

THE J. PAUL GETTY MUSEUM LIBRARY

AN

ILLUSTRATED WEEKLY MAGAZINE,

FOR THE

ARCHITECT, ENGINEER, ARCHÆOLOGIST, CONSTRUCTOR,
SANITARY REFORMER, AND ART-LOVER.

CONDUCTED BY

GEORGE GODWIN, F.R.S., F.S.A.

LATE VICE-PRESIDENT OF THE ROYAL INSTITUTE OF BRITISH ARCHITECTS:

*Honorary Member of various Societies; Author of "History in Rules," "Town Sweeps and Social Bridges,"
"Another Blow for Life," &c.*

"Every man's proper mansion-house, and home, being the theater of his hospitality, the seat of self-fruition, the comfortablest part of his own life, the noblest of his sonne's inheritance, a kinde of private principedom, nay, to the possessors thereof, an epitome of the whole world, may well deserve, by these attributes, according to the degree of the master, to be decently and delightfully adorned."

"Architecture can want no commendation, where there are noble men, or noble mindes."—SIR HENRY WOTTON.

"Our English word To BUILD is the Anglo-Saxon Bylsan, to confirm, to establish, to make firm and sure and fast, to consolidate, to strengthen; and is applicable to all other things as well as to dwelling-places."—DIVERSIONS OF PURLEY.

"Art shows us man as he can by no other means be made known. Art gives us 'nobler loves and nobler cares,'—furnishing objects by the contemplation of which we are taught and exalted,—and so are ultimately led to seek beauty in its highest form, which is GOODNESS."

VOLUME FOR 1872.

LONDON:

PUBLISHING OFFICE, No. 1, YORK STREET, COVENT GARDEN, W.C.

AN

THE BATTLE

Prologue.

THE day that we head our paper with a new date, does not necessarily mark any definite step in our lives and circumstances. The world wakes up much as usual, and man "goeth forth to his work and to his labour till the evening" without any sense of change; the duration of the period indeed is connected with the mechanism of planetary revolution, but the precise point at which we mark it off is arbitrary, and might be as well fixed in June as January. Yet the tendency to regard this recurring season as a new starting point, an occasion for considering our position, and our future work, is a natural and health-

ful one. It is a suggestion for a pause of inquiry as to the direction in which we are travelling, as well as an excuse for what the rowing men call a fresh "spurt." And so in wishing prosperous new year to all our friends, professional and non-professional, it will not be out of place to add a few words of suggestion as to the aim to be pursued by the representatives of architecture in the present day, if they would gain definite and enduring results from the work of this and the succeeding years.

Not that we are going to trouble our readers with an encyclopaedical view of the position and prospects of architecture, which, indeed, would be in danger of running somewhat beyond the ordinary limits of our article. And there are many practical points, on the importance of which all are pretty well agreed, and which only stand in need of sufficient experiment and investigation, to be regarded with an equal unanimity as to the ways and means of accomplishing the desired ends. But there are other subjects on which no one seems to agree, or to be much nearer agreeing now than ten or twenty years ago. And if there is one subject more than another in regard to which doubt, difference, and contradictory opinions seem to be the order of the day, it is that still vexed question, often so hotly debated of late years, as to the form, the nature, the degree of the purely artistic element which is possible in

modern architecture,—a question which, in some of its more recent forms, resolves itself almost into the inquiry whether there is really any such thing as architecture possible in the present day, anything comparable in importance and in beauty to the architectural remains of certain other epochs. Can we hope to say anything new or at all decisive on a subject which has been so much and so variously debated?

To a certain extent, the diversity of opinion on the question of style has been compromised. The "battle of the styles" is no longer carried on in its old form, and an armed neutrality prevails, consequent on the discovery and tacit admission, by partisans on both sides, that the mere revival of an old style will do nothing for us in the long run. A feeling of toleration has been established, partly owing to a really better insight into the principles of architectural style and design; and even one stern Goth is now content to admire and appreciate the beauties of Greek architecture, reserving his contempt for the detested "Renaissance,"—pooh-poohing Wren and all his works. It is satisfactory to find we have men so much greater than the architect of St. Paul's amongst us. More recently we have even seen another exclusively Gothic architect appearing as the champion of conservatism and respect in the treatment of our only Renaissance cathedral. This is so far well, as arguing the approach of a wider and more generalised view of the art of architecture. But there are evidences, among some of the most promising of our younger architects especially, of a growing doubt and dissatisfaction as to the whole status, the *raison d'être* of the profession of architectural design in these times,—a suspicion that the whole thing is possibly in some sort an anachronism: a feeling fostered, if not set on foot, by those who think themselves a rival body,—the engineers. And it must be said that such a feeling might not unfairly be prompted by the architectural history of this country for the last half-century. To the ordinary run of workers in the profession, those who are content to produce creditable and correct designs in the style preferred by their employers,—with whom the profession is, in fact, nothing more than a "respectable" way of earning daily bread,—such scruples would not, of course, occur. But to those who take more serious view of the work of their life, and who would be glad to feel that they are busied about work that will not only give them a living, but will be in itself a benefit to society,—something which has to be, and ought to be, done,—the doubt whether they are not engaged in a mere fashion, pursuing a shadow, may occur with disagreeable force and frequency, especially in the face of all the remarks and theories from time to time put forth from one quarter or another. They see that Greek architecture was enthusiastically studied and practised by men of excep-

tional ability, yet that its modern productions have failed to satisfy either our practical or artistic wants; that modern Gothic architects have strewn the land over with quasi-Medieval churches, of which people are already beginning to tire; and on the other hand architectural critics are ever found repeating that a new style cannot be deliberately made, and that some forms already in existence must be taken as a starting-point to work from. What is the truth out of all this contradiction? "Where shall we find the concord of this discord?"

The temporary character of the Gothic "revival," as it has mostly been practised, can scarcely be doubted. There has been such a blind admiration of everything Medieval,—such a systematised copyism,—such a condemnation of attempted progress,—the whole movement has been so closely associated with other mental tendencies and prejudices,—that architecture has been, in the main, reduced, more than at any other period, to a great dilettantism,—a mere medium for assisting in the reproduction or depiction of the lifeless features of a past age and state of society. On the other hand, it is not to be supposed or expected that men with any strong feeling for the beautiful and picturesque in building, practising as architects in the present day, must or can shake themselves free from the influence of the monuments of a greater age of architecture: nor is the fact that they cannot do so a clear proof that there is neither artistic genius nor originality among us in this century. For it must be remembered that the productions of the greatest periods in almost every art,—those which remain as standard examples for admiration and imitation,—have arisen at a time when the best part of the mind and enthusiasm of a nation has been directed towards that particular object. The Italian intellect of the fourteenth and fifteenth centuries was directed to painting, as one of the noblest objects of life, which might well employ the powers of the first men of the day. The English intellect of the Elizabethan era poured itself out in the drama; that of the Edwardian period found its expression in architecture; and the excellence of the dramatic and architectural works of the two periods is to be traced, in great measure, to the fact that in each case dramatic and architectural art, respectively, formed the one chief outlet for artistic expression, to which everything else was subordinate and subservient. The mind of the present age is more active, perhaps, than at any of those former great periods of art-production; but it is divided,—its strength is spent and distributed over a score of different forms of expression. Could we, by any magical spell, shut out suddenly from the educated England of to-day all artistic interest, all media for artistic expression, except architecture,—could we, at the same

time, furnish the same opportunity and excuse for the erection of great buildings which existed in the Middle Ages,—we should probably see a new growth of Architecture before long, in forms as impressive as any already existing. But we cannot do this: only a small part,—a very small part,—of the national mind is given to architecture at present; and that part is not in itself strong enough to escape from the impression left upon the art by the builders of a more purely architectural age. It is the same in other arts: we see it in the enduring influence of the school of Italian painting; still more remarkably, perhaps, in the almost ineffaceable impress left by that purely æsthetic people, the Greeks, upon the artistic hieut of mankind since their day,—as Lord Houghton has elegantly expressed it, in a little poem entitled, "The Flowers of Helicon,"—

"And downward thence to latest days
The heritage of Beauty fell
And Grecian forms and Grecian lays
Prolong'd a their humanising spell,
Till when new words for man to win
The Atlantic's riven waves disclose,
The wilderness there began
To blossom with the Grecian rose."

Certainly this neo-Greek blossoming on the other side of the Atlantic may not be, if looked at closely, exactly the kind of thing that an architectural critic would be enraptured with; it may be paired off, perhaps, with that resurrection of Mediæval castles which a New York paper assured Mr. Baskin he would find if he visited their city. But what we would indicate is, that the impress of the great age of every art, the age when that particular art was all-in-all to men, will not and cannot be effaced; that it must, and, indeed, ought, to influence those who aim at carrying on the same art in an age of more multifarious efforts and more divided aims. And, therefore, it is not fit that critics should hoist the black flag, and cry "no hope," because it is found scarcely possible to produce a pleasing architectural design in the present day, which shall not be largely based upon the features of one of the great styles of former times. It is natural and inevitable that it should be so. What is required is, that this adaptation from former styles should begin, so to speak, at the right end. The Gothic revival was not purely an architectural movement. It is a feature only in a temporary revival of modes of thought and feeling which were once part of the very life of the nation; a kind of blowing up of old embers, which is a very common phenomenon in history. Of this artificial revival, the modern Gothic architecture is part of the scenery; one of the "properties" of a very theatrical display. But it need not be used so. If instead of adopting the outer forms of the Mediæval buildings in the first instance, as we have mostly been doing in our churches, and fitting the use of the building to them, we begin at the other end, and, after considering the wants and requirements to be met, take suggestions from the Mediæval builders for their architectural treatment—hints to be worked out further, improved upon, adapted to the particular case in hand,—there is no reason why the study of Mediæval architecture should not exercise an influence in favour of, rather than adverse to, real originality. For originality consists quite as often in doing better, or in applying in some new manner what has been done before, than in absolutely creating a completely new form. We have instances among the works of modern architects,—not very numerous certainly,—in which this has been accomplished; in which we may see features and a mode of treatment clearly and ostensibly based on Mediæval models, and yet as clearly stamped with the modern designer's own individuality. And that designs so evolved may have a lasting and real artistic interest we may infer from comparing the results of a similar proceeding at another epoch in architectural history. We hold the Italian Renaissance to have been beset with serious, deep-lying faults and misconceptions, so far as architecture is concerned; but will any candid critic affirm that there is nothing in the designs, for instance, of Palladio and Sansorino—nothing in their working up and combining of classic details,—which has added to the domain of *inventive* design in architecture?

And it is in such consideration that we must find a reply to those who are inclined to look at engineering as the sole possibility in the present day. It has been suggested that the engineering works of this century are to us what the cathedrals were to the thirteenth century; that they may hereafter be studied as models, though

some may not suspect it now. There is a sort of basis for this idea in the fact (as we believe it to be) that few great things that have been done in the world have been recognised as great at the time of their being carried out. Presently the Mediæval architects had no idea that they were doing anything which would be the admiration of a future posterity, just as Shakespeare probably was not aware of the real value to mankind of the great dramas which he so carelessly giving to the world out of his superabundant treasury of intellectual wealth. But is it at all conceivable that at any future period any one would think it worth while to sketch, either en masse or in detail, the features of our principal engineering works, from more interest in them as beautiful and expressive objects? Can any lapse of time render the tubular bridge at the Menai Straits an object of pleasure to the eye? And in another point, too, the parallel scarcely holds good; for we should say the engineers of the present day have a very strong idea that they are doing great things, and make little concealment of their opinion on that point. The subject is recalled anew by the very suggestive paper "On the Progressive Use of Iron in Building," read at the Conference of Architects, and which we printed last week.

The opinion therein expressed, that the true architectural treatment of iron, is one which is frequently paraded in different quarters at present, and in which there is a certain degree of truth. But, like many other people who have got a new hobby, the advocates of this view override it a good deal. Mr. Aitchison thinks we had better have everything ugly, so long as it is our own. The alternative is not quite so desperate as that. We wish to have things that are beautiful and pleasant to look at around us, if possible; and when the writer of such a paper implies in one sentence that he can see no beauty in a Gothic capital (calling it a "course burlesquing of nature") and elsewhere finds admiration for so clumsy and bungling an artifice in building as the holding up of a long stone butel by concealed iron supports, we must conclude his "common sense" to be a little stronger than his artistic sense, and receive his observations on such points with caution. But there is a fallacy in the parallel drawn between stonework and ironwork in architecture, which seems to be oddly overlooked. Iron is not, like stone and timber, a purely natural material: it is one mechanically and chemically worked up to a condition for use in building. It is, therefore, under different conditions practically and architecturally; practically, because we do not really know how long it will last; and architecturally, because it can never combine with landscape as a stone or even a brick building will. If the Mediæval builders had been acquainted with iron, and roofed their cathedrals with it, it is probable that not one such roof would be left now: and on architectural grounds, the parallel between the cathedral vault and the railway station roof will not hold good, because it is evident that the builders of the former did look upon grandeur of effect as an object,—their buildings not being indeed utilitarian in a strict sense,—and it is certain that the designers or constructors of our railway-station roofs have no such aims. The point which might most reasonably be urged in favour of iron as the modern material, is that society is more changeable and mobile than formerly; that it may be more convenient to have comparatively temporary structures than vast piles made to last for generations. But even this argument, which would have a certain truth in it, we suspect would prove to be only very partially applicable. That iron is an important addition to our stock of building materials, and that there is an interesting problem for the modern architect in characterising architectural treatment of it, is, perfectly true. But why, because iron is discovered, stone should be any worse than before, we fail to see; and must label the dictum, which would call this the "iron age" of architecture, "not proven."

Another feature in the published report of the Conference proceedings, however, is suggestive; viz., the large space occupied by the purely practical papers, especially those dealing with treatment of new materials, and (on the whole, we must say) their superior interest and value. It is in the treatment of new practical requirements in general, and in the endeavour to bring these under the domain of architecture

properly so called, that the most interesting and fruitful problem for the modern architect may be said to lie. And most particularly this may be said in regard to town architecture. We are obliged to crowd together, in towns, for the needs of manufacture, of commercial as well as social intercourse. We have little less hideous, less depressing in aspect, without involving a disproportionate outlay; to render our private houses edifices pleasant and suggestive to look at, as well as comfortable to live in; these are points in which modern architecture with us has made but insufficient progress as yet, and in the course of endeavours to solve these the modern architect, if his interference be permitted, may find plenty of suggestion for novelty and originality of treatment. This kind of task, of course, seems prosaic, in comparison with the building of cathedrals, and yet it has its nobler side, too; and perhaps such humbler efforts, as they may seem now, would be as likely as any others to bring us to the "Golden Year," according to Tennyson's reading of it,—

"Old writers push'd the happy season back,
We forward,—circumers bold, for well I know
That unto him who works, and feels he works,
This same grand year is ever at the doors."

THE COAL QUESTION NOT ADVANCED.

VAGUE statements of contradictory opinions, illogical inferences from stated premises, blinking the main points at issue, and total failure to grasp the important question referred to them for inquiry, such are the salient features of the "Report of the Commissioners relating to Coal in the United Kingdom." It may be thought that it was from a dutiful wish to frame their language on the model of the very questionable English employed in the phraseology of the Commission itself, that the Commissioners have so successfully avoided the use of that terse, idiomatic, perspicuous style which would have been proper to a practical report on a subject of such deep national interest.

In fact, it can only be considered as a solemn mode of trifling to refer a question which should have been entrusted to the skilled investigation of a competent civil engineer, to the *diffident* hands of a Scottish duke and fourteen assessors. That respectable, even eminent, names are upon the Commission, there is no doubt. But what good service can the country expect from fragments of scientific or practical men bound up in tons of unorganised mass? "By snatches of time, now and then, from other duties," writes one, "I have got through my Coal Commission Report" (p. 71). "Preliminary estimates of the work to be done, and the cost incurred," writes another, "proved insufficient, both as regards time and cost." "I beg to record my earnest protest," are the words of the most eminent member of the Commission, "against the statement made in page xii. upon the probable existence of coal fields under the creeks and other secondary rocks in the South of England." Mr. Elliot disagrees with the introduction into the Report of the calculation by Professor Jevons, the only calculation, by-the-by, that has been verified by fact. Accord of any kind appears only to have been arrived at, by the careful suppression of any individual opinion, sage counsel, or practical issue of the five years' occupation of the Commissioners.

The Report commences with an elaborate statement of the mode in which the fifteen discordant Commissioners proceeded still further to pulverise their corporate existence by splitting themselves first into five, and then into seven, committees; the aptness of each of which for its task was insured by each of them having to leave to serve on any committee he pleased! It is true that the words follow, "in addition to that specially assigned to him." "The members chosen," it need not, therefore, surprise us to find, "proceeded, each on his own plan, to investigate." It is satisfactory to learn that, by the 9th of June, 1871, the work, which had been authorised on the 28th of June, 1866, "had so far advanced that the reporters held their first meeting," when they "forwarded a draft report upon twenty-three sub-reports." We wonder how long Isambard Brunel or Robert Stephenson would have taken, to draw up a report on this great engineering question, which really would have shed some light on the prospects of the future.

The object of the Commission, or rather what

ought to have been proposed as an object for the serious inquiry of a competent man, whose entire attention should have been exclusively given to the investigation, can only be inferentially arrived at, from the boggling language of the Commission, which the Commissioners quote at the head of their Report. That object ought to have been three-fold. First, to ascertain what quantity of coal exists in the United Kingdom, within practical limits of economical working, regard being had not only to absolute depth from surface, but to thickness of seam, and to mineralogical value of coal. Secondly, to state the actual consumption of coal, and to show, too, in what ratio, according to the statistics now attainable, that consumption may be expected to increase, regard being had to any increase in the cost of working. Thirdly, to point out the indications thus afforded of the probable diminution, increased cost, or even general arrest, of the coal supply of the future, and to indicate such improvements, engineering or legislative, as may seem called for to prevent waste, or in any other useful manner, to husband our supply.

There can be no doubt that a report that should reply to these questions, as intelligently and definitely as one of the great engineers, whose names we have mentioned, would have repaid to them, would have been a statistical paper worth some outlay of public money to obtain. How it is that no such report has been even attempted by this cumbersome and protracted Commission, it is for them to settle with those who appointed them. They appear, in fact, to have been instructed in the most slovenly manner, and to have by no means bettered their instructions by their mode of carrying them out. We speak, it must be understood, of the general Report, rather than of the more ship-shape details on which it is based.

The Commission, indeed, does call for a Report on the quantity of "coal which may be reasonably expected to be available for use." The mode in which this has been dealt with, is as follows:—"Doctor Sanderson,"—for it is characteristic of the Commission to hang their main assumptions on individual, and sometimes very slender, pegs,—states it to be his decided opinion that labour is not practicable in moist air of a temperature equal to that of the blood, namely, 98 degrees, excepting for very short intervals." It is unnecessary to say that we fully agree with Dr. Sanderson, although a reporter more familiar with the subject might have stated the facts in a more practical manner.

"The depth," the Commission continue, "at which the temperature of the earth would amount to blood-heat, is about 3,000 ft." We may remark that there is good reason (as admitted in a note) for calculating that this temperature, at which men cannot work, except for very short intervals, is attained at a depth of 2,690 ft., and that the pressure of damp heat upon the vital force is already considerable at 2,000 ft., a matter of not much commercial importance in reviewing the question of cost. A margin of 420 ft. in depth is, however, added by the reporters, in virtue of a difference of 7 degrees in temperature, between the heat of the working faces and that which they impart to the air. The evidence, however, reduces that difference from 7 degrees to 3 degrees. This is a question not only of efficiency of ventilation, and of the length to which the "long-wall system of working," which is credited with this advantage, is carried from the shaft, but of actual earth-temperature. A further depth of 580 ft., giving an additional rise in temperature of from 10 degrees to 11 degrees, and a corresponding amount of barometric pressure,—an element disregarded by the Report—is then allowed for "possible expedients which the future may elicit for reducing the temperature!" It is therefore "assumed that a depth of at least 4,000 ft. might be reached." At what cost is not inquired. That is to say, a theoretical addition of 1,310 ft., or of nearly 22 degrees Fahrenheit of temperature, beyond the depth at which, according to the evidence, men cannot work except for very short intervals, is "assumed" for the purpose of arriving at a round number of an agreeable magnitude. On this highly business-like and satisfactory assumption, the value of the labours of the Commission is made, in the first instance, to depend.

But we have not yet exhausted the assumption of Committee A. Even giving them their margin of 33 per cent. for contingencies, or for the possible outcome of lucky inventions, all carried to the credit side of the account, nothing is more certain than the fact, that a large proportion of

the coal, above the limit of practical working as far as depth is concerned, will never be brought to the surface. The Commissioners have, indeed, admitted this principle by limiting their calculations to beds of more than 12 in. in thickness. But it must be borne in mind, that with every fathom in depth, the great expense of opening a mine, the sinking of the main shaft, increases. The deeper the mine, the greater the area of the subjacent mineral that must be wrought from a single shaft, economy being duly considered. Without attempting to fix the inferior limit of the bed which may be thus economically wrought at a great depth, it is evident that 12 in. is ridiculously under the mark. Indeed, the bathymetrical limit must depend, in a great measure, on another element, entirely left out of sight by the Commissioners, namely, the mineralogical character of the coal. Between the total quantity of coal within 3,000 ft. or 4,000 ft. of the surface, and the total quantity of coal worth winning at these depths, there is an enormous difference. The Commissioners seem to think that if a spade is a spade, coal is coal. As to details of what every particular bed of coal is worth chemically, they evidently despise them. Have they not taken five years to make a report, such as it is? Would they not have required five-and-twenty years to frame such a report as we suggest? Let us be thankful for what we have got. If we are discontented, the Report has a word of comfort. "Every hypothesis must be speculative" (p. xvii.). Very true; but we hardly needed to go to a Cabinet Minister, and his colleagues, to be taught as much as that. In fact, a right acquaintance with the Greek tongue might lead any one to imagine that the phrase, though brief, is tautologous.

While thus the amount of coal practically likely to be worked is not even guessed at by the Report of this Commission, let us inquire how it fares with the second question, that which regards the probable future rate of consumption. Here, any one who looks at the Report with the admiration natural to ignorance, will say,—We have at least valuable matter! Here we have tables and diagrams, population curves, and decennial ratios! If the Commissioners do not know how much coal we have, they have at all events told us how long we shall be, before we expend that unknown "hypothetical" quantity.

Unfortunately, the same inability to make any practical use of the valuable information collected by the various committees, that characterises the Report under the first head, adheres to it consistently throughout. We are first told that 146,000 millions of tons of coal would last for 1,000 years, if burned at the rate of 146 millions a year; which profound arithmetical discovery is presented to us in two or three alternate shapes. A volume which was published in 1865 is then quoted, as giving an estimate that all our available coal will be exhausted in 110 years; and "yet another view" is placed before us, according to which, our supplies will last for "upwards of 1273 years." Between these rather wide limits, the Report leaves its readers to please themselves.

It does, however, although still with the same conscientious fear of incurring the responsibility of an opinion, detail an intermediate hypothesis, which it illustrates by tables and a diagram. Nothing can more strongly show, to any mind accustomed to deal with statistical information, the puerile character of the Report (as distinguished from the materials on which it is founded) than the selection of these hypothetical illustrations for prominent publication. The increase of the population of Great Britain in the decade 1811-21, was 1,971,416. In the decade 1861-71, the increase was 2,737,416. The first increase was at the rate of 15.977 per cent., and the second at the rate of 11.736 per cent. Thus, with a very rapid and augmenting actual increase, the rate of that increase, calculated on the numbers from which the comparison starts, in each instance, shows a diminution. It is assumed that this diminution in the rate of increase will continue; and a curve is drawn on that assumption, which arrives at an estimated population of 182,000,000 for the year A.D. 2231; to which date the exhaustion of our coal is considerably postponed, by this calculation. It is, however, left out of sight that while the rate of increase diminished from 1811 to 1841, this diminution began to disappear in the following decade; while from 1861 to 1871 the rate shows, instead of a diminution, an increase of nearly 5 per cent., or of 14 per cent. as compared with the lowest value. Any curve, then, that takes into account all the recorded

facts, will differ most materially from that proposed by the Commissioners. Indeed, the somewhat anomalous results of the seven censuses of the population, which form the element of the calculation, are such as to show, that we have as yet too few data to trace any course of probability, even for the next ten or twenty years. No serious and competent man, having his own reputation at stake, would have cared to give prominence to such a mere shot in the dark as the "Population Curve," lithographed by the Commissioners.

Connected with this totally imaginary curve, is a tabular estimate of the consumption of coal for the next four centuries, founded on the extraordinary assumption that, up to the year 1931, the consumption per head will slowly augment, but that from that date until the final exhaustion of the coal in 2231 A.D., it will remain an exactly determined and equal quantity. Really the public should not be called on to read what are called estimates, framed in such a manner as this!

We shall continue the subject in our next.

"HISTORY OF THE GOTHIC REVIVAL."

THERE was once a poet,—we will not here associate his name with his unfulfilled prophecy,—who wrote,—

"Doom'd to hide her banish'd head
For ever, Gothic architecture fled."

But did Gothic architecture ever fly this land? Notwithstanding all that has been said about the Revival of Gothic Architecture, we doubt whether it ever really died out. Every one knows there have been, for the last 200 years or more, edifices erected in accordance with the sympathies created by a study of Classic literature; and every one also knows that these do not, altogether, represent the work of those centuries. It would be, indeed, difficult to draw any line that would show so short a period as thirty years in which the most eminent architects did not design in the Gothic style. Inigo Jones has the credit of introducing Palladian architecture into England, but some of his Gothic designs in country mansions are of great interest. Sir Christopher Wren's Gothic was eclipsed by the proficiency he attained in the Classic mode of building, but not only were some of his earliest designs Gothic, but one of the last works of his long life, the steeple of St. Michael's, Cornhill, was also in that style. He died in 1723. In 1747 Walpole wrote to his friend Conway, that he had taken possession of his new purchase, Strawberry Hill. In 1749, Sir Hugh Smithson and the heiress of the ancient Percies were married, and in the succeeding years rebuilt a great part of Alnwick Castle in the Gothic style. "They are building at Northumberland House, at Sion, at Stanwick, at Alnwick, and Warkworth Castles," wrote Walpole to them, jeringly. And when the year 1796 came, the great octagonal tower of Font-hill Abbey, that was to be as high as a cathedral spire, was begun. In 1826 Sir Charles Barry built his church at Brighton; and in 1839 the first stone of the Houses of Parliament was laid. So that, in truth, Gothic and Classic architecture have existed side by side.

Mr. C. L. Eastlake, in the work before us*, gives an account of the events and circumstances that have led to the almost exclusive study of Gothic architecture, so that architects are found who are proud to say that they know nothing about any other, and do not think it worth while to look at an example of any other, even when it comes in their way. Mr. Eastlake shares our impression of the continuity, rather than decay and regeneration, of the Gothic style, by explaining that it is "an attempt to show how the taste for Medieval architecture, which lingered in England during the two last centuries, has since been encouraged and developed." A large feature of his book is a list of selected examples of Gothic buildings erected between the years 1824 and 1870; but he by no means limits his previous account to this period, for he begins with John Shute, and drops chronologically down past Inigo Jones, Wren, Holt, Batty Langley, Nash, Wyatt, and the rest, till he comes upon the men of our own time. We mention the list of selected examples, however, thus prominently because it appears to us to show the manner and measure of the author's bias, and of his knowledge of his subject. Some one

* "A History of the Gothic Revival." By Charles L. Eastlake, Architect. London: Longmans, Green, & Co. 1872.

remembered that even architectural critics, if possessed (however erroneously) with a strong conviction that an unsatisfactory building is going to be erected at immense expense, and that its erection will amount to a throwing away of the finest architectural opportunity of this generation, may think that they have grounds for opposing such erection, quite apart from any feelings which deserve to be called "virulent" or "malevolent." It is instructive, too, to be informed, on such good authority, what the "type of modern architecture" is, and that there is no mean between wild Mediaevalism and the New Post-office; but if the latter reference be meant for a fling at Mr. Fergusson, it is fair to remember that that gentleman has publicly and very clearly implied (though not feeling at liberty to make a direct statement) his non-complicity in that design, save in regard to some retouching and shaping.

Again, it would be a little rash to conclude that, because the *Daily News* can give no good reason for admiring Mr. Street's design, those who dislike it are necessarily in the same irrational predicament. We must protest, too, against the wholesale imputation thrown on the non-professional public by the statement that they are ready to "welcome" the termination of the dispute by the adoption of the present design, whatever its defects.

The English public know very little about architecture, certainly, but they (necessarily) know still less about this particular design, of which they have had but small means of judging; and to assert that they do not care what kind of building is put up in the metropolis, provided it answers its practical object, would be to infer that they are even more ignorant and indifferent about art than is really the case.

HAMMER-BEAM ROOFS.

At the meeting of the Architectural Association, held December 29th, 1871, a paper was read by Mr. W. White, F.S.A., on this subject, suggested for special consideration at a visit by some members of the Association to Eltham Palace a few months ago. The roof of the old hall, standing on walls dislocated by its action, might seem to discredit the principle of hammer-beam construction, if on examination it did not appear an instance of its imperfect application. The roof, although elegant in form and detail, is found to be very faulty compared with numbers of the other remaining specimens of its kind. The walls above the corbels are thrust outwards, and otherwise displaced; the framing of the principals has opened at the ridge, collars,—at most of the joints, in fact, of several of the trusses. The hammer-beams extend very slightly over the walls; the weight of the principal rafters descends within, instead of, as is usual, on the outer faces of the walls; on the depression of the end of the hammer-beams caused by subsidence at joints, rendered more largely by the flatness of the curved braces under the collars, the hammer braces have acted as powerful levers on the walls, submitting naturally to strange changes in their own forms at the same time. A combination of defects being found in this example. Mr. White considered carefully the various theories current as to the principles applied in these roofs. The idea that a system of equipoise was the aim of the constructors, though not unreasonable or entirely unsatisfactory, did not carry sufficient conviction to his mind to prevent him from considering that further investigation was necessary. His idea was, that trussing and tying, the intentional use of timber in a state of tension, were present in these combinations, as well as the more obvious and generally recognised corbelling and strutting. Dissecting the arrangement of the Westminster Hall roof, he found it probable that the great curved braces, assisted by the under-braces forming the trefoil, acted very frequently as ties, incapable of sagging or straightening, and thus of movement at their extremities. If this could be established,—with pendant pieces, principal rafters, and collar-beams in compression,—there would be found all the necessary parts of a true truss in the modern and customary sense; a construction in which the whole of the principal timbers are either pushed or drawn in the direction of their length. Though not in possession of a large amount of the kind of information required, only to be got by a minute examination of the joints of a number of roofs, in order to detect and appreciate the various halvings, tenoning, and

pinning, he thought he had found some confirmatory facts which would lead him to look still further into the matter; he, for his part, could hardly regard with ready acquiescence the statement often made that the course of Gothic roof construction in England "consisted in the substitution of frames of wood for arches and gables of stone, varying Mediaeval science from one material to another, and infusing into carpentry constructive principles that were previously the mason's own." The theory of equipoise, that might be summed up shortly as the balancing of the weight of the upper portion of the roof on the overhanging end of the hammer-beam against the weight of the lower portion on the other end of it pressed down by the principal rafter on the wall,—the top of the wall-pieces or pendant posts being a kind of fulcrum,—this theory supposes, almost of necessity, much forgetfulness by the old builders of the resistance of timber to tension. In view of the dignity and harmony with the masonic forms of large, grand architecture attained in the use of solid beams, of large scantlings,—dignity and harmony hardly possible with the use of more meagre scantlings nowadays; he was inclined to look for, what he thought he had found, viz., a not unscientific use of materials, a construction without parade of its triumph, but intentionally containing provision against the remotest as well as the immediate future. In the bulk,—considered as a new construction, we should now say the wasteful bulk,—of these timbers was lodged a reserve of power capable of being turned to new uses when slight failures, and perhaps varying conditions, altered the disposition of the strains. The roof of Westminster Hall, requiring only such maintenance as any building might be expected to call for after standing near upon 600 years, showed practically that the defects so readily seen at Eltham Palace Hall were not derived from the older example, which had within itself the means,—not of self-destruction, but of re-adaptation and of endurance.

The paper was illustrated by sketches and by many diagrams on the black board, which it would be necessary to reproduce in order to give in full what has been outlined above. The "Illustrations by H. Dunngay and C. Laver, of the Palace at Eltham, with Essay, &c., London, 1828," give the jointing of the roof with considerable care; though Mr. White thought he had detected a different treatment in some of the several principals. A discussion followed, and some opinions were expressed as to modern iron roofs, and their comparatively small chance of long endurance; the light rods used to provide against tensile strains have, it was stated, no reserve of strength to make them ready in case of new demands, in heavy gales, and other sudden changes of stress. Setting aside the inevitable, as it would seem, decay that will in no very long time demand the renewal of every iron structure, there are often other operating causes of disturbance, making one look with some satisfaction on the sober, simple construction, and the massive timbers, of the Gothic roofs. The lesson from the Eltham failure,—to give all cantilevers much solid bearing,—and other practical points, were dealt with; and the meeting separated with a vote of thanks to Mr. White, and wishes for a Happy New Year for all from the president.

NEW SYNAGOGUE FOR LIVERPOOL.

A new synagogue being required for the old Hebrew congregation, at present in Seel-street, a select competition was decided upon, and six architects were requested to furnish designs. Two of the invited architects declined to compete, and the remaining four accepted the invitation, namely, Messrs. Andsley, of Liverpool; Mr. Collins, of London; Mr. Grayson, of Liverpool; and Mr. Salomons, of Manchester. On Sunday, the 10th ult., by the votes of the free members of the congregation, the designs were reduced to two for further consideration; and ultimately the design by Messrs. W. & G. Andsley was selected to be carried out, and to Mr. Collins was awarded the second premium. The style of architecture adopted by Messrs. Andsley is Saracenic, treated with freedom. The building is to be executed in brick and stone, richly ornamented. The western front is in five graduated divisions, separated by octagonal and square turrets, terminating in domed canopies. A large doorway in the centre division gives admission to a vestibule, extending the whole

width of the building, and flanked with the staircases to the ladies' galleries.

The interior is spacious and lofty, and is divided into nave and aisles by columns and arches. The nave is covered with a vaulted ceiling, and the aisles by sloping panelled ceilings. The interior will be lighted by two orders of windows in the side walls, and a clearstory over the arches of the nave. At the east end of the building is placed the Ark, and behind it the choristers' gallery. The building is to be erected in Prince's-road, near the Church of St. Margaret.

EIGHT PLATES OF COAST SCENERY.

"COAST SCENERY."—the title seems to smell of the sea. It carries us off from dingy London to some daisy-carpeted southern down or northern link, looking out over bay or friar; from murky mid-winter, with the gas burning at noon, to the early autumn, with pater and mater-familias and their brood, rushing off north, south, east, and west, to the seaside, with that fondness for the water which is part of the nature of the city-people of Englishman.

The title above quoted indicates the presentation work, provided for the current year, for the members of the Art-Union of London, each of whom receives, for his guinea, besides the chance of a valuable prize in the general distribution, this series of impressions of eight steel plates, engraved from drawings by David Cox, Copley Fielding, and Samuel Prout.

It is only necessary to hear these names to be assured of the high quality of the works, and the originals have been worthily interpreted by the hurins of Mr. Willmore and his coadjutors.

We believe that that penchant for the sea we have noted will induce a great many people, who are only infants in art, to covet these plates; while the artistic quality of the work will tempt many who do not care much for the sea.

The views, though the same theme runs through them all, embody such different states of weather, &c., that monotony is satisfactorily avoided.

We have the calm summer evening, the setting sun lighting up the "Hulks," after Sam. Prout, which show the graceful sweep of line and careful touching in of detail in which he so delighted.

"Off Teignmouth," we have a short chopping sea, and the dark, driving clouds indicating rougher weather to come.

"At Beaumaris," while the sun still shines on the church and the houses along shore, the sea is getting rough, and the men in the boat are hastily getting down their mainsail.

In "Plymouth Sound," the contrast between the pitchy cloud in the background and the mainsail of the yawl and edge of the fortifications touched by the setting sun is exceedingly effective.

Taken as a whole, we do not think this Society has ever produced an annual work likely to please a larger number of people than the present. We cannot see that anything can be found in it to cavil at.

We notice from the return given in the report lately printed by the council, that in the last distribution the proportion of prizes was rather more than one to every twelve members, and we are mistaken if this year's issue, aided by the greater general prosperity of the country, does not greatly raise the proportion of prizes next April.

At a time like the present, when every institution, from Royalty to Bumblebee, is on its trial, and there is no title so sacred but that some one may be found with boldness enough to question it, it would be well for each one if it could show as good a *raison d'être*, as the Art-Union can, in pointing to such works as those now produced.

The New Library at Lincoln's-Inn.

For some time past the benchers of Lincoln's-inn have determined to appropriate some of the funds in their hands to the construction of a new wing to their library attached to the ball, which has of late years been found inadequate to accommodate the number of students who are in the habit of frequenting it. The design has now been carried out, and an additional building, 50 ft. in extent, is being rapidly constructed on the east side of the original structure, and immediately fronting the side of Vice-Chancellor Mahns's Court, which will produce a new building of nearly 110 ft. in length.

AGRICULTURAL PIPE DRAINAGE,
IN CONNECTION WITH ARTERIAL DRAINAGE AND
OUTFALLS.*

OUR president, in his opening address, at the commencement of the last session, kindly referred to my paper "On Arterial and Agricultural District Drainage" (vol. 1, p. 71, of the Transactions), and expressed a wish that our Institution should be put in possession of the details, both of the execution of pipe drainage and of its effects upon land.

Although the general results of drainage cannot but be well known to most of those to whom this is addressed, I venture to comply with the President's call, and will endeavour to place on record such information as I possess upon the subject.

Arterial drainage and outfalls are, as I have before stated, the leading works in all systems of land drainage, and to them I have paid particular attention as the means by which minor or subterranean drainage can be carried out safely, effectively, and permanently; but without a knowledge of the requirements of pipe drainage, arterial drainage cannot be properly designed and executed.

It may be remembered that in the paper referred to by our President, several methods are described by which arterial drainage can be accomplished, and it is shown that it must be dealt with in a scientific manner, and on an extensive and comprehensive scale, in order to prevent floods, to control the supply of water for all agricultural and social purposes, and to provide for the deep drainage of open ditches, and for pipe drainage.

Those who are familiar with this kind of draining, must have understood that the end of all pipe drainage, let the depths be what they may, is to keep the subsoil water at such a level as not to allow it to rise to the roots of the plants, injuring their growth by its coldness and non-fertilizing properties, and to render the soil above the pipes more friable and open, by making it moderately dry, and causing a circulation of air through it.

A very prevalent opinion existed that the sole use of pipe-drains was to take off to an outlet water which descended upon the surface of the land, as rain, or overflowed from springs, &c., and with many farmers this idea is still prominent, and they cannot understand that if drains are sunk in clay soils as deep as 4 ft., the drainage water will ever reach them, or the land ever be improved; and if left to themselves, they would not lay the drains deeper than 2 ft. or 2 ft. 6 in.

I have many times tried to convince them what is the source of the water, by showing it to them by trial holes dug in stiff clay, and asking them where they thought it came from, as there was no appearance of its having run down the holes from the surface of the land, or of its having percolated from the sides of the holes. I have shown them that it could only rise from the bottom; but in few instances only have I found that the conviction, even if arrived at, lasted very long. I have also shown them that, after a drain has been dug out to its proper depth, in a few hours water will gradually rise where there was none before.

Many instances are well known in which shallow drainage, say from 2 ft. to 2 ft. 6 in., has been taken up and the pipes roiled at depths of 4 ft. and upwards; and it is scarcely possible to believe that in the present day persons can be found who would practise shallow in preference to deep drainings. There have certainly been failures in deep draining, but these have arisen from imperfect work; either the pipes have not been laid in a true line in the drains, or proper attention has not been paid to the fall or inclination, or, more frequently, to the distance between each other at which the drains are laid.

When the soil between the drains has been rendered perfectly permeable, so that rain water sinks to the full depth of the drains, and the subsoil water rises up to their level, the work may be deemed to be satisfactory, as showing that the drains have not been placed too far apart, having regard to the depth in the particular soil which is being treated.

Many persons, being desirous of saving the cost of deep draining, have placed the drains closer together—with shallower depths; but it will be found that this system entails a greater cost and is not so efficient or durable. The

table, which will be found under the head of cost, shows the several rates per acre at various depths and widths apart.

The alternative, in case of a defect either from the pipes being laid at an insufficient depth, or too far apart, is to do the work over again or to allow it to remain a lasting disarrangement.

I will now proceed to direct your attention to the practical parts of the question, and will first deal with the nature of

Soils.—In laying out drainage the principal difficulty in determining both the depth and width apart of drains, is found in dealing with the different kinds of soils that are met with. The first question that naturally arises is,—what is the geological formation of the locality? and what is the inclination or dip of the strata? From the answers to these questions we are able to infer the existence or absence of permanent springs. Thus, for example, beds of gravel, sand, or other free soil, surrounded or underlain by beds of clay or other impervious strata, store up large bodies of water, which by slow percolation saturates the surface of the country. So that we can in such cases, by simple means and a small amount of work, free large areas of land from wetness. A knowledge of the soils may be gained by sinking trial holes, exceeding in depth the proposed drainage, or by boring to moderate depths.

The depth from the surface with which it is necessary to deal is really very small as compared with the great masses of material which make up any geological formation; but, nevertheless, it is highly necessary that the engineer should investigate every feature of the soil, the form of the land, its inclinations and produce, in order that he may be able to lay out the work to be executed both efficiently and economically, as well as in the manner best suited for the future improvement of the land. Soils may be classed in two grand divisions—clays and free soils, and it is these we have to deal with; but it must be remembered that each of them admits of several subdivisions, and in both cases rock may be mixed with them.

Depths of Drains.—In all cases in which loans of money are made by the drainage commissioners under the powers of their Acts, the Inclosure Commissioners, who sanction the charge upon property for the repayment of the loans, require 4 ft. to be the minimum depth of pipe drainage, and experience has fully confirmed the good effects of this rule, after several years' practice. This minimum depth has been fixed after mature deliberation; but it ought not to be imperatively insisted upon in every kind of soil or under all the varying conditions of land.

One constantly meets with the objection that water cannot get down through thick clay, and that it is useless to go so deep as 4 ft.; but our experience teaches us that the soil, having become more loosened and opened by cracks, admits the permeation of water to that depth at least; the very worm-holes permit the water to percolate, and after it has once found its way, by gravity, through the soil, by innumerable small passages, it never ceases, year after year, to continue the same course, until the whole depth, from the causes before cited, namely, the prevention of the capillary attraction upwards of ungenial water, the admission of air by the pipes, and the gradual filtering of rain from above,—is totally changed in character from that of an obdurate and untractable soil to that of a more genial plant-producing one.

The same effects are produced both in arable and pasture lands, but the system to be adopted in draining them is somewhat different. I have hitherto endeavoured to prove that there is a certain minimum depth at which pipe drainage is capable of producing the best results, more particularly when applied to stiff clay.

Distances apart.—I think a general rule might be established to determine, in connexion with the depths, the distances at which the drains should be placed apart from each other, and that is that the width should be a multiple of the depth: for instance, 4-ft. drains may be 16, 20, 24, 28, 32, 36, or 40 ft. apart, the depth being first found at which the level of the water-beds stands beneath the surface. We must then judge, from the nature of the soil, whether it will allow of the water finding its way, for half of any of the above widths, to the pipes, always bearing in mind that water will find its way most quickly to a vacuum or the point of least resistance. Take, again, any soil in which it may be found that the water level stands at 5 ft. deep, the multiples may be 40, 45, 50, 55, or 60 ft.; and so with 6-ft. drains, the widths may

be 60, 66, 72, 78, 84, or 90 ft. The drainer's judgment and experience will enable him to determine at which of these widths the particular soil which he finds will act best, remembering again that each line of pipes, *i.e.*, member again, only influences half the distance between it and the next one on either side of it.

The depths of pipe drains can be determined (as we have already seen) by many conditions of the soil and of the water-beds as they are found in the land; but the determination of the widths at which the drains should be laid apart requires much practical knowledge of the nature of different soils, especially as regards the facility with which they allow water to percolate through them, the object being to drain arable land sufficiently, while not overdraining grass land. The expense is lessened considerably when great widths can be attained, even at an additional depth. The rate I have before referred to as the measure of the width would still require the judgment of the drainer to decide what soils will be properly drained by any of those distances apart.

Inclinations or Slopes of Drains.—Owing to the constantly varying slopes of the country, scarcely any rule can be absolutely laid down for the inclinations at which the pipes should be laid. The greatest attention is required in laying the main pipes, into which the smaller branch pipes run. In flat countries they should always be set out with the spirit-level, and the depths from the surface given to the men at every one or two chains along the line. Water will run freely at inclinations of 1 ft. fall to 1,000 ft., 2,000 ft., or 3,000 ft. of length, where the pipes are well laid; but it must be observed that at every junction of a branch pipe the flow will be impeded in the main pipe by the water entering from the branch pipe, sometimes running with considerable velocity. So that as much inclination as possible should be given to the mains, in order that the hydraulic pressure may force the current towards the outlet. The inclinations of the minor or branch pipes must necessarily be controlled by the natural slopes of the ground. In a general system, laid out on a definite plan, it is better to have as few outlets as possible, and I need hardly say that all the minor or branch pipe-drains ought, at their lowest ends, to be united or joined up to one main pipe of such larger dimensions as may be proportioned to, and capable of discharging, the water from a given area of land; these larger pipes being conducted to the lowest extremity of the area to be drained, and there discharged into an open drain or stream.

The cost of long lengths of large pipes, increasing in size as they go, raises a question as to the expediency of using them, but the work is easier to maintain than when a large number of outlets is used.

I have frequently found it most useful, in laying both large and small pipes, where the bottoms of drains are in soft boggy, or sandy soils, and there is every probability of the pipes sinking or getting out of their proper inclination, to lay them on strips of wood cut into three planks of elm, or other timber as durables in water, from $\frac{1}{2}$ in. to $\frac{3}{4}$ in. thick. The cost is very trifling, and is as nothing compared to that of having to re-open and relay the drains, while doubt of the success of the work is thereby to a great extent avoided.

Outlets.—The pipe at the outlet or head should be raised above the ditch or stream, which should be cleared, and, if required, deepened for some distance, so as to ensure the water not being backed up into the pipes. I have adopted self-acting iron traps at the outlets, in cases where the tide has occasionally risen against them; but the chief object was to prevent the mud, of which there is generally a large quantity in tidal waters, from being taken up the pipes, and there left to deposit itself. All outlets should be protected by brick or stonework, set in mortar or cement, the foundations being sunk from 1 ft. to 2 ft. under the bottom of the ditch or stream, which should be paved to receive the water from the pipe.

Referring again to the depths of the drains, it is frequently necessary to lay the main drains 6 ft., 7 ft., 8 ft., or even 10 ft. deep in places, in order to drain land to an outfall, which lies at too low a level to allow of the ordinary depths being employed.

Sizes of Pipes for certain Areas.—In all engineering questions relating to the flow of water through pipes, there are fixed rules for ascertaining the quantity discharged, when running full, according to the size of the pipes, their

* By Mr. Richard Boxall Grantham, C.E. Read at the Ordinary General Meeting of the Institution of Surveyors, December 18th, 1871, Mr. Edmund James Smith (member) in the chair.

inclinations, and head or pressure above the point of entrance of the water into the pipe. But in the case of pipes in land drainage, which are not as a continuous tube, no rule can be applied to measure the quantity that flows, so as to adapt the sizes of the pipes to the particular cases in which they are employed, because the quantity of water which is taken in is very uncertain, and in some cases most irregular, and the inclinations vary at every change of surface, so that in some parts of the same pipe the velocity is very great, and at others very small. It is seldom found that the same amount of water is discharged out of any two pipes in the same field, and this is frequently the case even when they are side by side. The quantity of water varies very considerably under the different conditions of soils in which the pipes are laid; for instance, in free soils with springs, and in times of much rain, which penetrates quickly, all the pipes will run full, and likewise, at times, in free soils with rain alone. In free soils the percolation of water in suspension through the soil being slow, and rain water also descending slowly, the pipes are not overcharged; besides, in such soils, the pipes are at more frequent intervals, and would, if the water came as rapidly as from the free soils, discharge it more easily. In the early period of land drainage, pipes of 1 in. diameter were commonly used, but they were not continued for any length of time, and they were seldom if ever sunk in the ground deeper than 2 ft. or 2 ft. 6 in. Pipes of 1 1/2 in. diameter succeeded them, and, more recently, 2-in. pipes have been almost universally adopted for the branch drains. There was also the horse-shoe pipe, laid on the tile as a sole; but these have totally failed and become obsolete. The adoption of 2-in. pipes, the area of which is 3-14 square inches, has been a great improvement, inasmuch as, besides being in nearly all cases large enough for the water to run out, they allow the air to pass up when they are not full, as before described, and thus anchorate the condition of the soil above and around them. No single rule can apply as to size; but, as regards the sizes of main pipes, into which the minor pipes discharge, some attention is required to regulate them, and, if possible, their inclinations. In these cases, however, it would be impossible to fix the sizes by the ordinary rules of engineering; so that it is necessary to resort to experience, aided by a few approximations which serve somewhat as guides. These main pipes vary from 3 in. up to 12 in., and 2 ft. in diameter, in proportion to the area which will discharge into them, and the inclinations at which they are laid. The following table gives the approximate sizes of pipes for soils of maximum density and lightness:—

Diameter of Pipe.	Area of Pipe.	Area Drained.	
		In Clay Soils	In Free Soils.
Inches.	Square Fathes.	Acres.	Acres.
3	7-66	1 1/2 to 5	3
4	12-56	9	6 1/2 to 7
5	19-50	16	13 1/2 to 14
6	28-08	25	20 1/2 to 22
7	38-22	35	30
8	49-92	46	40
9	63-18	60	50
10	78-90	75	60
11	94-38	91	70
12	112-38	109	80

The several degrees of porosity of soils between the extremes, must be treated as experience may dictate, and the inclination at which the drains are laid will affect the question; for instance, a rapid fall of the branch pipes into the main pipe would necessarily require that the latter should be increased in size; but a slow discharge does not require larger pipes than those given in the table.

Directions of Drains.—In ordinary-sized fields it is convenient, and in no way interferes with the efficiency of pipe-drainage, to lay out the minor drains in each field exclusively for that field, but to connect them with a main drain, which may be laid so as to take the water from several fields to a distant outlet. In uniform soils, whether dense or free, the usual practice is to lay drains parallel to each other, on what is commonly called the *gridiron system*. In stiff clays, where the drains are more frequent, this plan is undoubtedly to be preferred, for the reasons before stated,—that the water may be equally drawn off from all parts, and the land uniformly aerated. In free soils, such as gravel, sand, and the like, where there are springs which rise to the surface, and are visibly saturating large or small areas, the drains may be run in

such directions as will enable them to tap those places, and ultimately to drain a larger area.

Deep as drainage may be laid, it is never altogether free from the possibility of being put out of order by the roots of trees or of certain kinds of crops which may penetrate the drains, and form a hindrance to the free passage of the water through them. The roots of the elm, ash, willow, and other trees are known to enter the pipes, and even pass through the ground for several yards to reach them, as if they were attracted by the moisture and air which they find in the pipes, and by the nourishment afforded them there. To obviate this difficulty, it is advisable, where it occurs or is apprehended, to use socket-pipes jointed with cement, or to lay the pipes as far as possible from the trees. I have found that embedding the pipes in lime, mortar, or concrete has prevented them from being choked, although close to trees which it was impossible to avoid, and has kept them clear for some years. The roots of some crops, such as wheat, turnips, carrots, mangold, &c., if they should penetrate the pipes, die away when the crops are removed, and are frequently washed out of the mouths of the drains by the strong flow of water through them. Other substances give the drainer a vast amount of trouble in obstructing pipes. Ochreous water, depositing oxide of iron, is a common source of obstruction. It appears to harden and consolidate as it receives air through the pipes, and ultimately chokes them. I have found it best to get at the source of the spring or springs, and conduct the water away by large pipes independent of the general system. Ferrous and parasitic plants will also get into the pipes, grow, and ultimately stop the flow of water through them. Another source of trouble is the percolation of sand into the pipes, which necessitates patience and care in taking them up, frequently after being first laid and relaid, until all the water has run out of the bed, and then laying them in straw and on strips of wool.

Pen land draining is one of those exceptional cases where great skill and attention are required. In an instance with which I am acquainted, some fen pasture-land that was letting at from 2s. to 3s. an acre, was drained and broken up, but it produced scarcely any crops. It was too closely drained, and some lime champed before it even partially recovered from the effects.

Mr. Clutton, in his paper on "The Cost of Conversion of Forest and Woodland into Cultivated Land," having alluded to the drainage which was carried out at Hainault and Shroob Walk, has drawn my attention to draining under those circumstances. I will just state that in the former case, although some pains were taken to grub up the roots of the oaks and hornbeams with the trees, we constantly met with them in the drains, and they were either taken out or cut through. Some of the roots in the light soils, in the southern part of the forest, were found deep in the ground.

At Shroob Walk, where the soil was almost entirely a uniformly stiff clay, we had not so much difficulty arising from this source, but in both cases the cost of draining was thereby increased, and this applies also to the land containing briars and underwood only. Could the draining have been delayed for a year or two, the roots would have nearly all rotted off.

Draining through rocky ground is very expensive, but, as in most rocks water either lies above the beds or below them, it frequently taps a large area of land, and where the rock projects out on the face of a sloping country, which it frequently does, it holds up the water in the land above it, so that one or two drains carried through it let free a large quantity of water, and the land will be permanently drained. The most obdurate rocks are those found in the high land of the old red sandstone, the lias, those of the coal measures, and others. This stone may be used for the farms or public roads, and this will very much relieve the expense of getting it out of the drains.

Cost.—The most material consideration resulting from all the experience of soils, depths, widths apart, inclinations, directions of drains, and sizes of pipes, is the minimum cost at which the work can be done, so as to obtain the best result in permanently improving the land. This must vary in different parts of the kingdom, according to the soil, the rate and quality of the labour for this kind of work, the seasons, and the price, quality, and cost of carriage of the pipes. Sometimes the cheapness of one or two of these items will counteract the dearthness

of the others, so that something like an average may be arrived at.

I have kept a register for some years past, which shows the rate of cost per acre and per rod of drainage works, executed under my supervision in localities distributed over a large part of the kingdom. This summary includes about 120 distinct works, representing every variety of soil and every degree of difficulty, ranging in quantity from 10 acres to 1,900 acres. The rates of cost extend from 3l. 6s. 8d. to 9l. 5s. 4d. per acre, and from 11 pence to 36 pence per rod, whilst the number of rods of drains to the acre varies from 39 to 115. The following are the results shown by this record up to the end of last season:—

Total Quantity Drained.	Total Number of Rods Cut.	Rods of Drains per Acre.	Total Cost.	Cost per Acre.	Cost per Rod.
A. B. P.	No.	No.	£. s. d.	£. s. d.	£. s. d.
15,006 2 16	1,136,219	75-7	90,284 12 10 6	6 0 3	10 7 0

It should be stated that these figures include the large and exceptional work of drainage of disafforested land at Hainault, the 1,900 acres of which cost upwards of 8l. per acre, and averaged about 105 rods of drains to the acre, the widths apart varying from 18 ft. to 60 ft. according to soil.

Where the rate per rod is high, the rate per acre may be low, and *vice versa*. This necessarily arises from the nature of the soils, the prices of the pipes, and the widths of the drains apart, with other varying circumstances before referred to.

I have arranged the following table, which gives the general prices of work under the various conditions:—

Ordinary Cost of Cutting and Filling Minor Drains, using 2-in. Pipes, at say, 25s. per 1,000.

Depth.	Rate per Rod for Cutting and Filling.		Rate per Rod for Pipes.		Total.
	s. d.	s. d.	s. d.	s. d.	
4 feet	0 8	0 5	1 1	1 1	
5 "	0 10	0 5	1 5	1 3	
6 "	1 1	0 5	1 6	1 6	

Cost of Main Pipes per Rod.

Size.	Price per 1,000.		Rate per Rod.
	£. s. d.	s. d.	
3 in.	1 15 0	0 7	
4 "	3 0 0	1 0	
5 "	4 10 0	1 6	
6 "	6 0 0	2 0	
7 "	8 0 0	2 8	
8 "	10 0 0	3 4	

Cost per Acre of Cutting and Filling, including Pipes at various Depths, and Distances apart.

Depth of Drains.	Distances apart.		Cost per Acre.
	Feet.	Feet.	
1	16	£. s. d.	
"	20	8 18 5	
"	24	7 3 0	
"	28	5 19 2	
"	32	5 1 10	
"	36	4 9 4	
"	40	3 19 5	
"	44	3 11 6	
"	48	3 5 0	
"	50	2 19 7	
"	55	4 10 1	
"	60	4 14 1	
"	65	4 2 6	
"	70	3 13 4	
"	75	3 6 3	
"	80	2 15 0	
"	85	2 11 3	
"	90	4 11 6	
"	95	4 2 6	
"	100	3 13 6	
"	105	3 6 0	
"	110	3 0 0	
"	115	2 14 9	
"	120	2 11 0	

To these rates should be added from 12s. to 15s. per acre for turfing, building up outlet heads, deepening and widening outfall drains, foreman's wages, superintendence, &c.

The cost of cutting through rock must always be exceptional, and no rule can be given for that kind of work.

Duration of Pipe Drainage.—Another question which deserves much consideration and attention is that of the duration of pipe drainage, and its continuously effective working. These properties depend almost entirely on the manufacture of the pipes, which are buried deep, and cannot be got at to be repaired without some expense, and which, when out of order, are

always liable to be neglected or repaired in an inefficient manner.

Where all the work has been well done, drainage executed thirty years ago is known to be in an efficient condition, although pipes were not then so deeply laid as they are now, and it may be fully expected that the deeper they are laid the less liable they will be to be injured or disturbed: a strong argument in favour of deep draining.

In conclusion, I have to make a few general observations on points which ought to be attended to in laying out and executing this kind of drainage, whether on a large or small scale. Like many other matters, drainage, when dealt with wholesale, can be done at less cost, and more efficiently. When an estate is to be drained, a comprehensive scheme should be at first determined upon, and taken in hand as a whole, whether the work is to be carried out all at once or to be extended over two or more seasons.

As to the manufacture of pipes—great variety exists in the cost, the localities in which they are manufactured, and in the quality. There is of late years a great improvement in the make of them. The cost in the yard, in different parts of the country, varies from 14s. to 25s. per 1,000, for 2-in. pipes, the 78 per cent. of difference partly arising from the quantity a manufacturer can make, owing to the facilities he has, and the nature of the clay, and partly from the price of fuel, or the amount of capital he can command. The carriage frequently very much increases the expense,—adding, in some cases, 50 per cent. to the first cost. The larger sized pipes increase in cost in greater ratio than the difference of the sizes, and the carriage also is greater in proportion, owing to increased thickness.

On an estate, where a large work is to be carried out, and where, probably, bricks are required for farm buildings and cottages, it is much more convenient to establish a pipe and brick yard upon it, provided proper clay can be procured, and a navigation or a railway affords the means of bringing coals.

Another important matter, upon which the successful result of pipe drainage mainly depends, is the superintendence. You want a man who not only can lay the pipes in a trench, but he must be of strict integrity, seeing that the trench is cut to fit the size of pipe, and with a proper fall, so that the waters shall always run clear away, and that every pipe is laid perfectly true in line, and so joined to its neighbour that neither loses any of its area by the ends not fitting truly and closely to each other. The foreman should watch closely that no bad (that is, unburnt) pipes are laid, as they will inevitably perish in time, and destroy the whole work. Men who are trained to the work become so skilled in laying out the direction of the drains that they can judge with tolerable accuracy the amount of fall in any distance, and the inclination at which the pipes should be laid. Of course in very flat countries the spirit-level must be brought to their assistance. The men who become the best skilled in digging the trenches make good wages; and I have always found that the workman who makes the best work earns the most money, and does the work most quickly. I would rather employ men who earn from 20s. to 23s. per week than those who can earn only 15s. or 16s.; but, of course, in a gang, all the men are not required for the most difficult and skilful part of the work. Farm bailiffs, who have other work to attend to, ought never to be employed to superintend drainage, as it requires the whole attention of the foreman to conduct a work cheaply and securely, and it is only men who are specially trained who can properly superintend it. There should not be larger bodies of men than from thirty to forty under one man's charge.

Another practice should be condemned by all who are interested in the success of these works, and that is that of giving pipes to tenants to lay themselves. Such work is never well done, and is just so much money thrown away.

All the drains ought to be laid down on the estate or other map so as to be referred to afterwards to find the outlets, and in case of extension to be able to add to the original work.

There is another matter connected with land drainage which must claim serious attention, and requires more than ordinary skill and judgment, *i.e.*, under-draining land to be made into sewage farms. I drained Breton's farm at Ronford, and after two years' working, it has answered well,—that is, the effluent water is, I

believe, superior to that coming from any other sewage farm. It is in a porous soil, and so is that near Merthyr Tydvil, which was drained by Mr. Bailey Denton. We have not yet had sufficient experience of the best mode of treating such cases, especially in clay, loamy, or rocky lands.

I hope to be able to give the Institution some information hereafter on this branch of the subject.

A long discussion ensued, which was adjourned to the next meeting, Monday, January 13th.

EXPERIMENTS ON THE STRENGTH OF MATERIALS.

DOLLING FREESTONE.

This result of some experiments on Dolling Freestone, from the quarries of Mr. C. Trask, have been made by Mr. Kirkally. It may be useful to record the results in our pages. The experiments were tried on eight beds and heights of stone to ascertain the resistance to a gradually increased thrusting stress, each stone being bedded against pieces of pine $\frac{1}{2}$ in. thick:—

Tested "against" the Bed.

6'04" x 6'05" = 36'54 super., height 6 in.—Cracked slightly with 75,240 lb., or 2,097 lb. per square inch. Crushed: 89,180 lb., or 2,411 lb. per square inch.

6'04" x 6'02" = 36'36 super., height 12 in.—Crushed: 79,620 lb., or 2,189 lb. per square inch.

6'03" x 6'02" = 36'30 super., height 18 in.—Crushed: 70,870 lb., or 1,952 lb. per square inch.

5'98" x 6'00" = 35'88 super., height 24 in.—Cracked slightly with 62,270 lb., or 1,735 lb. per square inch. Crushed: 65,890 lb., or 1,836 lb. per square inch.

Tested "on" the Bed.

5'98" x 6'00" = 35'88 super., height 6 in.—Crushed: 89,380 lb., or 2,490 lb. per square inch.

6'07" x 6'08" = 36'91 super., height 12 in.—Cracked slightly with 69,210 lb., or 1,876 lb. per square inch. Crushed: 83,620 lb., or 2,265 lb. per square inch.

6'08" x 6'04" = 36'72 super., height 18 in.—Cracked slightly with 72,770 lb., or 1,982 lb. per square inch. Crushed: 79,850 lb., or 2,174 lb. per square inch.

6'04" x 6'06" = 36'60 super., height 24 in.—Crushed: 77,040 lb., or 2,103 lb. per square inch.

SACRISTIES.

ST. GEREON'S CHURCH, COLOGNE.

ANY person who has compared the arrangement of our ancient English churches with the same class of building on the Continent, must have noticed the fact, that while on the Continent the sacristy always forms an important feature, and is frequently of large size, in England it is nearly always a small (not to say mean) building, and in most of our churches does not exist at all. Now, there is considerable difficulty in accounting for this difference in ecclesiastical arrangement, because the varieties of rubrics and rites were not sufficient to explain such a discrepancy. Some have supposed that in England the sacristy was formed by portions of the church being screened off for that purpose, and probably this was the case in some of our village churches, where to this day the lower part of the tower is still used for that purpose, though of course this most inconvenient arrangement could not have existed in the larger and more important churches. It has also been suggested that the great length noticeable in the chancels of some of our churches is to be accounted for by the fact that the altar did not stand against the east wall, but was placed one bay from the east end, and the space behind it was used as a sacristy; and there is much to favour this supposition; for, in the first place, where ancient sacristies do exist in this country, they are very frequently found built out at the east end of the church; secondly, the general arrangement of the great reredoses in our cathedrals and abbey churches, with doorways on either side of the altar, would seem to suggest such position for the sacristy; and it is quite evident that at Meopham, in Kent, and Tideswell, in Derbyshire, the sacristy was formed in the eastern bay of the chancel, which was cut off by a stone reredos, marks of which still exist in both churches. Even, however, if this were the case, the sacristies so formed must have been

exceedingly small. At first sight, this smallness of the sacristy would seem to point to great simplicity of rubric; but this is contradicted by the great size of the chancels in most of our churches, and their elaborate fittings, even if there were no historical evidence to prove that before the Reformation the English ritual was gorgeous in the extreme. Some people have asserted that in England, as a rule, the priest vested at the altar, and that the "parvise" was used for keeping the vestments, sacred vessels, &c.; but we can find no authority whatever for this assertion, and even supposing it to have been true that the priest vested at the altar, it is scarcely possible to conceive that his assistants did the same thing, or that the choir took off their cloaks and put on their cassocks and surplices in the chancel of the church. We confess that we are still at a loss to account for this peculiarity in English ecclesiology, and the suggestions which have from time to time been made upon the subject seem only to involve it in a deeper mystery.

Of the sacristies which do exist in this country, perhaps the most perfect are those of York Minster. However, even these are small and unpretending, and seem quite out of keeping with such an immense cathedral. The most beautiful buildings of this description existing in this country, are the sacristies of Wimborne Minster, Dorset, and Laton Church, Bedfordshire. The latter is a singularly beautiful example, and although rather small, is a costly building. It is vaulted with stone, and the roof supported upon a central column. Two sacristies exist at St. Peter's, Maneroff, Norwich, one above the other; both are at the east end, and occupy the usual position of the lady-chapel in large churches. Similar sacristies exist at the churches of Lavenham, St. Peter-per-Mountergate, Norwich, and Allhallows Church, Barking. The sacristy of the latter was rebuilt during the last century, but occupies the site of the ancient one. Good examples of ancient sacristies are to be seen at the churches at Margate, Rotherham, Hillesdon, and St. Mary, Oxford.

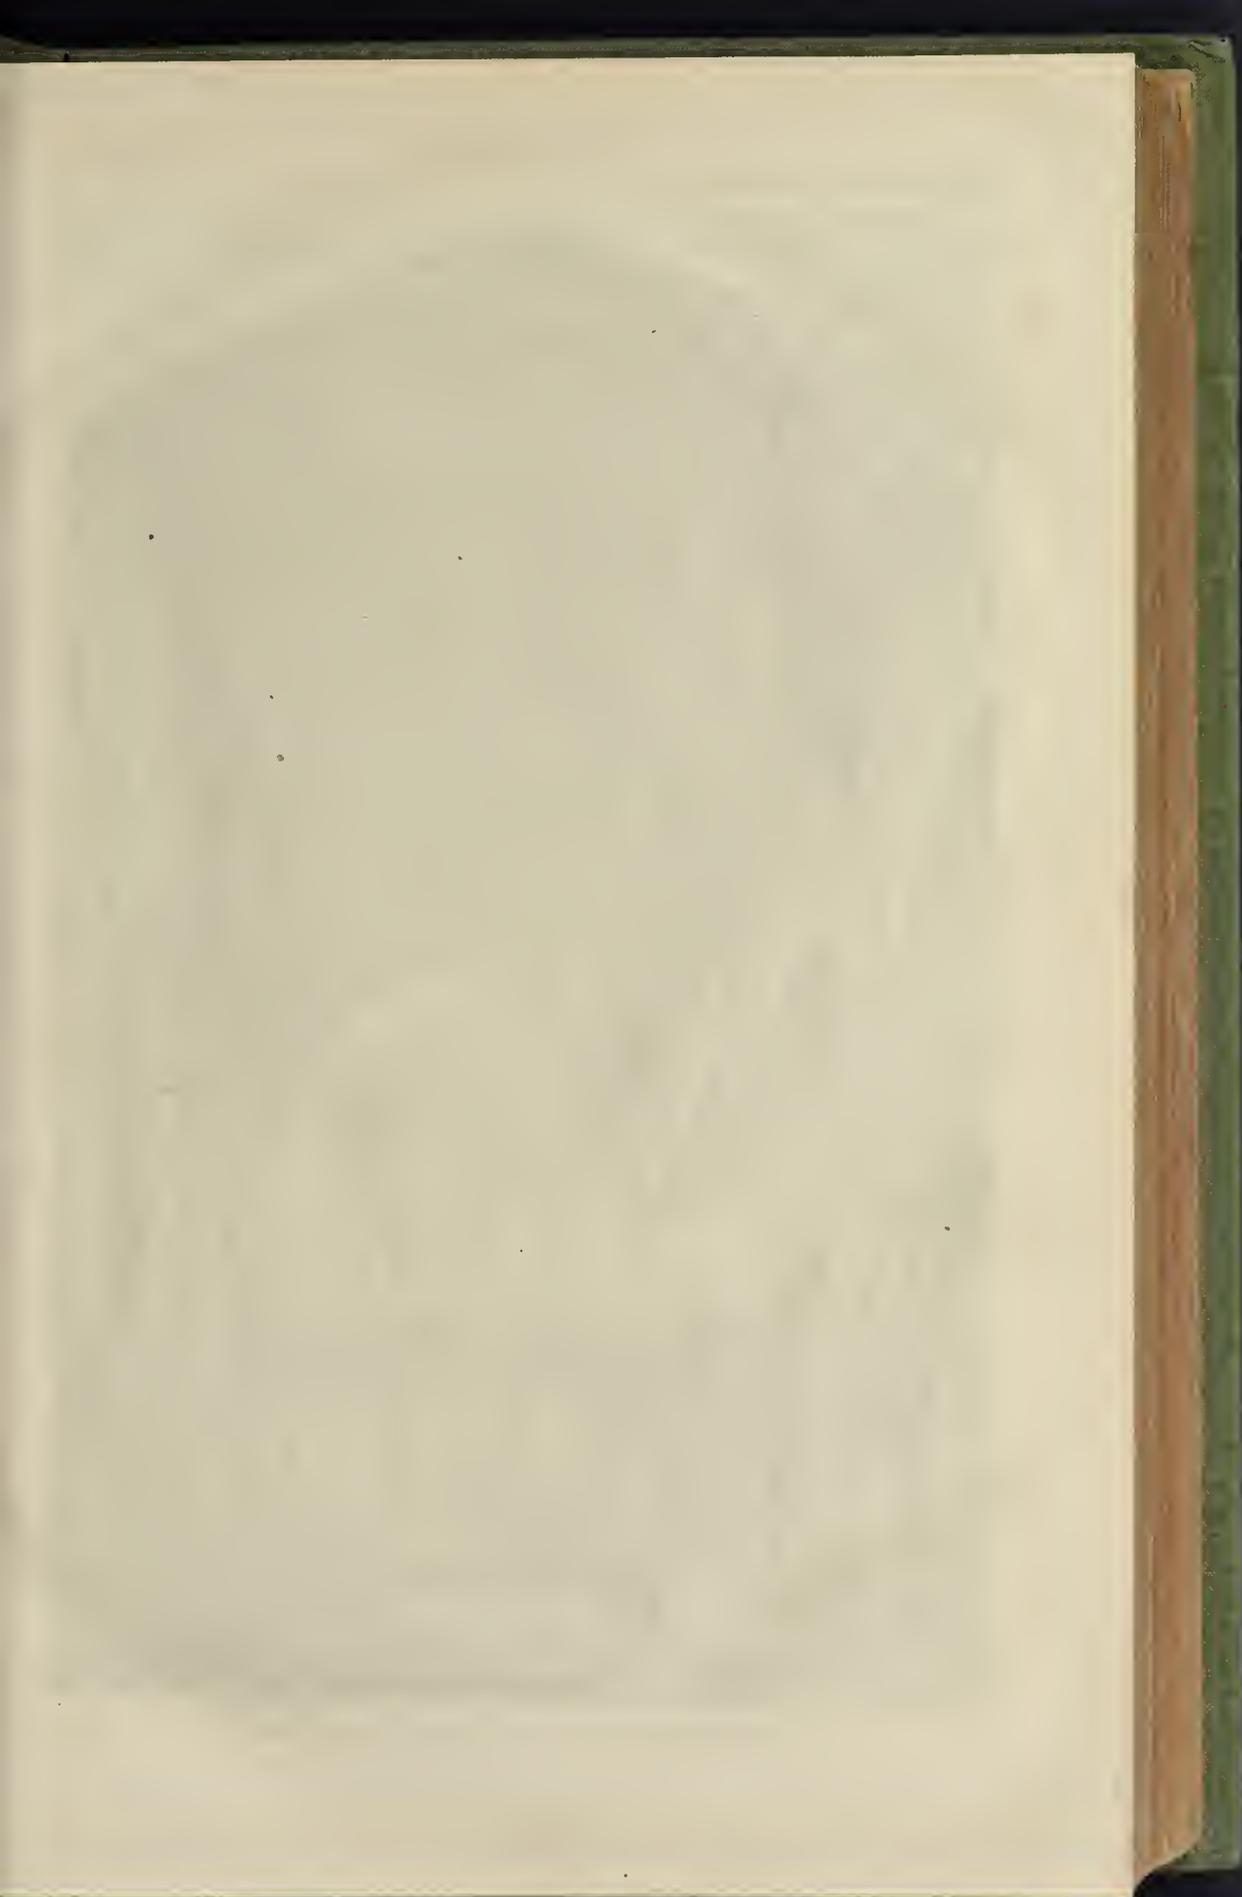

On the Continent, and especially in Germany and Italy, the sacristy is always an important feature. The example we give from the Church of St. Gereon, in Cologne, is a noble example, and is interesting from the fact of its containing a considerable amount of its ancient furniture; for instance, the altar, several aumbryns, the sink, &c. The rest of the furniture, though of the seventeenth century, is costly and handsome. The windows are filled with superb ancient glass, and, as will be seen from our engraving, the whole building is of a rich but very pure fourteenth-century style, singularly English in appearance, and quite free from that wiryness which is the defect of so many German buildings of this date.

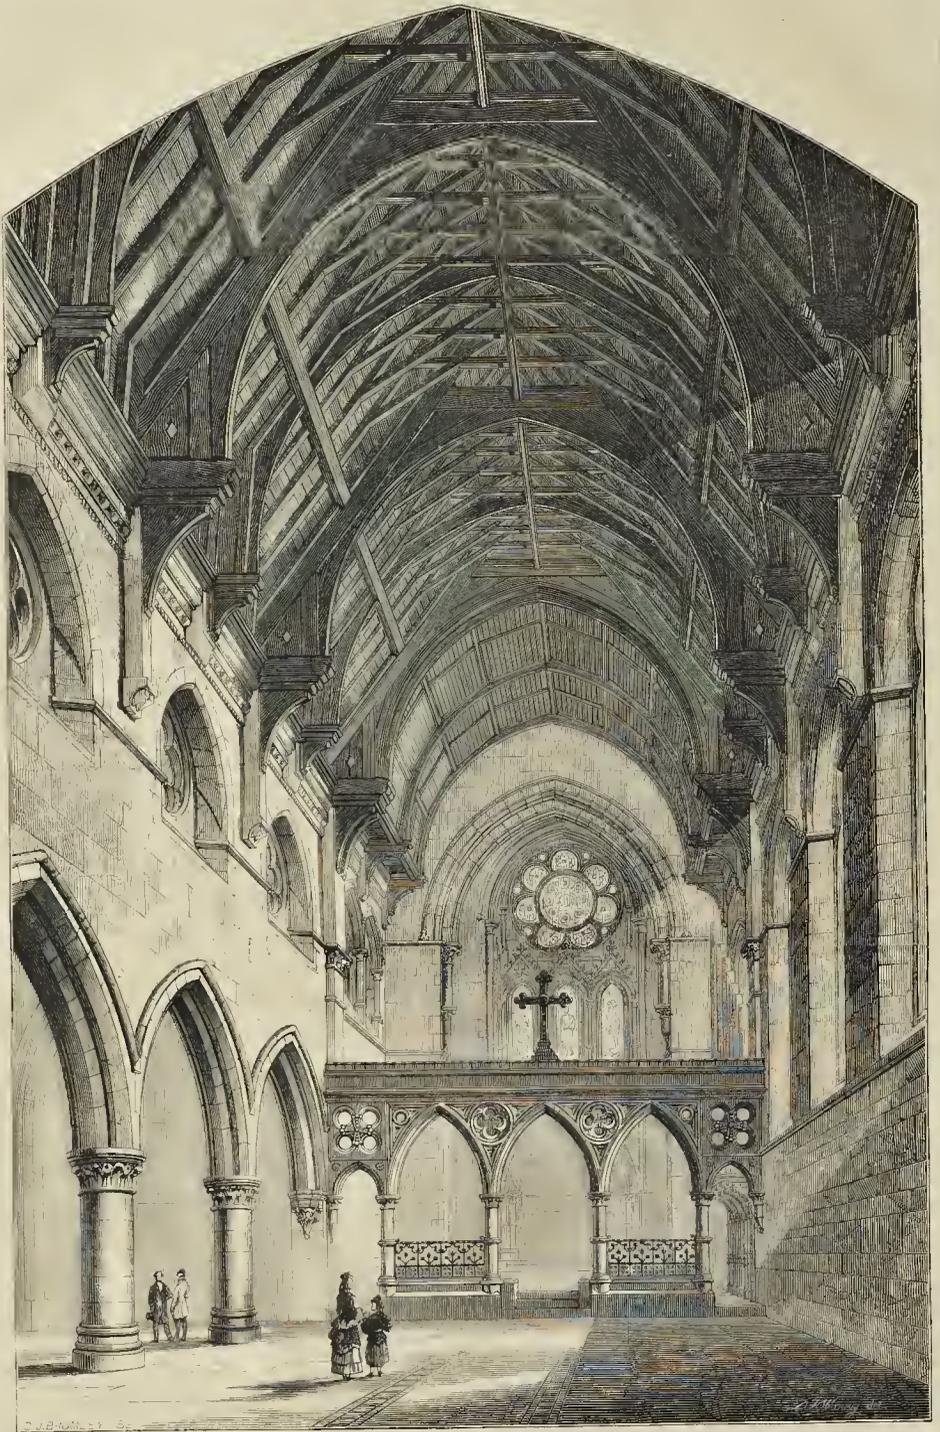

Remarkably beautiful examples are the sacristies of the Cathedral of Cologne; they are internally the most beautiful portions of the whole building, especially the outer sacristy, which consists of a square building, with its vaulting supported upon a slender and singularly graceful central column; the windows are of four lights. Against the east wall is an ancient altar with well-moulded "mensa" and base; and against the north wall is a most superb *sacro-mensa heisteria*, a perfect forest of niches and pinnacles. The floor of this beautiful apartment is composed of small black and white tesserae arranged in patterns, and is a most valuable example of a fourteenth-century pavement.

The sacristy of the Cathedral of Frising is perhaps one of the noblest in existence. It is divided into a nave and aisles of equal width, five bays long, by two rows of octagonal columns of red marble. The whole is beautifully vaulted in stone. At the east end are the altars, over which are ancient pictures of great beauty. The whole building was originally decorated in colour, portions of which can still be seen.

The sacristy of the cathedral at Hildesheim is of a similar plan, only its axis is from north to south, and not from east to west. It is a plaster building, and not so large as that of Frising. It contains one altar dedicated to St. Thomas of Canterbury.

The sacristies of the cathedrals of Ratisbon, Freiburg-in-Breisgau, Aix-la-Chapelle, and Munster, are all interesting buildings; and those of the churches of Oberwesel (which contains its ancient altar and reredos); St. Mary's, Wurzburg; Holy Cross, Schwabisch Gmund; and very many others, are excellent examples of the care which ancient German architects expended upon this portion of their ecclesiastical edifices.

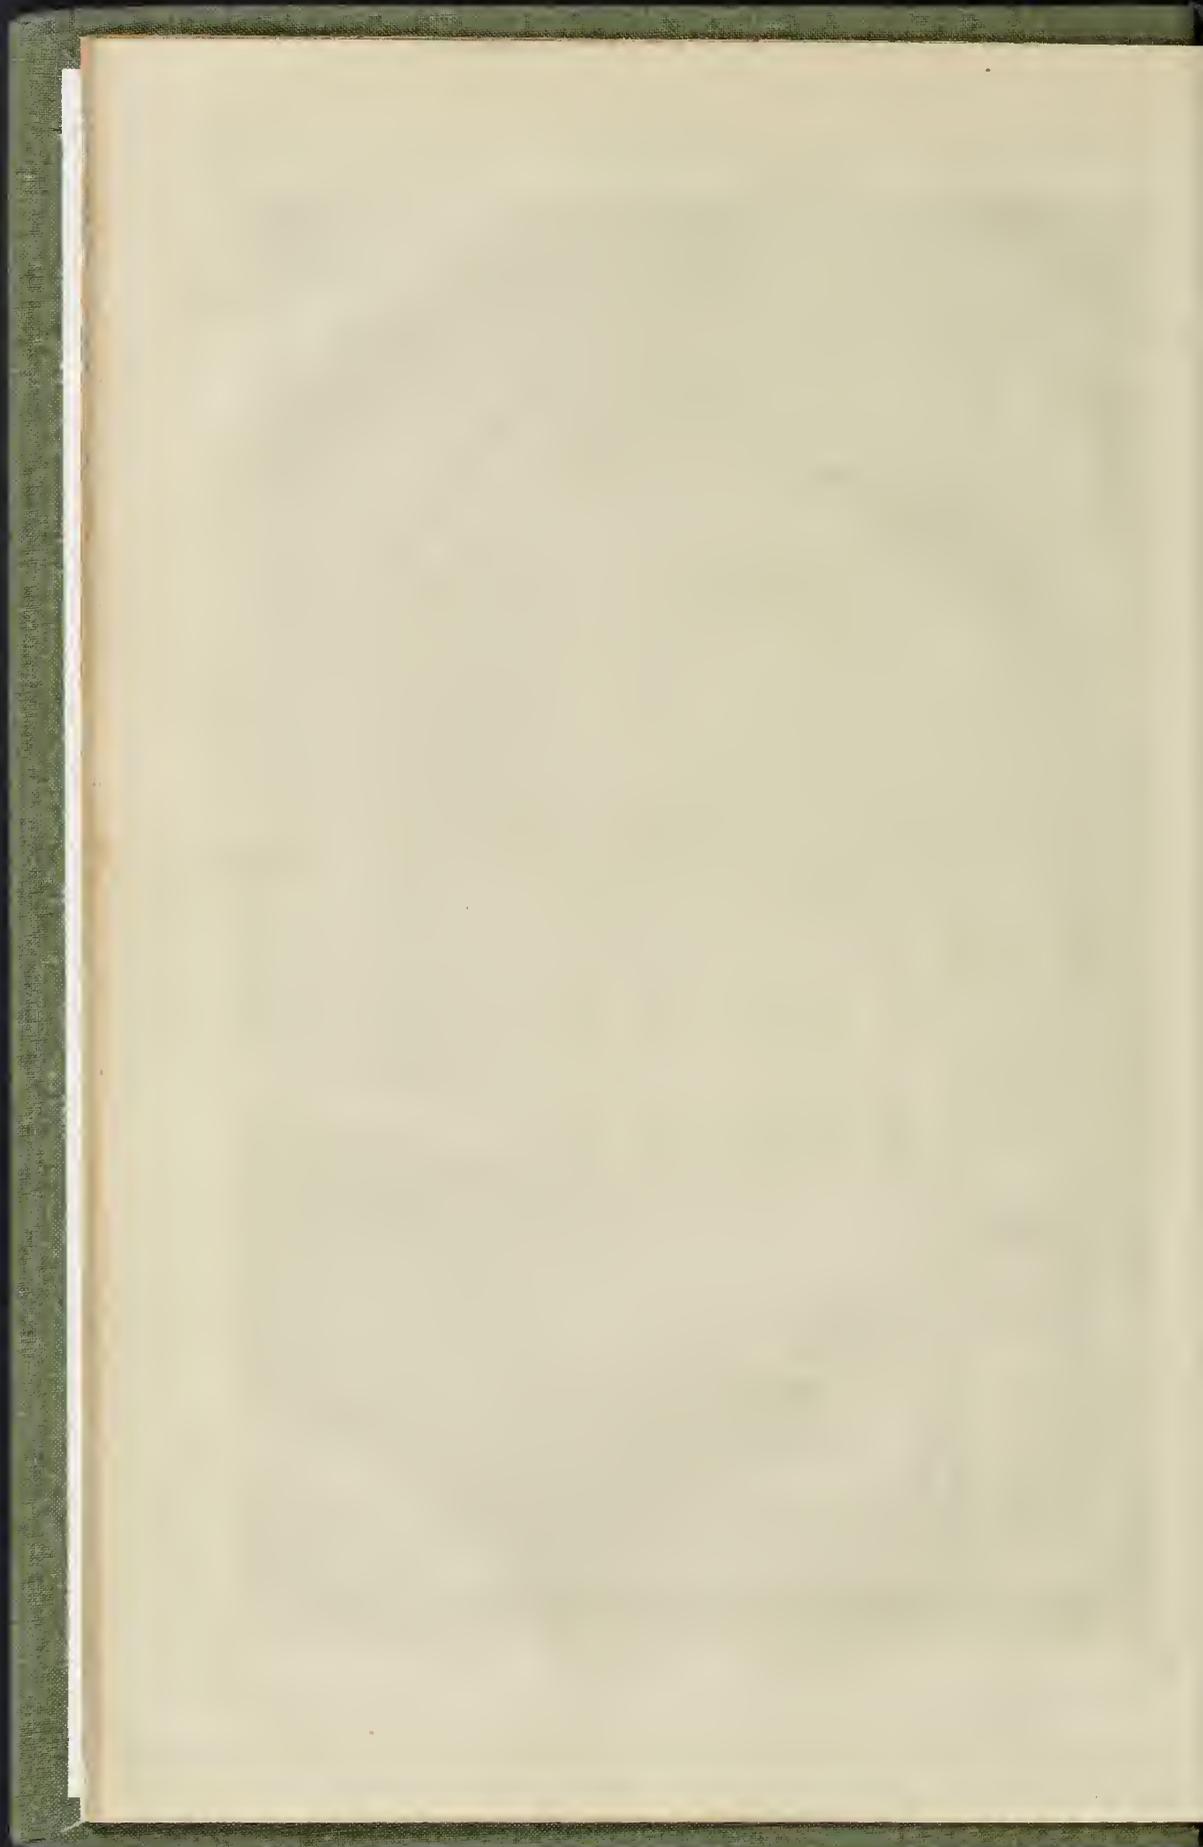

ST. JOHN'S CHURCH, BATH.—MR. ARTHUR BLOMFIELD, ARCHITECT.

THE SACRISTY OF ST. GEREON'S CHURCH, COLOGNE — FOURTEENTH CENTURY.

CHURCH OF ST. JOHN THE BAPTIST,
BATHWICK, BATH.

This is not an entirely new church. The original building, erected a few years since, consisted of a nave and chancel, with a transept, organ-chamber, and a small tower and spire, forming a porch at the north-west angle. The congregation having far outgrown the accommodation, an extensive enlargement became necessary. Mr. Blomfield was called in, and prepared a design for adding to it as much as the limited site would permit. The plan consisted of a large and lofty nave (the existing one becoming the north aisle), a south aisle and porch, a large organ transept, and priests' and choir vestries. This scheme had to be very considerably modified, and the south aisle abandoned, on account of the expense. The present plan has the same features, with the exception of the north aisle, but carried out in a plainer manner.

As there was considerable difficulty in adding a nave of satisfactory proportions in the usual way (owing to the limit of the site westward), the main roof is carried unbroken from east to west, only a sacarium, 15 ft. deep, being cut off by a lofty arch at the east end. The choir is taken out of the nave area, and surrounded by a low stone septum and metal screen, and towards the west there is a stone rood-screen, which serves to divide the choir from the nave, and to receive the thrust of the old chancel arch. The division is further marked by a pair of coupled principals in the roof.

The roof over the choir and sacarium is simply decorated in colour; and a considerable amount of stained glass, including the east window and the side windows in the chancel, has been presented by various donors. The reredos consists of a very effective mosaic picture of the Nativity, set under a richly-moulded arch, which forms part of the architectural design of the east end. This, as well as the decorative painting and the stained glass, was executed by Messrs. Bell & Almond. The altar and choir-stalls, in oak, were executed by Mr. Bates, of Stovesboro, Herts. The carving was done by Mr. Earp, who also executed the pulpit. The metal-work is by Mr. Shrivell. The contractor was Mr. G. C. Mann, of Bathwick. The organ, which is a fine instrument, though yet unfinished, is an electric one, by Messrs. Bryceson, the organist sitting behind the choir-stalls on the opposite side to the organ.

The general dimensions of the building are:—Nave and choir, 96 ft. 6 in. long, 29 ft. 6 in. wide, 35 ft. high to plate, 60 ft. to ridge; sacarium, 15 ft. long, 21 ft. wide.
The total cost was under 5,000l.

CHURCH DECORATION AT WEYMOUTH.

THE parish church of St. Mary's, Melcombe Regis, which is a structure devoid of the marked features of ecclesiastical architecture, has this year received a Christmas decoration deserving of a passing notice. The church, which furnishes some 2,000 sittings, is an elongated square, with galleries on the north-west and south sides—the gallery front being continuous, and divided by plain stone columns into spaces of about 12 ft. each. The entire sweep of the gallery front is covered with a series of needlework designs, in which the utterance of the shepherds, "Glory to God in the highest, on earth peace, goodwill toward men," is shown by church-text characters of about 13 in. each. The letters are formed principally of laurel-leaves and scarlet cloth on a white ground. The word "God," which occupies one of the gallery openings, is rendered by letters of white swan's-down on scalloped squares of scarlet cloth, the terminals of this design, as well as that of some others, being diapered with strips of scarlet cloth fastened at the points of intersection with rosettes of ivy leaves and swan's-down. The other principal words are composed of scarlet cloth, some with trimmings of swan's-down, each design having a border at top and bottom formed of single laurel-leaves, relieved in each half-lozenge by diamond-shaped pieces of scarlet cloth and wool, and forming a continuous zigzag pattern throughout the sweep. The gallery spaces on the east end have each the word "Alleluia," shown in white letters on a scarlet ground, with ornamental trimmings. On the eastern wall is a large painting about 30 ft. square, the sides being at the top of an elliptical shape, following the line of the ceiling. Fitted to the upper sweep of the frame, a roll, scalloped on the upper edge, and about 15 ft.

long exhibits the text, "A Saviour which is Christ the Lord," in white, on a ground of scarlet cloth. The letters, which are decorated with ivy-leaves and yew, form a continuous scroll. The credit of the design is due to Mr. G. R. Crickmay, architect, who is this year one of the churchwardens of St. Mary's parish, and it has been carried out by a small body of honorary needlewomen, who have shown precision and taste in the execution of the work.

ON THE PREVENTION OF NOXIOUS
SEWAGE EMANATIONS.

THE writer of the article with the above heading, in last week's *Builder*, advocates that is no other than a mischievous fallacy. He says that "there is no smell from self-cleansing channels; . . . that the only need of traps and ventilators is to guard against accidental stoppages;" and that, "as a rule, where there is smell from the drains or the sewers there is stagnant deposit." Now, it is a fact that "good tubular sewers or drains . . . so constructed . . . as to be self-cleansing, and to be always clear of deposit," give out noxious emanations the same as sewers and drains of deposit. The writer seems to think that, as "fresh human excreta is innocuous," and that as "the period of noxious decomposition begins usually not later than about four days in the sewer-tank," it is removed in self-cleansing sewers before decomposition takes place and foul gases are evolved from it. But this is not the case. Those who have taken particular notice of sewage flowing in sewers will tell him that little or no excreta is ever seen towards the outer end, and not even in those from separate streets. The water, and its motion or agitation in the sewers, quickly dissolve the excreta, whose gaseous constituents then enter into chemical combination with the water; then, the mass being foul, and warmer than the air which occupies the large rainfall space above it, the agitation of it by the flow, together with its warmth, and exposure to the less temperature of the overlying air, causes it at once to emit noxious gases. There is an old saying, that "the more you stir a certain compound the worse it smells." It is even so by the motion of the sewage through the sewers. The writer's fallacies, such as the above, and his theoretical interferences with the practical details of the necessary works, have retarded, and will, I fear, continue to retard, sanitary progress.

The lightest and most abundant of the gases which emanate from the sewage—namely, sulphuretted hydrogen,—flows up the drains to the highest points under the water-traps to the sinks and closets, through which it escapes, not only every time water is discharged down them, but when the pressure of the pent-up gases on the outlet sides of the traps is greater than the pressure of the external air on their inlet sides. The above, then, is what naturally takes place in every sewage-channel, whether it be self-cleansing or of deposit; and hence the necessity to "make a vent therefrom upward. . . . and carry the same to a convenient height; for so the offensive ayre as fast as it riseth bath issue, and stayeth not in the passage."*

The writer says truly that "the most effectual course is not to combat with the gases when produced, but to prevent their production." No one has ever prevented their production in self-cleansing channels, and cannot do so. "Good tubular sewers or drains . . . so constructed . . . as to be self-cleansing, and to be always clear of deposit," are as much "the bulbs of retorts, and the house-drains as the necks, conveying the "into the houses," as are the sewers and drains of deposit. The "bulbs," in fact, are in both the large air-spaces which are provided for the rainfall above the sewage. The nearest approach to the desideratum of preventing the production of the gases would be to reduce the capacity of the "bulbs" to a minimum,—that is, to make the sizes of the sewage channels proportionate to the maximum

* "How to Take Away the Offence of Noisome Vaults."—"Make the vent thereof upwarde as large or larger than the tunnell downward, and carrye the same up to a convenient height, for so the offensive ayre as it riseth bath issue and stayeth not in the passage."—*Sir Hugh Plat*, "The Jewell House of Art and Nature, 1594." This was drain-ventilation, about which there has lately been much clamour, publicly proposed 275 years ago.—J. P.

flow of the sewage. By doing this, noxious emanations from the sewage would be greatly reduced, or almost prevented. But this would involve the adoption of the "separate system of drainage," which consists in carrying off the sewage by one set of drains, and the rainfall by another set. This system, after every other has been hindered through, will be adopted. Complete ventilation of the main drains could be effected by revolving fans placed in them at suitable situations, and driven by the force of the sewage currents. The noxious gases as they emanate from the sewage would be drawn into and driven up the ventilating pipes, which would be connected with the fans, and carried above the altitude of the houses.

JOHN PHILLIPS.

NOTES FROM AMERICA.

I MUST preface my letter with a description of railway travelling in America, and confess that Great Britain is a long way behind the times. 1st. In regard to luggage. When a traveller arrives at a depot, his luggage is taken from him, a brass ticket given him, and a corresponding ticket attached to his luggage, the station marked on the same: so, when at the end of his journey, he hands the ticket, and receives his luggage. Again, the cars (all railway-carriages are called cars) are far more convenient: a smoking-car, palace-car (fitted up bondior fashion), and sleeping-cars, to each; there are a filter for drinking-water, and closets for males and females.

The New York State (about the size of England) is well intersected with railways. Some of the cities are really very pretty,—streets laid out with avenues of trees, in summer having a very pleasing effect, besides acting as a shade from the sun. There are several very fine cities, Albany being the seat of the State Legislature; and the House of Assembly, if built according to the drawings of the architect, will be a very imposing affair; but it seems to your correspondent, that if the cities would patronise bricks, instead of timber and limestone, there would be fewer fires, and the buildings erected would be of a more substantial character. New York city, in the writer's opinion, is a long way from a Paris, and never will approach London. The Central Park is a very beautiful place, with good skating-ponds, and fine walks; but there is a great deal too much "shoddy" in the "turn-outs," and one can see at a glance, like moek jewelry, it is very good for display, but, after all, not the genuine article.

Just now the municipal powers in New York are likely to be comfortably provided for in the State prisons, for merely robbing the City Treasury of a few millions of dollars. Could the writer but have had the privilege of surveying or estimating for the repairs of broken windows, he would have had now a "splendid stone front" in the 5th Avenue.

QUERCUS.

TURNERS AND WOOD TURNING.

HAVING seen a letter in your issue of December 16th upon "Wood Turners and Wood Turning," I hope you will favour me by publishing a few words upon the subject. "Wood Turner" thinks with Mr. Olley that if a man can produce two specimens from an architectural drawing, he must be a good workman. I must differ from them, as a good turner is expected not only to work from architects' drawings, but to do a hundred and one things that an architect would not think of; and allow me to say that as a rule (at the West end of London, and I dare say it is the same at the East end), when turners work from a drawing, if it is so ordered, they copy it exactly. As for what a turner can earn, I know men who consider themselves first-rate workmen, who, if they were paid full prices for their work, would never earn even moderate wages. Your correspondent wishes turners would combine to produce good work, and stand out for fair wages. There is now a society in existence for these purposes; but although it is flourishing, it has not received the support it deserves from the trade; and if "Wood Turner" be a journeyman, I hope he will add practice to precept, and join the society, and give the members the benefit of his twenty years' experience; and if he be a master, if he will address a letter to me showing what course the society ought to follow for the improvement of the trade, it shall be laid before the members, and it will be certain to receive careful consideration.

It is a pity so many apprentices are taken by men who do not know how to teach them their trade, but there are masters who do employ journeymen, and take apprentices, who are incompetent in every sense of the word. There is one who considers himself the first turner in London, and works from architects' drawings: he has had several apprentices, and his foreman says that he never turned one of them out as a first-rate workman. As for inferior workmen being obliged to become masters and ruining the trade, the masters have in a great measure themselves to thank for it, on account of the many inconveniences they put their men to, such as working in dark and badly ventilated workshops, having inferior lathes and tools, and in some instances keeping them waiting for their money. I have had to wait for two hours, and then go away short of half my earnings, and when I began my work on Monday morning, found my employer was in the country recruiting his health (with my money). Such things as these make careless workmen, and often drive men to the public-house, when they are waiting about on Saturday for their money. There are many first-rate workmen who have started in business for these and similar reasons. I shall address another letter to you more fully upon this subject, and likewise upon the late competition for the freedom of the Turners' Company.

W. A. BARBER, Secretary,
The Society of Journeyman Wood
Turners in General, Southampton
Arms, 350, Euston-road, N.W.

"A REVIVER FOR SOUTHAMPTON."

SIR.—Observing a letter under the above heading in your issue for December 23, 1871, signed by one who describes himself as knowing the district well, and as having given close observation to the subject, permit me, as secretary to the South Midland Railway Company, to express my surprise that your correspondent should state the saving in distance between South Wales and London, by the proposed tunnel, at twenty-four miles, when the promoters only set it forth at sixteen miles.

The ease with which it makes companies with autogenic interests work over each other's lines, and allow through rates at low charges, at the same time getting over difficulties on paper which have proved insurmountable in practice, is simply amazing.

It is aware that the line from Southampton to Salisbury is South-Western; from Salisbury to Bath and Pining Great Western, more than half of this being but a single line, and therefore incapable of accommodating the traffic of this port, extremely circuitous, and with bad gradients against the load?

Does he remember that the totally neglected country traversed by the South Midland is as fully entitled to consideration as regards railway facilities as its terminus, and that no comparison can be drawn between Mr. Fowler's high-level and costly bridge and that proposed at Sharpness, since Admiralty regulations can present no difficulties, the fact being that high-masted vessels do not go higher up the river than the entrance to the canal?

If your correspondent be interested against us, let him remember he will do his own case no good by misstating ours.

J. B. LE FELVRE, Secretary.

* * * With this the correspondence may end.

KENSINGTON ROAD AND HYDE PARK.

This main arterial thoroughfare, in its extent from Regent-circus westward to Kensington for a distance of two miles and a quarter, may be termed the grand Boulevard of London; the corresponding Bayswater-road on the north side, extending for a mile and a half along the Park border, being somewhat inferior in width of roadway, but having the advantage of more important buildings along its line.

The abatement of the old Park boundary brick walls, and the substitution of a handsome iron railing, have altogether changed the character of both these thoroughfares, and at the same time have given an apparent extension to the grounds and plantations within the *enceinte*. In the Bayswater line no paltry ranges of mean shops border the road, nor sever the continuous sylvan view; because on this line successive ranges of noble terraces have been erected within the last forty years, which, from their

happy position, fetch double the rental of equivalent structures in other parts of the town.

On the Kensington route it is far otherwise: the most valuable portion of the Park border, extending from Albert-terrace, Knightsbridge, to near Rutland-gate, for the length of half a mile, is curtailed off by ranges of paltry old shops, and by the still greater blot (so far as the frequenter of the antiquated grounds are concerned) of the antiquated cavalry barracks of Knightsbridge. The backs of the old houses have been judiciously planted out by landscape gardening, trees, and shrubs; but the barracks advance 30 ft. upon the Park drive, exhibiting windows and troopers, in dress and undress, to the extent of 450 yards!

The principal object for improvement is, however, not the Park border, but the grand Western Boulevard. From Kensington the road is sufficiently wide, and nearly direct, until approaching Prince's-gate, the Park side footway is gradually widened from 10 ft. to 20 ft., the west side of the gateway; as far as railing preserving its lineal direction as far as the east side the fence is protruded 18 ft. at a sharp angle upon the causeway, the south slope continuing onwards to the barracks; so that this building cuts off the view of nearly the entire width of the causeway, thus marring the line of route in this its most valuable portion. Here Princes-terrace, Emismore-place, Rutland-terrace, and the adjacent highly-improving quarters are choked in, and muffled up by unsightly shops and public-houses; as the barrack is an insuperable obstacle to all improvement, even in this position, which would otherwise command a *tenfold rental*.

There are other sites such as the Chelsea Guards' Barracks, which would be much more suitable to the Horse Guards, and even nearer to Buckingham Palace and the Houses of Parliament. The plot occupied by the barracks measures in length 400 yards by a mean width of 60 yards; and on the road line of this plot, at least 20 ft. might be thrown out into the road, to enlarge the causeway, and open a continuous view as far as the junction with the Brompton-rd. Upon this site a range of Park-side mansions might be built for a length of 300 yards, leaving a marginal plot of 30 ft. in width on both the Park and road frontages, giving at least 3,000*l.* a year in ground-rents, so as in quarters for the troops, and at the same time to realise incalculable advantages for this the best quarter of fashion, which has been so long under the ban of squalor and depression.

In completing the allocation and opening of the Boulevard to Albert-gate, there is, however, a range of nine paltry shops which should be cleared away, so as to open out the vista from the range of Albert-terrace on the east end, and the stables of his Grace the Duke of Wellington, occupying an area of 180 ft. by 90 ft., might possibly spare 20 ft. in depth along the Knightsbridge-road frontage for the public accommodation, and for the realisation of so grand a metropolitan improvement. These stables cover every foot of the large area, extending from the line of Park-wall in the rear, to the Knightsbridge footway in front, advancing on the latter 40 ft. farther than the barrack façade.

As viewed from Hyde Park-corner, just opposite Apsley House, from which the inner Park Drive and the Fair Mile Ride branch off, this southern border reach of Park presents a charming prospect. The borders are laid out in the most perfect style of landscape gardening; shrubs, fine forest trees, and flowers adorn its whole extent, as far as the Serpentine head and falls. But walk along it. For about 500 yards an appropriate iron railing fences it off from the main Piccadilly route; and then a narrow wedge of paltry and antiquated shops clings on to the old Park wall, as far as a modern chapel, with two public-houses as supporters, one on each hand; a pawnbroker; and lastly, the residence of the French ambassador, a handsome structure, at Albert-gate. In continuation, two fine houses follow on the opposite gate piers, and then there are five or six warehouses and workshops, built right up to the Park wall; after which the gardens of Albert-terrace open out, and redeem the stigma of huddled, shapeless, and crazy tenements. Next comes up to the wall the less offensive range of six houses in Park-place, and then, of course, a public-house; lastly, the barrack boldly intruding its unsightly red brick eleva-

tion, still unblushingly advances 30 ft. upon the Park drives. Well, what is the consequence? Why, the Park fashionable drive ends here, and a quadruple line of equipages during the season stops short of it, returns, and circulates within a range of a quarter of a mile!

A great portion of the tumble-down houses in the line belong to the Dean and Chapter of Westminster; and if we look to their possessions in courts, lanes, and the vile slums near the Abbey, there is small hope of improvement through their mediation. But this is a great and vital public question for some Governmental authority, or for the Board of Works. All the public parks have been wondrously improved of late, and the benefits derived from them by an increased and cumulatively growing population fully attest their value—no plant is disturbed, no flower plucked—and this shows their gratitude.

The parochial authorities of Kensington have of late widened the main street opposite to their new church now in progress; their co-operation in rectifying the grand Piccadilly boulevard would insure its completion. The extension and enlargement of great thoroughfares already undertaken by the Board of Works will no doubt prove highly beneficial to commerce, and to the inhabitants generally; but the improvement and widening of our old-established lines of intercourse, and the removal of blots that are odious in the eyes of foreign visitors would not only relieve our metropolis of discredit, but aid in elevating it to the rank it ought to hold, as being at the same time the wealthiest and the most beautiful in Europe.

QUINTANA.

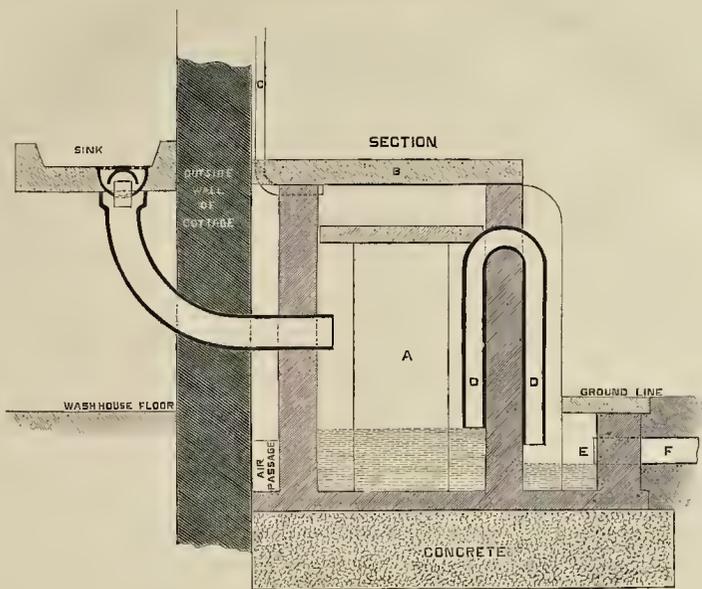

THE WOODEN STAIRS IN THE COURT THEATRE.

In reply to a letter from "Y" in a recent number stating that "there is a flight of stairs made of wood, leading from the street down to the pit of the Royal Court Theatre, Chelsea," Mr. W. Emden, as the architect of the theatre, writes:—"The pit steps are of stone, surrounded and entirely supported by brick walls, with a stone landing at head and foot; and the same can be said of all the other public stairs in the building. 'Y's' letter appears to have been written under a misapprehension arising from a cause which I proceed to explain. After the Court Theatre had been opened to the public the landing at the head of the pit stairs was enlarged, and to meet this enlargement the stone steps from pit to street (about seven in all) were cased with wood. This casing is completely cut off from the general woodwork of the theatre, and even though the building were burnt to the ground, yet would the stone steps from pit to street, with their wood casing, remain intact, nearly so: that they would continue to afford safe egress during the most violent conflagration must be at once apparent from my explanation."

This reply does not remove the objection raised. A landing having been formed at the top, as stated, the wooden flight of stairs is, of course, in advance of the stone steps, said to exist, to the extent of the width of the landing. The Building Act demands that stairs in theatres shall be of stone, or other fireproof material, and those down to the pit here are not so. "Y," therefore, is quite correct in objecting to them, and did not write under any misapprehension.

MONUMENT TO THE LATE BISHOP LONSDALE, LICHFIELD.

The monument which has been erected in Lichfield Cathedral to the memory of Bishop Lonsdale, who, after an episcopate of twenty-four years, died in October, 1867, has been publicly unveiled. The memorial, which is a fine work of art, stands underneath the arch on the north side of the sacristy. It consists of base, recumbent effigy, and canopy, with three elevations and pinnacles. In the base, which is composed of layers of green marble of various shades, and of alabaster, there are medallions in alabaster, with carved shields containing the late bishop's crest and symbolical representations. Around the upper edge of the base is engraved the following inscription:—"John Lonsdale, D.D., Bishop of Lichfield, born January 17, A.D. 1788; deceased October 19, A.D. 1867. Erected by the diocese in memory of his eminent learning and piety, his unwearied labours, and paternal care, during an episcopate of twenty-four years." On the massive base

Self-Acting Syphon Sewage Tank.

SELF-ACTING SYPHON SEWAGE TANK.

SIR,—A short account of this apparatus, which has now been for several years in successful action at some cottages of mine in Essex, may be of interest.

I may premise that when the cottages came into my possession the sewerage arrangements consisted of privies of ordinary construction for the excreta, and simple holes in the ground near the scullery for the house-slops; these holes, as well as the privy cesspool, being emptied at intervals, and the contents spread on the gardens. The privies were readily converted into earth-closets by reducing the cesspool in size, rendering it water-tight, and providing buckets and scoops for the earth; but at first the tenants would not use any earth at all, and, eventually, all they could be induced to do was to throw down earth occasionally, and that in quantities quite insufficient to absorb the moisture of the excreta and urine slops. The objection of the tenants to the use of the earth arose not merely from the trouble involved, but from a notion that it spoilt the contents of the cesspool as manure. Perfectly as the dry-earth system effects the innocuous disposal of the excreta, with proper care, my experience convinces me that nothing short of almost daily superintendence will secure this care in the present state of ignorance and indifference of agricultural labourers, even of the better class.

The question of how to dispose of the sink and scullery slops was more troublesome. There was no drain they could be run into without causing a nuisance; and how were they to be applied to the land in any way that should be self-acting? Ordinary surface irrigation would require too much attention; and sub-irrigation, by underground pipes, though more promising, was open to the great objection that the small amount of sewage would not be able to force itself any distance along the pipes, but would lie in one place, and gradually choke them. To overcome this difficulty, I devised the Self-Acting Syphon Sewage Tank. The accompanying sketch shows the tank as it has been actually in action for the last three years. The sink is connected by a trapped iron pipe, with a small water-tight tank (A), covered with a movable stone cover (B), and provided with a ventilating pipe (C), which is carried up the outside of the cottage. The outlet from this tank consists of a syphon pipe (D), so arranged that it will not discharge any sewage till the liquid in the tank rises above the top of the syphon, when it at once becomes charged, and empties the tank

very rapidly. As soon as the sewage is lowered to the level of the bottom of the syphon (which is a short distance above the bottom of the tank, so as to leave a space for the deposit to be cleared out periodically), the syphon is thrown out of action, and allows the tank gradually to fill again with sewage. The syphon discharges through a small well (E) into a drain (F) leading to the sub-irrigation drains, which latter consist of common 2-in. agricultural drain-pipes laid about 12 in. below the surface of the cottage gardens. The sewage flows out of the joints of the pipes, fertilising the soil, and purifying itself.

The syphon arrangement has these two important advantages,—first, that the concentration of the flow of the sewage, effected by discharging the collected supply of several days in a few minutes, forces the liquid a considerable distance along the sub-irrigation pipes, and prevents their being choked; and, second, that the intermittent action of the syphon gives full opportunity for the soil to purify the sewage, on the principle of "intermittent downward filtration." Of course, unless the land itself is naturally porous and dry, it must be under-drained, with special precautions; otherwise, the sewage will penetrate direct into the drains, without sufficient passage through the soil to purify it. I experienced this difficulty from the garden (the subsoil of which was mild clay) having been previously drained without any reference to its being irrigated; but, notwithstanding this drawback, the sewage was, under ordinary circumstances, entirely absorbed by the soil.

The sub-irrigation pipes were intended to be taken up and cleaned annually, and provision was made for readily doing this, by laying them on a continuous bed, formed by dividing larger pipes longitudinally into two equal parts; but it was actually found unnecessary to disturb them for nearly three years. A strainer has recently been introduced to intercept the solid matter from the syphon, which will, no doubt, render the action of the pipes still more satisfactory; and I am also making arrangements for having the whole apparatus constructed complete in iron, with various improvements, which will, I believe, render it cheaper, more efficient, and portable. Though designed for cottages, the apparatus is evidently applicable to any house where a dry system of disposing of excreta is used, and where there is a garden or other land below the level of the house to which the liquid sewage may be advantageously applied by sub-irrigation.

ROGERS FIELD, C.E.

there is a recumbent figure of the bishop, in full canonicals, with pastoral staff at the side, mitre on the head, the hands raised as in supplication, and the feet resting against the typical dragon. This figure is in alabaster. From the base rise four pillars of green marble, surmounted by foliated capitals. These, with four flying buttresses in yellow Mansfield stone, support the canopy, from which rise three richly-carved hoods and a number of pinnacles. The canopy is in Painswick stone. The hoods are surmounted with figures of angels, in alabaster. The whole is rich in carving.

The monument, which has cost 2,000*l.*, was designed by Mr. Gilbert Scott. The work, with the exception of the recumbent effigy, which was executed by Mr. Wats, the painter, was carried out by Messrs. Farmer & Brindley, Westminster. Some who remember the mild face of the late bishop seem to think that the expression on the features in the effigy is a little too harsh, though the likeness is good.

SOANE'S MONUMENT.

SIR,—I have read with much interest the correspondence in the *Builder* between a "Soane Student" and a "Lover of Truth," and can confirm the statements of both correspondents, for at the beginning of last year the tomb of Sir John Soane was in the deplorable condition described; it has, however, since been repaired under the inspection of Professor Donaldson and myself, at the expense of the immediate descendants of Sir John. This is the second time within the last nine years that the monument has been repaired at great cost, but we have no means of securing it from future wanton injury. The trustees of the Soane Museum in 1870 opened a correspondence with the parochial authorities of St. Giles-in-the-Fields, who repudiated their liability, and suggested the removal of the monument to the Soane Museum!

I entirely concur with your correspondents on the disgraceful neglect of our closed cemeteries. Why should there not be a legally-qualified Board to supervise and protect these cemeteries, many of which contain the remains and monuments of by-gone worthies? In some rare instances they have been planted and rendered pleasant places of resort—small breathing-places in our crowded metropolises. The cemetery of St. Giles-in-the-Fields ought to be an especial place of pilgrimage for the lovers of English art, containing as it does the remains of our great sculptor, Flaxman, and of Soane.

JOSEPH BONOMI.

Soane Museum.

THE OLD MASTERS AT THE ROYAL ACADEMY.

FEW things would give a better idea of the latent and wide-spread wealth of this country, even in objects of fine art, than a summary account of the 270 pictures which, in this the third year of its self-imposed task, the Royal Academy have collected from the galleries and apartments of public and private owners, and hung on the walls of Burlington House. True, there is room enough and to spare,—vacant saloons and single rows of paintings in one or two that are not vacant. True, the gathering of 1872 falls far short in number, and possibly in interest, of its predecessors. True, that there is much now exhibited which, even if it originally illustrated the art of the great names it boasts, or gave unmingled pleasure to the spectators, can be said to do so no longer. But, with all these admissions, there is yet enough to make a morning spent in the rooms of the Royal Academy an occasion of extreme delight as well as of valuable instruction.

The main feature of the present exhibition is a large number, comparatively speaking, of admirable portraits, by the first masters of picture-portraiture that the world has seen. An opportunity is given, not to the student alone, but to the skilled artist, and the ripe critic, for improving his taste by the comparison of noble works of Vandyck, Titian, Gainsborough, Rembrandt, Rubens, Velasquez, Sir Joshua Reynolds, Romney, and other painters.

As an instance of the rare educational value of the exhibition, we may refer to a most valuable set of studies, by Vandyck, which have been lent by the Duke of Buccleugh. It is, however, a doubt whether these monochromes are not sketches, of course by Vandyck, made for the engraver. Among these there is one of the Infanta Isabella Clara Eugenia, the Vice-Queen of the Low Countries, whose name is so familiar to the student of the time of the Emperor Charles V. She is represented, not in a widow's dress, as stated in the catalogue, but in that of a religious order, with her rosary by her side. The little panel on which this sketch is made, is, like the rest of this important series, some 9 in. by 7 in. The whole character of the Infanta has been grasped by the genius of the painter, and firmly, yet delicately given in the sketch. There is the heavy Austrian échin (the inheritance, together with the Tyrol, of Pouch-mouthed Mez), treated with grace, but without weakening the force of the feature. There is the eagle glance and the commanding brow and nose of one born in the purple. Now the Earl of Hopetoun has sent the full-sized painting of which this small panel contains the study. It is a magnificent picture, 55 in. by 44 in., in admirable preservation; and yet, grand as the picture is, it hardly renders the countenance with the vigour of the sketch. The *justa* position of these two historic treasures is extremely interesting.

It is not the fault of the Academy that Rembrandt had two mothers,—or at least that we are presented with the portraits of two very different old ladies under this title. One of them, No. 68, the property of the Earl of Hopetoun, is a replica of the well-known No. 775 of the National Gallery, the best being (if memory is reliable) a little more full-faced in the Earl's copy than in that belonging to the nation. The latter is inscribed, "Æ. S. I. E. (*Anno Ætatis Sux*) 83," and dated 1634. It was formerly in the Enard collection, and has not been identified by the careful compiler of the catalogue of the National Gallery with any known subject. The second portrait at Burlington House is numbered 179, and belongs to the Duke of Buccleugh. It is a very different countenance from that of the old lady in the ruff. Attired in the dress of a nun, with a thoroughly Rembrandtesque gloom thrown by the hood, and relieved by the white pliners, this noble old dame is reading a ponderous volume. Her features approach nearer to the regal curves of the Infanta Donna Clara than to the somewhat bumpy outline of the other portrait. But what is very remarkable is, that although there is no resemblance that can be traced between the modelling, or the technical drawing, of this fine countenance and that of the painter himself (of whom a portrait, also belonging to his Grace of Buccleugh, and numbered 158, hangs near, very closely resembling No. 221 in the National Gallery), one may well imagine that there is a likeness. Nothing is so subtle as family likeness. In the present instance, the similarity of outline is between the old lady in a ruff and the painter;

but a deeper sympathy seems to lie between his genius and the face of the noble woman.

Foremost amongst the most interesting features of the Exhibition is the Raffaele lent by his Royal Highness the Duc d'Anjou, No. 95 in the catalogue. This brilliant little Virgin and Infant is an undoubted work of the great master whose name it claims. It is on panel, 18½ in. by 11 in. It is in very good order, and judiciously framed, lighting up the whole side of the apartment with its red and blue drapery. The features of the Infant are on the same type as those of the Aldobrandini Madonna, which, however, it by no means rivals in heauty. But the loving, half-wondering expression of the mother's face is almost unrivalled among the Virgins of Raffaele. It is the expression, not the painting, that is so admirable; and the treatment of the hair of the child is—as far as memory serves—unique. Little rays and glints of glory spring out from the tiny hairlets; and although the conventional nimbus is indicated, both around Mother and Child, the self-luminous tints of the latter are wonderfully imaginative and divine.

Probably of more actual value than the solitary Raffaele are two paintings by Leonardo da Vinci,—the most cultured and learned, if not in all respects the first, of the great Italian masters. One of these is a Madonna belonging to the Duke of Buccleugh (117), on panel 18½ in. by 14 in. A curious injury has occurred to the forehead—on which a raised curved line suggests the idea that the upper part of the head has been restored. It is, however, most probably, an evidence of the barbarous piety that imagines that it adorns pictures of saints by attaching crowns of silver or of gold to the canvas. The complexion of the Virgin is of the lovely olive brown so often to be seen in the works of this master. The hair falls in crisp, almost wiry curls; the face of the Infant, who is contemplating a little cross, is almost sentimental. But the motive of the picture is that very Cross. As the child regards the symbol, so does the mother regard her child. The composition is, of course, masterly; the face of the Madonna, especially the mouth with its shadowy outline, exquisite. The large-sized hand must have been painted from the real model of the painter. The greenish blue of the background, where sea fades into sky, has suffered more than the rest of the picture. This painting is one of the highest value and interest.

The second Leonardo is the portrait of a young man, on panel, 21 in. by 14 in., the property of Mr. W. Fuller Maitland. It would be difficult to point out a picture so limited in size and in subject which more fully illustrates the genius of an unsurpassed artist; and yet it is one which a person might be pardoned for passing, if he only saw it closely, without remark. Full of cracks in the paint, faded in the colouring, with the modelling of the right hand so much obliterated that the outline appears to be out of drawing, a close inspection shows more traces of the ravages of time than of the magic of art. But stand at that distance at which Leonardo, in his *trattato di pittura*, defined that a picture should be seen, or a little further off, and the form becomes instinct with life, the hand assumes mobility and heauty, and the face looks forth with a noble individuality that dwells long on the memory. The figure holds a scroll on which is written, in Lombard hand, the date 1494, the words ANO 20, and the monogram M. R. The portrait has rare value.

Correggio is unrepresented in the exhibition. We may say the same of Titian; none of the four paintings attributed to that prince of portrait-painters bearing any visible marks of so illustrious a pedigree. Titian, indeed, may be said to be nobly represented at second hand, for Hilton's "Ganymede," the property of the Royal Academy, has been evidently inspired by the "Ganymede" of Titian in the National Gallery. In fact, the first impression was, "how much better lighted the picture is here than in the Gallery!" The treatment, however, is different. The noble head and mighty plumage of the royal bird, his soar across the field of vision, the charming face and eager heavenward look of the boy, the tender grasp of the eagle, which holds the quiver of the "Ganymede" rather than his flesh,—all these are elements of a very fine picture. The attitude of the bird is questionable; so it is with the eagle of Titian.

Other Italian masters in respectable numbers are more or less worthily represented by one or more pictures. Of Giorgione there is the "Temperance" belonging to the Royal Academy, famous for its glorious hair, but with a lip be-

tokening anything but temperance in passion. Of Guido Reni there is one of the stock figures, women with up-turned eyes and wounds of body or of mind—Cleopatras, Magdalenes, or what not. This one is called Saint Agatha. The right hand is beautifully drawn. The countenance is pallid with the pangs of death. There is a fine study of two figures by Andrea Mantegna, lent by the Duke of Buccleugh. Three Tintorettoes are harsh and grim. In one of them, a very ill-composed family picture, the first person of the Trinity is introduced in a most inconceivable fashion. Sir Conns Lindsay sends three portraits, entitled those of "the Painter's Three Daughters, by Palma Vecchio." It is impossible to recognise in either of these three squalling girls, with mouths most unpictorially open, the Juno-like heauty whom Bordone loved to paint. A holy family, by Palma Vecchio, is lent by the Queen, from the Hampton Court collection. In this, the St. John, who has attained to manhood during the infancy of his Irish cousin (contrary to the opinion of St. Luke) has a fine face enclosed in a veritable bush of hair. A noble modelled and tenderly treated St. Sebastian, by Palma Il Giovine, is attributed in the index to Il Vecchio. The Holy Family by Parigi Bordone, from Hampton Court, is an inferior work, for which these same damsels of the Palma family have been models. Sir William Drake sends a fine painting of Piero de' Medici, by Bronzino, in good preservation, with massive features, and most uncompromising aspect—a thoroughly characteristic portrait. Two very poor specimens, said to be by Sandro Botticelli, are without interest, unless it be from the fact that the worse drawn of the two is exhibited by Mr. G. D. Rosetti; which may explain certain peculiarities of style. One picture is attributed to Annibale Caracci, two to Gaspar Poussin, and one to Nicholas Poussin, which are best complimented by silence. The most noticeable work of the minor Italian masters is a large *noli me tangere*, by Barocci, 110 in. by 74 in., the property of Mr. Wentworth B. Beaumont. If abstraction can be made of the utterly undignified conception, and thoroughly conventional treatment of drapery, this is rather a pleasing picture. The composition is effective, although the left leg of the Christ is nowhere to be seen. The colouring is bright and lively; the Magdalen, the reverse of either a mourner or a penitent, is a remarkably gay, pretty girl, coquettishly and tastefully dressed. The shadowy outline which gives such delicacy to the faces painted by this artist is most conspicuous in these two very youthful countenances.

Passing to the great feature of the exhibition, we note no less than thirty-two paintings by Vandyck, a most unusual wealth of portraiture. Of these a couple of dozen are the studios contributed by the Duke of Buccleugh, to one of the most remarkable of which we have above referred. The portrait of the Marquis Spohna is lent by the Earl of Hopetoun; the complexion as fresh as if painted but year. The stern, crafty face looks out from the canvas as if its owner were ready for intrigue or for war. Nothing but the gleam on the armour recalls the lapse of nearly two centuries and a half. The portrait of James Stuart, Duke of Richmond and Lennox, is lent by the Duke of Buccleugh. It is a wonderful physiognomical study, and a marvellous painting. Then comes the noble Governess of the Netherlands, before mentioned. The profile of Henrietta Maria, Queen of Charles I, lent by the Queen from Windsor Castle, with a bust as flat as a pancake, shows that, as with lesser painters, the magic of this great master's touch might at times be impaired by the weight of a royal command. We should be much obliged to the writer of the catalogue to explain whom he intends to designate by the title of the Queen of Philippe le Roi,—a full-length portrait of a full-formed young beauty, in a black dress, half frightened at her own splendour. The bunches of pale brown curls, and faintly defined eyebrows, of which the right is arched more than the left, agree with the inscription, "Æt. Sux 16, 1631." The husband of this stately girl, the Counsellor Le Roi, not the King of Spain, a noble-looking man, also in black, with sharp face and hand resting on a noble deerhound, is the companion picture. These fine portraits, 80 in. by 48 in., belong to Sir Richard Wallace.

By Rubens there is one portrait only. It is life itself—a man in a ruff and sabbled robe, lent by Earl Brownlow. There are three landscapes, with cattle and figures, by Sir Peter Paul, tolerably well known; the "Timber

Wagon" (51), "The Rainbow" (125), and "The Watering-place" (195). Five paintings are attributed to Rembrandt—the old lady in the ruff, who was eighty-three when the painter was twenty-eight, which disposes of the maternity question; the old lady in conventional dress; portraits of the Burgomaster Paibian and his wife, the former in a falling ruff, with a fine sad countenance, looking out from the canvass, and a chubby ugly boy—the latter with a miraculous ugly ruff, within which is a very vigorous and masterful life. The child, to whom she is giving a dollar, has an unmeaning face, older than that of the mother. The signature "Rembrandt" casts some doubt on the authenticity of this portrait, as well as on the companion piece, exhibited by the Duke of Buccleugh.

Sir Richard Wallace lends two portraits of Spanish Infantas, by Velasquez. These pictures, together with some others from the collection of the late Marquis of Hertford, seem to have suffered by long keeping in the dark. Nine pictures have the assurance to claim Holbein as their father. If the portrait of Archbishop Warham be from the easel of Holbein, he must have intended it for a sign-board. The portraits of Sir W. Butts and his lady, are subtle in their physiognomical power. The keen, penetrating glance, and irritable yet humorous mouth of the physician to whom Shakespeare flung a crumb of immortality, are admirable. The lady looks well content to be so.

There are seven pictures by the English Vandycck, Nos. 140, 202, 247, 254, 257, 260, 263. The first of these, the portrait of Lord Camden, shows how noble a fine face may look in a formal wig. There is a soft, shadowy outline to the features of the great judge that recalls the touch of Barocccio. The second, belonging to the Marquis of Hertford, is gone. It looks like the ruin of a Romney. It is inconceivable that, as mere matter of manipulation of colour, it should be by the same artist as No. 247, a very fine, bright portrait of Vestris, a young man in a full mass of powdered hair thrown back from the face. Lady Mary Bouldby looks out from the canvas with her blue eyes, set off by her grey powdered hair, and square-cut red silk dress. No. 257 is rather gone. It might stand for Jonathan Wild. Lady Lucy Douglas is wonderfully poor for a Gainsborough, if such it be. Mary, Duchess of Montague, grand-daughter of the Great Duke of Marlborough, a stately and beautiful lady, might almost be taken for a portrait of Maria, Marchioness of Athlery.

The sixteen works by Sir Joshua Reynolds are enough to fill the mind with rage. Certainly there is sufficient to prove that this great painter was not over-estimated by his contemporaries. But here and there a picture, left as it came from his brush, shows what terrible havoc Time has wrought with the majority of his paintings. We are familiar with many of them by engravings. But the best of these reproductions are but feeble shadows of the fleeting beauty of the originals. We know Reynolds only by ghosts. The exquisite beauty of the "Comedy" who has enchained Garrick—and small blame to him—by her irresistible charms, is not even hinted at by the engraving. This noble picture is sadly gone. "The Jessamy Bride," two portraits, the "Infant Academy," Lord Hertford's portrait of a Lady in a blue dress, the charming "Infancy," the fascinating Nelly O'Brien, are faded, tarnished, or cracked. In Mr. Cowper-Temple's "Girl leaning on her Hand," with a face so full of fun, the bitumen comes out in piteous bubbles. "Cupid Disarmed" is sadly spoiled. The ruin of these beautiful pictures is rendered more deplorable by the striking contrast afforded by the admirable condition of Lord Hertford's portrait of Mrs. Robinson (143), in which the charms of a somewhat discontented beauty are fresh and bright.

Sir Peter Lely's portrait of Lord Chancellor Clarendon in his robes is a noble picture. The florid face, youthful aspect, trim moustache and royal of the historian, seem an anachronism when attired in the gold and black robe of State, with the heavily embroidered purple for the Great Seal on the table. There is a fine portrait of a Sculptor (88), in which a marked trait of the sculptor's band,—the division of the little finger from the others,—is marked. The head is dignified by a cloud of yellow hair,—the falling band is tied in an unusual and very picturesque fashion. The portrait of the Countess de Gramont is from Hampton Court. That of Lady Elizabeth Wrothesley is marked by the overstrained histrionic attitude so common in the painting and sculpture of the day.

A RESPONSE TO THE QUEEN'S LETTER.
DECEMBER 30TH, 1871.

The letter of her Gracious Majesty to her people has been read far and wide, and has touched the hearts of all. We need make no apology for printing the following response.

A good and gracious ending to the year
Thy letter to thy people comes, O Queen!
Right welcome to them are its genial words,
Breathing calm confidence and trust serene.
Calm confidence in their firm loyalty,
And trust serene in their large, loving heart;
'Tis not the first time thou dost truly say,
That in thy sorrow they have taken part.

How their hearts wept with thine ten years ago,
When he who well deserved those anguish'd
tears—
ALBERT THE GOOD—was taken from thy side—
Thy loss and theirs, to ever-coming years.

Yes; still they mourn that upright man, who
lived
As if he held from Heaven the high behest
To prove himself to his adopted land
True bearer of his motto—*TARU UNO FEST!*
And when, but now, the darken'd wings of
Death
Seem'd closing once more o'er thy sadden'd
soul,
Thy people's prayers for thy son's life
went up
To Him who can both life and death control.

At length, when better tidings were sent forth,
And hope revived within each watcher's breast,
How joyfully they hail'd the cheering words,
Which gave their anxious fears some little rest.

And now they wait, in tremulous regard,
For every whisper from that royal home,
And feel it is their own peculiar friend
Who from Death's shadowy portals back doth
come.

If it could be that any closer tie
Were needed, 'twixt the nation and its head,
'T would surely spring from this deep sympathy
Which centres round our Prince's still sick
bed;

And from thy noble-hearted words, O Queen,
With those of that sweet lady by thy side,
Whom thou dost call thy daughter, and who long
Has been thy faithful people's joy and pride.

May God in mercy grant our mutual prayer,
And soon again to health and strength restore
The son, the youthful husband, father, friend,
Whose kindly face we long to see once more.
R. F. H.

THE NEW GUILDHALL AT
WINCHESTER.

THE ceremony of laying the foundation-stone of the proposed new Town-hall and Public Offices at Winchester, which had been postponed on account of the illness of the Prince of Wales, was performed on Friday, the 22nd ult., by Viscount Eversley, the high steward of the city. The new building, which will be situated on the south side of the High-street, nearly opposite to St. John's House, includes a large assembly-room, 85 ft. by 45 ft., a council-chamber, orsions-hall, magistrates' room, public museum or library, offices for the town clerk and city surveyor, committee-rooms, police station, with apartments for superintendent and policemen, fire-engine house, &c., the whole of the interior being warmed by hot water. In the centre of the principal front a clock-tower rises to a height of 120 ft. to the top of the vanes, the faces of the clock being 85 ft. from the ground, and if illuminated will be seen from most parts of the city. The design of Messrs. Jeffrey & Skiller, architects, of Hastings has been accepted, the estimated cost being 11,000l.; and Messrs. Joseph Bull & Sons, builders, of Southampton, have contracted for its erection for the sum of 10,496l.

The mayor and corporation assembled at half-past one o'clock, and a procession of the civic, clerical, and other authorities, headed by the band of the 60th Rifles, escorted Lord Eversley to the site of the new hall, where the stone was laid with the usual formalities, in the presence of a large crowd of spectators. On arriving at

the site, Lord Eversley expressed his thanks to a merciful Providence which had enabled them to meet after the postponement. The mayor then requested Lord Eversley to lay the foundation-stone, and Mr. Alderman Budden, as chairman of the building committee, briefly described the intended new structure. The Archdeacon of Winchester then offered prayer, and Lord Eversley, having been presented with a silver trowel, laid the stone. The mayor thanked his lordship for the performance of the ceremony, and he, in return, addressed the mayor and citizens in a graceful speech, alluding to the fact that Winchester claimed the precedence of London for municipal institutions.

DRAINAGE OF WEYMOUTH.

SOME time ago, after a visit to Weymouth, we commented somewhat strongly on the sanitary condition of this otherwise agreeable watering-place, especially in connexion with the state of the Backwater. We are glad to hear that the Town Council are now considering a plan which has taken six months to prepare. It is proposed to construct a dam across the Backwater, and to form intercepting sewers, so as to carry the sewage from the Backwater. The system of sewage irrigation is also proposed, the estimated cost of the whole works being 27,600l. The scheme is said to be generally approved by the local authorities, and will, it is expected, be speedily carried out. If the town be wise they will allow no time to be lost after satisfying themselves that a really good plan has been obtained.

THEATRICAL.

AMONGST the good things going on at the theatres just now—and there are several—should be specially noticed "Pygmalion and Galatea" at the Haymarket, "The Bells" at the Lyceum, and "On the Jury" at the Princess's. The Greek interior prepared for "Pygmalion" shows care, and is very satisfactory. The statue was modelled by Mr. Burnie Phillip. The writing of the piece is admirable, and, if we mistake not, it will live. Miss Robertson particularly distinguishes herself in it, and Miss C. Hill displays force which few gave her credit for. The acting of Mr. Henry Irving in "The Bells" is a thing to be seen, and places the actor high in his profession.

Covent Garden.—Mr. Augustus Harris has again succeeded in producing incomparably the best pantomime of the season, both as regards its composition and getting-up. The story of "Blue Beard" is followed with consistent burlesque, and the scenery, processions, and ballet are fittingly gorgeous. The review of the troops, with a military revel, is one of the most remarkable scenes of its kind ever presented.

COMMON SENSE IN STAGE SCENERY.

WHEN considerable thought and expense are bestowed, as now, upon the imaginary fairy scenes at our theatres, to satisfy the tastes of the public, as also in competition one house against another, it is very distressing to find that a little common sense is not bestowed upon the scenes of ordinary pieces, especially in reference to the positions of doors and windows. Let me state one example, which is like many, as an illustration of the want of common sense. The fact that the *Builder* was the first who struggled to reform stage-scenery will be my excuse for sending this to you. In the next piece now being played at the Princess's, wherein two of our best actors in their individual walk, and a very promising and improving young actress, take part, there is a scene of an interior, which is made use of more than once, and where, facing the audience, there is a window, showing a distant view of the clock-tower of the Houses of Parliament and the tops of many houses, which, no doubt, is intended to make the audience understand that the river Thames flows between the room in which the action takes place and the prospect seen through the window. Within 5 ft. or 6 ft. of this window, in the same wall, is a much-used door, so much used, indeed, that I was kept in a state of excitement whenever an exit was made, expecting that a violent scream would be heard from the person just departed, on account of his having tumbled headlong into the street, if not into the bosom of Father Thames; and, what is still more ridiculous, in one instance the departed was looked after by

one present in the room, who, gazing through the open doorway, turned his face towards the position of the window. In reality such an arrangement is impossible; in ideality it is truly ridiculous; and I ask again, why cannot a little common sense be brought to bear upon such matters, which destroy all truthfulness in any piece placed before playgoers who may be otherwise carried away with the natural and painstaking acting of the performers? Y.

OXFORD-STREET TRAMWAYS.

By the reproduced and reprinted London Street Tramways (Extensions, &c.) Bill, which was rejected by the House of Commons last year, it is proposed that powers should be conferred upon the company to lay somewhere about 16½ miles of tramway in some of the principal streets of London. The thoroughfares include Edgware-road from Kilburn, Oxford-street, Grand Junction, Marylebone, and Uxbridge roads; Holborn, Holborn-circus, St. Andrew's-street, Shoe-lane, St. Bride-street, Farringdon-street, and Ludgate-circus; Goswell-road, Aldersgate-street, and St. Martin's-le-Grand; the Borough High-street, York-street, and St. Thomas-street, Denman-street and Duke-street; Marylebone-road, Chapel-street, Upper Baker-street, and Albany-street; Harrow-road, Portobello-lane, Westbourne Bridge, Westbourne-terrace, and Bishop's-road; Craven-road, Eastbourne-terrace, and London-street. The promoters bind themselves not to lay their lines upon or along the London Bridge Railway Station or station-yards, or any of the streets, roads, or other approaches leading thereto from the Borough High-street or Wellington-street without the consent of the companies in writing under their common seals. The railway companies will not be the only or the most formidable opponents of the proposed tramways.

INAPPROPRIATE CLOSING OF THE BRITISH MUSEUM.

STRELY some of our public institutions are managed with very little wisdom. On New Year's day the British Museum was closed for the purpose of being cleaned and making additions to its collections. It will be re-opened to the public on Monday next, the 8th inst. But why close it on New Year's day; another week would surely answer the purpose if it need be closed at all. We saw scores of holiday people within a brief space of time, who had toiled up to the Museum looking with dismay at the intimation that they had toiled for nothing, and worse than that, that their day was spoiled. Let us suggest to the trustees that another arrangement should be made next year.

THE DESTRUCTION OF BOILERS.

SIR,—My engine boiler, a Cornish one, nearly new, is much pitted or eaten on the upper side of the flues, which I attribute to the alum in the water. Of course it never encrusts or "furs up." I think of introducing some hot lime into it, to counteract the sulphuric acid of the alum. The boiler is now empty and dry, except the small "pits" (which are nearly half through the plates, and about ½ in. diameter), which are wet with a fluid of rather a sweet taste and of iron. Will any of your engineering friends assist me? W. D.

THE MINEHEAD RAILWAY.

THE first turf of this line was cut on the 28th ult. The contractor for the execution of the works is Mr. Frederick Furniss, of London. The finances requisite for the undertaking have been raised independently of the public. This branch line of railway leaves Watchet by a junction with the West Somerset Railway; and it was intended in the original Bill to cross the two turnpike-roads (one of which leads from St. Donnans, and the other from Doniford to Watchet) by level crossings; but, on the representation of the inhabitants of that place, it was afterwards arranged to divert the least important road, and the other to cross over the railway by a bridge near Mr. Thorne's yard, thence through the pasture-field, over the mill-stream and meadow, and cross the Mineral Railway at Whitehall, running by the side of that line up the valley, until within about half a mile of Washford. It then curves to the right and enters a

deep cutting on the north side, and closely adjoining the turnpike-road at the Green Dragon stop-gate, this being the most important piece of work throughout. Soon after it enters the valley at Old Cleve, and runs down to the sea at Bradley-gate, where it is intended to erect a station for Blue Anchor, Carhampton, &c. Thence from this point it runs parallel with the seashore, and between Higher and Lower Marsh there will also be a station for Dunster, &c., which is rather over half a mile distant. Afterwards it is a perfectly straight and level line to Minehead, the terminus being near the beach. The contractor is to complete his undertaking by the end of the year 1872, and the railway will afterwards be leased to and worked by the Bristol and Exeter Railway Company, with whom terms have been arranged.

COMPETITION, BERLIN.

WE are requested to announce that the First Commissioner of Works has received a programme for the erection of a new House of Parliament at Berlin, for which the architects of all nations are invited by the Imperial Government to compete. The particulars will be reprinted for the use of architects, and be ready for distribution at the Office of Works on Monday next. The designs will have to be sent in to the Imperial Chancery at Berlin, with the authors' names, before the 15th of April next, and a prize of \$144 will be given for the best design, and a fifth of that amount for each of the four next best designs.

"JACK PLANE"

SIR,—Would you oblige me by receiving the enclosed is. (stamp) for the benefit of the widow and children of the late Mr. Randall (Jack Plane), and at the same time allow me to appeal to all working men who have been readers of the sensible, manly, outspoken letters our deceased friend was in the habit of writing in the *Builder*, to contribute a trifle, according to their means, and so in some measure to console the widow and fatherless. An accident, any day or hour, might reduce those near and dear to us to poverty. OSES A. TATTON.

SURRENDER OF HOUSES BY A BANKRUPT TO THE SELLER.

IN the Court of Bankruptcy, before Mr. Registrar Spring Rice, in re Lessor, Mr. Webster, on the part of a debtor, who is a builder, made an application to the Registrar, under the 23rd section of the Act, under the following circumstances:—Shortly before he presented a petition for liquidation he had contracted with the owner of some building land to purchase two carcasses of houses and fit them up, and he now wanted to surrender them to the seller.

The Judge said that in all bankruptcy cases such an application could only be granted after notice. Mr. Dalton, who represented the trustee, stated that there were no rights of third parties to be interfered with. It appeared that a building contract had been entered into, between a person named East, and the petitioner, that Lessor should buy two carcasses in Tuffnell Park-road, at a ground-rent of 8s. each, Lessor contracting to finish them, and lay out 300l. The trustees were most anxious to disclaim the property, inasmuch as the charges upon it would be more than its value, and they were in this position,—they must either disclaim or be called upon by the ground landlord to complete the contract.

Under the circumstances of there being no third parties to be injured, the application was granted.

THE QUESTION OF WAGES.

WE are requested to state that a copy of the following has been forwarded to the employers in the building trade of London and vicinity:—

"Paviors' Arms, Johnstone-street, Westminster, January 1st, 1872.
SIR,—As the representatives of the Operative Stone Masons' Society in London and district, we again take the liberty of addressing you, in accordance with a resolution passed at a general meeting of the above-named society in reference to the nine-hours question, and in the matter appertaining thereto, viz., the question of wages. And in referring to these questions, we would beg leave to draw your attention to the rigid and daily increasing adoption of the nine-hours system throughout the country, and to the innumerable number of artisans that will commence that system from this day, at the same wages for the nine hours as they previously received for ten hours; and in many cases this has been conceded by the employers without a request from the employed. Another significant fact that we would call your attention to, is, the adoption of the nine-hours system by several of the large railway companies,—a class of employers that hitherto have not proved themselves very anxious to meet the just demands of those in their employ, not even sufficient to secure the public safety. Seeing such to be the case, and knowing that employers in the building trade of London and its vicinity have generally been unwilling to meet any just requirements of those in their employ, providing that reasonable notice of those requirements be given to insure the employers against any serious loss, we therefore beg to give you notice that the masons of London and its vicinity are desirous of continuing the nine-hours system, as at present established, all the year round, instead of expiring on the 15th of February, as

now arranged, and that we are willing to work at the present reduced rate of wages for the next six months; and that on and after the 1st of July, 1872, the wages be 8d. per hour, making our average weekly wages, as near as possible, the same under the nine-hours system as that hitherto received for the ten hours.
We hope, sir, that, in considering this request, you will keep in view the foregoing remarks, and grant us a favourable reply at your earliest convenience.—I remain, sir, your obedient servant,
P. WILSON, Secretary to the Committee.

Resolution passed at a General Meeting, Nov. 30th, 1871.—"Resolved, That our committee memorialise the master builders of London and its vicinity, asking them to concede the nine hours permanently, after February 15th, 1872; and give notice, at the same time, that on and after the 1st of July, 1872, we shall require an advance of 1d. per hour."

BUILDING ACT CASES.

AT the Woolwich police court, before Mr. Patterson, on Wednesday last, Mr. Collis, district surveyor, summoned Mr. William Tamsett, builder, of Charlton, for neglect to give notice for certain works done at No. 1, Inkermann-terrace, Charlton; to wit, constructing brick-work and flue to two coppers, the plan set forth being that the work was there before, but required rebuilding. The magistrate decided that Section 20 brought the work within the rules. Penalty, 20s.

HOUSE-DRAINAGE.

SIR,—An article in your valuable journal of last week, under the above, and signed, "D. A.," suggests that corporations should take this work entirely into their own hands, it being the only means of having satisfactory drainage. I would venture to suggest that the "respectable builder," or firm, should be employed for this work, without being subject to cutting down the price to the lowest fraction, which, of course, leaves no alternative but to encourage bad work. Is drainage the only work found fault with? Is it not a fact that works of every description have to be done over again simply because the "respectable builder" is cut out of his work through men who know or care not how work is done, so long as they make a profit? Who, may I ask, is to blame in this matter? Is it to be supposed that a speculative builder has no more sense than to spend 30l. or 40l., in order to make a good and complete job, if he is only to receive one-half this amount from his client in return? Again, are corporate bodies, as a rule, of perfect perfection? Would it be impossible for such a body of gentlemen to have the pipes laid to the wrong inclination, or even upside down? Let the public be satisfied to pay a fair price to respectable men, and doubtless they will get fair work in return. W. H. W.

THE ACTUAL CONDITION OF WARWICK CASTLE.

THE Chairman of the "Warwick Castle Restoration Fund" has sent us the following report on the condition of the building:—

Dec. 28, 1871.

DEAR SIR,—In reply to your request that I should send a statement of the extent of the destruction caused by the late fire at Warwick Castle, I beg to forward you the enclosed report.

The most ancient parts of the Castle are the vaulted basement under the state rooms, hall, &c., the main wall on the river front, some internal walls, and the towers and gateways on the courtyard walls. All these are uninjured by the fire.

The international decorations have been executed at periods ranging from the date of Charles II. to the present time.

The distinction between the state apartments and those used by the family is not so marked as has been supposed.

The whole of the rooms have been more or less occupied.

The present family, in order more freely to admit the public, have chiefly inhabited the east wing, but have never given up occupation of the rest when occasion required.

The main walls of the east wing are of the same date as the west. The rooms have been entirely reconstructed, and some years have been spent in decorating them with objects of antiquity procured from Italy and elsewhere.

The following is a list of the rooms and principal objects destroyed:—

The Hall—totally, except the outer walls, the roof of which was constructed about forty years ago, when the remains of a very early roof were discovered (1150). The panelling was of the

state of Charles II. All the furniture, chests, desks, embroidery, tapestry, the principal portion of the armour, including the buff coat of Robert Lord Brooke, and Charles Edward's sword, are entirely lost.

The Marble Floor is also much damaged. The Large Dining-room—partially injured. Breakfast-room (*temp.* Charles II.), the Library, Lord Warwick's Sitting-room, and Staircase are totally destroyed.

Lady Warwick's Boudoir—Partially burnt. Three rooms had been recently reconstructed and filled with ancient furniture and fittings, comprising Italian chimney-pieces, doorway and pilasters from Rubens's house at Antwerp, old Italian bookcases, tables, &c. The most valuable books and pictures were preserved; but a portrait of Francis, Earl of Warwick, by Gainsborough, a portrait of the first Lord Brooke, and various others, were destroyed.

Above were seven bedrooms, furnished with old leather pictures, carving, &c., all totally destroyed. Above the dining-room were three large bedrooms, with other rooms above them; these also are destroyed, as well as three rooms on the asement.

The contents of the dining-room, state rooms, and armoury passage were removed, and are injured. The whole of the state rooms and chapel west of the hall were not touched by the fire.

A. SALVIN, JUN."

CONSECRATION OF RYDE PARISH CHURCH.

On Tuesday the new parish church of Ryde—the corner-stone of which was laid in August, 1869, by the Princess Christian, as the representative of her Most Gracious Majesty the Queen, and which has been built by Mr. Gilbert Scott, R.A.,—was consecrated by the Bishop of Winchester.

The structure is not yet completed. The tower and spire are not commenced, and the ornamental details of the exterior are not fully carried out. The north porch, too, is not at present begun. The great east and west windows are by Messrs. Clayton & Bell. The interior carving of the church has been executed by Messrs. Farmer & Brindley. The capitals of the arcades are cut in foliage, natural leaves alternating with conventional through the series. The pulpit is of variegated alabaster, and is based upon a cluster of fluted columns of polished Derbyshire marble. It is octagonal, two of its sides being open to form an entrance; the other six are deeply sunk in panels, into each of which are introduced subjects sculptured in white alabaster, each panel comprising two representative figures of Old and New Testament or pre-Nicean saints and martyrs. Thus there are combined Isaiah and Jeremiah as prophets; St. John the Baptist and St. Barnabas as preachers; St. Peter and St. Paul as apostles; St. Stephen, St. Alban, St. Agnes, and St. Catherine as martyrs; the sixth pair being the Virgin Mary and Mary Magdalene. This work has been executed by Messrs. Twigg, of Ashford, Derbyshire; and the panels are by Messrs. Farmer & Brindley.

THE SMOKE NUISANCE IN BRISTOL.

A few days ago Mr. Arnold Taylor, of the Local Government Office, attended at the offices of the Board of Health, Bristol, in pursuance of a memorial from certain ratepayers, to make an inquiry with reference to the smoke nuisance in Bristol. A large number of tradesmen and others tendered evidence to prove the existence of a great nuisance in smoke, soot, and deposits of small coal. Among the large establishments generally complained of were Messrs. Fry & Sons' cocoa manufactory, Messrs. Finzel's sugar refinery, Counterslip; and the Porter Brewery, in Bath-street. The proceedings lasted about six hours.

At the close, a discussion took place, in the course of which the Government Inspector said his opinion was that an inspector should be specially appointed to look after the smoky chimneys, and he suggested that other cases might be taken before the magistrates. The smoke nuisance would never be abated in large towns until they got the local authorities to take severe measures, and make it a matter for general police duty. They had a stringent Act in London, and it was put into the hands of the

police, and every policeman on the beat had orders to report every case of smoke nuisance to his inspector. The Inspector mentioned incidentally that in Bradford the local authorities had taken the matter in hand, and the nuisance in that town had been reduced quite 50 per cent. What he wanted the Board of Health to do was, to look at it in this light, that a smoke nuisance was a preventible nuisance, and that it could only be dealt with by careful and continuous inspection; and he suggested that the Town Council might appoint a Smoke Committee independently of the Board of Health. Eventually the Inspector intimated that he should report what he had heard to the Local Government Board.

Books Received.

"CHOLERA and Typhoid Fever: a Plan for the Collection and Disposal of Sewage on the Separate System. By J. B. Waring, F.R.I.B.A., &c. Day, Savoy-street, Strand." Mr. Waring here advocates what seems to us a very impracticable system, however correct it may be theoretically; and above all impracticable on the great scale for towns. The Moulle dry-closet system is a good one, as an adjunct in country districts, or in or adjoining bedrooms for the use of the sick, &c.; but Mr. Waring out-Moules even the Moulle system. He says,—

"The plan I propose is this. Keep the fluid and solid refuse of your houses carefully apart. In every house there should be a well-built and spacious soil-shaft, with which every closet is to be connected. The seat of the closet is furnished with a pan having two separate vents, one for the liquid, the other for solid excreta. The liquid will flow off into a tank or reservoir prepared for its reception alone, and furnished with a tap, by which it can be taken off as required, and either be converted into ammonia, be used for any manufacture in which ammonia enters, or be otherwise utilised. The seat itself, when pressed on by the body, should cast a superficial layer of earth, sand, or soot, on the bottom of the pan,—the soot might be collected or kept in the house for the purpose; the excreta deposited, a covering layer of sand, earth, or other deodorising material, should be discharged over it, as in the earth-closet patented by Moulle. The pan should be furnished with a reversible bottom, and the excreta, thus thoroughly enclosed by a deodorising coating, will fall into the soil-bin beneath, forming altogether a very powerful manure, and be taken away at stated intervals by our present chulupen carts: by steam-carriage in large towns, and by carts in small, or by hand in villages, to properly-constructed receptacles in the country, and be sold (I believe at a very great profit) for manure, either in the immediate neighbourhood or wherever desired, with perfect ease, and with freedom from danger to health to any human being. We shall thus, by the aid of a little thought and care, have transformed our demon of death into an agent of life.

The ash and dust bin may be kept separate from the soil-bin; that is a matter of the simplest arrangement, and can be easily effected by a separate shaft. The servants' closet might be separate, and attached to a separate shaft, having special openings to the dust-bin and liquid tanks, for the ridance of basement refuse. We have still the slops of our houses to deal with; and this is yet more easy, by means of a sink in one side of the closet, communicating by a pipe with the special slop-tank beneath or by connection with the sewers, which are to convey away fluids only."

So, even on this system, we come to sewers and tanks at last. And yet Mr. Waring says:—

"Cesspools, drains, and sewers form a legacy from our forefathers which we shall act wisely henceforth to repudiate. Cesspools are generally abolished; drains and sewers we still stick to, and they to us. By the addition of more water, great care, improvements of construction, and the separation of the liquid from the solid matter at the reservoir, we shall have freed ourselves from their most deadly results; but we have only 'scotch'd the snake, not killed it.'"

—"Specification of Sir George Bowyer, bart., for Improvements in the Construction of Road Tramways. Clayton & Co., Whitefriars, Printers." Sir George has patented a simple plan of laying a tramway in asphalt, the wheels merely running in an easy groove a little below the level of the road, and into and out of which they can readily go. The asphalt is to be laid upon concrete, and can be drained by pipes beneath. If sharp-edged wheel-tires, he notes, wear the asphalt rapidly, they may be rounded off. This might be done in the case of the cars, but other wheels might waste the asphalt as well. —The Garden says,—What a pity it is we do not contrive some less expensive and more attractive way of destroying the thousands of evergreens planted about London every year, than that of planting them and allowing them to be blacken and perish before our eyes from the effects of our smoke-pestilential air. There perish annually as many beautiful young evergreen shrubs and trees in and near London from smoke as would suffice to plant a whole country. We know no greater evidence of obtuseness of mind than is shown by this persistent wasting of precious time and precious energy, and destruc-

tion of healthful and beautiful young evergreen trees and shrubs. It cannot be too widely known to every town-planter that so long as we are satisfied to live in a sea of the refuse of our fire-places, so long shall we find it impossible to have in cities healthy specimens of vegetation that retain their foliage in winter.—The *Art Journal* for the new month, says of Japanese Paper:—"Upwards of 250 distinct species of paper are manufactured in Japan. Many kinds made in the distant provinces are submitted to a distinct process in Yedo, and each kind has its distinctive name. Specimens of all these have been deposited, by the care of the Foreign Office, at the South Kensington Museum. We have little doubt that the manufacture of paper in this country will be affected by the acquisition of this valuable knowledge as to the mode of preparation of an article very superior to our own. The point most against the introduction of the hark of the *Bronssonetia* to our mills is, that it is not until the fifth year that the stools or shoots of the tree, resembling the shoots of the hazel in English coppices, are available for hark. The importation of the peeled fibre will probably be attempted. The substitution of a finer vegetable paste for any coarse and inferior size is no doubt one great cause of the excellence of the Japanese paper. The Tororo root would probably bear exportation as well as the fibres. If perfectly clean and pure fibres and roots were introduced, and Japanese workmen induced to show the process employed by them to the foreman of one of our mills, there seems little reason to doubt that, with the aid of our excellent machinery, we should soon produce such admirable paper as the world has never yet seen."

Miscellaneous.

Warwick Castle.—On Tuesday evening in last week, the second meeting of the Warwickshire Archaeological and Natural History Society was held at the Court-house, Warwick, when Mr. Tom Burgess, of Leamington, gave a brief history of Warwick Castle, from the earliest period to the time of the "King Maker." The lecturer gave an interesting account of the ancient earthworks yet remaining on the line of the Avon, and pointed out that these were evidently the frontier fortresses of an early tribe. Warwick was doubtless one of these frontier posts, and the mound in the court-yard was probably the site of this fort, if not the original mound itself. The subjection of Warwickshire to the Romans was dwelt upon, and then Mr. Burgess read the extract from the Saxon chronicle giving an account of the erection of the castle at Warwick in 913, not 915, as stated by Dugdale. This castle was one of a series of frontier Saxon fortresses erected by the daughter of King Alfred to repel the incursion of the Danes settled in Derbyshire and Leicestershire, on the east of the Watling-street Road, under their chief, Guthrum. The story of Gny and the Dun Cow was traced to the contemporary conflicts with the Danes, for Dun Cow was probably but a corruption of Dancgang. Sketches of the original fortresses, and the probable appearance under Ethelred, and Turchill, were made on a black board. The demolition of the old castle, by the adherents of Simon de Montfort, led to a summary of the progress of military architecture, and the present castle of Warwick owes much of its design to the lessons gained at the famous siege of Kenilworth, and the subsequent Scotch and French wars. It was this experience of the powers of attack and defence which induced Thomas, Earl Beauchamp, to erect the towers and outer defences on the east of the castle, as we see them now. Some floral legends connected with this period, the *planta genista*, the forget-me-not, and a peculiar Warwickshire legend of the red rose were related. The fact that Wycliffe translated the Bible, and that Chaucer and Gower were living during the building of the castle, was mentioned.

Photographs enamelled on Copper.—The *Illustrated Australian News* states that at Clunes a photographer named John Tanner has, after four years' labour, succeeded in producing photographs enamelled on copper. We may state, however, that five or six years ago a photograph was sent us from Canada which seems to have been enamelled on zinc. It had all the delicacy and fine texture of a daguerreotype without its metallic glance.

International Trade-marks.—The following American case is reported by Haselme, Lake, & Co., patent solicitors:—"An equity suit respecting trade-marks, of international interest, was recently decided in the United States Court for the Washington district. The suit was instituted by Mr. David A. Burr, counsel for Rogers & Sons, the celebrated cutlers of Sheffield, against Philp & Solomons, contractors to the Treasury department, for the supply of Rogers & Sons' cutlery. The plaintiffs alleged that the defendants had supplied counterfeit articles with their trade-mark, and they asked the court to grant an injunction, and claimed heavy damages. The defendants did not deny the sale of imitation articles or the use of the trade-mark in question, but proved that these articles were manufactured in Prussia by a firm known as Rogers & Sons, who use the trade-mark under a royal licence, and that Prussian cutlery bearing this trade-mark had been extensively imported and sold in the United States for many years, and also that the plaintiffs had not registered their trade-mark, as provided by the recent Patent Act. The defendants contended that the suit could not be maintained in view of the above facts. Wylie, J., refused the injunction chiefly on the ground that the plaintiffs had, by their acquiescence in the infringement, waived their right to assistance from the court, and he also stated that the Prussian firm was entitled to the use of the trade-mark where the cutlery was manufactured. The acquiescence of the plaintiffs was presumed, no evidence being offered to show that the trade-mark had been used with the consent or knowledge of the Sheffield firm. The judge did not comment upon the fact that the plaintiffs had not registered their trade-mark in the United States is now a matter of the first importance to English manufacturers and merchants, for which provision was made in the Act of last year."

Building Materials and Fire.—Mr. Mullett, the superintending architect of the Washington Treasury Department, U.S., has been interviewed. He says:—"Cast iron, absurd as the statement may appear, will not resist as much heat as good sound oak timber of the same dimensions. Fire expands the iron and warps it and breaks it very easily. Indeed, if oak timber should be treated by any of the processes of liquid silicate, it may be considered almost a fire-proof material compared with cast iron. As for stones suitable for building purposes, as I told you before, there are few that are fire-proof, though some approximate the necessary conditions, and, except in severe conflagrations, may be generally depended upon. Granite, marble, and sandstone are not to be trusted, as they soon perish by exposure to the heat, as has been shown a thousand times. But I am strongly in favour of liquid silicate as a preparation for wood to be used for building purposes. My attention was directed to this material some years since, but I have not had an opportunity to investigate the subject fully. I believe, however, that it merits more attention than any other suggestion that has been made public, and may yet prove one of the most practical solutions of the question of non-combustible construction that has yet been offered. Whether this or some other process for making wood incombustible is the more desirable, I am not prepared to say. I am, however, decidedly of the opinion that any process by which wood can be rendered non-inflammable at a reasonable cost would not only be an inestimable blessing to the public, but its use should be rendered imperative by law."

Accidents.—On Tuesday, during a heavy gale, a large brick building, the Rosebank Engineering Works, at Bonnington, near North Leith, was blown down. The loss is said to be upwards of 4,000l. Three or four men had a narrow escape.—While the petty sessions were being held in the village of Killybeg, in Leitrim, the floor of the court-house gave way, and about 300 persons fell to the ground floor, a height of 18 ft. The magistrates and attorneys escaped unhurt.

Motive Power for Street Vehicles.—It is reported from New Orleans that a new way has been discovered to use ammonia as a motive power, the principle being that of the ice-making machine. Motion is obtained by rapid evaporation and energetic absorption. An ammonia-engine is said to have made 800 trips, and drawn a car at a much cheaper rate than it could be drawn by horses.

The Royal Institution Lectures.—Dr. J. Tyndall, F.R.S., is delivering a series of six lectures "On Ice, Water, Vapor, and Air," at the Royal Institution. In his second lecture he illustrated a subject to which we adverted in speaking of the address of the president of the last meeting of the British Association,—namely, the principle of arborescence, in what we may call mineral life. Professor Tyndall showed some beautiful examples of crystallisation by making salts and metals deposit crystals from small quantities of their solutions placed in the electric microscope. Silver and lead ferns appeared as if endowed with life; crystals of ferrocyanide of potassium were seen growing, in pulsating waves, as if the crystallising force had to accumulate strength every few seconds to overcome some resistance,—a phenomenon which has not yet, it is believed, been investigated by men of science; at all events, the lecturer said that it was a novel observation to him. Crystals of chloride of ammonium grew, like delicate and graceful ferns. Finally, the lecturer showed how, beam by beam, Nature builds up the crystals of ice, every portion of the structure being singularly beautiful; and he melted a thin slab of ice in the electric microscope, so that the observers could see on the screen the star-like forms of which it is built up. Both old and young listened to the lecture, as usual, with the greatest interest and pleasure. The theatre was filled to overflowing, many of the listeners being only able to obtain standing-room.

Mr. Ruskin's Christmas Gift.—In his twelfth number of "Fors Clavigera" Mr. Ruskin tells his working-class readers that he has made them the Christmas gift he promised—7,000l. Consols in all clear—"a fair (dike)," he says, "of what I had, and to as much perpetuity as the law will allow me." He adds:—"It will not allow the dead to have their own way long, whatever licence it grants the living in their humours, and this seems to me unkind to those helpless ones. Very certainly it is inexpedient for the survivors, for the wisest men are wise to the full in death; and if you would give them, instead of stately tombs, only so much honour as to do their will when they themselves can no more contend for it, you will find it good memorial to them, such as the best of them would desire, English law, he thinks, needs mending in many respects; in none more than this. As it stands, he can only vest his gifts in trustees, desiring them, in the case of his death, immediately to appoint their own successors, and in such continued succession to apply the proceeds of the St. George's fund to the purchase of land in England and Scotland, which shall be cultivated to the utmost attainable fruitfulness and beauty by the labour of man and beast thereon, such men and beasts receiving at the same time the best education attainable by the trustees for labouring creatures, according to the terms stated in his book.

Proposed New Swimming-bath and Public Bathing Station at Brighton.—A memorial is now in progress of circulation, which will shortly be presented to the Town Council, petitioning them to lease a portion of the beach, opposite the Norfolk Hotel, to Professor Cavill, the champion swimmer of the South Coast, for the purpose of erecting a swimming-bath there, and also for the formation of a public bathing station. The size of the proposed bath is 60 ft. by 30 ft. It will be provided with about thirty dressing-boxes, and will be built of concrete below the beach up to the height of 12 ft. or 14 ft., the top being surrounded by a glass screen, something after the style of those used at the head of the West Pier. Mr. W. W. Eldridge, of Brighton, is the engineer. The bathing station would be situated on the southern side of the bath, and would be screened from the public gaze by canvas stretched on poles, and reaching from the eastern and western walls of the bath down to the water's edge.

Hoardings in Newington.—The *South London Chronicle* says:—"A very necessary precaution has been taken by the Newington Vestry. Builders must in future put up hoardings before pulling down old houses on the Walworth-common Estate, and where footways are disturbed a temporary planked footway must be provided. But why limit these provisions to this one estate?"

Edinburgh.—The North Bridge is to be altered and widened at a cost not to exceed 10,000l.

Cheap Telegraphic Communication with America.—It is proposed that the Government of Great Britain and the United States should purchase the existing cables and newfoundland land-lines, paying for the same by terminable annuities, and charging only such rates for the use of the cables as will meet the annual interest charge. For this purpose, one fourth of the existing tariff would suffice for the present,—that is to say, messages of ten words could be carried for 10s., instead of 2l. It has been found that with each successive reduction in rates the use of the telegraphs has enormously increased, as is evidenced from the fact that the earnings are now much greater with the rate at 2l. than they were formerly at 20l. per message. It is believed that the reduction to 1s. per word would not be final, but that still further reductions might be made, and the number of cables increased on the same plan of terminable annuities, without becoming any burden on the two Governments. The attention of the various Chambers of Commerce in Great Britain is being called by this question by Mr. G. T. Smead, of 21, Mincing-lane, London.

Accommodation for Private Patients in the Fever Hospital, Islington.—The pauper-poor asylums having now relieved the Liverpool-road hospital of the very poor, the committee have rendered the hospital available for the reception and treatment of other classes of cases, including the working class not receiving parish relief. Patients will be admitted into the general wards on the recommendation of a governor or annual subscriber of one guinea, or, as heretofore, on payment of two guineas on admission, or of one guinea weekly. For such patients as require isolation and better accommodation, eight large rooms have been prepared and furnished with every requisite for comfort, in which a single patient, or two children of the same family or from the same school, can be received. The payment for one of these rooms, with the attendance of an experienced nurse, and the care of the resident medical officer and physicians, and including food and medicines, has been fixed at three guineas per week. Members of working men's families will continue to be received into the hospital on much lower terms, we presume, than these.

Arbitration Case.—A case of considerable interest has just been concluded at the Westminster Palace Hotel. The Ryde Corporation have determined upon purchasing the works of the Ryde Gas Company, and the latter being willing to treat for the sale, the price was left to arbitration. The witnesses for the Corporation considered the value to be under 30,000l., and based their calculations upon a 16½ years' purchase of the net annual profit, which they placed at 1,800l. This they considered fair, as though the company is incorporated by Act of Parliament, they thought it should not be treated as such, while the Corporation had the power to purchase. On the other side, it was argued that the company was incorporated, and was thus entitled to a twenty years' purchase. They placed the annual profit at 2,800l., and if this calculation was adopted, and a further sum allowed for surplus land and plant, the company would be entitled to a sum of over 60,000l. The arbitrators, Mr. Cawley, M.P., and Mr. Hawksley, C.E., with Mr. Hunt as umpire, have taken time to consider their award.

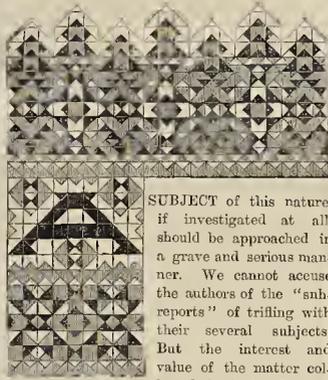

Pre-historic Relics in Cumberland.—At the last ordinary meeting of the Manchester Literary and Philosophical Society, Mr. R. D. Darbishire, F.G.S., gave an account of a remarkable discovery of pre-historic relics in Eden-side or Gihl Tarn, near Brunsfords Station, St. Bees, Cumberland. The find is a remarkable one, and is said to be, so far, unique in England, affording apparently a characteristic instance of the forest moss-pits. A watchful observation had failed, so far, to detect any traces of piles or platforms, such as indicate what are known as lake dwellings. Mr. Darbishire exhibited and described a series of cells, more or less highly finished; certain very interesting specimens of wooden huts for cells, clubs, and paddles; a quern, and several remarkable grinding-stones of different forms; and fragments of rude earthenware, found by Mr. Finham, of Quayle, and himself.

The Inventors' Institute.—A paper on "Inventions and Patents connected with Buildings," by Mr. Banister Fletcher, will be read this Thursday evening, the 4th of January.

The Builder.

VOL. XXX.—No. 1510.

*The Coal Question a Serious Subject.**

SUBJECT of this nature, if investigated at all, should be approached in a grave and serious manner. We cannot accuse the authors of the "sub-reports" of trifling with their several subjects. But the interest and value of the matter collected, is frittered away,

instead of being augmented, by each succeeding distillation; until in the ultimate Report of the Commissioners, which is that to which the public look, it becomes absolutely *nil*; or, in fact, assumes a negative value, as tending to show that nothing sensible can be said on the matter. Now it so happens that Professor Jevons published his work "On the Coal Question" in 1865, and that he there gave an estimate of the consumption in 1871, which has been almost exactly verified. Here, then, is a statistical expectation, which certainly deserves much more respectful treatment than to be put on all-fours with the optimistic speculations which we have just dissected. Indeed, when it is borne in mind that, while the general population of Great Britain may be roughly said to double itself in a century, the population of the larger towns, the great consumers of coal, tends to double itself in less than half that period, it would seem as if the most probable error of Mr. Jevons would be in defect, rather than in excess. In support of this view it should be remarked that the returns for the ten years from 1859 to 1869 show a rate of increase much nearer to 4 per cent. than to the 31 per cent. taken by Mr. Jevons.

In face of the protest of Sir Roderick Murchison, we must treat the question of the existence of workable coal, beneath the cretaceous and other secondary rocks in the South of England, as one which it is impossible, at present, seriously to discuss. The most salient points, therefore, which we consider that a competent reporter would have elicited, from the inquiries and evidence brought before us, are these.

The deepest colliery in England has a shaft of the depth of 2,376 ft., which is still being sunk. From the depth of 1,800 ft., to that of 2,376 ft., the increase of temperature becomes more rapid than is the case in the first 1,800 ft. The temperature of the earth, in this shaft, at the depth of 2,376 ft., is 92° Fahr., or 4° higher than that which would result from the data relied on by the Commissioners, but within 1° of the rate which we have ourselves adopted. At a depth of 2,706 ft. (neglecting the disparity of increase above shown to exist), the coal in this pit would become unworkable, without some as yet uninvited aid to the respiration of the miners.

Some of the Belgian coal-mines are stated

to be carried deeper than any in Great Britain. At *La Mouille longe*, a boring was continued for four years, from 1853 to 1857; and the enormous depth of 920 metres (or 3,017 ft.) was arrived at, without passing out of the coal measures. The Commission has not thought it worth while to seek for the practical test to which their theories might be put, by ascertaining the facts of the Belgian mines. The rate of increase of temperature indicated by this boring, is considerably higher than were the highest assumed from English data, and a variation in the rate, at increased depths, also results from the experiments.

In the Monkwearmouth Colliery, at a depth of 1,640 ft. from the surface, the physical powers of the miners begin to flag at a temperature of some 80° Fahr. Medical evidence is not required by those who are familiar with the effect of the summer heat of Egypt, of Algiers, or even of Italy, Portugal, Spain, and the South of France, on the English constitution, to inform them that the rise of every single degree above 81°, is accompanied by a sensible loss of the power of exertion. This temperature may be expected at the depth of 1,920 ft., and with every additional nine or ten fathoms, additional difficulty, exhaustion, and consequent cost are experienced by the miners.

It results from this view, that our national anticipation of a successful winning of our coal, at a depth much exceeding 2,700 ft. must depend on the result of a method to which the Commissioners have alluded, without seeming to be at all aware of its crucial importance. It is to the introduction of pneumatic machinery, that we are indebted for the completion of the Mont Cenis tunnel; not only on account of the mechanical advantage thus obtained, but also in virtue of the effect on the air of the tunnel, produced by the constant escape of the compound air that is forced in to work the machines. Mr. Lindsay Wood gives evidence that the air escapes from coal-cutting machines at a temperature of 7° Fahr. below freezing. But if, by the employment of such machines, or even by the introduction of special pneumatic arrangements for the purpose, the air would be so reduced in temperature as greatly to extend the zone of depth penetrable by the miner, all mines infested by fire-damp, or choke-damp, would be excluded from a benefit inconsistent with that voluminous ventilation, which alone can adequately dilute, and sweep away, the fatal gases. It is characteristic of the Report that it does not refer to this most important question. The "Sub-report of Committee A" contains a brief paragraph on the subject. The value of the collateral evidence obtainable at Mont Cenis, does not seem to have occurred to any of the reporters.

The only condition, therefore, from which we can at present calculate, with any practical wisdom, on the productive working of our collieries at a depth beyond 2,000 ft., is that of an adequate supply of air of a lower temperature. It would be possible, even in the summer, to deliver a ventilating current of a temperature little, if any, above 50° Fahr. at the entrance of the galleries at a considerable depth. But the deeper the shaft, the longer, on economical grounds, must be the working galleries, and the more will the temperature of the ventilating current be raised, by passage through the mines. This rise in temperature, which is somewhat unintelligibly alluded to in the Report, appears to be directly as the length of gallery passed, whatever be the volume of the current. It is rapid, of course, in proportion to the differences of the temperatures of the earth and the current, but is comparatively unaffected by the velocity of the latter; but any attempt to lower the temperature of a mine, by giving double rapidity to the ventilation, while it requires eight times the power, produces but inconsiderable results. In

Rosebridge Colliery, a column of air was raised 19.5° Fahr. in a course of 3,140 yards. The earth temperature here is only 80° Fahr. The results of such a length of passage, through galleries of 10 or 15 degrees higher temperature, would be far more marked and unmanageable.

Without undergoing the labour of remodelling details, on a plan which the Commissioners ought themselves to have regarded at least as an alternative, we are yet in a position now to state that the available quantity of coal on which we can, with any prudence, depend, must be very far less than the 146,480 millions of tons which the Report states "may be reasonably expected to be available for use." Instead of calculating the contents of a zone of 4,000 ft. in depth, we see that we are only justified in expecting to penetrate (with our present experience, and at anything like our present cost) to a depth of some 2,700 ft.; which is 32+ ft. deeper than our present deepest shaft. At, or even above, this depth, the soil is of the heat of the blood; and the rapid heating of the air, according to our present best methods of ventilation, would be such as to render workings, of a length at all proportionate to the expense of the shaft, quite intolerable for human labour. Besides the 13-40ths thus to be deducted, a further allowance, undefined but considerable, must be made for poor coal, and for seams above 12 in. in thickness, but too thin to be profitably worked at a great depth. Thus, for instance, in the Somersetshire coal-fields, the total thickness of coal in forty-six seams is only 98 ft. 4 in.; giving an average of 2.13 ft. for a seam. In the Golden Valley collieries, a depth of 1,920 ft. has been reached, and the cost of bringing the coal to the bank is said to be about 8s. per ton. It is thus clear that an effort to win coal from a considerably greater depth, out of the 6,000 ft. or 7,000 ft. of which these coal measures consist, is likely to be counteracted by commercial considerations. The modest term of 4,219 years for which this district will be able, in Mr. Prestwick's opinion, to maintain a yield equal to its present product, thus becomes a vanishing quantity. No engineer, with all the latitude of estimate with which the profession are sometimes reproached, could be justified, on the evidence adduced, in making the probable quantity of available coal, in the coal-fields of the United Kingdom, reach the amount of 100,000 millions of tons. The 110 years which Professor Jevons allows for final exhaustion must be, in common prudence, proportionately diminished in duration.

The check upon consumption that will be effected by a rise in price, is another of those essential elements of the question which are ignored by the Report. But for a hint on page xviii, it would seem as if the Commissioners were not aware that such a commercial question had any existence. This hint only makes the neglect still more glaring. There are many reasons to lead us to expect an immediate increase in the price of coal. To say nothing of the nominal increase, due to the steady influx of gold, we may remark, on the one hand, the uneasy feeling among the coal-miners, and, on the other, the mode in which winning is becoming more costly and hazardous, in such cases as those of the Golden Valley and the Monkwearmouth collieries. Whatever be the reason, there can be no doubt that the Commissioners, to use their own language in a note that forms an awkward comment on the text, "are taking the most favourable view in reference to deep working that the evidence will possibly allow" (p. 82). In fact, the idea of the propriety of that course of action on which Committee D (p. 118) so *naturally* plume themselves that they "have done all in their power to allay the fears of those who have thought that the national supplies of fuel must terminate," appears to have been the real motive of the Report.

* See p. 2, ante.

Such a mode of dealing with the subject is neither creditable, wise, nor honest. Great expense has been incurred, five years of time have been consumed, a mass of evidence has been collected, and the House of Parliament are presented with a report which blinks the main points, is either an absolute nullity, or is inconsistent with the evidence, and which acknowledges, in a note in small print, that its starting-point is contrary to experience. Showing us that coal cannot at present be economically worked at a greater depth than 2,700 ft., and that no mine in this country is worked within 324 ft. of that depth, it assures a workable zone of 4,000 ft. in depth! It places in contradiction to its conclusions, the opinion of our highest authority, himself a member of the Commission. It neglects altogether the evidence which is attainable in Belgium, and in the Alps, on some of the most important physical questions that affect the subject. It ignores the commercial question, the very bones of the matter, altogether. It tries to make things pleasant to the public; and it does so with a feebleness of utterance which it takes fifteen men to attain. No single writer would have had the courage to take the responsibility of such a report; no professional member of the Commission, if the matter had been left in his hands, but would have given us more reliable advice. The vice of referring such a matter to a numerous committee, presided over by a Cabinet minister, who has not the experience, and who ought not to have the time, to deal with the subject, is illustrated to the utmost. The opportunity of drawing up what would not only have been a State paper of the first class, but something more,—a permanent chapter in the physical, industrial, and commercial history of mankind,—has been frittered away. We are presented, under a high-sounding title, with a result neither reputable nor reliable, and we cannot repress the feelings of humiliation, and of disappointment.

PUBLIC IMPROVEMENTS IN PARIS AND LONDON.

SIR JAMES PENNETHORNE.

At a meeting of the Royal Institute of Architects, on the 18th ult., Mr. Arthur Cates read an interesting and valuable Biographical Notice of the late Sir James Pennethorne, which necessarily included reference to the numerous schemes for the improvement of the metropolis with which the subject of the memoir had been connected, and produced a discussion that may be usefully reported.

In 1832, said Mr. Cates, Mr. Pennethorne was, in consequence of the experience gained by his connexion with Mr. Nash, employed by the Commissioners of Woods, and commenced to devote his attention to devising plans for the improvement of the metropolis. The great works which had been carried out under the inspiration of Mr. Nash, and by which the West-end of London had been in fact created, were completed. The source from which the funds lavishly but wisely expended, had been derived, was no longer available; and a Select Committee of the House of Commons having, in 1838, approved and recommended for adoption the plans submitted by Mr. Pennethorne for metropolitan improvements, he was (with Mr. Chaworth) appointed to carry them out,—not, however, as designed by him, but trimmed and bowed down to satisfy the requirements of economy; and although the four streets authorised by the Act 3 & 4 Vict., cap. 87,—viz., New Oxford-street, Endell-street, New Coventry-street, and Commercial-street, Spitalfields,—have proved of the utmost service to the circulation of the traffic of the metropolis, it is now certain that could his enlightened views have prevailed over the narrow spirit which influenced the decision on his plans, the metropolis would not only have been greatly benefited, but improvements greatly needed, and now rendered almost impracticable, would have been carried out at moderate cost. Until the formation of the Metropolitan Board of Works (1855), he was constantly engaged in devising schemes for improvements, which were more or less advanced, some even having been brought into Parliament; but all general projects fell through from the difficulty of providing the necessary funds, a difficulty which is now removed. Besides the formation of the new streets, and other improvements, such as those at Picnic, Kensington Palace Gardens, Windsor High-street, &c., he carried out Victoria Park, Kennington Park, and Battersea Park; the works of the latter, after

many years of delay, having been hurried on in a manner which prevented the complete realisation of his design. The scheme for a northern park, which in 1852 was proposed to be formed under the name of Albert Park, was fully worked out by him; and had funds been available, and the project realised, would have added largely to his reputation as a landscape gardener.

In the course of the discussion which followed, Mr. Edward Hall, visitor said,—I wish particularly to direct further attention to the difficulties in which Mr. Pennethorne was constantly placed in treating Government works. During the whole time those works were under consideration, or were being carried into effect, he was thwarted in a manner which one could hardly conceive without close study of the subject, such as, I may say, I have myself given it. You will find some of the results of those difficulties in the line of Bow-street and Endell-street, and in that of which Coventry-street and Long-acre were to form part. If those lines had been carried out as Mr. Pennethorne designed them, we should not have had that corner which there is, where Coventry-street joins New Coventry-street, where stands the restaurant called the "Cremorne Branch," jutting out and interfering with the direct route of the traffic. We should have had a broader route, and there would not have been the danger that there is on every opera night, in Coventry-street. Nor would there have been the projection of the corner of Drury-lane and Great Queen-street. We should have had a tolerably straight line, taking in Coventry-street, Long-acre, and Great Queen-street, without the present twisted junctions. The actual defective arrangements were owing to the excessive anxiety for diminution of expense, and to the absence, in Mr. Pennethorne's supervision of his forethought as to future requirements, and his judgment as to modes of proceeding. Thus, only one side of what is now Endell-street was dealt with; and the other side remained as inferior property, whilst there were formed the awkward turns at the north and south ends of the street, instead of the line being made straight from Wellington-street to Bloomsbury-street. But it will surprise those who have not paid attention to the history of this subject, to be told that it was argued by recognised authorities in these matters, that a crooked line was better than a straight one. It was maintained by Mr. Higgins, a surveyor of the day of some eminence, that it was much better that the traffic should take a turn in the case of any crossing of streets than that it should cross at right angles. The consequence was that the suggestions of Mr. Higgins and of Mr. Richard Lambert Jones, the latter a great man in the City in those days, were preferred to those of Mr. Pennethorne; and it was also owing to their influence that Middle-row, Holborn, was allowed to remain so many years as it was.

Professor Kerr.—We lost in the late Sir J. Pennethorne a man of special ability and special education, who seems to have devoted his lifetime,—and that apart altogether from considerations of specific employment,—to the great question of the improvement of the metropolis, and not merely its improvement in the sense in which the phrase is generally used,—such as merely cutting a new street through a back slum, and making a new line of thoroughfare,—but, as far as he dared, the architecturesque improvement of the metropolis generally, which is a consideration of so much importance in London, as compared, for example, with Paris. There is a question which I have often heard asked, but have never yet heard properly answered, viz.—Why is it we in London find it utterly impossible to do as the Parisians have done with regard to their streets? We are richer than they. We have greater necessities with regard to traffic. The property affected, I have been told on the best authority, is not, as many of us may have supposed, more valuable than theirs. And yet we find they are able to cut straight lines in the precise direction in which they are felt to be desirable, and so to form grand thoroughfares through Paris in all quarters; and though it may be the fact that embarrassment has ensued, yet there is no appearance, even in this the darkest day Paris and France have ever seen, of the dreaded result of an actual crisis. I have always felt disposed to consider that money laid out in the improvements of a metropolis is money well invested for the people. True, it may not bring a direct return in the shape of a money profit, but it brings profit in many an indirect way,

which makes the outlay what is called a successful investment; and I think it is a pity our financiers and public men of business are so unwilling to take that view of the question. When a common tradesman builds new premises, or puts a new shop-front into his house, he does not expect to get a direct return for it in money. He makes his place more attractive and convenient, and he knows that his business will improve in various unexpected ways as the consequence; so that he makes it answer on strictly businesslike and financial grounds. In the same way I contend the public of the country, looked upon as a community in business, will find it a judicious investment, and not a mere waste of money, to pursue the architectural improvement of those great centres—and particularly London—in which business is carried on. By recent arrangements, as we know, the future improvements of London—at least, in their purely utilitarian bearing—are to be a portion of the operations of the Metropolitan Board of Works.

The question, however, arises—who is to take the initiative in those projects which such a Board can scarcely be expected to initiate. Our First Commissioners of Works, our architects may be excused for suggesting, are in this view of the case of no use whatever. It is notorious that our First Commissioners, one after another, have been mere politicians, who, having what is called a claim upon office, have been put into that particular position to work their way up, if possible, to some higher post in the scale of dignity. I humbly submit that is not the best way in which to deal with the architecture of London, or with the outlay of the public money, in any kind of building; and I think it may possibly be ultimately found to be necessary—I hope it may—to have something like a proper and responsible professional authority in connexion with the Government and Parliament, which shall take into consideration all questions of the kind; and especially those which affect Government property, and the great thoroughfares in which the Government buildings are situated, as in the case of the Whitehall quarter; and I venture to say it is impossible to accomplish anything upon a dignified scale, unless there is some such agency provided to initiate intelligent proposals with something like authority. I must say the Metropolitan Board, so far as it has gone, in street improvements, has succeeded to a greater extent than many of us supposed possible a few years ago. I think we must all agree that that body deserves especial credit for success in respect of the several grand lines of thoroughfare, which have recently been opened. But I think there are some things which the Metropolitan Board cannot be expected to do—which the Government must do if they are to be done, at all; and the question is a most important one,—how the initiatory steps are to be taken, now that the office of Government architect is swept away. I do not see in the policy of the present First Commissioner, or in the new machinery of the Office of Works, anything approximating to such an agency as would serve to initiate public works in an efficient manner.

Mr. G. Herbert West.—I would remark, in reference to the observations that have fallen from the last speaker, that in my opinion the different conditions in the laying out of new streets in London and Paris arise not so much from differences in the cities themselves as in the Government and the nature of the people. In this country we can never expect to have an autocracy such as that under which Baron Haussmann carried out the improvements of Paris on so grand and gigantic a scale, being seconded by an irresistible law of expropriation, which served more especially to make the fortunes of many who were engaged under it. The first plans carried out were those for streets which were not designed by M. Haussmann, but which were decided upon under the rule of Louis Philippe and the Republic. The plans were divided into three sets or networks, which we might characterise as the really desirable, the useful, and the extravagant. The first, which had been decided on before 1859, comprised the Central Markets, the Boulevard Sebastopol, the Rue de Rivoli, and the opening up of the city. The second, decided on in 1859, included the Boulevards Prince Eugene, Château d'Avant, and Malesherbes, &c., Pont de l'Alma, Avenue Marbeuf, &c., Rue de Rome, de Lafayette, &c., the Parc Monceau, and the Bois de Boulogne and Vincennes. The third network comprehended all the streets round the New Opera, *i.e.*, the Rues Halcy, Anker, Scribe,

Chateaudun, Quatro Septembre, &c., Boulevard Haussmann, &c., and on the left bank, the Boulevard St. Germain, and the Rue de Rennes, Guy Lussac, Monge, &c. The first set cost 272 millions of francs, the second 410, the third 615. Total, 1,297,000,000 francs, equal to 51,880,000*l.* Before the Boulevard Sebastopol was undertaken, there had been great discussion as to whether the existing streets, St. Denis and St. Martin, should be widened by buying up the houses and setting them back—whether an entirely new thoroughfare should be made. In 1850, partly perhaps for military reasons, the preference was given to the new boulevard. It was argued that interference with existing thoroughfares did more harm than good, and damaged trade, and that it was better to buy up houses in the back slums between two great streets, and drive a new boulevard through them. The difference in the nature of the traffic of the two cities is such that in London you cannot drive streets at haphazard through old quarters of the town and be sure of their bringing in a profit upon the outlay. In Paris, if they form a new street in which the ground-floors of the houses or shops, as is almost invariably the case, they are sure to meet with occupiers, and the upper floors will let in flats. So there is sure to be a good return on the money spent. But if you were to drive a new street through Drury-lane, you may be quite certain no one would live there; shop-keepers would not take the shops, and the houses would not let in flats, or as respectable lodgings, but the street would remain as poor as before. In Paris the tradesman occupies the shop and the rooms behind it, or at the top of the house, and in intermediate portions you have all sorts of people living, from the most wealthy to the poorest; and you are sure to have a traffic through the street, for Paris is a round city, while London is a long city. Our great avenues of traffic are by Oxford-street and the Strand; that in the other streets goes in no particular direction, but in Paris wherever you drive a new street you are sure to have traffic through it, since it forms one of the radii of a circle. This is clearly seen in comparing the omnibus maps of Paris with those of London. When a railway was proposed for Paris similar to our own Metropolitan Railway, it was objected to because the traffic was not sufficiently definite in its direction for it to be likely to prove of real service. In London you may have passage streets, but nothing more, however good the houses may be. In Paris you are certain to have a street more or less of palaces: some of the streets are very well inhabited, and all more or less bringing in good rents, and you cannot make sure of that in London. Since the Government have taken up the system of renouncing the employment of architects, you cannot have men in London corresponding to Baron Haussmann, or the present prefect of the Seine, with a body of architects working under him. In short, the differences of conditions are so great that you cannot fairly compare the two cities.

Mr. Eastlake.—What is the difference in rents?
Mr. West.—Enormously higher in Paris. There is one street built in the time of Louis Philippe upon the London principle, of setting back existing houses, I mean the Rue Rambuteau, which runs through the old part of Paris. The Boulevard St. Michel was certain to be a great line of traffic. The Boulevard Haussmann is perhaps the only great street without shops which could be compared with our streets of private houses. It is only half finished, and other streets have been left in such a state of incompleteness that you cannot take them into account. The Boulevard St. Germain has been begun at both ends and in the middle, but left unfinished, because it will require twelve millions of francs to buy up the *École de Médecine* to complete it. Some of those streets may be gone on with, but I should scarcely think M. Thiers will finish the streets round the New Opera.

Mr. Hall.—The real reason why in Paris the improvements are, as in my opinion, so much more successful than in London, is that in the former city there is preliminary design or *plan*. That is to say, there is general plan and principle observed, dealing with the whole of the French metropolis. In London there has been no general plan; for even Mr. Punchthorne's plans were only applicable to a small portion of the area of the metropolis, not to repeat mention of the fact that they were made under the greatest disadvantages. The principle in Paris has been that which was observed by Wren in making his

well-known plan for the improvement of the city. The principle in each case was this:—Decide what shall be your centres, and then form main lines to and from them, and direct lines. Every capital city has three or four main centres, such as a commercial centre, a centre of pleasure, a fashionable centre, and a centre of government; and it is necessary to decide upon these or to treat these as having been decided before you arrange your main lines. In Paris, pleasure is of greater importance than it is in London. Therefore, having decided to remove the Opera House, it was a main point to make routes converging to the place fixed upon as the site of the New Opera. I disagree with the last speaker in what he said with regard to the utility or non-utility of the streets round the Grand Opera. I think those streets have been well devised. I may mention, for example, the Rue Lafayette. Any one looking at the plan of Paris will see that the principle adopted by Wren has been carried out, though for the whole metropolis and suburbs, instead of the design being confined to one portion of the metropolis. I agree with the gentleman that some of the recent improvements of Paris are almost extravagances. No doubt a great deal has been done to keep the population employed. Still there is in Paris, I believe, a much greater return for the expenditure than people here are in the habit of supposing; and I am inclined to think when there is supposed to be a difficulty in getting occupation for buildings in new streets in London, it is forgotten that a part of the general demand of the present day for places of residence is one for residences for the middle and "lower middle" classes; but in too many cases we erect comfortless buildings, badly planned and ill-constructed by speculative builders, and there is no inducement to occupy them. People have been driven to reside in the suburbs; but there is a growing feeling of disadvantages which attend suburban residence. If we had properly planned buildings in properly planned streets, no doubt they would be occupied; and the improvements would give that return on the investment to which Professor Kerr has so well alluded.

Mr. R. Phend Spiers said:—As far as our experience has yet gone, there seems to be a decided distaste on the part of the English public to living in flats. There are some in Victoria-street, and though they have been built twelve or fourteen years, I am not aware that there has been such a demand for that kind of lodging as to call for a fresh supply. I can bear out what Mr. West says as to the facility with which shops and apartments in new streets in Paris are taken possession of. On the appearance of a new street, with the road hardly finished, and while the street itself is not much known, it is natural to suppose that the shops would only be taken by an inferior set of shop-keepers, who commence business somewhat in the way of the American stores, but it will be found that, after the lapse of two or three years, the shops are tenanted by respectable tradesmen; much money is laid out on them, and they form an additional attraction to the fine architecture of the street which has been opened. The rents of these flats far exceed the rent of our houses in London, even in the suburbs of Paris. In the outside of the outer line of Boulevards, a suite of five or six rooms on the third or fourth floor cost more than a twelve or fourteen-roomed house in the centre of London; and when you come to the Boulevard St. Michel and Boulevard Stansbourg, the prices obtained are immense. To a certain extent we may set against that the expenses which Londoners incur by living in the suburbs, in going to and from town daily. Some live at distances which cause an additional expense of 20*l.* or 30*l.* a year in railway or cab fares, and that does not include the family travelling expenses; and if these are added to the rent of the house in the suburbs of London, it would bring it up to about the same price as is obtained for the flats in Paris. The French have been accustomed to be satisfied with a much smaller quantity of everything than we are. They use very little water, and believing that they can wash themselves with the corner of a wet towel, they do not see the necessity for a bath; and the same with regard to food and everything. The rooms are only just as large as is necessary. They have not large families, or it would be difficult to understand how they could manage with such small accommodation. As a rule, these flats contain not more than a quarter the space which there is in our English houses.

Mr. E. R. Robson, Fellow.—In reply to the inquiry why it is that in London we cannot carry out public improvements on the same comprehensive scale as has been done in Paris,—it may be remarked that in this country we are subject to the provisions of the Lands Clauses Consolidation Act of 1845, which are applicable in all cases of public works and improvements, just as in the case of railways. The result is that in the case of opening out new streets you cannot obtain just the amount of property which you require, and no more, if there is any objection on the part of the owner. What has been done in the way of improvements in London has been done on a pottering though expensive scale. In Paris they have a fixed tribunal to which all cases of purchases are referred; but under the Lands Clauses Act such a thing as taking the exact quantity of land you want is impossible. Two points have been stated with regard to the laying out of streets: one is, that an absolutely straight line is best. For my own part, I think that is questionable. In my opinion, where the bulk of the traffic is of a heavy description, a slight *détour* is preferable to crossing streets at right angles. In Paris there is more light traffic than heavy. In making straight lines of streets we reduce the thing to the point of convenience, and art is nowhere. Take the case of St. Martin's Church: convenience would ignore such a thing, standing, as it does, partly across the line of St. Martin's-lane, but art did not. I do not myself hold the notion that all new streets should be strictly straight lines. In Paris we find that every straight street requires an ornamental column at the end, and it is the column which is seen rather than the architecture of the street.

Mr. Arthur Coates, in replying, said,—I am not surprised that the discussion should have taken the course it has. The contrast, vast as it is, between the public works of Paris and those of London is naturally a subject of great importance; but those who have spoken in terms of regret at the difference between what has been done here and on the other side of the Channel have forgotten one element. They have spoken almost as if this country was deficient in designers of taste and art. I protest that, while our rulers or those who have the control of these matters may be deficient in these points, there are plenty of men available who are competent to the task. The one great thing wanting has been funds, and in that respect London has been placed in a position different from Paris. Those who have not studied the map of London of 1805 can have no idea of the mass of tortuous lanes and miserable dens that have been swept away, where now we have valuable property, and some of the most important districts of the metropolis. The great work carried out by Nash which converted the narrow and tortuous lanes around Old Swallow-street into the present noble thoroughfare of Regent-street, and the great improvements round St. Martin's Church, Pall Mall East, West Strand, &c., were carried out at the expense of the State; and it having been decided that the land revenues of the Crown, from which the funds had been so wisely provided, should no longer be used for such purposes, the further progress of such works was suspended. I have indicated in my paper the manner in which it was desired to continue those improvements, but the only funds at disposal for the purpose were those arising from the coal duties, &c. For the works already executed, those dues were mortgaged for years, and further sums were obtained by further mortgage of those imposts. The funds thus raised were soon exhausted, and there were no means of raising other moneys. The policy of the Government had been to keep London in a state of helpless infancy, cut up into little districts, ruled as regards parochial interests by vestries, but without the power of combination and joint action, which alone could lead to the execution of works worthy of the metropolis. The constitution of the Metropolitan Board was a very great advance on this state of things. That Board in time acquired power to raise money by taxation, and we have seen the result of this control of funds, in the construction of new streets, projected many years ago, and the formation of the Embankment, which is a work equal to anything in Paris or any other city. We may assume that if London had been favoured with the means of raising money that existed in Paris, we should have had works which, if not equal in brilliancy, would have been equal in utility to anything in Paris. Paris has been more fortunate; the octroi, a ready means of

raising funds, was in full operation. At the end of 1852, the loans raised by way of annuity to meet the expenses of the occupation of the city by the allied armies in 1815 expired; but in place of the agitation which would have arisen, to reduce the taxation, and sacrifice the great interests of the City to a paltry gain for the present time, the wise administrators pledged those duties for further terms, and by the fund so raised and further loans, based on the credit of the municipal revenue, commenced those great works to which allusion has been made. It was the large sums thus raised which gave the first impetus to the improvements carried out by Baron Haussmann. Then, again, in France the State generally acknowledges its obligations to the capital, by contributing one-third, more or less, to the improvements carried out, which affects localities in which the State and the whole country are interested. Thus the works around the Palais Royal and the east side of the Louvre were constructed by the aid of large contributions from the State. If you compare the two cities, you must do so on the same basis, and London will then hardly stand in dis-advantage.

"INVENTIONS AND PATENTS CON- NECTED WITH BUILDING."

This was the subject of a paper read at a meeting of the Inventors' Institute, on the 4th, by Mr. B. Fletcher; Sir A. Brady presiding.

Mr. Fletcher said,—"I shall first take the entire building and work, thence to details. Probably I proceed in this form, as it is the usual course pursued in designing buildings, bearing in mind, too, the injunction by the poet,—

"Consider what you undertake,
And analyse it well,
And ever work from whole to part,—
Grand principle of master art,—
That makes that work to tell."

Well, in what does the house of to-day differ from the house built 100 years ago. I must be understood to mean the usual houses which are being built all over the kingdom, and not as alluding to an exceptional house here or there.

It is wise to imitate the prudent tradesmen who just now are "stock-taking," and I am afraid, if we take stock, and look upon the houses of to-day and those built some 100 years ago, like that I live in, we must say not merely that our predecessors built much stronger and better houses than we do, but also that the inventions and patents (grand as they are) have been so little utilised by builders, that even in conveniences the old houses will almost equal the modern. It is strange that this should be so, if one considers the almost appalling number of inventions and patents that yearly are granted. Take, for instance, this country, and the average number per annum during the last ten years: a little over 3,000 applications were made, and of these more than 2,000 were granted. The number applied for last year was 3,500, and of these, according to the average, two-thirds would be granted. Now see how slow Old England is. In the United States, for the year ending the 30th of September, 1871, 19,129 applications for patents were filed in the Patent Office (including reissues and designs), and as many as 12,950 patents were issued. Yet again, starting as this is, we find that this number was not so great as that of the preceding year. I notice the fees received during the year by the United States Patent Office amounted to 671,583l.!

I cannot say what proportion of patents relate to buildings; but one sees from time to time in our professional papers a long list of such patents; so that, no doubt, the thought must arise in the mind of the public: why, then, are not these inventions and patents more used?

I will explain. A man, if he can invent something which will enable him to produce cotton 1d. per pound cheaper, or some machine which shall be a perfect substitute for hand labour in some department where the demand is unlimited, may out of such single invention amass a great fortune. The one condition of such success is that the article manufactured shall be in great demand, and that his invention has saved money in its production, or that he shall produce a better article at the old price, or that by his invention useless materials may be made available (for example, much iron is now used by the application of the hot blast that formerly was thrown away: I do not say to the improvement of the iron, but that formerly it could not be used at all). Now, you will notice in all cases the basis of large profit is from extended demand for the article. It is therefore evident

that an inventor who turns his attention to patents in connexion with manufactures, has the prospect, if he succeeds, of larger profit than he who devotes himself exclusively to patents connected with buildings. This may account in some measure for the relative small proportion of inventions relating to building.

Having, then, shown that the inventive genius is somewhat allured from building-patents by the temptation of larger gains, a few words will be well to indicate the difficulties that beset those who, having devoted their time to this class of patents, succeed in producing a valuable and useful one. The architect who is building a house probably goes to see the invention,—likes it,—thinks he will try it,—hesitates,—finally probably decides against its employment, from fear that it may not be successful. Yet, I think, little blame can attach to him: if the invention succeeds, the merit is the inventor's; if it fails, all the blame falls on him, for selecting such a "fandangle, stupid thing" such will be the language his client may use to him. He therefore has no inducement to recommend a novelty, as it cannot benefit him in his practice, and by so doing he may lose a client. Is it, then, to be wondered at that we are so conservative in our decisions?

Qui bona, you may ask, all this explanation if there is no remedy? Well, I have a remedy. It is the formation of a commission, with unpaid members, who should inquire into patents or inventions, when (and not till then) the results are being manufactured for sale, and should test them, and should also invite the opinion of all who use them; and these commissioners from time to time should report the result of their investigations. I would base their operations very much on the mode of proceeding adopted by the commissioners of the Locomotive, and I think my hearers will agree with me, these commissioners have done much good. I feel sure that the commissioners I propose would be of great service if the gentlemen were carefully selected.

I have said that houses now are built very much as they were houses ago. Go into any ordinary house in any of the suburbs of London, and what difference will you find? Why, the house is as nearly as possible a counterpart of any old house, except that it is not so strongly built. Shutters are gone, and perhaps instead of the sash bars (which, by-the-by, some architects are now putting in their new works), a large square of plate-glass. In fact, the house when ready for letting usually has not one of the modern appliances.

This being so, let us consider what a house should be.

It should first have a good damp course, to prevent damp arising. Every room should have an air-flue to let the foul air escape, and those rooms where gas is burnt should also be provided with an external ventilator. The pipes from closets should be carried up in an inside recess, to prevent frost, and should be accessible by merely opening the wooden covering. The bells should also be so carried up. There should be a hydraulic lift where the house is large. Water, hot and cold, should be on the bedroom floors, and in the lavatories attached to the water-closets. Where cupboards are put, they should be fitted having regard to the use they will be put to. For instance: in bedrooms, they may be made like wardrobes. To see what is being done out of this country, look at the Americans. Take one of their houses: not a servant (or help, as I should perhaps call them) wanted upstairs, every room always ready except the dusting; the bed, a spring mattress (no making required); a tap to regulate the temperature of the room; washstand, with hot and cold water laid thereto, and waste therefrom; so that positively while we are quite helpless without our domestic servants, they can do every thing upstairs without servants. Surely the picture I have drawn shows how much we have to do before we can call the Englishman's castle really a home fit for this century. Well may I quote those lines,—

"So hard
The growth of what is excellent; so hard
To attain perfection in this neither world."

In proceeding to details, the lecturer compared granite and marble, mentioning that the price of the "dark slab" supplied at the Midland Railway Terminus was 3l. per foot run, for the columns, which are 2 ft. 8 in. in diameter, and advocated where slate was used for internal work it should not be in imitation of marbles, but should be in plain tints, relieved with gold and colours, some beautiful specimens of which were produced. He mentioned the various

kinds of stone-preserving processes, but would not express any opinion as to their merits. The new Midland Railway Station is being treated with Professor Church's process, and also with that of Mr. Ransome; and he also considered the patent stone of the latter, specimens of which were produced, worked with the chisel. He touched on fireproof construction, mentioning the price, inclusive of rolled joists and concrete, of the Dennett system at 4l. 10s. to 5l. 6s. per square for "model houses," and 5l. 6s. to 6l. 10s. for ordinarily-sized houses. Many specimens of moulded bricks he explained, with the machine for making them. As to concrete building, this formed an important portion of the paper, and he took great pains in showing its advantages and disadvantages as compared with the ordinary building materials. He noted the former to be cheapness, strength, and durability, rapidly of construction, and economy of space; the latter its liability to failure from the use of improper materials, or from the want of knowledge and proper care, and the limits which the material and method impose on architectural design and decoration. He objected to the imitations he had seen of stone fronts by concrete, with care of that material to form mouldings, and facing it with Portland cement. Such a method, he considered, would soon bring concrete building into disrepute. There is little doubt that concrete building, so far from being necessarily a "sham," may be made an admirable and useful material capable of perfectly legitimate treatment with good results. The different kinds of apparatus used in the erection of concrete buildings were treated of. Amongst the peculiar features of concrete buildings was mentioned that with regard to steps; four of Portland stone pounded to one of cement were stated as the proportion. The cost of these steps is about half that of Portland stone. Seven to one is the usual proportion for general building, but four to one is used for coping out for mouldings, and two to one where the projection is very great. An advantage in regard to sanitary arrangement was mentioned, viz.:—that it will take any number of flues for any purposes anywhere; so solid is the material, that flues may come within 3 in. of outer face. All fitting into vertical grooves must be avoided, as the swelling of the cement prevents the lifting of the apparatus. The new shaped core to chimneys was explained, which obviates the necessity of making the chimneys tapering, and it was shown that this prevented a series of recesses to catch and hold the soot. In roofing, the thickness of concrete should be 4 in. to 6 in., with thereon 1 in. of asphalt. He next alluded to Messrs. Hayward's latest invention in pavement lights, including the hexagonal and half prismatic lights, also the square half prismatic light for filling in existing pavement lights to increase their lighting power. He produced seven different samples of sash-fastenings, all to prevent opening from the outside, some being cheaper, and some more effective than that recommended by Colonel Henderson in his official circular. He considered it was want of information on the part of Colonel Henderson, and showed how the one he recommended could be opened from the outside if the sash did not fit very closely. Many examples of locks and their fastenings, door-springs, and rollers, water-bars, easement fastenings, revolving-shutters, electric bells and domestic telegraphs, cottage organs, stoves, lifts and hoists, dust-shoot boxes, pipes, paints and enamels, &c., were exhibited and explained. An ingenious letter-box was also introduced. And he concluded his remarks with this observation,—“I think, however, there is a grand future for architecture, but it must be by striving to combine in buildings all the scientific inventions of the day, to do so continuously and with judgment; and herein new forms will be created by the use of new materials, if only the desire be present not to be slavishly bound by precedent, but earnestly to strive to make the requirements of science express themselves in our works. Whilst, therefore, I contend no architect should have or invent any patent, or have any interest in any, for the reason that he may be tempted to use it when some better thing may have been discovered (and this merely from the natural love we all have for the children of our brain), he should be ever willing to experiment with all the inventions of others, and thus give them aid. I have learnt much while perusing my investigations, and if I but lead others to investigate for themselves, I am confident they will also learn much.”

The discussion was adjourned to February 1st.

THE LAW COURTS.

SIR,—If the people of England do not get a good building for the central Law-courts of the nation, it will certainly not be from want of public discussion; and yet, if a great national establishment can be designed by public discussion, as an Act of Parliament, it will be a new era in the history of architecture, and England will be the first country that has been able so to dispense with architectural genius.

If the multitude of critics, with the approbation of the public at large, can produce a work of art, then surely the architects who built the celebrated works of old have lived to little purpose, and again, if the works so produced are satisfactory, and "the people's architecture" is the best, it will still be a matter for curious investigation why the architectural art should be different from other arts in that respect. We do not get our pictures painted and our statues carved by public competition, nor is the poet laureate selected by a committee upon poems, still less should we think of inviting public opinion for suggesting improvements to the artist in the course of his work.

Now, it appears to me that this difference in our mode of dealing with architectural works, as compared with other arts, is possibly one of the chief causes why that art has fallen in this country into a lower rank, and why its productions have been unsatisfactory. I cannot see why the same course should not be pursued in architecture as in painting; namely, to select an artist, and then, having given him his instructions as to the general extent of the work, to leave him practically unfettered as to the manner of carrying them out. This notion will, I have no doubt, appear to many to be a rather startling innovation upon our habits in this respect. We have been accustomed to think that every man knows exactly what sort of a house he wants, and that a majority of a committee must be able to say what sort of a building is required for any public purpose. But I suspect the truth is, that the public have never sufficiently considered the subject to be able to separate the idea of the requirements of the business to be done in the house from the idea of the mode of providing for those requirements. What architect is there who has not received a letter from the intelligent house-proprietor about to build, showing exactly how the back staircase could be added on for next to nothing, or how a corner, 5 ft. square, with a gas stove in it, could be easily cut off from the hall for his own snugery; and yet, who cannot or will not say what is the traffic or business to be provided for in any part of the house.

There are instances to be found in the public buildings of our own country (and, indeed, of other countries) of the effects of this kind of interference with the architectural artist upon the buildings themselves; but of the results to the artists, the withering of individual genius, and the growth of a mere desire to please the popular taste, little is known or felt.

It is just this hampering of the genius of the architect which I think has been the main cause of the difficulties and disappointments connected with the Law Courts buildings; and, as an evidence of it, I may quote the very award of the judges on the competitive plans. This was to the effect that, as no one architect had precisely fulfilled the conditions laid down by the commissioners, they therefore selected that plan which most nearly did so, and combined it with the elevation most pleasing to themselves, and thereupon presumed that the most efficient building would be produced.

Now, is that a system likely to promote the growth of that independent, true artistic spirit which Mr. Fergusson says can be produced, if the architects and the nation choose it? Is it not in itself an argument why architects should be content to run along the groove of popular opinion, and cease to hope for any originality of thought?

And yet the judges were only strictly carrying out the instructions under which they acted, which were to select the plan that in their opinion best fulfilled the required conditions. It is to these conditions, therefore, that we must look for the fountain-head of the mistake. It is to these that I drew attention in a previous letter, which you were kind enough to publish in your periodical; and if you do not think the subject too much exhausted, I wish now to point out a little more in detail, what I consider to be the injurious effects of some of these upon all the designs for the law buildings.

The first and chief of them was, I think, the precise limitation of the area, both in extent and form. I will venture to say that for the business to be carried on there, and considering that it is acknowledged to be one of the largest collections of public buildings ever massed together, it was as small and as badly shaped a site as was ever appropriated to a public building. The area defined in the original instructions was about 900 ft., by 500 ft., the larger dimension lying approximately east and west. This is nearly the same as that occupied by the Houses of Parliament, but the latter is a long building of comparatively narrow depth, and with an open area about it, especially on the south side, which it faces. The Fulcrics and Louvre together occupy a length of nearly 700 ft., by 300 ft. broad; but they face the south, and the interior is nearly one large square. The Escurial is one of the largest palaces in the world, being 650 ft. by 550 ft.; a great deal of the site is garden; it is in a sunny climate and isolated; whereas the site proposed for the Law Courts is shut in on all sides by private houses; and the number and character of the offices to occupy it is such, that the whole area must be covered as closely as can be done, and without regard to aspect.

All sanitary engineering is tending in the present day to the spreading of buildings in such directions and extent as shall insure the greatest amount of sun and air; and the absence of these two vital forces in any public building would, no doubt, be perceptible in the health and energy of the functionaries employed in them. Now, I consider it impossible that any architect can arrange the rooms required in the original instructions on that site, without having a great number of small courtyards into which the sun will rarely or never shine, and a great number of windows of rooms with a northern aspect. And why should it be so? If the nation wants a palace of justice in which to conduct one of the most important branches of its administration, why should not the nation ask an architect to define the space required for it, letting him take these sanitary questions into consideration, as well as the greater one of taking the opportunity of opening out a fresh lung in the metropolis; thus making the Law Courts an abode of cheerful light instead of one of damp and darkness. It is not the expense that would stop the nation, for that has never stopped it in doing what it considered to be right; and when we consider what the single towns of Belgium did to provide town-halls and cloth-halls, and what our own provincial towns are now doing for their public buildings, expense would hardly be an obstacle in a question of space for the Chief Courts of Law of the British empire. It would be better to secure the ground, and to postpone some of the buildings to a future generation.

The real difficulty is in the limitation which has been imposed, step by step, on each authority concerned: first, the Government fearful of debates; second, the Commissioners fearful of responsibility; third, the architects anxious to do something; and, fourth, the judges cabled and confined by the acts of the other three.

What, therefore, appears to be wanted to make the site a habitable one, in a sanitary point of view, is greater length east and west, so that the buildings can be arranged in such a manner as to allow the sun to penetrate at some time of the day into nearly every living-room.

The second important defective point which appears to me to be found in the instructions is the proposal to make a great hall the central feature of the whole mass. This idea originated, I have no doubt, from both administrative and aesthetic considerations. The lawyers felt that a central place, where everybody would be sure to find everybody else, would be an important saving of labour and anxiety to all concerned in the business to be daily carried on in these courts; and both lawyers and architects were taken by the idea of a grand feature forming a veil as well as an aesthetic centre round which the whole mass could be grouped; and the architects, and especially Mr. Street, made the most of the idea, sacrificing certainly light and air; and in my opinion convenience and real aesthetic effect to it.

First, with regard to convenience. The law courts of England cannot be looked upon as one whole, like a palace or a State office, as far as their administration is concerned; they are only a collection of independent courts placed together for convenience of general intercourse.

Each court or set of courts has its separate times and nature of traffic, and separate staff connected with it. And whatever the changes in the business of the courts relatively to each other, it is not probable that the independent character of each court will be ever much reduced.

The members of the legal profession naturally wish for the greatest possible facility for their passage from one court to another; while, on the other hand, for the orderly conduct of each court, it is desirable that they should be separated from each other. For a distinguished barrister, who has to make speeches in two courts within a few minutes of each other, they should be as close as possible; but it may be doubted whether the officers of the court or the suitors would be so desirous of proximity.

Then, again, each court has its peculiar wants in accommodation, and the concentration of them in close symmetry would interfere with such peculiarities at the outset, and with any little additions or alterations that might be hereafter required; and who will be held enough to say that such will not be necessary in these days of change? For this reason alone ample space should be reserved round each court or set of courts.

Then, again, a great hall may be too great—for convenience in finding people. All the persons concerned in all the cases in all the courts would be mixed up together; and when they amount to some hundreds, a single room would probably not be so convenient as a long gallery, distinctly divided into compartments; the access to such a gallery from each court might be made easier than into one central hall, and the persons concerned with each court would be separated.

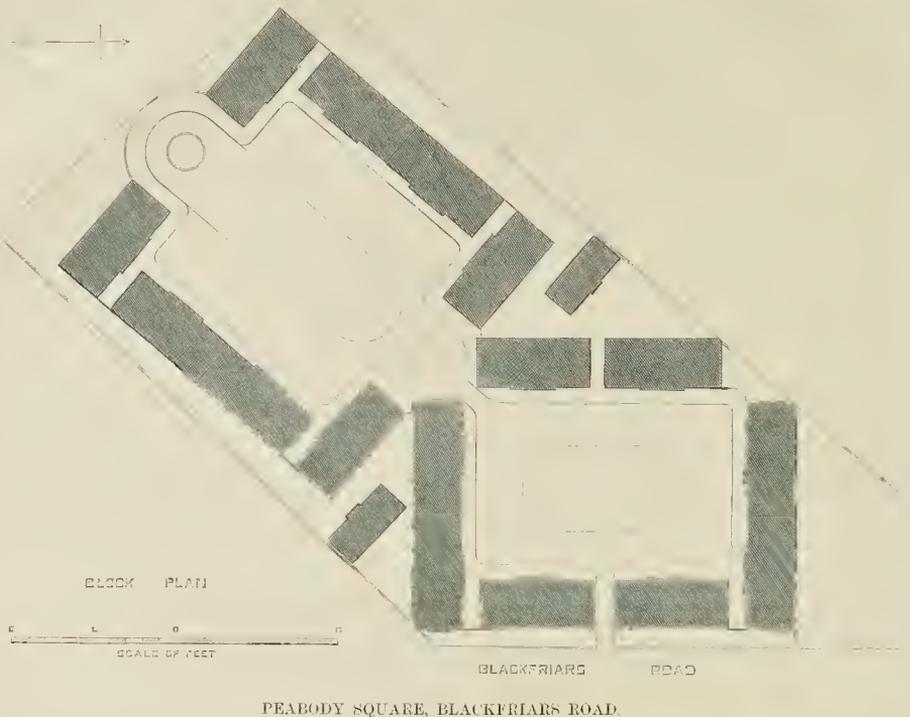

Lastly, concentration means an additional number of stories, and that means exclusion of light and air, and extra labour for the employés and the public.

Then, with regard to aesthetic effect. If I may venture, after the numerous and learned professional criticisms that have lately appeared in the public papers, to touch upon such delicate ground, I should say that the idea of a mass of building closely, concentrically, and symmetrically disposed round a central feature, is contrary to the principles of Gothic architecture, and more in accordance with those of Classic architecture. In the former, each building or block might be symmetrical, but the assemblage of them would not be necessarily so, as each would be designed to suit its own particular object. The character of Gothic architecture more accords with the idea of a collection of partially-detached buildings, and extending over a greater space than in Classic architecture; and therefore, from this point of view, the Gothic style is particularly suited to the Law Courts buildings. There are no examples of ancient Gothic establishments, I believe, to guide us in this particular case. The great ecclesiastical establishments consisted of those detached buildings whose independent symmetry would have been marred by too close juxtaposition. But the later styles of Gothic would doubtless afford a groundwork for an assemblage of independent buildings into one connected mass, such as the Palace of Justice ought to be. None of the architects, however, appear to have tried those styles.

Then, if I may venture a step farther, and enter upon the still more debatable ground of the moral effect of a design: it appears to me that, if the Courts of Law are to some extent independent tribunals, that idea should be visibly expressed in the building. All persons should be able to perceive that it is a collection of courts, and the actual courts themselves should be the most prominent features throughout the whole mass. But a central hall is quite contrary to this conception of the design; for it makes it simply one huge place of assembly, one gigantic forum or basilica, to which various tribunals are attached.

Thus it appears that on all four counts—moral effect, aesthetic Gothic effect, convenience, and health—the verdict should be against the central hall.

It is true that I am now writing in ignorance of the plan of Mr. Street's latest design. The area, and its shape, and the required accommodation, may have been altered since the original instructions were issued; but judging from the elevation of it that has been published, the general idea is only a modification of his original one; and, it is to be feared, a modification made, not in accordance with Mr. Street's own wishes, but to meet the views of the Government. But supposing the accommodation required to have

been so reduced as to do away with some of the objections I have raised, what provision is there for future extension, such as will inevitably be required as the population increases.

I venture to put forward those doubts affecting the whole proceedings connected with the Law Courts buildings, as questions of professional art. As a constructor of some years' practice, I wish to protest against any designs limited by such restrictions, as affecting the proper responsibility of an architect, and being incompatible with satisfactory work. And I hope that the leading architects of the country, who are all interested, and to some extent responsible, in the matter, will combine in requesting the Government to give an opportunity for a design to be made free from such trammels. Otherwise I fear the same result will happen to our latest and largest public building as has happened before in one or two such cases in this and other countries; that when it is half done, and a new Government in power not committed to the decisions of their predecessors, the building will be pulled down to make way for one on larger principles; and then not only will the time and money have been wasted, but it may be impossible to produce such a perfect work as could now be erected.

And I calculate on the support of Mr. Street himself to such a motion, as I should think he would not be sorry to have an opportunity of showing that his unfettered ability can produce a work which will be a mark, not of the past, but for the future, of English architecture.

J. B. COLLINSON,
Colonel Royal Engineers.

A New Pagoda has just been completed in Rangoon, amidst great popular rejoicings. The *Rangoon Gazette* says that "the total height of the pagoda and *steeple* is shown at 240 cubits and 6 inches, equivalent to about 375 English feet."

PEABODY-SQUARE, BLACKFRIARS-ROAD.

PEABODY-SQUARE, recently erected for the Peabody Trustees from the designs of Mr. H. A. Darbishire, consists of sixteen blocks of buildings, inclosing two quadrangles communicating with each other, and is situated on the site of the old Magdalen Hospital, on the west side of Blackfriars-road, near the Surrey Theatre.

All the blocks are alike in construction and arrangement. They are four stories high, containing ten rooms on each story, and these are distributed in dwellings of one, two, and three rooms, giving a total of 384 dwellings, and 640 rooms.

The living-rooms measure 13 ft. by 11 ft., and the bedrooms average 13 ft. by 9 ft., with a height of 8 ft. 2 in. from floor to ceiling. The former contain the usual cooking range, with boiler, oven, and hot-plate, and are provided with cupboards, shelves, and meat-safes. Some are provided with coal-boxes, others have coal-stoves in the adjacent sculleries. There are two sculleries on each floor, containing water-closet, sink, and water supply; also a dust-hopper communicating with dust-cellar in the basement, to which access is obtained by an interior staircase. A bath-room, with enamelled bath and plentiful water supply, is provided on the ground floor of each block.

These buildings differ from the majority of those which the trustees have erected, inasmuch as they have no corridors; the staircases are inclosed, and the washing accommodation is contained in laundries apart from the dwellings. The dimensions of the rooms, also, are rather larger, and their cupboard convenience is increased. The buildings are plainer, and less imposing in appearance, than their predecessors; their cost is materially less, and they are more popular with the tenants. As we said in the account we gave when they were first opened, they are more homelike and agreeable than the other establishments erected by the Trustees.

The handrics consist of two detached buildings, each containing accommodation for twenty washers at one time. The washing-rooms are on the ground-floor, with water-closet, wringing-machines, &c., and the drying-rooms are above. The works were executed by Messrs. William Cubitt & Co.

A portion of the site belonging to the trustees is still unoccupied, but it is proposed to cover it with similar buildings as soon as possible, the demand for the completed dwellings being considerably in excess of the present supply. We give with our view a block plan showing the position of the blocks, and a plan of one of them to a larger scale.

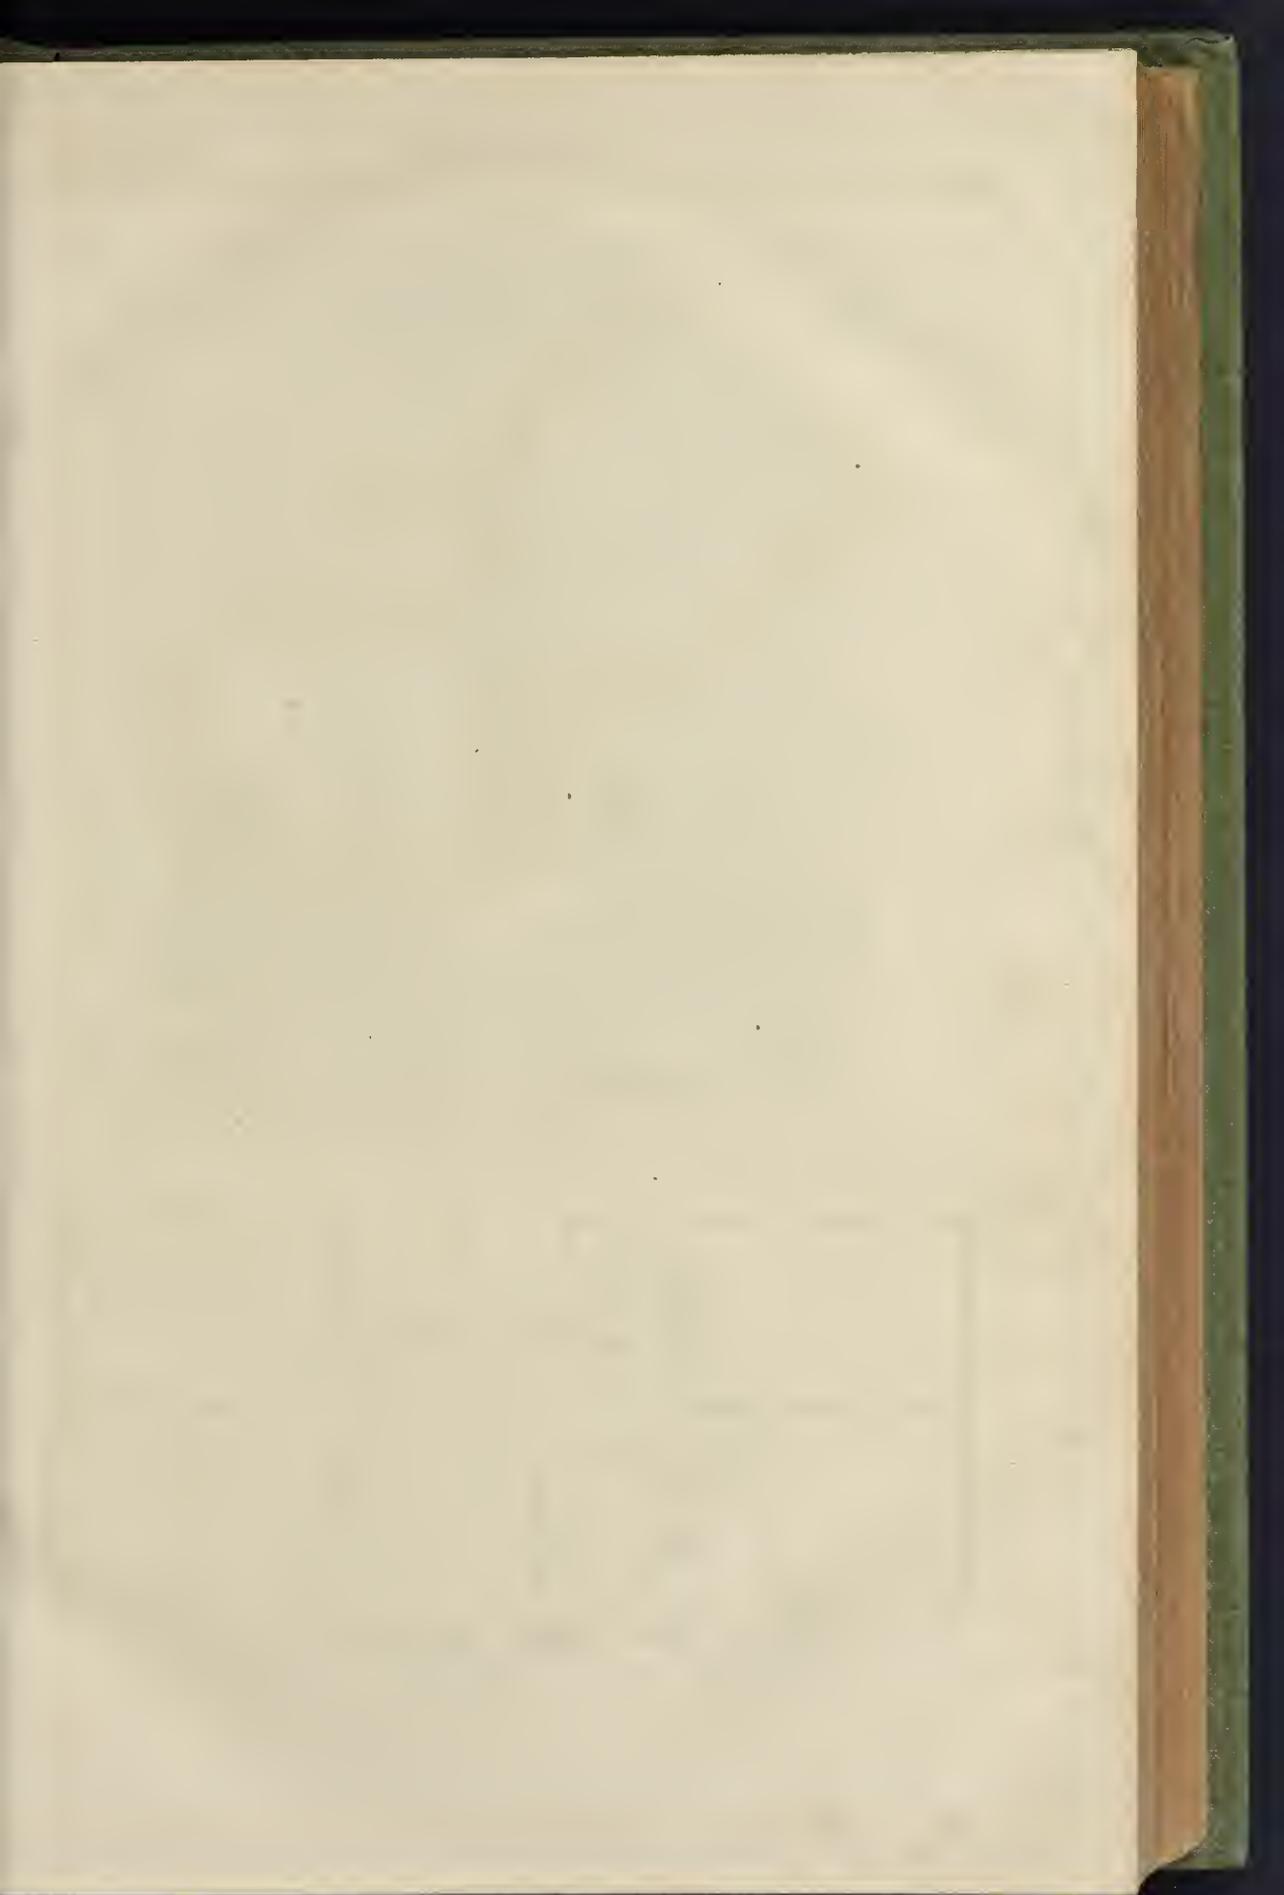

MONUMENT OF THE CHICAGO FIRE.

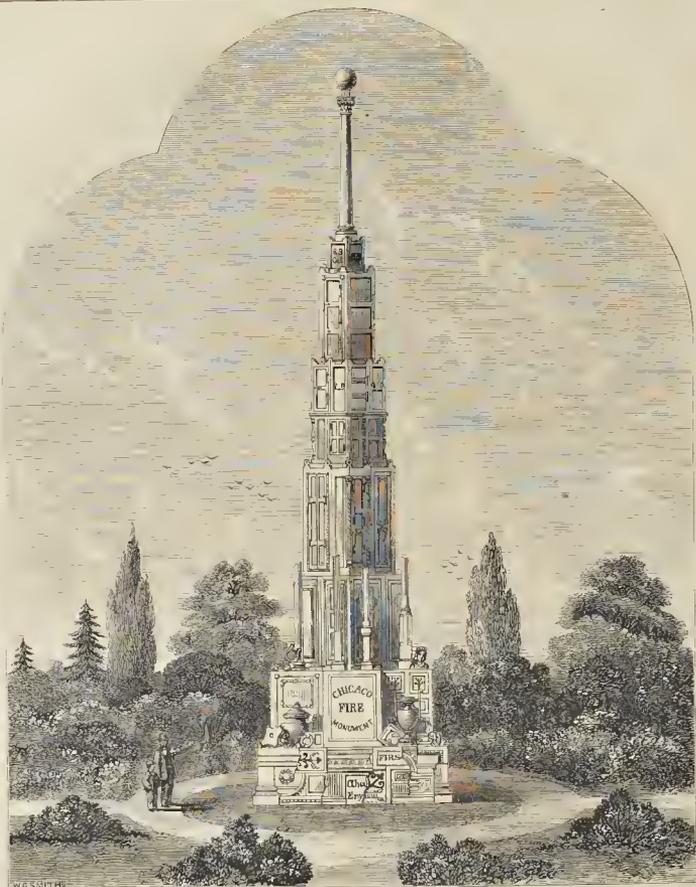

OUR engraving represents an odd monument about to be set up to record the recent dreadful fire. It is to be erected in Central Park, West Chicago, one of the large city parks, on a site just within the principal entrance, originally designed for a monument.

The materials are relics of the late fire that destroyed the entire business portion of the city, together with about one-third of the residences, and consist of iron safes, columns, sculptured stone cornice and ornaments, which have been presented for the purpose, and are now being hauled to the site.

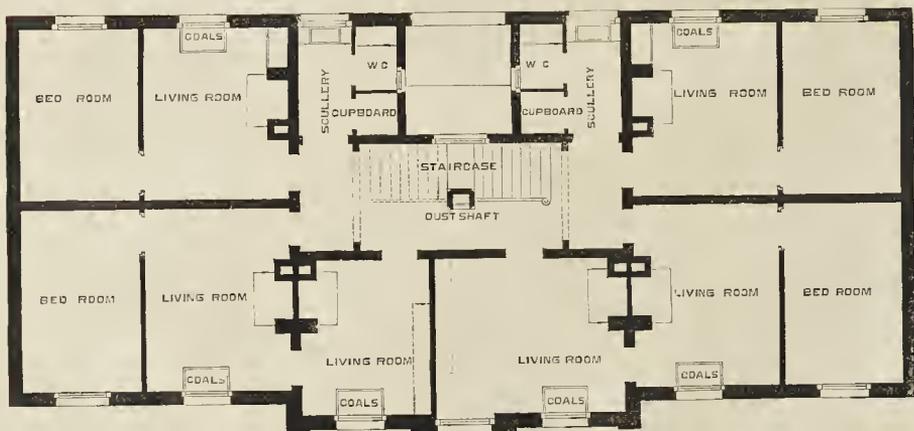

The height of it will depend to some extent upon the amount of material collected; it will exceed 100 ft. The work of construction will commence as soon as the weather will permit. The architect is Mr. W. L. B. Jenney, of Chicago.

We can scarcely anticipate a satisfactory result: the monument will suggest the advertisement of an enterprising safe-maker. Chubb, Milner, or any other of our manufacturers in this line would doubtless supply good specimens for the purpose free.

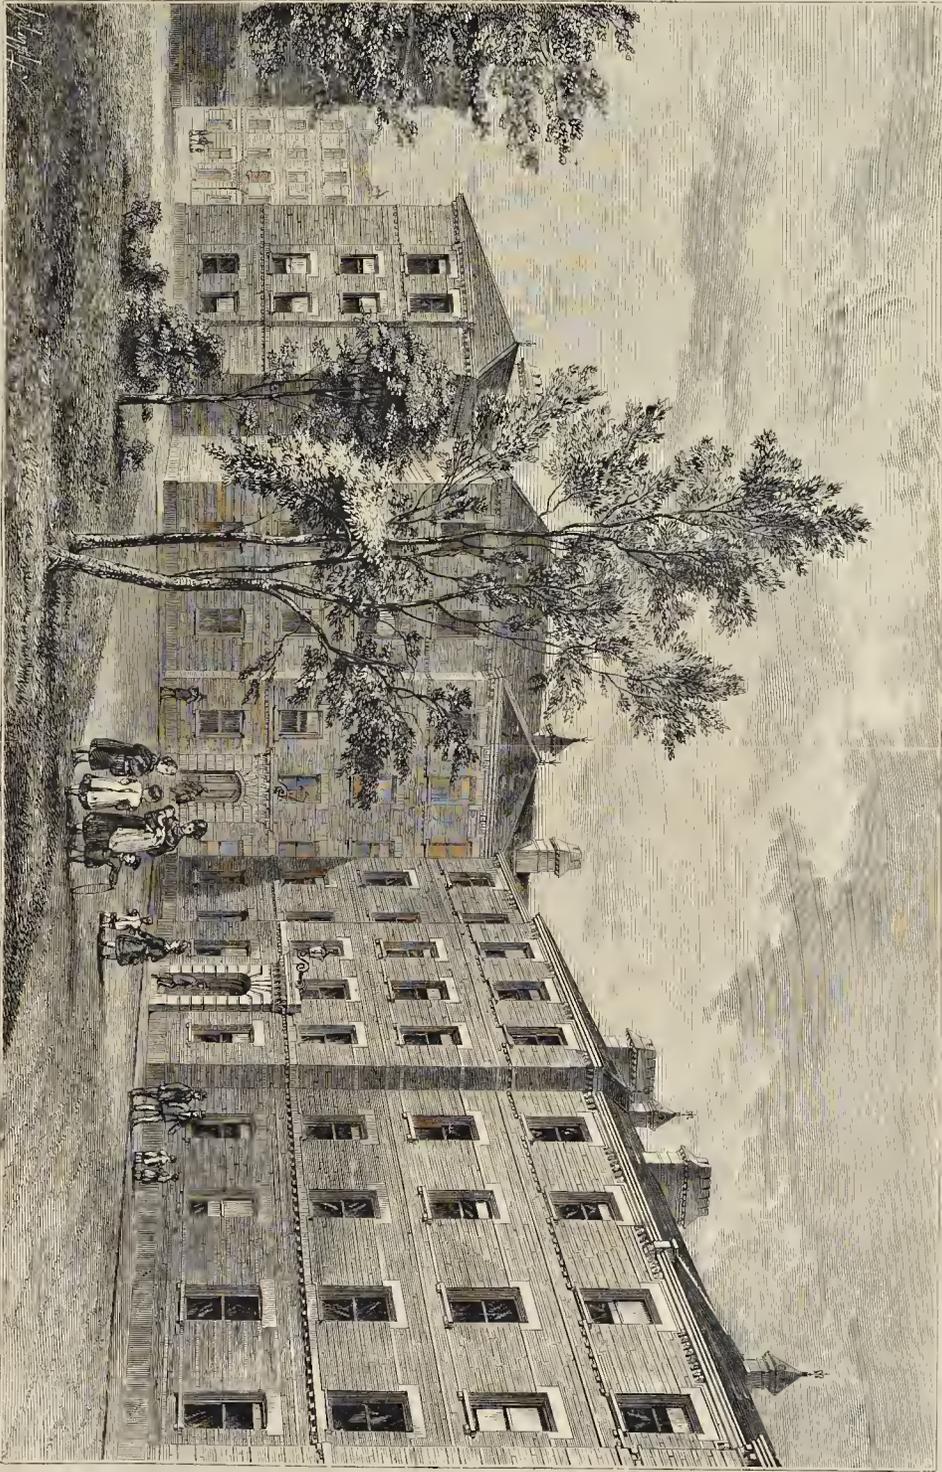

FIRE MONUMENT, CENTRAL PARK, WEST CHICAGO.—Mr. W. L. B. JENNEY, ARCHITECT.

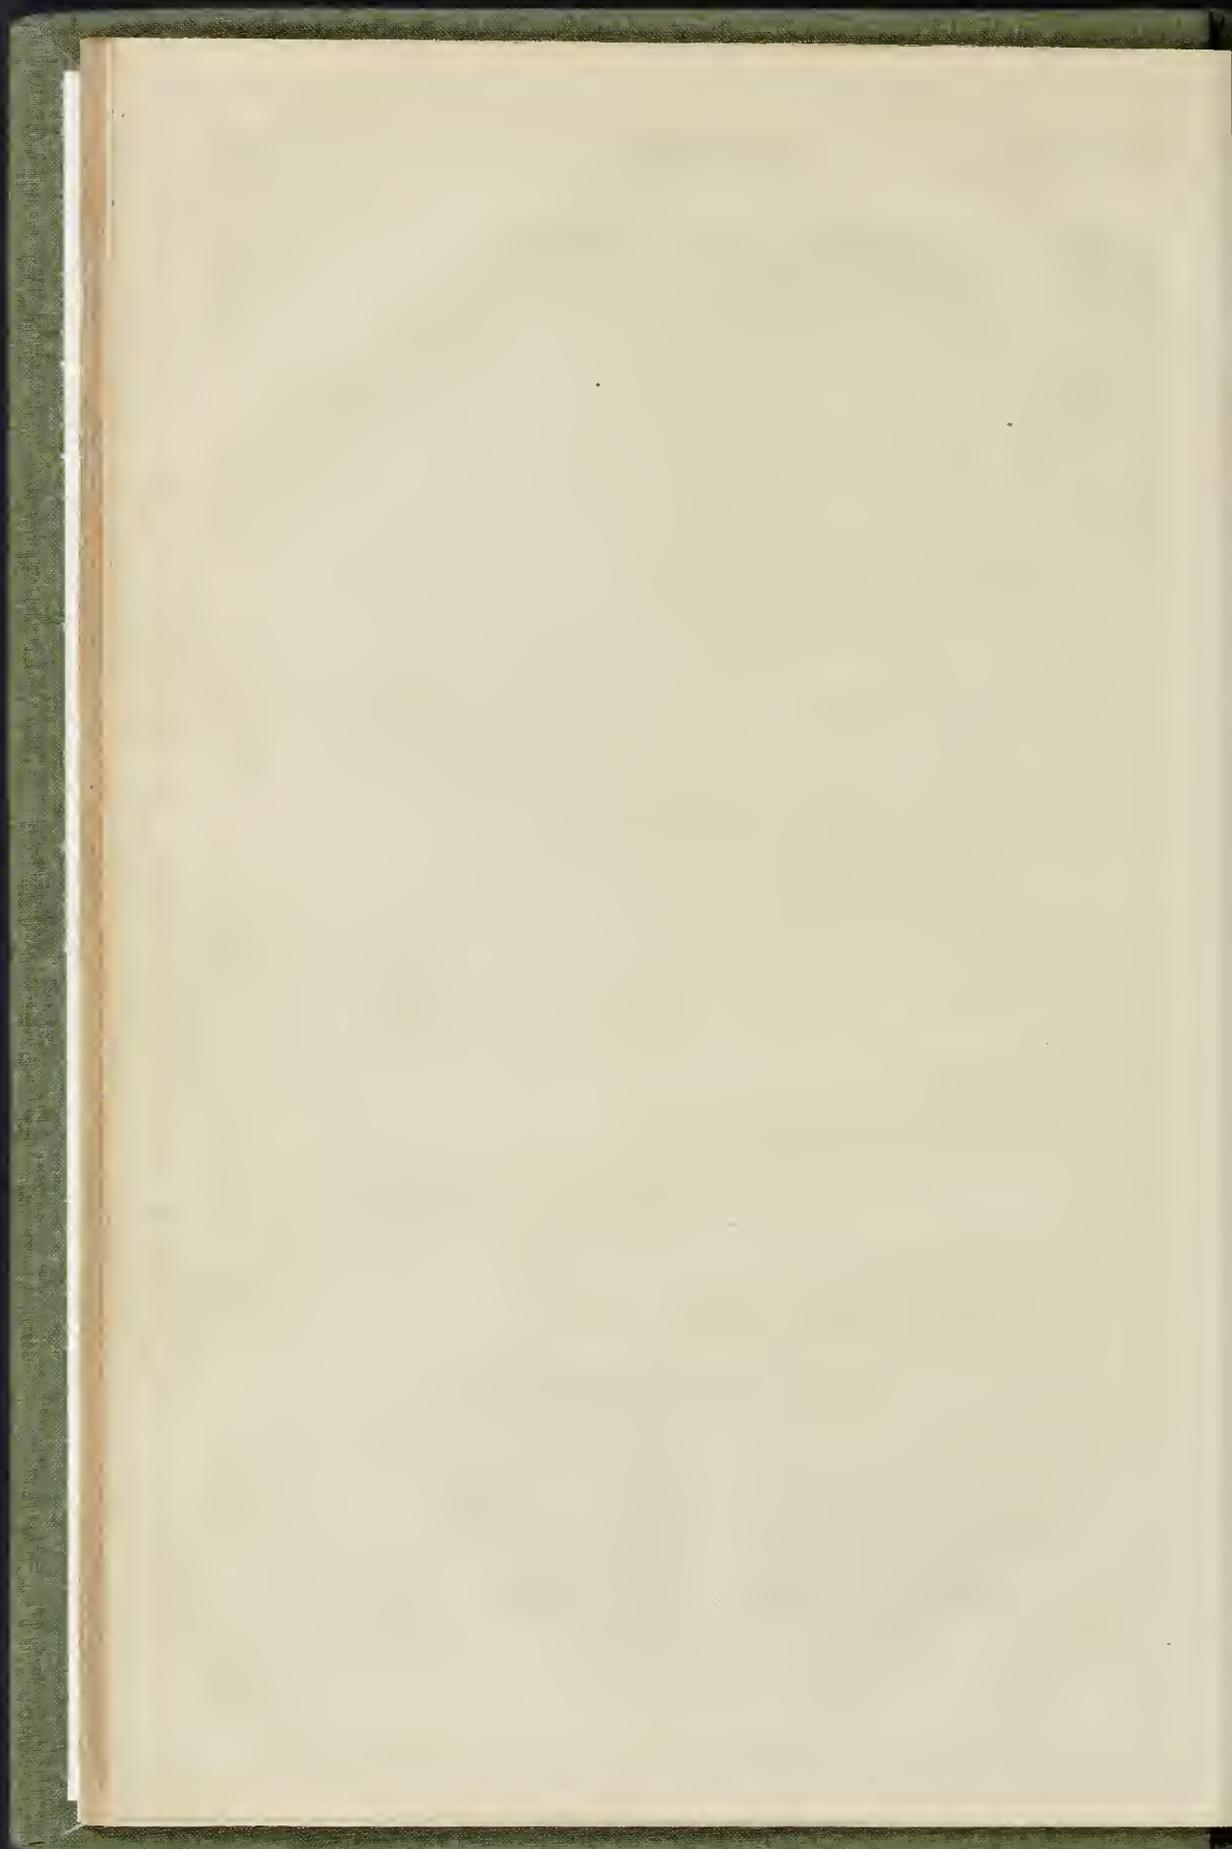

PLAN OF 1ST 2ND AND 3RD FLOORS

PEABODY SQUARE, BLACKFRIARS ROAD.

PEABODY SQUARE, BLACKFRIARS ROAD.—MR. HENRY A. DARRSHIRE, ARCHITECT.

DEADLY WAKES AND WASTFUL FUNERALS.

An edict has at last gone forth against wakes and funerals, both in Ireland and England. Cardinal Cullen has felt it necessary, not only to condemn the demoralising practice of nursing the dead, but to threaten a sort of religious penalty that is likely to have some good effect with the members of his flock. It is many years now since the *Builder* first drew public attention to the pernicious and criminal custom of "waking the dead, and so killing the living," carried on in the homes of the London Irish.

An Irish Roman Catholic priest located at the practice of "waking bodies is disgraceful." He cites what must be considered a terrible picture, that forty persons had sat in one room with the corpse, and that during the night fourteen gallons of beer were consumed.

To this painful picture might be added a little more colouring without the least exaggeration. Let us imagine that among these forty persons there were at least half of them females, the majority of them marriageable; and that besides the beer there was probably half a gallon of whisky drunk, and a quantity of tobacco smoked. The character of the songs and conversation that usually distinguish such gatherings can be imagined, and the moral degradation and blunted feelings they superinduce. Having ourselves witnessed Irish wakes, not alone in Ireland, but in London, in the wynds and closes of Edinburgh, Glasgow, Newcastle-on-Tyne, Birmingham, Sheffield, Leeds, Liverpool, and various other towns in the kingdom, we can form an estimate of their baneful effects.

We have known cases where the deceased, when living, was only existing from hand to mouth; yet his death and "wake" were the signal of the most wasteful expenditure on the part of his friends and relatives.

Many thousands of the London Irish are members of burial societies, to which husbands and wives may certain weekly subscriptions, amounting from twopenny to perhaps fourpence, and even sixpence a week. In this the conduct of these poor people is most commendable. The sums paid at death average, perhaps, from 50s., for a child, and from 5l. to 10l. or 12l. for an adult (husband or wife). Unfortunately too often this sum that should be economised by the survivor in the providing for the funeral and the grave, while bethinking of the future, is thoughtlessly squandered in nursing the corpse, and feasting the jubilant mourners who come from miles around to drink with all due reverence, "The memory of the dead." Then comes the solemn mockery of the poor man's funeral, or the poor woman's, as the case may be, and more money is wastefully spent. Certain of the Eastern undertakers, who specially provide Roman Catholic funerals, have in requisition "a Catholic house" for the conveyance of the deceased London Irish, and this custom has become so recognised, that many of the Irish poor would resent as an insult any attempt to convey the remains of their relative in any but the orthodox vehicle.

An Irish funeral of somewhat large dimensions may be seen almost any week in the year at the East-end of London, or in the Borough; but a bonafide Irish funeral cortege and procession, with all honours, is becoming a rather rare occurrence anywhere out of the Emerald Isle.

Once the body is consigned to the earth, a few of the mourners may return straight home; but, unfortunately, a very large portion of the men who form the funeral procession will betake themselves to the public-houses in the vicinity, and night and drunkenness envelop the conclusion.

If the dignitaries of the Roman Catholic Church had begun their crusade a quarter of a century ago, how much disease and misery might have been prevented! Imagine, in the case of a man or woman dying, perhaps, of some dangerous disease, the body being waked from Wednesday or Thursday till Sunday afternoon, the coffin, even if there be one, fill the last moment unclosed!

The love for "the Sunday funeral" induces the people to nurse their dead for days, to the imminent peril of the health of the entire neighbourhood. We are not exaggerating in any particular. What we state we know.

We are free to admit that there are respectable families who permit wakes in connexion with their deceased relatives from feelings of reverence and the old ties of country and

custom. Neither religion, morality, public decency, nor public health can, however, sanction or permit the continuance of such a baneful custom. The practice is bad and reprehensible in all views, whether it take place in homes above the reach of want, or in the homes of the working poor. If people could only be brought to realise the picture usually presented at these "wakes," in all their baleful, senseless folly and wickedness, their extinction might be looked for. There are probably very few writers or reformers of abuses who in reality know aught from personal observation of these doings. Many here in London, who view them in the mind's eye through snatches of information from time to time in the newspapers, laugh at them, from their comical aspect. There are worse evils attending and arising from the practice of "wakes" than the drinking of beer and whisky,—worse evils even than the infection transmitted from the dead to the living. The corpse may be buried, and the drunkard resume his daily labour; but in the home of the dead there may be more than one sad remembrance of virtue undermined, of young womanhood unsexed, and the dolorous sequence in the streets and the river.

Let the clergymen of all creeds side with the law, and let the law be not harshly but firmly enforced. It is sufficient to cope with the evils we have pointed to.

AS TO A NEW STYLE.

The question of a new style, which has lately been agitated, has closed, as usual, without producing any tangible results.

And thus it will ever be, until it is argued with a clearer conception of what constitutes a style of architecture than the writers of some of the letters I refer to have shown. A careful study of the history of the art will prove that the distinction between varying styles is not to be sought in the arbitrary use of certain "forms," "features," or "details," by one or the other, but that it lies far deeper, and is to be found in the characteristic mental tone of the builders themselves, of which such styles are an accurate reflex.

Let us take the case of the Greeks, a people whose leading characteristics were intense love of absolute perfection, and perfect confidence in their own ability to attain to it; whose emotions were few and kept carefully under control; unimpassioned advocates of philosophical calm, with a sweet distrust of variety. What sort of buildings could be expected of such a race, but just what they actually erected?—all on one simple fundamental plan, with no complicated construction or straining arches to destroy the appearance of self-contained repose which was the Greek ideal, but with all their homologous parts exactly uniform and worked up to as high a pitch of beauty as they were capable of.

It was far otherwise in the Middle Ages; the high emotional tone, the deep reverence of the Mediæval mind required to be impressed with the long-drawn aisles and lofty vaults of the Gothic church. In such a building the round form of arch inherited from the Romans, with its strong lateral thrusts, had no place; where economy of vertical space was not only useless but undesirable, the pointed form, which, in all its various uses, carries the aspiring principle firmly stamped upon it, was much more appropriate, and was no sooner discovered than universally adopted.

The same aspiring tendency carried the roof upwards into lofty gables externally, extended counter-weights into pinnacles, and tower-caps into spires; while a conviction of the unattainability of perfection, and yet of the necessity of pressing forward impatiently on the road to it, caused that roughness, want of finish, and healthy imperfection, which so much distinguish Gothic from Greek work.

Thus, with the exception of window tracery, the result of the accidental invention of colour-glass, we have the main distinctive features of Mediæval architecture; the production not of arbitrary "taste," but of an unalterable psychological law.

Did the limits of a letter allow, I might point out how Oriental indolence produced the flat surfaces and spiritless arches of Eastern architecture; how Egyptian gloom raised the massive piles that crowd that strange land; how the characters of the Chinese, Hindoos, and all other nations may be predicted from their architecture as safely as the habits of an animal from its

organisation; how, finally, even the safeguard of literal copying has not prevented this age fixing its stamp faintly on the so-called revivals of other styles. Can we, then, believe that it would fail to fix it with firmness and vigour on an architecture developed anew from its elements? Revivals of old styles can never be a success, unless we reproduce the tone of thought of the age that gave them birth. The clear mind of Pugin saw this; but unfortunately his admiration of Mediæval art was so great that he actually proposed to effect such an impossible reproduction, and in his enthusiasm led the way himself.

By developing an architecture from its elements, I mean that we should begin in theory, as other nations did in practice, from simple squared masses of building material; and bringing to the work a senso of beauty trained by assiduous study of the Creator's noblest works, shape these rough blocks to such forms as shall give not only pleasure, but satisfaction to the faculty so cultivated; and beauty, I believe, is but the expression of an all-pervading, guiding reason in form.

We can then add ornament, the representation of the most admired works of nature, to give additional interest to the building; enrichment or patterns to relieve plain surfaces; and colour, whose use needs no comment.

The ancients designed on these principles buildings which are real and true organisms, each part designed especially for its own place, all together forming a harmonious whole. We pick their buildings to pieces, and, considering each part as a fixed quantity under the name of a "detail," or an "ornamental feature," patch them together, like children with a box of bricks, to form structures frequently with as little truth in them as the well-known monster of Horace's imagination.

To predict what the style of this age will be is, perhaps, premature; yet, I think that there can be no doubt that the breadth of view which distinguishes modern thought will tend to spaciousness in the area of buildings. The pointed arch, I think, will be found unsuited to the period, and the round form will be adopted, with a slight ellipticity (the long axis, of course, vertical) to give it that life and vigour wanting to the pure semicircle; and, as the Mediæval architects made the development of painted glass windows one of their chief cares; so the great problem of this age, I believe, will be, or rather has been, propounded by the invention of wrought-iron roofs.

I have already trespassed too much on your space; permit me but to add, that I should not have written a letter controverting, as this does, the opinion of so many eminent architects, had I not first practically proved the possibility of designing buildings, monumental and domestic, in the new style whose cause I am advocating. Although want of leisure has hitherto prevented the working out of complete illustrative drawings, yet if any gentlemen who take an interest in the subject should be willing to lend their assistance, a short time would suffice to lay the scheme before the public in its practical working, as well as in its theoretical bearing.

Let me not be misunderstood. I lay no claim whatever to the "invention of a new style." I am simply anxious to show that the style of the nineteenth century is not a visionary dream; and that its conversion from a potential to an actual existence is neither difficult nor troublesome.

A CAMBRIDGE GRADUATE.

THE SITE FOR THE LAW COURTS.

DEMOLITION OF THE BUILDINGS IN ST. CLEMENT'S DANES.

DURING the present week the owners and occupiers of the houses and other premises in St. Clement's Danes, whose property has been obtained by compulsory purchase for the purposes of the New Law Courts, have commenced preparation for giving up possession of their several tenements preparatory to the work of demolition being proceeded with. Miss Coventry, the proprietress of the "Anchor" dining-room and restaurant, opposite St. Clement's Church, and who has received £2,500, as compensation for her lease and goodwill, closed her premises early in the week, and on Thursday had a sale of her effects preparatory to immediate removal. On Monday next, the 15th instant, the St. Clement's Danes Vestry, who have received 10,000l. for

their premises, including the old burial-ground and the almshouses adjoining, will give up possession of the property. Mr. Dr. Silva, the cigar-dealer and billiard proprietor, who occupies the premises next to the vestry-hall, and who has received £2,100*l.* in compensation, announces that he gives up possession at the end of the following week; and we understand that the Midland Railway Company, who occupy the premises adjoining as one of their parcel-offices, will remove about the same time. The occupiers of the four houses in St. Clement's-lane, leading to the Inn, who have also received notices, as well as the old matrons who occupy the six almshouses belonging to the Vestry, are to give up possession immediately, when the whole of the buildings will at once be taken down, but we learn that the bodies in the old churchyard will first be removed under the faculty granted by the Bishop of London. We understand that the St. Clement's Danes Vestry intend to make a comfortable provision for the inmates of the almshouses who will be turned out of their premises for the purposes of the New Law Courts.

SANITARY MATTERS.

Malton.—Drain fever and drain ventilation are now receiving every attention everywhere. The Malton Board of Health have appointed a special committee to inquire into the subject of drain-ventilation, the condition of private houses as to drain-connection and water-closet and soil-pipe ventilation, the covering of cesspits, and general sanitary matters. The inspector has been ordered to visit all houses using water-closets, to inspect drain arrangements, &c., and report.

Nottingham.—In a letter to the *Nottinghamshire Guardian*, Mr. Sidney R. Stevenson, architect and surveyor, Nottingham, says:—Having been called in to inspect and report upon the condition of the drainage of property in the higher situations of Nottingham, I have been astonished to find so little care taken in the sanitary arrangements of the better class of houses. In one case I found the cold and hot water cisterns (fixed in the bath-room) supplied the kitchen, bath, and lavatory; and from the same cold-water cistern the water-closet was supplied. It is almost superfluous to tell your readers that through the closet-valve in the cistern the noxious gases from the main sewer have the chance to force themselves into all parts of the house, and to impregnate the water with their effluvia. . . . A factory owner, with whom I am well acquainted, states that when he has occasion to blow off steam the inhabitants of the adjacent small houses have frequently told him that the steam from the sewer has found its way through their drains and sink-traps into their houses. If such be the case with the floating steam of an engine boiler, with how much more power must the foul gases of the sewers force their way through the majority of drains and traps? A serious case of typhoid has just come under my own observation from this cause. The residence abuts upon what is considered to be one of the most healthy parts of Nottingham—the Arboretum. The effluvia accumulates in the sewers of the lower parts of the town and rushes to the higher, and by accelerated power the gases force their way through lavatory basins, closet valves, and places little suspected. Surely these facts are worthy the consideration of the Sanitary Committee and their able surveyor, Mr. Tirbotton.

Sheffield.—At a recent meeting of the Local Health Committee applications for the vacant post of chief sanitary inspector were opened. These numbered upwards of a hundred. Though the committee sat upwards of three hours, they found it impossible, having other business to transact, to read the testimonials of the various candidates, and to come to a decision upon them. The meeting was therefore adjourned. The committee were able, however, to come to a decision as to who were the most suitable candidates; and fifteen or sixteen of the best were selected. The list of the selected candidates was as follows:—Mr. Tudor, engineer, Manchester; Mr. Drake, sanitary inspector, Salford; Mr. Weyer, civil engineer, Leicester; Mr. Clarke, sanitary inspector, Norwich; Mr. Roome, sanitary inspector, Rawmarsh; Mr. Dobson, sanitary inspector, Glasgow; Mr. Fitzpatrick, sanitary inspector, Liverpool; Mr. Coghlin, chief sanitary inspector, Margate; Mr. Winn, civil engineer; Mr. Maskell, from the office of Mr. M. E. Hadfield, Sheffield; Mr. Lancashire, from the office of the borough surveyor,

Sheffield; Mr. Crofts, nuisance inspector, Huddersfield; Mr. Currie, chief sanitary inspector, Newcastle; Mr. Watson, Sheffield; and Mr. Griffith, sanitary inspector, Ashton-under-Lyne. The contest was ultimately between Mr. Roome and Mr. Crofts, and the latter was elected by a majority of one.

Pollution of the River Lea.—A deputation from the Society for Improving the Condition of the Poor, consisting of Mr. Charles Reed, M.P., Messrs. Robert King, Hacon, and Kemp, have attended the Lea Conservancy Board, to present a petition:—

"That the river Lea is the means of wholesome exercise and recreation to many thousands of the inhabitants of Hackney and of the East of London; that the discharge of part of the sewage of the parish of Tottenham into the river Lea, north of Balby's-lane, makes both the river and its banks offensive to passers-by and dangerous to health, and pollutes the stream for the whole of its course through this parish; that those who live near the river and those who resort to it are exposed to the risk of disease by its effluents, and are deprived of the proper use and enjoyment of the river."

The petitioners therefore request that steps may be taken for preventing the sewage of Tottenham from being discharged into the river. The chairman received the petition, and stated that the Board was taking effective measures to suppress the evils complained of; but there were restrictions in their Act which retarded their proceedings; but he assured the deputation that the nuisance of the Tottenham sewage would soon be abated, as the Board had now under consideration a plan for the interception of the drainage of that populous place.

THE NEW "SOCIAL MOVEMENT."

MR. SCOTT RUSSELL has addressed a letter to the lords, gentlemen, and fellow-workmen who constituted his Representative Council of Working Men and Council of Legislators, containing a programme of the measures which he thinks are needful to turn the celebrated seven resolutions into legislative acts. He hopes it will soon become his duty "to lay before the Council of Legislators the communications they are awaiting;" but meanwhile, as the premature disclosure of their plans has for a while arrested the progress of the movement, he wishes to utilize the time by obtaining their individual co-operation, before the date of the meeting of Parliament.

He thinks that it should be stated in the preamble of these measures, that in some countries lands round towns are held by their inhabitants for the common good; that in England the Legislature has taken from the people millions of acres of common land, which were the entailed estate of the people; that though human beings have not been recognized as objects of value, skilled men and their families are national wealth, and the rearing and cultivating of healthy families is an object of the highest public utility. Parliament should, therefore, grant powers to villages and towns to purchase outlying lands just as railway companies do. The quantity to be—

"one acre for one-tenth part of the inhabitants in towns exceeding 20,000; half that quantity per head where the town exceeds 100,000; and in towns and villages under 10,000 it may reach one acre to five of the population. These lands are to be used as follows:—One-half shall be appropriated to detached cottages in gardens, the other half shall be held as common land, left free in the middle of the cottage ground, within which there may be enclosed school-houses in their play-grounds and gardens, recreation-grounds for the people, a town-hall, market-houses, and places of instruction."

The Corporation to have powers of road-making, purchasing and letting property, building and pulling down and destroying unwholesome buildings and appropriating land for the common good. The revenue for these purposes Mr. Russell would raise from the rent of land. The agricultural value of land is fifty shillings an acre; a town of 10,000 inhabitants would have an acre; that land 1,000 families in cottage gardens, who would pay 1,000 rentals of fifty shillings each; and, considering that the common lands have been taken from the poor for the benefit of the rich, they must be restored by means of a property-tax, which would, of course, fall on the rich. A third source of revenue would be the rental of the cottages. A rental of 105 shillings a year will not only pay for building a cottage, but will repay the capital in a moderate time; and thus "a rental of 155 shillings a year will give a family home, health, and garden ground." But for these purposes capital

will be wanted, not less than 150,000,000*l.* sterling—the price of a war.

"The rentals of these cottages will defray the interest and repayment of this 150,000,000*l.*, and the land-tax will enable the artificial value of the land to be converted into Consols. The increased value of a million skilled men will be worth to the country more than 50,000,000*l.*, a year in the enhanced value of the productions of their industry. Then there are roads, drainage, gas, police, markets, schools, and public buildings, and all the other elements of town organisation; these must be provided for by special revenues. The organisation of these communities is to be municipal.

"The public service is to be organised for the common good, on the fashion of the Post-office. An organised postal delivery, on the Swiss model of parcels and goods of all kinds, 'is of the highest importance to the well-being of the common people;' and the same is true of savings-banks, life and fire insurance, annuities, currency, and money."

"In the middle of every group of homesteads the State will have to plant out a group of skilled teachers,—men skilled in head and hand, men specially skilled in the trades and occupations of the district."

In conclusion, Mr. Scott Russell begs that those proposals may be taken into consideration, with a view of correcting and maintaining them "into fitness for laws." Whether they can be brought into one enactment or many, they all he contends, hold together, and in his view any one will probably fall apart from all the rest. He therefore urges that these questions may be considered, "not as isolated measures tending to better only a part of an ill-conditioned human being, but as the elements of a condition of life tending to better and elevating the physical, moral, and intellectual well-being of the whole man."

BEHAVIOUR OF SAFES AND VAULTS IN FIRE.

THE experience of the late fire in Chicago affords much information regarding the relative merits of safes and vaults for the preservation of papers or other valuables. The work of digging out safes from the ruins, which was begun as soon as the heat of the smouldering piles would admit, resulted in proving the fact that safes, however well constructed, would not, under all circumstances, preserve their contents unharmed. Those placed in wooden buildings, as a rule, held papers and books in good condition; the materials of which such buildings were composed burned so quickly and entirely, leaving nothing remaining to smoulder and retain the fire, that safes did not become heated through. But in buildings of brick and stone the result was more unfortunate. The safes fell among masses of material which burned steadily, and gave forth intense heat for days after the first fire, and thwarted any attempts made at removal. The safes lying in the midst of such heaps of fire became intensely heated throughout, and when efforts to remove them were finally successful, their contents were found, in many cases, to be ruined. Books, papers, and bank-notes still retained their form, but had changed to black in colour, and, upon the slightest touch, crumbled into powder. In almost an exact proportion to the length of time they had been forced to remain in the burning ruins, safes were found to have their contents unharmed, or partially or totally destroyed. It is evident that, while a well-constructed safe will hold unharmed books and papers; yet, remaining in the fire for a long period, no one yet made will fulfil its purpose. With vaults the result proved entirely different. In nearly every instance well-built vaults held their contents intact. Bricks and mortar proved excellent non-conductors of heat, and upon the opening of large vaults which stood for some days in the midst of fire, their interiors were found scarcely warm, according to our authority, the *American Builder*.

These discoveries will doubtless have the effect of introducing more largely the construction of vaults in buildings devoted to business uses, and the disasters resulting from their faulty construction, of which the one in the Custom House furnished a notable example, will perhaps induce more care in building. A vault badly built is worse than a poor safe, for the latter does afford a degree of protection to what is within it, while the former gives no protection at all.

It must not be inferred from the statements made above that safes buried in the ruins of the late fire did not accomplish a great degree of good. Property of immense value was preserved through their agency, and where not exposed to heat of the most intense character, and for a long time, the safes generally stood the test well, and reflected credit on the makers, and must continue to be used, even where faults exist; for, to

secure perfect safety, valuables must be placed in a safe surrounded by a vault; and, for ordinary fires, safes have proved themselves equal to all requirements. But for such occasions as the late fire only vaults can afford the perfect security needed.

THE TRADES MOVEMENT.

London.—It is understood that a conference of the master builders of the metropolis is about to be held, to decide upon what steps should be taken with reference to the request of the Stonemasons' Society that the employers should adopt a uniform nine-hours system for the whole year, instead of confining the nine hours to the winter months, and terminating that rule on the 14th of February. Added to this, the demand on the part of the society for an advance of one penny an hour on the present rate of wages, on and after the 1st of July next, has caused a considerable amount of anxiety amongst the leading men in the trade—in fact, amongst the master builders generally,—as the penny an hour would add something like 10 per cent. to the present amount paid the men. Not the least important question to be considered by the conference is stated to be—in connexion with taking contracts—that of the large prospective increase in the cost of building operations, should the nine hours and advanced wages hereafter apply to other operatives in the building trade besides the stonemasons.—The East of London has been placarded with notices, offering labourers employment at Carlisle at the wage of 3s. 6d., with the additional inducements of cheap lodgings, daily payments, and railway fares paid.

Lock-out at Messrs. Pontifex & Wood's.—The General Council of the Amalgamated Society of Engineers have considered and discussed a dispute which has arisen between Messrs. Pontifex & Wood, the extensive engineers of Shoe-lane, and their workmen; and to decide what should be the action of the men with reference to proposals of their employers, by whom they have been locked out. Mr. William Allan, the general secretary of the society, stated that he had an interview with the firm on the previous day, and he now submitted to the council the proposals of Messrs. Pontifex & Wood. Mr. Pontifex said in effect that the nine-hours system had been conceded to the workmen, a rate for overtime having also been agreed upon. What the firm wanted was that the men should leave off work for tea at half-past four, that they should take half an hour for tea, that they should resume work at five, and leave off finally at six. For the overtime worked the firm were quite willing to pay their men at the rate of "time and a quarter." After discussing the question in various aspects, the council unanimously resolved that the proposal of Messrs. Pontifex & Wood could not be accepted by the men, as it was at variance with the principle of the nine hours.

Trades-union Congress at Nottingham.—The fourth annual congress of the trades' societies and trades' councils of the United Kingdom commenced at Nottingham on Monday. There was a large attendance of delegates. Mr. George Potter, of London, was elected chairman until the credentials of the delegates were received. He delivered a short address, in which he congratulated the delegates upon the prosperous state of the trades generally, and trusted that good results would emanate from the proceedings of the congress. The scrutineers' report showed that eight trades' councils and forty-three district organisations were represented at the congress. Seventy delegates had been accredited, representing constituencies amounting in the aggregate to 255,712. Mr. Leatherhead (Nottingham) was elected president for the ensuing year. The mayor of Nottingham entertained the delegates at a banquet in the Exchange-hall.

The Potteries.—The members of the various branches of the Operative Bricklayers' Society, in the Potteries, Newcastle-under-Lyne and district, have given notice to the master builders that they require an alteration in the "working rules of the Potteries," passed some short time ago by Mr. Davis, the late Stipendiary. In the first place, they ask that the time for leaving work shall be half-past five o'clock, instead of six, during the summer months, that they may be placed in the same position in that respect as the other branches of the building trades. In the second place, they ask for an advance of wages one farthing per hour.

Arbitration in Trade Disputes.—A "Bill to extend the Application of the Act to consolidate and amend the Laws relative to the Arbitration of Disputes between Masters and Workmen," which is to be introduced into Parliament early in the coming session, has been printed. It bears the names of Mr. Mundella, Mr. T. Brassey, Mr. Samuel Morley, Mr. W. H. Smith, and Mr. Thomas Hughes. The Bill is not a long one, having only eleven sections, with an appendix showing what portions of the Act of 5 Geo. IV., c. 96, are to be incorporated in the new law. The Bill provides that its provisions shall apply to all Boards formed for the purpose of settling disputes of any kind between masters and workmen in any trade; that every master who agrees to be bound by the decision of any Board shall keep displayed a copy of these rules, and give a copy to each of his workmen, who, receiving it, shall also be bound by the rules; that the attendance of persons and the production of documents shall be secured by proper means and under certain penalties; that the decisions of the Boards shall be in writing, and be enforced; that no member of any Board, or person bound by one, shall be liable to any penalty under any Act relating to breach of contract between masters and servants, of which such Board might under its rule take cognisance; that the acceptance of this Act by Boards shall be voluntary, and this acceptance may be entire or partial; and that the provisions of the Act shall not apply to Boards of conciliation only. There is to be, by the provisions of existing law, incorporated in the Bill, power to summon witnesses, and compel them to give evidence on pain of imprisonment; power for a married woman to lodge a complaint in the name of her husband, and for children in the name of parents and guardians; and power to enforce awards by distress or imprisonment.

THE THREATENED STRIKE OF MASONS.

SIR,—The threatened strike of the "Operative Stone-Masons" on 14th February, as announced by their secretary in your last issue, is one which will, if persisted in, lead in all probability to a repetition of the great "Builders' Strike" of 1859, with all its disastrous consequences. But, as one who has suffered considerable loss on that occasion, I would earnestly beg the "Operative Masons" to consider what they are about, and whether they have any justification for plunging the whole building trade into confusion and loss. A strike of masons must necessarily involve a lock-out of other trades. It was only in October last that the "Operative Masons" sent to the Builders' Society a memorandum of their wishes, which was acceded to by the majority of London builders. This memorandum was to the effect that the hours of labour should be 504 hours for the 14 winter weeks of the year, and 564 hours for the other 38 weeks, or on an average something over 54, but less than 55 hours per week for the entire year.

But, as frost and bad weather are certain to interfere more or less with masonry, it follows that masons do not, under present regulations, work on an average 54 hours per week, which hours have been decided on by the whole engineering trade as a proper carrying out of the nine-hours system.

All my brother master builders to whom I have spoken agree that there is no reason for now altering the hours of masons' labour from those which they themselves put forth three months ago.

I hope sincerely that common sense will induce the "Operative Masons" to withdraw their notice.

A MASTER BUILDER.

BIRMINGHAM, PAST AND FUTURE.

WHAT is going on in Birmingham, we fear, applies to many other towns. It is a subject often recurred to in the *Builder*. The editor of the *Birmingham Morning News*, in a leading article on this subject, says:—

The condition of the old part of almost any old town has been described and lamented over times without number. We shudder as we pass the street end of the crowded court, and we apologise for the vices of its inhabitants, by asking what better can be expected from those whose very conditions of life shut out from them the possibility of knowing what pure air or bright light is. We regret the existence of these dens of infamy.

But how many people are there in Birmingham

who know at this moment in what manner the future dwellings of the poorer classes are being provided? Nothing is really known; nothing is plainly said. No official acquaints the Town Council, month by month, of what has been done to the permanent injury of the town. No one gets up in his place, or, indeed, has a place in which to get up and say,—“Since our last meeting, twenty, or forty, or sixty more so-called houses have been begun or finished, in which decent life is impossible, or in which it is possible to live with either health or happiness.” And yet surely this is a matter whose importance cannot be exaggerated, and of which it is an absolute necessity that we have definite and exact information. For the fact is that, almost without exception, these additions to our town are in the hands of speculators whose worldly means are certainly not equal to their energy or activity. The buildings of the poor are mostly built by the poor, with money borrowed from the rich. The system of leaseholds is almost universal, and, comparatively speaking, freehold land is not to be obtained. If a piece of freehold land comes into the market. The consequence is, that the constantly increasing endeavour is to place the largest number of tenements upon the smallest possible plot of land. By this means the ground rent of each separate house is kept down to a minimum; and the success of the speculation is rendered more certain. The next object is to build the houses themselves with the smallest amount of material that can possibly be used. The walls are thin, the timbers are few and weak, the roofs are light, the internal fittings are of the cheapest and commonest description. Every method is studied by which space may be saved, and materials economised. One of the commonest, and, at the same time, one of the worst expedients, is to build rows of cottages back to back.

BUDA PEST COMPETITION.

THIS competition, in which the engineers and architects of all nations were invited to send in designs for the improvements of the capital of Hungary, was concluded in December last, and the only prize awarded to foreigners was gained by Mr. F. A. Klein, C.E., of Cannon-street, City, and Mr. Alexander Fraser, C.E., of Brook-street, Grosvenor-square, for superiority in the arrangement of the communications between different parts of the city, parks, ornamental works, waterworks, sewers, and docks.

CEMENTING RAINWATER TANKS.

MR. W. B. WILKINSON, in the *Builder* of the 2nd of December last (p. 944), states that the proper proportion for coatings of cement or brick to tanks, to make them impervious is, in his experience, 5 of cement to 1 of sand,—at least, so I understand his letter. This, however, differs so considerably from what is frequently practised and recommended, that it would be of much service if that gentleman would kindly write something further as to this matter. “Rendered with fine cement $\frac{1}{2}$ in. thick” is, I believe a fairly frequent description in architects' specifications, and, I presume, is also a description of the work executed under them. Some books of instructions could also be referred to where pure cement is either recommended or described as in ordinary use for this purpose. Intelligent builders are sometimes known to argue that a mixture with the best Portland cement of an equal quantity of the very sharpest and cleanest road-drift (say, from a flint-mended road) will add greatly to its success as a rendering coat, stating, as far as they become intelligible, that pure cement, from its expansive habits, ceases to adhere to the surface in parts, and stands out in bulges, in which cracks are afterwards formed, or pieces fall off; others, again, are found believing in something like this 1 and 1 proportion, alleging that the addition of the sand secures a slower setting of the coat, and with that a more equal contraction of the mass; that cracks are produced by the forcible separation of adjacent areas at a certain stage of the process of setting when the material is not thus prepared.

The proportions used by speculating builders in the neighbourhood of London for the cement flats which they love to put over the “wing buildings” of the stereotyped eight-roomed house in rows, are stated frequently as one of cement to two of sand. It is true that they rarely leave a thoroughly water-tight roof behind

them; but that may perhaps be attributed rather to the construction habits of these builders than to the composition of their cement. This necessarily also is not a good guide for tanks; for although the flat has to resist rain falling with some force, it has usually a good fall, and gets rid of it quickly; whereas a rain-water tank holds a most ingenious and indefatigable prisoner, always searching to improve the least possible chance of escape.

An underground brick tank in use is not a very accessible place for conducting experiments; this perhaps is some excuse for a want of conscientious judgment, and for a request for some carefully ascertained facts from those who have them in their possession. STAGNUM.

CONFERENCE COMMITTEE ON PUBLIC COMPETITIONS.

SIR,—Grant me a corner in your valuable journal to acknowledge, with thanks on the part of the committee, the receipt of communications on the above subject from the following gentlemen:—E. Ashworth, H. J. Austin, A. W. Blomfield, J. Boulton, R. K. Blesley, W. E. Brown, S. C. Capes, W. Chick, T. C. Clarke, J. A. Cory, J. Cunningham, H. A. Darbishire, A. D. Dawney, J. S. Dodd, G. A. Dunning, Edward & Robertson, F. W. Fiddian, E. W. Godwin, A. S. Goodridge, W. J. Green, E. Gregg, R. Griffiths, G. H. Guillaume, F. R. Haswell, J. Hayward, C. Henman, J. Hicks, G. M. Hills, J. H. Hirst, J. Honeyman, J. W. Hingall, T. C. Hyno, H. Jarvis, jun., G. F. Jones, C. Inyan, W. H. Lynn, J. D. Mathews, F. R. Meeson, J. Milne, J. Morris, E. Nash, R. Owens, W. Papworth, R. Plumbe, T. C. Pope, R. J. Rounien, E. C. Robins, J. Ruskin, J. P. Seddon, P. G. Smith, L. Solomon, T. C. Sorby, H. H. Statham, N. E. Stevens, G. E. Street, T. J. Street, E. Taylor, T. M. Taylor, J. Thomson, J. J. Thomson, A. H. Yale, Wadmore & Baker, D. Walker, F. Wallen, J. E. Watson, T. H. Watson, W. H. Weighman, W. J. Wilcox, and C. G. Wray; besides two anonymous correspondents, who will oblige by sending their names.

ALFRED SYMONS,
Hon. Sec. Conference Committee
on Public Competitions.

CUTTING OAK TIMBER.

SIR,—I propose to panel a dining-room in a house in the country, and to cut down enough of my own oak timber to do it.

Will any one tell me what sized timber I should cut?—whether it is advisable to cut it in winter or summer, bearing in mind that if cut in winter all the bark is lost? Also, what size it should be cut into, and when?—that is, how long should it be on the ground, when should it be cut up; and, when sawn up and laid up to weather, what are the proper sizes for it to be sawn into as boards? What are the best lengths, widths, and thicknesses that the boards should be cut down into as not to warp too much when finally cut into panels.

J. R. H.

EXHIBITION OF OLD MASTERS.

SIR,—Would you allow me to suggest to the directors of the Royal Academy that at the next week of this exhibition (that time of closing should be extended to eleven o'clock in the evening, and the price reduced to 6s.) The same plan is carried out at their annual exhibition. By so doing they would confer a boon on hundreds of people who have no other opportunities of seeing these grand old masters, and cannot lose half a day to do so.

J. R. GOUGH.

VENTILATION OF SEWERS.

At a recent meeting of the local Board of West Derby, Liverpool, the following minute of Mr. Robert Rawlinson, C.B., on sewer ventilation, was received:—

"By a return recently made relative to the sewers in West Derby, it appears that about eleven miles of public sewers have been constructed, and that on these sewers there are seventy-five ventilating shafts. It is considered necessary for safety to the public health to ventilate public sewers at intervals not further apart than 100 yards, or eighteen ventilating manholes and grates on each mile of main sewer. This rule requires that there should be on the eleven miles of West Derby main sewers 188 ventilating shafts, or 123 additional to those now in use. Rain-water spouts may serve to ventilate house drains; but these should not be reckoned in reductions of main sewer ventilation. With means for sewer ventilation as indicated, the air in the sewers will be comparatively pure. There cannot be concentration or stagnation at any part of the system, and it is in concentration and stagnation that danger to health arises. With profuse ventilation there will not be perceptible smell at the ventilating grates at any one point, as the dilution and dispersion of sewer gas will be unceasing. Foul smells and dangerous escapes of sewer gas only take place from severely inadequately ventilated. The West Derby local Board has more fully ventilated the sewers of the district than many other local Boards; but, to be safe, the additional number, as now recommended, should be constructed."

The communication has been referred to the Main Sewerage Committee.

BUILDING OVER A SEWER.

At the Hammersmith Police Court, Mr. Jonas Turner was summoned, before Mr. Ingham, by the Kensington Vestry, for erecting a party wall over the crown of a sewer in the Brompton-road without their consent.

Mr. Harding, the clerk of the vestry, attended in support of the summons, and Mr. Clayton defended.

It appeared that in the construction of the Metropolitan District Railway through Brompton a sewer was diverted, and another built by the side of the tunnel, unknown to the Vestry. It was the main sewer for the drainage of Walton-street, which was in the parish of Chelsea. As the sewer was laid in the parish of Kensington, it was vested in the authority of the Vestry, under the Local Management Act. The existence of that sewer was brought under the notice of Mr. Broadbridge, the parish surveyor of Kensington, for the first time in August last, when the defendant's builders deposited a plan for draining three houses into it. The defendant had bought the land through which the sewer passed from the railway company, and had built three houses upon it. The wall in question had been erected over the sewer.

Mr. Clayton said the defendant purchased the right which the company possessed in the land, and he supposed that he could build his houses upon it.

Mr. Ingham fined the defendant 20s. and 2s. costs.

Books Received.

A Group of Englishmen (1795 to 1815). Being Records of the Younger Wedgwoods and their Friends; embracing the History of the Discovery of Photography and a Facsimile of the First Photograph. By M. METEYARD. London: Longmans, Green, & Co.

MISS METEYARD conceives that she has now traced the proofs which establish the fact that Thomas Wedgwood, the younger son of the celebrated Josiah Wedgwood, and the only man of great ability amongst his sons, though an invalid for years, and unable to do much to show his ability to the world, was, nevertheless, the original discoverer of the photographic art.

"This fact," she says, "I have now, I think, set beyond all question. I have traced the link which connected the Frenchman Dominique Daguerre with the elder Wedgwood, and so onward, as far as my materials permitted, till we came to the testimony of Mr. Humphrey Davy and James Watt, the great engineer. If the letter descriptive of the processes of the 'silver pictures,' written in 1799, by Josiah Wedgwood,—the second to Watt,—should yet be found, every doubt as to the originator of this art must vanish; but the family of Thomas Wedgwood knew the discovery was his. We have the living testimony of their descendants to that effect; and the admirable facsimile of the earliest known heliotype, or 'sun picture,' given in these pages will add strength to that testimony. Mr. Mayer, whose property it is, derived it from an undoubted source; and many of these heliotypes were, it is said, scattered at one time about the Potteries. Mr. H. Adlard, the eminent steel-engraver, has, through the labour of three distinct processes, admirably rendered the original heliotype; and Mr. Mayer, an authority in these matters, thinks that it was the aut's copy of an etching by Teniers, or one of his school."

It appears that so early as 1790 Thomas Wedgwood had a correspondence with Priestley as to researches on light, in which Wedgwood was engaged; and Priestley's letters are quoted to that effect. "I like very much the plan of experiments you mention," said Priestley, in one of them, "as they will very probably throw some new light on a very important subject, about which we as yet know very little: indeed, light and heat are little known, and yet I think they are as open to investigation as air." And, again, in the same year, Priestley says, "I do not know that any experiments have been made on the curious and important subjects you mention, and I have little doubt but your labours in so new a field will be crowned with considerable success. All that is known of the kind is the general aptitude of the more refrangible rays to be reflected in such media as water and the atmosphere." "There is nothing," added Priestley in a further letter, "more within the field of random speculation than light and heat; their connexion is evident, but which is the element of the other is unknown."

The immediate result of these experiments was the appearance of two papers on the "Production of Light from Different Bodies," for the volume of "Philosophical Transactions" for the year 1792. They are, as literary productions, very immature.

About 1802, the subject of the "silver pictures," so far as the name of Thomas Wedgwood is concerned, finally reappears. From about the year 1793-4, when his health gave way, he seems never to have repeated his experiments on any truly scientific scale; but his camera and other instruments remained at Etruria; and these, when seen by visitors, occasionally brought the subject under discussion. Mr. Olshofer and Mr. Josiah Wedgwood—who had been often present during these experiments—could give every detail; and thus when James Watt visited

Etruria in 1799, on business relative to a hand-mill he and Boulton were supplying to the firm, the subject of Thomas Wedgwood's extraordinary discovery seems to have been discussed; and a few days later, Watt received a letter (probably a promised one) from Josiah Wedgwood, in which were given the details necessary to experiment. To this Watt replied,—"Dear Sir, I thank you for your directions for the silver pictures, on which, when at home, I shall try some experiments. I was thinking on your mill after I left you, and fear the motion of the spindle is too slow," &c.

"Now," says Miss Meteyard, "if the coloured pictures found in recent years at Soho, and the two 'heliotypes' still existing, and known to be the result of a most original discovery made by Thomas Wedgwood in 1791, were one and the same, would Mr. Wedgwood have given this detail of process, or Watt acknowledged its receipt? The want of producing cheap pictures by colour-washing had been carried on at Soho since 1775-6, and would not Watt have applied to Boulton or Egginton? or, indeed, would it have been necessary, when five minutes in the workshop close at hand would have supplied him with every thing he could desire, to be subjected to paper, pasteboard, wood, and metal? Moreover, the Soho pictures and the Wedgwood heliotypes, when seen side by side, are so utterly and wholly dissimilar as to present not a vestige of affinity. The same methods could not possibly have been used in their production. In the Soho pictures we see clearly a faded water-colour, generally lined and shaded by faint pencil strokes on by a mechanical though free, process, akin to stencilling; whereas, the two heliotypes still in existence show strongly the results of a process, effected by some accidental or fortuitous process. The hues are those of tarnished silver, faint through time and an imperfect method of manipulation. Old heliotype pictures generally represent subjects taken from Angelica Kauffmann, Benjamin West, Zoffany, Reynolds, and other fashionable painters of the time, this water-colour process being found to be suitable to portraits and figures than landscapes. But after the advent of Boyell and the fine engravers he employed, such mechanically-produced pictures fell into disrepute, and Boulton and Egginton were to commercially cease to continue the manufacture of unsaleable articles. The processes were discontinued, or turned to other accounts, the stock sold cheaply off, and such remains as remained being stored away in the chambers and closets of a great manufacturer, only came to light when the generation of workmen who had assisted in their production had died out."

Miss Meteyard's arguments, which, by the way, she seems to have rather weakened than strengthened, and rather unnecessarily, by a good many repetitions of it may be, are finally clinched by the grand fact, that the paper published in the June (1802?) number of the "Journal of the Royal Institution," was headed "An Account of the Method of Copying Paintings upon Glass, and of making Profiles by the Agency of Light upon the Nitrate of Silver." Invented by Thomas Wedgwood, esq.; with Observations by H. Davy."

"Here," says Miss Meteyard, triumphantly, "in the plainest and briefest words, we have the fact of the invention, and the name of the inventor publicly stated by one who was not merely a friend, but a man of the highest moral and scientific attainments. Egginton and Daguerre are as remote from these facts as though they had never existed. Had they been false, some other man would have been the beneficiary of the discovery practised elsewhere, the scientific and artistic rivalries of the day were sufficiently keen to have led at once to denial and adverse claims."

Of the processes employed or the results obtained from the heliotype experiments at the Royal Institution, no account exists. Of the earliest heliotypes, those taken at Etruria, 1791-3, two are still extant. One, a breakfast-table scene, is to be found engraved in the "Life of Wedgwood"; the second, and the earliest valuable, is given by Miss Meteyard in her new volume. Of this she says,—

"It is clearly a heliotype, or, as we should now say, a photographic copy, of an ordinary book-enslaving, for the cross-hatching of the grass's foot is distinctly visible. It was, probably, hastily torn from some book of travels lying on the table, for the purpose of fixing in the camera, or behind the glass, through which the rays of the sun were to pass. The original of this heliotype would just fit into an octavo volume, and appears to represent a Savoyard piper in the costume of his country. Finding some excellence in the picture, he may have torn a print from the nearest book at hand, and thus immortalized, by a new art, what in itself was intrinsically worthless. The authenticity of this heliotype is undoubted, and, as the earliest known specimen of a most original and beautiful discovery, is considered, by those most competent to judge, to be of great value."

The volume under notice is an interesting one, more especially as regards such friends of the family of the Wedgwoods as Coleridge, Godwin, Wordsworth, and others. Thomas Wedgwood was a benefactor to all of those named. He settled an annuity of 150l. on Coleridge; and not only were the coats of Coleridge's visit to Germany paid by him, but those of Wordsworth also—a newly discovered fact,—as appears from business documents, in which the exact sums sent to both are given.

The way in which a host of the documents on which much of both of Miss Meteyard's volumes at the Wedgwoods has been based were saved from destruction by "the right man in the right place" is wonderful. Mr. Mayer, of Liverpool, a well-known patron of art, took letter, on one accidental occasion, during a shower, in a small scrap-shop, in the outskirts of Birmingham, while on his way to the Continent; and there he saw a number of old ledgers, but, on carelessly opening up the boards, he found them empty; sufficient remained, however, to show him that they were business ledgers of the Wedgwood establishment at Etruria. On expressing his surprise, the shop-keeper told him they had been very useful for wrapping bacon and butter in, and that he had lots more, but he was afraid they were of much less value, as they were not big books, but small bundles. "Let me see them," said Mr. Mayer; and he was conducted up a ladder, with many apologies, into a dirty loft, where, literally, hundreds of weights lay, and the first paper he picked out was an inventory of goods taken by Flaxman to Rome in 1787. That Mr. Mayer secured the prize at so much a hundredweight need not be told, and he saw them himself sent safely to Liverpool. Miss Meteyard has had the advantage of rummaging at will through all this mass of valuable MSS. She has already made good use of them in both of her published volumes, and seems to contemplate putting them to other purposes equally interesting to the public.

Miscellaneous.

The City Guilds and Technical Education.—On Wednesday afternoon a meeting of the masters and wardens of the various City Companies was held at the Mansion-house, under the presidency of the Lord Mayor, to consider the question of technical education, as affecting the guilds of the City. Reporters on presenting themselves were told that their attendance was not desired, as the meeting was purely a preliminary one, and confined to the masters and wardens of the companies, together with the various clerks. Several members of the Ivery committee are anxious that the various halls of the companies should be utilised, by having exhibitions on each relating to their various crafts; but the new idea advocated by the masters and wardens is, that an aggregate exhibition shall take place at the Crystal Palace periodically. We are informed that the only business of a practical nature transacted was the passing a resolution to form a preliminary committee, to consist of a member from each company, and to be elected by their respective companies.

Engineer Institute, Chatham.—The Chatham correspondent of the *Morning Post* says the works in connexion with the new Royal Engineer Institute, at the School of Military Engineering, are likely to be pushed on in earnest, Mr. Sollitt, the contractor, being now in possession of the site. The building is in the Italian style of architecture, with a spacious entrance situated in the centre of the principal front, over which are Corinthian columns, in Portland stone, supporting a cornice, which is surmounted by an open balustrade running the whole length of the building. The lower portion will be built with white bricks, whilst the upper part will be built of buff bricks. On the ground-floor there is to be a vestibule and hall, with lecture-theatre immediately in the rear, the access to it being in front of the main entrance. On the right are to be the halls of study for construction and military engineering, and on the left the library, which will be a spacious and noble room; and the clerk's and secretary's office, with accommodation for the Royal Engineer Committee, whose labours extend to almost every scientific subject in the art of war. On the first, or upper, floor, are rooms for the testing of materials, survey office, and photograph rooms; whilst on the basement floor there is ample room for printing, lithography, and the chemical laboratory.

The Channel Steam Ferry.—Plans are being made at Elswick of some hydraulic machinery to be used in Mr. John Fowler's scheme of carrying locomotives and railway carriages across the Channel from Dover to Calais. Sir William Armstrong has calculated that the machinery will hoist train and all from the rail into the ferry-boat in the space of 4 min. 37 sec.

Sanitary Condition of Mile-end.—Dr. Matthew Corner, Medical Officer of Health for Mile-end Old Town, has submitted his report on the condition and public health of the district for the year ending March, 1871, to the vestry of that hamlet. He accounts for its late appearance by saying that there was a considerable accession of work, caused by the presence of the small-pox epidemic; and before this had subsided, the rumours of the approach of cholera still further added to this work. If (he continues) the number of births and deaths proportionate to population may be taken, — the former as an indication of material prosperity, and the latter of good health, — it might be presumed that the hamlet maintains its reputation for salubrity. The number of births for the year was 3,724, or about 40·7 to every 1,000 of the present population. The corresponding rate for the whole metropolis was 35 per 1,000 population. The births exceeded the average for the previous five years by 333. The annual death-rate in the hamlet was 21·5 per 1,000 population living; that for the whole metropolis was 24 per 1,000 population. The report of Mr. H. Leslaw, sanitary inspector (which is appended to Dr. Corner's), gives an account of works executed during the years 1870-71, and shows that the improved health of the people of the hamlet is not without its specific cause.

Extraordinary Conduct of a Workman. At the Oldham County Police-court, Thomas Beesby, of Manchester, was charged with doing willful damage to a rope. The prosecutor was a contractor, named John Falkner, of Manchester. He had contracted to repair the top of a chimney at Boundary Mill, Chaderton. The prisoner was engaged to dress the stones. Some dispute arose, which resulted in another man being engaged in the prisoner's place. A number of men were raising stones, by means of the usual machinery, to the top of the chimney, when the prisoner went to the place and threatened that if they attempted to raise another stone he would cut the rope. He was told that if he did so he would endanger the lives of two men on the scaffold at the top. He left the place, but in a short time returned again with an axe. A stone weighing 5 cwt. was then being raised. The prisoner deliberately struck the rope with the axe and cut it in two. To save themselves from falling from a height of 50 ft., owing to the vibration, the two men at the top had to cling to the edge of the chimney. The prisoner afterwards cut the rope twice. The prosecutor confined the case to a demand for 1s. 6d. damage done to the rope. The prisoner was ordered to pay this amount, with costs, or be imprisoned seven days.

Swimming Baths for South London.—A large building has been erected in the New Kent-road, immediately at the back of the Elephant and Castle Railway Station, containing large swimming-baths, which are also convertible into two spacious halls, adapted for lectures and dramatic and theatrical entertainments. The length of the building is about 250 ft., one-half of which is devoted to a corridor, along which, on either hand, are over thirty private baths. In continuation is the great hall, or principal bath, which is also 125 ft. in length, and which, with two galleries, is capable of holding about 4,000 people. The interior of this hall will have attached to it a stage, measuring 52 ft. by 27 ft., which will be supplied with the mechanical contrivances necessary for producing theatrical entertainments. In addition to the large hall or bath there is a smaller one, which is 52 ft. in length by 17 ft. in breadth, and both will be supplied with all appurtenances suitable to the bathers' comfort and convenience.

Land-spring next Gloucester House.—In the St. George's, Hanover-square, Committee of Works, Col. Ogilvy presiding, Mr. Walker asked the surveyor if he knew that there was a landspring in the house next to Gloucester House. Mr. Tonkins said he knew of it a short time ago. A builder made an application for permission to drain this landspring. It appeared that the medical officer (Dr. Aldis), reported to the vestry about this landspring in September and October, 1869.

Royal Architectural Museum.—We learn that a cast of the black marble tomb of Gundreda, wife of William de Warenne, and daughter of William the Conqueror, originally placed over her remains in the Chapter-house of Lewes Priory, has been given to the Architectural Museum.

The Inns of Court Hotel in Holborn.—This costly building, which was erected only a few years ago by the Lincoln's Inn Hotel Company, has recently been the subject of proceedings in Chancery, under liquidation, the business of the company having turned out an unprofitable speculation. The matter was before Mr. Church, the chief clerk, at the Chancery Chambers, on Tuesday, when it appeared that there were two offers for the absolute purchase of the establishment, — one by Mr. Sawyer for 50,000l., and another by Mr. Brooke for 70,000l., the object of the latter being to carry on the business of the hotel in conjunction with a number of the debenture-holders. The Chief Clerk adjourned the case in order to ascertain if Mr. Sawyer was prepared to make a further advance upon Mr. Brooke's offer, when it appeared he was; and the probability is that this building will shortly be purchased by new proprietors at the amount of its original cost. The Chief Clerk remarked that he should not sanction anything but an absolute purchase.

The West Ham Irrigation Scheme.—Mr. Robert Rawlinson, C.B., the Government Inspector, has held an inquiry at the town-hall, Stratford,

"in pursuance of the Local Government Act of 1858, and of a petition duly presented by the Local Board of Health for the district of West Ham, addressed to the Local Government Board, praying for the issue of a provisional order for the extension of their borrowing powers, in order to raise the capital required for the erection of sewage outfall and sewage distribution in the way of irrigation."

For this portion the Board propose to purchase, at a cost of 80,000l., Dagenham Farm, situated at about five miles' distance from the parish. Captain Flowers, R.E., the sanitary engineer of the Lea Conservancy, was present. After a lengthened discussion, Mr. Rawlinson summed up by pointing out that at Leamington, Northampton, Birmingham, and other large towns, after thousands had been spent, irrigation had to be resorted to; that the pollution of rivers was a most important matter; and that they must adopt some means for getting rid of their sewage otherwise than by passing it into the Lea.

Opening of New Waterworks at Winstler. The populous Peak village of Winstler has been a scene of great rejoicing, the occasion being the inauguration of the water supply. An ample supply of water had been found on the estate of Mr. Thornhill, at Stanton, which that gentleman readily placed at the disposal of the committee, and voluntarily gave 50l. towards defraying the expenses of conducting it to Winstler. Lord George Cavendish, M.P., the Duke of Rutland, Capt. Arkwright, M.P., and many other persons in the neighbourhood, liberally contributed towards the object, and the result is that the water has been conducted from Stanton (about two miles) in pipes; and this and the formation of a reservoir is estimated to have cost about 1,000l. The inhabitants have also materially assisted by their contributions and labour.

Decoration of St. James's, Tunbridge Wells.—The chance of this church has been decorated by Mr. Samuel Fry, of South Grove House. On a red ground are painted the sacred monograms, so as to form a diaper over the walls, and between the windows are scrolls, on which are written parts of Psalm xxii. and Isaiah liii., suitable to the subjects portrayed in the windows. The roof which is painted a dark plum colour, is relieved with outline drawings of yellow ochre. The central subject is our Lord in Majesty: on each side are angels with trumpets, and others with censers in the act of adoration. Farther away from the centre are others holding scrolls, and above the figure of our Lord in the centre panel is the symbol of the Godhead.

New Works and Extensions in Sheffield. Large extensions of existing works are being made, or have recently been effected, at Sheffield, according to the local *Independent*, which gives a lengthened account of them. By far the most important of the new undertakings are the works of Messrs. Brown, Bailey, & Dixon. These works are now in course of erection, and it is expected they will be in full operation within the next six months. They will be by far the largest that have ever been erected in Sheffield at one time, as they stand on no less than thirteen acres, and will give immediate employment to 1,500 workmen. The works are at Atercliffe.

The Restoration of Paris.—The destination resolved on for the great buildings of Paris burned under the Commune is as follows:—The Hôtel de Ville will be rebuilt by the city; the Tuileries and Palais Royal by the State; the Palace of the Legion of Honour by subscription; the Caisse des Dépôts et Consignations by the society itself. The Cour des Comptes, the Grenier d'Abondance, and the Ministry of Finance, being totally destroyed, will be razed to the ground and the sites sold. M. Thiers is particularly anxious for the restoration of the Tuileries, and will himself shortly present a proposal on that subject. The pavilion by the side of the river will alone be preserved in its present state. The two others and the connecting walls will be pulled down, as they are so damaged as to be useless.—*Galignani.*

The Thames Embankment Line of Frontage.—In the St. George's, Hanover-square, Vestry, Mr. Farrer asked Dr. Brewer if a line of frontage had been defined on the Thames Embankment. He understood it was proposed to erect an hotel on the Embankment, close to the railway-station at Westminster Bridge, and that the superintending architect had defined the line of frontage. Dr. Brewer replied that the line of frontage had been defined, and the plan deposited with Mr. E. Hollis, the clerk to the Westminster Board. He might add that if they took Mr. Horsman's house as one phmb and the Board of Control as another, and struck a line on the Embankment, that would define the line of frontage. Mr. Farrer gave notice of a motion on this subject.

Technical Examinations.—The Council of the Society of Arts have come to the resolution,—“That the time has now arrived when the present system of examinations is no longer necessary, and that the encouragement of particular subjects, bearing especially on arts, manufactures, and commerce, should be promoted by special means.” It will therefore be held that, after the next examinations, to be held in April, 1872, the present system will cease. The Council have under consideration a scheme of technical examinations. It is proposed they should give notice annually of the three, four, or five manufactures which would be taken up the following year, with a slight syllabus of the examinations which would be held at a few convenient centres.

Land in Manchester.—The *Manchester City News* gives the following as the result of the sales by auction of real property,—land, houses, and chief rents,—in Manchester and its immediate neighborhood, for 1871:—January, 26,322l. 10s.; February, 13,615l.; March, 35,050l.; April, 47,343l.; May, 56,952l.; June, 12,217l. 10s.; July, 121,145l. 10s.; August, 23,077l.; September, 22,769l. 10s.; October, 32,751l. 10s.; November, 19,937l.; December, 25,017l. 10s.; total, 436,277l. The plot sold in St. Ann's-square, which was free from chief rent, brought the highest price of the year,—at the rate, namely, of 67l. 13s. 9d. the square yard. A small plot in Princess-street, opposite the new town-hall, sold last week at the rate of 33l. 14s. 7d. the square yard.

Archæological Discoveries at Athens.—Some interesting discoveries have been made in excavations at the Ceramicon of Athens. Several tombs, some quite intact, have been brought to light, and among them, it is said, is that of two ambassadors of Corcyra (Corfu), who formed part of the deputation from Xenophon, sent to ask for the assistance of the Athenians against the Lacedæmonians. Another bears the name of Hipparete, daughter of Alcibiades. Other researches have led to finding a monument, composed of five tombs, bearing inscriptions, and belonging to the Vexiplos family; and a sixth, ornamented with a basso-relievo composed of two women, one standing and the other seated.

Workmen for New Zealand.—We have had a large number of applications and letters, probably not fewer than a hundred, in consequence of mentioning in our last report that agents from New South Wales were seeking to obtain the services of artisans for the construction of a railway in New Zealand. We have no further information on the subject. The persons concerned, if men are really wanted, should take means to make their address known.

Surveyorship.—Mr. Robt. Willey, M.R.I.B.A., of Lodge-chambers, Lodge-hill, has been appointed Surveyor to the Hand-in-Hand Insurance Office.

Settrington Church, near Malton.—The wall at the east end of this church has been painted in encaustic from designs by Mr. J. W. Knowles, of York. The space immediately above the altar-table, and extending across the chancel, has in the centre of it a Greek cross, between the arms of which are the emblems of the Evangelists, and on each side of the cross and at the extreme ends of the wall are borders in colours and gold, the spaces between having the Decalogue illuminated upon them. The dado underneath this design is of a deep red, diapered with a pattern of a pale shade of the same colours, black and gold, and the cornice which surmounts it, and is of stone, has been painted and picked out in gold and colours.

Victoria Park.—At last week's meeting of the Metropolitan Board of Works, a deputation, headed by Mr. C. Reed, M.P., expressed an earnest hope that the Board would recognise the importance of preventing any further building upon the open spaces immediately surrounding Victoria Park, and that measures would be taken for acquiring from the Government the land necessary for laying it out as a recreation-ground. A memorial embodying the views of the deputation was referred to the Works and General Purposes Committee.

Proposed New Buildings.—It is said that the late Baroness Weld has left the bulk of her property to Archbishop Manning for religious purposes. Among the special bequests are a large sum for the erection of a Roman Catholic church at Oxford; 7,000l. for the erection of a mortuary chapel in memory of her son, the late Captain Weld; various sums for the building of churches at Newbury, Twickenham, and London, and also for chapels in Surrey and Berkshire. Mr. Welby Enjin is named as architect to the whole of the buildings. The family threaten opposition.

New County Asylum for Lancashire.—There is at present in course of construction at Wittingham, near Preston, a large new county asylum for the pauper and other lunatics belonging to Lancashire, and which, it appears from a statement made at a meeting of the county magistrates held last week, will involve an expenditure of 120,000l. This is in addition to two other large establishments of a similar character which have recently been erected in the south-eastern and the south-western portions of the county, namely, at Prestwich, near Manchester, and at Rainhill, near Liverpool.

Improvements at Deal.—A block of houses, on the site of the old Navy-yard of the Government, is now in course of erection on the esplanade fronting the sea, called Prince of Wales's terrace. These houses adjoin the picturesque Deal Castle, and will be completed in the spring, thus affording the seaside accommodation of private houses, boarding-houses, and hotel, so long required at this fast-rising watering-place.

The Power of the Diamond.—An interesting application of the material is furnished in the dressing of millstones. The intense hardness of the cutting material used,—the hard black, uncleavable diamond,—is such that a single diamond has been employed for more than a year dressing a pair of French burr-millstones daily, without perceptible wear or diminution of cutting power.

Shaping Metals.—In a process lately proposed for shaping metals a mould is made in sections to suit the article required, and a sheet of metal is placed in it, after which a cover is clamped on to the mould, and water-pressure is conveyed to the interior by a pipe, whereby the metal is expanded to the counterpart of the mould.

A Year's Work by School Boards.—The *School Board Chronicle*, in surveying the work of the past year, finds that we have 330 school boards, with others in course of formation. The great fact for rejoicing is that compulsory attendance at school is not likely to prove a difficulty, though at first it was the greatest bugbear.

Society for the Encouragement of the Fine Arts.—The first conversations of the season will be held at the Suffolk-street Gallery on the 18th inst. On the 25th, a lecture will be delivered at the Gallery in Conduit-street on “Mexican Art,” by Dr. Zerff.

“Jack Plane.”—We have received for Mrs. Randall from “An old Reader and Purchaser of the *Builder*,” 1l. 1s.; from “R. T.” 6d.; and from “Four Sympathisers,” 10s.

The Pugin Student's Drawings.—The drawings and sketches made by Mr. Ernest C. Leo during his tour as Pugin Student for 1870, have been exhibited on the wall of the Meeting Room of the Institute of Architects. A portion of them, viz., the series illustrating the Trinity Chapel and Corona, Canterbury Cathedral, have been presented to the Institute by Mr. Leo.

The Proceeds of the Passion Play.—The receipts at the late representations of the Passion Play at Ober Ammergau amounted altogether to 62,000 florins, of which 27,000 were given to the 600 actors, 1,200 to the poor, 3,600 reserved for public works, and 10,000 set apart for the construction of a theatre. The rest has not yet been disposed of.

The Proposed Cemetery at Clapton.—A letter has been sent by the Hon. Secretary to the promoters of the Clapton Park Cemetery Scheme, declining to approve of the proposed site for the purpose of a burial-ground. Mr. Bruce's decision has given great satisfaction to the inhabitants and owners of property in the district.

TENDERS

For the erection of a new parish church (exclusive of fittings and tower), at Easton, Feurbrookshire. Mr. E. H. Logan Barker, architect:—

Davies	£1,242 0 0
Hartley	885 0 0
W. & P. Wither	1,438 0 0
Morgan & Jones	785 0 0
James	745 0 0

For new villa residence and stables, at Abingdon, Berks, for Mr. T. Townsend. Mr. Edwin Dobby, architect:—

Claridge	£1,724 0 0
Kimberley	1,650 0 0
Bryson	1,438 0 0
Honour & Castle	1,586 0 0
Johnson	1,578 0 0
Wright	1,561 0 0
Orchard	1,529 0 0
G. Jones	1,500 0 0
T. Jones (too late)	1,450 0 0

For the erection of 132 dwellings, in Ashfield-street, Liverpool, for the Liverpool Labourers' Dwellings Company. H. & A. P. Fry, architects:—

Roberts & Robinson	£21,795 0 0
Jones & Co.	21,540 0 0
J. & R. Duckworth	20,989 0 0
Rome	20,800 0 0
Mullin	20,720 0 0
Haigh & Co.	20,517 0 0
Urmon	20,329 0 0
W. & P. Wither	20,325 0 0
Quibbitt	20,100 0 0
Tomkinson & Co.	19,925 0 0
Thornton	19,900 0 0

For new church, Grand Park, Rochampton, for Col. Croil. Mr. Wm. Allen Dixon, architect. Quantities supplied:—

Hutton & Chapman	£2,450 0 0
Wicks, Bangs, & Co.	2,370 0 0
Manly & Rogers	2,247 0 0
Mann (accepted)	2,145 0 0

For additions, &c., to Prince of Wales Tavern, Cambridge. Mr. J. L. Stewart, architect. Quantities supplied:—

South	£1,463 0 0
Ellis & Son	1,313 0 0
Elliot	1,068 0 0
Wray	1,039 0 0
Gough	980 0 0
Bliss	973 0 0
Yonison	959 0 0
Jerrard	894 0 0
Tapley & Co.	839 0 0

For taking up and relaying sewers, on the Harrey Estate, Leytonstone, for the Leytonstone Sewer Authority. Mr. John E. Bressy, surveyor:—

Cole	£375 10 0
Still	355 0 0
Dunkley	345 11 0
Ingham	333 0 0
Potter	324 0 0
Harris	319 0 0
Puzev	286 0 0
G. Jackson	270 0 0
Harbard	265 0 0
J. Jackson	259 0 0
Goodair	202 0 0
Sparrow	195 0 0

For stables, &c., at Old Ford, for the London General Omnibus Co. Under the supervision of Mr. P. Tash. Quantities supplied by Mr. A. J. Bolton:—

Heath	£724 0 0
Adams	721 0 0
Crabb	717 0 0
Bleas	653 0 0
Yates	647 0 0
Adins & Son	647 0 0
Johnson & Co.	622 0 0
Ford	580 0 0
Atkinson & Walker	585 0 0
Garrud	537 0 0
Robbins & Co.	517 0 0

For each-house, stables, and boundaries, at Hampstead, for Mr. James Harvey. Wm. Allen Dixon, architect:—

Wicks, Bangs, & Co. (accepted)	£212 0 0
--------------------------------	-------	----------

The Builder.

VOL. XXX.—No. 1511.

Originality.

Glance at the primitive signification of a word, so far back as it can be traced, gives us sometimes a hint of more than mere philology, a suggestion for apprehending more clearly the precise value of the idea hidden under an expression which has become hackneyed and drilled in its signification by constant use. The secondary meaning which such a word has acquired may be very different from its primitive meaning, yet the relation between the two may read a practical lesson. In architecture, for instance, there is now an almost pathetic cry raised, a kind of *vox clamantis in deserto*,

for "originality." The same demand is made in other quarters; in literature notably, and with some very queer results in response thereto; but it is more strongly and perseveringly urged in regard to architecture than to any other art. In many cases the demand seems the result of a wholesale development of negative criticism, on the part of writers who reverse Pope's conclusion, and say "nothing that is, is right:" ergo, give us something new; we do not mind what, so long as it is new. In this case it is clear that "originality" only means "novelty," and is used in that sense, whether intentionally or not. In common conversation, however, the word is used in almost exactly the same sense as "individuality," some quality or manner which gives a distinctive character to a man's work, by which we recognise it as his among other productions of the same class. A good many painters, a good many writers, are currently spoken of as "very original," of whom the expression is only true in this sense, and when, in fact, the more correct expression often would be that they are "very mannered," a phrase which cannot really imply the same thing as "original," since the one expression is always used with a complimentary, the other with an uncomplimentary, meaning. And as to novelty, if we set a column with its base upwards, and standing on its abacus, that would be "novel," no doubt, but would scarcely be praised as "original."

Origo is described in Latin dictionaries as derived from the verb *orior* (to arise), and its primitive meaning given as "that which causes a rising or springing up." And from one point of view this derivation certainly connotes to some extent the ordinary meaning attached to the word, as nearly synonymous with "individuality." That which has its source and "springing" in his own mind will be characterised by his own individuality, the latter being the apparent result, the former the hidden cause. But it is just this originating in the

artist's own mind which it is so difficult to get, and which is so rarely met with. We are so influenced by the ideas of others, so biased in our judgment by what has been done previously, so dependent on our predecessors for helps and suggestions, that it is only a small chance that is left for most of us to thrust into the composition anything that peculiarly belongs to our own mind and personality. It is only a few of the rarest and most powerful minds who have been able to become really founders of new ideas in art, "full-welling fountain-heads of change." The rest, it should seem, must be content to copy largely, to take most of their ideas second-hand, or to do nothing. "There's the respect that makes calamity" of so much of our architecture, in the eyes of the desponding school of critics. And if it is necessary to originality that each work of art should present a wholly new interest of its own, independently of whatever has gone before it, then is their despondency in this point very well founded indeed, so far as all analogy will enable us to judge. But the demand made by this class of critics upon architecture is an unreasonable one, in degree if not in kind, and such as would not be made upon any other art. We do not demand that each musician should invent new forms of composition, new principles of harmony, before we will allow him originality; we are satisfied if he can give his own colouring, his own treatment, to his ideas, without necessarily ignoring or departing from the laws and practice which governed his predecessors. We do not expect a new poet to invent a new language (and heartily wish some of them would not try!), or a painter a new system of manipulation. Yet these are hardly greater demands, relatively, than are made on the hapless architect by some of his advisers. But even if we waive the question as to the amount of originality of this kind to be demanded, is there not a question also as to whether this is the right way to look at the matter at all? Is it not just as fair and logical (and etymological too) to regard "originality" as signifying, not the effort on the part of each one to raise designs out of his own moral consciousness, but the return in each case to the original principle or motive on which the design of any particular object should be founded? Is not this in fact almost the very essence of originality, in so far as it can be obtained by the majority? We have occasionally minds which seem to be a new era in themselves; but for the most of men what is needed to make their productions worth terming original, is that they should look to the primitive meaning and intention of what they are designing, and treat it *ab initio* in their own manner, and not in somebody else's manner. When working on this principle, almost every man who is educated, and who thinks at all, has his own natural bias, his own idiosyncrasy, sufficiently marked to give distinctive character to his work. If, on the contrary, he works on a fixed type, accepted or thrust upon him, he voluntarily casts aside the main means and possibility of being original, and instead of enjoying the opportunity of varying the expression of an idea, he only allows himself scope for varying the form of other person's expressions. This drawback to originality in design is not confined to, or peculiar to, architecture. We see it, for instance, in the works of the earlier sacred painters of Italy, where certain types were accepted and followed for generations, not only for the faces and aspects of particular personages, but even for the treatment and disposition of the whole subject in representing such incidents, for example, as the baptism of Christ. Genuine originality was of course almost as impossible for painters under such circumstances, as it is for architects when they are willing to accept one particular type for a church, or for isolated portions of it, or of any other building.

Now, this consideration indicates, we think, more distinctly than it has hitherto been indi-

cated by architectural critics, the essential difference between originality, properly so called, and mere mannerism, novelty, or eccentricity. The latter is something only on the surface of a work of art, not in the least touching its intellectual value or the basis of its composition. When Sterne, in the later books of "Tristram Shandy," took to the devices of coloured leaves, blank pages, and unfinished paragraphs, this was not that he was more original than at first, but less so: he had worked far away from the original vein of humour from which the book had started, and, having spun it out beyond its limits, had recourse to these shallow devices to keep up the flagging interest of his readers. In like manner, when an architectural designer invents extraordinary and portentous chamfers over his doors, designs arches with scarcely any vertical pier, and with enormously deep vousoirs, and puts buttresses just where no one would expect them, this is not being original, but just the reverse: it is a proof that he has lost sight of the original object and end of building,—that he is using features without thinking of their origin or the principle on which they should be treated, and is only trying for a sort of cheap notoriety, by differing in small details from every one else, without purpose or reason, and deserves no higher praise than that of mere eddily. The worst of this kind of so-called originality is, that there is no rational limit to it, the effort of each one of the eccentric designers being to surpass the others in eccentricity; and as there is no principle to regulate or restrain their devices, such artists are driven to producing effect by a perpetually stronger dose, till their designs become little more than a jumble of meaningless whimsicalities.

To exemplify: if an architect has a window to design, he may choose to start from the assumption, either deliberately made or acted on through habit, that one particular form of window is the only one worth taking as a type, in the matter of design,—a pointed Gothic window, for instance, with moulded jambs and archivolts. Now, this leaves a very narrow field for the introduction of individual treatment. He can vary the radius of his arch and the profile of his mouldings; and, in order to be "original," he will take, perhaps, to some abnormal proportion of window, all height and no width, or the reverse, or will invent some ineffective variation of the moulding in the jambs in order to say that he did not copy, but was original. But if, instead of taking a Gothic window as his *point de départ*, he take the original idea of a window, which might be stated thus,—an opening for admitting light from without and for prospect from within, capable of variety of proportion in height and width, of being covefed at the top in various ways (by an arch, a lintel, or a combination of the two), presenting two special surfaces for decorative treatment (viz., the jamb and soffit at right angles to the window plane, and the filling in of the window plane itself, which may be decorative in an almost infinite number of ways), requiring an effectual and rapid removal of the rain from it at the foot, and in some situations being all the better for a weatherfend against sun or rain over the head,—if the feature, we say, be regarded in this way, there are fifty more chances of getting at an original treatment of it than if some one else's previous treatment were adopted as a fixed type, and we are limited merely to minute variations in detail of that type. And this would be originality in the true meaning of the word, attained by going to the origin of the feature, and taking the designer's own treatment of it from the beginning.

So of any other feature; a door, a tower, a porch: the question for the "original" architect is not, "What new variation can I make in the orthodox method of treating this feature?" but rather "What is the object of this feature, and how can I render it expressive and ornamental,

in keeping with that object?" We do not say that thus it would be possible for every architect to invent his own new treatment of every feature; the majority would necessarily be influenced in their ideas, some more and some less, by what others have done; nor do we say that it is either possible or necessary to do this kind of thinking out, *ab initio*, of everything a man has to design. Life is so short that the busiest amongst us especially are compelled to take many of our thoughts at second-hand. And it is probably quite true also, as several critics have argued, that the man who has studied most of other styles in all their varieties, will be the one likely to have the greatest number of original ideas at his command; for two different treatments of one feature will often suggest a third, again capable of variation, and so on. But we cannot help thinking that if this view of "originality" were more recognised and borne in mind by our architects, there would be more chance of really original designs making their appearance, not only from the fact that the mind of the designer would be applied to the consideration of what really was wanted to make an architectural treatment in a particular case, instead of what it might be the fashion to want, but also because from such a point of view even the copying and adaptation of other designs assumes a new aspect, since it is regulated by a principle which teaches us to adopt what is essential in the treatment, and ignore what is accidental, and thus places some sort of bonds to that reckless variation for variation's sake which has led to so many absurd eccentricities in modern architecture.

There will be one drawback, however, in the eyes of many modern architects, at least, to this view of originality, that in this case "originality" means thought. And people are living too fast now to pay anything for thought, and 5 per cent. certainly will not pay for it, in most cases, at least. It is to be feared that we cannot show our readers the way off the horns of the dilemma, except by adopting the simple but unpalatable course of doing work well, and being content to be ill paid for it. Whether the public mind will ever be in a state to recognise that there may be more thought in one building than in another (as they recognise it to some extent in paintings), and be willing to pay for this thought as "value received," is very problematical; but we take this to be the answer to those who demand more originality in architecture. Coleridge said that "to admire on principle is the only way to imitate without loss of originality,"—a dictum which the late Mr. Leslie adopted as a motto for his "Hand-Book for young Painters." Applying the same thought, we should say to the architects, that to design on principle is the only way to insure originality.

OUR GREAT FORTIFICATIONS AT PORTSMOUTH.

The effect on the architecture of the future of the employment of iron as a main material for building is a subject of extreme interest. It is not the architect alone who is concerned in the matter. While the architecture of a country, or of a period, is a reflection of the manners of the time, it reacts, in its turn, on the habits of the people. As far back as structural relics allow us to judge,—and the period is one not readily estimated in centuries,—the exigencies of military defence have greatly defined architectural progress. When to the strength of structure required for safety we add the means of such appeal to the imagination as was suggested by the rites of religion, we sum up the chief motives of architecture.

Six years ago (*Builder*, vol. xxiv. p. 73), as well as at other times, we ventured to offer some considerations on the effect likely to be produced on military, and thus on civic, architecture by the rapid strides that were being made in the improvement of projectiles. The Italian war had yielded novel and valuable experience, in the siege and fall of the once impregnable Gaeta, of the revolution that was in progress. Quietly and steadily, since that time, have our own Royal Engineers been at work, aided by the powerful resources of the Fairbairn Company at Manchester, in the preparation of an impregnable line of defences for our great naval arsenal of Portsmouth. With the commencement of the present year, the most novel part of these defences,—the skeleton framework of one of the largest iron forts,—has advanced to a condition which renders some detail likely to be acceptable.

The idea of impregnable fortifications is as old as any records of mankind,—older, it is possible than the lineal progenitors of any existing human races. What thews and muscles were theirs who reared the enormous megalithic structures of prehistoric date we have no means of judging. But we know that, not far back than two and a half millenniums, the great brick-building people that dwelt in the fertile valley watered by the Euphrates and the Tigris surrounded their thickly-populated home with enormous mounds of earth, faced with stone and with brick, from the broad summit of which even their women looked with contempt upon the armed forces of the invader.

What were the causes that led to the abandonment of the Assyrian method of fortifying large cities, or rather walled provinces, it is not easy to determine. The fact of the repeated capture of Babylon, and the knowledge of the power possessed by an invader of diverting the course of the great river that watered so large a population, must have told for much. But walls, though less stupendous, were still reared by the founder of cities. So late as the Roman occupation of England, that great engineering people drew lines across the northern boundaries of the island, to exclude the ravages of the Pictish and Scottish tribes. And the sentinels on the Great Wall of China still watch over this costly outwork of the stereotyped civilisation of the flowery land.

With the change in European life that succeeded the settling down of the successive waves of northern barbarians that had overflowed the corrupt and effete Roman Empire, individuals, whether petty rulers, great lords, or even municipal authorities, assumed more prominence than was accorded to any but the supreme heads and fathers of the nation in earlier times. Thus seigniorial castles and keeps arose, and the towers of many a robber chief dotted the landscape, in a manner more conducive to its picturesque charms than to the well-being of the inhabitants at large. We have examples of one kind of castle in the ancient Papal residence at Avignon. In this country we may point to Rochester Castle, as one of somewhat similar structure. The idea, indeed, of these square turreted buildings is illustrated by the Tower of London. But it is to another class of fortalices, such as is represented by the great Round Tower of Windsor, or by the Castle of St. Angelo, on a large scale, or by Conisborough Castle, in Yorkshire, and many an Irish tower on a small one, that our attention is recalled by the newest phase of our military architecture.

The combination of strength, economy of material, and economy of space that is given by a tubular structure is well known, even to those who have not pushed their experimental researches further than the examination of a stalk of wheat. For a defensible residence, a round tower, in the first instance, offers the most appropriate form. We remarked, not very long ago, as to the great number of these structures that rose, especially in Italy, before the introduction of gunpowder. But with that great advance in the science of offence, a new state of things arose. A single tower presented a mark that might be readily and fatally attacked by converging lines of fire. With imperfect artillery, the balance of force was greatly on the side of the attack. Private turrets, as no longer defensible, rapidly disappeared.

With regard to the defence of towers, or of regular fortifications, the erection of the noble circular towers that yet mark some fine old Norman structures was discontinued for two reasons. One was, that it was desirable to have the means of sweeping the assailants from the ditch by a well-directed fire. This the defenders of a round tower, or system of round towers connected by curtains, could not readily effect. The other was, that from every port-hole, or every embrasure, the gun pointed in a radial direction. Concentration of the fire of the defence on the head of the attack was thus impossible. For three excellent military reasons round towers, in spite of their great structural advantage, disappeared altogether from defensive works, even before the time of the organisation of the polygonal system by Vauban.

The latest outcome of engineering science applied to defensive structures has brought us back to round towers. At Shoemess, below Gillingham, and at one or two other commanding points near the junction of the Thames and the Medway, have recently been constructed new river defences of London and of Chatham.

Neither the metropolis nor the great school of our army can now be reached by any hostile vessel. These new forts are circular in plan, built in part of granite, but with the porches of their enormous guns protected by iron shields and framework of a strength suited to resist the utmost force of shot that can by any means be expected to reach them.

It speaks well for the officers and manufacturers who have been so long and so ably at work to protect the vital centres of the country from that surprise to which, a quarter of a century ago, we unquestionably lay open, that so little public attention has been hitherto directed to the progress of these important works. The notice that is now taken of them in course of execution for Portsmouth is due to the fact that the vast iron ribs of a structure that is without a rival in its gigantic strength (looking at the twin towers of 200 feet diameter each, and at the two smaller ones of 150 ft. and 120 ft. diameter, as forming parts of the same system of defence) have just been fitted together on the premises of the manufacturers at Manchester.

Portsmouth, it is asserted, when these works are completed, will not only be safe from any attack by sea, for we are approaching the limit of possible sea-borne batteries and offensive means, but she will be safe even in the unpleasant contingency of an attack by land. Eleven hundred thousand pounds is the sum that we are now spending in what our French neighbours call the blinding,—that is to say, the sheathing in a thick, impenetrable, ponderous shell of iron,—of the four forts that form the most novel and formidable features of these defences.

Of the great twin towers which are hereafter to give meaning to the line,—

"Britannia needs no bulwark, no towers along the steep,"

one is situated on a spot known by the name of No Man's Land, about 2,000 yards to the north of Hyde Sands, and the other upon the Horse Sand Shoal, some 3,500 yards south of Southsea. The main entrance to Portsmouth harbour lies between these two gigantic sentinels, which can bring their fire to bear on the channel at a distance from one another of only 2,000 yards. With these main forts are connected two others of similar construction, but of somewhat smaller proportions, the least of which,—that of St. Helen's, on the west of the Isle of Wight,—is of a diameter of 130 ft.

The two larger towers carry each two tiers of guns, the lower one containing twenty-four 600-pounders, of 12-in. bore, and weighing 25 tons each; the upper, twenty-five 400-pounders, of 10-in. bore, and a weight of 18 tons. The former throw a bolt weighing 600 pounds, which is propelled by the explosion of 85 pounds of powder. The velocity of the shot on leaving the muzzle of the gun is 1,300 ft. in a second. The force of impact is 7,000 foot tons at the muzzle, and 6,000 foot tons at a distance of 800 yards. In what we must comparatively call the smaller guns, the weight of projectile is 400 pounds, that of powder 70 pounds. The force of impact at muzzle is 5,000 foot tons; at 800 yards, 4,400 foot tons; and the velocity on leaving the muzzle 1,300 ft. per second.

We enter into these details for the reason that they are such as to enable us to understand how the military objection to the use of circular towers has been in this instance overcome. To attack an incoming iron-clad vessel, a concentration of fire is, no doubt, necessary. But the concentration which was formerly effected by training the guns of a broadside, as of a bastion, to bear on a single point, is now produced by the more simple, certain, and irresistible means of firing the whole weight of a broadside from a single gun. Could the bolts of the 64-pounders be made to strike at the same moment, in exact proximity, on the side of a vessel, the shock would be very far less than that caused by the delivery of a like weight of metal in one mass; while as to penetrative power, the large bolt possesses it, and the smaller ones do not. They might pepper away very disagreeably at the sides of one of the giants that are now set afloat, without any very imminent destruction. But the large bolt will go straight through 12½ in. of iron at 200 yards, 1½ in. at 1,000 yards, and 10½ in. at 2,000 yards. These measurements of the offensive power of the armament of the forts enable us to form a very satisfactory estimate of their defensive strength.

On foundations supposed to have been pre-

paved with great care, will be raised first a circular mass of masonry rising to the height of 16 ft. above high-water level. On this will stand a closely-jointed iron tower, of the height of 26 ft., and the diameter, as before stated, of 200 ft. The skeleton of the structure is formed of piers of wrought iron filled in with concrete. Vertical ribs of iron form a sort of palisade round these piers, being bound together by three wrought-iron rings, and finally planked with great iron slabs, each some 26 ft. long. There are three several concentric thicknesses of these iron plates, each 5 in. thick, the two intermediate spaces, also 5 in. thick, being filled solid with concrete. Under the port-holes, however, the thickness of the iron is increased to 17 in., with 10 in. of concrete. A bomb-proof roof covers the upper gallery, which runs round the inner part of this tower, on a floor of iron beams and concrete, to support the upper tier of guns. We can only hope for the sake of posterity that the effect of concrete on iron is fully understood.

This enormous mass of iron, of which the skeleton alone weighs 2,500 tons, is so delicately and accurately fitted together as to form a homogeneous whole. Every face joint is planned, every hole drilled. If it cannot entirely be said that neither hammer nor axe nor any tool will be lifted up upon it while it is in building; yet, that assertion will in a certain sense hold good: indeed, in the same sense in which it applied to that famous temple fortified dear to masonic tradition. Not a chip will be struck from the iron. It will all go together like the pieces of a watch, or of a rifle made by machinery. Hence any impact of shot or shell will be resisted, not by the surface struck alone, but by the whole immense weight and metallic elasticity of the entire tower. The enchanted castles of fairy tales are as nothing in face of this giant baby of modern metallurgy.

These noble iron forts will be accompanied by the minor protection of land batteries at Southsea and Gillecker, at the Needles and Hurst Castle.

We may be pardoned for one word as to the strategic importance of a series of works, as to the engineering qualities of which we have spoken. We cannot doubt that it is of the first order. We have to remember that for 800 years the sea has been to England a bulwark and a safeguard. On two occasions only since the Norman Conquest has this island been seriously menaced by a foreign foe. On each of these occasions our assailant was able to dispose of almost all the resources of that part of the Continent from which we could be readily attacked. The winds and the tides, with which even Julius Cæsar shunned a third time to contend, shattered the great Armada on our shores. The flotilla of Napoleon, if, indeed, it was more than a feint, as to which military writers are in doubt, was never able to put to sea. In this, the safeguard of the past, lies all the reality of our protection for the present.

For this reason, without prejudice to the importance of girding London with a chain of detached forts, and of protecting Chatham on its only vulnerable point, the hills on the left bank of the Medway, it is of vital importance to the safety of the country to have impregnable harbours in which our fleet may lie in absolute safety, ready to issue at any moment to sweep from the Channel an invading flotilla. For the Sussex coast, the point struck first by Cæsar, and then, eleven centuries later, by William, Duke of Normandy, Portsmouth is suited to fulfil this condition. With Portsmouth that which she is in course of becoming, no enemy will be able to throw a shell into her harbour. Resting on this perfect base, our fleet may be well able to answer for the inviolability of our coast south of the Thames. With regard to the Norfolk coast, a second Portsmouth would be desirable. We conclude that the Thames itself would be the station for the division of the fleet that had to defend this portion of our coasts. Portsmouth is our great defence against France. As to our defence against Germany, it is only about a twelvemonth since we have begun to feel that it is a duty to be provided.

While feeling that, in the present state of military and naval warfare, defensive measures like those which we have described are a wise and sound economy, we see no reason to depart from the opinion which we have before expressed, that the present form of seagoing bottoms is of an essentially temporary character. Two distinct considerations led us to form this estimate; and the course of events during the

past eighteen months has not only confirmed its accuracy, but gone far to turn opinion into certitude. One of these is the historic view. The amount of thought, science, and admirable workmanship that was expended, more especially by the armourers of Milan, in forming a perfectly safe, and at the same time very flexible, panoply for the defence of the person of the warrior, and a panoply of altogether different nature for the tournament, cannot be imagined by those who have never examined the actual suits worn by kings and nobles in the fifteenth and sixteenth centuries. A mode of attire that was at once consecrated by the use of generation after generation, and eminently handsome and noble, disappeared altogether in a few years before the improvement of projectile force. If this was the case with personal armour, how much more strong is the probability that a similar course will be followed by armoured ships, in which the mechanical laws of flotation operate as a positive limit to the thickness of the plate,—a limit beyond which one offensive power has already sensibly advanced. Add to this the fact, that it is not the strife between gun and target alone that must be regarded, but the irresistible force of that great guardian of forts and harbours—the torpedo. We feel convinced that the form of the war navies of the future must be altogether different from that of the strongest existing vessels, in which, when attacked by such torpedoes as we already make, the immense weight would only serve to ensure instant and total destruction.

Notwithstanding this progress of science, it may be hoped that the outlay on the Portsmouth works has been wise and satisfactory. Not only were all the details of these structures to a great extent determined before we had gained our present experience of torpedo action, but even were the case now to be decided, we should do well to pay a million or two extra for the mere sake of the moral effect, both on ourselves and our possible opponents. The fall of 1 per cent. in the price of Consols—to say nothing of the much larger amount of railway and other stocks,—would be a loss of six times the cost of rendering our chief arsenal impregnable. It may be urged that such a depreciation is only an imaginary loss,—that it is a debt we owe to ourselves, and a mere removal of money from one pocket to another. But the reply is, that the fall in the price of public securities is an index of the loss of public confidence, the effect of which is the arrest of enterprise of any description. When we know how a marked fall—say of 8 or 10 per cent.—is enough to paralyse trade, commerce, and manufacturing industry, we may easily believe that slighter depreciations of value represent diminutions of our productive action, of at least a magnitude equal to their own. To pay, then, a few millions more or less by way of insurance, in rendering our coast service, our fleet, not only seaworthy, but supreme; and our army that useful organ for which it offers an unsurpassed material, if only it be wisely organised and trained, is not only a penny wise, but a pound wise, economy. Regarded in this light, we congratulate the country on the well-organised defences now in course of completion at Portsmouth: while as a specimen of the art of the builder working in new material, to hid defiance to colossal engines of attack, which two years ago might have been well regarded as irresistible, we feel greatly proud of the iron fortifications that Manchester frames to guard our fleet.

EAST GREENWICH WORKHOUSE.

UNDER the title of "Christmas under the Poor Law," the leading journal gave, some time ago, an article concerning thirty-two of the thirty-three unions in the metropolitan poor-law district. The one union of the thirty-three "conspicuous by its absence" is singularly enough, that which includes two of the three towns—Deptford and Greenwich—represented in Parliament by the Right Hon. W. E. Gladstone, Prime Minister. The article in question contained statistics of varied character, embracing the number of houses, the number of inhabitants in the various unions at 1861 and 1871, the workhouses at which the inmates had egg-flip in the evening, and snuff and tobacco, and half-ounces of butter, in addition to statements of the quantities of beef consumed, and of the ingredients of the plum-puddings prepared. It is too late now to describe the Christmas treat in the Union Workhouse at East Greenwich, but a few particulars of the establishment will not be out of place.

It is not necessary to quote statistics largely to show that the Greenwich Union House is entitled to a place among the others of the metropolitan district. In locality the union is an outsider, but in extent and numbers it is a fair average example, and entitled to mention. It has a total population of 100,601 in the union, and has 851 inmates in the union workhouse. Among the others enumerated by the *Times*, that have larger numbers of either population or poor, are:—the City of London, with a population of 111,784, and 2,390 inmates of the house; Marylebone, with 159,169 in population, and 1,874 inmates of the house; St. Pancras, with 221,594 in population, and 1,610 inmates. On the other hand, showing smaller unions, with lower numbers of populations and inmates of the houses, there are Chelsea, with 71,086 population, and 523 inmates of the house; the Strand, with a population of 42,978, and 916 inmates; St. George's-in-the-East, with 45,235 in population, and 1,051 inmates; and White-chapel Union, with a population of 78,970, and 836 inmates. We do not know how the older children are dealt with in the several instances just referred to, but there are in the Greenwich Union Workhouse 66 children; and at the educational and training establishment at Sutton, 357 children chargeable to the Greenwich Union. The inmates of the Greenwich Workhouse, are at present 851, consisting of 320 males, adults, 465 females, and 66 children.

The assemblage of buildings constituting the establishment is Elizabethan in style, of white Suffolk brick, with stone sills and lintels, and was erected about thirty-six years ago. It does not provide a palace, as regards external appearance or internal decorations, but embraces such healthy and cleanly accommodation as is necessary for the shelter and maintenance of the helpless poor. A considerable space is left vacant, as garden-ground and forecourt, between the front buildings and the public road. The entrance is through a block appropriated to the Board-room, and a number of offices. This building is in two stories, and is flanked on each side by two other ground-floor structures, used for miscellaneous purposes. Behind the front block is an extensive quadrangle, one side of which is formed by the main building, and by long wings, which intersect and project upon it, without joining at the ends. The principal building consists of a basement, a ground floor, and two upper stories for dormitories, infirmary, rooms, day-rooms, &c. The entrance to the house is in the centre, close to which is the master's and other offices, and the dining-hall, which is used on Sundays as a chapel. A circular staircase, under a canopy, gives access to the rooms of the master and matron, and to the long corridors upon which the dormitories and infirmary and day rooms open. The number of cubic feet of air per inmate in the dormitories, the day-rooms, and the dining-hall, is in accordance with the ordinances of the Poor-Law Board. The statutory accommodation in the house is for 850 persons, we believe, and it contains at present just one over that number. Having gone over the whole house, however, we feel justified in saying that there is no evidence of crowding.

Mention has been made of the 400 Greenwich Union children that are at Sutton; but there are children chargeable that are too young to be sent thither, and about twenty will be found in the house.

Poor little waifs, three of them have been picked up in the streets! Who can foretell their future? They are all clean, happy, rosy, and bright-looking now, whatever their after lot may be. They are so young as not to have reached the age when dress indicates the sex of the wearer; but the mode of parting the hair and a little head ornament marks the girls.

A visit to a workhouse suggests melancholy reflections. It is humbling to note such a low form of human life,—in many instances it is mere existence, not life,—an unvarying round of eating, mauling, sleeping, dozing through an existence that has ceased to have use, aim, or object. It is curious to notice the effect that the workhouse régime has in prolonging the lives of those who may have often survived hard buffetings in the world. Anxiety and care concerning the future are thrown off at the entrance to the house, and the inmates are henceforth placed under conditions more favourable to health and longevity than they have ever before experienced. In the Greenwich workhouse there are 431 inmates that are over sixty years of age, and of these more than fifty have seen more

than fourscore years. Several have reached the verge of a century of life, and one, Thomas Taynton, of Bristol, who has been an inmate for four years, has passed, it is asserted, his 102nd birthday. These old persons of both sexes furnish startling illustrations of Shakespeare's marvellous text descriptive of old age and its infirmities, and of the "labour and sorrow" attaching to life beyond fourscore years. How true the descriptions of the aged as they are seen here! "The moist eye, the dry hand, the yellow cheek, the white beard, the decreasing leg, the increasing belly, the broken voice, the short wind, the double chin, the single wit; every part blasted with antiquity." The poor creatures can only drowsily answer shrieks in their ears by piping a childish treble, and in their pitiable second childhood are "sans teeth, sans eyes, sans taste, sans everything."

We heard good things said of Mr. and Mrs. Killey, the master and matron.

LONDON AS IT IS, AND AS IT MIGHT BE.*

In taking as the title of my paper, "London as it is, and as it might be," I am perfectly aware that I am choosing a colossal subject, and one which I can only hope to treat in a very cursory manner in one short paper.

In many respects there is no city in the world to be compared to London. Its vast extent and population, and its boundless wealth, form an inexhaustible theme for its panegyrists, and it would be perfectly absurd to compare any city, ancient or modern, with it in commercial importance and activity. Even in natural situation it is to be doubted whether many cities excel London. Whether we look at the central parts, rising by a gentle slope from the bold curve of the river from London to Westminster, or the natural beauty of the suburbs round the heights of Hampstead, Highgate, or Sydenham, or along the banks of the Thames as far as Richmond; and yet, with all these advantages, it cannot be denied that London is not so attractive as it ought to be. If to any one, one would think this place would, at least, be interesting to Americans, who draw their blood and their language from "Old England." But Americans will come here, rattle through the chief sights of the place as a matter of duty in a few days, and then rush off to spend the bulk of their time and money in Paris; and no wonder, for, compared with the gay and cheerful French capital, our London looks a dirty hole indeed. No one who wishes to pass a pleasant existence, with those advantages which are only to be obtained in a metropolitan city, would hesitate to choose Paris in preference to London, unless, indeed, the chance of being knocked on the head was thrown into the scale; then, perhaps, he might decide in favour of the latter.

It will not be out of place, then, I think, in an assemblage like this, which represents the architects of the future, to consider why this our city (which we justly and proudly consider the queen of the cities of the earth) compares so unfavourably with some others in external appearance; and if in the paper itself, or in the discussion which follows, we are able to ferret out any of its defects, and suggest any remedy for them, the object of bringing the subject forward will be answered.

I will divide what I have to say under four heads, as follows:—

First. London is abominably dirty, and there is no reason why it should be so dirty.

Secondly. It is much more smoky than it ought to be.

Thirdly. The general aspect of its streets,—even the principal ones,—is commonplace, uninteresting, and even ugly; and, compared with the advantages gained, a very trifling expense would make an astonishing difference in this respect.

And Fourthly. There is a want of uniformity of plan,—general supervision, from a fine-art point of view.

Now, as to the first head, by saying that London is dirty, I mean that it is dirty far beyond what it needs be. A certain amount of dirt we must always expect in every large assemblage of houses and human beings; but in London everything is dirty. How many of its buildings are so blackened by smoke, with their mouldings and cornices so choked up with the dirt of years, and in some cases of centuries, that

the effect intended by the architect is quite lost? How soon do its monstrous rows of brick-built houses assume one even tint of dirt? Even the trees seem only to assume their natural colour after a good shower of rain. The air is so full of dirt that everything is covered in an incredibly short time with a thick coating of dust; and as to the streets, an hour or two's rain is sufficient to convert them into a liquid sea of filthy mud. Now, the question is,—Is all this dirt absolutely necessary? Is there any reason, in the nature of things, why the dirt and smoke should have been allowed to accumulate on St. Paul's, for instance, apparently ever since it was built, without being once removed? Would it be sacrilege to give a good cleaning to the beautiful spires and spires in the City, the details of which are quite hidden by dirt? And why is the Mansion House the only building which is allowed an annual washing? This simple cleaning alone would quite alter the aspect of many views in London.

Then, look at the streets. A very few hours of rain are sufficient to make the evil appear. They are soon covered with a thick dirty mud. If the rain keeps on, this becomes more liquid, and is worked up by the cabs and vehicles into a regular slough. As these rush through the streets, they scatter the mud right and left over the unfortunate foot-passengers. These last transfer the mud from the road to the footpaths, and from thence into the houses, until the dirt and filth of London in wet weather has become proverbial. As an example of the mischief arising from this cause, I may mention that a few weeks ago I attended the service at St. Paul's on Sunday afternoon. It was one of those miserably wet days. The statues had just been thoroughly cleaned, I believe, for the first time since they were put up; and the crowds were being admitted by the west door; but, with that wisdom so characteristic of ecclesiastical authorities, no mats or scrapers were provided for those who entered to clean their feet, and the dirt from the streets outside was being rapidly transferred to the marble floor, there to dry, and to be afterwards ground up, and transferred, in due course, in the form of dust, to the lately-cleaned statues and other parts of the building.

But if the public buildings and the chief streets are dirty, what shall we say when we come to the back slums? What about the neighbourhood of Shoreditch and the New Cut? Those who have been employed on surveys or valuations in the back slums of London, may have seen those filthy little cottages, where each room is the dwelling-place of a family. At the window, on a board, sits the bread-winner,—perhaps a tailor or a shoemaker; the window has not been opened for years, or is nailed down, the panes broken and stopped up with wood, paper, or dirty cloths,—a miserable, squallid bed in the corner forms the nightly resting-place of father, mother, and sickly children, whose wizen features and rickety limbs are pitiable to behold; whichever way you look—floor, walls, or ceiling,—dirt, filth, you find on every side, and you rush out from the foul air with a feeling of intense relief,—those who have seen sights like these alone have some idea of the real dirt of London; but I leave these back slums for very despair at present, and will only speak of the chief streets and buildings. If the salt has no savour it will be in vain to try and season the whole lump; and I say that it is absolutely impossible to materially improve the aspect and cheerfulness of London, or make it vie in appearance with a city like Paris, till some thorough and frequent system of cleansing is adopted both of streets and buildings. The first and urgent want of London is cleanliness; and cleanliness we shall never have till public attention is thoroughly awakened to the evil, and the present condition of things is considered insupportable. Then, perhaps, a commission might be appointed to see why London is the dirtiest capital in the world, and some measures might be adopted for its continual cleansing. At present the dirt seems to be regarded as an evil which cannot be cured, and must be therefore endured. Some of the measures which might obviously be adopted are as follow:—Materials ought to be employed for the streets which experience has proved to be the most cleanly, such as the asphaltic and wood paving; and the streets and footpaths should be thoroughly cleansed as often as found necessary, the present staff for this purpose being at least doubled or trebled. More materials should be employed in the façades of streets which can be most easily cleaned, and every

building of any importance should be thoroughly cleaned at least once a year. What is the use of spending thousands of pounds in elaborate carving and ornament, and then permitting it to become merely the lodging-place of soot and dirt?

As a cleanly covering for buildings in a large town, I hold that the much-abused stucco, which can be painted as often as wished, holds a very high place; and Regent-street and the buildings round Regent's Park are certainly the most cheerful and clean-looking in London. But I do not wish for this reason to suggest building London façades in future with stucco fronts as the perfection of street architecture. Indeed, what I have to speak about under the head I am now treating of is not so much the erection of new façades as the keeping clean of those already built, and in this respect stucco has great advantages; and I believe I shall enter the Association with me when I say that if those who had the charge of the streets and footpaths kept them as clean as they might be kept, and those who had the charge of public buildings did the same, and that if each private owner of a house in a street-front were compelled to give his house a thorough and frequent cleaning, whether it were stone, brick, or plaster, a great step would be obtained towards altering the character and cheerfulness of London; and if the saving of things now constantly spoiled by dirt were taken into account, the measures adopted, even though expensive at first, would probably be found economical in the long run.

With regard to the second head,—that London is much more smoky than it ought to be,—I think there is no one in the audience will disagree with me on this, though the remedy may be more difficult to suggest than in the last case. On coming up by train from the country on a bright spring morning, with blue sky overhead, we notice a haze hanging over the horizon towards London as we approach the great metropolis, and, finally, the clear blue sky and pure air may be said to entirely disappear when we are whirled into the heart of the town. A really clear blue sky is never seen in London; there is always to be noticed a haze and dimness about it quite different from country air. Some one will say, perhaps, that this is a necessary evil, and one of the natural results of life in a large city; but anybody who has been accustomed to walk about Paris must have noticed that the air there seems quite as pure as country air, and everything in the best quarters looks fresh and clean from the sky down to the houses in the streets, except perhaps now where damaged by the shells of the Germans, or the fanatical hands of the Communists. It is almost impossible for us to tell how many bills we Londoners owe to this Hydra smoke, belched forth incessantly from hundreds of thousands of fires. It fills the air with soot, carbonic-acid gas, and other unhealthy products. It forms a large proportion of the dust which flies about ruining everything. It injures our lungs, and injures our eyes; it enters its way into our pictures and colour decorations, and thereby prevents the possibility of any general view of London being obtained. From the top of the Monument, or St. Paul's, on a calm day, the glorious prospect of industry and wealth rattling through the streets below, or carried on the bosom of old Father Thames, or attested by those forests of masts in the docks, is bounded in a mile or two by the sulphurous cloud which enshrouds everything in its arms. On a very windy day you can see farther; and when the wind shifts rapidly from point to point, it is curious to notice the smoky giant rolling first on to one and then on to another quarter of the City, the spires and prominent buildings of which alternately appear and disappear from view.

The smoke generally appears to cling pertinaciously to the town itself, so that the heights round, such as Highgate, Hampstead, and the Crystal Palace, are often visible, whereas the intermediate parts cannot be seen. What general views of London would be without smoke can be sometimes seen on a Sunday bright summer's morning, when scarcely any fires are lighted. I have sometimes been quite astonished at the beautiful views which have appeared from Richmond and the high part of Epping Forest; at such times giving general and beautiful views of the City which it would be impossible to tell existed at ordinary times. I was once told by a friend who had chambers in Pall-mall, and whose bedroom was a top room at the back of the house, that if he woke up on a summer's morning at three or four o'clock

* By Mr. A. Payne: read at a meeting of the Architectural Association, January 12th.

and looked out of the window, he had a clear and distinct view of a great part of the town; on looking out again, however, at six or seven, this had totally disappeared, and he was merely greeted by the smoke from the chimneys of the lower houses. It is this smoke, too, which forms a great part of the dust and black specks complained of under my last head, spreading a fine coat of dust and gloomy colour over everything they touch, and that it is prejudicial to the inhabitants is proved by the fact that those who have been bred in town two or three generations back lose vigour and stamina, as compared with those in equal circumstances in the country. But we have not done with the evils of smoke yet. Who does not know what a plague and nuisance a smoky chimney is. I have known more than one London architect's office where the draughtsmen have been obliged to sit in their great coats and gloves, in the middle of December or January, or else endure the alternative of being gradually smoked. Then comes the smoke doctor, that nightmare of the architect, with his horrible twisted chimneys, zinc cows, and other abortions, all warranted to cure, and "very handsome," according to the patentee's notions. These horrible things form an eye-sore in every street, and damage almost every architectural view in London. Let any one go on to Waterloo Bridge, and look at the noble and stately front of Somerset House, crowned with long rows of chimney-pots of such motley description that one might fancy that all the smoke doctors in London had had a turn at the building.

"Ah!" says the Gothic architect, "that is the fault of your Classic style, quite unsuitable to this cold climate, and to which chimneys cannot be adapted. In Gothic architecture, chimneys are a positive improvement." Are they, my Gothic friend, lover of realities and hater of shams? Come with me a little further down the river, and look at the Temple Library. Yes, those are very pretty elinancies, those at the sides, but they are never used, because they were found to smoke. I think you will hesitate to say that those ugly zinc pipes that climb up the roof (forming some of the most untidy chimneys in London) are a positive improvement.

I think it must be conceded, whichever way we look at it, that this smoke is a nuisance which ought to be abated; in fact, next to dirt, the crying evil we have to call out against in London is smoke; and, as in the former case, we shall never be rid of it till the public is persuaded that London is more smoky than it ought to be, and gives battle to the Hydra with that dogged determination to conquer which the British public generally does show when fully alive to an evil. Even then it would take months of discussion, and the brains of our scientific men would be severely taxed before we should have an answer to the question—How can we have heat and warmth without smoke, or with much less smoke than we have at present?

I believe this question has never been thoroughly and satisfactorily solved, though much has been written on the subject.

One of the chief methods which have been proposed to reduce the evils of smoke is improved grates and stoves, by which the amount of air supplied to the fire is regulated, and wasteful combustion prevented; and there is no doubt that a great deal might be accomplished in this way, and that it is a very important part of our duties as architects to study this subject, and see that our clients are provided with economical grates; for half the smoke and soot flying about in the air is nothing but wasted fuel and heating power lost. Closed stoves, no doubt, give less smoke than open grates; but it is to be doubted if Englishmen will ever give up their cheerful fireside for an ugly black stove. The same objection applies with equal force to heating by steam or hot water; and although an open fire often bakes you on one side whilst you are almost frozen on the other, still a bright blazing fire is a nice thing on a cold winter's night, when the snow and hail are beating outside, and not lightly to be given up.

In New York anthracite coal, or coal without bitumen, is used to prevent smoke with great success; and it seems strange that in this country coal should be prohibited on railway engines, where very little damage would be done by it, and be allowed in large towns where its effects are so disastrous. In Paris, at no very distant period, wood was burnt for fuel; and I remember an anecdote which shows how deeply-rooted was the antipathy of the fair Parisians

against coal. One of our English ambassadors, newly appointed to Paris, determined to set a good example to the inhabitants by burning coals instead of such an obsolete fuel as wood. Shortly after his appointment, he held a grand assembly, but was mortified to find that hardly any of the fair sex attended; they had heard that his excellency burnt coals, and fearing that their complexions might be spoiled, they stopped away. Whether complexions so susceptible were natural or artificial it is not necessary for our purpose to inquire: the moral is the same. No doubt, one of the most feasible plans for reducing the smoke- nuisance, would be to make regulations as to the sort of fuel used, and by advocating the use of coke and iron-bituminous coal wherever possible.

I hope I shall not be thought Quixotic in mentioning another scheme which has been hinted at in engineering circles. Those members of this Association who have been into the iron and coal districts, may have noticed some of the iron furnaces belching forth large quantities of flame and smoke, whilst others, which they are told are hard at work, they would imagine to be out, by their giving forth so little. Now, what is the reason of this difference? Simply that the owners of the latter class of furnaces have found out that by throwing away so much flame and smoke, they are wasting a great deal of heating power, and they collect the smoke and gases at the top of the furnace, and bring them back again for heating their boilers and other purposes. Is it not therefore possible, that if all the unconsumed matter which flies off in smoke in a vast city like London, were in some way collected and made use of, a very great saving would be effected, and the nuisance of smoke almost entirely obviated? The scheme, as I have heard it shadowed forth, is something of this sort. Every block of houses would be provided with one or more smoke towers, into which the fumes would be taken by descending or ascending flues as most convenient, with openings at intervals for sweeping. In the smoke tower, the smoke would be either burnt or utilised.

The advantages which could be afforded by this plan, if it could be brought from the level of mere suggestion to a practical scheme, are obvious, and there seems no reason why it should not answer as well for a block of small buildings as for one large one, or a factory, where it has often been carried out. In addition to carrying away and neutralising the smoke now thrown into the air, it would be a fatal blow to smoky chimneys, and the smoke-doctor and all his tin chimney-pots would be annihilated; for smoky chimneys are almost always caused by a downdraught on a chimney from some roof or higher point. The smoke-towers would be a fine opportunity for varied architectural design, and such blunders as the chimneys of Somerset House and the Temple Library would be unnecessary in the future. And with such powerful extraction shafts as the towers would be, we should have much greater chance of thorough ventilation for our houses, public buildings, and sewers, than we have at present.

I think I have now mentioned all the different proposals that have come under my notice for abating the smoke nuisance; perhaps some of the members present will be able to suggest others. At all events, I hope they will agree with me that something ought to be done. It is a scandal that the inhabitants of New York and Paris should keep their cities, comparatively speaking, free from smoke; and we, who consider ourselves in advance, or, at least, abreast of our neighbours, should permit the atmosphere of our city to be so polluted as it is at present. London never can and never will be a really pleasant place to live in till it is far less smoky than it is at present.

But I must now pass on to my third head.*

THE DEMOLITION OF THOROLD-SQUARE, BETHNAL-GREEN.

THE houses forming this square, to which we have repeatedly drawn attention in the pages of the *Builder* during the last quarter of a century, are condemned at last, and are now in course of demolition. If ever a parish swamp and fever-nest existed in this metropolis that knew no intermission in the sad havoc it made of human life and human morals, that hot-bed in the heart of Bethnal-green was one. Yet for

years the local authorities allowed it to exist, though its public shame was monstrous, and the dwellers within that ill-fated square were living and breathing in daily contact with the infectious dead. Its state twenty years ago, ten years ago, and last year, was nearly similar, but its latest phase was worse in one particular,—that the houses in the interval had grown older, and become absolutely uninhabitable. Here is the picture of the sanitary condition of this place of ill omen given in the *Builder* nearly a dozen years since:—

"At one inquest it was stated that, in twenty-two houses forming Thorold-square, twenty children had been attacked with illness, and that twelve of these had died. The Roger family occupied one room, and were ten in number,—eight children and the father and mother. Here, even without any other cause, overcrowding was sufficient to produce pestilence; but George Stratford, a weaver, tells us that there had been no water supplied to any of the houses but three for eighteen months, except through a broken and unusable pump. In the heat of summer they never had a puddle of water at any time for three weeks except what they begged from others as best they could. The closets had no pans and were not trapped;—in fact, they might be called cesspools,—sometimes they were empty, but he had seen them running over with soil. There were sixty families in the square, and about 350 children among them."

From 1860 to 1871, Thorold-square mended but little indeed in its water supply or closet accommodation, if we were to judge by a personal visit we made on two occasions last year. It was then simply disgusting to view the courtyard around, an open cess-pit into which the side channels of one side of Bethnal-green drained down a pretty steep gradient, carrying unmentionable filth and sewage to the very doors of those wretched tenements. The closets or perches, or by what other name they could be rightly termed, were indescribable;—the ash-pit or bin overflowing, and the middle of the square, filthy. Sicknes was still rife in the wretched abodes; the children were ragged, barefooted, bareheaded, and hungry, and not a few of them had the shrivelled and hardened features of old age. The aged were ghastly pale and broken down, and possibly broken-hearted; for how could they be otherwise, condemned in a manner to live as they were?

Is it not a mercy that such a slaughter-yard is abolished at last, though we hope at the same time that the evicted have found a housing of an improved kind near at hand to the centre of their employment. The houses that backed against the square on a line with Turin-street, and which, of course, formed a portion of this square, are being demolished also as we write.

Let it not be imagined that in the destruction of this villainous house property Bethnal-green gets rid of her worst evils. There are various other streets, lanes, and courts quite as bad, as we have long since instanced. Such as Nichols-street Old and New, and Half Nichols-street, Phoenix-street, and several other narrow and crooked defiles extending from the back of Shoreditch Church to a considerable distance eastward—right and left of Bethnal-green-road. In the demolition of Thorold-square a tablet with its name bearing date 1792 will disappear. The houses looked much older than that date would indicate.

SNOW-MELTING.

THE first fall of snow this season in the metropolis must have awakened in the minds of many inhabitants vivid memories of the almost total stoppage of traffic which occurred two years ago, when the heavy fall so rapidly accumulated in the leading thoroughfares in such a manner as to extinguish all locomotion except of the slowest and most expensive description, and defied all the efforts of the contractors' brooms and shovels in carrying it away. Then the removal of snow was the general topic of conversation, and induced the Commissioners of Sewers of the City of London to advertise a competition for snow-melting machines. Among those who tendered designs was Mr. J. F. Clarke, of Moor-gate (and to whom the 1st premium was awarded), who perfected an invention which he has patented, and which he considers fully able to grapple with and overcome any difficulty that may ever arise through such accumulations. Mr. Clarke does not propose to carry the snow to some far-off point, but, by a great concentration of heat at frequent places, anticipate the work of the wished-for sun. His patent consists in the employment of a series of metal slabs or plates heated by gas and air jets, and placed at an inclination of 2° to 1 ft. in a chamber or vault beside or over a sewer or drain. Upon

* In our next.

these heated plates the snow is thrown, and so melted, and the resulting water discharged into a sewer. The apparatus was put in operation last year, under the supervision of the City Engineer. The entrance to the rault can be easily made as a vertical shaft in any of the "side openings" usual to sewers. This vertical shaft is the shoot down which the snow is sent to the heated plates prepared to receive it. The advantage of the apparatus being placed in close proximity to the sewer is apparent, as an easy junction with the gas mains can be effected, and the apparatus itself offers no obstruction to the traffic. But to meet the exigencies of small towns, or any unforeseen circumstances in large cities, the apparatus is constructed so that it may be easily placed in a portable casing, and placed over any gully or other entrance to a sewer, and there perform its work. The cost in the City was ascertained to be from 5*l.* to 6*l.* per yard for destroying the snow without any extra street labour. If the same quantity had to be carted away, it is calculated the cost would be from 3*g.* to 4*g.* per yard, even supposing the horses able to travel.

The second prize for a scheme for snow-melting has been awarded by the Commissioners to Mr. J. S. Farrar, who proposed that the snow should be swept up to the centre of wide streets and the sides of small ones; then to be carted away, and thrown into the Thames, vacant spaces, the main sewers, and into heated troughs. Similar propositions were made in our columns long ago.

Mr. William Haywood made a report in 1871 on some experiments in melting snow, wherein he speaks somewhat favourably of Mr. Clarke's scheme. Mr. Haywood remarks, suggestively, in that report—"The recent snow-storm is the first to cause public inconvenience since 1867."

ORNAMENTAL GLAZING QUARRIES.

At a recent meeting of the Yorkshire Architectural Society, the Rev. G. Rowe read an interesting paper on this subject. He observed that a very moderate acquaintance with the works of Medieval artists was sufficient to excite our admiration at their singular fecundity of design; and the present subject afforded one of the many branches of ancient art by which the richness and variety of thought might be illustrated. In the general revival of the study of old stained glass, attention was attracted by that more manageable part of the subject which is understood by the term "ornamental quarries." After explaining the meaning of the word "quarry," he observed that the form of the quarry was a diamond, or sometimes a square put diagonally. It was also necessary that ornamental quarries should each contain within itself a separate pattern or device, since, as it often happens when the design occupied many adjacent quarries, the kind of glass is distinguished by the name of "Running Pattern" or "Grissaille Glass," much of which still exists in this country, and is very beautiful. The size of the pieces of glass which are called quarries has made them liable to vicissitudes peculiarly their own, and their number diminishes yearly. The common accidents of centuries, and the fragility of their material have been the chief causes of destruction; while, in more recent times, on the one hand their apparent insignificance has led to their being replaced by new glass; and, on the other, their easy portability has too often been practically put to the proof by over-zealous but not over-conscientious collectors of ancient fragments. But, notwithstanding, ornamental quarries are, even yet, sometimes found by the score. In such cases they may have formerly filled the windows of the church where they occur. These, however, are the chief dishes of the feast. More commonly only a few miscellaneous examples have been preserved. In some praiseworthy instances these have been carefully set aside upon the restoration of the building, and afterwards grouped together in one window, in a situation where the quarries could be easily inspected. It is also probable that in some cases we possess the only representative of the type that ever existed. The initial letters of the name of either donor or painter, or some canting allusion to it, seems to have been placed in a single quarry, perhaps at the bottom of the window, and to have survived all mishaps. These are extremely difficult to attribute to their rightful possessors unless some chance directs conjecture to the truth. Among other

specimens Mr. Rowe referred to one in St. Martin-cum-Grigory's church, with the letters C. R. upon it; and a square quarry containing a trefoil on which are the letters J. E. W., in Holy Trinity, Goodramgate, both of which wait for some one to unravel the mystery. He observed that there are but slender means whereby to judge of the age of quarries. Coarse rough glass of deep green colour is usually an indication of early date. As times went on they used better materials, or more probably melted them more thoroughly together, which caused smoother and cleaner glass to be manufactured. Its uneven thickness remains in old glass throughout, and at the same time forms its chief distinction from the modern materials, and also causes it to be more sparkling and gem-like. He observed that quarries are rarely found *in situ*. The ease with which a small independent piece of glass could be moved from one window to another manifestly conducted to this scarcity of examples in their original place in York. A handsome eiborium occurs at the Minster and in St. Dennis's. In the latter church is an Early Decorated window, having quarries for the background, which is surrounded by a border having a double rose, whose inner petals are yellow and the outer white. At St. Michael-le-Belfrey's is a curious grotesque representing a monk, armed with a sword and buckler, attacking a fabulous monster. Similar subjects often occur in the other work about the middle of the fourteenth century. In St. Martin-cum-Grigory's, York, is an interesting example of a quarry found in its original situation. The windows on the north side had been given by one person, probably a city merchant, whose mark appears in the border, accompanied with the letter R. There is also an R in a quarry in St. John's, Micklegate, of the same date and workmanship. Mr. Rowe next explained the method of arranging the quarries, which admits of a three-fold classification. The most frequent plan is to fill the whole inner space with quarries only, generally of one pattern, but sometimes with two, or even with an indefinite number of designs. Two of the south-aisle windows in St. Mary's, Castlegate, had, previous to the late restoration, the glass in the tracery border. It was composed of quarries of more than one pattern, with a plain white border; and in the centre of the lights were circles. These circular pieces contained crowned monograms of the sacred name of Jesus and of the name of the Blessed Virgin. In some instances the quarries are separated by a narrow band of richer work, producing an excellent effect. He gave several illustrations of this mode of arrangement, which always looks well. The third mode of dealing with them is where a considerable portion of the window is occupied by some picture subject, and the quarries are only used to fill up the empty spaces within the border. This practice especially indicates Perpendicular work; less often Decorated, and rarely if ever Early English. Instances of quarries being used as a background occur in St. John's, Micklegate, where a spiral pattern of four hawthorn leaves forms a ground to a picture containing figures of John Randman and Johanna, his wife. Another example has quarries set square-wise, bearing alternately a lion and an eagle. A latter instance is one which is coarsely drawn with eight small trefoils or points round a circle, and composes the field of a kneeling figure of Sir Richard York, who founded a chantry here, and died in 1498, being buried beneath the window. Other specimens are found in St. Dennis's, where the groundwork of a good Decorated picture window is formed of quarries bearing a cinquefoil. Mr. Rowe next observed that the form and size of ornamental quarries are liable to much variation. In York Minster there are some of gigantic size and corresponding poor effect, this being partly due to their devices, which are large and rambling, being indistinctly painted. The typical quarry presents a compact star-like design in the centre of a diamond, like that at St. Peter's, Norwich. A star of ten wavy points, at St. Martin's, York, is another good example. Some early quarries have a leaf springing from the bottom of the diamond. Graceful patterns are arranged by putting together four fleurs-de-lis; others are formed of four leaves, more or less natural. There are some examples of the first sort at St. Martin's, and of the second kind in St. Helen's and St. Michael's, Spurriergate. When the glass is of the full size and wants the border, it is a safe sign of the Perpendicular date. In the Renaissance

period the border was again revived, but the imitation is easily detected, for the bounding lines are not continued to the edges of the glass at the topmost angle. In Holy Trinity, Goodramgate, is a running pattern, where the golden border is rendered opaque by mineral colour and a row of dots scratched out of it. The effect is very good. Indications of dates are also to be derived from the changes which may be noted in the character of the workmanship. Much of the bold effect of early work is due to the custom of covering all the ground of the quarry with hatched lines crossing each other. In Early English work and in the rare specimens which we possess of the Norman period, these lines are painted with hair-like delicacy. In the Perpendicular lines, on the contrary, they sometimes employ these hatched lines to deepen the shades of the design itself, thus forging them were ornamenting a flat surface, and the lines, although occasionally fine and flowing, are usually broad and coarse. A late Perpendicular border at St. Michael's, Spurriergate, is composed of scrolls, wound round a stick, which bears the letters "n. m. n. m.," simulating an inscription. The colouring of quarry patterns is almost entirely limited to the use of the golden stain, which was introduced about the year 1310. The brown outline is painted on the inside in a medium which dries sufficiently firm to allow of the glass being turned over for the reception of the yellow stain at the back. The whole is then subjected to the fire at once. Cases where the whole pattern is stained yellow are met with in All Saints', North-street. In one example from St. Dennis's Church, what is probably a quarry has the design left white upon a yellow ground, which is distinguished from the border by a slight smear shade. After noticing at considerable length other peculiarities in the workmanship and the design, he next considered the question of classification. He observed the numerous examples which bear a quatrefoil in the centre, and the multitudinous varieties of the cross, which was developed, so to speak, from a form of four small circles surrounding a fifth. There are also many conventional designs, of which it was extremely difficult to make anything at all. About the middle of the fourteenth century the more natural drawing of plants and animals commenced. Of the latter, the most common is the heart, one of the supporters of Edward IV., of which an example is preserved in All Saints', North-street. In York Minster is a dog, which is, perhaps, part of the arms of the Stapletons, of Wighill. At St. John's, Micklegate, and St. Dennis, are examples of what, at first sight, appear to be horns, which is a Scriptural emblem, but they are probably butterflies. Mr. Rowe next passed to the numerous representations of birds, which were especial favourites with the later quarry painters. As might have been expected, quarries were a convenient vehicle for the representation of heraldic devices, including, under that term, initial letters, monograms, and mottoes. In conclusion, Mr. Rowe added a few words on the subject of modern quarries. The general revival of picture windows and the creditable specimens of this kind which are now produced by our artists have greatly tended to check the use of quarries. Besides the introduction of the latter, made of cast-glass, and very cheap, has brought disparagement upon this method of ornamenting our windows, but nevertheless they may sometimes be used with advantage,—for instance, in situations where light cannot be sacrificed. Moreover, quarry-windows admit of much enrichment. For small windows quarries alone, judiciously chosen, and bordered with rich colours, compose an excellent arrangement, at a comparatively slight cost. In every case the patterns should be hand-wrought, and be added some advice as to the patterns.

SCIENCE IN BIRMINGHAM.

BIRMINGHAM AND MIDLAND INSTITUTE.

THE annual meeting of the members of the Birmingham and Midland Institute was held on the 8th inst. in the Lecture Theatre. Mr. W. C. Aitken presided, and made a valuable address, dealing chiefly with the growth and progress of the Institution, the necessity for science teaching, and Whitworth's munificence. Speaking of the latter, Mr. Aitken said,—

The Whitworth Scholarship suggests to me a more powerful argument in favour of scientific instruction than a whole wilderness of treatises written by savans on the subject. Before us

rises the grand fact, that one who in early life was only a working engineer, who by his own unaided industry and perseverance conquered his early difficulties and realised a princely fortune; grander still to think that of that fortune he gave freely, to aid and to help those who, like himself, "feel it hard to climb," to facilitate the acquirement of that which he felt the want of himself in his youth, and his after-life confirmed him in, viz., the want of science in connexion with clever manipulative skill on the part of English workmen. In this he was still further confirmed by a visit made by him to America in 1853. He there saw that the superior intelligence of American workmen enabled them to use machinery of a high order, to compete with which the scientific education of our artisans is absolutely necessary. Hence Sir Joseph Whitworth's munificent gift. He maintains the connexion between science and manual skill. There is no more wisely-guarded gift than his. In the students' competition, the student must, to a certain extent, be able to use tools. In the mechanics' competition the candidate must be an expert. In both competitions ascertain amount of scientific knowledge must have been gained, for Sir Joseph Whitworth well knows from practical experience that these are the elements which united make the complete engineer, the able superintendent of a manufactory, and the perfect workman. Forty years ago Justus Liebig proclaimed to the world that the nation most quickly promoting the intellectual development of its artisans, must, by an inevitable law of nature, advance, whilst the country neglecting their industrial training must inevitably recede. This warning voice we heeded not. With abundant supplies of raw material, of mineral wealth to supply cheaply our great national industries, with workmen the best by far as regards muscle and clever manipulation, reckless and spendthrift-like we revelled therein, forgetting that cheap raw material can only for a time, in connexion with clever manipulation, preserve a monopoly, but only till a competing nation, by the education of its workmen, overcomes the difference in the price of raw material. This is distinctly proved by the competition we have been and are subjected to as regards manufactures, according to the Birmingham Chamber of Commerce; seventy-two branches of local industry are interfered with by the competition arising out of articles produced in foreign countries, where primary education, with a higher education embracing science teaching, is given to its artisans.

THE TRADES CONGRESS.

The proceedings of the Congress held in Nottingham have been very fully reported, and will afford subject for comment hereafter. Amongst the matters discussed of especial interest to the working classes was a resolution of Mr. Hicklin in favour of a reduction of the hours of labour throughout the country in every trade, "as it would be beneficial to the nation at large, and thereby proper advantage would be taken of the facilities for promoting the course of education, reducing taxation, and giving work to the unemployed." This, after some discussion, was carried by a large majority.

Amongst other resolutions passed were these: "That in the opinion of this Congress trades' halls and clubs are highly essential to the interests of labour, as they tend to bring working men together in a manner better calculated to further their objects than other places now resorted to admit of; this Congress therefore cordially advises every trade society to take the subject into immediate consideration."

"That this Congress views with serious apprehension the unfair competition caused by the introduction of convict labour being crowded into the public market, and that the disposal of such labour should be confined entirely to charitable institutions which exist in this country." The mover suggested that subsidised labour of this kind should be supplied to deaf and dumb asylums, hospitals, the army, navy, and the police. This, he thought, would be better for all parties.

Courts of arbitration and the question of labour representation in Parliament were also debated, a resolution approving of the direct representation of working men being passed. In the evening Messrs. Seely, Herbert, Mandella, and Morley gave a *soirée* to the delegates, in the Assembly-rooms.

On a previous evening a crowded working

men's meeting was held, under the presidency of Mr. Mundella, M.P. The Hon. A. Herbert, M.P., was also present. Mr. George Potter moved and Mr. Leigh seconded, "That in the opinion of this meeting trade-unions afford the best means of securing to the industrial population a just and reasonable share in the results of their labour as well as the rectification of the grievances under which they have long suffered." The resolution was carried, and a petition to Parliament determined on.

At the close of the Congress a meeting of the general committee was held at the Mechanics' Hall, Nottingham, to consider their mode of action for the coming session of Parliament, when Mr. Alexander Macdonald, of Holytown, Scotland, president of the Miners' National Association, was unanimously appointed president of the Congress Committee for the ensuing year. Mr. G. Howell, of London, was elected corresponding secretary for the Parliamentary Committee; and Mr. William Hicking, Nottingham, was appointed the provincial secretary of the United Trades Committee.

MONUMENT TO M. DUBAN.

A subscription has been opened in Paris to erect a monument to M. Felix Duban, at the office of the Central Society of Architects, 23, Quai de l'Horloge, and at the Ecole des Beaux Arts. A report of the proceedings on the occasion of the funeral of M. Duban, and the addresses then made, edited by M. César Daly, has been published, and will be found very interesting.*

PRIVATE BILL STANDING ORDERS.

The commencement of legislative action in relation to the private Bills for railways and other works, which Parliament is petitioned to authorise by the conversion of Bills into Acts, in the session of 1872, has been entered upon with a serenity by Parliamentary authority into the proceedings already taken, and whether the requirements of Parliament have been complied with up to this point, by the promoters of private Bills. The examiners on Standing Orders, Messrs. Frere and Robinson, stipendiary Parliamentary officers, have thus commenced their sittings.

On the first day the examiners' lists embraced the first sixteen Bills on the general list, and contained six railway Bills, and ten others, each of a different character from the other nine; as for instance, the Aberdeen District Tramways, Abraham Kill's Trust, All Saints' Church, Cardiff, Bannow Slob Reclamation, &c. None of the Bills were considered of much importance, or expected to excite much interest. In numerous instances when Bills are called by the examiner, there is no appearance on the part of promoters, from failure to have lodged the deposit, or the abandonment of their respective schemes from some other cause. The proposed new line to Brighton is among the dropped Bills of the session.

THE EDUCATION OF THE ENGINEER.

TOWARDS the close of the address made by Mr. Hawksley on taking the chair for the first time as President of the Institution of Civil Engineers, an address which will be deemed by some retrogressive in parts, he made a few useful observations on the subject of professional education, addressing them, he said, rather to each one of the 200 students of this Institution who happened to be present, than to the members who had acquired and usefully employed that peculiar knowledge by which they are severally known and distinguished.

To the students, then, the President said,—1st. Of all things, do not attempt too much. 2nd. Keep up and augment your knowledge of mathematics and the applied sciences, especially of those sciences which are most needed in that walk of the profession which you have selected for your own path; but again, I say, do not attempt too high a flight, for if you do you will never become a practical man. 3rd. Do not let your French grow rusty, and acquire German, if your leisure and aptitude are sufficient for the purpose, because your future vocations may be in countries in which those languages are either habitually spoken or are in considerable use. 4th. Acquire in the office, and by the study of esteemed works, a knowledge of form and design.

* *Fanfaillles de Felix Duban.* Paris: Ducher & Cie. 6, Rue Sorbonne. 1871.

5th. But bearing in mind that you will never become a practical engineer on theory alone, take every opportunity which presents itself of becoming apt in surveying and levelling, and in the methods employed in the setting out of works; learn the uses and applications of tools; make yourselves able to distinguish a good material from a bad material, good workmanship from bad workmanship, sound ground from treacherous ground, good puddle from bad puddle, good mortar from bad mortar, and a good workman from a bad workman. This knowledge is not to be obtained in a school, a college, or an office, and cannot be learnt from books. 6th. Make yourselves acquainted with every description of plant, and all the appliances and contrivances which an experienced contractor employs for the purpose of rendering a paper design into a substantial construction. 7th. Keep brief treatises on geology and chemistry always at hand, for some acquaintance with these sciences cognate to engineering is, in the present day, almost essential. 8th. Practise as much as possible the art of mental computation, for this will give you the means of almost intuitively arriving at determinations on questions of cost, and of at once seizing on the best of several alternative plans or methods. 9th. Be not afraid of soiling your hands or dirtying your boots, but be in every other respect—in thought, feeling, and conduct—a gentleman.

IRON PIPES FOR HOUSE-DRAINAGE.

In the opening address, already referred to, Mr. Hawksley said,—

On the subject of the removal of the sewage of towns, no new suggestions of importance to the professional engineer have recently appeared, nor, indeed, does it seem that in this department of municipal improvement much remains to be accomplished. It is, however, worthy of remark, that in house construction it seems desirable to abandon the use of earthenware tubes with numerous and imperfect joints, and to substitute the use of iron pipes, with few and perfect joints, care being taken to provide a sufficient number of flanchod or tightly-stoppered branches, to afford the means of access to the interior. By this simple arrangement, the escape of foul water and fetid gases from the drains into the lower stories of our dwellings may be effectually prevented, and it will become a comparatively easy matter to apply, in connexion with such pipes an effective apparatus without the house for preventing the access of contaminated air from the main sewers. In many cases, the so-called "ventilation" of the sewers is much neglected, and invariably with the natural result that the pent-up sewage gases make their escape at the place of greatest pressure or least resistance, and commonly into some house towards which the sewer ascends.

THE WHITTLESEY WORKHOUSE COMPETITION.

As many as twenty-five different sets of designs were submitted for this competition, with estimates varying from 4,000l. to 10,700l. Several of those were, either from excessive cost or inelaborance or inaptitude of design, deemed to be altogether unsuitable; and after examination of the remainder, four were in the first instance reserved for further consideration,—viz., those by Messrs. Nelson, of Leeds; Mr. Ladds, of Bedford-row; Mr. Oldfield, of Westminster Chambers; and Mr. Peck, of Gordon-square; estimated to cost, respectively, 5,000l., 4,500l., 4,550l., and 4,000l.

Eventually the design of Mr. Peck was selected conditionally on the contract for the building being accepted by a builder (to be approved of by the guardians) at a contract price satisfactory to the Board.

ST. MARTIN'S CHURCH RESTORATION, BIRMINGHAM.

ONLY eight sets of drawings were sent in, and from these the designs by Mr. J. Chatwin (1), Mr. W. Hale (2), and Mr. Edge (3), have been selected for premiums. In Mr. Chatwin's design, which is to be carried out at a cost of 12,000l., the west, together with the north and south, walls of the old church are retained; but the whole of the east end of the building is subjected to alterations, which have for their object

the lengthening of the edifice, with the addition of providing choir, vestry, and organ-loft at the north-east angle, and a vestry; and at the corresponding south-east side, the nave, hitherto a narrow span, is considerably widened, and the aisles undergo a corresponding reduction. At the east end a lofty arch, with bracketed pillars, connects the chancel with the nave. Short transepts are planned, with the object of providing gallery seats for the school children, and affording the extra accommodation which the abandonment of the present unsightly galleries necessitates.

In Mr. Hale's design the present setting out of the nave is maintained. The roof is open timbered,—a plain and effective design. Chiefly owing to the adoption of ridge roofing for the aisles, the elevation is more striking than that of the selected design, and more desire to adhere to the original design appears to be shown than is apparent in Mr. Chutwin's drawings.

LEICESTER MUNICIPAL BUILDINGS COMPETITION.

INQUIRIES are being made why the design by Mr. Barnard, to whom the first premium was awarded, is not being carried out. Some of our Leicester friends will perhaps explain.

CAMBERWELL VESTRY HALL.

ON Wednesday in last week the selection of the plans was made. The votes were by a show of hands, and stood as follows:—

NB Desperandum.....	1	—	—
Thoro'.....	11	8	—
Exposition.....	1	—	—
Civis.....	23	23	24
In Foro.....	15	10	30
Well Considered.....	23	25	24
Exclaudit.....	7	—	—
A l'oeuvre, &c.....	21	26	25

* Ties.

On opening the sealed letters "Civis" was found to be Mr. E. Power, of Walbrook Buildings, City; and "A l'oeuvre," &c., Messrs. Bertram, of King William-street. Mr. Power will carry out his design if tenders do not exceed the estimated cost of 8,000*l.* (which is made a special resolution of the vestry), and the works will proceed at once.

THE PROPOSED SCHOOL-BUILDINGS FOR WORCESTER.

IN an article on this subject in the local *Herald*, a correspondent suggests the desirability of the Worcester School Board seeking professional advice in the selection of designs. He says:—

"Upwards of thirty sets of plans have been submitted, derived from architects in the city and from London, Birmingham, Manchester, and elsewhere; the various designs being exhibited for public inspection at the Guildhall. However able the several members of the School Board may be in their various professional pursuits, they can scarcely be expected to know individually as gentlemen, or collectively as a Board, sufficient of the arts of architecture and construction to enable them to fairly and satisfactorily adjudicate upon the labours of upwards of thirty architects and the merits or demerits of their plans and designs."

Another correspondent states that certain plans which he can name were not deposited until the second day after the latest day for deposit, namely, the 30th ult.; and yet that these plans are included with the others for consideration of the Board.

ORDNANCE MAPS.

SIR,—Would it be possible for the officials having these maps in hand to expedite the publication a little? Admittedly they are splendid works in respect of accuracy of delineation, and are invaluable as bases of other maps and plans, and for reference; but, still, the time occupied in their preparation and publication is something alarming. The other day, observing an advertisement of a "new" series of plans of London, on a 25-in. scale, being published, I sent for a sheet, and had it coloured and mounted, for my office; but what was my surprise, upon examining it carefully, to find the notification that the survey was taken 1862 to 1865, and consequently when published it was already out of date! An entire line of railway, destroying many dozens of houses, had been made in the interim, and was not shown even as projected, and various other alterations which had meanwhile occurred were equally, of course, left out.

However carefully these plans may be taken, and whatever other care may be bestowed in the plotting, engraving, &c., it never can be contended that so great a lapse of time is necessary before publication. This 25-in. scale is now going on gradually over London; but who can tell what proportion of your readers will be alive at the finish if this is the rate of progress?

HERIOTSMO.

BUILDING IN SOUTH YORKSHIRE.

THE building trade in Sheffield and other South Yorkshire towns has during the past year been fairly brisk, and there is now a large amount of work on hand.

New printing-offices are in course of erection between High-street and the Hartshead, for the use of the proprietors of the *Sheffield Daily Telegraph*. They are entirely of brick, and will comprise printing-offices, reporters', &c., rooms, and all other conveniences. Mr. J. Rogers is the builder.

The erection of the new music-hall in Barker's-pool, Sheffield, is going on favourably, the slaters having just finished their work in time. The building itself externally has a somewhat heavy, overbulky appearance, but as the masonry gets in order and the scaffolding disappears, it will doubtless show to better advantage. When completed, one of the finest organs in the world will be placed in the great hall. An air-shaft is now being erected at the south-east corner in Burgess-street. Messrs. Longlen & Sons are the builders; Messrs. Dodger & Holmes, joiners, &c., and Mr. Bissett for plumbing work. This edifice is expected to be ready by Christmas, 1872, and will be devoted to concerts and other entertainments of the very highest class.

Messrs. Brown, Bailey, & Dixon are erecting with the greatest possible speed new works at Attercliffe, near Sheffield, where they will carry on business as steel manufacturers, spring-makers, ironfounders, and makers of all kinds of railway materials. The works cover 13 acres of ground, and will employ about 1,500 men. There will be a frontage to Milner-road, of about 400 ft. The shops are, machine and buffer shop, hammers, smith's shop, wheel shop and forge, rolling-mill; Bessemer-steel-works, to turn out 1,200 tons per week; and a rail-mill, which is to be the largest, or one of the largest, in England. Some of the shops will be ready next week, although the works were only commenced about five months ago. It is stated that Mr. George Brown (who is related to Sir John Brown) has designed the whole place himself, and has had it built under his supervision, the plastering being done by Mr. Uwin.

Mr. William Wostenholm, lately of Burgess-street, has just removed to a newly-built brick block of warehouses, workshops, &c., in Holly-street, which occupy the site whereon Messrs. Binney formerly carried on business as hammer, &c., makers. A new grinding-wheel has just been erected by Mr. Joseph Gaunt, in Cambridge-street.

New schools have been built very recently (and in some cases are yet unfinished), in Alderson-road, by Clubley & Stringfellow; in Hodgson-street, by Mr. Butler; in Pea Croft (ragged schools), by Mr. J. Butler; new schools and meeting-house for the Friends, in the Mect-house-lane; Pitsmoor schools altered by Mr. Shaw; new Wesleyan schools, Prospect-street, Walkley; Roman Catholic schools in St. Charles-street, Attercliffe, and some others. Messrs. J. H. Andrews & Co. are about completing the erection of the "Toledo Steel Works," at Neepsend, Sheffield. These works occupy over two acres, and have a frontage to the street of about 535 ft. They extend back to the river. Messrs. Sanderson, Brothers, & Co. are themselves building some extensive works at Darnall; and it is stated that they intend to concentrate their business there. Messrs. Cammell & Co., Limited, have built a new forge, to be used as an armour-plate mill; and an extensive forge is in course of erection at Messrs. Vickers, Sons, & Co.'s, Brightside. It is stated that both the last-named firms have put down the necessary apparatus to work some of their furnaces with gas, on the Siemens's patent principle. Messrs. Nixon & Winterbottom, Broadhall-street, have just rebuilt part of their works; Messrs. John Brown & Co. are putting down additional furnaces; Messrs. Newbold & Co., Newhall, have erected new works for saw-making; and Messrs. Firth & Sons, with many other Sheffield firms, have just completed altera-

tions suitable for their increasing businesses. New schools and church are being erected at Spring Hill, Sheffield, for the Roman Catholics; and the Midland Railway Company are erecting extensive new stabling in Saville-street, Mr. Saul being the builder. A very considerable number of other undertakings of importance are also on hand, in various parts of South Yorkshire; and the amount of private buildings is and has been very large indeed. A number of villas has been erected in Westbourne-road, Newbould-lane, Shortridge-road, &c., Sheffield, and a great number of smaller houses at Hecky, Walkley, and Attercliffe. It is stated that the slaters and other branches intend to go in for the nine-hours very shortly.

The price of mortar has been raised by some firms 6*d.*, in consequence of the advance in the cost of coals.

THE NEW (R.C.) CHURCH OF OUR LADY AND ST. PHILIP, ARUNDEL.

NOTICES of the progress of this church have from time to time appeared in this journal and in other papers, and occasionally it has been designated a cathedral, which it may be as well in this place to correct. It has not, and aims not at, more than the character of a parish church, of which there are so many and such splendid examples in the ancient fabrics of that class spread over the kingdom; and this church being founded and erected at the instance of the Duke of Norfolk, in the ancient deanery of the family he represents, being within a stone's throw of the famous Elizabethan Chantry and the old Church of St. Nicholas (the works of his ancestors), and grouping in the view of Arundel with the Castle, it would seem only natural, in the fitness of things, that a certain dignity and importance should be expressed in a structure that may be said to have a representative character like this.

The Duke, having chosen for his architects Messrs. Joseph A. Hanson & Son, and for builders the Messrs. Myers, the first work of throwing in concrete for the foundations was begun on the 27th of December, 1869; and although a very serious interruption took place in having to carry the foundations down to the solid chalk rock, which in some instances was as much as 50 ft. below the surface of the ground; yet, while we write, the building is well-nigh ready for the nave roof-plaster, some 70 ft. above ground; most of the exterior and some of the interior carving being done; the walls being 3 ft. and 3 ft. 6 in. thick (those of the tower much thicker), and faced with ashlar stone inside and out. The progress has been steady and regular, an evidence of the excellent arrangements and management of the builders.

The view of the church which we insert this week will give a good general idea of the arrangement. It is cruciform in plan, having nave and aisles to the west of the transept, and choir and chapels to the east. At the north-west angle the tower stands in the place of porch, and at the south-west angle is an octagonal baptistery projecting from the line of the south wall. Besides the entrance under the tower there is a great western portal, and in each transept a smaller door of admission to the church. At the south-east angle will be the sacristies, lying between and communicating with both the church and the presbytery. Within the church, at the west end is the large organ-loft, raised high on stone groined vaulting, and with carved stone parapet front. The whole of the church, the choir, the three chapels, the baptistery, and tower-porch, are to be groined vaulted in stone ribs and bands and chalk filling.

The dimensions of the church are as follow:—External length from east to west, 200 ft.; interior, across the transept, 91 ft.; width of nave and choir, 33 ft.; width of nave aisles, 12 ft.; width of transepts, 27 ft.; length of choir, 52 ft.; length of the chapel immediately on each side of the choir, and open to it by arcwalks, 34 ft.; height to ridge of nave groining, 72 ft. The groining of the nave, choir, and transept arches springs from a level of 50 ft. from the floor. The fîche, or sanctus bell-turret, rises to the height of 140 ft. The spire is intended to be 270 ft. to the apex. The north transept window (seen in the view) is 37 ft. by 18 ft.; sight measure. The diameter of the rose-window at the west end, 23 ft. 6 in. The church is intended to be opened during the present year.

THE (R. C.) CHURCH OF OUR LADY AND ST. PHILIP. ARUNDEL, SUSSEX.—MESSRS. JOSEPH A. HANSON & SONS, ARCHITECTS.

WATER SUPPLY IN MARGATE.

ONLY a few years ago the entire water-supply of the inhabitants of Margate was derived from wells, sunk but a few dozen feet down into the chalk, which is here from 900 ft. to 1,000 ft. thick; and these wells—public and private—were often within a very few feet of some neighbouring cesspool. Percolation, no doubt, went on continuously, day and night, from these cesspools into the wells, for no one in Margate then or now ever thinks of lining a cesspool with bricks, or of making it water-tight; and if this did not affect the death-rate, it must be supposed that filtration through the greater or less density of the chalk tended to disarm the exhalations of the cesspools to a great extent of their noxious qualities.

But the rapid growth of the town, and the perception by some of the inhabitants that, sooner or later, this comfortable and independent arrangement, of every man having his own cesspool and his own well, must inevitably break down, led to the proposition being made to the local Board of Health (Margate is a corporation now) that they should construct waterworks in the neighbourhood for the supply of the town; but the local Board rejected the proposition, and refused to expend the public rates upon any such visionary scheme. The matter was then taken up by a few private individuals, and they proceeded to form a Margate Waterworks Company (limited); but the local Board would not hear of it, and the joint-stock company to lay down their water-pipes in the streets. Thereupon the promoters of the scheme, nothing daunted, went to Parliament for powers to enable them to do what the local Board had forbidden; and to Parliament the local Board followed them; but there was some little hitch in the opposition offered by the local Board, who at first did nothing, until the time for lodging appeals had nearly gone by, and then made such scrambling haste that the resolution directing their legal representative to appeal was found to have been passed at a meeting of which the statutory notice had not been given quite soon enough to render it legal, and thus the opposition of the local Board fell through.

And so the Margate Waterworks Company got their Act, and Messrs. Docrwa & Son, of Ball's Pond-road, undertook the contract for the works.

There was no difficulty in getting water at the spot chosen, close by the famed Tivoli Gardens;—a main shaft of 13 ft. in diameter and 50 ft. deep, with leadings of an aggregate length of 400 ft., giving a yield of 200,000 gallons per diem,—equal to about 20 gallons per head of the population. The supply is continuous day and night throughout the town, and the analysis of the water is,—

Solid Matter per gallon.	Loss by Ignition.	Hardness before Boiling.	Hardness after Boiling.
45.02	3.30	18.31	10.35

The shares of the company are 10l. each, and its capital 16,000l. Very great difficulty was at first experienced in placing the shares, and many were offered at 8l. and 9l. each, that would now be esteemed cheap at 20l. The annual dividend is limited to 10 per cent., and the directors are making a move to increase their capital, and enlarge and extend their works.

Meantime, most of the public wells have been found to be more or less—and more rather than less—affected by infiltration of sewage matter, their brightness and clearness and softness have all been shown by analysis to cover very unmistakable dangerous qualities, and (not without some little opposition, however, on the part of the inhabitants, with many of whom these deleterious waters were in particular favour for the making of tea) the authorities have very properly had them closed.

And now the scene changes. The Town Council (the Local Board of the day) see that their opposition policy of a few years (about ten) ago was wholly wrong,—that the water supply of the town ought all along to have been in their hands, instead of in that of a private company; and now in the days of the success of that company, the Town Council have been making overtures to them to permit a purchase of their property for the benefit of the inhabitants; and so earnest are they in this matter, that they have within the last few weeks passed a resolution affirming the proposition that it is desirable for the town to possess the water-

works, and actually offering the company 32,000l.—just double their capital—for their interest therein.

The moral to be drawn from this plain statement of the facts is calculated to be of service to oppositionists upon local boards even of the present day. Whether the Margate Waterworks Company will sell out for double their invested capital remains to be seen. Rumour says that they will not.

APPOINTMENT OF ENGINEER FOR THE BRUTON DRAINAGE.

A CORRESPONDENT complains that having made an application for this appointment, and taken some trouble in the matter, he received intimation from Mr. Henry Dyne, by an open post-card, that his application "was not entertained." The complaint is a perfectly just one. Properly qualified candidates for such a post are certainly entitled to courtesy.

MEMORIAL CHAPEL TO THE LATE EARL OF DERBY.

A CHANTRY or memorial chapel, containing a statue of the late Earl of Derby, has been added to Knowsley Church. The new chapel has been inaugurated. It forms an addition to the north-east portion of the church, and has been erected at the expense of a number of friends of the late earl resident in the immediate neighbourhood. The design was furnished by Mr. Paley, of Lancaster. The chapel is built of red sandstone, and opens into the chancel by means of three arches, and into the transept by two arches. The groined roof is of pitch pine. The columns supporting the arches are of limestone, and the floor is partly of limestone and partly inlaid with tiles. The building will shortly be further enriched by several stained-glass windows. Around a portion of two sides of the chapel there are a number of carved seats of Dantzic oak, which are intended for the accommodation of the members of the Derby family who attend service at the church. In the middle of the chapel stands the monument erected by the tenantry. It is in the form of a recumbent statue of the late earl, by Nolle, in white marble, and resting on a carved tomb of white stone. The statue is said to be an excellent likeness. It represents the late earl attired in his robes of Chancellor of the University of Oxford, reposing as in the sleep of death. The four sides of the tomb will be enriched with the arms of the Derby family. The total cost of the memorial chapel is about 3,000l., of which nearly 1,000l. have been expended on the statue and tomb. The work has been carried out by Messrs. Burroughs & Son, builders, Liverpool.

THE LIVERPOOL FREE PUBLIC LIBRARY AND MUSEUM.

THE local Library and Museum Committee have just issued their report for the year ending on the 31st of August last. During the past year (they say) the Institution has pursued its course of usefulness to the utmost extent which the resources and space at the disposal of the committee have enabled them to go. The success of the autumn exhibition of pictures has been beyond their most sanguine expectation. The exhibition opened on Saturday, September 2nd, and closed on Saturday, November 18th. It was attended by 22,725 persons, besides holders of season tickets, numbering 313. The number of pictures exhibited was 887, of which were sold 235, at prices amounting in the whole to 6,395l. 2s. 6d. The committee have purchased, on behalf of the Institution, for the permanent gallery, pictures to the value of 500l., and are prepared to devote a larger sum for the same purpose next year.

The number of volumes issued from the reference library during the year has been 507,335, against 620,124 in the previous year. This diminution is partly accounted for by the closing of the library for several weeks.

During the year 2,038 volumes of books have been added to the library.

In reference to the museum, the following statistics are given:—Day visitors: 1869-70 (52 weeks), 146,473; 1870-71 (49 weeks), 362,657; decrease in 1870-71, 88,816. Evening visitors: 1869-70 (26 nights), 54,473; 1870-71 (25 nights), 42,730; decrease in 1870-71, 11,743. Total day and evening visitors in 1869-70, 500,946; 1870-71, 405,387; decrease in

1870-71, 95,559. Average of seven preceding years, 473,435; total of 1870-71, as above, 405,387; decrease, 68,048. The attraction of the museum not only brings visitors from the town itself, but the numbers have been largely swelled by excursion parties from the manufacturing districts. These fluctuate from time to time, according to the season, the weather, the wide extent of choice offered by the ever-increasing railway system. A cold, wet summer deters multitudes, whom a fine warm season would bring over.

A NEW SYNAGOGUE FOR SHEFFIELD.

THE corner-stone of a synagogue which is being erected by the Jewish community in Sheffield, has been laid by the Rev. A. L. Green, minister of the Central Synagogue, London. The present synagogue in Fig-tree-lane has for some time past proved inadequate to the requirements of a congregation much larger than was the case a few years ago; and, besides this, the lack of school accommodation has been very much felt. The new building is in North Church-street. The basement will consist of a school-room accommodating 60 children, with other rooms, approached on the level from North Church-street, and having a second entrance by a flight of stairs from St. Peter's-close. On the ground-floor is to be the synagogue, 38 ft. long by 30 ft. wide, fitted with pews along each side, and having the reading-desk or almemor in the centre. At the east end, in a semicircular recess, is to be placed the Aaron Hakodesh or Ark, containing the sacred rolls, on which are inscribed the Books of Moses. Over this will be a small stained-glass window, having the Ten Commandments worked thereon. A staircase in the lobby will lead to the ladies' gallery, which extends over the lobby. A teachers' residence and board-room are to be attached. The whole is to be built of brick, and in Early Gothic style. The roof will be open-timbered, and the seats and gallery front will be of pitch pine. The synagogue will accommodate about 230 persons. The builder is Mr. Wade; the joiner, Mr. Flowerday; and the works are to be carried out under the superintendence of Mr. Mitchell-Withers, the architect.

The total cost is estimated at about 1,800l.

NORTHERN ARCHITECTURAL STUDENTS' SOCIETY.

A MEETING of this Society was held on Tuesday evening last, Mr. W. L. Newcombe (president) in the chair. Some months ago Mr. Ralph Thompson, of Newcastle, offered to present to the Society a gold medal, to be given to the author of the best sketch or drawing from an existing building. The competition took place a short time ago, and the drawings submitted were sent up to Mr. W. Burges, of London, who kindly undertook the office of adjudicator. His award gave the medal to Mr. Joseph Oswald, of Newcastle, for a measured drawing of the choir of Lanercost Priory, Cumberland; and a present of books, as second prize, to Mr. W. H. S. Thompson, of Newcastle, for a sketch of the Ducre Tower, Lanercost. The president, in an appropriate speech, presented the medal to Mr. Joseph Oswald, who briefly replied. The medal is in the form of a star or Maltese cross, and has on one side the armorial bearings of Newcastle, and on the other a suitable inscription. After the presentation a paper was read by Mr. G. H. Morton, architect, and led to a short discussion.

THE NEW VICTORIA HALL IN SUNDERLAND.

THE newly-erected "Victoria Hall and Temperance Institute," Toward-road, near the Extension Park, Sunderland, has been opened with éclat. The new hall has been erected to supply the need, long felt in Sunderland, of a large public room capable of holding 3,000 persons; and as it is constructed in the theatre fashion, it is adapted for large public meetings, concerts, and musical and dramatic entertainments. The building fund has been supplied by a company of 11 shareholders, on the limited liability principle, the Sunderland Temperance Society holding shares to the amount of 2,000l., or one-fourth of the total cost of that portion of the building now completed,—the large hall, lobbies, and retiring-rooms. The cost of the completed portion was 8,000l. The principal

entrance is from Toward-road, whence a flight of steps leads to the floor of the hall, through a corridor. From the entrance level, a staircase leads to the dress circle, with its spacious lobby and retiring-rooms. The circle is fitted with numbered arm-chair seats, covered with red velvet plush, and a partition of glass separates the circle from the lobby. The platform is somewhat on the fashion of that in the New Town-hall of Newcastle. The original design of Mr. Hoskins could not be carried out for want of funds.

The whole of the various works have been carried out under the supervision of Mr. Charles Cobham, as clerk of the works. The contractors were,—for masons' work, Messrs. Hopper & Oliver; bricklayers, Messrs. Sydney & Parkin; carpenters and joiners, Messrs. David & John Rankin; plumbers, Mr. Henry Tonkinson; plasterers, Messrs. J. Montgomery & Sons; slaters, Mr. Robert Preston; painters and glaziers, Mr. G. N. Amison; gasfitters, Mr. J. J. Kirtley; upholsterers, Messrs. Holkirk, Smith, & Whitecross.

MID-LONDON RAILWAY.

THE ESTIMATES.

It may safely be assumed that, as so much expense has been already incurred in the survey of the line, in the scheduling of an immense amount of property, and in other outgoings, the promoters are quite prepared to find the necessary deposit, and to proceed, if opponents, legal forms, and the Legislature will permit them, to the execution of this important project.

In accordance with the Standing Orders of Parliament, the estimates of costs for the construction of the line were duly deposited on the 30th ult. for the 31st.

The Mid-London Line, it may be proper to recall, is to be promoted by two Bills, the more important being the eastern section. The names of five gentlemen of property appear on the Bill as constituting the nucleus of the company. Railway No. 1 is laid out as rather more than 1½ mile in length, to commence on the south side of Oxford-street, about eight chains to the east of the Marble Arch, and terminating in the parish of St. Anne, Soho, in George-yard, occupied by Messrs. Crosse & Blackwell. The estimated cost of this portion is for 163,000 cubic yards of excavation, at 6s., 48,000l.; covered way, including road, bridges, and retaining walls, 59,000l.; accommodation bridges and works, included in covered way,—culverts, and drains, 20,000l.; metallings of roads, 1,500l.; permanent way fencing, included in covered way, at 6,000l. per mile, 6,900l.; permanent way for sidings and cost of junctions, 1,000l.; contingencies, 15 per cent., 29,596l.; land and buildings, 6s. 1r. 16p., 390,000l.; total, 616,906l. Railway No. 2, of 1 mile 3 furlongs and 40 yards in length, extends from a junction with the eastern end of No. 1 to a junction in the parish of St. Sepulchre, with the London, Chatham, and Dover Railway. The estimated cost for this section is for works, 191,692l.; contingencies, at 15 per cent., 28,754l.; land and buildings, 7s. 1r. 10p., 480,000l.; total, 700,446l. Railway No. 3, of 6 furlongs 1 chain 18 yards, commences by a junction with No. 2, and terminates in Coleman-street, to the west of Moorgate-street. The cost of this line is estimated at 183,086l. for works; 19,956l. for contingencies; and 250,000l. for land and buildings, the land embracing 4s. 1r. 20p.; total estimate, 402,992l. Railway No. 4 commences by a junction at the end of No. 3, and terminates by a junction with the authorised Railway No. 1 of the East London Railway Company, in the parish of St. George in the East. The estimated cost for this section is, for works, 230,631l.; contingencies at 20 per cent., being 5 per cent. extra, 46,126l.; land and buildings, 7s. 2r., 410,000l.; total, 686,757l. Section No. 5 is a junction, 1 furlong 6 chains 10 yards, from Line No. 1 in the parish of St. Anne, Soho, to a junction with the authorised London Central Railway. The estimated cost of this section is 103,801l., including 50,000l. for land and buildings. The sixth section is a junction of 1 furlong 8 chains 6 yards, in the hamlet of Mile-end Old Town, between No. 4 and the authorised East London Railway; estimated cost, 85,714l.

An important feature in this project is the formation of a new street in two sections; the first commencing at the angle formed by Giltspur-street and Newgate-street, and terminating in the parish of St. Stephen, Coleman-street, in the city of London. The second section is from

the point just indicated to the junction of Commercial-street, Commercial-road, and White-chapel High-street. The estimated cost of the works, contingencies, land and buildings of the streets, is, for No. 1, 443,000l., and for No. 2, 957,000l. Part of the cost of the land and buildings for the new streets is included in the railway estimates already quoted.

The Bill and estimates for the western section of the Mid-London are again subdivided into two parts. Railway No. 1 is 2 miles 7 furlongs and 5 chains in length, commencing by a junction with the London and North-Western line at Willesden, and terminating in the parish of St. George, Hanover-square, on the east side of Park-street, near the west end of Oxford-street. In this section there are 37 road-bridges, and a railway-bridge, which, with retaining walls, are estimated to cost 102,000l.; the stations are estimated at 91,000l.; the total cost of works, 350,000l.; contingencies, at 15 per cent., 52,635l.; land (22 acres), and buildings, 338,000l.; total estimate, 711,535l. The second section, of 5 furlongs 5 chains, is from a junction between No. 1 and the London and North-Western Railway. This portion is estimated to cost 28,343l., including 5 acres of land.

The grand totals embraced by the two Bills and the two sets of estimates are thus: in the eastern section, lengths, 5 miles, 4 furlongs, and 22 yards; for railways, 2,596,616l.; for two streets, 1,400,000l. Western section, 3 miles 4 furlongs 7 chains, estimated cost, 769,878l., say 770,000l.; length of lines in all, 9 miles 7 chains 20 yards, estimated cost, 4,796,616l. This amount may possibly be considerably reduced by the Corporation of London, or the Metropolitan Board of Works bearing a portion of the expense of the new street from Holborn Viaduct to Whitechapel.

It is proposed to take powers in the Bills to underpin or otherwise strengthen all houses or other buildings within 100 ft. of the railway, after ten days' notice given to the owners, lessees, or occupiers of the houses or buildings to be underpinned, or otherwise strengthened, the company to be liable for inconvenience, loss, or damage, resulting from the exercise of its powers. If the owner, lessee, or occupier, gives a counter notice, disputing the necessity of underpinning, the question of necessity to be left to a civil engineer to be appointed at the instance of either party by the Board of Trade, the referee to be paid by the Company, and the other costs of the referee to be in his discretion.

LONDON ROOKERIES.

EFFORTS should be made to entirely sweep away the "rookeries" of London; i.e., those large collections of narrow, close, unhealthy courts and alleys which we find grouped together in masses, at certain parts of town. A single court is no object, but in some districts we observe a perfect wilderness of them grouped in an unwholesome mass. Now, when there are Alsatians of this description, the indigent will always seek them, or be driven into them, and all our efforts to improve their physical or moral condition, will be frustrated from the nature of their homes. Let these dens then be rooted out entirely, and let new dwellings on new streets be erected in their place. We do not content ourselves with building model lodging-houses in good positions; we propose to destroy whole territories of slums, and lay out new streets on the sites. At first sight, even 500,000l. may seem insufficient to grapple with such a colossal undertaking; but well applied, it would effect much.

It has proved more than once in the recent history of London that, upon buying up a quantity of crowded low-class dwellings, and making a good wide road through the mass, the ground thus opened out on an improved scale has gone far towards repaying the cost. A most important consideration and valuable for this purpose! Now in London there are several masses of courts on which this principle could be tried. An Act of Parliament would be necessary, which is said to cost about 1,000l. Take, for instance, the block of courts right and left of Bedfordbury, between St. Martin's-lane and Bedford-street; the blocks of courts about Drury-lane, about Clare Market, &c.; another block of courts south of Currier-street, Chancery-lane; the rookeries around Baldwin's Gardens, about Laystall-street; the fifty acres of courts and alleys all in a mass between Aldersgate-street and Bunhill Fields, opening

out of Upper Whitcross-street, Golden-lane, &c.; several acres of unwholesome courts in a block at the back of the Mint; and another block at Wapping between the London Docks and the river. These constitute the chief mass rookeries of London, and several have been remarked upon from time to time by the *Builder*. Our proposal is to buy them up, or the worst of them; then to level every building to the ground, lay out the land with good 40 ft. roads, and either build improved and larger dwellings there, or let the ground to builders. The ground or new buildings, as the case might be, could then be sold, and the net proceeds embarked in a fresh undertaking. It is doing only half the work to erect model lodging-houses here and there if the great bulk of the poor are still left festering in public stews. Let us sweep away these stews altogether.

Half a million of money would not indeed buy up all the courts of London; but it would do a very great deal by being invested and reinvested in the way just mentioned; more than might be thought. We submit that it will be difficult in the extreme to do the greatest good to the greatest number of people in any other manner. This would be a permanent and not a temporary benefit; it would affect the very poor most, and would indirectly benefit the whole capital. Building model villages, on the contrary, however desirable, would leave the poorest still untouched in their dens; and it must be remembered that the bulk of London working-men, however willing to live out of town, find it inconvenient or impossible in practice so to do.

H. & R. P.

EXPERIMENTS IN PAVING.

THE St. George's, Hanover-square, Works Committee have considered the question of the paving works necessary during the ensuing year. A report was read from a Committee of view recommending that in answer to a memorial from the inhabitants of Old and New Bond streets asking for asphalt to the carriage-way on the east side of Old Bond-street, a pavement of asphalt be laid down from Piccadilly to Burlington-gardens, and the inhabitants called upon to set their coal-plates in an iron rim. The Committee of view also recommended that Piccadilly between Bolton and Stratton streets be paved with Victoria stone. The surveyor, in answer to some questions, said the Victoria stone appeared to be a mixture of broken granite and Portland cement. After it was prepared it was placed in a bath of silicate, where it remained for a fortnight, becoming impregnated with silica and extremely hard. He had seen the Victoria stone laid down in front of St. Mildred's, Poultry, the only piece laid down in London, and considered it extremely durable, harder than York paving. The Committee decided to recommend the Vestry to adopt the report.

SEWAGE AND WATER SUPPLY.

HAVING suffered severely when young with fever, and since lost several friends, some of them men in the prime of life, who have left widows and large families to mourn their loss, and knowing others that are now sick with typhoid fever, I venture to pen these few lines.

During forty-five years, constantly having something to do in well-sinking, drainage, sewerage, waterworks, &c., my experience has shown me that as gunpowder is dangerous when put in contact with fire, so is nightsoil when in contact with water, where old wells, drains, cesspools, and inferior traps, and badly-fitted water-closets, are allowed to remain in use.

I enclose you section, showing the drainage and water supply of a house on a small piece of land I purchased in Chippenham, Wilts, twenty years ago, and on investigation at the time I found a large number of other cottages in the same condition.

—Knowing the danger, and having a large body of workmen, also my own family, located there, I endeavoured, with other persons, to obtain a public water supply generally for the town; but, not succeeding, I sank a private well for the use of ourselves and workmen, procuring most excellent water from the deeper springs, and from this well most of the inhabitants of the town are now supplied.

* The section shows a well for the water supply, lined with rough pieces of stone, between the cesspits of two privies, the contents of which percolate to the water.

As to rivers, I well remember seeing fine salmon taken from the Thames between Isleworth Ferry and Richmond Bridge, and often watched the gradual pollution of its waters since with regret. The time will come, if not at hand, when it will be necessary for the Legislature to take further steps in the matter, both as regards the water supply and the disposal of the sewage from the dwellings.

Providence provides a sufficiency of good water in England for every creature thereof to drink; and it will be expedient in some districts where the strata are favourable to sink new wells to the deeper springs, stopping out all surface matter and water. In other localities it will be necessary to revise some of those old water-courses and mill-dam rights, and also to substitute the steam-engine for the old water-wheel, so that the locked-up springs and pure water streams may be made more freely to flow for the use of the people?

With reference to the disposal of sewage, I think it would not only be a waste and loss to the country, but a sin to send it from our inland cities and towns to sea, for which it was not intended. As the grave is the great deodoriser of the dead, so is the earth to the excrement of the living.

The farm, England, is wisely arranged, with its parcels of fertile land, and also its portions of inferior soils, chalk downs, and sandy commons, left for the use of and improvement by man. And it contains also an abundance of the richest and most durable manure, if carefully husbanded, which ought to be conveyed to those soils placed by nature to receive it. And seeing what fine fruit, ears of corn, vegetables, and roots, were produced in the valley of the Thames, and by my father and others after the enclosure of Hounslow Heath, by the use of night-soil, urine, and contents of cesspools, I am convinced that in a reasonable time some of those unprofitable lands may be turned into fruitful gardens and paying fields in producing for the increasing population.

And if the Government and heads of families will still persevere in procuring for them good drainage, fresh air, wholesome food, and pure water, I think there need not be much alarm as to degeneration.

ROWLAND BROTHERHOOD.

THE NEW COURTS OF JUSTICE.

We have received a long letter from Mr. Edmund Sharpe, expressing his approval of special parts of Mr. Street's designs; but as it had already appeared in the *Times*, we cannot devote to it the space it would occupy.

Sir,—I have hitherto carefully abstained from all criticism on Mr. Street's designs, and have no intention of deviating from this course.

I regret, therefore, extremely, that the references to me in his recent pamphlet (many of which appear to me uncalculated for, and very misleading) oblige me to take steps to make public the real state of the case as regards my position in the late competition.

I hope my answer will be in the hands of the printer this week, and in the meantime must ask your readers to hesitate before accepting the statements referred to.

EDWARD M. BARRY.

DESTRUCTION OF CRUMPSALL CHURCH BY LIGHTNING.

DURING a recent thunderstorm of great violence, St. Mary's Church, Higher Crumpsall, Manchester, was struck and set fire to. There was a want both of water and of fire-engines; and the interior was completely gutted. The edifice was built in 1859, from the designs of Messrs. Mangnall & Littlewood, of Manchester, architects. It was 87 ft. long and 57 ft. wide (inside measurement), and contained sittings for 770 persons. It was in the Decorated Gothic style. The tower and spire were added about six years ago, at a cost of 1,500l., making the total cost of the building upwards of 6,500l. In the base of the tower was placed an organ, which, with the font and everything else in the building that could be burned, has been totally consumed. At the east end of the edifice there was a stained-glass window, which cost over 300l., and another at the south side. Both of these have been completely demolished. One of Milner's safes, although it was exposed to the fury of the flames for some time, has preserved

its documentary contents complete. The stone pillars of the church present the appearance of having been chopped with a ponderous axe.

The fire was first observed in the vestry, which is situated at the north-east corner of the building, and by some persons it is believed that the lightning struck this part of the church first. Others are of opinion that the spire was first struck, and that thence the lightning flashed down the conductor into the interior of the church, along a gas-pipe under the flooring, to the vestry, and afterwards to the roctory by an underground gas-pipe. Here it stopped by causing a slight breakage in the ceiling of the cellar, and without any other damage further than that of melting a small leaden pipe which supplies one of the upper rooms with gas.

The total amount of damage done is estimated at fully 3,000l., which, it is stated, will be nearly covered by the insurance.

LIBERALITY IN WILTSHIRE.

Sir,—In the agricultural village of All Cannings, in Wiltshire, a reading-room has been established by the more influential inhabitants for the benefit of working men, and which it is proposed to make self-supporting, if possible, by means of members' contributions. In the same village some new buildings are in progress, and the workmen employed thereon are necessarily strangers in the neighbourhood; but they have been in the same employ nearly three years, and bear characters above the average, yet are denied the privilege of membership, and consequently the use of the room.

You as well as the *Times* have urged the necessity of providing places of evening resort for working men who had done their daily labour; and I write this to show, first, the opinion entertained of building operatives in out-of-the-way country districts; and, secondly, the fact that with all the talk about the difficulty of wearing men from the public-house or beer-shop, and getting them to spend their leisure time in a better way, they have in many instances only "Hobson's choice."

T. P.

ST. PETER'S SCHOOLS, LONDON DOCKS.

The schools lately erected in this poor and thickly-populated parish were recently opened by the Lord Bishop of London. The school buildings are three stories high, and afford accommodation for 600 children, namely, 200 on each floor. The ground story is for the infants, the first floor for the girls, and the top floor for the boys. The schoolrooms are 7½ ft. long, 18 ft. wide, and 14 ft. high, and a class-room is attached to each, 19 ft. 6 in. by 18 ft. There are two entrances, one for the boys, and the other for the girls and infants. Two separate staircases have also been provided. Water is laid on throughout the buildings, and a lift for the supply of coals to the girls' and boys' schools has also been included in the general arrangements. Yards have been provided for both boys and girls, and are complete with the necessary offices. The buildings have been designed in an economical a style as possible. The exterior walls are faced with best stock bricks, relieved by bands of red and black bricks. All the windows have arches over them in red and malm bricks, with the exception of those to the boys' school, which have chamfered stone beads. A projecting parapet runs along the entire length of the building, and from the centre of the façade rises a gabled bell-cot, surmounted by a wrought-iron cross supplied by Messrs. Richardson, Slade, & Co. In a niche under the bell is a very beautiful carved stone figure of the Good Shepherd, from the studio of Mr. Farmer. The interior of the building has also been kept as plain as possible, the walls are all plastered, but the otherwise monotonous appearance is relieved by all the doors and windows having red and white brick arches over them, and all the windows have chamfered red brick sills. The wood girders carrying the floors are exposed to view, and are stained and varnished. The removable partitions between the school and class-rooms are treated in the same manner.

The corner-stone bears the following inscription—"To the Glory of God, and the advancement of His Holy Catholic Church, in the religious education of His children, this stone was laid on the Festival of St. Peter, A.D. 1871, by the Earl of Powis, LL.D., High Steward of the University of Cambridge. C. F. Lowder,

M.A., vicar. W. H. Martin, F. W. Paice, churchwardens of St. Peter's."

The contractor for the works was Mr. Ennor, and Mr. Whall acted as the foreman. The forms, desks, and class-room galleries have been supplied by Mr. Geo. Hammer, of St. Martin's-lane. The fittings for yard offices are from Messrs. Macfarlane's establishment. The gasfittings are being made by Messrs. Hart & Son; and a Gurney stove for each of the large schoolrooms has been supplied by Mr. Edwards, of Great Marlborough-street. Mr. J. R. Veal, of Wolverhampton, supplied the bills of quantities. The contract drawings were prepared by the vicar's brother, the Rev. W. H. Lowder, a former pupil of Mr. Butterfield, and now vicar of Alvanley, Cheshire. The buildings have been erected under the personal superintendence of Mr. Bowes A. Paice, of London, architect, who also supplied most of the working drawings.

MEETING OF BUILDERS IN LONDON.

We understand that a large meeting of employers of labour was held at the Palace Hotel, Westminster, on Thursday, the 11th inst. It comprised deputations from every seat of industry throughout England and Scotland. The demands of the operatives having gone on from ten hours to nine, and from that to eight and a half, with an intimation from Mr. Scott Russell that that was only a step to forty-eight hours per week, in competition with sixty-five on the Continent, masters find it indispensable, it was said, to form a defensive coalition, and the meeting turned itself on the spot into an association of employers to arrange or resist the demands of trade-unions and other combinations of workmen. A statement was given in by each firm of the number of hands in their employment, and the aggregate proved to exceed 100,000 men.

CEMENTING WATER-TANKS.

Sir,—In answer to "Stagnum," in your issue of the 13th, twenty years' experience has taught me the following:—Two of sharp washed sand and one of cement will stick to brickwork best. To make it impervious, float it, and finish it in one coat, by watching it as it setting; then take some dry cement in your hand, and dust it over, to draw out the water; work it again with the float, and then give it a thorough rubbing and pressing with the flat part of the plastering-trowel. By this plan I have completed a well 60 ft. deep, with the water streaming down the brickwork, and kept it all hack by beginning at the top and working down.

A. W.

Some of the remarks on this subject in your last number (p. 33) are good and correct. The addition of a proper proportion of good gritty sand makes the cement better, say, in the ratio of 1 to 2. The Hafody-Weiglodd Company, Wrexham, have a good article for the purpose, being a pure silica in its component parts. FLUANS.

WEST LONDON SCHOOL OF ART.

On Wednesday evening last Mr. Beresford Hope, M.P., presided over the annual meeting for the distribution of prizes to the successful candidates among the pupils of this institution, at 20½, Great Portland-street. The gallery was decorated with a good collection of the productions of the scholars, including oil-painting and water-colour, chalk, and pencil drawings, besides many architectural designs. On the platform were Mr. Geo. A. Stewart, the head master of the school; Mr. Peter Graham, the treasurer; Mr. S. M. Hubert, the hon. secretary; and Mr. J. H. Donaldson. At the request of the chairman, the head master read the annual report, which was of an unusually satisfactory character, and showed a steady increase in the number of the students as compared with that of former years. Mr. Beresford Hope, who has somewhat "dropped" architecture lately, made an interesting address, and insisted upon the necessity of the mind being trained to a wise perception of harmony and beauty. Without this perception, he said, a state of things bordering on the ridiculous would be produced. Art designing had the salutary effect of imparting ideas of proportion, of size, and, he might add, of common sense. If, unlike those who lived in the country, Londoners could not enjoy the sight of the majestic waves, or the variegated landscape, they might

find compensation in endeavouring, by the aid of schools like this, to elevate and refine their minds. He wished to impress upon his hearers that the prizes were but a means to an end. Having regard to the number, he was able to say that out of 116 schools of art in England this was one of the best. In conclusion, Mr. Hope complimented Mr. Stewart on the ability he had displayed in conducting the school. The successful candidates were then called forward, and received the prizes. Mr. Crayson, Mr. Webber, and Miss Keeton, gained the most. The Treasurer, in proposing a vote of thanks to the Chairman, could not help noticing that manufacturers, who had so great an interest in the success of schools of art, did not pay them so much attention as might be wished.

COVERED CAB-STANDS.

At the ordinary meeting of the Westminster District Board of Works, a letter was read from Colonel Henderson, the Chief Commissioner of Police, inclosing a sketch of a covering, which, with the concurrence of the Board and the Secretary of State for the Home Department, he proposes to erect over the cab-stand at Knightsbridge, near Sloane-street. Colonel Henderson, in his letter, set out that the Board would not be called upon to defray the expenses of lighting; that there would be a place at the east end of the stand for the sale of coffee and newspapers, and a refuge for persons waiting for the omnibus; while at the other end there would be a refuge for the cabmen. The cost of the stand, roofed in with glass in a horticultural fashion, Colonel Henderson estimates at about 700l.; and it was proposed, should the experiment prove successful to erect covered stands in other parts of the metropolis. Mr. Ridley hoped the Board would not surrender any of the public highway. The surveyor, in answer to a question, said he approved of the idea of the covered cab-stand. The Board decided to give the required permission so far as their legality can or may; with the proviso that the police authorities take all the responsibility, and remove the cab-stand covering at any time the Board call upon them to do so. Some years have passed since we first urged that protection should be given to cabs and their drivers.

CUTTING OAK TIMBER.

SIR,—In reply to the letter in the *Builder* of the 13th inst., I can give you some advice on the subject of "oak panelling."

I should select oak-trees known to be old and hearty, with clean, straight butts, from 15 in. to 20 in. in diameter; I should then have the bark taken off as they stand, and leave them thus till the winter,—the sap will then partially dry out, and make the wood a rich brown colour. As soon as they are cut down, have them sawn up at once into the lengths you require, the panelling, 6 in. or 8 in. wide and 1 in. to 1 1/2 in. thick. Be careful to cut out all the heart shakes, by having one cut through the centre of the log before edging the boards to the required width.

With regard to the drying process, stack the boards in a shed with a good draught through it, and load them down, with ships between each board, to prevent warping. If this be done they will be found to dry well and speedily, and they will not require to be exposed to the weather.

GEORGE MARSHALL, *Timber Merchant.*

SIR,—In reply to your correspondent, it is rather difficult to explain without diagrams; but I will try to do so. Cut the largest trees, bark then standing, in the spring, and fell them in the following winter, "if you wish to save the bark," but remember you lose nine months' seasoning of the wood (and there is, perhaps, too much made of this falling in the winter theory; it is seldom put in practice); cut off the longest length you require from the butt of the tree, and sell the top of the tree for a rougher purpose.

If the tree is large enough for the purpose, cut it into four, in sections, by drawing a vertical and horizontal line across the end, meeting in the centre. If too small for this, cut it into 4-in. or 6-in. plank, as soon as possible after felling, and then stack on end out in the open: do not lay on the ground, but stand it as nearly vertical on its end as possible, and keep it wet during the first three months. If the weather is dry, wet it with water poured on the top,

and allowed to run down. Let the ends stand on a piece of quartering, to keep it out of the dirt, or it will be stained some distance up. After standing thus for some six months, after putting it in a dry place for some time, cut it into the scantlings you require, always bearing in mind that oak will, after this seasoning, shrink in, at least half an inch to a foot, in width and thickness. They should then be stacked, and stripped, and covered with spare boards, and weighted on the top, for at least six months,—as much more as possible,—in a covered shed, with plenty of air, occasionally turned over and shifted, till they are dry enough to make dust when planed, and not turn the shaving black. They will then be fit for use.

I should advise for the panels to be cut as feather-edged boards, in radial lines from the centre of the tree; it will be a waste of material, but will repay in the beauty of the wood, and the way it will stand without warping. Most of the panels of the stalls of our old cathedrals were rent (*not sawn*) in this way, and stand admirably.

ROBERT PHILLIPS.

THE NEW HOUSE THAT JACK BUILT.

A Sanitary Version for Grown Children.

TWELVE CUTS.*

PAPER'd and plaster'd and painted down,
Nicely placed in the skirts of the town;

This is the House that Jack built.

This is the roof and the soaking rain
Dripping right through in seas of the drain,
In the New House that Jack built.

This is the nursery tow'd about,
Where smoke is kept in, and air kept out,
In the New House that Jack built.

This is the bed-room floor,—do you see?
And right at the end is the w-c.,
In the New House that Jack built.

This is the gas-pipe, sectional view,
'Neath the floor, with a nail driven through,
In the New House that Jack built.

This is the view of the kitchen floor,
The maid, and her bed behind the door,
In the New House that Jack built.

These are the dogs and the laddie cats
That would not harm the mice or the rats,
In the New House that Jack built.

This is the downward draught of the smoke,
Through the patent flue, designed to choke,
In the New House that Jack built.

This is the pump next the cesspit-wall,
Showing the well-hole, source and outfall,
In the New House that Jack built.

This is a view of the stagnant drain,
Where gases rise and fall with the rain,
In the New House that Jack built.

This is the master, ill in his bed,
And that is the doctor at his head,
In the New House that Jack built.

This is the coffin and stately hearse
Of the luckless subject of my verse,
That died in the House that Jack built.

LIGHTNING AND CONDUCTORS.

SIR,—I have seen it stated in the papers that Crumwell Church, near Manchester, which was destroyed by lightning on the 3rd inst., was furnished with a conductor. Will you kindly allow me to inquire, through the medium of your paper, what is supposed to have been the reason that the conductor failed to protect the building?

THOS. KNOWLES.

DAMP WALLS.

SIR,—I shall be obliged if any of your readers can tell me what many situated as I am would like to know, namely, how to keep out damp in an exposed position.

I have built a house on the borders of Dartmoor, using slate rubble for inside, and a light fireproof brick, made in the locality, for outside walls. These materials, with the aid of Aberthaw, having been put together in a very dry season, made the house a sieve, and for the first winter the house was wet through.

I next consulted some architect friends at a distance, who recommended me to give the outer walls a coating of a certain mixture of alum and soap. This was done, strictly according to orders, and the result was a second winter with the house wet through.

The following spring I had White's Portland cement put over the south and west sides of the house, to the ruin of its appearance, and, as far as I could judge, it kept the wet out, but the inner walls have nevertheless shown damp ever since (now two years), and I have had to listen.

A further portion of the house has been since coated with White's Portland cement, and has let in the wet as readily as ever.

I want to add to the house, but know of nothing suitable to build with. Battening does not keep out wet; it only hides it from sight by half an inch of plaster.

* The author would be very much pleased to see these lines practically illustrated in the interest of the public health. The readers of the *Builder* scarcely need it. No copyright reserved.

Can any of your professional or practical readers advise what, if any, solid building will effectually keep out wet? And if no solid building can be suggested, what is the best method of constructing double walls and bonding them together?

I have a dislike to paint and its periodical expense. Is there any material, of superior kind, of superior nature, of the consistence and waterproofness of tar, and that is made of a colour which is suitable?

I will only add that portions of the wall, painted externally four coats, let in the wet as badly as ever after the first year.

DEVONIA.

DUSTMEN'S WAGES.

In the St. George's, Hanover-square, Committee of Works, upon a complaint that dustmen had twice asked money for removing dust, Mr. Farris said he had made inquiries, and found there were three men employed, who were expected to remove seven loads a day, the price being 6d. per load. This was 1s. 2d. per man per day, which, he submitted, was a price much too low. Mr. Mitchell objected to an imposition being practised on the ratepayers. If people liked to give the dustmen money voluntarily, well and good; but a demand of money was another thing. The Chairman suggested that the contractor should be written to for an explanation. Mr. Cove considered the best course was, for the vestry to be its own dust contractor, and see that the dustmen had a fair day's work for a fair day's work. Dr. Schuchof suggested that the contractor be fined; upon which it was remarked that the price for removing the dust would be raised. The committee adopted the suggestion of the Chairman (Col. Ogilvy).

"POUR LES DAMES."

SIR,—Whether it be from a feeling of false delicacy, I know not, but the subject I will touch upon, with your permission, seems almost ignored. When our country-women are in France, their habits become somewhat Frenchified; and they are anxious to attain to the retiring accommodation there provided. What most foreigners think of our modest style, where health may be more maintained for some additional "penny sake," many are our large parks and promenades so destitute of accommodation, and why is the little that exists so carefully hidden from knowledge, as well as sight? Why should private individuals be left to provide for so great a public want? Such provision must always be inadequate, more particularly so when payment is demanded for that which is expected to supply and care for gratuitously. Retiring-places, *pour les dames*, should be erected in convenient corners, and one section should be free, whether in park, or street, or railway-station. I am sorry that it has been considered necessary to close the free places as some of our principal London stations, for surely a better course than that could be adopted. Many persons there are to whom ponies mean bread, and to insist on payment by them is hard, to say the least. The sterner sex has less to complain of, but a comprehensive system might be instituted that would provide for all requirements, without being unduly obtrusive.

LANTERN.

ASPHALTE PAVING.

THE Liverpool borough engineer (Mr. Deacon) has presented a report on this subject to the local health committee, containing information he had obtained on the subject of asphalt carriage-ways generally, together with the conclusions arrived at in relation to the probable advantages of their introduction into Liverpool, and suggestions as to the streets best adapted for a fair trial of two or more of the various asphaltes or asphaltic compositions now in use. Having referred to the experience of the use of asphalt in London and Paris, the engineer stated his opinion of its advantages and disadvantages in the following form:

"The advantages to be derived from the use of asphaltic pavements, as compared with granite or other sets, are—First, comparative freedom from noise under heavy traffic; second, absence from dust in dry weather, and of mud in wet weather; third, cleanliness of the footways, the dirt on which is chiefly brought from the carriage ways; fourth, increased comfort to carriage passengers; fifth, very great reduction in the wear and tear of horses and vehicles; sixth, reduction in the necessary width of openings to sewers and pipes; seventh, the facility with which repairs can be made, and their greater efficiency when made; eighth, the fact of the bed of concrete maintaining an even surface, and reducing the difficulty which results from settlement after reducing openings for repairs of pipes, &c.; ninth, the small, bulk and increased value of the street refuse as manure (which should be collected as soon as it falls); the absence of necessity for watering except for cleansing purposes. The disadvantages inseparable from the use of asphaltic pavements in Liverpool, as compared with the ordinary pavements, appears to be as follows—First, the greater first cost; second, general inapplicability to gradients exceeding 1 in 60; third, the sudden change in the traction of vehicles in crossing the joints between this and any other pavement; fourth, increased difficulty of finding loads in water or gas pipes."

Taking into consideration all the characteristics of asphaltic carriage-ways, the engineer said the conclusion could not be avoided that there were disadvantages inseparable from their use which would be felt to a greater extent in Liverpool than had been the case in London and some continental cities. Many of the streets in which their benefits would be most obvious had too great a gradient to admit of their use. There could be no doubt, too, that the cost of granite or other pavement was much less in Liverpool than in those places where asphalt had been largely used, so that the relative cost of the latter would be higher. Notwithstanding such drawbacks, the advantages of this pavement

would not fail to be felt; and if, as seemed probable, several companies would undertake to lay down a portion of some street on trial at an expense to the Corporation little, if any, greater than the present cost of sets, there could be no reason why they should not do so. For the purpose of comparative experiment, such as would enable the engineer hereafter to report on the subject with greater precision, that portion of Dale-street between Hatton-garden and North John-street (comprising about 4,300 square yards) would be the best. In London the Val de Travers asphalt was estimated to cost from 1s. 6d. to 2s. 3d. per yard per annum for seventeen years, and at the end of which time it was to be left as good as new. The Montrolier Asphalt Company offered to lay down their asphalt pavement over such portion of Dale-street as might be allotted to them, and keep the same in good repair for a period of twenty years, receiving from the Liverpool Corporation the same remuneration for the work as would be paid for laying and keeping in repair that portion of the street if paved with granite sets. The Barmes's Asphalt Paving Company tendered "for about 3,500 yards of asphalt paving for the carriage-road of any street in Liverpool possessing a gradient of not more than 1 in 40, the granite sets being removed, and excavations (if necessary) made to the depth of 8 in. at the expense of the Corporation." They added:—"We will, if with or without tramways, lay and furnish a concrete bed of about 6 in., and thereon lay asphalt of at least 2 in. thickness, thus furnishing the concrete, asphalt, and laying for the net price of 12s. 6d. the square yard; and we further undertake to maintain it in good order for the period of fifteen years, at the rate of 6d. per annum the square yard, reckoning over the whole surface."

The Health Committee have since come to the conclusion that it is not expedient to use asphalt for any of the roadways in Liverpool.

OLD WORK.

In the course of a lecture "On the Decline of Gothic Architecture after the Fourteenth Century," recently delivered at a meeting of the Chester Architectural Society, Mr. A. Rimmer said:—

Much stress was laid upon the necessity of entering into Greek feelings and trains of thought before Greek architecture could be understood, and the repose of the flat surfaces of Pentalican marble among the igneous rocks of Attica. The Greek felt security in the Parthenon, which was the state treasure-house, as well as the Temple of Athena, and, raised up on a bluff that, as there was no artillery, nothing could injure. But to appreciate the ancient classic mind more fully we should go to some of the remote provinces of Rome, for of the parent city so little was left that we knew almost nothing; the only safe thing to say being that there is nothing in the present day that can give us any idea of it. The lecturer said, "Take Idumca (Edom), a rocky fastness in the remotest parts of Arabia Petraea, and altogether unpromising for the hand of the architect," it was approached by a long winding road of four or five miles, that has no parallel in the world; sometimes it narrowed to a space of only a few feet, and sometimes spread out into deep caverns on each side, for the road went between enormous rocks, 400 ft. and more high, being three times the height, for example, of Chester Cathedral tower. Often the daylight was obscured by projecting cliffs, and the traveller seemed to go through a long tunnel with only a gleam of light far ahead. The mystery of this was proverbial before the Romans ever saw it. "Who will lead men into the strong city?" who will bring me into Edom? The marvellous Roman remains were dwelt on, and especially a vast temple that opened out to the astonished eyes of Captains Mangles and Irby (two of the few Europeans who ever were allowed to penetrate so far). They said, after describing the wonderful approach to Edom, covered with the remains of ancient Roman pavement, and having an infinite variety of grand sculptures, wherever there is light enough to see them;—"Where the precipices are at the highest, a gleam of stronger light breaks in at the close of a dark perspective, and opens to view, half seen at first through the tall narrow opening, columns, statues, and cornices of a light and finished taste, as if fresh from the chisel, without the tints or weather stains of age, and executed in a stone

of pale rose colour. Warmed at the moment we came in sight with the full light of the morning sun, the dark green of the shrubs growing in this perpetual shade, and the sombre passage from whence we were about to issue, formed a fine contrast with the glowing colours of the edifice. We know not with what to compare this scene: perhaps there is nothing in the world that resembles it. Only a portion of a vast front is seen at first, but it is so contrived that a statue with expanded wings, perhaps of Victory, just fills the centre of the aperture, which, being closed below by the sides of the rock folding over each other, gives the figure the appearance of being suspended in the air." The rest of a grand design opened at every step. This was to illustrate the eye for the picturesque that guided the architects of old; and, speaking of Gothic, he said that the old designers of England fitted their buildings to the sites they stood in so precisely, that after the solid spires of Liebfeld, that of Salisbury at first struck him as being lanky and too thin, and it was only when seen from various approaches on Salisbury Plain, covering over 200 miles, that he fully understood the picturesqueness of the sharp, incisive idea of height it was meant to convey. In order to design a building now, it would be necessary to make many drawings of the surroundings from the turnpike roads, and all the neighbourhood, to see where a stack of chimneys should show, where a front or a bay window, and where it should be partly hidden by a clump of elms or a hillock. This was not necessary formerly, for the old builders designed as they went on, and had all the accessories in their eye. A singular picture of the licence allowed to them may be found in the agreement for building the Trontbeck Chapel at St. Mary's, Chester, between William Trontbeck, esq., and Thomas Bates, mason. He describes the length and breadth, and says there must be "V, fairo and clenely wrought windows full of light," the best to be devised, &c. But the most touching part of the contract, and one that no mason could read at the present day without emotion, is where he speaks of the height of the chapel, which is to be carried up "as high as it needs reasonably to be." This shows how little the workmen of those days cared about "jerrying" their work. Unhappily, none of this chapel is left, and a series of splendid monuments perished with it; among these was one to Sir William and Lady Trontbeck of great beauty: the lady's head rested on a head-dress that might excite no remark in the present day, but must have been impressive in the sixteenth century. It consisted of a wreath of Trout and a Moor's head. The real cause of the decadence of English art is explained in an eloquent passage of Mr. Gladstone's, where he says that the lust for cheapness and the contempt for ornament took away the occupation of the true artists of England, and they ceased; this culminated in the time of Cromwell, where every article of beauty was thought to be idolatrous and carnal; but hadness does not satisfy, and Mr. Gladstone says, "the law of nature arrives at its revenge," "we have starved out the race that knew the laws and modes of the production of artistic beauty," and end by producing "malformations at a greater cost than would have sufficed for the nourishment among us of chaste and virgin art."

EARLS BARTON CHURCH.

THE works of restoration at this most interesting old church are now in hand, under Messrs. Slater & Carpenter. The tower is so well known as a so-called Saxon relic, that it is needless to say much about it; excepting that beyond repairing the floors, nothing will be done to it, nor will the original Saxon plaster outside be disturbed.

The nave and aisles are wide and lofty, and of good Decorated and Perpendicular detail. These portions will have new roofs in character, and the defective stonework restored, and will be entirely reset.

The chancel is a very interesting portion; it is of Norman date, and was originally terminated with an apse; but in the thirteenth century it was extended and finished with a square east end, having a noble triplet window. All along the Norman walls is a blank arcade, and the Norman sedilia and piscina are refixed in the later wall; above this arcade are the inner jambs of Norman windows, with rich chevrons worked on them; but the arches and the rest of the windows have disappeared, to make way for

larger Second and Third Pointed windows. The First Pointed low side windows remain, with the hooks for the wooden shutters which formerly filled them.

The general effect of the chancel is a mixture of all styles, and in the restorations it was felt that all must be left to tell their own stories of the changes which passed over the chancel; but with the roof it was different, for this was nearly flat and very modern. A new roof of oak has therefore been put on, of a high pitch, and covered with lead, and with new stone parapets and corbel table to harmonise with the thirteenth-century work. This roof has moulded beams and king-posts, and is boarded to eaves with rib mouldings at and between the arched ribs of the trusses. On the north side a new vestry has been built with red and white stone courses, as the ancient work in the aisles. This has a low pitched roof, so as to finish under the corbel table of the chancel.

The cleaning of the internal stonework is not yet done, nor any fitting or floors. The magnificent painted oak roof screen has been carefully preserved in its old position. Some remnants of the old wall paintings have been discovered, and will be preserved. The builder employed is Mr. Allen, of Irthingborough, and the clerk of the works is Mr. Lucas. Stained glass is in hand by Messrs. Bell & Almond for the three eastern lancets.

SCHOOLS OF ART AND SCIENCE.

Keighley Schools of Science and Art.—The annual meeting in connexion with these schools has been held, and the prizes distributed to the successful students. There was a fair attendance, but not so numerous as the important object of the meeting justified those interested in the school to expect. The chair was occupied by Mr. John Briggs, J.P. The report, in speaking of the new building, said,—

"As is well known, the superior and extensive accommodation of this building was provided with the definite purpose of supplying, as far as possible, many educational wants which had long been felt by the people of Keighley; and in order to show the importance of the undertaking, the extent of its development, and the influence which it must exert upon this community, it is desirable that we should revert to the educational position of the Institute a little over a year ago, and in a few words describe the means that were adopted to awaken public interest in the new system."

In reference to the Science School the report said,—

"It is very pleasing to announce that, although the school has but been in operation for eleven months, there are ninety-two boys attending it. It is largely taken advantage of by the leading manufacturers and employers of labour in the district; and yet, of the whole number, fifty-one are the sons of artisans. In order to keep up the scholastic requirements of so many, there are the following masters, and another is at present being advertised:—Head-master, Mr. J. Spencer, M.R.C.P.; teacher of chemistry, Mr. G. Ward, F.C.S.; art-master, Mr. A. Stevenson; French and German master, Mr. T. A. Cawley; assistant master, Mr. G. H. Rollason; teacher of music, Mr. J. Midgley; drilling and physical exercise, Staff-Sergeant Atty."

Of the School of Art, Mr. Stevenson (head master) reports:—

"During the year ending Midsummer, 1871, there had entered the classes 145 students; 129 of these being in the evening classes and sixteen in the morning class. The works (numbering 460) produced by 100 students, were sent to the Department of Science and Art for examination on the 9th April last. The result of that examination was satisfactory, the names of twenty-eight students being returned as having executed their work in a meritorious manner, ten of them being awarded prizes by the Government Examiner for the superior excellence of their productions. It is certain that at no former time have drawings of so high an order of merit been produced in Keighley. The excellent accommodation afforded in the new rooms, the extensive stock of examples and casts, and the valuable loans of works from the South Kensington Museum, have contributed to this result. Two free students have been appointed by the department and two by the council of the school."

In reviewing the rapid strides made in education since the new building was completed, the members of the council state that they are encouraged to continue the work which they have undertaken by the generous assistance which they have received from all classes in the town and by the hearty co-operation and assistance in carrying out their plans, of all the teachers and secretary of the Institute. Especially are thanks due to Mr. Spencer, who has entered into and undertaken the work of organising and conducting the teaching of the trade school and evening classes with great enthusiasm and ability.

Mr. Mundella, M.P., addressed the meeting. He said he had heard before coming to Keighley from several impartial sources that the institution which he was going to see was almost without a parallel in England. Taking, as he did, a deep interest in mechanics' institutes, and desiring to see them the universities of the

working classes, he could not express to them the pleasure and satisfaction with which he had gone through that handsome building. He found that a town where there were little more than 20,000 inhabitants had built an institution like that, costing about 14,000*l.*, and that there were between 1,800 and 1,400 persons receiving some advantages from the institution—a great proportion very important advantages in the way of instruction. After all his experience of mechanics' institutes, that was the most spirited and most creditable undertaking he had ever witnessed. He could not help feeling, as he went from classroom to classroom and examined the models and the classes and the laboratories and all the auxiliaries of a scientific training, that although Kichley was a small town, it had got some people in it who had got long heads and large hearts. The annual exhibition of the work of the students of the art school has just taken place. The subjects shown are 113 in number, and are composed of the choice of 466 examples which were sent up to the Kensington department for examination.

The Derby School of Art.—The prizes and certificates obtained by the students of this school at the last Government examination have been distributed in the Lecture-hall, Derby. The chair was occupied by the president, Lord Belper. The Rev. A. L. Simpson read an address on "The Importance to Society of the Study and Culture of Art." The paper dwelt at length on the influence of art upon the mind and aspirations of men, and further expressed the belief of its writer that the realization of the sublime of art by man was the means of elevating his tone and character, and of leading him to look forward to the perfections of heavenly eternity, of which the fanciful dreams and longing aspirations excited in his mind by the study of art were but the dim foreshadowings. Mr. Jno. Rickards (hon. sec.) then read the report, which stated that—

"The Derby Central School of Art was opened on the 3rd of May, 1870; and the total number of students placed on the register for the year was 215. Of these, 24 joined the morning classes, and 19 the evening classes. Referring to a table recently issued by the department, it will be found that out of 113 Art Schools in the United Kingdom, at the last examination, only 49 obtained a place in the National Competition, and of these only 23 obtained more important prizes than Derby, so that in its first year the school has taken a distinguished position in the higher competition of the whole Kingdom."

Mr. Simmonds, the head master, gave a brief outline of the course of instruction given in the School of Art. He condemned in strong terms the system of cheating adopted by many teachers of drawing throughout the country, who, in order to get a removal of their lessons for the next quarter, systematically "coloured up," and in some cases even filled up the outlines of their pupils' drawings. The system, he concluded, which prevailed in his school was that recommended by Mr. Redgrave and other eminent members of the Royal Academy, and of these authorities he was but a humble, though he trusted successful, mouth-piece.

Books Received.

Strange Duellings, being a Description of the Habitations of Animals. By the Rev. J. G. Wood, M.A. London: Longmans, Green, & Co. 1871.

This abridgment, by the Rev. J. G. Wood, from his "Homes without Hands," makes a very pleasant little volume, calculated to interest, whether the reader has entomological tastes or not. We make an extract from Mr. Wood's account of wood-boring insects, which will serve to show the character of the book, while it conveys information:—

"The well-known worm-eaten appearance of furniture is caused by certain beetles belonging to another family. As may be seen from the dimensions of the tunnels, the insects are very small, and their bodies are nearly cylindrical. The ravages which these beetles cause are fatal to all who happen to possess old furniture; but Mr. Westwood mentions that one common species, *Pissinus pectinicornis*, completely destroyed a new bedstead in the short space of three years. There is but one known method of killing the insects which have already taken possession, and of preventing others from following their example; namely, by injecting a solution of corrosive sublimate into the holes, and then treating the whole of the surface with the same poisonous liquid. I need, perhaps, scarcely mention, that insects which are popularly called death-watches belong to this family. Not only do furniture and timber suffer from the attacks of the *pellinus*, but articles of dress and food are also injured by them. Specimens of natural history are often spoiled by the holes which are drilled through them by the beetles; and stationers sometimes suffer from the voracious insects, which

bore holes through their wafers, fix them together, and there undergo their transformations within them. One species is obnoxious to wholesale druggists, on account of the damage which it does to the ginger. In some cases, half the ginger is drilled with holes, and rendered quite unsaleable. It is not, however, lost entirely, because it is reserved for the mill, and is then sold as ground ginger, the insects and their grub being rendered quite powerless, together with the ginger which they have not consumed. Such specimens are of course not exhibited to the general gaze, as the public would be very cautious of purchasing ground ginger if they knew what it contained."

Rudimentary Magnetism. By Sir W. SNOW HARRIS, F.R.S., &c. Second Edition, revised and enlarged by HENRY M. NOAD, Ph.D., F.R.S. London: Lockwood & Co.

This second edition of a standard work has been posted up to the present state of the science of which it treats, by the Vice-President of the Chemical Society, who has so particularized what he has added that it can always be distinguished from the author's remarks. The volume is illustrated by 165 engravings, and forms a complete treatise on rudimentary magnetism. The editor's new matter relates chiefly to Faraday's latest researches, and to the recent important investigations by the Astronomer Royal and others respecting the deviations of the compass in iron ships. The eighth chapter is the editor's wholly, and gives a succinct account of the progress of terrestrial magnetism, during the last twenty years.

Theory of Heat. By J. CLARK MAXWELL, M.A., F.R.S. London: Longmans, Green, & Co.

The aim of this book is to exhibit the scientific connexion of the various steps by which our knowledge of the phenomena of heat has been extended. It shows that the whole science of heat is founded on Thermometry and Calorimetry, and issues in Thermodynamic Energy and the Dissipation of Energy are pretty fully treated of; but still, although this branch of the subject is dealt with in a suggestive and interesting manner, our objection to Dr. Tyndall's definition of heat here also holds. When the author speaks of "the hypothesis that bodies consist of molecules, the motion of which constitutes the heat of those bodies," he does not give us a definite idea of what heat as a force really is. Suppose "the motion" of a mass of molecules is towards each other, or concentrative, surely that is not heat in the mass, but is like cold. And yet there is here a powerful force. Were the motion of the molecules mutually repulsive, or radiative, that would be like one's idea of heat in a mass, expanding, and even dissipating it; but this only shows that to speak of heat as being "the motion" of molecules or minute particles in a mass, is indefinite and incorrect. And, moreover, is not motion of any kind rather an expenditure of force than the force itself which causes the motion? Nevertheless, the volume before us is an able, and, as we have said, a suggestive one.

VARIORUM.

"A First Appearance," by Mrs. Evans Bell (*née Magnus*), is a very amusing and not uninteresting novel, recently published by Hurst & Blackett, and it has a claim on us for a sentence or two by its exposition of the loss and privation which poor weekly tenants suffer when they are obliged to leave houses condemned to be pulled down to make way for improvements. Too little consideration is usually shown for this class of tenants. If we had room, we would quote, too, a vigorous conversation the value of the "Trattoria" system, especially as carried on in Rome, in the hope that it might lead to the establishment of some houses of the kind in London,—houses where a dinner can be ordered by day for one person or for a family, cheap and good.

"You call at an establishment, order a dinner, say, for two persons, of six plates, soup, fish, *hors d'œuvre*, joint, game, and some sweet dish, besides vegetables and salad, to be sent every day. Henceforth at the appointed hour you find yourself, as if by magic, supplied with a perfect meal, beautifully brought to table, and served as hot as if brought straight from your own kitchen; for the dishes are sent ready garnished and fully prepared on an iron tray, with a cover, round a charcoal fire placed in the middle of it, in a large tin-box."

and this for about 2½ francs each person. Mrs. Evans Bell has shown in her book, with a pleasant and a knowing pen, the troubles and dangers that beset a theatrical *débütante* in our many-sided metropolis. The story is dedicated to the ingenious author of "Domestic Life in Palestine," Miss Mary Eliza Rogers.

Miscellaneous.

Sale of Woolwich Dockyard.—The portion of the dockyard sold is on the east side, adjacent to the centre of the town, and comprises upwards of four acres, including wharfage and warehouses, with a frontage to the river of 800 ft., approached by a new incline road about to be made in connexion with a public wharf which has been ceded to the local authorities by the Government. The property was divided into four lots, the first lot consisting of wharf property upwards of an acre and a half in extent, together with the mast-pond, a water area of 2 roods 29 perches, forming a complete dock and gates, which can be enlarged without difficulty, together with several buildings on the land, the whole having a river frontage of 303 ft. The upset price of this lot was 5,045*l.*; the lot was finally knocked down for 6,750*l.* Lot 2 comprised an area of 3 roods 33 perches, with a river frontage of 177 ft., and contains a shipbuilding slip 203 ft. in length. The upset price for this lot was 3,000*l.*, but there were no offers, and it was withdrawn. Lot 3, comprising nearly an acre and a half, with a river frontage of 220 ft., and a shipbuilding slip 253 ft. in length, was next submitted. The upset price was 3,150*l.* The lot was eventually sold for 3,950*l.*

Town Dwellings for the Working Classes of Manchester.—Mr. G. T. Robinson, F.R.I.B.A., has read a paper on "Town Dwellings for the Working Classes," before the members of the Manchester Statistical Society. Mr. Robinson said that, pre-eminently as Manchester had been for originating political and educational reforms, it was a striking anomaly that in this most urgent of social reforms it had hitherto taken no step. A great portion of the paper was devoted to the experiments made by the Metropolitan Association for Improving the Dwellings of the Working Classes, which endeavoured to secure a return for the capital invested. It also adverted to the Improved Industrial Dwellings Company, which had abandoned the open staircase system for the gallery system. To such a town as Manchester the gallery system, it remarked, was particularly applicable. What had been done by Sir Titus Salt in Saltaire, the Messrs. Crossley and Mr. Akroyd in Halifax, Mr. Hugh Mason at Ashton, and many elsewhere, was referred to. That which they, as individuals, had done from a sense of their responsibility ought, said Mr. Robinson, to be followed by collective effort in our towns. One attempt—and he sincerely hoped that it might be successful—had been made in Salford, but assistance on a much larger scale was urgently needed.

University College School Buildings.—At a recent session of the council of the College, the school committee represented the urgent necessity of an extension of the school buildings, in order to accommodate the rapidly increasing number of pupils. Mr. Samuel Sharpe, a member of the council and of the committee, announced his intention to present the College with 4,000*l.* towards the cost of the required buildings. Mr. Sharpe had already given two sums of 1,000*l.* each to the School-Building Fund, besides 1,000*l.* to the Retired Professors Fund, and 600*l.* to the Fine-Art Building Fund. The College has recently received from Mr. J. Pemberton Heywood a second donation of 1,000*l.* to the School-Building Fund, besides 500*l.* to the Fine-Art Building Fund. At the same session, Mr. Felix Slade's executors stated that, as further aid was needed to defray the cost of the Fine-Art Buildings at the College, and to provide easts, &c., they would give 1,600*l.* for these purposes. About two years ago these executors gave 5,000*l.* towards the Building Fund.

The Crystal Palace Aquarium.—On the 12th inst. a *soirée* was given in the aquarium of the Crystal Palace, when some shareholders and their friends assembled in the tropical department to interchange congratulations on the success of the undertaking which has achieved since its establishment, to witness the additions made to the collection, and to listen to a lecture by Professor Flower "On the Structure and Habits of Fishes." The corridor, with its black marble tanks, containing many varieties of fish of large size, was illuminated from above. It was a study of sea-life under highly favourable circumstances.

The Registration of Trade Unions.—For the first time since the passing of the Trade Union Act (1871), 34 & 35 Vict., cap. 31, the Registrar of Friendly Societies, Mr. A. K. Stephenson, holds courts for the reception of evidence with reference to the registration of trade-unions. Mr. Secretary Bruce has just issued regulations by which the registrar is now allowed to register a trade-union under a name identical with that of any other existing trade-union known to him, whether registered or not registered, or so nearly resembling such name as to be likely to deceive the members or the public. Mr. Bruce has issued another regulation to the effect that upon an application for the registration of a trade-union which is already in operation, the registrar, if he has reason to believe that the applicants have not been duly authorised by the trade-union to make the same, may, for the purpose of ascertaining the fact, require from the applicants such evidence as may seem to him necessary. The split in the Amalgamated Society of Carpenters and Joiners, which took place last May, is the first case calling for the latter regulation to be carried into effect.

The State of the Thames at Richmond. A numerous and influential deputation from the Local Boards and vestries of Richmond, Twickenham, Isleworth, and Brentford, has waited upon the Thames Conservancy Board, at their offices, Trinity-square, Tower-hill, to urge the desirability of constructing a dock and weir at Isleworth, to improve the river between Brentford and Teddington. Strong representations were made by gentlemen connected with the district, as to the reduced and polluted state of the stream, especially at Richmond, occasioned, it was alleged, by the action of the Thames Embankment, the dredgings below bridge, and absorptions by the water companies. Mr. J. Thorp, deputy-chairman of the Board, said he favoured that the object desired was a high or low water level. That had been discussed at the Board over and over again, but it was difficult to find the means of accomplishing it without injury to the navigation. It was the duty of the Board to do their best for the whole river, not a part, and he could only say now that the subject should be further considered.

Geometrical Teaching.—The annual meeting of the Association for the Improvement of Geometrical Teaching has been held at the University College, Gower-street. The president, Prof. Hirst, F.R.S., referred chiefly to the superiority of the method of teaching geometry pursued in Italy over that practised in England. The object of the association, he said, was to bring up to the level of geometrical teaching to the science of our day, and to endeavour to discover what unanimity there is among teachers by inviting contributions to the forming of a programme of a greatly improved method of teaching. He remarked that a perfect text-book was required, but such a book must be the work of a master, and that he had devoted itself four years to the subject. All teachers should aim chiefly at their own advancement; for only from a highly-cultivated instructor could proceed efficient teaching.

The Baroness Burdett-Coutts's Memorial. A public meeting has been held in the Hall of Columbia Market, in order that the proposed memorial to the Baroness Burdett-Coutts might be considered, and that the working men of Bethnal-green and Spitalfields might give expression to their wishes on the subject. The chair was taken by Alderman Sir Thomas Dakin. There was a good attendance, chiefly of working men. It was unanimously resolved, "That this meeting pledges itself generally to support the movement, and to confirm what the committee has done;" "That a committee be formed to collect subscriptions;" and "That an acceptable memorial be presented to the Baroness Burdett-Coutts." It is to be hoped that only those who can afford it will be asked to subscribe.

Benhar Coal Company.—This Company has been formed for working the well-known valuable Benhar Coal-field, comprising more than 2,000 acres, held in lease by Mr. George Simpson, coal-master, Benhar, Lanarkshire and Linlithgowshire, with the pits and mineral plant connected therewith. The mineral field is a nearly equidistant between Edinburgh and Glasgow, and is intersected by branches of the North British and of the Caledonian Railways. The field is said to present the advantages of a superior coal at very moderate depth, little water in the workings, and easy access to many markets.

The Labour Question in the United States.—We read in the *New York Times*, of December 21:—"The House of Representatives yesterday passed the Bill introduced by Mr. Hoar, of Massachusetts, to provide for an investigation of what may be broadly called the labour question in the United States. Mr. Hoar proposes a commission of three members, to be appointed by the President, with the consent of the Senate, to hold office for one year, unless their labours are sooner completed. The Commissioners are authorised to employ a clerk, and are to receive a salary of 5,000 dollars each. The subjects to which they are to direct their inquiries are, the wages and hours of labour of the labouring classes; the division of the joint profits of labour and capital between labourers and capitalists; and the effect of existing laws regulating commerce, finance, and currency on the social, educational, and sanitary condition of the labourers."

New Lunatic Asylum for Kent.—The magistrates of the county of Kent have just determined to erect a new lunatic asylum, capable of accommodating 1,000 inmates. The county already possesses an asylum at Barming-heath, and there are upwards of 1,250 patients located there; but lunacy has so rapidly increased during the last ten years, and the operation of the Metropolitan Poor Act, 1867, having thrown large numbers of inmates hitherto maintained in workhouses upon the county rates, the justices, to whom the matter had been referred, reported that there was no alternative but to build a new asylum. It has been decided to erect the new establishment in East Kent; and it is computed that the outlay will be from 150,000l. to 200,000l.

The Proposed new Surrey Chapel.—Some stir was produced at Surrey Chapel on Sunday morning, in consequence of an announcement by the Rev. Newman Hall, that the offer of a portion of the ground on which the Female Orphan Asylum, Westminster Bridge-road, stands, had been accepted for the sum of 8,000l., so as to erect the new chapel thereon. Cards had been left in the pews, and by the evening 2,500l. had been collected. Mr. Samuel Morley, M.P., had given 500l. There is also a reserve fund of 12,000l., which has been in the course of collection for many years. The new chapel will be commenced as early as possible, and is to have a lofty tower. According to the *Parochial Critic*, Mr. Ruskin is to be the architect.

Chester Workhouse.—The local guardians have resolved upon the purchase of a site for their new workhouse. Sixteen acres are to be taken, the place selected being in Hoole-lane, and the price 3,500l. The locality, says the local *Chronicle*, is not an undesirable one, and the price is not high. Some little doubt had been expressed about the drainage; but members of the board present stated that there was a good fall and that no danger need be apprehended on that score. The site was the unanimous choice of the guardians; and, considering the long delay which occurred in the erection of the Town-hall from a division of counsels upon this point, that must be regarded as a fortunate and satisfactory circumstance.

Value of Property in London.—At the Auction Mart last week, Messrs. Fox & Bousfield, submitted to competition the freehold premises, No. 53, St. Mary-axe, containing an area of 2,000 superficial feet, in the occupation of the Board of Guardians of the City of London Union, under a lease granted some twenty years ago, and at a rent of 120l. a year. A keen competition ensued, which resulted in the sale of the property for 7,700l., being at the rate of nearly 4l. per foot, equal to sixty-four years' purchase on the old rent. According to the *City Press*, a piece of land adjoining the Lombard Exchange, in Lombard-street, has been sold for 9,000l., or about 19l. 4s. 6d. per foot super.

A Gasometer Destroyed.—One of the large gasometers at the Northampton Gasworks has been totally destroyed by wind, and upwards of 2,000l. worth of damage done. The wind was blowing a terrific gale, and caught the gas-holder, and caused it to tilt on one side, when the east-iron columns, which are 2 ft. 6 in. in diameter, broke off, and one of the falling columns fell upon the top of the holder and made a large hole, through which the gas escaped, and the holder as soon as empty fell into the tank one mass of fragments.

New Docks at Milford Haven.—A movement has been started for the purpose of constructing docks at Milford, of such a size as will provide accommodation at neap-tides for a class of vessels similar to the Spain and other new steamers belonging to the National Steamship Company. It is stated that vessels of this class could make to New York two more passages per annum from Milford than from Liverpool. The necessary Parliamentary powers by which the construction of the works may be proceeded with are in existence. The cost, as estimated by Mr. Hamilton Fulton, the engineer, is 600,000l.

Trade Halls and Social Clubs.—An interesting paper on the subject of "Trade Halls and Social Clubs for the Operative Classes" was read by the Rev. Mr. Solly, on Thursday in last week, at the National Congress of Trade Societies, at Nottingham. An opinion was expressed by the writer that the great obstacle to the establishment of such associations was the want of mutual confidence among working men. A resolution was adopted approving of the scheme propounded in the paper, as tending to promote social reform, and recommending its adoption.

A Town Sinking.—The Northwich Local Board have had a discussion as to the sinking of the town and the salt-producing districts around. The trustees are about to deepen the River Weaver to Winsford Bridge, and it is said that if they do not get an invert or a plank piling of the river round the town, the whole town would fall, or there would be an immediate subsidence, and eventually a collapse of the greater portion of the property of the town. The sinking in many places is caused by the river running through the quicksand into the old rock shafts.

The Sanitary State of Scarborough.—In consequence of the notoriety obtained by Scarborough through the remarks of the medical press with respect to the illness of the Prince of Wales, the Local Board have resolved to inquire into the sanitary condition of the borough, and have addressed a circular with schedule of questions to each household. Information thus obtained will be used collectively, with a view to sanitary improvement; but particulars relating to houses individually will be kept in confidence. It is quite time something was done.

Hampstead Heath.—On Saturday, 13th the Metropolitan Board of Works took formal possession of Hampstead-heath, and dedicated it to the public. By the arrangement effected, the great bulk of the heath—that is to say, land consisting of the upper and lower heath proper, to the extent of, it is said, some 225 acres, is secured to the public for ever, at a cost of 45,000l. It is already being asserted that some of the most picturesque spots have been omitted in the purchase, and complaints are made.

Chester Walls.—The local *Chronicle* says,—"The foundations of some cottages are being laid at a spot which may be emphatically described as one of the very best sites in Chester. Outside the Casto walls, near the Grosvenor Bridge, and at a point singularly conspicuous, it has been considered a proper thing by the War Office to plant these small houses. They are intended for married soldiers." A pressing representation is to be made on behalf of the Town Council to the War Office against this senseless performance.

Church Struck by Lightning.—During a recent fearful storm of hailstones and thunder, which raged over the estuary of Leughor, the church at Penclawdd was struck by lightning, and much damage was done to the fabric. About 3 ft. of the point of the spire was knocked off, and a large hole was made through it lower down, close to the roof. Two windows at the west end were reduced to fragments, and a great part of the roof was either carried off or knocked in.

Opening a Public Hall in Sunderland. A large public hall, erected mainly by the friends of temperance, has been formally opened by the Mayor of Sunderland. The hall supplies a want which has long been felt in that town, namely, that of possessing a commodious building for political and other purposes. The hall is capable of holding 3,000 persons comfortably, and has been erected from designs by Mr. G. Gordon Hoskins, of Darlington, at a total cost of 9,500l.

Proposed Railway and other Works affecting the Holborn District.—The Surveyor to the Holborn Board, Mr. Lewis H. Isaacs, has reported on "the plans that have been deposited seeking for Parliamentary powers for railway and other works affecting the district." The report is published, and will be found interesting to those concerned. The value to the Holborn district of the proposed new thoroughfare from Vernon-place to Old-street is strongly dwelt on.

The Building Sites adjoining Finsbury and Southwark Parks.—At the last meeting of the Metropolitan Board of Works, on the motion of Mr. Newton, seconded by Mr. Savage, it was resolved—

"That the officers of the Board be instructed to take no further steps for the present towards letting land for building purposes in Finsbury and Southwark parks; and that it be referred to the Parks, Commons, and Open Spaces Committee to inquire and report on the best means of utilising the land in question for the public benefit."

An Artesian Well.—An artesian well has been sunk in the courtyard of the naval hospital at Rochefort to a depth of 816 metres (2,774 ft.). M. Roux, pharmacien to the hospital, reports that the temperature is 51 deg. cent. (about 105 Fahr.) Contrary to what is generally observed in artesian wells, the water contains a large quantity of saline matter, and is quite unfit for drinking or washing.

Club-houses for Working Men, Dundee.—Mr. Armstrong, one of the members for Dundee, has presented 5,000l. to be expended in providing two club-houses for the working men. Several gentlemen are to be appointed trustees, but it is intended to leave the working men who become members to make the arrangements of the institutions themselves.

Bruton, Somersetshire.—The Sanitary Committee of this town have engaged Messrs. Gotto & Besley, and Mr. A. W. Estridge, to prepare plans and estimates for the drainage of the town, and to report as to the best means of disposing of the sewage so as to prevent the pollution of the river.

The State of Yeovil.—The spasmodic endeavours now being made to remove some of the evil conditions that afflict Yeovil form a striking commentary on the reception given to our statements concerning the place made not long ago. An apology to us would not be out of place.

Royal Sanitary Commission.—On Monday evening, the 22nd inst., Mr. G. W. Hastings will open a discussion on the Report of the Royal Sanitary Commission, at a meeting of the Social Science Association, at their rooms in Adam-street, Adelphi, at eight o'clock.

The Wandsworth Mortuary.—At their last meeting, held this week, the Wandsworth Board of Works decided that the plans submitted for the proposed mortuary be approved, and that tenders be invited for the building from five local builders.

The New Instructional Institute.—The New Instructional Institute has been opened by his Royal Highness the Duke of Cambridge, in the presence of the principal inhabitants of the village.

The Floating Dock for Bermuda.—There appears to have been considerable bungling in placing this remarkable work in position. Considering that it cost a million of money, it has not hitherto received very careful treatment.

Park-lane Sewer.—Some abuse is being bandied about in connexion with the recent sewer works in Park-lane. Fresh inquiries are, rightly, to be made by the Vestry of St. George's, Hanover-square.

Drawing in Oxford.—Mr. Raskin's to offer 5,000l. for the purpose of an endowment pay of a master of drawing in the Taylor Galleries, has, with some modifications approved by Mr. Raskin, been accepted by the University of Oxford.

Halesworth Sewerage Competition.—The Sanitary Board has adopted the scheme proposed by Mr. Bennett Fitch, C.E. There were seven plans sent in.

Edinburgh.—Arrangements are in progress for providing a new cemetery for Edinburgh.

TENDERS

For new granary, Prince's-wharf, Prince's-stairs, Rotherhithe, for Messrs. T. & W. Easton. Mr. George Lor, architect—

Woodward	£5,650	0	0
Gammott & Son	6,213	0	0
Hill, Keddell, & Waldram	4,975	0	0
Crockett	4,960	0	0
Morter	4,910	0	0
Henshaw	4,315	0	0
Tarrant	4,797	0	0
Hart	4,786	0	0
Marringe	3,450	0	0

For excavator, a mason's, bricklayer's, carpenter's, and founder's work of Upsal Castle, near Thirsk, for Captain E. Tutton. Messrs. Goldie & Child, architects—

Hingworth & Sons	£10,306	0	0
Bulmer	9,367	0	0
L. H. & R. Roberts	8,847	0	0
Robson & Son	8,635	0	0
Keswick	8,670	0	0
Burnby	7,915	0	0
Hellerby	7,315	0	0
Shafloe & Barry	7,100	0	0
Weatherly & Rymer (accepted)	6,250	0	0

For the erection of a house, &c., for a gentleman, in Kent. Messrs. John Tarring & Son, architects—

General Estimate	£1,000	0	0
Principal For using Horse, Wainscot, Stables, instead of Lodge, & additional, additional.	434	0	0
Kimberley	£5,946	0	0
Dove, Brothers	5,375	0	0
Myers & Sons	5,339	0	0
Hill & Sons	5,234	0	0
Macey	5,258	0	0
Henshaw & Co.	5,017	0	0
Killy	4,999	0	0
Manley & Rogers	4,808	0	0
Perry & Co.	4,769	0	0

For the first portion of Messrs. Threlfall's new brewery, Liverpool. Mr. G. Stannell, architect. Quantities by Messrs. Curtis & Son—

Allowed for Old Materials.	£6,600	0	0
Kirkham	6,079	0	0
Tomkinson & Son	6,075	0	0
Haigh & Co.	5,795	0	0
Burrough & Son	5,640	0	0
Jones & Co.	5,428	0	0
Crmsou.	5,471	0	0
Holmes & Nichol	5,318	0	0

Ironwork.

T. H. Head & Co. (accepted)... £1,076 0 0

For the erection of Blewbury Vicarage, Mr. Edwin Dobby, architect—

Dedicated for Old House.	£20	0	0
Johnson	£1,918	0	0
Williams	1,760	0	0
Wheeler & Gregory	1,728	0	0
Kimberley	1,640	0	0
J. & T. Davis	1,630	0	0
G. Jones	1,620	0	0
T. Jones	1,620	0	0
Castle & Co.	1,565	0	0
Solly	1,558	0	0
Gibson, Brothers	1,547	0	0
Honour & Castle	1,428	0	0

(there is no royal road to the knowledge in question: it must be gained by observation and experience.) — P. L. S. (properly used, concrete may be safely adopted.) — H. W. B. (suggestions have often been made in our pages:—E. J. (we have already mentioned where subscriptions for Mr. Randall may be sent.)

We are compelled to decline pointing out books and giving addresses.

All statements of facts, lists of tenders, &c., must be accompanied by the name and address of the sender, not necessarily for publication.

NOTE.—The responsibility of signed articles, and papers read at public meetings, rests of course with the authors.

Bath and other Building Stones of Best Quality.—RANDELL, SAUNDERS, & CO. Limited, Quarriers and Stone Merchants. List of Prices at the Quarries and Depôts, also Cost of Transit in any part of the United Kingdom furnished on application to Bath Stone Office, Corsham, Wilts.—[Adv.]

Ashton & Green, Slate and Slab Merchants and Quarry Agents.—Shippers, Merchants, and Contractors furnished with Price-lists of every description of ROOFING and MANUFACTURED SLATE, Railway-rates, &c. Agents for London and Country for the Sale of the celebrated WHITELAND ABBEY GREEN SLATES. Drawings and Prices of A. & G.'s RED RIDGE TILES, specially prepared for use with these Slates, on application.—Offices and Show-rooms, 14 and 15, Bury-street, St. Mary Axe, London, E.C.—[Adv.]

Turret Clocks.—Mr. Streeter, 37, Conduit-street, London, W., Manufacturer of Turret Clocks (with gravity or dead-beat escapement) for Churches and Public Buildings. Estimates and Plans on application. Price of Yew-tree clocks from 15l.; church clocks, from 40l. The wheel-work throughout these clocks is of best hard brass or gun-metal. No iron wheels used. Timekeeping and durability guaranteed. Whole-sale Entrance—Burlington Steam Works. [Adv.]

"Like all grand conceptions, the process is remarkable for its simplicity." This was said by the *Globe* of the method by which *The Bazaar, the Exchange and Mart, and Journal of the Household* enables ladies and gentlemen to sell, exchange, or buy every description of property with ease, security, and without making their names public. Specimen copy, containing full directions, post free, two penny stamps.—Office, 32, Wellington-street, Strand, London.—[Adv.]

PERFECTION IN BOOKKEEPING.—Builders and others desiring a really good system, can have a SET of BOOKS for BUILDERS' WORKS, by JOHN BENTLEY, which was awarded the prize offered in "The Builder," No. 1189, and which has been adopted by many large firms. Also a Modified Arrangement by Single Entry, suitable for small builders.—Address, E. A. St. George's-road, Legent's Park, London.

THE NEW COURSE OF JUSTICE.—NOTES IN REPLY TO CRITICISMS. BY GEORGE EDMUND STREET, B.A. RIVINGTON'S, Waterlool-place.

Now ready, demy 8vo. price 12s. 6d. cloth, with 14 folding plates, and numerous woodcuts. Postage 6d.

LAND AND MARINE SURVEYING; and References to the Plans for Roads and Railways, Canals, Rivers, Town Water Supplies, Docks, and Harbours. With Description and Use of Surveying Instruments. By W. DAVIS HASKOLL, C.E. A carefully written and valuable text-book.—Builder London: LOCKWOOD & CO. 7, Stationers' Hall-court, E.C.

Now ready, with 46 plates, imp. 8vo. price 21s. 6d. (postage 3d.) **EXAMPLES OF BRIDGE AND VIADUCT CONSTRUCTION,** of MASONRY, TIMBER, and IRON; from the Contract Drawings or Attainments of select Works. By W. DAVIS HASKOLL, Civil Engineer. "One of the very few works extant descending to the level of ordinary readers, and treating on the common every-day practice of the railway engineer."—*Engineering*. London: LOCKWOOD & CO. 7, Stationers' Hall-court, E.C.

Now ready, woodcuts, 12mo. cloth, price 3s. 6d. (postage 3d.) **THE ARCHITECT'S GUIDE;** or, Office and Pocket Companion for Engineers, Architects, Land and Building Surveyors, Contractors, Builders, Clerks of Works, &c. By W. D. HASKOLL, C.E. & W. BILLINGS, Architect, and Others. London: LOCKWOOD & CO. 7, Stationers' Hall-court, E.C.

Now ready, with 13 large folding Plates, imperial 8vo. 12s. cloth (postage 6d.)

A PRACTICAL AND THEORETICAL ESSAY ON OBLIQUE BRIDGES. By W. H. RICE, M. Inst. C.E. "Second Edition, corrected by W. D. HASKOLL, M. Inst. C.E." "A very complete treatise."—*Builder*. "The Engineer's text-book."—*Engineering*. London: LOCKWOOD & CO. 7, Stationers' Hall-court, E.C.

On the 1st of FEBRUARY, **JACK OF ALL TRADES.** Edited by Professor PEPPER. Free Trade Union. Two penny. CLAYTON & CO. (Publishers), Bowdler-street, Fleet-street.

Now ready for subscribers, price 4s.; free by post, 4s. 4d. **THE ILLUSTRATED PRICE-BOOK FOR 1872,** for the Use of Architects, Engineers, Surveyors, Builders, &c. With Five Plates, containing Plans, Elevations, and Views of Mansions, Villas, and Cottages, with specifications. The prices and tables have been most carefully arranged and revised in order to make the work as complete as possible, and well adapted to the professional use and tradesman. "The Engineer's text-book."—*Engineering*. London: No. 10, Great Russell-street, Bedford-square.

W. H. BARBER, Surveyor, 12, Buckingham-street, Strand, W.C. twenty years with Messrs. Myers and Moore, Mansell, has REMOVED to the above address. Quantities and Estimates prepared, and every kind of assistance rendered on moderate and liberal terms. DISPUTED AND INTRICATE ACCOUNTS, ESPECIALLY ATTENDED TO.

T. A. RICHARDSON, ARCHITECTURAL ARTIST, Lincoln's Inn-fields, Chancery, Lincoln's Inn, W.C. Artistic Perspectives in outline or colour, competition working and detail drawings, designs from sketches or instructions. Highest references. Moderate terms. Established sixteen years.

CONVEYANCING, Surveying and Levelling, on the largest and most extensive scale, by the experienced and successful Surveyor, and Superintendent of the Construction of Buildings, by D. HALL, Esq., 15, Merrick-villa, Merrick-road, Clapham Junction. Land Surveying and Levelling. Published by A. SPRING (late ATCHLEY & CO.).

DUPUI, WANTED, an Additional Six Month's PAPER, for large bills, with Printing and Lettering, in Yorkshire. Age, 18 to 21.—Address, D. St. "Overseer" Office, Bradford, Yorkshire.

PRESTON SCHOOL OF ART.—WANTED, a MASTER, qualified under the Art and Science Department, to enter upon his duties immediately after the Midsummer vacation. Net emoluments from fees and grants have been about 100l. per annum, subject to the locality offers a favourable field for an efficient teacher to increase their amount.—Testimonials and applications to be addressed to Mr. W. HALL, Head School, Preston, and forwarded to him on or before FEBRUARY 10, 1872.

ARCHITECT'S ASSISTANT WANTED. WANTED, in the office of the Architect and Surveyor, a good and well-qualified DRAUGHTSMAN. One with experience in classic work preferred. Salary, two guineas per week.—Apply by letter, stating age, experience, &c. to A. J. Post-office, London, Wilt.

WRITING and GRADING.—A Young man, has had 18 years experience in writing and grading.—Address, 61, Office of "The Builder."

The Builder.

VOL. XXX.—No. 1512.

The New Project for a Channel Tunnel.

NCE more the question of constructing a tunnel under the Straits of Dover, which has so frequently been brought before the public, is upon the tapis. On the present occasion, it is right to admit, the previous projects have been pretty fairly reviewed. There is, moreover, a degree of diffidence, and a candid admission that many questions can be solved only by the test of actual experiment, that give evidence of a caution not always to be found in projectors. The subject, thus presented to the public, is by no means to be encountered with that ridicule which was very properly called for by some of the former schemes. Nor is it one to be met with a peremptory condemnation on positive engineering grounds. Investigation, however, of the proposed undertaking is desirable, whatever be the result of the best judgment that we may be able to bring to bear upon its principal features.

The first idea that occurs to the mind is, that the spirit of engineering enterprise, the absence or silence of which for so long a time too many of us have reason to regret, must have a more persistent vitality than has been generally supposed. Thirty thousand pounds, we are told, are asked for, and are found, or are expected to be found, for the purpose of experiment. Considering that the result of such an expenditure, if made as proposed, can be little more than to throw some additional light on the geology of a part of the English shore, with a distant hope, perhaps, that if anything should grow out of it the subscribers might be allowed to participate, the public spirit and disinterested magnificence displayed are calculated to inspire us with long dormant hope. If such a sum be forthcoming for the mere purposes of investigation, what may not be expected for the accomplishment of those numerous practical methods of employing money in agricultural engineering, which, not as matter of estimate, but as subject of demonstration, would yield such golden return?

The object of the Limited Company, we are told, is to sink a shaft on the English side of the Straits of Dover, and to drive a driftway about half a mile beyond low-water mark. One question concerning the engineering practicability, or otherwise, of constructing a submarine tunnel, depends on the continuity, or the reverse, of the strata which are known to exist on either shore. That these dip towards a junction is ascertained. The inclination on the opposite sides of the Channel varies considerably, being nearly three times as sharp on the French side as it is on our own. The mode in which these anticlinal lines meet, the existence of a more or less serious disruption of strata at the junction,—in fact, the geological cause of the formation of the Channel

itself, forms the real key to the engineering features of this part of the subject. What light is expected to be thrown upon this essential problem by the construction of a shaft and portions of a driftway at Dover we do not yet clearly make out.

The name of M. Thomé de Gamond is associated with that of several English engineers as concerned in the proposed enterprise. M. de Gamond, we are told, has for some thirty-seven years made a special study of the Straits of Dover. It scarcely justifies the scorn with which he speaks of competing projects, that the proposal, made by this gentleman in 1840, for a method of uninterrupted communication between Great Britain and the Continent, involved the filling up of the Straits of Dover. "*Point de Pyrénes*," was a joke to this. A solid and substantial mole was to be built from shore to shore. The modest sum of 34,000,000*l.* was allowed for the estimated cost; and the maritime power and supremacy of Great Britain were to be propitiated by the kind provision of leaving three gateways or navigable apertures through the mole. None but people who are ready to go to war for an idea could have been expected to originate such a scheme. More than that, no other people could be likely to appreciate it. The blind and incurable prejudices of the maritime interest could not be sufficiently enlightened to regard the grand project with favour. It shows a remarkable degree of confidence on the part of the promoters of the Limited company, that they should put forth the name of the projector of this mole as that of one of their engineers.

Whatever be the practical experience, or the sound judgment, of M. Thomé de Gamond as an engineer, he seems determined to add the laurels to be reaped in another profession to the credit due to the constructor of magnificent works on paper. In 1856, M. de Gamond was occupied with a project for a submarine tunnel. He dived several times to the bottom of the Channel to obtain specimens of the clay, on the last of which occasions he was attacked and severely bitten by conger-eels. It does not appear how either of these interesting facts sheds much light on the subject of the geological substructure of the trough of the Channel. But as two objections—one political, the other engineering—were urged against the advantage and the feasibility of M. de Gamond's scheme, he says, that he was content to meet them by what advocates call pleas. These are explained to be statements introduced in order to gain the success of a cause. It is not proposed that, this success once obtained, any further reference is to be made to the pleas. One of these pleas seems to have been a relic of the original idea of the mole. Twelve artificial islands were to be manufactured in the Channel, in each of which shafts were to be sunk, from which the excavation of the tunnel was to be carried on in each direction. We are aware that the construction of a shaft through a species of artificial island was successfully carried out as a part of the water-works of Chicago; but the idea of studding the Channel with artificial shoals and invented dangers could only occur to persons ignorant of, or hostile to, that maritime occupation which forms the very life of British power.

The other plea, in reply to the objection that we were not anxious to abandon the military defence of that wall of salt water which has kept our soil unprofaned by hostile foot for 800 years, was, that valves might be provided for the inundation of the tunnel in case of its being required for invasion. As it is well known that all the preliminaries of war between hostile nations are now invariably arranged on the courteous and considerate plan which requested the "gentlemen of the French guard to fire first," we must take the second plea also for what it is worth. We must further note that

the approbation which the ex-Emperor of the French is stated to have expressed of the project of uniting the two countries by a tunnel may be regarded under very different lights by French and by English eyes.

Mr. Low, of Wrexham, has brought to bear on the subject of the proposed submarine communication the experience of a practical miner; and has suggested, what we have ourselves more than once pointed out as a requisite of all lengthened tunnelling, that a double driftway connected by passages, and admitting of the mode of ventilation practised in ordinary coal mines, was the only method on which such an enterprise could with propriety be commenced. In reference to this, however, the improvements made in boring apparatus, and the aid to ventilation afforded by the escape of the compressed air by means of which such machinery is worked, have now to be taken into consideration.

For ourselves, we cannot but think that the political, or rather military, aspect of the case, is one that demands attentive consideration. Much may be said in favour of articulating our railway system with that of Continental Europe. Little doubt can be entertained that the international traffic that would be created by such a step would be very large. But other considerations must also be regarded. We have recently seen what large expenses the people of this country have incurred, and, as we think, wisely incurred, for making Portsmouth into an impregnable harbour for a war navy, intended to defend our coasts. Our annual budgets owe some three-fourths of their pressure to our efforts, past or present, to defend Great Britain from any possible attack. Works larger than any yet effected are known to be under consideration. The defence of London by a chain of detached forts is a subject on which military studies have been made, and as to which Parliament will probably be asked to provide means. There is no indication, at present, that it will be asked in vain. Unfounded security, and undue panics, have succeeded one another for some considerable time. Political capital has been made, at one time by shortsighted and eventually costly reductions of proper expenditure; at another by over zealous effort to repair these injuries to our power. The present feeling is, let us once for all put a stop to such discreditable vacillation. Let us see, since human nature is what it is, that our coasts are in a state of defence, our navy efficient, our army the very finest that can be formed out of such limited numbers, and then let us turn our attention to the conquests of peace. That, we think, is the common-sense outcome of all the long debates on the subject. It is matter, therefore, at least for consideration, whether we should be wise, at such a moment, to open in our ancient defences a new back-door, through which a robber might unawares break in. It is all very well to say that this postern shall be plated with iron, and provided with bars and locks. The question is, whether this is exactly the time to break through the wall to make it. The fortifications of Portsmouth and the Anglo-French Tunnel represent two opposite orders of ideas. Is it quite consistent to attempt the simultaneous prosecution of the two?

There is no doubt, were the incoming year to approach us, like the ambassador of Rome to Carthage, bearing peace and war beneath the folds of his toga, and asking which we would choose, what our reply would be. Peace and goodwill among mankind is, or ought to be, the aspiration of every good man. In none is that desire more strong than in those great military chieftains on whom has fallen the onerous responsibility of high command in actual service. There never was a man who had a keener sense of the horrors of war, or a more anxious, patriotic desire that his eyes might never witness their enactment in his native land, or indeed in

Europe, after his great struggle of 1815, than Arthur, Duke of Wellington. The blessings of peace, the growth of commerce, the augmentation of national wealth, the increase of human happiness, are matters which we not only desire, but in forwarding which to the utmost of our power we most of us pass great part of our lives.

For all that, we should be the worst of fools to forget the lessons of 1851, of 1866, and of 1870. Men whose philanthropy was much in advance of their knowledge of human nature, and whose acquaintance with the profits of commerce was much more accurate than their knowledge of history, had come to the conclusion that King Pickett's reign had come, and that the reign of King Pickett was peace. Our great brilliant summer palace of 1851,—that crystal and iron structure which had all the lustre, and something more than the permanence, of a bubble, was to be the temple of perpetual peace. Men's eyes were to be opened by education, their prejudices dispelled by mutual intercourse, and their peaceful relations secured by reciprocal interest. We know, however, what came of it. We have seen how an era of revolution and civil war, not ended, but suspended, by the most terrible military and national collapse on record, has been ascribed in by these cries of "Peace, peace." What we do not know,—what few of us have heard, and still fewer realised, is the unprecedented magnitude of the river of human blood that has flowed during the past decade.

That calculation which earned an American general the title of butcher,—the calculation that if his forces were twice those of his antagonist, he might expend man for man and have half of his army left,—has been distanced altogether by the more ghastly arithmetic of the German war. We never heard of less than 150 men coming unhurt out of a battle, as the sole representatives of a regiment which went under fire 3,000 strong. It is no exaggeration to say that, in the earliest encounters, when the French had the advantage of admirably chosen positions, and of the destructive fire of the mitrailleuse, and before courage, discipline, and military character had been exposed to the demoralising influence of defeat,—the terrible word,—the once terrible word, demerit, had to be spelled backwards with regard to German regiments. It was not a tenth that they lost, but nine tenths. It is true that no other generals in the world would have dared so to handle troops. It is true that no other troops in the world would so steadily have marched to certain death. Over and over again, as a line of soldiers reached the summit of a hill, exposed to the deadly fire of the defenders, they fell in line, like a sward of grass in a meadow before the mower. Let us remember these things, and let us ponder well before we attempt to bridge the Channel otherwise than by stone. The oracle of Delphos gave a reply to the Cretians, when they proposed to cut through the Isthmus of Corinth, that is not applicable to this question.—

"Delve not, nor towers upon the Isthmus pier,
Had Jove so willed, himself had made an ile."

Neither the military events of 1870 and 1871, nor the internal condition of France since the close of the war, have been such as to lead us to suppose that the present is the exact moment in which to seek to alter the geographical relations existing between the British Islands and the Continent.

It may, it is true, be urged in reply that, even if the scheme be at once taken up, and carried out with all possible despatch, we need be under no apprehension of any very proximate political or military consequence, as it will take up the lifetime of a generation to make both ends meet. There is some truth in this argument. The experience of the longest tunnel yet made in the world bears, more closely than do such small details as those of the driving headways of 600 or 700 yards long through the upper chalk, upon the anticipations we can form as to the rate of progress. That the actual rate, as we will show, would require the period of thirty-seven years for the completion of a tunnel beneath the Channel.

We do not treat this question as an engineering impossibility. Far less do we assume its practicability. We have made great advances within the last ten years in the art of mining. The success, engineering if not financial, of Mr. Barlow's little tunnel under the Thames, near the Tower, is a matter not to be ignored. Mr. Barlow, with commendable caution, constructed an iron tube

as the shield for his miners, and the lining of his tunnel. Yet such was the combination of skill and good fortune in the selection of the impervious stratum through which the little gallery was driven, that we can say, from personal examination, that a 6-ft. culvert might have been driven through the clay, and bricked within, without the use of any shield at all. This is, no doubt, an exceptional case. It was due to the existence of a bed of solid clay, such as the results of no less than thirty-nine borings led Brunel to anticipate in the line of his own tunnel, which could be pierced and lined before any action of a semi-fluid nature had appreciably commenced. It gives us no encouragement with regard to working through previous strata. Nor do we suggest that the favourable nature of the ground actually passed through would have justified any relaxation of the precautions adopted. Still, we have an important fact to set against the terrible difficulties which the genius of Brunel overcame in carrying his work through the loose and crumbling material of what was really the artificial bed of the Thames. We must take either experience for what it is worth. Each is a contribution to engineering science.

Again, we have had the experience of the completed Mont Cenis Tunnel. That is another point gained. We have information under separate heads from this great work. We have found it to be possible to drive a tunnel, from either end, without shafts, of a length never before attempted, so as to meet both as to line and as to level. We are told that the error in coincidence of the two lines, one of 7,000 yards in length, and the other of 6,800 yards, was under 3 ft. This is a great triumph of engineering skill. Secondly, we have the experience of the boring apparatus. We know the economy of time and of cost thus effected over the manual labour familiar to our early days. We have also important observations as to the reduction of temperature by the use of compressed air,—a matter of extreme importance in contemplating the possibility of making 11 miles of unventilated tunnel. The difference of temperature at the entrance and at the working face is stated at 22 degrees Fahrenheit. What the latter would have been but for the jets of air constantly issuing from the working cylinders, and causing a descent of the thermometer exposed to the jet to 7 degrees of frost, our mining friends can readily estimate.

Again, as to the rate of progress, we have valuable information. From the date of the commencement of the tunnel, August 15th, 1857, to that of the meeting of the workmen under Mont Frejus, December 26th, 1870, was 4,850 days. Taking the greater distance accomplished, which was that on the Bardonnèche, or Italian side, at 7,000 yards, we obtain an average progress of 1.43 yards per diem. The long period elapsing before the tunnel was open for the transit of trains must be added to the above-named period; but as that delay was the rather political than to engineering causes, it cannot be reduced to figures. Again, we have the element of cost. That of the Mont Cenis Tunnel, dividing the capital by the length, was somewhat under 200l. per yard. And rock of a very obstinate character occasionally occurred, which both retarded the progress and augmented the average cost.

A tunnel 22 miles long, executed at the rate and for the price of that under Mont Cenis, would thus require for its completion a period of thirty-seven years at a minimum cost of seven and a half millions sterling. We are not arguing that the cases are parallel, but merely giving the results of a comparison. To offer even an estimate of cost, or to rate the progress, not by days, but by years, we must know more than any one appears to do at present of the geological nature of the bed of the Channel. The exact length of the Thames Tunnel is not stated in the Life of Brunel. The expenditure was 454,000l.; which, divided over the approximate width of the river, gives a cost of about 1,300l. per yard.

It will be said that the progress through the dense strata that underlie the Alps was necessarily slower than would be the case through those of the submarine tunnel. That a passage would be made through a mountain barrier consisting of chalk more rapidly than through one of harder material, we admit. But it must be remembered that there are very special practical advantages attending the driving of an adit, or working of a gallery or tunnel from two ends, as

compared with working from shafts, which affect cost and rate of progress, as well as safety and comfort. A gallery thus driven in, or should be, always carried on a slight ascent, so that the drainage can be effected without engine power, and the material from the excavation is thus readily disposed of. The Alpine tunnel was constructed on a rising gradient from each end, although the so doing involved the introduction of a gradient of 1 in 43, instead of 1 in 90, which would have been attainable if the tunnel had been all on one inclination. In the Channel tunnel, on the contrary, we must commence by the sinking of a land shaft or shafts. The depth to be penetrated must be equal to that of the deepest part of the trough of the sea to be passed, plus the thickness of crust necessary to be left over the head of the workmen, plus the rise of an ascending gradient, steep enough to effect adequate drainage, of eleven miles. It will depend on the dryness or wetness of the strata pierced what this allowance is to be. Altogether we find that we must sink shafts of considerable depth,—in themselves matters of some expense,—up which every gallon of water that enters the tunnel must be pumped, and every ton of material excavated must be hauled. This may be fairly taken to counter-balance any presumed advantage from a less resisting medium.

On the important question of the geological character of the antiferrous beneath the trough of the Channel no light can be thrown by the proposed outline. M. de Gamond considers that this meeting is under the Varne bank. If it should be practicable to make any serious investigation in this locality, the results might be important. To reach this place by driftways was reported, in June, 1868, by the engineers now concerned in the scheme, to require from one million and a half to two millions sterling, or one fifth of the entire cost of the tunnel. The practical course, if the matter were seriously taken in hand, would be to drive a driftway from the shore nearest the point of supposed junction of the strata till that position was reached, or until reaching it was proved to be impossible. In that case we should have that positive information in the absence of which the scheme of a submarine tunnel can only be characterised as one that is extremely problematical.

There is, however, one primary consideration, in presence of which we must confess to some astonishment that the public should be asked to find 30,000l. without something like the same number of pence having been previously devoted to the purpose of showing that there exists even a *prima facie* case. One of the best known geological features of the earth is the riverless, streamless, condition of the great chalk downs. In valleys and hollows where, in other formations, brooks and lakes are found, the chalk formation is dry. The reason is the pervious nature of the material. The rain sinks through it as through a sieve, and descends until arrested by an impervious bed. Nothing but excessive evaporation (as in the case of the Dead Sea and of the Bitter Lakes) is known that can reduce the level of a great subterranean reservoir of water below that of low water in the sea. It is, therefore, our opinion, that the whole of the chalk below this level, without any assumption of infiltration through the bottom of the sea, is as full of water as a sponge. Through such a formation, subject, moreover, to a great hydraulic pressure, tunnelling would be extremely dangerous and costly, and the formation and maintenance of a driftway, unlined with masonry or with metal, would be an impossibility. We know that water is found at the level of the sea in chalk wells at Dover. We have reason to believe that the level of the subterranean lake which the chalk holds dips downwards from our inland chalk districts to the sea. The sinking of a single well far from 100 ft. to 300 ft. below the level of the sea through the chalk would be enough to verify or to correct this opinion. That, we take leave to point out, is the first step which ought to be taken by the promoters of a submarine tunnel. The information thus to be obtained would not, indeed, prove the practicability of the enterprise; but it might, on the other hand, demonstrate its utter impracticability. Engineering and geological theory are against that practicability.

We think no persons can with propriety appeal to the public for money until the simple step that we suggest shall have been taken. According to our best present knowledge we are asked for 30,000l. for an entirely impracticable scheme.

ON THE CONSTRUCTION OF THE ALBERT HALL.

At the ordinary general meeting of the Institute, held on Monday, the 22nd inst., Mr. T. H. Wyatt, president, in the chair, a paper "On the Construction of the Albert Hall," was read by Major-General Scott, C.B. We give that portion of it which relates more particularly to constructive details:—

The whole of the main wall was constructed of hard Cowley stocks set in Portland cement with three parts of sand. Portland cement was also in all cases used for the concrete necessary to bring the gravel surfaces which were to receive the foundations to a true level, and to fill in the excavation in the clay bottom, which extended on the south and south-east sides over one-third of the area occupied by the building. The outer wall, built in bricks made by the contractor, was also brought up to the level of the shallowest footings in Portland cement mortar of the above composition; but all above this, and all the cross walls and the walls within the main wall were executed in mortar made in a mill, with one measure of grey lime previously slaked, one measure of Portland cement, and six measures of sand. The set of this mixture was sufficiently rapid to prevent any settlement taking place which might bring an undue strain on the terra-cotta dressings. It also enabled the main wall to be completed to its full height, and the roof to be commenced before the outer wall and cross walls were brought up, and in no instance did any such inequality of settlement from this cause take place as to produce fracture. The outer wall was, of course, delayed for the terra-cotta. Delay in the supply of this material appears to be an ever irritating difficulty in its use.

The plastering used on the interior walls merits, perhaps, some attention. Instead of making the lime into coarse stuff, as is usually practised, and finishing with lime or gauged putty, the grey chalk lime of the Medway was ground to a powder and made into mortar on the following system:—One quarter of a cubic foot of plaster of Paris was stirred into a bucket of water and thrown into the pan of an ordinary mortar-mill, so as to make a milky fluid of the plaster of Paris; another bucket of water or so was then added, and 5 cubic feet of the ground grey lime gradually added, with the addition of more water; the mill continuing in action the whole time until the pan contained a thin slip of the lime and plaster. To this mixture 30 cubic feet of sand were added and thoroughly incorporated with it, and the mortar was then ready for use. This treated the lime sets without sinking, and makes what I have termed "scientific mortar."

For the finishing coat in rough stucco, the quantity of sand was reduced to 20 cubic feet, and after the first coat was put on the wall, the plasterers could in a few hours' time follow on with the finishing coat. For the first coating on lathwork the usual quantity of hair, but unbeaten, was added whilst the mortar was being incorporated, and the ceilings were finished with a mixture of slip prepared as before, with one part of chalk and two parts of sand for every part of lime used in the slip.

The whole of the outer corridors, staircases, and crush-rooms, and all the private and refreshment rooms round the building, are, as it is termed, fire-proof, no wood being used in their construction beyond that of the doors, windows, and the wood slips used to carry the concrete and tiled floors. Probably, in the case of a fire in the interior of the Hall, the tile would not be belied, for the inrush of fresh air would be so great as to keep all without the auditorium perfectly cool. Since also the audience empties itself into these corridors and crush-rooms in a few minutes, there is no great likelihood of loss of life in the event of a fire occurring. As precautions against fire, hydrants are fixed at several points on each floor level, the whole being in communication with thirty tanks on the picture-gallery roof, containing in all nearly 50,000 gallons of water. These tanks are supplied from a well sunk through the London clay into the chalk, in the rear of the building, and they also receive the rainfall on the large roof. The hydraulic lift is supplied from the same sources.

In the warming and ventilating arrangements I had the assistance of Mr. W. W. Phipson, who has had great and varied experience in the heating of large buildings. Coils of hot-water pipes are placed in three separate air-chambers, under the arena, the amphitheatre stalls and the main corridors of the building respectively. The

heated air from those in the arena ascends through the interstices of the floor; that from the coils under the amphitheatres through the risers of the steps on which the seats are placed; and that from beneath the main corridor finds its way through passages in the wall into the boxes, the picture-gallery, the corridors, the refreshment and private rooms and small lecture-theatres. The external fresh air is forced in by two fans, 5 ft. 9 in. in diameter, each worked by a 5-horse power engine, and blowing right and left through passages provided for the purpose into the three above-mentioned air-chambers. It may also be drawn through them by the ascension current of heated air in the Hall itself, which, when the gas is lighted, or the building warmed in cold weather, exerts an enormous force. The amphitheatre and corridor air-chambers, with their systems of coils of hot-water pipe can be together utilised for the Hall, or for the corridors and private and other rooms. In order to preserve equality of temperature in all parts of these chambers, the coils of hot-water pipe are divided into sections, each section having its own hot-water generator, in which the temperature is kept up by a supply of steam from three 25-horse power steam boilers at the back part of the building. There are sixteen such generators, each supplying its own system of pipes, with an admitting of hot water being put into action or thrown out at will. The total amount of heating surface in the various coils is represented by about 28,000 ft. of 4-in. hot-water pipe.

The chief difficulty in connexion with the management of the warming and ventilation of such a building is the control of the inward draft when the doors are open from the ingress and egress of the audience; but by carefully attending at these times to the closing of the louvers of the upper shaft through the centre ring of the roof, this draft can be controlled.

The conditions prescribed for the exterior were, as I have said, that the facade should consist of red brick, with terra-cotta dressings. The subject of terra-cotta as a decorative building material has been so fully treated of by Mr. C. Barry that it is unnecessary for me to do more in relation to its use in the Albert Hall, than refer briefly to the principles which guided us in its application and treatment. The terra-cotta material was considered simply as a superior description of brick, to be used in conjunction with plomo surfaces of a somewhat similar material, but of another colour. It was thought therefore unnecessary that the lines and edges should have the precision of stonework given them, or that the blocks should be of large size. It was further judged that delicate modelling would be out of character with a building which must be of very massive appearance, and which should depend more for its effect on the sweep of its lines than on exquisite finish. These opinions were held strongly by Mr. Townrose, to whom the Hall is indebted for the actual modelling or immediate superintendence of the whole of the modelling work, and I judged them to be correct. Many, undoubtedly, think that the modelling is too coarse, but I have been gratified to observe that the eye of the painter is generally pleased with the picturesque effect which this mode of treatment has imparted, an effect to which doubtless the varied and rich tints of the material itself have largely contributed.

The terra-cotta was all supplied by Messrs. Gibbs & Canning, of Tamworth. The blocks for the preparation of the moulds were supplied to them by us, and the terra-cotta work was fixed by masons furnished by the building contractors.

The terra-cotta of Messrs. Gibbs & Canning is prepared from fire-clay, without foreign admixture, and is burned at a high temperature, such as promises to render it very durable; the blocks are not made in the manner followed by Messrs. Blashfield & Blanchard, with cells which have to be filled in with concrete or grouting, but are chambered from behind, so that the brickwork of the wall can be built into them. It is necessary, therefore, in estimating the cost of fixing of this terra-cotta to allow for the extra brickwork necessary; but of course there is a saving of grouting and concrete, and it appears to me to make a better job than the blocks with the cells closed at the back.

The red bricks employed in conjunction with the terra-cotta were supplied by Mr. W. Cawte, of Farchim. They are very heavy and hard, having, if I may use the expression, a metallic-looking and slightly conchoidal fracture, are little absorbent, and are for beauty of tint unsur-

passed by any bricks in the kingdom. I was indebted to Mr. Gilbert Redgrave for the whole of the work connected with the preparation of the terra-cotta, as well as for his general advice and assistance in every part of the work; and Mr. Verity was charged with the preparation of the constructive working drawings.

It will be observed that on the exterior of the wall of the picture-gallery in the original design the surface was broken with decorative panels of Geometric design. It was suggested to me by Mr. Henry Cole that this wall gave a fine opportunity for a mosaic picture of figures which he thought should be considerably larger than life-size. My assistant, Mr. Townrose, on the other hand, while he approved of the notion as much as I did, was strongly in favour of reducing the figures to nearly half life-size; and Mr. Gamble, who was much consulted throughout, and who was my boldest adviser in most cases of doubt, supported him. In this conflict of views, I resorted to the counsels of the weak and prudent, and adopted the middle course, which had to my mind this recommendation. The first idea of a spectator would be that they were life-size, and although the apparent magnitude of the building might be enhanced by a reduction of the figures, it was better that such an expedient for producing effect should not be attempted, as the balcony immediately below it, with or without living persons standing on it, would certainly reveal the truth. On the other hand, I saw no reason to reduce the apparent size of the building for the sake of a fine mosaic picture. The figures, by the advice of some of the artists who undertook to prepare the designs, were finally made something over full life-size. It was at the same time arranged that the colours should be buff upon a chocolate ground, and that the outlines should be black. These points were settled in conjunction with Messrs. Pickersgill, R.A.; Marks, A.R.A.; and Yeames, A.R.A. The other artists who contributed designs were Messrs. Armitage, A.R.A.; Poynter, R.A.; Horsley, R.A.; and H. Armistead. The frieze was divided into sixteen lengths of about 60 ft. each, some artists taking two or three such lengths, and the sum accepted in payment for the work was so moderate as to entitle these gentlemen to the warm thanks of all who are interested in the application of pictorial art to architectural buildings.

This valuable series of designs is exhibited this evening on your walls. They are drawn on a scale of 6 ft. 6 in. to the foot, and the task of enlarging them to the size of the proposed mosaic reproductions was entrusted to Sergeant Spackman of the Royal Engineers, who was fortunate enough, as I believe, to make the enlargements to the entire satisfaction of the artists. He prepared small photographic negatives from the originals, and by means of a camera, illuminated with a lime-light, threw an image of the required size on to a screen covered with paper, upon which the necessary outlines were then put in with black lines. Sergeant Spackman, who is himself an artist, determined as a rule the thickness of the lines to be used, but on this point he consulted the artists whenever he was able to do so. The thicknesses of the tesserae employed in translating these enlarged pictures varied from $\frac{1}{8}$ of an inch to $\frac{1}{4}$ of an inch in five gradations.

It would occupy your attention too long to describe the process by which the mosaic workers produced the actual ceramic pictures on the walls of the building, and I have said sufficient to enable an opinion to be formed of the feasibility of the more general adoption of this species of mural decoration. I would only observe that the flat treatment in this case was not selected from a conviction that it is in itself superior to a treatment in relief for exterior decoration, but because the latter mode would have been very difficult or impossible, for two reasons:—First, it would have been hard to find a body of modellers who could have executed in the given time 800 ft. of full-size figures in relief, with the same degree of excellence as could be secured by adopting the work of the painter instead of availing one's self of the sculptor's art. Secondly, if this difficulty could have been got over, the means at my disposal were quite insufficient to have met the expense of executing the work by the assistance of the latter. The total cost of the frieze, including the designs, their enlargement and fixing, was 4,426*l.*, and its area is 5,200 square feet. Has this decoration been too dearly bought? To say that another mode of decoration would be more effective, if that mode be impossible under the

conditions of the case, will not settle the question of the mosaic flat treatment being or not being one that ought to be repeated. In discussing the question, the facility with which the artist's work can be effectually rendered in mosaic work without much artistic feeling or knowledge of the human figure on the part of the operator ought not to be lost sight of. For modelling in relief every workman employed must be an educated artist, unless the architect is satisfied that work of art shall be the characteristic of the work. May I be permitted to suggest, also, in favour of a flat treatment, that in London soot deposits and birds' nests have somewhat marred the effect of the sculptured figures in the pediments of our public buildings?

The Messrs. Lucas Brothers were the chief contractors, and the well-known character of their foremen, their boldness in meeting the views of the architect, and their ability in coping with the most formidable difficulties did not forsake them here. For clerks of the works I had Mr. Hensley, who showed the most zealous attention to his work; and Mr. Sankey, who superintended the preparation and fixing of the roof to my entire satisfaction. I was also much indebted for assistance to many other gentlemen, but I must not detain you by particularising the nature of the assistance they rendered. I ought not, however, to pass over the name of Mr. Charles Stephenson, who afforded me great assistance throughout the whole work.

DISCUSSION ON THE REPORT OF THE ROYAL SANITARY COMMISSION.

A MEETING was held at the Rooms of the Social Science Association, Adam-street, Adelphi, on Monday evening, January 22nd, when a discussion took place on the Report of the Royal Sanitary Commission. Mr. George Godwin presided.

The Chairman, in commencing the proceedings of the meeting, said that it was of the greatest importance that steps should be taken to keep the subject then to be considered before the public. We had just recovered from the alarm caused by the gloomy anticipations of what would have been a frightful loss to the whole community; and the cause of this was intimately connected with sanitary matters. Public opinion was in a state of excitement on the subject. Whether this excitement would speedily pass away with no definite result, as had been the case on many similar occasions, and whether the Legislature would act with effect, remained to be seen. It was their duty to urge the necessity for the consideration of sanitary measures, and of proper steps being taken to put matters on a better footing than now. He had heard, on other subjects, measures proposed in meetings of this Association, which at the time were not listened to by the general public, or were denounced as impracticable, but which afterwards had been generally adopted. He trusted that the present discussion, which he then invited Mr. Hastings to open, might have a good effect, and that in a matter which concerned the public good so much as the present, we might speedily see a great change.

Mr. G. W. Hastings said the Report of the Royal Sanitary Commission had a very wide scope; but in his opinion the chief points in it were, firstly, the constitution of the Board, to which it was proposed to entrust the carrying out of the measures to be adopted; and, secondly, the executive officers who were to be their agents. He was not sanguine that a complete measure of sanitary reform would be speedily passed, and he doubted if the subject could be dealt with satisfactorily in a short period of time. If one or two points could be settled in the next session, and those upon a right principle, we should have made more progress than if the whole subject were considered and settled hastily. The present arrangements in regard to sanitary matters were absurd, and often involved a conflict of authority between those who had charge of the different departments of the same work. To reconcile those conflicting local authorities, or supersede them by a better arrangement, was a very desirable thing. He had formerly expressed the opinion, which he still maintained, that in rural districts the proper authority in such matters as these was the county or its principal officers. In towns of some size the town councils might have the control, as being the best available body. In the rural districts the great obstacle in the way of improvement was the intervention of private

interests. The only way to eliminate this was to raise up an authority which would be superior to it. He thought that this authority might be confided to the Justices in Quarter Sessions. In addition to other qualifications, he believed the fact that they were not elected was an important one. The representative principle did not suit every case, and this was one to which he thought it wise not to apply it. The proposal that the present Boards of Guardians should exercise this authority in sanitary matters he did not agree with. He understood that Mr. Stansfeld was in favour of a County Board of Guardians to be chosen by the present Boards from among themselves. This plan would amount to a virtual disfranchisement of the present *ex officio* members of the Boards. Mr. Goschen's plan to give half the seats on the Board to the ratepayers, and half to the Justices, was more in harmony with his own ideas. This was a kind of revival of the old County Courts. The School Boards had been offered as a model, but these were far from being free from bias, and the objects for which they existed did not in every case have the first place in the minds of the members. He thought that should the election of sanitary Boards be confided to ratepayers, the efficiency of the arrangements would be not so much considered as the question of expense. The calm judicial mind which the Board of Justices would bring to bear upon such matters as questions of compensation, and other sources of dispute, would be highly useful. In matters which now come before these bodies, the impartial and impassive way in which they are considered, was a noteworthy fact. In the higher functions of politics, the necessity of separating the different departments was apparent, but this necessity did not exist in matters of local government. He, therefore, should not object to the union of legislative and judicial functions in the proposed Boards. In regard to the officials to be employed under the Boards, the wisest plan would be, he thought, to obtain the services of a few highly-trained men, and pay them well, rather than to endeavour to multiply officers with insufficient payments. One or two such officials would be able to serve each county efficiently. The geography of the Poor-law Unions was useless for sanitary purposes; to carry these out properly, we must follow the watersheds. There should be no such conflict as we have now; but all matters of irrigation, sewage, and such like should be brought under the notice of one authority. Each county can now appoint an analyst; and this appointment had been of great service. In like manner, the county might appoint its one or more health officers. If such a measure were enacted, it would be a step in the right direction, an instalment of a future more perfect measure. In conclusion, he hoped the meeting would not be content with the small areas proposed by the Report, but would recognise the principle that the wider the legislature the more likely it would be to work satisfactorily.

Mr. Webster, Q.C., condemned the proposed small areas, and agreed with the principle of making the watersheds the sanitary districts. He thought the Justices would make very bad sanitary administrators, and desired no half-measures, but a complete and comprehensive scheme of reform.

Dr. Rogers spoke of the impracticability of entrusting sanitary matters to Boards of Guardians. He favoured the idea of committing them to the Court of Quarter Sessions, and thought a system of sanitary inspection might be arranged with great effect.

Dr. Ramsey coincided with Mr. Hastings in nearly all his views. He thought the Commissioners had done a great work. If they had done nothing else, they had shown what was to be accomplished. He condemned the proposed multiplication of small bodies, as destructive of efficiency. The large centres of population might be treated as the counties, in regard to the establishment of local Boards. He thought, in a general way, it would be best to follow the old lines in the apportionment of districts.

Dr. Lankester agreed in the main with Mr. Hastings's remarks. He thought it was impossible to carry out the plans of the Commissioners. He could not say anything in favour of Boards of Guardians, but must confess that he was just as much afraid of justices. He thought there should be an independent Controlling Board, similar in its constitution to the Board of Works. The present action of sanitary authorities, as, for instance, in their doings in relation to the prevailing epidemic of small-pox, was highly un-

satisfactory. He desired to see a Central Board of Health established with power to enforce sanitary measures in every village.

Dr. Steward differed in several particulars from what had been said. All the arguments of Mr. Hastings were directed against the representative principle. But he thought people could not be taxed for the support of what they did not believe in. He thought we must take the present local machinery and use it as best we could. He preferred the Boards of Guardians to the Justices. The Controlling Boards should be elected directly, and not sifted through Boards of Guardians. The best area, he thought, was that of the present unions, of which combinations might be made, where requisite, by the central authority.

Dr. Little was not disposed to wait for a complete measure until people were educated.

Dr. Steward hoped whatever Acts might be passed that they would not clash the one with the other. He would refer the meeting to the joint report of the British Medical and the Social Science Associations in reference to the education question.

Mr. Frederic Hill made a few observations, concurring generally with Mr. Hastings's opinions.

Mr. Chadwick desired that the areas of districts should be extended, and these should follow the watershed. The engineer and the architect were important agents in the work of sanitary reform. We must look for improvement, in all the particulars, to the great hand-owners. He instanced the efforts of the late Duke of Northumberland in this direction as offering an example worthy of imitation. The officers he thought it was advisable to appoint by competitive examination, and not by nomination.

The Chairman said he thought no one could consider the report of the Commissioners as absurd, a term which had been used by one of the speakers, although we might not be able to agree with them in all their recommendations. There seemed to be in the meeting a unanimous opinion that Boards of Guardians were not the right bodies to trust for sanitary improvements, and that mixed Boards, consisting of magistrates and selected guardians, were preferable. He thought so too. Also that there should be superior officers of health, sufficiently paid to abandon private practice, with the Poor-law medical officers as assistants. One omission he might notice in the Report: the necessity of attention to good construction in sanitary works was not referred to. The ventilation of sewers, which should be made a law, was but just touched upon in the Report. He hoped the discussion would have some influence in the settlement of the question, especially as there was such unanimity on the main features. We could not wait till the education of the community was completed. Years had passed, and comparatively little progress had yet been made. The advancement of the human family should be the great aim of our efforts, and in our progress towards this end we should spare neither time nor money.

ON THE INFLUENCE OF GAS AND WATER PIPES IN DETERMINING THE DIRECTION OF A DISCHARGE OF LIGHTNING.*

ALTHOUGH the invention of the lightning conductor is one of the noblest applications of science to the wants of man, and its utility has been established in all parts of the world by the experience of more than a century, yet a sufficient number of instances are recorded of damage done by lightning to buildings armed with conductors to produce, in the minds of some, an impression that the protective influence of lightning conductors is of but questionable value.

The destruction, by fire, of the beautiful church at Crumspall during a thunderstorm on the morning of the 4th inst., has induced me to bring before the Society, with a view to their being known as widely as possible, some facts connected with the electric discharge which have guided me for some years in the recommendation of means by which disasters of this kind may be averted.

For the proper consideration of this subject it is necessary to make a distinction between the mechanical damage, which is the direct effect

* By Mr. Henry Wilds. Read at a meeting of the Manchester Literary and Philosophical Society.

of the lightning stroke, and the damage caused indirectly by the firing of inflammable materials which happen to be in the line of discharge.

Instances of mechanical injury to buildings, not provided with conductors, are still sufficiently numerous to illustrate the terrific force of the lightning stroke, and at the same time the ignorance and indifference which prevail in some quarters with respect to the means of averting such disasters; for wherever lofty buildings are furnished with conductors from the summit to the base, and thence into the earth, damage of the mechanical kind is now happily unknown.

Even in those cases where lightning conductors have not extended continuously through the whole height of a building, or where the lower extremity of the conductor has, from any cause, terminated abruptly at the base of the building, the severity of the stroke has been greatly mitigated, the damage being limited, in many cases, to the loosening of a few stones or bricks.

The ever-extending introduction of gas and water pipes into the interior of buildings armed with lightning conductors has, however, greatly altered the character of the protection which they formerly afforded, and the conviction has been long formed upon me that, while buildings so armed are effectually protected from injury of the mechanical kind, they are more subject to damage by fire.

The proximity of lightning conductors to gas and water mains, as an element of danger, has not yet, so far as I know, engaged the attention of electricians, and it was first brought under my notice at Ollham in 1861, by witnessing the effects of a lightning discharge from the end of a length of iron wire rope which had been fixed near to the top of a tall factory chimney, for the purpose of supporting a long length of telegraph wire. The chimney was provided with a copper lightning conductor terminating in the ground in the usual manner. In close proximity to the conductor, and parallel with it, the wire rope descended from near the top of the chimney, for a distance of 100 ft., and was finally secured to an iron bolt inserted in the chimney about 10 ft. from the ground. During a thunderstorm which occurred soon after the telegraph wire was fixed, the lightning descended the wire rope, and instead of discharging itself upon the neighbouring lightning conductor darted through the air for a distance of 16 ft. to a gas-meter in a cellar of an adjoining cotton warehouse, where it fused the lead pipe connections and ignited the gas. That the discharge had really passed between the end of the wire rope and the lead pipe connections, was abundantly evident from the marks made on the chimney by the fusion and rottilisation of the end of the wire rope, and by the fusion of the lead pipe. As the accident occurred in the daytime, the fire was soon detected and promptly extinguished.

Another and equally instructive instance of the inductive influence of gas-pipes in determining the direction of the lightning discharge occurred in the summer of 1863 at St. Paul's Church, Kersal Moor, during divine service. To the outside of the spire and tower of this church a copper lightning conductor was fixed, the lower extremity of which was extended under the soil for a distance of about 20 ft. The lightning descended this conductor, but instead of passing into the earth by the path provided for it, struck through the side of the tower to a small gas-pipe fixed to the inner wall. The point at which the lightning left the conductor was about 5 ft. above the level of the ground, and the thickness of the wall pierced was about 4 ft.; but beyond the fracture of one of the outer stones of the wall, and the slaking of the plaster near the gas-pipe, the building sustained no injury.

That the direction of the electric discharge had, in this case, been determined by the gas-pipes which passed under the floor of the church, was evident from the fact that the watches of several members of the congregation who were seated in the vicinity of the gas mains were so strongly magnetised as to be rendered unusable.

The church at Crumpsall is about a mile distant from that at Kersal Moor, and the ignition of the gas by lightning, which undoubtedly caused its destruction, is not so distinctly traceable as it is in other cases which have come under my observation, because the evidences of the passage of the electric discharge have been obliterated by the fire. From information, however, communicated to me by the clerk in charge of the building, as to the arrangement of the

gas-pipes, the most probable course of the electric discharge was ultimately found.

The church is provided with a copper lightning-conductor, which descends outside the spire and tower as far as the level of the roof. The conductor then enters a large iron down-spout, and thence is carried into the same drain as that in which the spent discharges itself. Immediately under the roof of the nave, and against the wall, a line of iron gas-pipe extended parallel with the horizontal lead gutter which conveyed the water from the roof to the iron spout in which the conductor was inclosed. This line of gas-piping, though not in use for some time previously to the fire, was in contact with the pipes connected with the meter in the vestry, where the fire originated, and was not more than 3 ft. distant from the lead gutter on the roof. As no indications of the electric discharge having taken place through the masonry were found, as in the case of the church at Kersal Moor, it seems highly probable that the lightning left the conductor at the point where the latter entered the iron spout, and by traversing the space between the leaden gutter and the line of gas-piping in the roof, found a more easy path to the earth by the gas-mains than was provided for it in the drain.

In my experiments on the electrical condition of the terrestrial globe* I have already directed attention to the powerful influence which lines of metal, extended in contact with moist ground, exercise in promoting the discharge of electric currents of comparatively low tension into the earth's substance, and also that the amount of the discharge from an electro-motor into the earth increases conjointly with the tension of the current and the length of the conductor extended in contact with the earth. It is not, therefore, surprising that atmospheric electricity, of a tension sufficient to strike through a stratum of air several hundred yards thick, should find an easier path to the earth by leaping from a lightning conductor through a few feet of air or stone to a great system of gas and water mains, extending in large towns for miles, than by the short line of metal extended in the ground which forms the usual termination of a lightning conductor.

It deserves to be noticed that in the cases of lightning discharge which I have cited the lightning conductors acted efficiently in protecting the buildings from damage of a mechanical nature, the trifling injury to the church tower at Kersal Moor being directly attributable to the presence of the gas-pipe in proximity to the conductor. Nor would there have been any danger from fire by the ignition of the gas if all the pipes used in the interior of the buildings had been made of iron or brass instead of lead; for all the cases of the ignition of gas by lightning which have come under my observation, have been brought about by the fusion of lead pipes in the line of discharge. The substitution of brass and iron, wherever lead is used in the construction of gas apparatus, would, however, be attended with great inconvenience and expense, and moreover, would not avert other dangers incident to the disruptive discharge from the conductor to the gas and water-pipes within a building. I have therefore recommended that in all cases where lightning conductors are attached to buildings, fitted up with gas and water pipes, the lower extremity of the lightning conductor should be bound in good metallic contact with one or other of such pipes outside the building. By attending to this precaution the disruptive discharge between the lightning conductor and the gas and water pipes is prevented, and the fusible metal pipes in the interior of the building are placed out of the influence of the lightning discharge.

Objections have been raised by some corporations to the establishment of metallic connexion between lightning conductors and gas mains, on the ground that damage might arise from ignition and explosion. These objections are most irrational, as gas will not ignite and explode unless mixed with atmospheric air, and the passage of lightning along continuous metallic conductors, will not ignite gas even when mixed with air. Moreover, in every case of the ignition of gas by lightning, the discharge is actually transmitted along the mains, such objections notwithstanding. A grave responsibility, therefore, rests upon those who, after introducing a source of danger into a building, raise obstacles to the adoption of measures for averting this danger.

LONDON AS IT IS, AND AS IT MIGHT BE.*

THE general aspect of the streets of London, even the principal ones, is commonplace, uninteresting, and even ugly; and, compared with the advantages gained, a very trifling expense would make an astonishing difference in this. What a difference, again, is there between London and Paris in this respect. There it is a pleasure in the best quarters to walk from one part of the city to the other: the fine broad boulevards, lined with trees, stretching in every direction; the fresh clear air; the white stone façades, rich with carving and sculpture; the tasteful shops, almost everywhere, make Paris the very pattern of a capital city. And this is my apology for referring to it so often in this paper.

The effect to Londoners coming back from Paris to their own dirty city, with its long rows of uninteresting brick-built streets, typified by Gower-street; its monotonous squares; its filth and its smoke, is disheartening in the extreme; in fact, it is only through the principal thoroughfares, such as Oxford-street, Regent-street, or the Strand, where the shops and the throngs of people afford some amusement, that the pedestrian would care to loiter in London. Those of us who live within the town usually rush about from point to point by cab, underground railroad, or omnibus, our only thought being to get to our destination as soon as possible. Thus what might be a healthful exercise, becomes a fatiguing strain on the nerves.

I do not mean to say that there is not more solid and finer architecture in some parts of London than in Paris itself, such as the clubs about Pall-mall, the mansions round Hyde Park, and several great public buildings; and in the City, too, there are whole streets of architecture which, for boldness and originality, and solidity of construction, are far superior to Parisian. But it is all hidden in narrow streets and courts, and if you were to turn up your head to look at it, you would be carried away or knocked over by the rushing crowds below; in fact, the only time to be able to really see it is on Sundays, or on the early morning or late evening of a summer's day, when those busy millions have left off their toil for a time, and drawn off to the suburbs. But all the street architecture of London, with very few exceptions, is isolated from the surrounding buildings in style and character; and very often placed where it can hardly be seen at all to advantage.

Where the Parisians have the advantage of us is in the arrangement of their towns and streets. Nothing is hidden; all can be well seen, and nothing seems monotonous or devoid of interest. Now, it is a great reproach to us that Paris should be so beautiful and London so ugly. We cannot have and we do not want here a Napoleon and Baron Haussmann, to cleave lines of street right and left, regardless of cost, and indifferent to private interest; but we ought, at least, to do our very best to find out some way to remedy the evil. Is it possible to suggest some plan, for instance, by which a walk from University College to Oxford-street, down Gower-street, might be a pleasant stroll; or a walk along either the Edgware-road or Euston-road a pleasant and interesting one? Some will say we ought to build in white stone instead of brick. This may sound very well in theory; but it is impossible and out of the question. If London cannot be made to look interesting in brick and plaster, it is pretty certain that it will have to remain in its present ugliness, unless there be some revolution in our systems of household and notions of economy. What we want is, to find some plan by which, without wholesale pulling down and building up, the existing London can be materially improved; and there are some improvements of this sort that seem to me to be obvious and easy of carrying out. The most important of these is a system of boulevards, lined with trees, in every direction, without, however, forming any new streets, or running to any great expense. No place could be more favourably circumstanced than London for constructing these useful and beautiful features of a large city. There are numerous, almost countless, broad roads in every quarter, of which I will take Euston-road or Pentonville-road as a familiar type, which has once been suburban, and have been lined in the main by private houses, with small gardens in front. As the town increases these roads become required for

* *Philosophical Magazine*, August, 1868.

* By Mr. Alexander Payne. See p. 40, ante.

shops, which are accordingly built out on the front gardens, one story high, and decorated on the top with all sorts of fantastic plaster casts, zinc-ware, &c., forming about as ugly a road as can well be imagined. Now, all that is wanted to turn these roads into magnificent boulevards would be to build the shops under the houses in the ordinary way, and to make use of the part now occupied by front gardens for wide foot-paths, bounded by trees. This might be attended with some expense in buying up the gardens; but this would be as nothing compared to the immense gain, which would entirely transform London into a new city; and it is highly probable that the property on each side of the roads would be so increased in value as to pay for the expense. Where there was much room to spare, as there would be in many cases, narrow gardens, with flower-beds and seats, might be formed under the trees; and where the underground railroad went underneath, shafts could be provided, by which that useful line would become less sulphurous and tunnel-like than at present.

It seems to me that, after clearing the air from smoke and dirt, the next urgent want is to introduce nature into London. We want nature's trees and flowers wherever we can find a place for them. The Embankment, with its gardens, and the beautiful flower-beds that have appeared of late years in the parks are steps in the right direction; but we want a great many more such steps. We want more public squares laid out as gardens, with fountains and seats. The parks are so far distant from one another that it is quite a journey to get at them; but if we had occasional public squares or gardens, however small, we could, in a long walk, put up with a dingy street or two for the sake of the gardens. I do not hesitate to say that it would be an immense gain to the occupiers of private squares themselves if they were all thrown open to the public; for instead of the privilege of paying a guinea or two for the right of entering one dingy square, and shutting everybody else out, they would have the right of entry into all for nothing; and they would also see hundreds enjoying a sniff of fresh air, and little healthy cheeks glowing, which but for that square would have been stived up in some pestiferous street, as they are now. This would be the way to educate the people, and do as much good as half a dozen British Museums. Why should not Leicester-square, for instance, be made a public garden? Is its present condition such a boon to its private owners or the neighbourhood that it cannot be given up? The lack of a place to sit down and rest your weary limbs is a terrible want in London, as at present. Let a stranger go down to the Embankment on a summer's day. He is, perhaps, tired, and wishes to sit down and watch the river; but there are no seats. Why on earth are there no seats along the Embankment? Happy thought,—ho will go into the gardens across the road: his only view, it is true, will be the well-known rinous brick buildings that uphold the architectural glory of London in this quarter; but, at least he can rest his weary limbs. He repairs to the garden, and he sees about five or six seats, each thickly studded with nursery-maids and children, who do not look as if they had the slightest intention of giving them up. A policeman, perhaps, tells him there are plenty of seats in Hyde Park; but, as he does not wish to walk three or four miles for a seat, he repairs either to the waiting-room of a railway-station or to some refreshment-room, where he purchases the luxury of a seat with a cup of coffee or a chop, which he does not want.

But, in the next place, we have many streets in London with and without shops which it would be impossible to turn into boulevards, and where we could not introduce trees or squares. Is there any way of improving this ordinary street architecture of London without pulling it down and rebuilding it. Most of our houses and shops have a facing of stone, stucco, or brick; those of stone are usually the aristocrats of the neighbourhood, of considerable architectural pretensions, and an example to the rest of the street: what is wanted is to "level up" the others (to use Mr. Disraeli's expression) to the same point. With regard to the stuccoed ones, I know of two examples, which prove that it is quite possible to make any ordinary brick house look artistic and interesting without facing it with stone or marble. I refer to Novello's music establishment in Berners-street, and to the confectioner's, in Oxford-street. Nothing could be plainer than the structural part of Novello's

warehouse, which is simple brick and stucco, but is so tastefully decorated in patterns in colour as to afford as much pleasure as many an elaborate stone building; and the same system might, of course, be pursued with any stuccoed building. The confectioner's is more elaborate structurally than the other, but far the greater part of its ornaments are in colours. This seems to me to be an entirely new and useful field for architects;—given an ordinary stuccoed house,—to make it look artistic and interesting; unless, indeed, we are to nitidly despise stucco, and decline to stoop to house-decoration of this sort as beneath our notice. If this be our line of action, we shall probably be deserted by the public, who will turn to engineers as a more useful body, and leave us to feed on the glory of our æsthetic ideas. I hold our true course to be to make the best of everything, even paint and stucco, and despise no materials, that are given us to work with; and by so doing I think we shall follow in the footsteps of the best of our predecessors. But, if stucco can be decorated, what can we do with brick? A little while since, a prize was offered to gentlemen of this Association for the best design for the front of an ordinary Gower-street house, and in answer several very pretty designs were sent in; but, I believe, in every case the idea was to pull down the front and rebuild it; and the objection to this is that it is very certain very few, if any, of the people in Gower-street will pull down the fronts of their houses and rebuild. But how are they to be made artistic and interesting without pulling them down? I confess this question seems to me a poser. I cannot imagine one of these houses in Gower-street looking interesting without pulling down the front and rebuilding it. I can only suggest,—put some flower-trays in front of every window; put some large pots or boxes in the basement area, and train creepers on trellises up the front if they will grow. Perhaps some one will be able to suggest a better way.

Time warns me I must pass on to my last point,—“That there is a want of general supervision in London from a fine-art point of view.” Nothing is more striking in London than the utter confusion and want of plan in the place taken as a whole; it is more like a collection of towns than one town, and the streets wind about and bend here and there in a sort of fortuitous manner, as if their position were the result of chance. The rights of separate individuals everywhere seem to override the public advantage, and the same is apparent in the motley architectural character of the streets. One man has his warehouse or shop built in Classic; his neighbour adjoins thereto a Gothic building, without the slightest attempt to make it accord in any way with the former one. I think Regent-street is the only street of any architectural pretensions in London which has anything like similarity or unity of design about it; in other cases the only attempt seems to be to make each separate building look well *per se*, without considering whether it is in harmony with the rest of the street of which it forms a part. Another thing most noticeable in London is the number of untidy uglinesses which mar almost every view.

If any man carries on any business in a town which is offensive to the sense of smell or hearing you can prosecute him as a public nuisance; but he is allowed to offend against your more subtle sense of sight, by putting up some monstrosity which is a perpetual eyesore, with impunity. I must say this seems to me quite as great a nuisance as the other.

Let any one, for instance, examine the different views of London on the north side of the river from the various bridges or points along the Embankment; he will hardly find a single view which is not spoiled by one of these eyesores, which would not be tolerated for an instant in the best parts of a Continental city.

What was the use of the consummate art with which Wren designed the beautiful spires of the City, in perfect harmony with his glorious masterpiece—St. Paul's—so aptly termed the “mother and daughters of London,” when every view is marred by the introduction of some factory chimney or huge gasometer, which might at least be banished to the other side of the river; or by such specimens of fine art as Charing-cross and Cannon-street Railway Stations?—the one adorned with a couple of sow's ears towards the river, and the other left in native ugliness.

I am sure I shall not be accused of exaggeration when I say that there are far more blotches, blemishes, and general untidiness about views

of London, and English cities generally, than Continental ones.

Are we to draw a deduction from this, that the English are naturally deficient in taste, as compared with other nations? This may be partly true, and the lack of unity of plan so discernible in English cities no doubt has its rise in that individuality and love of freedom which is one of the cardinal points of the English character; but I think more must be laid to the door of that strong current of Puritanism which has set in so strongly in Christendom for the last two centuries, and especially in England. If this age is anything, it is a utilitarian age. This, no doubt, is a virtue; but it has carried its utilitarianism so far as almost to despise beauty in its love for utility. Ornament of any sort, and all things beautiful, have been thought fit for Oriental and effeminate nations, or perhaps for the French, but quite beneath the notice of practical Englishmen. Fortunately for us, however, the love of beauty is a goddess and heavenly-born, and cannot be slain by any age, however fanatical,—not, at all events, while nature pays her such worship in her glorious architecture, where beauty and utility go hand in hand. Hence we see the strong reaction in favour of fine art that has undoubtedly set in. Large sums are annually spent at South Kensington and Schools of Art generally to educate the people in this important subject. So far so good; but surely the streets should not be allowed to counteract what is learnt at the School of Art.

There are several other points I should have liked to take up, in connection with this subject, such as the desirability of providing accommodation in flats for all classes; and the advantage of building houses higher, with wider streets and openings between. At present very many quarters of London are taken up with numbers of small houses, designed for only one family, but generally occupied by two or three; but these things have been amply dealt with elsewhere, and they are such large subjects of themselves that it would be quite impossible for me to go into them this evening. I will therefore close my paper simply by recapitulating what has been said,—namely, that London is dirty, smoky; that its streets are monotonous and devoid of interest; that there is a lack of arrangement and fine-art supervision; that it might become clean; that its air might be purified, and much of the smoke prevented; that the character of its streets might be entirely altered, by formation of boulevards and other improvements; and that, under proper supervision from sensible persons, its blemishes might be gradually removed, and it might become one of the grandest and finest, if not the grandest city of the world, instead of one of the dingiest; and my hope that it may and will become so must form my apology for taking up the time of the Association with a paper on “London as it is and as it might be.”

In the discussion which followed the reading of this paper at the Architectural Association, Mr. Blashill said he was afraid London could hardly be expected, as things stood, to be a clean place, even in the well-attended thoroughfares. It was a place of business of very heavy traffic, and looked upon as such by the influential people who belong to it. The English people, with power of choice, had not been a town-loving people, as our neighbours the Parisians are, for example; and this difference of sentiment had hitherto affected, and will continue to affect the question. No one, however, disputes that improvements may be usefully made. The City, for instance, seems likely to undertake the cleansing of footways within its jurisdiction; doubtless to be followed by other similar changes. As to the chimney-cowls, he was afraid that Continental cities were as badly off as ourselves. In a recent visit to Geneva, he had noticed that a chimney without its contorted piece of zinc was an exception. He was afraid Englishmen would never submit with any pleasure to dictation as to the appearance of their frechold houses; he for his part thought that attempts at uniformity in London streets were pretty generally failures, destroying the picturesque and individual character so much to be wished for, and unluckily dictating more often than not a by no means pleasing type of building for unmeaning repetition.

Mr. G. Herbert West said that one point with reference to works carried out in Paris necessary to be noted in any comparison with London was sometimes overlooked. People did not consider that the continuance of the Paris of Louis Phi-

lippe's time had become impossible; it was then a fortified city of the Middle Ages, with some modifications; change was absolutely necessary in order to open up the city and fit the communications to the traffic. Visitors to Paris saw what appeared on the surface; but those who knew it thoroughly, from living there and from long special investigation, did not feel inclined to compare it with London as in every respect superior. The main thoroughfares certainly are kept clean; but the back streets, with their narrow pavements, 1 ft. 6 in. to 2 ft. 6 in. across, and wide mud-filled gutters, are very bad; in these places Paris beats London hollow in bad weather. Again, in Paris, the street mud is washed into the sewers, a course hardly possible in those of London, which, in fact, convey little but water. Paris yet retains the cesspools that London has to a large extent got rid of, as is evident to the nose in walking in the streets after eleven o'clock at night,—perhaps the worst evil of the two. Asphaltic roads, with proper attention, may be kept clean with less difficulty than granite or macadam; but the at times dangerous slipperiness,—the impossibility of stopping in any reasonable distance a vehicle driven at a fair pace,—is a drawback felt much at Paris, as no doubt it will be here, unless in some way avoided. The old regulation in Paris that houses should be cleaned once in every ten years, might be applied to London. A jet of steam and water were used for some time, with the effect of removing about one-eighth inch of stone on each occasion. The custom now seems to be to use a sort of hearth-stoning process, and soap and water. He called attention to the portico of the Athenæum Club-house as a sample of work in London cleaned at intervals; the process pursued was, he believed, to rework all faces and mouldings, a method that must be stopped at some time. As to the smoke in Paris, it certainly was less than in London, in consequence of the different habits of the people. For 6,000 or 7,000 francs a year, an apartment would be rented containing a couple of reception-rooms, one not large bedroom, two smaller, and a kitchen; of course the accommodation for such a rental in London would be much larger, but the French have smaller families than the English, and with the smaller number of rooms fewer fires for warmth are required. For cooking, charcoal in a pan, put out when done with, is the substitute for the kitchen fire in England. Coal is burnt much more now than formerly, but wood always by preference; the ashes are habitually heaped up at the back, maintaining a fire at once economical and producing little smoke. Up to the 1st of January, 1860, when the fortifications were made the municipal boundary, instead of the octroi wall of 1784, as formerly, the city of Paris contained hardly any manufactories; and, since 1850, many have been removed, in order to avoid the octroi; thus their smoke and fumes are kept away. On the question of general aspect he could say but little for London,—he perhaps deserved all that had been said of it; but he could not praise new Paris without reserve; after a time the regularity, the long level lines of its cornices, the repetition without ceasing of similar features, coupled with painfully bad masonry construction, all tended to make even the most favourable critic heartily sick of the whole,—as a mass of pretentious mediocrity, for which had been destroyed too many of the features of the city, that, of all modern cities, possessed at one time the most noteworthy collection of sites and buildings,—lodged in the minds of all cultured people for their historical or intrinsic interest. The site of the Hôtel de la Trémouille, one of the most splendid works of the fourteenth century, is all that the inquirer after such buildings finds now. The passion for perfectly straight streets became, a while ago, a perfect mania; the Hôtel de Cluny was, it is true, saved by a *débour*,—a rare example; buildings newly illustrated in books five years before are now almost forgotten altogether. The process so thoroughly carried on in Paris could not be looked, perhaps not wished, for in London;—a personal, almost uncontrolled, direction of finances and public works like that of Baron Haussmann would not be allowed. The Project of the Seine, named directly by the Emperor, chose, subject to the Emperor's approval, the members of the municipal commission. The financial questions may be illustrated by the fact that the ordinary receipts of the city from 1852 to 1869,—from octroi, centimes communaux, estates, markets, &c.,—amounted to 40,000,000. The outlay on

works in the annexation and new parts of Paris has been 14,000,000; of the works in old Paris, 18,680,000; of the extraordinary works (the large new streets, &c.), 52,000,000; making in all, 85,000,000. In 1854, Baron Haussmann ceased to ask aid from the State; the Central Office of Works began the issue of bonds, which gave an available income of from 4,000,000 to 6,000,000, subject to the yearly consent of the Corps Législatif. This, however, was not found sufficient, and the new streets were mortgaged to contractors as they were made, and also the future income of the city. The law of expropriation, pressed well into the service by Baron Haussmann, gave his autocratic power still more scope. He had the power of taking all the property required for a new street, and a great space on either side of it. Formerly (by the law of 1841) the Corps Législatif decided on the question of "Public Utility;" but after the decree of 1852 this was decided by the Emperor alone. These few facts, and many more could be cited with the same tendency, would illustrate the arguments that might be used to show that Paris, and the public works there, in the views at least of Englishmen, might fairly perhaps be spoken of with less thorough respect, both as to the works themselves and some of the processes of effecting them, than was the almost universal custom.

DOINGS IN EDINBURGH.

There is not much appearance of activity in the building trade here at present. The demand for private residences has fallen short of the supply; and the other works on hand are few, and of no great magnitude; but there is a good prospect of a considerable number of important works being inaugurated in the course of the year.

The Gilmore-place Free Church is being roofed in; but the tower is still incomplete. Mr. Pilkington has in this instance refrained from freaks and eccentricities; there is a breadth and masculine simplicity about this church much more satisfactory than the restless efforts at originality which characterised his former works.

An Independent Church at Caltonian Crescent, Dalry, is nearly completed. It is the first effort of Mr. Alexander Heron. Funds do not seem to have been plentiful, and the building appears somewhat weak and superficial. The outline of the spire is far from pleasing. It would have been better had that feature been dispensed with, and more depth and solidity imparted to the body of the church.

The foundations for the new Infirmary have been taken out, and building operations will be commenced forthwith. This building will be of considerable magnitude, and the ultimate cost is estimated at about 200,000.

The line of new thoroughfare from the Waverley Station to Canongate, to be known as Jeffrey-street, is nearly cleared out. In this street the long-delayed Trinity College Church is to be built. The plans have been prepared by Mr. Lessels, after the style of the ancient edifice, which was erased to make way for the extension of the North British Railway Terminus. The building will be oblong in form, having a tower and spire rising to the height of 115 ft. at one angle of the main gable, and a turret starting from the ground, and roofed with stone, at the other. The chief doorway is a reproduction of that in the transept of the original, and the window above is from the same source.

The apse and two bays of the original choir, together with the clearstory and vaulted roof, will be re-erected at the rear of the new portion, to serve as a hall for congregational purposes. It is to be placed diagonally to the church proper, from which it will be separated by an ornamental wooden screen, the upper portion of the two arches being left open. The interior of the church itself will be of a common-place description, with galleries supported by iron columns ranging round three sides of it.

Another new church is talked of as being likely to be erected in Chambers-street, the new thoroughfare to the north of the college. In the formation of this street it was found necessary to demolish the School of Arts, and a new and superior building, designed by Mr. David Rhind, is to be erected, at a cost of 8,000, upon a site to the west of that occupied by the premises which have been erased. At the east end of this street it is proposed to erect a hall for the use of the University, to be dedicated to Sir Walter Scott; and a scheme for a new theatre in the same locality has been mooted. A movement

has been set on foot to have a town-hall, which is greatly needed in this city; it may also form one of the group of public buildings in this locality. Altogether Chambers-street is likely to be the centre of attraction in the old town.

The new Waverley Bridge is being actively pushed on, and when it is completed the new station will be proceeded with. This is a very desirable improvement, for the existing station is in every respect quite unworthy of the city. As the large piers of the North Bridge interfere greatly with the platform arrangement, it has been proposed to substitute an iron girder bridge for the stone one, but funds are not forthcoming. At all events, the roadway of the bridge is to be widened, and, if a new bridge be not constructed, this is to be done by throwing out projecting footpaths on either side, and adding the present footpaths to the driftway.

The trustees under the Walker bequest have at a late meeting set aside 45,000, for building the new cathedral. In this sum the cost of an organ, stained-glass windows, peal of bells, &c., is not included, so that it is not improbable that the ultimate expenditure may be double that sum. Six architects,—three from each side of the border,—have been invited to submit designs. The competing architects are Messrs. Scott, Street, and Burgess; Messrs. Peddie & Kinnear, and Lessels, of Edinburgh, and Mr. Ross, Inverness. We trust that this competition may lead to a more satisfactory result than has been the case in some recent instances of a like nature. A complete scheme for the allocation of the remaining part of the trust funds, which are to be employed in erecting and endowing additional churches, has been agreed on, but it has been thought desirable, before taking further steps, to have the opinion of counsel upon certain doubtful points.

The Union Bank of Scotland have acquired an extensive frontage in George-street with the view of building new premises there, which, it is said, are intended to equal if not to surpass in grandeur the other banks in this city; and probably no city in the world can show such an array of palatial edifices devoted to this purpose. Mr. David Bryce is, we believe, likely to be employed as architect.

Ramour has it that a new insurance office is to be erected at the angle of St. Andrew-street and Register-street, an excellent site for architectural effect.

The Tramway Company are anxious to push on the remaining portions of the line of rails, but they are not at one with the local authority. The steep gradients in many parts of the city have proved obstacles to the satisfactory working of the tramways; during the existence of hard frost it was with great difficulty that the large carriages were drawn up Leith-street, even with the aid of extra horses; lighter cars should be provided.

THE DUKE OF EDINBURGH'S COLLECTION, SOUTH KENSINGTON.

His Royal Highness the Duke of Edinburgh has obligingly sent to the South Kensington Museum the drawings made in illustration of his cruise round the world in the *Galatea*, by Mr. Brierly and Mr. Chevalier, together with selections from the objects of science, art, and curiosity collected in the course of it. The catalogue which has been prepared shows that there are 37 sketches by Mr. Brierly, 36 drawings by Mr. Chevalier (both the artists have done their work well), and 781 objects in the general exhibition. The collection, as a whole, is full of interest, regarded from many points. Some will be struck with the evidence it affords of the eager kindness with which the Queen's son was received throughout the colonies and dependencies of the empire; others will regard it as a valuable indication of the disposition and tastes of the owner, and of his consideration for the general pleasure; those who look closer will see that it affords many important lessons to our own people; while all will find it an interesting exhibition of things curious and beautiful. It has been well set forth by Mr. T. Clark and Mr. C. Fowleshand, of the Department; the birds, of which there are two grand cases, were arranged by Mr. Ward, the naturalist, and the arms, a beautiful collection, are shown in the shape of trophies, at the suggestion of the Duke himself, Messrs. Wilkinson & Co., of Pall Mall, assisting. Some of these arms present exquisite specimens of enamelling, metal chasing, mechanical ingenuity, and coloured decoration.

The articles from Japan include works in bronze, black and gold lacquer, and textile fabrics, unapproachable in this country. Notice, for example, the bronze incense-burner in three stages, given to the Duke by the Mikado (102); the box, of black and gold lacquer, containing various graces (559); and the remarkable dress of blue crapes representing the sky, and graduating downwards to a sedge landscape at bottom, with birds flying. However, we have no intention now of pointing to all that is noticeable in the exhibition; our object is to send our readers to study it for themselves. We will only add that the collection of gold and silver trawls, jewelled and mother-of-pearl and malachite, with which first stones of public buildings were laid in our colonies, is a marvel; and in viewing the engrossed addresses that chronicle the events the expert will notice with surprise the skill with which some of them are illuminated.

ALTAR VESSELS FOR ST. PAUL'S CATHEDRAL.

In 1810 the altar-plate belonging to St. Paul's Cathedral was stolen, and from that time to this copper gilt vessels have been used. At the cost of several persons, silver gilt vessels have now been prepared by Messrs. Lias & Son, of Salisbury-court, Fleet-street;—a large chalice, the gift of the Rev. W. J. Hall; two chalices and patens, presented by the Rev. W. Sparrow Simpson, F.S.A., who has taken particular interest in the work; other chalices and patens given by Miss Hale and Mrs. Melvill; and a large and costly alms-dish, presented by Mr. Joshua W. Butterworth, F.S.A., in memory of his late father; and some of the other gifts, we should say, are also in memoriam. The chalice (No. 16) is high, chased with wheat and grapes, relieved by bright flutes, in the style of the Renaissance; the body enriched with six medallions, containing the symbols of the Passion—the Cross, the Agnus Dei, the Scourge, the three Nails, the Crown of Thorns, and the Sponge and Spear; the foot ornamented to correspond with the body, with six medallions, containing the sacred monogram, the Chi-Rho, the open scroll, the pelican, the arms of the cathedral, and the crest of the donor* and the chalices are handsome and appropriate; the art a little weak, but the manufacture very good.

By far the most important production is Mr. Butterworth's Alms-dish, which is 2 ft. 3 in. in diameter. The centre subject is after Raffaele's cartoon, St. Paul preaching at Athens, chased in high relief; the border being after a guilloché in the chancel of the cathedral, with medallions containing scenes in the life of St. Paul.—1. St. Paul healed by Ananias. 2. St. Paul healing a cripple. 3. St. Paul raising Eutychus. 4. St. Paul before Agrippa. 5. St. Paul at Melita; and the arms of the donor. The work is *reposé*. The least satisfactory parts of the central subject, are the head of Paul, and the circular temple in the background. The right-hand side of the latter is so messed by the modeller, that it ought certainly to be altered before this otherwise fine dish be transmitted to its destination.

NOTTINGHAM SCHOOL OF ART.

The annual distribution of prizes in connexion with this school has taken place in the Exchange Hall. The Mayor (Mr. W. G. Ward) presided, and there was a large attendance.

A letter from Mr. Cole, of the Science and Art Department, who was to have presided himself, was read, in which

"he congratulated the town of Nottingham on possessing one of the very best Schools of Art in the country; and also said:—The town must adopt further measures for maintaining this position and extending the influence and advantages of further art-education, by the establishment of a Museum of Science and Art especially illustrative of those industries which have given to the town an eminent position it holds among the great manufacturing centres of the United Kingdom. . . . The School of Art already possesses suitable space for the commencement of such a museum. . . . The municipal authorities must incur the liability for the cost of watching, cleaning, and lighting the museum; and if this be done, Nottingham, within a few weeks from this time, might have a South Kensington Museum in its town, open daily, and for three evenings a week for the instruction and ennobling recreation of all classes. I say 'liability,' because the fees for admission on three days in the week would certainly yield some revenue. This revenue might be made adequate for all purposes without, perhaps, drawing upon the rates, if the entry and the manufacturers of the town would take a

* Since this was written, we have been informed by Messrs. Lias that, recognising the correctness of the objection we took on examining the work, the parts in question will be altered,—a determination very creditable to them.

sufficient number of annual tickets of admission for the students' day, say at 1s. and 10s."

The Mayor, in reading this part of the Report, said he could not sit down without bearing his testimony to the able services rendered by their excellent head master, Mr. Rawlin. From the Report, it appeared that,—

"In the annual Government examination, held last May, the Nottingham school again headed the list, making the fourth consecutive year that Nottingham has obtained the highest number of prizes among all provincial schools. In May last, however, the school took a much higher place, having not only beaten all provincial schools, but all the London schools, taking two more prizes than were taken at the National Art Training Schools, South Kensington Museum. In the prize bonus awards to art-masters this year Nottingham has taken the highest prize among all provincial schools. The first two prizes were taken by London schools; then the next eight were in the following order:—Nottingham, Manchester, Edinburgh, West London, Birmingham, Salisbury, Sheffield, and Glasgow. During the four years that bonuses have been given to head masters, it will show how greatly Nottingham had done its work when they found that in that time the master of the Nottingham school had taken 1701, in prizes, or 29¢ more than any other school in the kingdom, including the London schools."

Mr. Bowler and the head-master also addressed the meeting. The latter said:—

"It has ever been a source of regret to me that employers of labour and artisans could not feel more alive to the necessity and importance of a more widely-spread art-education. The race for pre-eminence between certain nationalities is now a very close one. We do not bridle ourselves up for the contest, we shall perhaps by-and-by, find that the laurels of success have been won by others. We are now enjoying unparalleled prosperity, and yet as a nation we are doing far less for art, in position and means would justify quite us to do. True, the country has one thing to be proud of, and that is the existence of that palace of art-treasures, the South Kensington Museum; and for the possession of which we are so deeply indebted to Mr. Cole, for it is in a very great measure owing to his efforts that the museum holds the proud position which it does. But we need more than that; the country should aid the action of the Science and Art Department still further, and not only give ungrudgingly that is necessary for the improvement of that museum, but also give with a bounteous hand for the purpose of erecting a young South Kensington Museum in each of our great provincial towns, that the seeds of art and refinement might be sown in many a soil now comparatively barren."

TRAVELLING IN RUSSIA.

COL. RICHARDSON GARDINER, whose handsome offer in respect of the one-day-to-be-misused statue of Shakespeare we had occasion to mention some time ago, has sent us notes of a journey recently made by him to the Russian capital, which will doubtless interest some of our readers:—

"At eleven p.m. we took our places from Berlin to St. Petersburg,—two nights' and two days' travel. Let us look about us and see what our arrangements are. L. and I have a double compartment-carriage, each opening out into the other by a door between; the one making up into beds for the night, and the other forming our compartment for day, all headed most genteelly by hot-water pipes laid on from the engine boiler. Good. Our commissionaire, whom we sent to engage this extra comfort for us, carried out his instructions well. Our companions have a large saloon carriage, heated by a wood-burning stove, and all of them are seated round it smoking their cigars.

Now, I have no doubt hundreds of English railway directors have travelled on these German lines, and if they are not deprived of the means of observation they must have noticed many little things,—small in their way,—but calculated to be of great service and convenience to railway travellers, which they might have very easily introduced on their own railways. *Here's one!*—In this North Prussian carriage there is a partition-board card, about 1 ft. square, headed "Fahrplausung" (travelling plan regulations), and underneath, "Aufenthaltszeiten" (stopping times), and it proceeds to give you, for the train you are in, its time of arrival at the stations, time of departure, difference carried out in another column as stopping time, and all times between six p.m. and six a.m., have a blue shade painted across them, leaving them quite legible, but not ended to show you that those are night times, without adding the p.m. or a.m., which sometimes carried through two or three days and nights, confuses you. It is well known that the Jews begin their day at six a.m., and their night at six p.m., each lasting twelve hours. The recurrence to this old mode of dividing the day and night, and the darkening of our railway time-tables. On another side you are informed where there is to be a *table d'hôte*, and other species of refreshment, what are the "Schlafvorrichtungen," or sleeping arrangements in the carriages, and the "Zollabfertigung," or revision

of luggage in the custom-houses, besides other information valuable to the traveller on the line.

Here we are at Dirschau, a town in ancient Poland, and crossing the frozen Vistula, a river familiar to my school days, and now we are going over its magnificent bridge, half a mile long, leaving Dantzag on our left, where the deals come from; and now we look out for Marienburg, and its Palace of the Ancient Grand Masters of the Teutonic Order, who nearly had their own house about their ears on one occasion when they were besieged in it. The *Meisters Kenter*, or chapter-house of the order, in which assemblies of the order were held and foreign ambassadors received, for they were great Swells in those times, rests on a single pillar of granite in the centre. The Poles, while besieging the city in 1410, endeavoured to aim a cannon ball so as to shoot away this pillar, and overwhelm at one blow beneath the ruins, the Grand Master and all his Knights, whom they knew from information of a deserter, to be at the time assembled in conclave. *The ball missed its aim, but lodged in a corner of the chimney, where it still remains.*

Königsberg, once the capital of Prussia—proper, and now third city in the Prussian dominions. There in the *Schlosskirche*, Frederick, Elector of Brandenburg, in 1701, placed the Crown on his own head, assuming the title of Frederick I., King of Prussia, just as the present King William of Prussia, and now Emperor of Germany, is reported to have done when he came to the Throne, and coroneted himself by the Divine will, following the example of his ancestor. I am informed there is a considerable quantity of amber found all along the coast near Königsberg, and this is how they get it. The high winds throw up a vast accumulation of sea weed. The amber-fishers go up to their necks, provided with nets, by which they draw the weeds to land. The amber occurs in the lower beds of the sea sand extending under the Baltic, and when the storms bear up the amber earth, the amber is carried to the surface.

My observation (limited, certainly, but, as far as it goes, trustworthy) is that the Russians are beginning to be jealous of the Prussians and their late doings, as the Prussians seem to be giving themselves 'airs' everywhere, which creates an antagonistic feeling in the persons 'aired,' and is not calculated to inspire them with a peaceful feeling towards their 'airers';—so do not let us be so sure that the French people and the French press are insane in imagining that some day or other the Russians and French may become allies; but here is the *bona fide* frontier at last, and we step out on Russian soil at Bierzobolow. Bravo, you Russian Tartars! I like the look of you! 'Good buffet, and plenty of time for refreshment!' 'Change carriages; passports and luggage examined.' All right; we have only nine large portmanteaus and boxes in the van, and twelve little parcels in the carriage, which have altogether cost to St. Petersburg a mere trifle of 18l. or so in excess of the allowance. I would not be so mean as to say that L. had had anything to do with this 'limited' baggage; however, business first and pleasure afterwards, so we at once go about our luggage. Before I go into that buffet, I will perform my first duty towards the Russians, by suggesting to any English custom-house officer, that *here*, in what our true-born Briton might call an outlandish place, he would learn a good lesson as to how his duty ought to be performed. First of all, everything in Russia is colossal and yet convenient, and we find that in a spacious *douane*, surrounded by a circular counter, numbered in divisions, without any hurry, bustle, or confusion, all our luggage is taken by the porters to a certain definite place, corresponding in duplicate to our numbered register-ticket; there the van luggage is deposited, and to the same place all the small parcels find their way; the officer on duty specifies to his *douaniers* what his requirements are, and, finding that we are a party of British subjects travelling for pleasure and not for trade, he deals most gently with our wardrobe, barely regarding even some new ball-dresses, which L. had had separately packed by the milliner, fresh from her establishment, in large deal boxes.

In to the 'refreshment department,' as poor Charles Dickens called it, and found there yet another example for our English 'Mugby Junction.' Half a dozen hot viands to choose from, accompanied by soup, coffee, or wine, and all of the best quality and description, served at a moment's notice, on table-cloths white as snow, with most attentive and respectful waiters; add

to this lavatories, with the requisite accompaniments of soap, towels, &c., and I leave you to judge of what has been talked about as barbarous Russia. Here we are, on our first introduction at a frontier station, finding more civilisation than has happened to my lot in many an old country through which I have travelled.

Wierzbolow, I find, is 560 miles from the capital, where we shall arrive to-morrow evening: so we are beginning to be near the end. And now time is up, and we must get ourselves into Russian railway quarters for the first time. Now let me next make a survey of a first-class railway carriage: here it is before me, and it appears to be something entirely novel. It has two ends and a middle. Well, so have most things; but how are they arranged? At each end there is a compartment for say, five sitters, but comfortably containing only three passengers, and the middle has four small square compartments (two on each side of the centre passage), large enough for one comfortably to curl up and sleep in, although evidently intended for more. Well, now outside, just in advance of the end compartments, there are doors by which you enter a cross passage, leading to a centre passage, which leads to your respective departments, so that by taking for L, her mail, and myself, one end compartment and the others taking out themselves the four centre small compartments, we leave the other end for stray passengers on the way, or others getting in at Wierzbolow. There are two stoves, one of which is fixed in the interior division of each of the end departments, so that half the stove is in the carriage, and the other half in the cross passage, and as the temperature was about 70° Fahr. on entering, we began to think we should not, at all events, suffer from cold on our journey.

If you can follow this plan you will perceive that our party were all, as it were, together under one roof, and that we could pay each other visits in our respective cabins, as our lumbering, oil, rolling, but still comfortable carriage, put me much in mind of a steamer of the olden time; and its wheels, as they rolled over the frozen rails, sounded just like the paddles beating against the waves.

We strongly objected to be stifled with heat in Russia, where we had expected to have met our fate by frost, and I addressed myself to the "storekeeper," who accompanies every first-class carriage, to reduce it by machinery which they have for that purpose; so I "unearthed" our Russian fireman from a corner of the cross passage, in which he had doubled himself up for a nap; and now began a series of amusing signs and symbols, which continued, with varied intermission, between this interesting old man and myself during the next twenty-four hours of our journey. He was a character in his way, and seemed to be a Russian originally from the far interior of Siberia, of the Tartar race,—brawny and muscular, with high cheek-bones, small bright eyes, terribly shaggy hair, and a face as broad as it was long,—a complete parallelogram. We soon got friends after arranging the stove.

550 miles from St. Petersburg, at 'Kuwno,' where, on the 22nd June, 1812, the French army crossed the Niemen on their advance to Moscow, and some rising ground on the opposite bank is still called Napoleon's hill. The town of Kuwno was occupied by a large corps *d'armée*, and suffered considerably. The remnants of the army recrossed the river at the same spot on the 13th December, in a very bad state of discipline. There is a monument existing commemorating this retreat, and bearing the following inscription in Russian, which, translated, is as follows:—"In 1812 Russia was invaded by an army numbering 700,000 men. The army recrossed the frontier numbering 70,000."

111 miles from St. Petersburg, at 'Wilna,' occupied by the French on the 28th of June, 1812. It had been evacuated by the Russians during the night. The Emperor Napoleon occupied in the Episcopal Palace the rooms which the Emperor Alexander had left the previous day. The country all along here is covered with snow, so I cannot form an idea as to its cultivation; but the villages are few and far between, and those do not exhibit any high degree of prosperity. They are mostly composed of wood, somewhat resembling, only in a poorer degree, the Swiss mountain chalets. Birds are scarce, not liking, probably, to face the deep snow. We have only seen two magpies for miles; but as the old couplet says, one magpie is sorrow, two mirth, three a wedding, and four a birth.

Between stations separated by long distances,

we amuse ourselves with the contents of the picnic-basket, and having Liebig's essence and Fortnum & Mason's compressed beef tea, with other delicacies, our Ena boils up some water, and we get a capital entertainment in the Swiss Family Robinson style. Our cabins are now kept by our old friend at a delicious temperature; but when we issue forth at a station, we all don our complete suits of furs, as the air is nipping cold, but full of oxygen and ozone, as the country is overlaid for hundreds, and even thousands, of miles with its wintry covering of snow, and we are warned by a notice not to put our heads out of the little window of our cabin, which is only 1 ft. square, as '*Cette impudence pouvait avoir des conséquences graves.*' But with our shubas, caps, boots, and gloves, it would be impossible even to feel a shiver with many more degrees of frost than we have had yet.

We get most delicious coffee at the buffets, and still more delicious tea, served in tumblers for the gentlemen, and cups for the ladies, with milk that the Russians are not yet sufficiently civilised to adulterate with unwholesome materials; and notice is given you of the starting of the train by three bells first pealing outside the station, and repeated by an official at the refreshment-room door, rung successively at intervals of a few minutes,—the first, a notice; the second, a warning; and the third, we're off. All along the line the men live in wood huts, which are all numbered outside with white paint, starting from the capital, so you can count off your approximation to the end of your journey as you get along. And now the numbers are gradually diminishing, until, at length, St. Petersburg bursts upon our view, with its colossal public buildings, its gorgeous palaces, churches with gilded cupolas, and sleighs with fast-trotting horses are awaiting us, into which we get with alacrity, leaving our luggage to the commis-sionaire of the hotel to bring after us, and drive off at the rate of twelve miles an hour over the frozen snow to the Hôtel de Russie, where we find, as we ordered by telegram, warm baths, comfortably-heated rooms, a dinner *à la Russe*, all awaiting our kind attention."

HOSPITAL FOR SICK CHILDREN, GREAT ORMOND STREET, BLOOMSBURY.

The Hospital for Sick Children, now about to be rebuilt, from the designs of Mr. Edward M. Barry, R.A., occupies a site of historic interest, and is peculiarly appropriate for a medical charity. The old house was the dwelling of Dr. Meade, the county Court physician, the Mæcenas of the men of letters of his day, and that of Addison, himself a wit, as well as a doctor of great repute, whose name, however, lives in Sir C. Hanbury Williams's line.

"Health waits on Meade's prescriptions still," as much as, or perhaps more, than in his medical works, now seldom read, although well worth the reading.

The house had a spacious garden twenty years ago, well furnished with shrubs and fruit-trees. The vines bore grapes, and the large hothouse was still standing when the new era in the history of the place began. The marble-flagged dairy exists still. The stables opened to the fields, and less than 100 years ago the horseman could mount and ride through green hedges all the way to Highgate, whose village steeple still forms the most striking object seen from the upper windows.

Bit by bit the old house has put on a soberness as it has longer served its present purpose. The gilded cornices have been discompered, the pictured panels of flowers and shepherdesses have been exchanged for a modest grey; but yet an incongruity has been unavoidable between the style of the building and its uses; for it has not grown fitter for its present purpose in the same proportion as it has lost its old quaint beauty. Deep cornices collect dust; wooden and painted walls are difficult to clean; warming and ventilation are hard to carry out properly; and, worse than all, a life of 170 years tells upon houses just as the customary three score years and ten do upon man. And so, with ever-increasing demands from the poor, which are not nearly met by the increase of beds from twelve to seventy-five, and with the constant need of yearly repairs, to keep the old hospital even habitable, the committee have determined to rebuild by degrees, as means are afforded them by the generosity of the public. That which it is now proposed to build is the

central block, which will contain most of the offices, the dispensary, operating theatre, chapel, and arrangements for the extensive out-patient department, on the basement-floor; and this plan has the great advantage of leaving the existing buildings almost completely undisturbed, and so of allowing the internal working of the hospital to go on without interruption.

Had the site been a larger one, the arrangement would in many respects have been different, and the problem to be solved by the architect much easier.

Before describing the details of the building, a few peculiarities may be mentioned as required in a children's hospital, which would be less necessary in a hospital for adults.

First. The out-patient accommodation needs to be more extensive and more complete in a hospital for children, because each patient requires a grown person to take charge of him, which, even if two or three should be brought by the same adult, the increased risk of confusion more than makes up for the saving in space occupied. Hence the need for special arrangements to prevent crowding, and to avoid the meeting of a double current of patients.

Secondly. Considering the liability of children to some forms of contagious illness, it becomes necessary to provide a separate waiting-room for patients on their first application, in order that as they come they may be immediately inspected by one of the medical officers, and thus will contagious ailments be separated from the others, who will be at once sent to one or other of the two large waiting-rooms, according to the physician or surgeon under whose care they are to be placed.

Thirdly. In connexion with the wards themselves, in addition to the bath-room and water-closets which are needed in all hospitals alike, it is very important to provide a ward-kitchen, where milk, beef-tea, and the various little articles of food so much needed for children can be kept in readiness day and night without the necessity of sending to the kitchen. It is also necessary to provide a vestuary in connexion with each ward, in which not only the ward linen, but also the children's own clothes can be kept, so as to secure perfect neatness and order.

It will be observed that there are no nurses' rooms in communication with the wards, because in children's wards nurses when present are always on duty; while they take their meals in a common room, and sleep away from the wards. The allowance of cubic space to each patient in the wards is in no case less than 1,000 ft.

The small separate wards speak for themselves, as being needed for special cases, while the quarantine ward at one end of the north wing is intended for the reception of cases of doubtful illness until the question of their nature is answered, when they will either be removed to the adjacent but detached fever ward not yet erected, or be restored to the general wards of the hospital.

The centre portion of the building in Powis-place is now in progress.

The out-patients' baths, the special arrangements for convalescents, and many obvious wants, are intended to be supplied, as shown in the plan, as soon as funds enable the committee to pull down and rebuild the two houses, 18 and 19, Great Ormond-street, which, as already said, are left for the present untouched.

Mr. John Walter, M.P., always ready for a good work, has consented to preside at a dinner in aid of the funds of this Institution, on the 7th of next month, and will, we hope, be well supported in his appeal for help.

The Princess of Wales has visited the hospital, and has sent presents of toys, &c., as have others of the Royal Princesses.

CHILDREN'S HOSPITAL, 17, GRAFTON STREET

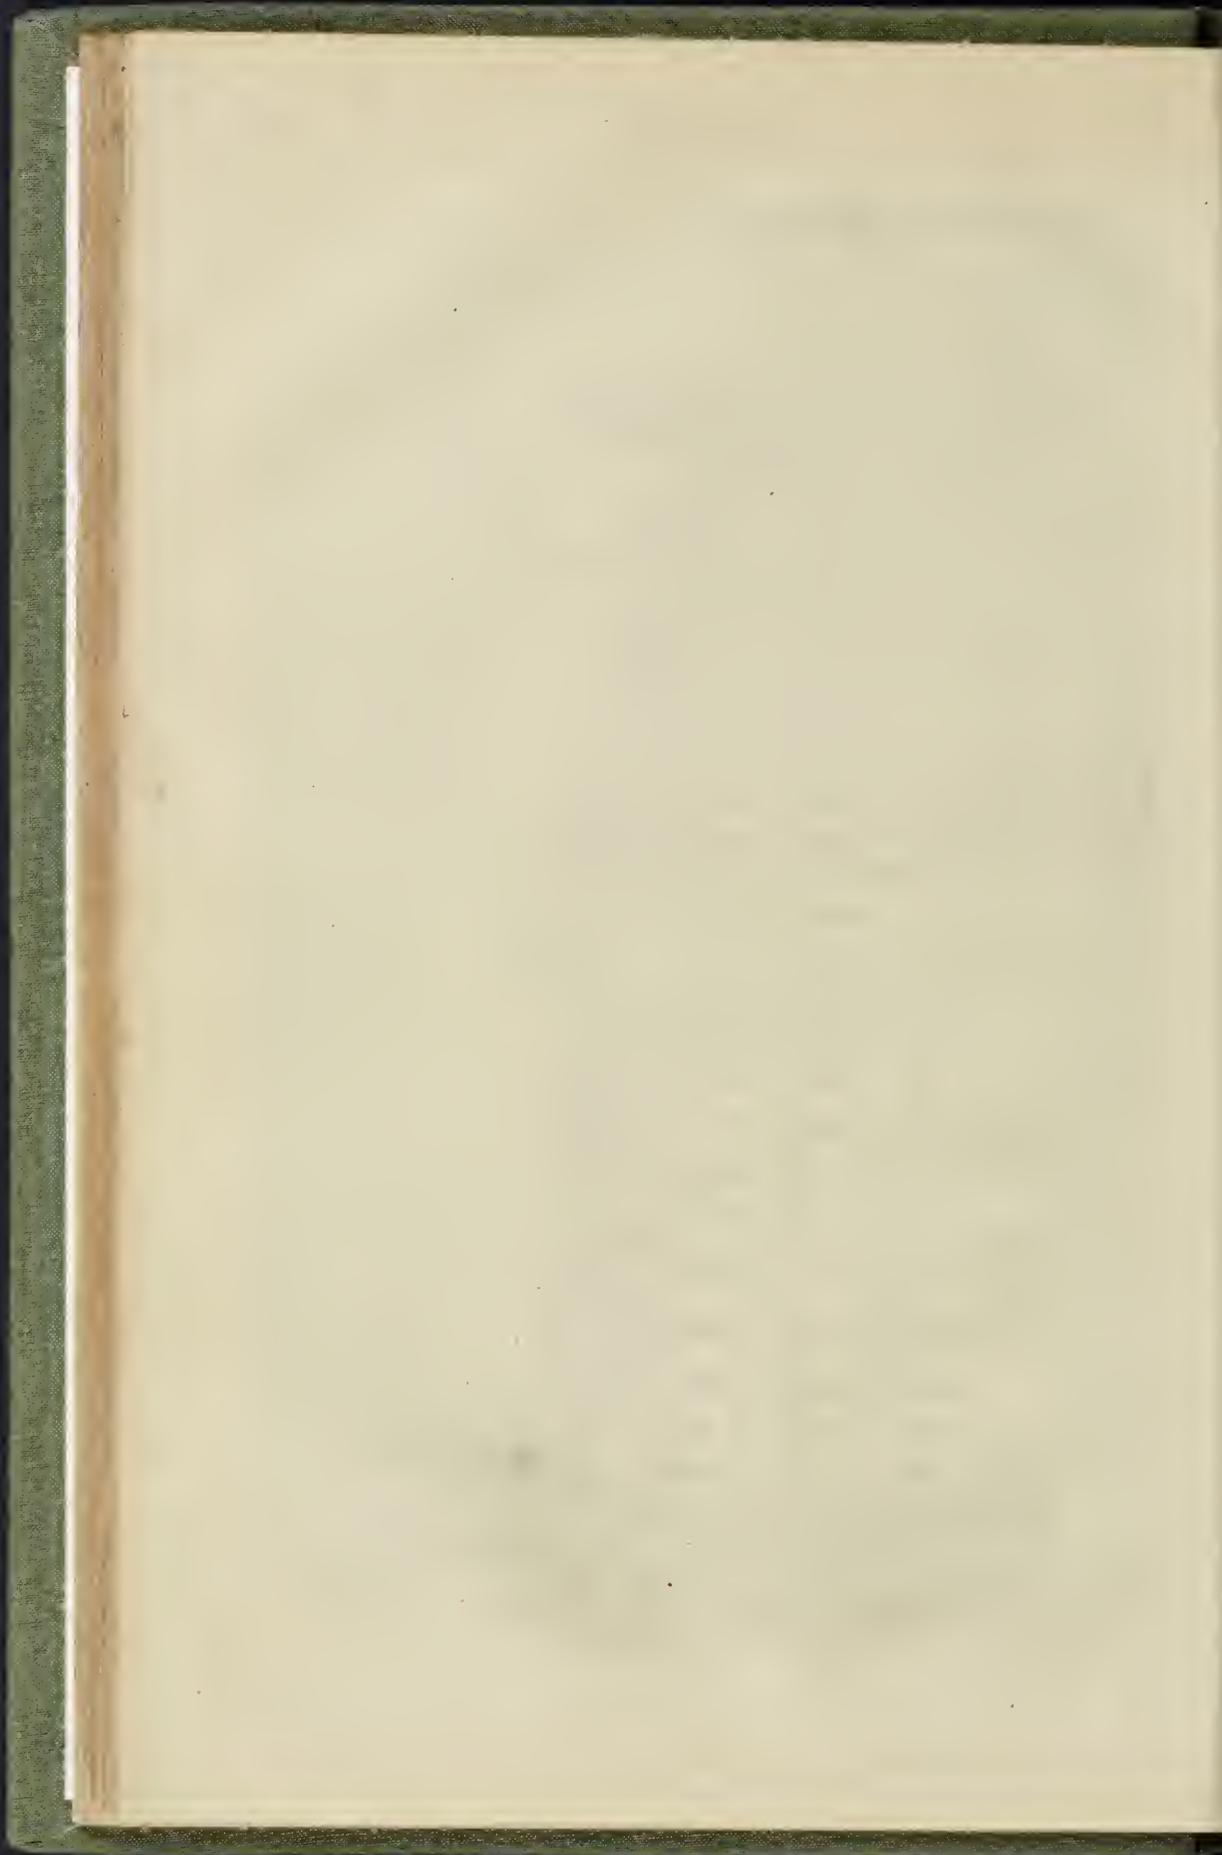

GREAT ORMOND STREET

GREAT ORMOND STREET

THE HOSPITAL FOR SICK CHILDREN, GREAT ORMOND STREET, BLOOMSBURY.—MR. EDWARD M. BARRY, R.A., ARCHITECT

BUILDING ON THE PEABODY ESTATE AT BRIXTON.

BUILDING on a large scale is now going forward on the Peabody estate, at Shopberd's-lane, Brixton. This estate, comprising sixteen acres of land, which was purchased, some seven years ago, by the late Mr. Peabody himself, in connexion with his philanthropic intentions of erecting dwellings for the working classes, has for some time remained a waste, but recently the trustees, instead of building upon it themselves, have commenced letting it on ground-rents, and dwellings of a class somewhat above those known as for the poor are being erected in large numbers, according to plans and conditions laid down by the trustees. Several streets have been laid out, and we understand that the entire number of houses on the estate will shortly be about 500, being equal to a population of something like 3,000. It is stated that the trustees have decided to spend the large income which these ground-rents will produce in erecting, from time to time, blocks of houses in different parts of the metropolis, similar to those in Blackfriars-road.

MR. EDWARD WALTERS, ARCHITECT.

We hear with regret that Mr. Edward Walters, of Manchester, died on the 22nd inst., at Brighton, after a few days' illness. He was architect of the Free Trade Hall, Manchester, and had a very extensive business, chiefly in the building of warehouses, many of which, as we have before had occasion to say, are of considerable merit. Mr. Walters had retired from the active pursuit of his profession for the last few years, but his business is still carried on by some of his former pupils. We shall give particulars of his career on another occasion.

NEW METROPOLITAN RAILWAYS, TRAMWAYS, AND MISCELLANEOUS IMPROVEMENTS.*

FROM year to year the number of permanent lines of railways, and in recent years of tramways, sanctioned, or actually opened, in the metropolitan district, increase in the aggregate mileage; but many of the proposed improvements shown in parti-colours, one year after another, disappear in succession, or the map of proposed improvements published annually by Mr Stanford would become so thickly lined as to be illegible. In recent years a notable change has occurred in some of the principal features of the publication. The lines of colour that ran abtwart the map in various directions related almost exclusively to railways, with portions of colour in one place and another indicating miscellaneous improvements. This year the tramway lines opened, sanctioned, and proposed, are distinctively indicated in blue colour, and, in the aggregate preponderate greatly over the proposed railways. The most obtrusive indications in red colour in this year's map relate to street and other improvements, chiefly public thoroughfares and markets, and are proposed by the Metropolitan Board of Works.

The most important new railway proposed, as shown in the map, is the Mid-London, of nearly nine miles in length, traversing London between east and west. For this important scheme the large amount required by standing orders to be deposited, has been, we learn, duly lodged. The other new railways proposed, include a London & North-Western extension from West Ham to the Victoria Docks; alterations in the South-Eastern direct line between Greenwich and Woolwich, including a diversion of the southern outfall main sewer at Greenwich; also a connecting curve between the South-Eastern and the London, Chatham, and Dover lines at Blackfriars; a junction between the Waterloo Station of the South-Western and the Blackfriars Station of the Chatham and Dover; with a few other projects, some of which are not likely to be further heard of, more than one of them being already, indeed, defunct. The plans for new railways, as lodged Nov. 30, embrace twenty-nine branches, and about thirty-nine miles of new lines.

The metropolitan tramways that will come under the consideration of Parliament embrace 185 branches and 116 miles of line. Three of

the projects are to be proceeded with by Bill. These are the Exhibition subway; London, Streatham, and Croydon; and the London Street Extensions; &c.; including the Oxford-street route, and eighteen miles of street tramway, in all. The London and Croydon Bill is for 9½ miles of line. One new provisional order tramway scheme is indicated for six branches and nearly two miles of new lines. Three Tramway Bills, which were suspended by order of the House of Commons, July 18th last, will be revived. They are for 57 branches and 22 miles of tramway. The consideration will also be resumed of eight other tramway projects that came under the Provisional Orders Suspension Act, 1871. They are for 86 branch tramways and 65 miles of line. The tramways of the longest mileage are, to Watford, by the Common Road Conveyance Company; to Croydon; to Southam, Ealing, and Shepherd's Bush; to Kensal Green, and to Fulham. The North Metropolitan Company has received Parliamentary sanction for the laying of many miles of tramway, as shown by the map, that are not yet constructed.

The miscellaneous improvements include, amongst others, the Admiralty and War Office rebuilding; Brighton and London sea-water supply; Holborn Valley and Farringdon Market improvement; Leicester-square Market and improvement; Newport Market and approaches; New Mint building site; metropolitan street improvements; Serle's-court and Cook-street improvements; and the Temple Subway.

The map is one of the most interesting that has appeared.

ABOUT A NEW STYLE.

SIR,—The cry for a "new style" is so loud and continuous that it cannot be passed by without notice, and hence we find that almost as often as the cry is raised has the attempt been made to satisfy it. How far successful, the greater part of your readers know. Now, although I am going to lay a plan down for this nineteenth-century English want,—we do not find it abroad,—I must say that the cry and the response are equally the offspring of ignorance of all history, as well as ignorance of and feeling for art. As well may the Bojesmen be able to spring at once into a high state of cultivation without the necessity of passing through those intermediate stages, as much required by a reasonable being before being convinced, as by the necessity for the convincing example of others more civilised than himself, as that a new style can at once be invented possessing all those æsthetic qualities required by the true canons of art, without the blast of ages and the refining influences of many workers.

In this age of iron and glass it has been suggested that those materials should form the foundation of an original architecture. To some extent they will, but iron for art is a terribly hard substance, and glass is a brittle one. The former for the purposes of art is little superior to the latter. Architecture, to be worthy of the name, should be unornamental, should last for ages, should upon every portion bear the mind of the different artists employed, should be fashioned by the hand of the cunning workman in stone, embellished by the sculptor, and glorified by the colourist. Iron and glass will never fulfil the conditions required by art, nor can wood, since it is too easily destroyed for any great art-work to be devoted to it. This more especially as regards edifices. Wood-carving, we know, was raised to a high pitch by our old Mediaeval workers, and in modern times by Grinling Gibbons; but much of the former has been devoured by time and destroyed by man, whilst the edifices which once contained much are now empty.

Stone presents more favourable conditions than anything else in building materials for the architect. Terra-cotta, and all burnt earths, whether called bricks or any other name, since their production entails mechanical processes, and these mechanical processes imply or determine repetition of parts or wholes, should never be used for monumental purposes, except for solid unadorned surfaces. A reason can easily be given. The designer produces a portion of the building in clay or stone; it is reproduced in terra-cotta; it may be ten, it may be a hundred,—ay, ten thousand times; and every time that such art work is produced more than once it loses value, as surely as a painting, if it could be reproduced as many times, would. It might be said, "Yes, it is none the less a work of art. You cannot make a thing less beautiful by repetition." I say you

can. If every beautiful woman were similar, and all women were beautiful, then would the eye see no beauty, but long for a change. The mind and the eye must be equally impressed, must teach art in concert, either for pleasure or pain. Thus, I argue, our new style of architecture must be a creation in stone, and that no new style can be revealed upon the spur of the moment, but must be the work of ages, and yet I come and say, "Hère is a new style; behold the clamouring hath its want, the agitator his will." Certainly "with reservations." Before producing this wonderful child, maybe I may ask the number of styles now extant. Shall we start with Syrian, or Egyptian? Shall we follow them with Grecian? and shall we divide Grecian into three, and then deny that the Romans had any architecture at all? If we do, our premises are narrowed considerably, and the more we try to work upon them the more they contract, until we find ourselves back in some remote age when the upright post and horizontal lintel are magnified to such an extent as to dwarf all after productions; but, not to be beaten, we start again. We argue there are only three roots, if I may so say, which have produced all ramifications, the greater of the ramifications being called styles. The three roots are the post and lintel, or horizontal root; the semicircular arch root; and the pointed arch root, each root nevertheless primarily shooting from the same plant.

Now, these roots and ramifications being admitted as necessary, if we admit that Greek art owed its origin to some previous growth, then the previous growth of Roman being Greek, Roman art has as much right to be classed as a style as Greek art, especially as the arch became an important feature. All styles are not, of course, equally distinct or well marked; in fact, the growth from the Roman for centuries was both laboured and slow. Scarcely do those phases popularly called Romanesque or Byzantine deserve the name of style. They really bear the same relation to Roman or Greek art which our Tudor or later Gothic, rightly termed debased, bears to the First, Second, or Third Pointed, with this difference,—the Romanesque led to one of the healthiest roots, or branches, if you will—the Pointed style,—our Norman being a description of Romanesque. The Tudor ends with rottenness and death. It has led to no art, and at the present time it seems that it never will. Taking real architectural art as commencing with the Grecian, tracing it through Roman, Byzantine, Norman, and the Pointed, we find many off-shoots almost as strong as the main trunk. Arabesque deserves a place to itself, as being a mixture of Romanesque and Hindoo; but, for the sake of my present argument, I had better not touch upon Hindoo art as China, with her early origin, would certainly claim precedence and continuing influence, as it is not unlikely that, although she kept so exclusively to herself, some wanderers had seen her architecture, and bore the knowledge of it westward.

We can now pretty well ascertain the number of admitted styles. We can see that one style was the off-shoot or continuance of a former, or many former styles. That, in fact, Roman art proper was a simple continuance of Greek. I do not mean Roman temples, for they were simply transplants, but their civil buildings: and here I will instance the Coliseum, and deduce from its treatment the production of a style—the Italian style. The manner in which this style was moulded and fashioned is both curious and instructive. An age of magnificence had arisen in the history of Rome, when the people had to be considered as well as the warriors and priests. Places of amusement had to be provided for vast numbers, and architecture seemed wanting, for several reasons. Had Doric, Ionic, or Corinthian buildings been erected as heretofore, no known material could have been obtained sufficiently large to span intercolumniations in such numbers as were required. Truly, blocks of granite might have been found, but the time and expense in the quarrying, in the carriage and in the erection of such monoliths, would have entailed a never-ending task. A building had, therefore, to be provided containing the increased space without necessarily increasing the size of the materials employed. Knowing as we now do the course pursued, we can hardly appreciate the difficulties to be overcome, or the success and applause which followed the achievement. The employment of one order in height having been found impracticable, the dogto or alternative was to use two orders. Common sense as well as mathematical and practical

* New Maps [of Plans, &c.] deposited in the Private Bill Office, November 30th, 1871, for Session 1872. London: Edward Stanford, Charing-cross.

knowledge, without much reference to art, would at once dictate the position of the orders; the strong to support the weak, the heavy below the light, the elegant and slender above the severe and robust.

My argument, therefore, is this: the Romans, who were certainly a wise people in their generation, did not rave about, did not attempt to produce, an entirely new style, however much they, as conquerors of the known world, might have deemed it incumbent to produce one; but sensibly took up a style which they found, and modified it in the manner before hinted at, taking the Greek orders almost as they found them, and clapping one upon another.

This, with the introduction of the round arch, led eventually to our own Mediæval orders—Norman, Early English, and Geometrical,—which mutually I will term chords of Doric, Ionic, and Corinthian, in the Greek. Perpendicular may be sympathetic with the Roman composite,—I mean no parallel. Why, therefore, should we not copy the Romans in this instance, as we seem to be doing in others? and, having already to our hand Norman, Early English, and Edwardian, treat them as the great colonisers treated the Greek,—using the first, second, and third as ingredients in the same building? The Norman heavy, stable, and bold for the main support; the Early English as lighter, less heavy, and more pliable above it; and Edwardian as richer, more elegant, and more varied above that. The best phases of Perpendicular (I cannot say Henryvillian, being no Welshman), in case of a very lofty building, might be pressed into the service. With the three or four phases of Gothic used in the same building,—the eternal sameness which so falls upon the taste in all our modern Gothic secular buildings, would be got rid of. The terrible nightmarish striving-after novelty—change—any thing—for variety sake would be less needed; and these old breeds being all grafted together upon one stem, would not unlikely bear a description of architectural plum before unknown, which would satisfy the craving for a new style, now amounting to a disease, which possesses seven-eighths of the community.

I am not joking, sir. I know that much of the beauty of our old Ecclesiastical edifices results from the juxtaposition of the different phases of Gothic art. There is one noble building which disappoints me the more I examine it, and I think the absence of this interweaving of styles is the cause. I mean Salisbury Cathedral. Admitting its splendid proportions, the harmony and beauty of its grouping, as seen from the east on a moonlight night, upon examination there is a stringiness, a poverty, a weakness solely attributable to the constant—and too constant—repetition. Examine the window above window in the transepts, one flight above another, which from the outside impress you as lighting different chambers, but from the inside utterly confuse you, and tell me if there is not some reason for my assertion.

In modern buildings of large dimensions, I may mention the Houses of Parliament, which have caused their designer and all connected with their infinite labour and pain from the use in their design of only one phase of Gothic,—twist it, repeat it, pile it up as you may. Enrich it—fill, if worked, it should turn out one of the best gold-mines ever discovered.—From the amount of ore thrown into it. Still is there a certain poverty, undiscoverable in one of our plainest old Gothic buildings with the exception of some few which have had the misfortune to be erected in one style. And so surely as the new Law Courts are put up will they also be a failure from the same cause.

The reason is this. We, as well as the Romans, indulge in monster buildings. Now these gigantic affairs are beyond the range either of Doric or Decorated; for consider, had the Romans, instead of using five orders in the Coliseum, used only one, what description of affair would it have turned out. Should they have employed but one order for the entire height, then behold Doric above Doric, then should they have used Doric above Doric, then look up at the maddening repetition. The Greek buildings were small and compact; one order thought out was sufficient, and then in some of their largest buildings I have no doubt the architects and builders had as much to do as they well know how.

Why, then, should we not do as the Romans did,—cast from us the desire to achieve the impossible, by endeavouring to make either

* *Pron. Henrikin.*

Roman, Early English, or Decorated do singly what a Greek order could not and cannot do; and take into our hands all our Gothic styles, and mould them into a whole as harmonious as any Italian building under the sun. I for one will, the first opportunity I have, try the effect of such a building, and I dare swear it will not be one of the most insignificant.

MARTIN UNDERWOOD.

WORCESTER GUILDHALL COMPETITION.

At a special meeting of the Worcester Town Council, a Report from the Survey, Buildings, and Property Committee, on the state of the Guildhall, was read. It contained, among others, the following resolutions:—

“That it be recommended to the Council to authorise this committee to obtain plans for the reconstruction of the Guildhall, giving the requisite additional accommodation, and that architects preparing plans be requested to limit the expenditure to 5,000*l.*.”

“That, in the opinion of this Committee, the wings of the Guildhall are in such a bad state of repair that they must at some early date be entirely rebuilt; and that the committee, having regard to this, be authorised to obtain estimates (in addition to the plans recommended by the foregoing resolution) plans for the entire rebuilding of the Guildhall and wings and offices, at a total expenditure not exceeding 18,000*l.*, in order that the Council and the citizens generally may be in a position to judge whether it would be better to reconstruct or entirely rebuild, and that it may be ascertained whether any large portion of the amount can be provided by voluntary contributions.”

The report was received and adopted; and the Council also resolved that the competition be thrown open, instead of being limited to architects of the city and county of Worcester, or the city architect (Mr. Rowe), as proposed by amendments.

It was agreed that premiums of 60*l.* for the best and 30*l.* for the second best plan for the reconstruction be offered; and premiums of 100*l.* and 50*l.* for the best and second best, respectively, for rebuilding.

The committee were directed to prepare instructions for the architects, and lay the same before the Council.

THE DECISION IN THE WORCESTER SCHOOL BOARD SCHOOLS COMPETITION.

Sir,—With this I send a copy of a protest which has been lodged by me against the recent decision of the Worcester School Board, by which they placed Mr. E. A. Day, of Worcester, with motto “De Dio” first; and myself, with motto, the arms, and “No Extras,” second, in competition for their schools.

As the reception of drawings after advertised date is an unheard-of proceeding, which, if allowed to pass unchallenged, will operate most seriously against every member of the profession, I politely request every architect, whether a competitor or not, to at once write me to London address (135, Chapside), an endorsement of my protest, as I consider in acting as I am doing I do so as much in the interest of the profession generally as for my own benefit.

The next ordinary meeting of the Board takes place on Thursday, the 1st of February, and letters posted on Wednesday will reach me at Worcester.

As I consider the matter one of vital interest to us all, I trust you will find room for a copy of the protest.

W. SEKHAM WITHERINGTON.

To G. W. Hastings, esq. chairman,
Worcester School Board.

PROTEST.

Sir,—Having received intimation that your Board have placed Mr. E. A. Day first in the school competition, and have awarded the premium of 30*l.* to myself, I beg respectfully to enter the following protest against Mr. Day's plans being carried out:—

1. The motto “De Dio” is a palpable play upon his own name.
2. That two or three days previously to the 30th, being extremely pressed for time, I sent to Mr. Marcus (the secretary), to say that, as the 31st (the day named in the advertisement for sending in the drawings) fell upon the Sunday, I should be glad to know when plans were to be delivered. The answer returned was, “Plans must be delivered before the 31st.”
3. On Saturday, the 30th, I sent to the Guildhall, to know what was the latest hour for the delivery of the plans, and the answer was, “Five o'clock to-day,” and although any extension of time would have been invaluable to me, my plans were deposited before that hour.
4. Though this information was given officially, of my own private knowledge I know that Mr. Day's plans were not delivered on Saturday; whilst I have positive proof that his drawings did not leave his office till after eight o'clock on Monday night, the 1st inst., at which hour, it would be only reasonable to suppose, the Guildhall offices were closed.
5. I need only say that the great principle of all compe-

titions is a certain time of delivery for all, and I am confident that it will be only necessary to explain to you and to your committee these facts, of which you have, of course, been hitherto ignorant, to insure that justice shall be done to me, and Mr. Day's plans disqualified.”

Mr. Henry Haddon, of Messrs. Haddon, Bros., Malvern and Hereford, whose design, “Idoncum,” was third, endorses the foregoing protest.

* * If the circumstances be as stated, the inappropriateness of the proceedings is manifest. Such a course admits the possibility of a favoured competitor being enabled to see the designs of other competitors before completing his own. Beyond this, however, it can scarcely be doubted that the decision is illegal; it is a breach of contract. If the matter be properly brought to the notice of Mr. Hastings, we have no doubt it will be set right.

TECHNICAL EDUCATION.

THERE has been a general meeting at Sir Antonio Brady's chambers, of the gentlemen who have taken a prominent part in the movement having for its object the establishment of a national technical university, for the purpose of completing the arrangements to establish an association representing all the interested involved.

It was stated that Colonel Gourley, M.P., had offered 500*l.* towards the establishment of the university. The result of the debate was the passing of resolutions deciding that the name of the amalgamated organisation should be the National Technical University and Trades' Education Association; that Sir Antonio Brady be the chairman of the council, and Colonel Gourley, M.P., chairman of the executive; that Mr. Scott Russell and Mr. R. M. Latham act as vice-chairmen of the council; that Mr. Thomas Brassey continue to act as treasurer; and that the hon. secretaries should be Dr. Mill, representing the original Technical Education University Committee; Mr. Campin, representing the Inventors' Institute; and Mr. Paterson, representing the working men.

It was understood that these appointments were provisional. An executive committee was also elected.

CITY SEWERS STILL DRAINING INTO THE THAMES.

At a recent meeting of the City Sewers Commission a report was received from Mr. Haywood, showing that no less than nine main sewers and nineteen smaller ones still drain into the Thames within the limits of the City; although in the last report of Mr. Bazalgette it was stated that there only remained certain portions of the lower outfall to be finished, and that the whole of the works were complete with the exception of a short piece at Blackfriars Bridge connected with the Fleet outlet.

Mr. Hora said that such a report as that just presented might well astonish the people of London, after spending 44,000*l.*, and it should be borne in mind that there were something like twenty or thirty inundations every year.

The Chairman observed that this was one of the most important subjects that court had had before it for some time. As an evidence of this he read an extract from a report of a deputation from King's-cross and neighborhood which waited upon the Metropolitan Board of Works on the 20th of last December. The extract had relation to the periodical inundation of the lower and basement premises.

MEETING OF BUILDERS.

A MEETING of master builders of the metropolis has been held during the past week, to consider the requisition of the Operative Stone Masons' Society to work uniformly all the year round 51 hours per week, and for a rise of wages from 8*l.* per hour to 9*l.* per hour from the 1st of July next. The proceedings have not been made public; but we understand that a unanimous opinion was expressed that 51 hours per week could not be agreed to by the engineers and other trades having just settled on 51 hours per week.

It was also generally agreed that it was an absurdity on the part of the masons to ask to work the same hours in summer as in winter, when dark days, frost, and bad weather interfere so very much with all building operations; and several masters expressed their opinion that no mason in their employ was able, under the present rule, to make an average of 54 hours per week all the year round.

It was also generally agreed that it would be almost an impossibility for masons to come and go at different hours to the bricklayers and other men on a building, and that to reduce all other trades down to 51 hours per week, in order to meet the demands of the masons, would be an act of injustice. The meeting was also of opinion that the present rate of 8d. per hour for an ordinary mechanic was a good rate of wages, and that the state of trade in London did not appear to warrant any increase. Ultimately it was determined to adjourn the meeting in order that some other builders not then present might be consulted before a decision was arrived at.

STAIRCASE AT THE LONDON TAVERN.

Sir,—Having just returned from the London Tavern, after two days' polling in behalf of candidates for admission into the London Orphan Asylum, I cannot but draw your attention to the state of the pieced stone staircase there. You did good service some years ago in drawing attention to mended stone staircases and cracked landings after the fatal calamity at the Polytechnic Institution. I am not an unnecessary alarmist, but most people who have visited the London Tavern on occasions such as I allude to know well how many persons spend the day on this staircase. The distress amongst widows and children, draped in black, on this staircase is always evident on these occasions, and there should be no possibility of a harrowing accident. I need not state that there is such a possibility, but I must say that any professional man visiting this staircase cannot but be struck with its apparent insecurity as the trends have been eased. Prevention is better than cure.

F.R.I.B.A.

DRAIN PIPES.

Will you allow me to express an opinion upon the paragraph,—“Iron Pipes for House Drainage,” page 43, of your last week's impression?—No cleaner, cheaper, more durable, or better adapted article can be used for house drainage than socketed, glazed stoneware pipes, jointed in cement. If the joints are left imperfect, gross carelessness is denoted on the part of those superintending, which need not occur where due vigilance is exercised. Iron pipes are more costly, to begin with; they oxidize, become filthy, and from the chemical action of the sewage soon wear out. Iron pipes should only be used where a sewer is out through a quicksand, or in similar exceptional cases where the cement joints of stoneware pipes cannot be made.

R. Y.

BETHNAL-GREEN.

Sir,—The remarks in your paper of last week concerning Bethnal-green are so much in accordance with a recent letter of mine, that I send you a copy for your use.

I may add that while the population of Bethnal-green is about 1.27th of the population of the metropolis, the pauperism is about 1.36th, but the rateable value is only about 1.61th. In consequence of this state of things, Bethnal-green receives from the Metropolitan Common Fund nearly 11,000*l.* yearly, or about 30*l.* per day, while the two (so-called) improvements in High-street, Shoreditch; and Bethnal-green will saddle the metropolis with a tax of more than 40*l.* per day for the next sixty years. I know of only two ways of bettering either a man's or a parish's condition. Either increase his income or lessen his expenditure. In Bethnal-green the latter is next kin to starvation. The former plan has yet to be tried.

T. G. ATKINS.

HEREFORD PASTORAL STAFF.

The clergy and laity of the diocese of Hereford intend presenting their bishop with a pastoral staff, and have selected a design submitted by Messrs. Cox & Sons, of Southampton-street.

It will be carved out of a piece of oak which recently formed part of one of the ancient pillars of the bishop's residence at Hereford,—a twelfth-century building,—and will be surmounted by a crook of the usual form, enclosing a carved figure of our Lord, seated as a king, holding an orb and cross in the left hand, the right hand erect in the act of blessing.

The crook will be mounted in silver, with

crockets also in silver, jewelled and embossed; and from the lower part of the crook there is a floriated bracket supporting an angel with displayed wings, carrying a silver shield bearing the name of the diocese, in enamel. The bands, crockets, and bases will be enriched with carvances in ornamental settings, and cut in the ancient form, the general style of the work being that of the thirteenth century. The fashion of presenting a staff to bishops has spread: this is the ninth, we believe, given within the last few years.

RAIN-WATER TANKS.

“STAGNUM,” in a recent issue, asks for more information as to coating brickwork of tanks. If good Portland cement be used with one-sixth sand a sufficient thickness is one quarter of an inch, but it should stand about fourteen days to harden properly before water is admitted. Each side should be laid on without a jointing, and the angles rounded out. The bricks on which the cement is laid should be damp, and the surface clean. The cement should be well rubbed, too, and not allowed to slide while soft. Neat cement, three-quarters of an inch thick, will be more apt to crack and blow out than a thin coat. The walls of the tanks should be built with equal parts of cement and sharp sand. If in a dry situation, and lime is used for building, the lime in the joints should be well raked out, and the walls should be firm enough to resist the pressure of the water.

W. B. WILKINSON.

DAMP WALLS.

Sir,—Having erected several buildings in exposed situations in Lancashire and Yorkshire where the driving rains will often penetrate the hardest stone, I am willing to give your correspondent “Devonia” the benefit of my experience.

Walls built with rubble or coursed wall-stones consist of an inner and outer casing, which is usually filled up in the middle with small pieces or scraps of stones, and then grouted with mortar so as to make a solid mass, bond-stones being introduced to hold the two casings together. In very wet situations the rain penetrates the outer casing, either through the mortar joints or the stones themselves, and is then drawn by capillary attraction to the inside casing. To prevent this the centre should be filled in with *dry* scraps and not grouted; the water then penetrates the outer casing and runs down the middle of the wall to the foundations, so that the inner casing is left dry. The bond-stones must also be weathered or tilted outwards, so as to throw off any wet that may enter at their top bed. Window-heads should also have a thin sheet of lead or zinc laid on the top bed and turned up inside the wall, so as to prevent wet from driving in over them.

If the building is in the neighbourhood of gas-works, a grouting of hot gas-tar boiled up with some pitch, and poured into the middle of the wall as it goes up, will make it thoroughly watertight, and impart a great amount of strength and solidity; this process adds considerably to the cost of the walling, but I have found it thoroughly efficient where other methods have failed.

A coating of Portland cement gauged with two parts of sharp sand *ought* to keep the weather out in any situation, and I expect the failure has arisen from using too much sand, or some other fault in the mixing or materials.

In building with brick in an exposed situation a similar plan should be adopted; an outer casing 9 in. thick, and an inner one 4½ in. thick, are carried up together but quite distinct, leaving 2 in. between, and tying them together by means of wrought-iron bands 9 in. long bent downwards in the middle, and spread out flat at each end so as to have a hold on the wall. This method is much used in the neighbourhood of Southampton.

Inside walls and partitions, if built of stone, will often show damp for a long time after they are built, as all stone contains in its natural state a considerable quantity of water, which is evaporated by the internal warmth of the building, and will appear like a sweat over the surface, through any number of coats of paint. It is therefore advisable to use brick for internal linings and partitions in preference to stone.

E. WYNDHAM TARN, Architect.

CARBONIFEROUS limestone, some beds of the lias, slate rubble, and a few other stones, where used for walling, have a tendency to condense the atmospheric vapour, causing it to trickle

down the face of the work, and prevent the use of paper.

A wall, properly coated outside with Portland cement, cannot admit rain. The defect is doubtless in the nature of the rubble backing, and the only remedy is to batter the inner face of the wall, using iron holdfasts to fix the battens, and packing them off the wall about ½ in., the wall to be pierced by a few interstices left in the joints under the eaves course and under the floor-line, to allow a current of outer air to circulate behind the battening, to preserve the wood and, as far as possible, to dry the moisture from the face of the rubble. The joints of the floor-boards should be grooved and tongued, and the wood skirtings tongued into the floor-boards, to prevent undue draughts of air in the rooms.

A SUB.

Sir,—To either paint or cement the exterior of any building generally interferes with the design. I consider the best plan is to deal with the inside walls in the following manner:—Take off the old plaster from the walls that are damp, and put on a rendering coat of the best Portland cement, without sand, about ½ in. thick; then put on a coat of equal parts of Parian cement and sand, to bring the wall to a level surface; and afterwards a finishing coat of Parian cement alone, of about the thickness of one-eighth of an inch; and when this last coat is setting, which you will notice by its changing colour, give it a coat of paint mixed up with very little oil in it, the object of which is to keep the chemicals used in the manufacturing of it from rising to the surface, often throwing off the paper if this is not done. This plan I have tried many times, and have never found it to fail. Of course, a great deal depends upon the cement being used properly, and it being of the best quality.

JOHN RUSCOE.

AN ODD OBJECTION.

LAMBETH WORKHOUSE.

At the last meeting of the Lambeth Board of Guardians, Mr. R. Taylor complained that although Mr. Parris was the architect of the new workhouse, yet his partner interfered in various matters. He thought if this course was pursued, they might involve themselves in some difficulties.

Mr. Higgs said no order for work could be given by the architect for a sum exceeding 25*l.* without the sanction of the Board.

After a discussion, it was agreed that the clerk should write to the architect, and request him to attend the Board personally upon all matters connected with the new workhouse.

SCHOOL-BOARDS.

London.—At the last meeting, on the 24th inst., Mr. Reed, M.P., moved the adoption of a Report from the Works Committee, calling to mind that the Board, on the 9th of August, requested the Works Committee to consider and report upon the question of obtaining architects and securing designs. The Board further resolved, on the 10th of January, 1872, that the system of class division should be tried on the Essex site, in Stepney. The Works Committee now recommended that, for the erection of this school, there should be a competition of architects, not exceeding twelve in number; that it should be referred back to the Works Committee to advertise for candidates, to select a number not exceeding twelve, and to submit the plans prepared by the competing architects to the Board. This recommendation gave rise to a long discussion, the result of which was that the whole matter was referred back to the committee, principally for the purpose of their finding out a larger site. On the motion of Mr. Reed, M.P., the Works Committee were empowered to recommend the engagement of four agents for two months, at a salary not exceeding 2*l.* per week, to assist the architect in looking out for sites, and premises to be hired, in those blocks in which the Board has decided, or shall hereafter decide, on the recommendation of the Statistical Committee, to erect schools.

Leicester.—At a meeting of the Board for discussion with Mr. J. R. Blackburn, Her Majesty's Inspector of Schools, Alderman Burgess said he wished to ask a question with reference to the sort of schools for which they would require architects. It seemed to him that they could not stir a step with the architects till they had

settled what kind of schools they were to build, as they must give them instructions. Their British Schools were built exactly in accordance with the plan recommended by the British and Foreign School Society. They had not been built above ten years before they found they had made a great mistake; they had altered and altered four times since the schools were built, and it had involved them in great expense. Of course they all felt that it was exceedingly desirable that they should start well, on the best possible system; and perhaps the inspector would give them his idea how they could get the best possible system of laying out their schools, and have them built so as to accommodate the children in the best possible way. The British schools at present wanted another remodelling, as the inspector would agree, but how to do it he did not know. He thought they would have most carefully to consider the plans of their schools, and he should like to ask whether the Department had arrived at any conclusion on this point, or issued any direction or suggestion to the School Boards on this subject. Mr. Blakiston said he thought not. If they adopted the present system of pupil teachers they had hundreds of models to go by; and if they adopted the Prussian system they must inquire abroad. The Rev. R. Hawley said he understood the inspector to mean that if they adopted the Prussian system they would have to be grieved very much less by the experience of the past than otherwise; but if they adopted the old system he was in favour of large schools,—at least, large schools were more economical, and that if they put in thoroughly efficient men they were the most efficient schools, but the difficulty was to get the men to manage them. Mr. Blakiston said, the largest school he had in his department was a school of 300 boys, but not many masters could manage it.

Derby.—At a meeting of the local School Board a report of the School Plans Committee was read. It stated that,—

"On Monday, the 9th of January, your committee met to receive the plans of the clerk, reported to have had received eleven sets of plans under seven different marks or mottoes, viz., three plans marked 'Alpha,' two marked 'Education,' one marked 'Latus Honore,' one marked with a 'Red Spot,' two marked 'Nota Bene,' one marked 'Prodesse quia conspici,' and one marked 'Non Semper.'"

"At the adjourned meeting on Wednesday, the clerk reported that he had received on Monday evening three other sets of plans marked 'In Spe,' as these were sent in after the time appointed they were not admitted for competition. In making the selection which they submit to the Board for adoption, your committee have been guided by the consideration of light, ventilation, and internal fitness for school work, rather than by the external appearance of building. The question of cost also has been duly considered by the committee in their selection. After very mature deliberation your committee resolved to recommend the plan marked with a 'Red Spot' as the first; 'Nota Bene' as the second; and 'Latus Honore' as the third. On opening the sealed envelopes, it was found that the selected plan had been prepared by Mr. A. Coulhurst, architect and surveyor, No. 10, Wilnot-street; the second by Messrs. Giles & Brookhouse, architects, St. James's-street; the third by Mr. G. Sheffield, architect, Bank-chambers, Derby."

The confirmation of the committee's report was unanimously agreed to. Mr. Bewick then read, as a substantive motion, that Mr. Coulhurst be appointed the architect for the superintendence of the erection of the new schools in Gerard-street, and that the premium of 10l. offered for the second best plan be awarded to Messrs. Giles & Brookhouse. The proposition was carried unanimously. A building committee was also appointed to carry out all needful measures in connexion with the erection of the new schools in Gerard-street, the committee to consist of the chairman, the vice-chairman, Mr. Thompson, Mr. Shaw, Mr. Holmes, and Mr. Roe. The clerk was empowered to apply to the Education Department for a loan of money needful to erect the new schools in Gerard-street, so soon as it should be ascertained what was the sum required for that purpose.

CARRIAGE ACCESS TO THE THAMES EMBANKMENT.

In the Vice-Chancellor's Courts (before Vice-Chancellor Sir John Wickes), The Marquis of Salisbury v. The Metropolitan Board of Works, is a suit instituted in reference to certain land reclaimed on the Thames Embankment, opposite the end of Salisbury-street and Cecil-street, and which has been laid out as a garden. The garden is surrounded by railings, the gates being locked at night, and the question turns on the construction of the Act of Parliament authorising the construction of the Embankment, under which rights of access are reserved to the Marquis and his tenants. The case was being heard on an interlocutory application for a motion for an interim injunction. It appears that the Marquis has in contemplation the erection of a large and important class of buildings upon this low level ground, and it is in respect to the erection of these that he seeks immediate relief, by injunction, for the purpose of enforcing

his right of road from the Embankment-road across the ornamental gardens. The question mainly depends upon the interpretation to be put upon Section 62 of the Thames Embankment Act, 1856, which has special reference to this property.

The Vice-Chancellor, in delivering judgment, said, the question was whether the property to which the reservation contained in the 62nd section referred is limited to Cecil-street and Salisbury-street, or whether it includes the low-level ground also. Without desiring to express any final opinion on the point, his Honour intimated his view that the reservation was solely for the benefit of the owners and occupiers of Cecil-street and Salisbury-street. The word "tenants" must be held to mean future tenants of houses in those streets. If it had been intended to comprise future tenants of the low-level also, he could not see why the low-level should not have been specifically mentioned. The right of the plaintiff to a carriage-way from the Embankment to the low-level ground was too doubtful to be enforced on motion for a mandatory injunction; but, as at present advised, his Honour thought that the inhabitants of Cecil and Salisbury streets had a right, at least, to a footway at all times across the ornamental gardens to the Embankment-road. Holding this view, he directed the motion to stand over until the hearing of the cause.

INDEX TO THE "BUILDER."

Sir,—I cordially second the proposition of your correspondent, that you should publish a useful Index and Reference to the *Builder* (at the end of the year) from the commencement—the same to form a volume of itself,—and will most willingly contribute towards its production, having been a subscriber from your No. 1 to the present time, and having all the volumes bound up.

I freely contribute towards its obtaining information required without loss of time in long searches, is my reason for troubling you with this. F. E.

THE "STANDARD" OFFICE NEW BUILDINGS.

AMONGST the improvements at present in progress in Shoe-lane, the extensive buildings which have for some time been in progress for the *Standard* newspaper, and which are now approaching completion, attract notice. The premises, which have been erected from designs furnished by Mr. Parkinson, architect, form a prominent feature amongst the surrounding buildings, and altogether occupy an area of about 700 square yards, extending in rear to a depth of 100 ft. The main elevation in Shoe-lane is 60 ft. high to the parapet, and contains a frontage of 61 ft. in length. The materials used in the ground-floor and first floor of the elevation are stone, the upper stories consisting of brick, with bold stone facings. The several entrances and windows on the ground-floor, as also the first floor, are semicircular-headed, ornamented with carving, whilst the windows of the second, third, and fourth stories, in number eight each, are segment-headed. The principal entrance is wide and massive, surmounted in the centre by a carved hood, whilst between the windows of the first floor are two similar curved figures, somewhat smaller in size, with the words "*The Standard*" in large characters, cut out of the stonework. The interior arrangements and fittings of the structure are, on paper, to be very complete. Apartments in the third story are specially devoted to a large library and reading-room for the use of the employés on the establishment. Immediately adjoining are the new premises erected for Messrs. Dellagana, for stereo- and electro-type purposes, and which are also approaching completion, under the same architect; Mr. John Anley, of Brunswick-place, City-road, being the contractor for both.

CHURCH-BUILDING NEWS.

Godstone.—The parish church has been enlarged and re-opened. The work was done by Mr. Carruthers, of Reigate, after the designs of Mr. Gilbert Scott, architect, who has retained all the relics of antiquity found during the work. The cost of the restoration amounted to about 4,000l., of which sum 1,000l. were given anonymously by "A Friend." Mr. Macleney, of Pencil, also contributed 800l. On the opening day the sum required only amounted to about 300l. The works carried out included the removal of a south transept, the galleries and pews also being swept away, the building of a south aisle, restoration of tower, including the raising of the steeple 16 ft., the opening of the roof of nave, the insertion of a west window, and west and south doorways according to remains found. The west doorway (as also the south) is Norman. This is formed of stone given by Mr. F. M. H. Turner, of Leigh-place, who also gave the stone used for the external work. Stone from the quarries here (of which Henry VII.'s chapel at Westminster is built) is used for the arches, columns, &c., the walls being lined with stone from Kent. The seats are open, and of oak.

The pulpit remains the same, but the stone base has been carved. A porch of oak has been built on the south side, near to which door the font is placed. It was intended at first to have a winding staircase to the ringing-floor at the south-west corner of the tower; but on the removal of the old vestry, &c., traces were found of the original staircase at the south-east corner. This had been at some time completely cut in two from top to bottom; it has been restored. The tower, which is now open to the church, has a low carved stone screen separating it from the chancel: in it is placed an effigy, executed in white marble, of the late Mrs. Macleney. A groined oak roof has been placed in it, and the quaint windows are filled with stained glass. The paving is, we believe, to be of coloured marbles. This is at the cost of Mr. Macleney. A new treble bell has been given by Mr. Thomas Rose. A three-light window on the south side has been filled with stained glass, representing the "Good Shepherd," by the family of the late Mr. W. Steming, of Godstone Court. The east window was already of stained glass, put in by subscription to the memory of the late Archdeacon Hoare. The window on the south of the chancel has been put in by Mrs. Hoare as a memorial to the same: it contains figures of King David and St. Cecilia. The reredos, of stone, has seven arches, the columns being of red marble: it is carved. The east wall on either side is lined with encaustic tiles, and above is the legend on a gold ground, "Holy, Holy, Holy, is the Lord of Hosts; the whole church is filled with His glory." Above this is a cornice of quarry stone, carved by the rector. The pulpit was carved by him when the chancel was restored a short time since.

Pateley Bridge.—The Church of St. Cathbert was re-opened on Thursday, December 21st, by the Rev. Bishop Ryan, of Bradford, after having been closed for some time during alterations. The gallery has been removed, and the old pews have been replaced by stalls. A stone pulpit and reading-desk have been erected. The alterations have been carried out by Mr. Grange, of Pateley, from the designs by Messrs. T. H. & F. Henley, architects, Bradford. This is one of the Parliametary churches of the early part of the present century. A system of decoration has been employed in order to deal with the unbroken monotony of the interior. The wall of the nave has been arranged in three divisions of colour. The dado is brown; forward to the springing of the window arches, it is citrine, relieved between each window by a centre ornament containing Christian emblems; above that it is of a deep buff powdered, with conventional roses and *flurs-de-lis* in brown. These divisions are marked by borders on yellow grounds. The chancel, reredos, and tablets are illuminated in both stencilled and painted ornament. The whole of the decoration was done by Messrs. S. Bottomley & Sons, of Crosshills, *vic* Leeds.

Beddington.—The most recent additions to St. Mary's Church consist of a new east window. The window and reredos erected at the same time as the north wing, and which were there during the Rev. J. Hamilton's rectorship, have been removed. The new window is not so deep by about 2 ft. as the one it replaces; the object being seemingly to allow the new reredos being raised. Cut in the basement stones of the arch over the window outside are *fac simile* heads of the present Bishop of Winchester (on the left hand), and on the right that of the present rector of Beddington—taken from portraits. The chancel screen has also had unmounted upon it a carved oak cross. The screen on the west wall of the north wing is also completed, and is formed of a carved oak frame gilt, filled in with a painting of the Last Judgment. The chapel, which is undergoing repairs, is also nearly completed.

Great Yarmouth.—The topstone of the new north-west pinnacle of the south-west aisle of the parish church has been completed. The pinnacle has been finished at an expense of about 200l. the cost being defrayed for the most part by the ladies of the congregation.

Romiley.—The design of St. Chad's Church, Romiley, has just been completed externally by the erection of the spire. The new spire rises to a height of 130 ft. It is octagonal in shape, rising with brackets from the top of the tower and belfry-stage. It is surmounted by an iron cross and a gilt cock. The work has been carried out by Mr. S. Norcross, from the designs and under the superintendence of Messrs. Medland & Henry Taylor, the architects for the church. The cost has been only 260l.

Maryport.—The foundation-stone of a new church has been laid at Maryport. The proposed building is intended for a Mission Church in connexion with St. Mary's Church at Maryport. The site is on the north side of the harbour. The church, when completed, will seat about 100; and the estimated cost of erection is, we understand, from 1,200l. to 1,100l. It has been designed by Mr. Eaglesfield, of Maryport, architect.

Snargate.—The old parish church of Snargate is been re-opened, after its repair and restoration. The arches of the aisles and tower were hidden by unsightly boardings, and the old interior was a sad picture of what in so many of our churches has been the result of many generations of niggardly neglect and bad taste. All is here changed, and the dimensions of the building are opened up, the nave and aisles are laid out with appropriate fittings, still leaving an open space to the west, from the font to the tower arch. The architect, whose plans have been adopted throughout, is Mr. C. T. Whitley.

Dover. The work of the chancel was executed by Mr. Ames, of Brenzett, and that of the body of the church by Messrs. Adcock & Rees, of Dover.

Bishopsgate, London.—A new chapel and schools for the district of Bishopsgate have been opened. The new chapel has been erected on the site of the Church of All Saints, Skinner-street, Bishopsgate-street Without, and, with the underlying schools, is capable of accommodating 500 boys. There are 300 sittings in the chapel, and 200 in the class-rooms underneath. Gothic of the plainest and most useful possible kind is the style of architecture of the new chapel and schools, and Mr. E. N. Clifton was the architect, and Mr. Brass the builder. Every few persons beyond those immediately concerned, says the *Clerkenwell News*, know anything about the Great Eastern Railway Additional Powers Act. It empowered the Great Eastern Railway Company to take down the Church of All Saints, Skinner-street, in consideration of the payment of a certain amount of money compensation to the parish in which the church was situated. In due time the money was forthcoming. Then came the question, what should be done with it? Should a new church be built, or what? After a good deal of deliberation on the part of the parochial authorities, they came to the conclusion that, in consequence of the great diminution of the population caused by railway incursions, and the consequent sweeping away of thickly-populated districts, it was unadvisable to build another church in a thoroughfare so near the parish church, and a chapel, in which religious services, school business, and meetings and entertainments might be carried on, was decided upon. To do this, an Act of Parliament was necessary. A Bill on the subject was introduced into Parliament in 1869, which was supported by the Archbishop of Canterbury and the Bishop of London, and which, after some opposition, became law. The result is the chapel and schools which were opened on Friday last.

SCHOOL-BUILDING NEWS.

Birball.—The new pile of buildings, including school and master's residence, situated near the entrance to the park at Birball, have been opened by Lady Middleton, who laid the foundation-stone on the 8th of May last. The school is built from designs superintended by Mr. Parsons, his lordship's agent; the contractors being Messrs. Dodsworth & Wood, Malton, for the masonry and joinery work, and Mr. Smiddy, Malton, for the plumbing.

Reedham.—A new infants' and mixed school, with a master's house attached, has been opened at Reedham. It is conveniently situated on Maypole-hill, the land on which it stands having been given by Mr. W. Jary, of Reedham Hall. The external walls of the building are constructed of red brick, with black and white brick and stone dressings, and a large stone window is inserted in the north end of the school-room, smaller windows being introduced on the western side. The building, which has a lofty, open stained roof, costs, with the fencing, about 800l., and will accommodate 200 children. Mr. W. P. Pearce, of Orford-hill, Norwich, is the architect; and the contractor is Mr. J. Withers, of Blofield.

Langport.—The new schools at Aller, near Langport, have been opened. The building is composed of white lias, and occupies an elevated

site on the slope of a hill above the rectory grounds. It consists of a general school-room, 33 ft. 6 in. long by 17 ft. wide, plastered, ceiled, ventilated, and lighted; a class-room, 13 ft. by 12 ft.; and cloak-room, 8 ft. by 6 ft. 6 in. At the southern end is a cottage for the school-mistress.

Bosford.—A new schoolroom, which has been planned and built by Mr. Woodbridge, of Hungerford, has been opened here. The Rev. G. F. Wells, at the opening, said,—For thirty years your rector, Mr. Wells, has endeavoured to obtain such a room as this. Last year the Government ordered that such a room should be built, for remember that, however good it looks, owing to the skill and care Mr. Woodbridge has shown, it is only built according to the requirements of Government for ninety children. The owners of property agreed to provide part of the means to build this school, the Government, the National Society, and the Diocesan Board to supplement that sum, so that now the room in which we are assembled is completed, and the cost of it will soon be paid.

Chester.—The new schools which have been erected in connexion with the Roman Catholic Church of St. Werburgh, in Queen-street, have been formally opened. There was sufficient ground, without infringing on the old graveyard, to admit of the erection of new schools without destroying the old school, that having been converted into an infants' schoolroom. The new building is a plain one, brick-built, covering an area 55 ft. by 45 ft. On the basement is the boys' school, which may be entered by two different doors from Union-walk. The principal room would be square, but for the projection of two buttresses, which are necessary to carry the timber supports of the upper school. Although these buttresses would be found to be objectionable when holding a meeting or entertainment, as they are continued upwards to the cross timbers of the roof, yet they afford corners for classes, which the teachers will know how to utilise. To each large room a smaller class-room is attached. All the rooms are lofty, well-lighted and ventilated, and will be warmed, the larger rooms by two Gill stoves in each, and the class-rooms by a fireplace in each. The entrance to the girls' school and also the infants' school, which, as already said, is the old school, is from Queen-street; and the upper school-room of the girls is reached by a broad winding staircase. Separate play-grounds and out-offices are attached to each school; and the internal fittings include new patent desks, which serve the threefold purpose of form and desk, form and table, and seat with sloping back. The schools were designed by Mr. Edmund, of Liverpool, and the builder was Mr. Andrews, of this city. The total cost is about 1,400l. It is estimated that the schools will accommodate 600 children.

Books Received.

"BRICKYARD CHILDREN: an Answer to the Charges of Mr. George Smith against the 'Tories,' Tinstall. By Jno. N. Peake. Grant & Co." In this pamphlet Mr. Peake makes a vigorous, indeed over-vigorous, reply to the allegations lodged against his own establishment, and adduces evidence to show that it is well managed. Our own observations, however, on the miserable condition of brickyard children as a class were founded on the examination of many yards, and are indisputable. The interference of the legislature was loudly called for.—"The Illustrated Price Book for 1872 (Sprigs, Great Russell-street)." includes a considerable amount of useful information appended to the lists of prices.—"Mechanical Arithmetic and Mensuration. By Charles W. Merrifield, F.R.S. London: Longmans, Green, & Co. 1872." This treatise has been written as one of a series of textbooks on science. It is not meant to be the first book of one wholly unacquainted in the elements of arithmetic. It gives elementary rules the precision and illustration which they need for the farther pursuit of the subject, and to the higher rules a gradual induction. The previous knowledge, however, assumed to be possessed by the student need not be great in quantity or high in quality, and all that the book contains is well known and established. There is a chapter on mechanical work, but nothing in the way of mathematical invention or discovery. The work is adapted to the use of artisans and students in public and other schools. The author is principal of the Royal School of Naval archi-

ture and Marine Engineering. —"The Transfer of Gas-Works to Local Authorities." By Arthur Silverthorne, C.E. London: Livermore & Robinson, Bedford-street.—The purpose of this pamphlet appears to be, to advocate the adoption of gas-works by corporate and other local public authorities,—a purpose which harmonises with our own efforts while engaged in past years in getting up and supporting the gas movement for the reduction in price and improvement in quality of the gas supplied by companies to the public. We are glad to be able to give so promising a list as the following of towns throughout England, where the exclusive control of the gasworks is now vested in the Local Board, Corporation, or Improvement Commissioners, for the time being, namely:—

Aberavon, Abergavenny, Beverley, Bingley, Birkenhead, Bradford, Blackpool, Burnley, Burton-on-Trent, Bury (Lancashire), Burton, Carlisle, Chorley, Clackhaston, Darlington, Dewes, Doncaster, Malvern, Halifax, Haverfordwest, Keighley, Knaresborough, Leeds, Leek, Lytham (Lancashire), Macclesfield, Manchester, Middlesbrough, Newton (Lancashire), Oldham, Richmond (Yorkshire), Ripon, Rochdale, Rotherham, Salford, Southport, Spalding, Stockport, Stockton, Teignmouth, Tenby, Wallasey, Walsall, Widness.

Thus it will be seen that the number of towns that have adopted the system of directing their own gasworks does not bear an inconsiderable proportion now even to the number of companies incorporated under special Acts of Parliament. The latter reckon at the present moment, in England and Wales, about 250, and the proportion of unincorporated gas companies to the former is in the ratio of 4 to 1. In Scotland, the towns in which the gasworks have been vested almost all lately are, Dundee, Glasgow, Perth, Paisley, Renfrew, Greenock, Arbroath, Kilmarnock, Forfar, Aberdeen.

Miscellaneous.

Metropolitan Fire Accidents.—According to the usual annual report just laid before the Metropolitan Board of Works by Captain Shaw, the total number of fires to which the members of the Fire Brigade were called during the past year was 2,056. As compared with the previous year, this shows a decrease of 101. No fewer than 38 lives were lost by fire during the year. The strength of the brigade at present is as follows:—50 fire-engine stations; 93 fire-escape stations; 4 floating stations; 51 telegraph lines; 82 miles of telegraph lines; 3 floating steam fire-engines; 1 iron barge to carry a land steam fire-engine; 8 large land steam fire-engines; 17 small land steam fire-engines; 16 7-in. manual fire-engines; 56 6-in. manual fire-engines; 13 under 6-in. manual fire-engines; 104 fire-escapes; 387 firemen. The number of firemen employed on the several watches kept up throughout the metropolis is at present 107 by day, and 169 by night, making a total of 276 in every 24 hours; the number of those sick, injured, on leave, or under instruction, is generally about 40; the remaining men are available for general work at fires. It remains to be seen what the result of the Metropolitan Water Act of last session will be, but it may be hoped that the provision for constant service, which comes into force on the 21st of April this year, will have the effect of at least making every fire-plug represent an immediate supply of water.

Adulteration of Gas.—The amalgamation of the gas companies does not appear to have been beneficial so far as the citizens are concerned. No doubt the amalgamated companies could, if they would, sell good gas cheaper than if they were not amalgamated; but, as we predicted at the time, they would not though they could. They are up to all such nefarious devices as tradesmen and manufacturers practise in the adulteration of their goods; anything, in their opinion, seemingly, being good enough for the stolid fools who allowed them to "amalgamate." Their gas, we should think, is common air illuminated by a little carburetted hydrogen, just as London milk is water tintured with the product of the cow; and it saves cost to allow the sulphurous and other abominations of the vilest coal to go along with it, and so the public have their supply of brimstone gratis direct from the manufactory. As appears from the Court of Common Council proceedings, sulphur is more prevalent than ever it was in the gas supplied to the City; and in many instances the consumers' bills, notwithstanding the reduction of price from 4s. to 3s. 9d. per 1,000 ft., are larger than formerly.

Accident at a National School in Salford.—An accident of an alarming nature has taken place at the National School-room in St. George-street, Salford, by which a number of young children sustained injury, and narrowly escaped losing their lives. Several workmen have been engaged in making alterations and additions in the school-rooms, and this work had not been fully completed when the children resumed their attendance at school for the first time. While the children in the infants' department were assembled, two gasfitters employed by Mr. Livingstone had passed through a trap-door to the ceiling under the roof, and continued their work immediately over the heads of the children. They were walking about, when all of a sudden the weak materials upon which they were standing gave way, and carried the two men, along with a large quantity of debris, down upon the children below, some of whom were for a time completely buried underneath it. The dimensions of the part of the ceiling which fell were about 18 ft. by 11 ft., and it was estimated that it weighs nearly a ton. The children were got out bruised and bleeding, but fortunately it was found that, with one or two exceptions, the injuries were not so serious as to excite apprehensions of grave results. The teacher was badly hurt.

Perils of Timber Stacks.—Last Sunday afternoon an accident, which unfortunately resulted in the instantaneous death of two little children, occurred at Mr. Bowman's timber-yard, adjoining the river at Low Elswick, Newcastle. Elizabeth Muckle, aged six years, and Thomas Henry Charlton, aged four years, had strayed from the house of their parents into the yard adjoining, in which a large quantity of thick, heavy batons were piled up in stacks. How long they were there is not known, but within a few minutes of three o'clock passers-by were startled by the crash of falling timber and a loud scream. This was enough to rive the charm, and several gentlemen at once climbed the rails into the enclosure, and then discovered that about a couple of tons of timber had toppled over, burying the two poor little companions beneath the mass. When the timber was removed, a frightful sight presented itself, and both the children were dead. It is supposed that they had been playing on the top of the timber, when the stack fell over and buried them beneath it.

The Work of the Telegraph.—It appears with regard to the progress of the telegraph system under the Government management, that while in the financial year ended the 31st of March, 1871, the messages amounted to 9,850,177, those for the current financial year ending the 31st of March next (estimating the remaining quarter according to the average of the preceding quarters) will reach 12,410,726,—an increase of 26 per cent. The total number of offices open on the 5th of February, 1870, when the business was taken over by the State was 2,932, and it is now 5,098. These 5,098 consisted of 3,291 postal offices and 1,807 railway telegraph offices. The great augmentation has been in the postal offices, which have risen from 1,658 to 3,291; those in the London district having increased from 177 to 361, in the West of England and Wales from 605 to 1,979, in Scotland from 155 to 321, and in Ireland from 122 to 560.

The Theatre in Shakspeare's Time.—On Saturday afternoon last Mr. W. B. Donne, the examiner of plays, commenced a course of lectures in the theatre of the Royal Institution, "On the Theatre in Shakspeare's Time." Mr. Donne started at almost the very birth of dramatic writing, and traced in an interesting and instructive manner the various improvements noticeable from time to time in the construction and the general treatment of the English language. The writers of Elizabeth's time and their works were particularly dwelt upon. Some extracts from the latter were read, for the purpose of showing the point of improvement at which English literature and the drama had arrived immediately before Shakspeare made his first appearance on the scene.

State of Dwellings in Limehouse.—A report laid before the last meeting of the Limehouse Board of Works by the medical officer of health for the district describes the houses in Victoria-place, Limehouse, as being in a condition unfit for human habitation, and the Board has resolved to proceed against the owners of the property under the provisions of the Artizans' and Labourers' Dwellings Act.

The Titeley and Presteign Railway.—The first sod of the projected railway from Titeley to Presteign has been turned at Presteign, amidst general rejoicing. Presteign is the county town of Radnorshire, and an important centre of business for the county. The projected line, when completed, will be about five miles in length, and will cost about 23,000*l.* It will form a junction with the Leominster and Kington Railway, near Titeley. It will probably in a short time be continued on towards Rhayader and the Central Wales line. Another line has been partly constructed from Eardisley to Kington. Direct communication will then be made with the immense fields of industry in South Wales. Lino will then find a ready demand at the hands of the South Wales ironmasters, and coal will be cheapened. The contractors for the line are Messrs. Perry & Sons, of Stratford, London; and the engineer, Mr. W. Clarke, C.E., of London.

Proposed Trades Hall for Manchester.—A meeting of delegates from the various trade societies in Manchester has been held at the Typographical Institute, Water-street. Mr. S. C. Nicholson occupied the chair. The Rev. H. Solly having addressed the meeting, the following resolution, proposed by Mr. W. H. Wood, and seconded by Mr. J. McKenna, secretary of the Coachbuilders' Society, was adopted:—"That premises be secured for a social club for the accommodation of the trade unionists of Manchester and Salford as near the centre of the city as possible, to be opened to members contributing 5*s.* per annum, rooms in the same to be let for the accommodation of trade societies at reasonable rentals." Mr. W. H. Wood, in support of the scheme, urged that such a club would answer exactly the same purpose as those occupying a higher grade in the social scale.

Removal of a Toll.—The *South London Chronicle* says,—"That obnoxious obstruction, the halfpenny-hatch in Balclayon-street, which so long placed a barrier to free communication between Bermondsey and Newington, has at length been removed; and now the hundreds of workmen whose nearest route to their daily labour lay through the hatch can take the nearest cut, and laugh at all that remains of almost the last remnant of a bygone system of tollage. We may add that the Bermondsey vestry, sensible of their position as non-obstructors, have determined to remove the only public bar which now exists in the parish,—*i.e.*, the one that blocks up Smith's-buildings, Edward-street. There still remains the toll on Waterloo Bridge. Now that the City has done thus much for Bermondsey, is it not time that the Metropolitan Board tried to give a like relief to the whole of London?"

Royal Dublin Society's School of Art.—The annual exhibition of the students' works of this school has been opened to the public free daily. The grand staircase, long staircase, and adjoining rooms are filled with art works handsome and catalogued to the unprecedented number of 607, comprising drawings of the human figure, landscapes from nature, architectural drawings, and surface designs. The silver medal for architecture was awarded to Mr. J. Bouchier for a drawing made from actual measurement of the Royal Dublin Society's House; also in orthographic projection and perspective and practical geometry bronze medals were awarded, the recipients being Mr. Beardwood, Mr. Robert Smith, and Mr. Tighe. For some of the designs for cabinet, damask, fans, dinner-plates, lace, surface decoration, carpeting, and wall paper, the leading manufacturers offered first and second prizes of 5*l.* and 3*l.* Mr. Lyne is the head master, and his assistants are Mr. Byrne and Mr. Murray.

The Park-lane Sewer.—In the St. George's, Hanover-square, Committee of Works, General Sir William Codrington, according to notice, moved "That the surveyor lay before the Committee of Works and the Vestry a plan and sections of the main drains of Park-lane and Piccadilly towards the south end of Park-lane; also of plans and levels of any house-drains in that neighbourhood which communicate with the main sewers, and of which complaint has been made." His only object in this motion was to obtain the requisite information. Mr. Walker seconded. Mr. John Morris suggested that a plan of the basement of Gloucester House should be added. Mr. Cove thought, now that the sewer in Park-lane was working in a satisfactory manner, the motion seemed unnecessary. The motion, being put, was carried.

Effects of the Gale.—A very heavy gale visited the metropolis on Tuesday night, accompanied with torrents of rain. Many accidents are reported, and amongst them is the fall of one of the large chimneys from the central tower of the Westminster Palace. Destructive floods are reported from many parts of the provinces. At Chelsea the gale was severely felt, and a stack of chimneys fell down in Lower Sloane-street, causing the death of a lady named McGarth, who resided at No. 77. It appears that between the house in question and No. 76, which was occupied by Mr. Bancks, the well-known dyer, was a high stack of chimneys, and about half-past five, when the gale was at its height, the stack fell with a tremendous crash, half falling through the roof of No. 76, and the other half through 77. The storm raged with great fury at Cambridge. In fact, there was a perfect hurricane of wind and rain. Buildings in course of erection in various parts of the town were blown down.

Tradesmen and International Bazaars and Exhibitions.—A public meeting, convened by the Metropolitan and Provincial Association for the Defence and Advancement of Trade Interests, has been held in the Egyptian-hall, at the Mansion House. The chair was occupied by the Lord Mayor and Mr. Alderman Finnis successively. The meeting was numerously and respectfully attended. The following resolutions—

"That this meeting views with regret and alarm the determination of the Royal Commissioners to convert the International Exhibitions at South Kensington into enormous retail shops; and pledges itself to use every lawful means to prevent the intended scheme being carried into effect."

"That the following gentlemen, with power to add to their number, do form a standing committee for the purpose of removing the grievances already complained of, by a humble address to her Majesty, petitions to the Houses of Parliament, and by using all other available means to oppose this objectionable scheme.—The Lord Mayor, Mr. Alderman Finnis, Mr. R. Crawford, M.P., Sir Robert Carden, and Messrs. Attenborough, Daniell, Copeland, Gatto, Blackwell, Podder, Harrison, and P. Orbanau, with power to add to their number."

were separately moved, and unanimously passed, by the meeting.

A "Quarter-Turn Full-Way High-Pressure Water Valve."—In reference to a valve so named the inventors, Messrs. Carr & Claret, sanitary engineers, state that it "opens full bore with a $\frac{1}{4}$ turn, and can thus be used in all situations in which the ordinary cock is applicable," so disposing of the objection (often raised with respect to valves) of a number of turns, and that, "unlike all previous valves, it is *actually* a full-way valve," whereas, "even the so-called round way cocks are not *absolutely* full way, while most valves and common cocks are little more than half full way." The disc which closes the aperture (in other words, the valve proper) is fitted with $\frac{1}{4}$ -in. solid mineralised indiarubber, which is said to be, in practice, almost impishishable, when used even for boiling water. The cost of the valve is said to be much lower than even the common valves yet made. It ought to come into use.

The Park-lane Improvement.—At the St. George's (Hanover-square) Committee of Works, a letter was read from the Metropolitan Board of Works, asking the vestry to assume the charge of the new foot and carriage ways in connexion with the Park-lane improvement. The surveyor (Mr. Tomkins), in answer to questions, said that the roadway in Hamilton-place was now in excellent condition. A short time ago, 3 in. of granite kerb were laid down. Mr. Walker said the road was as good a road as any in the parish. The committee decided to take to the road in accordance with the request of the Board; and it was understood that the refuge at the top of Hamilton-place would be removed, it being considered dangerous.

Masters and Men.—The proprietor of the West Central Iron-works, Drury-lane, and the South-Western Iron Foundry, Paradise-street, Lambeth, Mr. George B. Cooper, having concluded the nine hours per day to his workmen, from January 1st last, they presented him, on Monday evening, January 15th, with an address, accompanied by a silver inkstand, designed and manufactured specially by Messrs. Elkington. Mr. Cooper received the present with much feeling, and in speaking of the movement, said it had his support, and he hoped that the time acquired by his men would be used for their moral and mental improvement. His son, Mr. L. E. Cooper, afterwards read an address to the workmen.

Value of Land in London.—The freehold property, Nos. 27 and 28, Milk-street, Cheap-side, as sold at the Mart by Messrs. Debenham, Lawson, & Farmer. It consisted of two old houses, covering a site of 1,780 ft., and realised £501., or over 4s. 17s. per foot.—With reference to a paragraph we quoted in our last from City paper, as to a sale of land in Lombard-street, a correspondent acquainted with the circumstances writes to say that "it gives a also impression as to the value of land per foot. The amount in question comprised compensation for a retail business, and there are other exceptional matters connected therewith, which would reduce the value referred to, which I, as one having taken a prominent part therein, can well testify to."

Instruction in Science and Art for Women.—By permission of the Lord President of the Council, a course of six lectures, on the most celebrated and influential composers of Italy, France, England, and Germany, for the violin and the pianoforte, in connexion with the general history of music of the eighteenth and nineteenth centuries (illustrated by performances on the pianoforte), will be delivered on Monday afternoon, the 5th, 12th, 19th, and 26th of February, and the 4th and 11th of March, at half-past two o'clock precisely, by Mr. Ernstauer, in the Lecture Theatre, South Kensington Museum.

Junior United Service Club House.—This building, situate in Charles-street, St. James's-square, had a narrow escape from being destroyed by fire on Monday night. It appears that the members, during the whole of the day, had experienced a smell of burning wood, and at last names were seen playing round one of the pillars in the coffee-room on the ground floor. On making a closer inspection it was found that the ceiling, to the extent of 35 ft., with the wood work and supports, was on fire, and that the flames had actually penetrated the flooring in the first floor. With the aid of a number of hand & Mason's hand-pumps the fire was extinguished. The cause of the fire has been ascribed to a defective flue.

The "Abbotsford Grate."—The bars are closed close down upon the hearth, the space for the fire being lined at the sides and back with fire-brick, and instead of a grate forming the bottom, a fire-brick lump, fitting into and resting on a cast-iron tray, forms the bed upon which the coal is burnt, and all are so constructed to be renewable at any time without unsettling the grate. It is said that "the warming power of the grate is in excess of the ordinary construction, in proportion to the amount of fuel burnt, and the fire-brick lump at the bottom causes the most complete combustion."

A New Theatre in South London.—We understand that a new theatre is about to be erected in Newington-causeway, not far from the Elephant and Castle inn. The site is said to be extensive premises, situated on the western side of the road, and until recently occupied and known as the Steam Wheel Works. It is stated that the new building, the erection of which is immediately to be commenced, will be on a very extensive scale, and large enough to hold an audience of more than 3,000 persons.

The Kull Water Supply.—A report to the Kull Corporation Waterworks Committee on the proposed additional works for the supply of the water from Springhead, by the engineer to the waterworks, Mr. Thomas Dule, has been printed by authority. It develops three several plans, one for pumping all the water for the town's use direct from Springhead, at a cost of 79,814l.; the second, for supplying the west district direct from Springhead, at a cost of 61,372l.; and the third, for supplying water to the Stoneferry works from Springhead, at a cost of 26,977l.

Endowment of the Convallescent Hospital, Dundee.—Sir David Baxter, bart., of Kilmarnock, has been named by the directors of the Dundee Infirmary, a few weeks ago, to build a convalescent hospital for from fifty to sixty inmates, at a cost of from 2,000l. to 8,000l. He also promised to give the sum of 10,000l., provided an equal amount were given by others, for its endowment. Sir David has now written to the chairman of the infirmary, estimating that the other 10,000l. has been subscribed by his private friends, and that Messrs. Hill & Small are preparing the deed of constitution.

Church-Building at Aldershot.—It is proposed to build a new church at Aldershot capable of accommodating 1,000 persons.

Ventilation of the Court of Queen's Bench.—The bench, the bar, and the reporters at the Court of Queen's Bench joined in complaining on Saturday of the ventilation of that court. Mr. Manisty having to apologise for the loss of his voice through a severe cold caught in the court, Mr. Justice Blackburn wished that matters might be re-arranged, so as to give the bench a little of the air of which the bar appeared to have too much. From other parts of the court there were equally emphatic complaints on the same subject.

The Royal Academy.—The election of two Associates to fill the places of those who were admitted into the rank of Academicians Elect in November last,—viz., Mr. Dobson, the painter, and Mr. Lumb Stocks, the engraver, is to take place on the 29th of the present month. The candidates whose names have for a length of time been on the list of those who desire to belong to the Academy and have put down their names in accordance with the custom adopted, number, according to the *Daily News*, no fewer than 64 painters, 15 sculptors, and 13 architects.

Institution of Surveyors.—At the ordinary general meeting, held on Monday, January 15th, the adjourned discussion on Mr. Clutton's paper, entitled "The Cost of Conversion of Forest and Wood Land into Cultivated Land," and Mr. Grantham's paper, entitled "Agricultural Pipe Drainage in connexion with Arterial Drainage and Outfalls," was resumed, and, after a long debate, concluded. At the next meeting, January 29th, a paper will be read by Mr. E. J. Smith, entitled "Land."

Concrete Gas-holder Tank.—We have been informed that there is now in course of construction at the South Metropolitan Gas Company's premises, Old Kent-road, a concrete gas-holder tank, 152 ft. in diameter, by 38 ft. 6 in. deep to top of rest stones. We believe that this is the first instance of concrete being adapted for this purpose. The work is being carried out by Messrs. Thos. Docwra & Son, from designs by and under the direction of Mr. G. Livesay, the company's engineer.

The Leicester Municipal Buildings.—No official reply comes to our inquiry as to carrying out the selected design, but we have received several letters reiterating it, and expressing hope that the council intends acting fairly. The selected design, it should be understood, is the joint work of Mr. T. Barnard, of Leicester, and Mr. William Smith, of John-street, Adelphi, London.

Islington Workhouse.—The plans for the alteration of the old workhouse in Liverpool-road, Islington, have been laid before the Local Government Board, who have replied, through their architect, to the effect that no answer can be given for some weeks to come. In the mean time, the guardians have resolved to proceed with the demolition of the old buildings, so that they shall be ready to proceed with the new ones as soon as the plans are approved.

Luxembourg Cathedral.—This building has been lighted with gas by Messrs. Cox & Sons, of Southampton-street. Massive standards, the bases iron, and the upper parts in polished brass, with foliations, introducing coloured crystal jewels are used for the nave, and a number of polished brass brackets, of a design to correspond with the standards, have been supplied for various parts of the building.

Bangor Cathedral.—The restoration of the Bangor Cathedral, says the *Rock*, has come to a standstill. About 5,000l. are still required, and the means at the disposal of the committee are exhausted. Lord Penrhyn, who has contributed 3,000l., has undertaken works which will cost 2,000l. more. Mr. Kneeshall offered 1,000l. if mine owners will give a like amount. The bishop, Mrs. Campbell, the dean, and Lord Boston have already given in their names.

Aberdeen Builders.—At a meeting of the representatives of the employers of the building trade (with the exception of the masons) in Aberdeen, it has been resolved to intimate to the men their willingness to concede that the hours of labour, after the 1st of June, be fifty-two per week, without reduction of pay.

Utilisation of Sewage.—The Banbury Board of Health has agreed to purchase an estate, at a cost of 23,400l., for the purpose of utilising the sewage of the district. An examination has been held by a Government commissioner, no opposition being offered.

Sculpture in Spain.—The municipal council of Madrid have invited a competition among the artists of Spain to decorate the Plaza de la Independencia with six or eight statues of the heroes of the War of Independence.

TENDERS

For building new rectory house, at March, Cambridgeshire. Mr. William Smith, architect.—

Estimates and plans on application. Price.—Village clocks, from 15*l.*; church clocks, from 40*l.* The wheel-work throughout these clocks is of best hard brass or gun-metal. No iron wheels used. Timekeeping and durability guaranteed. Wholesale Entrance—Burlington Steam Works.[ADVT.]

NO PAINT—NO RUST.
GREAT DISCOVERY.
BRONZED IRON.
BY ROYAL LETTERS PATENT.

TURNER & ALLEN
(Sole Patentees),
ART-FOUNDERS, ENGINEERS, MERCHANTS,
AND CONTRACTORS,
201, UPPER THAMES STREET, LONDON, E.C.

Extract from Paper read at the Royal Institute of British Architects, December 3, 1871, by Henry Carr, esq., C.E.—
"The great desideratum of the day, no doubt, is some means of permanently protecting iron from rust: this is now said to be done by Messrs. Turner & Allen, of 201, Upper Thames-street. If the process of coating iron with copper can be successfully carried out on a large scale, it will be one of the greatest boons of our time."

A MASTER, qualified under the Art and Science Department, in order upon his duties immediately after the Midsummer vacation. Not necessarily from Great Britain, but he must have been, for at least one year, in the locality of a favourable field for an efficient master in carrying out the above. Terms and applications to be addressed to W. NEWSHAM, Hon. Sec. School of Art, Arnhem, Preston, and forwarded to him on or before FEBRUARY 10th, 1872.

PARTNER WANTED, with about 3,000*l.*
TO JOIN Advertiser and Another to WORK a valuable BUILDING QUARRY and STONE WORKS, near London. Lease 99 years. The capital is required for extending works, and working capital.—Apply, by letter, to Messrs. LAMBERT, BERGIN, & PETGILL, 8, Broad-street, Bedford-square, E.C.

JUNIOR CLERK WANTED, in an Architect's Office. Must write a good hand, and be able to give drawings ready.—Address, stating salary, A. B. 16, Great Marlborough-street, London, W.

PUPIL WANTED, in an old-established ARCHITECTS OFFICE. Moderate premium only required.—Address, C. D. M. Reid, Stationer, 5, Great Portland-street, Oxford-street, W.

OUT-DOOR APPRENTICE WANTED
by a Builder and Surveyor.—Apply to Mr. HOOFTON, 2, Clifton-villa, Finsbury.

WANTED, immediately, One or Two experienced WOOD CARVERS.—Apply to SAMUEL BARFIELD, Architectural Sculptor; Office, 6, Finsbury-lane, Leicester.

WANTED, immediately, in the Office of an ARCHITECT and SURVEYOR, a CLERK, who will take office generally, and, on having had experience in a builder's office, able to prepare bills of quantities, and measure builder's work preferred.—Apply, by letter, stating age, qualifications, and references, to J. B. 15, New-lane, Lincoln.

WANTED, a really first-class DECORATIVE ARTIST and DESIGNER. Must be able to show specimens, and give best references. State age and terms, to 83, Office of "The Builder."

WANTED, in a Jobbing Shop, at the West-End, an active WORKING FOREMAN of CARPENTERS and JOINERS. Must be of a most efficient character.—Send full particulars to 852, Office of "The Builder."

WANTED, a respectable BOY, in an Architect and Engineer's office, in the Easton-road. One who can trace instruments.—Apply by letter, stating wages, and full particulars, to W. 7, Lambeth-entrance, Wood-gate, London, E.C.

WANTED, by a Firm of Builders, a thoroughly competent CLERK and BOOK-KEEPER.—Apply by letter, stating where last employed, age, and salary required, to J. Z. 23, Tavistock-hill, Holborn, E.C. Applications not later than WEDNESDAY, the 31st instant.

WANTED, a SALESMAN in a CHURCH FURNITURE WAREHOUSE. Must be a good draughtsman, and well up in the details of the accounts of drawing fittings and furniture preferred.—Address, with references, and state salary expected, to the Office of "The Builder."
WANTED, a BRICKMAKER to make a MILLION Bricks, by one of Port's machines.—Apply to Messrs. FRY & CO. Pinnerford, Bristol.

The Builder.

VOL. XXX.—No. 1513.

The Rude Stone Monuments of all Countries.

It is something new to see Stonehenge and monuments composed of unhewn stones regarded as specimens of a style of architecture, divided into periods, and credited with architects. Hitherto, antiquaries have looked upon un-tooled monuments as mainly pre-architectural and possibly pre-historic. But Mr. James Fergusson has now elaborated an idea, slightly outlined by him about ten years ago, and, in a copiously illustrated work on "Rude Stone Monuments," endeavours to draw these wonderful relics within the confines of architecture and history, and arrange them in a sequence.* His

creed is that all groups of un-tooled stone are comparatively modern; and that those of the East, especially, are very late attempts to imitate ancient magnificence.

Our own great circles of unhewn stones he attributes to King Arthur. Their use or meaning has been a puzzle to antiquaries for centuries. Many conjectures have been made, from the days of Tudor and Stuart archaeologists to our own, concerning them, but these are all folded up and neatly shelved by Mr. Fergusson, who insists that these monuments are trophies raised on the battlefield in the strong hour of victory. With a victorious army on the spot, it would have been easy to raise a monument of this kind in a week, he urges; and then he proceeds to identify the sites of several of our largest circles with Arthur's famous battles. Curiously, from want of knowledge of the locality, probably, he is inclined to shift the site of the first battle from the Glen mentioned in the old writings into Dumfriesshire, near Lochmaben, where there happens to be a circular inclosure corresponding in particulars with that at Peurith, known as Arthur's Round Table. But Northumbrian antiquaries boast that there are few districts in the United Kingdom so rich in ancient camps, fortlets, incised rocks, cultivated terraces, and other signs of an early and numerous population as that through which the Glen flows; and, consequently, as the army was composed of the population in those days, none more likely to have been the scene of a great gathering in momentous times. The sites of the second, third, and fourth battles are unidentified, but the fifth is thought likely to be represented by one of the Cumberland circles, near Penrith; the sixth is associated with remains at Bas Lowe, in Derbyshire; the seventh with the Salkeld circle, or else with the Grey Yawds, near Cumrow; the eighth is laid in Wales, from its Welsh name, Guin; the ninth is thought likely to have been Caerleon, in South

Wales; the tenth, on the River Ribroit, is unidentified; the eleventh is supposed to have been at Stanton Drew, where stands a set of monoliths so impressive as to be chosen by Mr. Fergusson for the frontispiece of his work, and which we are enabled to reproduce; and the twelfth is represented by the great circles and lines of huge stones at Avebury. It is said of many things that they are too good to be true; and this association of our most mysterious monuments with our most mythical monarch is so delightful that we are afraid it must be another of those superlatively good fictions.

Before going further into the author's array of facts brought forward in support of his view of the recent date of rude monuments, we would throw out the hint that, without including the mention of the circular temple by Diodorus, some of the old Greek legends seem to indicate the presence of huge stones in artificial groups at a period prior to the writings of the Greek poets. Whosoever looked upon the head of Medusa, for instance, is said to have been changed into stone. As Perseus travelled homewards with it, he is recorded to have turned a whole army into stones by exposing it to view; and when he arrived at the court of Polydectes, he only held it up before the eyes of that monarch and his scoffing courtiers and they were instantly changed into stones. Could it be shown that there are, in Greece, circles and groups of stones similar to those of which Mr. Fergusson treats, we should have to consider whether or not it was their presence that dictated such fables to the poets. If we found there was a circle of stones in the island of Sirephos, where Polydectes kept his court, and rows, or groups, either drawn up in battle array or scattered in apparent confusion, on the spot associated with the rescue of Andromeda, and the subsequent battle with her suitor Phineus, should we not have grounds for believing that the legends were adapted to these relics? If these rude stones were known to the builders of the polished stone buildings of ancient Greece, the theory of their recent date must fall to the ground.

We would, too, remove a misconception concerning the absence of circles in Wales. Mr. Fergusson assumes there are none either in Anglesey or in any other part of the Principality,

although there are many dolmens. We refer to the work of the Rev. Henry Rowlands, entitled "Mona Antiqua Restaurata, 1766," and find he illustrates the remains of a stone circle in the township of Tre'r Dryw, Anglesey, and mentions a finer one of forty-two stones as situated between two mountains near Cesall Gyfarch, in Carnarvonshire. And this painstaking author wrote of Anglesey, "There are also up and down many remains of pillars and erected columns in all these precincts; some single and some ranged in circles; most of them broken and cast down." Furthermore, he endeavoured to ascertain whether there were any particular traditions attached to them by the simple Welsh people, and could find none but what was represented by their familiar name, Arthur's Quoits. This last fact is especially worthy of note, because a similar term popularly applied to another group of rude remains, at Gower, near Swansea, assists Mr. Fergusson to settle the site of one of Arthur's battles.

With regard to Stonehenge, we are assured there is no reason to doubt the truth of the statement of Geoffrey of Monmouth. This Medieval scribe distinctly states that Ambrosius erected Stonehenge in memory of the three hundred British nobles who were treacherously slain by Hengist when partaking of his banquet at Amesbury. If, deploring Mr. Fergusson, he had been content with this unvarnished statement, no one would ever have doubted it; but, unfortunately, he embellished it, by adding that the great magician Merlin brought the stones from Ireland. This flight of fancy cast a doubt upon the whole narrative; but it need not have done so, for we have only to read that some of the stones were transported from Ireland, without the aid of magic, instead of by that agency, and all is clear. As is well known, some of the stones belong to rocks that are not found in Great Britain, but are common in Ireland, and the transport of these rarer blocks from that country may have been the foundation of Geoffrey's report. Mr. Fergusson thinks that though the native style fell into abeyance during the Roman occupation, it still flourished in Ireland, and was selected by Ambrosius, or recommended to him by Merlin, as most suitable for the national memorial of the three hundred nobles. Following Geoffrey still further,

CELL IN CAIRN, AT LOUGH CREW.

* Rude Stone Monuments in all Countries; their Age and Uses. By James Fergusson, D.C.L., F.R.S., &c. London: John Murray. 1872.

he suggests that the pairs of blue stones within the choir were placed there to the memory of Aurelius and Constantine, who are said by that historian to have been buried within "the structure of stones which was set up with wonderful art, not far from Salisbury, and called in the English tongue Stonehenge." In effect, he bids adieu to the temple and tribunal theories, and to the Druidical serpent idea, and proclaims the erection of this Giants' Dance, as it has been figuratively called in old times, to have commenced in the year 466, and concluded in 470 A.D. It is, he declares, the most effective example of megalithic art ever executed by man. "The Egyptians and Romans raised larger stones, but they destroyed their grandeur by ornament, or by their accompaniments; but these simple square masses on Salisbury Plain are still unrivalled for magnificence in their own peculiar style."

We have said that Mr. Fergusson arranges the various kinds of rude stone monuments into a sequence. He begins with the kist, or kistvaen, found in sepulchral tumuli, as his first "period." The buried chamber for several interments is the first step forward. As such a structure could not be externally completed till all the intended burials were made in it, considerable delay must have occurred in some instances, and the next step would suggest itself as a remedy for this inconvenience. This is the external entrance piercing one side of a tumulus to communicate with the central chamber. So far so good, doubtless.

We next find him setting out as a fact that the buried chamber, when composed of large unhewn stones, was the predecessor of the open or free dolmen, or cromlech. The next step to leaving them uncovered was to elevate them on the summits of tumuli. Some writers have supposed that all the dolmens we now see uncovered were once buried, and are only now exposed to view because the mounds of earth have been removed. This supposition Mr. Fergusson holds as improbable, and even impossible; for, he urges, the supports of the capstones are not sufficiently close to have prevented the earth falling into the central chamber, in the course of the formation of the mound over it. The capstone of the dolmen at Pentre Ifan, in Pembrokeshire, is large enough, and sufficiently high from the ground, to admit of four or five persons on horseback taking shelter under it. It is not likely, he argues, that any man would take the trouble to hoist this stone on to its supports merely to hide it again directly under a tumulus; for a stone one-third or one-fourth its weight would have answered the purpose of a roofing-stone equally well. But, he continues, "the mode of architectural expression which these stone-men best understood was the power of mass. At Stonehenge, at Avebury, and everywhere, as here, they sought to give dignity and expression by using the largest blocks they could transport or raise; and they were right; for, in spite of their rudeness, they impress us now; but had they buried them in mounds, they neither would have impressed as now their contemporaries." It will be seen that the term "stone-men" here used is not to be taken in connexion with the archaeological divisions of stone, bronze, and iron, for which, indeed, he shows but cold appreciation. After the rude stone-monument builders had raised their dolmens to the top of their tumuli, their progress is not so easy to trace. But that the circle is one of the latest forms of rude stone architecture seems to him certain. The demi-dolmen also appears to be a late and economical invention.

In comparing Eastern with Western dolmens, Mr. Fergusson finds what he considers to be unmistakable proofs of the same successive forms of burial are indicated—the kist, the chambered tumulus, the elevation of the kist on to the top of the tumulus in the open air, and, finally, the formation of the circular hole in one of the slabs of it. In the most ornate of Indian tombs, this parentage is pointed out. The rails round it represent the circle of stones round the rude monument; the domed tomb is the tumulus; and the toe on the top of it is the elevated external kist-vaen. In the case of the Lanka Ramayana Dagoba, of which a view is given, there is, moreover, unnoticed by him, another mysterious association of ideas indicated in the presence of a series of concentric circles on the side of the tee shown. "That a people might both bury in barrows and erect domical cairns to contain relics, would not necessarily involve a

proof of the one form being copied from the other; but that both should be surmounted by a simulated sarcophagus or shrine, and both surrounded by one, two, or three rows of useless stones, points to a direct imitation of the one from the other which can hardly be accidental," presses the author. Many would suppose that the ornamental tomb is the development of the rude monument formed of unhewn stones; but he has arrived at exactly the opposite conclusion, as we remarked at the outset. Wood being the earliest building vehicle in India; and having regard to the curiously attenuated pillars of this particular monument, he considers that the Lanka Ramayana Dagoba is an adaptation in stone of forms previously wrought in wood, and that the unhewn-stone monuments are but rude and late attempts to copy these early efforts in polished stone; and as it is allowed that no hewn stone buildings were erected in India before the year 250 B.C., the date of the rude stone monuments must be placed a long time after this period,—probably as much as five or ten centuries. There has been no break, he believes, in this manner of building from the time it was commenced till the present day.

An interesting feature in the work is a map, illustrating the distribution of dolmens, and showing the probable lines of migration by the dolmen builders. India, and Syria, and the Circassian coast of the Black Sea, are the chief seats of these relics in Asia, as far as our present information goes. But as the thousands now observed in North Africa were unknown to us twelve years ago, we are justified in assuming that there may yet be discoveries of more in other localities. Italy and Greece are still unexplored, for we may take the solitary dot in each country as evidence of this fact either west of the absence of dolmens. The south, west, and northern coasts of Spain, show an almost uninterrupted chain of them, the Andalusian coast being the only gap. One of the lines of migration stretches from the African coast to Granada, across the Mediterranean; and another line shows a communication between Africa and France, the chief dolmen country. From Spain, Mr. Fergusson gives two more lines of migration northwards, the one landing upon the south coast of Ireland, to account for the mysterious connexion of the Irish Milesians with Spain, and the other sailing along the west coast, touching at two points, all it was met by a line coming from the Orkney Islands and Norway. From France he shows two short lines crossing the English Channel to land in Cornwall and Devonshire. Kent and York were reached by emigrants from Holland and Hanover; and Northumberland was gained by an independent migration from Sweden and Jutland. Central Europe has yielded only occasional traces of dolmen builders up to the present date.

Every one really under the influence of the attraction of these enigmatical remains of an unrecognised people will look through Mr. Fergusson's labours with pleasure, although, as he is the first to admit, and we fully believe, he may not have found the right clue to the mystery of the subject. His impression is that the dolmens, like the circles, all belong to a period subsequent to the commencement of the Christian era, and he shows what he thinks some very good reasons for assigning them this late date. Mr. Baker's account of a cromlech-building Indian tribe, which still continues to bury in cromlechs, is one of the strongest arguments that could be urged, though by no means conclusive. The presence of a dolmen in the centre of the courtyard of a ruined Sinite temple, at Iwolee, in Dharwar, of which a view is given, again speaks for their modern erection, for it is difficult to believe that the Sinite priests would have sanctioned the erection of a temple close to a tomb belonging to a dispersed tribe; and as their building is a thirteenth or fourteenth century edifice, it follows that this particular dolmen must be late indeed if erected there after the temple had been ruined.

A still more striking reason for a belief in the recent date of some of them is presented in the case of the dolmens at St. Germain-sur-Vienne, near Confolens, in Poitou. Here we have a huge unhewn capstone, measuring 12 ft. by 15 ft., and of proportional thickness, raised upon five columns, of Gothic design, whereof one has now fallen; which columns, as if to preclude the supposition that they were hewn out of solid blocks similar to those that support the generality of dolmens, are each composed of three separate pieces,—a base, a shaft, and a capital. "Doubt seems impossible with regard

to this," says Mr. Fergusson, triumphantly: "it is a dolmen pure and simple, and it was erected in the twelfth century. In itself the fact may not be of any very great importance, but it cuts away the ground from any *à priori* argument as to the age of these monuments. It does not, of course, prove that they are all modern, but it does show that some of them at least were erected after the time of the Romans, and at an era extending far into the Middle Ages." Spain furnishes another remarkable case in point. Within the walls of a church, at a place called Arrichinaga, about 25 miles from Bilbao, in the province of Biscay, are preserved huge, cumbrous, unhewn stones, which appear to be parts of a dolmen. That these great blocks should have been enclosed in a Christian edifice, is at the least exceedingly singular, if the fact does not warrant the author's assumption that veneration for them must have been felt when it was built. At Kerland, in Brittany, there is a demi-dolmen, from which arises a cross, as though some early convert was buried below, whose relatives still adhered to the traditional form of sepulchre.

We are enabled to reproduce some of the illustrations of these important evidences given in support of the author's position.*

We have a large amount of new matter on the score of Irish rude stone monumental antiquities. The great battle-fields of Southern Moytura and Northern Moytura he explored, with the assistance of Sir William Wilde's knowledge of the locality, and made out their wonderful story by the aid of their dolmens with single, and double, and treble circles, and circles without central dolmens, cairns, and other relics; more than this, he examines into the question of the date of these battles, and shifts it down the scale of events from the high place the old writers gave them to the first century before or after the birth of Christ, which, of course, enables him to fit this vast field of antiquities neatly into his theory. About eight years ago a range of twenty-five or thirty cairns was first noticed, on Slieve na Calliagh, the lags' or witches' hill, near Bragh na Boine, the whole of which have since been opened by Mr. Conwell. One of the most perfect of these tumuli, 116 ft. in diameter, is surrounded by thirty-seven stones as a retaining wall, and, on its north side, has a large stone set back from this circle, which is fashioned into a rude seat, and covered with the identical cup markings and concentric circles that have been recently found inscribed on rocks in so many parts of England and Scotland. There is a central chamber on this tumulus whereof twenty-eight of the stones are ornamented with similar and additional sculptures. Another tumulus contains a chamber, 29 ft. deep and 13 ft. across, with similar ornamentation on its walls and pillars, in the centre of which lay one of the largest of the low flat basins, whose use is still a matter of wonderment, that has yet been found. Below the basin were charred bones and forty-eight human teeth, a few jet objects, and a syenite ball. Pieces of pottery, bone implements, and more charred bones were found in various parts of the chamber; but though the sculptures appear to Mr. Fergusson to have been engraved with a sharp metal tool, there were no metal objects to be seen. One of Mr. Conwell's drawings representing this chamber we give. Our author supposes this range to be the cemetery of Taltin, celebrated in Irish legend.

As might be expected, the early monuments of Scandinavia and North Germany occupy some prominence, likewise, in the volume. It is, doubtless, the Scandinavian battle-fields that have given Mr. Fergusson the courage to assume that our own circles are memorials of battles. One of them, at Kongsbacka, has similar alignments, he perceives, to those at Dartmoor, Ashdown, and Karna, and this is assigned to the fifth century. No right in history, he affirms, is better known than the fight on the Brunnala Heath, in Östergötland, where the blind old King Harold Hildstend was vanquished by his nephew, Sigurd Ring, and it does not seem to admit of doubt but that the circles and cairns on the heath commemorate the event and contain the ashes of the slain; and yet this field is nearly identical in its appearance with the Irish battle-fields at Moytura mentioned above. This similarity causes him, in fact, to falter in his opinion as to the builders of the Irish circles, and to ask whether they may not have been erected by Scandinavian Vikings on the occasion of a descent upon the west coast of Ireland.

* See p. 68.

In spite of the haze that has settled over this branch of archaeology, Mr. Ferguson believes that it will yet be possible to unravel the history of its great pillars and grave circles and lines of grey stones. Continuous researches have done much for the monuments of Egypt, Babylon, and Nineveh; and are likely to do as much for the remains under consideration. Meanwhile, he places great stress upon the fact of the classic writings containing no allusions to them. He asks whether such an artist as Caesar is likely to have passed them over; especially, as when he watched the fight between his galleys and the fleet of the Veneti in the Morbihan, he probably stood on Mont St. Michel and among the stone avenues of Carnac. The Romans, too, occupied Old Sarum during their stay in England, and one of their roads passed close to Silbury Hill; yet there is no allusion to Stonehenge or Avebury in anything that is written. The same silence is observed with reference to the dolmens in France. It is true Diodorus mentions a circular temple on an island belonging to the Hyperboreans; but his statement is so vague that it is impossible to identify the island. Under these circumstances, the author thinks himself approaching the truth in assuming that the bulk of our rude stone monuments belong to the period succeeding the Roman evacuation. Of those who have investigated the subject for themselves, some will receive and some will resent Mr. Ferguson's interpretations; but all who look into his book and examine his two hundred and thirty-four illustrations will be gratified. We should give but a limited idea of the scope of the work, the principal object of the present notice, if we omitted to add that the monuments of the Mediterranean islands, Western Asia, North America, Central America, and Peru, are also described as fully as those of the parts of the globe already mentioned. On another occasion we shall discuss Mr. Ferguson's theory, and show what reasons there are for believing he may be wrong.

THE ANTIQUE: ITS STUDY OR ITS RESTORATION.

We are glad to learn that advantage is being taken of the reproductions of antique sculpture from South Kensington, as well as of the resources of the Art Library and Museum, to bring into definite and accessible form the rules of symmetry observed by the great artists of antiquity. It is extraordinary that it should have been left to the present time to accomplish so much needed a work. One valuable result, however, is evident, from the collection, in one spot, of accurate copies of the most famous statues, as well as of the manuscripts, drawings, and rare books which are so accessible in the Art Library. A few years ago, months or even years would have been needed in order to carry out that accurate investigation which may now be accomplished in weeks. To visit Rome, Florence, Naples, Paris, and the British Museum, in order to take measurements of the Apollo Belvidere, the Venus de' Medici, the Toro Farnese, the Venus of Milo, the Torso of Cupid, the Theseus, and other noble works of ancient art, is, in itself, an undertaking. Permission and aid for the purpose of artistic investigation would have been more readily asked than obtained. And, in inquiries of this nature, there are constantly fresh references to former observations, rendered desirable by the continuance of research, that are all but impossible when the objects of examination are scattered through the museums of Europe.

The indescribable and magic charm of antique Grecian sculpture is felt by all those who have ever crossed the threshold of the temple of art. The cause of this charm, or rather the causes, yet baffle the investigator. Not that we are unaware of the nature of some of these causes. We know that, in ancient Greece, the symmetry of the body was a matter of deep study, and of almost religious culture. A divine gift of beauty was inherent in the blood. The climate, the topographic influence of broken hill country, of cool sea breezes tempering the heat of summer, of rocky islets tempting to a timid navigation,—the great national games, the development of strength and grace for the express purpose of victory in the *palæstra*,—all tended to enhance this gift. Female beauty was impersonated as a goddess. Various forms of manly symmetry engaged the care of the sculptor. The ponderous muscular form of Hercules; the lithe, fleet, angry majesty of Apollo; the saucy grace of Cupid; were all regarded with the same reverent love with which

Raffaello or Murillo dwelt on the incidents of the Divine Life. The greatest of Greek philosophers mentioned magnitude of size as the first virtue of women; and that with as much simplicity, as if no educated man could doubt that a stature which gave promise of being productive of fine-grown children was the first quality that any one ought to seek in a wife. Little indications occur in Greek literature that show that such was indeed the habit of Greek thought; as when Xenophon mentions, with unfeigned admiration, the large and beautiful women who were to be found in the countries traversed during the expedition of the Ten Thousand.

Exact measurements of famous statues have, indeed, been taken at various times. In the library of the British Museum is a folio volume, containing thirty plates, on the proportions of the human body, published at Paris, in 1683, by Gérard Audran, an assistant of the sculptor, Lebrun. A German edition of this work was published at Nürnberg in 1686. Among the seventy volumes, original or translated, that bear the name of Albrecht Dürer on the title-page, is to be found the small folio bearing the quaint title, "*Vier Bücher von Menschlicher Proportion, durch Albrechten Dürer von Nuremberg erfunden und beschrieben*," which is full of wood-cuts of male and female forms, and of interminable geometric investigations of the solid contents of various figures, applied to the equipercentuation of the human form. The "*Trattato della Pittura di Leonardo da Vinci*" has been translated into German, Dutch, Spanish, and French, as well as into English by J. E. Rignaud; and contains hints of the utmost value, although they were never brought into definite form by the accomplished author. All these, and other yet more detailed works of an anatomical nature, are, however, far beyond either the reach or the requirements of the ordinary student.

Another mode of treatment is to be found in almost any treatise on drawing, in which complicated arrangements of squares, circles, and triangles are described around the delineations of lay figures. The whole web of diagrams may generally be traced to unacquaintance on the part of the delineator with the use of mathematical instruments, or with the simple relations of the sides of triangles. Thus, where one dimension of the person is normally or approximately equal to another, the relation is expressed by describing a circle, instead of by a simple indication of the fact. In one little work, now out of print, the ratio that exists between the base and the hypotenuse of a right-angled triangle seems to have been regarded by the author as a discovery of such novelty and importance, that he has impressed the diagram which illustrates it on the cover, as well as on the title-page, of his book.

All this learned, or unlearned, trifling, however, serves only to divert the mind of the student from an inquiry that may really have fruitful results. Can there be detected any such rules of exact proportionate symmetry either in the writings or in the works of the ancients, as to shed any light on the wonderful harmony of the forms of antique art?

We are convinced that one result of a thorough investigation of this subject will be the conviction that conventional rules were much more rigidly adhered to in the purest period of Grecian art than in the subsequent ages. How far the hands of Phidias and of Scopas were fettered by exact rules, and how far the grace and apparent mobility which later sculptors gave to their famous works arose from the neglect of the ancient canons, it will be most instructive to learn. It is clear, from some of the earliest relics of Greek art, such as the statue of Apollo found at Tegea, that Egyptian practice and example predominated over the early period of Grecian sculpture. In Egypt, what we now call the Conventional system was reduced to the most perfect and durable system that can be conceived. We not only deduce this from the long series of Egyptian monuments, in which, for the ages that elapsed from the dynasty that reared the Pyramids to the Ptolemies, so little change was made in the sculptured representation of the human form; but we are in possession of the actual canon of the Egyptian draughtsmen. We find apartments, in monuments of very different date, in which the unfinished state of the walls leaves exposed to view the constructive lines by means of which these ancient artists invariably set out their work. The entire surface to be covered with sculpture, painting, or the curious combination of the two, which is known by the name of

koinanaglyph, was marked off into squares. In the earlier period, nineteen of these squares were allotted to the height of a standing figure; in the later there were twenty-two. Every part of the frame was thus drawn according to exact and unvarying rule; and the identity of portraiture that prevails over every territorial division of the valley of the Nile, and during the reigns of at least twenty-five successive dynasties, is thus at once explained. Sculpture, in Egypt, crystallised at a date so far back as to be at present indeterminate; and the crystals kept their characteristic angles till Egyptian art itself perished under the attrition of Roman sway.

It is not to be supposed that, by exact investigation of the canon of the Greek sculptors, we shall be enabled to imitate the excellence of their work, any more than that by a careful study of the laws of prosody we shall be able to reproduce the poetry of Æschylus or of Euripides; but it is none the less true that such exact knowledge is necessary to anything like a critical appreciation of the merits of ancient art. How far this is absent from those spots where it is presumed to exist, is shown by the fact that the curators of the great national museums of London and of Paris, the British Museum and the Louvre, have each dealt with one of the most precious relics of antiquity in their possession in a manner that would have been rendered impossible by a very small amount of acquaintance with the laws of ancient sculpture.

The first of these misrenderings of the message uttered by the marbles of Greece is to be found in the case of the headless and mutilated statue of a Cupid, which is stamped by the impress of the purest times of art. To this beautiful fragment a portion of a left foot has been attached, which actually must have belonged to a figure of altogether different proportions. The height of the Cupid, when perfect, was close upon 56 in. The foot with which the statue has been accommodated measures 9½ in. or nearly 10 in., and cannot have belonged to a figure of less than from 64 in. to 70 in. in height; besides being of a long narrow form, that indicates the female sex. The important lessons to be drawn from the study of this exquisite fragment are rendered all but valueless by this inappropriate restoration.

The case of the beautiful female figure which was discovered, in 1820, in a cave in the Island of Melos, in several different portions, and which, after a curious series of adventures, was secured by the French Government, and now forms, perhaps, the most famous treasure of the Louvre, is still more remarkable. The curators of that museum, with a devotion to their duty which forms a bright exception to much of the history of the last two years in France, secured this statue from shell and from petroleum by an internet as careful as that by which domestic affection honours the relics of the departed. In the cracking of the plaster by means of which the original fragments had been united, it became evident that wedges had been inserted at the waist, which gave the upper part of the body that inclination to the left which is one of the most puzzling characteristics of the statue. As we are familiar with the figure, a plumb-line dropped from the fontanel, or hollow at the bottom of the throat, falls altogether without the left foot. The most authoritative rules on the subject of the equipose of figures are to be found in the works of Leonardo da Vinci, a profound master of the subject, and are accepted as artistic canons. "The pit of the neck, between the two clavicles," are his words, "falls perpendicularly with the foot which bears the weight of the body." "If the figure rests upon one foot," is another precept of Leonardo, "the shoulder on that side will always be lower than the other, and the pit of the neck will fall perpendicularly over the middle of that leg which supports the body." If the arms be extended, or if any artificial weight be carried by the figure, the position of the fontanel will be changed. But nothing but the strain of a severe effort could throw it so far from the perpendicular as is the case with the statue in question. And the idea of such exertion is entirely inconsistent with the serene majesty both of face and form.

No attempt to decide on the original position of the arms has yet been attended with success. Among the fragments of Termes and of other statues which were found on the same spot with this noble figure, was a hand holding an apple. From this hand, which has never been satisfactorily co-ordinated with the figure, the name of Venus was applied, by M. Quatremère de Quincy. There was an ancient group, of which the idea

is preserved in gems, of Venus standing by Mars, with her left arm resting on the shoulders of the god. But the figure in question can have formed no part of such a group, as the right arm of Mars would in that case have rested on her back. Neither is the countenance in any way appropriate to such a composition.

The girths of this statue, the proportion between the height and the width of the face, and the peculiar physiognomical outline of the upper lip, are not those of the antique Venus. The latter, especially, is characteristic of Juno, and the draping of the lower part of the figure, while the entire upper part is undraped, was a feature of the grand statue of Juno, by Polycletus; the idea suggested being that the Queen of Olympus was hidden from men, but visible to the Immortals. It is true that in the group of Mars and Venus there is a drapery about the lower limbs of the latter, but it falls lower, and has nothing of the composed dignity of the drapery of the Juno of Melos.

Monsieur Félix Ravaisson, *Conservateur des Antiques et de la Sculpture moderne au Musée du Louvre, Membre de l'Institut*, has written a little work of sixty-eight pages on this subject, illustrated by photographs of the statue in its different conditions, which has been published by Messrs. Hachette. The work is one of great interest and value; and the extreme beauty of the first photograph, representing the noble figure in the coffin in which it was enclosed to be transported from the Louvre, is such, that we trust Monsieur Ravaisson will take the precaution to have a gelatine plate taken from the negative, for the sake of obtaining permanent unmounted prints, before the latter is injured or destroyed.

M. Ravaisson's little work is divided into two parts. With the first we are disposed altogether to agree, from observations as to the plumbing of the figure, made before this brochure reached us. There is a plate representing three restorations of the statue, using that word, not to denote modern conjectural additions, but the presentation of the antique relic in its most correct position. No competent judge can doubt either the correctness of M. Ravaisson's views on this score, or the service that he has rendered to art by their publication. It appears from a letter from Monsieur de Clarac to Count de Forbin, when director of the Museum of the Louvre, now for the first time published, that some intrigue or jealousy between the architects of the Louvre and the conservator of antiquities led to the hasty erection of this statue, without the supervision of the latter. M. Ravaisson shows, in full detail, the modifications that successively became natural from the first cardinal error of not regulating the vertical line of the figure by keeping the horizontal joint which passes through the haunches truly level. Hence wooden wedges were introduced, stopping of plaster was added, and even a sacrilegious chisel was applied to the ancient marble. Independent reasons, founded on the inclination of the figure from left to right, on that from the back to the face, on the falling of the fold of the peplos that crosses the left thigh, and on the angle at which the right foot is placed to the leg, enforce the opinion that a level bed was formed at the period of the ancient restoration of a yet more ancient statue.

With the second portion of the work, for reasons previously indicated, we do not agree. M. Ravaisson adopts the idea of M. Quatremère de Quincy that this noble figure formed part of a group of Mars and Venus. We have seen no argument that appears to us conclusive, or even plausible, for giving the name of Venus to a statue of a character so different both in proportions and in expression from that proper to that goddess. Admitting that a proud and severe dignity is the chief characteristic of the figure, M. Ravaisson thinks that he traces in it the influence of the school of Lysippus. We are sure that the process of minute measurement would lead this distinguished *savant* to reconsider this idea. Lysippus is known to have diminished the heads of his statues, and given greater proportionate length to the limbs, in order, he said, to give more mobility and appearance of life. In the Venus de Medici this reduction of the size of the head is but too apparent—to the great disadvantage of a statue of which the figure below the throat is perfect. But in the Juno of Melos the head is proportionately larger than in any figure we can at the moment cite, except than in the Antinous or in the Apollo Belvidere. Not only is this the case with reference to the height of

the head, from the apex of the chin to the scalp, but the proportion between the width and length of face is fuller, as indeed is the case with all the horizontal proportions, than in the other instances we have mentioned.

We are happy to give an English echo to the expressions of M. Ravaisson as to Restoration. It seems, he says, that the habit of restoring ancient works is a fatal habit which henceforth should be entirely renounced. Formerly it was thought correct not only to repair antiques, but to turn them out "as good as new." Portions which were wanting were supplied from the fragments of other statues. A large number of statues have at present antique heads which do not belong to them, often those of a totally different epoch, and which, in other respects, in no way harmonise with the figure. In the Louvre itself we may see more than one Greek statue surmounted by the head of a Roman personage; more than one statue of a certain god or goddess surmounted by the head of a god or goddess altogether different.

In the absence of antique fragments, recourse has been had, to supply deficiencies, to the chisels of living artists, such as Montorsoli, Guglielmo della Porta, or even Michelangelo. It is none the less true that often these restorations have caused the antique relics to lose much of their value. In the first place, they have often damaged the general physiognomy and the significance of the statue. Thus in the Louvre we see an Apollo, of Archaic Greek style, transformed, by the attributes given to him, into a *Bonnie Eventus*, a Roman deity of a late age; and a Wounded Amazon, whose tunic originally kilted above the knee, according to the costume which the ancients invariably attributed to the Amazons, has become a floating robe. Above all, we see monuments of the finest workmanship disfigured by additions of extreme mediocrity. But even if such restorations were effected with science and with talent, it is almost impossible that the work succeeding should be in perfect accord with the ancient workmanship; and thus the entire work loses the capital merit of unity of style and of execution. Finally, we must add that, sensible of the extreme difficulty of bringing the restorations into perfect harmony with the antique, the artist has almost always finished by endeavouring to bring the antique into harmony with the restorations. This has been done by giving to the surface of the Greek or Roman work, sometimes with the chisel, more often with the file, the new appearance which the restored parts present. The beauty of a great number of excellent works has thus been irremediably injured. The statue of Diana the Huntress was repaired after this fashion by Barthélémy Prieur, an able sculptor, but one who did not fear, after having restored the parts which were deficient, to retouch almost the entire surface! This fact is sufficient to explain the hesitation with which we have always regarded this statue. M. Ravaisson justly says that the execution no longer seems to arrive at the height of the conception. The same is the case with the Pallas of Velettri: the same is the case with many of the fine statues that adorn other museums of Europe, especially that of the Vatican. For this reason, some of these statues, when compared with others more recently discovered, have been referred to an epoch much too modern. If the few untouched portions of the Diana and the Pallas be carefully examined, the hair, part of the tunic, and the right foot of the former, and certain portions of the drapery of the latter, the traces of Greek workmanship are, in the opinion of M. Ravaisson, certainly to be discovered. The sublime effect of the untouched fragments from the Parthenon, preserved in the British Museum, is happily contrasted with that of the above-described restorations.

A note is added to this essay, from the pen of M. Des Cloiseaux, member of the Academy of Science, as to the chemical character of the marble employed for the statue in question. This is stated to be calcareous Parian marble; the unusual designation being due to the fact that Paros produces two descriptions of statuary marble. The first is a pure carbonate of lime, which effervesces with acids, and has a specific gravity of 2.71. The other is a magnesian marble, a carbonate of lime and magnesia, which does not effervesce with acid, and which has a specific gravity of 2.835. It further appears to M. Des Cloiseaux that the upper part of the statue is not cut from marble of the same quality as the lower part, the grain of the former being somewhat finer, and the colour a little

more yellow, than is the case with the latter. We should like to see a similar test applied to the Cupid which we previously mentioned.*

LAND†

THE commercial uses of land are mainly of two kinds;—the one as the foundation for buildings for residence, and for trade and manufacturing and commercial purposes; the other as the basis for the production of food; and there is, in addition, its use for social enjoyment.

It is admitted that any one possessing, as the produce of his own exertions or of those of his predecessors, money in any form, save in that of land, may use it in any way he sees fit; but it is maintained that if the money be invested in land, the owner is to be regarded rather as a trustee for the good of society, which has a kind of primary charge upon all land. I have never seen this suggestion practically applied, except to owners of agricultural land.

Adam Smith, in his "Wealth of Nations," written in 1790, deemed it necessary to devote a chapter in refutation of the theory that land was the only source of wealth; the tendency to regard agricultural land as the source of all wealth still influences many minds.

Our earliest impressions convey to us the notions that the blessings of Providence are those of corn and wine and oil, and cattle on a thousand hills, and they are extended to those of the market, the counting-house, the iron-works, or the manufactory, only by an effort of the mind. A town operative never hears of any blessings of townspeople, beyond those shared in common with the agricultural and the pastoral labourer. Our classical reading strengthens these impressions; for the Greeks and Romans, having little trade, and that in the hands of slaves, regarded commercial occupation as servile. The leading idea of our poetry is that "God made the country, and man made the town;" and the feudal tenure of land is the basis of our legal system, in which the customs of merchants have been with some difficulty intruded. However small the parcel, land requires a solemn deed for its conveyance; while a cargo of iron worth 10,000*l.* may change hands by a pencil memorandum.

Yet the utmost that the most energetic agriculturist can do by increasing the produce of his land sinks into insignificance when compared with the additional value conferred upon it by its appropriation to commercial purposes. The cost of building is much the same in the City of London and in the agricultural districts, and the interest required on such expenditure is also much the same; but the site upon which a business has been built up by several generations (operating, perhaps, over the whole world) derives a value from the very magnitude of the revenue obtained upon it; and, as a fact, realises a value unattainable for land in any other form.

For commercial purposes, the value of land ranges from the rate of 1,000,000*l.* to the rate of 200*l.* for an acre; for agricultural purposes, it ranges from 200*l.* to 2*l.* for an acre; and for social enjoyment, seldom exceeds 200*l.* an acre. For many years the first division has been always increasing in this country, the second division constantly becoming more productive by the increased amount of capital available for its amelioration; both rising in value with the increasing wealth of the country. The rate of 1,000,000*l.* for an uncovered acre of land is obtained in the best parts of the City of London, 400,000*l.* at Liverpool, 100,000*l.* in Westminster, and prices, decreasing from those amounts down to 200*l.* an acre in the vicinity of small towns, and for sites of manufacturing works and for residential purposes, are obtained from land previously devoted to agricultural cultivation.

The rate for an acre of the most valuable uncovered land in the City of London, after the Great Fire in 1666, was 30,000*l.*, and it is stated that the value of the land was then one-third of the value of the property after it had buildings upon it. At the present time the highest rate for uncovered land may be taken at 1,000,000*l.* an acre, and such value constitutes fully three-fourths of the value of the property after it has buildings upon it. The increase is thirty-fold.

* Since writing the above we observe an announcement that the intended work on Symmetry to which we referred is from the pen of Mr. Conder.

† By Mr. Edmund James Smith, member. Read at the Ordinary General Meeting of the Institution of Surveyors, January 29th; Mr. Thomas Huskinson (vice-president) in the chair.

Bentham lays down the principle that all improvement in the value of land should be confiscated to the State. If this theory had been adopted, it would have applied to land available for commercial purposes much more hardly than to agricultural land; and the revival of this suggestion by Mr. Mill would also operate most on land used for commercial purposes.

Mr. P. Anson, in his excellent paper of last session, showed how the special values of portions of land in the City of London have been maintained by trades carried on in the same spaces for centuries, and makes self-evident the dependence of the values of the sites of buildings upon the trades there carried on. In view of this interdependence, it is difficult to say why this Benthamite theory should not extend to the profits of trade as well as of land.

In Egypt, this theory of confiscation is carried out. The State appropriates what it deems to be the excess of each Fellah's produce,* leaving to him his maize, cucumbers, and onions to make his existence possible; but taking away his wheat and his beans. By Englishmen, this practice is not thought to be wise even in the interest of the State itself: there is not much between it and the Benthamite theory.

The commencement of the great increase of buildings on account of increasing trade and population may be dated from about the year 1770, when the recovery of coal had become easy through the effect of steam power, and steam power had become generally available in consequence of the abundance of coal.

We now glance at the improvements in agriculture during the last hundred years.

In 1770, great part of the corn-growing counties were parcelled out into parishes, which much resembled each other in their agricultural features. The village stood in the best part of the parish surrounded by a small portion of inclosed land. Next to these inclosures there were large open fields, farmed in narrow strips by separate occupiers, and there were open meadows along the village brook, and large space of grass land on the outside of some, or of all, of the open fields. These fields were generally three in number, because three years were required for the fulfilment of their invariable course of husbandry, and they were divided into narrow strips because the tenants had originally each ploughed in each field as much as he could in a day. It was rare to find three acres in one tenancy lying together. There are still a few such open field parishes; one, Castor, near Peterborough, of which I show you a map.

The first step taken to effect improved cultivation was the inclosure (generally by Act of Parliament) of these fields and pastures which were called common, not because they were not private lands, but, because, after the corn and hay were carried, they were depastured in common by all the tenants of the parish. The effect of an inclosure was to substitute for perhaps a hundred of such strips of arable occupied by one tenant (like the strips coloured pink on the Castor map), an integral block of land, fenced in, and capable of cultivation in any way the tenant saw fit, and also integral fenced shares of the meadows and common pasturage.

This was an immense stride. The fields had previously been capable of cultivation according only to the rule of the parish, say—fallow, wheat, and beans, in the three fields, in turn; but the tenant could now cultivate according to his own judgment, and grow green crops for the maintenance of his live stock in addition to his shares of the meadow lands and of the grass pasturage. Baro fallow is now one-twentieth, then it was one-fourth, of all the arable land.

The high prices of corn from 1790 to 1818 operated as an inducement for the breaking-up of the grass land previously intercommoned on the clay soils (which had constituted nearly the whole of the wheat-growing land) and also for the inclosure and division into blocks of the heaths, and the chalk hills, and the light lands of the country on which wheat had before been scarcely grown.

Olive Cromwell gave 100*l.* a year to a farmer named Howe, for introducing the cultivation of turnips; but their cultivation had made little progress in the face of the practical impossibility of growing them in the open fields. As soon, however, as the land was divided into inclosures, turnips became the foundation of the alternate system of husbandry, and the basis upon which the rearing and maintenance of cattle and sheep are founded.

Under these Inclosure Acts the lands were also generally freed from tithes in kind; and no small portion of the farming superiority of the north-eastern counties is owing to the fact of the tithes having been there extinguished fifty years before the general commutation of tithes throughout the country under the Act of 1836. We have almost forgotten that no one, so long as tithes was taken in kind, could carry corn or hay, or store turnips, or move live stock, until the tithe-owner had taken his tenth stook, or tenth turnip, or his tenth calf, pig, or goose.

The great fall in rents after the year 1818 must not be left unnoticed. Rents then fell fully one-third. In many cases, lands are now held at the same rentals as they were let at in 1810-14. Those rents depended on the high price of corn; these rents depend on the increased produce of the land from improved cultivation. Those rested on an insecure basis; these may be regarded as permanent.

Except this change from cultivation in open fields and pasturage in common to cultivation in inclosures is duly borne in mind, the increase of agricultural produce in corn and in live stock in the last hundred years is wholly inexplicable.

It is stated by Mr. Caird in 1851, and it is repeated by Mr. Fowler in 1871, that the produce of wheat has only increased since 1770 from 23 to 26½ bushels to the acre. The comparison is fallacious. The present wheat lands are not only those which grew wheat prior to 1770, but large tracts which never could have grown wheat at all except under the alternate system of husbandry. The present average produce of wheat does not indicate the improvement on the area formerly cultivated for that grain, but is the average of a very different and of a much more extensive area. The wheat crop about 1770 was probably 2,500,000 quarters,—the wheat crop is now 10,000,000 quarters,—and this is the true comparison on this single point. The statement that the average per acre has risen only from 23 bushels to 26½ bushels is not a sound basis of comparison, because the lands cultivated for wheat are not the same.

The general principle of the provision of the food of the kingdom by the land of the kingdom was given up when the Corn Laws were repealed; for this country lies at a disadvantage in comparison with countries in a latitude more congenial to the production of a grain which can be carried at a cheaper rate, bulk for bulk, than most articles of commerce. It may be desirable that as large a portion of the consumption of wheat as is practicable should be grown in England, but that the whole consumption should be so grown at present is compatible only with the complete possession of the market. That object was not deemed worth the cost; nor could the duties on the importation of corn have been maintained.

We will now turn to another set of facts or statistics. The population of the towns with 10,000 inhabitants at the first census in the year 1801, was 3,500,000, and of the rest of the country 5,250,000. In the next twenty years the towns with 10,000 inhabitants rose to a population of 5,250,000, and the rest of the country to a population of 6,750,000; and in the fifty years which have since passed those towns have reached nearly 13,000,000, instead of 5,250,000, and the rest of the country somewhat less than 10,000,000, instead of 6,750,000. The increase in the country districts in the last five centuries was at rates decreasing from 10 to 3 per cent. (although there is no reason to think that the fecundity of the agricultural population is not equal to that of the town population), while the number of residents in towns of 10,000 inhabitants increased at about an equal rate of 20 per cent. on each decennial return of population.

That this increase in the towns took place so rapidly that the governing powers, whether in Church or State, failed to provide a corresponding extension of spiritual instruction, or of sanitary control, or of municipal government, is our main existing difficulty. It was not until about thirty years since that practical infidelity, an enormous death-rate, and a general want of government of the towns, forced these subjects into attention; and that provision began to be made for the instruction, and the health, and the welfare of the town population. Thirty years have elapsed, and great progress has been made. Money, and intelligence, and self-devotion abound, and the rate of the progress of improvement shows no indication of diminution.

But, whatever the result might be as regards the towns, the increasing population of the agricultural districts found residence and means of

employment within and around them, and the rate of wages has throughout this period been highest in the great centres of industry in the north, and lowest in the purely agricultural districts in the south of England. The difference, before the law of settlement was practically abrogated in 1865, was 60 per cent.—wages ranging at 13*s.* in the north and 8*s.* in the south of England.

The use of land for social enjoyment requires no dry statistics. The thirtieth Stanley and the twenty-first Acland resident on their ancestral estates testify to the continuity of landed possessions, as the fact of the sexton of the parish of St. George, Hanover-square, being served as the nearest male heir of Thomas Plantagenet, brother of the Black Prince, testifies to the mutability of fortune. It is remarkable that our capital, accumulating at the rate of 150,000,000*l.* a year, rarely establishes an entirely new social country centre, but finds an ancient place which the impoverished possessor vacates for the new man. There is no grade of our peerage in which there is not at least one whose honours were founded on success in trade.

The principle that all property is robbery is, at least, intelligible; but the moment that the acquisition of any property by the individual is admitted, it is impossible to say that the acquisition, by legal means, of one kind of property is robbery, and that of another kind of property is allowable. Property must stand or fall as a whole. It is, therefore, quite illogical to maintain that ancient inclosures are distinguishable from land cultivated as arable pastured in common during part of the year, or from pasturage pastured in common during the whole year. And yet it is maintained that obstacles should be interposed to prevent land-owners and their tenants from dividing into blocks for cultivation lands heretofore depastured in common, while it is generally admitted that ancient inclosures cannot be meddled with.

The rent of agricultural land varies from one-half the value of the produce in certain cases of grass land to one-ninth of the value of the produce in arable clay lands where the costs of cultivation are very large. Such rent increases positively with the improvement of land, but decreases relatively to the increased amount and value of the produce. Taking the "Witfield Example Farm" as an instance, the rent is stated to have been 44 per cent. of the value of the gross produce prior to the improvement in 1840, and to have been 20 per cent. of the value of the gross produce after the farm had been improved by the owner at an expenditure of 3,500*l.* This example accurately illustrates the fact that the additional labour and capital requisite for the production of large quantities of food and stock involve the acceptance by the land-owner of a less proportion of the actual produce of the farm, the expenses of labour, and the amount of capital employed being increased. The produce, valued at 463*l.* before improvement, was divided into 200*l.* to the owners, 65*l.* tithes and taxes; labour, 170*l.*; tenant, 28*l.* The produce, valued at 1,912*l.* after improvement, was divided into rent, 375*l.*; tithes and taxes, 90*l.*; labour and maintenance of stock, 1,000*l.*; tenant, 447*l.* The chief gain was to the country, for the value of the produce was increased fourfold; the next greatest gain was the substitution of a substantial tenant for a poor one; and the landlord had 5 per cent. interest for his outlay. The tithes remained unaltered, or the outlay would not have been made. If the tithe had continued to be taken in kind, 120*l.* would have been paid to the tithe-owner in addition to his previous receipt.

If the surrender of land to the State could be required, the owner and the occupier must be paid at least for everything, except for the value of the bare land, wild and uncultivated. I have known where lands have reverted to pasturage common to all the occupiers of a township, after having been inclosed by Act of Parliament, and allotted to individuals, subject to the provision that if the allottees did not fence in the lands they should revert to their previous condition. This is some measure of the amount which the owner and occupier would have to allow to the State as a deduction from the payment of the value of the land in fee simple and of tenant right if all lands were resumed by the State.

We have seen that the definition of land extends from that long used for commercial purposes, and worth at the rate of a million of money for the acre to land of so little value as that the allottees will not fence it and take possession. The circle will be completed by

* Egypt, by Rev. F. Darham Zincke. 1871.

observing that such least valuable land is frequently that where minerals are found, and that the striking vein of ore within it raises the value of the surface at one bound, so as to bring it within the character of commercial land. There is no middle course between declaring all property to be robbery and admitting that no land, however used, can be taken compulsorily without purchase.*

FROM ST. PETERSBURG.

CONTINUING his notes, Colonel Richardson Gardiner writes—Let me say something about the famous carriages of the country, the "troicka" and the "chetverka." The first is a large car on a sleigh, drawn by three horses abreast, and holds four people inside besides the driver, who stands in a sort of receptacle for his legs just inside the splash-board. The centre horse has a grand and gorgeous yoke, which attaches him to the shafts, and the outside horses run along in traces. The harness is brilliant with silver plating, but, best of all, the pace they go at is most exhilarating; when you get into the open country, where the snow is in good condition for sledging, or, still better, on the ice on the river or on the Gulf of Finland, and the driver exhorts his horses to increased action simply by his voice and the language he uses to them, which they seem perfectly to understand. Off they go at full gallop, which gives you the nearest idea to what must be the delightful sensation of flying, of which you can possibly conceive, and for miles and miles they will continue stretching away at a glorious pace, although, from the appearance of the animals, you would hardly consider them capable of it, but they are "very little fellows, and as hard as nails."

A "chetverka" is a four-horse carriage, but not used so much on a sleigh as on wheels in the summer. The four horses are harnessed abreast, but their position and action while in motion is most curious. The pair in the centre do most of the work and the outsiders represent effect, and in order to give you an idea of the appearance they present, first of all, imagine them to be all looking and standing straight to the front. Well, we will leave the centre horses in this position, and give our word of command to the rear and off horses one after the other. Now for the horses on the near side. Attention! Left face! Left wheel! March! And just as he has complied with your instructions, and put out his left or near leg, to commence the march and wheel, halt him. And then you have him as he commences his gallop when started off. For the horse on the off side you reverse your word of command as regards his wheel, which must be right wheel, and you get both your horses facing outwards, and causing the four to present from the point the shape of an extended fan.

We had a delightful drive in our troicka one evening last week to the "Ice Hills," which afford much amusement here in winter. We had a few friends to dine with us, and after dinner our troickas were ordered round, and away we went up the Nevski, over the river Neva, with temporary lamp-posts erected on the ice to direct the way, and arrived at full gallop at our destination. When we had mounted an immense flight of steps to get to the top of the ice-hill, we reached a platform, from which you perceived a very precipitate descent of glittering ice, extending for some considerable distance. There you find the Russian guides, with their long flat pieces of board, covered with cloth, and fixed on to irons underneath, exactly resembling skates. This is long enough for two people to sit upon, but very narrow, the guide behind to direct it in its flight over the ice, and you in front with nothing to hold on by. When thus arranged at the edge of the platform, your skating-board is pushed forward, and in a moment you are off at the rate of at least sixty miles an hour, as hard as you can tear, down the ice-hill. We hesitated some time before trusting ourselves to this amusement, but, summoning courage, I took the lead, and enjoyed it so much that I induced L. and all the rest of the party to follow suite; and away we went, one after another, helter-skelter down the ice, almost taking our breath away before we were eventually stopped at the bottom, by a judiciously-placed layer of snow. Then up again, continually renewing the pleasurable excitement.

This day is the Russian 6th of January (the Epiphany), kept very sacredly by the Russian Church, as the day on which our Saviour was

baptised by St. John. Accordingly, every year the metropolitan, or archbishop of St. Petersburg, accompanied by the emperor, his sons, and all the male members of the royal family, forms a grand religious procession, headed by representatives from all the Russian regiments, with their colours, and proceeds in state to a beautiful temple, erected for the occasion, immediately opposite the Palace, on the banks of the river Neva, to celebrate the baptismal ceremony. Such a sight of regal magnificence, combining all the splendour of the grandest court in Europe, with a full display by a most paganistic church, and realising to your mind a spirit of soul-felt devotion, I have never before witnessed. The long line of galleries, gorgeously decorated rooms, guards of soldiers from every regiment in St. Petersburg, hundreds of officers in full-dress uniforms, with orders glittering with jewels, ambassadors from every court in Europe, and then the emperor, with military music striking up by band after band, as he passed along, created a sensation more easily felt than described. From the windows of the Palace we watched the ceremony. The emperor, with all his court, the high priests of the Russian religion, countless thousands of his subjects, all bare-headed, with eight degrees of frost, while the archbishop offered up his prayer, and afterwards blessed the banners of the regiments of all Russia, by which he was surrounded. The religious ceremony terminated, the procession returned to the Palace, passing through the rooms, the emperor bowing to us all as we lined the way. To give you an idea of the liberality of the court, as well as of its magnificence, there were upwards of 2,000 covers laid for a champagne *déjeuner à la fourchette* for those who were invited.

THE BRIGHTON AQUARIUM.

FOREMOST among public buildings in Brighton is the Aquarium, which is nearly completed. Mr. E. Birch is the engineer, or, as we should prefer to say, the architect.

The ground occupied by the building and offices is a space of 700 ft. east and west by 100 ft. north and south. The principal entrance is opposite the Albion Hotel. The entrance-court (58 ft. by 35 ft.) leads into the entrance-hall (100 ft. by 50 ft.), and the restaurant (60 ft. by 30 ft.). From the entrance-hall we come to the aquarium proper, which consists of a continuous corridor, 460 ft. in length, and from 23 ft. to 46 ft. in width, having forty-two specimen tanks on either side, from 100 ft. to 11 ft. in length, in which the fish are viewed through plate-glass, forming the fronts of the tanks. A space for table aquaria, 100 ft. by 23 ft.; a conservatory, &c., 160 ft. by 40 ft., communicate with this corridor.

The engine-house, naturalists' rooms, &c., are at the east end of the building. The kitchens and other necessary offices are in appropriate positions, near the restaurant. The upper part of the building is arranged to form a promenade the entire length of the building, and will have verandas with seats under, facing the sea, band-house, and saloon. Ornamental balustrades and bases will be introduced on this promenade. Part of the aquarium stands on the road that led to the Chain Pier, and a new road, 60 ft. wide, to a sea-wall has been constructed between the Aquarium and the sea, from the Albion Hotel to the Chain Pier.

The building, externally, is of red bricks, with Portland-stone dressings. The principal front is of terra-cotta (red and cream-coloured), crests, tritons, sea-plants, and other appropriate enrichments being introduced; the arms of the company and the town of Brighton, and the monograms of the chief promoters of the undertaking. In panel, on frieze, in mosaic, is the text, "And God said, Let the waters bring forth abundantly the moving creature that hath life."

The corridor of the Aquarium has granite and marble erections, and carved caps, from which, and corbels at the sides, spring stone ribs of groining, with carved bosses at intersection of diagonal ribs, and filling in of red and black and white and red bricks in alternate bars. The paving to the corridors is of encaustic tiles. The tanks for specimens have plate-glass 1 in. thick, and will be lined with rockwork. There are steps leading from this corridor to terraces over.

The conservatory, &c., are similar in character to the corridor. The conservatory has a glazed roof, with ornamental cast-iron bosses. The works have been carried out under the superintendence of Mr. J. S. Nightingale.

Ransome's patent concrete stone has been used in some portions of the work, and has attracted attention, this being its first introduction in Brighton. Concrete of shingle and Portland cement has been extensively used in walls where out of sight.

WHY THE METRIC SYSTEM?

SIR,—The subject of the metric system and the question of its introduction into England having been recently revived, I have thought it worth while to trouble you with a few lines to show that it is quite unnecessary to introduce that most inconvenient standard, the metre, even to obtain the advantages which it offers in lieu of the great embarrassment which it would produce.

I have had some little experience of the metre in actual practice, and have often used our own standard decimal, and can thus confidently affirm the superiority of the English standard under parallel conditions.

The defects of the metre are, firstly, that it is too long to be a good integer of numeration; and, secondly, that for the same reason its subdivisions are inconvenient. Owing to its great length, a vast majority of things measured must be expressed fractionally, and, as respects its subdivisions, the centimètre is too coarse, and the millimètre too fine, for ordinary use.

It is obvious, however, that the support which has been accorded to the proposal to introduce the metre rests upon some plausible basis, namely, the facility which it is supposed it would give to mercantile transactions with the countries which have adopted it and its decimal notation, aided, it must be admitted, by some confusion in our own weights and our measures of capacity.

We may practically obtain both these ends without any serious disturbance of our own system.

Firstly, speaking of lineal measures, to obtain the advantage of decimal notation we have no occasion to resort to the metre. It would suffice to divide the inch into ten parts habitually instead of only on the best rules, as at present; and in our measurements,—at any rate, in those of moderate extent,—to make more use of inches and less feet than we generally do. Mechanical engineers and glaziers, to a great extent, already reckon their measurements in inches, and tailors drop the mention of feet altogether. Measurements thus reckoned would be commensurable to a remarkable extent with the metre, which is equal to 39.3708 in.

To demonstrate this, it will be convenient to give some suitable designation to the length of 10 in. From the Italian *palm*, of analogous length, let 10 in. be called the *palm*. Then for ordinary comparison, 40 in., or four palms, would reckon as one metre, and for business transactions, one four-palm measure lineal as one metre and $\frac{1}{4}$ per cent. added to it (that is, four palms = one metre, one centimètre, and five millimètres), the correction to be added to square and cubic metres being 3 per cent. and 5 per cent. respectively. These corrections, reversed, would reduce metres to the four-palm measure of the same denominations. The errors by which these approximate reductions are affected would be less than the probable errors of measurement; I mean as measurements are in practice taken, with due but not extraordinary care. If, instead of the per-centages above given, namely, 15, 30, and 50 per mil, the corrections on lineal square and cubic were respectively 16 per mil, 32 per mil, and 48 per mil, the agreements would be beyond the reach of ordinary measurement altogether; that is, without the aid of refinements which are never used except for scientific purposes. These percentages are easily applied on paper. They might be readily taught at our schools, and the results so obtained would be at once available for all persons who wanted to employ them. As respects larger measures, no advantage worth mentioning would attend the reckoning miles with kilometers or acres with hectares more nearly than at present. Perhaps, however, we might ultimately be led to a mile of 64,000 in. giving to each link of the Gunter's chain the measure of 8 in.; but this is looking further ahead than is at all requisite at present.

As respects our weights and measures of capacity,—to reduce quarts to litres, and pounds to kilograms, by an easy per centage applied to each, offers no difficulty. Our own sub-division by halving of these measures is more convenient in practice than the metrical system, and needs no revision. But if we should

* To be continued.

adapt decimal multiples of quarts and pounds for larger quantities, it would be found very simple, and improve our own system in its weakest point.
F. C. PENROSE.

THE LATE MR. THOMAS VERNON, LINE ENGRAVER.

On the 22nd ult. English art lost one of the ablest of its few remaining votaries in pure line-engraving. We allude to the death, at the age of forty-eight, of Mr. Thomas Vernon.

He was born in Staffordshire, educated in Paris, and was afterwards a pupil of Mr. Light-foot. Amongst the works which vindicated Mr. Vernon's position in the front rank of English line-engravers are,—The "Bacchus," after Hillon; the "Christ and Virgin," after Raffaello; the "First-born," after Cope; the "Virgin and Saviour," after Dyce; the "Princess Helena," after the "Lady Constance Grosvenor," after Winterhalter; the "Olivia Unwilling," after Leslie; the "Rubens's Wife," after Rubens; and his *chef d'œuvre*, the "Christ healing the Sick," after Marullo, from the picture in the possession of Mr. Tomline, M.P., a piece of engraving of the highest class, worthy of ranking with the works of Doo and Robinson. Mr. Tomline, our readers may remember, presented this plate to the Newspaper Press Fund, and it has not yet been published.

While English art is the poorer by Mr. Vernon's death, many personal friends deplore the loss on personal grounds.

IN MEMORIAM.

WILLIAM RANDALL AND REUBEN WARM, WORKMEN.

It is good for us to recognise merit everywhere, but especially merit in humble life, when it has to struggle with many unfavourable circumstances which the comfortable classes can so little realise.

The two men above named I happened to know personally, and, knowing, to respect most highly, for the good they did in the midst of their daily care and toil.

William Randall, journeyman carpenter, was remarkable for two things,—first, his constant efforts to call public attention to the necessity of providing extended means of culture and education for his fellow-workmen; and, secondly, his moral courage with which, on public occasions, he bravely opposed the popular view, when he thought it unjust or mistaken. In respect to the first of these matters, he was, as has been already stated in your columns, a constant contributor to the *Builder*, under the title of "Jack Plane," writing letters full of terse good sense and of practical suggestions. In respect to the second, one cannot too much admire, in these days, the honest outspokenness with which at meetings and discussions he often put forward views opposed to those around him, not from mere love of opposition, but from a simple desire that both sides should be fairly weighed. On a recent occasion he nearly suffered personal injury,—of course, unintentionally,—when hustled out of a crowded meeting, for his opposition to the resolutions proposed. He was in the habit of attending discussions and conferences on social questions, at the office of the Workmen's Club and Institute Union, and it was there that I made his acquaintance. His death was caused by the fall of a picture, and he lingered only a few hours. Notwithstanding his industry and inexpensive habits (he was a teetotaler), his widow and large family, including, besides a boy, six girls under thirteen years of age, are left without means, and it is on their behalf that I now write. The boy has been taken as an apprentice by his father's late employers; but, of course, he can as yet contribute but little to the support of the household. I shall be glad to receive any suggestions of aid for the education of the five younger children, and perhaps some of your readers may enable the eldest girl to find service. The mother has been enabled by a friend to purchase a sewing-machine, and is anxious to obtain mantle-work. Her address is 34, Swinton-street, Granby-inn-road.

Reuben Warm was a metal-plate-worker, in the employ of Messrs. Wilson, in Wardour-street. Some years ago, observing the serious disadvantages,—such as waste of time and material,—occasioned by ignorance as to the principles on which the required patterns should be struck, he set himself to learn practical geometry. With

much labour and perseverance, he then studied the application of these principles to the special work of his trade, and prepared a most useful hand-book,* illustrated by a large collection of designs. After his long day's work, he was always ready to devote his evenings to the instruction of young men in the trade; and latterly he conducted a class on this subject, at the St. James's and Soho Club. Such useful and unselfish services, given zealously and unostentatiously, deserve high praise. He has now died, after a very long illness, accompanied with great agony,—and, of course, deprived during that time of earning wages. Let me, therefore, say a word on behalf of his family. Mrs. Warm has three children. The eldest girl is being educated for the duties of an accountant, or a telegraph clerk, and is making excellent progress in her studies. I had hoped to obtain admission for the boy (nine years old) into the London Orphan Asylum; but the secretary states that the children of workmen are not eligible. The youngest girl is, from delicate health, at present unable to go to school or be otherwise employed. I shall be glad to aid or advise in obtaining a place for the eldest girl (fifteen), and education at some institution for the boy. I propose trying to obtain admission for him into the Orphan Working School, Maitland Park, and I hope this letter may bring some votes for his election. Mrs. Warm's address is 54, Marquis-road, Camden-square.

HODGSON PRATT.

8, Lancaster-terrace, Regent's Park.

CARVED OAK DECORATIONS.

MESSRS. HINDLEY & SON have exhibited at the Society of Arts a series of twenty-six carved oak panels, intended as a dining-room wall-decoration, for Mr. C. B. C. Wright, of Bolton Hall, Yorkshire. The exhibitors have thought them worthy to be made public for two reasons:—First, for the scheme and novelty of the design, which is the illustration of scenes of animal life in Britain, past and present, by panels introduced into a dado, or wainscoting, about 5 ft. 3 in. high; and, secondly, as evidence of the skill of the carvers in their establishment, who have executed the work from drawings, "without the aid of a single model," subject to the control and direction of the artist of the firm, Mr. George Lock.

It is claimed that the cost of producing the panels has been comparatively small in consequence, and we shall be glad to know what the cost to the purchaser really was. The fact that the workmen had no models is not to be boasted of; it is simply an extenuation of any faults apparent: the work would of course have been all the better if models had been resorted to. The panels are to be regarded as inexpensive sketches, rather than finished works; and we gladly say that some of them show much spirit, and that a few of them are very creditable specimens of wood-carving. As a whole, they will make a very interesting room, and are far superior to the senseless stuff which is supplied wholesale from Wardour-street for similar purposes.

Mr. Lock, under whose direction they have been produced, is now a veteran in the art. Many years have passed since we found him at work on the restoration of the carvings in St. James's Church, Piccadilly, and gave him hearty praise for the skill he showed there.

ASSESSMENTS.

AN interesting return, called for by Mr. Goschen, has been issued from the Poor-Law Board, showing the rateable value of—1. Lands; 2. Buildings; 3. Railways; 4. Mines; and 5. All other kinds of property, according to the valuation list, or other record of assessment, which was last in force during the year ending July-day in 1870, in each parish and union in England and Wales; also the number of separate assessments in such parishes and unions. It testifies to the greatness whereunto manufactures and commerce, and our cities, towns, and villages have grown, that buildings are assessed at a higher amount than all the other four denominations of property put together. The assessment on buildings excludes such buildings as are assessed with farms, and embraces houses,

* "The Sheet Metal-worker's Instructor." To be had of Mrs. Warm, of 54, Marquis-road, Camden-square, London.

shops, warehouses, mills, factories, docks, and wharfs. The amount at which they are rated is 55,078,528*l.*, or 52.7 per cent. of the whole. Lands, including farm-houses and farm-buildings, tithe rent-charge and uncommuted titles, are rated at 39,488,882*l.*, or 37.8 per cent. of the whole. Railways, including stations and depôts, are rated at 4,854,193*l.*, or 4.7 per cent. Mines stand for 1,829,946*l.*, or 1.8 per cent. All other kinds of property include quarries, ironworks, gasworks, canals, saleable underwoods, telegraph wires, and all property not considered to come properly under any of the other heads. These miscellaneous possessions are rated at 816,873*l.*, or 3.0 per cent. of the whole. The total assessment amounts to 104,420,283*l.*, over an area of 37,324,883 acres.

The amounts for which the metropolis is assessed are for lands, 118,836*l.*; buildings 17,108,736*l.*; railways, 617,780*l.*; all other kinds of property, 391,568*l.*; total, 18,236,920*l.* Separate assessments, 446,337*l.* In the metropolis, the City of London stands highest, as may be expected, for the value of its buildings, 2,171,292*l.*; the parish of St. George's, embracing the palatial residences of the West-end, comes next at 1,797,741*l.*; and St. Marylebone at 1,004,847*l.* St. Pancras, embracing the Great Northern, the Midland, and the Euston terminal stations, is rated for railways at 91,788*l.*; the City of London, for railways at 50,537*l.*; and Paddington at 33,300*l.* Wandsworth and Clapham are rated at 26,200*l.* for lands; Lewisham at 20,569*l.*; Fallow at 12,439*l.*; and, somewhat curiously, the City of London at 13,277*l.*, whereas Chelsea stands low for lands as 410*l.*, and Westminster is nil. Liverpool is assessed at nothing for land; 1,749,929*l.* for buildings, and 36,577*l.* for railways. Manchester also is exempted in the matter of assessment on lands, but pays 990,936*l.* on buildings, and 51,966*l.* on railways. Among the largest assessments for mining property are:—Merthyr Tydfil, 159,469*l.*; Auckland (Durham), 75,483*l.*; Wigan (Lancashire), 91,943*l.*; Chesterfield, 47,818*l.*; &c. The total number of separate assessments for England and Wales is 4,793,417.

A NEW LIGHTHOUSE FOR THE HEBRIDES.

MANY of our readers will feel interested in the following account of a new lighthouse which is just upon the point of completion on an obscure rock in the Hebrides. Our chief authority is the *Scottishman*.

The Northern Lighthouse Commissioners began the erection of this tower on the wild rock of Dhu Heartach five years ago. We are now able to state that the stonework has been successfully finished; and there is every likelihood that the light will be exhibited from the tower in less than a year hence. This work is one of national importance, and has involved much spirited enterprise.

Dhu Heartach, or St. John's Rock, is a singular oblong basaltic mass, lying fifteen miles and a half south-west of Iona. It is 240 ft. in length, by about 130 ft. in breadth, with a rounded top, 30 ft. above high water ordinary spring tides. The rock rises sheer out of four fathoms of water, and is clear of everything in the shape of outlying reefs, save on the west side, where, at a cable's length, three small patches show themselves at low water. In consequence of rising out of deep water, and being unprotected by outlying reefs, it receives the full shock of the Atlantic, and proves more inaccessible than even the Bell Rock or Skerryvore Lighthouses.

But the value of a light on Dhu Heartach, although erected at great expense, will be rendered apparent by the simplest statement. From the Rhinns of Islay to Skerryvore is fifty miles. The middle part of this line for eleven miles is dark,—that is, the manner is beyond the range of either light. Now, suppose a vessel caught in a south-west gale upon this dark line, and obliged to hear up for shelter, there is at present no light to leeward to guide it for many miles. Should it hear up to the northward, Dhu Heartach lies under its lee-beam only ten miles away, its presence marked by the seas that are breaking and roaring over it, and its terrors augmented perhaps by the darkness of a wild winter night,—while eight miles farther on, spread far and wide the West Reef and Torran Rocks, a perfect archipelago of sunken reefs, on which many a proud ship has gone to pieces and many a noble seaman found a watery grave! The only safe course at present is to steer

easterly, and try to get a hold of the bright light on Rhu Vaal, which shows over the Island of Colonsay, and keep a hold of it on for Mull, not approaching too nigh the Colonsay shore. But when once Dhu Heartach is lighted, matters will be entirely changed. Instead of being dreading and shunned, the mariner will boldly approach it; and when obliged to bear up for refuge in westerly gales, it will form a new point of departure, guiding him safely between the Torran shoals and the Colonsay land. Not only so, but it will also form an important link in the chain of western lights, on the British Islands, and illumine for the mariner nearly 500 square miles of water, at present dark and dangerous.

The tower of Dhu Heartach, like that of Skerryvore, is built of Mull granite, and a description of the works at Erraid, where the stones have all been quarried and prepared, will help to set forth the gigantic character of this lighthouse undertaking; but this, for want of space, we must defer to a subsequent occasion.

Communication is kept up between the quarries and the lighthouse road by means of a steamer belonging to the Lighthouse Board. There is an outlook, consisting of a small circular box, perched on the top of the island, 200 ft. above the level of the sea. It is provided with a powerful telescope, 5 ft. long, mounted on a stand, and capable of being pointed either in the direction of Dhu Heartach or Skerryvore. There the sentry sits all day long, when the steamer is not at sea, watching any signal that may be made on the rock, 15½ miles distant, ready to repeat it on the flagstaff at his door. Should the men on the lighthouse rock intimate, by the hoisting of a ball on the mast of the barracks, that communication is wanted, the sentry instantly hoists his black ball on the flagstaff; and the watch on board the steamer, seeing it, at once calls the master's attention to it, and, no matter how coarse the weather may be, the *Dhu Heartach* will be seen in less than an hour breasting the swell outside of Soay.

The principal facts regarding the history of the works on the rock may be soon told. In the summer of 1867, a landing was made, and operations commenced for erecting a barrack for the workmen similar to those used in the erection of Bell Rock and Skerryvore Lighthouses, with this exception, that this was all of malleable iron instead of wood. It consists of twelve malleable iron standards, each 35 ft. long, firmly braced into the rock, and bound together with strong iron stays. On the top of these rests a circular barrack, 18½ ft. high, and 16 ft. diameter, reached from the rock by a chain-ladder leading up to a hatch in the floor. It is divided into two apartments, lower and upper—the one containing cook's kitchen and two small rooms for the officers; the upper, a dining-table for the men, and thirty beds ranged round the walls, tier above tier. The lower room is lighted by twelve bull's-eyes, in the sides, the other by a glass ventilating lantern on the top. This was the home of twenty-five men at all hours during night, and the narrow space in which they were shut up in bad weather, with the waves rolling beneath them, and wild winds raging around them. Though a somewhat trying situation, we have never heard that the men's confidence has been shaken as to the stability of the structure.

Towards the close of the season of 1868, the excavation of the pit for the foundation was commenced, and early in 1869 the first course was laid. Five courses were laid in 1869, twenty-six in 1870, and forty-four during the present season—seventy-seven in all. The first entire course contained eighty-four stones, the last only nine. The last stone was landed on the 16th of August, amid great rejoicings; the balcony railing was fixed on the 11th of September; and the work on the rock thereafter suspended until the summer of 1872. It is confidently expected that the internal fittings, which are nearly all ready at Erraid, will be fixed during the next season, and that the light will be exhibited from the tower before the year is done. The rapid progress of the work has greatly surprised all who know anything of the savage character of Dhu Heartach. The sea is seldom at rest around it, and it is only during the summer months that anything like regular communication can be held with it. We learn that in 1867 there were only twenty-seven days on which landings could be made on it; in 1868, thirty-eight days; in 1869, fifty-nine days; in 1870, sixty-two days; and during the present season about the same number. Some of those landings were of very brief duration. It may

be interesting to know how so many stones were landed on such a wild spot during the short seasons that were available. It was attained as follows:—Whenever the men on the rock thought the wind and sea had sufficiently gone down for landing stones, the ball was hoisted on the barracks. The signal being observed by the outlook on Erraid, was repeated by him to the steamer. Instantly, all on shore was in motion; the fires on board were stirred, the loaded lighters were manned and warped alongside, the superintendent hurried down to the wharf, and in less than an hour the *Dhu Heartach* might be seen outside of Soay, with two lighters in tow, pushing on for the rock. Arrived there, the steamer is attached to her moorings, and the lighters are warped to buoys nearer the landing. Meanwhile, all is activity on the rock itself. Steam has been raised on the boiler of the small winch engine lying in a cavity near the base of the tower. On a signal given a lighter is run alongside of the east end, and in fifteen minutes eleven ordinary-sized stones are lifted off the barge by a landing crane, and set on the rock. Another crane lifts them on a wagon, travelling on an incline of rails up to the base of the tower. Here another lifts them off and sets them down. The second barge is unloaded as speedily in the same way. The stones are then considered safe, and more time taken to hoist them, by means of a projecting needle, to the top, and have them set in their respective places by means of a balance crane. All this process was chiefly effected by steam-power, under the special direction of Mr. Brebner, and carried on with great expedition on all practicable occasions. The success attending it has proved its efficiency.

The Dhu Heartach tower rises to the height of 138 ft. above high water. The shape is a hyperbolic curve—one which secures more than any other lowness of the centre of gravity and direct action of the weight of the mass on the base. It is to be remembered that the stability of these towers depends on weight, not on rigidity, and that the great object of the engineer is to secure the perpendicular pressure of the superincumbent mass on the base as far as consistent with other interests. Hence the engineer's idea is that of a monolith with cavities, and with this object in view, stone is joined to stone and course to course by various mechanical devices. In the lower courses the stones are joined by angles, curves, joggles, and bolts; in the upper courses, by bolts, clasps, twisives, and ribbon joints. Between each stone, throughout the whole structure, the most tenacious cement is employed; so that when finished, the whole column may be said to be one stone, with certain cavities of a definite form and for a definite use. The tower is solid for 31 ft., and the doorway at that elevation is reached by a gun-metal ladder battened into the wall. Above the doorway there are seven apartments, rising in succession the one above another. When the history of this great undertaking comes to be fully written, it will take its place honourably beside those noble treatises which narrate the history of the construction of the Bell Rock and Skerryvore towers.

Some commendation is also due to Mr. Alan Brebner, the resident clerk of works.

PATENT HYDRAULIC BRICKMAKING MACHINE.

A MACHINE, constructed by Mr. G. W. Hick, of Leeds, engineer, is described and illustrated in the *Engineer*. It consists of a revolving table, containing three monoliths, and also of as many pressing-cylinders, with their accompanying rams and plungers. This table is made to revolve intermittently. This intermittent motion of the table is effected by means of a loose ring fitted so as to work freely round the circumference of the table. The ring has a reciprocating motion imparted to it from a small water cylinder and ram. The working parts consist of direct-acting pistons and rams, carrying plungers or pressing-blocks, the pistons, rams, and cylinders being kept watertight by hydraulic leather packing.

On the feed-mould being charged with clay from the hopper or pug-mill placed over the table, it is carried forward by the ring one-third of a revolution, thus presenting the contents to the pressing action of two plungers actuated by separate pistons and rams—one plunger being forced downwards upon the upper surface of the brick, whilst the other is being forced upwards

or against the underside of the brick, both situated and working in a cylinder cast with the bed of the machine; thus the brick is effectually pressed. The mould containing the pressed and moulded brick is then brought over and opposite to another plunger placed in the lower bed of the machine, and called the delivery plunger, and also a fresh charge of clay is submitted to the pressing plungers. Simultaneously with the pressing of a brick the delivery of an already pressed brick is accomplished. The mould thus emptied by the delivery plunger is again filled with clay from the hopper, so that three bricks are moulded, pressed, and delivered during one complete revolution of the machine.

MEMORIAL OF THE DUCHESS OF SUTHERLAND, DUNROBIN.

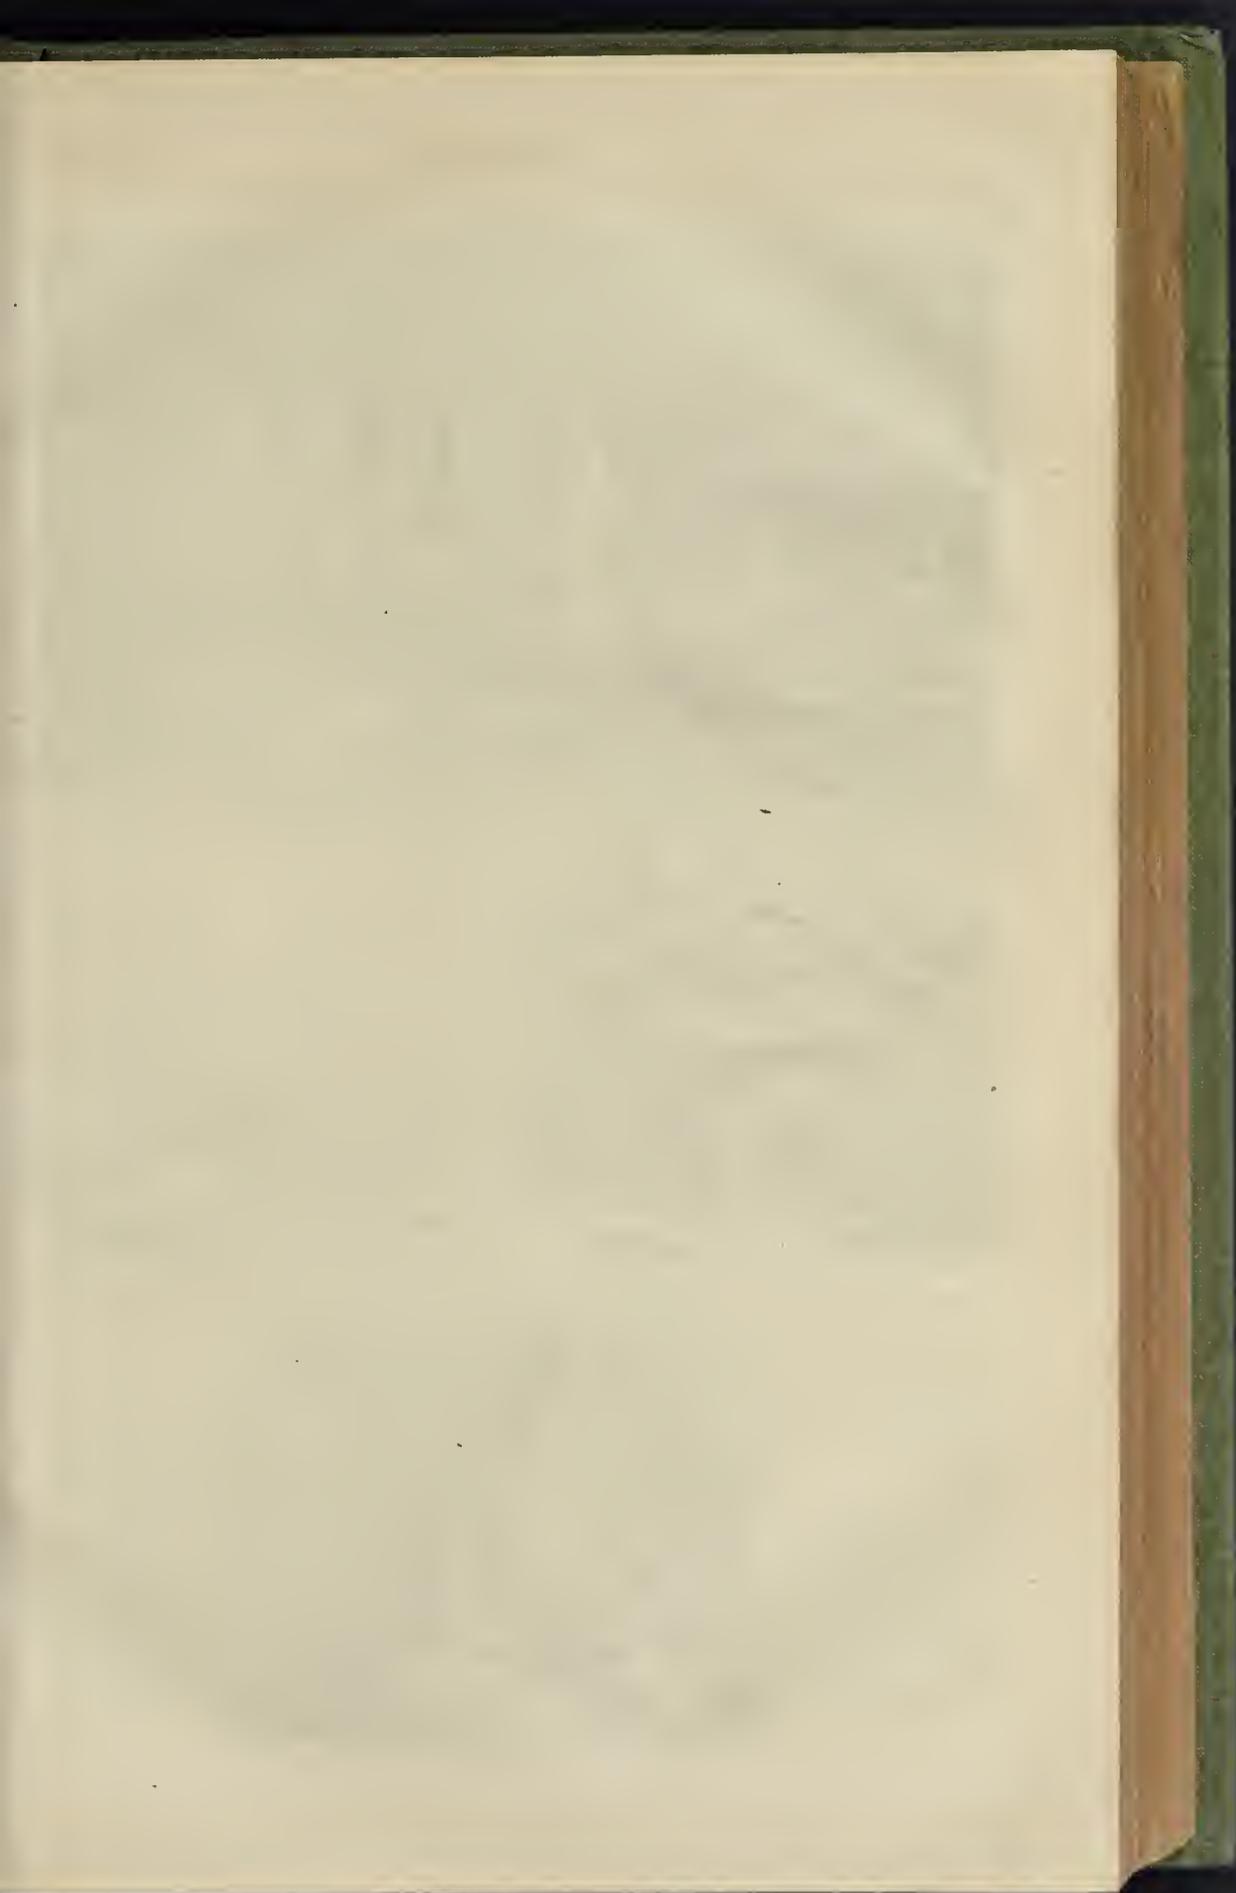

A COMMENCEMENT is about to be made with the erection of a monument to the late Duchess of Sutherland, which has been subscribed for by the tenantry on the Sutherland estates and others. The monument has been designed by Mr. John Robinson, and its execution has been intrusted to Mr. John Rhind. It is intended to be placed on a rising ground within the policies of Dunrobin Castle, and the white freestones for its construction will be supplied by the Duke from a quarry near Dornoch, and conveyed to the site by his grace's traction-engine. The monument will be a symmetrical structure, rising to the height of 40 ft., and in its outline bearing a sort of general resemblance to the monument erected at Dunkeld in memory of the late Duke of Athole. From a basement of three steps, covering a space 17 ft. square, the structure rises as a square mass of masonry, buttressed at each corner, relieved with horizontal mouldings, and finished at the top with a richly-carved cornice. Over this rise (one from each corner) four pillars, with grouped shafts and carved capitals. Externally the pillars support on each of the four sides a cusped arch, over which rises a crocketed gablet, terminating in an ornamental finial, and inclosing a triangular panel, intended for the display of monograms and armorial bearings. Internally the pillars are connected by groined arches, forming a sort of canopy, under which, and within the pillars, is to be placed a bust of the late duchess, executed by Noble. Above the gablets, between which pinnacles spring from each corner of the structure, the monument presents another stage of solid masonry, square in form, and having at each corner a round pillar with enriched capital, which, however, stands clear of the central block. Next comes a second open stage, consisting of eight pillars of various forms. On each side the pillars support a crocketed gablet, filled in with diaper-work, and between the gablets pinnacles rise from the corners as in one of the lower stages. From between these upper gablets springs a central spire, which, gradually tapering off, terminates the work with a crocketed finial and cross. In the execution of the monument a considerable practical difficulty has to be overcome. The four pillars forming the lower open stage must support the whole weight of the superincumbent stages, and, in the absence of buttresses, it is necessary so to adjust that weight upon the arches as to avoid lateral thrust.

MONUMENT OF THE DUCHESS OF SUTHERLAND, IN TREUTHAM CHURCH.

IN our volume for 1871* we gave a description of the marble effigy of Harriet Duchess of Sutherland, wife of George Granville, second Duke of Sutherland, executed in marble by Mr. Matthew Noble, sculptor, and which has recently been placed in Treutham Church. We publish in our present issue an illustration of the monument.

The tomb on which the effigy rests is executed in Sicilian marble, the cornice being supported by six columns, between which are square panels containing the inscriptions. The centre one, in Latin, was written by Mr. Gladstone, and fully quoted in our former account. In the foliage of the caps of the columns and in the cornice are introduced the hencherus and other flowers. The tomb was designed by Mr. John Robinson, architect, of Whitehall-yard, and executed by Mr. Earpe, of Leith.

THE PROGRESS OF THE PEOPLE.

MR. ALEXANDER REDGRAVE, principal inspector of factories, recently delivered a lecture in Bradford, wherein he gave some remarkable evidence as to the social progress of the people of this country. "Contrast," he said, "the prices of food and clothing of to-day with those which ruled thirty years ago. Contrast with them, at the same time, the relative power of increased remuneration to pay a higher price for necessities, I will not say luxuries, formerly not dreamt of. The following figures will enable us to imagine the position we would have been in with an increased population, having greater powers of consumption, but for free trade. This is the sum of the food imported into this country in 1870:—Animals, 4,155,463*l.*; corn, &c., 19,732,879*l.*; other provisions, 15,817,401*l.* Corn has ruled much lower than it did thirty years since, but meat has risen considerably, principally, I believe, from the enormous increase of meat-consumption in the country. The high rate of remuneration has enabled families to consume meat constantly who formerly only consumed it occasionally, and many who never consumed any can now afford to eat it frequently. But if meat has risen in price, tea and sugar have fallen greatly, and chiefly through the application of the true principles of taxation. Taking tea, in the first place, we find that in 1841 the duty was 2*s.* 1*d.* per lb., that the consumption per head was 1 lb. 6*oz.*, and the annual contribution of each person to the revenue was 2*s.* 11*d.* Coming now to 1870, we find the duty 6*d.* per lb., the consumption per head 4 lb. 10*oz.*, and the contribution to the revenue of each person was just 2*s.* 4*d.* per annum,—the revenue for the year being 2,910,000*l.* Then, again, with respect to sugar. In 1841, the duty upon sugar was 2*s.* per cwt., the average consumption per head was 17 lb. 8*oz.*, and the contribution to the revenue per head was 3*s.* 10*d.*, the revenue being 5,114,300*l.* In 1870, the duty would average, according to quality, rather more than 5*s.* per cwt., the consumption per head was nearly 54 lb., and the contribution per head to the revenue was about 2*s.* 6*d.*,—the revenue, notwithstanding the reduction of the duty one-half over the last nine months of the year, was just 4,000,000*l.*"

"We must look to all classes in considering the social condition of the people, and not only to those who live by labour. It is the aim of all classes to reach, at the least, the class immediately above them; and if we compare the taxes upon luxuries during the last thirty years, we shall see how far the middle-classes must have been augmented. For instance, it appears that in 1840, there were 318,251 horses charged with duty, exclusive of agricultural horses, which were exempt from duty. And notwithstanding the all but total extinction of stage-coaches and posting in 1870, there were in that year 744,906 horses charged with duty. In a similar manner, there is a comparison of the number of men servants and carriages kept, and of the consumption of wine—three elements of a well-to-do household. In 1841, there were assessed for duty 101,849 men-servants, and in 1870 the number was 267,671. In 1841, there were assessed for duty 28,334 four-wheeled carriages; in 1870 the number was 132,331. In 1841, the number of two-wheeled carriages was 41,663, and in 1870 the number was 249,991; and the persons charged with keeping such carriages were, respectively, in 1841, 34,694; and in 1868, 59,190. Again, taking the consumption of wine, an element of luxury and health, we find that the average consumption per head, in 1841, was a little more than one-fifth of a gallon, while in 1870 it had risen to half a gallon per head. Again, if we take the game licences, we find that they were, in 1847, 39,373, and 2,694 keepers; and in 1869, 54,203, and 4,921 keepers. But we may yet illustrate the increased wealth of the middle classes by an examination of amounts paid to legacy and property duty. In 1841 the capital subject to legacy duty was 41,476,521*l.*, and in 1869 this sum was more than doubled, for it amounted to 87,721,152*l.* The amount of property and income charged with duty in 1843 was 20,568,035*l.*; while in 1869 it was 386,519,366*l.* This is an enormous increase, even after allowing for the tax in Ireland, which did not come into operation until 1853. Another great advance has been the facilities for intercommunication by cheap postage, and for the diffusion of intelligence by cheap newspapers. In 1839 the number of letters delivered was 99,014,156. In thirty years the number had increased to

831,914,000. In the latter year also a sum of upwards of 19,000,000*l.* passed through the money-order office, and 2,727,763 letters of importance were registered. Since 1869 greater and very important facilities have been put into operation. The postage of letters, parcels, and newspapers has been re-arranged in favour of the public, and postal cards have been issued. That these arrangements have met a want will be credited by the fact that from the 1st October, 1870, to the 31st March, 1871, upwards of 58,000,000 post-cards have been issued, and upwards of 140,000,000 halfpenny labels and stamped wrappers. Cheap newspapers are of very recent introduction. For years the excise on paper, the stamp on newspapers, and the duty on advertisements, rendered a cheap newspaper impossible. But gradually each impost gave way before the more enlightened views of the statesman of modern days, and the press is unshackled; and what has been the result? In 1841 there were 134 newspapers in London, and in other parts of England and Wales there were 244, and in Scotland and Ireland, 167—total, 541. The number of stamps issued in the year was 59,936,897, which, as all newspapers were stamped, represents the number issued. At the present there are published in London 30 daily papers, upwards of 200 papers issued weekly, or at intervals within a week, and about 760 periodicals, partly of the nature of newspapers, partly of magazines, appearing at intervals from once a fortnight to once in three months. The number of provincial Scotch, and Irish papers is 1,158, and the number of papers and periodicals registered for transmission as newspapers is upwards of 1,000."

THE COVENT GARDEN WHOLESALE FLOWER-MARKET.

THIS mysterious establishment is undergoing extensive enlargement by Messrs. W. Cubitt & Co. When completed the area of the market, we are told, will be more than quadrupled. The new market will extend from the boundary of the old building in Covent Garden to Wellington-street, being about 200 ft. in depth, and its extreme width in the centre about 160 ft., altogether covering an area of about 3,000 square yards; and in order to effect this extension, it has been found necessary to demolish a considerable amount of property in Wellington-street and the immediate neighbourhood. One of the main entrances will be in the last-named street, in addition to that in Covent Garden. The basement has been excavated to a depth of from 12 ft. to 15 ft. below the ground-floor of the market, up to which eight square brick and stone pillars rise, and on these pillars are placed iron columns ascending to a considerable height, connected with semicircular arches at the summit between each column. The building will be carried up another story resting upon these columns and arches. The roof will to a great extent consist of glass, in the centre of which there will be a lantern. The entire basement will be arched over, and set apart for vaults and stores. We do not hear of any architect in connexion with the work.

DOMESTIC STAINED GLASS.

A PAPER was read on this subject by Mr. Lewis F. Day, at a meeting of the Architectural Association, held on Friday evening, the 26th of January. The small number of precedents in old domestic stained glass, as compared with those in church windows, was first noticed. From it was now resulting at first sight an increase of difficulty in this class of the glass producer's work,—perhaps compensated for by the necessity of attending to principles sought and obtained at first hand, stimulated in some degree by the stricter critical judgment shown towards novel works intended to be constantly seen in the ordinary daily course of life of their individual owners. The old glass may, however, be looked on as furnishing a large set of experimental processes,—specimens of methods partly or wholly successful pursued in the detail and execution of old glass; and brush painting in old times, which might be illustrated also by the Etruscan vase paintings executed in many respects under similar conditions. Viewing, then, the introduction of non-transparent glass in houses as a device primarily for hiding the view from without or within, Mr. Day treated in detail the characteristics of quarry glazing, and the opportunity

afforded by bands, borderings, tints, &c., of giving character, and that value resulting from the evidences of thought and design in fitting the work for a special position. To the introduction of tints in patterns there would be no objection on principle; but an intelligent haphazard arrangement was, he considered, in practice, more satisfactory, on account of its greater variety under happy accidents of lighting. Of plain glazing,—after an allusion to the success of the early Cistercian architects in this kind of work, so often mentioned with much appreciation by Mr. E. Sharpe,—the lecturer stated that here again the appearance of fresh design was indispensable, in order to obtain real beauty and interest. Diaper panels arranged in Paris only of a window, in a framing of emphatic lead lines, borders, &c., he considered preferable to the large single sheets of glass, rather too uniformly insisted upon now-a-days; smaller pieces, besides the great advantage of giving scale to a building, allow of decided definition of important forms, and the leading indicating the pitch of the design (as a note in singing), also of changes of tint; and (a not unimportant detail), the loss is often less radical in case of breakage. As to painted quarry-work, highly conventionalised work might be repeated in running patterns with propriety; but, in cases of a near approach to nature, such repetition seems to strike a wrong note; a bird or an animal (any piece of animated nature, in fact) may supply a most effective addition to the interest, which will be all but lost, or worse than lost, if any idea of mechanical mindless repetition is conveyed to the observer.

Mr. Day then suggested a scheme of decoration for the windows of a house with purely floral forms, bearing a relation to the uses of the different rooms: quarries of tobacco-plant conventionalised in smoking-room; coffee and tea in breakfast-room; noting, by the way, the suitability of the forms of these and other plants for similar decoration. Heraldry, also, though not particularly to be recommended for church windows, he considered might be often used with effect and some meaning in domestic work: suggesting that a plan adopted in old glass at St. Pierre's, Chartres, of countercharging the colours of the background with those of the coat, might be applied in new work: he did not know that it had been hitherto. Some of the heraldic windows at the Houses of Parliament he considered excellent. Treating of a still higher class of design for glass, with figure subjects in medallions, &c., he thought that strongly coloured and pronounced works, such as those in the windows at Chartres, might be compared to fresco painting; whereas suitable decoration for residences would be more properly compared to water-colours,—less forcible and more expressly elegant and refined. Backgrounds, landscape, and distances seemed quite out of place in very dignified monumental (church and similar) work, but not inadmissible and the nearer approach to ordinary nature in domestic work. The cost of glass, felt as a drawback sometimes to its introduction, he thought might be usefully reduced by the adaptation of replicas of medallions, if not carried too far. An entirely special design was often quite unnecessary; and the vulgarity of mere manufacture could be avoided by constantly fresh adaptations of existing materials. It perhaps might be advisable—though he hoped hardly necessary—to insist on complete lucidity,—a distinct glassiness being a most pleasing feature in a window, however it may have been turned into a thing of beauty, in the endeavour to modify, or to subdue or soften, the daylight passing through it.

In the discussion following the paper, Mr. R. P. Spiers called attention to the windows at St. Jacques, Liège, containing good figures, showing a grandeur of treatment, having, however, the later characteristics,—large pieces of glass, &c. He thought that in domestic work the safest counsel would be to use as much white, or nearly white glass as possible; not to distribute much colour of any strength.

Mr. G. H. West noticed that objections were sometimes made, not entirely without reason, to the stained glass in the upper portions of domestic windows, now apparently growing in use: introduced for purely decorative reasons, it, nevertheless, cut off most of the sky view. He observed also that in cases where patterned or obscured glass was required, all the effect, and an increase of safety, and the warmth of double windows, and perhaps in many cases a needful non-interference with symmetry, could be obtained by glazing with plate-glass outside the stained glass. He thought the attention, espe-

cially of students, might be usefully called to the chronological series of stained glass windows at the museum at Rouen; also to the early glass in the choir-aisles of the cathedral; later glass in other churches, and still later also (large fine pictures on glass), at St. Patrice's, for instance, in that city. Such quantity and quality of glass combined, he believed, did not exist anywhere else. Another member remarked on the substitution of stained glass in gilt leads, for the dwarf muslin curtains or wire blinds formerly in use, in windows adjoining streets, considering this an intelligent and pleasing use of the material probably destined to become very universal. After some other criticisms on points of detail, the meeting separated, having passed a vote of thanks to Mr. Day for his paper.

WORCESTER GUILDHALL RESTORATION.

At a recent meeting of the Survey, Buildings, and Property Committee, several letters suggesting arrangement of rooms, &c., were read, one proposing a large room for holding Oratorios in, in case the cathedral should ever be refused, and another that the hall should be carried further back. Ultimately the committee decided in reference to the reconstruction scheme of 9,000l. to submit to the architects sending in plans the following suggestions:—A large hall, about 4,000 superficial feet in area; Council-room, available also for conferences or small meetings, 1,000 ft. to 1,500 ft., five rooms for committees, &c., from 200 ft. to 400 ft. each; Recorder's Court, about 1,200 ft.; Police Court, about 1,000 ft.; four closets, lavatories, &c. For the larger or 18,000l. scheme the above, with instructions for a larger hall than before specified, and additional offices for Town Clerk (four rooms), Clerk to Magistrates, Treasurer, Nuisance Inspector, Street Inspector, Hall Keeper, &c. The general arrangement to be left to architects sending in plans. City Surveyor to furnish lithographed ground plans of Guildhall and adjoining buildings.

NEW RESERVOIR AT LAKENHAM FOR NORWICH WATERWORKS.

A second covered reservoir has been completed and opened at Lakenham. A stock of 3½ million gallons can now always be kept in readiness for the supply of the city. The first covered reservoir, erected about a year ago, is 128 ft. square, and 17 ft. from floor to roof, and was constructed on the principle of groined arches carried on independent piers, sixty-four in number, the outer walls for strength being made to form a series of bays, with half dome roofs. This system of bays is preserved in the new reservoir, so far as the outer wall is concerned; but a different principle is adopted inside, presenting a series of eight arched passages, the walls of which are pierced by corresponding side openings, and strengthened at intervals by buttresses. It is 128 ft. long, by 120 ft. wide, and has a depth of 18 ft. below the water line, and is thus capable of holding about one-third more water than the first, or "Saltzer" reservoir, which contains 1½ million gallons.

Both reservoirs are from the designs of Mr. Hawksley, the company's consulting engineer, and have been constructed by the company, under the superintendence of their manager, Mr. Ayrie, Mr. W. H. Bishop acting as clerk of the works.

EXTENSIVE NEW RAILWAY STATION IN LIVERPOOL.

ONE of the largest railway stations in the north of England is now in course of erection at Liverpool for the Midland, Great Northern, and Manchester and Sheffield Companies, who jointly have just constructed a new line of railway between Manchester and Liverpool, so as to give them a separate and independent through communication between London and Liverpool without using the London and North Western Company's line from Manchester to Liverpool. The new line is about to be opened for traffic, and the new station in connection with it, which is situated in Ranelagh-street, almost in the centre of the town, and called the Central Station, is rapidly approaching completion. The Ranelagh-street elevation is 310 ft. long, having a spacious area in front, somewhat resembling the Charing-cross Station, and has a commanding appearance. The station buildings are extensive, containing

the booking-office, waiting-rooms, managers' rooms, and the general offices of the several companies; also ornamental lodges, a carriage drive under a glass roof to the booking-offices, parcel-offices, and large dining and refreshment rooms. The interior of the station itself is very spacious, being 620 ft. long, whilst the entire area occupied by the several platforms and various lines of rails, is upwards of six acres in extent. The station is covered in by a massive roof, consisting of eleven elliptical spans, each 55 ft. wide, and extends the entire length of the station—620 ft., the area covered by the elliptical spans being 169,000 square feet. The extreme length of the station, station buildings, and approaches, is 838 ft., and occupies an area of upwards of seven acres. In order to secure the site for this large structure, a considerable quantity of very valuable property had to be purchased, including, amongst other premises, extensive new buildings and offices which had only quite recently been erected by the gas company, also several hotels, besides a large number of private houses and business premises, the amount which the companies have had to pay in compensation being very heavy. The station and buildings in connexion with it was designed by Messrs. Fowler & Brydone, of Victoria-street, Westminster, the engineers to the three-associated companies; and the works are being executed by Messrs. Kirk & Parry, of Queen-street, Westminster, and Sleaford, Lincolnshire; the contract being something more than 100,000l.

DAMP WALLS.

Sir,—It was with much interest that I read "Devonia's" letter upon this subject, knowing the importance of it to him and many others situated in that and other exposed parts. Having a knowledge of the climate of that wild district, Dartmoor, I am aware of the difficulties that he would have to contend against to build a damp-proof house. I have often wondered that, in a county like Devonshire, having such a fine store of beautiful building-stones as it has, some more effectual means have not been used or attempted to ensure weather-proof walls, than the unsatisfactory battening, or hiding and disguising, the fine appearance of the stone by stuccoing or slating.

The usual method of building in those parts, I believe, is to construct external walls 18 in. or 21 in. thick (generally of granite and other native stones), in random courses, and specified to be well flushed up. After such walls have been so constructed and well pointed externally with cement, I have seen the wet running down the interior of south and west walls in streams, and dripping from the window-heads on to the window boards, showing that the rain, accompanied as it generally is with high winds, drives through the granite, and gradually runs down the inside of the wall, making its appearance over the first opening, or out at the most convenient joints. If the floor-joints should have a bearing in those walls, or even if the flooring-boards run through to the stonework, it is surprising the quantity of wet they intercept, and this spreading over the floor, the consequences in course of time may be readily judged.

What I would propose and recommend (learnt from that large school, experience) is to build outer walls by either of the following methods—viz. to build an outer course of stone, 10 in. thick, and an inner course 8 in., leaving a space of 6 in. between, which is to be filled up with Portland cement concrete, well flushed into the interstices of each course of stones, and, when required, special perpend stones, selected for their non-absorbent nature. The other method that I have seen adopted is to build cavity-walls, bonded together by a special perforated non-absorbent bond of bricks. In some cases I have known the interior course to be carried up in brick.

In the latter method, cavity-walls, an additional expense is incurred by the necessity of laying lead over all openings; also great care is requisite to select non-absorbent bond.

Seeing, as I have, many proprietors and architects spending large sums of money in erecting buildings of this class, in the districts alluded to, many of them excellent pieces of workmanship to look at externally; but, through not being built upon a proper principle, dangerous and unfit to live in, I am impressed with the importance of the subject.

The different nature of the climate in those parts does not seem to have been provided

against in modern buildings so effectually as in existing ancient ones; and, as in most other cases, anything new, although commendable, is held in distrust. TAVISTOCK.

Sir.—Under the heading "Damp Walls" I observe a letter in your last issue. Being intimately acquainted with Dartmoor, also with the "fire-proof bricks" made in the locality, and, further, with the granite, from the disintegrated particles of which these bricks are made, I am not surprised that "Devonia" found his house like a "sieve," having adopted pretty sure means to that end.

It does not follow that a "fire-proof" brick is a "damp-proof" one, the very opposite being the fact; viz., that a good building brick, i.e., one that is "damp-proof," will be an indifferent fire-brick, and vice versa. The granite of Dartmoor is by no means damp-proof, and there is nothing in the manufacture of bricks from the disintegrated constituents of this granite to remedy the evil.

May I suggest two courses which your correspondent may now adopt, with, I will venture to say, success?

First, apply three coats of damp-proof paint, which contains neither white-lead, nor whitening. Such a paint is certainly to be obtained, and would stand for many years.

Or, second, let the house be encased with damp-proof bricks, which also are obtainable. This would, doubtless, be more expensive than the paint, in the first instance, but would prove a permanent cure if properly built and pointed with good cement. If the house—as it should be on Dartmoor—is built low, a slight casing with numerous bonds into the existing walls would be sufficient; an air space between the casing and the walls would also be advisable.

J. D. P.

NEW OFFICES FOR THE SHEFFIELD UNITED GAS COMPANY, AT SHEFFIELD.

The directors of this company held a meeting on Saturday last, for the purpose of selecting a design for the new offices to be erected near the new Post-office, on the approach-road to the Midland new station. The competition was strictly limited to the architects of Sheffield, and, we believe, nine sets of plans were sent in. These were, after deliberation, reduced to three, viz., those of Messrs. Hadfield & Son, Messrs. Flockton & Abbott, and Messrs. Hill & Swann. The choice of the directors fell upon the design of Messrs. Hadfield & Son, under whose care the work will at once be undertaken.

The building will have a frontage of 128 ft. to the station approach, and 108 ft. to the street, called Shude-hill. It will be of stone, in the early Renaissance style, of a Venetian type, the columns and door-cases.

The principal apartments will be on the level of the station-road, and will include entrance-hall, general office, manager's rooms, show-rooms, and staircase to the upper floor, which will be entirely occupied by apartments for the Board meetings, engineer, &c.

The estimate is 17,500l., and the time occupied in the building will be about eighteen months.

ACCIDENTS.

Fall of a Railway-bridge.—A railway-bridge, near Castle Ashby Station, on the London and North-Western line, gave way, owing to floods, just as a goods-train from Northampton was passing over it. No one was injured except the guard, and he was not seriously hurt.

Fall of a Boiler-house at Mossley.—A boiler-house in connexion with the mill of Mr. John Shaw, Micklehurst, has fallen, the destruction being such that scarcely a stone remained in its place, and the workpeople had not arrived. Fortunately, the workpeople had not arrived previously, and is supposed to have caused the mischief.

Fall of St. Paul's Churchyard Wall, Westminster.—A large portion of the wall bounding St. Paul's Churchyard, Coronation-road, Westminster, has fallen. On the Southville side of the church there is a deep, steep cutting leading to the ferry, known as Ferry-lane. At the top of the lane the churchyard is but a few feet above the level of the roadway, but the incline is so steep that near the bottom the wall rises to a height of more than 20 ft. It was here that the wall,

for about 20 yards, came down bodily, and without any warning; a great mass of earth falling along with it, exposing some fifteen coffins, large and small. Prompt measures were taken for covering the coffins, and protecting the churchyard. The accident is attributed partly to disturbance of the ground, but mainly to heavy rains.

STATE OF GLASTONBURY.

Sir,—I forward you an extract of a letter I have just received with reference to the state of Glastonbury and its drainage, wherein they say, "A party went to the Glastonbury ball, and the smell in the room from the bad drainage was so offensive that one of the ladies was taken ill the next day, and is now ill in bed with fever that they fear is typhoid." How much longer is this state of things to continue in towns, estates, and private houses, and how much longer are parties to inhale poison instead of pure air, especially in the country? They have had sufficient teaching in the *Bullein*, and now let them one and all take timely warning.

A SUBSCRIBER.

THE COURTS OF LAW.

Sir,—As the building for the Courts of Law will be one of the most important erections in this age and kingdom, and, if spared, of a permanent character, there cannot be too much thought and care bestowed by those who sanction the work, that it redound to the satisfaction of the public at large, and the credit of the national taste and appreciation.

I am not an architect, but have bestowed much attention upon the different styles of architecture; and, in the opinion of competent judges, have thrown some desired light in "The Basilica" (of which I sent you a copy), upon its origin, principles, and progress.

Admitting that each acknowledged style may have its merit, and, when well adapted to its object, may be raised to excellence, there seem to me certain conditions attached to every style in the construction of public buildings that should always be maintained to secure a proper effect upon the public eye, and by which the educated and uneducated are duly impressed, though the latter may not, like the former, be able to criticise the distribution of the parts.

The *tout ensemble* of each facade should have the first regard, and that should be broad, massive, and uniform, to secure, in the first instance, a fixed attention to the building as a unity, without any immediate distraction by the several parts. Without this there can be no sense of grandeur, with which every public building ought to impress the mind of the beholder, and overpower the pretensions of all the neighbouring private buildings.

The next requisite is, that the divisions should be well and boldly defined in subjection or harmony to the whole, diverging at equal distances from the centre, or principal entrance, and in perfect conformity with each other.

A diversity of parts which ought to correspond, is as if an artist should paint one eye of a different size and shape from the other—the one round and large, the other small and elliptical. The openings also should be level. When otherwise, it is like putting one eye an inch or more lower than the other. In many recent buildings symmetry appears to have been purposely dishonoured.

Let us one judge of the effects of architectural construction by the proportions, and harmony, and correspondences of the human frame, for the most famous writers on the subject have seized upon this analogy.

Next, and subordinate to the principal divisions, should be the ornamentation in high relief and deep incisions, decorative without being finikin; for the observation of the beholder should be calmly and leisurely withdrawn from the admiration of the contour to the appreciation of symmetry, grace, and proportion.

Stout of a firm texture and bright appearance is the best adapted to all public buildings. Brick requires ample stone dressings to be at all impressive, and even then is inferior to stone.

Any one who notices the banquetting-room at Whitehall, Spencer House from the Green Park, Somerset House, and Greenwich Hospital, will be struck with the impressive and superior aspect which they respectively present in comparison with all neighbouring buildings. What, then, was my amazement and disappointment

on seeing the representation of Mr. Street's ascensions for the New Courts of Law, to find that not one of the essentials described above was observed; but a jumbledom of a confused, incongruous multiplicity of diverse buildings, huddled together like "a happy family" of various animals, without head, subordination, or consistency!

Mr. Street is no doubt an able architect, capable of all that is required to construct a suitable and homogeneous building; but he seems to be a victim to the prevailing taste and purport of the last thirty or forty years, which is covet and consonant with the Oxford movement, the immediate object of which was to Mediaevalise everything, outwardly and inwardly, in accordance with the most corrupt period of the Romish Church. It is seen to a certain amount in the sister art of painting, and in all the grotesque revivals in wood and stone, brick and metals, and in all textile fabrics, to the delight and exercise of many imaginative ladies and feminine young gentlemen.

I hope there is too great a sense of propriety and of national feeling to suffer such a higgledy, piggledy style of building to be erected for the Law Courts of this kingdom,—to be unfavourably contrasted with all the public buildings of ancient nations, and those of all the capitals of Europe. The fables that are played with the roofs of this jumbledom combine all the worst features of a French capitulation. Turkish cupolas and minarets would be far more agreeable.

CHAS. FRED. WATKINS.

IMPORTANT LAW CASE.

O'GRADY v. THE RIGHT HON. E. CARDWELL.

It was sought in this case to recover damages laid at 500*l.* on foot of a contract to execute certain works at the barracks of Athlone, Ireland, which had been entered into by the plaintiff with the defendant as Her Majesty's principal Secretary of State for War. The motion was to set aside two defences which were alleged contained averments of a nature to make it uncertain whether the defendant intended to rely on the fact that the contract was an official contract, and that it was concluded under circumstances which rendered it not binding on the defendant personally. It was further alleged that the remedy of the plaintiff, supposing him to have any, was by a petition of rights. The court refused the motion with costs.

A word or two may be said in relation to this case. The employment of the plaintiff was certainly by Mr. Cardwell in his official capacity, but does this bar recovery of a claim, supposing it to be just? As this action is outside the region of politics, and the question at issue is a most important one to the building and architectural interests, we have a right to ask to what tribunal is the defendant responsible if not to the public ones? The plaintiff's counsel sought in vain to have the pleadings set aside, but the Court of Exchequer held that the defence was *prima facie* a good one.

The matter can scarcely rest here, for it will assuredly make many contractors hesitate in future before entering into a contract with officials if such decisions are to be anticipated in case of dispute. It is not a matter of Irish, but British interests. There is no plea of exorbitant charge or badly-executed work. There is only the plea of non-responsibility. Consequently the disputed claim, without any settlement, falls to the ground, because the action must not be against the Secretary for War in his official capacity.

The comfort to be obtained by a plaintiff on resorting to a remedy by a petition of rights, we fear, is very small, for he is only vouchsafed the hint by the counsel for the defendant that a remedy possibly may exist in that direction.

THE LONDON AND NORTH-WESTERN COMPANY'S NEW PASSENGER STATION AT BOLTON.

In connexion with a new line of railway between Bolton and Manchester, which the London and North-Western Company have just completed, and are about to open, in addition to the present line belonging to the Lancashire and Yorkshire Company, the former company are now erecting a large new station in Great Moor-street, Bolton. The building is an architectural structure, and of large dimensions. It contains a commodious block of offices, standing on high ground con-

siderably above the street level, which were ascended by a bold flight of steps, and at the south end of the station there is a spacious covered carriage-way. Four lines of rails are carried into the station, two on each side of the platforms; whilst, in addition to these, on the east side, there is a long coal siding for this department of merchandise traffic, the line of country through which the new railway passes opening out a large and important area of the Lancashire coal-field which has not hitherto had the advantage of railway communication. The cost of this new station is 45,000*l.*

THE NINE-HOURS MOVEMENT.

At a meeting held at Manchester, on Tuesday, 23rd of January, of the representatives of the General Builders' Association, and of the builders' associations of Hull, Liverpool, Halifax, and other towns, the following resolutions were passed:—

"That it is desirable that some uniform time should constitute a week's work in the building trade throughout the country. In the opinion of this meeting, 54 hours a week in summer is a proper and not excessive time, and this meeting agrees to assist in carrying out such an understanding wherever the question may arise."

"That this meeting thinks it a duty to advise architects, surveyors, and others interested in the erection and maintenance of buildings, of the enhanced cost of building materials and workmanship, in many cases consequent on the reduced hours of labour and the increased rate of wages."

"That this meeting desires to express its opinion of the great value of the Act of last session as a means of protecting labour from trade-union tyranny. And that in view of the attempts being made to obtain the repeal of that Act, a circular embodying the views of builders be prepared, signed by the chairman of each association in the trade, and sent to every Member of Parliament immediately upon action being taken in the House of Commons."

At a special meeting of the London Builders' Society, held on the 29th ult., to consider the circular addressed by the operative stonemasons to their several employers, it was resolved—

"That, having carefully considered the request of the 'Operative Stone Masons' Society in London and District, to 'continue the nine hours' system all the year round' and 'to increase the rate of wages from 8*d.* to 9*d.* per hour,' the employers present are of opinion that any diminution of the hours of mason's work during the summer months is unnecessary, and would cause great inconvenience and public dissatisfaction. The present working-hours, as proposed by the Operative Stone Masons last October, and agreed to by the employers, do not exceed an average of fifty-four hours per week, all the year round."

"That the wages of all artificers employed in the building trades, including stone masons, have been increased three times within the last ten years, and there is no cause shown why a further advance should now be made, nor does the state of trade warrant any such step."

THE WORCESTER SCHOOL BOARD AND THE PLANS FOR NEW SCHOOLS.

Sir,—Would you be surprised to hear that the authors of the three selected designs for the above carry on business within eight miles of the "faithful city"? Also, would it further astonish you to know that there is reason to believe that the estimates for the three said designs emanate from a firm of builders whose father was personally thanked by his colleagues (members of the Board) for "educating" the said members of the Board as to the respective merits of the designs submitted?

DIES NON.

A BUILDER'S COMMISSION AS AN ARCHITECT.

In the County Court at Tunbridge, in the case of Dove v. Smith, which was an adjournment from the November court, the plaintiff was a builder of Tunbridge, and the defendant a grocer of the same place. Since the summons was issued, defendant died, but the executors' names were substituted. Mr. Crapps, for the plaintiff, stated that the action was brought to recover 17*l.* remuneration for services rendered to the late Mr. Smith. The evidence on the part of the plaintiff was to the effect that Mr. Smith and Mr. Anison (Mr. Smith's father-in-law), called upon the plaintiff, and Mr. Smith told him he was desirous of building a house similar to the one built for Mr. Anison, only with the addition of a bedroom. He inquired the cost, and plaintiff said he could not say unless he first prepared the quantities. He then told plaintiff to do this so that he might state the cost, and if he found he could build it for 900*l.*, he should have the job. He made out the quantities, and informed Mr. Smith he could do it for 850*l.*, and submitted the plans to him and Mr. Anison. The plans were regarded as satisfactory, but shortly afterwards circumstances transpired which induced Mr. Smith to leave Tunbridge for Maidstone, and on his return in the spring he inserted an advertisement inviting tenders for the erection of two houses on the site of the one the plans, &c., of which had been prepared by plaintiff who, therefore, had no remuneration for his services. Plaintiff said there was no written agreement; but a verbal contract was entered into that he should build the house for 850*l.* He might have acted for the whole amount of the contract, but he did not choose to be harsh. He only charged 2*per cent.* for taking out the quantities, but he was entitled to charge for the plans separately. Mr. Smith's evidence was taken by the Registrar of the Hastings County Court. It was to the effect that he had some conversation with the plaintiff about building a house. Mr. Anison produced the plans, and the plaintiff

said he would draw out a rough sketch, or words to that effect, of the alterations required. Plaintiff took away Mr. Amison's plans, and afterwards brought a sketch stating that he could build the house for \$500. He heard nothing further from the plaintiff until he received a letter from him enclosing his charges for commission, but plaintiff was simply asked to give an estimate, and not produce plans. Mr. Smith denied that he ever had any plans in his possession belonging to the plaintiff. If he had wanted plans he should have gone to an architect for them.

The Judge said the real point was whether plaintiff was instructed. If he was he ought to be paid. Mr. Warner, for the defence, submitted that if it had been necessary to get out plans and quantities the plaintiff himself took the trouble of getting the job done to do; and that Mr. Smith merely asked for an estimate, not supposing that the plaintiff would be put to any expense.

Mr. Amison, called for the defence, stated that the plaintiff was merely asked for an estimate. After the advertisement inviting tenders was published the plaintiff told witness that he would have nothing to do with the work because the plans had been prepared by a man named Allen (whose misfortune was that of having been reduced from the position of a Government architect to a journeyman carpenter). He understood that the late Mr. Smith had offered plaintiff 50, or any just sum.

His Honour thought, in the face of that offer, the late defendant intended to have paid the plaintiff. He should therefore give a verdict for 100, and the costs.

THE THANKSGIVING DAY AND WORKMEN.

Sir,—As it is proposed that the Day of Thanksgiving for the recovery of the Prince of Wales shall be a public holiday, and if workshops are to be closed, workmen must, of course, lose their day's work, which is a great hardship, and a matter for the authorities to consider whether it will conduce much to loyalty; will you not use your influence that it may be deferred until Easter Monday, when workshops are generally closed? Thus, if workmen would not lose an extra day's pay, but rather would be able to contribute some small thank-offering towards the decoration of St. Paul's or the funds of an hospital, and then there would be no chance of dismissal from loss of money occasioned by compulsory loss of work.

The question affects some thousands of workpeople. Persons whose salaries go on all the same whether they work or play, may not know that in the case of mechanics, and labourers, and many others, no work means no money.

J. H. BARNICOLENSKY.

ASPHALTE PAVING.

Sir,—Your attention, for humanity's sake alone, is invited to the annexed letter taken from the *Telegraph* of January 30th.* The same experimental description of roadways in Holborn, opened for traffic on August 1st, 1870, is now in such a condition, notwithstanding the constant repairs that have been made in it, as to necessitate its removal or entire reconstruction. Over this piece of road innumerable poor animals have fallen, and no less than sixteen poor horses have been killed upon it, as witnessed by one of the drivers of an Islington omnibus.

A more recent application of the same asphalt in the Walworth-road seems to have suffered much by the continuous rain, and large broken-up spaces are undergoing repair.

There is also a length of the same asphalt running through Leicester-square and Cranbourne-street, upon which innumerable horses have been seriously injured, so much so, that recently a large printed circular was posted in most of the shops-windows, calling a meeting of the parishioners to petition for its removal through the falling off of the business of the shopkeepers, orders having been known to have been given to coachmen not to pass over it, and policemen to have been stationed to warn drivers to pass steadily over it.

Apart from the want of durability in the material, it is painful in the highest degree to witness the sufferings of horses endure when they fall, as they are constantly doing upon the asphalt, many of which fall for the last time, as instanced frequently in Cheapside and Holborn. The climate of London is altogether too moist for the adoption of asphalt for roadways unless some new method of application can be devised.

A. B. C.

THE REPORT UPON THE LIVERPOOL EXHIBITION OF PICTURES.

The Fine Arts Committee of the Liverpool Corporation have reported the results of the late Autumn Exhibition of Pictures at the Free Library and Museum, and the report has been adopted by the Library and Museum Committee. The Exhibition was opened to the public from 4th September to 18th November during the day at a charge of 1s., and from 16th October to 18th November during the evening at a charge of 6d. The number of admissions by payments at the door amounted to 22,725, besides 313 season tickets, and about 6,000 pupils of educational establishments admitted gratuitously. The number of works exhibited consisted of 430 oil colours, 450 water colours, 18 pieces of sculpture, 10 other works of art, forming a total of 908. Of these, 852 were for sale, and 235 were actually sold for sums amounting

* Walking through Cheapside this day (January 29th), between twelve and one o'clock, I saw no less than seven horses down. One of these poor creatures had its off hind leg completely broken, the skin ripped asunder, and the bone protruding,—a most painful sight to behold. A misty rain had just commenced to fall, which rendered the surface of the asphalt as slippery as a sheet of glass or ice.

to 6,355l. 2s. 6d., of which pictures to the extent of 1,377l. were purchased by members of the Town Council, exclusive of 500l. expended by the Corporation in pictures for the permanent Gallery of Art now in course of formation. The total receipts amounted to 1,481l. 9s. 8d., leaving a profit of 600l. 6s. 8d. It is contemplated to devote the surplus of these exhibitions to the purchase of pictures for a permanent Gallery of Art. If, as seems probable, says the report, the popular taste can be thoroughly roused and stimulated by such exhibitions, public bodies may then feel themselves justified in employing painting as an adjunct to architecture, and a revival of fresco paintings in our municipal buildings may take place.

ADVERTISING FOR TENDERS.

CHELSEA.

In the Chelsea Vestry the following tenders for the construction of a sewer in Gile-place and Cook's-ground, King's-road (768 ft. in length, and 3 ft. 9 in. by 2 ft. 6 in.), were considered. Mr. Steegles, Napier-road, Kennington, 22s. Mr. Kello, Stanhope-terrace, Regent's-park, 45s. Mr. Pizzev, of Battersea, 46s. 1s.; Mr. Bloomfield, Tottenham, 70s.; Mr. Wigmore, Wilham-green, 749l. 19s.; Messrs. Brass & Son, Manor-street, Chelsea, 800s.; Mr. Wittick, 224; Mr. Hubbard, 780s.; Mr. Neave, 766l. Mr. Davidge called attention to the fact that the lowest tender was 399l. 18s., and the highest 800l. Mr. Fisher proposed to accept the tender of Mr. Neave, and Mr. Symons seconded. Mr. Kingsbury thought the vestry should be consistent. When it was proposed to advertise in the local papers, it was suggested such a course would be found needless, as it would be sufficient to write to builders in the parish; but the vestry decided to advertise in other papers, and he would move to take the tender of Mr. K. Kello. This being put, ten voted for it, and ten against it. The chairman called for a division—for the amendment; 9, against it, 11. Mr. Neave's tender was accepted.

Books Received.

Sun Pictures. With Descriptive Letterpress. London: Sampson Low & Co. 1872.

UNDER this title we have twenty reproductions by the Heliotype process, of specimens of different branches of ancient and modern art,—oil painting, engravings, and sculpture. By this process mounting is superseded,—an important point in book illustration,—and permanence secured. Of the merit of some of these reproductions,—the Vandeyck portrait, for example,—we spoke when they originally appeared in *Art*. The collection makes a most charming volume, and is appropriately dedicated to H.R.H. the Princess Louise, whose elegant crayon "Portrait of a Canadian Lady" is the subject of one of the illustrations. "The Jeweller of St. Petersburg," by Mr. W. Cave Thomas, is one of the most striking prints in the book.

The City of London Directory for 1872.

Collingridge, "City Press" Office.

We gave our praise to the first issue of "The City of London Directory," and find it even more fully justified by the second, now before us. The work has been revised from information obtained by house-to-house call, and the corrections and business changes at Christmas are noted. It includes a good map of the City, on which the improvements during the year are marked. The lists show that there are within the City boundaries 270 architects and 366 surveyors. Prodigious! The list of surveyors, however, includes, of course, some of the names in the other list.

Examples of English Medieval Folio, taken from Buildings of the Twelfth to the Fifteenth Century. By JAMES K. COLLING, F.R.I.B.A. London: Published by the Author, 150, Hampstead-road.

THE previous work by Mr. Colling, "Art Folio," in which he gives an analysis of geometric forms, with a series of original designs for ornate enrichments, as well as studies from natural foliage, is well known and esteemed. In the present work he proposes to give a carefully-selected series of actual examples of art folio, drawn from English Medieval buildings, "to illustrate the most successful treatment of the various types of conventionalised natural forms in sculpture and painting," and he proposes to arrange them so as to show the progress of ornamentation and decoration. The first part, now before us, contains twenty plates, and gives promise that the author's programme will be well carried out.

Tables for Platelayers. By WILLIAM DONALDSON, M.A., A.I.C.E. London: Spion.

THESE tables are compiled from the formulae of the work on "Switches and Crossings," by the same author, and lately noticed in our columns. The tables, relating to various gauges, single and mixed, are preceded by an explanation. The volume must be a useful one to platelayers: it is cases in stout boards, and can be opened without breaking the back of the book, which is what cannot be said of every volume nowadays.

VARIORUM.

CASELLI'S "Illustrated Travels" for February thus sketches Salonica.—"As the bottom rowed us to the shore the charms of the panorama which we had been contemplating gradually disappeared; instead of the whitewashed walls, the towers, and the evergreens, we were struck with amazement at the desolate aspect of this once famous town, and the miserable appearance of its inhabitants. The two colossal towers which stand on the beach are queer specimens of military architecture; their bases are of cyclopean proportions, but their casemates are made of a strange composition of broken columns, stones, bricks, and mortar, all hashed up together. Their embrasures, and the guns inside them, were very shabby indeed; they looked as tame and harmless as the jaws of an old lion who has not a tooth left to bite with would be."—A new edition of Broc Hartley's "Luck of Nonring Camp, and other Tales," will shortly be issued by Messrs. Routledge & Sons, with two additional papers, not hitherto published in England, and with an Introduction and "Cossiping Glossary," by Tom Hood.—The current number of the *Leisure Hours* says to some relics of James Watt,—"We learn from James Gibson Watt, esq., the great-grandson of the immortal inventor, that some most interesting relics of Watt are still at Heathfield, in the very room next his bedroom, in which he worked till within a few weeks of his death, and which it would seem has never been entered since then, save on one or two very special occasions: there stands the lathe at which he was last at work, covered with chips; his tools, many of them his own inventions, just as he left them; his copying or diminishing machine, and some little works of art which he left unfinished. Watt's 'Parent Engine,' the improved 'Newcomen' or 'fire-engine' of the old pattern, and the 'Sun and Planet' engine, which contains the germ of all modern improvements except the crank, are in the South Kensington Museum, and are among the most precious things in the whole collection; other valuable relics of Watt are there also, and there Mr. James Watt tells us the relics now at Heathfield may eventually be deposited."—*Old Merry's Monthly*, illustrated (Warne & Co.), is a magazine quite after a boy's own heart.—*The Family Friend* (Partridge & Co.) and *The Children's Friend* are both remarkable for the goodness of the woodcuts with which they are illustrated, at an almost nominal price.—"The Perpetual Cross Calendar." By C. J. Recordon, B.A., of Pembroke College, Cambridge. Tribner & Co., London." The object of the author of this calendar has been to reduce the complete calendar of each year to its smallest possible compass. Each of the fourteen accompanying diagrams can be cut out, pasted on board, and hung up for ordinary use. It can also be engraved on a sufficiently small scale, in order to be placed in a watch-case. It could be applied to one of the faces of a church-tower. In this case the calendar should be made movable, so that every year the order might be changed to suit the case: thus a perpetual public or tower calendar would be secured.—"The Prince's Illness: its Lessons. A Lecture on the Prevention of Disease." By B. W. Foster, M.D., Birmingham. Churchill, London." This lecture was delivered to a popular audience in Birmingham last December. It is intended to show how greatly zymotic diseases may be diminished by simple sanitary precautions. There is nothing particularly new in it, but repetitions is desirable.—"The Drama in England" is treated of in the current *Quarterly*, and makes a very interesting article. The writer warmly advocates the scheme we have at heart for the establishment of a theatre in London not wholly dependent on the popular taste of the hour and where intellectual stimulus and refreshment may be looked for,—a theatre commensurate with the culture of the age. The writer takes the same view as to the *modus operandi* as was taken by Mr. Godwin in his initiatory observations on the subject, and thinks such

a theatre might be founded by means of a *guarantee* similar in principle to that under which our two Great Exhibitions were constructed.—Mr. J. W. Anson's little "Dramatic Almanack for 1872" includes some "Reminiscences of Asley's." The Graphotyping Company ought to be able by this time to do something better than the portrait of the editor given in the Almanack.—We have received a copy of Mr. E. M. Barry's pamphlet in reply to Mr. Street's statement, but too late for consideration this week.

Miscellaneous.

Mr. E. M. Ward's "Luther's First Study of the Bible."—We are glad to hear that an endeavour is being made to purchase, by subscription, this fine and interesting picture, exhibited at the Academy in 1869, for presentation to the British and Foreign Bible Society. A committee is now at work for promoting the object; it contains the names of numerous gentlemen whose influence, it may be hoped, will do much towards bringing the matter to a successful issue. Included in the list we find Sir Thomas Gabriel, Messrs. G. Moore, W. Leaf, W. Morley, F. Bennock, J. and F. Battam, A. Holtz, W. F. White, T. Walker, W. S. Silver, S. R. Ward, J. M. Stead, Major-General White, Colonel Worsley, Captain Bedford Pim, R.N., Rev. Josiah Pratt, Rev. F. C. Lloyd Jones, Rev. W. Windle, Rev. J. V. Povah, and others. The price of the picture is 1,000*l.*, of which one gentleman, by his own individual efforts, has succeeded in obtaining 200*l.*; and the artist himself presents a similar sum to the society. We sincerely hope the whole amount will soon be collected, and that the picture will thus find an appropriate home. Members of the society should interest themselves in it.

Wooden Pavement.—By the sanction of the Commissioners of Sewers a new principle has been lately introduced, and is now on its trial at the south end of Bartholomew-lane. The pavement is constructed of wood. It is laid on a bed of sand, of sufficient depth to form a good grade, say from 1 in. to 2 in.; on that a flooring is placed, which consists of two thicknesses, one laid horizontally, the other transversely, each thickness consisting of a $\frac{3}{4}$ in. board, prepared with tar. Upon these boards blocks of wood measuring 9 in. by 3 in. by 5 in. are placed, and between each row of blocks a strip of wood 1 in. by $\frac{3}{4}$ in., is nailed to the flooring, the object being to steady the blocks in their places during construction; after being thus laid, the spaces or joints are filled with hot gravel, upon which hot tar or pitch is poured. This is rammed tight home, and again repeated until the spaces are filled up. Subsequently another application of tar is made over the surface, on which a dressing of fine gravel is thrown: when dried the pavement is complete.

The Genius of Michelangelo.—Hawthorne, in his "Notes," says, speaking of the statues by Michelangelo on Giuliano de Medici's tomb in St. Lorenzo at Florence,—"The statue that sits above these two latter allegories, Morning and Evening, is like no other that ever came from a sculptor's hand. It is the one work worthy of Michelangelo's reputation, and grand enough to give him credit for; and yet it seems a simple thing enough to think of or to execute merely a sitting figure, the face partly overshadowed by a helmet, one hand supporting the chin, the other resting on the thigh. But after looking at it for a little time the spectator comes to think of it as a marble statue; it ceases to life, and you see that the princely figure is brooding over some great design, which, when he has arranged it in his own mind, the world will be fain to execute for him. No such grandeur and majesty have elsewhere been put into human shape. It is all a miracle,—the deep repose, and the deep life within it. It is as much a miracle to have achieved this as to make a statue that would rise up and walk."

Dyson's Diamond Stall Plates.—The "Diamond Stall Plates," for shop-fronts, registered by Messrs. Dyson & Co. have advantages of their own. The letters are silvered by a patent process on a bronze plate, and they require less cleaning than some other plates do.

Technical Education and the Nine Hours Movement.—On Monday evening a large public meeting of cabinet-makers, carvers, and chair-makers, was held in the Motley-street School-room, Shoreditch, for the purpose of establishing drawing-classes in connexion with the department at South Kensington. Mr. Benjamin Lucraft (of the London School Board), occupied the chair. He said that one of the largest employers of labour in the trade had voluntarily reduced the hours of labour to 52 hours a week, and he had not the least doubt but the nine hours movement would become general. He urged the importance of young men turning this leisure to their own educational advancement, so that men should not say a reduction in the hours of labour had only given them more time for drinking and idle amusements. Mr. Buckmaster then addressed the meeting on the advantages which a knowledge of drawing gives to working men. Several working men spoke in favour of the establishment of drawing-classes; a large number gave in their names; and classes will be commenced at once.

The Royal Historical and Archæological Association of Ireland.—The annual meeting of this association (originally the Kilkenny Archæological Society) was held Jan. 17, the Mayor in the chair. The Rev. J. Graves, hon. sec., read the report of the committee for the past year, after which it was unanimously resolved,—“That, in order to improve the museum and library of the society, and to render it more interesting to the public, subscriptions be requested from the gentry of the county and the citizens of Kilkenny, for the purpose, particularly as it is the intention of the committee to open the institution to the public; also that a sub-committee be appointed to carry out the necessary arrangements.” It was arranged that the sub-committee consist of the Rev. Mr. Graves, and Messrs. Prim, Robertson, and J. L. Ryan. The treasurer reported favourably on the financial condition of the association. Twelve new members were elected, and two members advanced to fellowships. Various presentations were made, and interesting objects exhibited.

Public Park for Ashton.—A few months ago Mr. H. T. Darton, solicitor, purchased the Highfield estate, on which is erected a large mansion. The house and grounds cost 16,000*l.* Wishing to promote the establishment of a public park for the inhabitants of Ashton, Stalybridge, Dukinfield, Mossley, and the neighbourhood, Mr. Darton offered the whole estate to the public for 2,000*l.* The late Mr. Samuel Oldham has already bequeathed a sum of 7,000*l.* to maintain a public park, and Lord Stamford came forward and offered to forego the chief rent on the Highfield estate, amounting to 131*l.* per annum, if it was converted into a place for the recreation of the working classes. A number of subscriptions were collected. Lord Stamford has now further offered also to give twenty-four acres of adjoining land absolutely, on the condition that a sum of 10,000*l.* be raised by public subscription during the present year for the purpose of buying Mr. Darton's interest and laying out the park and communitations.

Demolition of Radley's Hotel, New Bridge-street.—This well-known establishment in New Bridge-street, Blackfriars, is about to be taken down, and buildings of another character erected on the site. An announcement of the sale of the materials of the building has for some time been before the public, and the sale was to have taken place on Tuesday last, at one o'clock, at which hour there were not less than from 250 to 300 persons present connected with the building trade. When, however, the auctioneer, Mr. Glaisher, made his appearance, he somewhat surprised the company by the intimation that he had been desired at the last moment, by the Governors of the Bridewell Hospital, to postpone the sale for a month, in consequence of unforeseen arrangements in connexion with the Queen's visit to the City on the approaching Thanksgiving-day. After the display of some little opposition, the postponement was ultimately agreed to.

Clerk of Works for the Sheffield School-board.—Mr. W. H. Parsons has been appointed clerk of works to the Sheffield School-board, at a salary of 2*l.* 12*s.* 6*d.* per week, subject to one month's notice on either side, and that he be required to devote the whole of his time to his duties, under the direction of the surveyor to the Board.

Market Accommodation in the City.—At a recent meeting of the Court of Common Council the Markets Improvement Committee brought up a report as to the best mode of utilising the vacant land at the western end of the Metropolitan Meat and Poultry Market, in Southfield, and on the northern and southern sides of Charterhouse-street, and submitted designs and estimates for the erection of an additional market on that site at an estimated expense, exclusive of the value of the land, of 87,500*l.* The consideration of the report, was postponed, in order that it might be circulated among the members, but it will most likely be discussed at the next meeting.

The Lyons Exhibition.—On Monday a committee meeting was held at the Mansion-house, under the presidency of the Lord Mayor, for the purpose of considering the best means to be taken to insure the proper representation of the United Kingdom at the International Exhibition of Agricultural and Industrial Products and Works of Art, to be held at Lyons from May to October next. It was announced that the Minister of Agriculture and Commerce, under whose patronage the Exhibition was to be held, had promised that the French Government would furnish the medals to be awarded by the international juries, and that the committee of organisation at Lyons would defray the expenses of the London committee to the extent of 6,000 francs.

A Group of Sculpture for Ober Ammergau.—A letter from Munich says that the King of Bavaria, who was present last autumn at the representation of the Passion Play at Ober Ammergau, has determined to erect on the Pelberg, above Kefel, which commands the entire district, a colossal group in marble representing Christ at the moment when he said, "Behold thy mother," "Behold thy son." The execution of this group has been entrusted to Professor Falbig. The figures are to be 10 ft. or 11 ft. in height, and the height of the whole group will be from 36 ft. to 40 ft.

Extensions at the Blackfriars Metropolitan Railway Station.—During the present week alterations of an extensive character, which commenced a few days ago, have been going forward at the Blackfriars Station of the Metropolitan District Railway. We understand that the upper portion of the station, above the booking offices, is intended to be applied to the purposes of an extensive hotel or restaurant, and with this view three stories above the present ground floor of the station are now in course of erection extending to the entire length of the existing structure.

Coating with Zinc.—According to M. Böttger, copper or brass may be given a firmly adherent zinc coating, by the following method: Finely divided or powdered zinc, in a non-metallic vessel, is covered with a concentrated sal-ammoniac solution; this is heated to boiling, and the articles of copper or brass, properly cleaned, are introduced. A few minutes suffice to produce a firm and brilliant coating. The requisite fineness of the zinc is produced by pouring the molten metal into a mortar and triturating the same until it solidifies.

The Cathedral Restoration, Chichester.—This work still goes on. The Lady Chapel is completed, with the exception of the paving and carving of the bosses, &c., of the sedilia and piscina. It is understood that the paving, which is to be of a handsome pattern, is in the hands of the manufacturer. The chapel, when completed, will probably be used for the early morning service of the Theological College. The latest work undertaken is to pave the south transept with Portland stone and Purbeck marble.

Argyll-street Galleries.—A considerable suite of rooms in Argyll-street, Regent-street, has been opened as a "permanent exhibition of pictures," with a view to sale. The collection includes the large painting by Jacques Louis David,—“The Coronation of the Emperor Napoleon Bonaparte in the Cathedral of Notre Dame.” Mr. W. Harris is one of the secretaries.

The Joiners and Technical Education.—The Joiners' Company has placed at the disposal of the Birkbeck Literary and Scientific Institution, Southampton-buildings, three prizes for the encouragement of technical education.

The Invention of Steel Pens.—Mr. Henry Mitchell writes to a Birmingham contemporary:—The remarks which have appeared in the local papers upon the death of Mr. Joseph Gillett, that "the adaptation of machinery to the manufacture of metallic pens" was his invention, lead the public to wrong conclusions. It is due to the memory of my late father, John Mitchell, that I should state that he not only made steel pens, but used machinery in their production, for some time before Mr. Gillett commenced in that branch of business.

Material for Roofing.—According to the invention of Mr. J. Erichsen, of Copenhagen, best quality pasteboard is boiled in anhydrous coal-tar, limmer asphalt, powdered silicate of soda and potash, and liquid flint, or other silicious soluble earth. It is then passed through rollers, then sanded, and then rolled again. When fastened to the boards it is coated with Erichsen's India mastic, consisting of anhydrous coal-tar, limmer asphalt, Portland cement, Farnham rock, or other soluble silicious earth, all boiled together and well stirred.

Opening of an Oddfellows' Hall, Bristol.—The erection of the Oddfellows' Hall in Rupert-street is completed, and its opening has been celebrated by a banquet in the new building. The hall has cost, including the money paid for the site, about 2,000l. It has been erected from designs by Mr. Harford, of Lower Ashley-hill, the builder being Mr. James P. Stephens. The style is Italian, and the material used in the exterior work Pennant stone, with freestone dressings. The building is an ornamental one, and is to be used for lodge meetings and other purposes.

A Deep-water Dock for Hartlepool.—A deputation from the Hartlepool Port and Harbour Commissioners attended the last fortnightly meeting of the North-Eastern Railway directors, at York, for the purpose of pressing upon them the immediate necessity of affording increased dock, quay, and railway accommodation for the Hartlepoons, particularly the urgent necessity for a deep-water dock. The chairman of the Board informed the deputation that the directors are willing to carry out the entire scheme as proposed by their engineer.

The London Carpenters.—A preliminary meeting of the carpenters of London was held on Wednesday in last week, at which it was resolved to call an aggregate meeting of the trade to consider the propriety of memorialising for the nine hours system, to commence from the 1st of July; the notice thus to expire at the same time as that of the masons, so that if there is a strike or lockout they may not have to undergo the inconvenience of two agitations in the building trades at different times.

New Docks at Milford Haven.—A movement has been started for the purpose of constructing docks at Milford, of such a size as will provide accommodation at neap-tides for a class of vessels similar to the new steamers belonging to the National Steamship Company. It is stated that vessels of this class could make to New York two more voyages per annum from Milford than from Liverpool. The cost, as estimated by Mr. Hamilton Fulton, the engineer, is about 600,000l.

St. James's Park.—Rumours are again rife with respect to an intended encroachment by the Government on the grounds of the St. James's Park. It is said, that in order to construct the new Admiralty and War Offices, necessitated by the changes which the present Administration has effected, the Government propose to take a slice off the park, near where the wooden cannon stands, in the rear of the Horse Guards.

Brampton New Workhouse.—A considerable time has now elapsed since the guardians purchased a small field whereon to erect a new workhouse and the usual adjuncts. Plans were advertised for, and the most approved set for the inspection of the Poor Law Board in London. The central authority suggested a few alterations, and these having been completed tenders will soon be invited for building.

Thanksgiving-day in St. Paul's.—The tradesmen of Ludgate-hill have resolved upon joint action with a view to decorate that thoroughfare in a manner worthy of the occasion on the approaching visit of her Majesty to St. Paul's. They should obtain the best available artistic advice.

The Savoy Chapel, London.—A painted window, which has for the last few weeks been in course of construction at the Chapel Royal, Savoy, has been opened. The gift is an anonymous one, the donor, however, being a member of the congregation. The window is situated on the north side of the church, and is divided into six compartments, the upper three representing the birth, and the lower the baptism of Jesus. The window is the work of Messrs. Clayton & Bell, of Regent-street, and makes the fifth painted window presented to the chapel, that in the east being the gift of her Majesty; and it is expected that a sixth will shortly be erected.

Sale of the Grosvenor Mansions.—The large building known as the Grosvenor Mansions, situate in Victoria-street, Westminster, let out in suites of chambers, &c., producing a rental of 3,000l. per annum, was sold by auction, by Messrs. Chinnock, Galsworthy, & Chinnock, on the 25th January, and realised the sum of 19,500l.

Mr. Scott.—Mr. George Gilbert Scott, jun. M.A., has been elected a Fellow of Jesus College, Cambridge. Mr. Scott is a son of Mr. George Gilbert Scott, architect. He graduated in 1866 as senior in the Moral Science Tripos. In 1868 he obtained the Burney Prize. In 1870 and 1871 he acted as one of the examiners for the Moral Science Tripos.

The Vienna Exhibition, 1872.—The pilv-driving for the foundation is proceeding rapidly, sixteen rams being at work, and having fixed 224 piles in one day. Tenders will be received shortly for the carpenters' work, constituting the skeleton of the Palace, the Arts Exhibition, the Commissariat, the telegraph, post, &c.

Victoria Park.—The Government has consented to an agreement with the Metropolitan Board of Works, by which the thirty acres of Victoria Park which were in jeopardy will now be secured to the use of the public.

The Public Hall, Dorling.—The works are being pushed on by the contractor. The large hall is almost ready for the roof. The alterations to the existing building are also being rapidly executed.

Newspaper Press Fund.—The annual general meeting of this institution will be held on Saturday, the 24th inst. The Duke of Argyll will preside at the anniversary dinner, on the 11th of May.

Town Tramways for Sheffield.—The Sheffield Town Council have resolved to construct street tramways on their own account, the offer of a private company having been rejected.

Society of Female Artists.—The annual exhibition of works by female artists will be opened to the public on Monday, the 5th inst.

The Royal Academy.—Sir John Gilbert and Mr. Richard Norman Shaw have been elected associates of the Royal Academy of Arts.

The Leominster and Kington Line at Presteign.—The contract amount, we are told, is 30,000l., not 23,000l.

Erratum: the "Standard" Office New Buildings.—We are informed that Messrs. Jackson & Shaw were the contractors for the work, and not Mr. John Anley.

TO SEWAGE FARMERS and OTHERS. The Local Board of West Derby REQUIRE a competent person to SUPERINTEND the LAYING OUT of their SEWAGE FARM at Fazakerley, near Liverpool, in accordance with the plans of the Board's Engineer and Surveyor. Applicants must give particulars of their experience, previous engagements, and salary required. Written applications to be sent in before SATURDAY, the 10th prox.—By order, RADCLIFFE & LAYTON, Clerks to the Board. Public Office, Green-lane, The Brook, near Liverpool, 26th January 1872.

COUNTY of SOMERSET.—AXBRIDGE HIGHWAY BOARD.—26th and 30th Yc. 6*d.* DISTRICT SURVEYOR.—The Highway Board of the District of Axbridge are desirous of receiving APPLICATIONS from Persons fully competent to undertake the duties of SURVEYOR, as required by the said Act. The salary fixed at 200*l.* per annum, which is to include house-rent, travelling, and other personal expenses rendered necessary in the performance of the duties. No assistance will be allowed by the Board. The person appointed will be required to keep the accounts, as laid down by Act of Parliament; to devote his whole time to the duties of his office; and to hold the security of the Oathes Society to the amount of 500*l.* The district comprises thirty-eight parishes, the town of Axbridge being nearly in the centre, where the Surveyor will be required to reside. The farthest part of the district from the town is about 9 miles, and the public roads are estimated at 57 miles or thereabouts, exclusive of footways. Applications, accompanied by testimonials of character, capability, &c. must be sent to the Clerk, by post, on or before the morning of the 14th day of FEBRUARY, and one notice will be given to any candidate whose attendance may be required. None but experienced Surveyors need apply. For any further information apply to J. W. BENNETT, Clerk to the said Board. Dated, Axbridge, 25th January, 1872.

TO ARCHITECTURAL ASSISTANTS
WANTED, for a Permanency, in Yorksire, an ASSISTANT, well qualified in all classes of design, details, and specifications. Address, stating age, salary, references, &c. to B. G. Post-office, Huddersfield.

UPHOLSTERER'S FOREMAN
WANTED.—Age, experience, salary, and general particulars, to be stated by letter to C. H. S. 143, Oxford-street, W.

TIMBER TRADE.—WANTED, an active, energetic Man, as TRAVELLER. State last engagement and salary required.—Address, Messrs. WELLS & HARE, Timber and State Merchants, Chatham.

TIMBER TRADE.—WANTED, by a Young Man, with over seven years experience in the wholesale and retail timber trade, a RE-ENGAGEMENT as CLERK. First-class references and testimonials.—Address, J. W. & Co., Kempford-square, Richmond-road, West Norwood, S.W.

TO ARCHITECTS ASSISTANTS
REQUIRED (temporarily) a first-class DRAUGHTSMAN and expeditious practical ASSISTANT, especially skilled in the planning and design of country mansions in the Italian style. He will be needed for any gentleman to apply who cannot to the fullest extent meet all the above requirements.—Address, stating age, terms, experience, and full particulars, to 559, Office of "The Builder."

TO EMPLOYERS OF SKILLED LABOUR.—Several WORKING PROFESSIONAL MEN, refugees from Paris, seek EMPLOYMENT, as Architects, Draughtsmen, Civil Engineers, Painters, Decorators, Sculptors in bronze and marble, Electricians, Gasfitters, Plumbers, Plumbers, Tanners, Dyers, Brass, Bronze, and Copper Moulders and Moulders; Copiers, Sculptors, Profoundly of Languages, &c. and others. Full names and addresses of any of these, apply to H. F. JUNG, Watchmaker, 4, Charles-street, Clerkenwell, E.C.

TO GAS AND HOT-WATER ENGINEERS, BELLHANGERS, &c.
WANTED, by a practical Man, a SITUATION as above. Can take charge of a small or large job. First-class references.—Address, A. D. 15, Great Pultney-street, Regent-street, W.

WANTED, by a BUILDERS CLERK, aged 25, a RE-ENGAGEMENT. Well up in office work, book-keeping, and the different treatments of accounts, &c. Been used in the general management of building operations, which he would fill up time in shop if required. 30s. per week. Good references.—Address, H. 25, Ash Grove, Barking, E.

WANTED, by a CLERK of WORKS, a RE-ENGAGEMENT. Can be strongly recommended by the highest architectural references for ability and character, and has lately made important discoveries in Building Appliances, which have already been adopted by a large number of architects. Most accurate technical testimonials.—Address, 389, Office of "The Builder."

TO GASFITTERS, &c.
WANTED, by a Young Man, a SITUATION for Permanency, as GASFITTER and BELLHANGER, and all kinds of Jobbing. Moderate wages required.—Address, F. A. 355, King's-road, Chelsea.

TO PLUMBERS and BUILDERS
WANTED, by a Young Man, a Constant SITUATION as PLUMBER and GLAZIER. No objection to fill up his time in painting. Well up in closet work.—Address, T. G. Blenheim-street, Colchester, Essex.

TO CARPENTERS, BUILDERS, &c.
WANTED, by a Young Man, a Carpenter, of special character, a SITUATION, either in the Office, or at the Bench. He is a good penman, expeditious at accounts, and conversant with plans, specifications, &c. Can set out work with accuracy. Age 24.—Address, E. 39, Gray-street, Welber-street, Blackfriars-road, S.E.

TO ARCHITECTS AND SURVEYORS
WANTED, by the Advertiser, an ENGAGEMENT in an Architect's or Surveyor's Office in London. Has a knowledge of surveying and designing.—Address, M. H. Post-office, Dulwich, S.E.

TO BUILDERS AND FOREMEN
WANTED, by the Advertiser, aged 25, EMPLOYMENT in a good CARPENTER and JOINER'S SHOP. Town or country. Wages moderate.—Address, A. D. No. 7, Great Chesterfield-street, Marylebone.

TO ARCHITECTS AND SURVEYORS
WANTED, by the Advertiser, aged 19, an ENGAGEMENT in an office of the above. Four years' experience under articles.—Address, A. F. E. 10, Quaker, Architectural Association, 5, Conduit-street, Regent-street, W.

TO LANDLORDS AND OTHERS
WANTED, by the Advertiser, a PERMANENT SITUATION as COLLECTOR, and to SUPERINTENDENT HOUSE REPAIRS. Dependable references.—Address, A. R. 119, Old-road, Barnsbury.

TO BUILDERS AND ARCHITECTS
WANTED, by the Advertiser, who has just completed a large job, a SITUATION as GENERAL FOREMAN, or CLERK of WORKS. First-class testimonials. Joiner by trade. No objection to the country.—Address, S. M. 63, Camberwell-road, S.E.

TO PLUMBERS, GASFITTERS, and BUILDERS
WANTED, by the Advertiser, a SITUATION as IMPROVER to the above trades. Has also a knowledge of painting and glazing, having been three years on a large public building. Wages moderate.—Address, T. R. New Assizes, Hereford.

WANTED, by the Advertiser, aged 21, a SITUATION, as ASSISTANT CLERK in a large Builders' Office in London. Has had six years' experience in the office, and the last thirteen months in the office, where the highest references can be obtained. Can take out quantities, process drawing, &c. and show specimens.—Address, C. 27, George-street, Portman-square.

TO BUILDERS AND OTHERS
WANTED, by a thoroughly practical Man, a SITUATION as WORKING FOREMAN of PAINTERS. Can do graining if required. Unexceptionable testimonials. No objection to town or country.—Address, A. 2, Denmark-road, Kilburn.

WANTED, by a thoroughly practical Man, a Carpenter, Joiner, and Strainer, South Lambeth, a RE-ENGAGEMENT as a BUILDERS' FOREMAN, or CLERK of WORKS. Good references.—Address, H. A. 27, Thurloe-road, South Lambeth.

TO BUILDERS AND CONTRACTORS
WANTED, by a thoroughly practical Man, of twenty years' experience, a RE-ENGAGEMENT as AGENT or GENERAL FOREMAN. Five years with present employer. First-class references.—Address, C. P. care of Mr. Green, Architectural Carver, 74, Lancaster-street, Borough-road, S.E.

TO BUILDERS, CONTRACTORS, and OTHERS
WANTED, by a thoroughly practical Man, an energetic Man, BRICKWORK CUTTING or POINTING, by the Piece, or a SITUATION as Foreman of Bricklayers, or Clerk of Job. Thoroughly acquainted with drawings and setting out work. Good references.—Address, A. B. Boxer House, Southgate-road, Ilford, N.

WANTED, by a thoroughly practical Man, aged 26, Carpenter and Joiner by trade, a RE-ENGAGEMENT as GENERAL FOREMAN (out-door). Town or country. Twenty years' good London experience. Just now completed a five year job. First-class testimonials from last employer.—Address, W. H. 34, Borough-road, Southwark, S.E.

WANTED, by a thoroughly practical Man, a RE-ENGAGEMENT as GENERAL FOREMAN. Town or country. Carpenter and Joiner by trade. Twenty-five years' good London experience. Seven years' first-class testimonials from last employer.—Address, W. H. 34, Borough-road, Southwark, S.E.

WANTED, by a thoroughly practical Man, a RE-ENGAGEMENT as GENERAL FOREMAN. Town or country. Carpenter and Joiner by trade. Twenty-five years' good London experience. Seven years' first-class testimonials from last employer.—Address, W. H. 34, Borough-road, Southwark, S.E.

WANTED, by a thoroughly practical Man, a RE-ENGAGEMENT as GENERAL FOREMAN. Town or country. Carpenter and Joiner by trade. Twenty-five years' good London experience. Seven years' first-class testimonials from last employer.—Address, W. H. 34, Borough-road, Southwark, S.E.

WANTED, by a thoroughly practical Man, a RE-ENGAGEMENT as GENERAL FOREMAN. Town or country. Carpenter and Joiner by trade. Twenty-five years' good London experience. Seven years' first-class testimonials from last employer.—Address, W. H. 34, Borough-road, Southwark, S.E.

WANTED, by a respectable married Man, a GENERAL HAND in the GRAINING, PAINTING, and PAPERHANGING branches. EMPLOYMENT as WORKING FOREMAN, or others, or would take the work of a Builder piecework.—Address, H. E. Post-office, Basingstoke.

TO BUILDERS AND CONTRACTORS
WANTED, by a practical BRICKLAYER, a RE-ENGAGEMENT as WORKING FOREMAN. Thoroughly understands plans and setting out, or by the Rod, Gauge-work, or Painting, piecework. Two years and a half with last employer. No objection to a country job. Good references. Age 22.—Address, J. V. & Albert-gardens, Kilburn.

TO ARCHITECTS AND SURVEYORS
WANTED, by a good DRAUGHTSMAN, ASSISTANT. Can prepare designs from rough sketches; perspective drawings. Good colourist and penman. Four and a half years' experience. Unexceptionable references.—Address, W. G. E. No. 2, Lowndes terrace, Knightsbridge, S.W.

TO BUILDERS AND CONTRACTORS
WANTED, by a sober and energetic Man, a RE-ENGAGEMENT as GENERAL FOREMAN of WORKS (bricklayer by trade). Has had charge of several extensive public and private jobs. First-class references, and seven years' good testimonials from last employer.—Address, H. L. 2, Amber's-cottages, Cuscuton-road, Croydon.

TO ARCHITECTS
WANTED, by a good ARCHITECTURAL DRAUGHTSMAN, of seven years' experience, a RE-ENGAGEMENT. Well up in Office Drawings, &c. Good references. Terms moderate.—Address, 770, Office of "The Builder."

TO PLUMBERS and BUILDERS
WANTED, by a first-class PLUMBER, a SITUATION or JOB. Good references if required.—Address, E. CARTER, 96, Dayham-street, Camden-town, N.W.

TO BUILDERS AND CONTRACTORS
WANTED, an ENGAGEMENT, by a thoroughly qualified DAY CLERK. Neat and expeditious penman, quick at accounts, and accurate at cubing, squaring, and assisting generally. Good reference. Practically acquainted with the trade. Age 22.—Address, 271, Post-office, Red Hill, Surrey.

TO BUILDERS AND CONTRACTORS
WANTED, a RE-ENGAGEMENT, in a London ARCHITECTS OFFICE. Perspective, detail, working, contract, and specification drawings, and usual office duties. Fair colourist.—Address, N. Y. 4, Fitzland-place, N.W.

TO ARCHITECTS AND SURVEYORS
WANTED, a RE-ENGAGEMENT, by a Young Man, in a neat draughting office. Can prepare drawings from rough sketches, and assist in taking out quantities.—Address, S. R. 30, Arlington-street, Regent's Park, N.W.

WANTED, a RE-ENGAGEMENT, as SHOP FOREMAN, OUT-DOOR FOREMAN, or CLERK of WORKS, by a thoroughly practical London Builder's Foreman. Joiner and Strainer, well up in draughting, and well up in piecework and machinery of all kinds. No objection to fill up his time in the office. First-class testimonials from Architects and Builders.—Address, H. K. 41, Matilda-street, Cuckfield-road, N.

TO ENGINEERS or CONTRACTORS
WANTED, a RE-ENGAGEMENT, as CLERK, or INSPECTOR of WORKS, or GENERAL FOREMAN. Has been employed upon large works, having just completed a large contract in the City. With first-class references from last and previous employers.—Address, R. H. 8, Great New-street, Fetter-lane, Holborn, E.C.

TO PLUMBERS or GASFITTERS
WANTED, a SITUATION, in Town or Country, by a respectable Young Man, aged 20, as IMPROVER. In the above trade, to a good master. References of three years' standing.—Address, G. F. 25, Colledge-street, Chelsea, S.W.

TO BUILDERS, SURVEYORS, and OTHERS
WANTED, a SITUATION, by a practical CLERK, aged 25. Is well acquainted with estimating, quantities, measuring bills, and keeping accounts.—Address, A. R. 171, Blackfriars-road, S.E.

TO BUILDERS, CARPENTERS, and OTHERS
WANTED, a SITUATION, by a good CARPENTER and JOINER. Highest References. Wages moderate.—Address, G. R. 26, Joseph-street, Burdett-street, Bow, E.

TO BUILDERS AND CONTRACTORS
WANTED, a SITUATION, as CLERK, capable of managing a branch contractor. Has just completed an engagement with a first-class contractor as assisting agent.—Address, A. B. C. 5, Villie on the Heath, Hammersmith, N.W.

WANTED, a SITUATION, by an experienced Man in STAIRS, SHOP-FRONTS, Boxing Shutter, Slashes, and Frames, the Building Alterations, and the care of his own country job. Can make out working drawings and estimate up work. Wages 6d. per hour. Age 50.—Address, T. T. 19, New-street, Kensington-part-road.

TO BUILDERS AND CONTRACTORS
WANTED, a SITUATION, in Town or Country, by a good DRAUGHTSMAN. Well up in Builders' accounts, quantities, measuring, estimating, &c. Practically acquainted with the trade and setting out all kinds of work. Terms moderate. First-class references.—Address, N. Y. 7, Post-office, Woodstock, Oxon.

TO BUILDERS, CONTRACTORS, and OTHERS
WANTED, by a good practical MASON, a RE-ENGAGEMENT as FOREMAN, or Work by the Piece. Labour only. Town or country.—Address, R. N. 6, Newchurch-road, Dalston.

TO BREWERS and ADVERTISING WRITERS
WANTED, by an experienced Workman, a SITUATION, as SIGN WRITER. Good references, if required.—Address, R. H. Post-office, 40 Ford, E.

TO ARCHITECTS
WANTED, an experienced ASSISTANT, working, and detail drawings, perspective, plans and elevations. Town or country. Temporary or otherwise. Age 23.—Address, H. G. 42, Golding-road, St. Peter's Park, Harrow-road.

TO BUILDERS, SURVEYORS, and OTHERS
WANTED, by an experienced BUILDER'S SURVEYOR, well up in taking off and preparing quantities, measuring and estimating accounts, plans and elevations, &c. at present unemployed. First-class testimonials.—Address, X. Y. 24, Everett-street, Russell-square, W.C.

THE Advertiser, a good DRAUGHTSMAN, COLOURIST, and DESIGNER, wishes EMPLOYMENT. Had considerable practical experience in bridge building, surveying, &c. No objection to go abroad. Having a few hundred pounds capital would join an architect or builder already established in a good business.—Address, ALPHA, 251, Tottenham-cour-road.

THE Advertiser desires an ENGAGEMENT in a large Firm as ESTIMATOR, MEASURER, and BOOK-KEEPER. Is thoroughly practical, quick, accurate, and careful. Well recommended both as to character and ability.—Address, C. R. J. No. 10, Trinity-square, Borough, S.E.

TO BUILDERS AND CONTRACTORS
THE Advertiser, who has a thoroughly practical knowledge of the trade, requires an ENGAGEMENT as MANAGING CLERK. Can take off quantities, estimate, and measure and value all works connected with the business. First-class references.—Address, 9, "250," 24, Kingsland High-street.

The Builder.

VOL. XXX.—No. 1514.

Conventionalism in Art.

NOTWITHSTANDING the frequency with which the above-named term, and its opposite, "realism," have been bandied about by recent writers on art, it may be doubted whether a majority of readers connect any very certain or definite idea therewith; whether the importance of the principle which it represents, as bearing on the objects and forms of expression of Art, is adequately recognised. Perhaps a good many who not infrequently make use of the word "conventionalism" would find it difficult to explain the precise meaning in which they use it; and those compilations which profess to define the signification of words give us no help here. It is almost needless to say that the term was not in existence in Johnson's time. Webster recognises it; defining *convention* as "the act of coming together," hence *conventionism*, and *conventionalism* as "that which is received or established; convention or agreement." Richardson's later dictionary, again, ignores the word, giving only *conventional*, illustrated by a quotation from Reynolds,— "Poetry and elocution of every sort make use of signs, but these signs are arbitrary and conventional." The omission of the one word, and the illustration of the other, equally show that Richardson, as well as Webster, was quite unacquainted with the term "conventionalism" in its modern use in reference to Art; indeed, owing to the indifference to Art characteristic of English literary students in general, a dictionary of the English language is generally about the best place where one may look for new light in regard to terms of this class.

The fact is that just as "conventional" is a derived meaning from "convene" and "convention," so "conventionalism," again, is a derived meaning from the adjective, a degree further removed from the original signification of the verb. The quotation from Reynolds given by Richardson indicates plainly enough the meaning of "conventional," as applied originally to signs, such as letters and symbolic figures,—things which have no meaning in themselves, and no necessary relation to any fixed idea, but to which we have agreed to attach certain ideas. Reynolds, who was probably as innocent of artistic conventionalism, properly so called, as his friend Johnson could have been, was distinguished between the signs used in writing, which were purely arbitrary and selected, and those used in pictorial art, which were expressions of unalterable and universal forms of nature. And so long as pictorial art is regarded as merely this,—as purely imitative of Nature,—in her forms and details, there is no need for any intermediate shade of meaning other than this broad and general one to be attached to the word "conventional." But when modern art-criticism commences to weigh and to discriminate principles more accurately,—to look (may we not say) more deeply into the meaning and objects of art than the practical realistic school of Reynolds and his coeppers, for

the most part, cared to look,—it became apparent that between pure realistic imitation and purely arbitrary symbolism lay many degrees and grades of departure from nature; that possibly realistic imitation was not everything in art; that even in the imitative art of painting there could be a use of natural types without literal imitation,—not arbitrary, yet so far "conventional" that it permitted of a choice on the part of the artist as to how near to nature he would go, even of an "agreement" on the part of a school of artists to recommend departure from nature up to a certain point, more or less defined by canons of criticism. To this tendency (much more marked at some periods, and in some schools of art than in others) to depart more or less, in imitative art, from the real forms of nature, we have gradually concurred in giving the name of "conventionalism," as expressive of a principle of treatment which, while totally distinct from that arbitrary choice of symbols properly styled "conventional," is yet arbitrary as far as this, that it leaves us free to choose in what degree or in what special qualities we will endeavour to imitate nature.

But though it is in connexion with the art of painting that the existence of these two principles, conventionalism and realism, has been most clearly made manifest and recognised, and the strife most actively carried on between their respective adherents, yet that would be a very superficial view of art which should regard this opposition of the two principles as confined to the painter's art. In fact, the question as between conventionalism and realism is one which concerns more or less every form of artistic expression, and is intimately associated with the most essential considerations as to the objects and even the very existence of art in the widest sense. If the sole end of the various forms of art which more or less imitate nature, is to form a lesser world within the natural world, a mere mimicry of the beauty of the latter, then is realism the true goal of the artist, and power of technical execution becomes all-important as the sole means of attaining his end. In regard to painting in particular there have not been wanting able and acute critics to support this view; among recent adherents to this school we must count, apparently, one of the most brilliant contemporary French writers, M. Taine, who has criticised our art and literature with much originality and insight. Such a view, however, very much narrows the sphere and lowers the status and mission of art. It places art below even material nature; renders it, in fact, only a kind of dignified plaything, a means of reproducing in a fainter degree the same aspects or sounds or combinations which give us pleasure in nature. Such a view we take to be radically wrong; and to have been entirely suggested, probably, by the fact that one of the objects of painting and sculpture is to a certain extent imitative, from which a hasty generalisation has been made to the effect that art copies nature. There are other branches of art which afford little basis for such an idea; and the fact that painting comes nearer to literal imitation affords no real basis for it: either, the distinction in this respect between it and other arts being incidental rather than essential. All art stands on the same common ground, so far as general object and principles are concerned; and the enjoyment we derive from it is distinct from our enjoyment in nature, in kind as well as in degree.

Could we really reproduce in their completeness and intensity of effect those things which in nature cause us delight,—could we re-create nature for ourselves,—conventionalism would be then an impertinence or a mere imperfection. But we cannot do so, and therefore when working as artists we take our stand on a different ground. We endeavour, not to reproduce nature, but to produce that which will stir and

affect our own feelings in the same manner as natural beauty affects them. And so we select various classes of types or phenomena in nature as a language through which to speak or to render visible our thought. Since we cannot imitate and reproduce nature as a whole, we avoid the attempt, because it would always expose our work to disparaging comment, as falling so far short of the original. But we can select for ourselves such phenomena as we are able separately to deal with, and from which we can make a language or a form wherein to clothe our ideas. We can do this through colour, through light and shade, through form, through rhythm and harmonic proportion of sound. We use the human form, in various representations, as the means of expressing feelings and ideas; but we do not as a rule attempt that degree of *vraisemblance* which can be called deceptive or completely imitative. We eliminate that which we cannot fully imitate, and only seize those points which suffice to express our idea. We may approach nearer to nature, with success, in some artistic media than in others. We approach nearest in painting, because there we have the elements of form and colour, and can give the effect of relief, sufficiently to satisfy the judgment, without being accused of attempting any imposition on the senses of the spectator. The most careful execution will hardly cajole the eye into the belief that it is dwelling on reality instead of on a show. But the case is opposite in sculpture. Here we have the actual form, relief, and contour of nature repeated in solid and tangible reality. But for that very reason we shrink instinctively from applying imitative colouring, and thereby challenging direct comparison with the reality. Such an attempt would defeat its own end. For, in the first place, it cannot be supposed that the most subtle sleight of hand would avail to rival all the cunning of Nature in her infinite details, and we are again in danger of condemnation as bungling imitators. But suppose we could succeed in absolutely cheating the spectator, for the moment, into a belief in the life and reality of our work, what have we gained? Merely the praise of a cunning and painstaking sleight of hand; and what, on the other hand, have we lost? We have lost the object, the meaning, and end of our work, which was to express an idea, not to concentrate the spectator's attention on a feat of mechanical execution. It may be true, as Byron put it, that we—

"Have seen much finer women, ripe and real,
Than all the nonsense of their stone ideal;"

and the ripeness and reality we cannot remake and imitate; but that which is greater than these we can,—the poetry of form, of gesture, of expression, which will be all the more impressive in proportion as we refrain from weakening their effect by attempts at literal imitation of more material beauties. We may have seen landscapes, sunsets, moonlights in nature, more intense in their beauty and consequent effect upon us than any imitation of them on canvass could ever be; but the spirit of them we can reproduce, and from their elements create new scenes and new feelings which we have never actually met with in nature. We may be more deeply touched by the sounds of the sea, and the brook, and "the trees of the wood moved by the wind," than we could be by any attempted artificial imitation of them (which, indeed, in almost any conceivable case must be a mere piece of grotesque); but we can translate into measured tones the feelings which run through these unmetrical sounds of nature, and so we may have such things as the "Pastoral" symphony of Beethoven and the "Fingal's Cave" overture of Mendelssohn; not imitating either the brook or the tempest or the sea, but calling up in us feelings analogous to those excited by these natural phenomena and their associations. So

that, in whatever art-language we speak, it seems that we use forms or types which are parts of nature, as a language conventionalised to express feelings which are too subtle to be expressed in words. We will carry on the subject in our next.

THE CHAPTER-HOUSE OF WESTMINSTER.

It is now some years since we first called the attention of our readers to the neglected state of the beautiful Chapter-house of Westminster, as we did afterwards to the effort which was about to be made, under the auspices of the Very Reverend the Dean, to proceed with the restoration of that building. This has now been effected to a certain stage. Not only has the progress of decay been arrested, and the building placed in a thoroughly sound and weather-tight condition, but relics of ancient work have been discovered and preserved which throw light on the history of ecclesiastical architecture and decoration in England. A hall of great elegance has been added to the venerable series of the chapels and chambers of Westminster; the very cradle of English history since the date of the Norman Conquest. What yet remains to be done is to replace, to some extent, the dilapidations of time by the erection of appropriate woodwork; and, above all, to fill the large windows, the white light admitted by which is incongruous with the character of the vaulted apartment, with the jewellery of appropriate stained glass. We give a view of the restored building in our present number.*

The Chapter-house at Westminster is an octagonal building, to the south of that entrance to the Abbey known as "Poets' Corner." In the centre of this hall rises a lofty shaft of Purbeck marble, around which eight smaller shafts are clustered. From the bold and graceful capital of this central column, groined arches spring on either side to the walls. The roof is built of white chalk, groined with ribs of fire stone. The bosses which form the keys of the groins, although now, are executed from ancient designs. Four of them represent sacred subjects—Moses with the Law; David, the author of psalmody, the Angel of the Annunciation; and the Virgin receiving the mystic Ave;—the other four are boldly foliaged. A wall arcade surrounds the entire building, with the exception of the western side of the octagon. Here the only entrance to the Chapter-house is situated,—a doubly-arched portal, which leads through a vaulted passage to the great cloisters, from which entrance is now afforded by two iron open-work gates. There the prior and monks were able to assemble in a veritable cloacve, free from all possible interruption from the outer world. The entrance was decorated with extraordinary splendour. It was surmounted with a large pierced quatrefoil, in the centre of which was placed a large seated figure of Christ. An angel with a turban attended on either side; and in the four cycloets are the well-known emblems of the Evangelists. Around the main arch of the doorway, and harmonising with its rich mouldings, was sculptured a tree of Jesse—the royal and patriarchal figures lending the attention to the central occupant of the throne.

This portion of the Chapter-house was in a lamentable state of ruin. The central pillar, dividing the arch, was thrown down, as well as the greater part of the tracery. The windows of the passage were destroyed, and their apertures wholly blocked up. It has been only by taking the utmost care of every fragment of the original work that the task of restoration has been rendered possible. From a springer here, and a moulding there, a shaft here, and a capital or a fallen shaft, evidence has been gained of the features of the original work. To uncover from protecting whitewash the happily preserved diapers, and mural paintings, and delicate decorative features of the building, has been a labour of love, carried out with patience.

When the work of restoration was commenced, the central pillar of the Chapter-house was in a threatening condition, inclining towards the south-west. Many of the slender clastering shafts were broken and loose, being only bound together with coils of copper wire. The capital had been split into several portions, some of which had been replaced with plaster of Paris. The whole had been adorned with several thick coats of stone-coloured paint. On removing this, and taking down the loose shafts, the broken capital, and the annulets, the central pillar

proved to be perfectly sound. It is formed of a number of short cylinders, lying on their beds, the whole being held together by a bar of iron placed in a central perforation, and run in with lead. To this latter precaution the preservation of the shaft is due. Had the bar been run in with lime-mortar, the surrounding column would have been long since riven asunder by the slow but irresistible process of the oxidation of the metal. About a quarter of the metal required replacement, but to effect this was easily possible, from the sharpness of the mouldings in the sound portions. Copper plates have been inserted, which cover nearly the whole surface of the bed, and bind the portions of the restored capital together. The moulded annulets are new, with the exception of a portion of the central part around the main shaft. All the new portions are bonded together with copper.

The floor of the Chapter-house is covered with tiles, which have been well preserved by the wooden floor that was placed over them when the building was deserted. Only some 30 ft. of the entire superficies were missing, and even this deficiency appeared to be due rather to the decay of the tiles, from imperfect burning, than to violence or wear. The defective portions have been made good by new tiles, executed by Messrs. Minton & Hollins. There are nearly sixty different varieties of tiles used in this floor, of which forty have been made in imitation. The bearing of the kings of England since the time of Richard I., who added the third lion (that borne by the Dukes of Aquitaine) to the Norman two, is the prevalent ornament. But below the base of the shield, in a position, so far as we are aware, that is without precedent, are the centaurs of Stephen, which, though not grouped as either "tenants" or supporters, must have been placed there for heraldic reasons. On the southern side of the floor are six lines of lettering in bands running north and south. The letters are in separate *rosses*, capable of being arranged like type. They are much decayed. One word is traceable, which we read as, *ossians*. The folios of others of the tiles is bold and spirited. The interesting character of this floor needs no comment.

The arcades round the wall of the Chapter-house appear to have been all decorated with mural paintings, in oil, and by inscriptions, written on thick paper, and carefully attached to the walls. In those places where doorways have been broken through,—namely, in the south-east, the north-east, and the northern sides,—all vestiges of the paintings have, of course, been destroyed; but enough remains, not only to give a clear idea of the style of their ancient artists, but to enable us to understand the general plan of the chromatic decoration of the building. The gold, which has been freely used, remains in many places as fresh as if it had been applied last year. The tracery of the canopy-arches was painted in red and blue, relieved with gold. A series of sacred paintings ran round the arcade, the whole history of St. John the Divine, including his vision, being represented in separate groups. Below these celestial scenes were drawn a series of natural-history subjects, contrasting, so far as the remains allow an opinion to be formed, the wild and the domesticated state of various creatures, as the wild and the common ass. Below these, again, seem to have been a series of fish or aquatic animals.

Each bay, or side of the Chapter-house is adorned with an arcade, or row of five small arches, relieved from the wall. As the doorway occupies the western side, there were thus thirty-seven of these spaces; the large pointed window, which fills up the greater portion of the upper wall, rising at a higher level. Originally of a hundred distinct subjects were originally portrayed in these arcades, of more than half of which some traces are yet to be distinguished. Commencing on the left hand as we enter the Chapter-house, we find the legendary story of St. John. In the first picture, the arrest of the saint by the Proconsul of Ephesus, by the order of the Emperor Domitian, is represented. The proconsul wears a large golden crown and a formidable sword, and the apostle is distinguished throughout by a golden nimbus. In the second scene the saint is placed in a cauldron of oil. An attendant is pouring in the liquid with a ladle, and another blows the fire beneath it with a pair of bellows. In the third scene, St. John is shown as having escaped unscathed from the cauldron, and his banishment to Patmos is indicated by his figure in a boat, which is being pushed from the shore. There are five figures in this scene, and there were seven in each of

the preceding ones. In the fourth picture, the apostle is landed, and left desolate on the shore of the island, his companion returning in the vessel. In this scene the curious method of representing successive events in one composition, which Ghiberti has carried to such a remarkable pitch in his famous gates, has been adopted by the painter. The apostle and his companion being shown together in the stern of the boat, and the same figures being again separately represented, as parted from each other after the disembarkation.

In the next arch we enter upon the illustrations of the Book of Revelation, to which these scenes from the legendary life of St. John serve as a prelude or introduction. We are first shown the angel, making known to the apostle the object of his mission. Then St. John is portrayed writing to the seven churches of Asia, which are little stone buildings of a cruciform plan, each with a central tower, surmounted by a spire, and with leaded roofs. In the porch of the north transept of each of these quaint little buildings is displayed the Angel of the Church. In the third compartment is the figure of Christ, with a sword in his mouth, standing in the midst of the seven candlesticks, with the Apostle Galen at his feet. In the fourth, the same figure appears, seated on a throne, surrounded by a rainbow, with seven lamps of fire burning before it. The four Evangelists, and the four-and-twenty elders, with crowns and instruments of music, are represented in worship around. The opening of the seals succeeds, the weeping of the apostle at his inability to read the book being very literally represented. The riders on the white, the red, and the black horses follow,—Death on the pale horse having been unfortunately obliterated. From this part of the story the painting has been destroyed, until we reach the twenty-fourth bay of the arcade, in which the original form of the beast with seven heads and ten horns is faintly discernible. In the twenty-fifth bay there is only one compartment, which represents the Lamb standing on Mount Zion. In the twenty-sixth, also, but one compartment remains, representing the proclamation by the angel as to the fall of Babylon. In the next bay are two compartments, the first showing the two angels with the sickle and the fan; the second, the seven angels with the seven last plagues. In the twenty-eighth bay is shown the pouring out of the first two vials. Then comes the pouring out of the fourth vial, and the scorching of men with fire. In the thirtieth bay is represented the outpouring of the seventh vial, and the impersonation of the mystic Babylon seated on a scarlet beast. In the thirty-first bay four compartments are discernible, representing the declaration of the angel that Babylon is fallen, the calling forth of the people of God from her plagues, the angel casting a millstone into the sea, and the burning of the harlot with fire. Then follow the marriage of the Lamb; the worshipping of the angel by St. John, who is raised by the former figure; the triumph of Him whose name is called Faithful and True, on a white horse; and the angel calling to the birds of prey. In the thirty-third bay we have the war waged by the Beast, and the kings of the earth, with their armies, against the rider on the white horse; and in the thirty-fourth bay the loosing of Satan. The accurate following of the text, and the minute, realistic detail with which each incident is unmistakably represented, make this remarkable series of drawings rather a graphic rendering of the Apocalypse than a mere illustration. Nothing appears to have been omitted. Although the fidelity to the text is so close as at times to border on the ludicrous, the earnest, religious aim of the artist is visible throughout. There can be little doubt that when these paintings were fresh and the series uninterrupted a more distinct acquaintance with the account of the wonderful vision would have been gained by a visit to the Chapter-house of Westminster than would have been easily acquired in any other way,—at least, by the laity.

It is on record that one William of Northampton was employed on these paintings, about the middle of the fifteenth century. The style is vigorous and ingenious, and the artist follows his theme verse by verse. An artist of another order, however, has left his mark in the fine eastern arcade, in which were the seats of the Abbot, the Friar, and the Sub-friar, with, probably, those of the Chancellor and the Precentor. They are thought by Mr. G. G. Scott, under whom, as our readers know, the restoration has

* See p. 107.

been effected, to have been decorated by a pupil of Giotto, and two heads are yet to be seen there, not unworthy of the pencil of that famous master himself. We can recall nothing in mural painting finer than one of these heads, which bears a strong resemblance to the noble face of Achilles, where the heralds of Agamemnon are conducting Briseis from his tent, in a well-known fresco at Pompeii. The whole of these arcades appear to have been occupied by one grand composition, representing the reign of Christ in heaven. In the central compartment the Lord sits enthroned. His hands are held up, and his side is bared, to show the wounds received at the Crucifixion. Angels hold a veil, or dossel, behind the throne, and others bear the instruments of the passion. The remaining spaces were filled with clouds of cherubim and seraphim, the former represented on the larger scale, and occupying the most important positions. They have each six wings; two shadowing the face, two expanded for flight, and two veiling the feet. The prevailing colour of the wings is blue, which is that attributed to this exalted order of intelligences. The feathers are cooleted, like those of the peacock—the artist's version of "fall of eyes, within and without." One holds a crown in each hand, one a crown in one hand, and the "written stone" in the other. On the feathers of the wings of one of the cherubim are written the names of Christian virtues—not the cardinal, religious, and moral virtues, but certain qualities of religious excellence. Such are—*Officii sinceræ plenitudo; voluntatis discretio; simplex et pura intentio, munditia carnis; puritas mentis; confessio; satisfactio; caritas; elemosina; orationis devotio; simplicitas, humilitas, fidelitas.* In the outer niches are smaller cherubic figures, with faces expressive of sorrow, regarding the wounds of Christ. In the background above and foreground below, are a multitude of seraphim, distinguished by the colour red. All the figures have gilt nimbi.

It only remains to notice the three arcades in the south-eastern group, painted by another hand, and probably at a later date. The grouping of the figures here gives the idea of multitude, and is thought to illustrate the suffrages of the *Te Deum*—the goodly fellowship of the Prophets, the glorious company of the Apostles, and the noble army of Martyrs praising God. Some of the faces here are thought to be portraits.*

ON THE CONSTRUCTION AND ARRANGEMENT OF BREWERIES AND MALTINGS.

ROYAL INSTITUTE OF BRITISH ARCHITECTS.

THIS was the title of the paper read on Monday night last, by Mr. George Scamell, jun., of whose work on the subject we gave an account some time ago. Its importance is shown by the estimates lately prepared by Professor Leoni Levi for Mr. Bass, that the capital invested in breweries and maltings, &c., in the United Kingdom, amounts to 12,400,000, and that the total number of persons employed in the trade is 246,000, or, including the retail trade, 846,000. The number of breweries being worked now being nearly 4,500, and the quantity of malt annually consumed now amounting to 6,250,000 quarters; the total annual income to the revenue of the country from licenses for brewing, malting, and the duty upon malt, being upwards of 6,850,000.

After giving a sketch of the method of brewing, the reader proceeded to speak of

General Arrangement.—As far as possible the various utensils should be so placed that the wort may flow from one vessel to another, through the whole process, without pumping, i.e., the mash-tun should command the copper, the copper the hop-back, the hop-back the coolers, and these again should command the fermenting-tuns, cleansing-vessels, &c. Where, however, on account of the great height required by the vessels in a large brewery, the buildings would require to be of great height, it is best to arrange for one pumping; that is, from the hop-back to the coolers. Occasionally the copper is placed at the top of the building; then the raw wort has to be pumped up from the under back. The majority of brewers, however, object to

pumping raw wort, as it is urged that the wort is injured by being subjected to the action of the pump before being boiled.

A perfectly level site is not as a rule to be selected, as by taking advantage of any natural fall of the ground, even in a large brewery, the vessels may be placed so as to command each other without carrying the buildings to any undue height.

After the selection of the site, the next point to be considered is the position of the well. The proper selection of this place is most important, as the well should be so placed and constructed that there is no possibility of any sewage or deleterious matter leaking in, as in such a case most serious injury would result to the beer brewed from such contaminated water. It should also be convenient for driving the pumps from the engine. The site generally should also be thoroughly well drained, all the drains being of rather larger capacity than would suffice for ordinary buildings, and laid to a sharp fall, as a good deal of stale yeast and brewing refuse will find its way into them when washing out the various utensils, and if there is not a good fall, the yeast, from its peculiar nature, is liable to adhere to the pipes, and cause a great amount of inconvenience: this is a point that should be well attended to.

These preliminaries being settled, we will now pass on to the consideration of the brewery. For a large establishment, as a general rule it is best to divide it into three grand divisions, the first containing the mash-tun, and the accompanying utensils, hop and malt stores, &c.; the second division, which we will call the copper-house, containing the wort-coppers, boilers, hop-back, and under-back; the third division, the fermenting-tuns, which we will call the tun-room: all these divisions should be so situated that either division can be enlarged without altering the general arrangement.

In the first division the following vessels will have to be situated,—the cold-water tanks,—and which the majority of brewers prefer to have under cover. These tanks are generally of iron, and it is a great advantage to have them lined with white glazed tiles; if this be decided upon, the tank-plates should be cast with chequers on to form a key for the cement: if the tanks are under cover, and not exposed to the extreme variations of temperature, the expansion or contraction is not found to loosen the tiles. The underside of all iron tanks should be boarded, as if not the moisture in the atmosphere condenses, and the continual dripping is a constant source of annoyance, besides causing damage if any malt or hops happen to be stored beneath.

A vessel will have to be provided for heating the water for mashing. It should contain sufficient water for the whole brewing, and is generally best made of wrought iron, the water being heated by a steam coil. In some instances, where expense is not a great object, these vessels are made of copper.

The malt-rolls for crushing the malt vary in size from 6 in. to 18 in. in diameter, and from a few inches to 3 ft. in length, according to the quantity of malt to be crushed per hour. Space will be required over them for a hopper for containing the malt to be crushed, and a screen for screening the same. They should be situated so as to be convenient for driving from the steam engine; but the opinion of the brewer must be taken as to their position with regard to the grist case, as some prefer to have the rolls fixed directly over the case, and grind into it, whilst others prefer to have the rolls some little distance, and allow the ground malt or "grist" to be conveyed into the case by means of an elevator or Archimedian screw, thus giving the grist an opportunity to cool, as the temperature is considerably raised by being ground. The same description of elevators or screws may be used with advantage for moving whole grain.

We next come to the grist cases, or receptacle for the ground malt. They are made of wood or wrought iron, in which case they should be flush riveted on the inside, as the least obstruction will hinder the flow of grist. But, on the whole, I prefer a case made of thoroughly well-seasoned deal, as grist runs so much more freely on that than on any other substance. The stuff from which the case is made should be particularly well seasoned, and should be ploughed and tongued, as it is a difficult matter to keep the joints tight, the malt-dust blowing through the slightest crack almost as readily as water would. The angle of the bottom should not be less than 45°, the capacity should be sufficient to admit of it containing the whole quantity of malt to be

mashed, allowing 12 cubic feet per quarter, with a sufficient margin so as not to necessitate any levelling or trimming by hand. The weight of a quarter may be reckoned at about 3 cwt. Occasionally they are preferred made to hold double the quantity of the mash-tun, fitted with a division so as to enable two days' supply to be ground. The outlet will have to be arranged according to the description of mashing machine which may be decided upon. If an external one, then there must only be one opening. If, however, the grist is to fall into the tun direct, then two or four are best, so as to admit of the grist being pretty equally distributed in the tun. In this instance the outlets should be fitted with slides so arranged that they are all opened at the same time by one wheel or handle. The mash-tuns are generally constructed of wood, though occasionally of iron; if so the girders should be as rigid as possible, and if an internal machine is to be used, the framing for supporting the tun must be so arranged as not to interfere with the gearing for driving such machine.

We will next consider the second grand division, viz., the copper-house. The utensils that should be grouped together in this division are those from which a large amount of steam is given off, comprising the under-back, coppers, hop-back, and steam boilers; by keeping these vessels in a distinct house, the brewery may be kept comparatively free of steam. The under-back is a small vessel, and does not often require to hold more than from seven to ten barrels, and is used for running the wort into both the coppers. It should be placed as near as possible to the mash-tun, and should be ready of access and in a good light, as the brewer in charge will require to get to it continually to watch the taps whilst the wort is running from the mash-tun; it should be so situated as to allow of the wort flowing into the boiling-copper. The boiling in some establishments is effected by fire, in others by steam; this point must be decided by the brewer, who also must decide as to the greatest quantity required to be boiled at one time, as it is very rarely the case that the whole of the brewing is boiled at once. The usual allowance as to the capacity of a copper is that the copper should hold one-third more than the quantity to be boiled, to allow for the ebullition. The coppers should under any circumstances be kept as far as possible from the tun-room wall, as if contiguous the heat given off when boiling will seriously affect the temperature of the tun-room; they should be high enough to command the hop-back, allowing a good fall for the main for connecting to the same; there should also be a ready way of conveying the hops from the hop-loft. The setting of the wort-coppers should also be closely attended to; if in London, some description of smoke-consuming furnace must be adopted; if so, the patentee or maker of the selected furnace will give the size of that particular furnace suitable for the size of copper. If an ordinary furnace is to be erected, then for a copper the bottom of which is 7 ft. diameter, a furnace the bars of which are 4 ft. long by 3 ft. 3 in. is sufficient; or for a copper 5 ft. 6 in. diameter, then if the bars are 3 ft. long by 2 ft. 6 in. wide, and so in proportion for other sized coppers. The flues must finish, or, as it is termed, be *safed* in, so that the top of the flue is just below the level of the least quantity of wort required to be boiled at one time. All flues must be lined with fire-brick, set in fire-clay; such linings should not be incorporated with the settings, but an air space of 2 in. or 3 in. left between, being merely connected with the body of the work by a few headers here and there.

The crown of all boilers should be covered with some non-conductor to prevent the heat radiating, but most certainly not with brickwork, as under such circumstances, if any leakage take place round the manhole or safety-valves it may not be detected until the boiler is seriously injured. Provision must be made for getting into the flues for cleaning out or for examining the boiler; a drain must also be provided in front of boiler for conveying the waste water when blowing off. For all practical purposes the chimney-shaft need never exceed 75 ft. in height from the furnace-bars; and in designing a shaft should always be borne in mind the possibility of an additional copper or boiler being erected; therefore the area of the shaft should be rather larger than absolutely necessary for the present requirement. Mr. Rawlinson recommends for a tall chimney-shaft, that the shaft be carried up square with an internal circular lining of fire-brick, thus leaving spaces at the corners for air spaces; these spaces will

* A view of the entrance to the Chapter-house from the cloisters, and various other illustrations and descriptions of this part of the Abbey buildings, will be found in our earlier volumes.

tend to keep the external work cool, and it will not be so liable to split. This is no doubt an excellent arrangement for massive chimneys, but for shafts of ordinary dimensions it is scarcely necessary to go to this additional expense; all that is necessary is to line the bottom of the shaft, and about 12 ft. or 15 ft. of the top, with fine brick. The area of the outlet at top of shaft may be found by multiplying the number of pounds of coal consumed per hour by 12, and dividing the product by the square root of the height of chimney in feet, the result being the area of the top of the chimney in square inches. For a circular shaft the diameter at base should not be less than one-tenth of the height; the thickness of the work should not be less than one brick for the first 25 ft., and increasing by one-half a brick for every additional 25 ft. At the base of the chimney should be an iron door, to allow for removing the soot, and it is a great advantage to cause the flues to enter the shaft a few feet from the bottom, so as to form a receptacle for the soot without interfering with the flues. Where sugar is used for brewing from, it is convenient to have a separate vessel fitted with a steam pipe, for dissolving the sugar in before it enters the copper; this vessel should be placed as close as possible to the coppers, and can be made of wood or wrought iron.

There should be abundance of ventilation in the copper-house, both in the side walls and also in the roof. The openings in the walls should be so arranged that a copper or boiler can be easily removed and replaced, it always being a great advantage, indeed, almost absolutely necessary, that such utensils should be taken in whole. The fermenting-tun rooms were then described, and the vats sometimes required for storing beer.

Mr. Scamell said he had found that the cost of building a brewery will range from 2d. to 6d. per cubic foot. A 63-quarter brewery and malting, costing about 12,000l., costs about 2d. A 24-quarter brewery, brick built, cost 3,600l., or 4d. per foot. The buildings for a 100-quarter brewery carried up in stone, not including the tun-room, cost about 5,000l., or 5½d. per foot. A 40-quarter brewery of brick, with a considerable amount of moulded brick dressings, &c., 3,700l., or 6d. per foot. The total cost, including the plant for the 63-quarter brewery, and a 70-quarter malting, cost about 20,000l., or the 24-quarter total cost 6,300l., or 262l. per quarter. The 40-quarter brewery complete cost about 8,900l., or 225l. per quarter. The 100-quarter without tun-rooms would cost about 9,600l., or say 100l. per quarter. The 21-quarter, 7,700l., or 320l. per quarter. These amounts do not include the coopers department. Now, as a rule, a brewery coopers is only required for repairing, not making, casks, and should therefore be of a greater width than a shop where casks are to be made; about 20 ft. in width will be a very convenient shop. Each man will require to have a wood block, and an iron plate let into the floor for placing the casks on, when driving the hoops, and one or two commodious firing-places for firing the casks in; these should be about 6 ft. or 8 ft. square, and covered with an iron hood, having an outlet of not less than 2 ft. square at the apex; the floors should either be of oak plank or wood blocks, as ordinary street pavement; the hearths of the firing-places may be paved with brick on edge, as they stand the heat better than any other description of pavement. Over the shops should be a good loft for the storage of flags and hoops.

After treating of the construction of maltings, the reader urged that architects engaged on such works should get the views of the proprietor very clearly expressed in writing, as to the system upon which the brewing is to be conducted; in general it is a difficult matter to get definite instructions as to the many points of detail, and it is always advisable to get the brewer's authority in writing, confirming any particular form of apparatus which may be proposed to be introduced, and it is as well to get the views of the gentleman who may have to work the plant, as thereby many a hint may be obtained as to small matters of detail, which would otherwise be overlooked until the deficiencies were found out when commencing to work the plant, thereby causing a long bill of extras to the dissatisfaction of all parties.

Market, Newton Abbot.—A commodious market has just been erected at Newton Abbot, Devonshire, at a cost of 17,000l.

LAND.*

HAVING referred to the theory of the confiscation of all improved value of land, and to the doctrine that the State may resume all land into its possession, I will now refer to a clever essay which has recently appeared as one of the Cobden Club Essays,—“The Present Aspect of the Land Question,” by William Fowler, M.P., 1872.

The essayist maintains that, although all property is sacred, the present tenure and mode of possession are so unfavourable to its productiveness, that Parliament should intervene; but the essayist altogether omits to notice the legislation and the improvements effected within the last twenty years. Concurring with the essayist to a considerable extent, I propose to, partially, supplement his essay by noticing such legislation and improvements.

The essayist writes,—“The largest landed estates in the kingdom, the Bedford, Northumberland, Westminster estates, and those of the Earl of Leicester,—though in great part settled on tenants for life, are thoroughly well handled. But the question is, are they not exceptional? And, in order to clench the argument, the essayist quotes Mr. Caird's “Agriculture in 1850.” If he had quoted Mr. Caird's statement in 1850, that “at our former period has the general progress of agricultural improvement been greater than at present,—on every side increased exertions are being made by both landlord and tenant,” Mr. Caird's observations would have been properly appreciated; and arguments founded upon the *then* state of agriculture would have been obviously inapplicable to its state after the lapse of twenty years.

Wages were, for instance, stated by Mr. Caird at an average of 9s. 7d. in 1850, against 7s. 3d. in 1870. The average wages of the same countries were, according to the last Parliamentary returns, 13s. in the year 1870. Their rate at the present moment is still higher, and there is a demand for labour which it seems impossible to satisfy. The practical abrogation of the law of settlement in 1865 emancipated labour, and enabled it to flow freely throughout the country. The essayist makes no reference to this fundamental change.

Good cottages follow good wages and difficulty in finding a supply of labour. The best-managed estates have the best cottages. The cottages will never be built unless they pay fair interest; and the source of that interest must come, and in many cases already does come, from the increased produce of the land. I have been entrusted with the building of many cottages yearly for many years, and they all pay interest; but, where the land has not been well farmed, their cost may be part of the expenditure necessary to secure a good tenant.

The essayist maintains that we want “men to buy land in order to make a living out of it, and not men who buy it as a luxury, and can be satisfied with 2 per cent. interest.” Admitting that great estates are now frequently sold in lots, the essayist says “that no one would bid against a rich man intending to buy the whole,” and “that such a purchaser would not be likely to spend money in improvements.”

My experience is that “a man wanting to make a living out of land,” sells whatever freehold land he possesses, and becomes tenant with the capital so acquired. This seems natural and wise. The sum of 4,000l. can provide 400l. a year for the tenant of 500 acres of land, while as landowner his income is but 120l. a year. The question to him is whether he will be landowner with his capital producing 3 per cent., or tenant with his capital producing 10 per cent.

An estate is not, it seems, to be sold in the dearest market,—possibly to a purchaser who is willing to give fifty years' purchase,—nor is the property to be sold, as it is frequently offered, in lots, so as to afford an opportunity to the speculator who desires to resell, or to the adjacent landowner desiring to buy it, but it is to be sold only to some one desiring to purchase “in order to make a living out of it.” This kind of purchaser must, surely, soon be at the limit of his capital. The man who will take 2 per cent. on his capital is, on the other hand, not likely to have invested the whole of it in his purchase; and if his tenant will pay him 5 or 6 per cent. on money spent in draining, or

buildings, or improvements, he may after all get 3 per cent. or more on the whole capital expended.

The existence of tenant farmers, with both capital and intelligence, seems to be altogether ignored; and the tenant is viewed as without either the one or the other if he does not “buy land in order to make a living out of it.” We have seen why a man of intelligence, with 4,000l. of capital, should be a tenant rather than a landowner, and, as a matter of fact, such is the course generally adopted. According to the last agricultural returns, the farms exceeding 100 acres occupy 20,000,000 acres, or 65 per cent. of the whole acreage of cultivated land included in the last year's official returns. No one acquainted with the occupation of land throughout England for forty years can fail to recognise the result of the more liberal education given by farmers to their children, which has prevailed during the latter part of the period. The only practicable mode of increasing materially the produce of the land is to apply to it both capital and intelligence in the forms of machinery and management.

The problem yet to be solved is mainly how to counteract the uncertainty of the seasons. We admit that it is right to guard against contagious diseases and against preventable sickness, and we drain our land to carry off the superfluous water. We want to be able to go on our farms for the autumn and spring ploughings just in those few days of fine weather which there are in the worst years; and we want to harvest our corn in the few fine days in which the worst harvest season always comprises; and we want that the land shall not be parched by the treading of horses; and that the cost of cultivating clay lands—the old wheat lands—shall be reduced.

And steam ploughs and agricultural machinery promise us all this; and, as far as they have gone, have fulfilled their promises. But small farms and small fields cannot co-exist with steam cultivation. In almost every other form of production we have availed ourselves of steam power, and in all steam power, once introduced, has effected the desired results, and occasioned in the long-run the employment of a larger amount of labour. In farming, where steam power is introduced, a greater amount of labour is employed, and it is of a more intelligent kind; the compensation to the employer is found in the greater amount of the produce and the greater certainty of its production.

The essayist states, as an actual fact, that the value of lands in mortmain is one-sixth of the real property of the kingdom, and worth 500,000,000l. of money. The real fact is, that there is now very little land truly in mortmain in the country. The Settled Estates Act, the Church Emancipation Acts, the Globe Sales Acts, the Universities Acts, the Charities Acts, have afforded means for the sale of almost every corporate property. No reference whatever to these enabling Acts is made throughout this essay, and a total want of knowledge of some of them has been frankly admitted. As regards nearly all the estates formerly in mortmain and all the settled estates, the question of their retention or of their sale is only a question of expediency. There is no legal impossibility.

The essayist states that he has recently discovered an instance where the poor of a parish in Lincolnshire hold land worth 700l. an acre, from which they receive an annual return of some 2l. or 2l. 10s. an acre. A little further research will enable him to discover the Charity Commission, where the facts relating to this land must be registered; and the invocation of its authority will enable the sale of the land, and the yearly return of 23l. an acre to be received, instead of 2l. or 2l. 10s. This kind of difficulty has been obtained for the last eighteen years.

According to the essayist's personal opinion,—and his opinion is very valuable on this point,—the annual savings of the kingdom amount to 150,000,000l. a year. Yet he is of opinion that all corporate estates should be sold and converted into money. The incomes of corporations having generally specific appropriations and special claims to discharge, it is of the utmost importance that the recipients should throughout the future obtain not nominal, but real income. We are all familiar with the difference between reserved rents, which were real rents 300 years since, and the present rental of estates. The colleges, on Cecil's advice, reserved one-third of their rents in corn; and they have, for this third, always continued to receive substantial revenue. The suggestion now made is that the fee-simple value

* By Mr. Edmund James Smith, member. Read at the Ordinary General Meeting of the Institution of Surveyors, January 29th. See p. 80, ante.

† The first edition contains observations on the Ecclesiastical Commission, which, being confessedly unfounded, are to be omitted in the next edition.

of corporate real property (which must rise as money falls in value) shall be placed in the Public Funds,—in other words, be lent out for the benefit of the Government,—and thus be limited to a definite revenue, which can never be exceeded but may be decreased by the discharge of the debt or the reduction of the rate of interest, and which must bear a constantly decreasing proportion to the whole revenue of the kingdom.

Mortmain has had one good use. It has enabled us to trace for 300 years the annual value of precisely the same estate. Properties in mortmain could not vary in extent prior to the passing of the comparatively recent enabling acts; and we have, therefore, a complete series of valuations of the same properties throughout the period. In purely agricultural districts the extent, where no outlay whatever has been made by the owner, but all improvements have been made by lessees holding long leasehold terms, doubled itself between 1670 and 1770, and increased about fourfold between 1770 and 1870,—about eightfold since 1670.

We have seen that land in the best parts of the City of London is, in 1870, of thirty times its value in 1670.

There would seem to be many reasons why corporations should be the best of all possible owners. A corporation can exercise no political influence (if political influence be not altogether fictitious), wants no shooting, no game, no interference with the tenant, no change of tenants, and has no financial crisis. A corporation desires a well-farmed estate, with the rents paid regularly, and with fair interest on money invested in improvements in substitution of lying in the Funds at 3 per cent. A corporation can have no objection to grant leases; and its tenants, subject to paying their rents, are practically owners. There are always good-natured friends near every corporation estate, who will transmit to its managers, or to their own Parliamentary acquaintance, any complaints which seem to require, and some which do not require, to be investigated. The corporations are non-resident, admit; but the tenants are almost necessarily the best kind, many quite equal to the squire of fifty years since.

When the Northumberland Estate, now so admirably managed, was in the worst possible condition (Duke Algernon spent 524,600*l.* on its renovation), the Greenwich Hospital Estate, under the management of John Grey, of Dilston, was the example estate of the kingdom. The Continental strangers who came to inspect our farming were sent, as a matter of course, to Dilston, to view the Greenwich Hospital Estate. This amount of 524,600*l.* expended in the improvement of a single estate, is a princely amount, and Duke Algernon was only tenant for life; but the Percys have ever been princely people. The expenditure on roads, bridges, &c., was 29,690*l.*; on buildings, cottages, &c., 308,330*l.*; and on draining, 176,580*l.*, making up the total of 524,600*l.*

It may also be suggested that, if new systems are to be adopted, it will be more easy for the State to give them effect on a corporate property than to have to buy land on which to try them.

When the leasehold term of a corporation lessee comes to an end, he may be dismissed, under Parliamentary authority, and the farm may be cut up into twenty (or more) tenancies, and twenty new homesteads created with 25 acres each, and the twenty tenants may be pitted against the one tenant of the adjacent 500 acres. These little occupiers will work under more favourable conditions than if the lands had remained uninclosed and cut up into strips in open fields. But the result is, nevertheless, certain. Intelligence and capital will beat hand labour, and steam cultivation and machinery will prevail.

The most favourable condition of hand labour is the occupation of plots of land in the vicinity of large towns, where vegetables can be grown for the consumption of the town population. The produce, in such a case, reaches 50*l.* an acre annually. The land-owner may receive one-tenth, or one-eighth at the utmost, for rent, and one man off an acre of ground may obtain a return for his skill and labour somewhat exceeding the wages given in the neighbourhood. But the skill and energy necessary to effect this might earn a much better income in the town. The remarkable fact is, not the profit derivable by the individual, but the amount of produce obtainable from one acre of land when manure is readily accessible, and several crops can be raised in the year. It also seems almost impossible to exhaust land long used as garden-ground,

the thorough commixture of the soil producing effects obvious for centuries after the land has fallen under ordinary cultivation. No possible amount of hand labour could ever effect such a thorough commixture throughout the whole of our agricultural land, but steam cultivation may effect it.

Our neighbour, France, gives us a warning as to land culture, as in other respects. The law of 1793, compelling the sub-division of land amongst all the children of the parent, has existed somewhat more than two generations. M. Leonce de Lavergne, writing, in 1865, in its favour, tells us that thirty-seven farms which, in 1793, divided between them the 3,500 acres of the commune of Venast, now belong to 600 owners, with an average estate of less than 6 acres each, and those not lying in one plot. In many departments of France, says M. Monny de Morney, the partition of property has reached less than the fiftieth part of an acre. Imagine the condition of an owner of 3 perches of common field land. In France, of 8,000,000 proprietors, says M. D'Esterno, there are 3,000,000 exempted from personal taxation on the plea of indigence. There are 60,000 possessing 130 acres each on an average, and there are 4,500,000 averaging 12 acres each.

The French law of 1793 places the children of the family as a whole in the position of our oldest sons. That which he would take for himself about they take amongst them; for the liberty allowed to the parent to dispose of a small portion is practically disused, because its use is generally followed by legal proceedings after his death. The land is thus practically entailed by law on all the children, without the probability, which exists in an entailed estate, of an heir from time to time having the fee simple vested in him; for no such child throughout all time can have more than a life interest. The alternative is to limit the family fecundity wholly to primogeniture.

The sum of the whole matter is this. Restrictions on the use of land are as unwise and injurious to the State as restrictions of trade, and owners and occupiers will find for themselves, under the pressure of public opinion, the best mode of employing their land and their capital without State direction. The abrogation of the laws of settlement leaves labour free. The removal of legal restrictions on sales by corporations or by the owners of settled estates has practically extinguished mortmain. The future of agriculture depends upon machinery, not upon laws. There is no distinction between agricultural and other land. The prime use of land in England is for commercial purposes. The quotation from Mr. Cobden, prefixed to Mr. Fowler's essay, "I believe we have no adequate conception of what the amount of produce might be from a limited surface of land, provided only that the amount of capital were sufficient," embodies the main truth in relation to agriculture.

It is our daily duty to advise on the sale or the purchase or the management of indestructible property, and our first necessity is to train ourselves to a judicial frame of mind, so as to ponder the circumstances of each particular case, and accurately weigh, with the aid of past observation and experience, the advantages, present and future, of a proposed sale or investment. We are, therefore, obliged to extend our views much further than is necessary in the ordinary transactions of trade, where the sale or purchase exhausts its effects in a very brief period. The purchaser who bought the farm at Crews at a very high agricultural price, because he foresaw that, from the conformation of the country, the property must be intersected by the future great line of railway through that district, did exactly that which each of us aims daily to effect.

I have, therefore, thought that the subject of this paper was fitting for this institution; and I have expressed my views the more boldly because our institution comprises the leading surveyors throughout the whole of England, and their experience will, in the ensuing discussion, point out further supplementary information, and lead to the correction of any erroneous conclusions.

After a few remarks by members, the discussion of the paper was postponed to the next meeting on Monday, February 12th.

The Public Health.—The Queen's Speech contains the following passage:—"There will likewise be laid before you legislative provisions founded on the report of the Sanitary Commission."

WORCESTER SCHOOLS COMPETITION.

MR. DAY writes as follows:—

"SIR,—Observing that you have published Mr. Witherington's protest against my plans for the Worcester schools, I think it necessary to state that my delivery of plans was a legal one, as I have duly explained to the Board; and with regard to your remark as to 'the possibility of a favoured competitor being able to see the designs of other competitors before completing his own,' I have to observe that no such possibility existed, the plans being all packed and kept in the custody of the Board."

Many other statements made by Mr. Witherington are erroneous; but I have neither the time nor inclination to enter into discussion on these points.

ERNEST A. DAY.

A meeting of the School Board was held on the 1st inst. to consider the protest we printed last week, and according to the published reports Mr. Day ("De Die") admitted that his drawings were not delivered until Monday instead of on or before the date prescribed by the advertisement. The School Board came to the resolution "that the Board having heard Mr. Witherington, see no reason to depart from their decision in favour of Mr. Day."

SIR,—I think it possible that some misapprehension may exist in the public mind as to the facts concerning the late decision of the School Board on the architects' plans submitted to its judgment. I shall be obliged if you will allow me the opportunity of stating what the facts are.

In October last the Board advertised, in the Worcester papers, and in the *Builder*, inviting architects to send in designs. The form of advertisement was as follows:—

"TO ARCHITECTS.—THE WORCESTER SCHOOL BOARD are desirous of receiving PLANS for a BLOCK of SCHOOL-ROOMS, giving accommodation for 230 boys, 200 girls, and 300 infants, with class-rooms, lavatories, and all suitable offices, with external boundary-walls, iron palisades, gates, &c. In preparing their plans, architects are requested to combine economy with efficiency. The architect whose plans are approved will superintend the works on the usual terms. The second-best plan will receive a premium of 30*l.* The ground being somewhat irregular, the site should be seen before plans are prepared. Plans are to be sent in on or before the 30th of November, to Mr. MARCUS, Clerk of the Board, of whom any information may be obtained."

Several architects having written to the clerk to state that the time allowed was insufficient, the Board resolved to extend it to the 31st of December, and a further advertisement was inserted in the same papers to this effect:—

"TO ARCHITECTS.—EXTENSION OF TIME.—THE TIME allowed to Architects to send in PLANS for the ERECTION of SCHOOL BUILDINGS, as advertised in 'The Builder' of October 28th, is EXTENDED; by order of the Board, from NOVEMBER 30th to DECEMBER 31st, 1871.—F. MARCUS, Clerk to the Worcester School Board."

At the time when this extension was granted, it was quite overlooked that the 31st of December, 1871, fell on a Sunday; nor was this remembered till it was too late to remedy the mistake.

Under such circumstances some diversity of opinion would naturally arise whether Saturday, the 30th of December, or Monday, January 1st, was the ultimate day on which plans could be received. There is no express law on the point, and I think a good deal might be urged for either side of the question. As a fact, the competitors in this case took different views. Some sent their drawings on the Saturday; several sent theirs on the Monday, accompanying them with a letter stating that, as the day fixed fell on a Sunday, it was conceived that they complied with the terms of the advertisement by sending on the Monday following.

On Wednesday, the 27th of December, Mr. Witherington, sen., sent a youth (who is, I believe, employed by him) to Mr. Marcus, the clerk of the Board, inquiring, on behalf of his son, what was the latest day for sending in plans, as the 31st fell on a Sunday, and there were conscientious scruples as to sending on that day. The answer of Mr. Marcus was that he could not go beyond the words of the advertisement, which Mr. Witherington must construe for himself, but that if (Mr. Marcus) would not urge the rejection of any plan if there were any conscientious scruples regarding the 31st. No other communication on this subject passed between Mr. Marcus and Mr. Witherington; nor did Mr. Marcus, either on that occasion or any other, say that "plans must be delivered before the 31st of December."

On Saturday, the 30th, a messenger from Mr. Witherington called at the Guildhall, told the hall-keeper that he had to bring something for the School-board, and asked at what hour it must be delivered. The hall-keeper replied that it had better be left by five o'clock, as he might be absent at a later hour. Nothing was said as to the "something" being plans for the Board schools, nor had the hall-keeper any authority to speak, nor any knowledge to enable him to speak, nor as a fact did he speak, on such a matter. The Guildhall was not named in the advertisement, which directed plans should "be sent to Mr. Marcus, clerk to the Board." There is consequently no foundation for the idea that Mr. W. S. Witherington told that he must send in his plans by five o'clock on Saturday, the 30th. The choice of the day was his own.

It is now complained that Mr. Day, on the contrary, called the Monday; but there is no more ground for complaint against him in this respect than there is against the other competitors who sent on that day; nor in my opinion is there ground for complaint against any of them. It was a point on which a difference of opinion might fairly exist, and none can doubt that those who sent on Monday did so *bona fide*, and in an open way.

All the plans were kept in the custody of Mr. Marcus, sealed as he received them, until the Wednesday morning, when they were opened in his presence and under his inspection in the north room of the Guildhall, in which room they were all seen by the Board before the admission of any other person.

I have confined myself strictly to a statement of facts, and those facts I have verified by a personal examination of the witnesses thereto.

G. W. HASTINGS.

HANLEY PUBLIC BATHS: COMPETITION.

Out of thirty-one designs submitted, twelve were in the first instance selected by the Committee, and were then reduced to four,—those of "Mark Well," "Bono Populi," "A Competitor," and "Well considered." In presenting these, the Committee recommended the plans of "Mark Well" for the first premium of 30*l.*, and those of "A Competitor" for the second premium of 20*l.*

Mr. Miller raised the point that neither of the plans could be carried out for the stipulated sum.

Mr. Cartledge said that the Committee had adopted "Mark Well's" plans as the cheapest and best exhibited.

The members having inspected the four sets of plans, and heard the remarks thereon of the surveyor (Mr. Lohley), Alderman Ridgway moved that the first premium be awarded to "Mark Well."

The motion having been seconded, Mr. Miller moved as an amendment that, before awarding the premiums, means should be taken to obtain tenders for the execution of the designs.

Mr. Hampton seconded the amendment. The amendment, being put, was negatived. The motion was then carried.

On the motion of Mr. Alderman Ridgway, the second premium of 20*l.* was awarded to "A Competitor."

The sealed envelopes accompanying the prize plans were then opened, and it was found that the first premium had been awarded to Mr. R. Dain, Hauley; and the second to Mr. Charles Lynam, Stoke, both local architects.

THE LEICESTER MUNICIPAL BUILDINGS COMPETITION.

If the information we receive from the spot be correct, we are not likely to hear anything satisfactory as to the proposed municipal buildings there for some time: the matter is quietly shelved for probably a year or two, until the old cattle-market is removed, when the question will be re-opened, and eventually the erection will be made on this site, and not the Friar-lane site.

Corporations, committees, Government, forget the obligations, moral and legal, they are under to the architects who respond to their offers in such cases.

EXAMINERS ON STANDING ORDERS.

Up to the eve of the opening of Parliament, Messrs. Frere and Robinson, the examiners, had got to No. 217 on the list of private Bills, which number 304 in all. Some of the Bills called, however, have been passed on to a future day for consideration.

Among the Bills that have been passed during the week affecting metropolitan communications is the South Kensington Railway Bill, in connexion with which Standing Orders are declared to have been complied with. This Bill is for a railway 4 furlongs 3 chains in length, commencing on the south side of the South Kensington station of the Metropolitan and Metropolitan District Railway, and terminating on the eastern side of the building which mites the Royal Albert Hall with the conservatory of the Royal Horticultural Society, in the parish of St. Margaret, Westminster. The land scheduled for this short line only amounts to two rods. The works will include 28,000 cubic yards of earthwork in soft soil, at 5*s.* per yard, 7,000*l.*; a viaduct or girder bridge, 2,000*l.*; culverts and drains, 500*l.*; covered way, 13,000*l.*; permanent way, 1,620*l.*, being at the rate of 3,000*l.* per mile; stations, 11,500*l.* These, with a few other items, and 10 per cent. for contingencies, make up a total of 45,000*l.* for the little more than half a mile of line. Plans were lodged on the 30th November for a competing scheme, under the designation of the Exhibition Subway. This project appears to have been abandoned, but the Temple Subway Bill, for a connection between the Victoria Embankment and Lambeth, under the Thames, has passed Standing Orders. It will probably be time enough to project additional subways when the capital has been raised and the works executed in connexion with the City and South-west Subway, already authorised, and with the Temple Subway, to make which, powers are now petitioned for. Powers are taken in the South Kensington Bill to underpin houses and buildings within 100 ft. of the proposed railway. Lord George Gordon Lennox, Mr. Richard

Baxter, and Mr. Alfred Rhodes Bristow are the first directors named in the Bill. Mr. Rammell is the engineer.

Of Bills relating to London some have been withdrawn, abandoned, dropped, have not paid the deposit, or from whatever cause have not had any one to answer for them when they have been called by the Examiner. Among these are the Metropolitan and Wimbledon Line from West Brompton to Barnes, which lodged its plans, copy of Bill, and complied with various other Standing Orders, but has passed for all (this into the limbo of dead infants. Another unexecuted call was that upon the promoters of the London and South-Western and London Chatham and Dover Railways Junction Railway Bill, for a working junction between Waterloo and Blackfriars stations. It was supposed that the Holborn Viaduct Station, the works at which have been commenced, would give an impetus to this project, but the junction will not be made for yet awhile. It has been stated by a contemporary, usually well informed, that "the plans have now been fully agreed upon" for the Holborn Viaduct Station. It is curious that the engineers for the erection of the station know of no "fully agreed upon" plans, although it is true that the works are in active progress.

Among the Bills that have passed Standing Orders unaltered is the London Street Tramways (Extensions, &c.), for the construction of tramways in Oxford-street, Holborn, and other principal thoroughfares. The opposition to this scheme is doubtless reserved for the committee or probably for the House, which threw out the same Bill last session.

The International Communication Scheme (Mr. Fowler's ferry) has passed Standing Orders, but the Continental Communication Bill (Newhaven and Dieppe) has been postponed to the 21st February.

SOCIETY OF FEMALE ARTISTS.

The exhibition, in Conduit-street, of works by members of this society, now open, includes 316 pictures in water-colours and 105 oil paintings. Amongst them are works by artists who have gained a position, backing up their less experienced sisters, who find here, by the exhibition of their works, incentive to further effort. Thus Mrs. E. M. Ward sends a picture of mark entitled "The Tower, ay, the Tower," No. 321 (two of her daughters, by the way, Miss Flora Ward and Miss Eva Ward, are following promisingly in their parents' footsteps); Mrs. Benham Hay, "The Prodigal Son" (350), a very meritorious work; Miss Louisa Starr, a powerfully-painted "Portrait of Mr. Frederick Murrable" (354); Miss Louisa Burgess Swift, a very elegant "portrait" of a lady (337), with other pictures; and Madame Jerichan "Penserosa" (357), and "Danish Fishermen."

Amongst the water-colour drawings, Mrs. Murrable's contributions make a considerable show; "The Old Yew-tree Walk, Clifden, Maidenhead" (81), is especially noticeable. Miss Marian Croft's landscapes have considerable beauty, but exhibit the too free use of body-colour. "Eaton College" (63) and "Bridge-street, Chester" (71), both by Louise Rayner, would "hold their own" in any exhibition. Miss Julia Pocock is in strength, and we have marked "Evening" (28), by Miss S. S. Warren; "Calculations" (74), by Miss Partridge; Miss Gastineau's "Near Ventnor" (100); Lady Duckett's "Sparrows and Barberties" (108); "Joan of Arc" (109), by Miss H. Thornycroft; "Mignon" (126), by A. L.; and, with an extra tick, "Early Frost" (211), by Madame C. Bisschop,—a charming work.

THE PEABODY FUND.

The annual statement of the trustees for 1871 has been published. First Trust.—Under this trust, five groups of buildings—at Spital-fields, Islington, Shadwell, Westminster, and Chelsea,—have been erected, affording accommodation, collectively, to nearly 600 families; and the trustees also possess a site at Brompton, on which they contemplate building. The accrued rents and investments of this trust, after deducting its administrative expenses, amounted, at the close of the past year, to 32,922*l.* 1*s.* 3*d.* This sum, added to the original fund of 150,000*l.*, makes the property of this trust now amount to 182,922*l.* 1*s.* 3*d.* Second Trust.—The second donation of Mr. Peabody, to the amount of

200,000*l.*, became available for building purposes in 1869, and to this sum will be added, in 1873, in accordance with Mr. Peabody's bequest, a further sum of 150,000*l.* Out of this fund were purchased the site at Chelsea, and the Magdalen Hospital estate at Blackfriars-road. On the last-named property, the buildings were completed in August last, affording tenement to 300 families, for which applications were and continue to be largely in excess of the accommodation available. Profiting by experience, the trustees have introduced into these dwellings a new style and system of construction, affording, at less outlay and without increased rents, greater comforts and conveniences to the tenants than in the buildings previously erected. The following is the financial statement of the second trust to the 31st of December, 1871: Debit.—Amount as per last report, 213,918*l.* 1*s.* 7*d.*; interest and rents since received, 7,305*l.* 12*s.* 2*d.*; less expenses of management, 238*l.* 3*s.* 2*d.*, leaving 7,067*l.* 9*s.*, total, 220,985*l.* 10*s.* 7*d.* Credit.—Land and buildings, 73,707*l.* 9*s.* 7*d.*; investments, 141,198*l.* 1*s.* 11*d.*; cash at Bank of England, 6,010*l.* 15*s.* 11*d.*; ditto in hand, 6*l.* 3*s.* 2*d.*; total, 220,985*l.* 10*s.* 7*d.*

STATUE OF THE LATE EARL OF DERBY.

The members of the Junior Carlton Club may congratulate themselves on possession of the statue of the late Lord Derby, which has been executed for them by Mr. Theed for the amount of their comparatively small subscription,—about 700*l.* It is a replica of the statue lately placed in St. George's Hall, Liverpool, of "heroic size," an excellent likeness, dignified and vigorous. The costume, the robes belonging to the Order of the Garter, is very elaborate, and is worked with extreme care and skill. By great good luck, too, the marble, so far as the front view is concerned, and which is alone of any consequence in the position the statue is to occupy in the inner hall of the club, is nearly spotless. In short, it is a very successful and admirable work.

A WORD OF A SORT WITH OXFORD.

OXFORD is celebrated for her University. She has been celebrated for that several centuries; but why has her "matter in the wrong place" never been mentioned? She can say without contradiction, "I not only have the finest and the greatest number of schools, but I have the largest quantity of mind, of any town or city in Europe." The tourist who visits this seat of learning is as much impressed with one characteristic as with the other; and if he desires to bear away a memento of his visit, there is nothing like Oxford clay. There is another memento he will be certain to take, against his will,—catarrh and every other complaint that marsh, bog, fen, mud, slush, puddle, stagnant water, and cesspool can give him, to say nothing of fever and small-pox. On the cast, south, and west sides of Oxford there are thousands of acres of water waiting to moisten the throat of Phobus, and a great deal of this water is above the level of the city; consequently it is, with the present system of doing it, impossible to drain the streets. The most surprising thing is, that these pestiferous floods are encouraged. What for? "Tell it not in Gath!" That there may be safe skating for the collegians. Hundreds of (perhaps valuable) lives are thereby sacrificed. Compare the toleration and encouragement of these floods and all their attendant evils with one of the coolest acts of Vandalism ever perpetrated. The most attractive feature in High-street was the noble row of elm-trees in front of Magdalen College. To the everlasting disgrace of Oxford, the delightfully unbragous and picturesque productions of ages have been shorn, lopped, and decapitated, till nothing but the trunks remain, and all this has been done lest one of the branches should blow off, and make some nervous old lady scream. Death may steal in and carry off its hundreds of victims; but it must not bodily snatch off a victim indiscreet enough to walk on the shady side of the street in windy weather. Aquarius may have its victims, but not Boreas. If there are any who read this so unsophisticated as to ask, "If Oxford is situated in a marsh, how is she to avoid superfluous water?" let such see what has been done at the sister University and in the fens of Lincolnshire, Cambridgeshire, and Norfolk, ages since.

On that side of the city where the denizens do not be amphibious, a new and well-built one is springing up,—a, and with giant strides; and, to judge by the style and build, both architects and builders have scoured the globe to lay the golden eggs. New premises, works, and houses testify that the scores of London contractors to whom quantities have long been pingers might look in upon the University at the advantage to themselves. They will only have to pay their workmen the same wages the owners of the latter received; and the houses they build will let well before they are completed, so anxious are people to find a dry spot. The authorities have been dreaming about no kind of sewerage for two or three decades. Our forefathers who founded and built the city were not “of such stuff,” and unaccountably fixed upon the worst site they could be found in England; still, as it cannot be changed of the site, it behoves the present generation to do what they can to make it fit for purposes superior to water-rats, newts, and snappers.

GARGOYLE.

SOME NOTES FROM DUBLIN.

A NUMEROUSLY signed memorial was brought before the Public Health Committee, praying for the suppression of the scavenging department set up by the corporation at Blackpits, a poor and overcrowded locality of the city. A resolution was passed, requesting No. 1 Committee to take immediate steps in abating the nuisance. The suppression of a similar nuisance was urged, existing on the north side of the city, the banks of the Royal Canal. Scavenging filth is likewise here deposited for the purpose of shipment. The Under-Secretary has replied that the Government cannot sanction the appropriation of the old prison at Cranebogman for the purpose of a convalescent house for small-pox patients, on their discharge from hospital. Other findings can be procured quite as suitable in Dublin.

The Club-house Green—a pleasant green near Kingston Harbour—will not now be appropriated for the purpose intended, that of laying a storehouse. The Lord-Lieutenant is understood to have personally interested himself in the matter. So the Royal Irish Yacht Club, and the visitors and residents of the fine watering-place, will have their little oasis grass preserved.

The Dublin Bridges and Quay Walls Bill is meeting a very strong opposition, and it is very doubtful if it will ever become law. The duty gentry and ratepayers held a meeting, convened by the High Sheriff at the Court-house, Kilminkham, for the purpose of protesting against the Bill. By the provisions of the Bill, the county would be included in the area of taxation for the maintenance, rebuilding, and repair of the Dublin bridges and quay walls. All the speakers severely criticised the Bill, and the conduct of the corporation, thinking that it would be a great misfortune for the county if the control of its finance were handed over to the corporation of the city. Lord Talbot Malahide said, in the course of his remarks,—

“I admit that I have a considerable amount of corporation for the ratepayers of the city of Dublin. I view they are heavily taxed, and that they do not get the worth of their money; but if they are badly used it is their own fault. If they were to organise a corporation which would be worthy of the name, and instead of wrangling among themselves, and turning the council chamber into a debating club for discussing sensational political questions, would consider the interests of those whom they represented, we should have the city of Dublin in a different state from what it now is. It has been authoritatively stated that it is the dirtiest in Europe, and, from a considerable acquaintance with the city, I think I may confirm the statement.”

Often has the *Builder* said in substance what Lord Talbot de Malahide has at last openly given expression to.

Nearly five years ago the city engineer brought up a report on the question of erecting open abattoirs in the city for the slaughtering of cattle. He stigmatised the then existing slaughter-houses as the most filthy that could be imagined. They are the same still, and are situated in over-crowded neighbourhoods. The corporation have almost rested on their oars since 1867 in the matter of abattoirs. They are now about affording a licence to a butcher for the maintenance of one in Marlborough-place, a most crowded neighbourhood; and though it is protested against by some of their own members, and by some of the merchants and gentry, they are determined to have their own way. It is within the province of the Lord-Lieutenant to

interfere when any of the Sanitary Acts are infringed by the neglect of the corporation, or when it refuses to carry their provisions properly out.

The corporation are about appointing their present borough engineer in future as consulting engineer, and supplying his place by an assistant engineer. They allege that the time of the former will altogether be absorbed in future for several years with the work of the main drainage. What is the use of putting the city of Dublin to the expense of a main drainage, by intercepting sewers, if the sewage is to be cast into the Bay, after intercepting it in the first instance from passing into the river.

The Limmer and the Val de Travers Asphaltic Companies are pushing hard for precedence in laying their pavement in Dublin. The corporation are not disposed to indulge in the luxury of the Cheapside material to any great extent, or of any other asphaltic material, unless they can get the inhabitants of the streets desiring this new roadway to pay two-thirds of the first cost of laying.

Building operations are not at present very brisk in the city, but with the opening of the spring an increase of new works is anticipated, in addition to those already in hand or projected.

THE MOOR-STREET STATION, BOLTON.

Sir,—I recently saw an extract from your valuable paper in which it was stated the London & North-Western Railway Company were building a new station in Great Moor-street, Bolton, &c. I beg to say, as a person passing the ground in question, they are doing nothing of the sort; they only ought to be, and the reason why I think I can guess. They have begun the station (new), and have, after getting the street and all around into the most filthy and disgraceful state, suddenly stopped, owing, I suppose, to the amalgamation which they intend with the Lancashire and Yorkshire Railway Company; but I think they ought not, for some three or four months now, to leave the public in such a mess as they are doing, whether they can get their Act or not, and I for one should be glad if you would just give them a quiet little paragraph in your truly valuable paper to that effect. J. H. HOWARD, A Shareholder in both Companies.

THE TEMPLE OF DIANA OF THE EPHESIANS.

THERE appears to be every probability, or to speak forth bluntly the truth that is within, there is no longer room for reasonable doubt that the site of the great temple of Diana of the Ephesians has at last been determined by the judicious perseverance of Mr. J. T. Wood; the production of unequivocal remains of the building, and associated, moreover, with inscriptions as decisive, settles many a controversy. It may naturally be expected to open many more,—some, perhaps, that the outside world need not care to take part in till they have run their course, been argued out on all sides, and the issues cleared upon which general opinion may at last be fairly appealed to to declare itself. Then they who did best service will have been clad in cordial recognition. But even now there is little risk in expressing an opinion that the precise site ought not to have remained quite so long the secret that it certainly was up to the time that it was studied by the architect now on the spot. It seems only too clear, indeed, for the self-complacency, not to say composure, of some of us that the enigma in the terms it was stated did really include its own solution, and that comparison and analysis of the notices of ancient geographers and antiquaries only required to be somewhat more sagaciously conducted for all to be agreed at what spot the spade might be put in with all but certain hope of success. Put in it has at last been, with success the more creditable that the explorer did not come right by mere process of exhaustion, leaving no other opportunity for error or opening for research, but in virtue of reading off for himself with better skill the meaning of conjoint topographical and literary evidence. A conviction that was held to justify was duly vindicated by the resolute removal of 18 ft. of solid earth; and then back again after buried centuries the long-hoped-for testimony of the lower frustum of a column in position was brought to view of men, and to the light of now photographic day. Beyond the voracious and verifying photograph few details have at present reached this country, but the difficult excavation proceeds, in the meantime, it may not be without interest to pass in review the notices that have come down to us respecting the architecture of the temple of the great goddess Diana,—Artemis of the Ephesians: the pains will not be thrown away even should excavation

when it has done its best be rewarded with better success than, all difficulties considered, can be hoped for by the most sanguine. The precedent of the Mausoleum instructs us how vexatiously fortune will sometimes give much, indeed, to well-directed endeavours, and yet keep back the one or two evidential relics that would settle the last difficulty, and how ruins of the original monument may owe as much illustration to literary fragments as they confer. Let us weigh then the literary evidence that we have independently, and so be prepared to appreciate at once the full significance of whatever is brought up from below the ground; no doubt it would be agreeable to find that we are still in time to vindicate criticism from the opprobrium of only discovering after the monument is produced that it had been in possession of some main conclusions all along had it only had the dexterity to elude them. It is likely we may have to be satisfied with much less than this; with evolving, for instance, a distinct inconsistency between the several notices, and thus between the plans of restoration that are severally compatible with the conflicting authorities; with gaining a firm conviction of no more than the probabilities from general consideration of the seat of error,—of the possibilities of errors on all sides,—of the vitiation by inaccuracy of every notice more or less; and so we may find ourselves left at last fain to work out a result avowedly conjectural as based upon one most isolated avowal of an ancient writer, of whom it is only conjectured at last, not proved, that he knew anything about the matter, or that his words—if he had knowledge—have come down to us accurately.

And, then, it is quite possible that the restoration which evinces itself in the course of such an inquiry as beyond comparison the most probable by the evidence, may, after all, be proved wrong by the result of excavation. The highest probability remains still but a probability, and does not amount to warranty of absolute truth,—let this be ever a check to the positiveness of speculation,—but, still, much is done if the matter of highest probability can be established legitimately by the evidence. A true conclusion from false premises,—a correct restoration that is inconsistent with the grounds assigned for it,—we may value as Socrates avowed he valued the guidance of the man who only thought he knew the way to Larissa, though he did, ignorance notwithstanding, happen to take the right road and get there.

One other motive for this review of the evidence may be mentioned: although the result may only be a hypothesis, a hypothesis,—the best to be had,—is always of use to an explorer,—and this exploration, if supported as it should be, will not be brought to an end in a day;—it, at least, suggests what questions may be most reasonably put first,—gives a reason for striking in one direction in preference to any one of a multitude of others that are open: it is scaffolding that is not the less useful because constantly changed and altered and very unlike indeed to the structure to which it gives up its place at last. Neglecting, then, the notices that bear exclusively on the position of the temple,—a matter settled,—let us gather up the scattered hints as to construction, dimensions, and style,—and, as very materially affecting style, the date of the temple.

The temple that we are concerned about was in process of completion when Alexander passed into Asia, B.C. 334, in succession to one that had been set on fire on the very night of his birth, B.C. 356. He offered, we are told, but in vain, to defray all past expenses, and undertake all that were to ensue, on condition of being allowed to inscribe it as his dedication. This coveted honour was conceded for the Temple of Athens at Priene; and the stone that bears what is almost equivalent to the autograph of the great Macedonian is now to be seen in the British Museum, presented by the Society of Dilettanti, among other produce of their recent excavations. Strabo states that the temple of his day was an improved reconstruction,—was, in fact, this same reconstruction of that burnt by Herostatus. He adds, what is most important, that, besides private contributions, including personal ornaments of the women, some funds were realised by sale of the former columns, as proved by decrees, that, perhaps, may still reappear among inscriptions from the ruins. The conflagration of St. Paul's without the walls, in our own time, well illustrates what mischief fire might work on such a structure. It therefore appears that the improvement intimated

extended to the entire order; and we may safely assume the order of the temple that existed long after the time of St. Paul to be a work of the same fine character and in the same general taste as the contemporary Ionic structures, the temple at Prieno and the Mausoleum at Halicarnassus; and any scheme of restoration must be subject to certain control in unison with this fact, and may hope for furtherance from its due consideration.

Strabo distinguishes three forms of the temple; the original of which he names Chersiphron as the architect; the enlargement of this by an architect unnamed by him; the reconstruction after ruin or damage by the incendiarism of Herostatus, and with enhanced beauty by an architect whom he reports hesitatingly as the Chalcroetes (q.v., read Democrites), who laid out Alexandria.

From the hesitation with which he speaks as to the latest architect, we must not count too strongly on his knowledge who was the first; otherwise, when accuracy is in question, he is not an author to be lightly set aside out of regard for Pliny, who implies (xxvi. 14) that it was Chersiphron who was the architect of the last reconstruction.

But Pliny is supported here by Vitruvius, who speaks of the existing Ephesian temple as commenced by Chersiphron of Gnossus and his son Metagenes, and only completed by a Demetrius and Pæonius of Ephesus. It is thus clear that we must correct Pliny's text in another place (ii. 37), and read Chersiphron of Gnossus, instead of Chersiphron, to whom he ascribes the "admirable fabric of Ephesian Diana." The limiting date of this school of architects is further approved by the notice of Vitruvius that the same Pæonius, in conjunction with a Daphnis of Miletus, built—so far as it was ever built—the temple of Apollo at Miletus, a rival in magnitude to the Ephesian. The Gnossians, father and son, left a treatise on the symmetries of their Ephesian design. There is deeper significance than can be dilated on here in the observation that Greece at this date could be under obligations for artistic help to Crete,—to Gnossus, home of, at least, semi-mystical Dædalus and his artist clan,—of Dædalus, architect, even according to Homer, of the broad dancing-place of Ariadne. The literary works have perished; the architectural illustrations to a certain extent remain, and may yet give us back whatever was of chief importance in the written text.

Pliny states that the temple—which evidently to him is one and the same through all its transformations—was in course of building for 220 years, which, reckoned back, carry us from the date of Alexander's visit, and its final embellishments, to the time of Croesus, king of Lydia, and a distinctly marked epoch in its history, inasmuch as we learn from Herodotus that he contributed some columns. When Herodotus wrote, the Heraeum of Samos was the largest Greek temple that he knew (i. 60), although he pairs with it the temple as then existing at Ephesus (ii. 148) as a marvel of magnitude; the enlargement, that gave unquestioned supremacy to the Ephesian, was, therefore, later than his time. The only hint that I know for dating this extension more exactly, and not too much to be relied on, is, that it may have taken place after that conflagration of the temple that occurred as late as some sixty years before Alexander,—in the same year as the death of Socrates (B.C. 399).—(Euseb. Pamp. Chron. Cam., i. 134.)

Whatever temples may have preceded that which Herodotus knew, there cannot be a doubt that his occupied the site—and the site newly cleared—of the structure that we are interested in.

The vast Heraeum of Samos known to Herodotus must be carried up to the time of Samian prosperity and power (500—580 B.C.), the age of Polycrates and Croesus. He gives the architect's name, Rhœceus; he was also a distinguished sculptor. Diogenes Laertius states that Theodoros, son of Rhœceus, supplied the counsel to lay the foundations of the Ephesian temple on charcoal, as suited to resist the moisture of the ground. Theodoros, according to Vitruvius (Pref. vii.), left a work upon the proportions of the Heraeum, which was in the Doric style; and it seems most probable that the Ephesian temple at which he assisted was in the same,—that the columns therefore that Croesus contributed and that were sold at the rebuilding were Doric columns. There seems to be no reason for disallowing a prose treatise at this date, and resorting to some supposed second Theodoros.

The date assigned corresponds with Livy's

notice, which is, at least, evidence as to his belief, that about A.U.C. 157 (= B.C. 557) there was a temple of Ephesus built by contributions of the various states of Asia, and forming a centre of concord and alliance. Contributions of this nature—it may be said in passing,—the dedication of columns by the King of Lydia,—the custom for Asiarchs to be selected for honour on account of wealth, and to contribute—to have to contribute—liberally to public funds,—these may be the matters of fact represented, and no more by Pliny's strange notice that the 127 columns of the temple were presented by as many kings.

Pliny also has a notice of the expedients employed in providing a foundation for the enormous structure in a soft and marshy situation. The situation, he says, was deliberately chosen as a security against shocks of earthquakes and openings of the earth; otherwise, it may easily have been that the sanctity of a precinct of the goddess, who ever affected freely-watered groves and meadows (see E. Falkener, "Ephesus," p. 199), may have left the engineers no choice. The account given by Herodotus of the great works of engineering at Samos,—tunnelling through a mountain and vast mole of the harbour,—explains the resort to Samos for advice in a difficulty even greater than Stephenson had to cope with at Chat Moss. "To preclude sliding and instability," says the naturalist, "they laid down first a bed (beaten or trodden charcoal, and upon it fleeces of wool)." It seems just possible that this notice may cover an original fact of the use of charred plies; otherwise the fleeces of wool might have been laid down to more manifest purpose at first.

Of what solidity was the preparation made for the superincumbent weight we have a notice in the fragment that alone remains of the description of this wonder of the world by Philo ("De Sept. Orb. Mir.") "When the soil had been dug out to a great depth, and an immense excavation effected, the architect laid the foundations with stone from the quarries above; so that in these subterranean works he exhausted the quarries of entire mountains. The ground being thus rendered firm by a solid foundation, and strengthened to support, like an Atlas, the superincumbent building, he commenced the work by forming a basement of ten steps." Any exaggeration there may be in these expressions we shall find to have been invited when,—the basement thus prepared,—we proceed to the verified dimensions of the superstructure.

The dimensions of the entire temple (*universo templo*) are given by Pliny as 220 ft. by 425 ft. These measurements of front and flank present themselves, in the first instance, as probably those of the top step or stylobate, which in itself is the most natural and seems to have been the most usual standard of relative magnitude; but they may be those of the lowest step, which there was a motive for quoting in preference, in order to give the wonder of the world the advantage of the highest numbers obtainable, and the comprehensive phrase of Pliny would be justified by this interpretation. We have therefore to work out the consequences of each assumption in turn in connexion with whatever other information we possess that affects the question. There the numbers stand, and we must take them as authentic to begin with; it will be time enough when we find that the plan and proportions of the temple are not to be consistently brought out by them,—to consider which dimension is most likely to be erroneous on general grounds,—and what modification will bring out the most plausible result either as requiring least change or from satisfactoriness in itself, considerable change notwithstanding. We may, however, be more fortunate than to be driven to such straits. The further notices to be had regard to are these:—Pliny (xxvi. 14) states that the height of the columns was 60 ft., and the weight of the epistylia,—the architrave stones,—enormous; the number of columns he gives as 127, "made by as many kings," of which thirty-six were *celatoe* (sculptured in relief); one by Scopas. Pausanias confirms the extravagant magnitude of the temple, which, he says, surpasses in this respect all other constructions of mankind (iv. 31, 8. Cf. vii. 5). I must be driven to sore straits indeed before I can consent so to read Pliny's Latin as to gain a reduction of the columns to 100 with Fergusson or to 120 with Falkener by a supposititious comma before *viginti* or before *septem*.

Vitruvius states that the temple was of the

Ionic order, and octastyle and dipteral on either end, and having double rows of columns on the fronts. Philo, *de Septem. Orb. Mirac.*, states, as we have seen, that the temple was raised upon a basement of ten steps; but there is a possibility,—not, I think, a probability,—that he refers to a detail of an earlier temple that may have been changed in course of enlargement and restorations. It is possible also,—again, I think, not probable,—that the ten steps are to be reckoned exclusively of the top step or proper stylobate.

The full breadth of front of an octastyle temple is made up of seven columniations, plus the distance from centre of angle column to margin of steps, and the breadth of the steps of either end; understanding by the term columniation an extent from centre to centre of adjacent columns. Fergusson allows 11 ft. for the sum of the two half bases and margin, and 30 ft. for the spread of ten steps, 15 ft. on either side, which is a liberal allowance at least, as there may probably have been only nine treads to be accounted for, in consequence of the stylobate reckoning as a step. This leaves 178 ft. divisible by 7 ft., and brings out 25 ft. 7 in. for the columniations. It is by an oversight that he notes this interval relatively to his estimate of diameter of the column, as corresponding to the eustyle spacing, which prescribes an intercolumn, not of 3½ but only of 3¼ diameters.

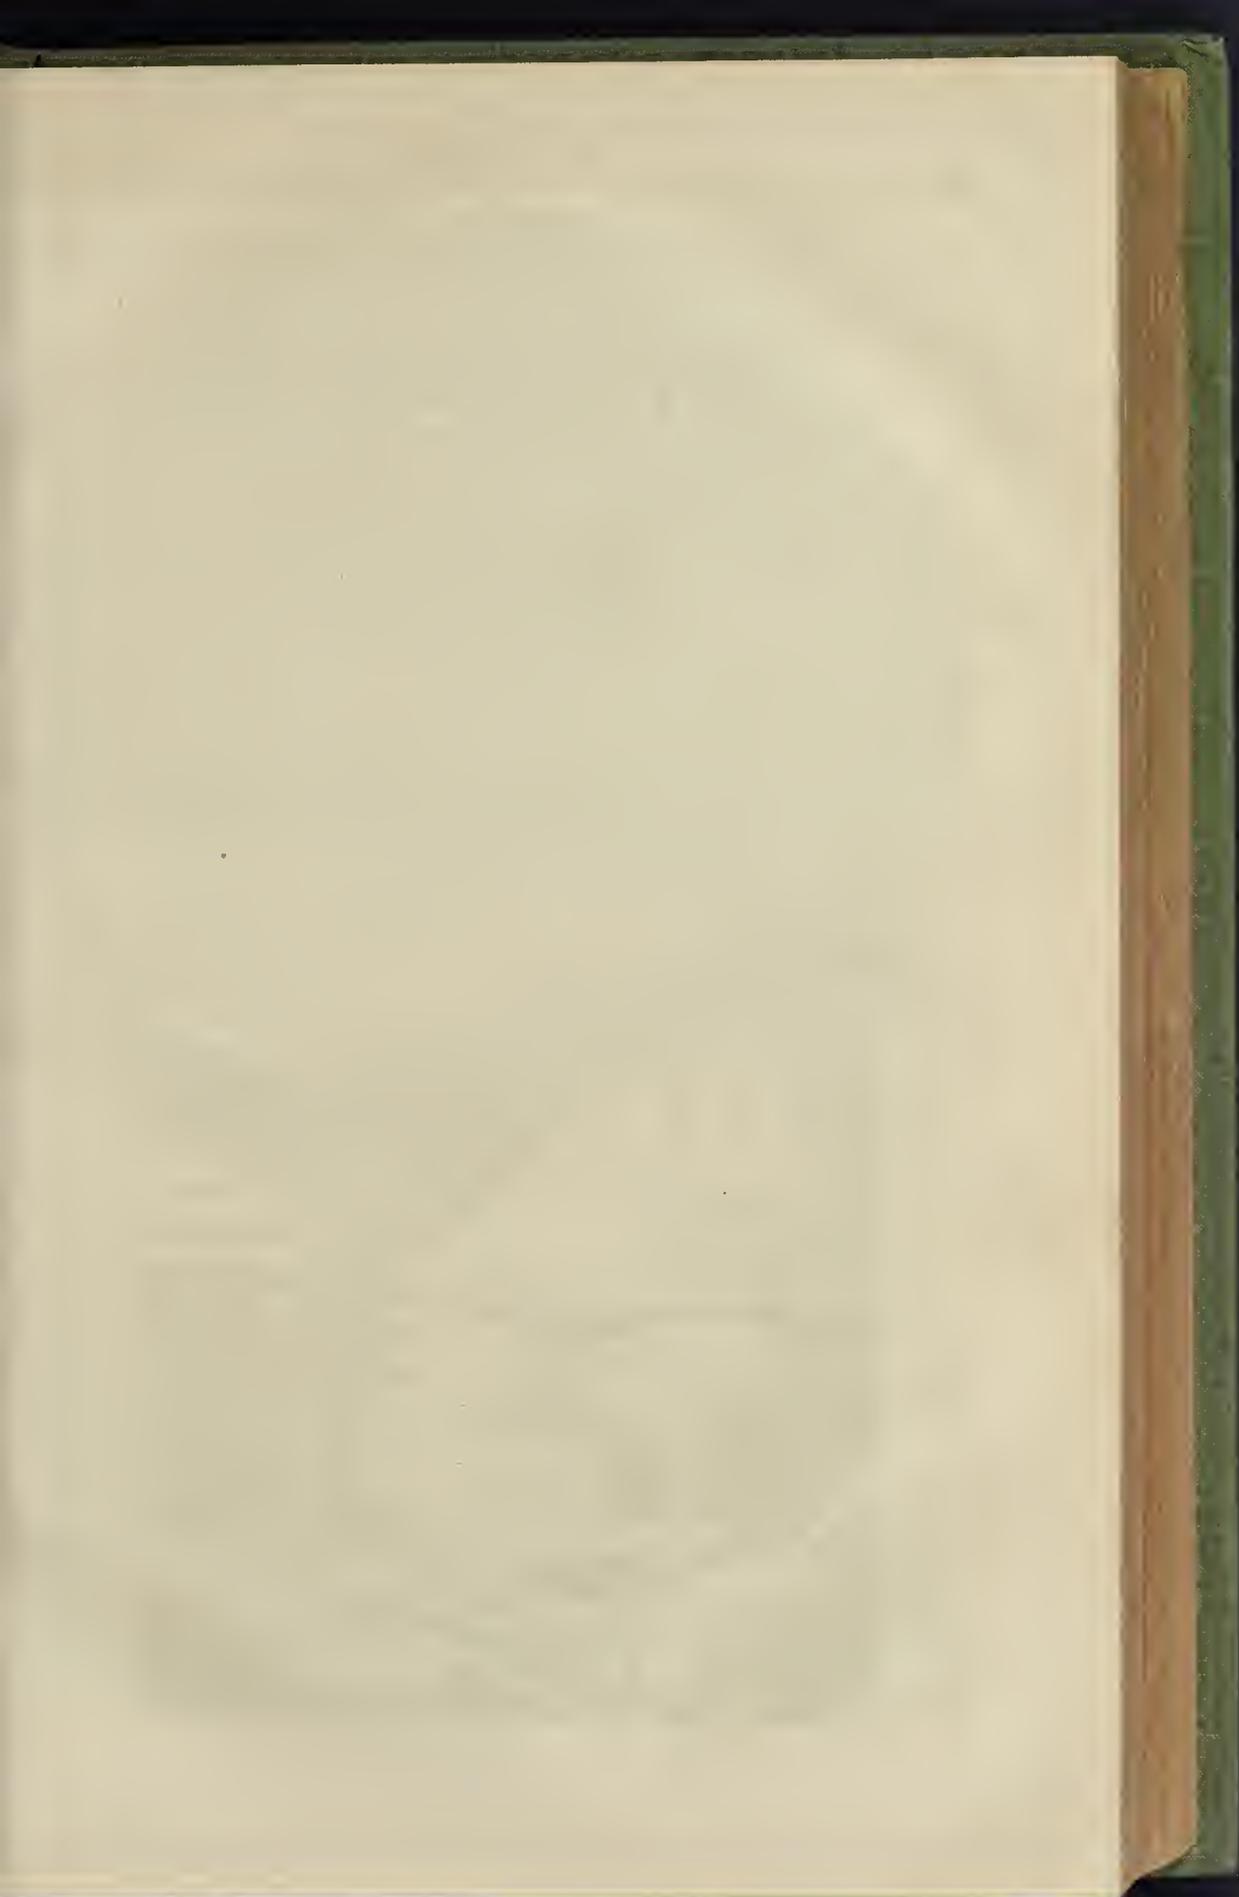

What is of more importance is, that we cannot possibly admit such an extravagant scantling for intervals by the score, as 25½ ft. With every consideration for the value to be assigned to consenting ancient testimony as to the magnitude of the structure, especially to the explicit account of Pliny, as to the difficulty of setting the enormous architrave stones upon the columns, we must demur positively to such dimensions in such multitudes. The architrave stones of the Parthenon are but 14 ft.; the single triglyphal span of the Propylæa, 18 ft.; that of the colossal temple at Miletus, 17½ ft. This temple, unlike the Ephesian, was never finished, but from its scale may well have been designed to be a rival; its proportions deserve more consideration here, not only because Iro is a notice that one of its architects, Pæonius, had been concerned in building or restoring the Ephesian temple, but from the height of its columns, as measured, being 63 ft. to compare with the 60 ft. of Pliny. The columniation of the Temple of Jupiter Olympius, of Athens, is 18-176 (the columns, 55-225). Only the angle architrave stone, which is exceptional, as entirely covering one capital, is 21-68 (3-438 by 4-1); it is the largest now found in construction at Athens, and weighs about 23 tons (Penrose). Only four such would be required for the structure. It is manifest, therefore, that we must give up a scheme of restoration that would apply the undiminished 220 ft. of Pliny's full breadth to the upper step of an octastyle front.

Edward Falkener, in his elegant and comprehensive volume on Ephesus, has taken the alternative of interpreting the Vitruvian passage, with a rather rash variation, and worked out a decastyle plan with surprising ingenuity and plausibility also; but here again the fatal difficulty is overlooked and passed over of assuming such a span for the architrave stone as 23-63 ft. It can scarcely be admitted that we have a legitimate option to exceed the spacing of the cited examples at Miletus or Athens; even if we strain probabilities so far as to adopt 19 ft., and allow 9 ft. for plinth and margins, we have still 20 ft. on either side, divisible among ten or more, probably only nine treads (19 × 9 + 9 = 180 + 40 = 220 ft.).

No doubt when we renounce the reference of the given dimensions of plan to the stylobate immediately and accurately, weary by no means bound to assume that they were taken upon lines of equal projection beyond it on front and flank. The steps may easily have had a further extension in one direction than the other; there is a precedent in the Ionic portfolios of the Society of Dilettanti. The ascent of as many as ten steps may, indeed, possibly,—in my own opinion probably in the highest degree,—have been interrupted by some wider step or platform. Such a probability at once affords a means of extrication from difficulties of extravagant spacing to advocates of either arrangement; but we are bound by the record to give the benefit of relief to the octastyle arrangement in the first instance before entertaining the decastyle that is in the position of an uncertificated pretender.*

THE CHAPTER-HOUSE OF WESTMINSTER. — As Restored by Mr. G. G. Scott, R.A., Architect

[See p. 98, ante.

MR. STREET AND THE NEW LAW COURTS.

SIR,—Mr. Street's recent pamphlet is neither so accurate nor so complete as it ought to be. Smarting under Mr. Fergusson's caustic account of his appointment, he seeks consolation in an endeavour to damage Mr. Barry; and as he could get no help in this attempt from any one of the facts of the case from the beginning to the end, if fairly stated, he—well, he does what no one ought to do, least of all one who assumes so lofty a tone of rebuke when dealing with his critics. It appears that the report of the sub-committee of lawyers upon the competing plans happened to be less favourable to Mr. Barry than to other competitors, but it also appears, though Mr. Street does not tell us so, that the Judges of Designs for whose use the report in question was made, did not indorse the view of the committee, but, on the contrary, gave Mr. Barry's plan the first place. Fairly stated, therefore, the fact of this committee's disapproval could afford Mr. Street no help in his attack on Mr. Barry. He consequently proceeds to manipulate the matter, and produces the astounding statement that the inquiry conducted by this committee was "the most important of all, as the final plan had to be founded on this very report to the exclusion of all others." "With sorrow for the writer," I have simply to say that this is not true. If it were true, surely the competitors would have been made aware of it. They would have been told that everything depended upon their satisfying this committee; but I doubt if the competitors knew until after the designs were sent in that any such inquiry was to be made. I believe that the first hint they had of the existence of the committee was in your pages, where a correspondent called attention to certain curious proceedings of the said committee, wherein an entirely new set of tests was proposed to be applied to the competing plans. It is well known that the committee did apply their new tests, and having first of all, and after seeing the designs, resolved definitely on certain all-important questions which had been left open in the instructions to the competitors, they proceeded to award the first place to the only plan which completely met these all-important questions—Mr. Waterhouse's. I am not in the least concerned to dispute the wisdom of their award. I simply state the fact as to the result of their inquiry. But, as already remarked, it was quite a subordinate inquiry after all. Their report, in company with others, was submitted to the judges of designs, who, whatever they did, certainly did not endorse the opinion of the lawyers. What, then, becomes of Mr. Street's statement? Moreover, if that statement were true, it would imply that the authorities had arrived at a foregone conclusion to accept no decision from the judges of designs which did not coincide with the opinion of this committee; and it may be that this is so. Certainly the final result is that the lawyers have to a great extent gained the day. They have got the plan, if not the man, they approved; though reading Mr. Street's pamphlet, one is left to suppose they have got both. Indeed, I think we have a right to complain of the disingenuousness of all Mr. Street's remarks about the plans. He quotes the clauses of the instructions to the competitors, which point out the paramount importance of arrangement and convenience of plan, and then so introduces his present plans, and the hearty approval given to them by the late lamented Mr. E. W. Field, as to create the impression that his plan has gained him his appointment. One is compelled to view the matter in this light because he is replying to Mr. Fergusson, who says he was appointed because his plan was "the worst." Now, every one knows that Mr. Street's plan was nowhere in the competition, and that his present plan is Mr. Waterhouse's. I have no doubt that this latter fact is the key to the hearty approval by the late Mr. Field, of which Mr. Street tells us. Why will he not make his statements complete?

I will say nothing on the question of style; but I will say this. Let not Mr. Fergusson nor any enemy of "higgledy-piggledy" lose heart. Mr. Street is, to compare small men with great, somewhat like Mr. Gladstone in one respect—he shows a great facility for being converted. Some people do not think so. I do; and, as the Attorney-General says, "I will tell you why." When the decision of the judges of designs was impugned by the unsuccessful competitors or some of them, Mr. Street was quite clear that

the decision was good, and that it would be rank dishonesty to upset it. When he was appointed sole architect, he did not think it rank dishonesty to accept and leave Mr. Barry out in the cold. *Voilà* conversion No. 1. When appointed, he threw over his own competing plan, and appropriated Mr. Waterhouse's,—conversion No. 2. Then came the famous battle of the sites, when he began by advocating Carey-street; but when Mr. Lowe, the purse-bearer, took the field at the head of the enemy, Mr. Street showed his gratitude to his friends the lawyers, who like his plans so much, by deserting them bag and baggage, and going over to the Embankment,—conversion No. 3. The lawyers gained the day, and the purse-bearer, vanquished, had to return to Carey-street, with the recalcitrant Mr. Street in his train. As that, however, may have been an unwilling journey on Mr. Street's part, we will not count it as conversion No. 4.

The conclusion I draw from this little truthful history is of a nature which ought to be consolatory to Mr. Fergusson. To get a satisfactory building for the Law Courts it may not be necessary to change the architect, but only to change his views, and the purse-bearer will do that for us in a trice. Report says that he is not at all unlikely to give us a proof of his power.

PLAIN-SPEAKING.

ASPHALTE AND ITS PROGRESS.

A CORRESPONDENT acquainted with this subject writes as follows:—

Mineral-rock asphalt was first introduced in England about thirty years ago; and from that time until lately materials were imported, and works executed, to any large extent, by the Pyremont Seyssel Company, and by Messrs. Armani & Co., only. The merit of this impervious and plastic material was comparatively little known and appreciated by architects and contractors, though as well adapted for flooring, flats, roofs, stables, granaries, warehouses, &c., for the prevention of dampness and vermin. The advisability of using asphalt, mineral or factices, for roadways, with the great traffic of London, is a question still to be decided, and only time and trial of the various sorts will resolve the question.

The asphalt of Val de Travers, for roadways, as in the Poultry, Cheapside, and Holborn, in its natural state, warmed, spread, and compressed, was first introduced in England in 1853; and the list of prices at that time shows for 1½ in. thick, only 1s. 5d. per foot super., or 12s. 9d. per yard. The City paid 18s., and afterwards 16s. per square yard, for the Poultry, &c. The experiments and samples made in that year left doubts as to its efficiency in all respects.

The asphalt powder of the Val de Travers Mine, being rich in bitumen, is well suited for roadways made with it; but it still remains to be seen how it can be well applied and utilised, in its warm and compressed state, so as to obtain a uniform, levelled surface. Wear and tear are also a difficulty. The specimen in Holborn was laid down at 2½ in. thickness; and now we have remarked on pieces taken up for repairs that it is reduced to nearly 1 in., by the continual heavy pressure.

Reserving for the future opinion as to what has yet been done, we feel strongly the sanitary and economical advantages of smooth and impervious street surfaces.

The old firm of Armani & Stodart, having transferred their business to the General Asphalt Company, Limited, and that company having entered into large contracts with the London Tramway Company, for asphalt paving of roads, have nearly finished five miles in Camberwell and Peckham parishes. Over 6 in. of strong concrete, they spread some fine broken granite, and fill and mix it up with asphalt, which they call "McAdam Asphalt," and on the top they lay a coat, 1 in. thick, of Seyssel asphalt, from the mines of Gardie Bois, Lovagny, and other natural mineral asphaltes, mixed with mineral tar. They employ a new machine, drawn by a horse, which they call "Locomobiles," which brings the materials hot and ready to the works, and thus prevents the smoke and smell arising.

However the question of using asphalt for roadways may be decided, we are convinced that good, natural, mineral asphalt may be properly and efficiently used for footways, and the attention of parish authorities may very properly be called to the subject.

Very few specimens, until now, were laid down for footpaths, but the General Asphalt

Company having obtained permission of the Board of Works to lay down their asphaltes on the footpaths on the south side of the Victoria Embankment, leading to Blackfriars Bridge, we shall have opportunity for judging.

We shall not enter on the merits of the various quarries of asphalt, but in all continental Europe there are not less than fifty-two mines or quarries, with more or less rock stone, mixed with bitumen, varying from 3 to 12 per cent. These quarries are situated—fourteen in France and Savoy, four in Switzerland, eleven in Prussia, Hamburg, Alsace, and Lorraine; eight in Austria, with Hungary and Dalmatia; nine in the kingdom of Italy, three in Spain, one in Portugal, two in the empire of Russia and Poland, and some are placed at too great a distance to be conveniently worked and imported. There are already formed twenty-four companies, limited, with capitals amounting to the large sum of 3,570,000l. sterling, but as yet only three or four of those companies have commenced operations.

COMBUSTIBLE BUILDINGS IN THE CITY.

SIR,—Can you give me and the public at large any information as to what the powers are that enable the City folks to permit wooden and inflammable structures to be put up close to the highway, while in the rest of the metropolis no one is allowed to erect a wooden outbuilding, even at the bottom of his own back-garden? Some time ago a large wooden and canvas structure was put up at the corner of Ludgate-hill and Bridge-street, Blackfriars, and now another wooden shop for the sale of tea sports its ugliness to thousands on their way to and from the railway-station, close by the last-named. Perhaps it is intended to fill up the plot of ground with a row of these unsightly and dangerous booths, close to the footway, and only waiting to receive a spark from one of the engines continually passing just over them to convert the lot into a glorious blaze of triumph. With your aid probably such a calamity may be prevented. Who is responsible for these irregularities?

Y.

ALL SAINTS' CHURCH, MAIDSTONE: MEDDLING.

SIR,—An offer has been lately made and accepted to supply stained glass to the east window of this church. The window is large, and the offer liberal. But the donor, or his professional adviser, or glass-painter, is not content with supplying glass: he proposes to demolish the present window, and rebuild it, or build another with similar tracery, 5 ft. higher.

In the history of the church, by Mr. Whicford, that architect observes,—"Perhaps few single buildings possess more completeness and uniformity than this church: one general idea is prevalent throughout, with a correspondence of parts, proportions, and details very uncommon in Middle-Age structures."

Now, the person who has the present job in hand seems to be of opinion that he knows better than the architect of All Saints', Maidstone, and that the completeness, uniformity, and general congruity of the building are not to be considered in comparison with the improvement his patch will make.

The present east window is in excellent preservation, and therefore presents no excuse for destruction on that account.

Surely such a tampering with an old church is a pitiful vanity, a wanton barbarism, and an impertinence to architecture. A. LEHASE.

THE SEWAGE QUESTION.

A REPRINT has appeared of the "Report of the Committee on the Treatment and Utilisation of Sewage re-appointed at Liverpool, 1870" (Taylor & Francis, Printers, Red Lion-court, Fleet-street), read at the meeting last year of the British Association in Edinburgh. It contains an account of several of the chief sewage experiments, such as those at Breton's Farm, near Romford; of Beddington Farm, Croydon; Norwood Farm; the Sewage Farm at Tumbidge Wells; the Redhill and Reigate Sewage Farm, &c.; also of the Dry Earth System, and its impracticability for cities and towns. It also gives an account of how the wind was taken out of the sails of the sensational Dr. Cobbold, who horri-

fied the public with his parasites in oxen fed on sewage farm produce. The Liverpool Committee took this bull by the horns, presenting the doctor with an ox for slaughter and examination after being fed for twenty-two months on the Breton Farm produce. This examination was made with the aid of Professors Marshall and Corfield, and in the presence of several members of the committee (which includes Professor Anstod, F.R.S., Mr. Bailcy Denton, Dr. Odling, Sir John Lubbock, F.R.S., and other scientific men). Dr. Cobbold had to confess "the perfect freedom of that animal from parasites of any kind." In his explanations he says, "The sewage had a strong smell of beer, suggesting the presence of sufficient alcohol to destroy the vitality of all ordinary parasitic germs." We should think this must have excited some sensation amongst the distillers.

INDIVIDUAL PROVIDENCE FOR OLD AGE AS A NATIONAL QUESTION.

A PAPER on this subject was read at the Society of Arts on the 31st ult. by Mr. George C. T. Bartley. The Earl of Derby was in the chair.

Mr. Bartley drew attention to the means which now are in active operation, and are understood more or less by the industrial classes, for encouraging habits of providence, and how they are made use of; showed how they fail to provide for old age; pointed out the means which do exist for enabling a man to put by, in small weekly sums, for old age; and treated of the means which it seemed to him should be taken to encourage providence for old age, and to make known among all classes the facilities which exist for this purpose.

He suggested the formation of an association whose work should be to promulgate information as to the best means by which the wage-classes, domestic servants, &c., can put by weekly sums to provide for old age; to make known more generally the advantages offered by the Post-office by purchasing deferred annuities and life assurances by weekly and other payments; to facilitate the means of collecting such small weekly sums by inducing manufacturers and employers of labour to open, on their premises, offices for the receipt of such sums as arranged for by the Post-office; and generally to endeavour to create habits of providing against old age and possible premature death among those earning small wages. It should not, said Mr. Bartley, give relief in any form, or be in any way of an alms-giving character, but should more fully make known among all, by means of lectures, addresses, personal intercourse, and other means, in all parts of the kingdom, the facilities which exist for enabling a man to provide for himself in proportion to his earnings, in the best manner, as in allowing a regular weekly deduction from the wages, and at the smallest possible sacrifice compatible with sound commercial security, such as in the Government Post-office deferred annuities, &c. The society, he added, should also endeavour to effect alterations or extensions in the Government systems at present in existence, if this should be required, and to frame others if experience from time to time proved them to be necessary. In conclusion, said the speaker, I assert that a far nobler field for charity than almsgiving is the prevention of distress, which can be best done by inducing and stimulating every one, as far as in him lies, to provide for himself and for those of his own household.

The paper was followed by a discussion, in which Lord Derby took part.

PROPERTY IN LONDON.

In the case "Gladstone v. The Duke of Newcastle" (Rolls Chambers), which was a proceeding by Mr. Gladstone and Lord de Tabley, as trustees of the late Duke of Newcastle, in respect to the mansion in Carlton House-terrace, in which the present duke had resided, an application was made on the part of the plaintiffs that a second valuation of the mansion should be obtained.

The solicitor for the plaintiffs said the valuation was 50,000*l.*, which was considered very much under its actual value. The interior of the house was very costly, and another valuer would give an estimate for a fee of 20 guineas.

The Chief Clerk (Mr. Hawkins) asked the rental of the house.

The solicitor said between 2,000*l.* and 3,000*l.* a year.

The Chief Clerk said it could have been ascertained, as an assessment must have been made.

The solicitor on the other side made no objection, as the fee for a fresh valuation would only be 20 guineas.

The Chief Clerk made the order, and, in answer to a question, could not learn whether the house was to be sold by auction or contract.

Order accordingly.

A DEPUTATION OF CIVIL ENGINEERS.

On the 30th ult., his Imperial Majesty the Emperor of Brazil received, in Paris, a deputation from the Institution of Civil Engineers, to present to his Majesty the diploma as an honorary member of the society, and to receive his signature in the register of members. The deputation, which was composed of Mr. Gregory, past-president; Mr. Homans, vice-president; Messrs. Brunlees and Woods, members of council; Mr. C. Henry Vignoles, representing his father, Mr. C. Vignoles, past-president; and Mr. Charles Manby, honorary secretary,—was graciously received by his Majesty, who, in a few well-chosen sentences, expressed the pleasure he had felt at joining a society in whose labours he fully sympathised, and always had taken so much interest. A considerable number of persons were present.

NEW TRADE SOCIETIES' HALL AND CLUB ROOMS AT CHELSEA.

THERE are at present in Chelsea and the neighbourhood upwards of seventy friendly societies, and a building is about to be erected in Chelsea specially for their use, which is to combine all the features of a public hall with those of a club and reading-rooms. The estimated cost of the building is 5,000*l.*, which are being raised in shares of 1*l.* each, amongst the members of the various societies, the amount being payable by monthly instalments of 1*s.* each, and already the greater portion of the shares have been taken, and a considerable part of the required capital raised. The undertaking is of a somewhat novel character, and when built, the hall will be the first of its kind in the metropolis erected on this plan of co-operation. We understand that a site has been obtained in the neighbourhood of King's-road, Chelsea, in the direction of Kensington, and that the erection of the building will shortly be commenced. In the meantime, temporary premises have been secured for the purposes of the club.

VAGARIES OF COMPETITION COMMITTEES.

SIR,—I can furnish you with another instance of what may be mildly termed the "vagaries of committees," but somewhat more eccentric than the Worcester case. The directors of the Leeds Exchange Company invited six architects, myself among the number, to furnish designs for their proposed building. The time was limited, and I applied for one day's extension of time, to enable me to finish the perspectives. I applied in vain, but one competitor, not having sent in perspectives, was allowed to prepare and send *in vivo*, some weeks after the competition was closed to the other architects.

The directors selected the design thus contemplated, placing my own second, and that of another Leeds architect third.

GEORGE COXON.

RESPONSIBILITIES OF ARCHITECTS AND BUILDERS.

WARDLE v. THE REV. JOHN BETHUNE.

This case (before the Judicial Committee of the Privy Council) has been decided. There had been litigation between the parties for more than ten years, and the present case was an appeal from the Court of Queen's Bench, Lower Canada. The appellant had built the cathedral church at Montreal, which had been destroyed by fire, and sued the respondent, the rector, for an alleged balance of 5,000*l.* The answer was that the tower had sunk, and the liability was denied. There had been three appeals in the matter besides the present one.

Mr. Horace Lloyd, Q.C., and Mr. Morgan

Howard were for the appellant; Sir Roundell Palmer, Q.C., and Mr. Bompas for the respondent.

Sir Joseph Napier read a long judgment, in which he reviewed the litigation and the law applicable to the case. Their lordships held that the architect and builder were to be considered as one, and bound to provide for the stability of the building. Their lordships would recommend to her Majesty that the appeal be dismissed with costs.

This seems a very important case, though there may be special conditions of contract that will prevent it leading in other instances. The dispute now pending with respect to the Covered Market at Preston seems to have features in common with the above case. Part of the market fell, and the builder denies the responsibility, claiming that he constructed the market in accordance with the architect's design, and that the design was faulty.

THE IMPROVED INDUSTRIAL DWELLINGS COMPANY, LIMITED.

THE report and statement of accounts to be presented at the seventeenth half-yearly meeting of shareholders of Sir Sydney H. Waterlow's Company to be held at the Mansion House, London, on the 10th instant, has been published. According to this report, the dwellings at Bethnal-green have been completed, and handed over by the builders; and about 160 are now occupied. The buildings in George-street, Grosvenor-square, will be opened in the course of two or three weeks. The directors hope that those in Compton-street will be opened shortly after, and that the others in King-street and Crab-tree-row will be partly occupied by Midsummer. The great demand for improved dwellings in the neighbourhood of Oxford-street has been shown in the case of the George-street buildings, there being already upwards of 180 applications for the thirty-eight dwellings. The directors hope soon to obtain additional sites near this locality, and have opened negotiations for that purpose. The directors have obtained from the Marquis of Westminster the lease of an additional site in Ebury-square, Pimlico, and sixty-four dwellings are now in course of erection there.

The report contains a table showing the progress of the Company since its formation in the year 1863. From this table we extract the following particulars:—

At 31st December.	No. of Dwellings erected and occupied.	No. in course of erection.	Total.	Expenditure exclusive of Cost of Land & Buildings.	Surplus Profit after payment of Dividend of 5 per cent.
1864	50	208	258	£ 15,078	£ s. d. 407 10 1
1868	50	19,432	19,482	170,425	407 10 1
1871	1,001	262	1,263	170,425	1,698 12 10

The directors say that they "venture to think that this statement is highly gratifying, as evincing the appreciation in which the efforts of the Company are held by the working classes; while the fact of the Company having from the commencement paid a dividend of 5 per cent., and carried forward considerable balances, is a strong proof that, while the tenants continue to pay the commercial value of their occupations, their independence is in no way interfered with; and the care generally taken of the property by the tenants, is an evidence of their desire to aid in the extension of the work, from which they derive so many moral and physical advantages."

THE CHANNEL TUNNEL COMPANY.

SIR.—Allow me to offer some statements in reference to the article in the *Builder* of the 27th ult.

The projects of M. Thomé de Gamond referred to in the article, are "studies" in which he was engaged up to 1867, and, however generally valuable, have no direct relation to the proposal of the Channel Tunnel Company.

The present proposal does not embrace any openings or shafts other than those on the shores. The engineers are Messrs. Hawkshaw, Brunlees, Thomé de Gamond, and Low, and their plans are approved by Messrs. Talbot and Michel Chevalier, and generally by a French Imperial Commission of Civil and Mining Engineers specially appointed to consider them.

The railway is to be made in the lower chalk, not in the upper chalk, as stated in the article,—an essential difference.

The investigations of the engineers, extending over

lengthened period and including deep borings on such...

The public are not asked to subscribe as stated. Subscribers are expressly asked only from a comparatively few wealthy individuals...

The article advises the sinking of a deep well on the coast to test the strata. There is more than one well already existing...

As to the time of execution the originators of the proposed tunnel have been very particular in their working size and in the material to be tunnelled through...

It will be seen, therefore, that "investigation" has been carried out in the most minute detail, and the work proposed by this company, which, if it meet the success expected, will form part of the complete tunnel...

THE SECRETARY OF THE COMPANY.

NON-CONDUCTORS OF SOUND.

Sir,—Will any of your readers let me know whether sand or sawdust is the best non-conductor of sound...

FLOORS AND DRY-ROT.

Sir,—Can any of your readers tell me whether a 3-in. close-jointed deal floor, laid on joists 5 ft. apart...

AS TO A NEW STYLE.

Sir,—If your numerous correspondents and contributors who write upon this subject with ideas no more advanced than those which prevailed twenty-five years ago...

"LES ARCHITECTES ONT TOUJOURS TORT."

"The union workhouse, we are told, is the proper hospital of the sick poor. Where else can he have such attendance, such medicine and proper food...

This is from the Times, 31st January, 1872: on the new "Broad roads" recommended by the Local Government Board.

A pleasing new version, as my architect-readers will notice, of "the safest thing you can do is to do nothing"; a now-slightly-discountenanced moral maxim (commonly attributed to Lord Melbourne)...

DECIES REPETITA PLACEBIT.

METROPOLITAN IMPROVEMENTS.

THE improvements projected by the Metropolitan Board of Works have been reported on to the City Sewers Commission by their Finance and Improvement Committee...

The Finance Committee, in their brief report, say:—

"As a summary of our opinion after careful consideration of these various projected improvements, we consider that the streets proposed by the Metropolitan Board of Works will relieve the present enormous traffic of the City to a very limited extent...

In respect of the important question, which the engineer has introduced, suggesting the construction of a new bridge to cross the Thames, east of London Bridge...

The series of proposed improvements reported on are summarised by Mr. Haywood as "Improvements in Wapping; Shoreditch improvements; Old-street, towards New Oxford-street; Harrow-road improvement; Newington Butts improvement."

In respect to the chief of these improvements, that of Old-street towards New Oxford-street, Mr. Haywood says:—

"Much of the traffic between the east and west of the City goes to districts south of the lines of the thoroughfare proposed by the Metropolitan Board, much of it to not short distances north of the City; thus any new thoroughfare intended to relieve London-street, Finchchurch-street, Cornhill, Chancery, and Newgate-street, will utterly fail in its object if it be for north-bound traffic...

The new line of street to which the Finance Committee refer is one proposed by Mr. Haywood in 1866, he says, after a careful survey and due consideration. It is thus described in Mr. Haywood's report:—

"It would start from the eastern end of the Holborn Viaduct, and be carried eastwards across King Edward-street and St. Martin's-le-Grand (north of the General Post-office), across Noble-street, Cook-street, Allernancy, Basinghall-street (north of Guildhall), and Coleman-street to Moorgate-street, at a spot about 230 yards north of the Bank."

Then passing little Bell-alley and Sadlers'-place to the end of Blomfield-street; and then by way of London Wall and Woramwood-street (which streets, being widened, would form part of the line of thoroughfare) to Bishopsgate-street; thence across Houndsditch and Middlessex-street to a junction with Whitechapel High-street, opposite the Commercial-road, which would be a continuation of it; and the whole would form a road leading in nearly a straight line from Holborn Viaduct to the Docks.

The width of the street should be 70 ft. or still better, 80 ft. Its length would be 295 yards, and the present distance from the western end of Newgate-street to Whitechapel, and thence to the north end of the Commercial-road, is 2,383 yards, and the new route would therefore be shorter than the existing one by 117 yards."

The report of the Finance Committee has been adopted by the City Sewers Commission, who will take a locus standi in the matter, reserving power to oppose the scheme of the Metropolitan Board.

SOCIETY FOR THE ENCOURAGEMENT OF THE FINE ARTS.

LAST week a lecture was delivered before the members of the Society for the Encouragement of the Fine Arts, at the Lecture-hall, 9, Conduit-street, on the subject of "Light and Colour," by Mr. William Spottiswoode, M.A., F.R.S. The chair was occupied by the Chancellor of the Exchequer. The lecture was illustrated throughout by experiments, conducted with the electric light, showing the combinations of colour proper, the different rays of light to be found in the spectrum. At the close of the paper the Chancellor of the Exchequer said,—One remark strikes me as resulting from the lecture, and that is, how very difficult it is to know in this world what is simple and what is complex. This sheet of white paper which I hold in my hand looks

Report from the Finance and Improvement Committee to the Hon. Commissioners of Sewers of the City of London upon the proposed Metropolitan Improvements of the Metropolitan Board of Works. And Appendix, containing the Engineer's Report upon the same, with Plan, January, 1872. Judd, Printers, Doctors'-commons.

the most simple thing in the world, and yet it is a very complex result of a great many things of which we have little conception or idea. Instead of being the beginning of the simple, it is the end of a large number of combined and complex elements which go to make up what you see here. Well, that is just like science. It begins by being difficult, but as you rise higher and higher in knowledge you will find that the difficulties with which you were at first met resolve themselves into very simple laws. That which appears to be simple in nature frequently, when examined, turns out to be exceedingly complicated; while that which appears to be complicated and perplexing often, when followed up, ends in absolute simplicity.

THE WATER SUPPLY OF SOUTH LONDON.

THE medical officer for Lambeth, Dr. McCormack, having examined the Lambeth water drawn from the main at Kennington-cross, and that of the Southwark and Vauxhall Companies, says:—

"Having examined the waters by the two most modern and delicate processes, and having got results by both which confirm each other in a most striking manner, I have no hesitation in reporting that both waters are totally unfit for human consumption, and are little better than merely extensively diluted sewage. Of the two the Lambeth water was a trifle worse than the Vauxhall, but both were much worse than many waters which have been already consumed and the wells closed. The analysis clearly showed that the company's filters have been completely overmatched by the late floods, and have been totally unable to remove even the suspended impurities, and we have simply been drinking the sewage matters and living organisms produced and poured into the river by all the town and farm drains along its banks; it is a little wonder that we are sickly, but it is a great wonder that so many of us have escaped disease."

THAMES SEWERAGE COMMISSION.

At Kingston-on-Thames, an influential meeting has been held for the purpose of receiving information from Mr. Bazalgette, as to his plan for purifying the river between London and Windsor from sewage. Mr. Peck, M.P., was voted to the chair. Since the passing of the many Thames Navigation Acts, the inhabitants of the towns and villages in the valley of the Thames have experienced difficulty in disposing of their sewage; and, in order to carry away its united bulk to lands where it will not generate disease. The area to be dealt with embraces about 100 square miles, containing a population of about 300,000 persons. Mr. Bazalgette proposes, in the first place, to purchase and adapt about 3,000 acres of inexpensive and almost unutilized land between Woking and Bagshot, to which sewage might be applied on the principle adopted at Croydon and other places. The sewage would be conveyed by natural gravity from Acton, Chiswick, Ealing, Hanwell, Brentford, Isleworth, Barnes, Mortlake, Kew, Richmond, Twickenham, Mitcham, Merton, Malden, Morden, Wimbledon, Teddington, Kingston, Hampton, Esher, Thames Ditton, Moulsey, Walton, and Weybridge, to Hampton, where it would be conveyed by pumping engines, and again flow by gravity till it arrived at Chertsey, receiving on its route the drainage from Sothall, Norwood, Heston, Hounslow, Hanworth, Sunbury, Laleham, and Shepperton. Other main sewers, commencing at Eton and Windsor, would bring the drainage from Windsor, Datchet, Old Windsor, Horton, Colnbrook, Egham, and Staines, also by gravity, to Chertsey, where a regulating reservoir would be formed, and where a second pumping station would raise the united volume to a reservoir at the head of the proposed farm, on, to, and over which the sewage would ultimately flow. The total cost is estimated at 650,000*l.* The rainfall from the local sewers would, in general, be excluded. To carry out this plan, a Board of Commissioners, elected by the parishes interested, would be proposed. The promoters allege that the scheme would give relief from the penalties under the Thames Navigation Acts, and a cheap and effectual method of disposing of the sewage at a distance. Preliminary steps have been taken to submit the scheme to Parliament in the present session. In the end of the meeting, it was unanimously resolved,—

"That this meeting is not sufficiently informed on the many questions and conflicting interests involved in the plan as briefly laid before it, and is not prepared to express an opinion thereon without further consideration."

Mr. Slagg, a resident engineer, objects to the scheme of the Thames Sewerage Commission, that—

"It is wrong in principle to combine many town

together for the purpose of disposing of the sewage. The true principle is, in my opinion, *dispersion*, and not *concentration*, of sewage. The principle of this proposed measure is that of the combination of many towns for the purpose of conveying all the sewage to one place. That seems to me a needless work. That it would be a very expensive work may be seen when it is considered that to enable this scheme to be carried out for the estimated amount of 880,000 gal. the volume of the rainfall must be excluded from the sewers, and for that purpose a set of drains must be laid in every town, both in the streets and through to the backs of the houses."

Mr. Slagg states that when it was proposed to adopt this "separate system" in London, Mr. Bazalgette himself, in reading a paper at the Institution of Civil Engineers in the year 1865 on the "Main Drainage of the Metropolis," objected to it; but Mr. Bazalgette says he was misunderstood, and disowns the objection.

DWELLING HOUSES.

DR. HIME recently read a paper before the members of the Sheffield Architectural and Archaeological Society on "Dwelling Houses." After some introductory remarks, the doctor said:—

The great object of sanitary legislation is to secure for each individual the greatest amount of fresh air, pure water, sunshine, and dryness of soil. Public sanitation in towns should provide for the people width of streets and their paving, the removal of fluid and solid nuisances from them, and (a most important matter) the establishment of unoccupied places to facilitate the circulation of air, and serve for breathing and recreation resorts for the inhabitants. The width of the streets is of great importance in relation to the height of the houses. The width should never be less than the height of the houses. The healthiest sites for dwelling-houses are known to be those on trap, granite, and other metamorphic rocks, where water readily escapes, and the soil, and consequently the air, are dry. Cholera is rare in houses on such sites. Permeable sandstone, gravel, and chalk, if unmixed with clay, are also healthy. Sands which contain organic matter, clay, and alluvial soils are always to be suspected. Thorough draining, both subsoil and surface, is a necessary preliminary to building. Dampness of ground necessitates dampness of air and of the walls. This causes chemical alteration in the organic materials in the houses, with absorption of oxygen and discharge of other gases; it favours, too, the growth of low animal and vegetable organisms, which poison the air of the dwellings, and produce disease. The decomposition of the organic contents of the soil is hastened by its dampness, and especially by rapid alterations of its hygrometric state, which is, perhaps, the chief condition of outbreak of cholera. Building materials should have great solidity, be bad conductors of heat, and be in a good hygrometric state. Calcareous stone is best,—some sandstone is so porous that, though dry to day, it may be soaked with damp to-morrow. Houses should never be built on ground filled up with ashes and other *debris*. The large amount of organic matter contained in it, which is freely exposed to the action of the air and moisture, becoming decomposed, must cause poisonous emanations, destructive to those who, living above, must breathe it. The drainage and other pipes laid in this soil is extremely liable to be entered by these poisons, and thus they are conducted into houses directly. Frequent sweeping and washing are necessary in every house. Dust is not alone unpleasant, but it is a fruitful source of disease,—perhaps the most so. The dust of curtains, carpets, papers, and other coloured substances, consisting of organic and colouring matter, being swallowed with the food and inhaled, causes many a doctor's visit. Every house should have a kitchen and wash-room distinct from the dwelling-rooms. The latter should be large enough to allow of each inhabitant obtaining 10 cubic feet of fresh air per hour when doors and windows are shut. Each house should have abundance of good water for drinking, cooking, and washing, including bathing: five to six pints per day should be allowed for drinking, at least eighteen gallons for washing, and eight to ten should be used daily to flush the sewers. Sick people require more,—from forty to fifty gallons daily. Water-closets consume various quantities, according to their construction. The nature of the closet and the method of removing the contents have become one of the most important questions which advancing civilisation has created. The dry earth system is quite inapplicable to large towns; it suits private houses of the rich or jails

well. The Goux system is equally unsuitable. The water system, where there is a plentiful supply of water, is infinitely the best and the cheapest. A sufficient fall of ground can nearly always be obtained. The improvement of the dwelling-house and the establishment of comfortable homes worthy of human beings is a necessary duty of the State and a noble work of the philanthropist. These necessary conditions may be advantageously supplemented by a little comfort and elegance. A little garden is a civiliser of great power.

LONDON ROOKERIES.

My attention has been directed to your article bearing the above title, in your issue of the 20th ult., and I beg to bear witness to the important suggestions contained therein. These rookeries should be,—I might say must be,—swept out of London. My experience is mostly confined to the "fifty acres of courts and alleys all in a mass between Aldersgate-street and Bunhill-fields, opening out of Upper Whitecross-street, Gendelane, &c." If I were to pen what I have seen in this neighbourhood you would refuse to publish it. Imagine the worst of dirt, squalor, misery, and vice, and you cannot approach the facts. They are much worse than the human mind, not accustomed to seeing these things, can imagine.

All this property lies in the parish of St. Luke, Middlesex. The vestry and parishioners now possess the power to remedy such a condition, but they refuse to do so. The medical officer has reported that much of this property should be registered and kept healthy by means of the 35th section of the Sanitary Act, 1866. The Vestry have refused to adopt it. An effort was made a little time since to carry out the suggestions made in your article, namely, to pull down, open out new streets, and to build model lodging-houses on the ground. The promoters were immediately put into disgrace, the prime mover thrown off the committee, and the public were assailed with falsehoods, and deceived. Why is all this? The facts are plain. In the parish many members of the vestry are holders of this squalid property, and their friends, publicans, brokers, and the like. They meet at a public-house, where the important work of the vestry is often settled. Surely, when the health of over three millions of people is jeopardised in this way, some action should be taken by the central authority.

While such places exist the School Board is almost a farce: they can do nearly nothing: physiological laws are all against them.

Your article mentions that it would be necessary to obtain an Act of Parliament. I think it is not at all necessary. The vestries now can, in conjunction with the Metropolitan Board of Works, open out new streets, while the following Acts of Parliament,—14th & 15th Victoria, cap. 34, "An Act to encourage the Establishment of Lodging-houses for the Labouring Classes"; 30th Victoria, cap. 32; and 31 & 32 Victoria, cap. 130, "An Act to provide better Dwellings for Artizans and Labourers,"—are sufficient for the purpose.

The Act 29th Vict., cap. 28, gives the parishioners the power to raise funds on most favourable terms, for carrying out such improvements.

All, therefore, which is required is a will. This with the powers which are dominant does not exist. No doubt, the action of these vestries is calculated to bring local self-government into disrepute, and will ultimately break up the present system of vestries; but these men do not seem to have the capacity to perceive this. In the interest, however, of the parishioners and of the metropolis, it is necessary that such a state of things should be speedily put a stop to, and with that view I am glad to see your valuable paper lending its aid.

FREDERICK HOVENDEN.

CHURCH-BUILDING NEWS.

Kirby Underdale, near York.—The chancel of the church here has just received an additional ornament by the erection of two stained-glass windows, and the decoration of the organ-pipes, by Mr. J. W. Knowles, of York. The windows are of two lights, with quatrefoil tracery, and in each light under a canopy of early character, is represented a figure of one of the Evangelists standing upon an arched base, in which is its

respective emblem. The organ-pipes have been dispersed with ornament of a conventional character, in green, red, and gold, upon a buff ground, the ornament being divided occasionally by horizontal bands of blue and gold.

Petersfield.—A meeting to consider the question of the restoration of the parish church has been held at the townhall. The Bishop of Winchester presided, and strongly urged the importance of the undertaking. Lord Hylton moved, and the Rev. J. M. Sumner seconded, a resolution, which was passed, that the meeting regretting the present unseemly state of Petersfield church, undertakes its restoration at the earliest possible period. Mr. Blomfield (who designed the newly-erected church of St. Mary, at Sheet) has been appointed as architect, and that gentleman will at once be requested to furnish a detailed report of the present state of the church, and a scheme for its restoration.

London.—The parish church here has been restored. The chancel has been restored at the cost of the Ecclesiastical Commissioners, and under the direction of their architect, Mr. Ewan Christian. The floor has been laid by Mr. Nursey, of Bungay, with tiles, in chocolate lozenges on a red ground, with figured yellow centres and borders; the pavement of the sanctuary being of smaller tiles, with a dark green border on the stone steps. The Communion-table has been raised on a foot pace, and new seats of oak (executed by Mr. H. Ward, of London) have been placed on either side of the chancel. Boarding has been inserted between the rafters and the lead of the roof, and the windows have been repaired. The cost has been about 370l. The remaining work already done (partly by money collected by the vicar, partly by money derived from a farm left for the use of the church), at a cost of about 600l., comprises the repair of the roof of the north and south aisle, and the lighting by means of gas burners, arranged on the capitals of the pillars, the repair of the east window, the restoration of the woodwork of the panels at the base of the screen—once painted and gilded—and the laying of the passage in front of the screen with a copy of the original tiles. The pews have been lowered, as a temporary arrangement. This has been done under the direction of Mr. Thomas Jeekyll, by Mr. B. W. Spaul, of Norwich, and Mr. H. Ward, who repaired the roof. The work immediately to be done is the opening of the tower-arch, the restoration of the tower window and roof, the removal of the organ to the end of the south aisle, where a vestry will be constructed; and the repair of the organ. Other work necessary and in contemplation is the restoring of the old benches, repairing and re-glazing the old windows, relaying the passages with tiles, restoring the south porch, and scraping the colour-wash off the columns and walls—which will involve an outlay of nearly 1,000l.

Cambridge.—It has been resolved to continue the restoration and enlargement of St. Beudief's Church. Plans by Mr. Brandon, architect, have been exhibited to the vestry.

Castle Hellingham.—The parish church, after partial restoration, has been re-opened. The chancel was restored in 1870, and it was resolved by the parishioners that the nave should be suitably restored, so as to accord with the chancel, and this was rendered the more necessary as part of the building was actually unsafe. The efforts to raise subscriptions have been attended with fair success, nearly 400l. having been collected from residents and landowners in the parish itself, and about 350l. from friends outside. Although this is far short of the original estimate, which amounts to 1,200l., yet much has been done. The work of restoration, which has been going on during the past five months, has embraced the entire rebuilding of the wall between the porch and south-east angle of nave, with all the windows, &c.; the repair and renewal of all the windows; the repair of all the stonework of pillars, round the doors, &c.; plastering throughout; the paving of the whole nave with Peake's tiles; and the warming with hot air. For the present the seats are chairs, as the funds will not yet admit of the expense of wooden benches. The doors have been, on the inside, re-caused with oak. The gallery at the west end has been removed, and several objects of interest discovered in the walls have been restored. Besides the question of benches, there is the more imperative necessity for the repair of the battlements and tower, the repointing of the north wall, the restoration and improvement of the west window (the only one that remains to be done), and the purchase of a new pulpit. The

architect employed has been Mr. H. Woolyer, of Bedford; and the builder, Mr. Rogers, of Earslboro.

SCHOOL-BUILDING NEWS.

Birmingham.—The proposed schools at Bloomsbury are to be built on a site which has one frontage to Lingard-street and one to Goodrick-street. The area of the site is about 4,000 yards. The buildings will be placed at the northern end of the ground, so that both the school-rooms and the playground will get as much sunlight as possible.

The schools are intended to accommodate 1,000 children, viz., 400 infants, 350 boys, and 250 girls. The infants' school will front to Lingard-street, and will form a distinct and separate building. The boys' school will front to Goodrick-street, and will be on the ground-floor. This building will be of two stories, the girls' school-room being over that of the boys. The boys will enter their school from Goodrick-street, and the girls and infants from Lingard-street.

The arrangement of the boys' school is as follows:—A porch or lobby is placed at the north end of the school-room, and on the right hand of the porch is a large cloak-room and lavatory, and a staircase, which leads to the master's private room or board-room, which is placed in an upper story over the cloak-room and lavatory.

To the left of the lobby is the door leading into the school-room. The school-room is formed of three blocks or parallelograms, arranged like the letter E, the middle arm of the E being omitted. The end blocks are each 20 ft. wide and 45 ft. 9 in. long, the middle one being of the same width, but 50 ft. long. The space between the two end blocks is filled up by three class-rooms, each room being 16 ft. 3 in. wide and 19 ft. 6 in. long.

The general shape of the school-rooms and class-rooms, taken together, may be roughly described as a parallelogram, whose outside dimensions are 3 ft. in length and 49 ft. in breadth. The clear height of the schoolroom is 15 ft. 9 in., and that of the class-rooms 14 ft. 9 in. The whole of the rooms are arranged so that the head-master can see every part of them without moving from his desk, and thus not only the school-rooms but also the class-rooms will be under constant supervision.

The plan, while fitted to the present system of teaching, can at any time be modified without expense, so as to increase the number of class-rooms, should the plan of dividing the children into distinct classes and instructing them separately be adopted. The girls' schoolroom is placed over the boys', but consists of two blocks only, the third block being occupied by the cloak-room and lavatory, and the mistress's private room.

There are also three class-rooms, as before. The whole of these rooms are built about half-way up the roofs, the total height in the clear of the schoolrooms being 40 ft., and that of the class-rooms 17 ft.

The superficial area for each child will be about 11 ft. of the school-rooms, and nearly 9 ft. in the class-rooms. It is proposed to warm the whole of the buildings either by hot air or hot water; but, except in the private rooms, there will be no fireplaces. The whole of the rooms will be carefully ventilated. The buildings are to be of brick, with tiled roofs; the floors of the school-rooms and class-rooms of wood. The windows will probably be of iron, and will be glazed with thick glass. There will be no skylights in any part of the buildings. The staircase to the girls' school will be of stone.

The infants' school is a one-story building, with entrance porch, large cloak-room and lavatory; a nursery, 22 ft. long and 23 ft. wide; a principal school-room, 60 ft. long by 32 ft. wide; and a cloak-room, 22 ft. long by 25 ft. in width. All these rooms will be well lighted and lofty.

The playgrounds are separated from each other by a wall, and the out-offices are arranged in a convenient manner. The architects are Messrs. Martin & Chamberlain, of Birmingham.

Dorchester.—The new girls' and infants' schools have been opened by the Bishop of the diocese. The schools, built by Mr. G. Wheeler, from plans by Mr. G. G. Scott, architect, have been erected as a joint memorial, at a cost of about 800*l.*, of which sum the vicar, the Rev. W. C. Macfarlane, has given 450*l.*, and Miss Macfarlane 100*l.*, to the memory of their late aunt; and Mrs. Cook (wife of Mr. W. Cook, churchwarden), 100*l.*, to the memory of her sister, the late Miss Wallis, and 100*l.* as her own donation. Several other sums have been given, which are almost sufficient for the purpose.

Bromyard.—The Church of England schools, recently erected in the parish of Thornbury,

have been opened. They are built near Thornbury Mill, about half a mile from the Wall Hills, on the summit of which are vestiges of a British encampment, supposed to have been constructed by Caractacus. The schools are intended to meet the educational requirements of the following parishes:—Thornbury, Edwin Ralph, and a portion of Collington.

Monkton, Kent.—For new schools for the parish of St. Mary Magdalene, Monkton, Mr. William E. Smith, of Upper Bedford-place, London, architect, Mr. Cephas Fead's tender (665*l.*) has been accepted.

Books Received.

"The Civil Engineer's Pocket-Book," by John C. Trautwine, C.E. 1872. (Trautner & Co.), treats of Mensuration, Strength of Materials, Bridges, Cost of Earthworks, Foundations, &c., and elucidates some important principles in construction. It is a very valuable little book—a cyclopædia in miniature.—"The Charity Organisation Reporter" is the title of a publication, issued weekly by the Society for Organising Charitable Relief and Repressing Mendicity. It does not profess to be a newspaper, but proposes to report so much of the proceedings of the Charity Organisation Society as is likely to be of interest to members of its district committees and of similar agencies in the country, and to its supporters generally. It will also bring together information relating to the removal of causes of pauperism and bearing on the elevation of the poorer classes.—A paper "On Customary or Local Measures of Land in the British Isles," read by Mr. Joseph Boulton, at the Liverpool Architectural Society, in November last, has been published in the Transactions of the Society.—Under the title, "Spiritualism answered by Science" (Longman & Co.), Mr. Sergeant Cox replies vigorously to the disingenuous attack made on him by the writer on this subject in the *Quarterly*. The learned Sergeant had clearly stated that he found "no evidence tending to prove that the force [whatever it may be] is other than a force proceeding from or directly dependent upon the human organisation," and he declines, therefore, to be termed a convert to "Spiritualism." It is quite time that the matter was investigated scientifically, and the ground on which charlatans stand knocked away from under them. Sergeant Cox deserves credit for the steps he has taken in this direction.

Miscellanea.

The Abolition of Tolls on Waterloo Bridge.—A crowded meeting has been held at the Lambeth Baths for the purpose of considering the abolition of the tolls on Waterloo Bridge and other metropolitan bridges. Mr. W. M'Arthur, M.P. (in the chair), stated that during the last six years 5,000,000 persons annually passed over Waterloo Bridge, the income from which amounted to 21,000*l.* per annum, and that since the opening of the bridge the sum of 851,760*l.* had been received by the company. Mr. M'Arthur suggested that the House of Commons be petitioned for an extension of the time to which the coal and wine dues were already mortgaged, and that the money so obtained be applied to the purchase of Waterloo Bridge. Sir J. C. Lawrence, M.P., thought that the best way would be to first free Hungerford Bridge. Half the traffic of Waterloo Bridge would thus be transferred to Hungerford; and, on a valuation of two years' traffic over Waterloo Bridge being taken, it would be found much reduced, and the bridge would consequently be sought for a much lower sum than it would otherwise be. It was unanimously resolved,—"That the tolls on Waterloo and other metropolitan bridges were a heavy tax on the community, highly injurious to the value of property, and detrimental to commercial intercourse, presenting an anomaly not to be found in any other city of Europe or America;" and "That this meeting urges upon the Metropolitan Board of Works and the Corporation of the City of London to confer and communicate with the Government and the Waterloo and other bridge companies with a view to the introduction of a Bill into Parliament for carrying out the foregoing resolution, and that the various metropolitan vestries be called upon to co-operate."

A Big Building for Boston (U.S.).—The *Boston Commercial Bulletin* states that it has been determined to erect there a building of "proper size" for great meetings. "The ground plan is to be a parallelogram, 822 ft. in length by 422 ft. in width, measuring 347,506 square feet in area, or a trifle less than 8 acres. Throughout the space not a single post, pillar, or support of any kind will obstruct the view from end to end. The roof, consisting of a double system of self-supporting trusses, will spring in a gentle curve directly from the foundations, constructed on piles, driven 35 ft. into the ground, the two segments meeting at the ridge and forming a graceful arch, at an elevation above the floor, of 172 ft. Similar segments will spring from the ground at either end, uniting with the side segments, forming an immense Mansard pavilion, with the graceful lines peculiar to that style of architecture. The trusses supporting these end segments of the roof will run the entire length of the building, having a clear span of over 800 ft., and knitting the whole roof into a substantial self-supporting structure. From the foot of the arches on either side end will rise perpendicular buttresses, 53 ft. high, at which elevation the curve of the trusses will leave a space of 18 ft. between the outer line and the line of the buttresses. This space will be floored, forming an outside promenade, with an elevation of 50 ft., a width of 18 ft., and a total length equal to double the combined length and width of the building, or half a mile."

Dedication of the New Freemasons' Hall, Bristol.—The building in Park-street formerly used as the Philosophical Institution and Museum was recently purchased by the Freemasons of Bristol, and it has been solemnly dedicated to the purposes of the craft. The premises have been decorated throughout. The upper floor, formerly used as a museum, has been set apart for the grand hall, and suitably arranged and embellished. Above the gallery at the end of the hall hangs a portrait of the Duke of Sussex, late Grand Master of the Order in England. At the western end is an organ, standing on a platform. Adjoining the grand hall is a chapter-room, and "the preparing room," in which neophytes are prepared for initiation. A reception-room is also provided. On the ceiling of the staircase are paintings of Justice, Fortitude, Temperance, and Prudence, executed by Mr. Bird, R.A., and which formerly adorned the ceiling of the old hall in Bridge-street. Mr. Diment, builder, Mr. Eastbrook, carpenter, and Mr. Hunter, gasfitter, have been employed in fitting the premises for occupation by the Masons; and Mr. Vowles has renovated the organ.

The "Scotsman" and the Walter Press. The Walter Press, invented by Mr. J. Macdonald, the manager of the *Times* printing establishment, is now used in printing the *Scotsman* newspaper. A reel of tightly-rolled paper, in the form in which it leaves the paper-mill, fully four miles in length, and weighing nearly six cwt., is placed at one end of the machine, and in the process of un-reeling is damped, printed first on one side then on the reverse with unflinching precision, is cut into sheets, and delivered at the rate of fully 12,000 copies per hour at the other end of the machine. The sole attendants necessary are two lads at the delivery hounds, and a third, the striker, who starts the machine and looks after the rolls as they are unrolled. While printing, the paper travels through the machine at the rate of nearly 1,000 feet per minute, and a reel four miles long is thus printed in less than twenty-five minutes. The delay in changing from one reel to another scarcely exceeds a minute, so that the production is thus almost continuous. With the two Walter presses in the *Scotsman* office, thirty-six miles of paper are printed each morning in two hours, and on Friday, when the *Weekly Scotsman* is also printed, the length of paper used is about eighty miles.

London and County Bank.—At the meeting of the London and County Bank, the report showed an available total of 102,548*l.*, including a previous balance of 4,494*l.*, and a dividend was declared of 6 per cent, with a bonus of 3½ per cent. (together, 11.18s. per share), making, with the June distribution, 18½ per cent. for the year. For the previous year the distribution was 17½ per cent. The deposits held are 16,116,730*l.*, an increase of 2,720,479*l.*; and the acceptances are 2,778,016*l.*, a decrease of 332,105*l.* The paid-up capital is 1,000,000*l.*, and the reserve 500,000*l.*

National Music Meetings at the Crystal Palace.—The arrangements for the first series of national music meetings, to be held at the Crystal Palace during the ensuing summer, are progressing satisfactorily. At these meetings, native and foreign choral societies, glee, madrigal, and part-song vocalists, cathedral and church choirs, military and volunteer bands, and amateur solo singers will be invited to compete for prizes, some of them considerable in amount. The project seems to us to deserve the hearty support of the public. It is intended that the meetings shall be held on five days during a fortnight at or about Midsummer in each year; and a council will be formed, consisting of eminent authorities in music, from which body the competitors for the different prizes will elect a jury by ballot. The greatest care must be taken in forming the tribunal; any failure in justice would greatly interfere with the success of the scheme. The total amount of the prizes will be 1,500*l*.

Accidents.—The engine of a Millard goods-train had just passed over the bridge east of Castle Ashby Station, when the main buttress gave way, and the bridge fell. The tender and more than twenty wagons were thrown over on to the line, but none of them fell into the river. The bridge was afterwards inspected by Mr. Woodhouse, the company's chief engineer. The accident was owing to the great rush of water against the buttress, the brickwork of which appeared to have been twisted completely round. A minute or two before the accident occurred an up Millard goods-train passed over the bridge; and if the two trains had met, as they sometimes do, on the bridge, the whole of it must have fallen in. —A large piece of masonry from the Castle of Vert Port Nice, was blown down on Friday week, and fell on a house, killing one person, and injuring seven others.

Testimonial to a Sanitary Inspector.—At a special meeting of the sanitary committee, St. Luke's, City-road, a handsome testimonial, inscribed on vellum, and mounted in a carved and gilded frame, was presented to Mr. James Neighbour, the sanitary inspector. The testimonial recorded that at a meeting of the vestry, held at the Vestry-hall, City-road, on Tuesday, the 3rd of October, 1871, Mr. Churchwarden Patten in the chair, it was resolved unanimously that the sum of 20 guineas be awarded to Mr. James Neighbour, the sanitary inspector, as an acknowledgment of the extra services performed by him during the late epidemic of small-pox, and that he be also presented with a copy of this resolution on vellum, in testimony of the appreciation by this vestry of the mode in which he has discharged his duties.

The Proposed New Market and Buildings, Leicester-square.—The company which has been formed for the erection of a new market close to Leicester-square, near Coventry-street, include in their plans a proposal to build on a portion of the square, dividing it into wide and spacious streets, leaving about half the area of the square open and still unbuild upon. It is suggested that the site and the property in the locality will be enhanced in value by the opening of a fruit and vegetable market on the side of Coventry-street, with two entrances from the last-named street, and platforms underneath, connected with the new railway which is about to be constructed, so as to unite the Euston with the Charing-cross and Waterloo Stations. All the requisite plans in connexion with the company's proposed works have been duly deposited with Parliament.

A Statue of George Kinloch.—Lord Kinaird has unveiled at Dundee a statue which has just been erected to commemorate the political life of George Kinloch, of Kinloch, who, in consequence of his intrepid advocacy of political rights, was compelled to flee the country nearly forty years ago. Great difficulties were at first thrown in the way of erecting the statue, but ultimately the town council gave a site. The work was executed by Mr. Steel, of Edinburgh, who is a native of Dundee.

Fall of an Archway.—On Tuesday last, an archway in course of construction in Messrs. Parker & Sons' spinning-mill, Dundee, gave way, and six men who were working on the top were precipitated to the ground. They were all more or less injured, two of them having received wounds which are likely to prove fatal. The accident was caused by the breakage of one of the tie-rods.

Vehar Waterworks Extension, Bombay. A "Report on the Toolsee Valley as an Auxiliary to Vehar, by Rieni G. Walton, C.E., Acting Executive Municipal Engineer; and Remarks thereon by Thomas Ormiston, M. Inst. C.E. (Bombay: printed at the Educational Society's Press, Byculla: 1872)" has been issued. The acting municipal commissioner, Mr. T. C. Hope, basing on the report and remarks of these engineers, says, in a letter to the clerk of the peace:—

"My own opinion after visiting the locality is that Toolsee should be utilised as an increase to the gathering ground of Vehar to the utmost extent of which it is capable, namely, to that of the third or largest of the three projects, but that it would be a mistake to attempt to make it anything more; that is, an independent supply either for annual use, or in the event of the Vehar dams bursting. For the latter purpose it is too small, and the money which would be necessary to connect it with Bombay direct, would be far better reserved for a totally separate reservoir of far larger dimensions elsewhere."

About 4-lacs of rupees appear to be the anticipated cost. Mr. Walton estimates it at less, and Mr. Ormiston at more.

The Trees on the Thames Embankment.—The Metropolitan Board of Works, at their last meeting, decided to offer a reward of 20*l*. to any person who could give information as to the offenders who have lately busied themselves in cutting—maliciously as was shown—the trees on the Victoria Embankment. A like sum will be given for information likely to lead to the conviction of future offenders. As Mr. Luntz stated, a vigilant and proper police attention should render the committal of these wanton acts impossible. If the scoundrel who has been guilty of this crime (damaging to all attempts to obtain ornamental places of public resort), were detected and pitched into the Thames, we would not cross the road to throw him a rope.

Government Acquisition of the Atlantic Cables.—In a printed statement of the present position of the movement for making the telegraphic communication with America international property, and thus securing a reduction in the rates for messages to one-fourth of the existing tariff, without loss to any one, Mr. G. T. Shead, of Mincing-lane, who is promoting the object in view, states that a Bill will be introduced in the approaching Parliament to enable the British Government to carry out the scheme, either alone or in conjunction with other Governments. This Bill will not include the purchase of any competing line brought forward since the proposition for Government acquisition was made public.

A New Military Prison at Denmark-hill.—Within the last few days the inhabitants of Denmark-hill and Coldharbour-lane, Camberwell, have been thrown into a state of considerable trepidation by the announcement that the Government have determined to erect a huge military prison in the neighbourhood, and that for this purpose 17 acres of land have just been purchased by the Government authorities on the brow of Denmark-hill, in the immediate vicinity of palatial residences and ornamental grounds. A public meeting is about to be held to protest against the erection of the proposed structure on the site which the Government have selected.

Peter the Great.—On Monday last a board bearing the foreign inscription was put up in the new Foreign Cattle Market at Deptford, by order of the City officials:—"Here worked as a ship-carpenter Peter, Czar of All the Russias, afterwards Peter the Great, 1698." That Peter the Great visited this country is apparently clear enough, but it has not been satisfactorily proved that he worked as a shipwright in Deptford Dockyard. The traditional belief is, however, very strong, and the great Czar's title has been given to a street in Deptford, a very wretched and woe-begone one, and quite unworthy of the name.

The Leicestershire Architectural and Archaeological Society.—The annual meeting of this society was recently held in the Town Library, Guildhall, Leicester, the Rev. Assheton Pownall, F.S.A., Rector of South Kilworth, in the chair. After the transaction of business in committee a general meeting of the members was opened, when Mr. North, the hon. secretary, read a report of the committee for the year 1871, and a statement of accounts for the past year; after which the report and accounts were adopted, received, and passed, to be printed in the usual manner. The committee and officers for the year 1872 were then appointed.

A Pleasant Prospect.—The gradual sinking of Nantwich, to which we lately adverted, is attributed by the *Mechanics' Magazine* to "the withdrawal of the lime from the subterranean salt lakes which underlie the town." The slip this winter occurred about the same spot where similar landings happened one or two years ago. The pit is about 300 yards in circumference about 100 ft. deep, and its sides are almost perpendicular. The inhabitants much fear that the town itself may ultimately suffer, not by gradual decadence,—that they are used to (it is not uncommon to enter a house from the street into what had formerly been the first floor),—but by one of these sudden collapses.

Royal Gallery of Illustration.—"A Peculiar Family" having been withdrawn, a new musical proverb, "Clarity begins at Home," written by B. Rowe, with music by Alfred Cellier, has taken its place, excellently sustained by Mrs. German Reed, Miss Holland, Mr. Corney Grain, Mr. Alfred Reed, and Mr. Arthur Cecil. A novelty by Mr. F. C. Burnard is in preparation, and also a work by Mr. W. S. Gilbert. Mr. Planche's charmingly-written "King Christmas" has proved a great success, and is running glibly and gaily.

Proposed New Theatre and Opera-House, Aberdeen.—A limited liability company has been formed for the purpose of building a new theatre and opera-house for Aberdeen, with a capital of 8,000*l*. The site is in Guild-street. The designs are being prepared by Mr. C. J. Phipps, of London, and will be executed under his direction, jointly with Mr. Matthews, of Aberdeen. The new theatre will seat about 1,000 persons, with standing-room for 200 more, and will probably be completed by next Christmas.

A Hard Cement.—The Abbé Moigno relates a circumstance which may contain a valuable hint in relation to the use of cement. A workman employed to repair the steps leading to a garden made use of Portland cement mixed with finely divided cast and wrought iron filings, or fragments, in place of sand. The result is stated to be that the mass has become so hard as to resist fracture, either with the hammer or pickaxe.

National Railway Association.—Mr. R. Brandon, honorary secretary of the National Railway Association, has just returned from a week's journey in Scotland, whither he had been invited by the provosts of Leith, Dundee, Jedburgh, Hawick, and Dumfries, to explain his scheme for the management of the railways by the State. Mr. Brandon lectured in each of the above-named towns, and resolutions approving of his plan were passed, and branch associations were formed in each town.

Reading Town-hall and Public Offices.—The local committee in committee have resolved that "this committee do deem it desirable to complete in such buildings any provisions for a new town-hall, or for magistrates' offices, or for a cow exchange or markets," and that the Public Offices Committee be requested, with the aid of Mr. Waterhouse, to prepare plans and specifications for new buildings, at a cost not exceeding 7,000*l*."

Intercommunication.—The desirability of forming a tunnel under the river at Gravesend has been suggested, with the view of connecting the present Tilbury and Southend line with the North Kent, and London, Chatham, and Dover lines. By this there would be a continued uninterrupted way between these lines and the Great Western, London and North-Western, Midland, Great Northern, Great Eastern, and Eastern Counties Railways.

Leeds New Bridge.—Mr. Richard Gouthwaite, of Lumbly, the arbitrator, has given his decision in the arbitration which was heard at the Town-hall, Leeds, on the 20th and 21st of December, as to the amount of compensation the corporation should pay Mr. William Emsley in respect of his shops and warehouses on the south-east side of Leeds Bridge. Mr. Gouthwaite has awarded the sum of 7,700*l*.

Royal Architectural Museum.—A conference is to be held at the Museum, on Thursday, February 15th, at 4 o'clock p.m., for the purpose of considering the best means of rendering the collection of greater advantage to workmen engaged in trades requiring a knowledge of art. Such a step is much needed.

Museum and Library for Devises.—The Vitulive Archeological and Natural History Society have determined to purchase some premises in Long-street, Devises, for a museum and library, at a cost of 620*l.*, provided that the purchase-money, with an additional sum of 300*l.* or alterations, can be raised by the 24th of February.

TENDERS

For the erection of house and schools at Ewell, Surrey, by Mr. Jas. Hammond. Messrs. Walker & Eism, architects.

Table with 2 columns: Name and Amount. Includes Mason (1,034 0 0), Nightingale (1,023 0 0), Thomas (429 0 0), Sheppard (994 0 0), Ifard (920 0 0), Wagner (850 0 0).

For additions and alterations at Walton Lodge, St. John's Wood, for Mr. J. C. Pavie. Mr. W. Todd, architect.

Table with 2 columns: Name and Amount. Includes Bonstead & Sons (645 0 0), Higgs (629 0 0), Langmeir & Budge (569 10 0), Blyth (568 0 0), Nightingale (555 0 0), Pitcher (539 0 0), Richardson (accepted) (464 10 0).

For alterations and repairs to Harford House, Stoke Newington-road, Kingsland, for Mr. S. N. Stowe. Mr. Edwin Shales, architect.

Table with 2 columns: Name and Amount. Includes Anon. (430 0 0), Richardson (359 0 0), Morley & Son (accepted) (330 0 0).

For billiard-room, new offices, coach-house, and man's room, to a mansion at Hampton-on-Thames. Mr. Herbert Pearl, architect. Quantities supplied by Messrs. Ardley & Mortimer.

Table with 2 columns: Name and Amount. Includes Kirby, Brothers (2,715 0 0), Pelly (2,294 0 0), Hallowell (2,211 0 0), Perry & Co. (2,105 0 0), Brown & Robinson (2,049 0 0), Brass (1,907 0 0), Hallowell (1,907 0 0), Higgs (1,987 0 0), Jarrett (1,983 0 0), Gammon & Son (1,983 0 0), Streptom (1,983 0 0), Williams & Son (1,983 0 0), Gammell & Way (1,947 0 0), Scrivener & White (1,895 0 0).

For the erection of a warehouse, and repairs and alterations to old premises in Purville-street, Bethnal-green, for Mr. R. J. Chillingworth. Mr. William Mundy, architect.

Table with 2 columns: Name and Amount. Includes Beale (2,038 9 0), King & Sons (1,076 0 0), Ross (955 0 0), Eaton & Chapman (971 0 0), Marr (1,020 0 0), Christoffer, Brothers (953 0 0), Forrest (837 0 0), Longwood (829 0 0), Blackmore & Morley (873 0 0), Dyer (905 10 0).

Royal Pavilion Music Hall.—Messrs. Lacy & Forkington state that they also accept a tender—1,031*l.*

TO CORRESPONDENTS.

G. L. S.—J. R. T.—F. M. C.—D. P.—M. J. C.—O. R.—F. A. K. G. S.—Mr. D.—F. P.—A. M.—I.—T.—G. G.—H. F.—C. B.—J. P.—T. W.—R.—J. F.—W. H. P.—R. G.—J. R.—A.—J. W. C.—U.—O.—W.—H.—B.—E. N.—T.—F.—M.—P.—A.—R.—F.—C. B.—W. C.—E. H.—I.—B.—T. S. (the character is the contractor to obtain payment, rights as it would be, would fall; but this would depend on the exact terms of advertisement and letter. Take legal advice.)—F. W. (new and plans will appear shortly.)—T. W. (what appear)—T. H. V. (note reached us quite late, when other bid was in type.)—Walls (next week)—A. L. (next week)—T. C. S. (next week)—Hastfield (next week)—A. W. M. (next week). Everett.—In letter "About a New Style," in 69, 474, "amazingly" in first column, should be "immaculate," and "Roman, highly English, or Decorated," at end, should be "Norman, Early English, &c." We are compelled to decline printing on books and giving addresses. All statements of facts, lists of tenders, &c., must be accompanied by the name and address of the sender, not necessarily for publication. Note.—The responsibility of signed articles, and papers read at public meetings, rests of course with the authors.

PUBLISHER'S NOTICES.

The TWENTY-NINTH VOLUME of "THE BUILDER" (bound), for the year 1871, is now ready, price One Guinea. Also, CLOTH CASES for binding the Numbers, price Two Shillings and Ninepence each. SUBSCRIBERS' VOLUMES, on being sent to the Office, will be bound at a cost of Three Shillings and Sixpence each. A COLOURED TITLE-PAGE can be had, gratis, on personal application.

Bath and other Building Stones of Best Quality.—RANDELL, SAUNDERS, & CO. Limited, Quarriers and Stone Merchants. List of Prices at the Quarries and Depôts, also Cost of Transit to any part of the United Kingdom furnished on application to Bath Stone Office, Corsham, Wilts.—[ADVT.]

Ashton & Green, Slate and Slab Merchants and Quarry Agents.—Shippers, Merchants, and Contractors furnished with Price-lists of every description of ROOFING and MANUFACTURED SLATE, Railway-rates, &c. Agents for London and Country for the Sale of the celebrated WHITLAND ABBEY GREEN SLATES. Drawings and Prices of A. & G.'s RED RIDGE TILES, specially prepared for use with these Slates, on application.—Offices and Show-rooms, 14 & 15, Bury-street, St. Mary Axe, London, E.C.—[ADVT.]

Turret Clocks.—Mr. Streeter, 37, Conduit-street, London, W., Manufacturer of Turret Clocks (with gravity or dead-beat escapement) for Churches and Public Buildings. Estimates and plans on application. Price.—Village clocks, from 15*l.*; church clocks, from 40*l.* The wheel-work throughout these clocks is of best hard brass or gun-metal. No iron wheels used. Timekeeping and durability guaranteed. Wholesale Entrance—Burlington Steam Works, [ADVT.]

NO PAINT—NO RUST. GREAT DISCOVERY. BRONZED IRON. BY ROYAL LETTERS PATENT. TURNER & ALLEN. (Sole Patentees). ART-FOUNDERS, ENGINEERS, MERCHANTS, AND CONTRACTORS, 201, UPPER THAMES STREET, LONDON, E.C.

Extract from Paper read at the Royal Institute of British Architects, December 4, 1871, by Henry Carr, esq., C.E.— "The great desideratum of the day, no doubt, is some means of permanently protecting iron from rust: this is now said to be done by Messrs. Turner & Allen, of 201, Upper Thames-street. If the process of coating iron with copper can be successfully carried out on a large scale, it will be one of the greatest boons of our time."

J. L. BACON & CO. MANUFACTURERS OF IMPROVED HOT-WATER APPARATUS, FOR WARMING AND VENTILATING Private Houses, Churches, Schools, Hospitals, Manufactories, Greenhouses, &c. OFFICES AND SHOW-ROOMS:—476, NEW OXFORD STREET, LONDON, W.C. WORKS:—FARRINGTON ROAD. Publishers of a Pamphlet on "Hot-Water Heating."

CONTRACT for DANZIC TIMBER, &c. Contract Department, Admiralty, Whitehall, January 31, 1872. TENDERS will be received on TUESDAY, the 5th of MARCH next, at TWO O'CLOCK, for 2,460 LOADS of DANZIC FIR TIMBER, 150 LOADS of DANZIC OAK TRUCKSTUFF, 200 LOADS of DANZIC OAK PLANK, 11,289 DRUM DEALS, and 2,292 STAGE DEALS, to be delivered at Her Majesty's Dockyard, and their Landing-places to themselves, on unlimited power of selection, and do not bind themselves to accept the lowest or any Tender. A form of Tender, containing all particulars, may be obtained at this Office. FRANKS W. BOWFIELD, Superintendent of Contracts.

YEOVIL WATER-WORKS.—To CONTRACTORS.—The Corporation of the Borough of Yeovil are prepared to receive TENDERS for the CONSTRUCTION of a COVERED SERVICE RESERVOIR, a TANK, and other Works connected therewith. Drawings and specifications may be inspected, and forms of Tender may be obtained at the office of the Town Clerk, in Yeovil, and of Messrs. THOMAS & CHARLES HANSMLEY, Civil Engineers, 30, Great George-street, Westminster, S.W.; and Tenders must be delivered at the Town Clerk's Office on or before FRIDAY, the 1st day of MARCH, 1872. The Corporation do not pledge themselves to accept the lowest or any Tender. Yeovil, 5th February, 1872.

LONDON AND NORTH-WESTERN RAILWAY.—To CONTRACTORS and BUILDERS.—ERECTOR of the PASSENGER STATION, FORMATION of a ROAD, at Halesden, on the Hampstead Junction Branch Line. The Directors are prepared to receive TENDERS for the ERECTION of the PASSENGER STATION and CONSTRUCTION of a ROAD at Halesden, on the Hampstead Junction Line. Plans and specifications may be seen at the Office of Mr. H. WOODGATE, Station Station, on and after the 17th inst. Tenders addressed to the undersigned, and must be accompanied by a deposit of 10*l.* on or before FRIDAY, the 2nd day of MARCH, 1872. The Directors do not bind themselves to accept the lowest or any Tender. S. REAY, Secretary. Euston Station, London, N.W. February, 1872.

PERSONS desirous of TENDERING for the ERECTION of a BAPTIST CHAPEL, at CROYDON, will please send their names and addresses, on or before the 15th instant, to JOHN THOS. BAILEY, Architect, West Croydon.

BOROUGH of LIVERPOOL.—To BUILDERS, CONTRACTORS, &c.—The Water and Rada Committee of the Council of the Borough of Liverpool, desire TENDERS for the ERECTION of BATHS and WASH-HOUSES in Seeb's-Parish. Plans may be inspected, and specifications may be obtained by application to the Tender, obtained at the office of the Borough and Water Engineer, Municipal Office, on payment of 2*l.* 2*s.* Scale of Tenders, which must be in the presence of the Tender, addressed to the Chairman of the Bath Committee, and endorsed "Tender for Baths and Wash-houses, Seeb's-parish," must be delivered at my Office, Municipal Offices, Dale-street, before TWELVE O'CLOCK on the 24th instant. The Committee do not bind themselves to accept the lowest or any Tender. JOSEPH RAYNER, Town Clerk. Municipal Offices, Liverpool, February 4, 1872.

BOROUGH of BRADFORD.—CORPORATION WATERWORKS.—To CONTRACTORS.—CONSTRUCTION of TWO RESERVOIRS at OSENTHORPE.—The Corporation of Bradford are prepared to receive TENDERS for the CONSTRUCTION of TWO COMPENSATION RESERVOIRS, and the Works thereon, connected, at Osenbothorpe and Leasnavy, at Osenbothorpe, in the Township of Harworth, and parish of Bradford, in the West Riding of the county of York. Drawings and specifications may be inspected, and forms of Tender may be obtained, at the Office of Mr. CHARLES GOTT, Civil Engineer, Corporation Offices, Bradford, on and after TUESDAY, the 6th of FEBRUARY instant, between the hours of TEN in the forenoon and FIVE in the afternoon. Tenders must be delivered at the Town Clerk's Office, Bradford, sealed, and addressed, to the Chairman of the Water Committee, "Tender for Reservoirs," before TEN O'CLOCK a.m. on FRIDAY, the 1st of MARCH next. The Corporation do not bind themselves to accept the lowest or any Tender.—By order, W. T. MCGAVIN, Town Clerk. Corporation Offices, Bradford, 2nd February, 1872.

TO BUILDERS.—Notice is hereby given that PLANS and SPECIFICATIONS for BUILDING a NEW MANSION, with Stables, &c., at Brandisfield, in the parish of Goulthorpe, and county of Kent, about six miles from the Marine Station of the South-coast Railway, may be seen at Brandisfield, on FRIDAY, the 15th, to SATURDAY, the 24th inst., on application to the Architect, Mr. HENRY COLEMAN, and all persons desirous of contracting for the works must send in sealed Tenders, directed to T. RIDGWAY, Esq., B. Chestnut-street, Belgrave-square, London, on or before SATURDAY, MARCH 2nd, 1872. Neither the lowest nor any Tender will necessarily be accepted. The Contractor must be prepared to enter into the usual legal bond for the fulfilment of his contract. Quantities will be supplied. Dated February 7th, 1872.

TO BUILDERS AND CONTRACTORS.—Notice is hereby given, that the Woolwich Local Board of Health will meet at the Town-hall, Woolwich, on TUESDAY, the 20th FEBRUARY, 1872, at SEVEN O'CLOCK precisely, to receive TENDERS for the CONSTRUCTION of about 400 feet of CIRCULEAK, 18 IN. dia., 2 feet 8 inches in diameter, and other Works, at the North-west, Plans and specifications may be seen at the Office of the Local Board of Health, on and after WEDNESDAY, the 15th inst. The person whose Tender may be accepted will be required to indemnify for the due performance of the Contract. Tenders to be in duplicate for the whole of the works, to be endorsed "Tender for Drains," North-west," addressed to the Clerk of the Woolwich Local Board of Health, and delivered at the Town-hall, Woolwich, before SEVEN O'CLOCK p.m. on the day above mentioned. The Board do not bind themselves to accept either the lowest or any other Tender, by order of the Board. ANDREW C. REED, Clerk. Town-hall, Woolwich, February 7th, 1872.

TO BUILDERS.—The Guardians of the Poor of the Bridge Union will, at their Board meeting, to be held on the 25th instant, be prepared to receive TENDERS for the ERECTION of NEW WAREHOUSE, WAREHOUSE STABLE and COACH-HOUSE, together with New Wash-house, Hot-water Supply, and other Buildings to the Union Workhouse, at Bridge, near the tertiary, according to plans and specifications prepared for that purpose, by Mr. BENJAMIN ADKINS, Architect, Faversham.—The plans and specifications of the several works, to be seen at the Board-room, Union Workhouse, Bridge; and bills of quantities prepared on application to the architect, to whom application is also to be made for any further information respecting the works. The Tenders (prepared upon the form supplied, are to be sent in to the Clerk of the Board of Guardians, Bridge-street, Canterbury, on WEDNESDAY, the 28th day of FEBRUARY, before FOUR O'CLOCK in the afternoon. The Guardians do not bind themselves to accept the lowest or either of the Tenders, and the person whose Tender may be accepted, must be prepared with satisfactory securities for the due performance of the works if required by the Guardians.—By order of the Board. ALLEN FIELDING, Clerk. Canterbury, February 6, 1872.

EDMONTON UNION.—To BUILDERS AND OTHERS.—ALTERATIONS and ADDITIONS to the EDMONTON WORKHOUSE.—The Board of Guardians will be prepared, at a meeting to be held at the Board-room of the Union Workhouse at Edmonton, on the 29th day of FEBRUARY inst., to receive TENDERS for carrying out certain PROPOSED ALTERATIONS and ADDITIONS to their WORKHOUSE, at Edmonton. Sealed Tenders, addressed to "New Buildings, Edmonton Union," must be delivered to me, at my Office, at Edmonton, on or before the 24th day of FEBRUARY inst. The plans and specifications may be seen at the Office of the Clerk to the Guardians, Edmonton, and all information obtained at the Office of the Architect, Mr. T. L. KNIGHTLEY, 104, Cannon-street, City. Persons Tendering are to take out their own quantities, the Board not undertaking to be responsible for the same. The Board do not bind themselves to accept the lowest or any Tender. Security in the penal sum of 500*l.* will be required to be given by the builder whose Tender shall be accepted for the due performance of the contract, and the names and addresses of two responsible persons as securities must be given with the Tenders. No Tender delivered after the time stated will be opened.—By order of the Board. WILLIAM PELLEY, Clerk to the Guardians. Edmonton, February 1st, 1872.

TO DUST CONTRACTORS.—The Sewer TENDERS for the REMOVAL of DUST, ASHES, VETTERABLE, and HOUSE REFUSE in this Parish for the coming year, to be made by Tender No. 1 to consist of that part of the parish north of the North London Railway, and No. 2 of that part of the parish which lies south of that line. The Contractor to find a shoot, horse, carts, labour, tools, &c. Bonds will be required, with two sureties of 100*l.* each, for the performance of the contract. The Sewer authorities do not bind themselves to accept the lowest or any Tender. Tenders to be sent to me on or before the 16th instant. W. A. TOOTELL, Edgware, February 3, 1872.

WATER—CARTS.—Notice is hereby given, that the Board of Works for the St. Barnard's District are prepared to receive TENDERS for the SUPPLY and USE of a sufficient number of WATER-CARTS, with all necessary gear, together with horses and competent drivers, to well and efficiently water the roads and streets within the district, comprising the two parishes of St. Barnard and Christchurch, from the 1st day of March to the 31st day of October next, a period of eight months. The carts, horses, drivers, and men are to be available and in working order at all times, and the water is to be done to the satisfaction of the Board, and as directed by their respective officers. Tenders must be left at the Office of the Board not later than FOUR O'CLOCK p.m. on WEDNESDAY, the 14th of FEBRUARY instant, and persons Tendering should be in attendance at that time. The contractor will have to execute a contract, and to be bound in the penal sum of 250*l.* and he will have to bear the expense of the loss of his carts, horses, and drivers, if any of the Tenders obtained on application. Board-room, Emmanon-street, Edgware, S.E. Feb. 1st, 1872.

The Builder.

VOL. XXX.—No. 1515.

Conventionalism in Art.

PURSUING this subject,* we repeat the observation that the importance of the use of conventional treatment,—in imitative art especially,—has been much more recognised at some periods of art than at others. In regard to all the arts which may specially be classed as imitative,—painting and sculpture in all their branches,—conventionalism seems to have been generally most attended to in the earlier and middle portion of their history. A superficial view might incline us to assign this to accidental circumstances—to a want of technic perfection in the artist; but that this is not the sole explanation we may infer from the fact that the same sequence is to be traced in the history of arts not so directly imitative, or dependent on the skill of the delineator. The music of the earlier schools, for instance, of Palestrina, or Bach, even of Mozart, is for the most part highly conventional, suggesting not the remotest reference to nature in any way. It is only in the modern period that we have music written (unconnected with words) to illustrate special ideas. So with the drama, which is conventional in its early history among nearly all nations; what we now call the “domestic,” or realistic drama being a late production of modern civilisation. So with painting: it was certainly the case that Giotto was an inferior draughtsman to Raffaele and Titian, but there is evidence in the manner and treatment of his subjects, nevertheless, that, though he would, no doubt, have drawn more perfectly if he could, yet he was not contemplating realism as the end of his art; and that the idea, as distinguished from the execution, was usually uppermost in his mind. And a review of the history of any branch of art will, we believe, show (what it is perfectly natural to expect), that it is in the decadence of the art, when the great ideas which it had to express have had their day, or have lost their hold on men’s minds, that attention becomes directed (as a last resource) to mere bravura of execution, and careful realistic imitation of incidents quite subsidiary to the subject, such as dresses and furniture, becomes a serious object in painting, just as the same kind of realism of details comes to be regarded as the chief thing in the drama; just as piquancy and novelty of effect, and brilliancy of execution in music, take the place of the higher and more serious qualities which belonged to the art in an earlier period of its career.

Still we must not for a moment be supposed to be advocates for that kind of dilettantism in art which consists in supposing that the idea is everything and the execution nothing. A more

dangerous mistake can hardly be made either by artists or the public. But it is important to discriminate between what is essential in imitation and execution, and what is superfluous or absolutely hurtful to the effect of a work of art. Now, it is just on this point that the modern school of artists who were at first called (or called themselves) pre-Raffaelites fell into singular and very odd inconsistencies. They saw, and managed to make others see, that there was in many of the painters of the earlier Italian school an earnestness and depth of feeling wanting in the works of the later and more highly accomplished technical exccutants of the cinque-cento period. But they, or some of them at least, could not separate this from the shortcomings and deficiencies of the early painters, which they proceeded to reproduce, in some cases in a very absurd manner. Equally singular, in an opposite direction, has been their way of dealing with landscapes. Starting on the ground that “study of nature” was to be everything, they directed their efforts to a hard literal reproduction of minute detail (which, in fact, never could be reproduced in all its minuteness on canvases), scorning the previous school of landscape-painters as people who were content to represent “conventional foliage,” &c. Yet were some of these very scorers themselves admiring and painting at the same time conventional figures, conventional often in the bad sense of being unlike nature and impossible in their attitudes and construction. And to crown their inconsistency, this very school of realistic landscape-painters have chosen for their special object of worship—Turner; the painter who, of all others (of all men of genius, at least), played the most extraordinary transformations with nature, and, in fact, made nature merely a suggestor for his own peculiar creations in effect. Now, just see what a curious confusion of principle, or no principle, there is here. And all this results from ignoring the relation which exists between the materials we use in art—language and the object we have in view in using them. We may make landscape-painting merely an affair of topography and natural history, no doubt; but it was not so that Turner used it. He, as well as every imaginative painter who ever lived, used it as a form of poetry—as the means of creating and imparting an original feeling; his studies were merely the collection of materials to this end. What we want in landscape-painting as an art is ideal beauty of scene and effect; it is not the sticks in the hedge that interest us. In this respect it is curious to notice the interest and artistic beauty of some of the French contemporary landscape painters (Corot and Duprez in particular), whose trees are absolutely unrecognisable as of definite growth or species in many cases; yet are their landscapes full of poetry, of suggestiveness. On the other hand, if we turn to *figuro* pictures, the case is different in one sense. We use the human figure, here, as the medium of expression and feeling; and it is an object so far more mechanical and exact in its physical structure than a tree, that it is essential for the attainment of our purpose that it should be drawn in its main points of proportion and construction, precisely as the best examples are in nature, or the result is merely an expression of grotesqueness or malformation; and it is equally essential that the artist should be able to represent what he intends to represent; that he should be a sufficiently accomplished draughtsman to foreshorten a limb without danger of his intention being misunderstood or standing as a manifest failure. In these respects conventionalism cannot be allowed in this branch of the art: a fact of which some of those who were at first among the leaders of the modern school before referred to have indicated their conviction, by gradually adopting a more realistic style of figures and of delineation than that which, fifteen years ago,

startled the frequenters of our exhibition-rooms.* But it would be wrong to suppose that there can be no conventionalism in figure-painting, or none which can add to the force and interest of pictures of this class. We may conventionalise here, either by the method of treating the figure itself, or by the accessories and surroundings with which it is connected. How far this should be done will depend both on the method of execution employed, and on the subject of the work and its degree of relation to real life. The more our method of execution is capable of, in the way of exact imitation, the more may be safely attempted: we may come nearer to nature in an oil painting than could be attempted in fresco; for the failure of any such attempt by the latter process would be certain, from its want of *chiaroscuro* and of delicate gradation of colour. On the same principle mosaic would seem to demand a yet more conventional treatment than fresco, to avoid conveying the impression of an unsuccessful attempt at what the nature of the material will not allow of. But the subject and object of the work also go far in deciding the matter. If it is to be a painting of everyday life, especially life on its comic or humorous side, realism, to the greatest extent to which the material will carry him, must be the artist’s aim. But if we are painting what is far removed by its association and history from the commonplace of everyday life, or what we wish so to remove, our work will actually gain in effect and in power by being removed more or less from the semblance and actuality of life by the use of a conventional tone of colour, a conventional flatness of treatment, or whatever removes it from all attempt at realistic imitation, and thereby concentrates our thought and attention solely on the higher aim and feeling of the artist. To exemplify: we recently saw a portrait of a lady by a well-known French artist of remarkable technical skill, which was an absolute marvel of imitation, producing on the eye an illusion which even a very near inspection scarcely dissipated. There is a value, in its way, in this kind of technical skill; but compare this class of work with such a portrait as that of Herr Joachim, by Mr. Watts, and who can doubt which is the finer and more artistic achievement. The latter, in one sense, is purely a picture: it could not for a moment be considered illusory: the tone and the whole effect, the total abeyance in which all accessories are kept, are all conventional; but this very removal of the details which would contribute to *vraisemblance* eliminates also all the element of vulgarity which attaches to mere trickery of imitation, and raises it to the height almost of an imaginative work. Very charming instances, too, of true conventionalism in figure-painting have been given in some of the small pictures of Mr. Mason (whom we regret to have missed from the Academy walls), whose subtle low tones of colour, and thin, flat execution, contrived to throw an air of poetry and idealism over what, in coarser hands, would have been mere paintings of rustics. An additional interest attaching to this allowable conventionalism in painting is that thereby we see not merely nature (which we might see for ourselves without the artist’s intervention), but nature as seen by the artist’s own mind, which (in cases, at least, where the said artist has a “mind”) makes a picture a very different thing from a mere transcript of external facts. It is this putting forth of the artist’s individuality

* The works of that very remarkable artist, Mr. D. G. Rossetti, will present, whenever they shall be publicly exhibited, some striking instances of the adoption of this kind of false conventionalism (as we believe it to be), this ignoring of the true and natural conformation of the figure, in the search after new and intense forms of expression and idealism. They will furnish also instances of the degree in which works evincing real genius, and almost an inspiration in colour, may fail to satisfy the judgment through mere (if it would almost seem ostentatious) neglect of technical truth in drawing and construction. This may be a prosaic part of the artist’s work, but it is not one to be rashly slighted.

which gives much of the interest attaching to the works of the French landscape-painters, before alluded to. It is true that a list of really successful fresh transcripts from nature may be a delightful possession, but it is almost an open question whether that less-realistic landscape-painting which gives us the artist's own feeling and idiosyncrasy be not the source of higher pleasure. In figure pictures of a high class, there can, we think, be little question in the matter: if there be, we shall "question" away the title to honours of some of the greatest artists the world has ever seen.

Before quitting the subject of painting, it is to be observed also that there is an additional interest for the critic, in all works which are conventionalised on right principles, in the perception of the relation of the means to the end, of the manner in which the material employed by the artist is adapted, in its treatment, to its true capabilities. This is more especially apparent in what may be called the subsidiary branches of the art. In water-colour we feel more interest in the broadly washed-in foliage of Cox and De Wint, than in the minute stippling and touching of some popular artists of the present day; not only from the very strong individuality of taste and feeling evinced therein, but because we feel that in such works the peculiar capabilities of the material are regarded, and we feel an additional interest in seeing how much can be done without overstepping these bounds. So in the use of crayon, for instance: a crayon portrait attempting verisimilitude of colour and detail is almost always a vulgarity, coarse and unrefined in effect; a study in monochrome in the same material may be a fine and effective thing, all the more so because removed by the conventional tone of colour from realistic effect, and from all attempt at competition with nature. In etching, again, the peculiar treatment by which the points of line and shadow in a landscape are caught, and the lights left broad and untouched (so well exemplified in Whistler's admirable etchings on the Thames, where in some cases the water is represented by nothing but an untouched blank), has its own interest as illustrating the capability of the art. In water-colour or pencil, such a treatment would be called weak and bald, because those processes are capable of more, even in slight sketches; in etching the very restraint under which the sketched labours, the conventional manner in which he is forced to represent ordinary incidents of nature, become in themselves sources of interest.

Some remarks on the relation of our subject to sculpture and architecture, and the arts accessory thereto, we must defer to another number.

CHESTERFIELD AND ITS BLACK SPOTS.

The casual visitor to this town of the twisted spire, after satisfying a natural curiosity in viewing the steeple phenomenon from various points of advantage, will probably take a note of the cleanly appearance of the streets and roads. This favourable state is due in some degree to the elevated position of the town, resulting in suitable gradients to the streets, thus offering rapid passage to the rainfall, leaving the surface in a dry state soon after every shower; but most of the good result is due to the excellent material employed in the formation and surface work, the greater portion of which is macadamised in the usual mode. Some parts, however, are coated with an artificial asphalt of excellent material, equally economical and substantial.

Many of the causeways and paths are constructed of similar asphalt of somewhat finer texture, and although much of this work has been laid down fifteen and twenty years, it presents a firm foothold of thoroughly indurated and even surface. Altogether, it is very superior to the usual kind of slippery, uneven granite causeway pavements met with in mid-land towns, with the advantage of much greater economy.

The system of paths adopted by the local surveyor is one that may be studied with profit by many towns of larger pretensions than Chesterfield. The material is of the cheapest description: simply boiled gas-tar, mixed with furnace slag, broken and sifted to different sizes, laid down, and rolled in the usual manner.

Unhappily for this northern Derbyshire town, in the eyes of the sanitary reformer the sense of tidiness vanishes rapidly when he ventures to dissect beneath the outer surface, and probes the

inward parts. Hence it is our duty—unpleasant though it be, for much commendable work has been done,—to speak in sharp tones of condemnation upon certain of the sanitary arrangements, slovenly propensities, and dirty habits exhibited in sundry parts,—less, however, the fault of the inhabitants, who seem anxious and willing enough for better things, than the neglect of the responsible authority.

The ancient market and borough town of Chesterfield, now without Parliamentary representation, is very extensive: the parish comprises an area of upwards of 13,000 acres, divided into eight townships. The town proper, however, with which we have now to deal, is more constricted, the population approaches 12,000, and the area is rather more than 200 acres.

The present system of sewers, laid down a few years ago, appears to be good and uniform, whilst the ventilation of sewers is commendable. The gases of decomposition are diffused evenly throughout the system, without concentration at certain points, as is common in most towns wherever ventilation exists. The town is for the greater part of its periphery bordered by two streams, the Hyper and Rother, and into these waters the sewage flows from numerous outfalls.

The larger sewers terminate in a duplicate arrangement of tanks, the sewage passing through three partitions of filtering media, two being charged with broken stones and gravel, and the last one with charcoal, after the manner suggested in one of the Parliamentary Blue Books. The result of this scheme is to keep back the grosser and heavier parts of solid sewage, and 250 tumbler-loads of such refuse have been removed from the series of tanks in six months. Nevertheless, the sewage practically passes unaltered, and even unclarified, into the Rother, from which river a small town some two or three miles below stream has the misfortune to draw its water for domestic and manufacturing purposes, a proceeding which, we are pleased to learn, is about to be discontinued. Let us hope that the act will be in time; for, with an epidemic in Chesterfield,—not an unlikely event,—the consequences must speedily prove most serious to the partakers of water charged with effluvia of an infected town. At the time of our visit no nuisance appeared to arise from the face of the waters, for it was flood-time; yet we can well understand those deep mutterings proceeding from residents near to the stream-sides of foul odours and miasmatic vapours arising in the warm, moist evenings of summer, when the flow of water and its volume are reduced to a minimum.

The responsible authority will do well to be thinking of a more effectual method of dealing with their sewage, and then speedily act upon it, for the present system of passing it through a few feet of inert gravel is merely a delusion. The facilities of the neighbouring lands appear suitable, whilst a sewer constructed to skirt the two brooks will properly intercept all sewage from passing into them and connect the present scattered outfalls into one.

A perambulation through the old town reveals a sanitary state truly deplorable. Leading out from the Market-place,—the central part of the town,—are a number of courts, lanes, and yards, entirely upon the declivity of the hill, for the most part terminating with their lower ends at the break side.

We entered Brown's Yard. An open gutter runs upon one side just facing the houses, the bottom end is in a filthy condition, and the gully at its extremity and the adjacent space around contained much ordure and garbage. Fortunately the people of the cottage whose door is opposite this mess have the good sense to clean it away weekly, which is done by the barrow-load. Near the bottom of the yard is the joint-stock privy for accommodation of the residents at this end; its proximity is denoted by the usual effluvium, which was strong even upon a cold day. By the exercise of a little agility and skill we contrived to obtain a momentary view of its interior, which showed accumulated abominations on seat, walls, floor, and approaches; hence the practice of passing excremental matter into the open sewer. The rooms of those houses we entered are small, with low ceilings, a trifle over 6 ft. high, which must prove very uncomfortable at all times and dangerous during periods of pestilence, now looming in the front and not far distant. Half-way up the yard are two more privies doing duty to six houses: they were foul, loathsome places, but not so filthy as the first one, although quite unfit to enter, and have been so, the neighbours

say, for more than two years. The seats are broken, and covered with ordure.

A mother told us her child had fallen through into the seething mass beneath, "and was like to be smothered." So we should think! Towards the centre of the yard, and within a few feet of and mostly surrounded by poor dwellings, is a nest of privies with ashpits, numbering more than a dozen. All we could get at were filthy and abominable, and a disgrace to a country boasting of civilisation. The brute creation never tolerates such sights as we witnessed in this locality. The whole place about this nest was reeking with sewage that flowed over the sodden ground. The upper portion of this lane presents a more favourable aspect than the centre and the lower. Nevertheless, these central privies just referred to appear to be the only conveniences for the inhabitants at this end.

Wagon-yard, in Willen-lane, is another of the sights of Chesterfield. Here are twenty tenements or more in a commodious open court, but everywhere presenting a disgusting appearance, with ashes here, garbage there, and ordure everywhere, even to the very doors. The yard possesses a cluster of eight privies, of a type such as is not often met with. The entrance of the passage leading to these places is guarded by a cart-load or so of ashes and house refuse; over which it is essential to climb to obtain a view of this Augean stable. The whole interior presents one mass of excreta, whilst upon the seats and floors the mess measured from two to three inches thick, so we judged. The vile smells of the locality were indescribable,—in summer and warm weather they must be simply unbearable; and no one could tell us how long the place had been in this state, nor when cleaned, but it appears to be the normal condition of the neighbourhood, and as such is tolerated.

By way of comparison and encouragement, Nicholson's-square is a model of cleanliness, although cramped for breathing-space.

Again, Castle-yard is a contrast, filthy, foul, and abominable, refuse and garbage here and there, the open gutter much in want of the hose and jet, and ordure is visible in most directions.

In Bradshaw's-yard are six houses, and two privies, one of the latter quite unapproachable for human filth. The ashpit is full to the top, and the accumulation of ashes and garbage stretches yards away from it,—a rough measurement showed about half a dozen cartloads collected outside the pit. We tried to discover when this specimen was last cleaned, but no one could remember! Heaps of household refuse are scattered over the surface of the yard. One small grate is supposed to receive the fluids and slugs; but in practice most of these are thrown down in front of the doors. Complaints are rife of the abominations; but, whilst some people are willing to take a turn at a little grooming, others will not; and so things go from bad to worse, until stinking disease makes a sweep; and then the authorities may possibly step in with a hose and broom.

Daniel's-yard contains few houses, but much garbage and debris everywhere, whilst the slugs and sewage flow over the lower end of the district, which is saturated with it.

Ward's-yard contains a number of courts, for the most part furnished with filthy privies. Some of them cannot be approached with decency. The road leading to the lower parts of the yard, where most of the houses lie, is almost impassable for mire and sludge.

Commercial-yard is another example. Here is a foul, wet, and reeking, undrained large ashpit, with privies emptying into it. The whole has an area of about 50 square yards. The privies are inaccessible from the quantity of ordure lying about. A pound expended in draining this disgusting place would make things much pleasanter for both passing pedestrians and residents. Numerous other places, of much the same character as those described, were visited; others, again, were models of good arrangements. Some foul spots lie very close upon the municipal buildings, and we wondered the council never feel discomforted by the stealthy, steady smells that must at times find their way into the midst of its deliberations.

On the outskirts of the old town lies the long, straggling village of Brampton,—a somewhat extensive place; its population, including Calthorpe and other hamlets, is about 5,000 inhabitants. Here the roads are of a very different character to those in Chesterfield, distinguished from the very boundary line by mud and mire! Time did not permit much research hereabouts,

and we did not see more than a very small portion of the village: however, sufficient for the day, for we saw enough.

In clearance-place the house-cells were cess-pits, and, of course, abominable: such spots are the very foci of disease. In the Old Road the house-cells contained twelve inches of water, and the people complained of the smell proceeding from them.

Just about the boundary line between Chesterfield and Brampton, but rather, we believe, in the former, is West-row. Here the privies are foul and stinking (those attached to the houses in Brampton were very favourable examples of this kind of convenience), whilst the sewage flows to the rear of the premises, and lies in an elongated stagnant pool, bordered by the house-walls, soaking the foundation,—the whole a green seething mass, awaiting in anticipation of a harvest of epidemic; afterwards it may possibly be removed.

It would be well for the old and justly respected magistrato interested in property round about to remember that there is as much honour and renown obtainable in preventing offences against health and decency, in providing houses comfortable for the occupants, where the manly vigour of the thews and muscles of the country can be maintained in their prime, rather than be allowed the chance, nay, certainty, of incurring subtle complaints that break up the frame, ending in the workhouse and hospital, as in convicting of petty offences against the common law.

Chesterfield possesses natural advantages that ought not in the interest of the community to be any longer discarded by the local authority. With an excellent water supply, good sewers, plenty of ventilation, and generally ample space, with roads and causeways of the best, and, not least, every power in their capital bye-laws, it is a sad blot upon her escutcheon that such places as these we have described should be tolerated for an instant. Why not place the regulation of all such matters in the hands of the surveyor,—the proper person, and not continue a divided authority? The chief constable may be an able man in his way, but he has not the special training of a town surveyor.

With a threatened epidemic at her doors, let Chesterfield wako up; and with broom and hose in hand thoroughly cleanse her inmost parts. If members of the Local Board are owners of property of the kind we have endeavoured to depict, let them set an example such as will be followed by the whole town, and thus become what they should be, teachers and leaders of the people.

Let not the public any longer await the coming of the sanitary inspector, nor the sanitary inspector await the coming of the public, but let each seek out the other; for in this waiting, we suspect, lies part of the secret of the present disgraceful aspect. If this be done, our warning will not have been in vain; and our next visit to Chesterfield may be pleasanter and our duty more agreeable.

THE TEMPLE OF DIANA OF THE EPHESIANS.*

LET us now turn back to the dimensions of Pliny's plan, 220 : 425. This length is within such a difference of double the breadth as to present on first view a probability that it falls short of exactness in consequence of representing the side of a double square that has been extended by a margin not proportionately to unequal sides, but equally all round. The single dimension that can be in question is easily calculated (425 - π = 220 - π × 2). The deduction of 15 ft. from both length and breadth would give us a plan of a double square 205 : 410, with a margin of 7.5 ft. all round. The first question that has now a claim to be considered is, does this double square mark the centre lines of a colonnade having a double number of columniations on flank,—that is, with one less column than twice the number on the front, as cols. 8 : 15, giving intercolumns 7 : 14.

On this assumption, the deduced margin 7.5 would stand as the measurement from centre of column to edge of top step, including that is semi-base,—or semi-plinth if such existed, and any margin between plinth and edge of step; this may have been scarcely any, as at Priene, or considerable, as at Teos,—viz., 1.280.

The semi-plinth of the temple at Miletus, as

given by Texier, is 4.45, to compare with (7.5 + 2 - π) 3.75, say 8 in. or 9 in. less. This difference would be easily disposed of if the Ephesian columns were without plinths, and their bases also somewhat smaller.

Pursuing the hypothesis, we have 205 ft. divisible among the columniations of the front :
 1. As Octastyle, 205 ÷ 7 = 29.3 for columniation.
 2. Decastyle „ +9 = 22.8 „
 3. Dodecastyle „ +11 = 18.7 „

It thus appears that a decastyle front would imply epistylia of 22.80, which we can hardly regard as more possible than the 29.20 of the octastyle; and it is only by adopting the hold, not to say wild, assumption that the temple had twelve columns on the front and twenty-three on flank that we obtain a dimension that is more moderately near, but still in excess of the limits that seem to be laid down by the exemplar temples of Athens and Miletus.

A dodecastyle temple, with 23 columns on flank, and a double colonnade all round, gives 124 columns, as against the 127 of Pliny; a triple row of columns on one front only would add 8 more, making 132; the same at the other end would raise the number to 140.

No regular arrangement of external columns will account for the odd number of Pliny's total; a central odd one is easily accommodated in the naos, and this consideration is sufficient to authorise,—to oblige us,—to include the sum of the interior columns in the 127. The enormous span of the naos, take what theory of restoration we please, would require a number of columns too great to come into the total as quoted; so that in this case, at any rate, there is no opportunity to apply, or no temptation to strain, Pliny's words, if to strain it be, as intended, to comprise all the columns in the temple. But a dodecastyle temple is so exceptional that it seems,—let it be plainly said,—it is impossible that it should have escaped record, among the numerous notices, had the Ephesian temple been really an example; the peculiarity must have been specified as its most wonderful characteristic. In this manner we are turned back on all hands from regarding our reduced oblong as that of the line of column centres, and must seek for some other interior proportion. The utmost probability up to this point is, therefore, that the equal margin of 7.5 represents the breadth of a certain number of steps ascending to an intermediate platform, which had the proportion 1 : 2. Five steps of 1.5 each in tread would make up the dimension; the platform itself would make a sixth step, leaving four more to be accounted for in the proper steps of the temple; that is, three steps and the stylobate, which is consistent enough.

If we pause to consider for a moment what an enormous mass of materials is implied in foundations upon marshy ground of a platform of the dimension given by Pliny, we may excuse the exaggerated phrases of Philo, and understand the reasonableness with which Herodotus took the work as at least a term of comparison with Egyptian magnitudes. Even in the case of the temple of Apollo Smintheus,—the archives of the Dilettanti Society must be again referred to,—where there was no lack of firmness in the foundation, the substructions are of extraordinary mass and solidity. The cubic contents of a basement of ten steps in ascent is of course an enormous addition of load.

The hypothesis, therefore, as it now presents itself, and demands to be worked out to its conviction or justification is this, that the Plinian oblong of 220 : 425, reduced by equal margins of five treads of steps (1.5 each) on all sides to a platform of a double square (1 : 2) 205 : 410 ft., supported the temple proper, which was again set upon a podium of four steps, including stylobate.

Deduct, then, the joint breadth of eight treads (= 12 ft.) on either side, = 24 ft., from the full Plinian breadth, and we have the remainder, 196 ft., divisible between breadth of top step of temple and joint breadths of the free platform on either side.

For the breadth of the step, we are in possession of certain probable limits; we are bound in the first instance to the Vitruvian averment that the front was octastyle; confirmed also by some medals, though the architectural testimony of medals is little to be relied on. The Plinian height of the column, 60 ft., limits the diameter of the column to between 6 ft. and 7 ft., and so furnishes at least a minimum for the diameter of a plinth. We should then have further to consider that it is unsafe to assume a length of architrave stone, that is a columniation,

at all in excess of, or even equal to, that at Miletus, 17.400, in a temple where the architect seems indeed from the greater height of his column to have aimed at surpassing—at trumping—the Ephesian marvel. But I am, in fact, enabled to avail myself here of one direct measurement, and of one only, that has been received from Mr. Wood, a columniation of 17 ft. 0½ in. fully verified by measurement of single and average of nine continuous columniations.

To employ this dimension in conjunction with the ancient, we must reduce it to terms of the same foot that Pliny quotes, and that no doubt was the Greek foot. Taking Mr. Penrose's equivalent 1.0134, we obtain 17.270 as equal to 17 ft. 0½ in. English. We have now,—

Columniations of octastyle portico, 17.270	
× 7 =	120.890
Breadth of two semi-plinths of Miletus order	9.110
Breadth of top step	130.000
Joint breadth of treads of steps on either side (1.5 × 8)	9.000
Breadth of lowest step	139.000
Joint breadth of platform steps (1.5 × 10)	15.000
Remainder for free platform = 33 ft. on either side	66.000
Full Plinian breadth	220.000

For a hypothetical length of the temple, the first claims are in favour of either sixteen or fifteen columns; that is, of a double number either of columns in the first case, or else of columniations in the second, as compared with the front.

On the assumption of sixteen columns, we have fifteen columniations:—

17.270 × 15 =	259.05
(Miletus) semi-plinth × 2 =	9.11
Length of temple on top step...	268.16
Steps	9.00
Length of temple on lowest step	277.16
Platform steps	15.00
	292.16
Remainder for platform, 66.42 ft. at either end (66.42 × 2)	132.84
	425.00

By this scheme of distribution, the oblong of centre lines of columns is proportioned as 7.15. The numbers of columns on front and flank being (8 : 16), 1 : 2, and the proportion of length to breadth on lowest step,—breadth, 139 : 277.160 length,—comes out so nearly 1 : 2 (139 + 2 = 278. Cf. 277.160), as to be virtually exact, and scarcely to need the correction for which there is full opportunity in estimate of plinth and steps. Thus, if the steps are taken as 8/16, or 1/36 for each tread of temple steps instead of 1/50, the result is absolutely precise. This change would give an enhanced dimension of 0.84 to platform remainder, both on length and breadth, making the exact proportion of 1 : 2,—

132.84	66.00
84	84
133.68	66.84

: 2 : 1

or probably it may be better to make the alteration in the plinth as 8.27.

The preciseness of these results, bewildering even to the propounder, may well seem suspicious to others. Too often, in such cases, we find that the seeming verification is merely fictitious,—result of every troublesome difference brought out by a backward calculation, being thrown into a dimension of which the arbitrariness escapes, perhaps, even the calculator's attention. But here quoted dimensions and stringent proportion allow no play except in a trifling difference of a semi-plinth.

With this result we may, perhaps, be so far satisfied; we have now to consider how to dispose the large number of 127 columns assigned by Pliny to the building. A dipteral scheme, as authorised by Vitruvius,—double row all round,—provides only for 80. If we treble the row at either end, as in the Olympium, and at the pronaos place 2 *in antis*, we raise the number to 90, and leave 37 for the interior. Here we are left to conjecture, unless so far as controlled and to that extent guided by certain limiting necessities, that do not help us very far. Thus, as the naos walls would range with the third columns of fronts, the interior width could scarcely equal the sum of the three intermediate columniations,—17 × 3 = 51,—say, at the very utmost, 50 ft. Following our only applicable precedent, the Parthenon, we will assume that the naos had a transverse row of columns at the

* See p. 103, ante.

extreme end, and two lateral rows, and of much smaller diameters than the exterior columns. It is in the transverse row that we have an obvious opportunity of disposing Pliny's odd column as central in a row of three, of five, or of seven. A row of five, as in the Parthenon, comes out as the most probable: three are manifestly insufficient, and seven would be unendurably crowded. The given width is then divisible between four columns, two diameter of column, and an ambulatory on either side, that would require to be wider than an inter-column: were it assumed to be of the same width, the divisor would be six columns, less one diameter. Let the dimension for this diameter be considered as thrown into the ambulatories; then $50 \div 6 = 8.33$ for columnation, which is consistent enough. That of the Parthenon naos is 8.67 or 7.50 . But to allow due width for ambulatories, take columnations at one-seventh, which leaves eleven for semidiameter and interval to walls. We have then thirty-two columns left to be disposed in opposite rows of sixteen, in a position that may be thought suitable for the enrichment of *calata*, along with the five at the end. As Pliny only mentions thirty-six so ornamented, we should have to assume that the central one was otherwise treated, or play tricks with the text ourselves, and read, "*et una a Scopis*,"—and a thirty-seventh by Scopas. At Bassa, however, a column in this position had certainly a peculiar treatment. Reckoning intervals to walls, the colonnades would extend to eighteen columnations, which are somewhat less ($18 \times 7 \text{ ft.} = 126$) than the eight external columnations with which they range ($17 \times 8 = 136 \text{ ft.}$);—to say nothing, however, of the improbability of but a single apartment, the proportion of naos so brought out,—2 : 5,—as an unusually long proportion, and the central avenue still more so; but it is enough, and only intended to show that the thirty-seven columns might, one way or another, easily find place.

There is another position assignable for the thirty-two columns *calata*, that in itself is a far more plausible alternative, and would leave free the distribution of the interior into more apartments than one. The inner row of columns immediately surrounding the cella will be found to number thirty-two exactly,—viz., six at either end and ten intermediate at the sides,— $16 \times 2 = 32$. I should conjecture that this range was elevated on at least one step, as in the Temple of Jupiter Olympius, where the inner range had a continuous plinth forming a step,—bases varied, of greater relative projection,—and diameter reduced. Whether in this temple the inner step was retained along the second or the third line in front is not stated, and does not appear, but I rather suspect, in variance with my conjecture here, along the second.

The height of the column is given by Pliny as 60 ft. Vitruvius says that the original Ionic columns of the Temple of Diana were eight diameters high,—a proportion which was changed afterwards,—whether in reconstruction of that temple or elsewhere does not appear,—to nine diameters.

There is some uncertainty of course whether the 60 ft. is an exact dimension or nearest round number, and also whether it includes plinth. Our only means at present of verifying this height is by comparing it for symmetry with spacing of the columns. It appears to coincide with the extent on plan of three columnations and a diameter; that is to say, with the space that includes the lower diameters of four columns and the three inter-columns, $17.270 \times 3 = 51.810 + 8.190$. This estimate gives 8.190 as remainder to answer either lower diameter of column, breadth of plinth, or perhaps breadth of abacus or spread of volutes. By previous calculations it will be recollected the plinth came out as 8.270. Sixty Greek feet divided by nine gives a diameter 6.670, equal to 6 ft. 9 in. English, for diameter of column, and leaving 1 ft. 6 in. for difference of plinth or projection on either side of about 94 in.

We shall do well to compare these results as to the Ephesian temple with the proportionate distribution of the temple nearest to it in scale of which we are in possession of any considerable particulars.

The decastyle temple of Jupiter Olympius at Athens had twenty columns on flank, giving an oblong of centre lines of columns proportioned as 9 : 19; the dimensions on the top step are 171.16 : 354.20, which do not compare in any definite proportion of low numbers; the additional margin equal on all sides that would be required

to bring this oblong to a double square ($354.20 - x = 171.16 - x \times 2$) (1 : 2) is 5.94, which would easily be appropriated in trends of steps; the corresponding dimensions come out in the Ephesian calculation as 4.50; the two trends of the Parthenon measure 4.974, or 1 ft. less. The dimensions of the plan on the lowest step would then be 183.01 : 366.08.

The plan of the peribolus, thickness of wall included, is given as 463.49 : 680.875, which manifestly points to a proportion of 2 : 3. The equation $(680.875 - x \times 2 = 463.49 - x \times 3)$ brings out 28.62 as the required reduction of each dimension, or 14.31 on either side. Deduct wall thickness, as given, 4.85, and we have an inner margin of 9.46, nearly 10 ft., between the inner face of the wall and the lines of the oblong, proportioned as 2 : 3. The absolute dimensions of this come out as 652.255 : 434.870.

That this inner line was in some way marked architecturally I do not doubt; but how marked I do not, in the absence of any remains, care to conjecture. If we deduct the length and breadth of the plan of the temple extended to the lowest step from this reduced dimension of the peribolus, we obtain 143.087 : 125.91 for breadth of platform on front and flank of temple. If we make the same calculated deductions (5.94×14.31 on either side) from Revett's measurements of the platform (164.30 : 146.16), we obtain 144.04 : 125.90 proportioned within a remote fraction as 7 : 8.

All these proportional regulations, it will be seen, correspond with others that have been conjecturally deduced,—but under stringent rule,—at Ephesus. The position, therefore, that has been assumed for the Ephesian temple upon its vast and solid platform has much analogy to that of the Athenian within its peribolus; in either case the definitely-proportioned plan of the proper temple is placed symmetrically within an outer quadrangle, also definitely proportioned, and of which the equal end margins have definite proportion of low numbers to the equal side margins.

The double-square plan of the Athenian temple as lying centrally within a peribolus proportioned as 2 : 3, has lateral breadth of platform proportioned to front as 7 : 8.

The Ephesian plan, also a double-square, lies symmetrically within a still larger double square, and its lateral and end margins of the platform are proportioned as 1 : 2.

To this broad and solid sub-basement I now recognise a direct allusion in the bymn of Callimachus where ascribing the original dedication of Ephesian Diana to the Amazons, he says that "at a later time a broad basement was built about the image."

Κτίσι δὲ τοῦ περιπέριτα ἑστῆσι πύργῳ
 Σιμῶθου
 Δωρῶν.—Callim. in Dian., 218.

On reviewing the results of our consecutive analysis with full consciousness of loyalty to data and accepted premises and processes, it is not easy to suppress the apprehension that they are even too complete and too plausibly coherent for it to be likely that they can be quite correct. Here they stand, however, in good time, and challenge examination with fullest confidence of approval of at least good faith. Having advanced so far, it is vexatious not to be able to proceed to study the symmetries of the elevation as completed by entablature and pediment: we might do so on admitted responsibility to the theory of Greek architecture alone,—alone, for beyond the recorded height and measured spacing of the columns, we have not another dimension to assist us. But the best evidence of all may be now forthcoming any day from the ruins themselves, and theory has already committed itself with sufficient temerity to have to await such demonstration of where it has gone wrong and how, with quite as much of anxiety as of archaeological curiosity and scientific interest.

W. WATKISS LLOYD.

THE FORTHCOMING BILL FOR REGULATING MINES.

THERE is reason to believe that the Act for the regulation of coal mines will be one of the first administrative measures of the present session. Considering the great importance of the subject, not only on account of what legislation may effect, but even more on the ground of the anxious attention directed to the proposed provisions by a large body of industrial persons; and the sentiments that

were pretty freely expressed, when the Bill was abandoned, with reference to the postponement of practical administrative measures to the discussion of vast organic revolutions, we think that we shall be doing good service to our readers in bringing under their notice the chief provisions of the proposed measure, in so far as we may be justified in anticipating them from the state in which the Bill of last year stood over as amended in Committee.

The preamble simply states that it is expedient to consolidate and amend the law relating to the regulation and inspection of coal-mines. This is an under-statement of the case, as it is not so much the regulation and inspection as the practical working which it is sought to amend; but the chief use of a preamble seems to be to commence by saying as little as possible.

The new Act, to be cited as the "Coal Mines Regulation Act," will come into operation on January 1st, 1873. The terms used are interpreted with comprehensive strictness, the term mine including every shaft in the course of being sunk, and every level and inclined plane in the course of being driven, for commencing or opening any mine, or for searching for or proving minerals; as well as all works below and above ground (who spare our readers the legal phraseology) adjacent to a mine. Owner, agent, Secretary of State, and summary jurisdiction Acts are severally defined. The Act is to apply to mines of coal, and of iron stone of the coal measures worked in connexion with coal, or with any disused or exhausted mine. The addition moved to clause 3, to the effect that it should not include clay-pits, seems to point out that it is not stated with sufficient distinctness that coal-mines alone come within the purview of the measure.

The first series or group of enactments in the Bill are those which refer to the employment of women, young persons, or children, in mines. From the commencement of the operation of the Act, female labour underground is entirely prohibited. No child under ten years of age is to be employed underground. Boys between ten and thirteen years old may be employed for not more than three days in one week, no day to exceed twelve hours. From thirteen to sixteen years of age the maximum time that may be spent underground is fifty-six hours in any one week. Mr. Elliot wishes to fix twelve, instead of thirteen years as the age at which this second rate of time should commence, and to extend the hours of employment to 120 per fortnight. Mr. A. Brown, on the other hand, wishes to reduce the hours of labour to fifty-eight per week. The time is to be calculated from the moment of leaving the bank-head to returning to the same. Twelve hours are to elapse between each period of employment; and intervals of one hour in five, or one hour and a half in ten, are to be allowed for meals.

Every boy between the ages of ten and thirteen is to attend school for ten hours per week, exclusive of Sunday attendance, or of attendance before eight in the morning or after six in the evening, unless prevented by sickness, by customary holidays, or by the fact of there being no school within a mile from his home. The owner or agent of the mine, the parent of the boy, and the immediate employer of the boy are each made responsible for his attendance or schooling. It is not stated whether all may be visited with penalties for one offence. Power is given to the paymaster of the boy to withhold 2s. per week, on the request of the schoolmaster, from the boy's wages, and to pay that sum to the former for schooling.

For the regulation of the employment of women and young persons above-ground, the provisions of the Workshop Regulation Act of 1867 are to be applicable. Registers of the boys employed are to be kept, and certificates of the school attendance are to be obtained.

The care of engines and winding apparatus is in no case to be entrusted to a female, or to a person under eighteen years of age, if steam power is employed, or under fifteen if animal power is used.

With regard to the payment of wages, three clauses are introduced by way of barrier against the evils of the truck system. An additional clause has been suggested by Mr. Pratt. With regard to this very important subject it is extremely desirable that there should be no patchwork. It appears, in our judgment to be absolutely necessary that the object which legislation has in view should, in the first instance, be defined, and then that such language should be applied as the framers of the Bill, properly

by Counsel, maturely approve, in order to express his intention. To have a clause from the author, and another from another, or to have the language of the original Bill patched and altered to include something more or something less, is sure to lead to confusion, and probably to litigation. The first clause, translated into English, provides that wages shall not be paid at a beer-shop or public-house; a provision as to the propriety of which all true friends of the miner will heartily concur. The second clause provides that all wages shall be paid in money at a proper pay-office. The third is to the effect that no deductions shall be made from wages for the cost of timber, or any other expense, in cropping the roof. All that we have to say as to these clauses is, that they should be plainly and intelligibly expressed, in language as to the meaning of which neither men nor masters can make any mistake. As they stand, the attempt to give exhaustive legal precision causes ambiguity in one place and surplusage in another. Mr. Pratt's addition is to the effect that no deduction shall be made from wages for any purpose whatever, except for certain specified items, if only set forth in the printed rules of the mine.

These items are to be confined to fines levied under the rules of hiring in use, cost of lamps, oil, candles, powder, tools, and stores, supplied, at the mine, to the miners, rent or fuel payable to the owners of the mines, and payments to sick clubs, schools, or similar purposes. Duly digested, this clause will prove a most important addition to the preceding protective enactments.

There should, we suggest, be added a fourth clause, to the effect that the payment of wages should be made weekly, and on the Friday. The advantage to the workmen of their wages being so enabled to attend the Saturday morning's market, is very great. Less to the masters there is none; and personal experience leads us to the belief that the loss of time incurred by drinking on the Monday is thus reduced to a remarkable degree.

Clauses follow to provide for the measurement of piece-work in mines. Mr. Pease, in each case where they occur, tries to strike out the words, "measuring or gauging," so as to leave the scales as the only criterion of price. This we think is an error, especially as the cost of weighing is put upon the men. The weight should not be paid by the men, but by a percentage on the coal. Inspection of weights and measures is provided for; and the manner in which right intentions, when they take the form of moving amendments in committees, tend to introduce anomalies or absurdities into Acts of Parliament, is exemplified by the amendment of Mr. Lancaster, to the effect that "the weight to be used shall be the pound avoirdupois, according to the imperial standard, without any reference to the contract per ton between the owner and the person employed." Fancy weighing the 800 or 900 tons that a mine "gets" in the year in pounds avoirdupois! What Mr. Lancaster means, no doubt, is, that a ton should be a ton, consisting of 2,240 standard pounds, and not of any other number, as in the case of a ton of gunpowder, which contains only a thousand pounds. This is a proper object, but it might be explained in proper terms.

We now come to a different subject. Clause 18 provides that it shall be unlawful to work any coal-mine that has not at least two shafts or outlets. It specifies that those shafts should be at least 10 ft. asunder. Sir D. Weddellburn proposes yards instead of feet. In the case of such terrific accidents as those which are evidently contemplated by this clause, we must ask of what avail such a frail and narrow barrier of what the Bill calls natural strata would be? 50 ft. would seem to be the least distance that should be specified, and in deep mines the space should be proportionably increased. The idea is to give the means of saving human life in certain cases, at a heavy precautionary cost imposed on the owners of the mine. We are far from contravening the propriety of the regulation. But, if this cost is to be enforced, let it be incurred so as certainly to effect its purpose. What would be the security of a pair of shafts, 3,000 ft. deep and 10 ft. apart? All agreements that go to prevent the provision of a second shaft are made illegal by the Act. In case of mining by way of searching for or proving minerals, or when the proved quantity of minerals is insufficient to defray the cost of a second shaft, the Secretary of State may grant an exemption, on the condition that not more than twenty persons are to be employed below ground at the same time.

General regulations follow. First, adequate ventilation is to be provided. Unused parts of the mine are to be fenced off. Why not say walled off? In approaching apprehended accumulations of water the working is not to exceed 8 ft. in width, and borholes are to be kept 5 ft. in advance. All underground inclined planes are to be furnished with proper lay-bies or manholes. The top of every shaft and all entrances to a shaft from the side or bottom are to be securely fenced. All shafts where the natural strata are not safe are to be securely lined or cased. Every working pit exceeding 50 yards in depth is to be provided with some means of signalling to the surface. A cover overhead is to be used when raising or lowering persons in a working shaft. This clause does not state what we conceive it to mean. A cover "overhead" is no protection to persons descending. What they require is a cover to the skip in which they are swung, which ought to be adequately strong, to throw off a stone falling down the shaft. No single linked chain is to be used in shafts, except for the short coupling chains attaching the cage or skip. Horns or flanges are to be attached to the drum of the winding engines; and an adequate break, and an indicator to show the position of the skip in the shaft, are made requisite. Fly-wheels and exposed portions of machinery are to be fenced, and every steam-boiler is to be supplied with steam-gauge, water-gauge, and safety-valve. Obvious as these precautions are, and important for the interest of the owners, we have no doubt that it is necessary to make them imperative by law. Lord Elcho suggests an inspection and report on all machinery and works once in twenty-four hours. This military notion,—admirable in its proper place,—would, we apprehend, produce nothing but a formalisation of negligence, and probably a false sense of security, among miners. Had Lord Elcho, said every six weeks, instead of every twenty-four hours, there would have been something practised in the suggestion.

The next group of clauses refers to the provisions against the fire-damp. Where an accumulation of explosive gas "is likely," no light is to be used but a safety-lamp. When these implements are used, they are to be previously examined and securely locked. In every mine where explosive gas is known to be produced, no powder is to be used for blasting or getting coal or other materials, except where it is taken into the mine in cartridges, and the place where the shot is to be fired is first examined and found to be safe. This clause should, we think, be more stringent, but it is one that demands very careful consideration. In fiery mines it should be made penal to introduce gunpowder on any pretext whatever, or to introduce candles, lucifers, tobacco, or any light but a locked safety-lamp. It is difficult to see what security is supposed to be attained by the use of cartridges. As preventing scattering powder by careless use is all very well. But the danger attending the use of powder in a fiery mine is from the explosion, not from the powder itself; and that is as violent from a cartridge as from a tamped hole. Lastly, no iron tamping-rods or iron pricklers are to be used. Penalties are annexed to the neglect or contravention of these regulations on the part of the workmen. This is a very necessary clause; but there is no provision for inspection to discover whether such offences occur, without which, stringently enforced, the prohibition will be a mere dead letter.

Clauses follow to provide for arbitration between the owners or agents of mines and the inspectors. The powers and qualification of the latter are defined. Maps or plans are to be accurately kept, showing the workings up to within six months of their date; and are to be produced to the inspectors. A map, on a scale of 6 in. to the mile, is to be sent to the Secretary of State by the owner of any mine that is abandoned or discontinued, within six months of such stoppage. These are valuable provisions. Classified returns of the persons employed are to be annually made to the Secretary of State by the owners of mines, the details of which are, however, to be kept private. Inspectors are to make annual reports, as at present. Provision is then made as to coroners' inquests. Penalties are annexed to offences against the Act of sums not exceeding 20l., for each offence on the part of an owner or agent, and 2l. for any other person; with an addition of 1l. per diem as long as the offence continues to be committed. Imprisonment with or without hard labour, for a period of three months, is incurred for wilful neglect,

endangering life or limb; two justices of the peace, or any stipendiary magistrate, or officer authorised by law forming a court of summary jurisdiction. Some technical clauses follow, and the Acts 5 & 6 Victoria, c. 99; 23 & 24 Victoria, c. 151; and 25 & 26 Victoria, c. 79, are repealed by the present Bill.

Such is the main outline, and such are the principal features of the Bill brought in by Mr. Secretary Bruce and Mr. Shaw Lefevre as amended in committee. It has very much to recommend it. It shows, with all our recent legislation, the evil of tinkering. That when a Bill has been settled in Committee it should be put into good intelligible English by one competent man, is a matter so obviously proper that our neglect of such a proceeding is sheer barbarism. That remark, however, is not special to this Bill. Some of the clauses are inspired by a spirit of fairness that no other Government than that of this country would dream of admitting for a moment. In the matters left for arbitration, for example, the Secretary of State is put on all fours with the mine owners. Whoever may complain of this, it is certainly not the latter. The annexation of penalties to those acts by which a man may injure not only himself but his neighbours, is a matter the obvious propriety of which will admit of no serious question. It is unfortunate that it should be necessary thus to treat grown men as children, but that that necessity there is no doubt. We know that what has already been done in the way of regulation and inspection has materially diminished the death-rate on coal; the numbers of fatal accidents bearing no proportion to their increase to the constantly augmenting yield of our collieries. From year to year the comparison may at times be misleading, but over a series of years it is reassuring.

In 1870 the fatal accidents were fewer by twenty-four, and the deaths in them fewer by 125 than in 1869; the yield of coal having risen in 1870 to 112,875,725 tons, and the number of male persons employed to 350,894, of whom 282,473 are returned as miners. We have recently had occasion to refer to the position of the spring of our manufacturing industry. To stop the enormous waste of coal which, especially in domestic use, is constantly going on in this country, appears to be a matter beyond the reach of legislative wisdom. But to insure human life from the effects of negligence; to protect the miner not only from any who might seek to oppress him from covetousness, but still more from his own carelessness and improvidence; to drive from our mines the shame of female employment; to save the precious hours given to childhood for the training of the future man, moral, physical, and mental, from being entirely devoted to the earning of a few miserable pence,—these are objects in which all good men must agree, and as to the best mode of attaining which there ought to be no very serious dispute.

We lay claim to no knowledge of the intentions of the Government further than such as may be derived from a survey of the actual state of the question. In a matter which is, or ought to be, neither of a political nor of a party character, we should have conceived that the best results would have been obtained by printing and circulating the heads of the proposed Bill before the opening of the session. To this condition of common sense we have not yet attained. But we invite all those of our readers who are interested in the matter, and more especially those of them who have seats in the House of Commons, to master the sketch we have endeavoured to trace,—to keep a sharp eye on such main provisions as those which provide for the proper method of payment,—for the sexes and ages of the persons employed,—for the tuition of the young,—for the ventilation and non-explosion of the mines, especially such as are known to be fiery,—and for the provision of a proper permanent survey of our proved mineral property, accessible to the administration of the country. Returns of the coal raised may, with great advantage, be required from the owners of mines. Clause 42 requires to be made more definite in requiring this. We hope that little private crochets such as those about not measuring or gauging work, or weighing by the pound avoirdupois, will not be allowed to interfere with the passing of a practical Bill. We trust that some of the earliest hours of the session of 1872 may be spared from that kind of fight which is called Parliamentary, for the more worthy struggle to avert some of the most pressing evils that affect the lot of the mines.

We understand that it is the intention of

Government to bring forward a measure dealing with the whole question of master and workman, a question with which the Coal Regulation Bill to some extent grapples. We think that legislation on the subject, if considered in the spirit of fairness and liberality to both sides, which characterises the sketch we have given, will discuss, and will obtain general and impartial support. Let us once more raise our voice in favour of the rendering normal the Friday night's pay. This simple regulation would be tantamount, in itself, to the addition of a considerable per centage to the money value of the wages actually received. And so far as our own experience goes, it would have a yet more sensible effect in the elimination of the Monday drinking, which is a natural and customary outcome of the Saturday night's pay-tale.

Since the above remarks were in the hands of the printer, Mr. Secretary Bruce has brought in the Government Bill. The chief modifications of the scheme which we have analysed are the following:—The enactments as to payment of wages are removed from the Bill, with a view to being dealt with in a more general measure. The new Act is to extend to stratified iron mines, slate mines, and mines of fire-clay. The day's work of children under thirteen years old is reduced from twelve hours to ten, and six half days may be worked instead of three whole days in a week. The representations of the workmen as to the evil of making weighing, instead of measuring, imperative, have been so far attended to that it is proposed to refer the matter, in any disputed case, to the decision of the Secretary of State, upon whom the provisions of the measure throw a responsibility, and confer a power, new to our legislation, foreign to our institutions, and calculated to lead to great confusion and discontent. The Bill makes a giant step towards the centralisation of executive power in the hands of the administration of the day, to which the attention of members of Parliament should be seriously given. As to double shafts, the point now urged is that there should be a sufficient communication between them. Safety is aimed at by the appointment of registered managers, subject to examination, and required to hold a certificate, who may be suspended or deprived, after due inquiry, in case of misconduct. An arrangement is proposed to allow of periodical inspection of mines at the instance, and under the direction, of the miners themselves. It is proposed to throw the responsibility of the propping and care of the roof of the mine on the owners and managers, and distinct intention is expressed to make the persons most deeply interested take efficient measures for the protection of their own life and property, instead of relying upon an activity on the part of the Government inspectors, which is altogether beyond the province of their office. While it is felt that due attention must be given to the discussion of these two details, favourable acceptance of the Bill was expressed by the professional members of the House.

CATHEDRAL RESTORATIONS.

Exeter.—A large and influential meeting of the inhabitants of the diocese has been held at Exeter, in furtherance of the restoration of the cathedral in that city. The work has been in progress in the interior for some considerable time, and the restoration of the choir will cost 24,000*l.* (about 18,000*l.* of which have already been obtained), whilst the nave will cost 10,000*l.* more; and the removal of some buildings which at present obstruct the view of the south side will cost 10,000*l.* or 15,000*l.* additional. The Bishop of Exeter earnestly commended the work to the meeting, and moved that it was most desirable to complete what was already begun. The motion was carried amid loud applause. On the motion of the High Sheriff, it was resolved that as the exterior of the cathedral was much concealed from public view by several incongruous buildings, application should be made to the dean and chapter and the Ecclesiastical Commissioners to consent to the removal, and to the laying out of the surrounding grounds in an appropriate manner. Chancellor Harrington, who has subscribed 5,000*l.* towards the restoration and re-seated the nave, as well as carried out a deal of similar work at his own private cost, expressed his willingness to give up his house.

Worcester.—The work of restoration on Worcester Cathedral is progressing satisfactorily, and an important portion of it has just been

completed. Sufficient money has been raised in the diocese for fully carrying out the designs, and it is expected that the restoration will be completed in a little more than a year from the present time. It is stated that the first artists of this country, and some "talented French refugees," have been engaged of late on the restoration of the choir, from designs by Mr. Gilbert Scott.

Bristol.—Bishop Ellicott, in his annual address to the clergy of his diocese, which has just been issued, observes:—"I regret deeply to say that I cannot report favourably of the advance of the work in the cathedral at Bristol. One of the best friends of the work writes to me that he has nothing satisfactory to mention, except that there has been no actual pause in the works of the new nave. Half-time work is now going on mainly on the south wall. What has been done up to the present time is as follows:—Two bays (the first and second) have been completed and roofed in. The third and fourth have been raised to the height of the crown of the windows, while the remaining bays have been raised about 30 ft. on the north side, so as to receive the south porch (nobly contributed by Mr. Wain, and now completed) and Mrs. Maza's lower window. On the west and south side the walls of these bays are only 10 ft. high. A portion of the cloisters has been restored, and stained glass contributed by the dean and other friends. What remains to be done, then, is much, and I regret to say there is little wherewith to do it. The appeal for the needed sum to roof in the whole nave (15,000*l.*) has been very inadequately responded to. Though a liberal Bristol citizen offered 2,000*l.* if the needed sum were raised before the next anniversary, I regret to say that as yet 1,600*l.* have been the total response to the munificent offer."

Gloucester.—Mr. J. D. Birchall, of Bowden Hall, has added to his previous contribution another 100*l.* to the restoration fund of this cathedral. The treasurer of the fund received in 1871, 2,592*l.* 13*s.* 3*d.*, and paid in that year 3,541*l.* 15*s.* 8*d.* The sum total of the receipts to December, 1871, is 12,465*l.* 13*s.* 2*d.*, and the sum total of the expenditure 12,178*l.* 6*s.* 2*d.* The need, therefore, of additional supplies without delay is very apparent. As the Bishop observes in his pastoral letter,—"The first portion of the great work may be considered as completed. Much, however, remains to be done. The state of the Lady Chapel is very deplorable; the stonework of the cloisters, and the windows on three sides, need extensive repairs; and in many other parts of the great building restoration is urgently needed."

Chester.—The restoration of Chester Cathedral has been steadily advancing at various points, and the results may be enumerated as follows:—The central tower, which was in so bad a condition that fragments of decayed stone used to fall on windy nights, has been for some time completely restored; so also has the south side of the choir, where tracery of the ancient form has taken the place of the windows which used to be seen there. At the eastern extremity of the south aisle of the choir a roof, which is supposed to have existed in the fourteenth century, but has afterwards destroyed, has been replaced. Some disappointment has been felt in consequence of the heavy appearance of the new roof, but the defect will be remedied by scaling. Here some new windows have been placed by Mr. T. Brassey, M.P., in memory of his father. In connection with this part of the fabric must be mentioned the restoration of the south side and eastern end of the Lady Chapel, to the appearance which they originally presented in the thirteenth century. Turning now to the nave, we find the south side, with its flying buttresses, along with the porch and the lower stage of the south-western tower nearly completed. Great progress has been made in the cloister on the north side of the nave, the completion of which is essential to give mechanical support to the groining of the north aisle. But the most conspicuous changes have been in the interior of the nave, from which the yellow wash has been removed and the injured masonry made good, where the south aisle has received stone groining, and where especially the great central space has been vaulted in oak. We notice here, in the centre the Royal arms of the Prince of Wales, "Earl of Chester," who before his illness gave encouragement to the work of restoration by a generous contribution. The various parts of this work of complete restoration remain to be done; for instance, the finishing of the west end of the nave and the north side of the choir;

but in order to deal effectively with the great south transept, which calls for extensive works both internally and externally, large accessions of money will be required. The original estimate for the whole undertaking was 65,500*l.* Of this sum, 40,000*l.*, including 10,000*l.* from the Ecclesiastical Commissioners, have been collected and nearly expended. There remains to be subscribed the sum of 30,000*l.*, and the hope of the Dean and Chapter is that of this sum 10,000*l.* may be obtained in the course of this year and next.

Fells.—The restorations on the west front of the cathedral are steadily progressing. The central part is very nearly completed, and much of the scaffolding has been removed, so that now the work that has been done can plainly be seen. So much of the more prominent parts of the stonework has been removed by the insertion of new stone that at first sight the restored portions have almost the appearance of a new structure. The Kilkeny polished marblo columns and mouldings contrast with the Donling stone. The workmen are now at work upon the south-west buttresses, and the southern and eastern portions of the south-west tower. The works are being carried on by Mr. White, the contractor, under the personal superintendence (with an occasional visit from Mr. Perrey) of Mr. J. T. Irvine, as clerk of the works.

ST. ALBAN'S ABBEY CHURCH.

The north side of the south aisle of the choir appears to have had originally a lancet arcade below the window. The arcade in a similar position in the north aisle is well known by the illustration in Brandon's "Analysis of Gothic Architecture." Only one bay remains, however, of the arcade in the south aisle. It was cut away under the windows—that were formed when it existed; and openings were made between the floor and their cills. In the course of recent examination of the walls in various portions of the buildings for the purpose of detecting the original form of the structure, and clearing away modern and ungainly accretions, a mass of roughly-constructed walling has been removed from the two bays westward of the door, now used for entrance to the building, at the east end of the south aisle. This has laid bare an unglazed stone screen in the eastern, and a pleasing doorway in the western, of the two bays, all in Tottenhoo stone. These stand, therefore (further back in the thickness of the wall), where the lancet arcade named above was aforesaid. The coincidence of position with that assigned to the Chantry Chapel recorded to have been built by Abbot Wallingford (who began to rule A.D. 1476) may probably lead to some interesting conclusions when excavations in the little graveyard have enlarged the amount of accurate information. The debris which was removed consisted of the fragments of a delicately designed and wrought shrine,—too fragmentary, however, for the design to be perceived. The visible surfaces are covered with strong colour and gilding,—forcible enough to cause acute pain to the advocates of unpainted masonry. Several fragments of Parbeck marble, evidently parts of an erection designed on a small module, have also come to light.

We hope that researches into the unexplored recesses of these most interesting buildings will enable us to report in the future some well-ascertained groups of facts that will throw light on our architectural history and antiquities, deduced from the materials extracted from the odd hiding-places in which they have been so strangely stored.

LAMPS ON THE EMBANKMENT.

LONDON, among other undesirable distinctions, possesses one that attaches to it from the variety and ineffable ugliness of its street-lamps. The patterns of the lamp-pillars are in many instances abominable, and a pillar that is not palpably off the plumb is quite a rarity. It is satisfactory to notice signs of improvement in this matter, and foremost among such signs are the handsome, substantial, spherical lamps that are being fitted on the artistic standards that surround the river-wall of the Victoria Embankment. These lamps are from the designs, if we mistake not, of Mr. Vulliamy, of the Metropolitan Board of Works. The lamps are spheres, of 24 in. diameter, or 26 in. over all. The glass is in four equal divisions above and below the central bar; one of the bottom quarters being fitted in a metal

...and adjusted to open, sliding within the cap for rather more than half its size, to each, for cleaning. The glass bars are of copper, rolled in such form as to give the greatest strength possible while exposing as little surface as may be for shadow. The apparent slightness of the glass bars might induce a fear that the lamps are fragile; but this is not found to be the case. Apart from ornamentation, and their being rather larger, the Embankment lamps are similar in structure to those at the Metropolitan and Metropolitan District Railway Stations, which have been found, on trial, to bear a crushing-weight of between four and five hundred pounds before sinking under it. Light and airy though they seem, each lamp, with the frame-rod in which it rests, weighs 1½ cwt. The whole of the metal in the lamp and frame that is above the capital of the cast-iron lamp-pillar is cast brass, or copper, rolled or stamped. Each lamp is furnished with three small brass rollers, upon which it revolves, as may be required, upon a ledge cast upon the inside of the central hand at the top of the standard. The metal-work, after being dressed, brazed, filed, and again dressed, where necessary, is cleaned and finished by bronzing. Mr. Parkes, who provided the lamps, was selected from among about a dozen competitors.

THE ROYAL ARCHITECTURAL MUSEUM.

The Council of this Institution are appealing to architects and employers of art-workmen to send students to the Museum, and they state that, beyond the collection, they are now in a position to provide for visitors many things in which they have hitherto been deficient; e.g., desks, chairs, facilities for taking down casts, &c.; while they contemplate, if the number of attendances should require it, the re-opening of the Museum at night. The catalogue, too, is now in hand, and will be issued without delay. To architects the Council represent the value of encouraging the study by their pupils of such a collection, and ask that a certain number of hours each week should be set apart as a rule for this purpose; employers of art-workmen are urged to give their men time to enable them to learn that which is the grammar of their art, by permitting them to visit the Museum, not after the day's work is done, but during working hours.

A conference was held in the Museum on Thursday, the 15th inst., at which the attendance was considerable, and included Mr. Beresford Pope, M.P. (in the chair), Lord Alwyne Compton, Messrs. G. G. Scott, Hayter Lewis, C. C. Nelson, W. Slater, E. Hall, George Phinckett, Elkington, Cox & Birnie Philip; Richardson, Slade, & Co.; Jock & Son, Lias & Son, Belfern, Hart & Co., Paice, Rudbeck, and others. The Chairman, Lord A. Compton, and Mr. Scott, placed before the meeting the views with which the Council had invited the Conference, and a number of suggestions were then made to which we may return on another occasion.

ERECTION OF DWELLING-HOUSES IN TOWNS IN IRELAND.

The smallness of the number of Building Societies amongst the labouring classes in Ireland has led to inquiries as to the cause of this state of things, within the power of the Legislature to remove. Dr. Hancock, of the Statistics Office, Dublin, points out the following as the causes which have come under his notice:—

1. Want of extending union rating to Ireland.
2. Want of extending to tenants improvements in human habitations in towns, the protection afforded to buildings on agricultural and pastoral holdings by the Irish Land Act of 1870.
3. Want of extending to expenditure in improvements of artisans and labourers' dwellings, when made by tenant or landlord, the priority "over all other estates, incumbrances, and interests whatsoever," which is granted to a local authority making such expenditure, by section 19 of Artisans and Labourers' Dwellings Act, 1868.
4. Want of extending to building leasing powers the definition of a "fair rent" contained in Irish Land Act, 1870, as a substitute for "best rent," required by statute and other leasing powers.
5. Want of extending to building leasing powers the facilities for hindering remainder-men, created by the Irish Land Act, 1870, as to charges for sums agreed to be paid by limited owner for tenants' improvements.
6. Want of extension to Irish County Courts of the equitable jurisdiction exercised by English County Courts.
7. Want of extension of Irish Record of Title to marketable as well as absolute titles, as proposed by the Lord Chancellor's (Lord Hatherley's) Bill for England and Wales.

8. Want of power in Irish Record of Title Office to establish a duplicate local register, for all dealings with artisans and labourers' dwellings, at the nearest post-office money-order office.

9. Want of power in local town authority to convert all waste unoccupied land, and land covered with ruinous houses (from defect of title), into useful building ground, by selling land after due notice, and investing money, until difficulties of title, which render the land waste, be removed.

Remark on these suggestions, Dr. Hancock says truly:—"The rule of requiring the 'best,' that is, the highest possible rent, to be reserved in a lease, as in the 25th section of Landed Property Improvement Act, 1860, has the effect of making a lease invalid if a landlord makes any allowance to a tenant in fixing the rent for previous improvements of the tenant or his predecessors. This is entirely inconsistent with justice and usage in Ireland, and accordingly, in the Irish Land Act, 1870, it was remedied as to agricultural leases granted under that Act; and instead of 'best rent' being required, the lease is to reserve a fair yearly rent without taking anything 'in the nature of a fine, premium, or forfeit,' with a proviso 'that in estimating such yearly rent, it shall not be necessary to take into account against the tenant the increase, if any, in the value of the holding, arising from any improvements executed by the tenant or his predecessors.' Many building leasing powers in Ireland, statutory and others, are rendered of very little value for want of 'fair rent,' as thus defined, being substituted for 'best rent.' As this has been done in the case of agricultural leases, it ought to be extended to building leases.

The subject is one well deserving further inquiry.

PATERNOSTER BUILDINGS, ST. PAUL'S.

A SUBSTANTIAL and comely block of buildings bearing this title has been erected in the central area of Newgate Market, from the designs of the City architect; Messrs. Sandon, Brothers, being the builders.

There is a passage-way on the ground-story through the block, north and south, and one east and west, the passage-way north and south facing Rose-street, in Newgate-street, and Paved Passage in Paternoster-row. The ground-floor all round is appropriated to shops, and there are two floors of rooms above. The elevations are in brickwork, with cement dressings, and all the ceilings within are boarded. To what extent ventilation is obtained for the inner portion of the parallelogram, we were not able to see, the gates which close the footways being fast at the time of our visit. The Messrs. Blackie have already moved into one of the shops, and other publishing firms will speedily be located there. We have still a belief, with all proper respect for the opinion of those who have thought otherwise, that a good direct thoroughfare north and south would have been a better arrangement for the public and the future than that which has been adopted. We conclude that the old houses around the area on which the new block has been erected will shortly come down; their present aspect is deplorable.

COMPETITIONS.

Sunderland Workmen's Dwellings.—The first premium has been awarded by the corporation of Sunderland to Mr. Thomas Oliver, of Newcastle-on-Tyne.

Saltash School-Board Competition.—We have received complaint that the clerk sent out one of the sets of plans before they were examined by the committee to a gentleman who was not a competitor. The statement, however, is not clear.

WORCESTER SCHOOL BOARD COMPETITION.

We have received at the last moment from Mr. Witherington a reply to Mr. Hastings, and copy of Counsel's opinion on the matter. We are able to make space only for the latter:—

"Worcester School Board and Witherington. *Ex parte Witherington.*
I am of opinion that there was no contract on the part of the Board, express or implied, to adopt the best plan submitted. All of the plans submitted might have proved objectionable, and the approval was necessarily a matter entirely in the discretion of the Board. The contract is in substance merely that the architect whose plans are approved shall have the superintendance of the work. Now it cannot be said that Mr. Witherington's are approved; for it is Mr. Day's plans which are approved. It does seem, indeed, that Mr. Day's plans were not set in in due time, for the fact of the 31st December falling on a

Sunday clearly would not extend the time until the Monday and therefore they ought not to have been received, or, at all events, not to have been looked at until it should have been ascertained that none of the plans sent in in due time were of sufficient merit; but inasmuch as Mr. Day's plans were received, and were adjudicated upon simultaneously with the others, the circumstance of their being sent in too late does not alter the fact that it is his plans which are 'approved,' and consequently that Mr. Witherington's are not. As above intimated, what is chiefly secured by the advertisement is, that the plans which are approved shall not be handed over to some other person, for him to execute the work.

In Ward v. Lowndes, 1 Ell. & Ell., 940, it seems to have been admitted that the plaintiff had become entitled to the premium, and the questions were only as to enforcing payment.

In point of fact, the advertisement is illusory, it not being such as to entitle the architect who produces the best plans in every respect, although admitted to be suitable, to have them adopted, but really leaving everything short of the misappropriation of them, in the power of the Board.

If the competition (such as it was) were to be opened, at Mr. Witherington's instance, and he were simply to send in his present plans again, he would probably not be entitled to retain the cheque for 300; but, under the circumstances, I can only advise him to acquiesce in what appears to me to be a very irregular and unjust decision on the part of the Board, and in that case I conceive he will be entitled to enforce payment of the cheque if resisted by the Board. (Signed) LUCIUS KZZLX, *Inner Temple, February 9th, 1872.*"

Sir,—Replying to the intimations of your correspondent, "Dies Non," permit us to observe, that we should be "astounded" to be told that our estimate "emanated from a firm of builders whose faith," &c., because no representative of any building firm, nor person connected with any member of the board, saw our drawings until after they were in the possession of the board's secretary. B. & G. C. HADDOS.

LOUTH HOSPITAL AND DISPENSARY COMPETITION.

The committee, after considering the merits of the several designs sent in, have selected the one submitted by Mr. John Johnson, of Moorgate-street, London, and have given instructions for the working drawings to be prepared. The arrangement of the wards is on the pavilion system. The accommodation provided on the ground floor consists of general sick ward, and an accident ward, with operating-room. Bath-room, lavatory, ward, scullery, and w.c. conveniences have been provided adjoining the entrance. The matron's room is near the entrance, and has a window for overlooking the sick ward, and the out-patients' department is kept distinct, and has a large waiting-room, medical officers' examination-room, and dispensary, with separate entrances; the dead-house and post-mortem room faces north, and is lighted by a large skylight. The dining-room for the convalescents has a south aspect. The administrative portion is well separated from the hospital, and comprises kitchen and scullery, with pantry, larder, dry goods, clothes, and other stores; the laundry, washhouse, and drying-closet being at the extreme end of the building. Servants' w.c., coal, wood, and beer stores, are conveniently placed.

On the first floor the women's sick ward is similar to the ward below, and the children's and separation ward is adjoining. A nurses' room, servants' bed-room, and clean linen store-closets are provided; also a private w.c. for the matron and nurses.

The exterior will be of light yellow brick, with red bands and arches, the dressings generally being of Ancaster stone. The works will be commenced as early as possible.

THE LAW COURTS COMPETITION.

Sir,—I am surprised to find that a statement of mine, that Mr. Street accepted the appointment of sole architect of the new Courts of Justice without previous communication with me, has been denied by Mr. Street. I shall, therefore, feel obliged if you will allow me to re-assert emphatically that such was the case. I first saw the news *in print in your columns* at a club. Disbelieving it, I made inquiries; and, having learned its accuracy, I wrote to Mr. Street, who then for the first time told me of it *in reply to my letter*, but neither then nor subsequently did he consult me in any way respecting it.

Having received the award of the judges as to what were declared the "vital points" of the competition, I have always felt that the award was substantially a judgment in my favour, though I have been willing to waive my exclusive claims in favour of a joint appointment with Mr. Street, as advised by the judges. Those who will take the trouble to read the whole correspondence as laid before Parliament will see

that this line has been taken in all my letters from the first.

I feel bound to mention this, as some garbled extracts have appeared elsewhere.

EDWARD M. BARRY.

FORESTERS' HALL, WILDERNESS-ROW.

WILDERNESS-ROW is not an inappropriate name for the place so called (which is close to Charter House), so ragged and rugged is its aspect. At one end of it, and somewhat in a corner, a new hall has been built, for that respectable and very numerous body the Foresters. The style of the exterior is of a mixed character, not very congruous, the stone porches absolute Gothic, and the rest of the structure what we must call Victorian. Still it has an agreeable air, and typifies a well-to-do body, desiring to stand equally well in the eyes of the public. We cannot, however, speak so contentedly of the interior. The large meeting-room, or "hall," with its gallery, is certainly the ugliest apartment we have looked at of late years, and is not likely to raise the taste of its occupants. The removal of the large pilasters and little arches with which the walls are adorned would improve it. The foundation-stone, which bears the name of the builders, Messrs. Henshaw, does not indicate that any architect was employed, and this may account for what we have objected to.

WESTMINSTER CHAPTER-HOUSE.

SIR,—Touching your description, last week, of the Chapter-house, Westminster Abbey, many of your readers will be gratified to learn whether and when it is probable that, like the cloisters leading to it, its useless solitude may be broken for the gratuitous instruction of the general public, who have paid for the restoration.

"How reverend is the face of this tall pile,
Whose ancient pillars rear their marble heads
To hear aloft its arch'd and pond'rous roof.
By its own weight made steadfast and immovable,
Looking tranquilly."

I presume there is some occult motive for carefully concealing the existence of the crypt. Doubtless it is a dark place; but surely this is not sufficient reason for keeping such an intensely interesting relic entirely out of sight. Some light is cast on its character by a view and plan in your volume for 1853, pp. 67, 198.

E. L. TARBUCK.

SIR,—In your interesting notice of the restored chapter-house, I notice two inadvertencies:—
1. "The seats of the abbot, the friar, and the sub-prior, with probably those of the chancellor and the precentor." 1. The prior and the sub-prior of course are the intended reading.
2. The stalls of the precentor and chancellor in this position are peculiar to chapter-houses of secular cathedrals. The duties of the chancellor are given in my "Traditions and Customs of Cathedrals," just published by Longmans. He was a dignitary in such foundations. In monasteries, the corresponding office was represented by the precentor, in addition to his common duties.

However, I am able to allot these five stalls, on the authority of the MS. Custumal of Westminster, to the abbot, the major prior, the sub-prior, and the custodes ordinis, the third and fourth priors, whose duty it was to hold chapter and collation. I printed a brief note of it in the *Ecclesiastic*.

MACKENZIE E. C. WALCOTT.

THE SEWAGE QUESTION.

London.—An inspection of the sewer works in the neighbourhood of King's-cross has been made by Mr. Bazalgette, who, in reference to the overflow of sewage, states that to effectually remedy the defects complained of would require the construction of an independent line of sewer for storm-waters only, at a probable cost of 70,000*l*. A communication to this effect was laid before the Clerkenwell Vestry, at its last meeting, and a resolution was adopted approving of Mr. Bazalgette's proposition.

Thames Sewerage Commission.—A deputation of gentlemen connected with several of the water companies of the metropolis has waited upon the Home Secretary, to point out the serious consequences that would follow Mr. Bazalgette's plan for purifying the Thames from sewage between the metropolis and Windsor. Mr.

James Clay, M.P., who headed the deputation, adduced in detail many reasons why the proposed scheme should not be carried out. The idea was to convey the sewage of twenty-four towns, containing a population of 300,000, all situated below the in-take of the West Middlesex, the Grand Junction, and the Vauxhall Water Companies, through many miles of sewer to a point above the in-take of the water companies, and discharge it in a part where in all probability the streams in Chertsey and the neighbourhood would be contaminated by it, and the water companies would thus become the distributors of impure water. For this reason the scheme was opposed by large landowners in the neighbourhood. The great object of the deputation was to prevent the impurity from being taken so close to their works. Other gentlemen urged the importance of Government interference, and the Home Secretary promised to give the "most serious consideration to the very grave objections that had been raised."

Cambridge.—On the 31st ult. a meeting of the University Syndicate held an interview with Mr. Charles Bateman, of Westminster, who had been called in under the sanction of the Senate to advise them upon the various schemes which have from time to time been submitted by Messrs. R. R. Rowe, Bazalgette, G. W. Stephenson, and J. Bailey Denton respectively, for the diversion of the sewage of the town from the river. The town surveyor (Mr. Stephenson) attended the meeting, and the whole of the previous designs, schemes, sections, and other drawings were placed at Mr. Bateman's disposal. On the following day, Mr. Bateman (accompanied by Mr. B. T. Moore, of Pembroke College, and the Town Surveyor) went over the town for the purpose of examining the existing sewers, and surveying the colleges, in order to ascertain if it were possible to utilise the existing sewers as a portion of a scheme to be submitted for consideration. After Mr. Bateman had minutely inquired into the various details, he made a survey of the different sites in the locality that had been previously inspected and reported upon as suitable for sewage-irrigation; and his opinion, we understand, coincides with those previously given by the other engineers, that the Chertsey and Milton neighbourhood is pre-eminently favourable. The Town Surveyor, according to the local *Chronicle*, is still in communication with Mr. Bateman.

Oxford.—The Drainage Committee having recommended that Mr. Bailey Denton be appointed Consulting Engineer, and that it be referred to the committee to settle the terms on which Mr. Denton is to be employed, the report has been adopted by the council.

THE PROPOSED NEW BUILDING ACT.

The Bill has been again revised, and is being prepared to be taken into the House. It is, however, by no means settled, and may even be divided, the sanitary portion from the constructional, before it is brought in.

LINCOLN WATERWORKS.

THESE waterworks, which have been in the hands of a private company, incorporated by Act of Parliament, have been transferred to the local Board of Health.

An Act of Parliament obtained last session for increased powers, contained an agreement for a sale of the waterworks undertaking to the Local Board, at a price to be fixed by arbitration. The arbitrators and umpire having been appointed, Mr. Cawley, of Manchester, on the part of the company; Mr. Hunter, of Wigan, on the part of the local Board; and Mr. Bancroft, of Manchester, the umpire; a hearing took place at the Westminster Palace Hotel last month, when Mr. Charles Pollock, and Mr. Brogden, instructed by Messrs. Twedd & Carline, solicitors, appeared as counsel for the company, and Mr. Horatio Lloyd and Mr. S. D. Waddy, instructed by Mr. Hebb, solicitor, appeared as counsel on behalf of the Local Board.

The sittings occupied four days. The scientific witnesses called on behalf of the company, were Mr. J. W. Leather, of Leeds, C.E.; Mr. Pasge, the company's manager; Mr. Thomas Fenwick, of Leeds, C.E.; and Mr. T. B. Foster, of Manchester, C.E., whose valuations averaged over 70,000*l*. The skilled witnesses called for the Local Board were Mr. Medlock, chemical analyst; Mr. Edward Ryde, of Westminster; and Mr. Henry Goddard, of Lincoln, surveyors;

Mr. Jno. Taylor, of London, C.E.; Mr. Jno. S. Norris, of Nottingham, C.E.; and Mr. Joseph Quirk, of London, C.E. The evidence of these gentlemen went to show a value for the whole concern, of from 40,000*l*. to 45,000*l*. Counsel having addressed the court, the arbitrators took time to consider their award.

URQUHART CASTLE, IN THE COUNTY OF INVERNESS.

ABOUT half-way between the two extremities of Loch Ness, the loch is suddenly reduced by about one-third of its ordinary breadth by the projection from its western shore of a bold head-land, under cover of which the glens of Urquhart and Moriston open upon the loch, and contribute to it, across a marshy deposit of gravel and peat, their respective waters.

The headland which is thus partially isolated between these waters and the loch is moderately lofty, and slopes down steeply towards its extremity at the north-east, again to rise and finally to terminate in an oval and rugged knoll of rock, which stands out from 50 ft. to 100 ft. above both the water and the contiguous land. Upon and covering this knoll is placed Castle Urquhart, which is thus a very prominent object from Lochness, and combines, in a very remarkable degree, natural and artificial defences upon its *enceinte* and within its area.

The rock, open at each end, and along its north-eastern side towards the loch, is protected on the land side by a deep and broad ditch, quarried across the neck of the peninsula from shore to shore, not, indeed, to the level of the water, but from 10 ft. to 12 ft., but to a depth which at one point gives a precipitous height of 30 ft. to 40 ft. to the rock forming its scarp.

In general plan, the castle, like the rock it stands upon, is an irregular oval, reduced to something of an hour-glass figure by the indentation of a small cove near its centre. At the north and most prominent end, is the rectangular keep. On the landward front is the gatehouse, and in the side opposite appears to have been a small tower. The *enceinte* is completed by curtain-walls, ranging in thickness and height from 4 ft. to 9 ft., and from 20 ft. to 40 ft., according as they supported buildings within, or occupied weak or strong points in the defences.

The entrance is by a causeway of masonry, 12 ft. broad, having a roadway between parapets, and about 80 ft. long from the counterscarp to the scarp of the ditch. At about 40 ft. from the counterscarp, and 6 ft. beyond the centre of the ditch, there is a deep, is an opening of 20 ft., formerly occupied by a draw-bridge, beyond which the parapets are higher, and probably formed part of some kind of advanced work, for the management and protection of the bridge. This part of the defence occupied the remainder of the causeway proper, about 20 ft., the ditch here being 80 ft. broad, and a platform of 20 ft., with a rise of 6 ft., intervening between the end of the causeway and the gate.

The gate is removed about 6 ft. to the south of the line of the causeway, so as to check a rush upon it. It is a plain round-headed portal of 9 ft. opening, between two half-round towers, and above it is the usual small look-out window of the portcullis chamber. Just within the gateway is the square groove, in which hung the portcullis, and beyond is a barrel vault, ribbed at intervals, for gates, and having a lodge door on the left hand. The passage ends in a plain but good round-headed gateway, the coigns and ring stones of which are of excellent ashlar, and which is set in the inner face of the gatehouse. This is a rectangular building, with two half-round towers flanking its outer entrance, and on each side of the central passage is a chamber also barrel-vaulted, but having semicircular and semi-domed west ends. One of these rooms, as mentioned, opens from its side into the passage, and the other from its end, into the court. The gatehouse had an upper floor, also vaulted, and apparently also a second floor, of which traces remain. Fragments of a chimney-shaft which has fallen from its front, encumber the causeway.

Emerging from the gatehouse, the rugged character of the interior comes at once into view. On the right is a path between two knolls of rock; that on the left moderately high, and not quite extending to the waterward curtain; that on the right high and steep, and its perpendicular face forming the landward curtain, the

wall crowning which is 9 ft. thick. At the south-east end, where the two ridges unite, is a small circular eminence, which may have been a beacon. This part of the outward is a fortress in itself, and upon its highest ground are traces of buildings. A fragment of the waterward curtain still stands about 30 ft. high, and 6 ft. thick; but there are no traces in this quarter of mural towers.

The gatehouse opens upon the narrowest part of the wall, where it is indented by a small cove. The curtain was carried round this cove, and contained a postern, whence a path led down to the water, here shielded by the cliff. There is a window in the curtain,—a part probably of a building for the protection of the postern and the galleys below.

The way from the gatehouse towards the left leads to the keep. It rises by a steep curve between, on the right, a high wall of some ruined building, and on the left a curious knoll of rock, scarping steeply into a rectangular figure, about 30 ft. high, and on the top of which are foundations of a building, 15 ft. by 30 ft., which must have been as tall as the upper floor of the gatehouse, and have commanded the adjacent curtain, from which it is separated by a narrow hollow way. Following the curved road, a cross wall is reached, which cuts off the inner from the outer ward, and formed an out-work to the keep. This ward is three-sided,—a sort of quadrant, the keep being at the apex. The land and waterward curtains form the two sides, and the base is a shallow curved ditch, in which is built the wall, and against it are two buildings like barracks. Between their inner ends was the entrance. This ward was exceedingly small, and is now thickly encumbered with ruins.

The keep is an excellent example of the stern rectangular Scottish fortalice of the fifteenth century. It is about 40 ft. square, of four stages, and built on the steep, so that its basement is above ground on the outer, and below it on the inner, or court side. This basement is 16 ft. by 18 ft., within, barrel vaulted, with walls, 10 ft. to 16 ft. thick, with a loop rising to the light on the land side. It was evidently the prison. The floor is opposite to the loop, and opens into a small lobby, having on the left the foot of the well stair, and in front a postern, 4 ft. wide, flat topped, and closed by a door, which opened on a small platform, about 25 ft. above the loch, which is reached by a steep winding path. The turnpike stair is 8 ft. in diameter, and is contained in the north-east angle of the tower, opening upon each floor, and finally upon the battlements. It makes no external projection, but is seen within, cutting off an angle from each floor. The basement and the highest floor are the only vaulted chambers.

The first floor is lighted by a segmental arched window to the court, and by small square-headed loops towards the water. These vary from 6 in. to 2 ft. in breadth of opening, and each has a little below it, an oilet-hole, which opens from the window-seat. No fire-place remains, but the east wall is destroyed, in which it may have been. This chamber seems to have been entered only by the well-stair.

The second floor has also openings under flat segmental arches, and on the south side is the main door, reaching about 20 ft. above the ground, and reached either by wooden steps or some other means now destroyed.

The third floor, or fourth stage, differs from the rest in that a small chamber is contained in the south-eastern angle, the door into which is in the south wall, near its east end. This may have been an oratory, but as the east wall of the keep is gone, and with it the east end of this chamber, which also is inaccessible, such details as may remain have not been examined. In the west wall of the main chamber is an excellent flat segmental arch in ashlar, which spans a fireplace and a window looking down the loch. This upper story was covered with a vault, in the west side of which are traces of a side arch, covering that over the fireplace and window. Most of the main vault has fallen in.

There do not appear to be remains of any garbages. The parapet is gone, but the wall is crowned by a bold moulding, and beyond this, at each angle there is a row of short corbels, which probably carried the usual bartizan turrets. Over the door, at the top of the wall, are four bold corbels, which evidently carried a machicolation for its defence.

Urquhart is far more extensive than most Highland castles, and the traces of barracks

show that its area was turned to full account. It would contain a garrison of from 400 to 500 men. Though the masonry is rough, it is good, the proportions of the keep are excellent, and the ashlar work used for the doorways, quoins, and window dressings, is well executed. What arches remain are roundheaded or segmental, not pointed. At the north-east angle the keep has a small short buttress set on anglewise, and one, also short, of a pilaster character, and slight projection, set on the west face of the north-west angle. The curtain springs from the keep, half of which is outside it.

Urquhart is one of the chain of fortresses, which stretched across the great glen from Inverness to Inverlochy, and were employed from an early period to defend and overawe the country. By some accounts it is spoken of as belonging to the Comyns of Balconch, but certain it is that when Edward I. was at Kildrummy, near Nairn, in 1303, he despatched a party who laid siege to this castle, and with some difficulty took it, putting Sir Alan de Bois, its governor, and the garrison to the sword. In 1331 it was held for Bahol by Sir Robert Lauder, of Quarrel Wood, as governor; and the office seems to have been hereditary, for Lauder's daughter married Chisholm, and their son, Sir Robert Chisholm, of Chisholm, who had Quarrel Wood, had also the constablership of Urquhart, then, and probably always, a royal castle. Chisholm's title, however, was insecure, for in 1359 David II. disposed the barony and castle to William Earl of Sutherland, and John his son.

After this, Urquhart was held under the crown by the Grants of Freuchie, afterwards of Castle Grant, who, as chamberlains for the Crown, got possession of most of the adjacent lands. In 1509, James IV., under an Act of the Scottish Parliament, granted three-fourths of Urquhart Lordship, and of the Baronies of Urquhart and Glenmoriston, to Grant of Freuchie, and his two sons, from whom descended the Grants of Glenmoriston and Corrimony. The castle has since remained in the Grant family, and is now the property of the Earl of Seafield, whose house of Balmacraan is in the lower Valley of Urquhart.

It appears that the Knights of the Temple had an establishment in the Bay, and brought into cultivation the lands on its eastern shore. Probably they were constables of the Castle. On the farm of Pinnians is still a place called Temple.

Until after the rebellion of 1745 Glen Urquhart was in a very disturbed state. Grant did not reside there, and the people were continually attacked by the clansmen from Glengarry, Locheil, and Kintail.

It is difficult to establish with any precision the date either of the early or the present castle of Urquhart. The ditch is no doubt much older than the siege of 1303. The remains of the castle now standing can scarcely be older than the fifteenth century, and probably it was one of those built about the middle of it, in accordance with the strong recommendation published by James I. on his return from his captivity in England.

An excellent account of this part of the Highlands, and of the descent of the Urquhart property, will be found in the "New Statistical Account of Scotland, for Invernesshire," p. 43.

G. T. C.

HULL DOCK COMPANY'S NEW OFFICES.

The Dock Company have taken formal possession of their new offices. The building stands on a triangular piece of ground, facing Junction street, New Cross-street, and the Queen's Dock respectively, the centre of the side next to the Dock projecting forward, and its plan consequently presenting much difficulty, especially as a maximum accommodation was required upon a comparatively limited area. The architect, by designing the building to follow the outline of the complete site, has utilised the whole area, and obtained space for a central court for light and ventilation. There being so much water in proximity to the site, the Italian style of architecture, of the "Venetian" type, has been adopted for the building, which is arranged with three façades, corresponding with the frontages. The main façades are connected with each angle by short circular façades, but having projecting porticos, with detached Ionic columns, on the ground floor, which serve as buttresses to towers and cupolas surmounting these angles.

The entire building is faced with selected Ancaster stone, excepting the principal sculptures, which are of Portland, and the basement, which is of Bramley Fall. The roofs are covered with Westmoreland slates. The whole structure is surrounded by an iron railing, the uprights formed of ornamental tridents and barpoons placed alternately, with solid square standards at intervals, capped by escutcheons and crowns.

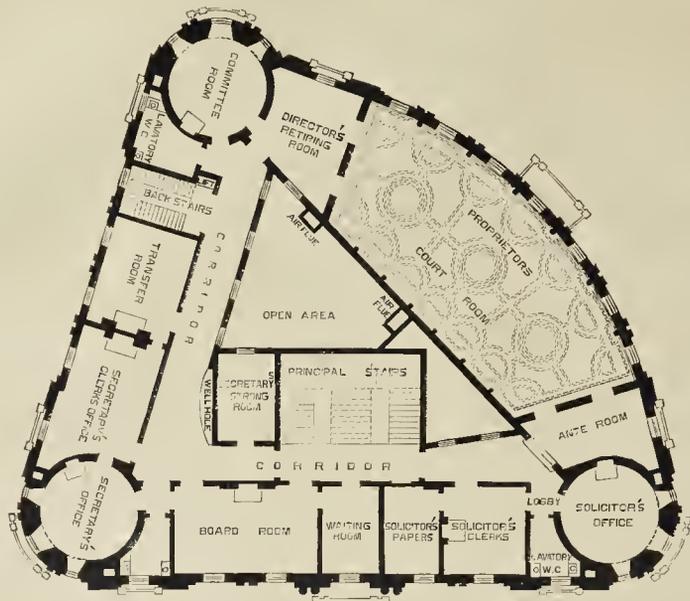

With regard to the plan of the building, the main entrance is placed in the centre of the Junction-street front; a portico and vestibule lead to a handsome entrance-hall, out of which, on the ground-floor, are arranged the various offices appertaining to the resident engineer and the superintendent dock-master, and from which a wide staircase of Portland stone, bordered by a wrought-iron railing of good design, leads to the landing of the first floor. From this landing are entrances to the board-room and waiting-room, a corridor to the right leads to the secretary's department, the accountant's office, strong-room, &c.; and one to the left conducts to the solicitor's offices, and to an ante-room, in which a memorial tablet,—containing the names of the chairman, directors, and officers of the Dock Company, and the architect,—has been placed; and to the proprietors' court-room, an apartment, 70 ft. in length, 29 ft. in width, and 21 ft. 6 in. in height, the highly-decorated ceiling of which is supported on each side by marble columns 16 ft. high, with ornamental Corinthian capitals and entablature, and a cresting over. The wharfage department is kept distinct from the other offices, having its entrance from the centre of the quay frontage. The wharf office is 100 ft. by 29 ft. and 18 ft. high.

Within the building is an open court: this affords means for thorough ventilation and lighting. The warming and ventilating arrangements are effected by means of a fan, worked by a small steam-engine.

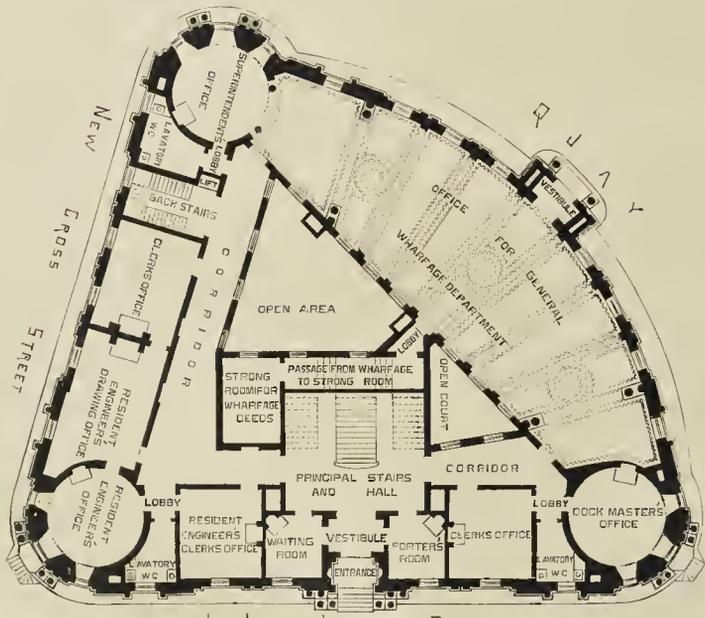

Mr. C. G. Wray, of London, was the architect. The erection of the building generally, including the brickwork, masonry, carpenters' and joiners' work, and painting, has been carried out by the Dock Company's own staff of workmen, under the superintendence of their resident engineer, Mr. R. A. Marillier, C.E. The whole of the structure is made fire-proof, the floors being formed of arches of Messrs. Dennett & Co.'s patent material. The arrangements for warming and ventilation were carried out by Mr. W. W. Phipson, of London. The sculpture in the tympanum of the pediment, the trophies over it and the quay front, and the figures in the spandrels of the centre arch in Junction-street, are the work of Mr. John Underwood, of London; and the modelling for the other parts of the carving, and for the internal enrichments, was also executed by him, under the immediate supervision of the architect. The carving of the main portion of the building, including the capitals, friezes, and panels, has been executed by Mr. Thos. Frith, of Hull. Mr. Thomas Welpton, of Hull, superintended the castings of the ornamental portion of the plasterers' work; and Messrs. Young & Wood, of Hull, supplied the inclosure iron railing. The wrought-iron railing to the principal stairs was executed by the Milland Architectural Metal-workers Company, of Coventry. Messrs. Strove, of London, supplied the sun-burners; Messrs. Howard & Sons, of London, the parquettes for the border of the court-room floor; and Messrs. Blanchard & Co., of London, the terra-cotta ridge cresting, &c. From the architect's design. Messrs. Richardson & Son, of Hull, glazed the windows with plate-glass, including the three engraved windows on the staircase.

The directors of the company, at their last annual meeting, recently held, made a very encouraging report. Considering that the capital of the company has been doubled, and more than a million of money spent in the new Albert Dock, it is satisfactory, and more than was expected, that nearly 4 per cent. on the capital thus increased was realised in the first year after the completion of their new dock. The reserve fund was created out of former dividends, expressly to make good the expected deficiency for the first few years after the increase of capital spent on the Albert Dock.

We hear that from the 1st to the 20th of January this year, there was an increase in dock duties alone of 700l. beyond what was gained in the same period last year, so that there would seem to be every prospect of increased revenue.

THE LYONS EXHIBITION BUILDINGS, PARK, AND LAKE.

LYONS UNIVERSAL EXHIBITION.

OUR readers know that a Universal International Exhibition of Agricultural and Industrial Products and Works of Art will be opened at Lyons on the 1st of May next, and closed on the 31st of October. It will be held in enclosed galleries and in an open space adjoining. We give a view of the building, which is constructed on land furnished by the City of Lyons, and known as the Parc de la Tête d'Or.

Articles for exhibition will be received at the building from the 1st of March to the 1st of April, 1872, inclusive, and applications for allotments of space should be made at the earliest possible moment, addressed to Mr. Edmund Johnson, Hon. Secretary of the London Committee, 3, Castle-street, Holborn, London.

Certain charges will be made to exhibitors for space.

At a committee meeting recently held in the Mansion-house, under the presidency of the Lord Mayor, for the purpose of considering the best means to be taken to insure the proper representation of the United Kingdom at the Exhibition, it was announced that the Minister of Agriculture and Commerce had promised that the French Government would furnish the medals to be awarded by the international juries, and that the committee of organisation at Lyons would defray the expenses of the London committee to the extent of 6,000 francs. It was resolved to communicate with the various chambers of commerce in Yorkshire, Lancashire, and elsewhere, and to suggest to the mayors of the cities and towns most interested in Continental trade the advisability of immediately forming local committees to obtain exhibitors. The productions exhibited will, it is said, be divided into nine groups, viz.:—First, silk, raw material, machinery, and manufactures; secondly, textile fabrics, clothing, and other objects worn on the person; thirdly, furniture and decorative objects for use in dwellings; fourthly, machines, implements, and tools; fifthly, products of the extractive industries; sixthly, alimentation; seventhly, agriculture and horticulture; eighthly, materials and processes of the liberal arts; and, lastly, works of art. All facilities will be given to the exhibitors for the sale of their productions, but no object exhibited must be withdrawn until after the closing of the Exhibition.

Group III. will include Furniture, Upholstery, and Decorative Work; Paper-hangings in all varieties; Porcelain, Earthenware, and Glass; Gold and Silversmiths' Work, Cutlery, Jewelry, Bronzes and other Artistic Castings, and Repoussé Work; Apparatus and Processes for Heating and Lighting.

* Group IV. will include a Workmen's Class:—Articles of all kinds produced by men working on their own account, with or without the aid of their families or apprentices; Machines and processes illustrative of work executed at home; Work specially illustrating the skill, intelligence, and taste of the workman.

Group IX. will consist of Oil Paintings on Canvas, Panels, &c.; Water-colour and other Drawings; Sculpture and Die-sinking; Architectural Designs and Models; and Engraving and Lithography.

We understand that the applications from English producers are fairly numerous.

THE PROPOSED CONVICT PRISON AT DENMARK-HILL AND THE HOME SECRETARY.

THE Government proposition to erect a convict prison at Denmark-hill is encountering much hostility, and a determined opposition on the part of the residents and the owners of property in the district, and public meetings to protest against the project are being held in different parts of Lambeth, Kennington, Camberwell, Brixton, and other places. On Saturday, a numerous and influential deputation, consisting of several members of Parliament, including Sir J. C. Lawrence and Mr. McArthur, the representatives for Lambeth; and Col. Beresford and Mr. Locke, the members for Southwark; together with representatives from the several local and parochial bodies in the district, clergymen, and others, waited upon Mr. Bruce, the Home Secretary, with whom was Mr. Winterbotham, the Under-Secretary, for the purpose of representing to the right hon. gentleman the evils and the injury that would be caused to the neighbourhood by the erection of the proposed prison in the neighbourhood. Sir J. C. Lawrence, in addressing Mr. Bruce on behalf of the deputation, referred to the opposition which he had offered in Parliament last session to the proposal for the enlargement of the Brixton prison, which the Government had now abandoned, and added that the site now selected at Denmark-hill was still more objectionable, and that there were numerous other more suitable sites which the Government might have selected. Several members of the deputation having pointed out the serious injury and deterioration in the value of property in the neighbourhood which the erection of the prison would cause, the Home Secretary in his reply, admitted the force of the objections which had been urged by the deputation against the site, and

added that, whilst the Government were fully impressed with its eligibility, they were quite ready to reconsider the matter if an equally accessible and eligible site could be found in another district. We understand that a site at Brockley, consisting of seventeen acres (which is the same in extent as that selected at Denmark-hill), has been offered to the Government by the St. Olave's board of guardians, to whom it belongs, for 400*l.* per acre; whereas it is said that the price of the Denmark-hill site is upwards of 1,200*l.* per acre. The site at Brockley is also said to have the advantage of being nearer to a railway station than that at Denmark-hill. The offer made by the St. Olave's guardians is stated to be under the consideration of the Government.

WHAT IS STONEHENGE; AND AVEBURY OR ABURY?

MR. FERGUSSON'S BOOK ON THE STONE MONUMENTS.

SIR,—I am glad that you imply a demur to Mr. Fergusson's theory as to the origin and purpose of the "Stone Monuments of all Ages and of all Countries," which book you reviewed on the 3rd inst. The unwarranted conclusions at which he arrives are distasteful and unsatisfactory to those who have given long and deep attention to this mysterious subject. I have studied these remains under all aspects of belief for more than twenty years, and I join absolute issue—as the lawyers say—with Mr. Fergusson, and with all his school, as to their supposed explanation of these monuments. These stones are all votive and hieroglyphic, and they are connected with Buddhism, or Buddhism; for this religion was that of all the world at one time. The mythic cradle, from which radiated as expressions all these stones, was India; and Professor Max Müller, in his reading of the religious traditions, is equally at fault, and equally misleading as his brother (stone-blind) worker, Mr. Fergusson. Even the name Buddhism is systematically mispronounced and misspelled. It should be *Bhuddism*—as the most profound among the Jains pronounce or sound it. The first syllable is an aspirate, in the same manner expressed and emphasised as the Æolic digamma, "*Bhudd*—*Fudd*—*Futt*—ism. Thence probably, *Bid*—*Böt*—*Föt* of the Indians and of the Chinese—*B*, *P*, and *F*, being interchangeable radically in all languages. A vast amount of philology, and of recondite ætrebology and theosophy, is under all this.

To return to the stone memorials, the importance of which cannot be overrated. They are stupendous historical expressions and land-

marks. I am fearful of occupying your space, or I could present such an array of facts, and of deductions elicited from every direction, as would fully convince. The conclusion of those who have gone the closest in their examination of all these mysterious stones, is that they are *plastic* in their character, and idolatrous in their purpose. What lies farther and under is excessively curious and interesting, and even sublime in its way, because so totally mistaken in subsequent times.

HARGRAVE JENNINGS.

ACCIDENTS.

Fall of a House.—At Trewellard, in Cornwall, the end wall of a substantial cottage fell, at a moment's notice, carrying with it the roof, the greater part of the other walls, and some of the furniture. The house and its contents were completely wrecked. A lode in East Levant had been followed too near to the surface. Recent heavy rains loosened and shifted the soil under the foundations of the house. Fortunately, no one was injured.

Fall of another House.—During a storm, and by night, a dwelling-house, situate at the back of Cliff-street, Mevagissey, also in Cornwall, containing three tenements, fell, and the inmates narrowly escaped with their lives, leaving the greater part of their furniture hurled in the ruins. It appears that the building had shown marked signs of sinking for some time past, and that the occupants had been on previous occasions warned, but owing to disputed ownership of the property by rival claimants, the inmates enjoyed shelter without paying rent.

Fall from a Scaffold.—A fatal accident has occurred at the new goods shed recently erected for the Lancashire and Yorkshire Railway Company at Barnsley. A labourer was engaged in whitewashing the top of the interior of the building. He stood on a single plank, and as he was reaching upwards, he overbalanced himself and fell. In falling, he caught hold of a spar, but released his hold, and fell on the second floor, and thence into the basement story, where he alighted on his head, and was killed on the spot.

THE RAILING ROUND ST. PAUL'S.

Sir,—It has puzzled me as well as several friends to find out the reason why the railings round the front of St. Paul's are not removed; for, of course, there must be one, and a very strong one, to prevent such a palpable improvement, both in the appearance and convenience of our crowded City, as would be effected if it were laid out similarly to the front of the Royal Exchange.

G. S. S.

THE SOCIETY OF ENGINEERS, WESTMINSTER.

MR. J. CHURCH, C.E., recently elected to the position of President of the Society of Engineers, has delivered his inaugural address.

Among the chief subjects were water-supply and drainage, land transit, gas consumption, and the probable duration of our coal supply. Mr. Church spoke in favour of sewage irrigation. "The purification of the sewage by irrigation," he said, "in respect to its soluble constituents,—the removal of which is the chief difficulty in the sewage problem,—is more than twice as effective as any of the processes of precipitation and of upward filtration; it is scarcely so complete, however, as the method of intermittent downward filtration." "Irrigation has now undergone the test of extreme practical application under greatly varying conditions, but with an almost uniformly satisfactory result. To the all-important question, 'Does the system effectually remove the sewage nuisance?' I think we are in a position to answer with confidence in the affirmative."

In speaking of the coal question, the views as respects the continuance of a supply from deep mines were in accordance with those lately urged in the *Builder*:—"Should the advance of science enable us to work coal at these prodigious depths, the cost of work will most assuredly be proportionately increased; and when fuel has thus become dearer, its consumption will be checked, and the stock will therefore hold out correspondingly longer. But this implies the crippling of the strong arm which rears our national wealth. True it is that there are vast and almost inexhaustible coal-fields in other parts of the world

yet untouched, and while coal is to be had there would be the opportunity of purchasing it. But,—in the words of the Coal Commissioners,—"It may be well doubted whether the manufacturing supremacy of this kingdom can be maintained after the importation of coal has become a necessity."

DEATH IN THE DRAIN.

A FEW days ago the whole of the persons employed in the winding-room at the mill of Messrs. Woods & Hampson, Swillbrook, Preston, became suddenly very ill, and were compelled to cease work. An examination of the premises revealed the existence of a drain from which noxious, and, in this case, deadly exhalations were emitted, filling the whole apartment, and rendering the atmosphere highly dangerous. The drain emptied itself into an adjoining water-course, which flows into the Ribble. When there is a "fresh" in the river arising from heavy rains, as during the past week, the sewage is backed up the drain, and prevented from getting away. Hence the present casualty. When the sufferers were taken home, medical aid was at once called in. Several, we regret to say, have died. On the discovery of the cause of these fatalities immediate steps were taken to remedy the defective drain, and to prevent the possible recurrence of so sad an event. Illness and death are constantly resulting from similar circumstances, as we have pointed out for years, though the cause of the effect, not being so obvious, is often unrecognized.

THE TRAMWAYS IN CAMBERWELL.

ALLEGED OBSTRUCTION TO THE THOROUGFARES. The tradesmen in Church-street, Camberwell, High-street, Peckham, and portions of Camberwell-road, have combined in an agitation to compel the Tramway Company to take up their double line of rails, on the ground that experience has already shown that in narrow thoroughfares the double rails are not only an annoyance to the inhabitants, but a great inconvenience to tradesmen, and a source of danger to pedestrians. At a numerously attended meeting, held a few days ago, several tradesmen spoke, and a resolution was passed to the effect, that the double line of tramways, in the narrow parts of the highways of the parish, was injurious to the interests of the ratepayers and tradesmen, in the very narrow margin left between the tramways and footpaths, and seriously interferes with the tradespeople and the general public.

ARCHITECTURAL ASSOCIATION.

THE members' annual *soirée* took place on Friday evening, the 9th inst., at the Rooms in Conduit-street. The walls of the galleries were rendered interesting by the exhibition of the Society of Female Artists. The public, of course, need not be admitted to the inner mysteries of a meeting strictly limited to members of the Association. It can, however, do no harm to record that the stage was neatly appointed, the actors full of their parts, and their acting of spirit. The awful warning lodged in "A Congregational Lesson" was pressed upon the bachelor members—the majority by long odds. Afterwards a roaring farce alleviated the serious spectacle of a worthy waterfamilias disturbed by rating questions. The skit on matters of current architectural gossip, looked for once a year by the initiate, was more creditable to Mr. E. J. Tarver's draughtsmanship and sense of fun than to his critical acumen.

RICKMANSWORTH AND ITS SANITARY ARRANGEMENTS.

A LOCAL correspondent writes us, complaining of the state of matters in his vicinity. He says the town has no Local Board, but sanitary arrangements are carried out under a committee of gentlemen and tradesmen, employing a paid surveyor. The case he refers to is, he says, probably one of the worst cases that have come under notice for some time. From what information he can get, the part of the town in question was drained into an open ditch running through different properties, the outlet end being "open, with a common privy standing across it; then passing through the next property with a barrel drain, and terminating with a common

privy; next comes a 4-in. stoneware drain, emptying itself into the last-named privy; and, going on further, we find a 6-in. stoneware drain; still following the chase some distance, we come to a brick drain, 9 in. wide, 9 in. high, arched over at the top, and full of solid matter from end to end. The ground around being very porous, is of course thoroughly saturated with sewage that must have been soaking in for years. I am at a loss to know how this state of things comes about. Surely the committee cannot be doing their duty." There are pig-sties, he says, on the top of the old brick drain, not 30 yards from dwelling-houses; and he speaks of the family illness (and no wonder) which has arisen from all this. The medical man urged a thorough inspection, which revealed the facts now stated. Our correspondent writes to us in the hope that there may not only be a thorough cleansing, but that when the place is properly drained, both trapping and ventilation will not be neglected.

WHY THE MÈTRE?

If you have space in your columns for a few more remarks supplementary to my last letter on the metric system, in which I pointed out that by adopting a 10-in. standard, to which I gave the name of a palm, we could not only obtain decimal notation for our own measures, but also such ready means of commensuration with the *mètre* as would, I hope, supersede in reasonable minds any demand for the introduction of that objectionable standard. I should be glad to offer an example of the working of the rule I gave for converting the French to the English measure, and *vice versa*, and in so doing I would propose a modification of so much of it as relates to square and cubic measures, for the purpose of adapting the rule better to the memory, and, indeed, with an increase of accuracy. The rule, as I now propose it, is as follows:—Let the 40-in. measure, which is compared with the *mètre*, be called an *ell*. Then, to bring *ells* into *mètres*, add 16 per mil.

Once according as the measure is—	lineal.	square.
Twice "	"	"
Thrice "	"	"

To bring *ells* into *mètres*, subtract 16 per mil, once, twice, or thrice, according as the denomination is lineal, square, or cubic.

The true ratios between *ells* and *mètres* are,—

337708 = 4	metres lineal.
1550060 = 16	" square.
6102710 = 64	" cubic.

Let our example be to reduce 16 *mètres* into *ells*.

Then 16,000	}	100 1 per cent.
256		80 1 per cent.
15,744	}	157
252		79
15,492	}	14
252		

Compare this with 155,006, and we see that the error is less than 1 in the fourth place of figures; indeed, the errors are all exceedingly small and quite inconsiderable beside the probable errors of the measurement. In the six cases contemplated in the rules the errors are as follow, viz., in the rule for converting *ells* into *mètres* lineal the error is $\frac{1}{10000}$; square, $\frac{1}{100000}$; cubic, $\frac{1}{1000000}$. The above are in excess. In the rule for converting *mètres* into *ells* lineal the error is $\frac{1}{10000}$; square, $\frac{1}{100000}$; cubic, $\frac{1}{1000000}$. These are in defect. It should be noticed that, although the errors in the square and cubic denominations appear to exceed the lineal, it is not so really when brought into comparison with the errors of measurement, because any small constant error in measurement, either arising from difference in rods or from personality in the measurer, would also be doubled in the square, and trebled in the cubic result; so that these resolve themselves into the lineal comparison after all, and such an error as 1 in 3,600 means unattainable accuracy in general practice. Deal and iron measures, for instance, are liable to as much extension or contraction as this from ordinary atmospheric influences.

F. C. PENROSE.

Sir,—Mr. Penrose, in his letter to you under the above heading, proposes a scheme which he modestly says renders it "quite unnecessary to introduce that most inconvenient standard, the *mètre*," into this country. After remarking upon the "great length"—though it is only 397 inches more than the yard,—and asserting what he would find very difficult to substantiate, viz., that the centimetre is too coarse, and the millimetre too fine, for ordinary use,—he proceeds to explain his scheme, which,

It appears, is to cross a new standard having a length of 10 m., designating it a "palm," using the decimal notation in connection with it, and then in mercantile transactions applying it to the metre by taking $\frac{1}{10}$ palms=90 inches,—and reducing by the same change, or the reverse process, of bringing up the metre to the $\frac{1}{10}$ palm measure by adding a per-centage.

When it is remembered that a different per-centage would necessarily be required for length, for area, and for cube; that these fractions would have to be added or deducted as the case might be; that to apply the divisions of the metre to those of the palm would involve a further complicity,—it can hardly be considered so simple a scheme as its author maintains.

Moreover, the accuracy with which the requisite calculation could be made is another important consideration,—especially in these days when accuracy is everything,—and from the impracticability of using a perfectly exact per-centage fraction, and possible errors of arithmetic, it is extremely doubtful, to say the least of it, whether the necessary precision could be obtained,—leaving time out of the question altogether, though in practice that is always an element of great consequence.

With reference to our weights and measures of capacity, Mr. Penrose says, "to reduce quarts to litres and pounds to kilogrammes by an easy per-centage offers no difficulty;" but,—looking to the difficulty in respect to the weight, which is the more difficult of course, the simplest of all,—the statement admits of a query. He says, "these per-centages might be readily taught at the schools," but some parties are so far from being in order to reduce the system of measurement to another, we must of necessity be acquainted with both. How can you possibly teach a child the way to reduce yards to metres, pounds to kilogrammes, quarts to litres, &c., without at the same time teaching most of the metric system? If your correspondent's scheme were adopted it would come to this,—that the scholar's memory would be burdened with both systems in addition to the method of applying the one to the other.

Now, as one of the principal reasons for changing our weights and measures is to lessen the labour of the schoolmaster, it is not to be wondered at that the labour can scarcely be said to render it "quite unnecessary" to introduce a system which can unquestionably be taught with a greater ease than the one at present in use. Let any one look through a common school table-book, and observe the extraordinary variety of measurements which children are expected to learn! To the young mind, the metric system, and its seven securities, much less retain, a complete knowledge of them. They consist of a multiplicity of distinct terms and figures, having no connecting links between them, and must be committed to memory as so many separate and dry facts. On the other hand, the metric system is so built up on a common basis, that it is incomparably easier to learn,—and it is so related, that one can be deduced from another, and there is scarcely a possibility of forgetting it when once mastered.

I know, sir, it has been urged against it that "centimetres" and "kilogrammes" are hard terms for children to recollect; but the difficulty is soon got over, and that objection, together with the fact that it would cause some little embarrassment at first, is completely vanquished by the arguments originally advanced in its presents: advantages which are recognised widely on the Continent, where the chief States have already adopted it, and where it is fast becoming general. It is almost exclusively used throughout the scientific world, which done is a sufficient proof of its greater accuracy and superiority. Like all other great improvements it has met with opposition, and even scorn, and it is the most successful of modern times—originally with the most determined and spiteful opposition, and as they eventually became that resistance, so the metric will inevitably supplant the crude, disconnected, and harassing system now used in this country. F. A.

THE STATE OF GLASTONBURY.

Sir,—Allow me, if not too late, to give you a warning against believing the statements, as put forth by "A Subscriber" in your valuable paper of February 3rd, and in your issue of the 10th, in respect to my best thanks or your efficient teaching a few years since.

The truth is, sir, the town proper of Glastonbury can at present boast of a perfect system of pipe-sewers, amounting in extent to about four miles, and which I and I trust shortly to have the pleasure of further enlarging, you, and all whom it may concern, that the Local Board will have then finished the drainage; carried the outfall a distance of one mile and a half below the Railway Station; and that our little historical town, the centre on Somerset, will not only pride itself on its attractive and magnificent ruins and surrounding scenery, but on its perfect system of drainage, laid down with all the latest improvements in sanitary science; and we shall also be enabled to boast of a sewage farm and efficient waterworks for the supply of the town. I trust by the time we have our next county hall that the parties attending it will be better enabled to distinguish between the sulphurous vapour thrown off from the defective gas and the supposed poisonous effluvia arising from the sewers; not that I think there will be any cause to find fault with either in the future. I would just add that the lady mentioned in "A Subscriber's" letter resides about five miles from Glastonbury, and in a neighbourhood where there has been no sewer for some time past. JOSEPH DAX, Surveyor to the Local Board.

CONCRETE BUILDING AND THE BOARD OF WORKS.

At Wandsworth Police-court, Mr. Ingham heard a case of considerable interest to the building trade, in a summons at the instance of the Metropolitan Board of Works with reference to the building of a concrete wall in Lombard-road, Battersea, which was not conformable to the bye-laws of the Metropolitan Board of Works. Mr. Ingham, the district surveyor, said "packing," consisting of pieces of pottery, &c., had been used with the concrete, and in making it, an iron bar, 1/2 in. diameter, was used in the wall he was bound to say it was extremely hard. He, however, said that the materials should be mixed and conglomerated together on the ground before being put in the wall. The bye-law in question is to the effect, that the wall would not stand without "packing." Mr. Newton, engineer, gave a description, with the assistance

of a model, of the use of "packing." He said there was a layer of concrete, then a layer of pieces of brick, stone, and so on, which formed the wall, the materials being thrown in by unskilled labour. He proceeded to say that the whole of the concrete was made of a mesh, but the "packing" was added to increase the strength of the wall. He argued that the use of "packing" was in compliance with the Act, which required walls to be properly bonded together. Therefore, the Metropolitan Board had a licence from the Board was unnecessary. Mr. Ingham said that the last witness had convinced him that the wall was not properly bonded together. According to his description, a wall of that sort might be properly bonded together, but there was no security that it would be. He was clearly against the defendant. Mr. Nasmyth, who was retained for the defence, asked to have a case granted for a superior court. He said it was a question of great importance, as contracts had been entered into for the construction of blocks of Peabody buildings with similar walls. Mr. Ingham said he would grant a case, but he eventually dismissed the summons, as it was found that there had been an informal notice.

LONDON CITY AND THE MAIN DRAINAGE.

In replying to the statement that notwithstanding the enormous expenditure on the main drainage many sewers expended themselves into the Thames, already mentioned in our pages, Mr. Bazalgette gave a reply at the last meeting of the Court of Common Council:—

He remarked in that the sewage formerly passing through and from the City into the river was discharged from an area of about 10½ square miles, the bulk of it flowing into the Thames near the City's western boundary, and therefore passing along nearly the whole of its river frontage. Of this upwards of nine-tenths had been diverted from the City since 1861, and now discharged at a point twelve miles below the City, and only a small amount of at low water and at all other states of the tide as formerly. Nearly half the whole area of the City had thus been dealt with, and works were now in progress by which the sewage of a considerable portion of the remainder would be intercepted within about two months. The diversion of the sewage from the comparatively small tract left would not involve works of an extensive character, but as the sewage operations required would traverse very narrow thoroughfares already overworked with heavy traffic in the close vicinity of lofty warehouses, of wharves, and the like, the sewerage operations required much previous consideration and very careful examination of the various localities and the special drainage arrangements. The requisite works being complicated by these considerations would be difficult and excessively costly in their execution, and could only be carried out as opportunity offered. Portions of those works would, however, be executed in the spring. There had been no want of foresight in providing for the drainage of this small remaining area, for the low-level sewer which passes through its centre affords a deep and sufficient outlet for all its sewages. Referring to Mr. Hayward's report, Mr. Bazalgette states that of the nine so-called main sewers only three were in fact main lines, from one of which the whole, and from the two others nearly four-fifths, of the sewage had been intercepted, and was discharged at the Barking Creek outlet. The other six were comparatively of an unimportant character. The nineteen called minor sewers were 200 feet, insignificant, and discharged but little sewage into the river; the greater number of them did not exceed 200 ft., and some were less than 100 ft. long, draining for the most part wharf and warehouse property. Of the 334 district sewers, they appeared in nearly all cases branches falling into the other outlets; upwards of ninety had been intercepted and the sewage was discharged at Barking. A large proportion of the remainder were much the same, and the sewage of six courts, mews, yards, alleys, and the like, the whole of which drained but little more than half a square mile.

ARCHITECTS' ACTIONS.

W. G. COLBOURNE V. REV. DR. COLLIS.

This was an action in Stratford-on-Avon County Court, to recover 25*l.* 2*s.* 6*d.* for designs, plans, and surveying the proposed site for the erection of a church at Ludington. The action had been heard in the absence of the defendant at the August Court, and the verdict given for the plaintiff. The defendant subsequently applied for a new trial, which application was granted. It was heard at this Court before a jury. Mr. Warden for plaintiff, and Mr. Lane for the defendant.

Mr. Warden, in opening the case, said the action was brought to recover 25*l.* 2*s.* 6*d.* under the following circumstances.—On November 18th plaintiff received a letter from defendant to call upon him on a matter of business, and in pursuance of that letter he did so, and a conversation took place. Plaintiff then proceeded to make a rough pencil sketch of a church. Plaintiff saw defendant frequently and listed the plans of the proposed church, and made tracings and plans for the church. Defendant called at plaintiff's office and approved of the plans and tracings shown. On the 31st of March plaintiff received a letter rejecting those plans. The plaintiff had always been under the impression that he alone was preparing plans. He had received express instructions from the defendant to prepare those plans. The plaintiff was never limited in the amount the church was to cost, and was never told that any one else was preparing plans. Plaintiff received an intimation on the 31st that Mr. Cotton's plans had been accepted. The tracings were retained by the defendant, but are now produced. An application to defendant to pay the amount now claimed resulted in the defendant offering to pay 10*l.* 10*s.* out of his own pocket, as it could not come out of the Ludington Church Fund; or the matter should be laid before a referee. The plaintiff declined to accede to these terms; hence the action.

The plaintiff having deposited to this,— Mr. Bateman, architect, Birmingham, said he had

examined the plans and specifications produced in court, and the charges for them were correct. The plans were prepared in the usual manner, and the charges very reasonable. If the works were carried out, the architect would be entitled to five per cent. on the cost, and if his plans were not carried out, then to two and a half per cent.

Mr. Newby, architect, was also called, and said the charges for the work done were fair and reasonable.

Mr. Constan, architect, Birmingham, quite agreed with Mr. Bateman and Mr. Newby.

Mr. Lane, on behalf of the defendant, addressed the jury to show that the plaintiff had exceeded his instructions, and that the plans were not suitable for the building required, and that the plaintiff was told that the cost of the building was not to exceed 700*l.*

In the course of the evidence on this side,— Mr. Hopkins, architect, said the per-centage charged was fair if no sum for the church was mentioned; but if 700*l.* was mentioned plaintiff would not be entitled to any.

Mr. Chamberlain, architect, said if the plaintiff had exceeded the estimate his plans would be rightly rejected; but he would be entitled to charge for making the survey and some other work pointed out.

The jury, after a very brief consultation, returned a verdict for the plaintiff upon all the points stated, and for the full amount claimed, with costs.

THE QUESTION OF "AN INDEX."

Sir,—On receipt of your issue of December 23rd ult., I was much pleased with the suggestion of one of your correspondents as to an index for the thirty years' volumes of the *Builder*, which this year will be completed. Being the fortunate possessor of twenty-nine volumes of your valuable publication, I have compiled for my own use an index of important subjects (not alone from the *Builder*) in two ways: the first system is arranged alphabetically as usual, the second classifies the subject matter according to the style discussed or illustrated, noting title of work, volume, and page, for reference.

By this means I am enabled to refer without unnecessary loss of time to any statement, opinion, or fact which I may wish to recall, and to any illustration of executed work, under its style or period. The index itself, however, has become cumbersome, because written, and needs the art of the typographer to reduce its bulk. As the undertaking, if carried out on the system above stated, would be costly, requiring much time of a professional expert to compile it, will you permit me to suggest that an announcement to the effect that such an index, separately bound or otherwise, will be issued for a certain price at the close of the present year, would, in my opinion, produce a demand for the same sufficient to reimburse the outlay at least, and at the same time, you would confer another lasting benefit upon your subscribers. A. F. M.

St. Charles, Missouri, U.S., January 19, 1872.

Sir,—There can be no doubt that an index is much required; but it can only be perfected with the aid of numerous subscribers,—for the work could not be done without much labour and some expense. An index, with the aid of subscribers, has been made of the first, second, and third series of *Notes and Queries*,—thirty-six volumes altogether,—which is very useful, and sells at a separate volume for 1*s.* An index of the thirty volumes of the *Builder* might be prepared in one volume, and the sale might be sufficient to justify the outlay, yet it would not be prudent to undertake the work without the guarantee of a sufficient number of subscribers before publication. Persons, therefore, who desire the index, should give their names, &c., forthwith. C. A. COOKE.

THE NEW CEMETERY, BUILDINGS AND RECREATION GROUNDS, AT BARROW-IN-FURNESS.

ONE of the most remarkable instances of the conversion of an open waste or rabbit-warren into a large and flourishing town, in the course of a few years only, is the borough of Barrow-in-Furness, in North Lancashire, which now contains a population of more than 40,000 inhabitants, with two large docks, and another dock or float, 200 acres in extent, in course of construction; whereas twelve years ago there were not more than 100 houses in the place, whilst only a few years before that time there were none.

Amongst the public buildings and other places of resort which have from time to time been erected and formed in rapid succession, the town council of the young and prosperous borough are now engaged in the construction of a large and handsome cemetery, which is not to be used for the purposes of interment only, but is also to combine with its pleasure-gardens and a lake, so as to render it a general object of use and recreation to the town. The land for the cemetery proper, consisting of 40 acres, has been given by his Grace the Duke of Devonshire, and the ad-

joining land for recreation purposes has been purchased from the Barrow Iron and Steel Company and the Railway Company. The laying out of the cemetery and recreation-grounds has been entrusted to Mr. Kemp, landscape gardener, who has a reputation for the laying out of cemeteries and parks. The contract for the erection of one of the chapels and some other buildings has just been taken by Mr. Garden, for 4,750*l.*, and the works will be immediately proceeded with. It is intended to open a portion of the cemetery for interments by the 1st of June.

It is stated that, although building has been going forward on a large scale at Barrow during the last few years, the demand for houses is greater than the supply, in consequence of the large number of artisans now employed in ship-building, the iron works, and the shipping of the new port, and in many cases more than one family are compelled to reside in the same house. This has led to the formation of a co-operative building society.

THE REMOVAL OF ST. MILDRED'S CHURCH, POULTRY.

THE preliminaries have this week been gone through in connexion with the removal of St. Mildred's Church, in the Poultry, which is about to be demolished in order to make way for City improvements. Messrs. Fuller, Horsley, & Co. have disposed by tender of the interior fittings, consisting of the seats, galleries, pulpit, and other articles, whilst the valuable and artistic monuments and tablets are being transferred to St. Olave's, Old Jewry, with which St. Mildred's parish has been united. The bodies in the churchyard are about to be removed to a spot in Hford Cemetery, which has been specially selected there; and the Ecclesiastical Commissioners have made a grant of 1,000*l.* for the purpose of erecting a handsome monument over the vault in which the remains will be deposited. In consequence of the two parishes of St. Mildred's and St. Olave's being now united, no new church will be erected in place of the old edifice which is about to be removed, but 4,000*l.* are intended to be expended in church enlargement in the parish of St. Olave, and a new residence is also to be built in the parish for the rector of St. Mildred's, at a cost of 2,000*l.*

EARL OF WARWICK'S SEWAGE FARM NEAR LEAMINGTON.

THE general scheme of irrigation presents some new and interesting features. It is on a scale of unprecedented magnitude, of which the following may be taken as a brief sketch.—One object has governed the whole scheme: to secure it all details have been subordinated, viz., to regard the sewage for its value as a manure, with the assistance of water as a carrier for its distribution, and for summer irrigation. Therefore, as a fixed sum will be paid for the sewage, the object has been to utilise it over the widest possible area, in order that a system of mixed and alternate husbandry may be adopted, including not only the ordinary operations of farming, but of wet and of dry farming, changing from one to the other systematically. In winter the sewage to be used simply as a manure on bare fallows, for spring cropping. To each of the eight hydrants on the rising main a "bend" is attached, with its mouth on the surface of the ground. This mouth is inclosed in a brick chamber. On opening the screw valve, the sewage enters the chamber, and is distributed by regulated outlets into stone-ware pipes; these pipes, working under a head pressure of from 8 oz. to 2 lb. on the square inch, carry the sewage to the exact point wanted. As may be imagined, the pipe work is extensive; the pipes were manufactured by Mr. T. C. Edwards, near Ruabon, North Wales.

SCHOOL-BUILDING NEWS.

Barking.—The new Infant School at Holy Trinity, Barking-road, was formally opened on the 12th inst., by Sir Antonio Brady, with the Rev. A. B. Delap, vicar of the parish; the Right Rev. Bishop Cloughton; and others. The building is of stock bricks, with Portland stone dressings. The architect is Mr. Henry Ough, of Stratford; and the builder, Mr. John Palmer, of Old Gravel-lane, St. George's East. The cost of the building, including architect's commission, is about 600*l.*

Hackney.—A project has been started for the erection of new schools in connexion with the Church of St. Michael and all Angels, London Fields, South Hackney, for 750 children. The estimated cost of the building, including a master's residence, is 4,500*l.* Grants from societies have been obtained to the extent of 2,347*l.* 10*s.*, and the list of local subscriptions amounts already to 650*l.*

Lensford.—The new schools for the district parish of St. John's, Lensford, have been opened. The school-house contains two well-lighted school-rooms, the dimensions of which are 35 ft. by 20 ft., and apartments for the schoolmistress. The buildings have been erected by Earl Cowper, with the aid of grants from the Diocesan Board of Education and the Education Department of the Privy Council. The schools will be conducted as public elementary schools under the Education Act of 1870.

Maldenhead.—The new Roman Catholic School, at the corner of Forelance-lane and Bridge-street, is now nearly completed. It consists of two rooms. One on the right as you enter, 31 ft. in length by 17 ft. in breadth, is the main school, capable of containing by Government measurement 64 children. The walls of this room are 8 ft. 6 in. in height; but as the roof is quite open, it gives a full height of 18 ft. The walls to the height of 3 ft. 6 in. are covered with cement, and the above are coloured with a light shade of blue. The roof is open, showing all the timbers, and in place of being plastered is covered in, the boards stained and varnished. On the left as you enter is a class-room, giving accommodation for 32 more children, making a total accommodation of 96 children, allowing 8 square feet of space for each child. The class-room is similar in character to the main school; but advantage has been taken of the peculiar shape of the ground to make one octagonal. Ventilation is provided for by windows opening in their centres, and also by adoption of the method of ventilation recommended by the Poor-law Board to be used in all workhouse hospitals. The passage between the rooms is paved with coloured tiles. At the back of the schools are out-offices, furnished with Moule's patent earth-closets, coal-house, &c. A yard, 18 ft. by 22 ft., is reserved for the children's playground. The site and a contribution were given by Mr. Wilberforce, of Ives-place. Mr. C. G. Wray, of London, is the architect of the schools; and the contract was taken by Mr. Price.

Malmesbury.—New schools are about to be built at Lea, near Malmesbury, upon a site given by the Earl of Pembroke, and in accordance with the requirements of the Committee of Council on Education. Mr. C. J. Phipps, of London, is the architect.

Books Received.

"A Year's Voluntary Work after Office Hours among the Costermongers of Golden-lane." By W. J. Orsman. 1871. London: Passmore & Albaster." Lord Shaftesbury is the president of this mission, of which we have heretofore seen reason to speak favourably. The institution has been in existence for ten years, and its usefulness has received praise from many of the London newspapers and magazines. The committee, it seems, are greatly in need of funds, not only to carry on the numerous religious, educational, and benevolent operations of the mission, but also to erect a plain building in Golden-lane; notice having been given by the owners of the building at present rented of their intention to sell it for other purposes. Their bankers are Messrs. Barclay, Bevan, Tritton, & Co., of Lombard-street. "Pamphlet and Crime: a True Cause and a True Antidote; dedicated to H.R.H. the Princess of Wales." By Robert Hill. London: Kelly & Co., printers." There is no trace in this title of the real purpose of this pamphlet, which is to advocate the establishment of the Alexandra Palace and Park on a new basis, with lower charges for admittance and for season tickets than heretofore proposed. The prospectus of the new company here referred to, however, will do doubt speak for itself, when we may recur to the subject.—*The Public Ledger*, a well-known daily newspaper, published at Philadelphia, U.S., has issued the "Public Ledger Almanac for 1872," gratis to subscribers. It contains some useful information as to local institutions and state officials, &c.—*The Pedlars Act, 1871*,

has been published among the "Penny Statutes for the People." Kent & Co., Paternoster-row."—*The Lithographer*, No. 20, Vol. ii., for February, shows that the lithographic trade patronise their own class journal, which contains some useful matter on various subjects.

Miscellaneous.

The Nine-Hours Movement.—On Saturday evening last, a meeting of the metropolitan carpenters and joiners, consisting of delegates from the various societies, shops, and jobs, representing about 5,000 society and non-society men, was held at the Brown Bear Tavern, Broad-street, Bloomsbury, to ascertain the opinion of the trade as to the propriety of memorialising the master builders in favour of the nine hours. There were 200 delegates in attendance, and nearly the whole of the large firms were amongst those represented. Mr. Hawkins, a member of the provisional committee, occupied the chair. The delegates having given in their reports, a discussion took place, which resulted in the following resolution being adopted, with one dissentient:—"That a circular be sent to the master builders of the metropolis on the 1st of March, informing them that the carpenters and joiners in their employ would, on and after the 1st of July next, require that the working hours be nine per day, or fifty-one hours per week, with payment at the rate of 9*l.* per hour, and to respectfully request them to reply to the circular by given at the expiration of six weeks from its being received." The questions of overtime and piecework stood over for further consideration at an adjourned meeting.—We are asked by some of the employed to mention that Mr. George Jennings has adopted the Nine Hours system.—The workmen who are employed at Messrs. Fletcher & Co.'s Masson Ironworks, Litchurch, Derby, have given a complimentary dinner to their employers in commemoration of the satisfactory adjustment of the nine-hours movement. The party was 250 in number, and the feast took place in the St. James's Hall. The Mayor of Derby presided, and Mr. Barton, a very old servant of the firm, was in the vice-chair. The proceedings throughout the evening were of a very satisfactory character.

Society for the Encouragement of the Fine Arts.—On Thursday evening, the 8th, Mr. Hyde Clarke delivered a lecture at the Society's meeting, entitled "How Art Declines: the Lower Empire," at which Mr. F. W. Rowcell presided. The lecturer referred to the history of art in Rome as imported from Greece, and to the abundance of great works and models, the number of artists, and the profusion of patronage; notwithstanding all this, a period arrived of progressive declension when everything wanted truthfulness. There was not merely debasement of material, but of form, in architecture, painting, and sculpture. This was affirmed to be contemporary with the corruption of manners and morals which pervaded the Government and all society. After instituting a comparison between the earlier and later schools of art in Rome and in England, and pointing out that art had most flourished in those States which had been free or still retained the traditions of freedom, the lecturer argued that proficiency in art could not be expected solely from material appliances, but was chiefly dependent on moral causes. Mr. Hyde Clarke referred not only to the schools of Italy and the Low Countries, but to Spain and the epochs in France of Louis XIV. and XV. and the two Napoléons. A discussion followed.

Public Park for Warrington.—The Warrington Town Council have resolved to purchase Bank Hall and Grounds, the seat of Colonel Patten, for the sum of 22,000*l.* It is intended to convert the hall into a town-hall, police-station, fire-engine depot, and other purposes connected with the Corporation. The grounds will be made into a public park. The total cost is estimated at 50,000*l.*

Rector of St. Andrew's University.—Mr. Ruskin's election to the Rectorship of St. Andrew's University has been declared illegal, under an Act of Parliament prohibiting a Principal or Professor of any University from being eligible for the post. The office falls to Lord Lytton, the unsuccessful candidate at the recent contest.

Trade and Navigation of United Kingdom.

—The following and other results, from carefully-prepared tables of the Statistical Department of the Board of Trade, and from similar sources, have been issued in a form by Mr. J. B. Redman, of West-
 London. Total tonnage of British and foreign
 ships with cargoes and in ballast engaged in
 foreign trade, entered and cleared at ports in the
 United Kingdom:—

Tons entered.	Tons cleared.	Total tons.
4,657,795	4,781,872	9,439,667
18,113,364	18,926,818	37,040,182

that in thirty years the trade of the country
 quadrupled itself. The same with cargoes
 in both tables include repeated voyages:—

Tons entered.	Tons cleared.	Total tons.
1,163,208	3,322,628	7,437,836
14,910,742	16,713,988	31,624,730
16,413,102	19,953,132	35,406,234

shows a still higher rate of increase in
 foreign trade. The ports of London and Liver-
 pool with nearly one-half of this enormous
 trade:—

LONDON.		
Tons entered.	Tons cleared.	Total tons.
1,904,918	1,683,463	3,588,381
4,953,366	3,026,916	7,116,282

LIVERPOOL.		
Tons entered.	Tons cleared.	Total tons.
1,635,315	1,659,939	3,295,254
3,416,633	3,326,139	6,772,772

importation of coal into the port of London
 the following remarkable results:—

Tons seaborne.	Tons inland.	Total tons.
3,553,304	81,675	3,634,979
2,885,710	3,775,207	6,760,917
2,762,712	4,464,718	7,227,430

Railway Amalgamations.—A meeting
 held by the Provost of Dundee, has been held
 at the Kinnaird Hall there in terms of a requisition
 to consider the probable consequences to the
 interests of the public of the extensive railway
 amalgamations recently proposed, and also the
 expediency of the State taking over the entire
 railway systems of the country. The Provost
 stated that the requisition had been signed
 by a large number of the leading citizens, traders,
 gentlemen holding official positions in the
 city. Mr. Brandon was present and explained
 the proposed scheme for shilling, sixpence, and
 penny journey-fares for all distances. It
 resolved "that this meeting regards the pro-
 posed railway amalgamations over the country
 as being in its general and commercial inter-
 ests, and also maintains that it is not possible
 to have restrictive clauses so as to insure com-
 plete protection to the public in any Amalgama-
 tion Bill which does not have the effect of up-
 lifting competition;" and "that in the opinion
 of the meeting the time has now arrived when it
 is the duty of the Government, in the inter-
 ests of the nation, to acquire the entire rail-
 way systems of the country, and for this purpose
 to form a branch of the National Rail-
 way Association in Dundee."

Society of Biblical Archaeology.—At the
 meeting on the 6th inst. a communication
 was received from M. Clermont Ganneau, an
 inscription in Hebrew or ancient Phœnician
 characters of the time of the kings of Judah,
 discovered at Siloam-el-Fokani, near Jerusalem.
 In a paper M. Ganneau related the discovery
 of incised tablets, executed on the wall of
 a rock-cut chamber or scullery, near to
 the tomb of the Sheikh of Siloam. The inscrip-
 tions are in the old Archaic character now
 known to the archaeological world in the famous
 Siloam stone. Some Christian had, about the
 middle of our era, wilfully mutilated the
 text of the writing, but enough still remained to
 identify its extreme value as a palæographic record.
 The first four lines of the first tablet
 contained a name believed to contain the name
 of the deity Baal, and to denote a votive dedi-
 cation to him by a functionary, whose name
 was given in the period of the later kings of Judah.
 The author inclined to think that the cavo had
 originally dedicated to Baal at a still earlier
 date, probably by one of Solomon's Moabitish
 kings, and that it was afterwards added to and
 altered in a subsequent reign. These are the
 chief, or nearly the chief, positively Hebrew
 inscriptions in existence.

Improved Industrial Dwellings
 in London.—Since our notice of the report to
 the Hon. H. Waterlow's meeting was given, the
 tenth half-yearly meeting has been held
 and the report adopted. A dividend at the rate
 of 10 per cent. per annum was declared. It was
 stated that out of the rent collection only 10%
 had been lost.

Heat and Light.—Dr. John Tyndall, F.R.S.,

in delivering a lecture at the Royal Institution,
 on "The Identity of Light and Radiant Heat,"
 said that, although once it was doubtful whether
 the two were identical, it was now known that
 such was the case. Radiant heat could be polar-
 ized like light, and Faraday had discovered a
 method of magnetising a ray of light strictly
 parallel to that found effective in a case of a ray
 of radiant heat. To say, however, without modifi-
 cation, we may remark, that light and radiant
 heat are identical is rather too much of an iden-
 tification; there is difference as well as identity.
 What causes the difference? In our volume
 for 1854 (p. 580), about the time when Dr.
 Tyndall states that he began his researches
 on this subject, we showed, in an article on
 the nature of "Electricity," what we believed
 to be the true nature of this difference, as
 well as of this identity; and the progress of
 science since has only led to a closer approxima-
 tion to that view of the nature and co-relation-
 ship of light, heat, and electricity, as physical
 forces.

Heavy Penalty for Breach of Building

Regulations in Newcastle.—At the New-
 castle police court, Miss Margaret Martha
 Ishella Dean has been summoned, at the in-
 stance of the corporation, for enlarging and
 altering an existing building, according to plans
 which had not been approved by the corpora-
 tion. The building in question is the Royal
 Music Hall, situated between Dean-street and
 the Side, and which has recently been opened
 to the public. It was stated, on the part of the
 corporation, that the defendant sent in a plan
 of alterations, which was passed by the corpora-
 tion, but that it afterwards came to the notice
 of the authorities that the defendant was erect-
 ing the building in defiance of the plan, and of
 sanitary considerations. The decision came to
 was to fine the defendant 5l., and 10s. per day
 for 146 days. On the main point, which related
 to the stage and a covered open space, it was
 stated for the defendant that she must go to the
 Queen's Bench upon it. Other cases, one for
 not having proper egress and ingress, were
 adjourned for a fortnight.

Death of Mr. Joseph Pease.—One of the

most successful men and largest employers of
 labour in the North of England has died at his
 residence, in Darlington. Mr. Pease, who was a
 Quaker, with his father, Mr. Edward Pease,
 George Stephenson, and others, initiated our
 present railway system, in connexion with the
 Stockton and Darlington Railway, which was
 the first line, and was opened in 1825. The
 deceased gentleman, then a young man, drew up
 the prospectus. Mr. Pease was the founder of
 Middlesbrough, by buying up the land upon
 which the present town is built, with others, and
 making it into a port for the shipping of coal,
 and a general maritime trade. His capital and
 enterprise had no small share in developing the
 immense iron trade which has attained such a
 degree of prosperity in Cleveland. It was,
 however, with the coal trade of South Durham,
 and the formation and extension of railways in
 the North of England, that Mr. Pease was chiefly
 associated.

The City Architect's Office.—At a meeting

of the Court of Common Council, on the 8th
 inst., in answer to Mr. Paterson, the architect
 (Mr. Horace Jones) said that his chief clerk
 (Mr. Carver) had been absent from his office,
 through illness, for between nine and ten
 months. Mr. Paterson: The Officers and
 Clerks' Committee are aware that great delay
 occurs in the business of the architect's office,
 and this frequently arises in consequence of the
 absence of the chief clerk. Mr. H. Gover
 moved that the re-appointment of Mr. Carver
 be not made. Mr. D. Rogers seconded the motion.
 Mr. Rudkin: As he is ill, do not let Mr. Carver
 think you have discharged him. I will move, as
 an amendment, that he be re-appointed for three
 months, pending the report of the Officers and
 Clerks' Committee. Mr. Lawley seconded the
 amendment, which was put and carried.

Deafness and Compressed Air.—In the

construction of a bridge over the Rhone between
 St. Maurice and Bex, M. Cuenod, the engineer,
 used an apparatus for fixing the piles beneath
 the level of the water in a gravelly soil. He
 noticed a curious but well-known effect upon the
 men employed within the compressed air. In
 the case of some, their deafness became sensibly
 diminished. Artists ought to have found in this
 fact something suggestive.

The Rebuilding of Chicago.—The Chicago

people are not only making great progress with
 the rebuilding of their city, but are illustrating
 the buildings re-erected by engravings published
 in a periodical called "The Landowner: a
 Journal of Real Estate, Building, and Improve-
 ment." In the issue for February are views of
 various extensive and important buildings now
 erected or in process of erection, including the
 new chamber of commerce and several extensive
 blocks of building for commercial purposes, the
 Equitable Life Assurance Society's premises, the
 Fire Monument, already illustrated in the
 Builder, and others. From a statement of the
 erection of the "Central Union Block," com-
 prising the Union National Bank, State Savings
 Institution, an insurance office, printers', sta-
 tioners', and other premises, all "in sixty days,
 by Hon. W. E. Coolbaugh and Messrs. Wheeler
 & Powers," we should fear that the rebuilding is
 going on at too fast a rate.

Land in the City.—From a report of the

City Lands Committee, quoted by the City Press,
 it appears that the following land has been let
 by them during the past year:—Two pieces
 described as lots 1 and 2, at the corner of Lud-
 gate-hill and the Old Bailey, to Mr. J. K. Farlow,
 80 years,—peppercorn for the first year, and
 525l. for the remainder of the term; a piece
 described as lot 3, on the east side of the Old
 Bailey, to Messrs. H., C., & E. Gilbertson, 80
 years,—peppercorn for the first year, and 200l.
 per annum for the remainder of term; three
 pieces of land, described as lots 4, 5, and 6, on
 the east side of the Old Bailey, to Mr. J. King,
 80 years,—peppercorn for the first year, and 550l.
 per annum for remainder of term; a piece of land
 forming the site of the late Debtors' Prison, in
 Whitecross-street, to Mr. W. Braham and Mr. A.
 Wells, 80 years,—peppercorn for the first year,
 1,450l. for the second year, and 2,900l. for re-
 mainder of term.

The Croydon School Board.—The report of

the general purposes committee was read at a
 recent meeting. It recommended "that the
 committee proceed to obtain from architects
 named by the Board plans, specifications, and
 estimates for a group of boys', girls', and infants'
 schools, with teachers' residences." The Board's
 opinion as to the detailed plans that were to be
 referred to architects was that it was expedient
 that certain general rules should be laid down
 for the guidance of architects. It was ulti-
 mately moved as an amendment, "that the
 meeting of the Board should adjourn till Friday
 next, and then go into the questions of detailed
 internal fittings of schools in general to be re-
 ferred to the architects." This was seconded,
 and the report of the committee was adopted.

The New Well, Guildford.—The new well

now only requires its covering to complete it.
 The water is so clear that the different seg-
 ments of the cylinder can be seen to its entire
 depth, 35 ft., as well as the pipe which supplies
 the water from the well. During the progress of
 the works the water has been pumped at the rate
 of 200,000 gallons per hour, and this only re-
 duced the water about 2 ft. 6 in. The supply
 required for the town is not likely to exceed 18,000
 gallons per hour. The pumping powers consist
 of the old water-wheel and an engine. The pipes
 are laid to within 5 ft. of the bottom of the
 new well. The ceremonial of testing the well
 has just been conducted by the mayor. The
 analysis of the water will be made by two an-
 alytical chemists.

Heating Apparatus.—Mr. Thos. Parker,

of Newcastle-upon-Tyne, architect, has patented
 a new hot-water heating apparatus. The princi-
 ples of the invention are comprised in the use of
 pipes of small bore for the flow and return of the
 hot water, laid chiefly on the floor of the build-
 ing; and also the use of heaters, similar to
 those used in railway-carriages, placed in the
 pews (if the building be a church), and in an-
 analogous positions in other buildings. The
 chief advantages claimed for this invention are
 greater efficiency, by the local application of the
 heat; a great saving of cost of apparatus; and
 flues, &c., under floors are dispensed with.

Technical College for Glasgow.—A move-

ment has been initiated at Glasgow to establish
 a Technical College there. It is proposed to
 raise 50,000l. for the purpose, and the college
 will be connected with the Andersonian Univer-
 sity and other local institutions.

* Within the metropolitan area the stipulations of the
 Building Act would render necessary some modification in
 this respect.

Enlargement of King's College Hospital.

Within the last few months King's College Hospital has been undergoing a considerable enlargement, by the addition of another wing at the north-east end of the building. The new portion which, architecturally, is uniform with the rest of the structure, increases the length of the hospital by 15 yards, and furnishes accommodation for upwards of 100 additional in-door patients, besides providing greatly increased space and convenience for the medical staff. The works have just been completed, and the large area in front of Portugal-street has been laid out, and planted with evergreens and other ornamental trees.

The Science and Art Museum for Nottingham.

At a recent meeting of the Town Council Mr. Cole's letter as to the establishment of a museum at Nottingham, which we lately quoted, was read and considered, and it was resolved that the council gratefully accept Mr. Cole's offer; that the Exchange-hall be used temporarily for the purposes of the exhibition till other arrangements be made; and that a committee be appointed to attend to the matter. It was urged in the council that a scheme for a new town-hall was at the root of the present movement; but what Mr. Cole could have to do with that it is hard to see.

Font for Overton Church, Raabon.

A font has just been presented to this church by the tenants and friends of Mr. Edmund Peel, of Brynnyps, to commemorate the birth of a son and heir to the Brynnyps estates. It is the work of Messrs. Cox & Sons, of London, and is in Caen stone, with marble pillars and richly-carved capitals supporting the bowl, and is octagonal in form. The eight panels are divided by marble pillars, and contain alternately the subjects of the baptism of our Lord, Christ blessing little children, the crossing of the Red Sea, and the dove repairing to the ark; the others being filled with foliage.

Thanksgiving Day and the District Surveyors.

At the last meeting of the Metropolitan Board of Works, in reply to Mr. E. Dresser Rogers, it was stated by the superintendent architect that the district surveyors of the several districts through which her Majesty passed would be held responsible for the safety of the platforms and places erected for the purpose of viewing the procession.

The Government Sanitary Bill.

It is understood that the measure which Mr. Stansfeld will introduce on Friday will include not only a consolidation of the existing sanitary laws, but also a rearrangement of areas; a reconstitution of suitable boards (chiefly by consolidation) to preside over these simplified and extended areas; and a great extension of the sanitary service of the country.

Proposed Statue of Cardinal Wolsey.

A committee is being formed for erecting a fitting statue of their late fellow-townsmen by the leading men in Ipswich. It is just 400 years since Cardinal Wolsey was born, and it is suggested that the present time is very opportune for raising a monument to so illustrious a native of Ipswich. It is proposed that the statue should be placed in the archedway.

A Good Example.

The following notice was posted at the entrance of Messrs. Chubb & Son's works, Wolverhampton, on Saturday morning:—"This manufactory will be closed on Tuesday, February 27th, the day appointed by the Queen as a thanksgiving-day for the recovery of his Royal Highness the Prince of Wales. Messrs. Chubb & Son will have much pleasure in paying the day's wages in full to each man and boy."

St. Paul's Cathedral.

The preparations in the Cathedral for the National Thanksgiving are going on steadily. Messrs. Myers & Sons are erecting the galleries in the body of the building and Messrs. W. Cubitt & Co. are fitting up the choir. The whole of the sanitary arrangements have been entrusted to Mr. George Jennings, under the direction of Mr. Taylor, of Her Majesty's Office of Works.

The New Reservoir, Oswestry.

A report has been made by the engineer to the local Board, as to several slips that have taken place during the progress of the works of the new reservoir for the water supply of Oswestry. The engineer, Mr. Minshall, of Wrexham, recommends the lining of the reservoir with bricks.

Paris Theatres.

We understand that the theatre of the Porte Saint Martin is to be rebuilt, in Classic style, with a grand pediment supported by eight enormous columns. A most extraordinary proposal with respect to theatres has been made. An architect proposes to erect four or five new theatres at the Place of the Château d'Eau, and the Commission of Dramatic Writers support the proposal.

A Roman Catholic Cathedral for Carlisle.

Miss Lowry, a Roman Catholic lady, who recently died at her residence, Darrahill House, near Carlisle, has by will left a large sum of money for the erection of a Roman Catholic Cathedral in Carlisle.

The Inner Temple.

A handsome clock tower, of stone, which serves also as the staircase, has been added to the Inner Temple Library, from the design of Mr. Arthur Cates.

Keighley.

On Friday, the 9th of February, Mr. Henry Alty, C.E., of Halifax, was unanimously appointed Borough Engineer and Surveyor to the town of Keighley.

TENDERS

For concrete and brick foundations for St. Luke's Church, Redcliffe-square, South Kensington. Messrs. G. & H. Godwin, architects. Quantities supplied by Messrs. Gardner, Son, & Theobald:—

Myers & Sons	£2,715 0 0
Nightingale & Walker	2,638 0 0
Hill, Keddiel, & Walker	2,187 0 0
Henshaw	2,295 0 0
Stimpson & Co.	2,285 0 0
Manley & Rogers	2,187 0 0
Dove, Brothers	2,165 0 0
Hibbins & Co.	2,152 0 0
Cowland	2,145 0 0
Arts & Co.	1,884 0 0
Hill & Sons	1,863 0 0

For the iron apparatus, cast-iron main pipes, consumers' meters, service pipes, &c., for the Audlem Gas and Coke Company, Limited, Cheshire. Mr. T. A. Hedley, civil engineer, Wolverhampton:—

Hill & Smith	£1,462 0 0
Newton, Chambers, & Co.	1,350 0 0
Jennings & Sons	1,235 0 0
Porter & Co.	1,220 0 0
Holmes & Co.	1,170 0 0
Poole	1,120 0 0
Willey & Ford (accepted)	1,054 0 0

For alteration to premises, Harbour-street, Ramsgate, for Messrs. Syrett & Son. Exclusive of hot-water apparatus. Mr. John R. Collett, architect:—

Harrison	£200 0 0
Green	228 0 0
Osborn	215 0 0
Englen	197 0 0
Smith & Son (accepted)	170 0 0

For enlarging retort-house at the gas-works, Ramsgate:—

Horne (accepted)	£608 0 0
------------------	----------

For house, offices, stores, and stabling, to be erected in London-street and Conduit-place, Paddington, for Messrs. Flower & Sons, of Stratford-upon-Avon. Messrs. Lee, Brothers, & Pain, architects. Quantities supplied:—

House and Stores		Offices, Stabling.	
Myers & Sons	£2,315	£3,285	
Thorne & Co.	2,200	5,200	
Bayes & Ramages	2,085	5,019	
Howard & Co.	1,987	4,981	
Thompson	1,934	4,938	
Temple & Forster	2,060	4,618	

For villa, Pengo-rod, on the Crystal Palace Park Estate. Mr. John Norton, architect. Mr. S. J. Thacker, surveyor:—

If Picked	
Deals.	
Moore & Grainger	£2,121
Staines & Son	2,088
Wright, Brothers, & Goodchild	2,023
Hammond	1,975
Stephenson	1,951
Saull	1,827
Baxter	1,823
Gooding	1,800
Waterson & Co.	1,758
Aitchison & Walker	1,600

For plots 31 and 32, on the Crystal Palace Park Estate. Mr. John Norton, architect. Mr. S. J. Thacker, surveyor:—

If Picked	
Deals.	
Staines & Son	£3,966
Stephenson	3,627
Mundy	3,608
Moore & Grainger	3,549
Wright, Brothers, & Goodchild	3,575
Waterson & Co.	3,460
Baxter	3,465
Aitchison & Walker	3,425
Hammond	3,250
Saull	3,059
Gooding	2,940

For three cottages, and addition to drying-room, at West Drayton, for Messrs. Wilkinson & Co. Mr. G. D. Martin, architect:—

Festridge	£417 0 0
Staines & Son	376 0 0

For finishing houses in Sparholt-road, Horsey-rhe, Mr. E. Gover, architect. Quantities supplied by Sharsole:—

Bridgman & Nuthall	£1,595 0 01
Wilkins	1,545 0 0
Tripp	1,450 0 0
Whiteman & Allen	1,416 0 0
Wright	1,395 0 0
Smith & Evers	1,380 0 0
Mundy	1,371 0 0
Langan	1,370 0 0
Winship	1,325 0 0
Odley	1,290 0 0
Blackmore & Morley	1,280 0 0
Day	1,275 0 0
Freedy & Son	1,150 0 0
Turrell	1,123 0 0
MacFarlane	1,055 0 0
Wannell (accepted)	1,048 0 0
Evans	1,055 0 0
Parker & Co.	830 0 01

For additions and alterations to house at Catford-bridge for Major Forster. Mr. W. H. Fletcher, architect. Quantities supplied by Mr. T. Ladds:—

F. J. & J. Wood	£4,134 0 0
Staines & Son	4,298 0 0
Willcombe & Oakley	4,150 0 0
Jerrard	4,078 0 0
Allpress	4,055 0 0
Stimpson & Co.	3,785 0 0

For partially rebuilding and restoring Boughton Church, Norfolk. Mr. R. J. Withers, architect:—

Bardell, Brothers	£835 0 0
-------------------	----------

For rebuilding Whitechurch Church, Pembroke-shire. Mr. R. J. Withers, architect:—

Evans & Morgan	£833 0 0
Thomas & Woodward	785 0 0
James & Lewis	697 0 0
Evans	687 0 0
Hughes	690 0 0
Hughes	660 0 0

For rebuilding Silian Church, Cardiganshire. Mr. R. J. Withers, architect:—

Davies	£875 0 0
James & Son	614 0 0
Morgau	505 0 0

For building All Hallows' village hospital, Ditching-ham, Norfolk. Mr. R. J. Withers, architect:—

Bardell, Brothers	£3,126 0 0
Fery & Co.	2,915 0 0
Bretwright	2,853 0 0

For alterations and bar-fittings to the "Anchor and Hope," Pond's-place, Chelsea, for Mr. J. Parker:—

Leggett	£648 0 0
Fenner	640 0 0
Sunnerville & Co.	614 15 0
Porter & Co.	493 0 0
Terry	489 0 0
Brown (accepted)	330 0 0

For erecting a villa at Staines, for Mr. J. P. Wall. Mr. R. J. Worley, architect. Quantities supplied:—

Bostel	£1,010 0 0
Bostel	885 0 0
Vaughan	775 0 0

We are compelled to decline pointing out books and giving addresses.

All statements of facts, lists of tenders, &c., must be accompanied by the name and address of the sender, not necessarily in publication.

Note.—The responsibility of signed articles, and papers read at public meetings, rests of course with the authors.

PUBLISHER'S NOTICES.

THE TWENTY-NINTH VOLUME OF "THE BUILDER" (bound), for the year 1871, is now ready, price One Guinea. Also,

CLOTH CASES for binding the Numbers, price Two Shillings and Ninepence each.

SUBSCRIBERS' VOLUMES, on being sent to the Office, will be bound at a cost of Three Shillings and Sixpence each.

A COLOURED TITLE-PAGE can be had gratis, on personal application.

th and other Building Stones of Best Quality.—RANDELL, SAUNDERS, & CO. Ltd., Quarrymen and Stone Merchants, etc.

lton & Green, Slate and Slab Merits and Quarry Agents.—Shippers, Merits, and Contractors furnished with Prices, of every description of ROOFING and MANUFACTURED SLATE, Railway-rates, &c.

ret Clocks.—Mr. Streeter, 37, Conduit-street, London, W., Manufacturer of Turret Clocks (with gravity or dead-beat escapement) Churches and Public Buildings. Estimates plans on application. Price—Village-clocks, from 15*l*.; church clocks, from 40*l*. The work throughout these clocks is of best brass or gun-metal. No iron wheels used, keeping and durability guaranteed. Wholesale—Burlington Steam Works. [Adv't.]

chitects, before committing themselves to system of Warming, should send to TRUSLAV, BROTHERS, & HOLDEN, 100, Notion-street, Sheffield, for a prospectus of Improved Patent Hot-Air Apparatus.

RNER & ALLEN, ART FOUNDERS AND ENGINEERS, 201, UPPER THAMES STREET, LONDON, E.C.

MANUFACTURERS OF LAMP PILLARS, GAS LAMPS, FOUNTAINS, GATES, RAILING, ETC. Either, Plain or Bronzed, in the highest Style of Art.

HOT-WATER AND GAS ENGINEERS.

Sole Importers of BARBEZAT'S FRENCH IRONWORK, and Publishers of French and English Books of Design, 2 vols., Price 2*s*.

PERIAL FIRE INSURANCE COMPANY, Established 1826. 1, Old Broad-street, E.C. and 17, Pall-mall, S.W. Capital, 1,500,000*l*. Paid up and invested 700,000*l*.

BATH or INJURY from ACCIDENT, with the consequent LOSS of TIME and MONEY. Provided for by a Policy of the RAILWAY PASSENGERS ASSURANCE COMPANY. Against Accidents of all kinds. Monthly Payment of 3*s*. to 5*s*. Secures 1,000*l*. at Death, or an allowance at the rate of 6*s*. per week for Injury. 11, COVINGTON, and 10, REDBET-STREET, LONDON. W. C. WILLIAMS & CO. WILLIAM T. VIAN, Secretary.

NEW BOOKS FOR BUILDERS, &c. THE ILLUSTRATED PRICE-BOOK for 1872, for the Use of Architects, Engineers, Surveyors, Builders, &c. Five Parts, containing Plans, Elevations, and Views of all Villas and Cottages, with specifications. The prices and tables have been most carefully arranged and in order to make the work as complete as possible, and useful to the professional tradesman. London: Published by R. A. SPIRIGG (late ATCHLEY & CO.), No. 19, Great Russell-street, Bedford-square.

NEW BOOKS FOR BUILDERS, &c. HENRY W. AGLAND, M.D. F.R.S. LIONEL S. BEALE, M.B. F.R.S. THOMAS MACKENZIE, M.B. F.R.S. CHARLES M. DEANE, Esq. ARTHUR FARIE, M.D. F.R.S. SIR WM. JENNER, Bt. M.C. M.D. F.R.S. REV. JOHN EDWARD KEMPE, M.A. GEORGE CUTCLIFFE, Esq.

THE POCKET TECHNICAL GUIDE and MEASURER for BUILDERS and MECHANICS: containing complete explanations of the terms used in building, mensuration, and technical directions for measuring work in all the trades; with a Treatise on the Measurement of Timber, and a Specification for Houses, Roads, and Drains. By A. A. POCKET.

THE POCKET ESTIMATOR for the BUILDING TRADES, with 33 Woodcuts (uniform with the usual Outline), 2*s*. post-free. ANTIMETES and MEASUREMENTS: being a Treatise on the Use of the Antimetres, &c. London: LOCKWOOD & CO. 7, Stationers' Hall-court, E.C.

CLERICAL, MEDICAL AND GENERAL LIFE ASSURANCE SOCIETY.

DIRECTORS. CHAIRMAN.—Right Hon. JOHN ROBERT MOWERAY, M.P. D.C.I. DEPUTY-CHAIRMAN (WILLIAM BOWMAN, Esq. F.R.S. (Sir CHARLES LUCKOCK, Bart. D.C.L. F.R.S. GERALD W. LYDECKER, Esq. M.A. The Viscount MIDDLETON. Ref. JOSEPH MOORE, M.A. Sir JAMES PAGE, Bt. Bt. M.C. F.R.S. Rev. FREDC. J. FAIRBORN, B.D. GEORGE H. FINLAYSON, Esq. Sir FREDK. M. WILLIAMS, Bt. M.P. ASSISTANT ACTUARY. BENJAMIN NEWBATT, Esq.

NINTH BONUS MEETING, January 4th, 1872.

The following are Extracts from the Reports of the Directors:— 1.—Progress of the Society in the Bonus Period. 'AS TO INCOME: THE NEW ASSURANCES were 2,159 in number, for an aggregate sum of 1,286,303*l*. at premiums amounting to 44,964*l*. per annum—results which, viewed in relation to the depressed condition of Life Assurance during the whole of the period, cannot be regarded as other than satisfactory. THE YEARLY REVENUE was increased by over 21,000*l*. per annum, and reached 226,308*l*. on the 30th June, 1871. THE INTEREST yielded by the whole of the Funds, whether invested or uninvested, was 3*l*. 5*s*. 6*d*. on the average of the entire period, being only 2*s*. 6*d*. per cent. more than that realized in the previous period. This increase was obtained not only without loss, but without the smallest impairment of security. 'AS TO OUTGOINGS: 177 Policies, amounting to 646,431*l*. . . . The mortality was very favourable to the Society, the payments having been below those estimated by fully 55,000*l*. . . . which occasioned them fewer by 99 than the number expected. THE EXPENSES incurred in conducting the business, always moderate and well within the provision made for them in the premium, were fractionally less than in the previous period, and fell below 7*s*. per cent. on the Revenue. It is thus seen that side by side with uniform success in the transactions of the Quinquennium, there was continuous growth in the resources and magnitude of the Society, which consequently stood, at the closing of the books, at a broader base than at any former time."

2.—Financial Position of the Society on June 30th, 1871. The Substantive Assurances on the 30th June were 8,679 in number, amounting, with their Bonus additions, to the sum of 5,445,025*l*. The Assurance Fund at the date of Valuation was 41,824,438 10 9 And the total calculated Liability 1,477,179 17 3 Leaving a Surplus of £34,278 13 6 Deducting therefrom the permanent Reserve Fund of 50,000*l*. pursuant to Sec. 37 of the Society's Special Act of Parliament, there remains to represent the profit of the 5 years of the Bonus 28,278 13 6, an amount equal to 26 per cent. of the total Revenue from all sources during the 5 years, and exceeding by 43,821*l*. 6*s*. 6*d*. the surplus of any previous Quinquennium.

3.—Results of the Division. "Of the sum now to be divided, five-sixths, or 235,906*l*. will fall to the Assured, and will produce a reversionary addition to the Policies of 2*s*. 6*d*. This Reversionary Bonus will average 4*s*. per cent. or vary according to age from 3*s*. 4*d*. per cent. on the Premiums received in the Quinquennium on all the Policies amongst which it will be distributed. The next DIVISION OF PROFITS will take place in JANUARY, 1872, and Persons who effect New Policies before the end of June next will be entitled at that Division to one year's additional share of Profits over later Entrants. The Report above mentioned, a detailed account of the proceedings of the Bonus Meeting, the returns made to the Board of Trade, and every information may be obtained of GEORGE CUTCLIFFE, Actuary and Secretary, No. 13, St. James's-square, London, S.W.

IMPORTANT WORKS OF REFERENCE.

- HISTORICAL and CHRONOLOGICAL ENCYCLOPEDIA: a Book of Reference for Students and General Readers. Edited by the late T. B. WOODWARD, B.A. Librarian to the Queen; compiled by W. L. GATES, Editor of the "Dictionary of General Biography." In one Volume, 8vo. [In May.] THE DICTIONARY of SCIENCE, LITERATURE, and ART. Fourth Edition, re-edited by the late W. T. BRANDE (the Author) and GEORGE W. COX, M.A. 3 vols. 8vo. price 6*s*. MAUNDER'S SCIENTIFIC and LITERARY TREASURY: a Popular Encyclopedia of Science, Literature, and Art. New Edition, in part rewritten, with above 1,000 new articles, by J. V. JOHNSON, Esq. 8vo. price 6*s*. MAUNDER'S HISTORICAL TREASURY: comprising a General Introductory Outline of Universal History, and a Series of Separate Histories. 8vo. price 6*s*. DR. LATHAM'S DICTIONARY of the ENGLISH LANGUAGE, founded on the Dictionary of Dr. SAMUEL JOHNSON, as edited by the Rev. H. J. TODD; with numerous Emendations and Additions. 4 vols. 4to. price 7*l*. MAUNDER'S TREASURY of KNOWLEDGE and LIBRARY of REFERENCE: comprising an English Dictionary and Grammar, Universal Gazetteer, Classical Dictionary, Chronology, Law Dictionary, Synopsis of the Poetree, &c. 8vo. price 6*s*. MAUNDER'S TREASURY of GEOGRAPHY, Physical, Historical, Descriptive, and Political. Re-edited and brought up to date by WILLIAM HUGHES, F.R.G.S. With 7 Maps and 18 Plates. 8vo. price 6*s*. THE PUBLIC SCHOOLS ATLAS of MODERN GEOGRAPHY. In Thirty-one entirely new Maps. Edited, with an Introduction, by the Rev. G. BUTLER, M.A. Principal of Liverpool College. Imperial 4to. price 3*s*. 6*d*. sewed, or 5*s*. cloth. "We have carefully examined these Maps, and we pronounce them the most intelligible and clear we have ever seen. Such an Atlas in cloth for five shillings is a marvel of cheapness."—English Churchman. MCCULLOCH'S DICTIONARY of COMMERCE and COMMERCIAL NAVIGATION. New Edition, revised and corrected to the Present Time by H. G. REID, Secretary to Mr. McCulloch for many years. 8vo. price 6*s*. URRE'S DICTIONARY of ARTS, MANUFACTURES, and MINES. Sixth Edition, rewritten and enlarged by ROBERT HUNT, F.R.S. assisted by numerous Contributors. With 3,000 Woodcuts. 3 vols. 8vo. price 4*l*. 1*s*. 6*d*. MAUNDER'S TREASURY of NATURAL HISTORY, or Popular Dictionary of Animated Nature. Revised and corrected by T. S. COBOLD, M.D. With 500 accurate Woodcuts. 8vo. price 6*s*. LINDLEY and MOORE'S TREASURY of BOTANY, or Popular Dictionary of the Vegetable Kingdom. With 274 Woodcuts and 20 Steel Plates. TWO PARTS, 8vo. price 12*s*. A DICTIONARY of CHEMISTRY and the ALLIED BRANCHES of other SCIENCES. By HENRY WATTS, F.R.S. assisted by eminent Scientific and Practical Chemists. 5 vols. medium 8vo. price 7*l*. 3*s*. SUPPLEMENT, bringing the Record of Chemical Discovery down to the End of the Year 1869; including also several Additions, and Corrections of former Results which have appeared in 1870 and 1871. 8vo. price 2*s*. 6*d*. GUILT'S ENCYCLOPEDIA of ARCHITECTURE, with above 1,600 Woodcuts. Fifth Edition, with Additions and considerable Alterations, by WYATT PATSWORTH. 8vo. price 8*s*. 6*d*. MAUNDER'S BIOGRAPHICAL TREASURY. Thirtieth Edition, reconstructed and partly rewritten, with above a Thousand additional Memoirs, by W. L. K. CATES. 8vo. price 6*s*. AYRE'S TREASURY of BIBLE KNOWLEDGE: a Dictionary of the Books, Persons, Places, Events, and other Matters of which mention is made in Holy Scripture. With Maps, Plates, and Woodcuts. 8vo. price 6*s*.

London: LONGMANS, GREEN, READER, & DYER.

PERFECTION IN BOOKKEEPING.—Builders and Others desiring a really good system, can have a SET of MODELS for BUILDERS BOOKS, by DOUBLE ENTRY, to which was annexed the price offered in "The Builder," No. 1,136, and which has been adopted by many large firms. Also a Modified Arrangement of the same, suitable for small builders.—Address: E. A. S. GEORGE'S-road, Regent's Park, London. Just published, for 1872, price 4*s*. the Sixty-second Edition of SKYRING'S BUILDERS' PRICES, calculated from the prime cost of materials and labour, to the present time, containing the Metropolitan Building Act, and a variety of new and useful information. London: RENT & CO. Paternoster-row, London; and may be had of all Booksellers.

THE "BUILDING SOCIETIES' GAZETTE," published Monthly, price 3*s*.; by post 3*d*. The recognized Organ of Building Society. Large and increasing circulation. Suitable medium for all Advertisements relating to Land and Houses. REED & WOODWARD, 37, Currier-street, CHANCERY-lane.

TO ADVERTISEES. 20,000 COPIES of THE BAZAAR, THE EXCHANGE and MART, THE JOURNAL of the HOUSEHOLD (Illustrated), will be issued and circulated on MARCH. Special advantages to Advertisers, orders for a series commencing before or with the above issue. Terms on application. Single copy, two stamps.—Office, 35, Wellington-street, Strand, London.

The Builder.

VOL. XXX.—No. 1516.

The Coming Event.

THE announcement of a General Thanksgiving Day and a State Procession to St. Paul's Cathedral has naturally led to a great routing out of old documents which might supply official precedents, and long quotations from contemporary

descriptions of similar ceremonies during the last and present centuries, more or less interesting, but displaying all these discrepancies in the details which have ever been found, and overall he found, unavoidable in accounts of a great public spectacle, by various eye-witnesses, however observant or truthful, placed in different positions, and deriving information where their knowledge may have been at fault, from different sources. The "leading journal" led us as might be expected, opening the ball with a reprint of the description of the procession of George III. in 1789, in the *Imperial Magazine* that day, communicated by Sir Digby Wyatt, which we were told that the Lord Mayor wore a cloak of purple velvet, which covered his horse well as his lordship,—a piece of intelligence which might have misled the right honorable gentleman who now fills that high office into the unnecessary extravagance of wasting a considerable sum in Genoa velvet of that "Imperial" description before he discovered, from less picturesque but more reliable authorities, that his predecessor was attired in his official gown of crimson velvet, as customary on such occasions, and which, as he could conveniently think in it, could scarcely have been of such ample dimensions as would be inferred from the above description. The *Morning Post* followed the last week, by a reprint of the report of the same ceremonial from its own issue of the 24th April, 1789, principally remarkable for the account of its politics at that period; and the *Daily Telegraph* of Monday last, extracted from the *funct Morning Herald* the narrative of the procession of the Prince Regent from Carlton House to St. Paul's, on the 8th of July, 1814, to offer up thanks for the restoration of Peace, complementing it with direct contradictions by the *Examiner* of the same date. We may ourselves venture to dispute the statement that "After the Royal carriage came two of the Grenadiers in costume on horseback." Other accounts have appeared, and may yet appear in other periodicals before this number of the *Builder* can be in type, and the official programme of the forthcoming ceremonial probably simultaneously with our publication: we shall therefore trouble our readers with repetitions of what we already all must have perused during the last few days, but indulge in a little gossip concerning such subjects in general. In the first place, the illustration of our opening observations respecting the impossibility of relying on minute details in even official documents, we will refer to the state procession of Queen Mary, through

London in 1553. Stowe, in his account, describes her Majesty as "sitting in a chariot of cloth of tissue, drawn with six horses, all trapped with the like cloth of tissue." Strype, on the contrary, says she was in "a litter," not mentioning horses; while Monsieur de Noailles, the French ambassador, who was actually in the procession, says in his official despatches, "The litter, covered by a canopy of cloth of gold, was borne by two mules, covered also with gold, and high upon it was seated her Majesty, dressed in a long mantle of cloth of silver, with a head-dress of silk;" therein again contradicting Stowe, who says she was "attired in a gown of purple velvet, furred with powdered ermine;" and also a MS. of the period which describes her as "richly apparelled with mantle and kirtle of cloth of gold, furred with minever and powdered ermines, having upon her head a circlet of gold, set with rich stones and pearls," which Stowe asserts was so massy and ponderous, that "she was fain to bear up her head with her hand." Here is circumstantial evidence with a vengeance! But "no more upon that head," as Dr. Pangloss has said before us. We could fill pages with such conflicting statements, to prove that the wisdom of our ancestors in these matters was not greater than our own, and that "errors" were not "excepted" in the accounts of the most ancient reporters, or, to speak more respectfully, the old gentlemen of the press. In pomp and splendour, however, there can be no doubt these Royal progresses infinitely surpassed those of modern days. In Nichols's accounts of those of Queen Elizabeth and King James I., the sense is almost wearied with the mere mental contemplation of the profusion of cloth of gold and silver in the dresses of the persons in the processions, the decorations of their litters or chariots, the very saddles and harness of the horses in some instances being "covered with cloth of gold, and furred with ermines, powdered," and in others with "crimson satin and velvet." Fuller, in his "Church History," commenting on the necessity for dispensing with the customary Royal procession from the Tower to Whitehall on the accession of Charles I., the plague being at that time raging in London, defends it also on the score of economy, as it would have cost his Majesty "threescore thousand pounds to be disbursed in scarlet for his train [i.e., retinue; observe, not mantle], a sum which if then demanded of his exchequer would scarce receive a satisfactory answer thereunto." Sixty thousand pounds of the money of that day to be spent for scarlet cloth alone! Fancy the Right Hon. Robert Lowe receiving a little bill amounting to the relative value at present as one item only in the expenses of the 27th inst!

Queen Anne went seven times in six years to St. Paul's to return thanks on various occasions; and George I. for his peaceable accession to the throne of these kingdoms. We do not remember seeing it mentioned that George III. went twice in state to St. Paul's; the second time being in 1797, to return thanks for the great naval victories obtained by Howe, Jervis, and Duncan; the procession being diversified on that occasion by three artillery wagons containing the French, Spanish, and Dutch flags captured during the various actions, attended by many of the gallant officers and men who had served in those actions, from the admirals to the powder-monkeys, with detachments from the marines at Chatham and Portsmouth as guards of honour. With the exception of this interesting variation, these processions, at least from the reign of Queen Anne, being arranged according to precedent, resembled each other as closely as the two black boys, Caesar and Pompey, who are known to have been "very much alike,—particularly Pompey;" and, therefore, although only one out of all, that of 1789, was to render thanks for the mercy of health restored, it is no more a

precedent for the order of the procession, or the regulations of the military and police, than that of the Regent in 1814, the latest of these particular national solemnities. For the graphic illustration of them we may direct the attention of our illustrated contemporaries to a very fine engraving published in 1789, representing King George III. and family passing through St. Paul's Cathedral, which is lined with the grenadier companies of the Guards in the act of presenting arms, a copy of which ought, we imagine, to be found in the print-room of the British Museum; at all events, one may be seen framed and glazed in the Earl Marshal's Court at the Herald's College. We may point also to another print representing the procession to St. Paul's on the Thanksgiving Day in 1713, which Queen Anne was unable to attend in person; and for the rabid archaeologist, to a print which was formerly, and, we presume, still is, in the possession of the Society of Antiquaries of London, representing King James I. and his queen, Anne of Bohemia, entering in procession Old St. Paul's, as it is stated, in 1616. This curious painting is engraved as a frontispiece to one of the volumes of Nichols's "Progress of James I.," and in his description of it he suggests that it was painted in anticipation of the visit of James in 1620!—a most amazing effort of imagination. We will not attempt to solve the mystery. It could not be misdated, and represent the procession in 1620, as James's Queen (Anne of Bohemia) died in 1619, and there she is in the procession. We will only undertake to assure our readers that an inspection of the engraving or of the original picture will not give them the slightest idea of the procession of Tuesday next, when we earnestly hope that the weather will not be guided by the precedent of 1789, on which occasion, to use the remarkable expression of a writer in the *Gentleman's Magazine*, it was most "offensive" to the general public, and the poor Guards, who were under arms as early as half-past three in the morning, the rain falling incessantly till noon, when their Majesties entered their carriage, and the sun came forth to greet them, and gild the refined gold of the royal liveries and equipages. The great gilt coach, however, which was built for George III., and first used in 1762, was not brought out on this occasion, so that there is a precedent for her Majesty's using what is commonly called the dress-carriage, in which she has lately proceeded to open Parliament, drawn, we trust, as in the former instance by eight of the noble cream-coloured Hanoverian horses,—a sight worth seeing alone.

It may be expected the *Builder* should say something about the various constructions in the streets, and the ornamentation of the houses in the line of the procession. There will be no pageants; no angel in green blowing a trumpet; no Gogmagog and Corinens at Temple Bar; no Dutchman perched on the cross of St. Paul's; no Spaniard capering on a tight rope from the Cathedral to the Deanery; but there will be triumphal arches, we trust, tastefully designed, and something like uniformity in the decorations of the houses. Cloth of gold and silver, gorgeous tapestries, rich embroidery as of old, are not to be expected; but fine effects can be produced by colour and arrangement with much less costly materials. The grandest spectacle of all, however, will be the thousands of loyal and loving subjects who will through those streets and crowd those houses to their roofs and parapets, personally to express their deep and genuine sympathy in all that affects the welfare of her Majesty Queen Victoria and her amiable family.

A New Infirmary in Southwark.—The St. Olave's Board of Guardians have just decided to erect a new infirmary in their district, and have also resolved that the new structure shall be built upon the model of the St. Luke's Workhouse, in the City-road.

CONVENTIONALISM IN SCULPTURE AND ARCHITECTURE.

BRIEFLY glancing at the relation of the subject we have been treating to architectural design,* we may appropriately say a word as to the position occupied by sculpture, the art which forms to some extent the connecting link between painting and architecture, in reference to nature and realism. In regard to the imitation of nature, this art occupies a different ground, and is practised under different conditions from the art of painting. The object here is to repeat and reproduce form as it really is, not as it appears under certain conditions and from some particular point of view. So far, then, it is direct, literal imitation of nature; the shaping of a solid bulk of material, instead of the suggestion of bulk by lines and shades upon a flat surface. Now, why not pursue the *évidance* by imitating the form, thus wrought out, with the actual lines and colour of nature? It is not altogether an idle question, because arguments have been brought forward, and may be again, by men of ability, in favour of such a treatment. The answer is twofold. In the first place, no imitation of natural colour and detail can, as before observed, be absolutely successful. We cannot, even with the more delicate resources of the painter's art, rival nature in her infinite imitation. Still less could this be accomplished by any such colouring process as would be possible on marble or other such hard and durable substance, and when every portion must be equally finished, and no devices of artificial shadow can be resorted to in aid of the effect. Yet it is just in this case that failure would be most glaring, owing to the very fact that the form is literally reproduced, which would bring into more relief the coarseness and comparative failure which must characterise any further and closer attempt at imitation. And if we could succeed in this, the success itself would be the greatest of failures, so far as the real aim of art is concerned. Imagine, in place of the orthodox white marble, a collection of images with flesh and draperies painted in imitation of the reality. The poetry of the art would have fled, and we might almost as well be in a waxwork exhibition. And the cause of the failure would be simply this, that the attention of the spectator would be directed so much to the success of the mere imitation,—so much, too, of the common realities of life would be suggested by it,—that little scope would be left for the contemplation of the work as an exponent of the higher expression and ideal of which the human form may be made the medium. By abstracting certain elements of reality, by limiting the imitation to that of form expressed in an artificial medium, we leave the sculptor's creation in a world of its own; we separate it in execution from the trickery of mere mechanical imitation, and in idea and association from the material realities of life, and leave it an abstract embodiment of the poetry of form and figure and action. Absolute mimicry of life in sculpture has not, we believe, been attempted by any civilised and educated artist; but the move made by our late distinguished countryman, Gibson, was a hazardous step in this direction, and one which we must be thankful has not been followed or carried further by succeeding artists. His professed object was to relieve what he had persuaded himself was the monotonous appearance of white marble: this would have been a good reason for choosing another material, or for adding a little decorative colour, perhaps, to certain of the accessories, but not for entirely colouring so beautiful a natural material, and impairing the delicate lustre in high lights which forms one of its chief charms. In fact, however, the celebrated Venus of the '62 Exhibition was an evident aim at the indication of flesh tint, and was only saved from something perilously near to vulgarity by the fact of its stopping considerably short of the full colour and tone of nature.† Laying aside the question of applied colour, the treatment of sculptural subjects requires to be carefully adapted to the material, and to the conventional expression of which alone, in its untouched

* See p. 67, ante.

† It may be doubted whether any representation of the nude figure in sculpture, so coloured as to be decidedly imitative of nature, would not be pronounced, in the present time and country, an offence against good taste, even by those who would never dream of supposing such a charge to be valid against similar works in the virgin material. Habit may have a good deal to do with this; but on æsthetic ground, at all events, the instinct which would prompt the objection is correct.

state, it is capable. This is a point, again, which has been overlooked in some popularly admired works of modern sculpture. The now well-known "Reading Girl" (to revert to another of the '62 examples), was an instance of this. So realistic a work in sculpture was a novelty, and found worshippers accordingly; but the ruffled dress and rash-bottomed chair were really out of place (the latter especially); because, in the first place, it is not worth while to spend so costly and durable a material, and so much labour, in working out such commonplace forms; there should be a *dignus vindice nodus*,—the best marble is well expended in perfecting the delicate contours of a beautiful figure, but not on dress and furniture; and, in the second place, these accessories were out of keeping artistically with the material. The chair was a realistic imitation of a commonplace article of furniture, thrust into a composition the very material of which removed it completely from reality. In a realistic painting the chair would have been well enough; in a conventional material like marble a conventional or ideal seat was required, not merely for the sake of beauty, but to avoid the confusion of two different classes of associations. This is a solitary instance; but the application, as we hope our readers see, is a wide enough one.

But in sculpture we are not limited entirely to the conventionalism of material or accessory. Under certain circumstances we may conventionalise the figure itself; we may eliminate some of the delicacy of contour and detail in nature, and substitute a simpler and grander line, a more massive and "built up" figure, so to speak.* This is the case to some extent with some of the finest antique statues, in which (as the able superintendent of the art classes at the London University has been pointing out recently) the anatomy differs materially from that habitually seen in the "Life" studio. But the cases in which conventionalism of form has been, and may be, justifiably carried to a great extent in sculpture, are almost invariably those in which the sculpture is to be used in close connexion with architecture. It is in this view that we referred above to sculpture as the "connecting link" between architecture and painting. The extent to which it may become so is exemplified in the Egyptian sphinxes and colossal sitting figures, of which, situated as they are in intimate connexion with the architectural design, it would almost be difficult to say whether they really are more sculptural or architectural in character. The same remark, perhaps, would apply to the Assyrian winged bulls, and in a considerable measure also to much of the sculpture of the Mediæval buildings. All these are specimens of sculpture designed and executed, not for its own sole interest as a central object, but as subordinate to a total architectural effect. In regard to their position, the *life* is more or less petrified out of the figures; they are reduced to an architectural stiffness and rigidity, so as to appear not so much figures added to the architecture, as portions of the architecture which have taken the type and some of the form of living objects. We are thus led, through sculpture, to architecture, and the manner in which we are so led is suggestive. We see that in proportion as we approach architectural art, in that proportion do we quit nature, and quit the representation of living sentient form. Architecture is of all the arts, the conventional art—the one which deals with principles and types of nature, instead of natural form. Accordingly, we could not use the higher forms—*sentient* forms, as we have termed them—of nature, as a portion of architectural design, without so altering them as to lose much of the sentient character, and even then we can only reduce them to a kind of neutral position. But if we descend from the sentient to the inanimate forms of nature—from the animal to the vegetable kingdom,—we find that we are then able to use the natural form as an integral part of the decoration of a building, with much less alteration, or conventionalising than in the other case. In all these cases, indeed, conventionalism is requisite, were it only in regard to the nature of the material in which the ornament is to be executed, and which is almost always of too coarse a texture to render with any fidelity the minutæ of nature. But the relation between the ornament and the general design of the building has to be con-

sidered also. In a style in which, as in the Gothic, the general outline and character of the building may suggest somewhat of the irregular and picturesque outline of nature, we can compound with a very near approach to nature in the small ornamental details; but even here those specimens of Gothic foliated ornament in which nature is decidedly conventionalised, though imitated in general form and type, are the most satisfactory to the judgment. In a style which, as the Greek, is completely rigid and artificial in its main outlines and composition, a much higher degree of conventionalism is requisite to render the ornament in keeping with the building; and the nearest approach to nature in this style, the Corinthian capital, is in fact highly artificial, while in that masterly and almost unequalled architectural feature, the Doric capital, the conventionalism is so complete, that we almost lose sight of any natural type at all; and were it not so, the feature would be, however elegant, too weak for the heavy and severe treatment of the general structure. In the ornamental detail of the Renaissance period there is much admirable conventional treatment, quite in keeping with the general character and expression of the buildings it was designed to adorn; the defect of the ornament of this period lying not in its intrinsic manner, but in the sameness of treatment and want of thought in its working out; defects very characteristic also of a great deal of modern Gothic ornament. But it is important to observe how universal has been the rule, in all the architectural decoration which has been recognised as the most beautiful and successful, of avoiding direct copying, and especially of sentient nature. In this respect the carving of birds and animals in the capitals of piers, initiated in some early, and imitated in some modern Gothic work, is a mistake, partaking a little of that kind of art which belongs to a half-civilised period. Such carvings, if allowed, must be looked on as part of the architecture, as mere additions to it; the restlessness and activity which we connect with the bird and the hare will not suffer such representations to blend with the immobile character belonging to architectural design. But surely it is more satisfactory that all detail that can be called architectural should appear as part and parcel of the constructive design, rather than as a picture affixed to conventionalised details, of which Mr. Ruskin in one of his lectures made sport. It might be a question whether any semblance of an animal feature was in place at all there; but there can be no question that, if it were used, it was right to conventionalise it, to bring it into harmony with the artificial character of the architecture, rather than to have the most life-like realistic model stuck on as an impertinence. We may mention, as a similar example, the conventional ornament, suggesting a winged lyre, in some of the internal capitals of the Paris Opera House. A realistic resemblance would have been commonplace; but the designer has cleverly managed to suggest this appropriate idea, while entirely preserving the proper character of carved architectural detail. Before quitting this subject it may be observed that in conventional decoration, as in conventional painting, there is an interest beyond the mere beauty of the feature employed, arising from the evidence of thought displayed on the part of the designer, and of his peculiar mode of looking at the thing. Thus, though the Corinthian capital is a more elegant and richer object than the Doric, yet the latter will probably always be regarded as the most interesting by the architectural critic, on account of the more subtle thought displayed in its treatment. To the same cause we may trace much of the interest of the beautiful Saracenic school of ornament, where every feature of natural form is discarded, and where only the metaphysical beauty of nature,—that which springs from order, proportion, repetition, variety of contour,—is made the basis for that endless play of fancy on the part of the designers which has given to this school of ornament so high a place in the history of decorative design.

The consideration of conventionalism as applied to architectural ornament suggests also a word in reference to one or two forms of art which can only be used in conjunction with architecture, though distinguishable as separate arts. In the treatment of stained-glass ornament, a good deal of very good work has been done of late years in England, if not elsewhere. But in the treatment of figure-subjects in this

* "This is building a man, not drawing one," said some one to Fuseli, on seeing his sketch in a figure with eagle in his peculiar energetic hyperbole of manner.

material there has been little real success, failure having resulted from two opposite misapprehensions in the mode of design and treatment. The naturalistic German school have erred in attempting the perfect realisation of the natural figure in a medium in which such realisation is absolutely impossible; the result being obvious failure, and an impression of coarseness and vulgarity of treatment. As to the attempts of the Munich school to paint landscape and distance on their windows, that is a kind of thing which we are totally unworthy to lenounce, and for which the English language applies no strictly Parliamentary terms at all adequate to the occasion. But in the English school of glass design, on the other hand, a mistake has been made in the opposite direction. The necessity for conventional treatment has been perceived, but it has been sought for in the adoption of the stiff, misshapen angular figures of the Gothic period. To treat the figure thus is not to conventionalise, but merely to distort it. However the artist may depart in such a case from the freedom and flow of line and attitude in nature, he is bound, nevertheless, to preserve perfectly the true balance of the figure, the true relation to each other of all points of the construction; the process of conventionalising in this case must merely take the form of a simplification, not a falsifying or contradicting, of nature. Unfortunately the modern glass designers have become very generally possessed with an idea that all which the Medieval men did was right, and we have had but few attempts to conventionalise the figure on true principles; or which the best hints might be found in some of the designs of Flaxman. The principle applies to mosaic; and here the true treatment of the figure has been better recognised, chiefly because the most important attempts in this art which has been made in England, the work has been in the hands of really able and educated artists. Yet there has not been wanting a demand, openly laid by some of our architects, for a return to the completely rigid and stiff forms of the early Byzantine mosaics, which, in fact, have been reproduced in all their archaism in sundry creos decorations in college chapels, and elsewhere. The demand is an unnecessary, not to say absurd, one; the material, when used in suitable positions, and at the requisite distance from the eye, not demanding more than a certain severity of line and dignified breadth of composition, to bring it completely into harmony with the exigencies of the case, and with the relation which the mosaic picture bears to the architecture in which it is set. The totally unnatural treatment demanded for it by mosaic would only be necessary if the mosaic were as much an integral part of the architectural design as are the winged animals of finials and Persopols. But it is not so: its rique texture, if not its brilliant colour, prevents its becoming so: it is simply an indestructible picture set in an architectural framework, and demands only so much conventionalism as will exclude it from presenting a harsh contrast with the lines of the architectural design, or with the evident restrictions imposed by the material.

Such are a few of the reflections not unnaturally suggested by a consideration of the manner in which Art deals with the natural forms and objects which compose the language by which she speaks to our feelings and intellects. The principle of conventionalism,—the question how near to each language of art, we may safely or rashly approach to direct imitation of nature, affects every method in which men have endeavoured to realise ideal beauty. The essential drama is in itself one great conventionalism, and we have it on the authority of one of Goethe's biographers, that when the author of *Wieland-Meister*, in his earlier days, superintended the production of tragedies at the Court Theatre at Weimar, so impressed was he with the importance of preserving the conventional consistency of the drama, that he would allow little action on the stage, and scarcely permitted the performers pointedly to address one another, regarding them simply as media for the delivery of the author's ideas. This was perhaps veridical conventionalism, even if we allow for possible exaggeration of the narrator; but the story is interesting as suggestive of the view of his form of art taken by the man who, of all great poets, seems to have possessed the artistic and critical faculties in the most evenly-balanced proportion. The precise preservation of proportion between realism and conventionalism has been rarely achieved in art. In the bas-reliefs of

the Parthenon we may see it, perhaps, in perfection, and in some of the Greek plays more perfectly than in any poetry, even that of Goethe, since Giotto appears to have attained the perception of it more perfectly than most of the great painters, falling short only in technicalities of execution; Raffaele in some of his noblest works, though not universally. Among modern English artists Mr. Leighton and Mr. Watts seem to have hit the mean more nearly than most others. To the English public the very idea of conventionalism as an important element in art is for the most part a thing as yet unthought of; how far this is the case we may conjecture from the total ignoring or misunderstanding of the subject evident in a large proportion of the writings put forth as "art-criticism;" it is fair to conclude that the writers of such criticism are in the main in advance of their readers, hard as such a conclusion seems to be as against the latter. This and cognate subjects in connexion with art are not likely, however, to be widely understood among us until this most unceremonial of civilised nations awakes to the perception that such matters really are worthy of serious study and thought, and that there is more in art-criticism than a mere question of liking or disliking.

THE QUEEN'S PROCESSION TO ST. PAUL'S AND FINE ART.

It would be not a little curious to find out, were it possible to do so, in how many ways, and in what special ways, modern "improvement" is in advance of the old ways of doing things in by-gone times. One thing is certain, that we are getting rid of what are called time-worn "prejudices" and old-fashioned modes of amusement and getting rid of time. *Fornalities* of all kinds are going out of date, and most of them, as the famous "processions" of past times, are now almost unknown. The modern world of business is too much occupied for such trifles and waste of human energy and time; it has something better to do, and certainly something more profitable. But the days were, when not only were processions, Royal processions, and others, of very great and absorbing public interest in themselves, but they were the foundational ideas on which a good deal of the fine art and sculpture of those times and countries were built up and found their origin. Modern enlightenment and extended education, as they are thought to be, have a natural tendency to ignore such things, both the things themselves and what they are so well fitted to encourage. Modern education means "book learning," but in times before a "book" was all-in-all, and the *description* of a thing or an event almost of more importance and interest than the thing or event described, a great procession from one spot or building to another was a notable event, and the occasion of bringing before the eyes and senses of the multitude not only graceful and brilliant costumes, but graceful and mentally impressive action. And not only were these improving and artistic doings accomplished with human beings and costumes, but opportunity was offered for the display of fine animal life, as is to be seen in the Parthenon frieze of Greek times, and in the triumphal procession of the Emperor Maximilian in the Dark Ages. These old processions and displays also gave opportunity for showing "improvements," if that be the word, in carriages and chariots and cars of different kinds. Indeed, in the old ways of doing these things, there will be found to occur perpetual opportunities for the exhibition and portrayal of objects of use and ornament which served to record the then state of the fine and useful arts. But these things are, it is to be feared, of the past, and but little likely to return, except perhaps by fits and starts;—an unfortunate circumstance, for where things are so rarely done they are likely to be done but indifferently well.

We are led to these thoughts on the old methods and ways of life, and the fine art which followed from it, by the rare and unusual occurrence of a Royal procession to St. Paul's. It would be impossible to imagine a case wherein things could well be in a more inadequate state of preparation; and it may be of some interest to hint at a few of the things needful, and at the differences between one of the old antique and quaint processions of past days and this coming modern one; and the great questions naturally present themselves: How is it to be done? what is the apparatus with which to do

it? what is its artistic value, if it have any? and can anything be done with it artistically afterwards by way of record of the event which it commemorates? But, first, a word on the old processions, such as the Greek carrying the "Populus" to the Temple—shown so accurately and completely in the Greek frieze in the British Museum—and which gave the sculptor Phidias his work. In that world-famous "procession" everything was evidently ready, and thought was had to the beauty and interest of its artistic completeness. The forms we see are plainly enough, and that fine horses, fine chariots, and fine men and women—not shut up in close carriages—made up the beauty and interest of it. As far as forms went, we know all about it, but the colours we can only guess at, though feeling sure that they must have added to the beauty everywhere present in it. Nothing could well have been added to increase the effect produced, and intended to be produced, on the minds of the spectators; and, to complete the charm of the whole, the Temple itself to which the procession walked, and the gateways to it, and the whole of the buildings on the way, were, as we see by the remains of them, worthy of the great art-loving race who produced them. It would be impossible to find, all the world over, a finer or a more glorious artistic embodiment of a national thought. Can we do anything in any way approaching to it? Have we any idea of a procession in a fine-art sense, and as expressive both of a national thought and an artistic way for carrying out that thought? Money, certainly, we have in sufficient abundance; money, more of it than the old Greek would ever have dreamed of. May we mention, as an instance of its plenty, that no less a sum,—we speak from personal knowledge,—than 7000. sterling has been offered and refused for the windows of a house in St. Paul's Churchyard commanding a good view of this very procession. But what is there to see, we may ask? Where is to be the artistic element in it? It is curious to note these things, and to look at them by an antique light. In our "Lord Mayor's Show" so curious a compound of show and glitter, and manners, and shabbiness, there is, as all know, the gilt coach itself, the only artistically quaint thing in it, the smart and new sherrif's carriages, the mounted band, and, what is more than all, as a telling part of it, the City companies' banners, borne by the shabby-looking watermen. All the rest of it is made up of the ordinary dull-looking vehicles seen everywhere, and of attendants in little else than ordinary costume. Will Tuesday's procession be better or worse than the Lord Mayor's Show?

It is perhaps only by contrast that we can come to anything like a fair estimate of the probable value of such a display, and of its artistic significance. We would therefore call to mind the fine old Middle Age procession, called the "Triumph of the Emperor Maximilian." The plates representing it were exhibited at one time at the South Kensington Museum, on the walls of one of the passages, and gave a good and true idea of what the men of the Middle Ages thought a triumphal procession should look like. Everything is firmly and carefully designed, and the harmony of the whole is most complete; for the dresses, carriages, horse furniture, banners,—indeed, everything in it, go to make up a complete and harmonious whole. It may well be contrasted with the Greek procession,—so unlike it, yet both so artistic and descriptive of the times that produced them. Can we do anything like this Maximilian Triumph, the Greek way of working out of the question? If we can, then will there be something to go out to view, irrespective of those exalted personages whom all London will be delighted to see; if we cannot, then may we ask, what is modern art, and are we in advance of the dark ages, or behind them, in matters artistic? Why, the fact really is, that the powers that be are at this moment thinking about what to do, and how to do it; and no man, in spite of an advanced education, can afford any sort of answer. We may also note in this place how differently, in different ages, men record things. In the old Greek days Phidias commemorated the procession of his time in enduring marble on the walls of a marble-built temple, dedicated to Wisdom. In Maximilian's days they left a record in fine and bold drawings, which it would be for us impossible to rival. In the days of Queen Victoria, in this art-enlightened nineteenth century, any one may buy a "view of the Lord Mayor's Show;"—a coloured one, too,—for a penny. We have one by us at this moment, and can but advise every curious reader to buy

one as well; for, we can assure him that it will be sold on the coming procession-day as a veritable representation of the Queen's progress! Who shall say that these are not art-loving times, with plenty of opportunities, and a whole world of competent executive artists to do the work, and a "Royal Academy" to exhibit it to the public, and Government schools to teach it!

But, again, can nothing indeed be done to make this procession, so notable in many ways, a little interesting and expressive? Can it be made artistic? Can it be made worth the trouble of recording it in any sort of material,—in marble, or stone, or wood, or even in the smallest of wood blocks, to be sold for a penny? Surely it is a test, and a fair one, of our art-capacity and power of meeting a new difficulty, and if possible mastering it. Comparatively very few people will see the procession itself, and still fewer the inside of the cathedral, and what is to go on there; but all might see adequate representations of it. The difficulty is twofold; to wit, to make the show itself worth the looking at, and then to represent it afterwards. If we might be permitted to offer a hint or two about it, it would be,—to include in it important personages, to keep the procession as close together as possible, and not to leave large blank spaces between carriage and carriage; and, above all, not to blot the whole show with a number of shut-up, close, dirty-looking vehicles, always somehow or other to be seen in such-like displays of professional favour. It is unfortunately only as a passing crowd that such a show as this can be of interest, for to go into detail in any way would be to abandon the subject altogether. There can be no artistic workmanship or design in it. No one expects it, or can do so; it would seem to be altogether out of or beyond the power of the age we live in. But that such should be the fact, is surely to describe the age as one in which the condition of practical art and fine art is not over-satisfactory.

THE PROCESSION AND THE PUBLIC SAFETY.

It will not be amiss on our part to direct attention to the character of a portion of the constructive preparations making for the event of Tuesday next. Up to the hour of writing these remarks we have journeyed twice over the entire route of the intended procession. We have been more concerned in our examination of those erections which have been and are being put up for the support of vast numbers of people, than those designed for pleasing effect, and the results of our observation may be simply stated.

There are some of the timber platforms or stands which do certainly not err on the side of strength, and there are others of very faulty construction with supports of not sufficient thickness in scantling. There is yet time to add to their security. Among the number of strong and substantial "stands" covering a large space, and calculated to accommodate several hundreds of people, may be instanced those occupying the frontage of the New Law Courts in the Strand, those at the junction of Fleet-street and Ludgate-hill, the Old Bailey, and those on either side of the Viaduct. Some large stands are being erected in Hyde Park, on each side of the carriage-drive near the Marble Arch. The platforms put up in front and at the side spaces of several of the churches in the line of procession in the Strand, Fleet-street, Ludgate-hill, though possibly secure enough, in consequence of their not having a very great depth, and being, moreover, protected in front with railings and their stone bases, are in other respects not very commendable specimens of constructive ability. The time to see them was when in course of erection, and when the scantling was naked, and not now, when their whole front view is hidden from sight with hoarding. It is not our wish to cause any alarm; yet we are anxious to point to defects capable of remedy. In constructing public platforms or stands for the support of human weight averaging several tons, tier upon tier, there is one consideration, and an important one, that should not be overlooked. A dead weight is not only to be provided for; but, in addition, an active moving vibrating weight. The axiom that the strength of a body is only equal to its weakest part, holds unalterably true also in regard to a roof or a timber platform. When a "stand" receives its living cargo, throughout the whole time it bears, it has also to resist strain: so it is most essential that

the strain should be counteracted sideways, or from front to back, by strong cross diagonal bolted bracing timbers. Now, in the majority of instances we have examined, the diagonal bracing is of a very inferior description, and bolting is the exception, not the rule. Cut-iron spike nails, and cut iron nails large and small, seem to have been the most in requisition. We took the trouble of examining the bolting of a few of the platforms, and we found that bolts were driven in, but not through, as no nuts were to be observed. The object obtained in this instance is obvious, but a simple spike nail of good quality would have been more honest and secure. The carriage or bearing pieces of public stands of the large dimensions we are describing should not be mere planking, but heavy timber; and the flooring for the seats should never be under 1½ in. or 2 in., and even then the bearing pieces should not be distant. It is nothing less than criminal folly to act according to the common opinion, that because a thing is for a temporary purpose any sort of construction will answer. If private individuals wish to speculate they are at liberty to do so, but there ought to be circumscribed limits to speculating at the cost of other people's lives. Given a large area, a guinea a seat would pay well a speculator in the building trade for the cost of his venture on his own account, as his timber would turn in again for use very little the worse for wear. At some of the clubs half a guinea the seat is found to pay all the cost.

We notice that the platforms surrounding some of our churches are ostensibly put up for the purposes of charity, the proceeds being intended for objects in that direction.

From the Holborn Viaduct to the Marble Arch there are hardly any available vacant spaces or waste grounds on which stands can be erected. In consequence, the householders and shopkeepers are making the most they can of their windows. Some have taken their windows out altogether where they were large, and have erected seats within the rooms tier on tier in first and second stories. In old houses this is rather dangerous work.

St. Paul's is, of course, as the chief point of interest, well attended to in the matter of space; every available angle of sight will be utilised as the piles of timber construction erecting within and without, as we write, testify. Here, at least, one expects to find structural security; and, so far as it has gone, there is no reason to complain. Every possible care has been shown.

The tall timber structure, the two piers of which enclose the stone obelisks, at the foot of Ludgate-hill, and which is intended as a triumphal arch, is strongly and firmly raised, and the heretofore unsightly iron railway bridge is getting a coat of bronze, and the City arms are being made conspicuously golden. A wooden roofing or canopy is raised above the bridge, and the aspect here and around, above and below, will be a most enlivening, though a rather overcrowded one.

The painting, festooning, and decorative part of the preparation on the entire route, have begun, but will of course be the last in hand. These works are not sufficiently advanced, as we go to press, to allow us to speak of them in detail.

We would again impress on all concerned, the necessity for the utmost caution, and the Police Commissioners and the City authorities would do well to act in unison, and with the advice of competent professional men, as to the security of the public erections in several parts on the line of route.

To be forewarned is to be forearmed, and there cannot be too many precautions adopted on this most exceptional event, for the preservation of human life and the public safety.

THE POLICY OF PUBLICITY.

An architect and member of the Institute writes to us as follows:—

"Do you think that a few remarks publicly made will have any effect on the Council of the Royal Institute of British Architects, with regard to the publication of the papers read at their meetings? There used to be a pleasure in reading the lectures in your paper, a few days after they were delivered, when all came fresh to one's mind, was looked for with interest, and made a greater impression upon the memory than when delayed. But now all interest is gone. A lecture was delivered on January 22nd, and only partially printed by you, which I should have liked to read in full, and no doubt many others had the

same liking; but up to this day, Wednesday, February 21st, no copy has reached me; and what interest I felt at the time has now quite passed away. The excuse cannot be on account of the time taken to print, because most of the lectures are given from the printed copy. Why do you not print the lectures, as formerly? I can hardly believe that the Council place any impediment in your way. It would be a great benefit, both to non-members as well as to members of the Institute, for you to publish the papers, and let the outer world know what is passing within the walls of the meeting-room. As to the Transactions, if the papers were printed in double column, instead of as they are now, they would be read with much more comfort, and readers would not run the chance of losing their place, in reading long lines, as in a lease, where one has to make use of one's fingers at each end of a line."

We have received a repetition of the inquiry why we do not print the papers in full from a friend of one of the lecturers who had, as the writer knew, enabled us to do so. The answer is very simple. In many cases we would willingly print the papers in full if we could do it immediately after delivery, and should do so, but we have received an intimation from the Council that they do not consider it desirable to allow the papers to be published by us *in extenso* before they are issued by the Institute. We are not about to quarrel with this decision,—conveyed to us in the most courteous terms, we desire to add, by the secretary of the Institute; but we must repeat the expression of our regret that such a policy still prevails there. We believe it to be short-sighted, narrow, and injurious,—altogether a mistake. We believe the Council would best fulfil their mission by seeking to obtain the widest possible publicity for all instructive papers connected with the profession and our art. It is not easy to find a sound reason for the opposite course. At one time it was said that publishing the papers in our columns lessened the chance of sale to outsiders of the Transactions issued by the Institute, but no one will venture to quote that as a reason now. There is no such sale under either arrangement. The sole reason, so far as we can learn, is that the members of the Institute may receive their own copy of the paper read before they see it in a public journal accessible to all; the result being, that information sometimes valuable is shut up and put away in a comparatively few thousands. Other associations have learnt this truth, and act upon it. At the congresses, for example, held by the Social Science Association, the addresses by the heads of departments are put into type, and even before they are delivered are gladly supplied to the newspapers far and wide for reproduction.

Enough, however, for the present. As we have already said, we are not quarrelling with the Council on the subject of their policy. It is a question of judgment, and they have perfect right to an opinion on the subject. We desire, however, to state emphatically that we believe their judgment to be wrong, and we trust, speaking in the interest of the Institute, the profession, and the art, that before long better counsels will prevail.

HINTS ON HOUSE BUILDING.

ROYAL INSTITUTE OF BRITISH ARCHITECTS.

At a meeting of the Institute on Monday, the 19th inst., a paper entitled, "Some Practical Hints on House-building," by Mr. Edward Roberts, F.S.A., was read. The reader said his desire was to invite attention to such subjects as these:—

1. Site, soil, and drainage.
2. Utilisation and disposal of water.
3. Artificial Lighting.
4. Warming and ventilation.

After treating of the first, he spoke of the utilisation and disposal of water:—"I may state that it is by no means uncommon for us to leave plumbers and other workmen to do as they please, and therefore, for want of consideration, we have supply-pipes to closets inserted in the same cisterns whence water is drawn for drinking purposes; soil pipes arranged so that they convey sewer-gas into the dwelling; and waste-pipes from wash-basins and sinks carried into closet traps, and although in the last case intermediate traps may be fixed, yet every time the closet-pipe is drawn the draft on the pipe empties the trap, and allows the foul air to escape through

to pipes into the rooms. Mr. Seddou and others have taken up the subject of sewer-gas. In the her cases the remedies appear to be either to use separate cisterns for the supplies for the several purposes, or to have partitions placed in such a manner as that the drinking-water cannot be contaminated; and in reference to wastes-pipes to carry them down separately into pipes from sewage-gas. In cases where supplies are by heads of water, whether by public companies or privately, if the water be stagnant in the pipes, freezing and bursting are the consequences of cold weather. The remedy appears to be to have the supply-pipes laid with a general fall towards the mains, so that when the pressure taken off the pipes may be emptied by gravitation; and disregarding companies' directions, to down ball-cocks to allow the flow to continue while the pressure is on, the stop bands which show distress in winter might then be dispensed with. In the case of intermittent supplies, there seems to be no other method than taking with sandcast or hay-bands.

Rain-water in the country is of primo importance, but is usually a cause of much labour and expense, first to conduct it to tanks, and next to pump it to the places where it is wanted. I am aware if any one has given a thought to this subject, except as to the form and ornamentation of gutters, pipes, and heads, and the description of force-pumps. I have found it more economical to provide for the water remaining where it falls, the top of the building. I thus save the expense of the down-pipes and tanks, the pumps and rising mains, and what is of far more importance, I avoid the labour of pumping it when it came, and every one of us must know how late is the time and force engaged in that operation in country residences. I produce one or two plans where the cisterns are introduced into the roofs for rain-water. In that of Christ Church, Finchley, not an ounce of the rainfall is allowed to escape; it is directed to a series of cisterns which supply the upper lavatories; an overflow supplies a second cistern, whence the water lavatories are served. Should these not retain the whole of the fall, it overflows to a tank in the basement, it being desirable to retain as much as possible.

The cisterns contain over 9,000 gallons, and the tank, 1,500 gallons. In the tower is a cistern for hard water, which supplies the closets, and in times of drought the rain-water cisterns are filled from the tower, but in only one case since its erection in 1860 has it been necessary to draw largely upon that source. I have invariably adopted this principle wherever possible, and I find it universally satisfactory.

It may be worth consideration how far the steam injector can be made available for filling cisterns. I have only once made the attempt, it abandoned it on account of the position of the cistern precluding the application of the injector, because of the water, when elevated, being also raised in temperature; the steam being from it is objectionable, and the boiling itself may tend to limit the use of the water itself. In factories it would appear to be perfectly admissible.

Although I have been referring to rain water in the country, I am not sure that its use need be limited to rural districts. The storm-water of towns is a difficulty; perhaps if rain-water were to be stored it would obviate some of the evils of sewer construction, and provide means for flushing in exceptionally dry seasons. The rain-fall on roofs in London, for instance, is probably one-sixth of the whole year, quite enough to make a sensible difference in the contents of the sewers, which are sometimes ruptured by the normal pressure of storm-water.

I pass now to the third part of our considerations—artificial lighting.

I am alive to the difficulties of the subject, and to the impossibility of saying any one thing authoritatively which may not prove in other cases to be wholly untrue and inapplicable.

I suppose it will be generally admitted that, regarding natural light, a skylight (except for very special purposes) is the worst light that can be adopted. It produces shadow from the person bending over any object; it causes cold in winter by the vertical radiation, and heat in summer by direct rays;—indeed, except where the light cannot be obtained, it is indefensible. Admitting this, who will say so of artificial light? That it is inconvenient if placed overhead is certain, and not one of us has felt the discomfort of such a light, and shifted our chairs in order to avoid the shadow of either head or hand,—and yet we constantly adopt it.

Does it never occur to us that whereas side-light in the case of daylight is the best and most convenient, artificial light from a similar point is equally proper? I believe that in our offices and libraries alone do we feel (and that I fear without studying the subject) that a lamp on our table, near to hand, removable at pleasure, and perhaps with the light deflected, and the eyes screened by a green paper shade, is approaching the perfection of light for use.

It has always appeared to me that every room should be lighted according to the uses to which it is to be applied.—a dining-room, for instance, should have a brilliant light, but soft on the table itself, with a softer light around the room, so that no part is gloomy, though absolutely free from prominence and glare; and, whether candles, lamps, or gas be the means, the light should be in the middle, somewhat akin to billiard-table lights, except as to the deflecting shades.

The mention of billiard-room lights induces me to give expression to my belief that, although, as a rule, no sufficient attention has been paid to other lighting, in that case it is nearly perfection, avoiding, as it does, shadow on the balls and cushions. Direct vertical light in other places may be unbecoming. I well remember the consternation and dismay said to have been caused to the Court beauties on the opening of the new ball-room at Buckingham Palace; and, whether true or not, this very fairly illustrates the position I take. The ball-room was at first mainly lighted by sun-burners; and the effects of the shadows from the ladies' brows, noses, and chins were such as to drive those sensitive creatures from the room. Since then candelabra and other lights have been introduced, and there is a feeble attempt to do that which, without knowing of that instance, I have frequently endeavoured to accomplish, but have not found my clients venturesome enough to indulge me,—namely, lighting by gas outside glass screens in the walls. If windows are the best lights which can be obtained, it seems to follow that similarly-placed artificial lights would be best at night. It would probably involve a great expenditure of gas, but the inside would be free from the damaging and uncomfortable effects of combustion.

We now come to the final item in my list,—*Air*, and here I am aware I shall be met by every variety of favourite theory and practice. I have, of course, one of my own, but it is not universally applicable, nor even generally so, except with varying adaptations.

Ventilation is not properly understood by the public, and is repressed or prevented in almost every case where provision is made for it, by the piling up of gratings, and so forth. Ventilation to be perfect should be the admission, by the means we choose, of an equal amount of fresh and pure air to that extracted. As self-acting extractors I have frequently adopted Chowne's air-syphons in two positions; the one from near the ceiling, to withdraw the merely heated air arising from gas or other lamps, and the other from the floor level; the latter, invariably in places where large numbers of persons congregate, for the extraction of those impurities which cause discomfort; for, relatively, carbonic acid gas is heavier at equal temperatures, and falls to the lower strata of atmospheres. This must have been experienced by every one in such places as omnibuses with closed doors, and in the old-fashioned church pew; in such cases the opening of the door is an immediate relief from headache and oppression, and the drowsiness for which the sermon usually gets the credit.

The admission of fresh air is another matter not generally considered. How constantly do we find gratings fixed in skirtings at which fresh cold air is to make its entry, and it takes the opportunity of making itself known by almost cutting off our feet with its keenness, and rendering the lower limbs sensibly lower also in temperature, causing those catarrhs which we never know how we have caught. On the other hand, warmed air is as frequently admitted from gratings in the floors or through vertical pipes. In both cases the converse systems should be adopted. *Cold air should always be admitted vertically*, and, if possible, at a level above the shoulders of sitters. Cold air thus admitted will ascend several feet without departing from its columnar form. As it is the same with warm air, which, when admitted, we require at the very lowest part of the room, it follows that it should be *invariably admitted horizontally*, thus

ensuring the benefit of its temperature and freshness, instead of receiving it, vitiated, after it has been up to the top of the room.

Mr. Roberts closed his observations by advising negatively:—

1. Never allow pervious drains in pervious soils.
2. Never allow a cesspool or drain near a well.
3. Never select gravel as a building-site if well-drained clay can be obtained.
4. Never allow drinking-water to be drawn from a cistern supplying a water-closet.
5. Never allow waste-pipes to be inserted into water-closet traps.
6. Never allow rain-water to run to the ground if it be required above.
7. Never allow water to stand in exposed pipes in frost.
8. Never allow pipes to be fixed so that they will not empty themselves.
9. Never ventilate except by pipes; inlets and outlets being equal.
10. Never use glazed earthenware pipes for upward flues.
11. Never allow chandeliers to be the exclusive light merely because it has been customary.

DESIGNS FOR FOUNTAINS.

SOME time ago Messrs. A. Handyside & Co., of Walbrook, desiring to obtain a good design for a fountain, to be executed in cast iron, at the cost of 400l., invited a competition, and offered premiums of 30l., 10l., and 5l. for those considered first, second, and third in merit,—all of these to become the property of the manufacturers. By a special note "Gothic designs were not invited."

In reply to the proposal, thirty designs were sent in by the time named, January 31; and from these the Messrs. Handyside have selected designs by Mr. Hugues Protat, first; Mr. G. A. Ilston, second; and Messrs. Batten & Edwards, third.

We are not moved to any warmth of expression by an examination of the drawings, which are for the most part of very ordinary character. Mr. Protat's design, which is entirely French in style, is to be executed forthwith, at a greater cost, we opine, if properly done, than the sum named. If the full-sized drawings are well made, the figures which constitute its chief merit finely modelled, and some improvement be made at the summit, where now stands an over-large vase, the result, we have no doubt, will be a very handsome fountain of its class.

ON INVENTIONS CONNECTED WITH BUILDINGS.

ON the 1st inst. Mr. Banister Fletcher resumed the consideration of this subject.* In the course of his paper he said,—

I endeavoured on the previous occasion to show what we architects considered good and what bad; and, further, what we considered was still required. I thought I should by so doing provoke discussion, and therefore sound conclusions would be arrived at.

I then dealt in detail with thirty-nine subjects. On the present occasion it is proposed to limit the discussion to three subjects. The first (its importance demanding that position), the improvement of the dwellings of the people of this country; the second, health; the third, as relatively least important, the security from thieves of our houses.

To treat, then, of the least important first, I should mention that much attention has been directed to sash-stops and fastenings, and I have instructions from Colonel Henderson to make and report to him on all sash-fastenings and sash-stops that may be submitted to me, and that I am determined to try and find out every invention relating to this class. I have already inspected some inventions, and desire to see every invention and patent, with the earnest desire that my report may contain notice of every invention. When my report is sent to Col. Henderson, he will select a committee to sit thereon. I would mention to his praise, and to show how far in advance in this day are some of our officials, compared with those we read of in days gone by (which some still call the "grand old days"), that he has told me he will send a circular to the inhabitants of this great City, embodying the result of that investigation.

* See p. 24, ante.

It may appear to some a rather trivial matter; but if such could see the reports, they would understand that it is no such thing. The great proportion of the robberies of this day occur through the ridiculously easy method of obtaining entrance to houses by the simple application of the knife. I write all present to help me to prevent this easy ingress. It is attributable chiefly to two causes,—first, the reliance we all place in the police; secondly, to the absence of shutters (the old security), or, if they exist, to their non-use. In ending this part of the subject, I would say any information sent to me and specimens shall receive my best attention, and will be reported upon. They must be sent me in the course of next week.

Surely this is a field in which the noblest efforts are required to make the homes of the people of England less of a disgrace to this country. I am sure if we only consider what home is,—how much time may be spent therein, even by the disolute,—how thoughts and actions have their origin there,—we shall be led to reflect on its overpowering influence for good and evil. Well has the poet said:—

"If solid happiness we prize,
Within our breast this jewel lies,
And there are fools who roam:
The world has nothing to bestow;
From our own selves our joys must flow,
And that dear but, our home."

But can any one imagine that the poet was alluding to such homes as I have shown exist? Much rather would the description which appeared in the *Builder* (p. 52) apply:—

"This is the roof and the soaking rain,
Dripping right through in search of the drain,
In the new house that Jack built."

We next come to the second subject, and the last; and while it is, perhaps more than any other, occupying men's minds, I shall be very brief, and summarise only a few of the leading points.

1st. That the main sewers of this city and other large towns are most defective, and, in short, are but elongated cesspools.

It is useless for any man to make a statement unless he confirms his views. I will briefly do so, and show conclusively how defective at this day are our arrangements.

I quote from the minutes of Mr. Robt. Rawlinson, C.E.

"By a return recently made relative to the sewers in West Derby, it appears that about eleven miles of public sewers have been constructed, and that in these sewers there are seventy-five ventilating shafts. It is considered necessary for safety to the public health to ventilate public sewers at intervals not further apart than 100 yards, or eighteen ventilating manholes and grates in each mile of main sewer. This rule requires that there should be in the eleven miles of West Derby main sewers 108 ventilating shafts, or 123 additional to those now in use. Rain-water spouts may serve to ventilate house-drains; but these should not be reckoned in reductions of main sewer ventilation. With means for sewer ventilation as indicated, the air in the sewers may be comparatively pure. There cannot be concentration or stagnation at any part of the system, and it is in concentration and stagnation that danger to health arises. With profuse ventilation there will not be perceptible smell at the ventilation-grates at any one point, as the diffusion and dispersion of sewer-gas will be increasing.

Foul smells and dangerous results of sewer-gas only take place from sewers inadequately ventilated. The West Derby Local Board has more fully ventilated the sewers of the district than many other local boards; but, to be safe, the additional number, as now recommended, should be constructed."

Wherefore, it would appear that the only remedy proposed is to give back to us to inhale diluted gas; and it is considered by doubling (about) the number of such outlets, the air may be comparatively pure.

It is often talked about what will that New Zealander say that Lord Macaulay invented, when he stands on the ruins of London Bridge. But what, I would ask, would our grandfathers say, if they could arise to-day, and find us not talking about getting pure air, but that all the vanished science of the day, the ambition of the scientific world, seemed to consider comparative pure air as the *summum bonum*. And remember, this result is only to be obtained by great additional outlay.

Take, again, the *Times*, at the close of the long discussion in that journal, in a leader devoted to summing up the result:—

"One correspondent after another points out new danger, until the case of the average householder might well seem hopeless. He learns that no trap is to be trusted, and that he and his family are, in fact, separated from typhoid fever by but 2 or 3 in. of treacherous water. Even if some totally new arrangement of pipes would afford protection, it is not every one who is in a position at once to reconstruct the internal mechanism of his house; and it may as well at once be recognised that the idea of reconstructing the whole system of metropolitan drainage is for the present Quixotic. Are we, then, without any available means of escape from this terrible enemy of health, and must we submit to pay a certain

tribute of lives as the condition of enjoying the decencies of life? Our readers, it would seem, may all, at a comparatively trivial cost, provide themselves in very great measure with the protection which we are in search of. To obtain a real additional guarantee against typhoid fever, would be well worth a definite and moderate expenditure, even if we cannot altogether exclude so invidious a foe."

To add to our misery, the *Saturday Review*, in a clever article on sanitary reform, says:—"What are now regarded as the best established conclusions of sanitary science may be discredited in a few years, and precautions supposed to be important to-day may by to-morrow have come to be accepted as essential."

There, then is a subject for the inventive genius. Next, the deduction I drew in the last paper was, that as it is impossible to return to the old cesspool, it behoves the engineer to find a remedy. Listen, again, to what the *Times* says:—

"It is plain that everything we wish to get rid of can be discharged out of the house, and there dealt with quite separately from the interior arrangements. It must have a ventilation, and that must be entirely distinct from the ventilation of the house. It has often been pointed out that it may be immediately subjected to a general system of ventilation by means of pipes and sewers conveying in ventilating shafts, carrying the effluvia high over our heads, above the level of gutters, cisterns, and soft-water supply. Why not? There was a time when there were no chimneys for smoke, but we have them now, many and tall. It is a mere affair of mechanism to bring every nuisance in this metropolis within the draught of public ventilation, and whether those ventilations be worked by steam, by furnaces, or by natural draughts, is only a small matter. Even if it costs something, it is an important matter as water supply. Let it be considered that an ordinary wind changes the whole upper atmosphere of this metropolis once every quarter of an hour, so that an effluvia once transmitted to the upper regions is effectually got rid of. Its mischievous power consists in its lurking down below, or being actually confined in our houses. What we say is, that the object is quite feasible, and the means of escape are sad impostors if they cannot tell us how it is to be accomplished."

I contend this is no remedy; it is merely repeating what was done with the sewers when cesspools were done away with. It was then said, "Use plenty of water, and send all into the river, and there's an end of it." We know to our cost how wrong that was, and most certainly in time we shall discover, if we follow this advice, that we shall have around and above a stratum of death-giving vapour.

I now proceed to the internal sanitary arrangements. The great defects I would point out are the frequent use of bell-traps, for the reasons I have explained,—the absence of ventilation of drains. Take the usual soil-pipe closets on each floor: it will surprise those who do not understand it, but if the soil-pipe is trapped at the bottom, the using of the bottom closet will often empty the traps above of all their water, and for the simple reason that "nature abhors a vacuum."

To show again how little this is appreciated, I do not suppose one in twenty of those who fancy they understand sanitary matters can say if the receiver in a pan-closet is air-tight; can say if he would draw the water out of the pan. The result would appear to indicate great ventilation, to prevent air-bound pipes and to prevent foul air confined in the sewer forcing its way into the house.

The result then seems to be, as to drainage:—

- 1st. Plenty of ventilation.
- 2nd. If possible do away with the pan-closet, because of the receiver.
- 3rd. Improve the valve-closet, which at present is imperfect.
- 4th. Adopt D traps instead of the bell, until some better trap is invented.
- 5th. Find some means by which (no matter how long summer may last) evaporation shall not take place to such an extent that traps in areas and sunlike exposed positions shall cease to be traps.

It has occurred to me whether oil would not have the effect of preventing this evaporation; it is used successfully in gasoliers.

Next, as to ventilation in houses. I think for economy and for health the ash and frame I propose, made from my design, appear to combine those advantages which are requisite, namely, easy ventilation without draft. It is clear (at least, I quote from a very large experience) that no ventilation will be tolerated by the people where the slightest feeling of air coming in is felt. Another model I produce, which I invented many years since and have often employed, also giving the upward current which is necessary, and is so cheap as to come within the reach of all. I have used it for stables as well as for rooms.

Water:—There should be a constant supply.

I have seen two self-closing taps that seem cheaper and to meet the requirements demanded by the water companies; but some tap is wanted which, while cheaper, shall be as effective, if not more so.

I close these few remarks with a quotation from *Punch*, because we may be sure if it comic papers treat upon such a subject it is much occupying attention. *Punch* is speaking to King Christmas:—

"Let us heap on more wood, and while the roaring log emits its festive fireworks, let us drain a foaming goblet in your honour."

"Let us heap on nothing of the kind," said the old gentleman, blantly. "The room is too hot already; but until we get rid of hearths and stoves, and have air-pipes, rooms will never be properly warmed."

If a spur be wanted to increased exertions, I would thus supply it. Surely, if the physician is more than armies to the public well, how much greater than he must be that man who, by his inventions, limits or prevents the necessity of calling in the physician.

FROM MOSCOW.

Moscow! holy Moscow! the ancient capital of Muscovy, the idol of every Russian's heart, whose shrines are to him the holiest in the empire, hallowed by centuries of grand historical events. What associations do not arise at the name? Moscow, the beautiful Moscow! the unfortunate. What vicissitudes of good and evil fortune has this city not passed through? Four times nearly consumed by fire—in 1536, by accident; in 1572, by the Tartars, when over 100,000 persons perished in the flames, or by the sword; in 1611, by the Poles, who destroyed by fire a great portion of the city; and lastly, in 1812, when the Muscovites gave up their ancient, holy, and beautiful city to the devouring element, the grandest sacrifice ever made to national feeling. The plague of 1771 diminished the population by several thousands, from which it has never recovered, and the history of its battles and sieges would alone fill many volumes. Take, for instance, one of the entrance-gates to the Kremlin, say the Nitrovolny Gate, under whose arches the troops of Tokhtamysh, of Sigmund III., and of Napoleon, have all marched within four centuries. In 1408, it witnessed the siege of Moscow, by Edigei; in 1551, the invasion by the Crimean Tartars; and in 1611-12, the battles between the Poles and the Russians for the possession of holy Moscow; and in 1812, Napoleon passed through it when it was partly destroyed by his orders, but subsequently restored by order of the Emperor Alexander I., of Russia.

But in this letter it is not my intention to revert to much of its ancient history, only so far as it is connected with its modern aspect. And now let me place myself on the top of the tower of Ivan Veliki, and take a bird's-eye view of the town, and let down what appearance it presents. In my various wanderings I have travelled through Asia Minor and the north of Africa, and I have floated on the Golden Horn, with Constantinople within my view; but I have never yet seen any town or city which presented a *coup d'œil*, so truly Oriental or Asiatic as Muscovy's honoured capital, the view from the summit of this tower being certainly one of the most striking and unique in Europe. I have immediately under and about me the most ancient and most historical part of Moscow, and four of probably the most interesting buildings in the world, all within a stone's throw of each other. 1st, the Kremlin, for centuries the palace of the ancient Tsars of Muscovy, which has been the happy home of many, but also the scene of the most deplorable and wicked acts of which history is cognisant. 2nd, the Blagoveschenski Sobor, or Cathedral of the Annunciation, where the Tsars were baptised and married. 3rd, the Uskenskii Sobor, or Cathedral of the Assumption, where the Tsars were and still are crowned. 4th, the Arkhangelski Sobor, or Cathedral of the Archangel Michael, where the ancient Tsars were buried, the present dynasty finding their last resting-place, as I have in a former letter informed you, in the Cathedral of St. Peter and St. Paul, at St. Petersburg. Thus truly you may pass from the "cradle to the grave," for here he buried emperors of such good repute that they have been immortalised by their subjects as saints, with others whose characters are too truly depicted by the cognomen they bore, and such a one was John the Terrible. All these buildings are in the Oriental style of architecture, with scores of

les and gilded minarets sparkling in the mid-
sun. The late Emperor Nicholas added a
ne and handsome façade to the old palace,
th extending its interior accommodation for
tern requirements. The Kremlin Palace,
th its cathedrals, monasteries, and other
dings, is enclosed within battlements of
d masonry, and pierced with five gates, the
cpical of which is the Spiski, or Redcemer
h, which is the "Porta Sacra" and "Porta
mphalis" of Moscow. Over it is a picture
h Redcemer, held in high veneration by the
odox. An omission to uncover the head
to passing under this gate was anciently
shelable, and the traveller should not fail to
to the respect to old traditions here exacted:
n the Emperor himself conforms to the
don. Criminals executed in front of this gate
ad their last prayers on earth to this image
h Redcemer. Beyond we see a city whose
unference is about twenty English miles,
it totally irrespective of form, but presenting
he eye a pleasing negligence and picturesque
gularity: houses large and small, public
ldings, churches, and other edifices, are
ngled confusedly together, and the streets
lute continually, and thus offer from time
e points of view, whence the eye is able to
ge over the vast area of housetops, trees, and
led and coloured domes. The profusion of
rches (370 in number) is a characteristic
ture of the city. The other objects which
st attract the observer are the Foundling
spital, the Treasury, the Arsenal, the Bazaar,
University, the Museum, the great Riding
ool, the Strastny, the Donskoi, the Simonoff,
i Novopaski Monasteries, and the Novo-
vichii Convent, the Petroski Park and Palace,
d the Hermitage and Zoological Gardens.

And now I descend from the Ivan Veliki
er, and enter the ancient part of the Kremlin
ace by the red steps, which are now only used
important occasions, such as when the
per goes to the Cathedral of the Assump-
n. These steps lead to a gold court, an
ence-chamber, and banqueting-room, and
to the Hall of St. Vladimir, to which the
ers proceed immediately after their coronat-
n, and take their seat upon the throne for
the first time, adorned with all the Imperial
gria, and afterwards dine amidst their nobles,
rined heads being alone seated at the same
le. We now come to a very interesting part
the palace, the terem, anciently devoted to
Tsarevna and her children. The rooms con-
n many objects of great curiosity, among
ich are the bed of Alexis, father of Peter the
eat, just as he left it when carried to his
ave; seals of many of the sovereigns, espe-
ally a gold seal of John the Terrible, which
is sealed the doom of thousands, and which
is most painful to behold from its unhappy
ccasions. There more rooms, such as the
all of the Patriarchs, &c., too numerous to
ticularise, on to the modern part of the
lace, built by Nicholas. There we have on the
ground floor all the private apartments of the
upper and Empress, and the upper floor, con-
nning the State apartments, which are as grand
d as gorgeous as an autocratic emperor like
holas, with untold means at his command,
uld make them. There are several large halls,
mong which the Hall of St. Andrew and the
all of St. George, 200 ft. long, 68 ft. broad,
d 53 ft. high, where the names of each indi-
idual decorated with this order since its foun-
ation is to be found inscribed upon the walls
n letters of gold; the furniture is black and
ange, the colours of the order. There is also
a picture-gallery, containing, among others, some
e pictures brought here from the Royal Castle
Warsaw.

R. RICHARDSON GARDINER.

DESTRUCTION OF ST. MARY'S CHURCH, CRUMPSALL, BY LIGHTNING.

At a recent meeting of the Manchester
Library and Philosophical Society, a paper was
ad by Mr. Joseph Baxendell, F.R.A.S., on the
struction of St. Mary's Church, Crumpsall, on
4th of January, by fire, from a lightning
scharge.

The interest taken in the question, he said,
duces me to submit to the Society the following
ints of a careful examination of the lightning
ndicator, spouts, gas-piping, &c., at the church
d rectory, which I made on the 27th ultimo.
he lower part of the conductor passes through
iron down-spout, and terminates in a common
n-pipe at a distance of only 3 ft. 9 in. from

the lower end of the spout, and at a depth of
only about 18 in. below the surface of the
ground. It has, therefore, no direct connexion
with the earth, and is in consequence absolutely
useless for the purpose for which it was in-
tended. The iron down-spout through which the
conductor passes received the end of a lead
gutter, which extended the whole length of the
church to the top of a similar iron down-spout
built in the wall inside the rectory, and connected
with another iron spout outside the wall by a
lead bend pipe. This leaden bend was above
the floor of the vestry, and at a distance
of 18 in. from it, and below the floor there
was a lead gas-pipe connected with the large
gas meter, which received its supply from a
main laid in the street leading to the rectory.
There was a small meter under the tower, but no
part of the piping connected with it approached
the conductor, the spouts, or the lead gutter,
within a less distance than 3 ft. Assuming,
then, that the lightning struck the top of the
conductor, its course would be through the lead
gutter to the iron down-spout in the vestry, and
then by a disruptive discharge from the lead bend
to the lead gas-pipe under the floor of the vestry,
and through the meter to the street main. The
lead gas-pipe would be melted and the gas
ignited. . . . I have assumed that the light-
ning struck the top of the conductor, but I must
state that I was unable to discover the slightest
trace of any action tending to support this view;
and it is at least equally probable that the stroke
fell directly on the top of the iron down-spout at
the east end of the church. . . . In either case,
however, whether the discharge took place upon
the top of the conductor or on the top of the
down-spout in the vestry, the ultimate results
would be precisely the same. Had the con-
ductor been directly connected with the gas
main, as suggested by Mr. Wilde, the accident to
the church would have been prevented, but not
that at the rectory. The practical conclusion,
therefore, to be drawn from a consideration of
all the circumstances of this disastrous oc-
currence is, that in towns and districts where
systems of gas and water-mains and pipes exist,
all lightning conductors should be directly con-
nected with the mains of both systems.

THE GOVERNMENT AUDITORS AND THE CORPORATIONS.

TROUBLES to public bodies, any more than to
individuals, do not come alone. "What luck,
Tim?" asked an Irishman, one morning, of an
old acquaintance, who was in the habit of avoid-
ing a meeting in consequence of his indebted-
ness for a small loan. "By the table of war,"
replied Pat, "I've seen a ghost." "Thin,
maybe," replied the other, with a touch of dry
humour, "'Tis the ghost of three and ninepence
I lent you." This authentic anecdote has its
application just now in the matter of some cor-
poration ratepayers and auditors. If a bomb-
shell were to be suddenly sent into the midst
of a quiet family party, it could not cause
more panic or consternation than the announce-
ment to certain corporations and public Boards
that a Government auditor was despatched with
due authority to look over and balance their
accounts. In the sister island there is a little
reign of terror inaugurated; but, unlike former
Irish outbreaks, it is a wholesome public panic.
On the 19th of December, a letter was addressed
to the lord mayor of Dublin, by the Under
Secretary for Ireland, in reference to the appoint-
ment of auditor for the borough of Dublin, with
copy of the warrant appointing Mr. Finlay,
signed by the Marquis of Hartington, and lodged
by Mr. Finlay with the town clerk. These were
accompanied with the opinions of the law ad-
visers and law officers of the Crown. Also a
notice, dated the 6th of January, 1872, was
given by Mr. Finlay to the town clerk, in pur-
suance of the 34th and 35th Vict., cap. 109, re-
lating to the corporation accounts.

Strange to say, these communications got into
the hands of certain members of committees, and
were not brought before or under the notice of the
council until several days had elapsed, and a
deputation was organised in the meantime to
wait upon the Under-Secretary, at the instance
of a committee, who held the document lodged
by Mr. Finlay, and not with the knowledge of
the council. The deputation were asked by the
Under-Secretary to put their views upon paper.
This, it seems, they have done, and up to the
time of our writing, nothing but a formal
acknowledgment has been received.

The object of the deputation to the Under
Secretary was to throw obstacles in the way of
the audit.

Of course there were several reasons alleged
why the audit could not take place. It was urged
that the corporation experienced nearly insur-
mountable difficulties in bringing the Local
Government Act into operation. We do not doubt
this for a moment, but not for the reasons advanced
by the committee of the corporation. Now, be
it known that all the ratepayers of Dublin are
unanimous in having a Government audit, for
they have reason to fear that matters are far
from being right. They would willingly pay for
the expense of the audit, for the satisfaction of
heholding what their eyes have never yet feasted
upon these many years.

The second trouble of the corporation lies in
the announcement made by Mr. Justice Fitz-
gerald in his address to the city grand jury.
He confessed that in looking over the calendar,
he missed one case he had expected to find,
—"He did not find any indictment, although
there should have been one, against some one
for a public nuisance. As the lord mayor was a
member of the commission, it might not be con-
sidered a proper tribunal before which to insti-
tute such a proceeding; but they could not slant
their eyes to the fact that in many quarters the
state of the streets was such that an
indictment for a public nuisance might lie
against those in whom the law had cast the
responsibility of keeping the streets in proper
order."

This, we would think, ought to have been
sufficient to stir any public body into action, and
rouse up its latent spirit, if it had any.

There are two other corporations in Ireland
who are likely to be fixed and transfixed by the
action of the Government auditors. Here, in
London, in the east and in the south of the
metropolis, we hear of some vestries likely to
come to saddle grief, on the head of illegally-
signed cheques, passed out by members of
certain committees, without the knowledge of
the council. There is one vestry in South
London who have erred to the trifle of a few
thousands, not hundreds, extending over a not
very long period.

THE PUBLIC HEALTH.

In the House of Commons, Mr. Stansfeld has
brought in a Bill relating to public health. This
measure was, he said, a logical consequence of
the Local Government Bill of last year, which
consolidated in one department the old Poor
Law Board and the Medical Department of the
Privy Council, amalgamating under one super-
vision the laws relating to poverty and the laws
relating to health. It was a sanitary Bill, and
nothing more; and it was founded upon the
report of the Sanitary Commission, with some of
the recommendations of the Rivers Pollution
Commission. The two great objects of this Bill
were the construction of local sanitary authori-
ties, and the institution of new sanitary powers.
He looked upon the first as of the greatest im-
portance. He thought the House would come to
the conclusion that among the foremost objects
of sanitary reform was the establishment of an
efficient machinery for enforcing sanitary regu-
lations. To this end, they required Government
supervision, definite authority with definite
responsibility. By definite authority, he meant
that there should be one, and only one authority;
and by definite responsibility, he meant that
legislation should cease to be permissive, and
that distinct responsibility should be placed on
these local bodies. He proposed to divide the
authority into urban and suburban; that the
urban authority should be the Town Council,
the Improvement Commissioners, or the Local
Board; and that the rural authority should be
the Boards of Guardians, with the exception of
those guardians who represented the urban por-
tion of the unions. He would confer upon the
rural authority all the powers both of the
Sewage Utilisation, and of the Nuisance Re-
moval Acts. To the urban authority would
be allocated the same powers, in addition to
the powers conferred by former Acts. Then
it was proposed to combine those powers
for certain purposes: the local authorities would
have power not only over nuisances outside a
house, but inside; they would also have power
to test the purity of water supplied by water
companies, and to deal with the adulteration of
food. They proposed that the sanitary bodies
should have the power of providing hospitals for

the treatment of epidemics, and he should ask the House to give the local government boards with respect to the country the same power which the Poor Law Board possessed with respect to the metropolis, of requiring the institution of public dispensaries and the supply of drugs. They proposed to call on the local authorities, to appoint the necessary sanitary officers, including medical officers. With the aid of these officers they hoped to be able to furnish statistics of disease in the same way as statistics of death were now supplied.

Sir C. Adderley said that he intended to introduce a Bill himself, but his measure was for the purpose of the consolidation and codification of the existing laws, which were in a state of great confusion. The sanitary laws of the country were less defective than confused, and they would not have a good sanitary system till they were simplified.

Mr. A. Johnston expressed a hope that the status of the executive officers should be improved, and that they should not be so much under the thumb of those who elected them.

Mr. F. S. Powell pointed out several improvements that ought to be made, such as closing of impure wells, the establishment of public mortuaries, and the providing of disinfecting apparatus.

Leavo was given to bring in the Bill.

CASES UNDER METROPOLITAN BUILDING ACT.

THE DISTRICT SURVEYOR OF HAMMERSMITH v. HAWKINS.

The defendant in this case, tried before Mr. Ingham, at Hammersmith Police Court, is a nurseryman, carrying on business at Shepherd's Bush, the ground he occupies being nearly covered by glass-houses of various heights, all standing upon brick walls, and each heated by hot water. Two chimneys have been built recently, and attached to some of the houses in question; but no notice had been given, and the district surveyor, Mr. Knightley, summoned Mr. Hawkins for not giving notice for one of these.

His answer was that the chimney was not a building, and that if it was, he was exempt on the score of distance, as glass-houses were not buildings, and, if they were, the Act exempted them. The District Surveyor quoted sec. 38, sec. 6, rule 15, sec. 21, sec. 20, rules 4, 6, 9, and 10, and secs. 31 and 68. The magistrate took time to consider, and eventually gave a decision in favour of the District Surveyor, observing that the intention of the Act of Parliament was clear, that all such constructions were to be considered as buildings; if not so, they would be entirely exempted, instead of which the Act definitely exempted only a proportion of such buildings. Notice of appeal was given; but upon the recommendation of the magistrate, the chimneys were measured, to ascertain if they were exempted on the score of distance, and the appeal was eventually abandoned.

THE MONTREAL CATHEDRAL CASE.

SIR,—With reference to your article on the cathedral at Montreal in the last number of your paper,—*Ward v. Bethune*—and your comments thereon, I am in a position to give you the actual facts of the case; and I must begin by saying that I not only have no kind of interest in the matter even indirectly, but the plaintiff and all the counsel are strangers to me even by sight.

The old cathedral was burned down, perhaps, sixteen years ago, and plans for a new one got out. The architect for the new one died, and another was appointed,—an Englishman,—who was instructed to carry out the plans of his predecessor. The foundations of the buildings were a separate contract, and as they were completed about the time of the new appointment, tenders were advertised for by the architect from the plinth upwards.

The present cathedral consists of a central spire (of considerable height), rising from the intersection of the transepts with the body of the church; and as the foundations were not calculated for the great extra weight on the nave arches, there was a settlement, and, of course, various parts of the building abutting upon them went down to the extent of some inches, making it unsightly. The contractor was refused the amount sued for in consequence of this, and pleaded that at least his own work was properly done, and the architect had certified it, who was strict in his requirements. So far is not of itself disputed; but the position the cathedral authorities take is this:—"We agreed to pay you for a building to be first-class work. Surely it is not necessary to say there must be no settlements or sinkings. The nature of

any kind of contract supposes this. If we ask a man to use the bottom of a trunk that seems to us sound, and put sides and a top to it; supposing further that when it comes home we find it useless, because the bottom is rotten,—do you think we are going to pay him in full? He ought to have told us; and so you, if you are going to spend 40,000*l.* of money we can never raise again, should look to the foundations you are using; you should have satisfied yourself and us. You are a man of skill; none of us are. Our contract was with you to build,—not an architect. The architect who designed them is no more. You are the man. If the fault had been open and apparent, nobody would have been required to be responsible. Let the cause be what it may we can only pay for complete work." I have no knowledge of law, but perhaps some of your readers can say if this is "common law" or statutory, and as such local in its application.

One thing is clear, that an analogy often relied upon by architects, that they are after all much in the position of other professional men, like lawyers and doctors, does not hold, because a man must die sometimes, and yet a doctor have earned his fee well; and in every case one lawyer must lose. Yet there is no "must" about the stability of a building. M. A.

THE LAMP STANDARDS ON THE THAMES EMBANKMENT.

THE mention made in our last of the lamps recently put up on the Victoria Embankment has brought us some inquiries concerning the dolphin standard which bears them. We have already given some particulars, but will willingly repeat that this standard was designed by Mr. George Villiamy, the superintending architect of the Board, and was put up in the shape of a plaster model some time ago in competition with two others. The plaster model was executed by Mr. Mabey, of Storey's Gate, Westminster, from careful drawings by the designer. From this model another was made in brass, highly finished, from which the standards to the top of the caps, from which the foliated arms extend which carry the copper globular lanterns, were cast and fixed by Messrs. Holbrook, iron-founders, Manor-street, Chelsea (selected in competition with other founders), in 21*l.* each. They are good specimens of iron casting, in very bold relief, the drawbacks, &c., necessary being 500 or 600 in number. The arms and lanterns above the capitals were made and fixed (in competition also) by Mr. Parkes, gas-engineer, London-street, Paddington, at 13*l.* each, fixed complete, and this, with about 1*l.* each extra for some little necessary adjuncts, gives the total cost of each, fixed and ready for lighting, which they will be on the night of the Thanksgiving, as 35*l.*

Mr. Villiamy may be complimented on the production of a very successful work. The same standard will be used on the Albert Embankment.

THE ARK IN THE EAST.

SIR,—Will you allow one who does not make architecture a "profession" to inquire, through the medium of your valuable journal, why the architect of the synagogue for Liverpool has placed the ark at the east end of the building? (See *The Builder*, 6th of January.)

What a great and pleasurable study to some men is the art of construction, the origin of form, and the use of the various parts of a building; they look upon the great buildings of antiquity as a hieroglyphic history of much of the social, heroic, and religious habits of the people of past generations; and it is because the Liverpool architect appears to violate the Jewish custom that I have asked the question as to the ark in the east. One cannot give the "thousand and one" reasons in a letter why the ark should not be at the east end of the synagogue; but one or two may for the present suffice; and, first, the law given to Moses (*Exodus* xxv. 9) appears to be in contradiction to idolatrous worship, and that the Israelites should turn their back upon all false customs of worship. "The seat of the congregation" set up in the wilderness had the only entrance on the east side, and the "tabernacle was reared" on the west "side;" and in the tabernacle to the west stood the ark, and over it the "mercy-seat" above the ark. King David appears to have been the architect of the first temple; for "he

gave to Solomon the pattern" of every part (see *1 Chron.* xxviii. 11, 12); nor was there any alteration as to position, the only entrance to the temple proper being at the east, and the ark at the west end. The ark was removed from the tabernacle to the temple. The Jewish synagogues appear to have numbered about 480 at one time in Jerusalem; but it is not likely that they would have been built contrary to a law which was given, for obvious reasons. The Prophet Ezekiel (viii. 16) speaks of turning and bowing towards the east as the very climax of "abominations;" and Josephus relates the fact of two young men, learned in the Jewish law, breaking down the eagle and other work that Herod the King had set up to beautify the temple. The eagle had direct relation to the same idolatrous customs, and was carried with the armies to battle, perhaps on the same principle that the Crusaders carried the cross.

The first cathedral built in this country appears to have been after the plan of the temple; for we are told, "the Archbishop of Canterbury had erected a cathedral of stone on the model of a Roman basilica. There, in imitation of St. Peter's, the altar was erected, not at the east, but at the west end of the church;" it was the ancient form of the Eastern Church, not yet discarded in the West" (653 A.D.). Perhaps the change did not take place until long after that date. J. C. CURTIS.

SCHOOL BOARDS.

MR. FORSTER, in reply to a question in the House of Commons, said building grants have been promised, since the 1st of August, 1870, to 999 schools, the amount of the grants being 168,131*l.* Of these 918 are denominational schools, whose grants amount to 160,850*l.* There are still 1,901 applications under consideration of these 1,287 have been approved by the office, subject to fulfilment of conditions, and 614 are waiting information from managers; 213 applications have been refused, and 194 have been withdrawn. Of these 999 cases it is quite possible that some of the promised grants may not actually be paid. The average grant to each will be about 168*l.* I think I shall make an outside guess if I say that the grants to meet all applications that have been made since the passing of the Act will amount to about 400,000*l.* This sum will represent 2,400 schools, providing, in rough average, for about 400,000 children. Taking the average of the last four years, the Parliamentary grant has been slightly less than one-fifth of the total cost of a school; so that this 400,000*l.* out of taxes will be met by 1,600,000*l.* private subscriptions, and will make provision for 400,000 children, which, without the grants and private subscriptions, would have cost the rates 2,000,000*l.*

The School Board of London have invited the following architects to send in designs for a public elementary school, to be erected in Johnson-street, Stepney, to accommodate 1,000 children, viz.—Messrs. E. Barry, Saxon Snell, Roger Smith, A. & C. Harston, Jarvis & Son, and A. Newman. The building is to be designed upon the principle of class division, sometimes called the Prussian system.

The Halifax School Board have come to the decision to erect four new schools, at an expense of 15,000*l.*

At the last meeting of the Wolverhampton School Board, a communication from the Central Department agreed with the Board that accommodation in new schools should be provided for 1,500 children; and they pointed out that their inspector in Wolverhampton had recommended that there should be—(1) a school in Green-lane, Dudley-road, for 250 children; (2) between North-wad and Stafford-road, for 350; (3) between Monmore-green and Horsely-fields, for 300; and (4) at Springfields, for 100. The tender of Mr. Clarke for the needed alteration at the late British school, in Walsall-street, was accepted, at 925*l.*

The Liverpool School Board have agreed to erect their first school on the class-room system.

Leeds School Board.—Messrs. Alexander & Henman, of Stockton and Middlesbro' have been appointed architects to the School Board School to be erected by this Board in Burley-road, Leeds.

Middlesbro' School Board.—At their last meeting this Board decided to build their first school from the designs of Mr. Blessley, architect, of Middlesbro', and their second from those of Messrs. Alexander & Henman, architects.

OLD ST. PAUL'S CATHEDRAL.

At the present time, when the subject of the completion of St. Paul's Cathedral is so much discussed, it may not prove uninteresting for us to retrace our thoughts into the past for a few moments, and to muse on the glorious old edifice which preceded Wren's magnificent achievement. I will not call the modern cathedral of London the master's *chef d'œuvre*, for such an assertion may be open to question; though the largest work he ever accomplished, still some of his other City churches have been by many considered more successful. I feel no little hesitation in reverting to so well-known and trite a subject as that of our lost old St. Paul's; but having investigated its history either attentively a year or so back in the course of some studies, I now venture to speak of it.

A little time since the Institute of Architects proposed in their list of subjects for medals and prizes a set of drawings illustrative of the restoration of old St. Paul's Cathedral founded upon Hollar's plates, engraved in Dugdale's *Monasticon*.^{*} No competitors, however, came forward, for those very sufficient reasons,—that the drawings, if made out to the specified scale of 8 feet to the inch, would have been of so gigantic a size as virtually to preclude their completion. The same subject was in the next session again inserted in the programme,—considerably modified, however, *i. e.*, drawings for the restoration of the choir alone being required. Having advanced during the previous year with the designs for the restoration of the whole cathedral, I had been led to study the entire question in all its bearings. In the following notes several of the characteristics that distinguished our beautiful cathedral are touched upon, every care being taken to avoid needless repetition of points that may have been previously discussed.† One of the earliest discoveries made was that of the numerous inaccuracies and discrepancies in Hollar's plates. To take one instance only among many. The arrangement of the various steps indicated in the ground-plan is contradictory. It may be remarked, in passing, that in 1646 (see Timbs's *Curiosities of London*)[‡] a considerable accumulation of rubbish had taken place, so that the entrances of the cathedral were buried, and thus a great loss to the dignity appropriate to such a temple was involved. It is questionable whether the plates show the pitch of the lead-covered roofs correctly; for the latter are so exaggerated in height as to seemingly crush the substructure. Very possibly the ancient inclination had not been preserved, for in 1561 a fire took place, destroying the steeple and the upper roof of the church and aisles. It is singular that no external doors to the cloisters appear. Generally speaking, in old examples there are two or three, or sometimes more, external doors, without counting those leading into the cathedral to which they are attached. The Chapter-house was not small, only 32 ft. 6 in. in internal diameter. In comparison with the spacious Chapter-house at Westminster, it must have appeared diminutive. Had this building been of large dimensions, it would have been difficult to contrive space for it in the middle of a cloister garth. The cloisters must either have been much extended, or otherwise the Chapter-house would have looked cramped and "boxed in." According to the scale marked on Hollar's ground-plan of the cathedral, the internal width of the tower was about 40 ft., a great span for walls but 7 ft. thick. Most of our cathedrals, even with smaller towers, appear to have walls 8 ft., 9 ft., or 10 ft. thick. Very probably these most striking features in Old St. Paul's, the pinnacles and flying buttresses springing from the lower part of the tower, were not portions of the original design, but were added during the progress of the building to strengthen the falling walls. The tower rose to a great height before the base of the spire was reached, and as most likely it was treated as a lantern, the internal effect must have been exquisite. The Consistory Court, as it appears in Hollar's plan, may, perhaps, be in its primary position, but I cannot find any Mediaeval examples in a similar situation, *i. e.*, placed in such way as to block up a portion of one of the nave aisles.‡ In

Billings's "History of Durham Cathedral," page 34, it is mentioned that the Consistory Court occupied a space under the crossing over the tomb of Bishop Langley (A.D. 1106-1437). This is almost the only case in which the position of this court is mentioned at all, as far as I know. It was unusual in cathedral plans to see large central doors to the transepts (Ickfield), however, being an example to the contrary, but no doubt, in an immense city such as London, it was desirable to have means of exit in these positions in addition to the western entrances. The Rev. Mackenzie E. C. Walcott, in his "Church and Conventual Arrangement," says that porches were frequently built on the town side of the cathedral, as at Salisbury, Wells, Hereford, &c. Referring to Hollar's illustrations, the piers in the western part of the choir have indications of being portions of the original Norman church, which might have been afterwards "cased" in the Early English period. The easternmost bay was probably wider than the others,—a somewhat unusual occurrence, the more general plan being to make the end bays narrower than the remaining ones. In none of the plates are there any appearances of a wall-passage, a truly remarkable fact in so magnificent a church. Far more probably, however, owing to the loose manner in which Hollar's views were engraved, it was not thought worth while to show them. The list of the general dimensions given in page 17 of Dugdale's *Monograph* does not seem accurate. For instance, the total length of the cathedral there specified (630 ft.) cannot refer to the *building*, but probably supplies the length of the *churchyard*. The scale on the ground-plan makes out the length of the cathedral from east to west, inclusive of walls, about 603 ft.

The situation of the chapels or chantries between the external buttresses of the choir is rather unusual, but nearly similar examples exist in connexion with the choir of Exeter Cathedral, and at St. Alban's Abbey. The treasury, with some show of probability, might have occupied such a position as this. Probably many of your readers have examined the quaint old painting in the possession of the Society of Antiquaries, representing an external view of old St. Paul's. This picture was executed in the reign of James I., and at a date consequently anterior to the publication of Hollar's plates in 1646. Turret-like pinnacles crown the apex of the gables to the east front and south transept; they would appear to form part of the original design, and did not exist when Dugdale's book was brought out. Such features are not very common, but we have instances in the south transept at York Cathedral, and the north transept, Westminster Abbey. The wide bay in the choir probably marks the junction between the earlier portion, commenced in 1222, and the easternmost bays soon afterwards added. It may have been treated (in the manner of design) as "intermediate;" that is, partly following the details of the older work, and likewise being executed in character with the new. In fact, the treatment may have been similar to that adopted at Westminster Abbey. "I think the older part may have included one bay of the great arcade and aisle, or, to say the least, some of its details were continued in that bay."^{*}

We do not find anywhere in Dugdale's work the position of the ancient scerity described; it does not appear that it formed an external structural feature in the building. Is it possible that the undercroft of the Chapter-house was used for the purpose? It is much to be regretted that no really accurate geometrical drawings of this fine cathedral exist. Yet with respect to the western front, Inigo Jones has, I believe, published elevations in his works. I might go on to expatiate upon the many striking features of old St. Paul's; its nave and choir, each with twelve bays; its noble transepts, which were unusually long; and its lofty tower, surmounted by the leaden spire. The writer of every popular article, however, upon Mediaeval London, has invariably, of course, alluded to this subject, and dilated upon its beauties and characteristics. May London ere long be able to boast of a complete Renaissance St. Paul's, a worthy successor to that edifice now gone for ever from among us.

EDMUND B. FERREY.

Court, in St. Paul's Cathedral, has been arranged as a morning chapel. The Holy Communion was celebrated in it for the first time on Thursday morning, on the occasion of the Bishop of London's ordination.—*The Rock*, quoted in the *Times*, December 27, 1871.
* Gleasons from Westminster Abbey (G. G. Scott, R.A.).

PRESBYTERIAN CHAPEL AND SCHOOL, BRECON.

The style adopted is Early Decorated. The walls are built with native stone rubble, and Bath stone is used for the dressings. The spire is 85 ft. in extreme height above the road level. The tower contains, in a semi-octagonal projection at the side, the staircase to a gallery across the front end of the chapel. The two front entrances are connected internally by a corridor, separated from the body of the chapel by a glazed screen, with doors in it, opening into the chapel. The chapel is 33 ft. wide and 58 ft. long in the clear, with an apse at the back. The pulpit is on a platform in front of the apse-arch. The accommodation, including the gallery, is for about 400 persons. The ceiling is arched in outline, the apex being 10 ft. below the ridge of the roof. Deal ribs divide the ceiling into panels, and these, as well as certain parts of the walls, are ornamented by chocolate-coloured distemper work. In the rear of the chapel is a school-room, 22 ft. by 39 ft., as well as a class-room and vestry, for the use of the minister. The woodwork throughout is stained and varnished. The cost of the chapel and school, including heating, lighting, and fencing, was 2,186 l. The architect was Mr. W. F. Poulton.

THE CLERKENWELL AND SMITHFIELD BRANCH OF THE LONDON JOINT-STOCK BANK.

The building forming the subject of the accompanying illustration stands on an irregularly-shaped plot of ground at the corner of Saint John-street and Charterhouse-lane, having a frontage of 68 ft. to Saint John-street and 53 ft. to Charterhouse-lane.

The principal entrance to the bank is at the splayed angle between the two streets, and has a grey granite architrave round the doorway, flanked by two polished Aberdeen granite columns, surmounted on the first and second floors by oriel windows, and terminating above the main cornice with a segmental pediment.

Above this rises an effectively grouped composition, comprising a chimney-stack ornamented with swags of flowers falling over a recessed panel, in which is carved the date of the erection.

The elevations are Italian in style, the ground-floor order being Doric, surmounted by three ranges of grouped windows. The building is rusticated at the angles, and over the third-floor windows runs an enriched frieze; above which a bracketed cornice finishes the whole composition. The facades are executed throughout in Portland stone.

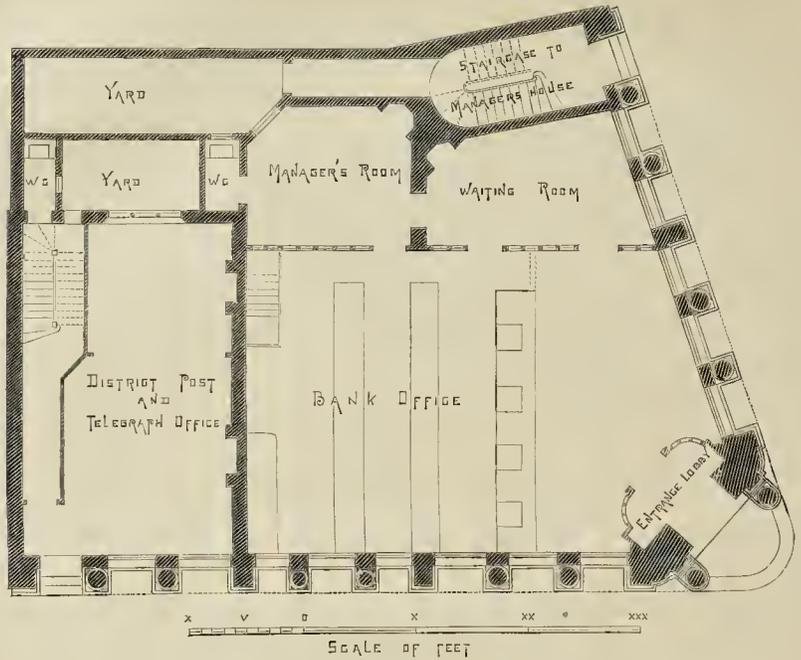

Internally the basement contains the necessary lavatories, closets, and other accommodation for the clerks, a messenger's room, three strong-rooms, and a fireproof safe for books and papers. The ground-floor is divided into two portions, the larger containing the bank office (11 ft. by 27 ft.), with manager's room, waiting-room, and private entrance to the residence above; the smaller portion, with entrance in St. John-street, is sublet as a District Post and Telegraph Office. On the first floor are the manager's dining and drawing rooms, with the usual domestic offices, and the second and third floors are occupied as bed-rooms.

Messrs. Brown & Robinson were the contractors, the total cost being about 12,000 l. The subsidiary trades were distributed as follows:—The iron girders and rolled-iron joists were supplied by Messrs. M. T. Shaw & Co.; the fireproof flooring was executed by Messrs. Dennott & Co.; and the carving was entrusted to Messrs. Bell & Almond; and Messrs. Mannelle supplied the polished granite. The sanitary appliances were manufactured by Mr. George Jennings; the strong-room doors and iron safes by Messrs. Leadbeater & Co.; and the gas-fittings by Mr. Hugh Mather.

The whole of the works have been executed from the designs and under the superintendance of Mr. Lewis H. Isaacs, architect, of Vernal-hill-buildings, Gray's-inn. Mr. Tracey was the architect's clerk of the works, and Mr. Cornish represented the contractors.

Rochester Cathedral.—It is proposed to supplement the work of restoration at the Cathedral, undertaken by the Dean and Chapter from funds at their disposal, by filling the new windows at the east end of the choir with stained glass, the funds to be raised by subscription.

* All the remarks here referring to Hollar's plates point to Dugdale's *Monograph* on old St. Paul's.
† I contributed a short article on old St. Paul's to the *Builder* (vol. xxvi, p. 165), to which I would refer those interested in this matter for further particulars.
‡ The Consistory Court in the modern St. Paul's, till very lately, occupied a similar position to that in the Mediaeval Cathedral. † What was formerly the Consistory

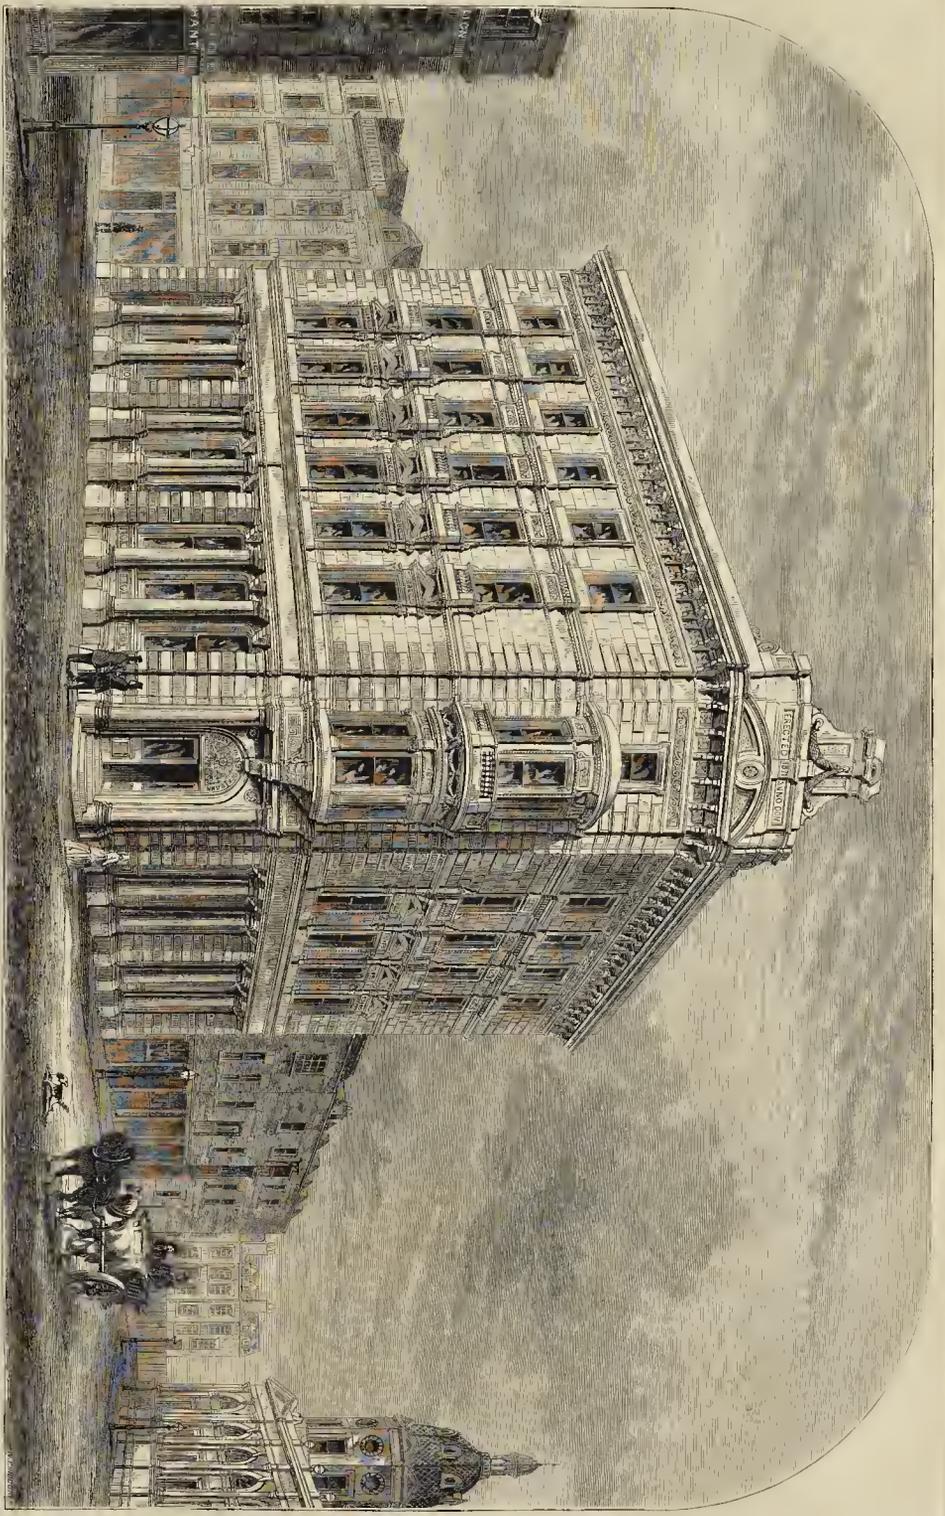

THE CLERKENWELL AND SMITHFIELD BRANCH OF THE LONDON JOINT STOCK BANK.

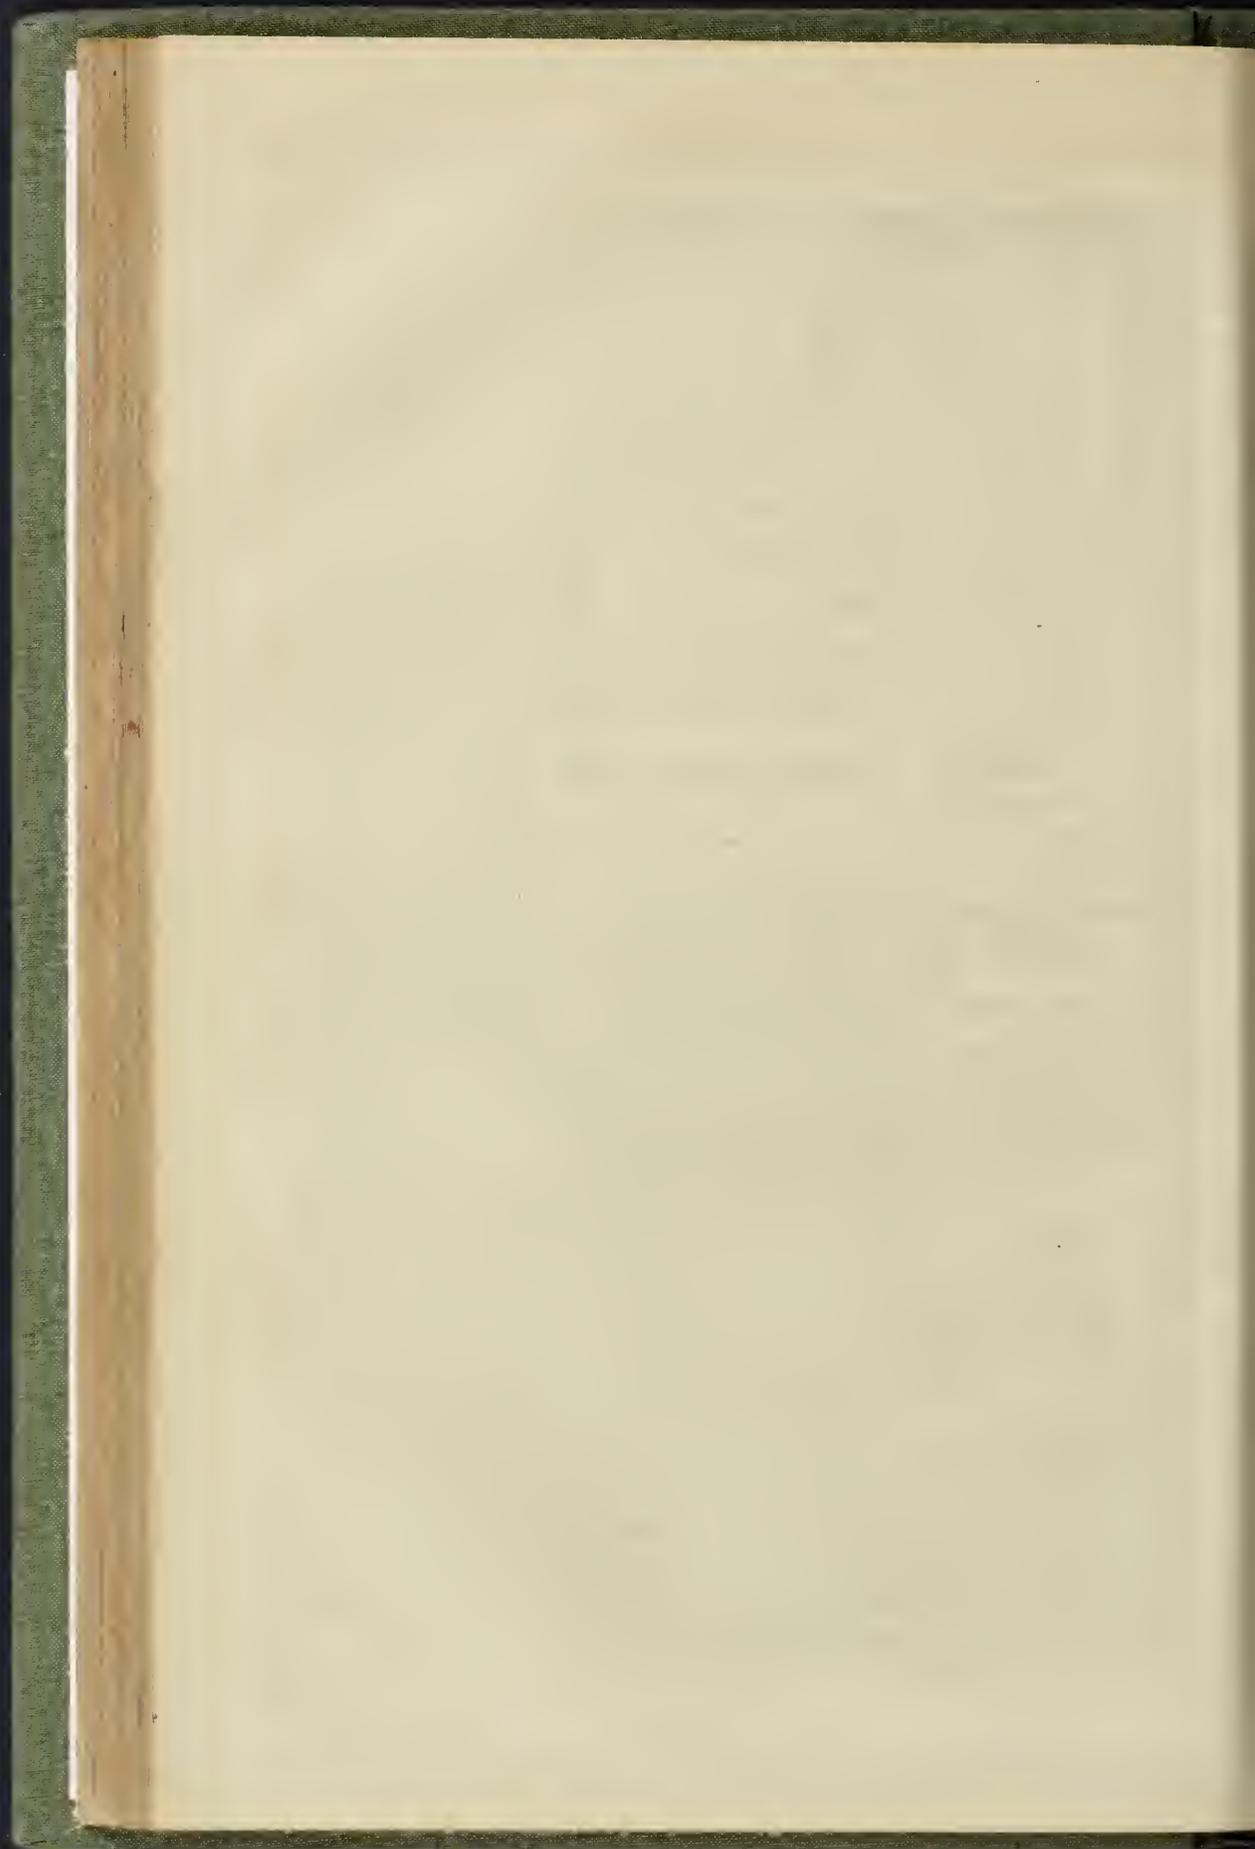

Plan of Ground Floor.

PRESBYTERIAN CHAPEL AND SCHOOL, BRECON.—MR. W. F. POULTON, ARCHITECT.

THE OLD BANK AND SMITHFIELD BRANCH OF THE LONDON JOINT STOCK BANK.—MR. LEWIS H. ISAACS, ARCHITECT.

FORM FOR "CONDITIONS" OF BUILDERS' CONTRACT.

AFTER long consideration and numerous revisions the following Conditions of Contract, on the basis of Headings sanctioned by the Royal Institute of British Architects, have been prepared by the London Builders' Society:-

1. The contractors are to provide everything of every kind necessary and requisite for the due and proper execution of the several works included in the contract according to the true intent and meaning of the drawings and specification taken together, which are to be signed by the architect and the contractors, whether the same may or may not be particularly described in the specification or shown on the drawings, provided that the same are accurate and obviously to be inferred therefrom, and in case of any discrepancy between the drawings and the specification the architect is to decide which shall be followed.

2. The contractors are to conform in all respects to the provisions and regulations of the Metropolis Local Management Act and the Metropolis Buildings Act, and to the regulations and bye-laws of the Metropolitan Board of Works and of the local authorities, and they are to give all notices required by the said Acts to be given to any local authorities, and to pay all fees payable under any of the said Acts to any such authorities or to any public officer.

3. The contractors are to set out the whole of the works, and during the progress of the works to amend on the requisition of the architect any errors which may arise, and to provide to provide the necessary appliances or furnish the necessary vouchers to prove that the several materials are such as are described. The contractors are to provide the quantity of the architect, to which materials and workmanship being the best of their respective kinds; and the contractors are to leave the works in such respects clean and perfect at the completion thereof.

4. Complete copies of the drawings and specification signed by the architect are to be furnished by him or by his clerk to the architect and the contractors for their own use, and the same or copies thereof are to be kept on the buildings in charge of a competent foreman, who is to be constantly kept on the ground by the contractors, and to whom the architect is to give by his certificate. The contractors are not to entitle the works or any part thereof without the consent in writing of the architect.

5. The architect is to have at all times access to the works, which are to be entirely under his control. He may require the contractors to dismiss any person in the contractor's employ upon the works, who may be incompetent or misconduct himself, and the contractors are forthwith to comply with such requirement.

6. The contractors are not to vary or deviate from the drawings or specification, or execute any extra work of any kind, unless ordered in writing by the architect, and to comply with any of the provisions of any of the Acts of Parliament, regulations, or bye-laws herebefore mentioned, or unless ordered in writing by the architect, and to be sufficiently shown by any order in writing, or by any plan or drawing expressly given and signed or initialed by him, as an extra or variation, or by any subsequent written approval signed or initialed by him. In cases of day work, all vouchers for the same are to be delivered to the architect or clerk of the works at latest during the week following that in which the work may have been done; and only in cases of day work, or in cases of such as may have been authorized by the architect to be so done, unless the work cannot from its character be properly measured and valued.

7. Any authority given by the architect for any alteration or addition in or to the works is not to vitiate the contract, but all additions, omissions, or variations, made in or to the works, shall be at a price not to have been previously agreed upon, are to be measured and valued, and certified for by the architect, and added to or deducted from the amount of the contract as the case may require, and in any process of amendment, or where the same may not apply, at fair measure and value.

8. All work and materials brought and left upon the ground by the contractors or by their order, for the purpose of the works, are to be at the disposal of the contractor as the property of the employer, when payment shall have been made of the amount of any certificate in which the value thereof shall be included, and in such case the same are not to be removed or taken away by the contractors or any other person without the special licence and consent of the architect; but the employer is not to be in any way answerable for any loss or damage which may happen to or in respect of any such work or materials either by the same being lost or stolen, or injured by weather or otherwise.

9. The architect is to have full power to require the removal from the premises of all materials which in his opinion are not in accordance with the specification, and in case of default the employer is to be at liberty to employ other persons to remove the same without being answerable or accountable for any loss or damage that may arise or happen to such materials; and the architect is also to be at liberty to require the removal of any materials not to be substituted; and in case of default the employer may attend such removal and substitution are to be borne by the contractors.

10. Should any of the works be, in the opinion of the architect, executed with improper materials or defective workmanship, the contractors are, when required by the architect during the progress of the work, forthwith to re-execute the same, and to substitute proper materials and workmanship; and in case of default of the contractors, the employer may employ other persons to re-execute the work, and the cost thereof is to be borne by the contractors.

11. Any defects, shrinkage, and other faults which may appear within months from the completion of the building, and arising out of defective or improper materials or workmanship, are, upon the direction of the architect, to be amended and made good by the contractors at their own cost, unless the architect shall decide that they ought to be paid for the same; and, in case of default, the employer may employ other persons to re-execute the work, and the cost thereof is to be borne by the contractors.

12. The contractors are to insure the building against loss or damage by fire, in an office to be approved, in the event of the contractor's neglect, or in any other way, the value of the works executed, until it shall be covered in,

and thenceforth until completion in three-fourths of the amount of such value, and are, upon request, to produce to the architect the policies and the receipts for the premiums for such insurance. All moneys received under any policy for loss or damage by fire, or towards the rebuilding or reparation of the works destroyed or injured. In case of neglect the employer is to be at liberty to insure and deduct the amount of the premiums paid from any moneys for injuries to persons or for structural damage to property.

13. The building, from the commencement of the works to the completion of the same, is to be under the contractors' charge; they are to be held responsible for, and are to make good all injuries, damages, and repairs occasioned or rendered necessary to the same, by fire or by causes over which the contractors shall have control, and they are to hold the employer harmless from any claims for injuries to persons or for structural damage to property happening from any neglect, default, want of proper care, or misconduct on the part of the contractors or of any one in their employ during the execution of the works.

14. The employer is at all times to have free access to the works, and is to have full power to send workmen upon the premises to execute fittings and other works not included in the contract, for whose operations the contractors are to afford every reasonable facility during ordinary working hours, provided that such operations shall be carried on in such a manner as not to impede the progress of the works included in the contract; but the contractors are not to be responsible for any damage which may happen to or be occasioned by any such fittings or other works.

15. The contractors are to complete the whole of the works (except painting and papering, or such other works as the architect may desire to delay), within calendar months after the commencement of the same, unless the works be delayed by reason of an inclement weather, or causes not under the contractors' control, or in case of combination of workmen, or strikes, or lock-out, or other causes of labour, or matters of which the allowance shall be made by the architect, and then the contractors are to complete the works within such time as the architect shall consider to be reasonable, and shall from time to time in writing advise and in case of default, the contractors are to pay or allow to the employer as and by way of liquidated and agreed damages, the sum of £ per week for every week during which they shall be so in default, until the completion of the works (except as aforesaid) shall be so completed, provided the architect shall in writing certify that the works could have been reasonably completed within the time appointed.

16. If the contractors shall become bankrupt, or compound with or make any assignment for the benefit of their creditors, or shall suspend or delay the performance of their part of the contract (except on account of causes mentioned in clause 15, or on account of being restrained or hindered under any proceedings taken by parties interested in any neighbouring property, or in consequence of not having proper instructions for which the contractors shall have duly applied), the employer, by the architect, may give to the contractors or their assignee or trustee, as the case may be, notice requiring the works to be proceeded with, and in case of default on the part of the contractors or their assignee or trustee for a period of days, it shall be lawful for the employer, by the architect, to enter upon and take possession of the works, and to employ any other person or persons to carry on and complete the same, and to authorise him or them to use the plant, materials, and property of the contractors upon the works, and to make such changes therein as may be necessary for carrying on and completing the said works are to be paid to the employer by the contractors, or may be set off by the employer against any money due, or to become due to the contractors.

17. When the value of the works executed and not included in any former certificate shall from time to time amount to the sum of £ , or otherwise, at the architect's reasonable discretion, the contractors are to be entitled to receive payment at the rate of 80 per cent. upon such value until the difference between the per centage and the value of the works done shall amount to per cent. upon the amount of the contract, after which time the contractors are to be entitled to receive payment of the full value of all works executed and not included in any former certificate, and the architect is to give to the contractors certificates accordingly, and when the works shall be completed, or possession of the building shall be given up to the employer, the contractors are to be entitled to receive the balance of the amount remaining due, according to the best estimate of the same that can then be made, and the architect is to give to the contractors certificates accordingly, and the contractors are to be entitled to receive the balances of all moneys due or payable to them under or by virtue of the contract within months from the completion of the works, or from the date of giving up possession thereof to the employer, whichever shall first happen. The contractors are to be entitled to receive any sum reserved for painting and papering or otherwise, on the completion thereof. Provided always that no final or other certificate is to cover or relieve the contractors from their liability under the provisions of clause No. 11, whether or not the same be notified by the architect at the time or subsequently to granting any such certificate.

18. A certificate of the architect, or an award of the referee hereinafter referred to, as the case may be, showing the final balance due to the contractor, shall not be conclusive evidence of the works having been duly completed, and that the contractors are entitled to receive payment of the final balance, but without prejudice to the liability of the contractors under the provisions of clause No. 11.

19. If the employer shall make default in paying any moneys to which the contractors may become entitled, for days after the amount thereof shall have been certified, or if the works be delayed for months by or under any proceedings taken by any other parties, the contractors are to be at liberty to suspend the works, and to require payment for all works executed, and all materials wrought up, and for any loss which they may sustain upon any goods or materials purchased for the works, and in such case the contractors are not to be bound to proceed further with the works contracted for. The contractors are to be entitled to such interest and at such rate as the architect shall certify upon all moneys payable to the contractors, payment of which may have been unduly delayed.

20. Provided always that in case any question, dispute, or difference shall arise between the employer, or the architect on his behalf, and the contractors as to what amounts, if any, ought in fairness to be made to the amount of the contract by reason of the works being delayed through no fault of the contractors, or by reason of, or on account of any directions or requisitions of the

architect, involving increased cost to the contractors beyond the cost properly attending the carrying out of the contract according to the true intent and meaning of the signed drawings and specification, or as to the works having been duly completed, or as to the construction of these presents, or as to any other matter or thing arising under or out of this contract except as to matters left during the progress of the works to the sole decision or requisition of the architect under clauses Nos. 1, 3, and 10, or in case the contractors shall be dissatisfied with any certificate of the architect under clause No. 7, or under the proviso in clause No. 15, or in case he shall withhold or not give any certificate to which they may be entitled, then such question, dispute, or difference, or such certificate, or the value or matter which should be certified, as the case may be, is to be from time to time referred to the arbitration and final decision of the architect, or in the event of his death or unwillingness to act, then of his death or unwillingness to act, then of an architect being a Fellow of the Royal Institute of British Architects, to be appointed on the request of either party by the President for the time being of such Institute, and the award of such referee is to be equivalent to a certificate of the architect, and the contractors are to be paid accordingly.

LEAKY SEWERS.

Sir,—Will any of your readers kindly afford me information on the following case? A barrel sewer, 2 ft. internal diameter, has been constructed of brickwork, 4½ in. in thickness, set in Portland cement, the top of the arch being from 1 ft. to 2 ft. below the general level of the ground. No connexions of any kind have been made, the end of the sewer being closed. Upon testing it, however, the sewer was found to leak to the extent of about 110 gallons per chain per twenty-four hours, the soil through which it is carried being rather damp.

I should be obliged for any information from practical experience as to whether this amount of percolation is excessive; and if so, about what would be a fair allowance for normal leakage. B. A.

ENLARGEMENT OF CUMBERLAND INFIRMARY.

It has been resolved by the governors of the Cumberland Infirmary to enlarge it. The intended additions and alterations consist generally of the re-arrangement of the present buildings, with such modifications as will adapt it to the requirements of medical science, the removal of the dispensary from the centre of the building, and so separating the in-door and out-door patients, and the increase of the total accommodation, by means of new wards, from 72 to 100 beds. The cost of the new buildings is estimated at 7,000l. Messrs. Cory & Ferguson are the architects employed. A committee has been authorised to carry out the plans, subject to any subordinate alterations which appear necessary to them in the progress of the work. The committee at the same time are requested to renew their efforts, in order to raise the further sum which shall be found necessary for the completion of the work.

THE RATING OF THE ALBERT HALL.

At the Court of General Assessment Sessions, held at the Guildhall, Westminster, Sir W. H. Bodkin, presiding, the corporation of the Hall of Arts and Sciences, Kensington-gore, appealed against the assessment committee of St. George's Hanover-square Union, in respect of the rating of the Albert Hall. From the statement of Mr. Poland it appeared that the parish of St. George's, Hanover-square, had set down the gross annual value of the Albert Hall at 12,000l., and the net rental at 10,000l., upon which they proposed to charge a rate of 8s. 4d. in the pound. Mr. Poland said that the expenditure of the corporation exceeded the receipts, and that under the terms by which the corporation were limited in their charter, they never could make it a profitable speculation. He called Mr. Cole, the secretary, who stated that although some of the boxes on the first tier were worth 1,000l. each, they became the property of the holders of them for all time, and they had the right to use them whenever the hall was open to the public. There were 800 seats reserved for the Commissioners of the Exhibition of 1851, who had contributed 80,000l. towards the expenses of the hall. There were about 3,000 left for the use of the public. There were about twenty musical entertainments in nine months, exclusive of competitions by organists. As a rule members did not let their

* The Council of the R.I.B.A. require that this blank should be filled in with the name of a Fellow of the Institute.

seats, for they were very frequently empty. The number of persons present at the entertainments varied from 3,000 to 10,000. At the close of the case, the chairman said the Bench were impressed with the belief that nothing had been shown to justify the high value set upon the place by the parish, and reduced the gross annual value from 12,000*l.* to 1,500*l.*, and the rateable value to 1,250*l.*, with costs.

FORESTERS' HALL, WILDENESS ROW.

SIR,—Referring to your article in last week's issue, under the above heading, the last clause of which runs as follows:—"The foundation-stone, which bears the name of the builders, Messrs. Henshaw & Co., does not indicate that any architect was employed," &c.,—we beg to inform you that the original architect of the building was Mr. W. L. Gomme; but, by some arrangement unknown to us, Messrs. George Lansdown & Pollard were appointed by the committee to superintend the execution of the works.

W. HENSHAW.

THE PROPOSED NATURAL HISTORY MUSEUM AT SOUTH KENSINGTON.

In the House of Commons, on Monday night, Lord Elcho asked the First Lord of the Treasury whether a vote of 30,000*l.* on account having been taken at the close of last session for the erection of a Natural History Museum at South Kensington, according to a design by Mr. Waterhouse, he would, before proceeding with the work, cause the design to be exhibited alongside of the three designs which were selected, after public competition by the Commission appointed by the Treasury in 1864, to award the prizes for the best designs for a new Natural History Museum. And whether, as these designs were submitted to the public in the Victoria Gallery, while the design of Mr. Waterhouse had not been obtained by any public competition, and had only been seen by a few members of the House of Commons, where it was exhibited in the Library at the flag end of the session, he would choose some more public place for the exhibition of the designs.

Mr. Gladstone replied that the matter had advanced beyond the stage at which it would be possible to do what his noble friend wished. The House of Commons had passed the Bill, and 30,000*l.* had been given towards the actual erection of the building in reference to a particular design; and it was the duty of his right hon. friend the First Commissioner of Works to proceed in due course to give effect to the intention of Parliament. For that purpose all the specifications had been drawn and tenders invited for the contracts.

SANITARY EDUCATION.

The people of this country are not well informed as regards sanitary matters,—poor-law relief, &c. Could not the Post-office be made a means of distribution through the length and breadth of the land of short, pithy papers on these subjects, written in the form of tracts,—no official look about them, but simply well-printed, neat bills? They might be sent by millions, to every house, at a little expense. Acts of Parliament, if seen, are seldom read. Many people seldom see a newspaper; and if anything on sanitary matters were in it, it would not be read; but attention would be fixed on such papers as I have described, if sent to people's houses.

Educate the people on these matters: the results would be good. Tell them that filth and bad drains mean fever and small-pox; cleanliness and thrift are the way to independence.

CONSTANT READER.

MICKLEHAM, NEAR DORKING.

The chancel of the parish church, restored by the munificence of Mr. W. M. Praed, the lord of the manor, with an organ-chamber added at the cost of the parishioners, was re-opened on Saturday, February 17th, with an afternoon service. There was a large attendance of the neighbouring clergy, and others, the friends of the rector, the Rev. W. H. Hanks, who met the Bishop at the rectory. "The Church's One Foundation," No. 320 of Hymns Ancient and Modern, was sung as the procession entered the church. The

Bishop of Winchester preached an impressive and appropriate sermon, from Rev. ii. 12, in which he expressed the strong hope that the restoration of the chancel would be soon followed by the rebuilding of the nave in a style corresponding thereto. He spoke in a well-deserved strain of condemnation of the sham arches of wood and plaster, of the inconvenient galleries, and the wretched accommodation for the poor, and urged that no remedy of an effectual kind, short of rebuilding the fabric, could be attained; and, looking at the wealth of the parish, this end ought easily to be secured.

The chancel is in keeping with the Norman character of the church, having a large arch of oolitic stone. A stone screen traverses the upper opening of the organ-chamber. A reredos in alabaster and marble, and a light communion-rail in oak, decorate the east end; and memorial windows, by Clayton & Bell, have been added by relatives of deceased parishioners.

The whole work has been carried out from the designs of Mr. Joseph Peacock, by Goddard & Son, of Farnham, the contractors.

The only part of the church supposed to be of genuine antiquity is the tower, which could probably be retained, under a new design, for the body of the church.

DAMP WALLS.

HAVING nearly completed the construction of a house on the banks of the Dork, a few miles from Dartmoor (where wind and rain are copiously supplied), I was advised by local residents before commencing to give my attention to the construction of the inner and outer walls, in order to resist the action of the weather, and, as they term it, the perspiration of the stone. Acting on their advice, I constructed the outer walls of 18-in. rubble limestone, from a neighbouring quarry, and mortar made with the lime burnt from the same stone, casing them inside with 4½-in. Bridgwater bricks, leaving a cavity of 2 in. between, and bonding the casing to the main wall occasionally with headers.

The whole of the inner walls and partitions I constructed entirely of bricks, thereby preventing the dampness so complained of, arising out of stone when fires, &c., are in use.

The entire surface externally is coated with Cleavers & Mist's Portland cement (properly gauged), which was completed in the fall of last year; and from that period up to the present there has not been the slightest appearance of dampness.

While constructing the house I also gave my best attention to the construction of the joiners' work. The window-frames are solid, with sashes hung.

I had taken such precautions as were laid down in an article on windows, appearing in the columns of the *Builder*, October 7th, 1871; but in this instance, under its present arrangement, I have failed. Can any of your correspondents, used to building in exposed situations, assist me?

BERRY POLKOV.

SIR,—The evil complained of by your correspondent "Devonian" is, indeed, a serious one, but I think it is remediable.

In the first place, he is in error in lining his walls with rubble slate: its utter non-absorbency and its natural coldness cause it to condense the water out of the contiguous saturated air. Internal damp walls commonly arise from this cause, as the quantity of water in suspension in the atmosphere increases with its temperature: thus a cubic foot of air at 70° will hold a given amount of moisture greatly in excess of air at say 50°; but if that air at 70° impinge upon a surface of say 50°, the air will deposit upon that surface an amount of moisture equivalent to the different points of saturation.

The course I should propose in new buildings, is to build the outer walls of rubble, say 10 in. or 12 in. thick, according to local custom, and leaving a clear air space of say 3 in.; build the inner walls of good absorbent brick, bonding the two together with iron bond 9 in. long, two bonding-irons to each superficial yard of wall, canked at the ends, and bent down in the middle to drip off any moisture that may find its way to the cavities.

The cavities should be kept clear from mortar-droppings during the execution of the work, and air-bricks left top and bottom for ventilation, and means of drainage provided. The wet can never drive through such a wall, and there are no means of conduction except the window-cills,

and these should be of non-absorbent stone, and the windows should have backs and eilows, and plenty of ventilation behind them.

I should recommend "Devonian" to weather-slate the outside of his house (it can be made ornamental), and to batten the inside, leaving a 2-inch clear cavity from bottom to top, &c., below the lowest floor to the cavity of roof, with plenty of air to it. The wet will then be prevented from entering the solid wall from the outside, and the saturated internal air from being condensed by contact with the cold slate lining.

THOMAS CHARLES SORBY.

SIR,—Can any of your correspondents give a cure for ground-damp? I have cut a drain 12 ft. deep, and laid drain-pipes 2 ft. below the cellar, 2 ft. apart; but it does no good. I know the almost impossibility of effecting a cure, but thought it possible that some of your readers may have applied themselves to the task; and, if not found a cure, have found some means of mitigating the evil, and should be obliged if they would say a word.

A. B.

SIR,—In the case where rain drives through the walls of a house already built, the most effectual remedy is to protect it with verandahs on the ground floor, and to case the walls above with roof tiling or slating. Painting or coating with soap and alum washes may be sufficient in some cases, and Portland cement facing in others; but none of these are so permanent or efficient.

A. J. B.

THE PROPOSED CHANNEL TUNNEL.

SIR,—I have read with great interest your remarks upon the proposed Channel tunnel, printed in the *Builder* of the 27th ult., and most thoroughly agree with your opinion, that the work would be of the greatest difficulty and expense, even if not impossible; and I submit that the experience I am about to describe to you quite hours you out in your opinion.

I have during the past three years been engaged as engineer in carrying out a system of deep intercepting sewers for the city of Norwich, which, from the quantity of water met with, have cost 110,000*l.* The city stands on a subsoil of sand and gravel resting upon the upper chalk, which in parts comes to the surface, and the low level sewers, which are about four miles in length, are all from 5 ft. to 19 ft. below the water level, were nearly all executed by tunnelling, frequently 50 ft., 60 ft., and even 80 ft., below the surface of the ground, and were chiefly excavated in the chalk, although between 2,000 ft. and 3,000 ft. of running sands were met with in some portions of the work. You mention that at Dover, which is close to the sea, water is found in wells at the sea level: now, the ordinary level of the rivers Yare and Wensum is only about 2 ft. 6 in. above the mean level of the sea at Liverpool (Ordnance datum), and Norwich is about twenty miles from the sea, yet in sinking our shafts in any parts of the works we always met with water at about the level of the river, the soil beneath this level being quite saturated.

To enable us to work we were obliged to employ a large amount of steam power, for the chief part of the time thirteen engines and pumps being at work day and night, and from seventeen to twenty millions of gallons of water being pumped up in every twenty-four hours. By continued pumping the water level for a radius of about three miles round the city was lowered several feet, varying with the distance, those wells nearest the works being, of course, dried to a greater depth and sooner than those at a distance. The chalk here, being the upper chalk, has continuous beds of flints at intervals of about 4 ft. or 5 ft., and the chief runs of water were found to be along these beds, the re-deposited chalk, here known as "chalk-marl," was partly encountered and was much less porous. The proposed Channel tunnel being entirely under the sea, and in the upper chalk covered by many fathoms of water, and, doubtless, saturated, it is difficult to understand how it will be possible to carry on the work unless it is executed in short lengths and at once lined with cast-iron segment plates. No masonry could be built, as it is clearly impossible to lower the water level in a porous soil, beneath the sea, and the percolation of the water would be so free and strong that any cement would be washed away before it could set. Even in our works this was clearly shown. When, through any accident

o the machinery, if the bricklayers were at work, he portions they were employed upon were aimed, and although every possible care was taken to make the work water-tight, many leaky laces have occurred, and it is found to be extremely difficult to stop these, even under a head of water of less than 20 ft.; how much more difficult would it be under a pressure of as many fathoms?

Bearing in mind the difficulties and anxieties experienced in the works now mentioned, and which were under my own observation, I feel called upon to give you this information to strengthen the opinion you have expressed.

The risk to life would also be terrible. In our case, if a pump stopped through accident the water rose so fast that, in many places, if working only a few hundred feet from a shaft, all had to run for their lives. What chance, therefore, would men have at even one mile from a shaft, to say nothing of eleven miles? There is nothing so troublesome to deal with as water, as all those who are in the habit of so doing know to their cost.

ALFRED W. MORANT.

A NOBLE OFFER.

THE people of Aspatiria, in Cumberland, want a new Market-hall and Assembly-room; and at a public meeting, held on the 17th instant, to receive the report of a committee on the subject, it was unanimously—nay we not add, magnanimously—resolved that the sum of two guineas should be offered as a premium for the best plan of a building, embodying the principles laid down by the committee. We sincerely hope the proposition will meet with the response it deserves.

A PARK FOR BIRMINGHAM.

At the quarterly meeting of the Birmingham Town Council, on Tuesday, the Mayor read a communication from Mr. Alderman Ryland, containing a proposal from his relation Miss Ryland, of Barford-hill, Wandsworth, to present to the town a piece of land for the purposes of a public park. The land consists of about 54 acres, about two miles from the town-hall. In the event of the acceptance of her offer, Miss Ryland is prepared to lay out the land in an ornamental manner, at an expense of about 5,000l. The proposal was accepted with warm expressions of gratitude.

THE TRADES MOVEMENT.

Oxford.—A meeting of the master builders in this city has been held, to consider the demands of the men in their employ to have their hours of labour reduced from fifty-eight hours and a half to fifty-four hours per week. After some discussion it was agreed that they would concede two hours per week to the men, requesting them to work ten hours per day the first five days, and allowing them to leave work on Saturdays at one o'clock. This decision has since been communicated to the men, who held a meeting, and resolved not to accept the proposal. Should the builders refuse to comply with the request of the men, a strike is intended to take place on the 1st of March.

Shields.—The joiners and house carpenters of North Shields have come out on strike. They asked for 28s. per week, instead of 26s., and to work fifty hours per week. They have nearly come to terms. The masters conceded the time and advance in wages; but they wanted the change to take place in May instead of March.

Sunderland.—A meeting of the bricklayers, masons, and plasterers of Sunderland has been held, when it was decided to demand fifty-four hours and 38s. per week, notices to be given at once, and expire on Monday, the 4th of March.

Dundee.—A meeting of about 300 sawmill workers in Dundee has been held, to consider the advisability of adopting a fifty-one hours' limit. Mr. William Stewart was called to the chair, and a resolution was passed to the effect that fifty-one hours should be a week's work, the change to commence on the 1st of April. It was also agreed to demand that wages should be paid weekly, instead of fortnightly, as at present; that all overtime should be paid at the rate of "time and quarter" for the first two hours, and "time and half" afterwards.

York.—A strike has taken place in York, possessing the new feature that it was a strike of one class of employes against another, and not between them and their masters. At the railway

Plant Works, a class of workmen called "strikers," engaged and paid by the smiths, had struck against the latter on a demand to be paid 8s. in the pound instead of by the day, and ultimately the smiths, who, by the absence of the "strikers," were thrown out of employment, were compelled to succumb, and grant the requirements made of them. Following their example, the "strikers" at the Phoenix Ironworks at York have made the like demand of the smiths employed at that place, and the two bodies have stood out against each other. Between the two stools the masters come to the ground.

CROWDED OUT.

Now, while Parliament is sitting on all subjects of reform, dilly-dallying with the people, to defer a coming storm, 'T would be well and wise, I'm thinking, if our magnates would look down

On the overcrowded dwellings of the suffering poor in town. We are told all men are equal, and that life's a common lot, Yet very different tenements have different people got; One resides in a palace, where luxuriousness is law; Another in a cellar finds a bed of rags or straw.

Have they ever seen St. Giles's?—ay, or noted Bethnal Green? Or Golden-lane? or many a like abominable scene? If they had, they'd hold my notion,—'tis a scandal gross to find How little rich folk care about the humbler of mankind.

In foul courts and dismal alleys, scarcely fit for beasts of prey, Tens of thousands of the sons of toil are thickly stow'd away.

Can their boys grow up in vigour? Can their girls be pure and fair? Drinking only poison'd water, and inhaling stagnant air? I have seen one small apartment, measuring sixteen feet by ten, Habited by thirteen persons, women, girls, and boys, and men;

I have heard their awful language, I have mark'd their savage glare, As they came in from the reeking street to lie down—anywhere.

Can we wonder that our prisons should abound in youthful crime? Or that countless numbers perish every year before their time?

In the rookeries of London 'tis that pestilence begins, To punish not the poor alone, but rich folk for their sins. For commerce, banking, merchandise, proud buildings large men will raise;

With money that has oft been made in very dirty ways; But, save a Peabody, a Couits, or Shaftesbury, again, How few have thought of decent homes for London working men?

There's a loud cry for more churches, yes! and more church livings, too, But is there not as urgent work for Christian men to do? Let them build schools and houses for the young, and horey land, And they'll prove as noble altars as can grace our favour'd land.

Let Puritans who argue for an arbitrary clause, To put down grown-up vices, just consider nature's laws; Men cannot thrive, as rats do, in a sewer or a sink, And from holes that are not homes arise the evils born of drink.

It is not by means coercive, by invidious rules and Bills, The demon can be thwarted who both soul and body kills; Sow the seeds of moral beauty where rank weeds now daily creep, And a better human harvest we in God's good time shall reap.

Oh, Ministers of ancient Truth!

Oh, Ministers of State!

Whose proud ambition 'tis to see

Our country good and great;

Put aside your party warfare,

In a common cause combine,

And your names as saints and sages

In the Book of Life may shine.

G. LINNEUS BANKS.

A CONCRETE HOUSE.

SIR,—Having nearly completed a handsome Gothic house in the new material, Portland cement concrete, I should be happy to allow any one interested in the subject to inspect the same for the next ten days on presenting his card to my gardener on the premises. The house is within sight of the Addlestone Station on the London and South Western Railway, and about twenty miles from London.

G. B. EDWARDS.

CAUTION TO ARCHITECTS.

SIR,—Let me caution architects and assistants in the provinces against a person who called at my employer's office on the 10th under pretence of seeking employment as draughtsman, but in reality begging; he got a trifle from me by making statements which I have since ascertained to be entirely false. If any gentleman visited by this individual will have the goodness to detain him, and send me a note or telegram, I shall be delighted to prosecute. He is of middle height, shaves his chin, his whiskers and moustaches being brown, inclining to grey; was dressed in a worn-out frock coat, tall hat, flannel shirt, and narrow red necktie; carried a roll of tracing engravings, which he offered for sale, representing himself as having had twenty-one years' experience; named some very well-known London firms as his former employers; said he had been five months in hospital with fever, &c.; and made attempts to shed tears, and so on.

C. HANBURY.

39, Castle-gate, Nottingham.

ASPHALTE AND ITS PROGRESS.

SIR,—In a recent number of the *Builder*, a correspondent says,—“However the question of using asphalt for roadways may be decided, we are convinced that good, natural mineral asphalt may be properly and efficiently used for footways, and the attention of parish authorities may very properly be called to the subject. Very few specimens until now were laid down for footpaths, but the General Asphalt Company having obtained permission of the Board of Works to lay down their asphalt on the footpaths on the south side of the Victoria Embankment leading to Blackfriars Bridge, we shall have opportunity for judging.” Allow me to state that mineral asphalt has already been used to a very large extent for footways in the parishes south of the Thames, where I have laid several miles of my asphalt, known as “Wright's Tar Pavement,” and as I am still engaged in laying down considerable quantities, I have every reason to believe that experience has proved this material to be a success.

W. WAHAR.

VENTILATION OF RAILWAYS.

SIR,—May I appeal, through your influential columns, to the various Railway Companies (except the Metropolitan, which has a sensible arrangement), to adopt a little sanitary measure much needed; videlicet, to make the small ventilators over the doors permanently fixed open without the possibility of their being closed. No one who has to travel daily from a near-London station can fail to realise the sickening nausea produced on leaving the breakfast-table and fresh air, and plunging into the atmosphere of a railway carriage, in which several obese specimens of both sexes have, for the previous thirty miles, carefully bottled and corked themselves, without the slightest possible inlet for fresh, or outlet for foul, air.

The dread, but almost imaginary bugbear “draught” would do but a trifle of mischief compared with the injury to health caused by the poisonous atmosphere.

A. J. * * * “Draughts” are no imaginary evil, and work more rapidly even than vitiated air; but railway carriages may be properly ventilated without necessarily incurring this evil,—and should be.

ARCHITECTURAL EXAMINATIONS IN THE COUNTRY.

SIR,—It seems to me a great mistake to confine the examination of architectural students to London. It is not all of us, especially assistants, who can come up to London for a week or a fortnight, whereas the papers might be sent down from the Institute to the different large towns, and put into the hands of the local architectural associations, and so students from that town or district might come up to be examined. After each examination I would publish the questions and a list of candidates, successful or otherwise. I think, then, in a very short time, almost every student would present himself for examination, especially if architects would also make it a point to accept no assistant that had not passed the preliminary. At present principals are indifferent about the education of their pupils, and parents are ignorant of the advantages of an examination. Depend upon it, if the subject were well ventilated, a great revolution would be effected in the education of the profession. Both parents and principals would be proud to have it known that their sons or pupils passed with honours the examination. In fact, principals would be obliged to see to the education of their pupils for their own advantage. It would soon be known that pupils from such and such an office never presented themselves at the examination or failed to pass it: the why and wherefore would be asked, and thus the working of that office would be exposed. In giving a list of candidates, I should say from whose office they came. I think the matter could be worked easily and inexpensively.

E. SCOTT RIDSDALE.

CHURCH-BUILDING NEWS.

Upper Arnhem.—Christ Church has been consecrated. The style of architecture adopted is Early English, of the twelfth century. The plan comprises a clearstoried nave, with north and south aisles and chancel, with organ-chamber and vestry on the north side. Beneath the organ-chamber is the heating-chamber. At the west end of the church, opening into the nave by an arch, in three orders, is the tower, 20 ft. square at the base, and rising to a height of 117 ft. It is divided into ringing-chamber and belfry-stages. The entrances to the church are by means of a south porch and south entrance in chancel. There is also a separate entrance to the vestry. The nave is 83 ft. long and 32 ft. 4 in. wide, and is divided into five bays by an arcading, resting on moulded columns, having moulded and carved caps and moulded bases. The chancel is 33 ft. long and 24 ft. wide, and is separated from the nave by a moulded chancel-arch, having moulded piers and moulded and carved caps and moulded

bases. The total internal length of the church, from east to west, is 137 ft.; width, 60 ft.; height from nave-floor to ridge, 56 ft. The windows throughout are lancet, with coupled lights in the aisles and triple lights in the clearstory. The chancel lights are similar, but bolder in treatment, and having nook shafts with moulded caps, bands, and bases. The east window is tripled, with a vesica light over. The ringing-chamber in the tower is arcaded. The belfry-stage has coupled openings on each face, fitted in with louver boarding. The floors of the passages are laid with cleansed Bradford flagging. The chancel floor is laid with tiles, in geometrical patterns, and there are wood floors under all the seating. The seats are open benches, of pitch pine, with ornamental-cut ends. The reading-desk, of oak, is placed at the south pier of the chancel-arch, and the pulpit, also of oak, at the north pier of the chancel. The communion-table, and framework for tablets are also of oak. The font, which is of stone, is placed under the tower. The roofs are open timber, with principals, having curved braces, purlins, ridge, &c. The rafters are framed. The whole of the roofs are double-boarded, and covered with green Westmoreland slates, having a moulded stone ridge. The roof of the tower is leaded. The walls throughout are of stone, of great thickness, faced externally with double-broached sandstone, from the Horsforth quarries, and plastered internally. The stone dressings throughout are tiled. The church is lighted by means of gas-standards and brackets made of bronze. The church, which is heated by means of hot air, will accommodate 651 adults; but this amount can be greatly increased, if found necessary, at a future time. The total cost of the church, including site, bells, and clock, will be between 7,000l. and 8,000l. The whole of the works and fittings have been carried out from the designs of the architects, Messrs. Adams & Kelly, of Park-square, Leeds, and under their superintendence. The following are the contractors:—Mason and joiners' work, Mr. Thomas Whiteley, Leeds; slaters, Messrs. Watson & Wormald; plumber and glazier, Mr. Geo. Wilson; iron-founders, Messrs. Heaps & Robinson; plasterer, Mr. Walsh, Upper Armlay; painter, Mr. W. E. Switbank. The pulpit has been made by Mr. Tomlinson, of Leeds; the font, by Messrs. Fielding & Dark. The carvings have been executed by Mr. Stevens. The gasfittings and ornamental ironwork have been supplied by Messrs. Jones & Wellis, of London; and the heating-apparatus by Messrs. Haden, of Trowbridge.

Marton.—The quaint old timber church at Marton, whose history extends back to the thirteenth century, has recently been undergoing the process of restoration,—a work rendered necessary by the dilapidated and unsafe condition of the original structure. The imroads of time had reduced it to such a ruinous condition that an effort was made by the incumbent, the Rev. J. P. Firman, and others interested to bring about a much-needed restoration. It had been found, upon an examination of the lower part of the main timber supporting the tower and spire, that the portions below the surface were completely gone. Mrs. Barber, the daughter of the late Rev. John Darcey, incumbent of Marton for thirty-eight years, offered to restore the chapel at her own expense, if Mr. Firman would promise her his aid and superintendence in the undertaking. The offer was accepted. The state of the building having been gone into by Mr. Butterfield and Mrs. Barber, plans were at once drawn by the architect and submitted to the incumbent and parishioners, and afterwards to the bishop, whose united sanction and approval they at once secured. Upon examination it was found that the timber supports for the tower were in a very decayed condition, and it was found necessary to renew the four square compound posts at the angles of the tower, which are strengthened by struts in the form of buttresses. How they have kept their position so well is a marvel, having no foundation to rest upon beyond that of a large stone simply sunk into a bed of loose sand. In digging out for the new foundation some pieces of ancient tiles and a portion of what seems to have formed the surface of some wall-painting; also some copper coins, of Queen Anne's reign. Among the old tiles turned up was one bearing on its surface a clear representation of two keys, with an unsheathed sword between them, in yellow glazed work on a red ground. The surrounding farmers placed their teams at the disposal of the incumbent for the conveyance of materials. Under the direction of the builders, the work through-

out has progressed satisfactorily. The spire, in its new garb of oak shingles, gives the appearance at a distance of being a stone erection. The chancel, which is now in timber and plaster, to correspond with the nave, adds to the general effect, and is an improvement upon the old brickwork, while internally the work of restoration accomplished is such as to conduce to the comfort of the congregation. Perhaps one principal alteration that has been effected has been the flight of nearly twenty stone steps, leading from the road up to the west entrance, which hitherto has not been made use of, as its nearness to the road indicated it ought to have been. Part of these steps are outside, and the remainder within the tower. A new oak font, lined with lead, has been designed to harmonise with the general materials of the church. The entire windows are filled with stained glass. Figures of St. Andrew and St. James occupy the east windows of the aisles, and simply quarry glass with some little colour is used in the others. The entire work has been carried out under the supervision of Mr. Butterfield, the builders being Messrs. W. & H. Restall, of Bisley, Gloucestershire.

Bromsgrove.—It is proposed to erect a new church at Bromsgrove, from the design of Mr. John Cotton, architect. The present state of the subscription warrants the supposition that it will be carried out to the full extent of the plans. The origin of the structure was a sum of 500l. bequeathed by the late Rev. More-Molyneux, provided the church was begun within twelve months of the date of the bequest, otherwise the money was to revert to the Diocesan Church Building Society. The twelve months alluded to will expire towards the end of April, and consequently the work must be commenced in a few weeks. Nearly 3,000l. have already been raised towards the estimated cost of about 4,000l., which will include 3,500l. for the building and the rest for improvements to site, boundary walls, and other incidentals. The originator of the building fund, the Rev. More-Molyneux, was connected with the town through relationship with the Rev. G. W. Murray, the present vicar of Bromsgrove. The Bishop of Worcester gave 500l., and the Diocesan Society made a grant of 250l. The site was purchased of Mr. Chesshire, of Birmingham, and contains about three-quarters of an acre. There will be no burial-ground, as there is a capacious cemetery for the use of the town and district. The architect has chosen the Early Decorated style. There will be an apsidal chancel, with organ-chamber and vestries for clergy and choristers, nave and aisles, south porch, and tower at north-west corner. The tower will have a tapering spire, the altitude of the spire being about 175 ft. from the ground. There will be 600 sittings, most of them free, exclusive of the choir benches in the chancel. At first, chairs will be used in the nave, but eventually red deal benches will be fixed when the funds are forthcoming. The church is intended to be built with the local sandstone, the walls being lined inside with buff coloured bricks, relieved with stone stringing and bandings; the dressings, arches, window tracery, &c., being executed partly in Bath and partly in local grey sandstone. A basement will be sunk to accommodate the heating apparatus. The system of warmed fresh air will be adopted, ventilators being arranged in the roof to carry off the vitiated air.

Malling.—It is proposed to erect a new chapel at the workhouse. Towards this project the sum of 200l. is still required, only 750l. having been yet subscribed. It is necessary that the work shall be begun as early as possible in the forthcoming spring. Plans have been adopted, designed by Mr. E. W. Stephens, and the tender of Mr. Church, of East Malling, has been virtually decided upon.

Syston.—The parish church of Syston has been restored, at a cost of 1,000l., and re-opened. The earlier vestiges have as far as possible been replaced in the new work or otherwise conserved. Additional accommodation has been obtained by the redistribution of the seats. Much remains to be done to render the church complete and provide a sufficiency of accommodation. The peal of bells has been re-adjusted. The church is warmed of a genial heat, needed here by the absence of the porch, which for the present has been deferred from lack of funds. The greater portion has been executed by Mr. Thomas Black, builder, Barrow, assisted by Messrs. Moss & Sharp, of Syston; the heating apparatus by Messrs. Hunt & Pickering, of Leicester; the hell-founders being the firm of

Taylor, Loughborough. Mr. Ordish, of Syston, was the architect employed.

Ponn (Wolverhampton).—The church has been restored and enlarged. The peculiar situation of the edifice at a junction of roads permitted of an extension in one direction only,—the east; and in that direction the extension could only be made after overcoming the sharp rise in the ground. The plan was to take down the chancel and entirely rebuild it, after lengthening the nave by the addition of two bays. This has been done, according to the plans of Mr. Paley, architect, Lancaster, by the Messrs. Higham, builders, Wolverhampton, at a cost of 3,000l. The nave has been lengthened by the addition of two bays, and provides increased accommodation to the number of about 150. The new seats are open low pews of pitch pine. The seats of the other parts of the church have been altered to the same pattern. The roof of the nave, as of the chancel and the chancel aisle, are open and of oak. The chancel is divided from its aisle by three ornamented and moulded arches. The old stained window of the chancel is left into the aisle, while the chancel itself is lighted by a new stained glass window of five lights. Messrs. Bratt, of London, were the artists. The reredos is of alabaster, inlaid with mosaic, representing in the centre a cross, on one side a vine, and on the other corn, emblematical of the bread and wine of the Lord's Supper. To these are added the emblem of the four Evangelists, two upon each side. The lower large undecorated slab of alabaster was found in the church during the alterations. The chancel is floored with encaustic tiles, the altar-rails and screens are of wrought iron work, and the chancel stalls are of carved oak. A new organ, built by Walker, of London, will be placed at the east end of the north aisle. The whole of the church has been re-floored, and is heated by an apparatus supplied by Mr. Blakemore, of Wednesbury.

Ipswich.—The church of St. Mary, Stoke, has been again enlarged and re-opened. The enlargement determined upon was to build a new nave and chancel on the south side of the existing church, so that the old nave and chancel should become a north aisle to the new building. This was perhaps the only way in which the church could be enlarged; but it was attended with the serious drawback that, without going to great expense, it was impossible to give the building an imposing external appearance. The new nave and chancel are the same height throughout, and are covered by a continuous roof, the style which has been adopted being the Perpendicular, to which the older portions of the church belong; the nave nearly equals in length the older nave and chancel, and the new chancel extends 10 ft. to the eastward, the natural and unavoidable consequence being that what with north aisle and transept, vestry, south porch, and a small south transept used as an organ-chamber, the irregularities are too great to be pleasing. The walls of the new part are faced with cut flints, with dressings of Bath stone; the gable of the east end and also the upper part of the south porch, which has been rebuilt with considerable alterations, being ornamented with alternate squares of flint and white stone. The large east window has been filled with stained glass, by Mrs. Lacon, of the Goldrod, in memory of her late husband, Capt. Lacon, R.N. Each of the five lights contains a representation of one or more of the leading incidents of the life of our Saviour. This window was supplied by Messrs. Clayton & Bell. The architect employed was Mr. Butterfield, and the contractor was Mr. G. Hewitt, of Ipswich. The stonework was done by Messrs. Chinnock & Co. The additional sittings number 318.

Engwardine.—The parish church has been restored and re-opened. The sloping walls between the transepts on either side the church obstructed the view and interfered so seriously with the hearing, that the question of how to remedy this objectionable state of things became a most difficult one to deal with. This difficulty, however, has been overcome by the erection of a longitudinal arcade on either side of the nave, and also transverse arches to carry the transept roofs, so converting the double transepts into gabled aisles. The external parts of the building have not been altered more than was found to be absolutely necessary to carry out the design of restoration, the only additions being the building of a vestry on the north, and an aisle on the south side of the chancel, for the organ and the accommodation of the children. The plain arch which separated the chancel from the nave has

replaced by an arch the entire width of the aisle, enriched by moulding, in keeping with the early work. There also at one time existed an arch between the tower and the nave which I been closed up, but has now been opened, it exposes the west window of the tower to the west. The nave and northern transept roofs have been restored without any alteration in the sign. The roofs of the southern transept, the chancel aisle, and vestry, are all new and in keeping with the other parts of the building, and the high pews of bygone days have been replaced by modern low seats of varnished deal. The font is of hard blue stone, and stands at the north side of the nave, near the tower transept. The pulpit is of oak on a stone base, and the whole of the chancel fittings are oak, as also the lectern. The main entrance is through the tower, and now that the screen has been taken down from the tower arch, the whole church is thrown into view. There is a second transept at the west end of the south aisle, as well as an entrance for the clergy through the stry. The lancet window at the side of the chancel has been restored, and a three-light window, moulded and in keeping with the chancel arch, has replaced the poor modern window which formerly existed. The transept windows have all been restored, and the little Norman window is introduced at the west end of the south side. The east window has been filled with leaded glass, supplied by Clayton & Bell, of London, at the cost of Mr. Hutchinson, of Longworth. The floor is laid with encaustic tiles, manufactured by Mr. William Godwin, of Lurgardine. The work has been carried out by Mr. James Bowers, of Hereford, under the supervision of Mr. F. R. Kempson, at a cost of nearly 9000.

Eastcheap, London.—St. Clement's, near Eastcheap, has been re-opened, after re-arrangement by Mr. Butterfield. The whole of the ancient oak carving has been preserved, and the canopy over the pulpit is decorated. The seats are in modern fashion, all open. The organ has been approved by Messrs. Gray & Davison. The fitting has been brought out in colour.

Malmesbury.—The church at Lea is about to be restored under the direction of Mr. C. J. Phipps, of London, architect.

SCHOOL-BUILDING NEWS.

Sheffield.—The formal opening of the boys' portion of All Saints' Schools has been celebrated. The schools are in connexion with the church erected by Sir John Brown, on Ellesmere-road, and they occupy a site, given by the same donor, immediately in the rear of that edifice. The building is in three blocks, one of which is the boys' school; the second, the infants' school; and the third, the girls' school. It is in the Gothic style of architecture, so as to correspond with the church. The entrances of both the boys' and girls' schools are surmounted by bell-towers, 45 ft. high. There is sufficient accommodation for 300 boys, the same number of girls, and an equal number of infants. Considerable attention, we believe, has been paid to ventilation. The architects were Messrs. Flockton & Abbott.

Leek.—The St. Luke's Church boys' new school has just been opened for use. The school-room is 60 ft. by 26 ft., 14 ft. high at the eaves, and 23 ft. in the centre. It has class-room, porch, &c. It is of red brick, with stone dressings to the buttresses, windows, gables, &c. Mr. Sugden was the architect.

Burton-upon-Trent.—A Primitive Methodist new school-room has been erected here, and has been opened also for divine worship and Sunday-school tuition. The building is in the Romanesque style of architecture, is 52 ft. by 28 ft. in size, has two class-rooms and out-offices; and the society now connected therewith numbers twenty members, and about ninety scholars. The school-room will accommodate 300 children.

Castle Fields, Shrewsbury.—The new schools for the district of All Saints have recently been opened by the Bishop of Lichfield. The building consists of an infants' school, with porch and lavatory, and a girls' school and class-room, on the ground-floor. A square bell-turret, with tiled roof, contains the stairs leading to the upper or boys' school, which has also a class-room. The total number of children for which provision is made is about 260. The walls are built of red brick, relieved with bands, &c., of white and blue brick, and the roofs are covered

with Staffordshire tiles; wooden frames, mullions, and tracery are used for windows. Mr. Edward Haycock is the architect, and the work has been carried out by Messrs. Bowdler & Darlington, for 8521.

Stapleton (Shropshire).—The first stone of a new school for this parish has been laid, by the Venérable Archdeacon Allen. The school will stand on a convenient site, facing the east end of the church. A mistress's house will be provided. Brick, with stone dressings, are the materials to be used. The roofs will be covered with Ridge Hill brindled tiles. The contract has been taken by Mr. W. Jones, builder, Stapleton, for 4741. Mr. Haycock, of Shrewsbury, is the architect.

Easton (Bristol).—The chief corner-stone of new school premises for the parish of St. Gabriel, Easton, has been laid. The site adjoins the church. The schools, which have been a little while in progress, are being built in accordance with the requirements of the Education Department, from designs by Mr. Neale, of Bristol, architect. The building will be of brick, in a similar style to the church, and the rooms will have open-timbered roofs. There will be provided two schoolrooms, 65 ft. by 20 ft., with a class-room, 18 ft. by 20 ft., to each; together with master's residence. The contract has been taken by Messrs. Wilkins, at 1,2601., but, owing to the depth of the foundations, the total cost, including fittings, will amount to 1,5501. The school, when complete, will accommodate 600 children.

Tunstall.—National schools have been opened here. The two schoolrooms on the ground floor have been considerably increased in height, and are used, one as the girls' school, and one as the infants' school. On the upper floor an additional room, which is used as a boys' school, has been added, 71 ft. by 26 ft., and is so arranged that in connexion with the old one on the same floor it forms one adapted for public gatherings in the district. The façade of the building, which has a considerable frontage to King-street, is in the Gothic style, executed with red bricks, and relieved by bands, &c., of white and blue bricks. The central portion of this front projects slightly before the sides, and is carried up in a gable form surmounted by a lofty bell-turret, finished on the top with a gilded iron cresting. The whole is from the design of Mr. G. B. Ford, architect, Burslem, and executed by Mr. Beech, builder, Tunstall.

VARIORUM.

"The Pocket Technical Guide and Mensurer for Builders and Surveyors. By A. C. Beaton (Lockwood & Co.)," professes to give in a waist-coat-pocket book, 3 in. by 2 in., a complete explanation of the terms used in building-construction, technical directions for measuring work in all the building trades, and complete specifications for houses, roads, and drains, and of course it does not do it. "Distilled books," says Bacon, in one of his Essays, "are like distilled waters, flashy things." And this is true, even when they are distilled by a knowing hand; but what is to be said of a work of this kind when it is performed by one who can thus instruct anxious students,—"The mouldings running round arches . . . is termed an archivolt;" "The upright bar of a window is called the Mullion;" and (more instructive still) "A Pinnacle, or Spire, is that part of any building which rises above the roof." We have no pleasure in breaking a butterfly on a wheel, but good nature has its limits.—The *Law Magazine and Review* (Butterworths) has become a monthly journal of jurisprudence for both branches of the legal profession at home and abroad. The change from a quarterly to a monthly journal will make it a more effective organ of the profession than it has hitherto been throughout its long and useful career. "Every lawyer feels that the changes coming upon us both in regard to law and procedure are of the very gravest possible nature. The fusion of law and equity, the alteration of the procedure of our courts, the reform of our system of appeals, of our land laws, of our jury system, are sufficient to indicate how important are the questions which are already to the front. Other journals will discuss them from the point of view of the public, the *Law Magazine* from that of the legal profession." The first number, now before us, includes a very interesting notice of the late Mr. Edwin Wilkins Field, the artist-lawyer, written with a right appreciation of his energetic character and genial qualities.

Miscellaneous

Watchman's Electric Tell-tale Clock.—Messrs. J. Bailey & Co., of the Albion Works, Salford, have just introduced to public notice a new tell-tale clock, as a certain detector of the watchman who is remiss in his rounds. The apparatus is the invention of Mr. F. M. Pratt. It consists of an ordinary clock, to which is attached a cylinder, revolving upon a vertical axis, and driven by the mechanism of the clock. The cylinder is covered with a sheet of paper, attached to it by spring clips, so that it can be removed when used, and a clean sheet substituted for it. Each sheet of paper is divided longitudinally into hours, and, if necessary, into parts of hours, and crosswise into as many divisions as there are places to be visited by the watchman. Each cross division has a corresponding marker, which indicates, by the impression it makes upon the paper, the time the watchman visits the place connected with that marker. The markers are actuated by electromagnetic apparatus, and in each room to be visited is an actuating knob. One objection to all such apparatus is, that the watchman of premises has his attention perpetually distracted by being made watchman of the tell-tale clock; and while listening to some suspicious sound, or watching some suspected spot, is liable to come under suspicion himself by forgetting all about the time and the tell-tale just when he is attending most diligently of all to his duties, unless, indeed, he be more concerned about watching the clock than the premises.

The Railway Interest.—It has lately been shown that 14,247 miles of railway are now being worked in the United Kingdom, on which have been expended a sum than 500,000,0001., which is five times the amount of the annual value of all the real property of Great Britain, and two-thirds of the national debt. The gross net annual revenue of the railways in this country, after deducting all working expenses, exceeds 22,000,0001. sterling, more than the total revenue, from all sources of Belgium, Holland, Portugal, Denmark, Sweden, and Norway. The companies have in their direct employment more than 100,000 officers and servants. The value of the rolling stock exceeds 30,000,0001. The consumption of coal and coke by railway-engines amounts to between 2,000,000 and 3,000,000 tons a year; so that in every minute of time throughout the year above 4 tons of coal are consumed, and 20 tons of water are flashed into steam. The consumption of fuel is about equal to the amount of coal exported from Great Britain to foreign countries. There are more than 3,000,000 tons of iron laid down in rails alone, and the chairs would weigh nearly 1,000,000 tons; so that there are not far short of 4,000,000 tons of iron on the permanent ways of the United Kingdom, and of these about 30,000 tons of rails have to be every year replaced. No one will deny that our railways make a figure in the world.

Book Publishers.—In the last issue of "Fors Clavigera," Mr. Ruskin says, "I find, in the present state of trade, that when the retail price is printed on books, all sorts of commissions and abatements take place, to the discredit of the author; and, I am convinced, in the end, to every one else's disadvantage. I mean, therefore, to sell my own books, at a price from which there shall be no abatement—namely, 9s. 6d. the plain volumes, and 19s. the illustrated ones. My publishers, Messrs. Smith, Elder, & Co., will sell all my books at that price over their counter; and my general agent, Mr. G. Allen, Heathfield Cottage, Keston, will supply them at the same price, without abatement, carriage paid, to any person in town or country, on remittance of the price of the number of volumes required. This absolute refusal of credit or abatement is only the carrying out of a part of my general method of political economy; and I adopt this system of sale, because I think authors ought not to be too proud to sell their own books, any more than painters to sell their own pictures."

The Institution of Civil Engineers.—At the meeting of the members of this Society, on Tuesday, the 20th instant, Mr. T. Hawksley, the president, being in the chair, it was moved, seconded, and resolved unanimously, "That in consequence of Tuesday, the 27th of February, having been appointed by Her Majesty to proceed to St. Paul's Cathedral to offer Thanksgiving for the recovery of his royal highness the Prince of Wales; the meeting be adjourned until Tuesday, the 5th of March.

Silicate Paint.—A curious deposit of almost pure silica was recently discovered in one of the hills in North Wales. The deposit lies in a basin of volcanic origin, at a considerable level above the sea, and forms the bed of a small lake about two miles in length and one mile in width. Amongst its uses, it is stated that it would be especially suited for producing crystal glass, and in the manufacture of porcelain, especially if the small percentage of oxide of iron were removed from it. At present the only use made of this silica is in the production of paint. For this purpose it is especially suitable, as it mixes freely with the pigments and oils, and is worked with ease. Moreover, it entirely resists the action of any acid, and withstands the action of heat. Added to these advantages, are those no less important, that the paint has no metallic base in its composition, and when laid on it becomes extremely hard, and polished on the surface. The proprietors of this deposit have for some little time past been producing this paint at the works of the Silicate Paint Company, Fenwick-street, Liverpool, and extended trials have been obtained with it. Time is necessary to establish the correctness of what is stated about this paint, but it seems deserving of trial.

The Antiquities of Surrey.—At a committee meeting of the Guildford Institute a printed circular from the secretary to the Surrey Archaeological Society was read, containing a resolution adopted by the Council, affirming the desirability of obtaining a museum in the county in which to place the antiquities of Surrey belonging to the Society. The circular alluded to the various places in which a museum might be established, as Guildford, Reigate, Kingston, Croydon, and Southwark; and in reference to the first, remarked that it had been observed in favour of Guildford that it was the county town. Alluding to Croydon, the circular mentioned that the town had a fine literary institution, which had offered to place a room at the disposal of the Council, and take charge of the collection entirely free. The committee considered it very desirable to take steps towards securing the collection at Guildford, and appointed a sub-committee, with power to add to their number, to communicate with the Archaeological Society on the subject. Acting on the part of this committee, Mr. Capron, on the 6th inst., asked for information as to the probable space which would be required for the collection, both at the present time and for some future period. The correspondence was to be laid before the Council on the 21st.

Stained Glass for Christ Church, Oxford. A correspondent of the *Times*, describing the work recently done in the Cathedral of Christ Church, Oxford, says,—“The whole of the choir has been relaid with a beautiful design of costly marbles, with inlaid emblematical figures of Maltese workmanship, which struck me as being of extreme beauty; and I am informed that new stalls and woodwork are being prepared for the whole building. The cathedral never had any ancient glass except a few fragments of great richness. But a lady connected with the cathedral has offered to defray the cost of the rose-window and the four Roman lights below. A window has already been filled in memory of the late lamented Mr. E. Denison, M.P., and others are in progress in memory of Mr. John Walter, jun., and Mr. F. Vyner; and the friends of the late Marquis of Lothian will be glad to hear that the present Marquis proposes to give a large window in memory of his distinguished brother.”

Destruction of Brambridge House.—A fire has taken place in the extensive mansion of Mr. Thomas Fairbairn, situated at Brambridge, on the Itchen. Since it has been purchased by its present occupier a new drawing-room and conservatory, with other expensive alterations, have been carried out at a cost of 25,000*l.* The fire originated in the flue of the nursery in the top story, and gained such a mastery that it was not got under until the entire front of the building down to the ground-floor ceilings was gutted, and a large portion of the back part also destroyed. The sewers had been employed in the room adjoining the nursery on the previous day. All the valuable pictures are saved, but scarcely any portion of the mansion but the walls is left. The damage done cannot be less than between 50,000*l.* and 60,000*l.* Near the house was a small Roman Catholic chapel, where Mrs. Fitzherbert is said to have been secretly married to George IV.

Brickdust Mortar.—According to the *Journal of the Franklin Institute*, in the Spanish dominions ordinary brick-dust, made from hard-burned, finely-pulverised bricks, and mixed with common lime and sand, is universally and successfully employed as a substitute for hydraulic cement. The writer, during an engineering experience of six years in Cuba, had ample opportunity for testing its merits, and found it in all respects superior to the best Rosendale hydraulic cement for culverts, drains, tanks or cisterns, and even for roofs, whether for setting flat tiles, or for making the usual tropical concrete flat roof. It is regularly known there as an article of commerce, sold in barrels by all dealers in such articles at the same price as cement. The proportions used in general practice are one of brick-dust and one of lime to two of sand, mixed together dry, and tempered with water in the usual way. The Romans, our readers will remember, used pounded bricks in their mortar. Its presence serves to distinguish Roman work in England.

Water Supply of the Metropolis.—In the House of Commons Mr. Stapleton asked the President of the Board of Trade whether it was intended to take any steps under the Metropolis Water Acts, 1852-72, in consequence of the polluted state of the water recently supplied by some of the water companies. Mr. Forster in reply said a water commissioner has been appointed to examine, at least once a month, whether the water of the various companies is fit for use, and to make a report respecting it both before it undergoes the process of filtration and before it passes into distribution. He is also instructed to make a special report when there is any necessity for such a step. In the case to which the question refers he was asked to make a special report, which I have just received. After the consideration of that report I shall be able to decide whether there should be any further inquiry into the water supply of the particular companies referred to.

Sewer Gases and External House-Protecting Drain Traps.—The passages by which sewer-gas usually enters houses are soil-pipes from water-closets, and waste and overflow pipes from cisterns, baths, lavatories, bath and lavatory safes, and sinks. Water-closets may be ventilated by extending the soil-pipe through the roof, or by means of two small pipes tapped into the D trap and carried through an external wall. There is a new trap (Mansergh's), manufactured by Donlon & Co., of Lambeth, which is intended to prevent the ingress of sewer-gas by the second set of passages, and is always to be placed outside the house. When waste-pipes are connected to house-drains by such means, the hell-traps, now commonly attached to sinks, and the syphon-traps on cisterns and other overflows may be dispensed with, as this arrangement cuts off the communication between the house and the sewer.

Northwich Workhouse.—At the last meeting of the Northwich Board of Guardians, the clerk said that tenders for the erection of infectious wards at the Workhouse had been sent in and examined by the committee, who submitted the following for the consideration of the Board:—Mr. Peter Hodgkinson, Booth Lane Head, Sandbach, 745*l.* 10*s.* 6*d.*; Mr. W. Leicester, Northwich, 750*l.*; Mr. James Bostock, Northwich, 750*l.*; Mr. Joseph Molyneux, Winton, 769*l.* 15*s.*; Mr. W. Joynton, Northwich, 755*l.* 12*s.*; Messrs. Vernon & Done, Tarporley, 878*l.* 10*s.*; Mr. J. P. Cardwell, Altrincham, 739*l.* (accepted); Mr. Tomlinson, Manchester, 890*l.*; Mr. H. J. Bennett, Northwich, 900*l.*; Mr. J. Owen, Bowdon, 769*l.* The architects are Mr. Redford, of Manchester, in conjunction with Mr. Davenport, of Over, near Winsford, Cheshire.

Preservation of Paste, &c.—A scientific contemporary states that the decomposition of paste may be prevented by adding to it a small quantity of carbolic acid. It will not then become offensive, as it often does when kept for several days, or when successive layers of paper are put on with paste. In the same way, the disagreeable smell which glue often has may be prevented. If a few drops of the solution be added to ink or mucilage, they will not mould. For whitewash, especially when used in cellars and dairies, the addition of one ounce of carbolic acid to each gallon will prevent mould and the disagreeable odour which sometimes taints milk and meat kept in such places. We have found clove-oil, mixed with water, and a few drops of dextrose, mixed with water, and a few drops of olive-oil, keep for months, while used as paste.

From Jerusalem.—Some time ago a rock-hewn passage, leading southward towards the Temple area from the subway at the Convent of the Sisters of Zion, was opened. Mr. Schick has found a continuation of this passage, or rather aqueduct, as it is now proved to be, towards the north, and has traced it from the Convent to the north wall of the city, a little east of the Damascus gate. At this point the aqueduct has been partially destroyed by the formation of the ditch, cut in solid rock, which lies in front of and communicates with the well-known caverns; it is therefore older than these, and can hardly be assigned a later date than that of the kings of Judah. It may also be the “conduit of the Upper Pool,” mentioned in Isaiah and the Second Book of Kings.

Railroad Enterprise in Peru.—The *New York Evening Express* says:—“The Peruvian Government proposes a railroad 14,000 ft. above the level of the sea. It will connect different parts of the country (by railway and steamboats), the former going over the main ridge and valleys of the Andes, at an elevation of 14,000 ft. above the level of the sea, or 7,000 ft. higher than the highest point of the Sierra Nevada, crossed by the Central Pacific Railroad, the elevation being within 1,000 ft. of perpetual snow. The combined railway and steamboat communication will cross the continent at its widest point, and M. Meigs, the contractor, has had contracts in this country amounting to over one hundred million dollars.”

Sales at the International Exhibitions.—The Royal Commissioners for the Exhibition of 1851, although they do not agree with those who believe that the interests of art, or those of the public, would have been injured by the proposed sales of manufactured objects, not in the Exhibition itself, but in the annexes, in accordance with conventions entered into with the French and Belgian commissions, have resolved that, as the French and Belgian commissions have liberally relinquished the rights accorded to them, her Majesty's Commissioners, with the view to reconcile conflicting interests as far as possible, will adopt the rules, as respects sales, laid down for the Exhibitions of 1851 and 1862.

The Preservation of Victoria Park.—At a meeting of the Board of Works, Mr. Runtz said it was necessary that the Board should come to a decision at once with regard to the Victoria Park land question. He therefore moved that the Board purchase certain portions of the land about to be sold by the Government at a cost of 20,450*l.* Mr. Newton seconded the motion. Mr. Dresser Rogers, Mr. Alderman Stone, Mr. Lawrence, and Mr. Saunders addressed the Board, and after considerable discussion a resolution was moved that the Government undertake the care of the land so purchased, and include it in Victoria Park. The resolution was carried by a large majority.

New Goods Warehouses on the Metropolitan Railway.—In conjunction with the Great Northern and Midland Companies, the Metropolitan are about to erect new goods warehouses between Farringdon-street and Redcross-street in the City, and they are also negotiating with the South Eastern Company for the erection of similar warehouses near West-street, Smithfield. The chairman of the Metropolitan states that in a very short time the sales of surplus lands will enable the company to reduce the capital invested in them by 100,000*l.* He also further states that their rentals from land and other property which they have to let is being considerably increased, and that it was being considered that such surplus property would shortly realise about 50,000*l.* year.

Sewers in London.—The St. George's Hanover-square, surveyor, reporting on the state of the sewers in the parish, says, “I regret to find that in so large a portion of this parish (the drainage is in many cases highly unsatisfactory.) In the in-wards, sewers flat-bottomed and unsound, ill-shaped, and unnecessarily large, with the advantage of a good fall, are little, if at all, better than those in the out-wards, which, though sound and of better form, yet having a very little fall, are liable to accumulate deposit, which cannot be removed without flushing.” The estimate for flushing is 423*l.* 15*s.* The report was understood to be adopted.

Paternoster-buildings, St. Paul's.—Mr. Alfred M. Ridge writes to say that these buildings were erected from his designs, not from designs by the City architect, as stated in our last.

The Restoration of Warwick Castle.—A proposal has been made in New York for the nation of an American committee to co-operate with the English committee in the undertaking to find funds for the rebuilding of Warwick Castle. The *New York Tribune*, in an editorial notice of the project, says,—"The formation of a fund to restore the burned portions seems to have originated in a general feeling among Englishmen that the castle was a possession in which the whole nation had an interest; but we just as well say that it was the inheritance of the whole Anglo-Saxon race; and we, too, claim our share in the honour of contributing to the costly work of repairing it."

The Metropolitan Board of Works and the Southern Embankment.—The Metropolitan Board of Works having declined to include the southern embankment in the Bill which they are about to present to Parliament, having reference to the cost of lighting and maintaining the northern embankment, the Vestry of Lambeth have decided to present a petition to the House of Commons, praying that both embankments may be placed upon the same footing, and that the cost of lighting and maintaining the embankments be equally borne by the whole of the metropolis.

Fresco-Painting.—A return to an Order of the House of Commons contains a copy of Reports to the First Commissioner of Works and Public Buildings on the frescoes in the Houses of Parliament. This Report emanates from a committee of artists employed in the decoration of the Westminster Palace, and is signed by Messrs. Cope, Watts, Ward, Armitage, Herbert, S. Barff, and E. J. Poynter. These gentlemen see that, notwithstanding the ill-success which it attended it of late years, the use of fresco-painting ought not to be abandoned. The failure it is said, probably due to the want of experience in the method among English artists.

Improvements at Morecambe.—The Morecambe Pier is to be greatly lengthened, the works having been let to Mr. Horne for 4,550*l.* The work is to be commenced immediately, and to be completed by the middle of June. The pier will extend the pier-head 60 yards, making it 100 yards in length. The contractors for the new station at Morecambe have commenced work, and excavations for foundations are now being made. The contractors for the new sea-wall and promenade on the road to Eysham are making satisfactory progress.

London Association of Foremen Engineers and Draughtsmen.—The nineteenth anniversary festival of this institution took place on a Saturday evening last, at the City Terminus Hotel, under the presidency of Mr. James Howard, M.P., who was supported by Admiral Sir Spencer Robinson, Lord Elcho, Mr. B. Amelsson, M.P., Dr. Tyndall, Mr. J. R. Ravenhill, C.E., Mr. C. B. Vignoles, and several other gentlemen, some of them connected with leading engineering firms. The company numbered nearly 300.

A Foot Bridge at Cannon-street.—A few days ago, a footway for passengers by the side of the South-Eastern Railway, crossing the river at Cannon-street, was opened for pedestrians, which provides a new means of communication between the north and the south sides of the Thames. The entrances are from Dowgate-street, on the Middlesex side, and from Clink-street (leading to the Borough Market), on the Surrey side, and the toll charged being one halfpenny, as at Hingerford and Charing-cross. The footway is open from five in the morning till nine in the evening.

Land Register and Transfer Book.—A new register-book is proposed by Mr. W. Streeter, barrister-at-law, to include all lands, whether rehold, copyhold, gavel-kind tenure, borough English, and all other land whatsoever in England, "for making land available as a mercantile security, and also for simplifying the registration of the title to real estates; and to serve the purposes of sale and transfer of land, as well by way of absolute ownership as upon trust, or by way of mortgage."

South Kensington Museum.—The arrangements for the special loan exhibition of ancient musical instruments at the South Kensington Museum, which will be opened in June next, are now in active progress. The exhibition will include instruments noted for their decorative, archaeological, ethnological, or intrinsic technical merits.

Lost Land.—The *Stamford Mercury* states that a survey has recently been made at Cleethorpes of land which has "gone to Humber," or been devoured by tidal action upon the Cleethorpes. It is computed that upon the Humber stone foreshore alone, by throwing up a substantial sea-bank, 500 to 700 acres may be reclaimed at an expense of 10*l.* per acre. Lord Carington is the owner of the frontage. When Domesday Book was compiled, this land extended to a point near to the present mid-channel of the Humber.

Proposed New City Market.—A special meeting of the Court of Common Council was held at Guildhall last week, to consider whether it was advisable to erect a new market adjacent to that in Smithfield for the sale of meat and poultry. The scheme was recommended by the Markets Improvement Committee, at a total cost of 167,500*l.*, of which 50,000*l.* was for the land. Four petitions were, however, presented against it, and the debate arising upon the subject was adjourned.

The African Diamond and Gold Fields.—A shilling "map of the South African republic or Transvaal; showing the newly-discovered gold diggings in the diamond-fields in the Orange River state, adjoining," has been "published by authority, and mapped by Matthew A. Purcell, C.E., 18, Buckingham-street, Strand, London." A detailed map of this new district of country has been much wanted, it seems, and has now been supplied, at great cost and trouble.

Mining Property in Chili.—Some of the most renowned copper and silver mines in Chili, the property of the late Mr. Sampson Waters, who realised a large fortune, have lately changed hands through the agency of Messrs. Driver, the auctioneers. They were the whole of the San Pedro, and parts of the Desembriador copper mines, and shares of the Juana and Colorado silver mines, with valuable plant, and realised upwards of 106,000*l.*

New Works on the Lancashire and Yorkshire Railway.—The total amount of share capital to be raised for the new works for which the company are going to Parliament amounts to 1,300,000*l.*, and amongst other new stations, and other works proposed to be erected out of this sum are two large new stations, one at Bradford, and the other at Blackburn, in addition to the widening of a long viaduct on the company's line to Liverpool, near Wigan.

The Railway Bridge in Southwark Street.—At their meeting last week the St. Saviour's Board of Works authorised the clerk to give notice to the London, Chatham, and Dover Company that if their railway bridge in Southwark-street were not made water-tight within fourteen days, so as to prevent the water from percolating through it as at present, proceedings would immediately be taken against the company by indictment.

Oxford Architectural and Historical Society.—The First Evening Meeting will be held on Tuesday, February 27, when papers will be read "On the most important Archaeological Discoveries during the past Year, in the Neighbourhood of Oxford," by Mr. J. P. Earwaker, Merton College; and "On the Garford Barrow, near Abingdon, lately opened," by Mr. James Parker.

Institution of Surveyors.—By permission of the Council of the Institution of Civil Engineers the Ordinary General Meeting, of Monday, February 12th, was held in the Lecture Theatre of that institution, when the discussion on the Paper, by Mr. E. J. Smith, entitled "Land," was resumed, and, after a lengthy debate, was adjourned to the next meeting, to be held on Monday evening, February 26th.

Copper Gas-Pipes.—The *Journal de l'Eclairage* states that on the occasion of a workman cutting through such a pipe with a file, an explosion occurred, by which he was much burnt. It appeared, upon examination, that the pipe was coated with a black matter, which was found upon analysis to be an acetate of copper, liable to explosion between 203 and 245 degrees. The circumstance is not unprecedented.

Leek.—To the Congregational church and schools, a new lecture-hall, &c., is about to be added. All the buildings arc of stone, in the Early Decorated Gothic style. Mr. Sugden, of Leek, is the architect.

Asphalte Roadways.—The Corporation of London have given instructions for Princes-street, Mansion House, to be laid with asphalte, by the Montrotier Asphalte Company, on a substratum of concrete, made with the natural hydraulic cement from Lyme Regis. The enormous traffic in this part of London will prove a crucial test for roadways executed in the manner proposed.

Winchester Assize Courts.—The designs for new Assize Courts, Winchester, by Mr. H. T. Wyatt, obtained in a limited competition, are, we believe, to be carried out by Messrs. Hill & Sons. The buildings are Gothic in style, and the cost will be something like 30,000*l.* The old courts will be retained for witnesses, and form part of the general design.

St. Andrew's Church, Holborn.—The Church of St. Andrew's, Holborn, is to be decorated under the superintendence of Mr. S. S. Teulon, architect, a sum of 750*l.* having been decided upon by the trustees to be expended. The specified suggestions of Messrs. W. Phillips & Son, of Baker-street, Portman-square, have been accepted for the execution of the work.

The Liverpool Tramways.—The corporation have resolved to purchase the tramways within the borough, and to keep the tramway system in their own hands. They are supporting a Tramway Bill to these ends in Parliament, with power to borrow 250,000*l.*

Sunderland Workmen's Dwellings Competition.—The second premium was awarded to Mr. Thomas Tillman, of Sunderland.

TENDERS

For sewer and boundary-wall and gates to land at West Brompton, for the managers of the Metropolitan Asylum District. Mr. John Giles, architect:—

	Sewer.	Boundary-wall and Gates.
Avis & Co.	£2,815 0 0	... 2,535 0 0

We are compelled to decline pointing out books and giving addresses.

All statements of facts, lists of tenders, &c. must be accompanied by the name and address of the sender, not necessarily for publication.

Not.—The responsibility of signed articles, and papers read at public meetings, rests of course with the authors.

Bath and other Building Stones of Best Quality.—RANDELL, SAUNDERS, & CO. Limited, Quarrymen and Stone Merchants. List of Prices at the Quarries and Depots, also Cost of Transit to any part of the United Kingdom furnished on application to Bath Stone Office, Corsham, Wilts.—[ADVT.]

Ashton & Green, Slate and Slab Merchants and Quarry Agents.—Shippers, Merchants, and Contractors furnished with Prices lists of every description of ROOFING and MANUFACTURED SLATE, Railway-rates, &c. Agents for London and Country for the Sale of the celebrated WHITLAND ABBEY GREEN SLATES. Drawings and Prices of A & G's RED RIDGE TILES, specially prepared for use with these Slates, on application.—Offices and Show-rooms, 14 and 15, Barry-street, St. Mary Axe, London, E.C.—[ADVT.]

Turret Clocks.—Mr. Streeter, 37, Conduit-street, London, W., Manufacturer of Turret Clocks (with gravity or dead-beat escapement) for Churches and Public Buildings. Estimates and plans on application. Price:—Village clocks, from 15*l.*; church clocks, from 40*l.* The wheel-work throughout these clocks is of best hard brass or gun-metal. No iron wheels used. Timekeeping and durability guaranteed. Wholesale Entrance—Burlington Steam Works.[ADVT.]

Architects, before committing themselves to any system of Warming, should send to TRUSWELL, BROTHERS, & HOLDEN, 100, Nottingham-street, Sheffield, for a prospectus of their Improved Patent Hot-Air Apparatus.[ADVT.]

NO PAINT—NO RUST. GREAT DISCOVERY. BRONZED IRON.

BY ROYAL LETTERS PATENT. TURNER & ALLEN (Sole Patentees), ART-FOUNDERS, ENGINEERS, MERCHANTS, AND CONTRACTORS, 201, UPPER THAMES STREET, LONDON, E.C.

Extract from Paper read at the Royal Institute of British Architects, December 4, 1871, by Henry Carr, esq., C.E.:

"The great desideratum of the day, no doubt, is some means of permanently protecting iron from rust: this is now said to be done by Messrs. Turner & Allen, of 201, Upper Thames-street. If the process of coating iron with copper can be successfully carried out on a large scale, it will be one of the greatest boons of our time."

J. L. BACON & CO. MANUFACTURERS OF IMPROVED HOT-WATER APPARATUS,

FOR WARMING AND VENTILATING Private Houses, Churches, Schools, Hospitals, Manufactories, Greenhouses, &c.

OFFICES AND SHOW-ROOMS:—476, NEW OXFORD STREET, LONDON, W.C. WORKS:—FARRINGTON ROAD. Publishers of a Pamphlet on "Hot-Water Heating."

TO BUILDERS.—TENDERS are invited for a new HOTEL to be built at Kerkley-nax Lowestoft, containing about thirty rooms, Plans and specifications may be seen on or after FEBRUARY 26th; and Tenders are to be sent in by TWELVE o'clock on FRIDAY, the 5th day of MARCH. The lowest or any Tender not necessarily accepted. GEO. GLOVER, Architect. Lowestoft, February 20, 1872.

TO BUILDERS.—TENDERS are REQUIRED for the ERECTION of TWELVE HOUSES. Plans and specifications may be seen at the Office of Auctioneers, on the 26th and 29th FEBRUARY, and the 1st MARCH, at 10 o'clock, and to be returned when Tenders are delivered. The lowest or any Tender not necessarily accepted.

TO BUILDERS.—The Directors of the Lichfield Brewery Company desire to receive TENDERS for the ERECTION of a NEW BREWERY at Lichfield. The drawings and specifications can be seen at the Office of the Company, or at the Architects, Mr. GEORGE SCAMMELL, 18, Great George-street, Westminster, on and after MONDAY, the 26th inst. Quantities will be supplied free two guineas (which will be returned) to the bank in Tenders, and copies may be obtained from the Surveyors, Messrs. CURTIS, 1, Chancery-lane, Old-barrack-street, London, E.C., on and after THURSDAY, the 1st MARCH, at 10 o'clock. Tenders are to be sent in, addressed to the Secretary, on or before THURSDAY, the 7th day of MARCH, 1872. The Directors do not bind themselves to accept the lowest or any Tender. Lichfield, 20th February, 1872. JOHN GILBERT, Secretary.

TO BUILDERS.—MOSS HALL ESTATE. The ARCHITECT—TENDERS will be received on and after MONDAY, the 26th inst. Full particulars, specifications, &c. may be seen at the Estate Office, 7, Alexandra-grove, on and after MONDAY, the 26th inst. Security for the execution of the contract. Tenders to be addressed to S. G. Carr of Messrs. Hest & Carter, 11, St. Helen's-place, E.C., up to the 1st of MARCH.

TO BUILDERS.—The Corporation of Carmarvon are prepared to receive TENDERS for the RESTORATION of the Guildhall.

Drawings and specifications may be examined at the Office of Mr. J. THOMAS, Architect, Castle-square, Carmarvon. Tenders to be delivered at the Borough Surveyors Office, sealed and addressed "Tenders for Guildhall Restoration," on or before SATURDAY, the 2nd day of MARCH. The Corporation do not bind themselves to accept the lowest or any Tender.

TO BUILDERS and CONTRACTORS.—Persons desiring to TENDERS for the ERECTION of the BRISTOL and WESTERN COUNTIES RACE-COURSE and OFFICES at Upper Knowle, Edinminster, near Bristol, may see the Plans and Specifications of the Work at the Office of Mr. S. H. HYDE, 59, Queen's-square, Bristol. Tenders to be sent in addressed to "The Bristol and Western Counties Race-course Company (Limited)," on or before MONDAY, the 4th of MARCH next. The lowest or any Tender not necessarily be accepted, and no payment will be made for any Tender sent in. GEORGE B. HOLLAND, Architect, New-ascot, Feb. 19th, 1872.

TO BUILDERS and OTHERS.—TENDERS are required for the ERECTION of a YEOVMANRY DRILL HALL, with corrugated iron roof, at the Star Tavern, No. 45, Pease-pool, Aylesbury. Apply to Mr. J. W. GIBBS, Architect and Surveyor, 4, Franco-road, Windsor, where the plans may be seen on or before the 5th day of MARCH, at 10 o'clock. Tenders to be returned on receipt of a blank Bill Tender—Tenders addressed to Mr. A. WILSON, 10, St. Andrew-street, London, E.C., up to the 4th day of MARCH, 1872, endorsed "Tender for Drill Hall."

TO BUILDERS.—Builders desirous of TENDING for the REBUILDING of the certain ALTERATIONS at the Viarage House, Canewdon, near Rochester, may see the Plans, specifications, and conditions at the Viarage House on or before the 5th day of MARCH. Tenders for the work are to be forwarded to the Viarage, addressed to Mr. Rev. T. A. WILSON, 10, St. Andrew-street, London, E.C., up to the 31st of MARCH next. The lowest or any Tender will not necessarily be accepted. GEORGE WOOD & SON, Solicitors, Bechford, Essex.

February 18th, 1872.

TO CONTRACTORS.—BUILDERS wishing to TENDERS for the ERECTION of a MANSON at Teborch, near Baywin, in the County of Carmarvon, for Mr. HIGGINS & CO'S use, may see the plans and specifications of Messrs. HIGGINS & CO'S Office, 10, St. Andrew-street, London, E.C., on or before the 5th day of MARCH, between the hours of NINE a.m. and SIX p.m. Tenders to be sent in on or before the 5th day of MARCH, at 10 o'clock. The lowest or any other Tender will not necessarily be accepted. Any further particulars may be obtained from Mr. R. G. THOMAS, Architect, Mansel Bridge. February 12th, 1872.

TO CONTRACTORS.—The Directors of the Louth Water Company are prepared to receive TENDERS for the CONSTRUCTION of a SEWER, ENGINE and PUMPER HOUSE, and other works; also for the Supply and Laying of Water Mains, Distribution Pipes, Valves, &c. for the Supply of the Borough of Louth with Water.

A printed copy of the schedule of quantities and specification can be obtained from the Office of the Engineer, at the Works of Messrs. SHELDON & ROBINSON, 7, Westminster Chambers, S.W. Tenders to be addressed to the Secretary of the Company, WILLIAM WYTHE, Fox Box, Louth, Leicestershire, and specifications may be seen on or before MARCH 1st, 1872. The Directors do not bind themselves to accept the lowest or any Tender.

TO CONTRACTORS.—SCOTSWOOD, NEWBURN, and WYLLAM RAILWAY.—NOTICE is hereby given that the Directors are prepared to receive TENDERS for the CONSTRUCTION of the GREAT SECTION of the above RAILWAY from Scotswood to Newburn, consisting of a double line of Railway, 2 1/2 miles in length. Plans, sections, drawings, and specifications may be seen and schedules of quantities obtained on and after MONDAY, MARCH 19th, 1872, at the Office of the Engineer, Messrs G. A. HARRISON and W.M. GEO. & E. LAWS, Central-buildings, Grange-street, Newcastle-upon-Tyne. Sealed Tenders, addressed to the Directors, and to be sent in on or before THURSDAY, the 22nd day of MARCH, at 10 o'clock. The Directors do not bind themselves to accept the lowest or any Tender. Newcastle-upon-Tyne, February 16th, 1872. W.M. COCKBURN, Secretary.

N.B.—The Plans, &c. for the Second Section from Newburn to Wyllam, will be ready in a few days.

PARISH OF CHELSEA.—Notice is hereby

given that the Vestry of this Parish will meet at SIX o'clock in the evening, to receive TENDERS for the SUPPLY and ERECTION, from the 26th March, 1872, to the 25th March, 1873, both days inclusive, of the following ARTICLES and WORKS:—

- Sewerage's Brooms
- Sewerage and Watering
- Sewerage, Watering, and Removing Dust, &c. Kensal New Town.
- Carriage and Horse Hire
- Collection and Removal of the Dead, Ashes, &c.
- Street Lamp-post Fixing, and the Supply and Fixing of Lanterns, Fittings, &c.
- Coal and Coke
- Plinths
- Graffiti, of different kinds, broken.
- Do. do. do. for delivery at Kensal New Town.
- Mason's and Pavier's Work and Materials.
- Red Gravel Hoopings.
- Gravel, Shingles, and Gravel Hoopings.
- Bricklayers' Work, Sewers and Drains.
- Collection and Removal of the Dead, Ashes, &c. Kensal New Town.
- Watering the Roads.
- Supply of Fuel and do. do. Kensal New Town.

The Tenders (except those for the supply of water, &c. for watering the roads) are to be open printed forms, which, with further particulars, may be obtained at the Office and copies of the brooms, lamp-post lanterns, &c. required may be seen at the Surveyors Office, here daily, between the hours of TEN o'clock in the morning and FIVE o'clock in the evening, on and after MONDAY, the 26th day of MARCH, at 10 o'clock. Tenders are to be sent in, addressed to the Secretary, on or before THURSDAY, the 7th day of MARCH, 1872. The Directors do not bind themselves to accept the lowest or any Tender.

The Vestry reserve to themselves the right of making special contracts for any of the above trades and for any of the above articles and works, if they shall see fit, and do not bind themselves to accept the lowest or any Tender.

The Tenders are to be delivered sealed, addressed "To the Vestry of the Parish of Chelsea," and endorsed "Tender for—" by or before TWO o'clock on the said 4th MARCH proximo. Each Tender must be enclosed in a separate envelope.

All contract-bills will be presented to the Vestry. If any article or work be not supplied or executed to their satisfaction, the Vestry reserve to themselves the right of making special contracts for any of the above trades and for any of the above articles and works of other parties at the expense of the contractor. Parties Tending must appear personally at the time the Tenders are opened.

By order of the Vestry, CHARLES W. VESTRY, Clerk. Vestry-hall, King's-road, S.W. February 22nd, 1872. Each person tendering, as a guarantee for the execution of the works, is required to bring (but not to enclose) a bank note, value ten pounds (£10), which shall be retained until the work is completed. The note will be returned should the Tender not be accepted. The notes brought with Tenders subsequently accepted will be retained until the contract deeds are fully executed, or until the contracts are otherwise completed.

The Builder.

VOL. XXX.—No. 1517.

Contemplated Legislation as to Employers and Employed.

It is announced that the important question of the relations between master and workman will come to the fore in the course of the present session of Parliament. Even if no specific enactment had been contemplated on the subject, it must have cropped out in the course of the discussion of other matters,—such, for instance, as the Bill for the regulation of collieries. In all questions affecting workmen's clubs or benevolent institutions, strikes, conspiracies, payment of wages in cash or in kind, one general principle is involved. It becomes, therefore, extremely important that this true

principle, which underlies all the relations of our and capital, should be distinctly understood. It is very possible that exaggerated fears, or equally disproportionate fears, may be entertained as to the effect of legislative action on those relations. All the more is it expedient steadily to contemplate the question in the white light of truth, undisturbed by the taint of controversy.

It is unnecessary here to go far back into the history of the relations of employer and employed. The only reason for any reference to this part of the matter is to be found in a fact, that the condition of the agricultural labourer presents features from which the state the manufacturing operative or craftsman has come almost entirely dissociated. While the ancient laws as to villenage, ascription to the lord, or any of the successive steps from serfdom to freedom, are only to be studied in actual operation in Russia, or in non-European countries, they have yet left their mark on our institutions. The tie between a pauper and his parish is a relic of these laws. And in our remotest rural districts, the day labourer is, in point of fact, though not by the enactment of law, very much under the command of the resident farmers, who are the sole distributors of employment. So much is this the case that a certain amount of female and infant labour in harvest time is in some cases compelled, as a condition of agricultural employment for the man. No view of the case, therefore, can be adequate that fails to glance at those instances where the influence of the feudal system, and of a social state older and under an feudalism, has not yet become entirely operative.

Without touching upon the ethics of the case, may be stated as the preliminary condition of inquiry that the relations between the employer and the employed are regarded, according to the genius of the age, as simply matters of contract, the sanctity of contract is a subject especially congenial to the English character. There can be little doubt that the tendency of modern legislation, as well as of modern thought, is to trace all the relations of society more and more

upon the basis of contract, either actual or implied, and perhaps fictitious. Labour is theoretically regarded as a commodity. The labourer has something to sell;—the strength of his muscles, in the humblest cases,—the intelligence and skill of his eyes and fingers,—the experience and ability developed by the practice of his craft. The higher and rarer the power he brings to the service of his fellows, the higher his pay. One man can only guide a plough; another can move an army in the field. To each according to his ability should be his remuneration.

If contract, then, be the basis on which the employment of labour is to be regulated, the next point is that contract should be rendered at once free and binding. In its inception it should be perfectly free; as free, that is to say, as the condition of civilisation will admit. Its permanent and enforceable character is an element as necessary to its proper action as its freedom of origin. And enforcement involves penalty. For all parties to be free to contract, there must be a third party, that is to say, the law, to take care that a contract, freely and duly entered into, shall not be treated as a dead letter.

This, we hold, is the main principle to be borne in mind. Details may be numerous, and modifications may be necessary. But with one luminous principle kept distinctly in view, countless squabbles may be arrested. It is as when a sailor guides his course by the stars or by the compass. With every shift of the wind he may tack or veer; with the encounter of every wave, he may deflect to the right or to the left; but his object is fixed, and his course, infinitely variable in its momentary direction, is, in the main, straight.

Freedom of contract, however, implies one important preliminary. To be real and effective, there is requisite, not equal, but equivalent, knowledge and intelligence on the part of the contracting parties. Here, again, the principle is clear, although the application may become extremely complex. Legislation recognises this truth, by rendering contracts in certain cases invalid. Infants,—legal infants, be it understood,—are considered incapable to contract. So,—shall it be said to the honour of the civilisation of the day?—are married women. If a contract be shown to have been entered into in consequence of fraudulent representations,—that is to say, in consequence of one party receiving information superior to that of the other, and making an unscrupulous use of such information,—the contract may be void or voidable. The common sense of justice entertained by mankind confirms this rule. If the case of the soldier who has enlisted when he was drunk be cited as an exception, the answer is that drunkenness, itself a crime, cannot be pleaded as an excuse for any act committed during the temporary unintelligence of the actor. A man cannot be allowed to plead his own *fort*.

It is evident that so long as there exists a great disparity between the education and the means of information possessed by different classes of society, there will exist a cause of disturbance in the freedom of contract. But all that legislative action can contemplate, by way of interference in the matter, is, to give relief in case of actual fraud. Hardships there must and will be, and mistakes many; but under troubles of this kind the education of the whole people makes its way. The more widespread is education of all kinds, especially, in this case, knowledge of what is actually going on in the special occupation to which the contract refers, the more thoroughly free will be the inception of contracts.

Having regarded thus far the general state of the case, the next point to consider is the relative or counterbalancing advantage possessed by the employer and by the producer of labour. It is not equality, as we have hinted, that exists or should exist between the parties

but equivalence. All barter, all exchange, all contract, are based on one man having something with which he is willing to part, in exchange for something with which some other man is willing to part. An African savage, for whom bountiful nature supplies the fruit and the leaves which form his sole food, clothing, and furniture, is the best example of what we may call a self-contained man. What does he need to buy or to sell? First, indeed, he has to buy a wife; and here comes his initiation into commerce. Later, he has found out,—and so much the worse for him,—that by stealing and selling his brother he may acquire a certain quantity of ardent spirit, or of gunpowder; and so, little by little, he enters into the comity of civilised nations. With every increase in art and in industry, with every new division of labour, the difference between the producing value of man and man increases, while, on the other hand, the artificial bonds of mutual interdependence are in the same degree drawn more closely together.

The tendency of the present course of affairs, in almost every instance, is to throw the balance of advantage on the side of the owner or producer of labour, as compared with the employer. We do not say that this balance is, at this moment, on that side. The inquiry necessary to solve that question would be intolerably minute; and by the time that it was completed it would be necessary to re-commence it. But as to the direction of the change which is taking place, we think it can admit of no doubt. That all, or nearly all, the advantage was originally on the side of the master, cannot be denied. What, and where, will be the upshot, is not easy to foresee. But that, in contracting together for the execution of a common object, which neither party can at present separately attain, the actual workman is, more and more, becoming able to fix his own terms, is a fact that must be steadily borne in mind in any useful investigation of the subject.

In our large manufactures,—such, for example, as the iron trade,—this tendency of the scale to turn in favour of the labourer as against the capitalist may be most plainly pointed out; and so long as competition is the principle that regulates trade, this movement of the scale must go on; for it will be seen at once that the increased facility of obtaining information which modern science is daily yielding is, mainly, an advantage to the workman. It is to his interest to communicate knowledge to his fellows, while it is to the interest of the employer to keep it to himself. Let us take such an instance as the arrival of a large foreign order. Suppose that the Russian Government wishes to purchase 50,000 tons of rails. Every iron-master who catches scent of the commission will maintain the utmost possible silence. He will seek to make use of his knowledge in order to obtain the job. The fewer of his competitors who tender, and the less those who do tender know of the course of business adopted by the Russian Government, as to inspection, mode of delivery, mode of payment, and other details, the better will it be for his chances of securing the order. On the other hand, with the workmen the case is diametrically opposite. "Here is our master," they will say, "with a heavy contract round his neck. He is no doubt under penalties as to time. It is a good opportunity for obtaining an increase of wages." The more fully this knowledge is spread among the producers of labour, the more united and effective will be their action. And it is evident that, from year to year, it will be more and more difficult for the masters to obtain exclusive information, and more and more easy for the men to communicate intelligence. It is hard to see how the continuance of the competitive system among manufacturers can fail to involve them in constantly increasing difficulties. Unless something in the nature of a vend, or syndicate, be introduced into the great trades, our manu-

facturing industry contains within its bosom the elements of its own destruction.

This view of the case is, no doubt, new, neither to employer nor to many of the employed; but it has never, so far as we are aware, been brought before the public. Its importance is immense. Then it must be remembered that the capitalist is, in almost all respects, far more dependent on what we may call the goodwill of his particular establishment than are the operatives. He has given heavy securities in the form of land, buildings, machinery, organised staff, and other expensive outlay, the value of which depends altogether on the activity of his establishment. Great works, unless in full swing, are productive of nothing but vexatious loss. Labour, on the other hand, is free both to migrate and to emigrate. The displacement of the abode of a labourer is a matter of very little difficulty. In fact on great public works, especially our railways, have been principally carried out by floating, migratory labour. After a time the "navy" grows tired of his locality, usually passes a long boat in the public-house, makes a ten or twenty mile march, and offers to a new-found employer nothing but his sturdy arms, and perhaps, if unusually provident, a shovel or a pick. The perfect freedom of contract thus secured did, however, in point of fact, turn out very well for all parties during the construction of our great lines of railway.

With the agricultural labourer on the other hand, the case is reversed. Tied to his cottage, and burdened most likely,—owing to the discontinuance by the farmers of the good old habit of keeping their workmen beneath their roof,—with a wife and child or children before he is one-and-twenty, the rustic can only look for an amelioration of his condition to a large increase in his own educational activity. So fully is this understood by his employer, that we have known instances of strong objections being made to the teaching of geography in village schools, lest the labourer should learn that all the world was not as his parish, and that other parts were accessible to his feet.

To pass from that portion of the case which is still rapidly undergoing transformation to the second part, the sanctity of the contract, the first thing desirable seems to be that there should be a thorough universal definition of what such contract is. We should not be left to common law,—that is to say, to a state of things which no man can be expected to understand except on condition of heavily paying a lawyer to tell him, who, ten to one, may tell him wrong. We require such a plain, simple, authoritative definition of the law of contract between the labourer and his employer as may admit of no mistake. The first element in such a law is a definition of the time of hiring. This varies in different cases. It may be a question of minutes. In the case of a fire, the rupture of a dyke, a railway accident, or the like, every available hand may be required for a very brief time. On the other hand, in the case of the agricultural labourer, a year is the shortest time that should be contemplated by an engagement. Domestic servants, foremen, skilled artificers, operatives, exercise numerous vocations, to each of which some term of contract is most appropriate. This should be broadly and intelligibly defined. The time for which each party is bound, not by vague special agreement, misunderstood, it may be, by either at will, but by distinct general regulation, should be unmistakable. This is an essential part of any true freedom of contract.

The question of wages should be no less distinctly regulated. It is a disgrace to our age that we should yet be called upon for legislation to protect the workman from the truck system, under one disguise or another. The main points required are, that the rate of wages should be fairly stated at the commencement of the employment; that they should be paid in money, without deductions, at fixed dates, at the place of employment, and not at any public-house. For weekly payments, it is of the greatest importance to the workman, and therefore of real service to the employer, that, as we recently urged, the pay-day should be on a Friday. Connected with this should be a provision, to be enforced under stringent penalties, that any goods supplied by the employer to the workman should be supplied at cost price. Were this once enforced, the truck system would be at an end.

It might tend to the establishment of that perfect understanding which is an essential element of all harmonious organisation, if a printed agreement, on a penny stamp, were rendered imperative. The revenue would benefit;

its officers would, at all events, be credited with the ability and the desire to scent out any infractions of the law; and the tax is one that would be sweetened to the tax-payer by the great benefit accomplished by the clear definition of his position.

With these provisions, which may be said to be altogether in favour of the workman, were it not for the consideration that the higher is the actual position of the latter, as regards education, intelligence, and the self-respect of a citizen of a great country, the better is the condition of the just, competent, and upright employer,—must be coupled distinct guarantees for both the freedom and the fulfilment of contract. The legal recovery of any sums due for wages must be simplified to the very uttermost. For instance, the penny stamped agreement, in the absence of a receipt, might be taken as sufficient evidence of debt. If a magistrate had power to make summary order for the payment of wages, for any time not exceeding a month, on the production of one of these documents, unless the corresponding receipt were forthcoming, the habits of business-like regularity that would perforce ensue would be of no small value to the community. With measures intended to secure payment, must be coupled measures calculated to insure fidelity of work, industry, and order. We can do little more than indicate this part of the question. But just in the proportion in which caprice on the part of the employer is checked, by defining the rights of the workman, must fidelity on the part of the employed be rendered imperative. We bring forward this view, not as one with which any of us are at the moment prepared fully to deal, but as one which it is essential to discuss, and which must be properly wrought out before any settlement of the question can be more than vague, temporary, and unsatisfactory. Properly regarded, it is to the interest of the operative, as much as to that of his employer, that a broad and trenchant line should be drawn between the idle and the industrious workman. It is lamentable that the action on the part of the workmen themselves, instead of being directed to insure this end, has been lately bent in the very opposite direction. Here lies the main difficulty of the whole case; and, until this difficulty can be solved in a manner consistent with wisdom and equity, here is the seed of the decadence and decay of the industrial eminence of Great Britain.

With any legislation to settle the question of labour, must be blended a sharp and summary penalty against intimidation. In no respect can the freedom of contract exist, while either party is subject to menace or to danger from a combination on the part of others. It is most expedient that this question of combination should be removed from the tangled web of legal construction and phraseology, and dealt with with Draconic simplicity and severity. It may, and no doubt will, be said, that provisions of this nature are mainly protective of the employers. Such is not our opinion. Even if such were the case, so long as that protection is not ineffectual, the masters are entitled to receive it. But as matter of experience, it is the honest, steady, industrious workman who chiefly suffers from intimidation. If civil society is to exist, its members are entitled, as a just return for what they yield to society, to be protected against private war, or the threats of private war. Short, therefore, of such measures as should render the unproved accusation of intimidation anything but a serious offence, the utmost stretch should be given to the law for the prompt and condign punishment of a crime which, more, perhaps, than any other, strikes at the main springs of our national wealth.

We need not disguise the fact that we have regarded the entire question from a lower ground than we would naturally select. Unless the moral, as well as the legal, view of the relation of master and man be true and elevated, we shall effect but little permanent good by legislation. Into that, however, we cannot now enter. While something higher than contract ought to regulate these relations, it is still true that contract is that to which the spirit of the age looks; that with it alone legislation can deal; and that it ought to be free, fair, and sacred.

Metropolitan Fire Brigade.—At their last meeting the Metropolitan Board of Works agreed to advance the salary of Captain Shaw, the chief officer of the Metropolitan Fire Brigade, from 750l. to 850l. per annum. An increase was also voted to several of the other officers of the Board.

THE GENERAL EXHIBITION OF WATER-COLOURS.

The eighth exhibition under this title, now open at the Egyptian Hall, bears out its distinctive epithet by the variety of subject and style of treatment to be found among the large number of drawings (nearly 700) which make up the collection. We have every grade of subject, allegorical and grotesque, ideal and realistic, subjects too ambitious to be successfully treated, others too mean to be worth treating; worked in every manner, from pure water-colour to almost undiluted body-colour. As in all such exhibitions (and as it must be when painting has become so great an extent a competition in successful manipulation) there is, after subtracting whatever might be called really bad, a large residuum of praise-worthy mediocrity,—of works which are simply attaching to them, without any further interest. Of those which go beyond this point, which are marked out by individuality of thought and treatment, we will endeavour to indicate the best, without suggesting that we have exhausted the list.

Among drawings of figures, Mr. S. Solomon's are likely to be most noticed. "Until the day-break, and the shadows flee away" (189) shows three very beautiful and imaginative heads; of his two quasi-allegorical figures, Nos. 73 and 201, the latter, "Dawn," is the best; the other has little distinctive sentiment, and the drapery is too heavy and solid-looking. Mr. Barno Jones will hardly increase his reputation by his solitary contribution (196), also in the allegorical line,— "The Triumph of Fame, Fortune, Oblivion, and Love"—four small drawings in one frame, executed apparently on canvas, after some fashion peculiar to the artist. The first is fine in composition, and the best design altogether; the nude figures in all are unhappily of a most unsatisfactory nature, meagre and starved-looking, and disproportionately long in the trunk. Pity that an artist of real genius should be content with this kind of work, which can only be set down to carelessness or intentional eccentricity. Madame Bisschop's "Sweet, my child, I live for thee" (227), a repetition in water-colour of an oil-painting to be seen recently in Mr. Wallis's Gallery, is open perhaps to the contrary charge of being weaker in idea than in execution. The handling of the two figures and the accessories can scarcely be too highly praised, as a piece of broad, effective treatment in almost pure water-colour. Miss (or Mrs.?) Russell's "Juliet and the Nurse" (307) is a very careful attempt at a realisation of the latter character, so difficult to do justice to: the Juliet lacks intensity of expression. The drawing is a large one, with much brilliancy of colour. "The Iron Way" of Mr. C. Martin (338) has merit of a different stamp. In the interior of a railway-carriage, skirting the Bay of Naples, sits an Italian priest, gazing through the window with a painful expression of dissatisfaction at the present rate of "progress." There is a thought here, worked out with simple and unexaggerated force. Genuine pathos there is in the attitude and expression of the young girl whom Mr. Scott shows us (425), awakened by the morning sun, to lament afresh that "Thou hast left me over, Jamie." Mr. Poynter's two portraits (81 and 100) are interesting and carefully-worked studies of colour and detail in dress and ornamental accessories. "A Sketch" of an old man mending an umbrella (563), by Mr. J. Knight, should not be overlooked. By Mr. Townley Green wished his "St. Giles-in-the-Fields" (574) to be mistaken for one of Mr. Pinnow's drawings, he has, perhaps, succeeded; but he had better look out for a style of his own,—stolen goods of this description seldom bring benefit. The three little drawings,—two of them minute in scale and finish,—of M. Felix Regamy (595, 617, 614) show that he has a style and manner of his own, though an artificial and sensational one. The minuteness of finish in one at least of these reminds us of Meissonier. "Enter certain Maskers" (600) is a title which at once suggests the name of H. S. Marks, whose little drawing, suggestive of the style proper to fresco-painting, will perhaps be judged by not a few to be the best thing in the Exhibition. Two charming little landscape sketches by the same hand (555, 575) give pleasant proof of this artist's versatility; the latter has all the appearance of a rapid *con amore* study by a hand chiefly practised in landscape; no one certainly would, without the catalogue, refer these and No. 606 to

the same author. Mr. W. Crane's "Church of the Capuchins" (182), carefully studied as it is, one really can hardly accept as "water-colour;" there is scarcely a bit of transparent colour in it. Mrs. Stillman (*vide Spartali*) is represented by a large drawing of a monk "In the Cloisters" (167), Mr. F. Dillon by "An Egyptian Effendi" (194), a very highly-finished drawing. Miss Gilbert's "Happy Memories" (170), Mr. Jopling's "Water," head of a young lady (262), and Mrs. Sparker's "Springtime" (387) should be overlooked. Miss Maddox Browne's ambitious and clever work, No. 295, is marred by the total lack of beauty where it should have been most apparent, in the face and form shown in the magic mirror.

Among noticeable landscapes is Mr. Whitaker's fine drawing, "The Coming-in of the Sea-fog, Pwllie, South Devon" (51), where a glow of evening sky above is divided from its reflection in the wet sand and water of the foreground, by the dark mass of cliffs in shadow and partially enwrapped in fog. The whole effect is very fine. Among the rather small class of landscapes which interest by their individuality of style may be mentioned those of Mr. Ditchfield, especially "A French River" (38) and "On the Thames" (208), which in general manner remind one a little of Corot, without suggesting plagiarism. Mr. Field Talfourd's small drawings are still more interesting on a similar account, as showing originality in the artist's view of nature and in the use of his materials; note especially the two little grey sketches, Nos. 320 and 616. Mr. Macallum's "Cutting Peat" (306) is a fine, powerful drawing, with figures of considerable character and interest in the foreground; Mr. Aston's "Tees at Rokeby" (270), a very good piece of pure water-colour treatment, especially praiseworthy for the breadth and simplicity with which the masses of foliage are treated; this drawing has already appeared in a provincial exhibition. Mr. Howard's No. 173 (no title), an evening scene with much light in it; Mr. Pilleau's "Temple of Koom Omhos" (43); Miss Malleson's "On the Look-out" (101), with a great deal of wind in the thin trees; Mr. Parker's "Misty Sunrise" (217); "A Calm Evening" (230), by H. W. Williams; these and some others will repay attention as studies of landscape.

Among drawings of architectural subjects the first place will certainly be given to Mr. Spiers's sketches in "Paris after the Commune" (23, 70, 26, 592), admirable in effect without being in the least laboured. "Temple Bar in August, 1871" (659), by Rose H. Long, a careful little drawing from the Law Courts site, will soon have a certain historical interest.

Among drawings of flowers we must not omit a notice of "Azalea" (45) and "Study of a Japanese Lily" (339), both by Mr. Jopling; the former a fine combination of colour, with its crimson flower and blue and white vase. Among sketches exhibited on the screens are some very good specimens by Mr. Ditchfield and Mr. Slembro.

There is a great deal to look at in this exhibition, especially for students of the various methods of handling possible in water-colour.

ART VERSUS MANUFACTURE, AND THE EXHIBITION OF '72.

THERE would seem to be no possibility of making things artistic stand still, or even go on in some regularly appointed way. We all supposed that the movement set on foot by the Exhibition of 1851 would, without doubt, continue, and, moreover, that nothing much better as an art influence, and as an encouragement to artist workmen, would or could be devised. Nothing, we are sometimes told, succeeds like success, and most surely the 1851 Exhibition was a success, and the only thing which could well add to its good name was that it might be repeated at least once in every ten years. But even to a great success there may sometimes be a drawback, and a something that may have in it an element of failure. So much has been said about that special Exhibition of '51, and on exhibitions generally, that it would almost seem impossible to give utterance to a new thought about them; but the real truth is that most of the talk has been beside the mark, and the world has forgotten to ask, or to keep in mind if it never knew it, what these Exhibitions are really and truly for, and what it really is that they ought to do, or at least endeavour to do. Now, as it seems to us, nothing could possibly be

better than the original idea or plan of the first Exhibition, as it must have struck the mind of any one who tried to understand it. It was simply, though no one actually said so, supplementary in its action to the yearly exhibition of the Royal Academy. The Royal Academy exhibits *pictures and sculpture*. The *bona fide* work of the artist, and the real and true idea of the '51 or first Exhibition was to exhibit and show to the world, not only as the Academy does with its pictures, the works of our own artists, but the work of the foreign artist and workman as well. This was the main idea and the chief and crowning one,—the artist and the artist-workman were those who were to show to the world what could be done with the raw materials and unornamented materials provided by nature and machinery. But was this primitive and good idea realised and truly carried out? We are obliged to confess that it was not, and that not only was it not carried out and fairly acted upon, but that the final outcome of the whole scheme was the direct negative of the main and true idea, and its very reverse. The Exhibition culminated, not with artistic work, but with manufactured work, and it was to the employing *manufacturers*, and not to the executive artists, that the Exhibition gave its prizes, and its commendations, and its applause; and, as all know, everything went off with flying colours, and made up a magnificent success. But there can be no evil, however obscure or little known to the world, without the chance of its growth into something or other, if it be only to assure the world that "progress" is going on and is being made; and it so happens that the idea of art-manufacture, which the Commissioners of the Exhibition accepted for art, throws the whole power of it practically into the hands of, not artists or artist-workmen, but *tradesmen!* It was not the artist's studio, or even the workman's workshop, but the show-shop and the warehouse that got the ascendancy; and the consequence has naturally been, as was only to be expected, that the "goods" exhibited and the character of them became altogether secondary to the selling of them. And not only is this most significant fact to be borne in mind, but it should be understood that the principle of art-manufacture involves the perpetual repetition of the same thing over and over again. The artist, even if he exist, or has done any real work, is soon nowhere; and the "shop" soon grows into gigantic dimensions, and all but smothered out of existence the poor little *work* shop out of which the object, whatever it is, originally grew. All this and more came to pass in the last Exhibition, the small shop grew into a huge national bazaar, and no one seemed to think of anything but the mere selling of the goods and the replacing them by others, as readily and quickly as it could be done; and you soon found, as we did in the French Court, that it was impossible to learn even the name of the artist or artist-workman to whom the real credit was due for any artistic quality any one object possessed. The exhibitor, and the showman and showman, you readily found, but the artist and workman were nowhere. We may, perhaps, be allowed here to instance in proof of this the Renaissance chimney-piece in white marble in the French Court; it contained, in addition to the happy thought of it, the finest example of drapery marble cutting in the whole building, and was a true artistic performance; the showman of it you might see every day, and the name of the selling firm in sufficiently legible letters, but even the name of the man who drew and carved the fine work it was in vain to search for.

Now this, it will be confessed, is a very singular state of things in these modern and advanced and educational days wherein so much, and at such vast expense and trouble, is being done to teach people art and the principles of art; and when there are vast organisations all over the country for the express purpose of encouraging the artist and the workman. The Art Department, with its accompanying museums, costs the country some 100,000*l.* a year; and the simple meaning of that tangible and expressive vote is, that that large sum is in the end for the express purpose of helping towards the recognition of the individual artist and the artist workman. It does not do this, unhappily; but in words and common talk it is compelled to recognise the artist and the art-workman, for there is no one else to pretend to teach.

Do not let any one mistake the significance and meaning of these modern doings and their influence on art and artists; for it is not a little

important just now to get a clear view of things artistic and manufacturing. The important meeting at the Mansion House, presided over by the Lord Mayor, some little time ago, was for the purpose of protesting against the big shop or bazaar system of conducting an artistic show. The meeting thought that the foreigner had had the best of it, and the foremost enemies and the best places in the big window at South Kensington, and consequently the very best chances of show and sale. And so, doubtless, he had; but the real question was, and it is a pity, indeed, that some one of the speakers did not think about it,—did the Frenchman, for instance, show to the world the most individualised work, and did he make any effort at all to evidence this to the world? In other words, did the Frenchman produce true and *bona fide* art-work, and was he so far aware of it and alive to its value and importance as to fairly recognise the executive artist as well as the work that he produced? Unhappily there is but one answer. All were alike; neither the foreign exhibitors nor their British rivals made any attempt to bring into prominent notice the artistic power which made their works of any value. An artist's name, it is true, was here and there to be found out, but it was the rare exception and not the rule; and this it is that brings us, perhaps unconsciously, to the real nature of these exhibitional displays of so-called art as a final result. Artists and artist workmen, of course, did the work. There is no other way after you leave the machine; but they do not work *individually*, but in *gangs*, or one after another, so that it is in most cases really impossible to name the man who did the work: all have had a share in it, no one man can claim it, as in a cabinet picture. The whole system is out of joint, and the real and true nature of art-power, and its proper and only true mode of action, is in no way recognised. What a pity it seems that no one at the Lord Mayor's meeting said one word about it, or even hinted at it; perhaps no one knows anything whatever about it! And yet is it the true cause of the interest and character to be found in the old work of the past. It was not machinery, or "improvement," or "education," or a comprehensive knowledge of every style of art and of every thing or organisation that made the great artists and workmen, or that built cathedrals and old churches, or temples of the gods, but the artist and the artist-workmen acting as individualised powers, and, consequently, original powers; for nature, either directly or indirectly, never repeats herself. The difference may be small, but still there is always a difference. It is wonderful to think how entirely the art-power in human nature is misled, and lost sight of, not here only, but over all Europe and throughout what is called the civilised world. What the London manufacturers were really complaining of, is a free trade and selling affair, with this added, that, seeing as they did the difficulties in the way, they thought it best to object to the shop altogether. But the Royal Commissioners, with their executive officers, cannot evidently see why buying and selling should not go on all through the Exhibition as at the end of it; for the collection being made up of articles manufactured by machinery, and by human agency acting mechanically, and as machines, the work produced *must constantly repeat itself*: the article sold over a South Kensington counter at the opening of the Exhibition is replaced at once by its duplicate, and so on to the end of the show. What is the difference between them? A lot of dinner-plates, for instance, artistically got up, according to the Minton standard of art, are simply repetitions of each other, though the patterns on them may differ; but they are the same things perpetually repeated, for they are the result of a system of manufacture, the individual object passing from hand to hand, or from machine to machine, like a pin, or a nail, or a lock. But all this is not art; for, having looked at one "bit of ware" out of a thousand, you have seen 'em all. This is business, maybe, but it is not fine art, nor the individualised expression of the mind of man, and the work of his hand in material. But it is the latter that the original idea of these Exhibitions was intended to foster.

It would, perhaps, be impossible to exaggerate the importance of this question, as bearing upon future Exhibitions; and we can but hope that in time some of our influential art societies, such as the Institute,—we do not dare to think of the Royal Academy, who are they who *ought* to do it,—will take up and carefully consider this great subject. For ourselves, we would only urge on the Royal Commissioners, who will,

doubtless go on with their bazaar and shop system of show and sale, to *add*, as far as they can, to the alterations of next year's show by devoting a space in their building for the express and *only* purpose of exhibiting the works of the *bona-fide* artists and artist-workmen. This should be done irrespective of "art firms," as they are called. The recognition should be to the actual workman, using that word in its widest sense as well as in its narrowest sense. Given the material, whatever it is, let us know and see the name, at least, of the workman who actually cut or carved it into form, or painted it afterwards, or who moulded it out of formless clay. Let, therefore, but a small corner of the Exhibition be occupied in this way, and delivering there during the Exhibition becomes impossible, for the same object cannot be replaced. It must possess, according to its power, an individual interest of its own, and will bear to be looked at twice. It is the expression of the mind in and through material forms always fresh and new.

AUTOGRAPH ARCHITECTURAL DRAWINGS ABROAD.

IN continuation of a former account of autograph drawings of the great masters in architecture preserved in public libraries in Italy, addressed to the Institute of Architects, Professor Donaldson, having recently visited the libraries of Venice and Milan, which he had not been able to see when he made his former report, has submitted the following memorandum made at Naples.—The Public Library is in the building of the Stadt (or the old Museo Borbonico), now called the Museo Nazionale. The only autograph architectural drawings are contained in ten folio volumes, 17 in. by 11 in., attributed to Pirro Ligorio. They treat of statues, medals, buildings, costumes, ceremonies, &c., of the ancients. The text is beautifully written, apparently by some scribe, in clear characters on blue paper. The illustrations of buildings are generally drawn on white paper. The volumes are divided into our consecutive series of chapters. The three chapters 48, 49, and 50, are more especially devoted to archaeological and architectural subjects, beginning with the history of the burial of the dead, from the origin of burning the corpse among the Romans after the wars of Marius and Sulla, illustrated by drawings of cinerary vases, cups, rings, altars, sarcophagi, and other articles connected therewith. He gives a bird's-eye view of an antique Ustrinum, or place of cremation. Then follow drawings of the tomb of Cecilia Metella, and plans and sections of various tombs and sepulchral temples identical with those published by B. Soria from the drawings of G. B. Montano, the ruins of which peculiar and very curious sepulchres then existed in the Campagna; but which have since the sixteenth century been dismantled of their marbles, and totally destroyed. There is a plan and elevation of the Mausoleum of Augustus. At the end are four drawings of the Piscina or Castel d'Acqua di Marius, and of the Porta Maggiore, and details connected with the distribution of water in Rome. These last are on blue paper, and not on white, as are the other illustrations.

Besides these it does not appear that there are any other architectural drawings preserved in this library. One or two of Pirro Ligorio's volumes relate to ancient medals with exquisite drawings of them, but not specially to architectural medals. The text evinces a large acquaintance with the literature of the Ancients, and perfect knowledge of antique usages.

THE CITY GUILDS.

THE great City companies were anciently, as all know, *bona-fide* guilds of trade,—handicrafts principally, bodies of traders or vendors of goods secondly. The spirit of their formation comprised the teaching of the "mysteries" of the crafts, the protection of the rights belonging to the legitimate calling, the upholding and fostering of the industries established, and the consolidation and perpetuation of these guilds of trade intact. The first change which our City guilds of trade underwent was long subsequent to the date of their early charters, which will be found to particularly specify the rights, duties, and observances attaching. The carpenters, masons, plasterers, bricklayers, goldsmiths, plumbers,—in fact, all crafts,—were once represented by duly-apprenticed persons,—

masters, employers, and journeymen. We will not discuss here some of the exclusive privileges that once appertained to the acquirement or exercise of these crafts, though, perhaps, necessary to a certain extent in early days, when a limited commerce and a limited population existed, and a very limited intercommunication with other parts of this country was attempted. The fact is now clear and patent to us all that the City companies have not for some two centuries back been City guilds of trade, except in name. Many of the first charters date back several centuries. Some few of them may be traced to the walled towns of the Middle Ages. Subsequently, new and renewed charters have also been granted, confirming and enlarging certain privileges, all with a view of fostering and supporting the trades in question. The City companies have not done much for London handicrafts since we entered upon the present century. They distribute many charities, in accordance with wills or bequests made by members some centuries ago; and not a few of the said bequests have been turned or diverted from the original intentions. To be a member of our City companies was once to be also an artificer or manufacturer in reality. The goldsmith was a goldsmith, and not a plumber; and the carpenter did not belong to the Mercers' or Salters' body. The voting of honours to foreigners, or the bestowing of the freedom of the guild on those of no occupation, was unthought of. These innovations belong to very late times indeed; they belong to our time, and the period when the City companies ceased to represent, or were gradually ceasing to represent, their special guild of handicraft or calling.

This brings us to consider the most serious point of the subject,—the funds controlled by our City companies, made up of sundry and numerous bequests extending over some centuries. There is no doubt about the matter, that the majority of all the early bequests were left by members of these guilds, who were actually belonging to the *crafts* the bodies represented. The wording of these legacies will show the wishes entertained by the deceased members, and the direction in which the donors desired their bequests should be expended.

Many relate to alms for the poor of certain parishes and to members of particular trades. Others relate to the apprenticing of orphans, children of members, or in default to strangers' children, that a certain trade might be learned, the trade of the donor. Others, again, relate to religious teaching and primary education, or schooling with a view to apprenticeship to special trades. The aims of the donors were to assist, support, uphold, foster, and transmit the rights, privileges, and preserve intact the existence of *these guilds of trade* for the original objects for which they were formed.

The City companies do not profess to perform their original duties. What is required now is a commission of inquiry, as to the belongings and spendings of our ancient City companies,—not with the intention of abolishing them, but with a view to their reform, and of utilising them for the purpose of assisting, not only in the matter of education, technical and otherwise, but of making them to some extent representatives and encouragers of the special branches of handicrafts, trades, and calling their names would imply.

It is perfectly within the province of every one of these City guilds to establish technical schools of instruction, lecture-halls, libraries, reading-rooms, laboratories, model workshops, or normal schools of art, and annual exhibitions in relation to their own respective constituencies. What a mapped-out field of labour is here before them of practical usefulness, in no way difficult, intricate, or remote of realisation! If every one of our City companies or guilds of trade would set about instituting this reform, each guild of trade nearly would have a technical college or university of its own, in no way interfering with the usual scholastic colleges or universities of the kingdom. The aim of technical instruction is to make men competent workmen, to dignify the calling of the craftsman, to make him feel the same love for his calling as those of the higher professions feel for theirs. By accomplishing this, class animosities will be destroyed, and the bazaar Capital will no longer be feared, for Labour is its parent.

Our City guilds could be made instrumental in doing a variety of practical work. By prolonging their existence, and still allowing them to perform many of the duties that have devolved upon them in connexion with the corporation,

they could subservise by their power and position in this city many other useful ends. That a crisis has been reached at last in their history and function, it would be idle to deny, and foolish to attempt to explain away. If they would protect themselves against a *coup d'état* some fine morning, levelled by some unsympathising but utilitarian minister, it behoves them to be up and doing. The City companies have their ancient charters to fall back upon, which royal warrants do not usually disturb, but Acts of Parliament may repeal or abolish certain rights and privileges lying in abeyance, or only exercised in semblance, or for no useful purpose. What exists for the general good is seldom interfered with, though its origin may date far back than the Hierarchy. The City companies or guilds, by exercising their legitimate functions, will carry the voice of the country with them, and they can plead what is even stronger than law in many particulars—"customs and usages of trade."

We do not desire to see our City companies standing up again rehabilitated with all their antique belongings, as guilds of trade; but we do desire to behold them as useful, practical bodies, really representative of trade, and turning the wealth of which they are only trustees into those channels of education, labour, and social and moral reformation for which it was bestowed.

We should be glad to waken up our ancient guilds to a sense of their position, and to show them how trouble may be averted, and necessary work for the common weal performed, resulting in satisfaction to all and prolonged security to the guilds in particular.

THE ABBEY CHURCHES OF CAEN.

THE ARCHITECTURAL ASSOCIATION.

THE ordinary general meeting of the Architectural Association was held on Friday evening, the 23rd February; Mr. Rowland Plunne, President, in the chair. Votes of thanks were passed to all who had assisted in the visit paid on the 17th instant, to the new City Library and Museum, adjoining the Guildhall, now drawing towards completion; the roofs being covered in, the windows partially glazed, and the fittings in course of execution. This was the first of the Saturday afternoon visits of this session, now a well-recognised part of the work of the Association; and was made by a fair number of the members, the building having arrived at what is deemed a good stage, affording useful opportunities for observing the general design, and the details of construction.

A paper was then read by Mr. R. Phené Spiers, "On the Abbey Churches of Caen," giving a careful description of their general features and details; discussing among others the questions not yet, perhaps, finally solved as to the original design of the clearstory of the nave of the Abbaye aux Hommes, involving interesting considerations with reference to the roof designs of the large churches erected at the end of the eleventh century. Considering also the method of the evolution of the ordinary quadripartite vault of Mediæval churches, and of the hexapartite arrangement which had preceded it. For dates, and the many comparatively recent discoveries which have given firm grounds for constructing hypotheses, Mr. Spiers made use of the elaborate paper read by Mr. J. H. Parker, at the Royal Institute of British Architects, in session 1863-64, and of the researches of M. G. Bouet, given at different periods, in M. de Caumont's "Bulletin Monumental," and in a separate publication; as also of the "Mémoire," published by M. Ruprich-Rohert, the architect, to whom many of the works of the past and for the future, at these fine holdings, owe their designs.

The paper was illustrated by sketches, drawings, &c., with plans of the buildings in question; among the latter, a complete measured ground-plan of the Abbaye aux Dames, as yet unpublished, but destined to form part of a new edition of Augustus Pugin's "Specimens of the Architecture of Normandy," to be edited by Mr. Spiers, and produced forthwith. Strange to say, no plan of this well-known church has been hitherto published, with the exception of a small woodcut in a work by M. Ruprich-Rohert; and it may perhaps seem not less strange that, notwithstanding the large amount of attention devoted to the Mediæval antiquities of Normandy, and the large number of books to their delineation, the drawings of Pugin, as engraved

by Le Keux, published in 1827, remain the most thorough authorities, the standard, practically the only, sources of accurate information on these and other buildings of the province.

In the discussion which followed the reading of the paper, opinions were expressed adverse to the polygonal or circular ends, formed by arching between the buttresses of the chapels round the choir of the Abbaye aux Hommes, Bayeux, Coutances, &c.: it being argued that the very bold forms on plan of the buildings, and the consequent masses of strong shadow, do not prepare the eye for the slower curvatures and want of bold projections to be found above; and further, that the too prominent horizontal divisions abruptly terminating all the vertical lines against the forcible impression produced by the unity of character of a design where the vertical tendency manifests itself from base to skyline. As to the original nave roof, opinion seemed to lean towards a purely wooden roof, without cross arches, as at the Abbaye de Corbie; the high level of the capital of the main pier, as discovered by M. Bouet, in the pocket of the existing vault, being considered as putting a semicircular stone arch across the nave out of the question. Some regret was expressed at the seemingly unnecessary destruction of masonry in fair condition, and the retouching of old surfaces throughout in the course of recent works at these churches.

ROYAL INSTITUTE OF BRITISH ARCHITECTS.

At a meeting, to be held on Monday, the 4th instant, the Council will recommend that the *Royal Gold Medal* be awarded, subject to her Majesty's gracious sanction, to Herr Ober-Baurath Professor Friedrich Schmidt, President of the Austrian Institute of Engineers, and Architect to the Cathedral of St. Stephen, Vienna, whose works we have assisted to make known in England.

Further:—
That the *Sonne Medalion* (with the sum of £01, under the usual conditions) be awarded to the author of the drawings distinguished by the motto of "Steadfast." (Subject of design—A Town Hall in a Country Town.)
That the *Institute Silver Medal*, with £1. 5s., be awarded to the author of the drawings distinguished by the motto "Per se totum solus ducens." (Building illustrated—Tattersall Castle, Lincolnshire.)
That in the same competition a *Medal of Merit* be awarded to the author of the drawings bearing the motto of "Alta Tullii." (Building illustrated—All Saints Church, Edington, Wiltshire.)
That in the same competition, the two sets of drawings bearing the respective mottoes of "Expirance" (Building illustrated—St. Leonard's Priory, Stamford), and "Leda" (Building illustrated—Pulbow Church, Somersetshire), be distinguished by *Honourable Mention*.

That the *Student's Prize in Books* be awarded to the author of the Design for a Staircase in a Domestic Building, bearing the motto of "Alpha."

That the *Student's Prize in Plans* be awarded to the author of the drawings illustrating the restoration of Eastbury Manor House, and six sets of drawings illustrating the Convent Gateway, Barking, have been submitted by candidates for

After due consideration, and on the report of the sub-committee specially appointed to examine the drawings, the Council have resolved with regard to the drawings of

That the first prize of 42l. be awarded to the author of the drawings distinguished by the motto of "Stet fortuna domus."
That in the same competition the second prize of 20l. be awarded to the author of the drawings bearing the motto "Brigid."
Convent Gateway, Barking.—That the prize of 10l. be awarded to the author of the drawings distinguished by the motto "Ercowwald."

Having received two letters complaining of the awards, we have examined the designs, and find no reason to express any objection to the decision of the Council. Difference of opinion in two or three cases there may fairly be: we think, for example, that the very creditable set of drawings of Inigo Jones's Banqueting Hall deserve Honourable Mention better than one, at any rate, of the two sets which have it; but it is obvious that the Council have given good consideration to the various works submitted, and we do not feel called upon to question the justice of their award.

THANKSGIVING DAY.

THE accounts of the royal visit to St. Paul's, of the decoration of the line of the route, and the illuminations at night, which have been published in the daily papers, are so full, graphic, and for the most part accurate, that repetition in our narrow limits would be foolish. These accounts, produced within a few hours after the event, although they will be taken almost as a matter of course by the millions who read them, constitute a series of

achievements little less than miraculous, and show the amount of ability employed on the periodical press, and the extent to which the division of labour is carried even in literary undertakings.

The structural accidents have been very few. We have heard only of two, both in Pall-mall. Many of the erections were strengthened, we are informed, after the appearance of our notes last week, and disaster may thus have been prevented. The erections within St. Paul's were of the most substantial character; and, if little taste was displayed in the decoration of them, they well answered their purpose. The view of the Cathedral, filled as it was, was remarkably fine, and the service was impressive in the highest degree. Her Majesty the Queen has since given £1,000, towards the decoration of the building, and H.R.H. the Prince of Wales 500l.

London has not been so gaily adorned in modern times, and has never seen a grander sight than the people presented on Tuesday, the 27th of February. Several subjects offer themselves for consideration from our special point of view, but we prefer to take another opportunity to set them forth.

FATAL THOUGHTLESSNESS.

SIR,—Having spent some hours of Tuesday, the 27th, in the parks, my attention was drawn to the crowded state of the trees, they being occupied by Darwinian sightseers, who had in some instances poised themselves dangerously over the heads of less aspiring folks. In one instance, eighteen men (about a ton weight) were sitting on one branch, until it broke and came down with them, killing one, and breaking the limbs or otherwise seriously injuring the rest. This took place in the enclosure of St. James's Park, just previously to the starting of the procession, and near to Buckingham Palace. I had been watching the branch—an immense one, and quite rotten in the centre,—and was not in the least surprised when it broke; my surprise is that many others did not break also, with a similar or worse effect. I suppose none but themselves are responsible for this, but technical education seems sadly wanting, when you see men and women whose wisdom-teeth are things of the past, doing that which the instinct of brutes does not allow them to do! Cannot somebody point out to the masses the breaking strain of timber, and of iron hurdles, the perforating power of perpendicular iron spikes, the scant elasticity of human bones, and the weight of congregated human bodies? Can they not, or will they not, think?

There are many trees in the parks whose lower branches extend most temptingly, and which should be inspected carefully, so as to be propped up or lopped off, according to their state, but should not be allowed to jeopardise human life by a similar catastrophe to that of Tuesday. Had the tree been a few yards nearer the railings, the loss of life would have been terrible; and although people have no right to clamber up the trees, yet they will get there on these occasions, and wholesale mutilation and death are too severe a punishment for an act of stupidity.

RANGER.

PRODUCTIVE PRISON LABOUR.

THE reform of our present wasteful conduct in the management of prisoners has been helped on by a paper at the Society of Arts (21st ult.), by Dr. F. J. Monat, late inspector-general of prisons, Lower Beugal. The conclusions at which the speaker arrived on the subject of prison labour are as follow:—

That the State is bound to provide secure and properly-constructed prisons for convicts, with adequate establishments.

That all prisons should be made schools of industry, and should be rendered self-supporting by the introduction of remunerative labour.

That the industrial system is well calculated to secure the immediate object as well as the end of imprisonment.

That the conversion of gaols into schools of industry is not only consistent with the maintenance of strict discipline, but is the most rational and humane means of enforcing it.

That the utilisation of convict labour in handicrafts is a perfectly legitimate employment of such labour, and that there is no sound economic objection to the adoption of the principle by the State.

That the necessary and accessory incove-

nences of imprisonment are in the imprisonment itself, when properly and strictly carried out on the separate system; and that convict labour should not be used or regarded as a punishment, but treated as an alleviation of punishment, except to the very moderate extent in which labour may be used as a measure of gaol discipline for breaches of prison rules.

That the labour should be strictly confined to the prison precincts, and should, in no circumstances, bring the prisoner in contact with the outer world.

That as punishment and reformation stand very much in the same relation to each other as curative and preventive measures in medicine, all sound systems of prison discipline should subordinate the former to the latter, because the infliction of pain or cure can only affect the individual, while reformation or prevention may influence the many, and the major in all such cases should be preferred to the minor.

NEW MASONIC HALL, LEEDS.

THE foundation-stone of the new Lodge of Fidelity, 289, Leeds, was laid by the W. M. privately, without any ceremonial, last week, and a banquet was held in the evening to commemorate the event.

The new Lodge will comprise an entrance-hall and staircase, a banquet-hall, and lodge-room, and a residence for the Tyler. The designs have been prepared, and are now being carried out by Mr. Bakewell. The builder is Mr. S. Whitley, of Leeds.

THE HABERDASHERS' COMPANY.

THE Court of this company are naturally proud of the success obtained at Cambridge by a scholar of their Monmouth Grammar School, Mr. W. R. Webb, and what they have done in consequence will serve to encourage those pupils of Monmouth School, who, by natural abilities, combined with perseverance and attention, may prove that they have profited well by the education they have received. After offering congratulations to the visitors and masters of the school, the following resolution was ordered to be transmitted to Mr. Webb:—

"At a Court of the Master Wardens and Assistants of the Worshipful Company of Haberdashers, held on Monday, the 11th of February, 1872, William Henry Skyring, esq., Master, it was moved by the Rev. C. Mackenzie, Frendary of St. Paul's, seconded by William Henry Wood, esq., the Father of the Company, and resolved unanimously, That the sum of £100, be granted out of the company's funds, by three annual sums of 30l., to Robert Ramsey Webb, B.A. of St. John's College, Cambridge, a former scholar of Jones's Grammar School at Monmouth, as a mark of the admiration of the Master Wardens and Assistants, the Governors of that school, of his talents and industry by means of which he has attained the very high distinctions of Senior Wrangler and First Smith's prizeman at the University of Cambridge in the present year."

The name of the present Master of the Company (Mr. Skyring) will sound like that of an old acquaintance to many of our readers. Mr. William Hawes, when Master of the Company, brought a number of well-known men from time to time round the table in their handsome hall, and the example is not being lost sight of under the present head.

ROME.

AT the last conversation of the British and American Archaeological Society, Mr. Parker entered into the question of aqueducts. He referred especially to the Claudian and Anio Novus, whose ruins are still so conspicuous, and incidentally to the other aqueducts, nine in all, mentioned by Frontinus, subsequently to whose time, and to the reign of Trajan, were raised ten aqueducts by different emperors. He alluded to the prescribed method of carrying the later added channels over the structures of the earlier aqueducts, and also mentioned the law prohibiting the erection of any other buildings against or within a given space on each side of the aqueduct structures. The Anio Novus, brought into the city along the majestic arcades of Claudius, alone supplied all the fourteen Regions with water, while the other channels reached only a limited number of the civic quarters and houses. The aqueducts were the centre round which other works of the ancient Romans may be considered as historically grouped, and to which antiquarian research may be most efficiently directed. Diverging from that theme, he dwelt upon the ruins of imperial buildings on the Palatine, and maintained his theory (contrary to that of Signor Rosa) that

the aggregate of halls and courts comprising the beautifully-painted chambers discovered about two years ago can be no other than the residence of Augustus, rebuilt for him by order of the Senate, within the Arx of Romulus.

Mr. Hecanus gave an account of the remains of the Temple of Claudius (called Claudium) on the Coelian Hill, where a stately portico of travertine is seen in the gardens of the Passionist Convent. He pointed out the proved identity of those ruins with the magnificent pile forming a sacred inclosure round that temple rebuilt by Vespasian after it had been destroyed by Nero to make room for one wing of his Golden House, and observed the interesting character attaching to that portico in ruin, as the only example before us in Rome of such a cinerary still retaining architectural features round a faner for heating worship.

PROPOSED EXAMINATION IN ARTS AND MANUFACTURES.

THE Committee of the Society of Arts appointed to consider the propositions submitted by Capt. Donnelly, are of opinion that it would be of public advantage if the Society of Arts were to supplement the existing examinations of the Science and Art Department by organising examinations in the science and technology of the various arts and manufactures of this country, and that these examinations should be conducted by a Board of Examiners, capable of testing the practical knowledge and skill required in the application of the scientific principles involved in each art or manufacture.

The Council have decided to call a conference of manufacturers and others likely to co-operate in the matter, such conference to be held shortly after Easter. The Council propose, in case the scheme shall meet with sufficient support from the conference, to make a beginning of the system this present year, and to take up as the subjects the manufactures of paper and cotton. With this view they are forming two special committees respectively to draw up the detailed rules for these examinations, and to settle the necessary programme.

UNSAFE LANDINGS.

THE St. George's, Hanover-square, Vestry have considered the opinion of Mr. Thrupp,—

“That where the vaults are found to be built with upright walls, the Vestry have no power to compel the owners or occupiers of the houses or building adjoining to vault the cellars and to keep such vault in repair afterwards. The only powers the Vestry possess with respect to these vaults are derived from 57 Geo. III., cap. 29, sec. 70, and 18 and 19 Vict., cap. 130, sec. 102, and the former of these sections only applies to the cellars and so much of the covering thereof as forms the opening thereto. But I do not think that the Vestry can compel a lowering of the vaults, unless under 18 and 19 Vict., cap. 130, sec. 38, and then it will take place at the cost of the Vestry. The responsibility for accidents happening upon a landing in bad condition would rest with the parties liable to repair the landing, and I am of opinion that this liability both by the local Acts and public Acts, thrown upon the Vestry (57 Geo. III., cap. 29, sec. 52 and 54; 7 Geo. IV., cap. 28, sec. 25, 26, 32, 35; 4 William IV., cap. 8, sec. 43, 44, 45 and 19 Vict., cap. 120, sec. 103, 25 and 26 Vict., cap. 102, sec. 77, 78, and 95). These sections appear to me to throw upon the adjoining owners or occupiers the first expense of laying these landings, and upon the Vestry the expense of their subsequent maintenance. In the absence of suitable provisions, it is evident from the case of *Robbins v. Jones* (C. B., N. 8, pp. 242, 243), that the repair of these landings would fall upon the public guardians of the highways,—in this case the Vestry. In the case of an accident occurring through the bad condition of the iron coverings, the owner or occupier, probably the latter, would be liable, inasmuch as they are bound to keep these coverings in repair. It will follow from what I have already written, that these landings are regarded by the law as part of the ordinary foot pavement, and should therefore as such be repaired and reinstated by the Vestry, and out of the same funds as the ordinary pavement.”

It was decided to enter this opinion on the minutes.

PARIS.

THE *Société Central des Architectes* has memorialised the Prefet of the Seine, in consequence of proposals made for the complete demolition of the ruins of the Hôtel de Ville. The Society, through its president, M. Baltard, protests against the error of supposing that restoration is not possible, points out how much of the structure remains, the ample authorities that exist for reinstating properly the destroyed parts, and asserts that the destruction of the building would be inconsistent with a love of art and judicious management of the municipal finances. The Society, including, as it does, the professional members of the Academy of Fine Arts, the chiefs of the administrative service,

and the architects most distinguished by ability and probity, is entitled to be heard; and we sincerely hope the memorial will have its intended effect, and that steps will at once be taken to commence the restoration of the building.

Fifteen working men, from Manchester, have given evidence with regard to the condition of English workmen before a committee of the National Assembly appointed to inquire into the subject.

M. Ch. Garnier, the architect of the new opera and the author of a recently-published volume, entitled “Le Théâtre,” will, it is supposed, be elected member of the Académie des Beaux Arts, in place of M. Vaudoyer.

The architect, Léon Vaudoyer, has been struck dead by apoplexy, at the Ecole des Beaux Arts, while examining the works of the pupils. He was born in 1803, received the Grand Prix de Rome in 1824, became member of the Institute in 1868, occupying the seat of M. Lebon. He designed, among many other works, the Cathedral of Mar seilles, the national monument to General Foy, &c.

FROM AUSTRALIA.

Melbourne.—The want of proper market accommodation in the eastern part of Melbourne has long been felt, and in the early part of last year competitive designs were invited by the corporation, and premiums of 200l. and 100l. were offered for the first and second best designs. In response to this, fifteen or sixteen sets of plans were sent in on the 1st of September, and at a recent meeting of the council it was decided, by a majority of 16 to 9, to award the first premium to the design bearing the motto “C'est Ici,” belonging to Mr. John Flanagan, Collins-street; and the second to the plan marked “Mercato,” belonging to Messrs. Reed & Barnes, of Elizabeth-street. The *Australian Illustrated News* gives an illustration of Mr. Flanagan's design.

The present site of the markets covers an area of 2½ acres, and upon this Mr. Flanagan proposes to erect fourteen shops fronting Bourke-street, but not by any means of a costly character. They will occupy 40 ft. in depth of ground, and each will have a counting-house on the ground floor, with dwelling over, having from five to seven rooms in each. The yards and kitchens are on the top, supported by fire-proof floors. Some of the shops have galleries round, about 9 ft. high; and the two ends and centre have attic stories and Mansard roofs. There is a large central entrance to the market from Bourke-street, with a tower over it, rising to a height of 112 ft. The remainder of the ground is to be occupied by the wholesale and retail markets, having entrances from Bourke, Stephen, and Little Collins streets. The wholesale market is roofed in with four spans of 50 ft. each, with wrought-iron curved girders, springing from cast-iron fluted columns, the spandrels filled with cast-iron ornaments. Louvre frames are fixed on top for ventilation, covered with glass running the entire length of each bay. The height of the apex of the roof from the floor is 50 ft. The entrance gates are of wrought-iron, having cast-iron ornaments. The retail market consists of one principal avenue, running parallel to Bourke-street, with three avenues extending from it to Little Collins-street, all having shops on each side, with galleries over for the sale of light goods. At the end of the central avenue a market-keeper's residence is provided; and at the end of the avenue, next Stephen-street and the Haymarket Theatre, closets and urinals are provided for the use of visitors and stall-keepers. Access is provided from the central to the end galleries by means of a wrought-iron lattice bridge, having cast-iron ornaments attached at the intersection of the lattices. The roofs are constructed of wrought-iron ribs, and covered with slates, boarded underneath, stained and varnished. Louvre frames running the entire length of each avenue are fixed on tops of ribs, having glass louvres in sides, and covered on top with glass, giving good light and ventilation. Cellar accommodation is provided under the shops in the avenues for storage purposes, and having entrances from the wholesale markets. The staircases leading to the galleries are to be of cast iron. The floors of the wholesale markets are to be formed of pavers with flagged passages all round for foot-passengers. The buildings are to be of brick, cemented, and the estimated cost is about 87,000l.

There have lately been erected in Little Collins-street West new and commodious premises for ex-

tensive wholesale ironmongers. The structure is erected on the site of buildings traded in for many years by Messrs. Gill, Fowler, & Co. Its length it occupies 127 ft.; it is 40 ft. in width, and is three stories in height. The ground-floor is 17 ft. high, the front portion being devoted to the usual offices of a mercantile establishment. At the rear the ground-floor is asphalted, with a pitched cartway. The first-floor is 14 ft. in height; the second floor is 13 ft. in height. A hydraulic lift raises and lowers goods to the first and second floors, and to the cellar. The building is erected of bluestone, with slate roof, the front being of brick, and cemented, with rusticated basement, sub-zodiac, &c., and the facade crowned with a dentilled cornice. The two upper floors are carried by cast-iron columns. The architect was Mr. Thomas Watts, and the contractor Mr. George Coruwall. The total cost was about 8,000l.

About six months since a new composition, consisting of resin and sand, for use in break-blocks on railways, was invented by Mr. Ross, of Williamstown, and a trial was given to it on the Victorian Railways, by using it in the blocks of one of the engines. Mr. Meikle, superintendent of the locomotive department, has sent in his report on the invention, from which it appears by the old method the number of miles traversed by an engine without any alteration in the blocks was 4,000, but with the new composition the engine ran 6,514 miles. There has been one disadvantage, however, and that is an increased tendency to take fire in proceeding down the declines.

MANCHESTER NEW POLICE COURTS.

The new Police Courts have a frontage to Minshall-street of 182 ft., and to Bloom-street of 117 ft. They are now approaching completion, and the two courts, which are to be appropriated to the police business of the city, have been formally opened.

The style of building is that type of Pointed Gothic of which examples abound in Florence, Verona, Siena, and other cities of Northern Italy. At the angle of Minshall-street and Bloom-street is a large and lofty tower, the lower portion of which is occupied by offices, and the upper by the clock, which has four illuminated dials, 8 ft. in diameter, and strikes a bell weighing upwards of a ton, which is placed in the arched chamber at the top. The principal entrance into the building, for the use of magistrates and persons officially connected with the courts is in the Minshall-street facade. From the entrance a broad flight of steps leads to a spacious corridor parallel with Minshall-street, which is about 6 ft. above the footwalks, and gives access to barristers' dining-room, porters' room, and various other apartments on this floor. In the centre of the Bloom-street facade is the entrance to the public hall, connected with the police-courts, which is 84 ft. by 40 ft., and contains rooms for witnesses in waiting, separated by low glazed screens. A wide staircase from this hall admits the public to a corridor 10 ft. wide, on the court floor, which gives the witnesses and officers access to the two courts, and is terminated by the general office at the angle of Minshall-street and Bloom-street. From the corridor a short flight of steps leads to the balcony connecting the public portion of that portion which gives admittance to that portion which is reserved for spectators only, who are entirely separated from those having business to transact. Opposite to the entrance in Bloom-street, a staircase from the public hall admits witnesses immediately wanted to a gallery which is raised 8 ft. above the hall floor. The ceiling being at the level of the bench (which is 4 ft. above the court floor), admits of the gallery-floor being raised, so that each court may be reached by a few steps, which are so placed that witnesses can pass at once into either court. This arrangement also admits of the court officials calling witnesses wanted either from the hall or the waiting-rooms. The public hall on the sessions side, which has its entrance from Minshall-street, is arranged in a similar manner, with the addition of a refreshment-bar, room for solicitors, and private lavatories. The remaining portion of the ground-floor is occupied by the rooms for prisoners awaiting trial, which are reached by double flights of stone steps from the cells below, and have each a separate stair leading to the docks. These waiting-rooms on the session side are separate from those on the police side by a large open area, 86 ft. long, by 44 ft. wide, with

entrance for the police van to drive into for the purpose of discharging prisoners, and a large courtyard for the police. This area divides the building into two portions, and is an important aid to light and ventilation. Ascending to the court-floor from the magistrates' entrance in Minshull-street, previously mentioned, a corridor of 8 ft. wide is reached, extending the whole length of the building, and gives access to a series of offices facing Minshull-street, connected with the business of the various courts.

The four courts, two of which are appropriated to the police business, and two to the sessions, occupy the centre of the building, and are surrounded by the offices and corridors before mentioned, an arrangement by which the noise of the adjoining streets will be materially lessened. Each court is a large lofty apartment, 53 ft. by 33 ft., and 36 ft. high, and is lighted by sixteen windows, and has a ceiling of pitch pine, panelled and perforated for ventilation; the walls are also panelled to a certain height. The magistrates' stalls on the bench are covered by a canopy the full width of the court. The barristers' seats, docks, witnesses' and public galleries, and the other fittings are of pitch pine also. The object in the arrangement of the court fittings has been to concentrate, as far as practicable, the business of the courts, and to bring the prisoners, witnesses, jury, and barristers as near the bench as possible. In order to give increased facilities for the rapid despatch of business in the two police-courts, speaking-tubes and bells have been arranged to communicate from each of the magistrates' clerks' seats and the two docks to the general office. Similar provision has also been made for communicating from the courts and general office with the officials in the basement, &c. Over the grand jury-room and adjoining the corridor are placed apartments for the resident porter. The ceiling of the basement story is raised 6 ft. above the footpath in the street, in order to effectually light and ventilate the various rooms and passages, especially those connected with the cells for prisoners. The story is 14 ft. in height. A corridor, 15 ft. wide, extending along the back of the building, and two shorter passages at right angles with the main corridor, give access to the cells, which are of various sizes. The windows in these corridors are large and numerous, glazed with obscured plate-glass, of great strength, and protected by strong wrought-iron bars. The warming and ventilation of the courts is a subject to which especial consideration has been given; and provision is made for passing heated air from the basement through a series of cavities or flues into the court-rooms and corridors. Air-ducts are arranged so as to convey a supply of fresh air to the courts, and secure a complete and constant change in the atmosphere. Heating-chambers and boiler-houses are placed in the basement, and large channels are constructed under the former to convey fresh outer air thereto, which, after being purified and warmed, passes into the courts at the time in use. The extraction of the vitiated air is effected by trunks and channels, which convey it to the ventilating shaft in the centre of the building, inside of which the smoke from the boilers and the various fires throughout the building is conducted by a wrought-iron flue.

The general contractors of the main building and the fittings of the courts have been Messrs. R. Neill & Sons; the ironwork is done by the Fairbairn Engineering Company; the heating and ventilating by Messrs. Hadon & Son; the carving, by Messrs. Earp & Hobbs; the gas-fittings, by Messrs. Thomson & Co.; the stained glass, by Messrs. Lavers, Barrand, & Westlake; the clock and bell, by Messrs. Cooke & Sons, of York; the grates and chimney-pieces, by Messrs. Wilson & Co. Mr. Samuel Taylor has acted as clerk of the works from their commencement; and the whole of the works have been executed under the direction and superintendence of the architect, Mr. Thomas Worthington, of Manchester.

A BIG GRANARY.

The only "grain-elevators" in the United Kingdom are those of the Mersey Dock Board, situated on the Liverpool and Birkenhead sides of the river; and of these we have recently received some particulars. The scene of operations is a huge pile of warehouses, or granaries, covering several acres of ground, and reaching upwards to the height of some six or eight floors. The grain-ships arrive alongside these warehouses, and the cargo, whether in bulk

or in bag, is emptied into what is called the "well" of the building, a depth of 22 ft. below the level of the quay. It falls into a "hopper" capable of holding six tons; and it need scarcely be stated that the object of thus lowering it is to dispense with the manual labour which would otherwise be necessary in filling the apparatus by which it is raised to the different floors. Corresponding with the "well" at the bottom of the building is a "tower" at the top, and the distance between the two is 145 ft. A hucket worked by a hydraulic ram travels between the two, and when a given quantity of grain has been emptied into the hopper the bucket descends, and by liberating a certain spring on its way to the bottom of the well, an arrangement is brought into play whereby the filling of the hopper is suspended, and the grain contained in the lower or sloping part empties itself into the bucket. The hopper is made to hold six tons, and the quantity discharged at each descent of the bucket is one ton—that being the quantity contained in the part of the hopper below which the filling process has been temporarily suspended by the action already described. A single stroke of the ram, and the hucket is raised from the bottom of the well to the top of the tower, the distance of 145 ft. with a ton of grain being accomplished in 45 seconds. On its upward journey, the bucket, which, it should have been stated, works on a sort of rails or guides, replaces the arrangement disturbed by its downward motion, and the process of filling the hopper is once more restored. Reaching the top, the bucket is acted upon by what is called the "tipping-wheel," and thus made to empty itself into the tower, where the contents are weighed, and got in readiness for distribution throughout the different floors and sections of the immense building. This subsequent process is even more novel and interesting than that just described. The upper floor of the warehouse is traversed in every direction by belts or bands revolving on pulleys, driven by small hydraulic engines. These bands, which are composed of india-rubber and canvas amalgamated, are from 15 in. to 18 in. in width, and about $\frac{1}{4}$ in. in thickness. A sort of "mouthpiece" is fitted on to the bottom of the hopper containing the particular kind of grain to be distributed; and by this means it is thrown on the band revolving underneath, in an even and continuous stream, and in sufficient quantity to keep the hucket going regularly between the well and tower, with its load of a ton every three-quarters of a minute. The grain is carried forward on the band at a very considerable speed; and by the introduction of what is called the discharging or throwing-off apparatus, which can be attached at pleasure, it can be deposited in any section of the top floor, or diverted down shafts, which carry it to any of the numerous floors underneath. These warehouses in Liverpool have been in operation about three years. The machinery, which is of a very simple but effective character, was supplied by the firm of Sir W. Armstrong, of the Elswick Works, Newcastle-on-Tyne; and the system is stated to be superior to that in operation at Chicago, where "grain-elevators" are quite an institution. The capacity of the Liverpool warehouse is something like 40,000 tons.

THE COST OF ASSOCIATED HOMES.

WITH reference to observations that have been made as to Associated Homes obtained by co-operation, Mr. W. Morrison, as a director of the Improved Industrial Dwellings Company, has addressed a communication to the *Co-operative News*, giving some useful information touching the cost of such buildings.

"I think [he says] that our operations have covered a sufficient extent, both of area and expenditure, to afford a trustworthy basis for calculation, as according to our last-balance-sheet our completed buildings are in eleven different localities, from Greenwich to Pimlico, and our expenditure on sites and buildings amounts to the sum of 212,175*l.* The accommodation provided suits the industrial classes in London; we have a very small proportion of unoccupied tenements, and in our last completed block in George-street, Grosvenor-square, where the rooms are not yet dry enough for immediate occupation, we have already received 180 applications for thirty-eight tenements. These blocks vary in height from three to eight stories, and consist of "tenements," each tenement having its own outer door opening into the street, or on

to a common staircase; the number of rooms in each tenement varying from two to five (counting as one room a kitchen with copper, dust-shoot, and water-closet)."

"I will first take our leasehold buildings, erected on building leases. In these cases the cost of the site takes the form of an annual rent, and does not appear in the following lines, which, however, include every other item of cost—legal charges, draining, laying on gas and water, paving and making or repairing roads. In the case of three blocks, containing 1,050 rooms, I find the cost was 43,066*l.* or about 41*l.* per room. In these cases the block contained dwelling-rooms alone, and no shops.

In the case of two blocks on freehold land, containing 216 rooms, all being dwelling-rooms, the cost was 11,120*l.*, or about 51*l.* per room. This includes all charges, as before, as well as the cost of the land.

The other buildings erected by the company are either built on a large estate, purchased in Bethnal Green, where it would be difficult to apportion exactly the share of the cost of site to each particular building, or have shops on the ground-floor, which will disturb the calculation of the cost per dwelling-room; but the figures given above are large enough to deduce a fair average.

In applying them to the employment of co-operative funds in the erection of blocks of a similar character, co-operators must recollect that, with the advancing cost of labour, building prices must advance also. On the other hand, building is cheaper in the provinces than in London, and the cost of freehold or leasehold land lower.

There seems to be no better mode of investing the surplus funds of a co-operative society than in the erection of dwellings for its members. It is an investment at home; the expenditure can be directed and controlled day by day by the committee of management; the proper cost in each locality can be easily ascertained, and a little care in supervision is a complete protection against gross fraud. The Act of last session has removed all legal impediments.

I confess that when I hear of large sums of money being invested in foreign bonds, or in the securities of companies at home, by committees of management, I do not feel quite comfortable. One has heard of so many shrewd men of the middle class being bamboozled by adroit rogues in companies, one knows so many cases of State repudiation of debts, that one cannot hope for immunity from similar misfortunes on the part of co-operators. I should like to see their spare funds kept at home within their own control, and employed in building or in pushing co-operative production at their own doors."

AID TO TECHNICAL EDUCATION.

IN a paper on the "Aspects and Prospects of Technical Education," read by Dr. John Yeats at the Social Science Association, on the 19th ultimo, the reader said,—It seems to me only just that when the State disburses money, the State should also undertake and be bound to see that the object for which the disbursement was made is fully attained; and this can be done in no way so effectually as by demanding of every pupil, male or female, frequenting a State-subsidized place of instruction, be it school, college, or university, a *minimum* of attainments, graduated according to circumstances, but insisted on before he or she commences an independent career.

Time will not permit, or I would gladly recount what a society akin to ours has accomplished in Holland. It has lately promoted a technical exhibition; it has long had night schools or technical schools in every principal town and village; it has elevated a race of depressed and dispirited *technici*, and made of them a contented thriving community. Cannot our own society accomplish something too?

What has been done or written, especially of late, to diffuse amongst our own artisans, in a popular form, the triumphs of mind over matter? Lord Brougham wrote, years ago, a celebrated essay on the "Pleasures and Advantages of Science," but a second is very much needed. It seems to me that amongst the most urgent literary wants of late have been accounts of the raw materials of industry; sketches of the development of skilled labour; the story of the growth of trade, &c. Having been at work in these matters during many years I can say no more of them myself, but recommend abler men

to take them up, and particularly on behalf of this great Class V., the *technici*, to prepare:—

(a.) An exposition of the successful applications of technical knowledge during the last half century.

(b.) Some account of the prizes still open to competition, such as the premiums of the Society of Arts, the Queen's prizes, &c.

(c.) An essay on the national danger of neglect of science, and the reasons for the asserted security and superiority existing on the Continent.

(d.) A fair statement of the advantages and disadvantages existing among foreign artists. The Gewerbeswesen.

(e.) A comparative view of ancient guilds and modern trade-unions, raising the question of apprenticeships.

(f.) An abstract of the best-known organisations of industry in our country, such as those of Messrs. Bliss & Son.

(g.) The same drawn from Continental sources: French, Dutch, German, the Handwerksloeh, and others.

(h.) Popular treatises on what is known in Germany as *Erlkünde*, *Waarenkunde*, *Werkzengkunde*, *Handwerkskunde*, and *Handelsswissenshaft*.

DAMP WALLS: GROUND DAMP.

"A. B." should drain the site of the house. Isolate the same from the adjoining land in the following manner:—All round the four sides of the building, and from 6 ft. to 10 ft. from the walls, construct an ordinary land-drain in the most careful manner, with sole-tile at bottom, filling up the trench with bushes, turf, and gravel. This drain should start at one corner, level with underside of footings, and be laid with a fall of 1 in 100, or more, to the opposite diagonal corner into a well. The writer has obtained a dry site in the wettest clays and a good supply of water by these means. The site may be left to take care of itself; but, to make doubly sure, sink a well 8 ft. deep in the centre of basement, and lead the drain-pipes spoken of into it, laid in gravel. In some cases this well will be found supplied with water; in others perfectly dry.

Valuable hints are readily given in the *Builder*. It is to be regretted that the recipients fail to communicate at a later period the success or failure of the remedies suggested, consequently much experience is lost. Twelve months hence let us hope "A. B." will profit by this hint, and favour us with the result.

A. Z.

THE BIRMINGHAM SEWERAGE BILL.

The Birmingham Sewerage Bill is important alike in the locality to which it relates, the objects it proposes to accomplish, and the means proposed to be adopted for the accomplishment of such objects. The framers of the Bill cannot be congratulated upon the breadth of view or vigour with which they grapple with this great work. The Bill is a bundle of pottering, paltering, huxtering expedients, rather than a fulcrum for the effectual uprooting and removal of an evil, and its conversion into good. The Bill contains fifty-two sections, and is to give extended powers to the corporation as the sewer authority for the borough, for making further provisions for its sanitary condition. The corporation propose that they should have powers to take lands, to agree for easements, to construct works, stop up roads, and exercise other important functions. They may collect, store, deposit, precipitate, filter, disinfect, deodorize, decalcate, and distribute for irrigation or fertilisation, the liquid sewage of the town. They may supply such sewerage to occupiers by agreement, and may recover penalties from persons using it without agreement. The manufacture of valuable saleable sewage, rather than the thorough cleansing of the town, seems the paramount object of the Bill. Unauthorised drains must not discharge into the sewers, and no matters may be passed into them that are injurious to vegetation. Manufacturing chemists, galvanizers, and wire-drawers, are specially indicated from using the sewers as a means of getting rid of their waste products. By passing into the sewers matters injurious to vegetation they will be liable to a penalty of 20*l.*, and a fine of 40*s.* per day for every day that the offence is continued after notice. Curiously enough, while thus careful to exclude from the sewers matters "injurious to vegetation," the occupiers of premises having water-closets are to be encouraged (?) by a fine

of 10*s.* per annum for each closet. The powers asked for in the Bill include provisions for borrowing 300,000*l.* by mortgage on sewerage, for raising money by annuities, and to order alterations as to the construction, cleansing, and removal of the contents of middens, cess-pools, privies, and water-closets; but how does the Bill provide for abolishing middens, cess-pools, or privies?

NEW CITY AND COUNTY ASYLUM, HEREFORD.

THIS establishment, of which we give a plan and view, was determined upon in 1868, when a limited competition took place, and the design of Mr. Robert Griffiths, the county surveyor of Stafford, was selected.

The building is now nearly completed. The main front is nearly due south, and the principal approach is arranged so that the several exercising yards will not be overlooked, or the patients disturbed or annoyed by persons frequenting the asylum. In the basement of the administration block, in the centre, are the boilers for the purpose of providing steam for cooking and hot water for heating the corridors of the several blocks and recreation-hall and chapel. Adjacent to the entrance the following accommodation is provided:—Porter's day and bed room, superintendent's room, waiting-room, clerk's office, with fireproof closet, stairs to committee-room, and steward's rooms, patients' visiting-rooms—one for each sex. Over this part, on the first floor are the committee-room and waiting-room, with w.c. attached, and the steward's bedrooms. The matron's and assistant surgeon's rooms, dispensary, &c., are to the right and left of the recreation-hall, with bedrooms for each on the first floor. The general store-room is of large dimensions, subdivided by partitions, for classifying the goods. It has a steward's office in the centre, and distribution-rooms at each end in connexion with the corridors to the male and female sides of the building, and with kitchen offices.

The administration block is central in position, between the store-room and dining-hall, and consists of kitchen, scullery, servants' hall, cooks' room, bread-room, larders, and dairy. A serving-room and scullery are provided between the dining-hall and kitchen. Over this portion are the servants' bedrooms, approached by separate stairs.

The dining and recreation hall, with the chapel over, are in the centre of the south front.

To the east and west of the dining-hall is the Asylum proper,—the males on one side, and the females on the other, but separated from the parts already described by fire-proof corridors and staircases, and two lofty water-towers. There are two blocks, with exercising galleries, 12 ft. wide, on each side of the hall, with day-rooms, single rooms, dormitories, lavatories, and store-rooms, the attendants' rooms being so placed as to give complete supervision. The baths and lavatories are in a separate block at the rear, concealed by a passage, with windows on both sides, so as to cut off any disagreeable or injurious effluvia from the main block.

The above description applies also to the npper floors.

To the north of the Asylum proper, and to the east of the principal entrance, are the various workshops, bakery, &c.; a shoe-room and lavatory for men returning from field labour; and a small day-room and dormitory for the working patients. Here also are the brewhouses, dirty clothes wash-house and drying closet, and dead-house.

A similar block to the west contains the laundry, wash-house, receiving and distribution rooms, and day-room, dormitory, and kitchen for the women engaged in this department.

The walls of the airing-courts are built in an

excavation, with sloping sides, so that the coping is only 3 ft. above the level of the courts, thus doing away with anything like a prison effect, and creating as little sense of confinement as possible.*

Ventilation is secured by means of flues and shafts in connexion with extraction towers, furnished with a gas apparatus, to secure an outward current of air.

The superintendent's house is to the west of the Asylum, near the entrance lodge, which is an obvious advantage. At the same time there is less disturbance of the patients than there would be if it were in the centre of the south front.

The general walling is of red bricks, made on the site, relieved with white bricks, in hands, strings, door, and window heads, with blue brick pilasters, and a sparing use of stone from the Grinshill and Bath quarries.

The ground-floor joists are of English oak, and all the other timber for carpentry of Baltic red fir. The floors of corridors, single rooms, day-rooms, and dormitories, are laid with English oak. The whole of the roofs are covered with Bangor slates, and the hips and ridges also with slate rolls.

The two towers shown in our view to east and west of the recreation-hall are each fitted with a cast-iron water-tank, and the water is pumped into them by a steam engine fixed in the basement under the brewhouse, and every portion of the building is supplied with water from these towers.

With regard to heating, all the day-rooms, galleries, and dormitories have open fireplaces, in addition to those portions heated by hot water.

Gasworks have been erected on the site, as the distance (three miles) was too far to bring the gas from Hereford.

The accommodation is as follows:—

Block No. 1, men's side, west of dining-hall...	109
Block No. 2, " " " " " "	89
Workshop Block	24
	218
Women's side the same.....	218
	436
Total	336

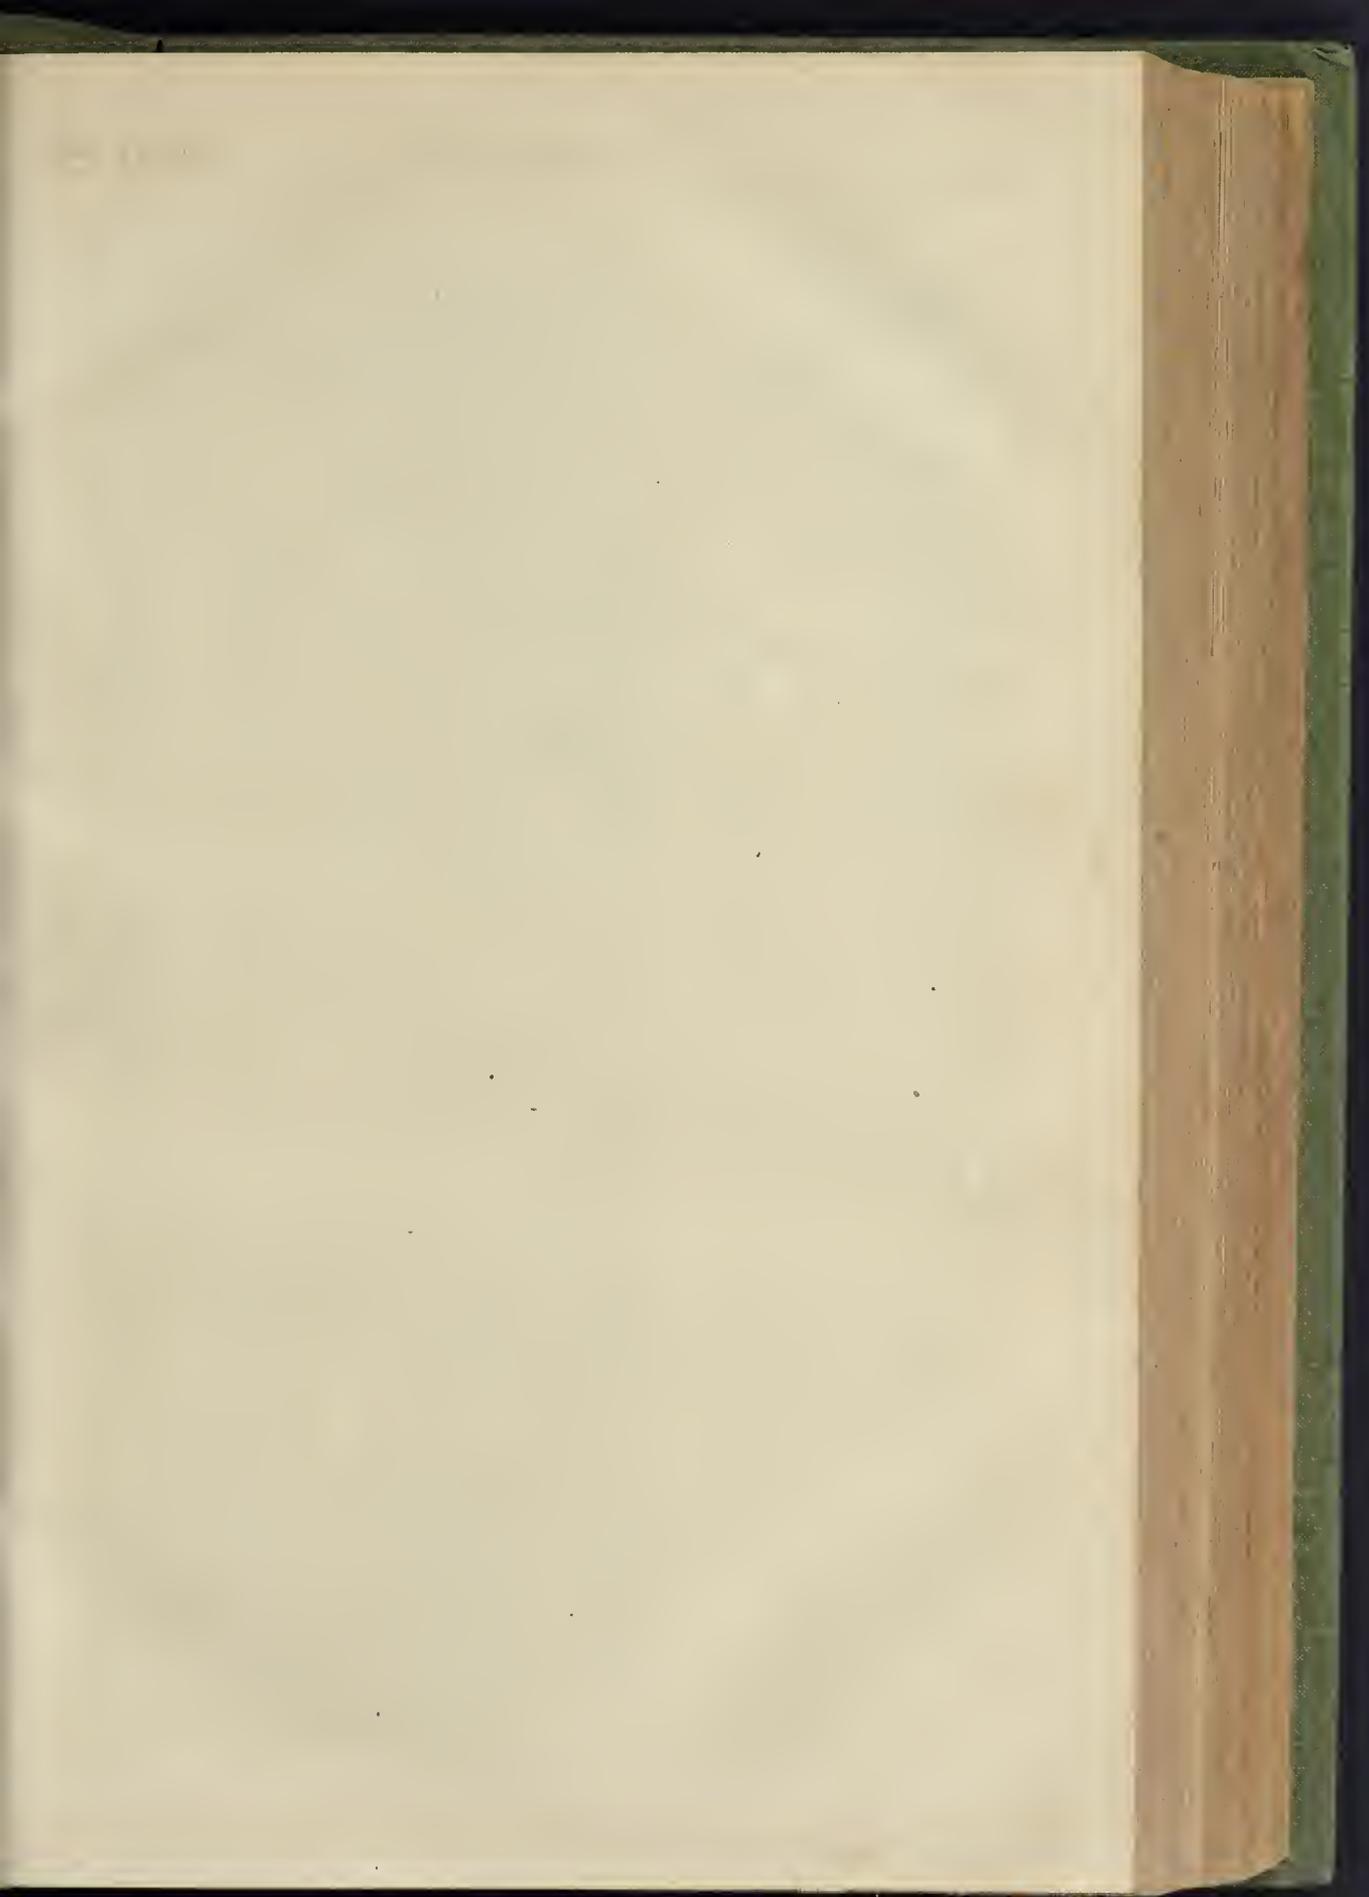

The contract was taken by Mr. James Clatter, buck of Gloucester, at somewhat over 41,000*l.*; but this did not include fittings, airing-court walls, forming of roads, yards, and approaches, engineering, or gasworks, which will bring the amount to about 55,000*l.*

Messrs. Goddard & Massing, of Nottingham, have carried out the heating and engineering works; and Mr. Bower, of St. Neots, the gasworks; Mr. Charles Smith was clerk of the works; and, as before stated, the architect is Mr. Robert Griffiths, of Stafford, who has recently erected the New Cheshire Asylum, near Macclesfield, and is about to commence one for the county of Northampton.

THE CITY AND COUNTY ASYLUM, HEREFORD. — Plan of Ground Floor.

THE CITY AND COUNTY ASYLUM, HEREFORD.—Mr. ROBERT GRIFTHS, ARCHITECT.

THE NEW LAW COURTS.

MR. C. BENTINCK, in the House of Commons, in prefacing a question that stood upon the paper in his name upon the subject of the new design for the Courts of Justice, said that on the 21st ult. he had asked the Chancellor of the Exchequer whether Her Majesty's Government approved the designs which were stated to have been accepted, and that the right hon. gentleman had stated that he did not approve those designs. He understood that during the vacation certain alterations had been made in these designs, and wished now to ask the right hon. gentleman whether that were the case; and, if so, whether he would consent to exhibit the altered plans in the library of the House of Commons, or elsewhere within the precincts of the Palace of Westminster, for the inspection of members of that House.

The Chancellor of the Exchequer replied that, although the plans had been exhibited in the library of the House for several weeks during last session, the House could not be brought to pronounce an opinion upon them. Under these circumstances he did not know what good purpose could be derived from exhibiting them again, especially as the works were now proceeding under them.

Mr. C. Bentinck gave notice that he should call attention to this subject on a future day, and move a resolution in reference to it.

THE REBUILDING OF GLOBE BRIDGE, AT PECKHAM.

The Vestry of the parish of St. Giles, Camberwell, have, within the last two or three weeks, been receiving fresh tenders for the intended new bridge at Peckham, to carry the Commercial-road, Peckham, over the Grand Surrey Canal; and at the meeting of the vestry, last week, the tenders, eight in number, were opened, when it appeared that they varied in amount from 3,350*l.* to 2,500*l.*, the lowest two being that of Mr. J. Brown, of Disan-road, New Cross, 2,610*l.*; and that of Messrs. Peach, Brothers, Loddon, Norfolk, 2,500*l.* The vestry decided to accept the tender of Messrs. Peach, Brothers, subject to the approval of the sureties, and in the event of their not being satisfactory, and that the tender of Mr. Brown be accepted, with a like proviso. The present bridge is only 12 ft. wide, and quite inadequate to accommodate the existing traffic. The new structure, which has been designed by Mr. James Dredge, of Buckingham-street, Adelphi, will be constructed of wrought-iron arched girders, resting on brick abutments. The span will be 27 ft. 4 in. and the width of the roadway the same as that of the approaches on the other side, namely, 40 ft.

IRRIGATION IN SOUTHERN INDIA.

INSTITUTION OF CIVIL ENGINEERS.

At a recent meeting, the paper read was "On the Value of Water, and its Storage and Distribution in Southern India," by Mr. George Gordon, giving an account of the ancient native and the modern systems, under the two heads of tank and channel irrigation. The value of water to the cultivator was shown, first, by contrasting the yield of dry crops with that of rice and sugar-cane, from actual experiments. From these it appeared that the net profit per acre on dry crops was 8*s.* 2*d.*; on rice, 4*l.* 16*s.* 10*d.*; and on sugar-cane, 1*l.* 6*s.* 6*d.* In the two last cases, a very low rate for the water was assumed, viz.: 12*s.* per acre for each crop of rice, and 24*s.* per acre for each crop of sugar-cane, as provisionally paid by Government. A comparison between dry crops and rice, and dry crops occasionally flooded, was then made, based on the average price of grain extending over five years, and deducting one-fourth from the gross value of the crop in the case of dry crops, and one-sixth in the case of wet crops, to cover loss in bad years. Without deducting the water-rate, the difference in the net value of the crops was as follows:—Between dry crops and rice, taking the most unfavourable comparison, 25*s.* 7*d.*; between dry crops and the same occasionally irrigated, 30*s.* 8*d.*; and between two dry crops and sugar-cane (which occupied ten months of the year), 8*l.* 2*s.* 8*d.* But if water was stored, so as to allow a second crop of rice to be grown, the advantages were nearly doubled. The author then showed that, provided a water-rate proportioned to the value of the water was fixed, irrigation would benefit the cultivator to

the extent of 8*s.* 6*d.*, or 50 per cent., and yield a gross return on the outlay of 14*s.* 9*d.* per acre; and if water were stored for a second crop, the gain to the cultivator would be 19*s.* 6*d.*, or more than 100 per cent., and the return to the agency supplying the water 37*s.* 3*d.* per acre, the cultivator not having to expend any capital in improvements. Of the 37*s.* 3*d.* per acre profit, 22*s.* 6*d.* was about the sum due to the storage of water, supposing such storage works to be added to distribution works already constructed. It was shown that the cost of large works of irrigation might be safely reckoned at 7*l.* per acre on an average, or 8*l.* 10*s.* if 5 per cent. on one-half the capital for ten years during construction were added. If the profits made by the application of the water were divided, in the proportion of one-third to the cultivator and two-thirds to the agency supplying the water, works of channel irrigation would benefit the cultivator, as above stated, to the extent of 50 per cent., and yield a net return of 7*l.* 4 per cent. on the capital expended. With respect to the cost of tanks, the author gave some figures to show that the construction of flat country tanks of the second class, or even of the third class, would offer a very doubtful return, although in some cases it might pay the cultivators to construct them. Great profits had been made by Government in several cases, by restoring or repairing tanks and also channels which had become ruined; such net profits amounting to from 10 per cent. to 45 per cent., and in one instance, which was cited, to 250 per cent. The construction of large storage reservoirs would, the author considered, return a very large percentage on the outlay.

WHERE DOES THE MUD COME FROM?

SIR,—Will you allow me to suggest through your columns that this is a question which may well engage the attention of those who have the charge of our thoroughfares; for if the following theory be correct, our tempers as well as our pockets are likely to be sorely tried, owing to the general road-repairs that will before long have to be undertaken throughout London?

I do not apply the question to macadamised roads, but to those that are covered with blocks of granite, as also to the footways. It does not seem to me so much a case of granite versus asphalt as that of bad workmanship in regard to the laying of the former; for a somewhat close attention to the matter has convinced me that by far the greater part of the mud that has been of late daily carted away consists of the very subsoil on which the granite blocks and pavement rest, and which, owing to the ill-laying of the stones and the badness in quality of the material used for binding them together, naturally, after a lengthened period of wet weather, becomes thoroughly saturated, and finds its way to the surface. If this be so, what can we otherwise expect than during a continuance of fine weather to find our streets sinking in all directions, owing to this displacement as well as contraction of the remaining soil? There can be no question that during the late had weather asphalt has fairly maintained its ground in public estimation, both as regards cleanliness and safety,—for footways especially,—and that bad workmanship will have to answer for all the miseries that have yet been endured and are still in store for us. The finest piece of granite road-laying in London is to be seen on the Holborn Viaduct and in the adjacent streets, and their extreme freedom from dirt during the late trying weather, as compared with other parts of the City also placed under the charge of street orderlies, is sufficient proof of what might be done, if only there were the will, to remove from London the reproach that attaches to it from the neglected state of its thoroughfares.

G. C. E.

THE NEW ST. JAMES'S HOTEL, DERBY.

THE new St. James's Hotel, erected by the St. James's Hotel Company (Limited), and situated in the Corn Market and St. James's-street, Derby, has been opened to the general public.

The hotel contains on the attic floor thirty-two bedrooms, and on the second floor about the same number, with two sitting-rooms, bath-rooms, and all requisite accommodation. On the first floor, facing the street, is a large room, which is proposed to be used as a ladies' coffee-room; there is a bath-room, &c., adjoining. A corridor leads to a good-sized dining-room, and

four other private sitting-rooms. On the landing are first-class private sitting and bed rooms. At the back, but leading from the principal staircase, is an assembly-room (to be called the St. James's Hall); attached is a serving-room, and on the same floor are stock or show rooms. On the ground-floor is a spacious entrance, leading from St. James's-street, with a coffee-room on the right-hand side, and on the other side is another large room for commercial gentlemen, with a luggage-room and offices adjoining. In front is the bar, with still-room and smoking-room. The principal entrances are provided from the Corn Market and St. James's-street, with access through an outer hall, covered with an ornamental iron and glass roof, which is to be fitted up and used as a lounge. The manager's room is central, and the bar commands a view of all the entrances. Speaking-tubes and bells communicate from the managing department to all parts of the premises. The inner halls are paved with encaustic tiles. The staircase is close to all the entrances, but not in the way of any, being in an inner hall. It is of stone to the first floor, and continued the same size to the attics, with iron scrollwork in the place of balusters, and mahogany handrail. On the first landing is a broad mirror, from the floor to the ceiling, facing the first flight of stairs. On the newel post at the bottom is a large figure in bronze supporting a clock. A hydraulic lift is placed between the kitchen and manager's room, and works from the basement to the attics. The kitchen, servants' hall, and working offices are spacious, and fitted up effectively. The hack or kitchen court is covered with a glass and wood roof. The basement is divided into cellars under all the hotel. Housemaids' closets, with hot and cold water and soft water, are provided on each floor. Attached to the hotel also is to be provided a luncheon-bar or restaurant, with lounge, smoking and billiard rooms, and necessary offices. Spirit vaults adjoin the gateway to the stables. The architects for this pile of buildings are Messrs. Giles & Brookhouse, Derby; and the builder is Mr. Dusautoy.

LEAKY SEWERS.

It is obvious that if the sewer inquired about by "B. A.," in the *Builder* for February 24th, although built in only 4½ inch brickwork, be laid in soil only "rather damp" no leakage ought to take place; but if the 2-feet barrel-drain be laid entirely, or even partially, below the water level in the land, and consequently always exposed to water, it is impossible to say what quantity of water might percolate through such a slight thickness of brickwork. A great deal would depend upon the description of bricks used and the length of the sewer. If there were any junctions prepared for future extensions, but not at present made effectually water-tight, a still larger quantity of water might enter than was due to the percolation through the brickwork of the sewer.

Q. E. D.

ECONOMY IN THE LEAMINGTON KITCHEN RANGE.

In recording my treatment of this range, it may be well to say a few words about its construction and usual action. With a very small fireplace, it has to heat water, a large oven, and a hot-plate for cooking; the bottom of the grate is double, reducing still more the apparent space for fuel. The upper (or real) bearing bars are framed together and stand separately about 1½ in. or 2 in. over the lower bars. When the half-door of the fire is shut, the draught is intense, and as I have heard it said "you can burn away any quantity of coal you please," it is very difficult to restrict your servant to the use of coals.

In practice, as may be supposed, the fire is very apt to go out suddenly; and not only so, but the false bottom soon wants renewing, and you also find that the range must be disused once a year or oftener, to replace a burnt-out burr.

Having had my full share of all these drawbacks in a grate, of which I admit the general excellence, it occurred to me that by putting a solid 2-inch burr in the place of the false bottom, I should check the excessive draught, and retain much general heat. This has completely answered, and during three years no burr has yet had to be renewed. The fire is much more enduring, and we can allow some

coal to be occasionally added to the coke without grumbling; there is no want of heat, for we have had to caution our servant against overheating the plate.

I have been told that in Birmingham it is not an uncommon practice to mould some tempered fire-clay into the bottom of ordinary fireplaces, and I would admit this to be an improvement upon the sheet-iron, and of course a step in the right direction. Allow me to add in reference to my former letter, that the poker should be made a little more pointed than is usual.

G.

THE TRADES MOVEMENT.

Ipswich.—A meeting of the master builders has been held to consider a circular received from the committee of workmen formed on the previous week, asking for the concession of the nine-hours system. After some discussion, it was unanimously resolved not to accede to the request of the men, as it was considered prejudicial both to the workmen and to the public.

Wolverhampton.—Nine years ago, after a series of ruinous strikes in the building trade at Wolverhampton, both masters and men resolved to refer their differences for the future to Mr. Rupert Kettle. An arbitration board was appointed, and has existed in the trade ever since. The last agreement between masters and men was come to after arbitration had endured for four years, and the men, thinking that the time had come for a change, in the direction of the nine-hours system, gave notice to arbitrate the point, and a meeting of the board of arbitration was fixed to be held for legislation upon the subject. Mr. Burkitt, the secretary of the board, gave the usual notices to the different branches embraced in the movement; and the arbitrator, Mr. Kettle, together with certain of the masters and men, were present in the Quarter Sessions Court of the Town-hall, the use of which had been lent for the purpose by the mayor of the borough. It was then found that Mr. Lovatt, one of the principal employers, could not attend; and it further transpired that the notice to the bricklayers, though it had been left at their club-house, had not been called for, and that, therefore, the bricklayers were unrepresented. These causes combined to make an adjournment of the conference necessary. Before, however, the adjournment took place, some conversation ensued, in which the very great benefits that had resulted from arbitration in the Wolverhampton building trades were admitted by masters and men alike; and Mr. Kettle said that, in all his experience of arbitration, he had never known a case in which the men had not abided by the rules in the utmost possible good faith.

Walsell.—At a meeting of the operative carpenters and joiners, it was unanimously resolved to request the employers to concede the nine hours system. It was also resolved that the wages for day-work should be 6½d. per hour, and that overtime should be paid time and a half; and that during the winter season the men employed on buildings should be paid the same as those employed in the workshop.

Deddington.—A meeting of more than thirty of the principal employes of Messrs. Franklin, builders, has been held, to discuss the bours of labour on a Saturday, which have hitherto been from six a.m. until five p.m., the employes' feeling somewhat aggrieved that their time for cessation of labour is not at one o'clock on a Saturday, similarly to most of the large firms in Oxford and Banbury. After considerable discussion it was unanimously agreed that a deputation wait upon Messrs. Franklin, and urge them to agree to close their establishment like their neighbours, and this without any deduction on account of wages. It has since been understood that Messrs. Franklin have proposed that their employes working out of the town may leave off work on Saturdays at one o'clock, and those in the town at three o'clock, to commence the first Saturday in May. Messrs. Franklin's employes had a meeting, and consented to Messrs. Franklin's proposal.

Wednesday.—Messrs. Stevenson & Son, painters, decorators, &c., have made an unsolicited offer to the workmen in their employ of an advance of 2s. per week in their rate of wages, and a reduction in the hours of labour, viz., to leave work at two o'clock on Saturday, instead of four, to commence on the 1st of April. The offer was accepted.

Gloucester.—The United Trades' Committee of Masons, Bricklayers, Carpenters, Plasterers,

and Labourers have addressed a circular to the master builders and contractors of Gloucester and its vicinity, requesting them to adopt the nine-hour day's work, receiving the same amount of wages now received for sixty hours; and that this concession come into force on the first Monday in April in the present year.

Edinburgh.—The plasterers' labourers of Edinburgh came out on strike, owing to the refusal of their employers to grant their demand of 2s. per week on their pay. The strike is general in the city so far as the labourers are concerned; and the master plasterers, who explain that only ten weeks ago they voluntarily advanced the labourers' wages 2s. weekly, and that now a similar advance is asked, are apparently determined not to give way. The late advance spoken of by the masters raised the rate of the labourers' wages, for thirty-nine hours' work, to 11. weekly—the skilled labour of the plasterers for the same time being paid at 11. 2s. 9d.

Glasgow.—A great strike lately appeared imminent in the ship-building and engineering trades on the Clyde. A mass meeting of the workmen, at which from 10,000 to 12,000 were present, had been held, to consider the terms of compromise offered by the masters, namely, a reduction of the working hours to fifty-four per week, and an increase of wages to the extent of 5 per cent. Delegates from the various establishments reported that, except in one case, the men had decided to reject the terms offered by the masters, and ultimately the meeting resolved, all but unanimously, to adhere to the original demand for a reduction of hours to fifty-one per week, with an increase in the rate of wages. The men employed at one of the shipbuilding establishments had already gone out on strike, when the masters came to an arrangement with the men, virtually agreeing to the nine-hours system.

Wantage.—The first really useful advantage of the nine-hour day's work seems to have been taken at Wantage. The adoption of the nine hours in this town by Messrs. Gibbons, and by Challoy by Messrs. Nalder, has given their numerous employes much spare time; hence the necessity of establishing classes by which improvement of the mind may be obtained, has been taken into consideration. The town-hall has been completely filled with a most attentive audience, composed for the most part of mechanics and artisans, to hear a lecture by Mr. Buckmaster, who insisted that scientific knowledge was indispensable to the artisan and mechanic in pursuit of their respective callings. The lecturer illustrated some of the more humorous conversations which he had had with those who considered themselves perfectly masters of their work. Classes will be formed as soon as the necessary arrangements can be made.

A NEAT INSCRIPTION.

The chancel of Whittingham Church, Northumberland, lately rebuilt from the designs of Mr. F. R. Wilson, is now adorned with the following inscription by Lord Ravensworth, incised upon a brass plate:—

Cancelum
Hujus veteris ecclesie
Fictate majorum extractum
Receptorum manu infeliciter reparatum
Hecarius Thomas Baro de Ravensworth
In honorem DEI
Sumptibus suis restitutum curavit
A.D. MDCCCLXXI.

SCHOOL PLANS: LONDON SCHOOL BOARD.

The sub-committee on school plans state in their report that the best number for a class is 30, and that the number ought in no case to exceed 40. The schools (except the infant school) should be arranged or graded according to the Government standards.

When a section in any school belonging to one standard numbers sixty children it may be conveniently divided into two classes, for each of which a class-room should be provided, but so that the two class-rooms may be thrown into one for the use of the whole section collectively when required, care being taken that the partition between the two rooms be such as to exclude or sufficiently to deaden in each room the sound from the other. In graded schools the area of the class-rooms should be calculated at nine square feet per scholar. The total area for general school and class-rooms together should be on the scale of ten square feet per scholar. The gallery in the general school-room should be constructed for two-thirds of the whole number of scholars in any group, or for fewer than 1,000 children, the senior schools for boys and girls separately would be too small. Therefore, in groups intended for less than 1,000, the departments should be three only,—infants', boys', and girls'. The majority of the com-

mittee suggest that in a group of schools intended for 1,000 or more there should be four departments—namely, infants, junior mixed, senior boys, and senior girls. After illustrating the principle of division recommended, the committee suggest plans for the arrangement of infant schools, adding that the area of the general school-room and of the class-rooms together in infant schools should contain in all cases not less than nine square feet per scholar. In all the graded schools of the Board, that is, in all besides the infant schools, there should be for each separate school department a general school-room, the area of which is calculated on the scale of four square feet for every scholar, and four class-rooms in two pairs, one pair for the use of each section or standard, and each pair capable of being thrown into one room—the area of each class-room to be calculated on the scale of nine square feet for every scholar in the class, and the number in each class to be 30, 35, or 40, according to the numerical unit adopted for the school department.

PROFESSIONAL CHARGES.

Sir.—The Conference Committee on Professional Charges has issued a proof schedule of charges, containing certain suggested modifications in the R.E.B.A. scale published in 1862.

As the object of the committee to avail themselves of the opinion of architects generally before preparing the schedule for presentation at the next Conference, will you allow me, through the medium of your journal, to inform those architects who are not members of the Institute, the Association, or other professional societies (who will receive copies through their own societies) that an application here a copy of the schedule will be sent to them.

J. DOUGLASS MATHEWS, Acting Secretary.
9, Conduit-street.

ST. PAUL'S.

The attempt at illuminating the dome of St. Paul's on Tuesday was a failure, as usual; and, in order to prevent failures on future occasions, it would be as well to try experiments at once, so as to be prepared for such occasions; and the experiment I would propose would be to place a powerful electric light in the topmost story of each of the west towers, and on the summit of the dome of St. Paul's School reflecting upon the dome. Additional lights, if necessary, and the effectual might be placed on the turrets of St. Austin's, Christ's Church, and St. Mary Magdalen's, Fish-street, all directed towards the same object.

W. S.

THE PUGIN TRAVELLING STUDENTSHIP.

From the six candidates who submitted drawings and testimonials in competition for the Pugin Travelling Studentship of 1872, the Council of the Institute have elected Mr. John Sulman, of Ashbarton-road, Addiscombe, subject to the usual conditions prescribed in the Pugin deed of trust.

The drawings of Mr. Edwin J. Munt were considered next in order of merit, and deserving of honourable mention.

LIGHTNING DISCHARGES.

Sir.—In an article, inserted in the *Builder* (No. 1512), read at a meeting of the Manchester Literary and Philosophical Society, on the above subject, in accounting for the occasionally destructive effect of lightning in buildings supposed to be protected by lightning-conductors, the following passage occurs:—"It is not surprising that atmospheric electricity, of a tension sufficient to strike through a stratum of several hundred yards thick, should find an easier path to the earth by leaping through a few feet of air or stone to a great system of gas and water mains, extending in large towns for miles, than by the short line of metal extended in the ground which forms the usual termination of a lightning-conductor." This statement is a plausible method of accounting for some of the disasters which have occurred from lightning discharges, when considered in conjunction with some of the accompanying circumstances, in observed cases. We cannot dispute facts. But it may be asked, How about the element of time? for electricity, quickly as it travels, takes time to do so. If the conductor has been of sufficient capacity in the upper part of its length to receive and convey the electric fluid, without injury to the building, why should we suppose that it should, for any reason whatever, leave the conductor, already conveying it, in order to strike through "a few feet of air or stone." Unless, indeed, the electric fluid be supposed, if we may so speak, to have a preconceived knowledge of the comparatively greater difficulty of its course, if it continue its passage along the conductor. The writer scarcely considers that any supposed previous electric condition, by induction or otherwise, of "the water and gas

mains" affords a sufficient reply to the objection here brought forward, so long as the conductor is, from its material and size, of sufficient capacity to convey the current.

The practical value of the suggestions made by the writer of the paper in question, I do not at all wish to dispute.

W. S.

SCHOOL BOARDS.

Bridgwater.—The School Board have received estimates for the proposed new schools at East-over from builders who had been invited to furnish them. The highest estimate amounted to 2,500l., the next figure was 1,700l., and the other estimates amounted to 1,580l., 1,350l., 1,320l., and 1,280l. respectively. The plans were examined in detail, but the consideration of them was adjourned.

Caterham, Surrey.—Mr. Richard Martin, of Caterham, has been appointed architect to the Caterham School Board.

CHURCH-BUILDING NEWS.

Leeds.—The Church of St. Luke, Beoston-hill, has been consecrated. This new structure has been erected from the designs of Messrs. Adams & Kelly, of Leeds. It is built of stone. The style adopted is the Gothic of the thirteenth century. There is a clearstoreyed nave, with north and south aisles, a chancel with aisle on the north side, and organ-chamber and vestry on the other side. The foundations have been laid for a tower and spire. The windows of the aisles are coupled, and have lancet heads; those in the clearstorey have tracery heads; the east window is a five-light one, with tracery, and is filled in with stained glass, the gift of Mrs. Bescock; and at the west end there are three-light windows, with a triple light surmounting. The roof of the nave is open to the apex. Interiorly, the total length of the church is 110 ft. 6 in., the width is 47 ft. 6 in., and the height from floor to ridge is 52 ft. The seats are free and unappropriated, and afford accommodation to 700. The total cost has been 3,150l. Messrs. Weatherley & Rymer, of York, were the contractors.

East Claydon.—The church at East Claydon, which has for years been in a state of dilapidation and ruin, has been restored, as a mark of respect to the rector of the parish. The church has undergone a transformation, both externally and internally; the only eyesore now being the tower, but this, it is hoped, the inhabitants themselves will, before long, place in a state of decent repair. A new carved oak porch replaces a very unpretending erection of brick and plaster, which comprised both the porch and vestry. The walls have been almost entirely restored, being copied as nearly as possible from the old. The parapet is new, and is of Dulton stone; all the old dressings have been restored, assimilating to the old. The earth has been lowered to the original foundation line, and an underdrain has been inserted to keep the foundation dry. The cost of restoring the body of the church has been borne by the subscriptions to the testimonial fund; and the chancel by Sir H. Verney, bart., M.P. One window on the north side of the chancel was perfect, and the others were copied from it. The east window is new; it is copied from the old one, and is the gift of the Rev. W. F. Fremantle; it is said this window will, at some future time, be fitted with stained glass. The roof has been raised 2 ft. 6 in., in order to place the windows in their former position, and has been restored with new oak panelling, and moulded and carved rails. The floor has been raised to its former level, and paved with Godwin's encaustic tiles. A sedilia has been formed in the south window of the sanctuary, and a credence in the north; the latter the architect has designed from two stones found embodied in the walls. The new prayer-desk is from a design by Mr. G. G. Scott. The doorway formerly existing in the west end of the north wall is re-used for the door leading to the vestry, which forms the eastern end of the north aisle. The roof is entirely of oak, of the Decorated period, with moulded beams, carved braces, and moulded rafters. The seats are entirely of wainscot. The roof of the nave has been raised 2 ft., to clear it from the windows. The arch has been restored in its own material. All the windows and internal dressings have been restored with stone to match the old. The original level of the floor, which is paved with black and red tiles, has been retained. The

whole of the interior of the tower, as far as the belfry floor, has been restored with new doors, new glazing, and new belfry floor on stone corbels. In the chapel there remains a portion of the church, evidently of a much earlier period than any other part of the building. The work has been under the superintendence of Mr. Hannaford; the builders were Messrs. Mansfield & Booth, Buckingham. The sum subscribed for the purpose of restoration is about 1,700l.

Sutton Coldfield.—Measures are now being taken for the restoration and enlargement of this church; plans for the purpose having been prepared by Mr. Thomason, architect, Birmingham. The church very much needs the proposed restoration. It consists of tower, nave, north and south aisles, and chancel, with two side chapels, built by Bishop Vesey, the great benefactor of Sutton. At present the tower (blocked off from the nave) is used as a vestry; heavy galleries disfigure the edifice; and the body of the church and the galleries are filled with high square pews—of the densest Georgian type,—so constructed as to occupy the largest possible space, and to afford the least possible room for the congregation. These pews ought to give accommodation to 700 persons; but, from their awkwardness of arrangement, they do not give sitting space for more than 450 persons. It is proposed to remodel the galleries, to add a second north aisle and vestry, to open the tower into the body of the church (so as to serve for an entrance and a baptistery), and to replace the pews throughout by open seats. In this way accommodation will be made for a total of about 1,000l. The cost of the intended improvements will be 2,500l., of which about 1,100l. are already offered.

Langport.—A public meeting has been held in furtherance of the restoration of St. Mary's Church, Huish Episcopi. The chair was taken by Capt. Stuckey. It was agreed to confine the renovation to the body of the church, the holders of the rectorial tithes being liable for the repairs of the chancel. A new roof will be required to the south transept, and that of the north, which is now of order, requires considerable repairs. A new vestry is also needed, the present room being almost useless, the fire which occurred a short time since having nearly destroyed it. To carry out this work of reparation, it was considered that 1,200l. would be required; and it was resolved that the landowners and inhabitants should be at once appealed to for assistance. The chairman announced that nearly 800l. had already been promised. A report on the state of the structure, and the work necessary to be done for its complete restoration, prepared some time ago by Mr. B. Ferrey, F.S.A., the diocesan architect, was read, and it was agreed that his assistance should be again sought, in order that specifications for the work might be immediately prepared.

Woodstock.—The church of St. Mary, Glympton, has been reopened, after considerable improvements, both in the church and chancel, under the superintendence of Mr. Street. The expense has been chiefly defrayed by Mr. H. Barnett, M.P., the patron of the living, and by the Rev. C. W. M. Bartholomew, the rector, aided by contributions. Four new windows, of Geometrical character, replace the very plain openings which had lighted the church, and a new roof has been placed on the chancel, and crosses on the east end both of the nave and of the chancel. A porch and vestry have also been built. A new altar has been presented. Plain stalls for the choir have been provided, and the chancel throughout has been laid with encaustic tiles. The east window, presented by the family in memory of the late George Henry Barnett, of Glympton Park, is of stained glass, by Clayton & Bell, representing the Crucifixion in the central light, and portions of our Lord's history, in connexion with the Virgin Mary, to whom the church is dedicated, in the side lights, with our Lord in glory in the apex.

Southampton.—The restoration of St. Michael's Church is now being pushed forward with all possible haste, the committee being in hopes that the work which they contemplate executing at present may be completed by Easter in order for the church to be then re-opened. The roofs of the aisles have been strengthened, and the whole of the pews and galleries removed; the aisles will be open from end to end, and not blocked up so much as formerly. The old roundabout staircase to the belfry and tower, which previously occupied so much room, has been done away with, and a circular one substituted, and placed in a much more advantageous position. The

flooring of the church will not be quite so high as formerly, the original level being taken, and the seats are to be open and, according to the plans, capitally arranged, while the alterations will give a better view from the interior of the east window and the altar. The work is being executed by Mr. H. I. Saunders, builder, of London.

Hanley Castle.—The chief stone of a new church has been laid here. The new edifice is to be a Chapel of Ease for the parish of Hanley, and has been in course of erection since the month of November last. The sole cost of the church has been undertaken by Mr. Samuel Martin, of Catterall, in the parish of Hanley Castle, and formerly of Liverpool, and the expense of the work is estimated at 5,000l. The site of the edifice is near to the Hanley-road, on land given by Sir E. A. H. Lechmere, bart. The old school church is situate at a distance of half a mile from the new church, and it has long been found to be quite inadequate to accommodate all who wished to attend the service. The new church is to be dedicated to St. Gabriel. The architect is Mr. George Gilbert Scott, and the builder is Mr. Wm. Porter, of Malvern Wells; Mr. Jas. Burlison is clerk of the works. The new edifice will be in the Pointed Gothic style of architecture, and will consist of body, tower, and spire, with nave and aisles. It is being built of Cradley stone, with Bath stone dressings, lined with brick. The walls are supported with stone buttresses. The tower is on the north-east side of the church. The entrances are on the west and north-west, and there is another entrance on the east side of the tower to the vestry and belfry, which will be constructed to accommodate a peal of six bells. The east window will have five lights, filled in with tracery. The windows in the aisles are double-lighted, with simple Gothic tracery in the head, and above them, in the clearstorey, there will be placed cinquefoil lights. The roof will be steep, and covered with slate. An ornamental cross will be fixed on the east and west points of the ridge. The spire and tower will consist of three stories, and the total height of tower and spire will be 124 ft. In the interior there will be an open roof composed of stained deal. The church is divided into nave, aisles, and chancels. The seats will be open, with sloping backs, and made of pitch pine. The memorial stone is in the base of the north-east pier of the chancel arch. The floor will be of deal, upon oak sleepers; but the aisles will be laid with encaustic tiles. The church will be heated with hot air. The building, it is expected, will be completed before the close of the present year. It is distant about two miles and a half from Malvern Wells. It is to accommodate 420 persons.

Penn.—The parish church of Penn, says the *Wolverhampton Chronicle*, has been re-opened, after being closed some months for restoration, enlargement, and beautification. In the way of enlargement there were difficulties, owing to the want of space, the site being hemmed in by roads, the only plan available being to build eastward. Even this was attended with difficulty, as well as expense, as the ground rose rapidly close behind the old chancel. A sufficient quantity of ground having, however, been cleared, the old chancel was removed, and the new work substituted consists of two new bays added to the nave, nearly doubling its length, and affording accommodation for about 150, and an entirely new chancel and chancel aisle, the dimensions of the chancel being 32 ft. long by 16 ft. wide. The material employed is Bromsgrove stone, and the interior walls of the chancel and chancel aisle are lined with stone from the same quarry. The roof is open timbered, and executed in pitch pine; and the floor of the chancel is laid with encaustic tiles, from Longwardine. The prayer-desks, and the seats for the choir (in the chancel) are new, carried out in oak, carved, and some seats for children, placed in the chancel aisle, are of pitch pine. The pulpit has been transposed from the north to the south side, where it has been fixed on a stone base. The chancel is separated from the chancel aisle by an arcade of three ornamented arches, and it is approached by four steps from the nave, the altar space being elevated four steps above the floor of the chancel. The east window of the old chancel, which was filled with stained glass, at the expense of the late Mr. W. H. Sparrow, has been erected in the chancel aisle, and in its place now appears a window of five lights, filled with painted glass, the gift of the same gentleman's daughters, as a memorial of their father. Mr. Preedy, of London, supplied the window.

One of the principal ornaments of the chancel is a reredos, the gift of Miss Sparrow, and executed in alabaster (partly found in the church in the course of the excavation) by Bell & Allmand, of London, according to designs by the architect. The reredos is inlaid with glass mosaic work, the centre tablet representing the cross, and the tablets on either side corn and the vine (typical of the bread and wine), and the emblems of the evangelists. Miss Sparrow has also presented a brass lectern (by Hardman, of Birmingham), and an iron screen, which separates the chancel from the chancel aisle. The altar-rail, also of ornamental ironwork, is the gift of Mrs. Mapleton, wife of a former curate of the parish. At the east end of the north aisle provision is made for a new organ, which is in course of building by Walker, of London. The church will in future be warmed by a new apparatus by Blakenore, of Wednesbury, introduced in substitution for stoves. In addition to the entirely new part of the work, the old portion of the church has been put in good repair. The whole has been re-floored, the roof has been boarded and felted, to correspond with the new roof, and re-tiled, and in a niche over the doorway of the south aisle a figure has been placed of St. Bartholomew, to whom the church is dedicated. Mr. Paley, of Lancaster, brother of the vicar, was the architect, and the contractors were Messrs. G. & P. Higham, of Wolverhampton. The outlay was about 3,000*l.*, of which 400*l.* were deficient on the day of the reopening.

Gelling.—The parish church has been reopened. This old freestone structure has been renovated and restored. The roof was dilapidated, the plaster and whitewash which had been daubed over the sedilia, piscina, and arches were water-stained, the walls were bulging in and out, the woodwork was grimy, and the whole interior was damp, dirty, and gloomy. The lofty steeple is among the very few in England which hugle out in the middle. The zig-zag walls which had for years been getting more and more out of the perpendicular, have been put into line, the stone scraped and made to bear some relation to the quarry from which it had been brought, the flooring has been restored, new modern seats have been supplied, and a light and cheerful look has been imparted where a gloomy and depressing aspect before existed. New open seats and chairs are substituted for the old ones, and one of Whitaker & Constantine's new convoluted stoves has been placed beneath the floor. In the chancel, Mr. Forester, the rector, has, at considerable expenditure, carried out his plans of restoration completely. The freestone, sedilia, and piscina, with their mouldings and arches, have been cleared of the repeated coatings of lime-wash, and restored to their original appearance; and the same may be said of the walls and windows. The floor within the altar-rails has been laid with tessellated tiles from Brossley, of a pattern which presents a quiet and sober combination of colours. An entirely new roof has replaced the old one at its original pitch, and the ceiling is an azure, or deep sky-blue, on which the sun, the moon, the planets, and various constellations are depicted in gold or some suitable colours.

DISSENTING CHURCH-BUILDING NEWS.

Tunbridge Wells.—The Congregational church has been reopened for divine worship, after having been closed about three months, during which alterations and improvements have been made. The architect was Mr. Pertwell, of Chelmsford, and the contractors Messrs. Strange & Sons, of Tunbridge Wells. The contract was taken for 875*l.*; but, in addition to what was originally contemplated, it has been found necessary to execute some repairs. The repewing (the benches being stained and varnished), the lighting, the ventilation, and the heating, together with a renovation of the whole of the interior, have been carried out. The old platform has given way to a new one. A new organ will be shortly erected by Messrs. Beddington, of Soho, at the cost of 240*l.*

Aboston.—The Wesleyan New Chapel, the building of which was commenced in August last year, has been opened for divine worship. The edifice has been erected on land belonging to the trustees in front of the old chapel, a portion of which was taken down to increase the size of the new building. The old chapel is now used as a Sunday-school. The new chapel is a Gothic building, 45 ft. long by 24 ft. wide on the exterior; the height from the ground level to

the apex of the gable being 27 ft. The external elevations of the chapel and porch are of pressed red bricks from Spondon, relieved with Coxbeech stone-dressings to the windows, doors, gables, and buttresses. The roof is covered with Bangor slates, with ornamental ridge tiles. The main timbers of the roof being exposed, are wrought, stained, and varnished, with white plaster ceiling, and the walls are stuccoed and lined in imitation of stonework. The chapel is heated by one of Johnson's patent Gill stoves fixed underground, with circulating air-flues, procured from the Derwent Foundry, Derby. The seats, which are stained and varnished, are all uniform in design, of the bench style, with reclining backs and stall-ends. The chapel is seated for about 160 persons. The pulpit is of pitch pine and deal. The space for the communion is raised above the level of the main floor, and has a moulded railing, supported by light cast-iron balusters, painted blue, picked out with gold, not a vermillion, and enclosing a marble communion-table.

Brighouse.—Baillife Bridge, situated about midway between Lightcliffe on the west, Wike on the east, and Brighouse on the south, has been left with scanty accommodation for religious service. The Methodist New Connexion proposed to put up a new chapel. The ground has been purchased at a cost of about 80*l.*, and the new building is from plans by Mr. J. W. Hellivell, of Brighouse, architect. The edifice is to seat about 400, and the estimated cost is about 800*l.* The building will include schools and other necessary accommodation.

Frodsham.—The foundation-stone of a new Wesleyan Chapel has been laid at Frodsham. Mr. Thomas Hazlehurst had offered to build a new chapel at his own expense. This offer was accepted by the Frodsham Wesleyans, and Mr. Charles Hazlehurst, a brother of the donor of the chapel, gave them a piece of land in Warrington-road for a site. According to the designs, furnished by Mr. C. O. Ellison, of Liverpool, the chapel will be Gothic, but treated after the French style of architecture, and built of the white stone of the district. In the front there will be a doorway in the centre, with polished granite shafts, and moulded and carved arch, with a five-light window above, nearly filling the front gable. At each side there will be five double windows, with tracered heads, and at one corner a tower and spire, 120 ft. high, with lights and projecting pinnacles, each of the latter having polished granite shafts. Inside, the roof and ceiling are to be entirely of pitch-pine, and iron columns will support the galleries and roof. These columns will have capitals of hammered iron. The principals are to be of moulded pitch-pine, with carvings at the intersections. There will be a gallery on three sides of the chapel, and at the pulpit end will be the orchestra, with pine and ornamental glass screen. The whole of the woodwork will be pitch-pine, and the ends of the open stalls will be carved. It is intended to fill the whole of the windows with stained glass. The chapel inside is 56 ft. long by 44 ft. wide, and will seat 600 persons. The height of the ceiling is 36 ft. above which there will be a ventilating chamber the full length of the chapel, with ornamental perforations in the ceiling. Heat will be supplied by means of hot air. In addition to the chapel there will be a lecture-room at one side of the chapel, 35 ft. by 24 ft., and four vestries. The estimated cost of the work is about 6,000*l.* The builders are Messrs. White & Son, of Runcorn. The approach to the chapel will be laid out with shrubs and trees. It is also the intention of the Wesleyans to build a house adjoining the chapel for the accommodation of their minister, at a cost of from 800*l.* to 1,000*l.*

Hull.—A new Primitive Methodist Chapel is immediately to be commenced in Williamson-street, Hedon-road, Hull. The ground-plan contains the chapel, 85 ft. by 55 ft.; main school-room, 50 ft. by 30 ft.; two infants' schools; and a kitchen, each 24 ft. by 14 ft. The plan of the first floor shows the gallery in the chapel, which takes the entire round of the building. At the back of the chapel and above the school buildings are shown thirteen large class-rooms. The seating in the chapel will all be carved and struck from one centre. The gallery fronts will be light and elegant in design, being white and gold, and supplied with ornamental cast-iron work, backed with crimson cloth. The whole of the buildings, with the exception of the kitchen, will be heated with hot water in lieu of fires. The style of architecture adopted is Italian; the estimated cost being 4,000*l.*, exclusive of heating apparatus. The

architect engaged is Mr. Frank N. Pettingell, of Hull and London.

Stainland.—The various works in connexion with the erection of the new Congregational chapel at Holywell-green, have been let by tender;—Masons' work, to Messrs. Benjamin Edwards & Son, Holywell-green; joiners' work, Mr. Joseph Hodgson, Holywell-green; slaters' Hill & Nelson, Batley; plaster work, Messrs. Bancroft & Son, Halifax; plumbers' work, Mr. Joseph Aspinall, Eland; glaziers' work, Mr. J. Boer, Leeds; painters' work, Messrs. E. & B. Briggs, Low Moor; ironwork and gasfitting, Mr. J. M. Dovey, Manchester; granite and marble, Messrs. G. & J. Fenning, London; carving, Messrs. Walker & Emloy, Gateshead; warming apparatus, Mr. J. W. Lewis, Newcastle-on-Tyne. The total amount of the tenders is about 6,000*l.* The foundations are already in. The total cost will be defrayed by Messrs. John Shaw & Sons, Brookroyd Mills, Holywell-green. The tower, with its spire, rising to the height of 120 ft., will be seen for miles round. The design comprises— nave, 74 ft. by 28 ft. 6 in.; aisles, 58 ft. 6 in. by 10 ft. 8 in.; choir, 18 ft. by 14 ft. 3 in.; two vestries in the rear, and two porches in front, formed by the tower on one side, and the staircase on the other. The present accommodation is designed for 600; but with the addition of transepts, for which the building is arranged, 400 more sittings can be provided. The pulpit will be of Caen stone. The windows will be glazed with cathedral tinted glass; the lobbies and margins will be paved with mosaic tiles.

Masbro'.—The corner-stone of a new Wesleyan Reform Chapel and School-room has been laid at Masbro'. The building, which will be in the plain Italian style of architecture, and calculated to seat about 400 persons, will be finished, it is expected, by the 1st of May next. The basement floor will be a school-room 11 ft. in height, above which will be the chapel. The whole building will be surrounded by walls and iron fencing. The chapel will be 20 ft. high in the interior, and instead of the usual pulpit a platform will be constructed. The whole of the works connected with the erection of the building will, it is estimated, entail an outlay of 800*l.* The architect is Mr. John Dodd, of Masbro'; the contractors for the joiners' and masons' work being Mr. Charles Ripley and Mr. Gardiner respectively.

SCHOOL-BUILDING NEWS.

Stoke-new-Guildford.—This school, which is situated at Bell-fields, and which has been in course of erection for the last six months, is opened. The structure consists of a school-room, 52 ft. by 20 ft., a class-room, 20 ft. by 16 ft., and a small open porch, from which the school and class rooms are entered. The materials employed are yellow stock bricks, relieved with hands and dressings of red and black bricks. The arches over the doors and windows are also in red and black. At the west end is a small gable with two openings in it, in one of which is hung the bell. The roof is covered with plain and ornamental tiles, in hands of red and dark tiles alternately. The schoolroom is lighted by a large three-light window at each end, and by seven two-light windows. Above the end windows are smaller ones, opening with lines and pulleys for ventilation, which is also secured by numerous gratings at the floor level. The school and class rooms are warmed by open fires, the stoves and chimney-pieces being hold, but plain. In the class-room is a gallery for the infants, and the school-room is fitted with desks, which by a mechanical arrangement may be converted into seats with backs for use at lectures, &c. The school will accommodate about 170 children. In the rear of the main building are the closets, fitted with Moule's patent carth apparatus. The works have been carried out by Messrs. Swayne & Sons, builders, of Guildford, Mr. Edward Ward Lower being the architect. The amount of contract, we understand, was about 630*l.*, which included fittings.

Nell Gwyn's House at Highgate an Hospital.—A medical dispensary reports that a convalescent hospital in connexion with St. Bartholomew's, is to be erected at Highgate, and that the old mansion in which Nell Gwyn lived, situated behind the St. Pancras Infirmary, and opposite to the Highgate branch of the hospital for sick children, has been presented to the hospital, and will be fitted up to accommodate forty or fifty patients.

VARIORUM.

THE *Leisure Hour* informs the learned Edinburgh Professor who objected to Addison's creation hymn, "The spacious firmament on high," because it taught errors in science, that a new set of nursery rhymes are prepared, of which we give two specimen stanzas:—

"Twinkle, twinkle, solar star,
Now we've found out what you are,
When into the noonday sky,
We the spectroscope apply;"

and,—

"Little Jack Horner, of Latin no scorners,
In the second declension did spy,
How of nouns there are some
That ending in 'um'
Do not form the plural in 'i,'"

These are as good as the couplet of Tennyson in its improved form:—

"Every moment dies a man,
Every moment one is born;"

which must be thus written in order to bring the language into strict consistency with statistical science:—

"Every moment dies a man,
And one, one-sixteenth is born."

The new number of the *British Workman* (with two remarkably good engravings) reprints an interesting and suggestive story from Holmes's "Kind Words to all Classes," called "Ben Starkie's Strike for Less Wage and More Time."

—The Nation's Wave of Suspense in 1871

(Houston) gives in a tabular form a record of the critical illness of the Prince of Wales, with a conspectus of the bulletins issued by the physicians in attendance, and notices of contemporary and connected events.—Lockwood & Co. are about to publish a new "Quarterly" under the title of "Naval Science,"—a magazine intended to promote the improvement of naval architecture, marine engineering, stean navigation, and seamanship. It will be edited by Mr. E. J. Reed, C.B., the late Chief Constructor of the Navy.—The *Garden* speaks thus of the "rockwork" at the eastern end of the Serpentine:—"Not long ago the site of this was an ordinary steep bank shaded by trees, with an objectionable and watery hollow at its base. It was resolved to improve it by covering it with an extensive 'rockwork.' It is difficult to give an idea of what this is like, but numbers of our readers may have an opportunity of seeing it for themselves. Suppose a cottager, in some part of the country where cottagers display grotesque taste in their usually pretty little gardens, to be owner of a few barrowfuls of the rubbish of burnt bricks, cinders, &c., and to make of these and a little mortar a flat shapeless mass on the ground, with a bole in the middle to act as a sort of vase. Suppose the whole surface of the large bank in the park to be covered with a gigantic and hideous plaster of this kind, and a roundish bole here and there left to be filled with earth for the reception of plants, and the reader who has not an opportunity of seeing this scene will have some idea of what it is. We should hesitate to describe it were it not under the eye of everybody, as people might naturally conceive it incredible that such a course should be pursued in a public park on which vast sums of money are spent."

—The *Daily Telegraph*, in a leading article devoted to Sir Christopher Wren, thus comments on the small amount of interest in him displayed by his countrymen:—

"The critics are still in a rage because there are not extant more Shakespearian autographs and more copies of the first folio, hundreds of which were probably burnt in the vaults under St. Paul's, used by the booksellers for war-rooms,—because it has not yet been discovered why the poet bequeathed to his wife only the second best bed in his house, and because it has not been made clear what he did when he first went to London, and whether he did or did not take refuge in the metropolis to escape a quarter-session prosecution for stealing Sir Thomas Lucy's deer. There is no such anxiety among the countrymen of Sir Christopher Wren to ascertain what manner of man he may have been, that was the habit in which he lived, what were his likings and dislikes. That he was the King's surveyor-general of works, a fellow of the Royal Society, a distinguished Freemason; that only a scandalously mean pittance was allowed him as architect and superintendent of buildings in St. Paul's Cathedral; that from the beginning to the end of his undertaking he was shamefully baffled, and bullied by Boards of Commissioners and Cathedral Chapters, and was at last turned out of his employment to make room for an incompetent plasterer, are circumstances of which most cultivated persons have a more or less vague idea, but only a few have had a personal acquaintance. As to Sir Christopher in the flesh, a casual acquaintance with the print-shop windows, or the pages of illustrated dictionaries and books of biography, may remind us that he was a portly old man with a high perwig. But there were many portly gentlemen in perwigs during the Caroline period; and, casually glancing at his effigy, the architect of St. Paul's might very fairly pass muster for Sir William John Deane, or Sir John Deane, for the French poet, Boileau, or for Villiers, Duke of Buckingham, Nollekens, the sculptor, used to tell a

story of an ingenious print-seller in Soho, who, during the 'No Popery' agitation preceding the riots of 1780, furnished up an old plate of Sir Christopher, had another name engraved at the base, and sold the copies as portraits of Titus Oates, there being a great demand for pictures of the 'Protestant Martyr' just then among the serious classes. Altogether, the great Constructor has been allowed to linger, so far as his individuality is concerned, in obscurity as complete as that which envelops the private life of the famous grammarian, Lindley Murray, of whom the most that is known is that he was a valetudinarian American gentleman, who lived for five-and-thirty years on the ground-floor of a cottage near York, subsisting entirely on boiled mutton and turnips, and delivering interminable discourses on philology to young ladies in training to become governesses."

Miscellaneous.

Collapse of the Australian Meat Preserving Companies.

—Just as the demand for Australian cooked meat is being established in this country among the workhouses and the poor, there is risk of a failure in the supply. The establishment four years ago of meat preserving in Australia proved most advantageous to the pastoral and agricultural interests. Not only has the price of stock been arrested in its downward tendency, but the value of fat sheep and cattle, notwithstanding the large increase in their numbers, has improved to the extent of at least 25 per cent., a 60 lb. sheep being worth 2s. and a fat bullock 2l. more than in 1867, when the Melbourne Company first commenced operations. The present partial collapse of this important interest, the prospective winding up of some companies, and the temporarily suspended operations of others, are matters therefore of national importance. The principal cause of this wide-spread failure appears to have been that too many companies have been started. There are at the present time, or at any rate there were lately, twenty-six meat-preserving establishments at work in the various Australian colonies; Victoria having ten, Queensland seven, New Zealand five, New South Wales two, and South Australia two. Prejudices are not overcome in a few months, and notwithstanding the efforts of energetic persons interested in extending the demand for Australian preserved meats, there is still a very wide-spread prepossession amongst Englishmen and Scotsmen in favour of seeing and knowing what it is they are eating. In the case of several companies the whole of their available means were swallowed up in the expense of building. Thus the Australian, with a paid-up capital of 1,015l., spent upon premises no less than 10,930l.; and the Victoria, with 10,830l., contrived, notwithstanding the protests of the manager, to sink upon bricks and mortar no less a sum than 9,544l. Half a dozen companies might have succeeded where a large number have broken down. Strenuous efforts should be made to combat the prejudices against preserved meat in England.

The *Metropolis Water Act*.—The new *Metropolis Water Act*, providing for a constant supply, has come into operation, and it is now to be the duty of the water companies to see that every house is properly provided with fittings, and to enforce the conditions which will be sanctioned by the Secretary of State. The penalties for defective fittings are decisive, for not only is the defaulter liable to a fine of 5l., but the companies have power to cease the supply of water, and to report him to the nuisance authorities. If the provisions of the Act are not complied with as regards fittings, misuse of water, and undue consumption of it, the company supplying the water, without prejudice to any remedy against the defaulter, may cut off the service and cease to supply water so long as the injury remains, or is not remedied; and in every case of so cutting off or ceasing to supply, the company shall within twenty-four hours thereafter give to the nuisance authority, as defined by the Sanitary Act, 1866, notice thereof; and if the fittings are not repaired within the prescribed time, the house shall be a nuisance within the meaning of the 11th section and sections 12 to 19 inclusive, of the Nuisance Removal Act, 1855, and shall be deemed as unfit for human habitation.

The *City Markets*.—At its last meeting the Court of Common Council resumed the discussion on the proposition to enlarge the Smithfield Market, by the erection of a new building on the vacant site at the western end of the present structure. It was resolved, after a long debate, to adopt the recommendation of the Markets Committee in favour of providing further accommodation.

Newspaper Press Fund.—At the annual general meeting of the Newspaper Press Fund on the 21th ult., the report referred to the adoption of a new rule of the society, under which they are empowered to make grants to deserving members of the press not members of the fund, to an extent not exceeding 10 per cent. of the average annual amount of the donations in the preceding years. The grants by way of relief within the year amounted to 403l. 1s. 6d., the number of cases being twenty-five, of which four were applications under the new rule. Fifty new members have been elected during the year, the roll now comprising 262 members, of whom 178 are resident in London, and 84 in the provinces. The invested capital of the fund now amounts to 6,200l. The alteration in the rules should be an additional incentive to the public to assist in maintaining the prosperity of the fund. The retiring members of the committee, Messrs. C. V. Boys, H. C. Corbet, H. Findon, J. M. Le Sage, and C. Shaw, were re-elected. Mr. M'Rea, Mr. Goring, and Mr. Mackenzie were added to the committee; and the treasurer, Mr. Hyde Clarke; and the auditors, Messrs. D. M. Evans, W. Gladding, and C. R. Saunders, were re-elected.

Adulteration of Food and Drink.—A Bill has been introduced into the House of Commons by Mr. Muntz for the suppression of adulteration. It provides for the appointment of analysts in London by the City Commissioners of Sewers and the vestries and district boards; in the country by the Courts of Quarter Sessions and town councils. Inspectors of nuisances and other officers appointed by the local authorities may procure articles suspected to be adulterated and submit them to the public analyst, and upon obtaining a certificate from him stating that the articles are adulterated, may obtain a summons against the seller or adulterator. The penalty for adulterating articles of food, or drink, or drugs is to be for the first offence not exceeding 50l. and costs, and for a second offence imprisonment with hard labour for not more than six months. The penalty for selling adulterated articles is 20l. with costs, and after a second offence the magistrates may cause the offender's name and address to be published at his own expense in such way as may seem to them desirable. The expenses of executing the Act are to be paid out of the local rates. It is to be hoped the new analysts will be of more use than those appointed under a previous Act of Parliament.

New Public Halls, Glasgow.—There being some apprehension that a scheme which is to give to Glasgow a new suite of halls would require to be abandoned, a number of the leading townsmen, headed by the Lord Provost, have come forward, and at a cost of 28,500l., purchased the ground. It is proposed to abandon the Tontine and Insurance principle, at first adopted, and to proceed at once with the westerly portion of the building, which will in itself be complete, consisting of a great assembly and banqueting room in connexion with suites of smaller apartments. This hall will be so arranged as to be available as a Chamber Concert-room, capable of accommodating an audience of about 1,000. The proprietors of the ground will retain for five years, in the interests of the Public Hall Company, now to be newly organised, the portion necessary for a great Philharmonic Hall, which may at any time within that period be erected. Meanwhile, the present shareholders will be asked to retain the shares already taken up, so as to enable the scheme to be at once proceeded with.

Sanitary Condition of Dover.—The Local Government Board sent down an inspector to inquire into the sewage of the town; but it now appears that, the Town Council having complained about the Government outfalls here, the military authorities in turn found fault with the sewers of the corporation, and the investigation was held in consequence. The result of the inquiry has been to show that both the town and the military outfalls are in not quite as good a state as could be wished, and doubtless those of the garrison are much worse than the others; but fortunately the evils complained of have not been sufficiently serious to affect the health of the soldiers or the people.

St. Bridget's Church, Wavertree, Liverpool.—This church, which was designed by Mr. C. A. Heffer, architect, was opened on Tuesday, the 27th ult. A full description of it, with illustrations, will be found in our volume for last year, p. 544.

A Hale Old Labourer.—The *Preston Herald* says,—“There is now living in Preston, and working hard every day, a man whose like is not to be met with every day, named Frank Bradley. He was born at Drumbeg, in Ireland, in 1776, and is consequently ninety-six years old! Notwithstanding his advanced age, Bradley, as intimated, still works hard, and during the present week he might have been seen at the mill of Messrs. Leese, of Fyde-road, mounting a long ladder, and going three or four stories high with a hodful of bricks on his shoulder! He was twenty-two years old when the Irish Rebellion of last century took place. After serving in the army for fifty-four years, he has earned his livelihood as a bricklayer's labourer. Bradley is hale and hearty, has nearly all his teeth, has lost none of the hair of his head, and looks likely to live for years.

Illegal Projections.—Dr. Appleton, in the St. George's, Hanover-square, Vestry, moved, “that a return be prepared of the several cases of illegal projections made since the passing of the Metropolis Local Management Act, in which this Vestry has taken proceedings for the purpose of giving effect to the law, and of the costs incurred by so doing; and that a copy of the same be forwarded to the Metropolitan Board of Works, and their special attention be called to the large amount of money which the Vestry has expended in these proceedings, and the very unsatisfactory results, in order, if possible, to obtain more energetic action in such cases from their officers, or an alteration of the law to enable the Metropolitan Board of Works themselves to prosecute for neglect or defiance of their authority.” The motion was carried unanimously.

This New Park at Stepney.—The contractors of the Metropolitan Board are now engaged in converting Stepney-green, which is situated in the heart of the most crowded quarters of the east of London, into a public recreation-ground. It had fallen into a neglected condition, and its inclosure and adornment having become the subject of discussion at the Local Board, the Mile-end Vestry, an appeal was made to the Metropolitan Board. After a brief delay, the Metropolitan Board consented to contribute the whole cost,—about 3,000*l.*—of converting the fields into flower-gardens and recreation-ground. The lord of the manor of Steubunthe has granted Stepney-green for the free and perpetual use of the people, and, except in regard to the expenditure for inclosure and culture, this open space has been secured to the public without cost.

The Workmen at the Law Courts.—Messrs. Dore, the contractors for the foundations of the new Law Courts, provided their workmen, over 200 in number, the best opportunity of remembering Thanksgiving Day, by supplying them with a good dinner,—a substantial mode of practical thanksgiving which we hope has had many imitators. A large tent had been erected on the ground, and at two o'clock an array of roast and boiled joints of the best quality, with vegetables and beer in abundance, followed by plum-pudding, jellies, and creams, were displayed before the British navy, to which he did ample justice. An announcement that the day's holiday would not involve the loss of the day's pay was, as might be expected, appreciated.

This Thames Embankment.—Mr. Gladstone having stated that the sum proposed to be paid to the Government by the tenants at Whitehall, in consideration of their giving up their claim to the piece of vacant ground reclaimed was wholly inadequate to its value, Mr. W. H. Smith gave notice, amid cheers from both sides of the House, that he would, on the earliest possible day, again bring the subject under the notice of the House and submit a resolution. The motion he proposed to submit on the subject would be in this form,—“That in the opinion of this House it is the duty of her Majesty's Government to take the necessary steps to give effect to the recommendations of the Thames Embankment Committee of 1871.”

American Cars for English Tramways. The Lohdell Car-wheel Company, of Wilmington, Delaware, has shipped for New York seventy-six car-wheels to George Starbuck & Co., a large manufacturer of cars in Birkenhead. They are to be placed on cars to run on London tramways. This is the second shipment by this company to England.

The New Railway and Station Works from Loughborough-road to the Crystal Palace.—A new branch railway, together with a special station, is about to be constructed from the Loughborough-road station of the London, Chatham, and Dover Line to the High Level Line of that company's line near Denmark-hill, for the purpose of reducing the distance between Ludgate-hill and the Crystal Palace, and avoiding the detour and change of carriages at Brixton. The new line involves the destruction of much valuable property in the neighbourhood. Within the last few days the works on the new line have been commenced, by taking down a considerable number of houses and shops in Flaxman-road, near Coldharbour-lane.

Fall of a Warehouse in Maidstone.—A large warehouse, situated in St. Faith-street, had been let to a maltster, for storing grain, of which a considerable quantity was delivered, a large proportion of it loose. The building, however, seems not to have been sufficiently substantial for the purpose, for the front wall bulged out, and fell across the street, the floorings gave way, and the contents of the warehouse, mixed with bricks, planks, and rubbish, were scattered over the roadway. The loss will be very considerable, not only to the owner of the building, but to the proprietor of the grain.

Brickdust in Mortar.—With reference to a paragraph in your last as to brickdust mixed with lime and sand being used in Cuba and the Spanish dominions, I would say that forty or fifty years ago it was extensively used in this part of the kingdom (Hull), and was called “simmon,” or, as I think, in one of your early volumes, by the French name “ciment.” It was mixed with mortar for fence-walls, &c., and with lime and hair for outside plastering, repairing roofs, and chimneys. Cement has superseded it for plastering and walling, and black (or furnace) sand or blacksmith's ashes for pointing and repairing.—A BRICKLAYER.

New Coal Depot at Wandsworth.—In addition to the large and extensive coal depot which the Midland Railway Company recently erected and opened at Walworth, adjoining the London, Chatham, and Dover Company, they are now about to construct a similar establishment, adjoining the Wandsworth-road Station of the last-named company, and for that purpose they have just purchased ten acres of land, on which the intended depot is to be erected. The establishment at Walworth is one of the largest in the metropolis; but that about to be built at Wandsworth will be on a still more extensive scale.

A New Monster Line of Steamships.—It appears from advices just received from America that a new company (the Randal Steamer Company) has just been formed in New York, with a capital of 12,000,000 dollars, to build six steamers on a large scale, to run between Liverpool and New York in a much shorter time than is at present occupied by the steamships of the Inman and Cunard companies, and it is stated that the new line will have a mail subsidy from the United States Government. The tonnage of each vessel will be 8,000 tons.

Liverpool New Southern Hospital.—An official statement appears to the effect that of the 45,000*l.* required for the new hospital 32,000*l.* have already been contributed, leaving a balance of 13,000*l.* yet required to complete the work. To realise this amount the committee propose, by permission of the Liverpool Town Council, to hold a grand fancy fair and flower show in Sefton Park, during Whit sun week. The foundation-stone of the new building was laid on October 23rd, 1867, by the late Earl of Derby, and the early completion of the work is only delayed by the want of the remaining funds.

A Speculation.—It seems that when the College Wynd at Edinburgh was recently demolished under the powers of the City Improvement Trust, all the oak found in the houses that were pulled down was bought by one person. His object was to manufacture the wood into souvenirs of Sir Walter Scott. This, it seems, has been done, and in many of the shops in the city card-trays, paper-knives, and other articles, have made their appearance, bearing to be made of “Wood from Birnplace of Sir Walter Scott, College Wynd, Edinburgh.” The *Scotsman* says they are tastefully made.

Tillage by Steam.—Spring is coming on and the companies who, in different districts throughout the country, undertake tillage by steam, are preparing for another season of activity. The existence of these companies, the large amount of capital which they represent, to say nothing of their dividends, are satisfactory evidence that mechanical appliances driven by steam can be used with profit in the cultivation of the land. Ploughs of the present day would amaze a farmer of the last generation, particularly that ingenious implement which makes four furrows at once, and that other which digs or grubs as may be required.

First Walk of the Oxford Architectural Society.—The first walk this term has taken place, when Magdalen College was visited. The members and their friends, upwards of 150 in number, and among whom were many ladies, met, shortly after two o'clock, in the Hall, where they were received by Mr. Henderson, the vice-president. The Rev. Dr. Millard, vicar of Basingstoke, who was formerly one of the secretaries of the Society, accompanied the party over the College, after addressing them in the Hall.

State-Room to Prevent Sea Sickness.—A target in luxurious fittings of the White Star Company's steamer *Baltic* is a revolving state-room, which is said to be effectual as a preventive against sea sickness. This room is situated almost midships, and close to the bottom of the chief companion way, and is fitted upon “points” in such a manner that, no matter how the vessel rolls or pitches, those in their berths are always on a level. We should, think, however, that it cannot prevent upward and downward movement.

The East London Tabernacle.—This large building for religious purposes in the East of London has been opened for the use of the Baptist congregation under the pastorate of the Rev. A. G. Brown. The new Tabernacle, which will provide sitting accommodation for 3,000 persons, has been erected in Burdett-road, Bow, at a cost of about 12,000*l.* The frontage is nearly 114 ft. in length; the height, 60 ft., with a turret at each end; and the depth, 83 ft. The basement contains a school, or lecture-hall, 92 ft. by 64 ft., with class-rooms.

Park-lane Sewer.—It has been unexpectedly discovered that there is a second sewer in Park-lane, 5 in. or 6 in. above the basement of Gloucester House. It is stated that, although the newly-discovered sewer had been stopped up at both ends as unfit for use, houses still drain into it, and the sewage oozes into the house in question.

Value of City Land.—Two freehold houses were sold by auction, at the Mart, Tokenhouse-yard, last week, part of the estate of the late Mr. Edward Loseby. They had a frontage of 53 ft. to Bush-lane, Cannon-street, and of 14 ft. to Cross-lane, embraced 2,900 square feet of land, and were sold for 10,250*l.*, to Alderman Truscott.

Engraving by Jets of Sand.—Mr. Morse, of the United States, now obtains fine effects, it is said, by simply allowing corundum or emery to fall through a tube of the length of 8 ft. on to the prepared surface. By this very singular means all the exposed parts of the glass or silver plate are etched in the most perfect manner.

Sweeping the Pavements.—The Chamberwell Vestry have considered a proposition in favour of sweeping the footpaths at the public cost. It was objected that the expense would be too great, and that the ratepayers would not be willing to pay. Ultimately the motion was rejected.

TENDERS

For additions to Sudbury Hall, near Harrow, to adapt it for a Girls' Industrial Home, for Mr. Williams, Messrs. Fishers & Brock, architects:—

Scrivener & White	23,183 0 0
Perry & Co.	3,160 0 0
Carter & Son	2,981 0 0
Wood	2,837 0 0
Newman & Mann	2,415 0 0
Manley & Rogers	2,757 0 0
Haynes	2,597 0 0

For building ten cottages, rear of Angel-road, Lower Edmonton, for Mr. Rayham, Mr. T. J. Hill, architect:—

Fairhead	22,195 0 0
Bayes & Ramage	1,907 0 0
.....	1,828 0 0
Childs	1,850 0 0
Lizell	1,423 0 0
Rust & Brown	1,490 0 0

For the erection of an oak palisade fencing, at the new cemetery, Charlton, for the Charlton Burial Board:—

Table with 2 columns: Item and Amount. Includes Wood (£318 15 3), Bays and Ranges (375 0 0), Bown (202 8 0), Langton (292 8 0), Fetham (257 5 6), Hill & Son (280 4 0), Woodcock (27 15 0), Tasker (268 9 2), Richardson (253 3 5), Marshall (accepted) (298 13 6), Pett (208 4 0).

For building two villa residences, at Enfield. Mr. T. J. Hill, architect:—

Table with 2 columns: Item and Amount. Includes Ward (£993 0 0), Bays and Ranges (375 0 0), Patman (849 0 0), Fairhead (805 0 0), Chads (812 0 0), Rist & Brown (575 0 0).

For additions and alterations to Brunswick Cottage, Upper Sydenham. Mr. C. F. Jones, architect:—

Table with 2 columns: Item and Amount. Includes Pawley (£457 0 0), Staines & Son (438 0 0), Bricker (347 0 0).

For bricklayers', tilers', plasterers', and other works, for proposed house at Caterham. Mr. R. Martin, architect. Quantities supplied by Mr. F. Sparrow:—

Table with 2 columns: Item and Amount. Includes Hunter (£842 0 0).

For carpenters' and joiners' work, at same house:—

Table with 2 columns: Item and Amount. Includes Baker (£429 0 0), Serveney (412 0 0), Bridgman, Nathal, & West (383 0 0), Simons (367 0 0).

For the sewing of Malpas:—

Table with 2 columns: Item and Amount. Includes Lee (£1,059 0 0), Carlisle (988 6 8), Coker, Jun. (850 2 9), Huxley (883 0 0), Walker (813 0 0), Bugbrin (789 0 0), Hoops (accepted) (720 17 5).

For part rebuilding and alterations, for Messrs. Dawson, Brothers, City-road. Mr. James Harrison, architect:—

Table with 2 columns: Item and Amount. Includes Emor (£1,130 0 0), Little (1,129 0 0), Houshal (1,120 0 0), Paak (1,085 0 0), Browne & Robinson (1,065 0 0).

For the erection of three six-room dwelling-houses, Crown-street, Brighton, for Mr. J. D. Bradley. Mr. W. W. Eldridge, architect. Quantities supplied:—

Table with 2 columns: Item and Amount. Includes Barnes (£865 0 0), Blackmore & Howard (675 0 0), Holloway & Son (620 0 0), Lockyer (550 0 0), Reynolds (455 0 0).

For redressing the fronts of Nos. 130 to 170 (even numbers only), Marylebone-road, including new party fence, and front fence walls, &c., to Nos. 174 to 204 (even numbers only), Marylebone-road, for Lord Portman:—

Table with 2 columns: Item and Amount. Includes Simpson & Son (£3,680 0 0), Browne & Robinson (3,650 0 0), Brown (3,300 0 0), Phillips & Son (3,295 0 0), Harris & Sons (3,118 0 0), Bird (2,981 0 0), Longmire & Burgo (2,870 0 0).

We are compelled to decline pointing out books and giving addresses. All statements of facts, lists of tenders, &c., must be accompanied by the name and address of the sender, not necessarily for publication. Note.—The responsibility of signed articles, and papers read at public meetings, rests of course with the authors.

Bath and other Building Stones of Best Quality.—RANDELL SAUNDERS, & CO. Limited, Quarymen and Stone Merchants. Lists of Prices at the Quarries and Depôts, also Cost of Transit to any part of the United Kingdom furnished on application to Bath Stone Office, Corsham, Wilts.—[ADVT.]

Ashton & Green, Slate and Slab Merchants and Quarry Agents.—Shippers, Merchants, and Contractors furnished with Price-Lists of every description of ROOFING and MANUFACTURED SLATE, Railway-rates, &c. Agents for London and Country for the Sale of the celebrated WHITE and ABBEY GREEN SLATES. Drawings and Prices of A. & G.'s RED RIDGE TILES, specially prepared for use with these Slates, on application.—Offices and Showrooms, 14 and 15, Bury-street, St. Mary Axe, London, E.C.—[ADVT.]

CLERICAL, MEDICAL AND GENERAL LIFE ASSURANCE SOCIETY.

DIRECTORS. CHAIRMAN.—Right Hon. JOHN ROBERT MOWBRAY, M.P. D.C.L. DEPUTY-CHAIRMAN. (WILLIAM BOWMAN, Esq. F.R.S. SIR CHARLES LOCKOCK, Bart. D.C.L. F.R.S. GERARD W. LYDPERKER, Esq. M.A. The Viscount MIDDLETON. Rev. JOSEPH STOBBS, M.A. Sir JAMES PAGET, Bart. D.C.L. F.R.S. Rev. FREDRICK J. PARSONS, B.D. GEORGE H. FLYNKARIS, Esq. Sir FREDRICK M. WILLIAMS, Bart. M.P. ASSISTANT ACTUARY. BENJAMIN NEWBATT, Esq. ACTUARY AND SECRETARY. GEORGE CUTCLIFFE, Esq.

NINTH BONUS MEETING, January 4th, 1872.

The following are Extracts from the Reports of the Directors:—

1.—Progress of the Society in the Bonus Period. AS TO INCOME: The NEW ASSURANCES were 2,159 in number, for an aggregate sum of £364,390, at premium amounting to 44,694, per annum, results which, viewed in relation to the depressed condition of Life Assurance during much of the period, cannot be regarded as other than satisfactory. THE YEARLY REVENUE was increased by over 21,000, per annum, and reached 234,568, on the 30th June, 1871. THE INTEREST yielded by the whole of the Funds, whether invested or uninvested, was 46 1/2 per cent. on the average of the entire period, being fully 3 1/2 per cent. more than that realized in the previous period. This increase was obtained not only without loss, but without the smallest impairment of security.

2.—Financial Position of the Society on June 30th, 1871. The Substantive Assurances on the 30th June were 6,670 in number, securing, with their Bonus additions, the sum of 5,445,628. The Assurance Fund at the date of Valuation was £1,828,438 10 9. And the total calculated Liability was £1,471,173 17 2. Leaving a Surplus of £357,278 13 6. Deducting therefrom the permanent Reserve Fund of 50,000, pursuant to Sec. 32 of the Society's special Act of Parliament, there remains to represent the profit of the 4 years the large sum of 2,997,268, or an amount equal to 26 per cent. of the total Revenue from all sources during the 4 years, and exceeding by 49,801, 6s. 6d. the surplus of any previous quinquennium.

3.—Results of the Division. The Cash Bonus, which is the present value of the Reversionary Bonus, and therefore the true measure of the allotment, will average 28 per cent. on the like payments, as against 25 per cent. at the last Division, and 28 per cent. in 1865, which was the highest previous percentage. No comment can illustrate better than this comparison the merits of the present Division.

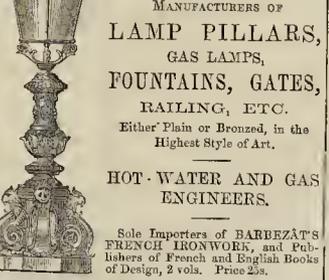

The next DIVISION OF PROFITS will take place in JANUARY, 1872, and Persons who effect New Policies before the end of June next will be entitled to that Division to one year's additional share of Profits over later Entrants.

The Report above mentioned, a detailed account of the proceedings of the Bonus Meeting, the returns made to the Board of Trade, and every information may be obtained of GEORGE CUTCLIFFE, Actuary and Secretary, No. 18, St. James's-square, London, S.W.

Turret Clocks.—Mr. Streeter, 37, Conduit-street, London, W., Manufacturer of Turret Clocks (with gravity or dead-beat escapement) for Churches and Public Buildings. Estimates and plans on application. Price:—Village clocks, from 15l.; church clocks, from 40l. The wheel-work throughout these clocks is of best hard brass or gun-metal. No iron wheels used. Timekeeping and durability guaranteed. Wholesale Entrance—Burlington Steam Works. [ADVT.]

Architects, before committing themselves to any system of Warming, should send to TRUSWELL BROTHERS, & HOLDEN, 100, Nottingham-street, Sheffield, for a prospectus of their Improved Patent Hot-Air Apparatus. [ADVT.]

TURNER & ALLEN, ART FOUNDERS AND ENGINEERS, 201, UPPER THAMES STREET, LONDON, E.C.

HENRY HILL, whose last known address was Cuckold-street, Hatfield-hill, is requested to COMMUNICATE with WILLIAM WILDS, Hertford.

IMPERIAL FIRE INSURANCE COMPANY. Established 1863. No. 1, Old Broad-street, E.C. and 15 and 17, Pall-mall, S.W. Capital, £1,000,000. Paid up and invested 700,000.

DEATH or INJURY from ACCIDENT, with the consequent LOSS of TIME and MONEY. Provided for by a Policy of the RAILWAY PASSENGERS ASSURANCE COMPANY. Against accidents of all kinds. An Annual Payment of 3s. to 6s. Insures 1,000, at Death, or an allowance at the rate of 5s. per week for Injury. St. CORNHILL, and 10, REGENT STREET, LONDON. WILLIAM J. VIAN, Secretary.

THE FIFTH EDITION, in One Volume, 8vo. price 6s. 6d. GUILTY'S ARCHITECTURE, illustrated with more than 1,100 Wood Engravings. Revised, with Alterations and considerable Additions, by WYATT PALFORTH. Follows the Royal Institute of British Architects. Additionally illustrated with nearly 400 Wood Engravings by G. Jewitt; and more than 100 other Woodcuts.

Hardly any book has done better service with reference to its special profession than Gwilt's excellent Encyclopaedia. The publishers did well to entrust the work to Mr. Palforth for revision. A New market has been introduced with the beneficial results to the book and its users. A great deal has been done for the improvement of Gwilt's text, and the work is enhanced in every respect of quality by the novelties and elegance.—Athensum. London: LONGMANS, GREEN, & CO. Paternoster-row.

SIR W. FAIRBAIRN'S WORKS ON ENGINEERING, &c. Second edition, complete in 2 vols. 8vo. price 18s. each. TREATISE ON MILLS and MILLWORK. By Sir W. FAIRBAIRN, Bart. C.E. Second Edition, carefully revised, of both volumes, with many Plates and Woodcuts.

The whole subject is so ably and systematically treated, that we believe there is no question connected with mill-work upon which the practical man is likely to require information, that he will not find fully elucidated in Sir W. Fairbairn's work. It is a work which commands itself to all engaged in the engineering profession.—Mining Journal.

By the same Author, 3 vols. crown 8vo. price 10s. 6d. each. USEFUL INFORMATION for ENGINEERS. IRON SHIP-BUILDING, its History and Progress, with many Plates and Woodcuts, price 10s. THE APPLICATION of CAST and WROUGHT IRON to BUILDING PURPOSES. 4th Edition, price 10s. London: LONGMANS, GREEN, & CO. Paternoster-row.

MR. JOHN BOURNE'S WORKS ON THE STEAM-ENGINE. Latest Edition in 4to. with Frontis., 57 Plates, and 849 Woodcuts, price 42s. cloth. A TREATISE on the STEAM-ENGINE, in its various Applications to Mines, Mills, Steam Navigation, Railways, and Agriculture, with Theoretical Investigations, Tables, and Practical Instructions. By JOHN BOURNE, C.E. By the same Author, Improved Edition.—CATECHISM of the STEAM-ENGINE, with Practical Instructions for the Manufacture and Management of Engines of Every Class. With 89 Woodcuts. 10s. 6s. price 6s. RECENT IMPROVEMENTS in the STEAM-ENGINE. New Edition, including many New Examples, with 124 Woodcuts. 10s. 6s. price 6s. HANDBOOK of the STEAM-ENGINE, a Key to the Catechism of the Steam Engine. With 6 Woodcuts. 10s. 6s. price 6s. TREATISE on the SCREW PROPELLER, 4to. 6s. London: LONGMANS, GREEN, & CO. Paternoster-row.

The Builder.

VOL. XXX.—No. 1518.

The Thanksgiving Illuminations and the Fine Art in them.

Old King Ludd, if ever such a personage had existence, and ever moved about in this world, could not have risen from his grave on the night of the Thanksgiving Day to see the crowd and witness the confusion in the place called after him, he would never have got over his surprise. No such crowd certainly was ever before seen on Ludgate-hill, and no such sight ever presented itself to the vision of men, from King Ludd to Christopher Wren, or from his day to the "Thanksgiving" day itself. We live in very practical and mechanical times; so much so indeed, that but for an accident we should never have had this imposing show of people and strange things on Ludgate-hill to talk about; and if therefore it be only for variety's sake we would say a few

words on what is to be got or learnt from it in an artistic point of view. But first a word or two on the character or generally of these kinds of display, so exceptional as they are. Unfortunately all that is done or even attempted would seem to be but little else than a matter of passing business merely; so no one, we can but conclude, ever properly and seriously considered what to do in the way of "illumination" or in the temporary house decoration of a day. No one, we may presume, ever thought of such a thing as producing an artistic work, or ever thought for a moment of calling in the aid of some artist "illuminator." We do not seem to have arrived in any way at that degree of "civilisation" which would impress on the world the startling fact that it is always necessary to employ some one to do a thing. Nothing comes into being of itself; there must always be an active personal agent in the work, whatever it be, whether merely temporary and for the passing hour, or so last for ever, or for as long as the material itself will hold together. This may seem but a mere truism to many, but it is a principle to be borne in mind and well worth remembering, for the fact really is, that no one in the late show knew what to do *himself*, and yet, stranger to say, no one seems to have thought it necessary to go out of his house to find the right man to do it for him. Do not let us be misunderstood. Of course there was, as there always is, the usual resource,—the *shop and counter* to go to. There were flag-shops, and red cloth warehouses, and gasfitters in abundance, and plenty of stock in hand for the work; but where, we may ask, was the man or men, the artists who were to mould all this material, abundant as it was, into shape? What, for example, was a man to do with a whole cartload of flags of all shapes and sizes, from one but little bigger than a pocket-handkerchief, to one

pretty nearly as large as the front of the house before which it hung? No man along the whole route from end to end knew what to do with his fine flags; and when the place did happen to be appropriate, it did not seem to occur to any one that when a number were used there would needs be room for some power of selection and choice, and that one device must be better and more appropriate than another, and that, so to speak, an *idea* might have been shadowed forth by the said flags. This was somewhat curiously exemplified in the flag display on the top of Montague House, Whitehall, on the tall French roofs of which there were no less than sixteen of these large fine-coloured flags, of all colours and patterns,—stripes, crosses, union-jacks, and all,—but the whole showy display was simply meaningless and without any significance, nor was it in any way related to the noble owner of the mansion. Surely there must be in such a place and surroundings "hannars" with a meaning enough, and the noble duke might have displayed to the wondering modern Londoner the armorial bearings of his house, and the successive additions to it, and, in short, the heraldic history of his family might have been shown; for to do such a work at all in such a place, and with means so ample, it was surely worth while to do it well and intelligently, if possible! It was possible to do it, but it was not done, for there was evidently no man to do it, or even to attempt it; for it came, as usual, from over the counter, and from nowhere else! In passing, we may notice a pretty flag arrangement at Gwydyr House, with stars and Prince of Wales feathers in crystal, as it is termed, which to see at its best it was necessary to stay out rather late, till the show was over, and to look at it in the dark, for these crystals look best and most gem-like by reflected light. It was a pretty enough display, and must have cost a little thought. We have said thus much about the banners and flags, because they are so effective in such national displays, and because they *might* be made so much more so, if but artistically treated and thought a little about, and harmonised with each other.

We might write a good deal on the show generally, and on the "stands" put up in so many places, and which effectively broke every now and then the dull house-frontages, some of them very handsome; and on the "Venetian" flag-staffs, the right forms and placing of which were, as we take it, so utterly missed; and a multitude of other little details to be observed by the eyes of the curious; but our main object is to say a word or two on the Ludgate-hill and St. Paul's part of the show. We do not mean the inside of St. Paul's, which may come in at another opportunity, but to the outside of it, and on the strange effect of the red and blue lights display. By a kind of accident, we must suppose, it was that some four or five enthusiastic scientific people took it into their heads to light up with fitful gleams the dense and packed crowd perfectly still and immovable sometimes, but coming down the famous hill at others in close streams somewhat in the way of a quickly-moving glacier, for nothing seemed able to stop it. There being so many of these intensely bright and moving lights, the strangest possible effect was produced; for the intensely bright and straight rays crossed and recrossed each other in every possible way, and produced an effect to be seen nowhere else on that eventful evening. We mention it for the sake of its singularity, for it does not seem to have been noticed elsewhere, and because it added not a little to the St. Paul's show. It was a pure and happy accident, like the packed crowd itself. Of course, too, there were flags in abundance, and illuminations of all sizes and kinds and degrees of costliness, and open windows, and, what to many might seem a kind of defect amidst so much glitter, the *dark* forms, shapeless enough, of the upper parts of the houses and roofs where visible, and there was

also the dark-coloured crowd by way of foreground. What old Rembrandt would have said, or thought, or done, with such a chance, who can venture to say? He certainly never could have seen such a novel sight without some permanent impression being made on his mind, and which impression he could not have kept to himself; the world *must* have seen it *through him* on canvas or on his magic paper. But this, good as it was,—we say again by happy accident,—was not all, for there was, of course, the huge front and dome of St. Paul's in the far background, with its circles of coloured ship-lamps round the lantern and dome,—hardly enough of them, by the way, and too wide apart, but still, good, so far as they went, for they did not obscure or put out the building, as the close and too brilliant gas-jets do; the "architecture" being lost, you seeing nothing but the bright lights. It is always possible to overdo a good thing, and to spoil a good idea by working it to death. There was, as all know, one thing yet which it was thought would give to the whole display a sort of finishing-stroke, and make of the "Thanksgiving illuminations" a something *per se*, to wit, the lighting up of St. Paul's with red and blue fires. Some disappointment seems to have been felt at this part of the show, as falling somewhat; and to those who were in expectation of volcanic effects it certainly was so; but to many who looked only for what was possible, it was not a little striking. It was necessary to use some little judgment and physical force in the finding a place to see it properly. Nothing could possibly be stranger or more weird-like than the sight of the fine building when lighted up with its red fires and smoke, the sources of the light being invisible from a low point of sight, the whole of the strange and novel sight culminating in the coloured fires and smoke (not a little important element in it) seen for a few seconds from the golden gallery surmounting the dome. Some may think this mode of lighting a building a little too theatrical; but in reality it was not so: it was *real*,—and but for a moment or two, and gave one almost the idea of a mighty conflagration—the burning of a city. It has been said that Turner, after relapsing into falsities and artificial nothingness, was recalled to truth and nature by the sight of the burning of the Houses of Parliament. What would he have thought of this sight; and how, at his best, would he have painted it on canvas, with all his wonderful skill and lightness of hand in the painting of smoke, and mist, and darkness, and coloured light? It was truly, though so transient, a subject well worthy of his powers. What a pity it is that he has no successor to record the magic scene.

AN HOUR AT THE BRITISH MUSEUM.

The recent remarks in our columns* on the study and restoration of the antique, have directed general attention to some of the noble marbles contained in the British Museum; and especially to that mutilated statue of Cupid, to which we more especially referred. In fact, something like a challenge was given for the careful examination of this exquisite relic. The challenge has been fairly met, in all honour and good feeling, and the results, as our readers will see, are in every way confirmatory of the justice of our remarks. With the frank concurrence and courteous aid of the officers of the Museum, it has been placed beyond doubt that this figure has been improperly restored.

The Cupid which is now in the Elgin room of the Museum, was found in fragments on the Acropolis of Athens, and was put together in the Museum itself. For a time it was called Icarus, being supposed to have formed part of a group of Dædalus and his son. The thongs or straps which cross on the chest, and which no doubt denote the slinging of the quiver of the boy god, led to this view. The figure has even been thought to have fallen from one of the pediments of the Parthenon.

* See p. 79, ante.

While the left foot, the authenticity, or rather the applicability, of which we questioned, is now attached to the figure, there is a piece of marble close by, which is actually separate, but which evidently formed a portion of the original plinth. On this fragment are to be seen the toes of the right foot. Careful comparison shows that they altogether differ both in workmanship and in size, from those of the foot which has been attached to the figure. They have the same indescribable *cachet* of the Athenian artist that belongs to the body and limbs, and are as unlike the straight, harsh, ill-modelled toes of the attached foot as can well be imagined. Further, as far as it is possible to speak with certitude, in the absence of a chemical analysis, the marble of the foot differs from that of the statue. It is not easy to demand a more complete demonstration of the truth of the charge brought by M. Ravaisson against the restorers of the antique.

It is perhaps hardly realised by the public of this country how rare and how costly are the treasures of ancient art contained in the British Museum. The younger establishment at South Kensington has been wisely kept so much more prominently before the public, that the elder museum, acting on an entirely different policy, has been somewhat eclipsed, so far as general attention is concerned. This is by no means as it should be. While South Kensington contains so much of the artistic wealth of the era of the *Renaissance* and the succeeding periods, Bloomsbury is alone in this country, and, to some extent, alone in the world, in respect of the stores of the antique. We do not at this moment speak of the extremely interesting series of Egyptian monumental sculptures; or of the more recently added contents of the ruined mounds of Assyria. But with regard to the age and the country in which sculpture attained its highest perfection, a very large proportion of all the known specimens of the work of the schools of Phidias and his contemporaries are actually within the walls of the British Museum. The Elgin collection was made by the Earl of Elgin, when ambassador at Constantinople in 1801-1803, under the powers of a firman from the Porte, and has probably been the means of rescuing the mutilated sculptures of the Parthenon from utter destruction. While antiquities, to tell their whole story, should always be studied *in situ*, and while the defacing of a monument for the purpose of ornamenting a museum is, in itself, an act of barbarism, the case is altogether altered when the alternative lies between deportation and destruction. The fire of the Venetian fleet, in the year 1687, caused the most fatal damage to the Parthenon. From drawings which were made in 1674 by Carrey, a French artist, of the sculptures of this temple, it is evident how much more damage has been done by war than by either time or earthquake,—the two fatal causes which have, by their combined operation, destroyed the greater part of the unrivalled sculpture of Greece. The Venetian general, Morosini, might have been an English rustic, or a landed proprietor in the vicinity of Avebury, and yet not a greater barbarian than he actually was.

The remains of the sculpture, from the hands of Phidias and his school, that filled the pediments of the Parthenon, as well as those of the metopes and the frieze of the same temple, form the basis of the Elgin Collection. With these magnificent ruins are placed some remains from the Erechtheum, from the Temple of Wingless Victory, and from the Choric monument of Thrasylus. Near them are casts from the Temple of Theseus, also at Athens, illustrating the art of about twenty years earlier than the era of Pericles. In the adjoining hall, called the Hellenic room, is a collection of marbles from the ruins of a Temple of Apollo, near Phigalea, in Arcadia, which was built by Ictinus, the architect of the Parthenon, in B.C. 430. There are here also casts from the metopes of a temple at Selinus, in Sicily, representing the archaic state of Greek art; and casts from the pediments of a Doric Temple of Minerva, in the island of Aegina, which is thought to have been erected about B.C. 500-478.

To this nucleus of Greek antiquity has been more recently added a group of relics from the Mausoleum at Halicarnassus, formerly one of the seven wonders of the world, which was rediscovered by Mr. Newton, in 1857. This celebrated monument was erected by the conjugal piety of Artemisia, the widow of Mausolus, Prince of Caria, to contain the remains of her deceased husband. Its date is about B.C. 352. It consisted of a lofty basement, on which stood an

oblong Ionic edifice surrounded by thirty-six Ionic columns, and surmounted by a pyramid of twenty-four steps. The structure rose to the height of 240 ft.; and it was crowned by a chariot and horses of white marble, in which it is supposed that a portrait statue of Mausolus was placed, as if in celebration of his apotheosis. Around the building ran a frieze, representing, in high relief, the battles of the Greeks and the Amazons. The four sides of the tomb were decorated by four celebrated sculptors of the late Athenian school, Scopos, Leochares, Bryasius, and Timotheus. The chariot group was the work of Pythos. The sculptures of the various friezes, reliefs, statues in the round, and colossal lions that surrounded the tomb, were all of Parian marble.

Of this magnificent monument, the remains which are now arranged in what used to be called the great Elgin room of the British Museum, consist of architectural marbles, such as capitals, mouldings, lions' heads, and floral enrichments; sculptures in relief, which formed portions of friezes or smaller panels; and sculptures in the round. Among the latter are the statue, it is supposed, of Mausolus himself, that of Artemisia, represented as the deified charioteer of his car; and fragments of male and female figures, horses, and lions. The interest of this noble collection, whether we regard the unrivalled fame of the monument itself, or the value which is given to the relics by the precise determination of the date of their execution, and the names of the sculptors, is extraordinary.

There are now on their way to the Museum relics of a scarcely less interesting character, from that famous Temple of Diana at Ephesus, of which we have recently spoken at some length. The great peculiarity in this case is the existence of sculptured columns, adorned with groups of figures in high relief; an unusual mode of enrichment, of which we find a later illustration in Raffaele's cartoon of the Beautiful Gate of the Temple, and the reproduction of which has been recently attempted in the terra-cotta columns at South Kensington. We shall have occasion, on the arrival of this precious consignment, to give further particulars; only now remarking that the workmanship of these columns is such as to furnish yet another proof of the manner in which true artistic feeling is strangled and stifled by the passion for over-ornamentation.

We thus find, within the halls of our great national Museum, an unrivalled series of illustrations of the progress of Greek art from its archaic period to the commencement of its decline. The history thus displayed presents, in many aspects, a striking parallel to the history of Gothic architecture throughout Europe, as well as of that special branch of the subject which may be studied in our own island. Again, a similar history may be traced in the development of the art of the glass-stainer. That antique sculpture, Medieval architecture, and a special art of decoration, which may be thought rather to have called upon the architect to afford scope for its display than to have waited upon any structural exigencies, should have all followed courses so strikingly parallel, is a matter of more than ordinary coincidence. It evinces the action of something like a law of organic growth. This law is to be sought, however, rather in the mental characteristics of the great Aryan race, of which Greek and Teuton alike form a part, than in the essential principles of art. That such is the case is proved by the contrast afforded by the long-maintained and unchangeable durability of Egyptian sculpture and painting. Again, in the art of a race of a totally different blood, which we are only commencing to study, namely, that of Japan, we find but little to recall the successive stages of European art. What we do find, in these widely-separated cases of Aryan progress, is this. First, the mind of the artist appears to have been possessed with a deeply religious feeling, a sense of awe, and a desire to devote to the embellishment of the temples of his worship the full power of an energetic but inexperienced workmanship. As year after year the hand became more exercised in its cunning, increased facility of execution reacted upon conception. The stone, becoming more obedient to the chisel, reflected yet higher and higher creations of the imagination. In each case the loftiest sublimity of conception appears to have been attained before the hand of the artist had been trained to its utmost cunning. The broad and grand style which characterises the work of Phidias and his school is justly regarded as the

acme of human art. Yet, on the ground of its plastic skill alone, it is not perhaps equal to that displayed in a somewhat later age, when the Homeric spirit seems to have evaporated from the marble, but when the latter had become as obedient to the hand of the sculptor as wax itself.

In the same manner we may compare the spirit and the execution of our own Early English and Decorated Gothic with the more elaborate details of enrichment by which perpendicular Gothic with us, and the Flamboyant style on the Continent, gradually became overlaid. Without discussing, at this moment, the cardinal periods of change, there can be no doubt that the course followed by Gothic art was, first to increase both the delicacy and the beauty of the structural lines, then to allow them to bud and bourgeon into lovely decorative foliage, and finally to confound and conceal them beneath a mass of endless ornament. If we compare the lancet windows of such a structure as the Lady Chapel of St. Saviour's, Southwark, or the arches of the reign of Henry III. or of Edward I. in Westminster or in St. Alban's, with the pendent stone ceilings of St. George's Chapel at Windsor, or of King's College Chapel at Cambridge, the development to which we refer will become manifest. Again, in the advance in brilliancy of execution in stained glass, which may be traced from the twelfth to the sixteenth century, the same order occurs. The solemn grandeur of the Early English stained-glass windows produces an effect on the mind altogether of a higher order than that due to the fairy-like sparkle of the cinquecento work. Yet, as matter of manufacture, and of all the manipulation of the artist in glass, there is no doubt that the latter is very much in advance of the former.

The materials for sculptural scholarship, in which the British Museum is so rich, do not close with the Carian fragments. But it is not so much to sculpture proper that we now have to look for the elements of an historic review, as to that portion of the sculptor's art that is executed by the medallist. In the age of Alexander, it is believed, it first became the custom to place the head of the reigning sovereign on the obverse of his coins,—a place previously given to some religious representation or symbol. We do not know of a contemporary coin of Alexander of any very striking beauty to which we can at the moment refer; but in the Gold ornament room at the Museum, in a case of Greek silver coins, may be seen a superb coin of Lysimachus, bearing the head of Alexander, and no doubt struck from the die prepared during the lifetime of that monarch. We are familiar with the features of the great Macedonian from the exquisite three-quarter face gem wrought by Pygmales. The profile on the coin is in no way inferior to the famous gem. The effigies of other sovereigns carry on the evidences of the state of art while passing from its religious stage to that in which it sank to little more than a costly mode of flattery; a flattery precious in its results, as it has given us a series of portraits of the highest physiognomic value. In the 1821 edition of the works of Professor Camper are to be found engravings of a copper coin of Bocchus, king of Mauritania (circ. B.C. 90), and of a silver coin of Pharnaces, king of Pontus, some half-century later, which contrast very favourably with the stiff head of Alexander, engraved on the same page. But to say nothing of any more or less idealised portraits, such for instance as those of Homer, of Sophocles, or of Pericles, there is, in the Museo Borbonico at Naples, a full-sized bronze portrait bust of Scipio Africanus, which must date late in the third, or early in the second century B.C., which even descends to the somewhat ignoble detail of showing the stumps of the hair over the whole of the closely-shaven head. Thus we come down with almost uninterrupted illustration to the portrait bust of Julius Caesar himself, in the gallery of the British Museum, and to the yet more wonderful intaglio called the Payne Knight Cassar, representing the same stern and lofty features, which come out under the glass in *altissimo* relief, and full face.

Greco-Roman art is also finely illustrated. A recent purchase has been the statue of a young man, undraped, represented in the act of holding a fillet round his head. This was discovered in the theatre at Vaison, the ancient Vasio, in France. There seems no reason to doubt that it is a copy of the famous Diadumenos of Polykleitos, the companion statue to that still more celebrated figure of the Doryphoros, or spear-bearer, which is referred to as the canon of Polykleitos. The Roman statue,

however, is a late and somewhat slovenly copy. The conception is thoroughly noble and antique, the execution is comparatively bald and poor. We should explain that, in forming an accurate and reliable judgment of style in sculpture, two special qualifications are requisite. One is, if not the habit, at all events the instinct, of the sculptor. No amount of observation will confer a true critical acumen on a person destitute of this artistic sense. The second requisite is, of course, knowledge of examples. The man who unites those two qualifications will be apt to say little as to style. He knows perfectly what it is. He can distinguish a Greek from a Roman bust or coin as readily as he can a horse from a donkey. But he no more thinks of boasting of this power than of his personal strength, beauty, keenness of vision, or any other natural and yet highly-cultured endowment. It is the man who knows little who prates much, and who tries to give weight to his opinions, for they are nothing but opinions, by reiterated assertion, and by the free use of technical slang.

We are therefore glad to be able to give other reasons for assigning a late date to the copy of the Diadumenes than the mere sentiment of style. When brought to the test of actual and minute admeasurement, this statue altogether fails in that exact proportion which characterises the Greek work of the best time. There were certain rules, into which we cannot for the moment enter, which were observed with such accuracy by the Greek sculptors, in proportioning the forms of different types, that they may be illustrated with equal precision from the symmetry of the grand Juno of Melos, an early Greek work, and from that of the delicate Venus de' Medici, a much later Rhodian work. The exactitude of reference to a certain modulus, in each case, is so minute that it amounts to absolute demonstration of this canon. But in the Diadumenes all is vague. The sculptor seems to have wrought by eye, and not by measure. In this very circumstance we may trace either a cause or a result,—at all events, a concomitant,—of the substitution of portrait sculpture for religious work. That fixity of rule which may be called conventional, but which was really but the reducing to system of the highest idealisation, is altogether inconsistent with the serenity of faithful portraiture. Italian sculpture at this very hour illustrates this view. At no period in the history of art has the power of cutting marble been greater or more delicate than at present. Some of the modern Italian statues to which we referred our readers in our account of the International Exhibition at South Kensington last year were in point of execution absolutely wonderful. In some of them, it is true, there was merit of a much higher order than this mechanical excellence; but in others, more especially in a pair of portrait statues exhibited at the Workmen's Exhibition at Islington, realism appeared in its very basest form; they were vulgar photographs of men, which looked very life-like, but very vulgar. We may refer to the City statue of Peabody, and to the figure on the Thames Embankment intended for Brunel, as further examples. We have not exhausted the subject, either as regards the transformations which art undergoes in passing from the solemn and decorous penury of its cradle, through the might of its religious fervour, to its decline into the staid of a mere pander to vulgar ostentation, or as regards the illustration of this progress to be drawn from the marbles, and even more from some of the unrivalled bronzes of the British Museum. But here we must pause for the nonce.

We ought, in justice to ourselves, to add, that this is the first notice of the Diadumenes which has appeared in print. The statue in question has not yet been placed in the public part of the Museum. There is, however, another type of the same subject, which was purchased from the Farnese Palace at Rome, and which has been for some time in the Sculpture Gallery, to which our remarks may be taken as applicable. This copy was dug up, we believe, on the site of the Baths of Caracalla.

St. James's Park.—In the Commons, Mr. W. H. Smith has given notice that he will ask the Chief Commissioner of Works whether it is the intention of the Government to proceed with a Bill, whereof the plans are deposited, for obtaining powers to take a certain space of ground off St. James's Park, 350 ft. in length, and from 60 ft. to 70 ft. in depth, for the erection of additional offices for the Admiralty.

MEMS. CONNECTED WITH THANKS. GIVING DAY.

It is stated that the number of passengers conveyed over the Metropolitan, Metropolitan and St. John's-wood, and Hammersmith and City Railways on Tuesday (Thanksgiving Day) was 243,863. This serves to give some idea of the enormous number of persons who were out on that occasion.—It is about to be proposed in the Court of Common Council:—"That in order to testify in an enduring form the deep sense of this court of the national importance of the recent general Thanksgiving, a memorial window of a suitable character be placed in the new library now in course of erection, and that it be referred to the New Library and Museum Committee to carry the same into effect at an estimated expense not exceeding 500 guineas."—The subscribers to the Fleet-street Decoration Fund have resolved:—"That 20l. from the surplus fund (amounting to 59l. 11s. 1d.), and the scarlet cloth on hand be presented to King's College Hospital; that 20l. be presented to the Harrington General Dispensary; and 10l. to the Police Orphanage, as an acknowledgment of the efficient services of the police on Thanksgiving Day."—Messrs. Sangor's Circus procession, which passed along nearly the whole line of route after the Queen had returned, was not the least striking incident of the day. It wanted harmonising and uniting by an artistic mind, but was, nevertheless, far superior to what is usually done in this way. The outlandish dresses were quite new, evidently, and were a mass of gold, silver, and colour, satins, velvets, and so forth. There were numbers of pretty horses; an immense gilt and painted erection (drawn by ten horses), with many smaller cars; a camel, or dromedary; an elephant, with his brilliant howdah; Cupids driving teams of half a dozen cream-coloured ponies; and a live lion crouched at the feet of a girl who represented Britannia, with helmet, shield, and spear. It was a risky thing to take such a cavalcade through the crowd, but we heard of no accident resulting.—As to the reported accident at Marlborough House, Colonel Hogg said, in the House of Commons, in reply to a question, it appeared from the report of the district surveyors that, after careful inquiry, they had not found that any structure which had been erected or was in course of erection in the neighbourhood of Marlborough House, up to the evening of the 26th of February, had fallen; but they stated that a standing-place, set up near the porter's lodge in Marlborough House-yard, and which consisted of loose planks, had been thrown down by the crowd, and was the cause of a serious accident. He desired to add, that the district surveyors performed their difficult task in a most careful way, and, after making inquiry, he had ascertained that no accident occurred to any structure they examined.—The expenses incurred by the Board in making arrangements for the accommodation of members of vestries and district Boards on the occasion of her Majesty's visit to St. Paul's, amount to 3,000l.—We understand that the proprietor of the *Central News*, through the courtesy of the cathedral dignitaries, introduced a wire into St. Paul's, and despatched a description of the ceremony to all parts of the kingdom as it progressed.—New locks and handles were made for the Temple Bar gates by Messrs. Hart & Co., the men working night and day to get them done in time, but they were, after all, not used.

COTTAGE BUILDING IN NORWAY AND SOME OF ITS TEACHINGS.

In the present state of things architectural, so confused, and with so much that indicates a fast-coming change, it must be not a little interesting to inquire into the work and methods of work of those who have not had, as we have, vast heaps of art "precedent" to go by and to copy. It is not a little singular to reflect on that it has been reserved for these modern days to be so entirely at the mercy of what has gone before. In no other age of the world has the architecture of the *then present* been at the mercy of that which preceded it. It never would seem to have copied,—always followed or seconded. Each age or generation took up the work as left by those who preceded it, improved on it or not, as the case might be, and so, in effect, left behind them practically a new style, a growth out of that which preceded it. It did not copy or make effort to reproduce what had gone

before, but simply went on with the work, and, by degrees, worked out a new style. Nothing can show this more convincingly than the primitive system of hut or cottage building in Norway,—*i.e.*, in those parts of it removed from the influence of modern and new systems of construction and new and patented materials. The subject is a curious one, and worth a little consideration and inquiring into, if only as a primitive system of doing things before style commenced, and before any one ever thought of copying. How to build architecturally and artistically, without any architectural precedent—in other words, to build up mere material constructively and ornamentally,—is an important question. It has been contended that this cannot be done,—that some definite architectural forms and ornament are absolutely necessary; and that these are the work of time and growth, and that no "architecture" in its full meaning, can come out of mere and simple construction; but it is a little wonderful to see, if you look a little below the surface, how much of architecture is to be found in the simply and rudely constructive. Before we go further, it is not a little to be regretted that no trustworthy system has as yet been invented of rendering wood *fireproof*; for the want of it, and the consequent disease of timber construction, have thrown woodwork into the background. No wooden houses, where any sort of building art prevails, are now possible, so that timber house construction and fine art are of the past. This is to be regretted. A complete history of wooden house-building and architecture with wood only for its material is to be gathered in Norway alone; indeed, this history may be said to go back beyond the historic era, for there are evidences of wooden buildings on piles of a date far beyond written records. Architecture grew up here and there, doubtless, out of materials and simple and necessary construction, each separated nationality or race having its own.

But the main practical interest of the subject lies of course in the strictly modern plan of hut or cottage building, as it exists, and as people now live in such buildings. Of course we are speaking only of the purely native system of building proper to the country, and not of that which is gradually superseding it, and which has been borrowed from foreign sources. These cottages are formed of pine logs, but roughly squared, with the sharp edges cut off so as to be nearly octagonal. These logs are laid one upon another, and with a layer of moss between them in lieu of mortar. The logs forming the side or end walls are notched, so as to receive the ends of the timbers forming the front and back walls. Each log is from 12 in. to 13 in. or more square, so that the walls are about a foot thick. The walls are about 10 ft. high. In the better sort of cottages the whole of the interior of the rooms are lined or panelled, so that it would be difficult to discover a better system of building, or one more entirely suited to the climate. A warmer kind of walling could not be devised, nor one more "comfortable" in appearance. The floors and ceilings are boarded, the former raised from the ground by stone sleepers, a foot or two high. We hardly know what will be said about the roof; but why should a clever thing be lost sight of? Improvement of course is introducing *state*, always neat, if not genteel, but the poor old Scandinavians looked to warmth and comfort, and perhaps to harmony and picturesqueness, if not to the "architecturesque;" and they covered their rough roofs with close boarding, then with birch bark peeled off in flakes; and then on this they laid earth about 3 in. in depth, retained by a fillet running along the eaves. A crop of moss of course soon covered this earth, so that a more picturesque or better coloured roof could not be, or a warmer or better heat-protector or keeper-out of cold. The joiners' work is but rough, like the walls and roof, but all harmonises, and may truly boast of one good quality,—it keeps out the wind and the weather! Surely such a system of building as this is as good as can be for the place it is in, and for the surroundings of rude forest, and rapid watercourses and lakes. Some might think this a better way of building a cottage than the thin-walled and meagre model cottage, which is, says a good authority, but "the skin of a house." The old Scandinavian and his not yet thoroughly civilised modern successor think nothing does but the solid timber logs between them and the cold. Nothing, indeed, can be more *comfortable* than the interior of one of these wood-walled and wood-lined rooms. With the prosperous

Scandinavian there is always a room for everything, for the material being so plentifully supplied by a bountiful nature, there remains but the trouble of building and putting together. Many of the houses are two-storied, and the stairs, from the ground to the upper story, are sometimes singularly quaint and architectural. Now, this is an old-fashioned way of work, and rough as may be; but we may ask, what workman is there that would not sooner live in such a tenement than in a patented, thin-walled, and corrugated iron roofed model-house of the most recent make and pattern, and choke-full of scientific inventions and improvements?

It will thus be seen,—at least, to some small extent,—that in this far northern and somewhat out-of-the-way country there now exist materials for forming some idea as to the origin if not creation of a style of architecture, the growth out of mere *constructive necessity*, and out of the materials afforded so abundantly by nature on the spot whereon it has grown up. We cannot in looking at it avoid the pressing thought of how much light is thrown analogically upon the origin and progress of Gothic architecture in these islands, for both are the results of Northern thinking out and requirements. We say "Northern," and use the word in place of a better, and as descriptive of the doings architecturally and architecturally of a people distinct from Southern and Eastern races. It leads us, too, to the much vexed question, now especially interesting, of how far is it possible to invent an entirely new style of architecture? Is it possible to create a new style of architecture to be founded on, and to grow out of, simple and necessary construction? and can it be accomplished in one age, or even so far carried on in one as to show itself as a something distinct in that age, and will the study of all other styles help or hinder it? No small amount of discussion might be raised on such a revolutionary project, and without something to go by,—"precedent" of some sort or other. There are some who might even go so far as to say the thing is impossible in the very nature of it. One thing, however, this Northern work undoubtedly shows, and it is this, that art and architecture may grow out of bare construction with "precedent," or a something to go by, entirely absent. This simple architecture harmonises perfectly with the scenery and surroundings of the place it fills. There is no jarring element in it. As to the modern transplanted villas and smart houses, you wonder where the latter came from, and who could possibly have imported them, so fearfully do they put out nature,—the nature which surrounds them,—a primeval forest growth, nature's own work, and which, as it would seem, man cannot without more capital and science destroy. What a pity it is that "improvement" has not stayed its hand here and there, and left us a town or even a small village from the old days,—some small collection or group of houses, whereon no disturbing artistic element would be found, with its quaint inn, irregular streets of houses, so truly "picturesque,"—its small church, and all these other little quaint things, once upon a time to be seen everywhere. A little of this, as all know, is to be found here and there, and the antiquary and the architect have ransacked England to find them out, and to transmit them to posterity on paper; but the things themselves are fast disappearing, and must soon be numbered with the things that were. But in Norway these strange things are yet to be seen, and a curious light indeed they throw on things architectural and artistic.

A FRENCH ARCHITECT ON THE ARCHITECTURE OF THE SECOND EMPIRE.

FRENCHMEN, naturally more emotional than ourselves, are more given to import their emotions into their business affairs. Since the downfall of the Napoleonic dynasty, and the crushing disasters which followed it, little has been publicly spoken or written in France on any subject whatever without an ultimate reference to the woes of the country and their supposed causes, or without an anathema hurled against the invader. The architects of France have, naturally enough, proved no exception to this rule. In graveside orations they have added a political lament to the expression of personal sorrow, and in written disquisitions they have endeavoured to cast odium of failure on the shoulders of the régime under which they recently flourished. One of the latest archi-

tectural opponents of the Second Empire is M. Daniel Ramée, and his strictures have been admitted, under reserve, into one of the Parisian professional journals. The charges which he brings forward are numerous, and expressed in no measured terms. Many of his *confères* differ from him; but many also agree with him; and in order that our readers may understand the views of those French architects who look on his darkest side, we translate a portion of his lengthy tirade. He says:—

During the eighteen years from 1852 to 1870, Paris and many other towns in France have completely changed their aspect. The venerable monuments which recall the national traditions and memories and glories of the past have been gravely marred and mutilated, cut down, and hacked about,—have even been thrown to the ground to make way for edifices of no intrinsic artistic merit. Moreover, a deplorable change has gradually taken place in the public taste, and particularly in architecture. There has, perhaps, never been an epoch which is richer in resources and materials of all kinds; and never in any epoch or among any people have public works absorbed a larger amount of the public moneys. Yet there has never been a people who with so vast means of execution, have produced such paltry results or results so sad and regrettable.

The degradation in which architecture lay under the feet of the Second Empire arose from two principal causes:—first, the equivocal and pernicious management of new architectural schemes; and second, the thoroughly bad and insufficient education given to students destined for the architectural profession. It is of the first alone that we shall speak. Under the Second Empire everything was sacrificed to the consolidation of the throne of Napoleon, and in pandering to the depraved tastes of those who helped to establish it. Under that Empire architecture, like the other arts, was abandoned to intrigue, and partially to baseness, to mastery, incapacity, to confusion, and to disorder. And architecture itself was without unity, without knowledge of its lofty purpose, without sincerity, without healthful fancy, and last of all without that elegance which is one of its chief attractions. All these faults arose from the absence of a capable, enlightened, independent, sagacious, and really national supervision. The ministry of Public Works was awarded by chance, by favouritism, or through the influence of those in Court favour, and was at the mercy of vain and inflated cliques, who utilised the power of office to carry out their own whimsical and fantastic caprices. Hence naturally emanated those servile and often burlesque conceptions in which oddity and frivolity predominate, and which are marked by degeneracy of taste and a want of suitability to the times,—in short, which, while seeking to derive inspiration from the masters of the art, only succeed in bringing forth hybrid works without character; which are displayed, too, with impertinent assurance and stupid satisfaction before the public, in whom they excite little interest and still less admiration. For the real non-official public looked with a cold and indifferent eye on those edifices which cost it so dear, which it saw surcharged with blunders and inconceivable artistic liberties, and which are but bad imitations of the styles of the past or their decadence. This public was, moreover, disgusted with the boastfulness which thought to impose on enlightened and independent spectators; it was astounded at the audacious presumption which outraged and violated it, which provoked and annoyed reflective people, and which excited the contempt of all true artists.

The more we regard the architecture of the eighteen years of the Second Empire the more does it appear insipid and inconsistent. The works produced during that time are only an eternal reproduction of academic types, which have been stereotyped for years, and which it is fatiguing to encounter without variation on every occasion.

To pile stones on stones, mouldings on mouldings, columns on columns, to fill deformed niches with second-rate statues, or to raise them on pedestals and establishments, to leave no blank space in the elevations, but to cover them over with debased profiles and sculptures of doubtful merit; to add ornaments which are of no conceivable use in the positions which they hold, except to mislead the eye, and detract it from the weakness and poverty of the architectural composition, has not resulted in the production

of a real work of art, and has only given satisfaction to the vulgar and the interested creatures of the Empire, but never to those animated with a love of what is suitable and beautiful and true. The First, like the Second Empire, suppressed liberty, and used its every energy to hasten the national decadence, so that it might establish its own absolutism. The intellectual tone has been lowered, and all creations of the imagination have been less bright and glorious. The Arts were stranded in the universal shipwreck in which our military glory flourished. With very rare exceptions, the buildings of the Second Empire, tricked out in the unintelligent gaudiness of the *parvenu*, and hurried up with so much precipitation, remind us of the structures of Augustus and of Constantine. To produce works quickly and abundantly, to prefer quantity to quality, seem to have been the device of these princes,—and notably of the former,—to consolidate their dynasties; and the Second Empire has not failed to pursue the same course with the same end in view.

EXHIBITION OF THE ROYAL SCOTTISH ACADEMY.

In our annual remarks upon this exhibition, we have made it our aim neither to praise inordinately nor to blame severely. Over-laudation is, we believe, more detrimental to the progress of art than the opposite; for by it many have been encouraged in the production of mere mechanical representations of nature when they might have been more happily employed as decorators, or in some useful handicraft. It is no pleasing task to speak unfavourably of works by which men gain a livelihood; but when these are exhibited to the public, criticism is courted, and it is unreasonable to chafe against unfavourable comment, when every scrap of praise is eagerly appreciated.

It is with satisfaction we remark that an unusual number of works have been rejected this year,—satisfaction not at the disappointment that will undoubtedly be experienced by many, but at the good effect it will have upon art, in stimulating the careless to greater exertion, and in causing some to consider whether it would not be to their own advantage to abandon a pursuit for which they are unfitted. Notwithstanding the smaller number of works exhibited, there are still some hardly worthy of consideration, as works of art; but the general effect of the exhibition is more satisfactory than that of the last. It must not be thought that we enter the picture-gallery with the expectation of finding there a galaxy of genius; we are more than satisfied if we discover one star shining over so dimly, and a few satellites giving forth a reflected light.

As is usually the case, this exhibition derives much of its attractiveness from works which have previously been exhibited elsewhere; these include Landseer's "Rent-day in the Wilderness," Orchardson's "Toilers of the Deep," Pettie's "Sally," and "Love Song," Halswell's "Pilgrims at Scala Santa," Baron Ley's "Marguerite, Duchess of Parma, giving Alms," Alma Tadema's "First Reproach," "Qual Fight in a Roman House at Herculaneum," by Raffaele Pozzi, and some others.

Many of the best-known local artists seem to have reserved their works for the Royal Academy. This practice is gaining ground year by year, and the Scottish Academy may be looked upon as a nursery for its more powerful rival. It is therefore a matter of interest to cast about with the view of finding out the men likely to fill up the gaps.

Works by Mr. Robert Gibbs may have appeared at former exhibitions, but they must have been unimportant, as we have no recollection of them. In the only picture he exhibits he aims high, and does not miss the mark. No. 561, "Last United Visit of William Lord Russell's Family the Day before his Execution," reminds us of the well-known "Release" of Millais. The jailer who opens the door of the prison has his back to the spectator, but the figure is very suggestive; Lady Russell bears evident marks of deep sorrow, but she is dignified and composed, and the little ones are worthy of their parents. The manipulation is bold and effective, and the colour subdued and harmonious.

We have no recollection of meeting the name of William F. Hole in former exhibitions; he contributes three works to the present collection, all characterised by a certain degree of quaint

ness. No. 115, "Chancer reading to Blanche, Wife of John of Gaunt," represents the poet, the duchess, and two attendants in a garden, shaded by trees where peacocks disport in the sunshine, and a fountain trickles refreshingly. No. 376, "The Canterbury Pilgrims," is a humorous representation of the "sundry folk that by adventure y-fell in fellowship," treated in a conventional manner, and displaying much humour; and in No. 547, "My Ward, Sir," we are presented to a lovely and loveable little maiden, gracefully attired in the costume of a period of which the present is an unhappy imitation.

No. 157, "Old Mortality and Sir Walter Scott," by Mr. James Drummond, represents the enthusiast at his self-appointed task, restoring a tombstone, while in the background the parish clergyman is conducting the great novelist into the churchyard. Sir Walter is represented as a young man got up in the fashion of the period, and old Paterson, in a patched blue over-coat and leather leggings. In composition and colour, the picture (which is carefully finished) is good, but we do not find in the "Old Mortality" of Mr. Drummond those strongly-marked characteristics of the original presented to us in the novel. Mr. Drummond's other two pictures, No. 332, "James VI. calling at the Shop of George Heriot," and No. 414, "An Edinburgh Armourer's Shop, temp. Charles I.," a Highland Chief selecting Weapons," exhibit the artist's accurate knowledge of antiquarian details.

Sir George Harvey has in his "View of Shandon House" (151), undertaken a subject few could grapple with satisfactorily. The mansion is a new one, and the grounds around it are newly laid out and planted, yet the artist has, without shirking details, by means of skillfully disposed light and shade, and by his treatment of the distant landscape, produced a satisfactory result. No. 342, "The Eagles' Nest, Loch Awe," is in the familiar style of the artist, and the scene is impressed with a weird solitariness which is enhanced by the introduction of a single figure.

Mr. Macfaggart, although producing no large picture this year, appears to great advantage; his seaside scenes are fresh and charming. No. 69, "The Fisherman's Noon," is worthy of Hook, and "The Children at Play" (180), and those "On the White Sands," are delightfully natural. The shore, sea, and sky are in each case rendered with truth and simplicity.

No. 113, "The Peacemaker," by Mr. James Archer, represents a lady endeavouring to reconcile a Cavalier and a Roundhead. The incident is plainly told, and the expression and posture of the actors appropriate, but the drawing is very defective. Such, too, is the case in No. 151, "A Bit of Romance; the Host takes his Guest Home for the Night," where we have a horse which appears to have been studied from a wooden model, and the rider from a lay figure, propped on its back. The subject (a knight escorting a monk) is, however, redeemed to a certain extent by a quaint and Medieval feeling which is attractive to some minds.

There are artists who paint a single figure well, but who avoid the greater test of depicting some worthy event requiring the delineation of action, expression, and emotion. Mr. G. Paul Chalmers must be reckoned amongst this class; he continues to exhibit single figures, all displaying much technical excellence, and, indeed, we have seldom seen finer *chiar'oscuro* and livelier dessein than appears in No. 348, "Sympathy." We are quite aware that the mere grouping of a number of figures in a picture is no test of its merit, and that a single figure may possess all the finest qualities of art, but he who cannot go beyond that can never occupy a very high position. In No. 455, "On the Tunnel," Mr. Chalmers has made his first essay at landscape painting, and in this branch of the art he promises to be successful.

Mr. Mouston paints his figures on so high a key as to make harmony almost an impossibility. No. 53, "Danger," and No. 278, "The Watch on the Moor," are not badly conceived, but the glare of colour on the costumes is such as to render it impossible to paint up the landscape to it, and in both instances the landscape is an essential part of the picture, and evidently not intended to be subordinate to the figures.

Mr. W. E. Lockhart is very vigorous in No. 1, "Andalusian Quack Doctor," vigorous to a fault, for the brush marks are in some parts so strongly pronounced as to produce a feeling of slovenliness and harshness. This is the more to be regretted as the composition is admirable, and the de-

lineation of character remarkable. The Quack, with spectacles on nose, seated upon his mule high above the surrounding crowd, is the very embodiment of a solemn humbug; but one's feelings are in sympathy with the young mother with her sick child, who carries away the highly-coloured drug as if it were an infallible remedy.

Mr. Robert Gavin appears to have visited the Southern States of America, and presents us with a number of subjects from Mulatto and Quadroon life, in which he contrives to give us an interest. No. 267, "Master and Slave" (a young master and a young and pretty slave), tells its own tale; she looks upon him as a god, he upon her as a chattel. No. 436, "The Planter looked upon the Slave's gold, and then upon the Maid," exhibits a still more painful episode in the same sad story.

Mr. Joseph Farquharson, who was gaining a good position as a landscape-painter, has directed his attention to figure subjects, and has achieved a decided success in No. 456, "On Grandma's Knee," a cottage interior, with an old woman and child. The leading lines have a fine bold sweep, and the painting is solid and genuine.

Mr. Otto Lyde also exhibits a cottage interior, "Sunday Morning" (160), simple and pleasing. The number of cottage interiors exhibited is remarkable, many of them well painted, but conveying no particular sentiment or idea. This want is not, however, felt in the exhibits of Mr. Joseph Israels, which are full of expression, and charm as in spite of fearful drawing. The arm of the woman in No. 273 is swollen out to preposterous dimensions, and the feet of the child upon her knee are ridiculously small in proportion to its body.

We have on former occasions referred to the originality of the Scottish School of Landscape Painters,—an originality the result of the study of nature having for subject the noble scenery of the North. But it would appear that foreign art is beginning to exercise an undue influence upon some of the younger men, and in place of originality we have imitation. The Scottish School was originally founded upon the Dutch, but it had gradually emancipated itself and formed a new and distinctive school, influenced doubtless, from time to time, by others, but never stooping to slavish imitation. Form,—the first thing which catches the eye in nature,—was never ignored for mere effect, and, above all, truthfulness was its mainstay. Landscapes by foreign artists have, for some years past, secured a ready sale, but we suspect home imitations of such are not so likely to be sought for; so that, even in a mercenary point of view, the probable result is failure.

This tendency is observable in No. 22, "The Silver Dee," by Mr. A. D. Reid, in which truth is sacrificed to produce a silvery effect. In No. 413, "Broadsea," there is a similar sacrifice to breadth.

Mr. John Smart's landscapes are vigorous and truthful. No. 165, "Mid-day," is bright and effective. Those of Mr. James Docherty are appreciative, and Mr. James Cassie's full of repose and beauty.

As to the older hands, Mr. Waller Paton is much as usual; Mr. Sam Bough not quite up to his usual mark. No. 114, "London from Shooter's-hill," is stazy, and too much of a panorama; and Mr. Beattie Brown more varied in his subjects, and sensible as ever. Of the architectural drawings we will speak separately.

ROUND CHURCHES.*

M. LUCAS has taken, as the basis of his work, a well-known article in Britton's "Architectural Antiquities," which groups together the rude stone circles at Stonehenge and Avebury, the circular temples of Greece and Rome, and the circular churches of the Middle Ages, with special reference to the origin of the churches dedicated to the Holy Sepulchre, at Cambridge, Northampton, Little Maplestead, Essex, and in the Temple, London, and with a view, apparently, of showing that all circular temples are but an expansion and fresh application of the original idea that expressed eternity and infinity by the figure of a circle, in the most remote ages of the world. M. Lucas has enriched it with notes relating to churches built in honour of the Holy Sepulchre, in Spain, Portugal, Italy, Prussia, and Paris; has added a letter from Mr. Wyatt Papworth, dotting down a list of English works on the four English churches mentioned; and,

* "Les Temples et Églises Circulaires d'Angleterre." Par Charles Lucas. Paris: Ernest Thorin. 1871.

evidently, in consideration of the services rendered him by Britton's labours, has entitled his volume a tribute to the memory of that industrious pioneer, in a dedication to two of his friends, Professor Donaldson and Mr. George Godwin.

In the essay no doubt is admitted as to the purpose of the numerous stone circles in Great Britain: they are circular temples, quite as unmistakably as though they were all on sites as secluded as that on the little rocky, sea-weedy islet in the St. Kilda group. There have always been nations that worshipped the sun, or the moon, or fire, or other visible object, who could not confine themselves within walls when engaged in their devotions; and these stone circles can be sought but the temples of those who could tolerate no other vault than that of heaven, and no limit to their prospect but that of the horizon. If Mr. Fergusson's theory that they represent victories in the battle-field, or other modern theories have met the eye of the French architect, they are not set forth to unsettle earlier convictions: the responsibility of these convictions, however, is left in words, with the author's translated.

The most ancient temples of which there are written descriptions are the tabernacle made in the desert by order of Moses, and the splendid Temple of Solomon. The essay passes from these and Egyptian temples to the six Greek circular temples mentioned by Pausanias; and thence to the more numerous examples in Rome and its environs, whereof the Pantheon is chief. After an enumeration of present remains, and transformations into Christian edifices, and the records of those that are now no longer seen, we are landed in England in company with the forty monks, under St. Augustine, sent by Gregory the Great to overthrow paganism and implant the doctrines of Christianity.

Our attention is particularly called to the pope's instructions not to destroy the Pagan temples, but to be content with displacing the idols, sprinkling the walls with holy water, erecting altars, and depositing relics; thus converting them into churches. They inform us that, in the instances where these directions were carried out, the form of the earliest churches must have been identical with that of the temples, whatever that may have been. And here Stukeley is brought in to suggest that the oldest churches were round. The Anglo-Saxon churches were also frequently finished with a hemicycle at the east end.

The tradition that the four round churches that we are thus gradually approaching were built by the Jews is next discussed and dismissed. M. Lucas adopts the view of Mr. Essex, and deems it unlikely that a form for which there is no Jewish precedent should have been chosen by the Jews, or that buildings should have been erected by them in quarters not belonging to them. In Cambridge, the synagogue would have been located in that part of the town still known as Jewry. On the other hand, the tradition that they were built by the Knights Templars is examined and accepted. All four of the edifices mentioned, together with the two sanctuaries at Temple-Bruer and Aslackby, are attributed to this body.

Turning now to the Knights Templars, we are reminded that their order originated with Helen, mother of Constantine the Great, and was organised in the immediate neighbourhood of the Church of the Holy Sepulchre in Jerusalem. Bede's account of this edifice, as being a large round church, is quoted; and a slight outline of its fortunes indicated. The enthusiastic veneration of the Templars for the Holy Sepulchre probably induced them, it is suggested, when dispersed over Europe, to reproduce its configuration in the churches of their commanderies.

Then follow, from the sources we have indicated, short accounts of the four churches in succession. That of Little Maplestead being probably less familiar to our readers than the more famous edifices of Cambridge and Northampton, or that of the Temple, we will follow M. Lucas as to it for a few lines. Little Maplestead adjoins Great Maplestead, and both are parishes in the county of Essex. In the reign of Stephen, Robert Dosselli, or Dorsnel, held Maplestead. His heiress, with the consent of her husband, gave the parish to the Knights Hospitallers of St. John, who established a preceptory in it, and, by means of gifts from many

* The round church in Abyssinia, described in the *Builder* at the time of the war, with the ark or altar in the centre of concentric circles, is interesting in this relationship.

benefactors, became very flourishing. After the Dissolution, their possessions, Temple Sultan and other estates, were given by Henry VIII. to Mr. Henry Harper, since when they have passed through the hands of various families. The church differs in plan from the other three, and is, indeed, *unique*. Its semicircular apse would suggest an early origin, but the style of the ornamentation does not confirm its evidence. The windows, arches, and columns, are all of thirteenth-century workmanship. Only the font, with its heavy and primitive ornamentation, suggests an earlier date; but this testimony is negatived by the small basin, in which the immersion required in the early ages of Christianity could not have been practised.

M. Lucas incidentally mentions the following churches as dedicated to the Holy Sepulchre in France.—The church of the *Saint-Sépulchre de Chauvigny* (Poitou); the churches of the Holy Sepulchre at Cambray, Abbeville, Mondidier, and St. Omar, in the North of France; those at Caen, Rouen, and Amnezy; the Holy Sepulchre of the Church of St. John at Joigny; and the chapel of the Holy Cross of Jerusalem at Clam-pigny. And he catalogues, with brief remarks, the church of La Vera Cruz, in Spain, which was built by the Templars upon the model of that at Jerusalem, and in honour of it; the great octagonal chapel of the convent of Christ at Thomar, Portugal, founded, it is believed, by the first grand-master of the Portuguese Templars; the round church of the Holy Sepulchre at Brindisi, quoted as resembling that at Cambridge; the church of San-Sépulcro at Bologna, which is also of a round form; and the Cathedral of Paderborn, in Prussia, founded by Charlemagne. M. Lucas concludes with a more precise account of the Church of the Holy Sepulchre in Paris, built in connexion with a hospital to receive pilgrims passing through that city on their way to or from the Holy Land, in the fourteenth century.

Our increased facilities for travel give architecture an international, or cosmopolitan, character that increases in intensity year by year. It is pleasant to see that the stream of pilgrims flows to our shores as well as from them; and we thank the accomplished architect whose essay is now before us for his painstaking indication of the fact.

PRACTICAL EXPERIENCES IN VENTILATION AND WARMING.*

WHEN, in January, 1868, this Society did me the honour to listen to my paper, entitled, "A few Remarks on some of the Sanitary Necessities of House Buildings," and my explanation of how these necessities had been provided for in the house built for me in Grove-street, an opinion was expressed by some of the members present that many of the ideas propounded and carried out were, at that time, new and merely theoretical, and a wish was expressed by Mr. Baul and others that I would go to the Society the results of the working of the plan, after twelve months' practical experience, by living in the house.

By your permission I will now lay before you my experience from living in the house, during four cold winters and four hot summers, both seasons being calculated to test severely the merits of both the warming and ventilation.

The points that it was thought required confirmation by experience were principally those connected with the warming and ventilation. It will, perhaps, be remembered that the plan recommended and adopted was to have a reservoir for fresh air in the centre of the house, with the rooms opening out of it on each side, and that this reservoir should be separated from the stairs lobby by swing doors, in order that the cold air, rushing in when the front door is opened, shall not pass into this reservoir; that the air shall be admitted into this reservoir specially, say, through gratings in the floor; so that it may be, at least, as pure as the air in the street, and that its quantity may be regulated according to requirements, and that it may be readily warmed when the air in the street is too cold to be admitted into the rooms without being warmed; that it shall be warmed either as it enters this reservoir or afterwards, but certainly before it is admitted into the rooms, and that this reservoir shall be repeated on each floor of the house, and with the same provisions; that

the air in this reservoir shall have free entrance into the rooms, even when the doors are shut, either through the skirting-board or through the cornice of the room; that I preferred the cornice; that the vitiated air shall have exit through the ceiling,—and that, not directly to the external air, but up an interior wall to a chamber in the roof over the central reservoir, and that it should not even then have a direct exit to out of doors, but be drawn out of this chamber by a syphon, provided with a means of being kept permanently heated, in order to produce motion from the rooms, and to prevent all possibility of back or down draught,—and that, for this purpose, I preferred the kitchen fire; that the exit-flue from each room shall proceed separately into this chamber, and each have a separate entrance into it, in order that the syphon may draw equally from each room; and that each flue shall be regulated by a valve in its course, to open when the full current of ventilation is required, or closed partially when few persons are in the room, so as to hasten or retard the current of air in the room, or to divert the fresh warmed air altogether to the bed-rooms at night.
