Indianapolis and Cincinnati line. Connections were formed which gave the road entry in Chicago as well as into Saint Louis; new rails were laid; new equipment was purchased, and, in 1890, the "Bee Line," with all its connections, was consolidated with the Big Four, the new system assuming the latter title. Later the Wabash & Michigan and the Old Indiana, Bloomington & Western, with its two divisions, one reaching to Peoria on the west, and the other to Sandusky on the east, were incorporated in the great system.

Some idea of the full extent of the Big Four system may be gained from the following list of railroads, all of which are now incorporated in the Cleveland, Cincinnati, Chicago & Saint Louis Railway Company:

The Pendleton & Indianapolis R.R. Co. was chartered 15 Jan. 1846. This road was combined with the Indianapolis & Bellefontaine R.R. Co., before its construction was completed. The name of the latter company was changed to that of the Indianapolis, Pittsburg & Cleveland R.R. Co., in 1854. The Bellefontaine & Indiana R.R. Co. was chartered in Ohio, 25 Feb. 1848, and, in 1864, it was consolidated with the Indianapolis, Pittsburg & Cleveland Company, under the name of the Bellefontaine Railway Company. The Cleveland, Columbus & Cincinnati R.R. Co., was chartered 14 March 1836. In 1862, the company purchased the Springfield, Mount Vernon & Pittsburgh road, originally chartered in 1850 as the Springfield & Mansfield R.R. Co., and, in 1868, it consolidated with the Bellefontaine Railway Co., taking the name of the Cleveland, Columbus, Cincinnati & Indianapolis R.R. Co. In 1880 it leased the Mount Gilead Short line.

The Indianapolis & St. Louis R.R. Co., was the outcome of the efforts of the Cleveland, Columbus, Cincinnati & Indianapolis; the Pittsburg, Ft. Wayne & Chicago, and the Indian-

CLEVENGER — CLICHY-LA-GARENNE

apolis, Cincinnati & La Fayette companies to secure an independent line from Indianapolis to Saint Louis. The first meeting of the roads in consolidation was held 5 Sept. 1867. Six days later a 99-year lease was signed with the Saint Louis, Alton & Terre Haute Ry. Co., which was the closing link in the through line from Indianapolis to East Saint Louis. When the Indianapolis & Saint Louis Ry. Co. was sold by the receiver, in 1882, it was purchased by the Cleveland, Columbus, Cincinnati & Indianapolis Ry. Co., and has since been operated in its interests. With it was taken the Carbon & Otter Creek Valley R.R. Co., a line used as a feeder to the I. & St. L.

The Indianapolis & Cincinnati R.R. Co., chartered 4 Oct. 1853, was a combination of the Lawrenceburg & Indianapolis, the oldest line in Indiana; the Lawrenceburg & Rushville, afterward the Lawrenceburg & Upper Mississippi, and the Shelbyville & Indianapolis roads. These several consolidations were all effected prior to 14 Feb. 1864, when the Indianapolis & Cincinnati road was itself consolidated with the La Fayette & Indianapolis Company to make the Indianapolis, Cincinnati & La Fayette R.R. Co. In 1870 the system went into the hands of a receiver, and, in 1880, it was sold and incorporated as the Cincinnati, Indianapolis, Saint Louis & Chicago Ry. Co.

The Cleveland, Cincinnati, Chicago & Saint Louis Railway Co., the official title of the "Big Four Route," was a consolidation of the Cleveland, Columbus, Cincinnati & Indianapolis; the Cincinnati, Indianapolis, Saint Louis & Chicago, and the Indianapolis & St. Louis Railway Companies. It was effected 30 June 1889, but, prior to that time, the Cincinnati, Indianapolis, Saint Louis & Chicago Company had acquired the Vernon, Greensburg & Rushville, the Fairland, Franklin & Martinsville, and the Cincinnati, La Fayette & Chicago roads. The latter included the recently acquired Kankakee & Indiana R.R. The Hope & Greensburg had been built and had been extended to the Columbus, Hope & Greensburg.

The Mad River & Lake Erie Ry. Co., chartered 5 Jan. 1832, constructed its Findlay Branch in 1845, and acquired control of the Sandusky City & Indiana R.R. Co., in 1854. In 1858 it changed its name to the Sandusky, Dayton & Cincinnati R.R. Co. In 1865 it went into the hands of a receiver, and was reorganized, 1866, as the Sandusky & Cincinnati R.R. Co. For about two years it was operated by the Cincinnati, Dayton & Eastern R.R. Co., but when, in 1868, the lease was surrendered, the road adopted the name of the Cincinnati, Sandusky & Cleveland R.R. Co., but all the lines operated by this corporation were finally brought under the control of the Big Four. Among these was the lease of the Columbus, Springfield & Cincinnati R.R. Co.

The Cairo, Vincennes & Chicago Ry. Co. was practically a receivership consolidation of the Danville & Southwestern, the Saint Francisville & Lawrenceville, and the Vincennes & Cairo roads. In 1890 the Big Four assumed control of the lines under an operating agreement. Among the properties of the company at that time was a large and important portion of the old Saint Louis, Terre Haute & Alton R.R. Co.

The Cincinnati, Wabash & Michigan R.R. Co. was the result of a consolidation of the

Warsaw, Goshen & White Pigeon R.R. and the Grand Rapids, Wabash & Cincinnati road. It was effected in 1871. In 1882 it was consolidated with the Elkhart, Niles & Lake Michigan R.R. Co., under the name of the Cincinnati, Wabash & Michigan Railway Co., and in 1892 the entire property was purchased and incorporated in the Big Four system.

The White River Railroad Co. was taken under an operating contract in 1891, while the Cincinnati & Southern Ohio Railroad Co., formerly the Louisville, Cincinnati & Dayton, was virtually constructed under the directions of the Cleveland, Cincinnati, Chicago & Saint Louis company and became a part of that system.

The Cincinnati & Springfield Railway Co., was acquired by the Cleveland, Cincinnati, Chicago & Indianapolis Ry. Co., under a 999-year lease, sometime prior to its completion, in 1872, and so passed into the control of the Big Four Route.

For the year ending 30 June 1905, the total earnings were \$22,141,110 and other income \$284,217. The operating expenses were \$16,131,112 and the total payments were \$3,915,378, thus showing a surplus of \$2,378,837.

H. J. RHEIN,
General Passenger Agent.

Clevenger, klěv'ěn-jěr, **Shobal Vail**, American physician: b. Florence, Italy, 24 March 1843. He was the son of an American sculptor of the same name. During the Civil War he was a first lieutenant in the engineer corps, and later United States deputy surveyor in Montana and Dakota, writing a 'Treatise on Government Surveying' (1847). He graduated at Chicago Medical College, 1879, established himself in practice in that city, and is a specialist in nervous and mental diseases, and a professor and lecturer in several colleges. He has written: 'Comparative Physiology and Psychology' (1884); 'Artistic Anatomy' (1885); 'Spinal Concussions' (1889); 'Medical Jurisprudence of Insanity, or Forensic Psychiatry' (2 vols. 1898), and many professional articles in scientific and medical journals.

Clèves, klāv (German *Kleve*), Prussia, chief town of the Rhine province, 70 miles northwest of Cologne, and 4½ miles from the Rhine, with which it is connected by a canal. It has manufactures of machinery, tobacco, leather, and cotton. In the centre of the town rises the old and renowned Schwanenburg (Swan's Castle), the ancient residence of the dukes of Clèves, founded, according to tradition, by Julius Cæsar. The collegiate church, dating from the 14th century, contains monuments of the counts and dukes of Clèves. Prussia (Brandenburg) acquired Clèves in 1609. Pop. 15,000.

Cliche, klěsh, an electrotype or stereotype cast from an engraving.

Clichy-la-Garenne, klē-shē-lä-gä-rěn, France, (Latin, *Cligiacum*), a town in the department of the Seine, near the right bank of the Seine, and on the railway between Paris and St. Germain, about four miles northwest of Paris. In the 7th century it was frequently the residence of the court. It contains a parish church, the erection of which is due to the celebrated Vincent de Paul, who was curate of Clichy in 1612; and has manufactures of white-lead, chemical products, glue, varnish, rolled lead, etc. Pop. (1901) 39,521.

CLIENTS — CLIFFORD

Clients, citizens of the lower ranks in ancient Rome who chose a patron from the higher classes, whose duty it was to assist them in legal cases, and to take a paternal care of them. The clients, on the other hand, were obliged to portion the daughters of the patron if he had not sufficient fortune, to follow him to the wars, to ransom him if taken prisoner, and to vote for him if he was candidate for an office. If a client died without issue, and had made no will, his property fell to the patron. Clients and patrons were under mutual obligation not to accuse each other, not to bear witness against each other, and in general not to do one another injury. This relation continued till the time of the emperors. It may be considered as the transition from a patriarchal state, in which family relations are predominant, to a well-developed political system, securing the rights and independence of the individual. In modern times the word client is used for a party to a lawsuit who has put his cause into the hands of a lawyer.

Cliff. Nearly vertical rock walls are formed in a variety of ways by natural means. In the development of a drainage system in any high-lying tract of country, ravines, gorges, and cañons are formed by the down-cutting streams, as Watkins Glen, N. Y.; the gorge of the Niagara River, and the Grand Cañon of the Colorado. After long erosion the softer rocks may be removed, leaving the harder with steep faces standing above the surrounding country, as at the Delaware Water Gap, in the Catskills, and many places in the Appalachian Mountains. In high mountains glaciers dig out deep channels. Cliffs formed in these ways may be called cliffs of erosion. Where a high coast borders any large body of water, the waves eating into the land form cliffs, as on the northern shores of Scotland, southern England, the coast of Maine, and elsewhere. Such cliffs may be called sea cliffs. Cliffs may also be formed by the rock fractures known as "faults," where the rocks on one side of a fracture rise faster than they are worn down by weathering. Such cliffs are not uncommon; they are found in many parts of the West, being especially prominent in arid regions like the Colorado plateau, where weathering is slow. Such cliffs may be called "fault cliffs."

Cliff Dwellers, a race of Indians formerly living in the cliffs bordering on the valleys of the Rio Grande and Rio Colorado. Their homes were built in the recesses of these cliffs at a height often of several hundred feet from the ground, and at the present time seemingly inaccessible, as the former paths that led to them have nearly all been destroyed by the crumbling away of the rocks. These dwellings sometimes consisted of many rooms, and in some cases were two or more stories high, hewn in the rock, with wooden lintels in the doors and windows, which were probably closed with skins or blankets. The walls were finished with a plaster of clay. How the inhabitants subsisted is not known, but probably mainly by hunting and fishing, as the soil about these localities is barren. The Pueblo Indians, who are still to be found in that section, are probably descendants of the Cliff Dwellers, and possess considerable skill in making articles of pottery, etc.

Cliff-Dwellers, The, a novel by Henry B. Fuller (1893). It is a story of contemporary Chicago; a sober arraignment of the sin and greed of a purely material civilization. The protagonists of the drama take their title of "cliff-dwellers" from their occupation of various strata of an enormous office building. The story is too sincere to be called a satire, and too artistic to be called a photograph; but it is executed with a merciless faithfulness that has often elicited both characterizations.

Cliff Haven. See SUMMER SCHOOLS.

Cliff Swallow, a species of swallow (q.v.), the *Petrochelidon lunifrons* of ornithologists. The sexes are alike, of a lustrous steel-blue color above, with a brownish white crescent on the forehead, the under parts generally grayish with a blue patch on the breast, and the throat, chin, and sides of head rust color. From most other species of the *Hirundinidæ* (q.v.) the cliff swallow is distinguished by the very short square tail, beyond which the tips of the folded primary wing feathers extend, and the thick bill. The cliff swallows inhabit North America, except Florida, to the northern limit of the tree zone, and breed in colonies nearly throughout their range; in winter they enter South America. Probably on account of their social habits, cliff swallows are distributed very irregularly, in some places being very common, in others rare. Formerly this species attached its remarkable retort-shaped nests of mud to cliffs, which have now been generally forsaken for the more convenient and accessible eaves of barns, etc.; on this account it is known in some localities as eave swallow, in others, from the material used in constructing the nests, as mud swallow.

Cliff'ord, the name of a very old English family, several members of which have played an important part in history. The founder of the family, Walter, son of Richard Fitz-Ponce, a Norman baron, acquired the castle of Clifford, in Herefordshire, under Henry II., and hence took the name of Clifford. In 1523 the Cliffords became earls of Cumberland, but in 1643 this title became extinct. The male line of the Cliffords is at present represented by the baronial family Clifford of Chudleigh. The first Baron Clifford of Chudleigh was Thomas Clifford, one of the members of the Cabal, who was raised to this dignity in 1672.

Clifford, George, Earl of Cumberland: b. 1558; d. 1605. A celebrated English navigator.

Clifford, Hugh, English civil servant: b. London 5 March 1866. He entered the Malay states civil service in 1883 and was British resident at Pahang 1896-9. He has published: 'In Court and Kampong' (1897); 'Studies in Brown Humanity' (1898); 'Since the Beginning' (1898); 'In a Corner of Asia' (1899); 'Bushwhacking' (1901); and is joint author with F. Swettenham of a 'Dictionary of the Malay Language.'

Clifford, John, English Baptist clergyman: b. Sawley, Yorkshire, 16 Oct. 1836. He was educated at the Baptist College, Nottingham, University College, London, and the Royal School of Mines and has been minister of the Praed Street and Westbourne Park Church, London, from 1858. He was president of the London Baptist Association, 1879; of the Baptist Union, 1888 and 1889; of the British Chau-

CLIFFORD — CLIMATE

tauqua, 1899-1900, as well as of other assemblies. He has received degrees from several English colleges as well as of D.D. from Bates College, Lewiston, Maine, and has been for years the acknowledged leader of the Baptist faith in England. He was editor of the 'Baptist Magazine,' 1870-83 and has published 'Familiar Talks with the Young' (1872); 'George Mostyn' (1874); 'Is Life Worth Living' (1880); 'Daily Strength for Daily Living' (1885); 'The Dawn of Manhood' (1886); 'The Inspiration and Authority of the Bible' (1892); 'The Christian Certainties' (1893); 'Typical Christian Leaders' (1898); 'Social Worship an Everlasting Necessity'; 'God's Greater Britain' (1899).

Clifford, Lucy Lane, English novelist, married to William Kingdon Clifford (q.v.) 1875; after whose death in 1879 she turned to literature for support. Her writings, some of which are notably original and striking, include: 'Very Short Stories' (1882); 'Mrs. Keith's Crime' (1885); 'Love Letters of a Worldly Woman,' which attracted much attention (1891); 'The Last Touches' (1893); 'Aunt Anne' (1893); 'A Flash of Summer' (1895); 'Mere Stories' (1896); 'A Woman Alone' (1901); 'Woodside Farm' (1902); and the plays, 'The Likeness of the Night' (1900); 'A Long Duel' (1901); 'A Supreme Moment' (1902); 'Margaret Vincent.'

Clifford, Mrs. W. K. See CLIFFORD, LUCY LANE.

Clifford, Nathan, American jurist: b. Rumney, N. H., 18 Aug. 1803; d. Cornish, Me., 25 July 1881. Through his own efforts he obtained a common school and academic education, studied law, and began practice in York County, Me., 1827. He was a member of the State legislature, 1830-4; speaker of the House, 1833, and attorney-general of the State, 1834-8. He served two terms as representative in Congress 1839-43, advocated Van Buren's re-election, took part in public discussions with the leading Whig orators, and established a reputation as one of the most eloquent of democratic champions. He was United States attorney-general under President Polk, and a special commissioner to Mexico to arrange terms of peace between that country and the United States, and he negotiated the treaty which secured California as a part of the United States. He resumed law practice in Portland, Me., 1849, and won an enviable reputation for forensic ability. In January, 1858, President Buchanan appointed him associate justice of the United States supreme court. As the oldest associate judge in 1877, he presided over the electoral commission conducting its proceedings with noteworthy impartiality, though a firm believer in Tilden's election.

Clifford, William Kingdon, English mathematician: b. Exeter 4 May 1845; d. Madeira 3 March 1879. Educated in his native town and at King's College, London, he proceeded to Trinity College, Cambridge, where he graduated in 1867 as second wrangler. In 1871 he was appointed professor of applied mathematics at University College, London, a post which he held till his death. In 1876 his health gave way, but was restored by a summer spent in Spain and Algiers, though not permanently, for two years later he again broke down, and died

soon afterward. In mathematics his teachings and writings are regarded as marking an epoch in the history of the science in England. His 'Canonical Dissection of a Riemann's Surface,' his theory of 'Biquaternions,' and his memoir 'On the Classification of Loci,' may be mentioned as his most important contributions to this subject. He also wrote on philosophical subjects. Among his works the most important are: 'Elements of Dynamic' (vol. i. on 'Kinematic,' 1878); 'Seeing and Thinking' (1879); and 'Common Sense of the Exact Sciences' (1885, completed by Karl Pearson). In 1882 appeared a collection of his 'Mathematical Papers,' and in 1879 his 'Lectures and Essays.'

Clif'ton, England, a popular watering-place of Gloucester County. It is a suburb of Bristol situated within the city boundary, on the summit of lofty cliffs, whence its name. A suspension bridge 703 feet long here crosses the river Avon 245 feet above its bed. Clifton contains many handsome residences but neither trade nor manufactures. It is known for its hot mineral springs. Clifton College is an important educational institution. Pop. 44,400.

Clifton Springs, N. Y., a summer and health resort in Ontario County on the New York Central and Lehigh V. R.R.'s, famous for its sulphur springs. Pop. (1900) 1,617.

Climacteric (*annus climactericus*), a critical year or period in human life wherein, according to astrologers, there is some notable alteration to happen in the body, and a person is exposed to great danger of death. The word comes from *κλιμακτής*, the step of a ladder or stair. The first climacteric is, according to some, the seventh year; the others are multiples of the first, as 14, 21, etc.; 63 and 84 are called the grand climacterics, and the dangers attending these periods are supposed to be great. Some held, according to this doctrine, every seventh year a climacteric; others allowed this title only to the product of the multiplication of the climacterical space by an odd number, as 3, 5, 7, 9; others considered every ninth year as a climateric. The idea of climacterics is very ancient.

A climateric disease is a disease affecting both men and women, but more obvious in the former. It may be looked for about the 63d year of age, but varies in the time of its coming, according to the constitution of the individual, the limits being in the one direction 50, and in the other 75. Its most common predisposing cause is mental anxiety or suffering. The expression of the countenance alters for the worse, the pulse becomes accelerated, the flesh wastes away without obvious cause; there are sleepless nights, and wandering pains flit through the head and chest, and sleep is either deficient or brings little refreshment. After a time recovery as a rule takes place, but the countenance never recovers its former aspect, or the constitution its vigor.

Climate (Gr. *κλίμα*, "a slope or inclination"). The term was used to denote the effect of the oblique rays of the sun on the temperature of the earth and its atmosphere. To-day it is applied to the sum of the atmospheric conditions as recorded for a long period of time; or, in other words, it is the totality of weather, while "weather" is the physical con-

CLIMATE

dition of the atmosphere at a given time or during a limited period.

One may well speak of the weather to-day, or of last month, or of some past year; but not of the climate of a day, a month, or a year. The climate of a place is what may be expected to occur as the result of a study of its continuous weather records for a long period of years,—the atmospheric pressure, the temperature, the rainfall and snowfall, the time and frequency of frost, the extremes of heat and cold, the direction and velocity of the wind, the amount of air that flows from the different points of the compass, the amount and intensity of sunshine, the humidity and transparency of the atmosphere, and its electrification.

The study of the causes of the weather and of the laws of storms constitutes that branch of science known as meteorology; climatology is to be considered as a subdivision of meteorology.

Climates may be broadly divided into marine, continental, mountain, and plain, with the many variations produced as these conditions gradually or precipitately shade off the one into the other.

Basis of Climate.—If the axis of the earth's rotation were perpendicular to the ecliptic (the plane of its orbit) there would be no seasonal changes, for the rays of the sun would fall upon every point on a parallel of latitude with the same angle of incidence on each day of the year. There would be but one season at any place and it would never end; and there would be little variation in the intensity of storms. But as the axis of the earth is inclined at an angle of 23.5° to the plane of its orbit, and as the direction toward which it points remains nearly constant, there are but two days in each year when both hemispheres (north and south) are exactly one half in sunshine and one half in darkness, that is, at the vernal and autumnal equinoxes, when the sun crosses the equator. At all other times in each hemisphere the angle at which the sun's rays strike the earth, the depth of the air through which they pass, the length of the day, and the proportions of each hemisphere immersed in sunlight, are increasing or decreasing. As these four conditions increase in the northern hemisphere after the vernal equinox the summer grows upon us, reaching its greatest degree of heat about four weeks after the summer solstice. The lag of temperature is due to the fact that the atmosphere, being heated mainly by radiation from the earth and comparatively little by the direct action of the solar rays, does not attain its greatest heat until after the land and water have reached their maximum temperature and in turn have communicated this heat to the air above. Up to June 21, or the summer solstice, the northern hemisphere receives each day more heat than it loses, otherwise it could not gain in temperature; after the solstice the sun each day at meridian is found to have receded a little to the south. At places north of the tropic of Cancer its rays fall with increasing obliquity and pass through a greater depth of air, and impinge for a less time each day, so that within a few weeks the earth begins to radiate more heat each day than it receives. The maximum heat of summer occurs, on the average, when the loss of heat from the earth is just equal to that gained during the day from

the sun. This, as previously stated, occurs several weeks after the sun is well on its way southward. About September 21 the autumnal equinox occurs, when the sun crosses the equator, and, as at March 21, the days are of equal length at all latitudes of both hemispheres. On or about December 21—the winter solstice—the sun is farthest south, and the same conditions prevail in the southern hemisphere that prevailed in the northern hemisphere on June 21. North of the equator the sun is now least effective; its rays reach the earth at the lowest angle through the greatest depth of air, and they are operative for the fewest hours during each day, of any portion of the year, but the greatest cold does not occur. This comes about four weeks later, when the increasing heat received each day by the earth from the sun is just equal to that lost by radiation.

The effect of latitude will be understood by reference to the following figure:

As the latitude increases, the rays of the sun will fall with increasing obliquity, and they lose in power by being spread over a larger surface, and by traversing a greater depth of air, which absorbs more of their heat.

The same beam A, "when the sun is vertical, is spread over a surface such as CC. When the sun is inclined at an angle as shown in the figure, the beam is spread over a surface, C' C', which is somewhat greater than the first, and it passes through a column of air, B' B' C' C', greater than that of BBCC. The intensity of insolation at midday decreases approximately as the cosine of the latitude."

Near the equator the sun's rays at midday fall perpendicular to the surface of the earth, and there is virtually no change in the length of the day, and consequently there is little variation in the daily or seasonal temperature. As the variation in the length of the day increases with the latitude, there are regions, in the temperate zone, where the length of time that the sun's rays fall upon the earth each day more than compensates for their obliquity. On this account the interior of continents may have at midday a higher temperature than prevails at the equator.

Solar energy is about seven per cent greater at perihelion (the point in the earth's orbit nearest the sun) than at aphelion (the point farthest away). As perihelion occurs in December, or the summer time of the southern hemisphere, and aphelion in its winter, that region has a greater annual range in the intensity of solar insolation than the northern hemisphere. If the land surfaces of the two hemispheres were equal in area, the southern would have colder winters and warmer sum-

CLIMATE

mers than the northern, and this is the case in portions of the southern hemisphere where the land area is large. But the great capacity of water for heat, and the slowness with which it radiates the same, modifies seasonal extremes that otherwise would be much greater.

Variations in Climates.—If the earth were all water or all land, and if the land were everywhere of the same elevation, most of the factors that cause variations in climates—often considerable for regions closely contiguous—would be eliminated from the equation. Every point on the same parallel of latitude would have the same mean annual temperature, and the same average heat in summer and the same average cold in winter. New York and London, separated by eleven degrees of latitude, would not, as now, have about the same mean annual temperature. If it were all water, there would be no such extremes of heat and cold as we now know. It is probable that a thermometer exposed in shade four feet from the surface of the earth would not anywhere—even at the equator—ever register above 90° F.; there would be no frost within 35° or 40° of the equator, and zero temperatures would be recorded only in regions within 30° of the poles. If it were all land the heat would be much more intense than now in the tropics, and in the temperate and frigid zones the heat of summer and the cold of winter would reach extremes unknown at this time.

All the anomalies of climates are caused by the different specific heat capacities of land and water; their different powers of conduction and radiation; the irregular distribution of these two surfaces; the widely-varying elevations of the land; the trend of mountain ranges; the prevailing direction of the winds, and the carrying of large quantities of heat by ocean currents from the equator toward the poles, and the relative quantities of cloud and rain or snow. It is germane to a proper understanding of climate to know something in detail of the manner in which the air is heated. At 100 or 200 miles above the earth's surface there is only the hypothetical ether, which, while too tenuous to be detected or measured by any methods or appliances so far known, is supposed to be the medium that transmits solar energy to the earth and diffuses it through space. This energy, coming in many different wave-lengths and with widely varying intensities of vibration, produces several different phenomena as it is absorbed by or passes through the air, or as it impinges on the surface of the earth. The waves differ in their effects on different objects, depending on the length and the absorptive response of the substances upon which they fall. The waves have heating, lighting, and chemical effects simultaneously in themselves, and it is only the nature of the objects upon which they fall that tends to differentiate them. The atmosphere, even at the surface of the earth, absorbs but a small part of the heat-waves. They therefore reach the earth and warm its surface; and the earth in turn, by radiation, convection, and conduction, sends back into the air long heat-waves, which, unlike the shorter solar waves, are readily absorbed by the atmosphere. The atmosphere is thus warmed from the bottom upward. This accounts for the perpetual freezing temperatures of very high mountain

peaks, although they are nearer the sun than are the bases from which they rise. At the height of one mile in free air the temperature is about the same at midday as at midnight. Only during recent years have we begun to realize how extremely thin is the stratum of air next the earth that has sufficient heat for the inception, growth, and maturity of both animal and vegetable life. The raising of the thermometer shelter at the New York City observatory from an elevation of 150 feet above the street to an elevation of 300 feet, has caused an apparent lowering of the mean annual temperature of 2.5° F. On the hottest day in summer, if one could be lifted up to a height of only 1,000 feet in free air, he would find a marked change in temperature. The United States Weather Bureau at 16 stations made a total of over 1,200 kite observations in the United States in 1897. They showed an average decrease of 7.4° F. for the first 1,000 feet of ascent during the warm months, and when the observations were taken near the hour of daily maximum heat the decrease was frequently as much as 15° . At the height of six miles the cirrus clouds common to this level are, on account of the low temperature, always composed of minute ice spiculæ, never of watery droplets like the lower cumulus clouds. In the middle latitudes of both hemispheres the air at this height is ceaselessly rushing toward the east, passing uninterruptedly over the cyclonic and anti-cyclonic systems that cause our storms and cold waves at the surface of the earth. Glaisher and an assistant ascended to a height of about 30,000 feet. They suffered greatly from the cold, which measured many degrees below zero, although the time of year was 5 September. At the height of six miles the average temperature, determined by many balloon ascensions is about -50° F.

The difference between continental and marine climates is marked. The same amount of heat will raise the temperature of a land surface four times as high as it will raise that of a water surface. Land is a good absorber and a good radiator, but it is a poor conductor and a poor reflector. The absorbed heat does not penetrate into the ground to any great depth. The land, therefore, retains its absorbed heat near the surface and quickly and freely radiates that which it has absorbed. These conditions give to large land surfaces much higher temperature during the day, and much lower temperature during the night, than obtain over a water surface of the same latitude and much colder winters and much warmer summers. As an illustration, it may be stated that the Bermuda Islands, in the North Atlantic Ocean, have a mean daily range of temperature of only 10° F., and an annual range of only about 50° ; while Memphis, Tenn., near the same latitude, in the interior of a large continent, has a daily range of 17° and an annual range of 112° . At Memphis a temperature of 104° has been recorded in summer and -8° in winter. At Bermuda the temperature generally reaches 90° during the summer, but very rarely exceeds that figure, while temperatures below 45° are also very infrequent. The two places are typical of continental and of marine climates. All regions bordering closely on the sea partake of both climates, the predominating one being determined by the direction in which the coasts

CLIMATE

trend, their elevation, and the direction and force of the prevailing winds.

In the middle latitudes of both hemispheres the prevailing winds are from the west, and therefore continents lying in these regions have a marine climate in their western coastal regions, where the air moves from the water to the land, and nearly continental climate in their eastern coastal regions, where the general movement of the air is from the land to the sea.

The distance to which moist and equable air conditions extend inland is determined by the elevation of the land and its trend relative to the incident winds, and the proximity of mountain ranges. The humid air from the Pacific meets the lofty range that skirts the western shoreline of both North and South America; it is forced up the mountain side until the cold of high elevation and the cooling of the air by expansion as it ascends cause it to precipitate its moisture mostly upon the western side of the mountain, and it passes to the interior of the continent bereft of that life-giving moisture which, were it not for the intervention of the mountains, would spread a mantle of luxuriant vegetation 1,000 miles inland. If the disintegrating effects of temperature and rainfall had worn down the Sierras, the Plateau, and the rugged crags of the Rocky Mountains to the height of the Appalachians, the vaporous atmosphere of the Pacific would flow eastward far more freely than now, and meet that which, by the convectional action of cyclones, is frequently carried from the Atlantic Ocean and the Gulf of Mexico inland to the Mississippi valley; then rain would be more abundant and the whole of the United States would have arable land.

To give a further idea of the effect of mountain systems on the climates of continents one needs only to reverse the conditions just mentioned; if the Appalachian Mountains were as high as the Rocky Mountains, and if they extended farther southward and bordered the Gulf of Mexico, then the Ohio River, the Mississippi, and the Missouri and their many tributaries would not exist, and the world's greatest granary would be a gray and nearly barren plain.

The specific heat of water is greater than that of almost any other substance. It requires ten times the quantity of heat to raise a pound of water one degree than it does to raise a pound of iron one degree. Solar rays penetrate the sea to a considerable depth; they are quite uniformly absorbed by the stratum penetrated. In consequence of these laws and conditions a vast quantity of heat is stored by the ocean in the tropics and slowly given to the air as the ocean currents carry the warm water toward the poles. In this connection the writer would correct what he believes to be an exaggerated popular idea relative to the effect of the Gulf Stream on the climate of Europe. The North Atlantic circulation, flowing northward on the western side of the ocean (except a southward current from Davis Strait that chills Labrador and somewhat affects the temperature of the New England coast), and southward along the coast of Europe, is many times more effective in modifying climate than is the Gulf Stream. That the western part of Europe is warmer, more humid, and subject to less radical changes in temperature than equal lati-

tudes in North America, except on the Pacific coast, is due primarily to the great ocean that lies on the west of Europe. Without ocean currents of any description, this body of water would give to the air that moves from it to Europe a more equable temperature than is possessed by the eastern part of the North American continent. Continents, therefore, partake largely of marine climates on their western borders, and principally of continental climates on their eastern borders.

Climate affects the health, happiness, and well-being of people more than any other condition that goes to make up their environment. Within the broad confines of the United States there are many, but not all, shades and varieties of climate. One of the questions most frequently asked is, "Where shall I find a climate possessing both dryness and equability of temperature?" To this interrogatory reply must be made that the ideal climate as regards equability of temperature and absence of moisture does not exist in the United States, but that the nearest approach to it will be found in the great Southwest.

The temperature of the Southwest is not equable in the sense of having an extremely small daily range, but it possesses the quality of annual uniformity in a greater degree than will generally be found elsewhere except on the seacoast, and there the humidity is great.

The most equable temperature on the globe will be found on the high table-lands and plateaus of the tropics. Santa Fé de Bogota, in the United States of Colombia, has an average temperature of about 59° F. for all months of the year, and the range for the entire year is less than is often experienced in a single day in some parts of the middle latitudes. But while the ideal temperature may be found on the higher elevations of the tropics, the rainfall is much greater and more continuous than in this country.

The temperature of a place depends chiefly on three conditions,—latitude, elevation, and contiguity to large bodies of water. At sea level in the tropics extreme conditions of heat and moisture produce very great physical discomfort. But even under the equator it is possible to escape the tropical heat of low levels by ascending from 4,000 to 6,000 feet. In the economy of nature there is a certain limit beyond which the two extremes, dryness and equability of temperature, cannot coexist; thus we may find a region so deficient in moisture as to satisfy the requirements of the case, but the very lack of moisture is a condition that facilitates radiation and thus contributes to great extremes of temperature. Regions may be found, as on the lower Nile, where there is a lack of rainfall coupled with a high and moderately uniform temperature. The mean winter temperature of Cairo, Egypt, is 56° F.; mean summer temperature, 83°; a range from winter to summer of 27°. The mean winter temperature of Phoenix, Arizona, is 52°; mean summer temperature, 87°; a range of 35°. It is by no means difficult to find a counterpart of the far-famed Egyptian climate in the great Southwest.

The dryness of the air and the clearness of the sky are the conditions upon which daily ranges of temperature depend; the greater these, the greater the range of temperature

CLIMATE

from day to night. While a high summer temperature is characteristic of the Southwest and other portions of the Rocky Mountain plateau, it is a fact that the sensation of heat as experienced by animal life there is not accurately measured by the ordinary thermometer. The sensation of temperature which we usually refer to the condition of the atmosphere depends not only on the temperature of the air, but also on its dryness and the velocity of the wind. The human organism, when perspiring freely, evaporates the moisture of its surface to the dry air of the interior arid regions, and thus lowers its temperature and prevents sunstroke, which, in the more humid regions from the Mississippi valley eastward, occur in great number with the air temperature much less than obtains in the West.

The meteorological instrument that registers the temperature of evaporation, and thus in some measure the actual heat felt by the human body, is the wet-bulb thermometer. The latter, as indicated by its name, is simply an ordinary mercurial thermometer whose bulb is wetted with water at the time of observation.

Effect of Climate on the Races.—Climate is the most potent of any factor in the environment of races. It is climate and soil, plus heredity and form of government, that produce either vigorous or weak peoples. In this respect it is a question if the United States does not possess a constant potential that, all other conditions being equal, places it in a class by itself.

Climate, soil, and good heredity may produce a race large of stature and of great physical endurance, but unless such a people exists under a liberal form of government, in which public education is fostered and the arts and sciences taught, it is unable to employ its strength in those lucrative vocations that alone give a high per capita of wealth; and wealth means power. It is also weak in defending itself, either in war or in commerce, against a people of less numerical strength that is liberally educated, skilled, and humanely governed.

If one reads of the overthrow of political dynasties and the subversion of trade and commerce, it will occur to him that the northmen have usually been conquerors. If we consider the invigorating effect of cold air and marked changes of temperature alone we might expect to find the strongest and most resourceful peoples inside of the Arctic circle; and if we consider fruitfulness of soil alone we might reasonably expect to find the dominant peoples in the tropics. But the fact is that the greatest human potentiality occurs somewhere between these two extremes. The boundaries cannot be accurately determined by the naming of certain parallels of latitude, but a close approximation is made to the truth in the statement that the most vigorous people physically and the most resourceful mentally will be found in the most northerly regions that will produce not simply cereal crops, but an abundance of them.

The sweep of the cold wave, as it is known in the United States, is quite distinctly North American. Nowhere else on fertile plains, unless it be in Russia, does the temperature show such wide oscillation within such short periods of time, nor do the icy blasts sweep over such a broad area. It is probable that much of the physical and the intellectual energy that have

caused the United States to excel in agriculture, in manufacturing, and in commerce were caused by the invigorating effect of the cold, dry, highly electrified air of the North American cold wave. The anti-cyclonic systems of air that constitute cold waves have a marked downward component of motion. This motion brings from a considerable altitude to the surface of the earth some of the high electrical potential of the upper air, which is strongly stimulating to man and to other forms of animal life. These cold north winds have a much greater specific gravity than warm and humid winds, and this condition, added to the force with which they come, scatter and diffuse the befouled air near the surface of the earth. Enough has been said to indicate that climate is nearly as important a part of the environment of animal life as it is of the vegetable existence, and that a wide range of annual temperature, if it be not so great as to limit the production of cereal crops, favors the development of strong races of men.

Change of Climate.—Notwithstanding the popular notion to the contrary, there is reason to believe that there has been no appreciable change in the climate of any large area within the period covered by authentic history. Changes in the surface of the earth may be noted within the lifetime of an individual, that are thought to prove that a change of climate has taken place, when the alterations may be due to the persistent action of freezing, thawing, rainfall, and flood. Great changes have occurred during geologic periods, but it is the opinion of the writer that they take place so slowly that thousands of years must elapse before their effect is measurable.

Effect of Forests on Climate.—Extremes of temperature, both heat and cold, are slightly less over forests than over open regions, but the most important effect of forests on climate is the economic conservation of precipitation, diminishing the intensity of floods by restricting the flow-off, and by shading the snow deposited during the winter from the increasing sun of spring and early summer. More moisture is absorbed by the soil when it is covered by forest than when it is cleared of its forest cover, and it follows that deforestation, if extensive, may diminish the supply of springs and streams.

Investigations in Germany and in India seem to indicate that there is an appreciable increase in rainfall as a result of reforestation. In general forests may be looked upon as the effect rather than the cause of rainfall.

Climate and Animals.—The geographic distribution of animals is doubtless the outcome of definite laws—laws that stand in close relation with the past history of the earth through a large portion of geological time. What those laws are forms a subject of great importance in studies of evolution,—a subject, it may be remarked, entirely too great to be adequately treated in the present connection. Naturalists are generally of the opinion that all animals have been produced from those that preceded them by some slow process of transmutation or development, and that this modification of animal forms took place very slowly, as evidenced by the fact that the historical period of nearly 4,000 years has hardly produced any perceptible change in a single species. That marked

CLIMATE AND CLIMATIC SPECIES AND VARIETIES

changes in the climate of the earth have occurred during the remote past there can be no doubt, and that those changes left a marked impress upon the fauna of the globe there can also be no manner of doubt. The great northern ice sheet and the accompanying cold of the glacial period, if it did not cause the extermination of the receding fauna, doubtless led to its migration to more congenial climates.

The part played in the faunal distribution of the globe by the present climate seems to be indirect rather than direct, although there are many facts which seem to point to a direct relation. While it is true that the fur-bearing animals of the frozen north are generally to be found in arctic regions, yet they send their representatives far into the temperate latitudes, and indeed into the borders of the regions inhabited by the more exclusively tropical species. On the other hand, the tiger, whose home is naturally associated with the hot districts of India and the Indian Archipelago, is equally at home in the elevated regions of the Caucasus and the Himalayas, where his footprints are not infrequently found impressed in fields of snow. Other groups of animals are more limited in their migrations. Some are so closely adapted to an arboreal life that they never stray far beyond the limits of forest vegetation, while others are so tolerant of climatic change that the limit of their possible range is conditioned only by the character and quantity of the food supply and the interposition of impassable physical barriers.

Climate and Plants.—The factors necessary to the development of plant life are light, heat, soil, and moisture. The ideal conditions as regards these essentials do not usually obtain, or, if they do, multitudes of plants seek to take possession of the region, so that there is a continuous struggle for existence in which many more plants fail than succeed.

The climatic factors heat and moisture are combined in several ways in different parts of the globe, and these combinations give widely different vegetation; thus a maximum of heat and a minimum of water give desert conditions where only specially adapted plants can exist. If, on the other hand, a maximum of heat is combined with a maximum of water, the result will be vegetation such as exists only in the rainy tropics. The possible combinations of the two climatic factors are very numerous, as are also those of soil and the effects of animal life and human agencies. Yet the vegetation of the globe is susceptible of a fairly definite classification. Following Humboldt, and adopting such terms as express in a general manner the vegetation characteristic of each zone, we have the following classification:

Zones of	Average Temperature
1. Palms and bananas.....	78°—82°
2. Tree-ferns and figs.....	73°—78°
3. Myrtles and laurels.....	68°—73°
4. Evergreens	60°—68°
5. Deciduous trees.....	48°—60°
6. Conifers.....	40°—48°
7. Lichens, saxifrages, and dwarf shrubs.....	32°—40°
8. Lichens and mosses.....	32° and below

While in a general way these zones stretch around the world in wavy belts, somewhat as

do the isotherms, similar belts may be found encircling mountain peaks and chains with increasing altitude above sea-level. Indeed it is possible to pass successively from tropic to arctic vegetation on a single mountain peak in the tropics.

Chief United States Weather Bureau.

Climate and Climatic Species and Varieties. Although a half century ago it was generally held that changes of climate have not profoundly affected organisms, yet the recent detailed study of variation has shown that climate and local influences have been the causes of origin of probably a very large number of the species contained in our museums and described in biological literature. Among insects, birds, and mammals it has been estimated that from a third to a half of the known species are climatic or local species or varieties, or local races. As is well known, Americans born of foreign parentage are larger than their ancestors, whether English, Irish, Germans, or French; and Boroditch has shown that the children of Americans of both sexes born in the United States, are larger than those of foreign races. This is generally attributable to difference in the climate of the Old and New Worlds, our American climate being drier, more changeable and stimulating than that of Europe. It appears that the introduced English sparrow has undergone a gradual modification since its introduction into this country about 40 years ago. Bumpus has critically examined over 1,700 eggs of this bird, one half from England and the other half from Providence, R. I. It was found that the eggs of the American race or breed vary more than the European, that they are smaller and of a strikingly different shape, being more rounded and with a much greater amount of color variation. This is attributed by the author to a suspension of natural selection. However, this may be, it belongs with the class of facts which show that the modification is primarily due to the change from one climate to another. Cockerell has found that a common European snail (*Helix nemoralis*), introduced into this country soon begins to present variations not known to exist in England, while in the introduced butterfly, *Pieris napi*, 12 American varieties, and of *P. rapæ* four varieties have appeared on American soil within the few years which have elapsed since their appearance and spread on this continent. Where different mammals are transported from temperate to tropical countries the wool tends to become replaced by hair, and other changes occur. The turkey does not vary in temperate regions, but when acclimated in India it degenerates in size, is incapable of rising on the wing, becomes black, and with the long pendulous appendages over the beak enormously developed. Cold has naturally the inverse effect, mammals transported to the

CLIMATE IN THE TREATMENT OF DISEASE

north from the tropics become more or less woolly. As the result of the severe winters and the elevation of Angora in Asia Minor, the cats, shepherd dogs, goats and hares are clothed with a long fleece like wool.

Islands present different climatic features from the mainland being damper, etc., and hence the birds, reptiles, and other animals present slight but constant differences from their allies and probable ancestors on the nearest continents. And not only that of the same group as in the Galapagos Islands, but also each island is tenanted by a distinct local variety of birds. This has also been noticed by Wallace in the East Indian archipelago. The swallow-tail butterflies of islands tend to have shorter tails, and the outlines of the wings differ. Thus the local races become incipient species, and by being isolated are prevented from crossing with the original stock or species, and in this way geographical varieties or representative species are produced. When great changes have taken place in the topography, portions of land cut off from the continent, or continents become divided, species have arisen. Thus in the late Tertiary, Asia and America were continuous, but when Bering Strait was formed, the bison of this country and that of Europe (aurochs) became specialized, becoming different species. In this way multitudes of species have probably arisen over all parts of the world.

A. S. PACKARD,

Late Professor of Zoology, Brown University.

Climate in the Treatment of Disease.

The relations of climate to medicine are peculiarly significant. The influences of heat, cold, moisture, and sunlight are definite, and to many individuals, sound as well as unsound in mind and body, the problem of life's continuance depends on their climatic surroundings. Many people can live with comfort in Colorado who would die of tuberculosis in a comparatively short time in the Eastern States. Nor is tuberculosis the only diseased condition that demands a certain climatic environment. Chronic emphysema, Bright's disease, heart disease, etc., may be influenced for good or for evil by climate.

Medically speaking, climates may be divided into a number of arbitrary classes. Manifestly such are subject to an immense amount of variation. A physiological classification given by Solly is into the following groups. Sea climates, on the ocean, on islands, or on the coast; land climates, low, up to 2,500 feet; medium, 2,500 to 4,500 feet; high, 4,500 feet and over. Again, climates may be sub-divided into cold and hot, either being dry or moist. All such classifications are arbitrary, and their exceptions to general rules are many.

Ocean climates vary according to the latitude, and the proximity to the Gulf Stream. Apart from such particulars, however, ocean climates are characterized by their equability, not only in the daily range of temperature, but, winter and summer as well, the presence of a large body of water, tends to equalize temperature, moisture, winds, etc. Humidity is a second feature of ocean climates. The moisture in the air acts as a veil, as it were, and this mitigates the fierce heat, and at night gives up the heat to the air. High grades of humidity with great heat are extremely prostrating. Sea

air is impregnated with the vapors of salt, and perhaps those of iodine and bromine, and it is free from dirt and bacteria. Ozone is always great in amount. Ocean climates are apt to be soothing. They increase the appetite greatly; there is increased inclination to sleep and increased bodily metabolism. When not too bracing and exciting, ocean climates are well adapted to the treatment of neurasthenia.

Island climates, if the islands are not very large, are practically ocean climates. Coast climates partake of a double nature. Because of the disturbing influences of increased land heat radiation, coast climates are less equable. They are usually less humid, precipitation being more active; winds often play a very important factor in coast climates, hence a knowledge of the local conditions is essential to estimate correctly the qualities of any given coast climate, although all coast climates bear a family resemblance to ocean climates.

Low inland climates are usually characterized by high barometric pressure, lessening with the elevation, and more or less humidity, becoming less as the distance from the ocean increases. Mountain ranges modify this greatly, as in California, for instance, where the Coast Range causes the precipitation of moisture on one side of the range, leaving the other side very dry although very close to the sea. The driest, low inland climates are those usually in the interior of the continent; the proximity of large bodies of inland water, however, modifies these. The moist, inland, low climates that are warm are the poorest for therapeutic purposes. They are enervating, depressing, and mosquito-ridden, hence malarious and noxious in many particulars. The moderately moist and warm climates, such as are found in Florida, for instance, and in many coast regions, as southern California, act as sedatives to the nervous system and are excellent in neurasthenic conditions. They are adapted to convalescents and to chronic invalids, particularly in Bright's disease, tuberculosis, and chronic cardiac troubles.

Moderately moist and cold climates, such as are found at Saratoga, in the Adirondacks, in Wisconsin, at Baden-Baden, Wiesbaden, etc., may be called indifferent climates. They are valuable as changes, and, being near large centres of population, are readily reached, and amusements, games, etc., with good regimen, work benefit to those who have been overdoing. Moist and cold climates are not desirable therapeutically. Tuberculosis abounds in such climates.

Dry and warm climates are found in west Africa, Egypt, Nubia, southwestern Texas, southern California, and the less elevated regions of Utah and Arizona. Tuberculosis, chronic joint conditions related to rheumatism, Bright's disease, heart disease, neuralgias, and neurasthenias, all do well in this type of climate. It seems, as an all-around climate, the best type. Thus far in the United States the comforts to be found in cities with this climate do not commend themselves to travelers. European and African travel is much preferred, although there is little question but that the American resorts are their equals from a climatic, but not from an historic point of view, nor from "comfort to the traveler" standpoints.

Mountain climates are characterized by clean air, low humidity, increased light ozone, and

CLIMAX — CLINGMAN'S DOME

rarefied air. The effects on the body by the rarefied air are marked. There is increased respiratory activity, and increased heart action, that later may become irritable. Persons in good health usually accommodate themselves, but the aged and weak are inconvenienced by high climatic conditions. Sleep is usually improved in those able to accustom themselves to the changed conditions, and muscular and nervous power is increased thereby. To the overworked business man, a rest in the not too high mountains, if his heart can stand exercise in the rarified air, mountain climates are excellent. Consult: Hinsdale and Weber, 'Climatology.'

SMITH ELY JELLIFFE, M.D.
Editor 'Medical News.'

Climax (Gr. κλιμαξ, a ladder or stairs), a rhetorical figure in which a series of propositions or subjects are presented in such a way that the least impressive comes first, and there is a regular gradation from this to the most impressive or final; opposed to "anti-climax," in which the ideas are presented in the reverse order.

Climbing-fern (*Schizæaceæ*), a family of ferns, mostly tropical, which have various peculiarities. It contains 5 genera and 75 species, two of which are represented in eastern North America. One, *S. pasila*, or curly grass, is a rare fern sometimes found in wet soil in the pine barrens of New Jersey during the months of August and September. The other is the Hartford fern (*Lygodium palmatum*), occurring in most thickets and open woods along the eastern seaboard of the United States during the summer months. The plant is a slender and flexible climber, with palmate leaves, surmounted by a panicle of forked pinnules, making it a very desirable decorative house-plant.

Climbing-fish, or **Climbing-perch**, a spiny-rayed fish (*Anabas acandens*) belonging to the family *Anabantidæ* which, with the *Osphromenidæ* constitute the sub-order *Labyrinthici*, characterized by the enlarged and peculiar labyrinthine structure of the superior pharyngeal bones, which are formed of excessively delicate plates of bone covered in life by a moist membrane and enclosing air-spaces between them.

In the climbing-perch the labyrinthine organ is greatly developed and extremely complex, and serves as an air-breathing organ of such great importance that the fish readily suffocates if prevented from having access to the air. To a fish which inhabits small stagnant pools, where the water contains but a small supply of dissolved air, such an apparatus is almost indispensable, and the climbing-perch, like a number of other fish which live in similar situations, regularly breathes free air. It has the very remarkable habit of leaving the water, especially during rains, and ascending the trunks of palm-trees for as much as six or eight feet, for the purpose of capturing insects. This habit is so well known to the natives of the East Indies that their name for the climbing-perch is said to mean "the fish that climbs trees." The early accounts were, however, received with much skepticism, but have been fully and repeatedly confirmed. The feat is accomplished partly by means of the tail and spiny anal fin, but chiefly through the peculiar structure of the gill-cover,

of which the opercular bone has a serrated edge, which clings firmly to surfaces, and the sub-opercular is so freely movable that it serves the purpose of a sort of leg, first extended forward and attached, then by appropriate muscles the body is advanced an inch or so at a time. The climbing-perch and all related forms are found only in the Indian and Indo-Malayan region.

Climbing Plants. See LIANAS.

Clinch, Charles Powell, American poet and play-writer: b. New York 20 Oct. 1797; d. there 16 Dec. 1880. For many years he was editorial writer, and literary and dramatic critic for the press; also writer of many poems, theatrical addresses, and dramas. Among the latter are: 'The Spy'; 'The Expelled Collegiates'; and 'The First of May.'

Clinch River, a stream that rises among the hills in the southwest part of Virginia, passes into Tennessee, flows through the valley between Clinch Mountain and Powell Mountain, and unites with the Holston at Kingston, to form the Tennessee. Its length is estimated at above 200 miles, for more than half of which it is navigable by small boats.

Cline'dinst, Benjamin West, American artist: b. Woodstock, Va., 1860. He is a painter of portraits and pictures in the genre style, and in 1900 was awarded the Evans prize of the American Water Color Society. He is best known as a popular illustrator of stories in the leading illustrated magazines, the 'Century,' 'Harper's Magazine,' and 'Scribner's Magazine,' especially containing much of his work.

Cling'man, Thomas Lanier, American senator: b. Huntsville, N. C., 27 July 1812; d. Raleigh, N. C., 4 Nov. 1897. He graduated at the University of North Carolina 1832, adopted the legal profession, and was a member of the State legislature 1836-40. He was elected to Congress as a Whig and with the exception of the 29th Congress, served continuously from 4 Dec. 1843 to 14 June 1858, when he was appointed United States senator. During his service in the House he took part in all the leading debates, not missing, it is said, a single day's session, and for a time was chairman of the Committee on Foreign Affairs. His speech on the causes of Henry Clay's defeat, led to a duel with William L. Yancey. He later joined the Democratic party. Entering the Confederate army as a colonel, he was promoted brigadier-general 17 May 1862, commanding the North Carolina troops, and served until his surrender with Gen. J. E. Johnston in April 1865. After the War he was chiefly engaged in mining and scientific pursuits. He made contributions to the sciences of geology and mineralogy, and in 1855 measured and made known the highest point in the North Carolina Mountains, since called "Clingman's Peak," and in 1858 determined the highest point of Smoky Mountain, now called "Clingman's Dome." The important mica mines in Mitchell and Yancey counties were first opened by him. He published a volume of 'Speeches and Writings' (1877); 'Follies of the Positive Philosophers' (1878); and 'The Tobacco Remedy' (1885).

Clingman's Dome, a peak of the Smoky Mountains, near the boundary between Tennessee and North Carolina. It was so named

CLINIC — CLINTON

in honor of Thomas L. Clingman. Its height is 6,619 feet above the sea-level.

Clin'ic, a place in which practical instruction in medicine is given; also the process of instruction. Clinics are usually held in dispensaries, where, by reason of free treatment, many patients congregate, thus affording good clinical material.

Clink-stone (so named from its sonorousness), grayish felspathic rock of the trachytic group, with a slaty structure, and generally divisible into tabular masses that are sometimes used as roofing-slates.

Clinometer, klī-nōm'ē-tēr, an instrument used for taking the dip and strike of rock strata. In its commonest form it consists of a sort of protractor with a pendulum attached. When the clinometer lies horizontally the indicator points to 0°, and when inclined the amount of inclination is shown at once by the pendulum. It is most convenient to combine compass and clinometer in one instrument.

Clinopo'dium, a genus of herbs or low shrubs of the mint family (*Labiatae*), containing about 50 species, of which 9 occur in the southeastern United States and California. The plants are known under the common names of wild basil, calamint, bed's-foot, and basil balm.

Clinton, Charles, American colonist, ancestor of the Clintons in New York: b. County Longford, Ireland, 1690; d. Ulster, now Orange County, N. Y., 19 Nov. 1773. His grandfather was an adherent of Charles I., and after the defeat of the royalists fled for refuge to the north of Ireland; and his mother was daughter of a captain in the parliamentary army. Having determined with a number of his friends to emigrate to America, he chartered a ship, and sailed for Philadelphia 20 May 1729. After a passage marked by the attempt of the captain to starve the passengers in order to possess their property, and in which after the death of several, among whom were a son and daughter of Mr. Clinton, it was proposed, but not attempted, to wrest the command from the captain, he was landed with his companions 4 October at Cape Cod. The place for a permanent settlement was selected in the spring of 1731 in Ulster County, N. Y., about 6 miles west from the Hudson River, and 60 miles north from New York. Clinton was chiefly occupied as a farmer and land surveyor, but was also judge of the county court, and in 1756 was appointed lieutenant-colonel, and served with two of his sons in the expedition against Fort Frontenac.

Clinton, De Witt, American statesman: b. Little Britain, New Windsor, Orange County, N. Y., 2 March 1769; d. Albany 11 Feb. 1828. His descent on the father's side was from English ancestors long domiciled in Ireland, and on the mother's side he was of French extraction. His education was begun in a grammar school near his home, continued at the academy in Kingston, Ulster County, and completed at Columbia College, where he bore away the college honors in 1786. He immediately engaged in the study of the law and was admitted to the bar in 1788. His ardent temper and earnest ambition carried him at once into the political field, and his sentiments, sympathies, and affections determined his position under the banner of his kinsman, George Clinton, the chief within the

State of the Republican party. While the question of the adoption of the Federal constitution was yet a subject of popular discussion, he proved his zeal and controversial power by writing a series of letters signed "A Countryman," in reply to the celebrated letters of the 'Federalist.' He entered the legislature in 1797 and the State Senate in 1798, soon becoming the leader of his party in the State. In 1801 he became United States senator, resigning in 1803 to assume the office of mayor of New York. He remained undisturbed in the mayoralty from 1803 until 1807, when he was removed. He was reappointed in 1809, was displaced in 1810, was restored in 1811, and thenceforward continued therein until 1815. Within this period of nearly 12 years, Clinton was also a member of the Senate of the State from 1805 until 1811, was lieutenant-governor from 1811 to 1813, and during a portion of that time also held a seat in the council of appointment. He was an unsuccessful candidate for the Presidency in 1812. He adopted early and supported ably and efficiently the policy of the construction of canals from Lake Erie and Lake Champlain to the tide-water of the Hudson, and showed to his fellow citizens, with what seemed a spirit of prophecy, the benefits which would result from those works to the city, the State, and the whole country, in regard to defense, to commerce, to increase of wealth and population, and to the stability of the Union. In 1815 he presented a memorial to the legislature in behalf of the construction of the Erie Canal and in 1817 a bill was passed authorizing the work. In 1817 he was elected governor of New York and re-elected in 1820. He declined re-election in 1822, but was again elected in 1824, and after overcoming constant, unremitting, and factious resistance, he had the felicity of being borne, in October 1825, in a barge on the artificial river which he seemed to all to have constructed from Lake Erie to the bay of New York, while bells were rung and cannons saluted him at every stage of that imposing progress. No sooner had that great work been undertaken in 1817 than the population of the State began to swell with augmentation from other States, and from abroad; prosperity became universal; the older towns and cities expanded, new ones rose and multiplied; agriculture, manufactures, and commerce were quickened in their movements, and wealth flowed in upon the State from all directions. He was re-elected governor in 1826, dying while in office. Consult Hosack, 'Memoir of De Witt Clinton' (1829); Renwick, 'Life of De Witt Clinton' (1840); Campbell, 'Life of De Witt Clinton' (1849).

Clinton, George, Vice-President of the United States: b. Little Britain, Ulster County, N. Y., 26 July 1739; d. Washington, D. C., 20 April 1812. He was a son of Charles Clinton (q.v.) and served as lieutenant under his brother James at the capture of Frontenac, but afterward studied law. He was a member of Congress in 1776, and voted for the Declaration of Independence, but was summoned to the army as brigadier-general before it was prepared for signature. In 1777 he was elected governor and at the same time lieutenant-governor of the State of New York, which latter office was, on his acceptance of the other, conferred upon Mr. Van Courtlandt. He held the office of governor during the next 18 years, for which

CLINTON

eventful period the history of his life is that of the State. He was again chosen governor after spending five years in private life, in 1801, and in 1804 became Vice-President of the United States.

Clinton, Sir Henry, English general: b. about 1738; d. Gibraltar 23 Dec. 1795. He was the grandson of Francis, sixth Earl of Lincoln, served in the Hanoverian war, and was sent to America as major-general in 1775. He took part in the battle of Bunker Hill, and in the battle on Long Island which resulted in the evacuation of New York by the Americans; was made Knight of the Bath in 1777, proceeded up the Hudson that year in a vain effort to relieve Burgoyne, and was promoted to the chief command of the British army in America in 1778. After being forced by Washington to evacuate Philadelphia, he commanded an expedition to South Carolina in 1780, and blockaded and captured Charleston. He sailed from New York with 7,000 men to relieve Cornwallis on the very day that the latter capitulated. He was superseded by Gen. Carleton in 1781, returned to England the next year, and died soon after he had been appointed governor of Gibraltar. He wrote a narrative of his conduct in America (1782), and a rejoinder to Lord Cornwallis' observations on it (1783); also observations on Stedman's 'History of the American War' (1784).

Clinton, James, American military officer: b. Little Britain, Ulster County, N. Y., 9 Aug. 1736; d. there 22 Dec. 1812. He was the fourth son of Charles Clinton (q.v.). With his father he served at Frontenac, in 1758, as captain, and commanded in 1763 the forces raised to protect Ulster and Orange counties against the Indians. He accompanied Montgomery to Quebec in 1775, and was appointed brigadier-general the following year. While his brother George was governor of New York, he was overpowered at Fort Clinton by the superior force under Sir Henry Clinton, and being severely wounded narrowly escaped with his life. He afterward served against the Indians under Sullivan in 1779 and was present at the surrender of Cornwallis. After the peace he occupied many distinguished civil stations.

Clinton, Canada, a town of Huron County, Ontario, situated on the Buffalo & G. branch of the Grand Trunk Railway, about 32 miles northwest of Stratford. Its industries are numerous. There are salt-wells, a tannery, a grain-elevator, and a flour-mill, and factories for the production of carriages, organs, threshing-machines, fanning-mills, etc. There are several churches and a collegiate institution. Pop. about 3,000.

Clinton, Ill., city and county-seat of De Witt County, situated on the Illinois C. R.R., about 42 miles northeast of Springfield. The chief industry of the region is farming. There are machine shops here, and the city has an electric-lighting system and water-works, several churches and two public schools. Pop. (1900) 4,452.

Clinton, Ia., city and county-seat of Clinton County, situated on the Mississippi River and on the Chicago & N. W., Chicago, M. & St. P., Chicago, B. & O., Chicago, R. I. & Pac., and Iowa Midland, 128 miles west of Chicago and 60 miles southeast of Dubuque.

Industries.—The city is a trade centre for a region of 50 miles radius and has large manufacturing and other industries, including lumber mills, furniture factories, sash and door factories, iron bridge works, gasoline engines, boats, automobiles, wagons, harness, boxes, brick, locks, and railroad machine shops.

Public and Educational Institutions, Etc.—The city has a good public library, hospitals, business colleges, Wartbury Lutheran College, Mount Saint Clare Academy, Our Lady of Angels Seminary, churches of all denominations, public schools, five banks with a combined capital of \$800,000, electric lights and railways and an assessed property valuation of over \$2,000,000.

Government.—The present form of government is by a mayor and a council of nine members elected biennially. Pop. (1903) 23,370.

Clinton, Mass., a town of Worcester County, 12 miles northeast of Worcester and 40 miles west of Boston; on the Nashua River, and the Boston & Maine and N. Y., N. H. & H. R.R.'s.

Industries, Etc.—The chief industries are the manufacture of wire-cloth, gingham, and carpets. Here are located the Lancaster Mills, with 2,100 employees; the Bigelow Carpet Co., with 1,250, and the Clinton Wire-Cloth Co., with 500.

Public Institutions, Buildings, Etc.—There is a national bank, with a capital of \$200,000 and average deposits of \$375,000. The Bigelow Free Public Library contains 25,000 volumes. The churches are Congregational, Baptist, Methodist, Presbyterian, Unitarian, Catholic, and Adventist. There are also the Clinton Hospital and the Clinton Historical Society.

Government.—The government is administered by means of town-meetings. The board of selectmen holds office for three years and appoints the chief of police and other subordinate officials.

History.—Up to 1850 Clinton was a part of Lancaster (q.v.), but it was then incorporated as a town. Pop. (1900) 13,667; (1903 est.) 14,639.

Clinton, Miss., a town of Hinds County, about 10 miles from Jackson. Its only interest lies in its being an educational centre. Among other institutions of learning is Mississippi College (q.v.), with nearly 300 students, and a school for colored students.

Clinton, Mo., a city and county-seat of Henry County, 37 miles northwest of Sedalia, on Missouri, K. & T., the St. Louis & San F., and Kansas City, Clinton & Springfield R.R.'s.

Industries, Etc.—Clinton has 3 flour mills with a combined capacity of 3,200 barrels daily; 2 corn-meal mills, capacity 750 barrels daily; cooperage and railroad division shops, ice plant and foundry and gas-engine factory. It has 2 banks with a combined capital of \$75,000, and has an annual business of \$25,000,000.

Educational Institutions, Etc.—Clinton has an excellent public school system, and also colleges for men and women, including Bind College for Women and Clinton Business College.

Government, Etc.—The city was first settled in 1837, became a borough in 1858 and a city in 1876. It is governed by a mayor and a council of eight members elected for two years. Pop. (1903) 6,000.

Clinton, N. Y., a village of Oneida County, situated on the New York, O. & W. R.R. In

CLINTON BRIDGE CASE — CLITOMACHUS

the neighborhood there are stone quarries. The chief interest of the place lies in its educational institutions. Here is located Hamilton College (q.v.), and there are seminaries for young women, an academy and a union school. Pop. (1900) 1,340.

Clinton Bridge Case, a case in the United States supreme court, December term 1870; a leading precedent as to the rights of railroad traffic *v.* river navigation, although it specifically decided only the right of Congress to take pending adjudications out of the hands of the courts by special acts, and to legalize any bridge as a post-road under its power to control interstate commerce. The Chicago, I. & N. R.R. Company proposed to bridge the Mississippi from Clinton, Iowa, to Albany, Ill., under authority from those States. One Gray filed a bill in equity in the circuit court of Iowa, praying for a preliminary injunction pending hearing for a final injunction, on the ground that the bridge was an obstruction and danger to navigation. Before the final hearing, however, the bridge was built, and Congress passed a special act 27 Feb. 1865, declaring it a lawful structure and a post-route, prescribing rules for the operation of the draw, and providing that all suits for obstruction to navigation should be brought in the circuit court of the State involved. The defendants on final hearing objected to the reading of proofs, on the ground that this statute closed the case, and the court so found. On appeal to the supreme court, the appellant argued that the act did not intend to legalize its maintenance in whatever condition it might be, or bar suits to abate that condition as a nuisance; and that it was unconstitutional if it did, as taking private property without compensation. The supreme court affirmed the judgment of the court below, but admitted that a suit at common law for damages would have raised a different set of questions.

Clinton Stage, in American geology, the middle member of the Niagara Series of the Silurian System. It comprises shales and shaly sandstones with some limestones, and is typically developed at Clinton, N. Y. From New York the series extends southward along the Appalachians to Alabama, reaching its maximum thickness of over 800 feet in Pennsylvania. From the Appalachians the series stretches 1,000 miles westward, except for the area of the Cincinnati anticline, to Wisconsin, where the Series is represented by limestones. From one to three beds of oölitic hematite (fossil iron ore), from 1 to 10 feet thick, are found in the Clinton at many points along the Appalachians and have yielded considerable ore. See IRON ORE; NIAGARA SERIES; SILURIAN SYSTEM.

Clinton's Big Ditch, a phrase applied to the Erie Canal, connecting the Hudson River with the Great Lakes. The name was given in derision because the canal was planned and carried to completion by De Witt Clinton.

Clinto'nia, a genus of plants of the lily-of-the-valley family (*Cornwalliaceæ*), named after De Witt Clinton, naturalist and governor of New York. It comprises six species, four of which are natives of North America, the other two being Asiatic. Yellow clintonia (*C. borealis*), has greenish-yellow drooping flowers, with blue berries. It grows in moist woods

from Newfoundland south to North Carolina, and westward to Wisconsin and Minnesota. The white clintonia (*C. umbellulata*) is found in the woods of New York and New Jersey, and as far south as Georgia, and westward through Tennessee.

Clio, klī'ō, daughter of Zeus (Jupiter) and Mnemosyne (Memory), the muse of history. She is represented with a wreath of laurel upon her head and a roll of papyrus in her left hand. She was the mother of Hyacinthus and Hymenæus. There was also a sea nymph named Clio, daughter of Oceanus and sister of Beroe, who figures in Greek mythology.

Clionidæ, klī-ōn'ī-dē, a family of *Pteropoda* (q.v.), which lack the shell and external gills, have the body spindle-shaped with wing-like fins situated near the head, and the head provided with short tentacles. They are pelagic animals of remarkable transparency, and live in vast numbers in the Arctic and Antarctic seas. Their chief popular interest lies in the fact that one species, *Clio borealis*, although only about an inch in length, furnishes the chief food of the great whalebone whales of the North. The whalers call the schools of these pteropods brit and deem their presence a good sign of whales.

Clipper, the word used to designate a modern construction of large sailing vessel. The peculiarities of these vessels are, their long sharp bow, their greatest beam lying abaft the centre of the ship, and their depth of keel. The speed attained by the opium and slave traders had attracted the attention of naval architects generally, and the shipbuilders of Great Britain (notably those of Aberdeen and Liverpool) and of America vied with each other in producing vessels which, while preserving fair carrying capabilities, should, as the primary requisite, be fast sailers. In this they succeeded to a remarkable extent, and the feats of the Atlantic, Australian, and China clippers, some of which attain an average speed during the voyage of over 15 miles an hour, used to be a topic of great interest and excitement among those connected with shipping and ocean traffic. Owing to the improvements in steam vessels, and the many advantages possessed by them over sailing vessels, clippers, as a special type of ship, are now little heard of.

Clissold, Augustus, English clergyman: b. about 1797; d. Tunbridge Wells, 30 Oct. 1882. He was graduated from Exeter College, Oxford, in 1823 was ordained priest, held the curacies of Saint Martin-in-the-Fields and Saint Mary, Stoke Newington, and about 1840 withdrew from the ministry. He had become a very close student of the writings of Swedenborg, and though retaining through life his connection with the Church of England, he was president of the Swedenborg Association, became a life member of the Swedenborg Society, and liberally assisted it with funds. Clissold translated and published at his own expense Swedenborg's 'Principia Rerum Naturalium' (1845-6) and 'Œconomia Regni Animalis' (1846). He wrote also many original works, the larger part on Swedenborg and Swedenborgian views.

Clisthenes. See CLEISTHENES.

Clitomachus (Gk. *Κλειτόμαχος*), Greek philosopher: b. Carthage about 190 B.C.; d. Athens about 110 B.C. He went to Athens about 146

B.C., where he became identified with the Third, or New, Academy, of whose founder, Carneades, he was one of the most distinguished disciples. On the death of Carneades in 129 B.C., Clitomachus succeeded to the academic chair. Carneades wrote nothing, and Clitomachus was the chief expositor of the system of the New Academy. Diogenes Laërtius is authority for the statement that he wrote 400 books on philosophical subjects. Cicero, who appears to have devoted considerable study to the work of Clitomachus, praises him highly in the 'Academica.' He followed in his teachings the largely skeptical views of Carneades, denying the possibility of attaining absolute truth, or any certain criterion of truth. Of his works there remain only a few titles and some renderings by Cicero in the 'Academica.' See ACADEMICS; GREEK PHILOSOPHY.

Clitus, klī'tūs, son of Dropis, and brother of Hellanice, the nurse of Alexander the Great. He was one of the generals of Philip and Alexander, and saved the life of the latter in the battle of the Granicus by cutting off the hand of Rhosaces, who had just lifted up his arm to kill Alexander. Notwithstanding this service, however, Alexander killed him in a fit of anger at a banquet in honor of Dioscuri.

Clive, Catherine Raftor, KITTY CLIVE, English actress: b. London 1711; d. 6 Dec. 1785. She was the daughter of a poor Irish gentleman living in London, and coming to the notice of Colley Cibber, manager of Drury Lane Theatre, made her début there at 17. She achieved instant success and till her retirement from the stage in 1769 was one of the most popular actresses of the time, her forte being comedy. She married George Clive in 1732, but was separated from him later. She was intimate with many of the literary and social lights of her day, among others Horace Walpole, who presented her with a house at Strawberry Hill. Consult Fitzgerald, 'Life of Mrs. Catherine Clive' (1888); Doran, 'Annals of the English Stage' (1888).

Clive, Robert, BARON OF PLASSEY, English soldier and statesman: b. Shropshire, 29 Sept. 1725; d. London 22 Nov. 1774. His father obtained for him the place of a writer in the East India Company's service, and in his 19th year he went in that capacity to Madras. Two years later Madras surrendered to the French, but Clive escaped to Fort Saint David, where he entered the military service. He took part in the unsuccessful attempt to capture Pondicherry in 1748. When the British opposed Chunda Sahib, whom the French wished to make nabob of the Carnatic, and their candidate was besieged in Trichnopoly by Chunda Sahib, Clive was sent in 1751 to attack Arcot, the capital of the Carnatic, which he captured without opposition, and later compelled a detachment of Chunda's troops to retire. He then relieved Trichnopoly, and captured the forts of Covelong and Chingleput. In 1753 he went to England for a time, and on his return to India (1755) he was given the government of Fort Saint David. He was soon called to Madras to command the relief expedition sent to Bengal, where the nabob Suraj-al-Dowlah had taken Calcutta. Clive took possession of that city, and with a very inferior number of men entered the nabob's camp and captured his cannon. The nabob then offered

terms of peace very advantageous to the English. Clive very shortly formed a plot to dethrone Suraj-al-Dowlah and place Mir Jaffier on the throne. In the famous battle of Plassey (21 June 1757) Clive's force of 3,000 men put to flight the nabob and his army of more than 50,000. Mir Jaffier now wished to govern without British interference, but the rebellions against him forced him to seek the aid of Clive, who was appointed governor of Bengal. Clive again went to England in 1760, where he was raised to the Irish peerage, and was elected member of Parliament from Shrewsbury. A disagreement between Mir Jaffier and the British governor officiating in Clive's absence caused Clive's return to India in 1764. He found the trouble with Jaffier settled, and devoted himself to the reform of the civil service in Bengal, and the restoration of discipline in the army. After his final return to England (1767) severe attacks were made upon him for his conduct in India, and a parliamentary inquiry followed which resulted in the passing of the resolution that he "had rendered a great and meritorious service to his country." But the worry due to the attacks, together with his failing health, so depressed him that he committed suicide.

Cloaca, a sewer, an underground drain or conduit. The Roman Cloaca Maxima (the greatest or main sewer) is said by tradition to have been constructed under the direction of King Tarquinius Priscus (616-578 B.C.), but none of the existing part is older than the 3d century B.C. It is still used in the drainage of Rome. It received numerous other branches between the Capitoline, Palatine, and Quirinal Hills. It is formed of three concentric rows of enormous stones, piled above each other without cement. The height inside is about 13 feet and its width is about the same.

In anatomy a cloaca is a part of the intestine in which the intestinal, ovarian, and urinary outlets terminate. This structure exists in birds, in reptiles, in the amphibia, and in the mammalian order *Monotremata*. In the *Rotifera* also the perivisceral cavity terminates in a dilatation or cloaca, which forms the common outlet for the digestive, generative, and water vascular system. There is a cloaca also in insects, and one also in tunicated mollusks. The latter is sometimes called the atrial chamber. In the embryonic development of man there is a period during which a cloaca also exists.

Clock. All instruments for the accurate measurement of time have three parts in common. One is a vibrating body, which may be a pendulum swinging under the force of gravity, or a balance wheel vibrating on its axis through the action of an elastic spring. The second feature is a source of power, which may be a weight or a stiff steel spring, called the main spring; the object of either is to keep up the vibrations of the balance wheel or pendulum, which would otherwise soon cease through friction and the resistance of the air. The third feature is a system of wheel work by which the power is transmitted from its source to the vibrating body, and by the revolutions of which the time is indicated. The instruments by which these results are brought about may be classified as watches, chronometers and clocks. The watch (q.v.) is a portable form of the instrument, generally so constructed as to be car-

CLOCK

ried in the pocket and moved about into any position without interfering with its going. This requires that the source of power shall be a spring and the vibrating body a balance wheel. The chronometer (q.v.) is a larger and most accurate watch constructed on the same general principles, but intended, when moved, to maintain a horizontal position. The term is sometimes applied to the most accurate pocket watches; and to distinguish it from them the chronometer proper is sometimes called a marine chronometer. The term is chosen because the instrument is used to keep time at sea for the determination of a ship's longitude.

In the original construction of the clock, to which this article is especially devoted, the vibrating body was the pendulum and the source of power a weight which could be wound up with a key. But, in order to secure the advantage of being easily handled and moved about it is now very common to make the smaller class of clocks with either a main spring or a balance wheel or both. But such clocks, unless made in the most expensive way, do not keep time as accurately as those with weight and pendulum; the latter are, therefore, to be preferred in all cases where a clock can be kept in one and the same position, and is wanted to keep fairly good time for considerable periods.

In the earliest instruments of these different kinds the vibrating body was a small horizontal bar, which moved back and forth under the influence of the wheel work. This was before the idea of applying a spring to keep up and regulate the vibrations had been suggested. Such instruments were extremely inaccurate in their results. The possibility of the pendulum clock dates from the time of Galileo, who first showed clearly that a pendulum completed its swings in nearly the same time, whatever its arc of vibration, which time was dependent on its length. But the practical inventor of the pendulum clock was Huyghens, the great Dutch astronomer of the 17th century. He invented the various appliances of the clock, the striking apparatus excepted, in substantially the form that we have them to-day. What is sometimes called the astronomical clock does not differ in principle from the ordinary pendulum clock, and has nothing distinctive about it except that it is made with the greatest perfection throughout, in order to go with the utmost attainable uniformity from day to day. So successful have clock-makers been in recent times that an astronomical clock which varied by one tenth of a second during a day would be regarded as practically useless. A good clock of the kind should keep time within three or four hundredths of a second a day.

The accompanying plate shows in detail the various parts of the ordinary clock. Fig. 1 gives a lateral view of the wheel work. An end view of the mechanism is shown in Fig. 2. P is a weight suspended by a cord which rests in a spiral groove going round and round the main cylinder C. In order that the clock may be wound up at any time, a ratchet wheel DD, Fig. 2, is used with a grooved cylinder, around which is wound a cord carrying the weight. The manner in which the ratchet acts is too obvious to need description. It is to be remarked that, in the ordinary house clock, the action of the wheel work stops while the weight

is being wound up. As the clock then loses all the time taken to wind it up, the best class of clocks are constructed with a second ratchet which keeps them going while being wound. The action of the weight is transmitted through the train of wheels d, E and F, to the scape wheel GH, which acts on the pallets IR, connected with the crutch which acts on the pendulum. In Fig. 1 By is the pendulum and its crutch vibrating in a plane perpendicular to that of the paper. In the upper part of its length, which passes through the crutch U, it turns on a horizontal axis which can be seen in the Fig. extending horizontally from the framework of the clock from just above X to the right. Thus, as the pendulum vibrates the arm of the crutch UX vibrates with it. This vibration releases alternately the teeth of the scape wheel GH, a double motion of the pendulum back and forth being required in order that first one tooth and then the other may escape. As shown in the figure the end R of the anchor is moving upwards, the tooth H of the scape wheel being just about to slide off. During the time that the pallet R is holding the scape wheel, the latter slides and presses upon it, thus pressing the side of the crutch against the pendulum. When the tooth H escapes, the anchor is in such a position that another tooth strikes the lower surface of I and acts on that in the opposite direction while the pendulum is swung the other way. Thus the teeth escape alternately, first one and then the other, in regular alternation, gently pressing the pendulum during its swing each way.

The construction of the escapement is of the utmost importance when the best performance of a clock is required. If one examines the second hand of an old-fashioned house clock he will notice that, at the moment of each beat, the second hand moves forward to one second and then has a slight motion backward before the next beat. This backward motion takes place immediately after one tooth has escaped, and continues until the pendulum has sprung to its greatest distance on one side. This backward action throwing extra action on the pendulum tends to accelerate its motion. Hence, good clocks are provided with a "dead beat" escapement invented by Graham. In this form the pallet on which the teeth of the scape wheel first impinges is at right angles to the radius from the centre of motion of the anchor to the pallets themselves. The action of the scape wheel then does not begin until the pendulum reaches a certain point of its downward swing, which point is the same whether the swings are wide or narrow.

Under the system just described, the pendulum is kept in continuous vibration and the wheel work in continuous motion from the time the clock is wound up until it is run down. But it is also necessary that the clock shall, at every moment, show the time on its face. This is brought about by the wheels O and N, Fig. 1, one of which is arranged to revolve in an hour, the other in 12 hours. The result is too familiar to need any description. If the wheel work which moves the hand were rigidly connected with that of the clock, the latter could not be set without moving the whole of the clock work. The system of wheel work which carries the hands is, therefore, so arranged as

CLOCKWORK.

Ordinary Clock movements and Pendulums

Water Clock

Sun Dial

Electric Clock

CLOCKS, HISTORICAL AND CELEBRATED

to be held on the axis *c*, by friction, thus admitting of its being turned at pleasure, while it is held by the axis so long as the hands are untouched. The minute hand is rigidly attached to its axis in order that it may be used as a hand in turning the wheel work of the two hands. Generally, but not always, the hour hand is held on its axis only by friction so that it can be turned around at pleasure without interfering with the other hand or with the going of the clock.

It is, of course, necessary to the correct going of a clock that the length of the pendulum should correspond to the number of the teeth in such a way that, as the pendulum goes through its natural vibrations, the wheels shall go according to the time of day. In the old-fashioned house clock, and in most good modern clocks, when it is desired to show seconds as well as hours and minutes, the pendulum takes one second to oscillate in each direction. It is then called a "seconds pendulum." There are then 30 teeth in the scape wheel, the latter turning through one sixtieth of the revolution as each alternate tooth escapes. The seconds pendulum is about $39\frac{1}{4}$ inches in length. (See PENDULUM.) It is not easy to move a clock about when the pendulum is so long. Hence, in ordinary clocks for household use either a balance wheel or a shorter pendulum is used. If the latter is one fourth the length of the seconds pendulum, it will vibrate in half a second. But, as clocks are constructed, the pendulum is not always made to vibrate in any simple fraction of a second. In this case, although a second hand may be put on the clock, and may go through its revolution in a minute, its motions will not beat seconds.

The rate of going of ordinary clocks varies with the temperature, the clock going faster the lower the temperature. In the case of the pendulum clock this is because the pendulum rod contracts with cold and expands with heat. If a balance wheel is used, not only does the balance contract with cold but the spring which moves it becomes stronger; so that for a double reason the clock goes faster in cold weather. Hence if accurate time is to be kept the pendulum or balance wheel must be compensated for changes of temperature. To show how this is done in the case of the balance wheel see CHRONOMETER. For the two methods of compensating a pendulum, see PENDULUM. Between the extremes of temperature to which the house clock is ordinarily subjected the differences of rate will only be about five or six seconds a day. As few people are able to regulate their clocks to this degree of precision it is only in very good clocks that compensation is attempted. The effect of heat and cold is much greater on the balance wheel than on the pendulum and may amount to half a minute or more a day.

The striking mechanism of the clock is brought about by a separate train of wheel work with its separate weight or spring, as shown in Fig. 2. There are two systems of making a clock strike the hour, one of which may be called the continuous system, and is used in clocks of American construction, while the other is mostly used in French clocks. The continuous system is one in which the striking goes on in its regular order, two always following one, three following two, and so on, no

matter how the hour hand may be situated. In this system if the clock begins striking wrong through running down or from any other cause it will continue to strike wrong until a proper adjustment is made. This is effected by touching a spring or pulling a wire in the clock, by which the striking mechanism is set in action and the clock made to strike around until it comes to the right hour. The French system is arranged with an eccentric cam on the axis of the hour wheel which stops the striking mechanism when the hammer of the clock has struck a number of strokes corresponding to the position of the hour hand. On this system the striking mechanism needs no adjustment to always strike correctly.

S. NEWCOMB.

Clocks, Historical and Celebrated. The most ancient form of clock was the clepsydra (q.v.) or water-clock. The clepsydra having been developed into a device with a dial and indicator operated by the current of water, the next improvement was the substitution of a weight for the water to operate the index. Archimedes is credited with this device. The necessity of some contrivance to regulate the descent of the weight led to the invention of the escapement and pendulum, a rude form of which is said to have been produced by Gerbert of Auvergne, afterward Pope under the name of Sylvester II., who died in 1003. In an old chronicle it is related that Charlemagne received a clock from Harun Alraschid in 809, to which small bells were attached, and in which figures of horsemen, at the hour of 12, came forth through doors and retired again. There is a more exact description of this work of art in the Franconian annals, attributed to Eginhard, in which it is particularly said to have been a clepsydra, and that at the end of each hour little balls of metal fell upon a bell and produced a sound. In the 12th century clocks were made use of in the monasteries, which announced the end of every hour by the sound of a bell put in motion by means of wheels. From this time forward the expression "the clock has struck" is often met with. The hand for marking the time is also made mention of. Of William, abbot of Hirschau, who died at the end of the 11th century, his biographer relates that he invented a horologium similar to the celestial hemisphere. Short as this account is, it still appears probable that this abbot was the inventor of clocks. In the 13th century there is again mention of a clock given by the Sultan Saladin to the Emperor Frederick II. This was probably put in motion by weights and wheels, as it marked the hours, the course of the sun, of the moon, and the planets in the zodiac. In the 14th century there are stronger traces of the present system of clock-work. Dante mentions clocks. Richard, abbot of St. Albans, made a clock in 1326, which indicated the course of the sun and moon, as well as the ebb and flow of the tide. Large clocks on steeples were first made use of in the 14th century. In 1340 a monk named Peter Lightfoot made for Glastonbury Abbey a clock with an escapement and regulator for securing equable motion. At the time of the Reformation it was removed to Wells Cathedral, where part of it still remains. In 1835, the mechanism being entirely worn out, the clock was supplied with new works and the

CLOCK AND WATCH INDUSTRY — CLÆLIA

dial somewhat remodeled, and a minute circle and index added. At the base of the arched pediment which surmounts the square of the dial is an octagonal projection from which rises a panelled turret. Around this, fixed to two rings of wood, are sets of horsemen which formerly revolved in opposite directions as the hour was struck.

Of all horological machines, the successive clocks at Strasburg Cathedral have perhaps attracted the most attention as mechanical curiosities. These have been three in number. The first was constructed about 1352, the second in the latter part of the 16th century. Early in the 19th century it was evident that reconstruction was necessary, and this was ultimately entrusted to Charles Schwilgue, who entered on his task in 1838 and completed it about the middle of 1842. On the 2d of October of that year the new life of the resuscitated marvel was solemnly inaugurated. On the floor level is a celestial globe indicating sidereal time, and the rising, setting, and passage over the meridian of Strasburg of all stars visible with the naked eye. Behind this is a calendar showing months, days of the month, dominical letters, and all feast days. Above the calendar is a gallery with allegorical figures representing the days of the week (Sunday, Apollo drawn in a chariot by horses; Monday, Diana drawn by a stag; Tuesday, Mars; Wednesday, Mercury; Thursday, Jupiter; Friday, Venus; Saturday, Saturn), which pass in order from left to right. Above this is a dial for showing ordinary time, a planetarium, and a globe showing phases of the moon. Next come movable figures representing the four ages of man, which strike the second stroke of each quarter on a bell. A genius seated beside the ordinary dial strikes the first note of each quarter with a sceptre; the genius on the opposite side turns an hour-glass at each hour. Death strikes the hour with a bone. Above, a procession of the 12 Apostles passes at noon before Christ, bowing at his feet, while he makes the sign of the cross. During the procession a cock perched on the top of the left-hand turret flaps its wings, ruffles its neck, and crows three times.

A clock at Berne, which dates from 1527, presents some curious features. Three minutes before the hour a wooden cock crows and claps its wings; in another minute a procession of bears (baren, referring to the name "Berne") passes around a seated figure of a bearded old man; the cock (above the arch, and to its right) then crows again. The hour is struck on a bell at the top of the tower, by a foll with a hammer, and at each stroke, the bearded figure raises his sceptre and opens his mouth, while he turns an hour-glass; a bear inclines his head at the same time. Then the cock crows again.

Another celebrated clock is at Venice, dating back to the 17th century. It has a dial of blue and gold, and is surmounted by bronze figures which strike the hours upon a bell. On Ascension Day, and for 14 days after, figures of the Magi come forth in procession and salute the Virgin and Child (as shown above dial) when the clock strikes 12.

Yet another is the clock of the English Houses of Parliament at Westminster. It was designed by Lord Grimthorpe (then Mr. E. B. Denison) and was first set going in 1860. The tower is

320 feet high, and the dials are 180 feet from the ground. Each of them is 22½ feet diameter, of opalescent glass set in an iron framework. The hour figures are two feet long and the minute spaces one foot square. The works contain three trains — one drives the hands, another the mechanism for striking the hours, the third the chimes. The pendulum is fully 13 feet long and weighs nearly 700 pounds. The going part of the clock requires winding once a week, the striking parts twice. The hour bell weighs 13 tons, the quarter bells collectively eight tons. Though there are clocks with larger dials, this clock is probably the most powerful as well as the most accurate of all large time-keepers. It cost more than \$110,000.

Clock and Watch Industry. See WATCH-MAKING, MODERN.

Clodd, Edward, English writer: b. Margate, Kent, 1 July 1840. He entered commercial life in 1860 and has been secretary of the London Joint Stock Bank from 1872. He is the author of 'The Childhood of the World' (1872); 'The Childhood of Religions' (1875); 'Jesus of Nazareth' (1880); 'Myths and Dreams' (1885); 'Story of Creation' (1888); 'Story of Primitive Man' (1895); 'Primer of Evolution' (1895); 'Pioneers of Evolution' (1897); 'Grant Allen' (1900); 'Story of the Alphabet' (1900); 'Thomas Henry Huxley' (1902).

Clodia, one of the three sisters of Publius Clodius Pulcher. She was married about 60 B.C. to Quintus Metellus Celer, who died the following year, probably from poison. Cicero having rejected her advances, she conceived a mortal hatred against him, and, in concert with her brother, used every possible means to effect his ruin. On her accusing Cælius Rufus of an attempt to poison her, Cicero undertook his defense, and depicted her dissolute life in a speech which is still extant.

Clodius Pulcher, klō'dī-ŭs pŭl'kēr, **Publius**, Roman politician. He was the son of Appius Claudius Pulcher, who was consul about 79 B.C. In the third Mithridatic war he served, with his brother, Appius, under Lucullus. He then served under his brother-in-law, Quintus Marcius Rex, proconsul of Cilicia; was given the command of the fleet and fell into the hands of pirates, but obtained his liberty. He returned to Rome about 65 B.C., and in the following year accompanied the proprætor, Lucius Muræna, to Gaul, where he enriched himself by the most scandalous means. He is said, though apparently on insufficient ground, to have been implicated in Catiline's conspiracy, and continued to be a ringleader in almost all the seditions of the time, till he became a candidate for the prætorship, opposing Titus Annius Milo, and was killed in an encounter with Milo. The celebrated speech of Cicero in defense of Milo has saved the name of Clodius from oblivion.

Clœlia, klē'lī-ā, a girl of Rome, who, the legends say, having been given up to Porsena as a hostage, escaped to Rome by swimming the Tiber. The Romans, however, to keep faith with Porsena, sent her back to him. Porsena would not retain her, but, as a reward for the generosity of the Romans, freed her and her fellow hostages, and also gave her several of the Etrurian youths for her service.

CLOG-ALMANAC — CLOOTS

Clog-almanac, an almanac or calendar made by cutting notches or characters on a clog or block, generally of wood. The block had generally four sides, three months for each edge. The number of days is marked by notches, while various symbols are used to denote saints' days, the golden number, etc.

Cloisonne, in ceramics, a method of enameling, applies for the most part to metal, since the effects are more easily attained thus than when it is applied to porcelain; specimens of the latter sort being, indeed, chiefly regarded as curiosities. In cloisonné work (so-called from *cloison*, a partition), fine metallic walls of the same material as the basis (for example, copper) are soldered by a strong cement by one edge to the basis; and these walls in this manner form numerous cells or compartments, in which the vitrifiable enamel pastes of various colors are placed. The enamel is then vitrified by several firings—three or four generally being required before enough enamel can be applied to afford an approximately level surface—and subsequently is ground and polished to a high degree. The Gauls in Roman times and previously made cloisonné, and it was employed for decorative purposes in shrines, altar-pieces, and church plate in the Middle Ages. It has not since been used until recent experiments were attempted. The Oriental cloisonnés are well known, particularly the Japanese. The art is said to have been introduced into Japan from China in the 16th century of the Christian era. Japanese cloisonné is made chiefly at Owari, Kioto, Tokio, and Osaka. In later specimens of the Japanese work the partitions are reduced to a minimum, apparently making no separation between the color masses of the enamel. The finest examples of the Oriental cloisonnés display great brilliancy.

Cloister (O. F. *cloistre*, Lat. *claustrum*, bar, enclosed place), a court enclosed by covered walks. The latter are, strictly speaking, the cloisters, the central space being termed the cloister garth. The walks, or ambulatories, are open on the side toward the garth and when appertaining to monastic or collegiate establishments were intended for the use of monks or nuns or the clergy attached to the Church. The cloisters are usually, though not invariably, placed on the south side of the church. They are commonly square on the plan, having a plain wall on one side, a series of windows between the piers or columns on the opposite side, and covered with a vaulted or ribbed ceiling. They form part of the passage of communication from the church to the chapter-house, refectory, and other parts of the establishment. The chapter-house usually opens from the east walk, the refectory and certain other domestic buildings of a monastic house, from the south walk.

Cloister and the Hearth, The, a novel by Charles Reade, published 1861. The masterpiece of this vigorous novelist recreates the 15th century, and presents to modern eyes the Holland, Germany, France, and Italy of the Middle Ages, as they appeared to mediæval people. The dramatic quality of the story, its vivid descriptive passages, the force and individuality impressed on its dialogue, its virile conception of the picturesque brutality and the lofty spirituality of the age it deals with, the unfailing brilliancy of the novelist's treatment of his theme,

and its humorous quaintness, place 'The Cloister and the Hearth' among the great historical romances of the world.

Clonmel, klön'měl, Ireland (Gælic, that is, "Vale of Honey"), a municipal borough situated on both sides of the Suir; part in Tipperary and a small part in Waterford; and 90 miles southwest of Dublin. Three stone bridges cross the Suir and connect the parts of the town; it has good streets, well paved and well lighted. Clonmel was founded by the Danes, and has long been noted for its love of learning. The fame of the schools established by the Franciscans in the 13th century extended to all the seats of learning on the Continent. The chief edifices now in the town are an Episcopal church, two Roman Catholic churches, a Franciscan abbey, the court-house, jail, barracks, free library, town-hall, convents, schools, lunatic asylum, etc. The trade is chiefly in grain, cattle and provisions; and there are flour-mills, creameries, a brewery, etc.

Laurence Sterne, the novelist, was born in Clonmel, and Lady Blessington, the writer, was born near by. Pop. 8,500.

Clontarf, klön'tärf, Ireland, a town in county Dublin, on the northern shore of Dublin Bay, some three miles northeast of Dublin. It is a much frequented watering-place, and is historically interesting as the scene of Brian Boróimhe's victory over the Danes in 1014. Pop. 5,200.

Cloots, Jean Baptiste von, zhöñ báp tēst fōñ klōts, Prussian baron, well known during the Revolutionary scenes in France under the appellation of Anacharsis Cloots; d. 24 March 1794. He was born at Cleves in 1755, and became possessed of a considerable fortune, which he partly dissipated through misconduct. He traveled in different parts of Europe, and formed an acquaintance with many eminent individuals, among whom was the celebrated Edmund Burke. The first work in which he distinguished himself was the ridiculous masquerade called the 'Embassy of the Human Race,' partly contrived by the Duke de Liancourt. On the 19th of June 1790, Cloots presented himself at the bar of the national assembly, accompanied by a considerable number of enthusiastic followers of various nationalities, English, German, Italian, Spanish, and others. He described himself as the orator of the human race, and demanded the right of confederation, which was granted him. At the bar of the assembly, 21 April 1792, he made a strange speech, in which he recommended a declaration of war against the king of Hungary and Bohemia, proposed that the assembly should form itself into a diet during a year, and finished by offering a patriotic gift of 12,000 livres. On the 12th of August he went to congratulate the legislative assembly on the occurrences of the preceding 10th, and offered to raise a Prussian legion, to be called the Vandal Legion. The 27th of the same month he advised the assembly to set a price on the heads of the king of Prussia and the Duke of Brunswick, praised the action of John J. Ankarström, the assassin of the king of Sweden, and, among other absurd expressions, he said, "My heart is French and my soul is sansculotte." He displayed no less hatred to Christianity than to royalty. In September 1792 he was nominated deputy from the department of the Oise to the national conven-

CLOSE TIME — CLOTHING

tion,* in which he voted for the death of Louis XVI. "in the name of the human race." He became an object of suspicion to Robespierre and his party, was arrested and condemned to death.

Close Time, a period of the year during which certain animals are protected by law, and are not allowed to be caught or killed. Such animals are chiefly those that are killed for food or sport, and include birds, fishes, and quadrupeds, as well as certain others — crabs, lobsters, and oysters, for example.

Clo'sure (often needlessly *clôture*, the same word in French), the European substitute for the American "previous question": the power of shutting off debate when the speaker or the majority think it has exhausted legitimate argument and is used for mere obstruction. As the equity of neither deciding power can be guaranteed, it is also a possible weapon of mere "gag-law"; but it has shown itself to be the only method in which parliamentary institutions can be worked. In Congress the "previous question" exists in the House, but not in the Senate, and this possibility of indefinite blocking of public interests by a single unscrupulous member, has caused an active movement for introducing it into the Senate also. In the British Parliament no such rule existed till 1882, debate being unlimited; and the fairness of its members, and their unity of feeling as Englishmen, had prevented any serious ill results. But about 1872 Isaac Butt, the leader of the Irish Home Rule party, began the policy, carried on after his death by Parnell, of putting a stop to all legislation on English subjects until all Irish demands had been granted, by talking against time, making irrelevant motions, calling for divisions on every motion, etc. For many years Parliament struggled under this, extremely loath to tie down the immemorial freedom of debate, but was finally forced to act, and in 1882 passed a "closure" rule, which allowed the speaker, on request of 40 members, to pronounce debate closed and call for a vote. In 1887 this was modified to require the petition of 200 members, or of only 100 in case the negative vote is less than 40. The French *clôture* dates from Louis Napoleon's accession in 1851.

Clotaire (klō-tār) I., son and successor of Clovis (q.v.), first king of the Franks in Gaul, reigned as sole king from 558 to 561. CLOTAIRE II., a king of the same Merovingian dynasty, reigned over the Franks 30 years later.

Cloth. See WEAVING.

Cloth of Gold, Field of the. See FIELD OF THE CLOTH OF GOLD.

Clothes-moth, a moth (*Tinea pellionella*), of the family *Tineidæ*, in which the wings are long and narrow, pointed at the end, and with a long finger. It is pale buff-yellow, with no definite markings. It may be seen flying about the house the last of May, or still earlier if the weather be warm, when it lays its eggs in woollens. The young caterpillar is whitish, and begins, on hatching, to construct a flattened cylindrical case in which it lives, dragging the case about with it. The mischief is done by the worm, the caterpillar working through the next 10 months, finally changing to a pupa in its case, and the best preventative is cold storage at a temperature of 40° F., or the use of naphthaliun or camphor. Woolen garments should be care-

fully brushed and put away in cotton sacks or in camphor trunks, or wrapped tightly in stout paper, or stored in large pasteboard boxes rendered tight by gumming a strip of wrapping paper around the edge, so as to seal the box completely. Consult: Packard, 'Guide to the Study of Insects'; Howard and Marlatt, 'The Principal Household Insects of the United States'; 'Bulletin 4 of the United States Department of Agriculture.'

Clothing, the artificial coverings worn by human beings for protection against the weather and from motives of decency. Nothing is more necessary to a comfortable state of existence than that the body should be kept in a nearly uniform temperature. The skin, by increase of the perspiration, carries off the excess of heat; the lungs, by decomposing the atmosphere, supply the loss; so that the internal parts of the body are preserved at a temperature of about 98° under all circumstances. In addition to the important share which the function of perspiration has in regulating the heat of the body, it serves the further purpose of an outlet to the constitution, by which it gets rid of matters that are no longer useful in its economy. The excretory function of the skin is of paramount importance to health, for if the matters that ought to be thrown out of the body by the pores of the skin are retained, they invariably prove injurious. When speaking of the excrementitious matter of the skin the sensible moisture which is poured out in hot weather, or when the body is heated by exercise, is not meant; but a matter which is too subtle for the senses to take cognizance of, which is continually passing off from every part of the body, and which has been called insensible perspiration. This insensible perspiration is the true excretion of the skin. A suppression of the insensible perspiration is a prevailing symptom in almost all diseases. It is the sole cause of many fevers. Very many chronic diseases have no other cause. In warm weather, and particularly in hot climates, the functions of the skin being prodigiously increased, all the consequences of interrupting them are proportionably dangerous. Besides the function of perspiration, the skin is an organ of absorption. It is also the part on which the organ of feeling or touch is distributed. The skin is supplied with glands which provide an oily matter that renders it almost impervious to water, and thus secures the evaporation of the sensible perspiration. Were this oily matter deficient, the skin would become sodden, as is the case when it has been removed — a fact to be observed in the hands of washerwomen, when it is destroyed by the solvent powers of the soap. The hair serves as so many capillary tubes to conduct the perspired fluid from the skin. The three powers of the skin, perspiration, absorption, and feeling, are so dependent on each other that it is impossible for one to be deranged without the other two being also disordered. For if a man be exposed to a frosty atmosphere till his limbs become stiff and his skin insensible, the vessels that excite the perspiration and the absorbent vessels partake of the torpor that has seized on the nerves of feeling; nor will they regain their lost activity till the sensibility be completely restored. The danger of suddenly attempting to restore sensibility to frozen parts is well known. If the addition of warmth be not

CLOTHING AND FURNISHING TRADE

very gradual, the vitality of the part will be destroyed. This consideration of the functions of the skin will at once point out the necessity of an especial attention, in a fickle climate, to the subject of clothing. The chief end proposed by clothing ought to be protection from the cold; and it never can be too deeply impressed on the mind (especially of those who have the care of children), that a degree of cold amounting to shivering cannot be felt without injury to the health, and that the strongest constitution cannot resist the benumbing influence of a sensation of cold constantly present, even though it be so moderate as not to occasion immediate complaint, or to induce the sufferer to seek protection from it. This degree of cold often lays the foundation of the whole host of chronic diseases, foremost among others which are found scrofula and consumption. Persons engaged in sedentary employments must be almost constantly under the influence of this degree of cold, unless the apartment in which they work is heated to a degree that subjects them, on leaving it, to all the dangers of a sudden transition, as it were, from summer to winter. The inactivity to which such persons are condemned, by weakening the body, renders it incapable of maintaining the degree of warmth necessary to comfort without additional clothing or fire. Under such circumstances a sufficient quantity of clothing of a proper quality, with the apartment moderately warmed and well ventilated, ought to be preferred to any means of heating the air of the room so much as to render any increase of clothing unnecessary. To heat the air of an apartment much above the ordinary temperature of the atmosphere, we must shut out the external air; that of the close room becomes extremely rarefied and dry; which circumstances make it doubly dangerous to pass from it to the cold, raw, external air. But in leaving a moderately well warmed room, if properly clothed, the change is not felt.

The only kind of dress that can afford the protection required by the changes of temperature to which high northern climates are liable is woolen. Those who would receive the advantage which the wearing of woolen is capable of affording must wear it next the skin; for it is in this situation only that its health-preserving power can be felt. The great advantages of woolen cloth are briefly these: The readiness with which it allows the escape of sweat through its texture; its power of preserving the sensation of warmth to the skin under all circumstances; the slowness with which it conducts heat; the softness, lightness, and pliancy of its texture. Cotton cloth, though it differs but little from linen, approaches nearer to the nature of woolen, and on that account must be esteemed as the next best substance of which clothing may be made. Silk is the next in point of excellence, but it is very inferior to cotton in every respect. Linen possesses the contrary of most of the properties enumerated as excellencies in woolen. It retains the matter of perspiration in its texture, and speedily becomes imbued with it; it gives an unpleasant sensation of cold to the skin; it is very readily saturated with moisture, and it conducts heat too rapidly.

There are several prevailing errors in the mode of adapting clothes to the figure of the body, particularly among women. Clothes should be so made as to allow the body the full exer-

cise of all its motions. The neglect of this precaution is productive of more mischief than is generally believed. The misery and suffering arising from it begin while the child is yet in the cradle. Girls have for a while the same chance as boys, in a freedom from bandages of all kinds; but as they approach womanhood they are subjected to trammels in the form of stays. The bad consequences are not immediately obvious, but not the less certain on that account. The girl writhes and twists to avoid the pinching which must necessarily attend the commencement of wearing stays tightly laced. The posture in which she finds ease is the one in which she will constantly be, until at last she will not be comfortable in any other, even when she is freed from the pressure that originally obliged her to adopt it. In this way most of the deformities to which young people are subject originate, and, unfortunately, it is not often that they are perceived until they have become considerable, and have existed too long to admit of remedy.

Clothing and Furnishing Trade. Much as the modern clothing manufacturer would delight to honor the memory of the man who first conceived the idea of making ready-to-wear clothes, search as he may the records of the past, there is nothing to indicate his name or habitation. In fact, so utterly recordless are the early days of the trade that everything in any way relating to its origin may be said to have been lost in the obscurity of time, and yet, strangely enough, it was not more than three-quarters of a century ago that such an article as a ready-made garment was unknown in America. In view of the comparatively recent origin of the trade, therefore, it is somewhat remarkable that nobody should be able to furnish any information about the beginning of an industry that is now one of the great sources of income in the United States.

Of course, there is a tradition which specifies that the first attempt to make ready-to-wear clothing was made at New Bedford, Mass., where the sailors, whether returning from their whaling trips or bound for new adventures on the sea, were most unwilling to wait for the slow process of the shears and the goose. To supply these immediate and pressing needs, it is said, one of the dealers who controlled a large part of the custom of the men from the ships, made up a few garments from the coarsest material, and for these he secured such good prices from the impatient seamen when they called at his shop that other merchants who dealt in such clothing were quick to see the wisdom of his course and, accordingly, followed his example.

Whether this tradition is true to fact or not, it is generally admitted that the industry of making ready-made clothing owes its origin to some such emergency. When the idea reached Boston, about 1830, its practicability had already been proved in some other place, so, for want of better information, it is not at all improbable that the Yankee genius who first devised this method of meeting the demands of his impetuous customers lived in New Bedford, and that he was the person who unconsciously laid the foundation for the great industry which was to have such a stupendous influence upon the commercial history of the nation.

Prior to the first quarter of the 19th century every man who desired to purchase a new suit of clothing was obliged to go to his draper for

CLOTHING AND FURNISHING TRADE

such raiment. He was there measured, much as he would be measured for custom-made garments to-day, but as every stitch of the work was necessarily performed by hand — the sewing machine not having been invented — the process was a slow one.

This lack of labor-saving machinery was one of the factors which tended to retard the development of this new branch of the clothing trade. It was taken up in Boston, and, a few months later, was adopted by New York clothiers, but it was not until some years had passed and the Metropolitan merchants were compelled to meet the eager demands of those who were impatient to emigrate to the newly-discovered goldfields in California, that the trade in such clothing was greatly stimulated. In the South and West, however, and especially in those sections that were most remote from the commercial centres, the demand for such garments was greatest, and as people, even in the East, began to find that ready-made clothes were more economical as well as more convenient to purchase, the clothiers found it necessary to open small factories in which it might be possible for them to fill their orders more systematically.

The history of the wholesale production of ready-made clothing began about 1831, when George Updyke, once mayor of New York city, opened a factory for the manufacture of clothing in Hudson street. He had a store in New York and one in New Orleans. About 1834, John D. Scott, Updyke's brother-in-law, removed to New York from New Jersey to assume charge over this factory, the firm name then being changed to John D. Scott & Co. Finding that they could trade profitably with the South, they soon opened other branches in Memphis and Charleston, and business was carried on in all of these stores until 1865, when, owing to the death of Scott, the firm was dissolved. Large and lucrative as their business had been, however, their product consisted chiefly of the coarsest kind of garments. They supplied the planters with some good clothes, but the bulk of the material they manufactured was intended for the use of the negro field hands.

It is quite natural that the success attained by Updyke, and afterward by Scott, should have inspired other clothingmen to follow their example. John T. Martin, from whom, through a variety of changes, has come the present house of Rogers, Peet & Co., went to Saint Louis long before the war, and there he amassed a large fortune by supplying the South and West with the cheap clothing which those sections required. Thomas Chatterton, who began his business career as a clothing dealer, finally entered the manufacturing field, and, in 1856, he established a large factory at 60 Liberty street, New York. A few years later he removed to Warren street and the firm name was changed to Lewis, Chatterton & Co. Brooks Brothers began business about 1845. As they intended to cater quite extensively to the trade of the sailors who always congregated about the water front, they located their first shop at the corner of Catherine and Cherry streets. The firm of Browning, King & Co. was started by William C. Browning, in 1858. Prior to that time Browning had been employed as manager of the clothing department of the store owned by his father, John H. Browning. In 1858 he secured a partner in the

person of John E. Hanford, formerly of Lewis & Hanford, a firm that had been engaged in the manufacture of clothing for the South and West. The new house entered the same field and was extremely prosperous until the outbreak of the war, when their loss amounted to fully \$500,000. Soon after war was declared, however, they entered into a contract with the Federal government to furnish the soldiers with clothing to the amount of \$1,200,000, and, although the firm of Hanford & Browning was dissolved in 1862, the business was continued under the name of Browning, Button & Kimball. This was afterward changed to William C. Browning & Co., and, finally, to Browning, King & Co., under which name the firm now conducts stores in 15 cities, in addition to its wholesale-house in Chicago, and its factory in New York.

Among the other ante-bellum clothiers, some of whom are still in business, but most of whom have long since retired from this commercial field, were Lewis B. Brown & Co., A. T. Bruce & Co., H. & J. Paret, C. J. Longstreet & Co., Archibald Young & Co., Garrett, Young & Co., and Little, Pyan & Carhart, afterward successively Schaeffer, Whitford & Co., Carhart, Whitford & Co., and, as at the present time, Hackett, Carhart & Co.

The advent of the Civil War was a crucial period in the history of the clothing trade. Nearly all the large manufacturers had been dealing largely with the South and West. Those whose trade was mainly with the Southern States accordingly lost heavily, so heavily that several of the firms went to the wall, while others who had a well-established line of customers throughout the West and North benefited greatly by the sudden demand for clothing that followed the declaration of hostilities. Many manufacturers, like John T. Martin and Hanford & Browning, secured large contracts for making uniforms for the government troops. As the small factories which were then in operation were quite unable to fill such enormous orders, this clothing was at first made in the homes of the workmen, but, afterward, the demands upon the producers continuing to increase, larger factories were established and the requisite help was employed. Naturally this was a great stimulus to the clothing trade, and yet the period was by no means a bright one for the manufacturer. Thus, while the government was reasonably prompt in payment, such payments were made in certificates and as these were subject to depreciation, the business of filling these contracts was not without its hazards. Of course, there were few Northern dealers who did not possess strong faith in the stability of the government, and the most prominent manufacturers, having sufficient capital to enable them to weather the financially stormy days of the war, received their reward when, by the re-establishment of the national credit, their certificates went once more to par. Moreover, busy as these manufacturers had been during the war times, peace was followed by still greater activities in the clothing trade. Returning home, the soldiers required new clothing and the demand was so pressing that it was absolutely impossible to supply it. It is safe to say that millions of dollars were spent for clothes and other articles of men's furnishings during the first 12 months that followed the close of the war.

In reviewing the history of the clothing trade

CLOTHING AND FURNISHING TRADE

during this period of its development it is interesting to remember that such a demand for cheap clothes could never have been filled if it had not been for the invention of a machine which greatly increased the powers of production. This was the sewing machine, which was introduced to the clothing trade about 1850. Prior to the perfection of this invention the clothing manufacturers had been unable to produce their goods with sufficient rapidity to meet even the ordinary demands that were made upon them. To offset this difficulty huge bundles of garments were sent to the country towns in the neighborhood of New York, Boston, and Philadelphia, where they were sewed by the wives and daughters of the farmers, most of whom were glad of an opportunity to obtain such means of employment during the long months of the winter. As they were chiefly unskilled laborers, however, their work was performed so roughly that it could be used only to supply the cheaper class of trade, and all neat work was necessarily retained in the cities, where it could be finished by experts in the use of the needle. Under such circumstances it is not difficult to realize with what delight the sewing machine was hailed. Promising as it had seemed, however, it was not, in the beginning, entirely satisfactory. It was found that the machine-stitching ripped and that it was by no means as firm as the hand-sewed product, but when the lock-stitch came, and it was not long before this improvement was perfected, the principal fault was remedied. From that day, therefore, the machine was used by every maker of such clothing, and, without this aid, it would have been utterly impossible to have produced the garments required by the government during the four years of the war.

Another improvement which came about 1870, was the introduction of the cutting machine in the wholesale manufacture of clothing. In the old days nothing but the heavy old-fashioned shears had been used, but they had been superseded by a long knife, especially in the factories. With this knife, which operated something like a saw, it was possible to cut as many as 18 thicknesses of cloth at one operation, whereas, in the use of the shears, a single thickness only could be cut. For many years this was regarded as the best possible method of cutting clothing, for the Fenno and Worth cutting-machine did not appear until fully 1870.

This invention, which has helped so much to revolutionize the clothing industry in the United States, consisted of a circular disk, which, as it revolved with great rapidity, was capable of cutting as many as 24 thicknesses of cloth with the speed of the buzz-saw and an accuracy that could not be duplicated by any human agency. By the use of such inventions it is now possible to cut and sew hundreds of suits of clothing in less time than was formerly required by the draper for his work of fashioning a single garment. Among all the methods used in olden times the only one which is still in general use is the ancient goose, for nobody has yet found it possible to suggest any improvement in its form, although, in many instances, electricity has taken the place of the old-fashioned furnace as a means of heating it.

Of course, with such an ever-increasing demand for ready-made clothing, the manufacturers were compelled to devise some system

by which their garments might be produced more expeditiously. The result was a concentration of effort by a new division of labor. For example, whereas the work of making of a whole suit was formerly left to a single tailor, under the new system many hands were employed in constructing one garment. Thus, leaving the hands of the designer, whose position is a most responsible one, the garment passes into the hands of the cutter, who deftly attends to his portion of the work. From his hands it goes to those who are to sew it, the persons who sew only certain parts of each particular garment. There are also vestmakers, "hands-on-pants," as the technical phrase has it, then to others who sew on buttons, and to those who make button-holes, a difficult operation which is now largely performed by machinery.

It was many years after the inauguration of the ready-made clothing industry that manufacturers began to make ready-to-wear clothes for boys, and this branch of the trade has continued to be developed separately and along its own lines. It was the firm of Smith & Davidson that first decided to devote their attention to the making of children's garments. This was about 1860. During war times the firm was known as Peck, Randolph & Co., and, in 1865, Smith removed to Williamsburg, where he established the present house of Smith, Gray & Co. Among other pioneer houses which were prominently interested in the manufacture of clothing for boys, one must not fail to mention the firms of W. T. Runk & Co., now represented by their legitimate successors, Hippel, Tillard & Runk; Dayton & Gilman, a house now known as Dayton & Close; William Banks & Co., and Barrett & Schaeffer. Of course, prior to the days of the factory product all children's clothing had been made at the homes of the dressmakers who had contracted for such work.

To say that the United States is the land of ready-made clothing is in no sense intended as a disparaging remark. The day has passed when men can feel that "hand-me-downs," as such garments were formerly known, stamp the wearer as parsimonious or vulgar. In the early days of the trade there may have been some ground for the prejudice that was so generally felt in regard to "slop clothes," but as the methods of manufacture improved and the demand for a better grade of goods increased, the American factories began to make a product that was in no sense inferior, either in style or material, to the best work of the merchant tailors. In the early days, cheap clothing may sometime have meant "slop" clothing, but when men realized that it was only necessary for them to pay a little higher price to secure the best quality of goods the wonderful advance in the character of factory-made clothing commenced. Since that point was finally settled, some years after the war, there has been no cessation in the development of the trade, and, to-day, it is safe to say, not only that nine-tenths of the men and boys of this country are attired in ready-made garments, but that the majority of them are clothed as neatly and as well as the one-tenth who still persist in patronizing the custom tailor.

Statistics of this trade are not easily obtained, and yet, in view of the conditions which have so long existed, it is not surprising that the figures that are accessible should show that the growth of this industry has been something

CLOTHO

stupendous, especially since the advent of that period of activity which followed the outbreak of the Civil War. In 1860, therefore, New York had 303 clothing manufacturers, while Philadelphia had 352 such factories. The total output of these 655 factories amounted to about \$27,000,000, of which sum New York was credited with more than \$17,000,000. So far as the entire country was concerned the total product for that year was less than \$81,000,000. According to the latest census reports, in 1900, the manufactures of woolen goods and worsteds in the United States amounted to \$238,744,502, while, in addition to this, the cotton and silk manufactures were respectively \$339,200,320 and \$107,256,258. As it is safe to say that about three-quarters of the woolen cloth as well as a large portion of the cotton and silk produced in the United States is used by the makers of ready-made clothes it is not difficult to see how much influence the clothing manufacturer must have upon manufacturing interests in general. The following table, prepared from the latest reports of the United States census, presents a clear and compact view of the extent and development of the clothing industry during the latter half of the 19th century. In comparing these years, however, it must not be forgotten that the figures for 1850 include both the clothing and tailoring trades. The statement is as follows:

PRODUCTION OF MEN'S GARMENTS.

Year	Capital	Wages	Materials	Products
1850.....	\$12,509,161	\$15,032,340	\$25,730,258	\$48,311,709
1860.....	27,246,093	19,856,426	44,149,752	80,830,555
1870.....	50,223,380	30,746,579	86,794,706	148,660,253
1880.....	70,861,696	45,947,353	131,363,282	209,548,460
1890.....	128,253,547	51,075,837	128,846,857	251,019,609
1900.....	120,620,351	45,505,778	145,297,248	276,861,607

The history of the men's furnishing trade dates from 1832, when the firm of David & Isaac N. Judson, then one of the most prosperous men's clothing-houses in New York city, began the manufacture of custom shirts as a systematic industry. For several years this firm had been active in catering to the demands of the South, and when, as often occurred, the order for clothing was accompanied by one for "shirts," the commission was entrusted to such casual seamstresses as might be under contract to supply this kind of work. As time passed, however, and such orders continued to increase in number, the idea of manufacturing "stock" shirts suggested itself, and, accordingly, in 1832, this house opened the first shirt factory in America at the corner of Cherry and Market streets, New York.

For about eight years the Judsons had everything their own way, but, in 1840, the firm of Luke Davies & Son, which had been engaged in the sale of so-called men's wares since 1822, also opened a shirt factory. In fact, while Davies has long been known as the "father" of the trade, he quite as well deserves the title of god-father, for he it was who gave to it the name which it has since borne, that of "furnishing goods." For many years his firm was one of the most prosperous houses in the city. Originally importers, for nearly everything that a man required in matter of dress was then imported, they later branched out into many kinds of manufacturing enterprises which gave them

such a wide influence in the trade that there are few of the long-established houses that do not owe their existence, in some way or other, to the firm of Luke Davies & Son, or their successors, Robert K. Davies & Co., who continued the business until 1890, when their long record of commercial success ended in failure.

It was from the Davies house that Joseph S. Lowrey went, in 1857, to establish the firm of Lowrey, Donaldson & Co. Ten years later it changed its name to that of Joseph S. Lowrey & Co., under which title it is still conducting business. Fisk and Flagg also left Davies when they started the firm of Fisk, Clark & Flagg, and as nearly all the large firms which now control the various branches of the men's furnishing goods industry can trace their descent from one of these concerns, those who are well informed regarding the history of the business usually refer to the elder Davies as the "father" of the trade.

Although nearly all the great improvements, and certainly the most marked developments in the men's furnishing goods industry, have dated from the latter part of the 19th century, the period between 1840 and 1860 was an important one in the history of the trade, for it was during this decade that the American dealers ceased to be importers and became their own manufacturers. From the earliest days of the colonies the American market for men's wear had been supplied from abroad. Custom shirts were practically the only exceptions to this rule, and many of these were made to order in England. Finally, however, a dry-goods dealer named Brown began to make collars — "string collars" they were called in those days, because they were worn with the old-fashioned stock tie — and, within a comparatively few years many other merchants were following his example.

From this beginning came the collar factories; a little later, the making of cuffs, then other necessities, like neckwear, suspenders, underwear, hosiery, and, finally, all the hundred and one inventions which the well-dressed man of this day requires to perfect his toilet. During the past decade, however, the manufacture of each of these articles has become a distinct industry, each of which has required the invention of special labor-saving machinery just as it has demanded its specially skilled workmen.

Some idea of the extent of the furnishing goods trade may be obtained from the fact that, in 1900, there were 470 establishments engaged in this business, and while the invested capital represented more than \$20,000,000, the value of their annual product was nearly \$44,000,000. In addition to this there were nearly 1,000 hosiery manufacturers, with a product of more than \$95,000,000, much of which represented their output of men's hosiery, and the shirt manufacturers, with their 1,000 factories, and their product of \$50,000,000, to say nothing of the countless other makers of men's specialties whose reports are scattered through the several volumes in which the progress of American industries up to the beginning of the 20th century has been recorded by the Census Bureau.

Clotho, one of the three Fates or Destinies who are represented by the ancient classical writers as spinning the thread of life. Clotho held the distaff, Lachesis spun the thread which Atropos cut when the span of life was reached.

CLOTILDA — CLOUDS

In zoology, *Clotho* is a genus of snakes of the tribe *Viperina*, family *Viperidae*. *C. arietans* is the puff-adder of the Cape of Good Hope. In astronomy, *Clotho*, is the name of the 97th asteroid, discovered by Tempel 17 Feb. 1868.

Clotil'da, St., the daughter of Chilperic, king of Burgundy: b. 475; d. Tours 545. In 493 she became the wife of Clovis, king of the Franks. She was the chief means of securing the conversion of her husband to Christianity, and largely influenced his life. After his death she lived a life of austerity at Tours. She was canonized a few years after her death. Her remains were buried in the Church of St. G enevi ve at Paris, and burned at the Revolution to prevent their desecration; the ashes are still in the Church of St. Leu.

Cl ture, kl -t r. See CLOSURE.

Cloud, St., or **Clodoald**, son of Clodomir, and grandson of Clovis, king of France. After the death of his father, and the murder of his two brothers, he became a monk, and found refuge in a monastery near Paris, which took from him the name of St. Cloud. He died there in 560.

Cloud'berry, a plant (*Rubus cham morus*) called also knoberry, mountain bramble, and mountain raspberry, is found in peat-bogs and swamps from Maine and New Hampshire westward and northward to Alaska. The plant is of humble growth, the leaves few, large-lobed, and kidney-shaped, the flower large and white, the fruit orange-red, and of an agreeable flavor. It is a native of the northern parts of America, Europe, and Asia. In Great Britain it is chiefly confined to elevated moors. In Norway and Sweden it is much more abundant; the fruit is highly valued, and makes excellent preserves.

Cloud-burst, a sudden and violent rainfall, covering a limited territory, and of brief duration. It occurs in the hottest season, and most frequently on the slopes of mountains and in arid regions, and is generally accompanied by severe and continuous lightning. The cloud-burst is caused by the contact of a warm current of air, surcharged with moisture, with a cold current, the result being swift condensation and immediate precipitation of the water formed.

Clouds, masses of minute globules of water or crystals of ice and snow suspended in the atmosphere.

The minute globules of water that make the cloud are evidently condensed from the invisible moisture that is always present in the air in greater or less quantities. The studies of Aitken, J. J. Thompson, Wilson, and others have thrown considerable light on the processes of condensation. If pure, dry air,—that is, air from which all dust and traces of electricity have been removed,—be mixed with pure vapor of water, and the moisture be cooled below the temperature of saturation, it will be found that condensation of water vapor does not generally occur. If, however, fine dust be injected into the pure mixture without altering its temperature or pressure, a fine mist is developed at once. It has also been discovered that if a charge of electricity, however small, be introduced, condensation takes place at once. From these experiments it is inferred that nuclei of some

sort, such as dust particles or electric particles, are necessary for the formation of water globules, other conditions being favorable.

The original classification of clouds by Howard in 1803 took account of form only. A more recent classification—the one now in general use—takes account of both the form of the cloud and its altitude. In this system three principal forms are recognized, namely, cirrus, cumulus, and stratus, with their modifications. These three main classes present the most obvious differences in form and shape; they develop at widely different altitudes and move with varying velocities. It is possible to further subdivide each class into a number of varieties, and in practice this is done when an observer becomes skilled in distinguishing the special forms and subdivisions of the main types.

The definitions of the principal types as recommended by the International Cloud Committee, and generally adopted by meteorologists, are given below.

Cirrus (Ci.).—Isolated feathery clouds of fine fibrous texture, generally of a white color, frequently arranged in bands, which spread like the meridians on a celestial globe over a part of the sky and converge in perspective toward one or two opposite points of the horizon. (In the formation of such bands Ci. S. and Ci. Cu. often take part.)

Cirrus clouds are the highest of all and move with the greatest velocity. They develop up to a height of about 10 miles, although their mean height is a little over 6 miles, being higher in summer than in winter. Their average velocity in winter is about 75 miles per hour, and in summer 65 miles per hour. They may be formed by mixture of air strata of different temperatures, or by the cooling of a moist streak in the upper atmosphere by expansion and radiation. In the latter case, if the surrounding air be very dry, the newly formed cloud is soon dissipated.

Cirro-stratus (Ci. S.).—Fine whitish veil, sometimes quite diffuse, giving a whitish appearance to the sky, and called by many cirrus haze, and sometimes of more or less distinct structure, exhibiting tangled fibres. The veil often produces halos around the sun and moon.

This cloud, as its name indicates, is one of the composite forms. Its structure is much on the same order as that of pure cirrus; in fact it is generally composed of cirrus fibres tangled and interlaced in a most complex manner. The variety of forms, however, is practically unlimited, and it undergoes rapid changes, especially in advance of a cyclonic disturbance. Like cirrus, it is composed of crystals of snow or ice, develops at a great elevation and moves with high velocity.

Cirro-cumulus (Ci. Cu.).—Fleecy cloud. Small white balls and wisps without shadows, or with very faint shadows, which are arranged in groups and often in rows.

This is a broken layer of cloud, of which the component masses are not fibrous, like cirrus, but more or less rounded. A second, although rather rare form of cirro-cumulus is the mackerel sky of northern Europe. The cloudlets in this case are rounded, but not fleecy. The altitude of cirro-cumulus ranges from four to six miles, and its movement, like cirrus and cirro-stratus, is quite rapid.

CLOUDS

Cumulus (Cu.).—Woolpack clouds. Thick clouds whose summits are domes with protuberances, but whose bases are flat. These clouds appear to form in a diurnal ascensional movement which is almost always apparent. When the cloud is opposite the sun the surfaces which are usually seen by the observer are more brilliant than the edges of the protuberances. When the illumination comes from the side this cloud shows a strong actual shadow; on the sunny side of the sky, however, it appears dark with bright edges. The true cumulus shows a sharp border above and below. It is often torn by strong winds, and the detached parts (*fracto-cumulus*) present continual changes.

This cloud is undoubtedly formed by the condensation of water vapor in the summit of an ascending column of air. The flat base of the cloud marks the level when the condensation temperature is reached, and the upper dome-shaped summit represents the head of the air column protruding into colder space. In the temperate latitudes it is usually a cloud of the warm season and forms at an altitude of about a mile above the surface of the earth. Its average rate of movement ranges from about 20 miles per hour in summer to 30 in winter. There are many special varieties and forms of cumulus cloud.

Alto-cumulus (A. Cu.).—Dense fleecy cloud. Larger whitish or grayish balls with shaded portions, grouped in flocks or rows, frequently so close together that their edges meet. The different balls are generally larger and more compact (passing into S. Cu.) toward the centre of the group, and more delicate and wispy (passing into Ci. Cu.) on its edges. They are very frequently arranged in lines in one or two directions.

Alto-cumulus clouds may occur when the ascending currents are not strong enough or do not persist long enough to form thick cumuli, or they may represent the vapor that is condensed in the upper portion of a series of atmospheric waves as suggested by Von Helmholtz. The alto-cumulus level ranges from one and a half to two miles. It is higher than the cumulus level, although the summits of cumulus clouds often penetrate into and above it. The mean velocity of alto-cumulus clouds is about 40 miles per hour, being somewhat higher in winter and lower in summer.

Cumulo-nimbus (Cu. N.).—Thunder cloud; shower cloud. Heavy masses of clouds, rising like mountains, towers, or anvils, generally surrounded at the top by a veil or screen of fibrous texture ("false cirrus") and below by nimbus-like masses of clouds. From their base generally fall local showers of rain or snow, and sometimes hail or sleet. The upper edges are either of compact cumulus-like outline, and form massive summits, surrounded by delicate false cirrus, or the edges themselves are drawn out into cirrus-like filaments. This last form is most common in spring showers. The front of thunderstorm clouds of wide extent sometimes shows a great arch stretching across a portion of the sky, which is uniformly lighter in color.

Cumulo-nimbus clouds are of massive dimensions and the most impressive of all clouds in the realm of nature. The upper surface of this cloud, which is sharp and well defined in the earlier stages of its formations, becomes soft and wispy soon after rain begins to fall from its base. The cloud itself may be divided into three planes, namely, the lower, consisting of vapor, the middle of water, and the upper of ice or snow. The tops of some of these clouds reach 6 or 8 or even 10 miles into the atmosphere. Prof. Bigelow computes that the temperature in one of the loftiest of these clouds

ever observed fell from 79.5° F. at the ground to -74° F. at a height of nearly nine miles.

Stratus (S.).—Lifted fog in a horizontal stratum. When this stratum is torn by the wind or mountain summits into irregular fragments they may be called "*fracto-stratus*."

This cloud, as its name implies, is merely a horizontal sheet floating at a low elevation and without any special structure. It is generally formed by the intermingling at the surface of contact of air strata of different temperatures, and it indicates a horizontal flow of air rather than an ascensional movement in the case of cumulus clouds.

The average elevation of stratus clouds is less than half a mile, and their average velocity about 15 miles per hour.

Strato-cumulus (S. Cu.).—Large balls or rolls of dark cloud, which frequently cover the whole sky, especially in winter, and give it at times an undulated appearance. The stratum of strato-cumulus is usually not very thick, and blue sky often appears in breaks through it. Between this form and the alto-cumulus all possible gradations are found. It is distinguished from nimbus by the ball-like or rolled form, and because it does not tend to bring rain.

This cloud is not sufficiently uniform to be called stratus, nor sufficiently lumpy to be called cumulus. It is a cloud of moderate elevation, about 9,400 feet in summer, and 7,800 feet in winter, and its rate of movement varies from 20 to 30 miles per hour. It is often a thin cloud through which patches of blue sky can be seen. Again it covers the sky completely, and presents a gentle undulating surface with a tendency to break up into long parallel rolls or bars.

Alto-stratus (A. S.).—Thick veil of a gray or bluish color, exhibiting in the vicinity of the sun and moon a brighter portion, and which, without causing halos, may produce coronæ. This form shows gradual transitions to cirro-stratus, but, according to the measurements made at Upsala, was only one half the altitude.

The average height of this cloud is about three and a half miles in summer and three miles in winter. Its average velocity ranges from 40 to 50 miles per hour.

Nimbus (N.).—Rain cloud. Dense masses of dark formless clouds with ragged edges, from which generally continuous rain or snow is falling. Through the breaks in these clouds there is almost always seen a high sheet of cirro-stratus or alto-stratus. If the mass of nimbus is torn up into small patches, or if low fragments of cloud are floating much below a great nimbus, they may be called "*fracto-nimbus*" ("scud" of the sailors).

As soon as rain falls from a cloud it is called a nimbus, whatever its form before the beginning of rain, with one exception, namely, when rain begins to fall from a lofty cumulus cloud it is called a cumulo-nimbus to distinguish it from a system of pure nimbus clouds, the latter being flatter and more in the nature of a sheet cloud.

Colors of Clouds.—The brilliant colors sometimes assumed by clouds at sunrise and sunset are probably caused by selective absorption and reflection of light by dust particles or vapor haze in the atmosphere. The clouds of the day-time, especially those having a great elevation, are white, since they reflect the greater part of the light incident on them.

The bases of cumuli are generally of a dark shade, while the portions in shadow are mostly of a pearl gray.

CLOUDS — CLOUET

Thunder clouds sometimes have an olive-green tint, and this is thought by some observers to portend high winds and heavy rain-fall.

Utilization of Clouds in Weather Forecasts.—This subject has been the subject of considerable study by Ley, Abercromby, and others in Europe, and by McAdie, Clayton, and the writer in the United States. In forecasting weather changes from synoptic charts the clouds frequently show the advance of a cyclonic disturbance, but not before the same information is given by the circulation of the surface winds and the fall in the barometer. Unfortunately it is not possible to fully describe and telegraph the significant features of the various cloud forms so that they may be available at a central weather station; in the case of a solitary observer, however, some skill in making local predictions of the weather may be attained by a careful study of cloud forms in connection with falling weather.

Methods of Observation.—The kind, amount, and direction of clouds form a part of meteorological observations whether made for purposes of weather forecasting or for purely climatic studies. In the last-named event it is chiefly desired to know the extent of sky covered with cloud on the average of the season, since one is then able to judge of the nature of the climate with respect to sunshine. In weather forecasting it is important to know, not only the kind of cloud observed, but both its direction and apparent velocity, although in actual practice the last named is rarely attained. This information is best obtained by means of the nephoscope. An excellent form of nephoscope was devised by Prof. C. F. Marvin, United States Weather Bureau, in 1896. Prof. Marvin's nephoscope is shown in the illustration.

The Improved Nephoscope.

The circular frame, A, is mounted upon three leveling-screws, and its upper surface is graduated to degrees, numbered from 0 to 360, the numbers increasing in a direction contrary to the direction of motion of clock hands. The plate and mirror, M, revolve smoothly within the circular rim, A, being carried upon a hollow vertical axis at the centre. The arm, B, carrying the sighting staff, S, also revolves upon the central axis, the outer end traversing the narrow annular space between the mirror and graduated rim. The staff, S, is telescopic in construction, and is attached to the arm at B by a hinge which permits the staff to be in-

clined from the vertical to any extent, but always in a plane perpendicular to the mirror. The top portion of the staff is provided with a crosshead, which is surmounted by a small sighting-knob, s. The crosshead is adapted to receive the secondary staff, S', which slides with gentle friction through the crosshead, and is tipped at either end with small secondary sighting-knobs, s' and s''. By reason of the telescopic construction of the staff, S, the crosshead can not only be turned about in any direction, but it and the sighting-knob, s, can be raised by various amounts, being held in place by friction. The hinge at B is made in such a manner that when the staff, S, is placed in a vertical position, the small rod sliding inside can be forced down into a hole in the hinge, the effect of which is to lock the hinge so that the staff is held rigidly in a vertical position.

In using the nephoscope the observer looks down upon the mirror, M, and observes the reflection of the cloud. By moving his eye he brings a point of the cloud image and the reflection of the sighting-knob, s, into coincidence at the centre of the mirror. The head should be held so that the knob is always seen at the centre of the mirror. The cloud image will then appear to move away from the centre of the mirror. The mirror is then revolved until the graduated line becomes parallel with the motion of the cloud, when its direction of motion may be read off and its apparent velocity determined by timing the image as it passes along the graduated scale of the mirror.

Other forms of the nephoscope have been devised and used, mostly in European countries, and Prof. Cleveland Abbe, of the United States Weather Bureau, has devised a very convenient form of nephoscope for use on vessels at sea.

In determining the height of clouds, direct observations of their angular altitude are made by two observers at the ends of a measured base-line, whence the altitude may be computed by trigonometric formulæ. The same results may be obtained by photography, but the method is not so direct, and the computations are more laborious.

ALFRED J. HENRY,

Prof. of Meteorology, U. S. Weather Bureau.

Clouds, The, a comedy by Aristophanes; acted in 423 B.C. Though one of the most interesting and poetic of the author's plays, the people refused to hear it a second time. But its literary popularity counterbalanced its failure on the stage.

Clouet, kloo-ā, French family of artists, descendants from Flemish ancestry. 1. JEHAN, yā'hān, the first known of the family, was in 1475 a resident of Brussels. 2. His son JEHANNET, yā-hān'nēt: b. 1485; d. 1541, migrated to France and located at Tours. In 1518 he went to Paris and became court painter to Francis I. A portrait of the king, in the Louvre, is said to have been painted by this artist, also another portrait of the king, in the Pitti Gallery, Florence, is credited to him. Several other pictures in European galleries are said to have been painted by him. In all the style is that of the Flemish school. 3. FRANÇOIS, frāñ-swā, son of Jehannet: b. 1510; d. 1572. succeeded his father as court painter to Francis I., and retained the position under Henry II., Francis II., Charles IX., and Henry III. His

CLOUGH — CLOVE-BARK

works are mentioned in the records of the court. Some authorities mention a brother of François, but of him nothing positive is known.

Clough, Anne Jemima, English educator: b. Liverpool, Eng., 20 Jan. 1820; d. Cambridge 27 Feb. 1892. She was a sister of Arthur Hugh Clough (q.v.), and after a girlhood spent in Charleston, S. C., opened a day school in 1842. Becoming interested in the general subject of education the North of England Council for Promoting the Higher Education of Women was founded through her efforts, and from this sprang the idea of the Cambridge higher local examinations. Lectures for women having been established at Cambridge in 1869 Miss Clough, in October 1871, took charge of a house of five women students, out of which grew the present Newnham College, over the administration of which she presided until her death. During her busy career she accomplished much for the higher education of English women. See B. A. Clough, 'Memoir of Anne J. Clough' (1897).

Clough, klūf, Arthur Hugh, English poet: b. Liverpool 1 Jan. 1819; d. Florence, Italy, 13 Nov. 1862. He studied under Arnold at Rugby, then at Balliol College, Oxford, and became a fellow of Oriel College in 1842. In 1848 he visited Paris, and spent the winter of the following year in Rome. In 1849 he became head of University Hall, London, but resigned in 1852 and went to America, where he lived for a few months at Cambridge, Mass. On his return next year he was appointed an examiner in the education office. His poems were published, along with a genial memoir, by F. T. Palgrave in 1862; his poems and prose remains, with letters and a memoir, were also published by his wife in 1869. 'The Bothie of Tober-na-Vuolich' (1848), is his best known poem; others are 'Dipsychus' and 'Amours de Voyage.' They are masculine and vigorous in tone, and contain many noble thoughts, and strokes of genuine humor, alternating with passages of deep pathos and tenderness. He is affectionately commemorated in Matthew Arnold's 'Thyrsis' and 'Scholar Gypsy.'

Clough-Leigher, klūf'-lā'tēr, Henry, American organist and composer: b. Washington, D. C., 13 May 1874. He studied at Columbia University 1887-9, and at Trinity University, Toronto, Canada. He was organist at various Washington churches 1890-99, of Grace Church, Providence, R. I., 1899-1900, and since 1900, has been instructor in musical ethics and theory in the Howe School of Music, Boston, Mass. Among his many compositions are a Festival Service in D major (1896); 'Te Deum Laudamus,' G major (1898); 'Te Deum Laudamus,' G minor (1901); song, 'Like a Rose Should Be' (1901).

Clous, John Walter, American soldier: b. Germany 9 June 1837. He came to America in 1855 and engaged in business. He enlisted in the United States army 2 Feb. 1857, and was promoted second lieutenant 29 Nov. 1862. He took part in the siege of Yorktown, the Seven Days' battles in June 1862, Malvern Hill, Second Bull Run, Antietam, Frederickburg, Chancellorsville, and Gettysburg, being twice brevetted for gallant conduct at the latter. He served on the frontier and in Indian campaigns

1868-86, as judge advocate in many important trials and cases 1862-86, was assistant to the judge advocate-general 1886-90, and professor of law at West Point 1890-6. During the Spanish-American war he was appointed a brigadier-general of volunteers, and served on the staff of Maj.-Gen. Miles. He attained his lieutenant-colonelcy 12 Feb. 1892. He is the author of lectures on 'Military and Martial Law and Suspension of the Writ of Habeas Corpus,' delivered at Union College in the Butterfield lecture course.

Clove, the unexpanded flower-bud of an East Indian tree (*Caryophyllus aromaticus*) somewhat resembling the laurel in its height and in the shape of its leaves. The flowers grow in clusters, and the petals are small, rounded, and of a bluish color; the seed is an oval berry. The Molucca Islands, where the raising of different spices was formerly carried on by the Dutch colonists to a great extent, appear to be the native land of the clove, and the best are still brought from that quarter. At one time, however, in order to secure a lucrative branch of commerce in this article to themselves, the Dutch destroyed all the trees growing in other islands, and confined the propagation of them to that of Ternate. But both clove- and nutmeg-trees were transplanted from the Moluccas into the islands of Mauritius and Bourbon, and the clove is now cultivated with success in many warm countries, including Zanzibar and the West India islands. At a certain season of the year the clove-tree produces a vast profusion of flowers. The operation of gathering is performed between the months of October and February, partly by hand, partly by hooks, and partly by beating the trees with bamboos. The cloves are subsequently dried by exposure to the smoke of wood fires, afterward to the rays of the sun. When first gathered they are of a reddish color, but by drying they assume a deep-brown cast. This spice yields a very fragrant odor and has a bitterish, pungent, and warm taste. It is most frequently used in culinary preparations. When fresh gathered, cloves will yield, on pressure, a fragrant, thick, and reddish oil; and by distillation a limpid essential oil.

The medical value of cloves is due to the presence of eugenol, C₁₀H₁₂O₂, in the volatile oil. Eugenol is extremely active, acting like the phenol, or carbolic acid group, to which it is related. Clove is a marked local anæsthetic, a strong antiseptic and bactericide, an excellent stimulant to the sympathetic nervous system, expelling flatus from the stomach and the intestines, by increased peristalsis, and increasing the flow of the gastric and intestinal juices. Its value in toothache is due to its anæsthetic and bactericidal properties. A number of new compounds of eugenol are on the market. Benzoyl-eugenol and cinnamyl-eugenol are used in the treatment of tuberculosis.

Clove-bark, the bark of various aromatic trees, used in the manufacture of drugs and spices. A tree (*Dicypellium caryophyllatum*) of Brazil supplies a cinnamon-like cylinder which is commonly known as clove-bark in the American markets, and is used in medicine as *cassia caryophyllata*. The name is often given also to *culilawan* and cinnamon.

2. Strato Cumulus.

CLOVE-PINK — CLOVER

Clove-pink, or **Clove gilly Flower**, the carnation (*Dianthus caryophyllus*), more especially a whole-colored, clove-scented variety of it.

Clover, **Lewis Pierre**, American lawyer and journalist: b. Springfield, Ill., 1864. He was educated at Racine College, Wisconsin, and admitted to the bar of Illinois in 1885. He is a great-grandson of Ninian Edwards, a former governor of Illinois, and grandson of Ninian W. Edwards, a distinguished Illinois lawyer. He is a grand-nephew of Mary Todd Lincoln. He has been a member of the staff of the *New York Evening Sun* for several years, writing upon legal subjects and proceedings.

Clover, species of the genus *Trifolium*, belonging to the pea family (*Papilionaceæ*) and to the natural order *Leguminosæ*. Of *Trifolium* about 300 species have been described; they are most abundant in the north temperate zone, a few in South America and South Africa. Some are very important in agriculture, either for pasturage, fodder, or for soil-improvement.

The word "clover" is also applied to species of related genera, as bur-clover (*Medicago*), sweet clover (*Melilotus*), bush and Japanese clovers (*Lespedezas*), prairie clover (*Petalostemon*), etc.

The true clovers (*Trifolium*) are herbs with mostly three foliate leaves; purple, pink, white, or yellow small flowers in dense heads or spikes; and straight membranous pods containing one to four seeds.

The most important species to the farmer is the common red clover (*Trifolium pratense*), now naturalized here, but believed to be a native of Europe and northern Asia. It has been grown in England for over 300 years. It is a more or less hairy perennial, growing from six inches to two feet high. The leaflets are usually three in number, short-stalked, springing from the same point, oval, and often having a whitish horseshoe mark in the centre. The flower-heads are dense, oval or ovoid, about one inch long; florets sessile or nearly so, red, rarely white, remaining erect in fruit; calyx sparingly hairy. It is one of our best forage plants for nutritive value, high yield, and good range of adaptability; it is commonly found in meadows and pastures, and is used as a green manure. It flowers from April to November. The seed weighs about 60 pounds to the bushel, and, if sown alone, 10 to 12 pounds will sow an acre.

Perennial red clover (*Trifolium pratense perenne*) may be regarded as an offshoot of common clover, from which it differs in being of longer duration and hardier. Zigzag clover, Cow-grass and Marl-grass or Mammoth clover (*Trifolium medium*) may be an offshoot of *T. pratense*, from which it differs in being a larger plant, having zigzag stems, the flower heads larger, longer stalked, and often of a deeper purple color, with a practically smooth calyx tube. The leaflets have no horseshoe mark. It is native of Europe and Siberia and blooms during the summer.

Alsike or Swedish clover (*Trifolium hybridum*) is an erect perennial, growing one to two feet high. Its flowers are pink to white and are open about the same time as those of timothy. It is suited to heavy clay soils and is the only clover that will stand irrigation. It has smaller and shallower roots than com-

mon clover. It is sometimes sown alone, when, owing to its small seed, four pounds per acre is sufficient. It is better suited to mixtures. It was introduced into Great Britain from Sweden in 1834.

White, Dutch, or honeysuckle clover (*T. repens*) is a common perennial, low-growing plant with white to pinkish flowers, native of Europe, Siberia, and perhaps of the northern United States. Its method of seeding makes it permanent. As its yield is small it is seldom grown alone, but is often incorporated in mixtures. It is a bee-plant and is common on nearly all soils. See DUTCH CLOVER.

Crimson, carnation, Italian or scarlet clover (*T. incarnatum*) is an erect, hairy annual, growing six inches to three feet high. The leaflets are nearly sessile, the flower-heads are terminal, oblong, or ovoid, one to two and a half inches long; flowers red, purple, pink, or white, sessile; calyx hairy. It is often grown as a catch or cover crop in orchards, etc., and sometimes for grazing and hay. It is quite ornamental and is now grown by the florist.

Yellow clover or hop clover (*T. agrarium*) is a hairless or slightly hairy annual clover, growing 6 to 18 inches high, with small yellow flowers which are open between May and September. It is common along roadsides and waste places.

T. procumbens is also called yellow clover, or hop clover; it is more spreading and hairy than the above. It is common on dry soils.

Alexandrian or Egyptian clover (*T. alexandrinum*) is an annual, bearing oval, pale yellow, or whitish flowers. As it is an important fodder in Egypt it is presumed that it will be of value for the southern States.

Moliner's clover (*T. molineri*) is a biennial with pale flowers. Rabbit-foot, stone or old field clover (*T. arvense*) is a common annual of no value.

T. dubium or *minus* is the least hop clover or hop-trefoil, also called yellow suckling clover, and is regarded by some as the true shamrock.

Uses and Feeding Value.—Clovers are grown for hay, pasture, soiling, silage, green-manuring, cover-crops, and soil improvement. Clovers or some other legume should have a place in every rotation, because of their deep, fleshy root system and capacity for appropriating free nitrogen from the air in the soil by means of bacteria on their roots. Their deep roots penetrate the subsoil and transfer valuable plant food to the surface soil, which is liberated when they decay. It has long been known that the growing of legumes improved the soil; Pliny recommended that such crops be grown previous to grain crops. The wisdom of this is now supported by recent research. In 1888 it was announced that the nodules on the roots of leguminous plants were colonies of bacteria, and that their work was to take up nitrogen from the soil-air for the benefit of their host; hence we have the fact that a large quantity of nitrogen may be removed from the soil for a series of years in the form of clover-hay or alfalfa hay—yet the surface soil be richer in nitrogen at the end of the period than it was at the beginning. Plowing a crop of clover under as green-manure is a very effective way of enriching the soil in humus. This is now practised in orchards to a considerable extent; the tillage they receive and the

CLOVER-WEEVIL — CLOVIS

crops removed rapidly deplete the fertility of the land, hence the introduction of the practice of seeding down the orchards during the summer with some legume, as crimson clover, cow-peas, soy-beans, etc., to add humus, protect the land from washing during the fall and winter, and in wet seasons, by using up the moisture, to aid in maturing the buds of the trees and enable them to stand the winter; the crop being plowed under the following spring when cultivation begins.

The average percentage composition of clover is given as —

	Protein	Nitrogen-free extract	Ether extract	Crude fibre	Ash	Water
Red clover, green..	4.4	13.5	1.1	8.1	2.1	70.8
Alsike clover.....	3.9	11.0	0.9	7.4	2.0	74.8
Red clover, silage..	4.2	11.6	1.2	8.4	2.6	72.0
Red clover hay....	12.3	38.1	3.3	24.8	6.2	15.3
Alsike clover hay..	12.8	40.7	2.9	25.6	8.3	9.7

With ruminants the average coefficient of digestibility is —

	Dry matter	Protein	Nitrogen-free extract	Crude extract	Crude fibre
Red clover, green..	66	67	78	65	53
Red clover hay....	61	62	69	62	49

At the Wisconsin station, clover cut three times in one year yielded 25 tons of green forage per acre; this may be regarded as a maximum yield. The first cutting, made 29 May contained only 8.2 per cent of dry matter, and was on this account unsatisfactory as a soiling crop, although, generally speaking, this crop is a most valuable one for this purpose, being relished by all stock. The total dry matter contained in the three crops was nearly four tons per acre.

If given in excess while green, or grazed, it is liable to cause bloat. To prevent this, give dry fodder in addition, and do not turn the animals out when they are very hungry or the dew is on. Clover pasture is excellent for growing pigs, and they may be fattened on it.

Experience has shown that the best time to cut clover for hay is when one third of the heads are turning brown. As ordinarily cured it is liable to be dusty, hence it is not considered a satisfactory feed for horses. For growing and idle horses, bright, clean clover hay is both economical and valuable. Hay from over-ripe crimson clover is dangerous for horses; the bristly hairs, accumulating in the intestines, form balls, causing stoppages and death. Clover hay is a most valuable forage for cattle, especially milch cows; 10 to 12 pounds may be fed daily, its high nitrogen content permitting a reduction of the amount of concentrated feed. It is one of the best coarse fodders for sheep, and when

chaffed fine is used for feeding laying hens in winter.

Clover Diseases.—The common diseases are: Clover rust (*Uromyces trifolia*), which appears in various stages on the leaves, leaf-stalks, and stems of the plant, particularly white clover. White minute cups appear in spring or early summer, accompanied or followed by small brown spores, which are finally followed by darker spores which live through the winter and germinate the following spring.

Clover rot (*Sclerotinia trifoliorum*) attacks many legumes. The disease causes a browning of the stem and leaves, which are soon spotted with a white mold, which ultimately forms solid, wavy black bodies often half an inch long. These produce mushroom-like bodies the following spring. Burning over the infested field and a proper rotation of crops are advocated for both diseases.

A leaf-spot (*Pseudopeziza trifolii*) is often destructive, especially during a wet fall. The leaves are covered with small black spots. Dodder (q.v.) is a parasitic plant responsible for considerable loss in some places.

Clover Insects.—Of the various insects which injure clover the following are prominent: The clover-root borer (*Hylastes trifolii*) which has in some sections killed out the clover the second year, thus necessitating a change in the rotation of the crops. The clover-stem borer (*Languria mozardi*) is widely distributed. The clover-leaf beetle (*Phytonomus punctatus*) is a weevil which feeds at night, consuming all parts of the plant. The clover-leaf midge (*Cecidomyia leguminicola*) is one of the worst pests; the eggs are laid in the blossoms, where the larvæ feed on what should be the seed. They pupate in the ground or in the seed. There are two or three broods annually. Various insects attack the stored hay, the most common being the clover-hay worm (*Asopia costalis*).

S. FRASER,
Instructor in Agronomy, Cornell University.

Clover-weevil, a kind of weevil, of the genus *Apion*, different species of which, or their larvæ, feed on the leaves and seeds of the clover, as also on tares and other leguminous plants. *A. apricans*, of a bluish-black color and little more than a line in length, is especially destructive. See WEEVIL.

Cloves, Oil of. See CLOVE.

Clo'vis, king of the Franks: b. 465; d. Paris 27 Nov. 511. He succeeded his father Childeric in the year 481, as chief of the warlike tribe of Salian Franks. He united with Ragnacaire, king of Cambrai, declared war upon Syagrius, the Roman governor at Soissons, and utterly routed the Romans near Soissons, in 486. Soissons was then made the capital of the new kingdom of the Salian Franks. Clovis married Clotilda of Burgundy, who had been educated in the Christian faith, and was desirous that her husband also should become a Christian. When he was hard pressed in a battle against the Alemanni at Tolbiac in 496, Clovis called on the God of Clotilda and the Christians. Consequently, when the victory was won, and territory of the Alemanni submitted to him, he was solemnly baptized at Rheims, 25 Dec. 496, with several thousand Franks, men and women. Hos-

tilities soon broke out between Alaric, king of the Visigoths, and Clovis. In the battle fought at Vouglé, near Poitiers, the latter gained a complete victory, slaying his enemy with his own hand. After this victory Clovis received the honor of the consulship from the Emperor Anastasius. In the last year of his reign Clovis had called a council at Orleans, from which are dated the peculiar privileges claimed by the kings of France in opposition to the Pope.

Clovis II., king of Neustria and Burgundy: d. 655. He was the second son of Dagobert, whom he succeeded in 638.

Clovis III., king of France: d. 695. He was the son of Thierry III., whom he succeeded in 691 at the age of nine. He reigned five years, under the guardianship of Pepin d'Heristal, mayor of the palace.

Clowes, klowz, Frank, English chemist: b. Bradford, Yorkshire, 1848. He was educated at the Royal School of Mines, London; Royal College of Science, Dublin; and the University of Würzburg, and was professor of chemistry at University College, Nottingham, 1881-97, and emeritus professor since 1897. He has published: 'Text-book of Practical Chemistry and Qualitative Analysis'; 'Text-book of Quantitative Analysis'; 'Elementary Practical Chemistry'; 'Introductory Quantitative Analysis' (1890); etc.

Clowes, Sir William Laird, English naval critic: b. London 1 Feb. 1856; d. there, 14 Aug. 1905. He was educated at King's College, London; and from 1876 to 1895 was correspondent for various newspapers. He wrote much on naval development, and on art and sociology. His works include: 'The Naval Pocket Book,' issued annually; 'The Needs of the Navy'; 'Four Naval Campaigns' (1902); and the novels, 'The Captain of the Mary Rose' (1892); 'Blood is Thicker Than Water' (1894); 'The Great Peril' (1893); 'The Double Emperor' (1894); 'Told to the Marines' (1902); and also 'The Miniature Cyclopaedia' (1888); 'Black America' (1892); 'Eclogues' (1889). He was the editor and chief contributor to 'The Royal Navy; a History from the Earliest Times to the Present' (1897-1902). He was knighted in 1902.

Clown, a role peculiar to the stage of English-speaking people, but bearing some resemblance to the *gracioso* of the Spaniards, and the *Hanswurst* of the Germans. The origin of the word is uncertain, some deriving it from the Latin *colonus*, in the sense of a peasant farmer, and others connecting it with certain Scandinavian and other Teutonic words. On the old English stage the clown was the privileged laughter-provoker, who, without taking any part in the dramatic development of the piece represented, carried on his improvised jokes and tricks with the actors, often indeed addressing himself directly to the audience instead of confining himself to what was going on on the stage. In Shakespeare, on the contrary, a distinct part was assigned to the clown, who no longer appears as an extempore jester, although the part he plays is to a certain extent in keeping with his traditional functions. At a later period the clown was altogether banished from tragedy, and allowed to appear only in the after-piece, performing gro-

tesque dances, singing comic songs, etc. He is now confined to the pantomime and the circus, in the former of which he plays a part allied to that of the French Pierrot.

Cloyd's Mountain, Battle of. On 3 May 1864 Gen. George Crook of the Union army marched from Fayette, W. Va., to break the Virginia & T. R.R. at the New River bridge. He had 11 regiments of infantry and 2 batteries of artillery, in all about 6,100 men, brigaded under Col. H. G. Sickel, C. B. White, and R. B. Hayes. He marched through Raleigh, drove a small Confederate cavalry force from Princeton, and on the 8th reached Shannon's Bridge, seven miles from Dublin, where he was joined by 400 cavalry. Here he found next morning that the Confederates—three regiments and a battalion of infantry and two batteries—under Gen. A. G. Jenkins and Col. John McCausland, were barring his way, strongly posted behind log and rail breastworks, on a steep and thickly wooded spur of Cloyd's Mountain, with guns sweeping the road and open country in front. Crook opened on the position with artillery, and then, under cover of the timber, sent White with his own brigade and two regiments of Sickel's to turn the enemy's right, and the moment they were engaged Sickel and Hayes charged directly to the front across a meadow swept by artillery and musketry fire, and up the steep ridge. Parts of the line were repulsed, again to rally and go forward, and after a hard contest, in which bayonets and clubbed muskets were used across the works, they were carried, the Confederates retreating to Dublin, leaving, as Crook reports, 230 unwounded men as prisoners, and two guns, in his hands. The Union loss was over 600, that of the Confederates about 500. Gen. Jenkins was mortally wounded and left on the field. Crook followed the retreating troops, and when near Dublin encountered about 500 of Gen. John H. Morgan's command, under Col. Smith, that had come from Sattville, and endeavored to cover McCausland's retreat. These Crook drove back, and at night he occupied Dublin. On the 10th he marched to Newborn and thence to New River Bridge, which McCausland tried to save, but after a two-hours' artillery duel in which Crook had 11 men killed and wounded, he seized and destroyed the bridge and the railroad for a considerable distance, then marched by way of Union, Alderson's Ferry, and Lewisburg to Meadow Bluff, which he reached on the 19th, his march harassed by the enemy's cavalry. Crook's entire loss was 109 killed, 513 wounded, and 72 missing. On his return march he was obliged to leave 200 of his wounded, with surgeons, who were captured. The Confederate loss, as reported, was 76 killed, 262 wounded, and 200 missing or captured. Consult: 'Official Records,' Vol. XXXVII; Pond, 'The Shenandoah Valley in 1864.'

E. A. CARMAN.

Cloyne, Ireland, a town 16 miles south-east of Cork. It has an ancient cathedral, near which is a round tower, a Roman Catholic chapel, a free school, founded by Bishop Crow in 1726; besides national schools. From 1638 to 1833 it was the see of a bishop belonging to the Established Church of Ireland, but in the latter year it was united with Cork and

CLUB

Ross. From 1734 to 1753 George Berkeley, the philosopher, was bishop of Cloyne. Pop. 1,300.

Club, a company of persons associated for some common object—social, literary, political, etc. It has been claimed that social clubs were known to the ancient Romans, but the evidence of their existence is scanty. Inscriptions tell of clubs of Roman citizens in foreign cities, and also of military clubs. For several centuries the club has been a peculiar institution in England, and of late it has become a prominent feature in American life. It is not easy to determine at what time clubs originated in England, but Occleve mentions one to which he belonged (during the reign of Henry IV.), called "La Court de Bone Compaignie." In 1659 Aubrey explained the word "clubbe" as meaning "a sodality in a tavern." He adds, "Here we had a balloting-box and balloted how things should be carried." The earliest London club of any celebrity was established about the beginning of the 17th century, at the Mermaid Tavern, Friday Street (otherwise known as Bread Street). Among its members were Shakespeare, Sir Walter Raleigh (the founder), Beaumont, Fletcher, Donne, and Selden. Ben Jonson figured at another club, which met at the Devil Tavern, near Temple Bar. It appears certain that clubs existed alongside of coffee-houses in the 17th and 18th centuries. At that time, however, their character was very different from what it is now. The coffee-houses of those days were the nearest representatives of the modern clubs, while the clubs were commonly nothing but a kind of restaurants or taverns where people resorted to take their meals. There was one feature, however, which was peculiar to clubs from the first, and distinguished them from coffee-houses; namely, that while anybody was free to enter a coffee-house, it was absolutely necessary that a person should have been formally received as a member of a club, according to its regulations, before he was at liberty to enter it. Almack's, Brooks', and White's were among the best known coffee-houses. Among the earliest of the London clubs was the Kit-Cat Club, formed in the reign of Queen Anne. Among its 40 members, who used to meet at the shop of a pastry-cook (Christopher Cat or Katt), in order to do justice to certain mutton pies for which he was famous, were six dukes, among them the Duke of Marlborough; five earls; many of the most distinguished leaders of the Whig party, such as Sunderland, Halifax, Sir Robert Walpole, and others; and several of the leading authors of the day, among them, Vanbrugh, Congreve, Addison, and Steele, the last two owing to the club idea the form given to the 'Spectator.' Another club formed about the same time was the Beefsteak Club. Originally these two clubs had no pronounced political views, but in the end they began to occupy themselves with politics, the Kit-Cat Club being Whig, and the Beefsteak Club, Tory. There have been several Beefsteak clubs since. During the last century it was common to give eccentric names to clubs, and the conditions of being admitted to membership in any one of these clubs were as a rule equally remarkable. Among these may be mentioned the Surly Club; the Split-farthing Club; the Ugly Club (of

which Wilkes was elected president for life, and Mirabeau was an honorary member); the Unfortunate Club; the Lying Club, the members of which were not permitted to utter a single truth during their sittings, unless they had been expressly authorized to do so by the president. Perhaps the most celebrated club of the 18th century was that which was first called The Club, but which was afterward known as the Literary Club. It was founded in 1764, and numbered among its members Dr. Johnson, who was for a long time its president, Sir Joshua Reynolds, Edmund Burke, Oliver Goldsmith, Edward Gibbon, and other distinguished men. In 1864 the 100th anniversary of its foundation was celebrated. In the rules which Dr. Johnson wrote for another club, the Apollo, he coined the still-serviceable word, "clubbable." In 1800 there were only half a dozen clubs existing in London, and within a century there were 100, with a total membership of 80,000. The most important London political clubs of the present day are the Carlton Club, founded by the Duke of Wellington, and the Reform Club. The former is the principal club belonging to the Conservative party in the kingdom, and the building in which its members meet, which is the most palatial edifice of the kind in the kingdom, may be regarded as the headquarters of the Conservative party. This club was founded in 1832, and the number of its members is 1,600. The Reform Club, the building belonging to which stands next to that of the Carlton Club, was long the great club of the Liberal party, founded in 1837, members 1,400. Among the other important London clubs are the National Liberal (7,000 members), Constitutional (6,550), United Service, Athenæum, Army and Navy, Travelers, Garrick, Primrose (5,600), etc. Similar clubs were started in the chief cities of England and in the colonies.

The first French society to take the name club was Le Club Politique, established in 1782, and a few years later, Le Club de Boston, or Club des Américains, was formed in Paris. The political clubs had no regular form, as they were tolerated only during revolutionary epochs. The Club des Jacobins, the Club des Feuillants, the Club des Cordeliers, and the Club de Montrouge were the most famous clubs of the time of the first French Revolution, and formed the storm-centres of that movement. None of the French clubs survived the *coup d'état* of 9 Nov. 1799, by which Napoleon overthrew the Directory. Two clubs were formed during the revolution of 1830, but they were both dissolved by the law relating to associations. At the revolution of February 1848 hosts of clubs started into existence, the most celebrated of which was the Central Republican Society (*Société centrale républicaine*), but their duration was short, for the Constituent Assembly in the following year ordered them all to be closed.

About the same periods as in France, political clubs were introduced into Italy, Germany, and Spain, especially during the time of the first French Revolution and that of 1848. In Germany, however, they were put down by a law of the empire in 1793, and in 1832 a federal decree was issued prohibiting all kinds of political societies and assemblies. In 1848 the number of clubs found in Italy, and particularl

CLUB-FINGERS—CLUB-ROOT

in Germany, was very great, but their collapse was as sudden as their rise. Later in the century municipal clubs, somewhat on the "good government" order, arose in Prussia. The city of Berlin had 75 such organizations in 1896. Some of these clubs maintain death-benefit and savings-bank features. Social clubs of the English type have not spread rapidly on the Continent. In France the name *cercle* was given to clubs of this nature. The most fashionable clubs of Paris are Le Cercle de la rue Royale and the Jockey Club. Many sports besides horse-racing are represented in the club life of the French capital. The automobilists, and the devotees of yachting, fencing, etc., have their separate organizations. There are also cercles for army officers, for literary men, for artists, and one connected with agricultural interests. Alpine clubs (q.v.) are found in many European countries. The French society of that name has numerous branches. Catholic clubs of workmen exist in different parts of the country.

Although clubs were not unknown in the United States toward the close of the 18th century (the Hoboken Turtle Club dating back to that period), yet their spread and development were slow previous to the Civil War. Among those ante-dating the War may be named, the Union Club of New York (1836), the Somerset Club of Boston (1857), and the Maryland Club of Baltimore (1857). The Union League Club of New York (1863) grew out of the purpose to defend and perpetuate the national integrity, to encourage loyalty to the Federal government. Other Union League clubs were formed later in Philadelphia, and other cities; and in all the important centres of the country there grew up large and flourishing societies of a political or social nature, or such as combined the two features. The Manhattan Club became the chief social Democratic club of New York. The St. Nicholas Club represented a different type, a society founded upon a similarity of ancestry or antecedents and endeavoring to preserve historical associations. As these organizations have increased in number they have become more varied in character, until not only politics, science, art, music, literature, sociology, religion, philanthropy, and professional, commercial, social and sporting life are all represented, but the subdivisions are bewildering and continually increasing. Athletic clubs of various kinds are numerous and popular, abroad as well as in America, especially those for golfers and cyclists. The Cycling Tourists' Club, with headquarters in London, has a membership of 45,000.

University clubs draw together the college-bred men of various sections or cities. The largest one of the kind in the United States is that in New York, which had, in 1902, 2,566 members. The city has also a Yale, a Harvard, and a Princeton Club. The Reform Club, organized in 1878, works for good government and agitates the tariff question. Among the largest clubs of the metropolis in addition to those already mentioned are the following: New York Athletic, 2,800 members; New York Yacht, 1,300; Century, 1,172; Army and Navy, 1,200; Metropolitan, 1,040; Players, resident 500, total 1,000; Lotus, resident 600, total 956. Others noteworthy for special characteristics are: The Knickerbocker Club, Authors' Club, Press

Club, Grolier Club, Catholic Club, Holland Society, etc. The Chicago Athletic Club has 2,500. In Philadelphia, in addition to the Union League, the Manufacturers' Club, the Art Club, the Rittenhouse, and the New Century, are numerically strong. Clubs devoted to the cultivation of vocal music are largely formed of the German element in our cities. Prominent among these societies are the Liederkrantz, the Arion, and the Mendelssohn.

Wherever the Anglo-Saxon race is represented in sufficient numbers, even in the remotest parts of the globe, the club idea has taken root, and we find English-speaking clubs or such as are suggested by or modeled upon English originals. India has more than 140 clubs; Pekin has its Reform Club; Cairo its Cycling Club, and Zanzibar its Golf Club. The Scotch Thistle Club of Hawaii shows its origin in its name and springs from the same source as the Caledonian clubs of America. Indeed, the tendency of men of a common blood to seek, when on a foreign soil, a social bond of unity, accounts for a special type of club. The line between organizations calling themselves societies and those known as clubs, is not always distinctly marked, but in general it may be said that where the social element is slight or lacking, the term club is inappropriate. This element entered largely into organization of many women's clubs in the early history of such societies, but their literary, professional, and especially their philanthropic features have become more prominent of late years. See BOYS' CLUBS; GIRLS' CLUBS; MOTHERS' CLUBS; WOMEN'S CLUBS; WORKINGMEN'S CLUBS.

Club-fingers. See HAND.

Club-foot (Lat. *Talipes*), a congenital distortion of the foot, of which there are several varieties. Sometimes the foot is twisted inward (*T. varus*); sometimes the heel is raised and the toes only touch the ground (*T. equinus*); sometimes the foot is twisted outward (*T. valgus*); or it rests only on the heel (*T. calcaneus*). The deformity consists at first in the contraction of the muscles and tendons of the feet, but ultimately the bones become distorted. If attended to in time, the foot may be gradually coaxed to its natural shape, and even in more advanced cases the deformity is usually curable by modern surgery.

Club-moss, the common name of the *Lycopodiaceæ*, a natural order of the mosses, containing four genera and 110 species, two of which, lycopodium and psilotum, are found in America, and two in Australia only. The club-mosses are found as gigantic fossils in the Upper Silurian, Devonian, and Carboniferous periods, and are a marked feature of the rocks of the two latter periods. See LYCOPODIUM.

Club-root, Anbury, or Finger-and-Toe (*Plasmodiophora brassicæ*). This fungous disease is known under the above common names; it attacks turnips, cabbages, cauliflowers, and allied plants, often seriously injuring the crop. The term "club-root" arose from the club or wart-like excrescences which result from a plant being infested; owing to the tendency of the root to split up in this manner the term "finger-and-toe" is also applied. In Europe these knob-like growths cannot be regarded as conclusive evidence of this disease, as they may be

CLUMBER SPANIEL — CLUVER

due to attacks of a gall insect. This fungus belongs to a very low order known as the slime-fungi; it can readily enter the young host plant, where it grows and reproduces rapidly; by the time the host should be mature, in fall, the fungus has formed millions of spores, which live over winter. The fungus can live for years in the soil, and no means of killing it is known, although applications of lime and potash reduce its ravages considerably. Methods of prevention are advocated, as, keeping the land free from cruciferous weeds, as wild mustard, etc., and destruction of all affected roots by burying with quicklime, or burning.

Clumber Spaniel, a short-legged spaniel averaging from 30 to 35 pounds in weight. Its legs are somewhat bowed, and its feet are large. It is a good swimmer, and is valued for its retrieving qualities, and its silence while hunting.

Cluniacs, or **Congregation of Cluny**. See CLUNY.

Cluny, klü-nē, or **Clugni**, a monastery of that branch of the Benedictine order known as the Congregation of Cluny, or as Cluniacs. It was founded in 912, at Cluny, 15 miles from Macon on the Saone. In the 12th and 13th centuries Cluny was perhaps the most notable monastic foundation in Europe: it had many hundred monasteries under the jurisdiction of its abbot. The first Cluniac house in England was founded by the Earl of Warenne, companion-in-arms of William the Conqueror. The church of the mother, established at Cluny, built in the 11th century, was regarded as one of the wonders of the world: this monument of gothic architecture was at the Revolution secularized by the republican government and was sold to the commune of Cluny, and by them was leveled with the ground. Napoleon, on being invited by the townsmen to visit the place, made reply, "No; you are vandals." There were suppressed by Henry VIII. in England and Wales 35 Cluniac houses, one of them a convent of nuns.

Clupeidæ, kloo-pē'ī-dē, the herring family, fishes of the order *Isospondyli*. The oblong, compressed, or nearly rounded body is covered with usually very thin, delicate, and easily detached cycloid scales, but the head is scaleless; the caudal fin is forked, the dorsal and specially the anal fins, elongated, and the last dorsal ray sometimes thread-like and prolonged. The skeleton is remarkable for the great number of delicate rib-like intermuscular bones; the maxillary bone forms the greater part of the upper jaw, and, like the rest of the mouth, is toothless or provided with only minute teeth; the gill-rakers are usually elongated and numerous, and there is no gular plate or bony piece in the floor of the mouth. There are nearly 30 genera and 150 species now known, most of them marine, but many migrating into fresh water to spawn. North America has 15 genera and 40 species. The most important of all food fishes belong to this family, of which the alewife, herring, shad, menhaden, and sardine (qq.v.) may be named.

Cluricaune, kloo'rē-kôn, in Irish mythology, an elf of evil disposition who usually ap-

pears as a wrinkled old man, and has knowledge of hidden treasures.

Cluseret, Gustave Paul, güs-täv pöl klüz-zè-rā, French officer and Communist: b. Paris 13 June 1823; d. Toulon 23 Aug. 1900. He came to the United States soon after the breaking out of the Civil War, and after serving on Gen. McClellan's staff became a brigadier-general. In 1864 he edited the 'New Nation,' in New York. Subsequently he returned to Paris, and was war minister of the commune in April 1871. From Paris he fled to England and Mexico, and was condemned to death by a military tribunal in 1872. He was, however, pardoned and allowed to return to Paris in 1880, and in 1888, 1889, and 1893 was elected to the Chamber of Deputies.

Cluse, Charles de la, shärl dé lä klüz (CLUSIUS), French botanist: b. Arras 18 Feb. 1526; d. Leyden 4 April 1609. He traveled extensively in Europe in pursuit of his favorite science, and by over-exertion and numerous grave accidents, he ruined his health and became a cripple. He was made keeper of the Botanical Gardens at Vienna, and in 1593 accepted the chair of botany at Leyden. His principal works are: 'History of Rare Plants'; and 'History of Plants,' a translation from Dodoens.

Clustered Column, in architecture, a pier which appears to consist of several columns or shafts clustered together; they are sometimes attached to each other throughout their whole height, and sometimes only at the capital and base.

Clutha, kloo'tha, sometimes called MOLYNEUX, the largest river of New Zealand, in the southern part of the South Island. It receives the waters of lakes Hawea, Wanaka, and Wakatipu, and flows in a southeasterly direction through the counties of Vincent and Tuapeka, and then between those of Clutha and Bruce, till it reaches the sea in Molyneux Bay, after a course of 150 miles.

Clut'terbuck, Captain Cuthbert, the feigned editor of three of Scott's novels: 'The Monastery'; 'The Abbot'; and 'The Fortunes of Nigel.'

Cluver, kloo'vèr, or **Cluverius, Philipp**, German geographer and antiquarian: b. Danzig 1580; d. Leyden 1623. He applied himself first to the study of law, but afterward, against the will of his father, almost exclusively to history and geography. Being on that account left without support by his father, he was compelled to enter the service of the Austrian army, but at the end of two years he returned to his favorite pursuits. He now traveled through England, Scotland, France, Germany, and Italy, and then settled in Leyden, where he gave himself up entirely to literary labors till his death. His first geographical work, 'Germania Antiqua,' was published in 1616. Two carefully prepared antiquarian works, one upon Sicily, Sardinia, and Corsica, the other upon Italy, followed. His most important work was not published till after his death. It is entitled 'Introductio in universam Geographiam tam Veterem quam Novam,' and is the first successful attempt at a systematic treatment of geography in the whole extent of its historical and political relations. The first edition appeared at Leyden

CLUYSENAAR — CNICUS

in 1629, but it has been frequently republished. The most complete edition is that of Bruzen de la Martinière (1729).

Cluysenaar, Alfred, Belgian artist: b. Brussels 24 Sept. 1837; d. there 23 Aug. 1902. He was the son of a noted architect, with whom he at first studied sculpture, but he was more attracted to painting and subsequently studied art in Brussels and Paris, exhibiting 'A Dominican Meditating' in 1861. Other pictures of his are a 'Vocation,' now in the Brussels Museum, and a 'Mazeppa,' and six large mural paintings for the University of Ghent.

Clwyd, kloo'íd, Wales, a river in County Denbigh, rising on the northeast of the Bronbanog, and entering Abergele Bay, after a course chiefly northwest of about 30 miles, during which it is joined by several small tributaries. It is navigable at high water for vessels of 80 tons burden to the town of Rhuddlan, two miles from its mouth.

Clyde, Lord. See CAMPBELL, SIR COLIN.

Clyde, klíd, Scotland, a river which has its sources amid the hills that separate Lanarkshire from the counties of Peebles and Dumfries, flows by Lanark, Hamilton, Glasgow, Renfrew, Dumbarton, Greenock, etc., and forms finally an extensive estuary or firth before it enters the Irish Sea at the southern extremity of the island of Bute. From its source to Glasgow, where navigation begins, its length is 70 or 80 miles. Its principal tributaries are the Douglas Water, the Mouse, the Nethan, the Avon, the Calder, the North Calder, the Kelvin, the White and Black Cart, and the Leven. Near Lanark it has three celebrated falls—the uppermost, Bonniton Linn, about 30 feet high; the next, Corra Linn, where the water takes three distinct leaps, each about as high; and the lowest, Stonebyres, also three distinct falls, altogether about 80 feet. The Clyde, by artificial deepening, has been made navigable for large vessels up to Glasgow, and is the most valuable river in Scotland for commerce.

Clydebank, a police burgh and town of Scotland, in Dumbartonshire, on the north or right bank of the Clyde, about six miles west by north of Glasgow. It is of modern origin, its chief industry being ship-building. Pop. (1901) 18,654.

Clydesdale, a breed of horses named from the valley of the Clyde in Lanarkshire, Scotland. Clydesdales are about 16 hands high, are compact and muscular in build, and have a long, easy stride. They vary in color, being black, gray, brown, or bay, and are used for draft-horses. Specially fine specimens of this breed are found in the eastern United States, in the service of the municipal fire departments of large cities.

Clydesdale, or Paisley Terrier. See DOG.

Clymene, klím'ē nē, the daughter of Oceanus, and mother of Atlas and Prometheus.

Clymer, klí'mér, Ella Dietz, American poet: b. New York. She began her career as an actress in 1872, but in 1881 she abandoned the stage. She has published three volumes of poems: 'The Triumph of Love' (1878); 'The Triumph of Time' (1884); and 'The Triumph of Life' (1885). She was one of the founders of the "Soros" Society, and its president in 1889.

Clymer, George, American statesman: b. Philadelphia 1739; d. Morrisville, Pa., 23 Jan. 1813. He entered mercantile life when a lad and acquired a competence. He was prominent in public affairs prior to the Revolution, and in 1775 became one of the first Continental treasurers. He was chosen in 1776 to succeed a member of the Continental Congress who had refused to sign the Declaration of Independence, to which he promptly affixed his signature, the 38th after John Hancock's. He was active in the patriot cause during the Revolution, was a member of the convention that framed the federal constitution, and in 1788 was elected a member of the first congress under that instrument. In 1790 he declined a re-election, and in the succeeding year was appointed collector of the excise duties on spirits, the collection of which in Pennsylvania led to the whiskey riots. Clymer acted firmly, yet temperately in the troubles, till finding the office distasteful, he resigned it, and was appointed, with Pickens and Hawkins, to negotiate a treaty with the Cherokees and Creeks in Georgia. No man was more averse than he to the assumptions of aristocracy, to the excellencies, honorables, and esquires, who, he said, abounded more in the United States than in any other country in the world. He seldom spoke in public, but when he did his ideas were expressed in language, keen, pithy, and laconic.

Clysters, medicaments introduced into the lower bowel, usually for the purpose of expelling its contents. When used in ordinary cases of constipation a syringe of a peculiar construction, capable of injecting water in a lukewarm state, and either pure or mixed with soap, is often employed with immediate effect; but all kinds of clysters require to be used with moderation, as they have a tendency to impair the energy of the alimentary canal. Enemas are also used to supply nourishment when it is impossible to administer it by the mouth, as in cases of tetanus, spasmodic closure of the œsophagus, etc.

Clytemnestra, klít-ēm-nēs'tra, daughter of King Tyndareus and Leda, and half-sister of Helen. She bore her husband Agamemnon two daughters, Iphigenia and Electra, and one son, Orestes. During the absence of Agamemnon in the war against Troy she bestowed her favors on Ægisthus, and, in connection with him, murdered Agamemnon on his return from Troy, and, together with her paramour, governed Mycenæ for seven years. Her son, Orestes, killed them both.

Clytie, klít'ē, the daughter of Oceanus and Thetis, who pined away through love for Apollo, and was changed by him into a sunflower.

Cnicus (Latin for safflower, which name was first given to the thistle), a monotypic genus of the natural order *Compositæ*. The plant is an annual herb which came originally from the southern part of Europe, and occurs from May to August in waste places along the Pacific coast as well as on the eastern seaboard from Maryland to Nova Scotia. *C. benedictus*, or, as it is sometimes called, St. Benedict's thistle, was formerly used as a febrifuge, but is now rather considered a tonic and diaphoretic.

CNIDUS — COACH

Cnidus, nī'dūs, or **Gnidus**, Asia Minor, a town in the province of Caria, and a favorite resort of Aphrodite (Venus), who was hence surnamed the Gnidian Goddess. She had there three temples. In the first, probably erected by the Lacedæmonian Dorians, she was worshipped as Doritis. The second was consecrated to her under the name of Aphrodite Acræa. The third, called the Temple of the Gnidian Aphrodite, and by the inhabitants, the Temple of Aphrodite Euplæa, contained Praxiteles' marble statue of the goddess, one of the masterpieces of art. This was afterward removed to Constantinople, where it perished in a conflagration in 1461.

Cnossus, nō'sūs, or **Gnossus**, more anciently CNOSUS, or GNOSUS, now MAKRO TEIKHO, the capital of Crete in the time of Minos, was built on the Cæratu, a short distance from the northern coast, and founded by Dorians, who diffused their institutions over the island. Homer mentioned it as already a great city, and the residence of the celebrated Cretan king; it long maintained its preponderance, until it was weakened by the growing importance of Cydonia and Gortyna. It was renowned in mythology by numerous legends of Jupiter, born, married, and buried in its vicinity; of Minos, Ariadne, the minotaur, and the labyrinth. In later times it became a colony of the Romans. Ænesidemus, the skeptic philosopher, and Chersiphon, the architect of the temple of Diana in Ephesus, were born there.

Coach, a large, close, four-wheeled vehicle, generally constructed to carry passengers inside and outside; used for purposes of state, for pleasure, or for traveling. It cannot be determined at what time covered carriages first came to be used, but they were in use among the Romans. The earliest carriages appear to have been all open, if we may judge from the figures of Assyrian and Babylonian chariots found on the monuments discovered amid the ruins of Nineveh and Babylon. At Rome the matrons used to be conveyed on festal occasions in covered carriages called *carpenta*, which was a high distinction, since during the republican period the use of carriages in the city was entirely prohibited. At a later period covered carriages, richly ornamented, were used by the Romans on occasions of state and ceremony. After the fall of the Roman empire they went out of use again, and during the feudal ages the custom was to ride on horseback, the use of carriages being considered effeminate. Although mention is made of them again before the end of the 13th century, they do not appear to have become common until about two centuries later, when, however, they were regarded exclusively as vehicles for women and invalids. But a little later they seem to have been looked upon as appendages of sovereignty, and the German princes vied with one another in the splendor of their equipages, while their use was prohibited to the nobility and their vassals. About 1282 the Queen of Charles of Anjou entered Naples in a caretta, which seems, in some respects, to have resembled a modern coach. In England a kind of carriage called a "whirlicote" was in use in the reign of Richard II.; but coaches, properly so called, are stated by Stow to have been introduced in 1564 by a Dutchman, who

became coachman to Queen Elizabeth. Stow adds:

After a while, divers great ladies, with as great jealousy of the queene's displeasure, made them coaches, and rid in them up and downe the countrie, to the great admiration of all the beholders; but then by little and little they grew usual among the nobilitie, and others of sort, and within twentie years became a great trade of coach-making.

They were, however, for a long period confined to the aristocracy and the wealthy classes. Sometimes six or even eight horses were harnessed to the coach, partly no doubt for the sake of display, but chiefly because the wretched state of the roads required that number. At first coach-wheels were very low, which circumstance also contributed to prevent the attainment of any considerable speed, and to make it necessary to use several horses to draw them; and no one seems to have pointed out the advantages of large wheels until, in 1771, a Mr. Moore for a short time attracted a good deal of attention by pointing out the fact that it was much easier to draw a coach or cart with large wheels than with small ones, and by actually constructing a coach "very large and roomy," which was "drawn by one horse, and carried six persons and the driver, with amazing ease, from Cheapside to the top of Highgate Hill," coming back "at the rate of 10 miles an hour, passing coaches-and-four, and all other carriages it came near on the road." A contemporary account states that this coach had two large wheels, 9½ feet in diameter.

Hackney-coaches were first used in London in 1625. They were then only 20 in number, and were kept at the hotels, where they had to be applied for when wanted. In 1635 an attempt was made to restrain their use by a proclamation of Charles I.; but, this being found unsuccessful, their number was limited, and a commission was given to the Master of the Horse to grant licenses for their use. In this year only 50 were licensed. In 1634 one Capt. Baily, who had formerly been a sea-captain, hit upon the plan of keeping a number of hackney-coaches, with drivers in livery, standing at a particular place (the "Maypole," in the Strand), where they might be had whenever they were wanted. Hackney-coaches now rapidly became more general. The four started by Capt. Baily in 1634 had increased to 200 in 1652, to 800 in 1710, and to 1,000 in 1771.

The following facts relating to the history of stage-coaches are taken from Chambers' 'Book of Days': Stage-coaches were introduced into England about the same time as hackney-coaches. The first stage-coach in London appears to have run early in the 17th century, and about the middle of the same century they appear to have become general both in London itself and in the better highways in the neighborhood. Before the end of the century they were started on three of the principal roads in England. Their speed at first was very moderate, about three or four miles an hour. They could run only in the summer, and even then their progress was often greatly hindered by floods and by the wretched state of the roads generally. In 1700 a week was considered a marvelously short space of time to take to travel from York to London; and even 60 years later a fortnight was spent in going between Edinburgh and London. The first stage-coach

COACH — COAHUILA

that traveled between Glasgow and Edinburgh, which was set on foot in 1749, occupied two days in the journey. The first efforts to accelerate the speed of traveling was made by a body of Manchester merchants in 1754, who started a conveyance to which they gave the name of the "Flying Coach," and which was intended to cover the distance between Manchester and London in the unusually short period of four days and a half. In their prospectus, the proprietors of the new vehicle made the following announcement:

However incredible it may appear, this coach will actually (barring accidents) arrive in London in four days and a half after leaving Manchester.

Thirty years later, Mr. Palmer, of Bath, after a considerable amount of opposition, succeeded in inducing the government to put in practice certain suggestions which he made, by which he showed that great saving both in time and money in the conveyance of passengers and letters would be effected. The result was the establishment of the system of mail-coaches, which continued to be the means of traveling in England until their place was taken by the railways. The first mail-coach started between London and Bristol on 8 Aug. 1784.

The manufacture of elegant coaches is a proof of much wealth and mechanical skill in a place, many different artists being employed in their construction, who become skilful only when the demand for their work is considerable. Brussels was once famous for the manufacture of carriages, and many are built there still. Vienna-made coaches, etc., are also in good repute. See also CARRIAGE; CARRIAGE AND WAGON INDUSTRY.

Coach, or **Dalmatian Dog**, a short-haired dog of moderate size and rather handsome shape, white, with numerous round black spots, kept as an attendant upon carriages, and of no use otherwise, except in some parts of northern Europe, where it is used to draw milk-peddlers' carts and other small vehicles. Although called Dalmatian, the breed is believed to have originated in Spain.

Coach-whip Snake, an American snake (*Masticophis flagelliformis*), characterized by a long, narrow head, projecting upper jaw, superior orbital plates large and projecting much over the eyes; nostrils large, lateral, and near the end of the snout; eyes large, iris dark gray; neck small, body long, and tail attenuated like a whip-cord, which it also resembles in the braided appearance produced by the arrangement and dark border of the scales. The color of the head, neck, and a third of the body is glossy black, becoming paler toward the tail, which is tawny brown; the scales of the tail have dark margins; the lower surface in front is bluish slate, behind white clouded with brown; the colors vary in their shades, but near the head it is always black. They sometimes attain the length of seven feet. It moves with great swiftness, and feeds on young birds and small animals; though inoffensive to man, it defends itself bravely, twining its long folds around its enemy. The species is rare, and appears to be confined to South Carolina, Georgia, and Florida. In its general form, in the scales, and in the plates on the head, it somewhat resembles the black snake.

Coadju'tor, a Latin term, nearly synony-

mous in its original meaning with assistant, and applied by the Romans to a kind of deputies or lieutenants given to magistrates to assist them in a press of business, or supply their place in absence. The term was afterward introduced into the Church and given to persons who were associated with prelates, archbishops, or bishops, to assist them or act as substitutes for them in the discharge of their functions. The appointment usually made the coadjutor the successor of his principal, and in this way great abuses arose. At first the coadjutor was nominated by the king on the presentation of the archbishop or bishop with whom he was to be associated, and who generally took care to present some nephew or cousin, who had been or was about to be ordained, and thus the highest ecclesiastical positions became in a manner hereditary in a certain number of families, contrary to the ecclesiastical maxim which declared them to be purely elective. The abuse once begun made rapid strides until the Council of Trent introduced several reforms, by providing that the nominations of a coadjutor should not take effect except in cases of necessity or manifest utility, the Pope being made sole judge of these cases. Coadjutors, as now understood, are of two kinds, one temporary and revocable, allowed on account of illness or other incapacity, and allowing no right of succession; the other irrevocable and carrying with it the right of succession. The Council of Trent did not favor the "irrevocable right of succession," but the Pope grants it in special cases. A coadjutor differs from a "suffragan," and the words have slightly different meanings in different countries. The term and the office is not confined to the Roman Catholic Church; it is in use also in the Anglican Church.

Coagula'tion (Latin, "to curdle"), the peculiar change from the state of a liquid to that of an amorphous solid, exhibited, under certain conditions, by proteid bodies and their solutions. The hardening of an egg by boiling is a familiar instance of the process. In this case the change is induced by heat, and begins when the temperature reaches 160° F. or thereabouts. Another familiar case is the clotting of blood, which occurs from a very different cause. The blood contains two albuminous substances which are concerned in the phenomenon, and which are known respectively as "fibrinogen" and "fibrinoplastic substance." These are normally held in solution; but as soon as the blood is removed from the body they undergo a change whose nature is not well understood, the product of which is a stringy, elastic, fibrous or jelly-like solid known as "fibrin." In the pure state fibrin is white or gray, but in the blood-clot it appears strongly red, because its fibres imprison multitudes of the red corpuscles of the blood unless special care is taken to prevent this action. Casein, the principal proteid constituent of milk, does not coagulate from the direct application of heat, but it coagulates very quickly when rennet is introduced, and it also coagulates spontaneously under the influence of certain of the products of fermentation that develop in the milk after it has been exposed to the air for a time.

Coahuila, kō-ä-wē'lä, Mexico, a state bounded on the north by the United States, on the east by Nuevo Leon, on the south by San

COAITA — COAL

Luis Potosi and Zacatecas, and on the southwest, west, and northwest by Durango and Chihuahua. Its area is about 60,000 square miles. The capital is Saltillo. The principal mountain ranges are in the districts of Rio Grande and Monclova. Besides these we may mention the Sierra Madre, in the Saltillo district; the Sierra Paila, in Parras; and Sierra Noas, in Viesca. The rivers are: Rio Grande (also called Rio Bravo), forming the boundary line with Texas; the Sabinas, forming the boundary between the districts of Monclova and Rio Grande; the Alamos, Monclova, Patos, Saltillo, Aguanaval, Nazas, and their tributaries. The principal lagoons are those in the districts of Parras, Viesca, and Monclova. Extending from the foot of the mountains northward are sterile plains, where the heat is intense; to the southeast lies the Laguna region, fertile and temperate; the mountainous district, rich in minerals, has frequent frosts. In general the climate is not healthful, the most common diseases being malarial fevers, typhus, rheumatism, and affections of the respiratory and digestive organs. Mining has recently become one of the chief industries. Silver, lead, coal, iron, copper, and gold are found. The first position, however, is still held by agriculture. Cotton, corn, wheat, sugarcane, etc., grow readily; and grape-culture is attracting special attention. The grapes of Parras are considered by some experts equal if not superior to the Malaga and Granada varieties. The state's output of cotton in 1897 was valued at \$6,264,632. The value of ixtle produced in the same period was \$2,430,338. Cattle-breeding is carried on quite extensively. The export trade is principally with the United States, to which, among other products, are brought ixtle and its various manufactures. The commerce of Coahuila is in the hands of Americans, Spaniards, Germans, and Frenchmen; its total trade is of the estimated value of \$11,000,000, or \$12,000,000, silver, per annum. Manufactures are: cotton and knitted goods, wines, tanned skins and hides, soap, candles, cheese, shoes, molasses, furniture, pottery, carriages, wagons, and chocolate. The railroad system includes a number of important lines. There are good wagon roads; also telegraph and telephone service and an efficient mail-service. The state is divided into five districts, subdivided into 33 municipalities. Pop. 285,000.

Coaita, kō-ī'ta. See SPIDER-MONKEY.

Coal. No suitable definition of the mineral substance called coal exists. Such a definition as «anything dug out of the ground that will burn» is obviously too loose; at the same time a definition based strictly on chemical composition is of slight value, since coal is a very complex substance and good coals vary greatly in composition. Generally speaking, coal is believed to represent the remains of various kinds of plants. It is found in seams or beds, separated by other beds or strata of clay, shale, grit, or sandstone. Inasmuch as all plant life depends on the energy received from the sun, and as, through the sun's rays, plants are enabled to fix in more or less stable form the carbon of the carbon dioxide from air and soil, it is permissible to define coal as buried sunshine. Such a definition at least indicates the great source of the

energy given off as heat and light from a coal fire.

Origin.—Many theories have been advanced as to the origin of coal. Thus coal beds have been attributed to the drying up of petroleum lakes on old land surfaces, to the separation of carbon by some fanciful chemical process from limestone, and to accumulation of seaweeds along old ocean beaches. These theories may be dismissed without discussion; they may help explain some particular instance, but are so unsupported by facts that they are of no wide application. The generally accepted theory applies to practically all kinds of coal deposits and is, briefly, as follows:

When the woody material, cellulose, of the leaves and stems of plants, falls on the ground, it soon oxidizes or decays, and the oxygen, hydrogen, carbon, and nitrogen present pass into the air or soil as gases, the hydrogen and oxygen chiefly as water vapor, the carbon as carbon dioxide, and the nitrogen as ammonia. Finally of the original material, say the trunk of a great tree, only the ash, composed chiefly of silica, alumina, and iron oxide, is left. Thus it happens that the leaves, twigs, and branches that have fallen for thousands of years in a forest are represented by a few inches of vegetable mold or humus, plant substance not yet oxidized to ash. If, however, the ground be covered by water, as in a swamp, air is partly excluded, and decay proceeds so slowly that vegetable or animal remains may be preserved for long periods of time. Still oxidation goes on: the dead plants gradually give up their hydrogen, oxygen, and carbon as water, marsh gas, and carbon monoxide and dioxide, and change to a mass of partly decayed vegetable fibre or even to a black muck.

A damp climate and a land surface from which the rainfall runs off slowly, favor the formation of extensive swamps, though in a climate as damp as that of Ireland peat bogs climb hillsides, the mosses (*Sphagnum*), the chief plant growth in such swamps, dragging up water by capillary action. On the plains of Alaska and Siberia, where the ground is permanently frozen, mosses cover the ground with a thick mat, and such swampy plains are called tundras. In a lake country can be found areas which a little investigation shows were at no very remote date covered by shallow bodies of water, but are now swamps, the original lakes having been filled by the dead mosses, rushes, and other aquatic plants. Along the seashore in a region of average rainfall, where the coast is of low relief and the rivers sluggish, sand-bars form by wave action off shore, and behind these bars are salt lagoons and marshes, changing, farther from the ocean, to brackish, and finally fresh-water swamps.

Fresh or brackish water and a fairly warm though not torrid climate are indicated by the fossils of plants and animals found in or near coal seams. From these facts and from the vast extent of some coal fields it is believed that coal beds represent old coastal swamps, possibly of the type of the Dismal Swamp in Virginia. Now if we suppose such a swamp-covered coast to

COAL

sink slowly, the encroaching ocean would cover the accumulated peat and muck with sand and silt until finally the swamp might be buried thousands of feet by sediments from the receding land surface. Instead of steadily sinking, however, the probabilities are that during the great coal-forming epochs the land alternately sank and rose through thousands upon thousands of years, and thus one swamp was buried over another, resulting in those alternating beds of coal, shale, and sandstone characteristic of all coal fields.

The progressive diminution of hydrogen and oxygen compared with carbon is shown by the following table from Percy's 'Metallurgy,' in which carbon is taken at the constant amount of 100:

	Carbon	Hydrogen	Oxygen
Wood	100	12.18	83.07
Peat	100	9.85	55.67
Lignite	100	8.37	42.42
Welsh bituminous	100	4.75	5.28
Pennsylvania anthracite	100	2.84	1.74

The loss of water and of combined carbon, hydrogen, oxygen, and nitrogen, in the change from peat to coal, caused a great loss of bulk. The pressure of overlying strata, or of those earth movements that warp and fold the rock formations, reduced the bulk still more. Thus it can happen that a coal seam one foot thick may represent what was 50 feet of peat in the ancient swamp, and it is fair to assume that an average seam of true coal is not one fifth the thickness of the original peat beds.

Some geologists have believed that when the old swamps now represented by coal seams were accumulating thick beds of peat, the climate was torrid, while the earth's atmosphere contained a higher percentage of carbon dioxide than now. It may be said, however, that a torrid climate is not necessary for the existence of great swamps; and as to a higher percentage of carbon dioxide in the air, were the present land surface of the globe covered with a layer of coal one foot thick, the carbon contained therein, if restored to the atmosphere, would mean an increase in the amount of carbon dioxide of but about .5. This about represents the difference between air in the city and in the country, and the effect of such an increase in stimulating plant-growth is at best doubtful.

As to the age of the coal formations it may be said that true peat deposits are all of later age than the Tertiary, and in North America only peat and incoherent lignite occur in later formations than the middle Tertiary (Miocene) though the early Tertiary (Eocene) formations contain great areas of lignite. In Europe there are lignitic deposits in the Triassic and in the Carboniferous. The great coal-forming age in North America and in Europe was the Carboniferous, though true coals occur in the Permian and in the Triassic, and in North America there are very important coal fields of Cretaceous age. Isolated pockets of coal, but

no workable coal fields, occur in pre-Carboniferous formations. See CARBONIFEROUS SYSTEM.

An idea of the relative compositions of peat, lignite, and true coals may be had from the following table:

	H ₂ O	C	H	O	N	S	Ash
Condensed peat..	20	47.2	4.9	22.9			5.0
Lignite, Alaska..	16.52	55.79	3.26	19.0	.61	.63	4.18
Bituminous coal, Connellsville, Pa.	0.89	82.48	4.50	5.61	1.45	.94	34.1
Anthracite coal, Lykens, Pa....	0.73	82.89	4.53	.40	.64	.68	10.13

Varieties of Coal.—Various elaborate schemes of classifying coal have been advocated, but have not gained popular acceptance. In fact in the coal trade in this country the word coal is often applied to a true lignite. However, since the chief heat-producing element in coal is carbon, a classification in wide use is based on the value of the coal as fuel; that is on the percentage of carbon present and the condition of the carbon.

Part of the carbon is fixed, that is, cannot be driven off by heating in a retort; part is combined with the hydrogen and nitrogen as volatile hydrocarbon compounds which can be driven off. The percentage of fixed carbon is highest in anthracites, but even the semi-graphitic anthracite of Rhode Island contains a considerable percentage of hydrocarbons. The proportion of the volatile hydrocarbons to the fixed carbon in a coal is called its fuel ratio. On this basis the distinctions usually made are lignite, bituminous, semi-bituminous, semi-anthracite, and anthracite. Cannel coal, in which the percentage of volatile hydrocarbons is very high, is believed to be of different origin from other coals. It may represent accumulations of seeds, spores, resins, or gums, and possibly of fish remains, in pools in the ancient swamps. Generally speaking, in anthracite the volatile matter is below 6 per cent, in semi-anthracite below 10 per cent, in semi-bituminous between 12 and 18 per cent, and in bituminous above 18 per cent. In cannel coal the volatile matter may be as high as 50 or even 65 per cent.

Lignite, or brown coal, is brown to black in color, though the powder is always brown. It often shows plainly its vegetable origin, containing stems that look like undecomposed wood. The lustre may be resinous or dull; the specific gravity is .5 to 1.5, some kinds floating on water. Lignites burn easily with a smoky flame, generally contain a high percentage of water, crumble easily, and slack to mud on long exposure.

Bituminous or soft coal is black; the powder is black; the lustre may be resinous or dull; the specific gravity is 1.25 to 1.4. It contains less water than lignite and bears transportation better. Bituminous coals are subdivided according to their properties or uses, into coking, free-burning, smokeless, gas coals, etc. Coking coals partly fuse or cake in burning. If low in ash and very low in sulphur they are highly valued for forging and for making coke and gas. The famous coals of the Cumberland region in Mary-

COAL

land are classified as semi-bituminous. In coking coals the less volatile hydrocarbons present, the higher the yield of coke, but in gas coals the more hydrocarbons the better. A good gas coal will give 10,000 cubic feet of gas per ton. Smokeless coals burn with little smoke and are used for domestic purposes and for steam production.

Cannel coal (from *cannyl*, "a candle"), is black or brownish, has a dull lustre, does not soil the fingers, and shows few or no traces of vegetable structure. It grades into bituminous shale. It contains from 40 to 60 per cent of volatile matter, lights readily, burns with a steady flame, and is used as a fuel for open grates, but chiefly for enriching gas made from other coal. It is mined in the United States at Cannelburg, Ind., and in the Jellico district, Ky.

Anthracite, called also hard coal, is black with a black powder and does not soil the fingers. The specific gravity is 1.3 to 1.75. It kindles slowly, but, owing to the high percentage of fixed carbon, burns without smoke and gives an intense heat. It was formerly much used in this country for smelting iron and is still used as a steam fuel, but its chief use is for household purposes.

Generally speaking, the less water, ash, and sulphur in a coal the better. The water must be evaporated before the coal burns, ash represents inert matter, and sulphur is objectionable for several reasons. A first-class coal should not contain over 6 or 7 per cent of ash and a good gas coal should have less than .7 per cent sulphur.

The following table gives the composition of some representative American lignites and coals:

	Water	Volatile Hydrocarbons	Fixed Carbon	Fuel ratio	Ash	Sulphur

Coal Fields of the World.—North America, Europe, and Asia contain the great coal fields of the world. In southern Africa, in Australia, and in New Zealand are deposits of importance. Only small and disconnected areas are known in South America and the only mines worked on a large scale are in Chile. As to Asia, the coal fields of China

are vast and of great promise but are still practically undeveloped. Coal is abundant in India and Burma and the output is increasing fast, particularly from the mines in Bengal. The rather small coal field of Japan is being opened rapidly. The chief coal-producing States of Australia are New South Wales and Queensland. The South African mines are in Cape Colony, Natal, and the Transvaal.

Great Britain long led the world in coal-production, but was passed by the United States in 1899. The important coal fields of Great Britain lie in southern Scotland, stretching with interruptions, from the coast of Ayr to the mouth of the Firth of Forth; in the north of England, in Durham and Northumberland counties; in central England, where the several fields worked include parts of 10 counties, the most important being Yorkshire and Lancashire; in the west of England, near Bristol, and in the Forest of Dean; and the very important South Wales field in the counties of Monmouth (England), and Glamorgan and Carmarthen (Wales), this field producing the best coal mined in Great Britain.

On the continent of Europe, France, Belgium, Russia, Austria-Hungary, and Spain have coal fields of more or less importance. The French coal fields may be grouped in three divisions, those of the north, of the centre, and of the south. The northern field, in the departments du Nord and Pas de Calais, extends into Belgium. The fields of central France are generally small and irregular, the most important being in the department of the Loire. In the south of France the coal fields of Alais and of the Aveyron are of some importance. The coal field of Belgium is a narrow belt extending across the country, except for a short interruption, from the Pas de Calais in France to the Aix-la-Chapelle coal field in Prussia.

Of the German states, Prussia has the largest and best coal fields. These include the Aix-la-Chapelle and the Eschweiler; the very important coal fields of the Ruhr, or of Westphalia; and, extending into Bavaria, the Saarbrücken field, perhaps the most remarkable in Europe for the number of seams and total thickness of coal. In the extreme southeast of Prussia are the important and comparatively undeveloped coal fields of Silesia at the head waters of the river Oder. Of the other German states, Saxony is a considerable producer of coal, the most important mines being near Zwickau.

In Austria-Hungary, coal fields extend from Lower Silesia into Bohemia, and from Upper Silesia into Moravia, with mines near Schlan, Radnitz, and Pilsen. There are also great deposits of lignite, extensively developed near Einbogen and Bilin, and valuable mines of lignitic-bituminous coal near Fünfkirchen in southern Hungary and about Syria and Carinthia in the Austrian Alps.

The most important coal field of Russia is the Donetz basin, between the Don and the Dnieper rivers. It covers a large area and is being developed steadily. Spain has several coal fields, one of some importance in the Asturias, and two others but little developed. Lack of railroads has prevented their exploitation.

COAL

North America, as noted before, surpasses all the continents in the extent and variety of its fuel supplies. The United States leads the world in coal production, and there is little prospect of any country surpassing it before that far distant day when the great coal fields of China are well opened. Canada has coal fields of importance near Pictou and on Cape Breton Island in Nova Scotia, known as the Acadian coal field; also a vast and but partly developed field of lignite and true coal in Alberta and eastern British Columbia, and another field on Vancouver Island. Alaska has no true coal, but workable beds of lignite occur on the coast and in the Yukon valley at Rampart and Circle City.

The Mexican coal fields are of much local importance, but are not likely to produce any coal for export. The principal field is in the State of Coahuila, extending from Eagle Pass to Sabinas. Coal seams have been worked in Sonora, Hidalgo, and Michoacan.

The following table showing the production of coal and lignite of the chief coal-producing countries of the world is compiled from figures published in the 'Engineering and Mining Journal':

Country	Pro-duction	Country	Pro-duction
United States..	293,298,550	Belgium	25,090,490
Great Britain...	245,321,708	Russia	17,929,320
Germany	166,117,978	Japan	8,265,000
Austria-Hun- gary	43,363,700	India	7,840,000
France	32,590,691	Canada	7,630,255

The above figures are for the years 1902 or 1901, and are short tons (2,000 pounds).

The United States, Great Britain, and Germany together produce over 80 per cent of all the coal mined in the world.

The coal fields of the United States, not including Alaska, are of various ages from the Carboniferous to the Eocene, the two great horizons being the Pennsylvanian of the Carboniferous, and the Laramie of the Cretaceous. The total area covered by possibly productive seams of lignite, bituminous coal, and anthracite is fully 250,000 square miles.

For convenience the coal fields may be grouped in these divisions: the Appalachian, covering 70,800 square miles; the eastern interior, 58,000 square miles; the northern interior, 11,300 square miles; the western interior, 94,000 square miles; the Rocky Mountain, 43,600 square miles; and the Pacific coast, 1,050 square miles.

The Appalachian field extends from near the New York and Pennsylvania state line southwesterly through the western half of Pennsylvania and eastern Ohio, the western end of Maryland, the extreme southwest of Virginia, nearly the whole State of West Virginia, eastern Kentucky, and Tennessee, into north-central Alabama. This field is of Upper Carboniferous Age, and with it are included the very important anthracite fields of eastern Pennsylvania, and a small area of graphitic anthracite in Rhode Island and southern Massachusetts. There are also coal beds of Tertiary Age (Newark) in the Rich-

mond basin, near Richmond, Va., and on the Dan and Deep rivers in North Carolina. The Richmond field, though the first to be worked in the United States, having been opened in 1750, is now almost abandoned. The Chetham mines in Durham County, N. C., are of some importance.

The anthracite fields of Pennsylvania are divided for convenience into the northern, or Wyoming, lying in or near the valleys of the Lackawanna and Susquehanna rivers from Carbondale to Shickshinny; the Lehigh, comprising several basins about Hazleton and part of the Panther Creek valley; and the Schuylkill. The last really includes several fields extending from near Mahanoy on the north to Pottsville on the south, and from Tamaqua on the east to Lykens on the west. The total area of the various anthracite basins is about 480 square miles. The coal was mined first about 1765, and at the rate at which production is increasing the estimated life of the field is about 50 years. However, as mines go deeper, and mining costs increase, the resulting higher prices for coal will probably restrict consumption, and with a declining output it is possible that the anthracite mines may not be wholly exhausted in 200 years.

Owing to the competition of lower-priced bituminous coal in the form of coke, the use of anthracite for smelting iron has declined greatly of late years, and its consumption for industrial purposes is not increasing. For steam-production only the small sizes, pea, wheat, buckwheat, and rice, are much used, and these chiefly on railroads running through the fields or in cities having strict smoke ordinances. Anthracite, being clean, smokeless, having great heating power, and burning slowly, is chiefly used for household purposes and is sent to market broken into lumps of several sizes, known as broken or grate, egg, stove, and chestnut, these being called prepared sizes, in distinction from the small or steam sizes before mentioned. The market supplied by the Pennsylvania mines is along the Atlantic seaboard from Nova Scotia to Georgia, also a narrow strip of country extending from Montreal westward through southern Ontario and the States of the Union bordering on the Great Lakes. The chief markets are in New England and in New York, New Jersey, Pennsylvania, and Illinois. Out of a total shipment of 47,665,203 long tons in 1899 it is estimated that 7,144,131 tons went to the New England States, Massachusetts taking half the amount; 12,503,896 tons to New York; 4,693,500 tons to New Jersey; 13,803,253 tons to Pennsylvania; and 2,188,294 tons to Illinois. The total exports of 1,707,796 tons went almost wholly to Canada.

The bituminous coals of the Appalachian field include gas, coking, and steam coals of the highest grade. The largest and best seams or those most easily opened have been exploited so far, and the resources of the Appalachian field are still enormous. The State of West Virginia alone is estimated to contain more workable coal than the whole of Great Britain. The best-known of the various areas now opened are the Clearfield, in Pennsylvania, producing coking, gas,

COAL GAS — COALITION

and steam coals, shipped largely to seaboard points; the Broad Top, in Pennsylvania, producing coal of rather better grade, shipped to the same markets; the Cumberland, in Maryland, producing a famous steam and smithy coal, shipped to the seaboard and to interior cities from Canada to the Rocky Mountains; the Pittsburg, in Pennsylvania, whence come gas and steam coals largely used locally, but also shipped to points on the Great Lakes and on the Ohio River and lower Mississippi; the Connellsville, in Pennsylvania, yielding coal used chiefly for making a standard grade of coke; the Hocking Valley, in Ohio, whence are shipped steam coals to near-by cities and to distant ports on the Great Lakes; the Kanawha, in West Virginia, shipping gas and steam coal to various points on the Great Lakes or on the Ohio River and lower Mississippi; and the New River, Flat Top, and Pocahontas fields in West Virginia, producing steam, gas, and coking coals of varying excellence, the best grades having no superior, which are shipped mostly to seaboard points, though an increasing tonnage is made into coke to supply blast furnaces at Pittsburg, Chicago, and various Ohio cities. In eastern Kentucky is the Jellico field, whence gas and steam coal is shipped to a wide territory, including seaboard cities, and in eastern Tennessee are several basins yielding gas, steam, and coking coals, used locally and shipped to compete with the Jellico coal. The important district in Alabama is about Birmingham: the coal is shipped to Atlantic and Gulf ports for steam- and gas-making, and a large proportion of the output is made into coke for use in local furnaces and foundries.

The eastern interior field covers western Indiana, nearly the whole State of Illinois, and part of Kentucky. The coal is of Carboniferous (Pennsylvanian) Age, but in general lies in thinner veins and is of poorer quality than that of the Appalachian field. Most of the output is used as a steam fuel by railroads and in the many manufacturing cities that lie in or near the field. Certain grades are much used as a household fuel. The field contains no first-class coking coal.

The northern interior field covers a large area in the southern peninsula of Michigan and has been opened chiefly by the mines near Bay City and Saginaw. The seams are comparatively thin, and the coal is generally of poorer quality than that of Indiana and Illinois. The output is used locally. The beds are of Upper Carboniferous Age.

The west central field extends from western Iowa across western Missouri, northwestern Arkansas, and eastern Nebraska and Kansas, through Indian Territory into Texas. The coal beds vary widely. In parts of the field the coal is barely more than lignite, while in northwestern Arkansas it approaches semi-anthracite. The markets supplied cover a great area. Fully half of the output is used by railroads, and of the other half at least 40 per cent is used for household purposes. The measures are Carboniferous.

The Rocky Mountain field includes the numerous disconnected areas lying in narrow belts along either flank of the range from the Canadian frontier southward for 1,000 miles;

Montana, Utah, Wyoming, Colorado and New Mexico having mines. Along the flanks of the mountains and in the parks or plateaus in the main range the coal is largely bituminous; but eastward from the range the coal measures, which are of upper Cretaceous (Laramie) Age, are lignitic, and vast beds of lignite underlie the plains of Montana, Wyoming, and North and South Dakota. The mines now opened supply the great trans-continental railroads, the chief users. In places the coals make good coke, used by local smelting plants. The resources of the field are vast and but little developed.

The Pacific coast coal field is of Tertiary Age and most of the output is lignite. It includes some unimportant basins in California, several fields in Oregon, of which the Coos Bay has been most developed, and the Roslyn and Puget Sound fields in Washington, the former producing a good bituminous coking coal. The California and Oregon fields are of little more than local importance, but the Washington mines supply railroads and steamships and are an important factor in the coal trade of San Francisco.

The rank of the principal coal-producing States of the Union is shown by the following table compiled from figures published in the 'Engineering and Mining Journal.' The figures are for 1902, except that for Pennsylvania the 1901 figures are taken, owing to the anthracite output in 1902 being curtailed by a long strike of the miners. The figures given include coal and lignite:

States	Short Tons	States	Short Tons
Pennsylvania ..	149,777,567	Kansas	5,379,500
Illinois	31,000,000	Wyoming	4,900,000
West Virginia..	26,162,173	Tennessee	4,800,000
Ohio	24,700,000	Maryland	4,565,311
Alabama	10,327,713	Missouri	4,250,000
Indiana	8,357,417	Virginia	3,100,000
Colorado	7,522,923	Indian Territory	3,000,000
Kentucky	6,421,266	Washington ...	2,690,789
Iowa	5,800,000	Arkansas	2,200,000

It will be seen that Illinois already produces about as much coal as France, and West Virginia produces more than Belgium. The production of Pennsylvania in a few years bids fair to equal that of Germany.

Coal Gas. See GAS ILLUMINATING.

Coal Gas Poisoning. See CARBON-DISULPHIDE; COAL MINING; ILLUMINATING-GAS POISONING.

Coalition, The, in political history. (1) ENGLISH. In 1783, after the American War, there were three parties in Parliament, neither able to stand alone. The weakest (C. J. Fox "conscience" Whig) joined the second (Lord North, Tory), ousted the strongest (Lord Shelburne, opportunist Whig), and the coalition tried to pass an India bill with self-perpetuating offices. Fox had long denounced both North and George III. without stint personally as well as politically, and was a chief agent in debauching the Prince

COAL MEASURES — COAL MINING

of Wales (afterward George IV.); and the king was furious alike at his accession to power and North's ingratitude. As the two statesmen had professed utterly irreconcilable basic principles, the people were equally disgusted with what seemed a grossly corrupt bargain for the sake of office — though a different view is now taken. The king killed the India bill by threatening the Lords, dismissed the Coalition ministry, and made the younger Pitt premier; at the next election the Tories received an overwhelming majority. remained in power many years, and the name "Coalition" was long the most unsavory of bywords. (2) AMERICAN. In 1824, there being no electoral majority for President, the smallest (Henry Clay) party joining in electing the head of the second (J. Q. Adams); the largest (Andrew Jackson) considered this defeating the popular will, and when Adams later made Clay secretary of state, declared it to be in pursuance of a corrupt bargain, and gave it the name of the ill-savored Fox-North Coalition. The nickname was used for many years with damaging effect, though perfectly irrelevant, as the Clay and Adams parties were in close sympathy politically, and their heads not hostile personally. The Clay men much preferred a trained and gentlemanly statesman like Adams to one whom they regarded as an ignorant and violent demagogue, and Clay's position and ability entitled him to the place, which other great party leaders (Blaine, for example) have held later.

Coal Measures. See COAL; CARBONIFEROUS SYSTEM.

Coal Mining. Coal mining differs from metalliferous mining chiefly in the better ventilation required, the extent and regularity of mine workings, and the necessity of getting out the mine product with as little dust as possible. The principal gases found in coal mines are carbon dioxide, CO_2 , heavier than air, suffocating, but not inflammable, called choke-damp by miners; carbon monoxide, CO , about as heavy as air, poisonous and inflammable, the dreaded white-damp of the miners; carburetted hydrogen, CH_4 , light, not poisonous, but inflammable, the chief constituent of fire-damp; also, but less important, sulphuretted hydrogen, poisonous and inflammable, but easily detected by its odor. Of these gases, marsh gas, given off in large quantities in some mines, is the chief agent in coal-mine explosions. A mine is said to be fiery when the coal-seams give off much fire-damp. Many of the deeper coal-mines of Great Britain, France, and Germany are very fiery. The most fiery mines in the United States are in the anthracite region of Pennsylvania, the South Wilkes-Barre shaft at Wilkes-Barre being one of the most fiery mines in the world. A mixture of marsh-gas and air in certain proportions explodes violently on contact with flame. Coal-dust in the air makes a much smaller proportion of marsh-gas an explosive mixture.

To enable men to work in places where sufficient air to carry away the gas does not circulate, or to enable them to work in very fiery mines, safety-lamps are used. In a safety-lamp the flame is enclosed by wire gauze and cannot ignite gas in the air outside the gauze, unless the gauze is heated to the combustion point of the gas. The safety-lamp was invented by Sir Humphry Davy in 1815 and has been improved

in various ways. Many patterns are in use; one of the latest types used in Pennsylvania and Germany is known as the Wolf lamp. The Hepplewhite-Gray lamp is much used in England. A safety-lamp indicates the presence of fire-damp by the lengthening of the flame.

Carbon dioxide and carbon monoxide given off by the coal in place are produced in the mined-out areas known as "gob." These gases are the chief constituents of after-damp, the gases resulting from an explosion of dust or fire-damp. They, rather than the shock, cause the terrible loss of life in mine explosions, since men may be killed by carbon monoxide without knowing they are in danger.

Good ventilation is thus a prime necessity in coal mining. It is sometimes secured by a furnace over a shaft, the fire producing a sufficiently strong up-current. But in all fiery mines, and generally in all large mines, large revolving fans, sometimes 35 feet in diameter, are used to circulate the air. The fans may exhaust or force in air (up-draft or down-draft); various types of mine fans are used, but the majority of those in service in Great Britain and at the larger mines in this country are modifications of the Guibal type.

As most coal-seams worked are a few feet thick, but of considerable extent, and as in this country at least, most coal-beds lie flat or dip at low angles, a coal-mine can be opened in a more regular way than a metalliferous mine. Two systems of mining are used — the pillar and room ("board and pillar"), and the long wall. The first, generally used in the United States, consists in taking out various portions of the coal as the work proceeds, from the mine-opening, and the remainder in working back toward the opening. The long wall system, used in certain bituminous districts in the United States, and extensively used in England, consists in taking out all the coal in a long face as the work advances from the mine-opening, the roadways and air-passages being protected by packs or walls. It is best suited for thin coal-seams with weak roofs, while the pillar-and-room system is best suited for thick seams with rock roofs. The two systems grade into each other.

Coal is broken from the face of the seam by the miner under-cutting it with his pick and then putting in a blast strong enough to bring down the coal. Black powder is generally used in this country. Abroad explosives making less flame are required by law in many districts, and in some of the very fiery German mines wedges operated by hydraulic power are used. To blast coal from the solid rock like an ore, though occasionally done in Illinois and elsewhere in this country is wasteful and dangerous. Fine coal is less valuable than lump, and dust greatly increases the danger of an explosion.

To under-cut the coal, machines are sometimes used. Those in general use in this country are of two types: the Harrison, or puncher type, with a reciprocating piston impelled by compressed air, carrying a cutting bit; and the chain machine, having an electrically driven chain carrying cutting teeth. The latter type, though not favored for fiery mines, is probably more used in newly opened mines, than the former. No machines are used in the Pennsylvania anthracite mines. Of the total bituminous coal (225,826,849 tons) mined in the United

COAL MINING

States in 1901, 57,843,335 tons were under-cut by machines.

The coal, when broken down, is roughly sorted by the miner or his helper and loaded into mine cars which are hauled to the main haulage roads by mules. Here the cars from the various gangways are usually made up into trains (or "trips") and hauled to the shaft bottom or the entrance of the mine by a wire rope (tail-rope haulage), by a compressed air locomotive, or by an electric locomotive. Sometimes the cars are attached singly to an endless wire rope like cars on an ordinary surface cable road (endless-rope haulage). Mines of the shaft type are to be found in largest numbers in the hard-coal districts. The hard-coal mines are likewise the deepest. Occasionally an extreme depth of 1,500 feet is attained. Two other styles of mines are found in both anthracite and bituminous fields,— "drifts" and "slopes." The drift mine is dug straight into the mountain from one side. The passageway or heading may have an upward trend. The slope mine slants downward to the extent of perhaps 35 or 40 degrees, the main heading often measuring a mile or more in length.

Occasionally coal is found in quantities near the surface of the ground. This is true to-day in parts of Missouri. At both Hazelton and Summit Hill, in Pennsylvania, coal has been extracted by an uncovering operation known as "stripping," which is regarded as apart from mining proper. An interesting process also is "pocket mining," but this is practised comparatively little to-day. An outcrop of coal at various points on the side of the mountain suggests the possibility of a rich mineral vein. Digging is begun directly into the bed of coal projecting at the surface. This form of mining is seldom highly profitable, for when the digging has progressed at considerable expense to a point where the mine should be expected to pay, all operations are suddenly cut short by the encountering of solid rock, which, owing to some upheaval of the past, has "faulted" the vein of coal from its natural course. These pockets at intervals in the mountains where pocket mining is done present an interesting sight. About Shickshinny, Pa., they are numerous.

In shaft mines, and especially those of anthracite, mules are used very extensively. Where mechanical power is employed to haul trains in the main haulage-ways, these beasts bring the cars only from the side headings or the rooms. The mules do not see daylight for months at a time. In bituminous drift mines evolution has included the introduction of miniature trolley trains of 40 or 50 cars, each train being in charge of a motorman and brakeman. In anthracite drifts steam locomotives of a small and peculiar type, known as "hogs," haul the trains. In a slope mine cable trains transport the coal. One end of the cable is attached to the train, and the other winds upon a drum at the power-house. When the cable turns a corner it passes around what is known as a "bull wheel." Twenty-five one-ton cars may comprise a cable train of soft coal. Anthracite cars often hold four and a half tons. In soft-coal mines the man in charge of the cable train is called a "rope rider." In bringing his cars out of the mine he sits upon the ring which connects the cable with the train. In the anthracite slopes a

man stands upon the side of a car ready to "sprag" the wheels when a stop is made. Spragging consists in throwing short but stout lengths of wood into the openings between the four spokes of the car wheel. The height of the bituminous vein is often not more than four or five feet, thus making the quarters of the miners rather cramped. In the mining of anthracite only two thirds loosened from the vein is of value. The miner must use good judgment in loading only the paying coal. To handle and transport chunks in which slate predominates is unprofitable. Even the better coal has more or less slate in it, while in bituminous coal the slate is principally at the top and bottom of the vein and not mixed with the product as mined.

Off from the main or side headings of a hard-coal mine "breasts" or "chambers" are opened. In bituminous fields these are known as "rooms." A tunnel or neck 40 to 60 feet long may connect the room proper with the main passageway. Beyond the neck the chamber may broaden out to a width of 30 or more feet, continuing indefinitely. The coal between the rooms forms what is known as a "rib" or "pillar." As the rooms begin to broaden to their maximum widths, timber props are placed between the floors and ceilings to support the loose rock and earth. Apart from supporting the great mass of solid rock, they are of little service.

When all the coal that it is practical to mine in the chambers has been extracted, the work of drawing the ribs between the rooms is begun, eventually allowing the rock above to cave in. In addition to securing the coal in the ribs, this process is necessary, that the weight of the mountain bearing upon the entrance to the mine may be lightened. As mining progresses, the weight is thrown upon the main heading, until, were it not for the drawing of the ribs, this main passageway would close.

When drawing a rib, the soft-coal miner keeps but one car beside him. He cannot tell how much of the rib he will be able to remove before the rock above his head will fall. The first warning of approaching danger is a drumming noise from the layer of stone overhead. Sometimes this noise may be heard hours before the final crash; in anthracite mines it may be perhaps weeks before. Again, it may come with marked suddenness.

The coal, when brought to the surface, is screened, and at many bituminous mines is then shipped as lump and slack. Sometimes it is broken and washed, and in the anthracite region of Pennsylvania, where coal is shipped in seven or more sizes, the coal, as it comes from the mine, is passed through the breaker.

A modern coal breaker built on the side of a hill at Mocanaqua, Pa., will serve to illustrate the construction and operations connected with this important branch of coal-production. This breaker is 300 feet in length and 180 feet in height. It is capable of turning out 1,000 tons of clean coal per day. Some breakers have a much larger capacity. The Mocanaqua breaker was originally built at a cost of \$50,000, but with recent improvements and the installation of the latest machinery its total cost reaches \$100,000. It is heated by steam.

The anthracite is brought to the head of the breaker over a little railway leading from the

COAL MINING MACHINERY

mine in the side of the mountain. The coal, when dumped from the cars, passes over a screen 30 feet in length, through which the fine coal sifts. The big chunks next pass to the breaker proper, where rolls with sharp teeth crush it. It next runs into a screen which is cylindrical in shape, and not unlike a locomotive boiler in appearance. As the coal is handled in this device, it falls through perforations of different sizes, each size dropping into a separate chute. On benches at intervals on these chutes, sit the breaker boys, presided over by a foreman. As the coal passes slowly down the chute at their feet, these lads pick the slate from it and throw the refuse into a parallel chute. The inexperienced boys are always at the upper end of the chutes. They succeed in picking a part of the slate from the coal, and then it passes to the next workmen in line, who continue the operation until, by the time the product has reached the boys at the bottom of the chutes, it is pretty well cleaned. The coal is also washed to free it from dust. From the chutes the various-sized coal finds its ways into bins, from which it is discharged into cars.

Mechanical contrivances for sorting have recently been installed at great cost in modern breakers. These inventions are spiral in shape, and provide for ridding the coal of much of its slate by centrifugal force. But even with these machines the final operation must be performed by boys or men.

A large amount of the soft coal of Ohio and Pennsylvania is brought to the lower harbors of the Great Lakes, bound for the Northwest and Canada. The cars which carry this coal have a capacity of 100,000 pounds, whereas, in the early days of the coal industry in this country, coal cars scarcely carried 1,800 pounds. On reaching the lake ports, coal for Canada may be taken 60 miles across Lake Erie in car ferries. But the bulk of the coal that comes to the lake ports is unloaded directly into the holds of lake vessels by means of most wonderful and massive machines, which pick up a 50-ton car and dump its contents as quickly as a pail of coal could be emptied into the magazine of a stove. Some of these machines can be operated by three men, and yet have a capacity of 500 tons per hour. A large and modern coal vessel will carry a coal cargo of 6,000 tons. The cargo record is 7,800 tons. More than 2,500,000 tons of coal have gone to the head of the Great Lakes in a single season.

Historically considered, coal mining perhaps dates back to about the end of the 12th century. Coal, as an inflammable substance, appears to have been known to the ancients, and to the Britons before the Romans visited their island, it being found frequently in ravines and beds of rivers of a color and texture so decidedly different from the strata which in general accompany it; but as at that period, and for centuries afterward, the country was covered with immense forests, which supplied abundance of fuel for every purpose of life, there was no necessity for using coal as fuel. The working of coal, therefore, only became an object of attention as population and civilization advanced, when agriculture began to be studied, the woods cleared away, and the arts of civil life cultivated; accordingly we find that the working of coal in Great Britain, as an article of commerce, is comparatively of modern date. The

first charter giving liberty to the town of Newcastle-upon-Tyne to dig coal was granted by Henry III. in 1239; it was then denominated "sea-coal," on account of its being shipped for places at a distance. In the year 1281 the Newcastle coal-trade had become so extensive and important that laws were enacted for its regulation. In Scotland coals began to be wrought much about the same time; and a charter was granted in the year 1291 in favor of the abbot and convent of Dunfermline, in the county of Fife, giving the right of digging coals in the lands of Pittencrieff, adjoining the convent. Coal began to be used for iron-smelting about the beginning of the 17th century. The working of coal gradually increased, though on a very limited scale, until the beginning of the 18th century, when the steam-engine was brought forward by Newcomen in the year 1705, and was applied to collieries in the vicinity of Newcastle about the year 1715. This machine produced a new era in the mining concerns of Great Britain, and, as it were in an instant, put every coal-field within the grasp of its owner. Collieries were opened in every quarter; and the coal-trade rapidly increased to an astonishing extent. This extension of the trade was greatly aided by James Watt, who so very much improved the construction and power of the steam-engine as to render it one of the most complete and most useful pieces of mechanism.

SAMUEL SANFORD,

Formerly Assoc. Editor, Engineering and Mining Journal.

Coal Mining Machinery. Deposits of coal, or coal seams after being opened up by means of shafts, slopes, or tunnels, are worked by either the room-and-pillar, or the long-wall systems. The coal is cut from the seam by hand or by the use of some form of coal-cutting machines. In America, and especially in the United States, the room-and-pillar system is the one most generally used, although modifications of the long-wall method are often employed under local conditions that favor its economical application.

Coal-cutting machines are of four general types — "pick" machines, "chain-cutter" machines, "cutter-bar" machines, and "long-wall" machines. They are operated either by compressed air, or by electricity.

The electric coal-cutting machine consists of three distinct parts — the electric motor and carriage, the outside frame, and the inside or cutter frame. The motor is of the multipolar type, with an iron-clad armature and two field coils. The compressed-air coal-cutting machine differs from the electric machine only in the method of applying the power, a double engine being used instead of an electric motor.

Pick machines are quite similar to the various forms of rock drills. Fig. 1 shows a Jeffrey electric coal drill, designed to be handled by two men. It represents a type of machine

COAL MINING MACHINERY

not extensively used in the past, but which is now being more and more appreciated on account of its economical operation. It consists of a one-and-one-half-horse-power motor wound for practically any direct current voltage and capable of developing a speed of 2,000 revolutions per minute; a feed screw operating

Fig. 1.

at a speed of 360 revolutions per minute; a steel frame made to suit any height of coal; and a drill auger usually ranging from three feet to six feet, but which may be made of any size or length, according to requirements. The total weight of a machine suitable for working a six-foot vein of coal is about 188 pounds. These machines are also arranged to be operated by compressed air, or by hand. The power machines drill in coal at the rate of 6 to 12 inches per minute.

Fig. 2.

Fig. 2 illustrates the general view of a Morgan-Gardner electric pick machine, and Fig. 3, the sectional details of a Sullivan direct-acting undercutter. In these machines a reciprocating piston is actuated by a spring and cam—the spring strikes the blow, and the cam driven by the motor draws the piston back. The number of blows delivered range from 175 to 250 per minute. These machines are used to great advantage in entry driving, cutting necks, and turning rooms, or in any narrow place

Fig. 3.

where it is difficult to use the chain machines. Operated by two men, one a skilled runner, and the other a helper, they are capable of easily cutting from 50 to 70 feet, $4\frac{1}{4}$ to 6 feet under, per shift of nine hours.

Chain-cutter machines consist of a low bed-frame of metal upon which is mounted a motor that rotates a chain equipped with the cutting

teeth. They are arranged to cut horizontally as in the "breast" machines, or vertically as in the "shearing" machines.

Fig. 4 shows the "Goodman" electric chain breast machine. It consists of a stationary frame which is held to the floor of the mine by jacks at both the front and the rear. Two smooth rails or guides are attached to the motor. The chain runs on the outside of this travelling frame and is equipped with teeth or cutters set at different angles in its links, so that the lowermost of them just clears the floor upon which the machine stands, while the uppermost runs about four inches above the floor. This arrangement cuts a kerf in the coal of sufficient width to allow the travelling frame to enter after the cutters. These cutters are held in the chain by set-screws so as to permit of their being quickly removed and replaced when necessary, an operation very frequently required in cutting hard coal containing sulphur. In operation, the machine is set near the face of the coal with the forward cutters just clearing the same, with the rollers under the rear of the machine set upon a skid, and the front of the machine resting directly upon the floor of the mine. The rear jack is

Fig. 4.

set hard against the roof of the mine, and the front jack is set into the face of the coal. Two men are required for its operation—the runner who has charge of the operating machinery, and the helper who places himself near the face of the coal and shovels away the "slack" or machine cuttings as fast as the chain delivers them. The train of gears driven by the motor performs two operations—it carries the cutter chain around the guides or travelling frame, and simultaneously moves the motor and the travelling frame forward upon the stationary frame. This results in the cutting of a kerf about four inches in height and equal in width to that of the cutter head under the coal to a depth of five, six, or seven feet, according to the length of the machine. As soon as the motor reaches the end of the stationary guides, the forward feed is automatically stopped, the runner throws the reverse lever, and the motor travels backwards pulling the travelling frame out of the coal. When the machine is clear of the coal the jacks are loosened, the machine is moved over and the jacks reset in readiness to make another cut. The number of cuts that may be made ranges from 30 to 75 per day of ten hours according to the time consumed in cutting, moving out, and resetting, depending upon the width of the rooms and the character of the roof and face. The power required to operate this class of machines ranges from 10 to 50 amperes at 220 volts, according to the condition of the machine, and the character of the impurities in the coal.

COAL MINING MACHINERY

For cutting in low veins of coal, machines of this class are usually mounted upon self-propelling trucks. The mining machine is arranged with a clutch which can be thrown in and out of gear when necessary. In order to utilize the power of the motor to propel the truck it is thrown out of gear with the cutting mechanism, so that when the machine is moved from one point to another in the mine the only part of the apparatus in motion is that which is necessary to operate the truck. The motor is equipped with a reversing switch which enables the truck to travel in either direction as may be desired. In low veins of coal when the roadways in the rooms are not of sufficient height to allow mules to enter, the self-propelling truck is not only almost a necessity, but greatly reduces the cost of working veins ranging from 24 to 36 inches in thickness.

In a great many coal mining districts the formations are such that the coal is produced in better condition when sheared than when undercut, and there are also cases that require both operations. When shearing a room or entry with machines, it is necessary to raise the machine to the top of the vein where the first cut is made and then to let it down far

is 36 inches in height, 5, 6, or 7 feet in depth, and 4 inches in width. The average cutting capacity ranges from 50 to 100 feet per day of 10 hours.

The long-wall machines are of two types, the "cutter-bar" machine illustrated by Fig. 6, and the "cutter-wheel" machine shown by Fig. 7.

A cutter-bar machine consists of a steel frame finished smooth on one of the long sides so as to slide along the face of the coal. It is supported on the bottom on a steel shoe plate, and carries upon the middle portion a powerful electric motor, the armature shaft of which lies lengthwise of the machine and is geared at one end to a sprocket which drives the "cutter-chain" around a steel "cutter-bar" extending at right angles to the frame. These machines are of the "under-cutter" type, and are capable of making cuts ranging from 38 to 50 inches according to the length of the cutter-bar employed. The cutter-bar is carried on a swinging frame, and by means of a lever can be tilted in its width up or down from the horizontal position to enable the chain to avoid any especially hard substance by cutting over or under the same. A cable-winding drum or

Fig. 5.

enough to make another cut. Fig. 5 shows a Jeffrey electric shearing machine in position ready to cut. It is rigidly supported by two main columns at the balancing point of the structure, to which the frame is tightly clamped, and the front end is steadied by two auxiliary

Fig. 6.

columns. The cutting capacity of these machines depends upon the character of the coal and the condition of the mine. A single cut

Fig. 7.

other similar arrangement, operated by a ratchet lever connected with the motor and the driving sprocket, winds up a wire or chain cable which is attached to one end of the frame and passes around a sheave fastened to the front jack. The action of this arrangement feeds the machine along the face of the coal. In undercutting, a jackscrew forces the cutter-bar under the coal where it is retained by the action of the bits on the moving chain, against the coal, without requiring a rail or other contrivance to keep the machine in position. The average work accomplished by a machine of this type is 500 lineal feet of undercutting in one shift.

The "cutter-wheel" machines of this class employ a cutter wheel in the periphery of which the bits or cutters are inserted, instead of a chain which travels around the edge of the cutter-bar. They are operated either by electricity or by powerful twin compressed air engines and are designed to undercut three, four, or six feet in depth, with a kerf of about four inches. As in the case of the cutter-bar machines, suitable arrangements are provided to tilt the cutter-wheel so that it will not only avoid very hard substances, but will also follow the variations in the inclination of the bottom.

Good ventilation becomes a prime necessity from the very beginning of coal mining operations. This is secured by various means, ac-

COAL MINING MACHINERY

According to the character of the mines. Sometimes the fire of a furnace placed over the shaft produces a sufficiently strong upward current of air, but it is not applicable to fiery mines, and for such, and in general in all large mines, various forms of revolving fans and exhaust ventilators are used for this purpose.

Fig. 8.

Fig. 9.

Fig. 8 shows a type of these machines that may be driven by belting or by a direct connected electric motor, and Fig. 9 shows a form of steam mine ventilating fan with curved vanes, which is operated by a steam engine especially designed for the purpose, and mounted on the same frame with the fan. Some of these fans range in size up to 35 feet in diameter, and are employed to draw the air out of, or

Fig. 10.

force it into, the mines. Fig. 10 shows a Bullock Champion ventilator which may be used as an exhauster or a blower, as circumstances may require. It consists of a fan-wheel, which may be driven by belting or by a direct connected steam engine or other motor, and a

hood and attendant diaphragm that may be revolved independently of the motion of the fan wheel, by a hand wheel, thus changing the current at will from exhausting to blowing or vice versa.

Mine haulage.—Up to a very recent period, the coal cut by the various machines already described has been hauled from the side headings or rooms to the shaft bottoms almost exclusively by mules, but they are being rapidly supplanted by improved systems of steam haulage in the anthracite coal regions, and electric haulage in the bituminous drift mines adopted to meet the demands of various conditions which necessitate haulage systems of greater speed and power than that afforded by the use of mules.

The solution of the problem of mine haulage, constantly increasing in complexity by the longer haulage consequent to the extension of the mines, and the demand for a larger output, requires the consideration of several important factors, such as the grades of the haulage roads, the height of the veins of coal, and the expense of the installation and maintenance of the various forms of haulage machinery. Electricity as applied to mine haulage appears to satisfy these conditions better than any other form of power, and the development and extensive use of the electric mine locomotive is the natural result of the best efforts in this direction.

These locomotives are made in a great variety of forms and are equipped with single or double multipolar motors. They range in weight from 2½ to 15 tons, and are operated either by the more familiar overhead trolley

Fig. 11.

wire, or the later third-rail systems. The latter consists of a stationary third rail of heavy iron bars running between the two track rails, which are used as the return conductor. The bars of the third rail are perforated at regular intervals throughout their entire length, and are made into a continuous rail by means of fish plates. The locomotive consists of a substantial steel frame mounted on suitable track wheels. This frame also carries two steel sprocket or traction wheels, which are driven by the electric motors of the machine, by means of suitable gearing. These sprocket wheels engage the third rail through the perforations therein, and serve the double purpose of driving the locomotive along, and taking up the current from the third rail to feed the electric motor. The third rail is enclosed in an insulating wood casing, and is usually laid about five inches off the centre of the regular track, thus allowing sufficient room for the animals to work without interrupting the operation of the mine while the plant is being installed. Fig. 11 gives a general illus-

COAL MINING MACHINERY

tration of the system, the chief advantage of which appears to be its positive working; the practicability of using light rails on heavy grades; and the minimum consumption of power in moving the dead weight of locomotives of comparatively light tonnage. The locomotives used at the present time in operating the "Morgan" electric third rail haulage systems range from 6,000 to 10,000 pounds in weight, and range in capacity from 75 to 150 horse-power. The smaller machines are equipped with single motors and the larger with double motors, wound for either 250 or 500 volts, as may be

Fig. 12.

desired. Fig. 12 illustrates a 150 horse-power locomotive of this type with the operator in position.

These locomotives as well as those operating the trolley systems are capable of hauling trains of 40 to 50 cars each, or about double the number of cars usually comprising a cable train. These cars are made in a great variety of forms to adapt them for different kinds of service, and have either steel or wooden bodies. They are arranged to open at the side, or with a "drop-gate" having "wings" which prevent

Fig. 13.

the coal from spilling out at the ends of the gate when lowered. This gate also serves as an extension platform from which the coal may be conveniently shoveled. Fig. 13 shows the general construction of steel coal or pit cars, and Fig. 14 shows an electric 10-ton locomotive of the trolley type, hauling a trainload of coal.

The coal when brought out of the mines is prepared for shipment. At many of the bituminous mines it is screened and shipped as lump or slack, or it is first broken and washed before shipment. The washing of coal to free it from impurities such as shale, slate rock, sulphur, and clay, is generally recognized by

coal operators as a treatment that not only increases the value of small coal, but saves a great deal of that which otherwise would go to the culm pile and be totally wasted.

A washing plant, Fig. 15, consists essentially of a structure containing a storage hopper, a cone-shaped washer tub, a pump to supply the water, suitable belt or bucket conveyors to haul the coal, and the necessary engine equipment to furnish the driving power.

The "washer proper," Fig. 16, consists of a steel bell-shaped cone with refuse chambers

Fig. 14.

operated by rack and pinion, together with the central shaft and its projecting arms and stirring blades. The coal is brought to the washer directly in pit cars or by chain elevators and conveyors, and is discharged into the "washer tubs" through the spout (a), from which it passes into the centre ring (b). The water enters through the housing (c) and passes into the tub through the interior perforations (d). The coal is kept in a constant state of agitation by the "stirrers" and as it descends in the tub it meets the upward current of the water which carries the good coal with it and discharges it

Fig. 15.

at the overflow (f), while the impurities such as sulphur, slate, and bone coal, of greater specific gravity than the good coal, pass downward and settle in the chamber (g). When this chamber is filled, the upper valve (h) is closed and the lower valve (k) is opened and the collected refuse discharged. Then the lower valve is closed and the upper valve opened in preparation for a repetition of the operation. The good coal passes out with the overflow onto inclined perforated chutes or screens, by which it is drained and then delivered by means of conveyors to storage bins, or is allowed to fall directly into cars for transportation. A sup-

COAL OIL — COAL-TAR

plementary settling tank or "sludge," Fig. 17, is useful in treating such grades of coal of which the finer portion is carried away by the overflow and totally lost. It consists of a

Fig. 16.

wooden or steel tank separated by partitions into three parts (a), (b), and (c), which are connected together by weirs over the partitions. The water carrying the fine coal is delivered into (a), from which it passes into (b),

Fig. 17.

and thence into (c), from which it is taken out by pumping. The bottoms of (a) and (c) slope toward (b), which acts as the boot of a

Fig. 18.

perforated bucket elevator. The bottom of (a) is roughened for the greater part of its width, so that it gathers the fine coal as it settles and

delivers it at the centre of (b), from which it is removed by the buckets of the elevator. The capacity of coal-washing plants ranges from 20 to 60 tons per hour. By their use a better quality of fuel coal is obtained, and also an improved charging material in the production of coke.

The preparation of anthracite coal for shipment is quite different from that of the bituminous varieties. It is usually shipped in seven or more sizes, obtained by passing it through a "breaker" equipped with a system of crushing

Fig. 19.

rolls and screens, which break up and separate it into the sizes desired. The coal brought from the mines is first dumped onto flat oscillating screens through which the fine coal is sifted. The large chunks are then passed through the crushing rolls, Fig. 18, equipped with sharp teeth which break the coal into smaller pieces of various sizes. From the rolls it passes into revolving screens, Fig. 19, of perforated metal, or wire cloth, through which the pieces of each size are dropped into separate chutes, from which they are discharged into the storage bins. WILLIAM MOREY, JR., C. E., Consulting Engineer, New York City.

Coal Oil. See PETROLEUM.

Coal-tar, or Gas-tar, the black, opaque liquid obtained by condensation from the products of the distillation of coal. As it comes from the condensers it contains more or less water, which rises to the surface when the liquor is allowed to stand for a time, bringing with it the ammonia and ammoniacal salts that are present. The tar as thus freed from water is used in the crude form for a variety of purposes, notably as fuel, for the preservation of building-materials, and the manufacture of sheathing-paper. It is exceedingly complex in chemical constitution, something like 100 different substances having been recognized in it up to the present time, many of which are of great industrial importance. In the utilization of coal-tar for the manufacture of these, it is first roughly separated into parts by fractional distillation,—an operation that is rendered possible by the fact that the various constituents have widely different boiling-points. The distillation is carried out in wrought-iron retorts, and the details of the operation vary somewhat among the different manufacturers. The scheme here given probably represents average practice.

The temperature of the retorts containing the tar being gradually raised, the first products to be expelled are certain gaseous or very volatile substances, such as sulphuretted hydrogen and carbon disulphide, which must be carefully

COAL-TAR COLORS

treated to avoid danger from fire, since their vapors form explosive mixtures with air. As the temperature gradually rises, other bodies are driven off, and the total product that is obtained at temperatures below 350° F. is kept separate, and designated "light oil." This is treated with soda lye, sulphuric acid, and water, and is then redistilled, fractionally, in special apparatus and in a much more careful manner. By accurate regulation of the temperature, benzene, toluene, and the xylenes are successively obtained, followed by other products that are of less commercial importance.

That portion of the original tar which comes off at temperatures between 350° and 445° F. is known as "carbolic oil," or as "heavy oil" (because it sinks in water), and serves as a source of two exceedingly important substances known as naphthalene and carbolic acid. The former separates out from the heavy oil upon cooling. It is then pressed, treated successively with caustic soda and with sulphuric acid, and redistilled. When purified, it is used in the manufacture of dyes. The liquor from which the naphthalene has crystallized out is shaken with caustic soda solution to extract the carbolic acid and cressol. Upon standing, the aqueous solution containing those substances rises to the top and is removed. Sulphuric acid is then added to it, when the carbolic acid and cressol separate in an oily form. Carbolic acid is greatly used as a disinfectant, and as a raw material for the manufacture of numerous other important substances.

That part of the original tar which distils between 445° and 520° F. is known as "creosote oil," and is used for the preservation of timber. This portion consists mainly of carbolic acid, cressol, anthracene, and naphthalene. That part of the tar which passes over at temperatures above 520° F. is known as "anthracene oil," or "green grease," and is used for the manufacture of anthracene (q.v.), and hence alizarin (q.v.) and the alizarin colors. The final product that is left in the retorts after the extraction of the anthracene oil is called "pitch," and is used in the manufacture of artificial asphalt.

It need hardly be said that when a manufacturer is concerned with only a limited number of the coal-tar derivatives, he modifies the process of distillation in accordance with his immediate needs, so as to obtain the greatest yield that is economically possible of the particular substances in which he is interested. Hence the temperature-limits that are given above, for the various portions of the distillate, are subject to certain modifications according to the special end in view. See COAL-TAR COLORS.

Coal-tar Colors, the coloring matters that are artificially prepared from substances occurring in coal tar. They are exceedingly numerous, and are mostly of complex chemical constitution, belonging to the group known as aromatic compounds (q.v.). The coal-tar colors are exceedingly important in the arts, and are used in enormous quantities in dyeing and calico-printing. In popular language they are often called aniline colors. This designation is incorrect, however, for although they include the colors of the aniline class they also include derivatives of phenol, anthracene, and other bodies. Some prejudice exists against the coal-tar colors in the public mind, because they are

believed to be less permanent than the natural animal and vegetable colors, for which they are substituted. This criticism was quite justifiable some years ago, but a considerable number of coal-tar colors are now known which are fully as "fast" as the natural ones, and in some cases the coal-tar color has a decided advantage in this respect. England may be regarded as the original home of the coal-tar color industry, but in recent years it has passed largely to Germany and France, the change being due in large measure to the attention that is paid in the educational institutions of the latter countries to the subject of synthetic chemistry. Following are a few of the more notable events in the history of the development of the coal-tar color industry, as given by Benedikt: Naphthalene was first discovered in tar in 1820 by Garden; anthracene in 1832 by Dumas; and phenol in 1834 by Mitscherlich. Faraday discovered benzene in 1825, but its presence in coal-tar was not recognized until 1845, by A. W. Hofmann. In 1826 Unverdorben discovered aniline among the products obtained in the dry distillation of indigo, and in 1834 Runge proved its existence in coal-tar, and observed that it gives brilliant colors when brought in contact with chlorid of lime. In 1834 Mitscherlich discovered nitrobenzene, and in 1842 Zinin showed that aniline can be manufactured by the reduction of nitrobenzene. The last-mentioned discovery was of exceeding importance, for although aniline occurs in coal-tar it is in such small quantities that it could not be profitably extracted on a commercial scale. In 1854 Bechamp greatly improved the process of manufacturing aniline from nitrobenzene, and in 1856 Perkin prepared mauveine (the first aniline dye) on a large scale. In 1858 A. W. Hofmann published a paper in which he showed that magenta (aniline red) can be prepared by the action of carbon tetra-chlorid upon aniline, and in 1859 Verguin first manufactured magenta in quantity. During the next few years various other colors were discovered and placed on the market, and aniline black was discovered by Lightfoot in 1863. Pelletier and Walter discovered toluene in 1837, and in 1848 Mansfield showed that this substance occurs in coal-tar. The coal-tar color industry was greatly stimulated when Graebe and Liebermann effected the synthesis of alizarin in 1868, thereby opening up a new and important field of chemical activity. Previous to this date alizarin was obtained from madder-root, but it is now almost exclusively manufactured from anthracene. Baeyer produced the first eosin dye in 1874. The synthesis of indigo was the result of a long series of investigations, the final step in which was taken by Baeyer in 1878; and in 1880 a German company placed a substance known as nitrophenyl-propionic acid on the market, for depositing artificial indigo upon fibres by Baeyer's method. Other methods for the artificial manufacture of indigo have since been discovered, but the natural dye is still largely used in spite of all efforts to displace it.

The marks that are used in commerce for designating the shade of a color consist usually of certain letters affixed to the name of the color to be described. Thus R is used for red, O for orange, J or G for yellow (Fr. *jaune*; Ger. *Gelb*), B for blue, and V for violet. Thus "Scarlet RR" or "Scarlet 2R" signifies a scarlet whose tint inclines toward red, and the doubled

COAL-TAR COLORS

R signifies that an intermediate color is recognized, whose tint lies between that here specified and the pure scarlet. Aniline blue occurs in a reddish shade which is designated as "Aniline blue R"; while the finest quality of aniline blue is designated as "Aniline blue 6B."

Much attention has been paid to the connection between the color of a substance and its chemical constitution, but no absolute rule can be given for predicting the color of a compound whose formula is known. In the case of the aromatic series, however (which is of special interest to the student of coal-tar colors), the following may be said: All of the aromatic hydrocarbons are colorless (or white), and the same is true of such of their mono-substitution compounds as are obtained by replacing one atom of hydrogen OH, NO₂, or NH₂. If two hydrogen atoms are replaced, the resulting compound is also colorless if the radicals introduced are alike. If they are unlike, and one of them is NO₂, then the resulting compound is colored. For example, benzene, C₆H₆, is colorless, and so also are its derivatives, aniline (C₆H₅.NH₂) and nitrobenzene (C₆H₅.NO₂), which are obtained by replacing one atom of hydrogen by NH₂ and NO₂, respectively. But if a second atom of hydrogen in the benzene nucleus of aniline be replaced by NO₂, we have the compound NO₂.C₆H₄.NH₂, which is known as nitroaniline and is yellow. The presence of certain atomic groups in the molecule of a substance appears to have a strong influence, also, upon the color of the compound. This is particularly noticeable in the quinones, which contain the group .O.O., and in the azo compounds, which contain the group .N:H. . The difference between a colored substance and a coloring matter, or dye, must be borne in mind, however. A dye is a substance which unites directly with the animal or vegetable fibres of the fabric to which it is applied, or with a mordant with which those fibres are impregnated. According to Witt, a true dye must contain two species of molecular groups, one of which is called the chromophor ("color-bearer"), while the other serves to make the compound acid or basic, so that it can form salts. The groups NO₂, .N:N., and .O.O. are examples of chromophors. Compounds that contain chromophors, but are neither acid nor basic, are called chromogenes ("color-generators"). They are not dyes, but may be transformed into dyes by the introduction of a salt-forming group such as OH or NH₂. Azobenzene, C₆H₅.N:N.C₆H₅, is a colored substance, but it is not a dye. It is a chromogene, however, because it contains the chromophor-group .N:N.; and if one of its hydrogen atoms is replaced by the group OH, the compound C₆H₅.N:N.C₆H₄.OH, known as oxyazobenzene, is obtained, which is a true dye. Again if one of the atoms of hydrogen in azobenzene is replaced by NH₂, the compound C₆H₅.N:N.C₆H₄.NH₂ is obtained; this is also a true dye, and is known to chemists as amidoazobenzene. (Consult: Hjelt, 'Principles of General Organic Chemistry,' from which these examples are taken.) Coloring matters that are basic in nature are always used, in dyeing, in the form of salts; that is, it is the compounds of these substances with acids that are used, and not the free bases themselves. "Substantive" coloring matters are those that are directly absorbed from solution by the fibre to be dyed. "Adjective" coloring

matters are those that are not directly absorbed in this manner, but which require the fibre to be first "mordanted," or charged with certain metallic salts, or "animalized" with albumen, or treated in some other manner, before the dyeing can be done.

Classification.—It is impossible to give an entirely satisfactory classification of the coal-tar colors. The following scheme is due to Benedikt, and appears to be as good as any. (See Benedikt, 'The Chemistry of the Coal-Tar Colors,' for a full account of these colors and of their chemical relations.)

- 1.—ANILINE DYES.
 - (a) *Rosaniline Group.*
 - (b) *Indulines and Safranines.*
 - (c) *Oxazines.*
 - (d) *Aniline Black.*
 - (e) *Thionines* (coloring matters containing sulphur).
- 2.—PHENOL DYES.
 - (a) *Nitro Bodies.*
 - (b) *Nitrous Derivatives* (coloring matters formed by the action of nitrous acid on phenols).
 - (c) *Rosolic Acid.*
 - (d) *Phthaleins and Indophenols.*
- 3.—AZO DYES.
 - (a) *Amidoazo Dyes.*
 - (b) *Amidoazo Sulphonic Acids.*
 - (c) *Oxyazo Dyes.*
- 4.—ARTIFICIAL INDIGO.
- 5.—ANTHRACENE DYES.

ANILINE DYES.—*Rosaniline Group.*—The coloring matters belonging in this group may be regarded, for the most part, as derived from two fundamental "mother substances," known respectively as triphenylmethane and tolyldiphenylmethane. Triphenylmethane, C₁₉H₁₆, is (in theory) obtained from methane, CH₄, by replacing three of the hydrogen atoms by three phenyl radicals. It therefore has the constitutional formula

The carbon atom which serves to unite the three phenyl radicals to the single hydrogen atom is known as the methane carbon. Tolyldiphenylmethane is derived from triphenylmethane by replacing an atom of hydrogen, in one of the phenyl radicals, by methyl, CH₃. Numerous basic substances are obtainable from these by replacing one hydrogen atom in two or three of the phenyl groups by NH₂, and by subsequently replacing the hydrogen of the NH₂ by methyl, phenyl, etc. The bases so obtained are colorless, from which circumstance they are known as the "leuco-bases." By oxidation they are converted into the color bases, which are also colorless for the most part. Prominent among the color bases are the two substances known as rosaniline and pararosaniline. Rosaniline (q.v.) is most conveniently obtained by oxidizing a mixture of aniline and liquid orthotoluidine. (See TOLUIDINE.) Pararoslaniline is formed in the same way from aniline and solid paratoluidine. Pararoslaniline may be prepared, however, from triphenylmethane, and rosaniline from tolyldiphenylmethane. The dyes that are classed under the rosaniline group are the salts of the color bases referred to above. Thus magenta (or fuchsin) is a mixture of the hydrochlorids of rosaniline and pararosaniline, and methyl violet is the hydrochlorid of penta-methylated pararosaniline. Auramine is the

COAL-TAR COLORS

hydrochlorid of the more complicated base imidotetramethylamidodiphenylmethane.

Indulines and Safranines.—The indulines and safranines are distinct from each other in all respects, save that they are derived from the same mother substances. The induline bases are formed when aniline acts upon an amidoazo compound, such as amidoazobenzene (or aniline yellow), with liberation of ammonia. The best-known base of this sort is violaniline. When the same mother substances are caused to interact so that oxidation occurs and hydrogen is liberated (instead of ammonia), safranine is formed. Blackley blue is one of the best known induline colors, and magdala red is one of the best known of the safranine series.

Oxazines.—This group contains coloring matters that may be regarded as derived from phenoxazine,

It includes muscarin, gallocyanin (or solid violet), Nile blue, resorcin blue, and prune.

Aniline Black.—This substance is formed by the cautious oxidation of aniline hydrochlorid. If the oxidation is not sufficient, violet or green colors are obtained; while if it is excessive quinone is formed. Aniline black may also be produced by the electrolysis of a concentrated solution of an aniline salt.

Thionines.—Thionine coloring matters are obtained when the hydrochlorids of certain of the aromatic diamines are dissolved in a solution of sulphuretted hydrogen gas, and subsequently oxidized by ferric chlorid. Methylene blue is the only color of this group that is in extensive use. It is prepared from dimethylaniline, $\text{C}_6\text{H}_5\text{N}(\text{CH}_3)_2$, by treatment with hydrochloric acid and sodium nitrite, and subsequent sulphurization with sulphuretted hydrogen, and oxidation with ferric chlorid.

PHENOL DYES.—*Nitro Bodies.*—This group contains substances that are derived from phenol, and are mostly yellow in color. Picric acid, which is one of the best-known examples, is formed by treating carbolic acid (phenol) with nitric acid according to the following equation:

Phenyl brown, Victoria yellow, and naphthol yellow are further examples of dyes of this class. Aurantia, which has the formula $\text{N}(\text{C}_6\text{H}_2(\text{NO}_2)_3)_2.\text{NH}_4$, may be placed in this group. The acid of which it is the ammonia salt is obtained by the action of nitric acid upon methyldiphenylamine, $\text{N}(\text{C}_6\text{H}_5)_2.\text{CH}_3$.

Nitrous Derivatives.—This group consists of those dyes that are obtained by the action of nitrous acid upon such bodies as resorcin, naphthol, thymol, and carbolic acid. Fluorescent resorcin blue is the only example of the group that is in extensive use in the arts. If resorcin is dissolved in sulphuric acid and treated with nitrous acid (obtained by adding nitrite of sodium to strong sulphuric acid), a red substance known as diazoresorufin is obtained, having the formula $\text{C}_{18}\text{H}_{10}\text{N}_2\text{O}_5$. When this body is treated with bromine, a hexabrominated substitution product is obtained, whose ammonium salt is the commercial resorcin blue.

Rosolic Acid.—The rosolic acids may be regarded as rosanilines in which the amido groups

have been replaced by hydroxyl, OH. They may be prepared from the rosanilines or from triphenylmethane. They are classed as phenol coloring matters, however, because they (or at least their more common representatives, the corallins) are more conveniently prepared from phenol. Yellow corallin is obtained by the action of strong sulphuric acid upon phenol, followed by the prolonged action of oxalic acid. It consists chiefly of pararosolic acid (aurin) and of derivatives of rosolic acid. If yellow corallin is heated with ammonia to about 270° F., red corallin, $\text{C}_{19}\text{H}_{13}\text{O}_2\text{NH}_2$, is formed.

Phthaleïns and Indophenols.—The indophenols are formed by the simultaneous oxidation of a phenol and a paradiamine. Commercial indophenol is a blue powder or paste prepared from nitrosodimethylaniline and alpha-naphthol, and is used for obtaining indigo blue shades upon cotton and wool. The phthaleïns are manufactured from phenols and phthalic acid, or phthalic anhydrid; but they may also be regarded (like rosaniline and rosolic acid) as derivatives of triphenylmethane. When a phenol is heated with phthalic anhydrid at moderate temperatures, water is eliminated, and two molecules of the phenol combine with one of the anhydrid, the compound so obtained being known as the phthaleïn of the corresponding phenol. The phthaleïns of resorcin and of pyrogallol are by far the most important ones in the arts. The anhydrid of resorcin phthaleïn (known as "fluoresceïn") is obtained by heating resorcin with the correct molecular proportion of phthaleïn anhydrid to about 390° F., until the mass becomes solid and no more steam is given off. The product so obtained is cooled and pulverized, and sold in this form for the manufacture of the eosins, for which it serves as practically the sole commercial source. Pure fluoresceïn is a yellowish-red crystalline substance, with feebly acid properties. Fluoresceïn is seldom used as a dye, but its sodium salt (uranin) is employed to some extent in printing upon woollens. The empiric formula for pure fluoresceïn is $\text{C}_{20}\text{H}_{12}\text{O}_5$; and its nitro and halogen substitution products are known as eosins. Thus bromine forms, with fluoresceïn, the substitution product $\text{C}_{20}\text{H}_8\text{Br}_4\text{O}_5$, which is known to the chemist as tetrabromfluoresceïn, and to the dyer by various names such as "Eosin yellowish," "Eosin J," and "Soluble eosin." A somewhat similar compound, in which chlorine is the substituted halogen, is known as "Aureosin J."

Azo DYES.—These coloring-matters all contain the binary molecular group .N:N., and may be prepared by the action of phenols or aromatic amines upon diazo compounds, which contain the group in question. See *Azobenzene*, under BENZENE.

Amidoazo Dyes.—This group contains only three representatives that are of commercial importance,—aniline yellow, chrysoïdine, and Bismarck brown. They are all derived from azobenzene. Thus aniline yellow is the hydrochlorid of amidoazobenzene, chrysoïdine is the hydrochlorid of diamidoazobenzene, and Bismarck brown is the hydrochlorid of triamidoazobenzene.

Amidoazo Sulphonic Acids.—Helianthin will serve as an illustration of this group of coloring matters. It is prepared by the action of dimethylaniline upon diazobenzene sulphonic

COALING STATIONS — COAST AND GEODETIC SURVEY

acid, and occurs in commerce in the form of the sodium salt,

On silk and wool it yields a fiery orange color. Acid yellow, which consists chiefly of the sodium salt of the disulphonic acid of amidoazobenzene, also belongs in this group, and while it is not used alone to any great extent, it is employed in various combinations, and large quantities of it are also manufactured for use in the preparation of the other diazo coloring matters.

Oxyazo Dyes.— These may be regarded as derived from oxyazobenzene, $\text{C}_6\text{H}_5\text{N:N.C}_6\text{H}_4\text{OH}$, which was first prepared in 1866 by Peter Griess. They are far too numerous and varied to be considered in any general encyclopædia, and they are not treated in any considerable detail even by Benedikt, who says:

The immense number of coloring matters belonging to this group is easily accounted for if we consider that every primary amine belonging to the aromatic series, after having been converted into a diazo compound, will combine with almost any phenol or derivative of a phenol (in which the hydrogen atom standing opposite the hydroxyl group is not substituted) to form an azo dye.

The first patent for a dye of this group was taken out by Griess in 1878, and since that date many others have been taken each year.

ARTIFICIAL INDIGO.— Numerous methods for the artificial preparation of indigo are known, but all are too expensive in execution to displace the natural product to any great extent. For calico printing, extensive use is made of an artificial product known as "propiolic acid," which can be converted into indigo, upon the fibre, by the use of suitable reducing agents. The blue that it gives is not entirely pure, but the printing process is far simpler than when the natural indigo is used, and for this practical reason propiolic acid is preferred. In its manufacture cinnamic acid is first prepared by heating benzal chlorid, $\text{C}_6\text{H}_5\text{CHCl}_2$, with sodium acetate. The cinnamic acid so obtained is treated with fuming nitric acid, and the ortho-nitro-cinnamic acid that is formed is isolated. This is brominated with free bromine, and afterward boiled with potash and alcohol. Ortho-nitrophenyl-propionate of potassium is formed, from which ortho-nitrophenyl-propionic acid (which is the substance commercially known as propiolic acid), $\text{C}_9\text{H}_5(\text{NO}_2)\text{O}_2$, is liberated upon the addition of hydrochloric acid. This is transformed into indigo blue, $\text{C}_{16}\text{H}_{10}\text{N}_2\text{O}_2$, upon boiling with reducing agents, according to the equation, $2\text{C}_9\text{H}_5(\text{NO}_2)\text{O}_2 + 2\text{H}_2 = \text{C}_{16}\text{H}_{10}\text{N}_2\text{O}_2 + 2\text{CO}_2 + 2\text{H}_2\text{O}$.

ANTHRACENE DYES.— The coloring matters derived from anthracene (q.v.) contain hydroxyl (OH), and are slightly acid in nature, forming colored "lakes" with metallic oxides and with the alkaline earths. They require mordants, but they are faster than most of the other coal-tar colors, and are also faster than most of the natural dyes. Alizarin, purpurin, anthrapurpurin, and flavopurpurin are among the better-known coloring matters obtained from anthracene. (See ALIZARIN and PURPURIN.) Alizarin is used in dyeing for red, black, blue, orange, and violet, and has replaced the madder-root dyes almost absolutely.

Many of the more important substances connected with the manufacture and use of the

coal-tar colors will be found under separate headings. The principles that underlie the application of the coal-tar colors in the dyer's art are outlined in the article on DYEING (q.v.). In addition to Benedikt's excellent work, consult: Hurst, 'Dictionary of the Coal-Tar Colors'; Nietzki, 'Chemistry of the Organic Dye-Stuffs'; and Schultz and Julius, 'Systematic Survey of the Organic Coloring Matters.'

A. D. RISTEEN, Ph.D.

Coaling Stations, depots established by maritime governments at various important points throughout the world, where the ships of the navy may obtain supplies of coal. The utility of such stations, when properly fortified, as points of refuge, defense, and repair for warships in the event of war can hardly be over-estimated. The more important of British stations are Aden, at Trincomalee (Ceylon), Singapore, Hong Kong, Sierra Leone, St. Helena, Mauritius, Jamaica, and Simon's Town (Cape Colony). During 1898-1900 the United States established coaling stations for its navy at San Juan, Porto Rico; Pearl Harbor, Hawaii, Pago Pago, Samoa; Cavite, near Manila; at the chief port of Guam, Ladron Islands; and at convenient points in Cuba; and coal "piles" at La Paz, Mexico, and at several points in Alaska. Some of the British coaling stations supply both naval and mercantile vessels.

Coamings, in naval architecture, a framework surrounding the opening of a hatchway, designed to stiffen the parts weakened by the opening, and, by being raised above the deck, to keep water from entering the hold. A rabbet or groove in its inside upper edge receives the hatches.

Coan, kō'ān, **Titus,** American missionary: b. Killingworth, Conn., 1 Feb. 1801; d. Hilo, Hawaii, 1 Dec. 1882. After spending several months (1833-4) on a dangerous exploring expedition in Patagonia, he went to the Sandwich Islands (1835), occupying the Hilo station 47 years, and in that time converting 14,000 natives. He wrote: 'Adventures in Patagonia' (1880); 'Life in Hawaii' (1881).

Coan, Titus Munson, American physician and critic, son of Titus Coan (q.v.): b. Hilo, Hawaii, 27 Sept. 1836. He now resides in New York, where he founded in 1880 the New York Bureau of Literary Revision. He has written: 'An Ounce of Prevention'; 'Topics of the Time' (edited).

Coanza. See KWANZA.

Coast and Geodetic Survey, United States. To all nations whose territory touches the sea or other water navigable to any extent, or who have any interests in the commerce of the sea, a full and complete knowledge of the coast—its nature and form, the character of the sea bottom near it, the location of reefs, shoals, and other dangers to navigation, the direction and strength of currents, and the character and amount of magnetic disturbance—is of the greatest moment.

To supply this knowledge the governments of all maritime nations have in modern times executed surveys of their coasts by the most exact methods.

Some idea of the importance to this country of like operations and their extent may be

COAST AND GEODETIC SURVEY

formed when it is remembered that the coast line of the United States and Alaska, measured along its general trend, exceeds 10,000 miles in length. To represent the actual shore line as surveyed, which includes all the islands, bays, sounds, and rivers in the littoral or tidal belt, these figures would have to be multiplied many times. To this must be added the shore line of Porto Rico, the Hawaiian Islands, and the Philippine Islands. The length of the general shore line of only 14 of the principal islands of the latter group exceeds 11,000 miles.

On the recommendation of President Thomas Jefferson, Congress in 1807 authorized the establishment, as a bureau under the secretary of the treasury, of a national coast survey. For the purpose of furnishing geographic positions and other data to State surveys, the scope of the bureau was in 1878 enlarged, and its designation became the United States Coast and Geodetic Survey.

The plan upon which it is organized is the outgrowth of trial and experience during the first 50 years of its existence, and from its inception almost every year has seen some new feature added or some old one discarded.

Under the direction of a superintendent there are two great divisions of its work. They are the field and the office.

The field work includes all of the practical operations of the survey on land and sea.

Except in time of war, in accordance with the plan of reorganization of 1843, the work upon the land was divided between civilian assistants and officers of the army, the hydrographic parties being in charge of naval officers. Since 1861 no officers of the army have been connected with the survey, and the conduct of the hydrographic work was about equally divided between the civilian assistants and naval officers until 1898, when the naval officers were relieved, and since which time none have been assigned to the survey.

The civilian assistants consist of a body of trained experts permanently attached to the survey, and numbering between 50 and 60.

The service owns a fleet of 11 steamers and 6 schooners, besides steam and motor launches.

The office is that part of the establishment which receives the records, original sheets, etc., representing the results of field work. They are registered and deposited in the archives until in turn they are taken up for examination, computation, and adjustment, prepared for publication, and finally published. Original charts are reduced or enlarged, engraved, electrotyped, and printed.

For the convenience of administration the operations of the main office at Washington are carried on by eight divisions, each having some specified portion of the general work to perform. In these divisions are employed the required force of clerks, draftsmen, computers, engravers, instrument makers, printers, etc., numbering in all about 145.

There are sub-offices at San Francisco, Seattle, Honolulu, and Manila.

Many of the field operations of the survey being geodetic in their nature, a system of primary triangulation, together with the determination of geographic positions by means of astronomic methods, must furnish the foundation upon which the whole rests. On the Atlantic coast a chain of triangles, beginning at the eastern

boundary of Maine, stretches to the Gulf, constituting an oblique arc, which, besides serving as a basis for the coast triangulation, adds much to our knowledge of the figure of the earth.

An extensive system of triangles extends across the continent along the 39th parallel of latitude, connecting the surveys of the two coasts and furnishing a basis for the surveys of the 13 States through which it passes. It is also one of the longest arcs now available for the determination of the figure of the earth. Another triangulation system is being executed along the 98th meridian. Its extension southward through Mexico has already begun, and there is a prospect of its extension northward through the British possessions.

In connection with these principal systems, the triangulation has been considerably expanded in the New England States, New York, and several western States, including California, where some exceptionally large figures were introduced. The longest line so far observed is that from Mount Helena to Mount Shasta, over 190 miles in length.

A tertiary triangulation for topographic and hydrographic purposes has been completed along the entire Atlantic and Gulf coasts, and over more than half of the Pacific coast, except Alaska. Much progress has been made in the latter territory by methods which possess a sufficient degree of accuracy for immediate use and are capable of rapid execution.

In the determination of astronomic positions the exact methods originally developed in the survey have been adhered to and perfected. The methods of using the zenith telescope for latitude and the telegraph for longitude have been constantly improved.

The topographical operations have been mostly restricted to a narrow margin, not often over three to five miles wide, along the coast and surrounding harbors, bays, and rivers up to the head of tide water. In some cases it has been somewhat more extensive, notably in the survey of the District of Columbia, where the scale was 1-4800 and the contour interval only five feet.

The hydrographic operations have extended as far out from the coast as was necessary for the interests of navigation, and have included, all harbors, channels, bays, etc., as far as the work has gone.

Deep-sea soundings have been made extensively, especially in and about the Gulf Stream.

Much attention has been given to tides, and continuous series of tidal records have been obtained at several important points.

The results of the operations of the survey in connection with the study of terrestrial magnetism can be found on its charts and in its other numerous publications on the subject. In addition to the determination of the magnetic elements at many widely distributed points and their frequent redetermination for secular variation, special observations are also made at certain base stations, with the aid of self-registering instruments, for the purpose of obtaining the record of the numerous variations of the earth's magnetism continually taking place.

The study of the force of gravity as a part of the great geodetic problem has received attention for 30 years, and the survey has of late years developed methods and instruments which will lead to a great extension of the work at a less cost

COAST AND GEODETIC SURVEY

than by older processes, but without lowering the standard of accuracy.

A network of precise levels covering in a general way the eastern half of the United States, connecting the Atlantic Ocean, the Gulf of Mexico, and the Great Lakes, has been executed, and in the future will be extended to the Pacific Ocean.

Throughout its history the survey has constantly been called upon to determine boundary lines, both State and national, which have been in dispute.

At the present time, with its assistance, three State boundaries are in the process of settlement.

The Office of Standard Weights and Measures, charged with the maintenance of the standards of length, weight, and capacity, which was under the direction of the superintendent of the Coast and Geodetic Survey until 30 June 1901, is now an independent organization under the title of the "National Bureau of Standards."

The principal publications of the survey consist of about 500 different charts; tide tables for all the principal and many minor ports; a monthly edition of 4,700 copies of a circular known as 'Notice to Mariners,' containing notes of all changes along the coast; 'Coast Pilots,' containing minute sailing directions for all navigable waters along our coast; and the 'Report of the Coast and Geodetic Survey', which contains, besides the reports of the superintendent and his assistants on the conduct of the work, a series of special reports upon various technical and scientific operations of the service. For details of the work of the bureau see CHART; COAST PILOTS; GEODESY; GRAVITY; HYDROGRAPHY; LEVELING; SURVEYING; TIDES; etc.

O. H. TITTMAN,
Superintendent.

Coast and Geodetic Survey, Methods and Publications of. The work of this Survey as briefly outlined by the preceding article may be described in greater detail under the following general headings: (1) Triangulation and Reconnaissance; (2) Base Apparatus; (3) Time, Latitude, Longitude, and Azimuth; (4) Terrestrial Magnetism; (5) Hydrography; (6) Topography; (7) Tides and Tidal Currents; (8) Leveling; (9) Coast Pilots; (10) Charts; (11) Gravity; and (12) Geodesy.

Triangulation and Reconnaissance.—According to the usual practice, the triangulations are classified as primary, secondary, or tertiary, depending upon their relative importance and the size of their individual triangles. The work of selecting the various triangulation points is called *Reconnaissance*. This work increases in complexity according to its character and extent, and ranges from preliminary and minor triangulations of a moderate degree of accuracy along the seacoast, the windings of river mouths, estuaries, etc., for the purpose of selecting points for the control of a hydrographical or topographical survey of limited extent, to the work of selecting and establishing the points of great triangulations required for connecting surveys independently executed many miles apart. The reconnaissance also determines the character and size of the various instruments to be used in the prosecution of the subsequent operations, the kinds of stands or piers to be built to support

those instruments, and the kinds of signals or objects to be used at the distant stations. For great distances, heliotropes are used by day and powerful lights by night. During the past five or six years, acetylene lamps in connection with powerful condensing lenses have been used for night signals.

The theodolites used in primary triangulation are equipped with accurately graduated circles 12 to 24 inches in diameter, reading to seconds of arc or closer, by three micrometer microscopes, the mean of the readings constituting one observation of a direction. Under perfect conditions, a single careful observation would be sufficient; but, in order to eliminate inaccuracies resulting from instrumental defects, personal errors of observers, and the varying meteorological conditions, which influence the line of sight, three successive observations are made on different parts of the circle by shifting it through a definite portion of the circumference after each set of observations. The present practice is to use sixteen positions on the circle, making one reading with the telescope direct and one with the telescope reversed for each position, thus giving sixteen measures of each direction.

The lengths of primary triangulation lines vary according to the character of the country. Very long lines are possible only in high mountain regions. The longest line thus far observed is that from Mt. Helena to Mt. Shasta, California, a distance of 190 miles. In lower countries, heavily wooded regions, or where mountains of nearly the same height are closely crowded together, the lengths of the lines vary from 10 to 40 miles.

In secondary and tertiary triangulation the lengths of the lines range downwards from 20 miles to less than one mile. In this work heliotropes are rarely used, and the angles are often measured with theodolites having circles from 6 to 12 inches in diameter. In general the same principles apply as in primary triangulation, the details of the work varying with the attending circumstances. The lengths of the sides of the triangles are computed from the data obtained by measuring the angles, and the latitudes and longitudes of all stations are computed by geodetic formulæ.

The accuracy of the triangulations is tested in various ways—by determining the error of closure, or by comparing the computed length of a line obtained through a long chain of triangles with an actual measurement of the same line. In the case of the former, the sum of the angles of a plane triangle must equal 180° , and as the same condition applies to a geodetic triangle after it has been reduced to a plane triangle by deducting the spherical excess due to the figure of the earth, any existing difference between 180° and the corrected sum represents the error of closure. In the best work the amount of this difference averages somewhat less than one second. An example of a test by the second method is afforded in the triangulation between the Maryland and Georgia base lines, 602 miles apart. The line tested was a triangle side situated half way between the base lines, and the comparison was made by computing its length from each base line through the triangulation. The discrepancy was scarcely perceptible, being a little more than half an inch in a length of thirty miles. The accuracy

COAST AND GEODETIC SURVEY

of these methods are such that they may be considered practically exact.

Base Apparatus.—Four principal forms of apparatus are used by the Survey for the measurement of base lines. (1) The iced bar, a monometallic single-bar system; (2) the duplex apparatus, a bimetallic multiple-bar system; (3) the secondary apparatus, a monometallic multiple-bar system; and (4) the tape apparatus, a monometallic single unit system.

In the iced bar apparatus, the measuring unit is a steel bar 5 meters long, that length being defined by microscopic lines engraved upon the polished surfaces of small platinum plugs set into the bar near the ends and in its neutral axis. To permit this, the upper part of each end is cut away for a short distance. While in use, the bar is supported in a metallic trough filled with melting ice which keeps it at a constant temperature. The trough is supported upon a carriage movable upon a track built for that purpose. In making the measurements, the successive positions of the ends of the bar are fixed by powerful microscopes firmly attached to stout posts solidly planted in the ground. Measurements possessing an extraordinary degree of accuracy are obtained by the method, but they are considered too slow and costly for determining the length of an entire base line, and the most recent practice of the Survey is to use it for measuring with great precision a distance of 100 meters near and parallel to the base line intended to be measured, and use that length of 100 meters as a field standard for the testing and comparison, under actual field conditions, of the apparatus by which the actual base is measured. When a number of bases are to be measured during the same season, this field standardization is effected at the first and last base lines of the series.

The duplex apparatus has two separate measuring rods in each compound bar, one made of steel and the other of brass. These rods are tubular, the thickness of their walls being based upon the specific heat and conductivity of each metal, and they are given equal capacities for absorbing and radiating heat by being plated with nickel. The rods are so arranged that an independent measure is conducted with each, thus giving for any measured distance two results; one in terms of the steel, the other in terms of the brass component. By means of attached scales direct comparisons between the two are made whenever desired. The difference between the two measures determines the average temperature of the two rods, and also, by means of the ratio of the expansions of the brass and of the steel, the corrections by which the measures are reduced to standard without reference to mercurial thermometers. Each compound bar is, however, provided with three such thermometers, so that a single measurement gives three results, one duplex and two separate thermometric results, which although they are not absolutely independent, yet afford valuable checks upon the reliability of the measurement.

The secondary apparatus is a simple monometallic system which possesses a considerable degree of accuracy. The measuring rods are made of steel. For the purpose of checking radiation they are inclosed in massive wooden bars from which they project a little at each end. Temperatures are determined by means of

mercurial thermometers, two for each bar, which are inclosed in the wooden casing with their bulbs in contact with the steel rod, one near each end. The best results are obtained by equally dividing the measurements between periods of rising and falling temperature.

Steel tapes standardized under field conditions, by comparison with test bases carefully measured with ice bars, have been recently used with marked success. They have also been successfully used in connection with the duplex and the secondary apparatus. The steel tapes now used are either 50 meters (164 feet), or 100 meters (328 feet) long. They are 6.34 millimeters (0.25 inch) wide and about 0.47 millimeters (0.019 inch) thick. While in use they are supported at intervals of 25 meters (82 feet), the intermediate supports being wire nails driven horizontally into the sides of stakes previously arranged for that purpose. In making the measurements, the successive positions of the forward end of the tape are marked upon copper strips fastened to the tops of suitable posts previously aligned and driven into the ground at the proper distances. A tension of 15 kilograms (33.1 pounds) is applied to the tape by means of a lever, the amount of the tension being measured by a spring balance. With this amount of tension the sag of the tape between the supports is very slight, therefore a high degree of accuracy in the measurement of the tension is unnecessary.

The temperature of the tape is determined by two mercurial thermometers attached to the tape near its ends. At the present time all tape measurements are made at night, as it has been found that mercurial thermometers will not accurately indicate the temperature of a tape in daylight. It seems very probable, however, that the use of the "thermophone" to determine the temperature of the tape may enable the making of precise tape measurements in daylight in the near future, and thus considerably facilitate such operations. Its use in this connection was suggested by Professor Burton of the Massachusetts Institute of Technology. The temperature of the tape is obtained by the application of the principle of differential variations, with varying temperatures of the electrical resistances of steel and German silver, the tape for this purpose being made one arm of a Wheatstone bridge. It is also probable that the alloy of steel and nickel called "invar," which is almost absolutely unaffected by changes of temperature, may be successfully used in tape measurements made in the future, and lead to a more frequent use of the tape apparatus with a corresponding increase in the number of geodetic bases.

In comparing the results obtained by the use of the tape apparatus with those of the duplex apparatus, experience shows that the judicious use of tapes readily allows the repeating of a measurement with no greater discrepancy than about one-twelfth of an inch per mile, or about 1 part in 760,000, and that the duplex apparatus admits of a remeasurement with a discrepancy no greater than one-sixteenth of an inch per mile, or about 1 part in 1,000,000. In both cases the accuracy of the measurements is well within the limits required for even the most accurate triangulations, therefore the cost of the work becomes the most important point to be considered in this connection. The cost of measur-

COAST AND GEODETIC SURVEY

ing a base with the duplex or any good bar apparatus is nearly three times as great as that required for tape measurement.

Time, Latitude, Longitude, and Azimuth.—The time determinations as made by the Survey are those required in connection with observations of latitude, longitude, and azimuth.

Time is determined by observations of the sun or stars with instruments which measure their altitude or indicate their meridian passage. Sextants and altazimuth instruments are generally used for approximate determinations, and transit instruments adjusted to the meridian for refined work. With the transits, chronographs are frequently used for recording the observations.

Latitude.—Determinations of an inferior grade are made with sextants or altazimuth instruments by observations on the sun or stars, but determinations of the first order are made by observations on the stars with zenith telescopes. In the latter method, the observation of from fifteen to twenty pairs of stars on three nights is considered necessary for a good determination.

Longitude.—The most accurate results in the determination of longitude are obtained by the telegraphic method, by which the differences of time between the positions in the field and some first class astronomical observatory are determined by the exchange of time signals. The instrumental equipment for this purpose consists of a transit, a break circuit chronometer, a chronograph, and a set of telegraphic instruments at each station. For work of primary importance, the local time is determined in the usual manner at the two places on the same nights for six nights, and a comparison of the chronometers made on each night over the telegraph line by means of chronometer signals. The transmission time of the electric current is derived by sending signals in both directions. The personal equation of the observers is eliminated by the interchange of observers after half the work is completed. In longitude work of the first order, observations on twenty stars each night are considered necessary for an accurate determination of the local time at the two stations, the transits being equipped with Repsold self-registering micrometer eye-piece for the purpose of eliminating the personal equation of the observers.
