With his sketch of part of the Casa del Infante, our author points out that in Spain, as it was in Italy, the architecture of the revival may be divided into at least two great schools, viz.—the early, in which sculpture, and particularly sculptured arabesque, plays a prominent part; and the late, in which regularity in the use of the orders, and a system of rigidly-proportioned plain architectural members form the main constituents of the most highly commended structures. Both merged into the extravagance which follows when architects learn to draw with facility rather than to think with steadfastness and propriety. As Italy had its Borromini, so bad Spain its Churriguera.

The iron pulpits to be found in Spain, of course attracted his attention, and sketches of some of them are given. In the one from Avila Cathedral of the sixteenth century, we no longer meet with a superposition of perforated plates, but the operations of heating and chasing, and indeed cutting the metal with chisels, files, and hammers; working, in fact, as the Italians term it, "a nas-ticio." The basis of the design is no longer Gothic, but strictly of the regular Spanish Plateresque Renaissance, with balustrade columns, figures in niches and arabesques, imitated from the Italians.

The method of working this pulpit is no longer that of the simple smith, but really corresponds much more closely with that of the armourer, which reached its zenith about this

period. There can be no doubt, we agree with our author, that the Spaniards gained much of their well-known skill in the manipulation of iron and steel from the Moors, who had themselves obtained knowledge from Damascus, and perhaps even improved upon the knowledge they had derived from that source. Many fragments of finely-wrought ironwork of the Middle Ages still exist in Spain, but generally in a fragmentary condition.

Spain still possesses much fine bronze-work, in spite of the intrinsic value of the material which has led to the fusion of treasures of art all over the peninsula. Amongst these, Sir Digby points to the magnificent eleven gilt life-size portrait statues of the Spanish Royal Family from Charles V. to Philip II., with which Pompeo Leoni decorated the "Entierros Reales" of the Escorial, and the same sculptor's still finer statues of the celebrated prime minister and favourite, the Duqué de Lerina, and his duqueza, founders of the convent of San Pablo, at Valladolid, whence they have been transferred to the museum of that city. As semi-architectural, semi-sculpturesque works in bronze, occasionally with an admixture of iron upon a large scale, of course, the most important and abundant are the late rejas, or metal screens, of the great Spanish churches and cathedrals. Of these ample notices are given by both Ford and O'Shea,—authorities at once so excellent and so readily accessible as to render unnecessary any more than a passing reference to them. Alluding to the two principal tools by which metal-work was executed, viz. the hammer and the pliers, our author says, in England and in France the first was used in preference, at least, to the last; while in Germany, Burgundy, and the Low Countries the last was specially affected, and by its means foliage, both natural and conventional, was rendered with great skill, facility, and taste. The Spaniards, as is proved by some of the sketches given, were at an early period dexterous in the use of both tools, uniting the massive style engendered by the predominant use of the hammer with the more florid and fanciful manner springing out of the light and convoluted forms created by a more liberal use of the pliers.

The habit of the Moors was almost universally to make their exterior architecture plain, and to reserve richness and elaboration for the interiors of their houses. The fact that what is commonly internal architecture has been used by Moorish workmen on the external façade of one of the houses sketched would be sufficient of itself to prove that it had not been executed for a Moor, even if the Gothic mouldings and ornaments of the buttresses, impostas, cornices, and string-courses failed to assert the Christianity of those for whom the house may have been built. The date of its construction, judging from style, is put at about the middle of the fifteenth century, at which period, in Spain, Renaissance features had in no wise affected the integrity of either Gothic or Moorish architecture. In this case, all the mason's work is Gothic, and all the stucco work is Moorish; and this distinction of style, according to the technical mode of construction, is not an uncommon feature of Mudejar work.

A sketch, representing part of a doorway, illustrates two of the special points of architectural interest, viz. the entirely Moresque character of the stucco-work at a comparatively late date, and the profuse use of "azulejos," or coloured tiles. Some of these may be recognised, although in a sketch, in black and white. It is not easy to make them apparent in the coverings of the lower part of the door-jamb. It is, however, in and about the splendid staircase that this charming tile lining, of the use of which we have here of late date commenced a revival, asserts its value as a beautiful mode of introducing clean and permanent polychromatic decoration.

A sketch of a façade, in the style known in Spain as "Mudejar," that is, neither Gothic nor Moorish, but a compound of both, illustrates two principles constantly followed by the Moors in their treatment of decoration,—viz., to preserve the continuity of all scroll-work from root to fully-developed foliage,—a principle entirely disregarded in all previous ornamentation based upon classical practice,—and to care first for large surfaces to satisfy the eye with harmonious relations of those surfaces to one another, and to the spaces they have to enrich, from a distance, and then to provide minor fillings and intersec-tions, so as to supply adequate elaboration for close inspection. In addition to the decorative effect produced by variations in relief, still

greater refinement was obtained by patterns in colour, painted upon the surfaces of the modelled ornaments. Although almost everywhere the colour has either been rubbed off or rubbed into confusion, the abrasion, Sir Digby says, has, for the most part, only the pigment and its aluminous vehicle, leaving the surface of the stucco bare, and showing the outline of the delicate ornament which has been drawn in by the pencil of the artist.

Speaking of the mosaic decoration of the Alhambra, our author points to the advantages possessed by the Moors over the Greeks in working such mosaics as the one alluded to, and notes that, while a Greek would have required 119 separate pieces to make up what is shown, the Moor wanted only 49. Moreover, instead of having to chip every one of the 119 pieces to a definite size and shape, and then to place them slowly, so as to ensure the truth of his angles of 45° and 22½°, as the Greek or Italian had, the Moor had only to place one of his 49 pieces with precision, and, provided he never took any of the eleven patterns, of which his repeats are composed, out of their right turn, his mosaic would work itself, with scarcely any other attention on his part.

We should not deal fairly by a large body of distant readers, who avowedly regulate their orders for books by what is said of them in our pages, if we did not mention that the sketches are lighter than might be desired, and are addressed rather to those who know than to those who want to know.

The volume is dedicated by the author to his "brother in art," Owen Jones, in affectionate terms, creditable to both.

EXPLORATIONS IN CYPRUS.

The explorations that have been carried on during the last three years in Cyprus have led to discoveries far beyond the expectations of the most sanguine searchers after the buried treasures of antiquity. The very position of the isle made it the receptacle of gems of art, in past ages, from east and west. The offerings to Venus at Golgos and Paphos came from all lands, and furnished, no doubt, a nucleus of the antiquities now brought to light.

The vicissitudes of the island's history contribute also to the variety in date and nationality of the objects found. Held by the Pharaohs, the Persians, the Salamine governor, the art-protecting Evagoras, and the great Alexander successively, it passed subsequently into the hands of the Romans, and thus, east meeting west, were mingled on this isle their respective arts. The altar of the Paphian queen became adorned with gifts from eastern and western potentates. The Cyprian race of the present day must be a compound descent from Greeks and Romans.

Many objects of great interest have been found long since on the island. The "Codex Cyprius," the unchanaged Gospels, was found here in 1673. Pooceke speaks of ruins and some few tombs, but of no works of art. The Duc de Luynes possesses some rare silver bowls found there; and in 1845 some few bas-reliefs, &c., were found. The indefatigable researches of Di Cesnola have produced an almost incredible number of objects. Count Luigi Palma di Cesnola is of an old Italian family,—has fought in the wars of Italian independence, and in the Crimea under General Anselmi. In 1860 he went to America, joined the army of the States as volunteer, and after having greatly distinguished himself in many actions, attained the rank of brigadier-general, became a citizen of America, and was appointed consul to Cyprus. His father before him had fought for Greek independence, and he himself earned the thanks of the Cypriotes in his resistance of Turkish tyranny in 1869. He is about forty years of age, of an intelligent, energetic, persevering character. Having obtained a firmam from the Sultan, and being discontented with all the results of previous excavators, he began in earnest after having studied carefully all native traditions and defined the sites of the twelve celebrated old cities.

We will quote from the able article of an American review some few passages of the result of Di Cesnola's labours. "Upon arriving at his consular residence at Larnaca" (the ancient Citium, the birthplace of Zeno), "Di Cesnola discovered of the massive stone tazza recently discovered at Amathunta, and just contributed by Napoleon III. to the Louvre Museum. It is nearly 11 ft. in diameter, about 7 ft. high, and

weighs 1,000 pounds. It bears inscriptions in Phœnician, Hebrew, Syriac, and Greek, supposed to be of the ninth or tenth century B.C. The inhabitants of Larnica had coins and terra cotta fragments in their possession.

Commencing his subterranean searches among tombs already opened, he found the town was actually constructed on the old necropolis of the Phœnician Citium, or the Kitim of the Old Testament. Opening many adjacent tombs, he found many objects of ancient art, mostly of terra cotta. Among them were many statuettes of the crowned Venus; then came the figure of the water-carrier of the East to light, then the bearded giant of Assyria, the Sphinx of Egypt, the Phœnician woman playing her lute, &c., setting forth the great similarity of all ancient Eastern art.

In 1866, through his attention being drawn, by a peasant, to a stone covered feet below the surface, he discovered the necropolis of the Greek Isathim, at Dalj, a few miles north-west of Larnica, where, Virgil relates, existed the largest temple dedicated to Venus. "A great many tombs were here opened, revealing a grand collection of objects of Greek art;—coins of the age of Phidias, of the Imperial Greek class, of the Alexanders, the Seleucides, and of the series of the kings of Cyprus."

The collection of Greek glass accumulated was very extensive and varied, both in form and colour. Plates, cups, pateræ of lovely forms and varied tints; a red oinoche, or special wine-bottle, used at the Symposium; an unguentary, with yellow spiral lines, iridised. The most finished amphore were of yellow. The collection of glass numbered 1,700 pieces, and is said to be the finest extant.

The collection of jewelry found is very rich, especially in gold rings, engraved with legends, the palm, or the yew.

The objects most numerous are in terra-cotta, consisting of statuettes of Venus and her worshippers. While excavating at Dalj, Di Cesnola came upon the necropolis of the Phœnician Idahim, long buried beneath that of the Greek. The Phœnician tombs he found oven-shaped, with stones at the opening. Some skulls were found. The ancient customary Phœnician gold plate over the mouth of the dead was frequently found. Bronze articles were found also in the tombs;—in stone, Phœnician, Egyptian, and Assyrian heads; statuettes of the Phœnician Jupiter, with a patera in one hand and a cornucopia in the other; heads of the bull, &c.; in terra-cotta, gigantic Assyrian heads with the beard in a bag; fire worshippers and the meriah, or victim of sacrifice to the god of fire, lamps, &c., perfume-holders, a curious procession,—two donkeys carrying baskets, a man on horseback, with two water-jars, a chariot with three musicians, one with a man holding a sabre, one with a female, one with a man and a warrior with casque and shield; little terra-cotta houses, with figures looking out of the windows; hundreds of vases of all kinds, with and without handles, some with Phœnician inscriptions, &c. In pottery are fine red vases, with geometrical designs in black. Much interesting study could be gleaned by the consideration of these Dalj vases. Among the Greek vases are several of an Assyrian character, and on another a design similar to the hunting-scene on the sculptures of Nineveh; whilst, in many of the ancient tombs that have sure Assyrian marks, were alabaster vases, with wedge-shaped ornaments. The Dalj vases may well serve to trace the progress of art. Di Cesnola's labours continued, when the seasons permitted, over a space of three years, and 200 men were employed by him. It is said in that time and with this aid he opened 8,000 tombs. (?)

He next turned his attention to the discovery of the debatable opposition Temple of Golgos, or rather the necropolis was the aim of his search; and he not only found the latter, but the former also. The Golgos Temple is at a distance of fifty miles from that of Paphos,—by many considered identical until now. The temple seems to have been destroyed by fire. The columns having been of wood, no traces of them are left. The vases indicate Doric and Ionic architecture. The temple was quadrangular, 60 ft. by 30 ft., and supposed to have been 50 ft. high, and also, unlike others dedicated to Venus, to have been roofed. It seems to have had no windows, but to have been lighted by stone lamps, each in the form of an Ionic temple, with red pillars,—many of these being found, and stono vases near, probably for oil, all much worn

from use. Several lines of double pedestals ran through the centre of the temple, on which must have stood colossi. A few coins were found,—one of Evagoras I. Votive offerings of stone were found all over the ground, most with holes bored in them for hanging on the walls. The destruction of temples effected by Theodosius was carried out in Golgos; and though, as it is said, the very statues were broken in pieces, and then scattered miles apart, there may yet be hopes that, with such vigorous, untiring search, much may be recovered. It is said, in the ruins of Golgos were found a thousand statues, one-third of them the size of life. Di Cesnola found in the temple statues of Hercules and Apollo; Nana; the Chaldean Venus; Ishtar, the Assyrian; Mylitta, the Babylonian; Astarte, the Phœnician; Aphrodite, the Greek; and Amathanta, the bearded Venus: showing that statues of other divinities were admitted into temples built for particular deities.

The Colossus of Golgos, 28 ft. in height, with its Assyrian cap, is the most prominent of all. Its beard is divided into four parts, encased: there has been an inscription on the neck. It may have been the head of a high priest of Ishtar, date about eighteen centuries B.C. Most have the same grand Eastern characteristics of Assyrian sculpture, with the careful finish of detail.

There exists no specimen of Persian origin, though the island was long under the Persian sway: of Egypt, Greece, and Rome there are many. A beautiful life-size draped statue of the Macedonian period may be placed beside many of the most highly-prized statues of Greece.

Much may be yet learned from the deciphering of the inscriptions, above thirty in number, found, in Cypriote, on the statues. The stone of which the statues are formed is from the island. The workmanship is from the hands of the various nations who held the island in possession.

Di Cesnola had just planned the excavating of Konklia, and had defined and bought Paphos, when an edict from the Sultan put an end to his work. Let us hope, only *pro tem*.

In various parts of the island he had found priceless treasures in gold, silver, bronze, and copper coins, one struck by Ptolemy Philadelphus, bearing the portrait of Arsinoe, vases and other objects similar to those found in the tombs. The collection has formed a matchless museum; that part containing the ancient glass vies in variety and beauty with the celebrated museum at Kertsch. Di Cesnola has visited Turin and explained his researches before the Academy of Science. The archaeological societies of Athens, Rome, Dresden, Berlin, Paris, have received him as honorary member, as well as those of Florence and Turin, and decorations have been bestowed on him by the Kings of Bavaria, Italy, and Greece.

The collection, no doubt, will ultimately become possessed by America.

SOCIETY OF PAINTERS IN WATER COLOURS.

THE Winter Exhibitions of sketches and studies by members of the Society of Painters in Water-Colours vary in little else but denomination from the usual display of summer seasons; and if there be any real pleasure in uncertainty, it is not one that attends a visit to the Gallery, 5, Pall-mall East. Sir John Gilbert, A.R.A., will ever be best appreciated in such performances as leave it most clearly evident how rapidly and powerfully he can paint: further finish would detract from such splendid examples as "The Return of the Victor" (177), or "Prisoners of War" (264), so infinitely preferable to the more studied composition that an assemblage of "The Characters in the Plays of Shakspeare" (108) has occasioned; without show of such advantages as constitute this artist's forte, it is too plainly indicated that the faculty of individualising is not one of them. Mr. Fred. Taylor, likewise, will owe some of his best reputation to the graceful ease and vigour with which he can produce a picture out of slight materials, and in no time; his charming specimen of a mounted sportswoman "Throwing off the Hawk" (347), though described as a sketch, leaves nothing to be desired, and is the best out of three or four similarly agreeable drawings. It would be absurd to apply the term "sketch" to the elaborate representation of "A Fishmonger's Shop" (350), by Mr. F. Walker, A.R.A.; the verisimilitude to the various kinds of the fishy tribe, heaped in groups for choice and sale, glittering with gem-like brilliancy of colour,

betokens a very close application of study, with a successful result, so far as imitativeness is the confined object of such labour. It is a very extraordinary but uninteresting achievement, with very little room in such a subject to evoke the poetic sentiment that commonly invests Mr. Walker's adaptations of ordinary incident; the effect of this drawing is to disappoint as much as to astonish. "Le Plaisir de la Pêche" (374), by R. W. Macbeth, a very agreeable and cleverly rendered little episode, to prove that there may be more to be made of catching fish than serving them up when caught, for sale, and it has a double aptitude for provoking comparison; it needs not have been much better to be mistaken for other emanation than its proper one. And this affinity is as visible, though not so satisfactorily, in a larger drawing by Mr. Macbeth, of a father seated in the garden watching his daughters, designated "My Roses" (184); the garden and the more real roses are by no means the less attractive by reason of papa's partiality. Mr. E. K. Johnson's fair musician at "The Old Organ" (153) is very nice and unaffected: she stands in half-light, with rainbow-hues from a stained-glass window to make her look the more reflective. The same neatness and refinement that characterise this picture are evident in "Caught at Last" (260), the catch being a stiff old Puritan who has given hot work to his Cavalier pursuers. "Un Franceseano" (179) is a capital study of a monk by Mr. Carl Haag, and "A Moselle Peasant Girl" is an admirable sketch by Mr. W. C. T. Dobson, R.A. (205); but the figure-draughtmen would be more than usually outdone by the landscape painters on this occasion if it were not for one member.

Mr. J. D. Watson's contributions are so numerous, and offer such strong testimony to skill as well as industry, that it becomes quite a difficulty to select, out of nineteen instances of it, one special proof of his great ability: he draws so correctly,—wide "Studies for Book Illustration" (244), and is so enamoured with rich, deep tone and forcible tints, *vide* "On the Shore" (204) or "In the Wood" (237), and "Retirement" (344), that from over-assertion of these acquirements he is apt to exaggerate, and so sacrifice natural appearance. A very brilliant representation of a beautiful boy, doing the part of "The Cupbearer" (58), in Medieval costume, is very gay and pure in colour. Mr. G. J. Pinwell's single contribution is a marvel of finish and truthful effect, though the theme of it is only "A Long Conversation" (381) between two very ugly and coarse women; and Mr. J. Boyd Houghton's cleverness and originality are apparent enough in "The Young Musician" (50) and an Eastern mountebank drilling his performing monkey, "A Full-dress Rehearsal" (55), to leave no doubt of his being a great acquisition to the Society.

It would be pleasant labour, though really labour, to examine thoroughly the numerous landscapes that seem to have an equal claim on the attention, and if the purpose were to analyse their qualities severally with a view to account for the impression their general excellence conveys, it would be such a task as would puzzle the most anxious to overcome it. Why should Mr. G. Dodgson obviously give to paper the virtue of a "camera lucida," and with no outline more than may grow from a blot of wet, show nature as he and all others see? "A Yorkshire Beck" (20) and an "Old Quarry in Larpool Woods" (44),—a splendid proof of how force and depth of tone may be got without blackness; whilst Mr. E. Duncan, with a clear definition of bough and weed, acts like a looking-glass, and proves that nature is as he sees it, and everybody else, by a "Study in Lullingstone Park, Kent" (121), and "Study on the Thames, near Stratford" (201)? Mr. Birket Foster's raging sea is wonderful, like a raging sea, in his fine drawing of "St. Andrew's" (30), though stipple and pretty colour, both in that and the sky do away with any feeling of dread one may have of angry elements. Mr. Collingwood Smith; Mr. Paul J. Natfel,—who has nothing better, even whilst all he does is so good, than his delightful little drawing, "On the Arto Beck, near Caton, Lancashire" (383); Mr. H. Gastineau; Mr. C. Davidson; Mr. J. J. Jenkins; Mr. T. M. Richardson; Mr. Arthur H. Marsh,—"On the Conway, North Wales" (113), to witness; Mr. J. W. Whitaker; Mr. W. M. Hale,—"Sunset in Glen Gondi" (148); Mr. Alfred P. Newton; Mr. Francis Powell; Mr. S. P. Jackson; the Messrs. Callow; Mr. D. Cox, jun.; Mr. Arthur Glennie; &c., can all evoke such keys and tones from a japan tin

colour-box as are attuned in chorus to the song of nature's charms.

Mr. Alfred W. Hunt shows some very choice studies on the screens; and Mr. E. A. Goodall is seen to best advantage there, too, in "Arabs returning from the Pastures near the Pyramids of Goezeb" (340) and "The Coptic Church, Old Cairo." Mr. G. P. Boyce's small drawing of "The Tempe, from Ludford" (386) is very beautiful; and Mr. J. W. North's exquisite little epic, "Meadows Sweet" (388) is a treasure that would tempt honesty.

THE PROPOSED GREAT DOCK EXTENSION AT LIVERPOOL.

ENORMOUS INCREASE IN THE STEAM SHIPPING TRADE.

THE proposed extension of the Liverpool Docks, for which the Mersey Docks and Harbour Board have decided to seek powers in the ensuing session of Parliament, may be regarded as one of almost unprecedented magnitude, and will involve in its execution an amount of building and other works, independently of the excavations and masonry required for the new docks and quays proper, which has seldom, if ever, before been attempted by any public body. The proposed works have been resolved upon mainly in compliance with the repeated demands of the steam shipping interest of the port, more especially the trade between Liverpool and America, which within the last few years has developed itself, and expanded at an unexampled rate, as we shall presently endeavour to show, not only as regards the number and tonnage of the ships now in existence, but also as to the vessels at present building for the several steam-ship companies. These different companies have latterly so impromptu the Dock Board for increased water area and quay space, each company alleging that the other was unduly favoured, that, after having in vain endeavoured to meet the demands made upon them, by appropriating to the several companies, interests, and trades, as much dock and quay space as possible in the existing dock area, the Dock Board, literally worried, appear to have had no alternative but that of entering upon the gigantic project for dock extension which is now to be submitted to Parliament. The magnitude of the new undertaking may be conceived, when the existing number of docks, with their water area, and quay, wharfage, and warehouse space, is stated. Those docks, which occupy a river frontage, from north to south, of upwards of six miles in length, are twenty-seven in number, consisting of the Carriers', Canada, Huskisson, Sandon, Wellington, Bramley Moore, Stanley, Colingwood, Salishury, Nelson, Clarence, Trafalgar, Victoria, Waterloo, Prince's, George's, Canning, Salthouse, Albert, Wapping, King's, Queen's, Coburg, Brunswick, Egerton, Union, and Hercules Dock, and contain an aggregate water area of more than 259 acres. The total water area of the existing Liverpool Docks is 259 acres and 587 yards, with a lineal quay space of 18 miles and 916 yards. The water area of the Birkenhead Docks is 165 acres and 3,565 yards, and a lineal quay space of 9 miles and 878 yards; the total area of the docks on both sides of the river being 424 acres and 4,152 yards, and the lineal quay space 28 miles and 34 yards. The proposed new docks, both at the north and south ends of the port, more especially at the north, will almost double this already large area; and as regards the north, it may be stated that the Dock Board have for some years past been in possession of land on the foreshore of the Mersey, to the extent of more than 200 acres. This land the Dock Board made at a very large outlay, having previously purchased the foreshore from the Lord of the Manor, the Earl of Derby. After reclaiming the land from the river they erected a river wall between one and two miles in length. Their intention was at the time to convert a portion of this land into additional docks, but Parliament restrained them from doing so until the Birkenhead Docks, then in progress, were completed. It is this land, along with other land at the south, that it is now proposed to utilise for dock purposes; and when the new works are completed, the present river frontage of the docks will be increased by between one and two miles in length, and extend a considerable distance inland.

The immense expansion of the steam shipping trade of the Mersey, which, as we have already stated, has led to the dock extension above indicated, is worthy of remark. The increase is

chiefly in the trade between Liverpool and America, but the Mediterranean and the Pacific coast have also participated in it. The Cunard line of steamers, now some thirty years ago, was the pioneer of steamships between Liverpool and America, when the company's vessels, four in number, were despatched once a week. The Inman line followed some years afterwards, this company's steamers being again followed some years subsequently by the Liverpool and Montreal Company, now called the Allen line. Other new companies followed in succession, until, at the present time, there are no less than six distinct lines of large steamships trading between Liverpool and the American continent, having a fleet of upwards of 100 ships, with a tonnage of more than 300,000 tons, and instead of one vessel alone leaving the port weekly, considerably more than an average of one per day are now despatched, several of the companies, as in the case of the Cunard, the Inman, and the National companies, despatch their vessels twice, and even thrice, a week. Large, however, as is the combined fleet, both in numbers and tonnage, it is not equal to the demands and requirements of the trade, and at the present moment there are eleven new vessels in course of building for the several companies, representing upwards of 30,000 tons.

It is to meet the requirements of this fast-expanding steam shipping, together with the large timber trade of the port, that the proposed extensive augmentation of the existing dock area has been resolved upon. It is true that in addition to the present dock space on the Liverpool side of the Mersey there are on the opposite shore at Birkenhead some of the largest and most magnificent docks in the world, which have been constructed at an outlay of several millions. These docks, which form part of the Mersey Dock Estate, are in themselves amply sufficient, whether as regards water area, or quay space, to supply all the additional accommodation required; but although the Dock Board have offered every facility to shipowners to make use of them, neither the steam trade nor the shipowners generally can be induced to resort to them, except to a very small extent, the result unfortunately being that this fine portion of the Dock Estate, upon which such an enormous amount has been expended, is comparatively avoided, and unremunerative, and without using a figure of speech, may be designated "a splendid ruin."

There can be little doubt that the comprehensive project about to be submitted to Parliament will be sanctioned, and we may in a short time expect to see on the banks of the Mersey works of almost unexampled magnitude actively in progress, which for some years to come will give employment to many thousands of skilled artisans and others.

The total number of new docks which the Board propose to construct is twelve, six of which will be at the north end of the port. These docks will be much larger than any of the existing docks, their average water-area being from eighteen to twenty acres each, and their estimated cost, including quay-space, sheds, roads, and approaches, 3,549,867*l.* The six new docks which the Board propose to erect at the south end of the port, will not be on so large a scale as those above-named, but they will nevertheless cover a large area, the water-area of one of them being eight acres, and another between eleven and twelve acres. Their estimated cost is 1,284,18*l.*, making the entire outlay for the whole of the new docks which it is proposed to construct, 4,834,051*l.*

ON PROFESSIONAL ESPRIT DE CORPS.*

We have all discovered, I hope, that we cannot afford to confine our attention exclusively to positive matters, whether technical, artistic, or professional. It occasionally becomes necessary, if we desire to understand our position and our prospects aright, to give attention to the motive forces by which our collective action is shaped and impelled, and to attempt to gauge the depth of the intangible moral agencies at work in the great world, and in that professional microcosm the welfare of which is of so much importance to us all.

We fully recognise the importance of mastering all the material and artistic elements with which our art and our practice have to deal, and of regulating and considering all those steps of

* By Mr. T. Roger Smith; read at the Institute of Architects on the 15th inst.

professional conduct upon which the success of our undertakings so largely depends. But there exists a something of greater moment to us than rules of practice and scales of fees, or than any individual detail of study; an actuating principle so intangible and so unobtrusive that we run some risk of forgetting its importance and of neglecting or underrating its claims upon our notice and our care.

If we set a justly high value on reliable rules and maxims of procedure, at what rate should we prize an animating spirit, such as shall substitute for a formal conformity to strict rules a voluntary and hearty adherence to a line of action? The spirit is better than the letter. The living soul is worth more than the dead trunk and limbs; and if we combine all the architects of England into one organised and compact professional body, the task will prove fruitless unless that body be animated by an active and a healthy spirit,—in fact, a professional *esprit de corps*.

That wonderful similitude under which men intimately associated together, and inspired by a common enthusiasm or a common affection, are likened to a human body, has grown, like many other Scriptural ideas, so familiar to us that it has almost lost its force. When we say a body of men, we almost forget what we mean. The military services have appropriated the phrase with the intention to carry out, as far as discipline and careful forethought can do, all that the emblem implies. The corps of engineers, a corps of artillery, and so forth, each means an organised body of men linked together by strong ties, and into whom it has been sought to breathe a spirit of devotedness to their duty and comradeship towards one another. I need not tell you how successfully the perfect organisation of military service has in many instances been made vital, so to speak, by the glow of a fervent soldier's spirit. An intensely strong bond of union has grown up in the different branches of the army, manifesting itself in a jealous loyalty to the traditions of the service, an enthusiastic devotion to it, a high sense of honour as growing out of it, and a generous good-will towards every member of it. This is what is meant by *esprit de corps*. The greatest commanders have been those who have roused and cherished such a spirit the most. The most successful armies have been those in which it has been the ruling passion.

And now I am to invite you to consider with me for a few moments the importance to ourselves of our possessing so much of this temper of mind as is appropriate to the circumstances of our professional life, in the hope that we may come to recognise *esprit de corps* as one of the things needful to us, and its cultivation as one of the most important objects which this Institute and the kindred societies throughout Great Britain can keep in view. It is, indeed, almost the sole object of the present paper to direct attention to the subject. It will, of course, be expedient to say something as to the conditions essential to the growth of *esprit de corps*, the existence of it in other professions, the means by which its increase can be stimulated, and the good which we may hope to gain from it; but none of these considerations is, in my view, at all so important as the mere recognition of the subject. If professional *esprit de corps* can only become to some slight additional extent admitted as one of our stock ideas, to be from time to time considered, discussed, and kept in view, the object proposed will be fully answered. It is not, let me add, a feeling that professional *esprit de corps* is altogether wanting in our body which has prompted me to raise the subject; I admit, with pride and pleasure, that a wide, a healthy, and, I hope, a growing spirit of brotherly friendliness and helpfulness exists in the profession, and that a large amount of zeal for the craft and honest pride in our work is to be found among us, and especially among those frequenting this room; but the promotion of this temper of mind seems not to be sufficiently recognised as an object to be kept in view; we shut our eyes to its great importance; we fail to provide for and encourage it as we ought and might; and, as a consequence, it languishes where it might flourish, and is imperfect when it could easily be complete.

Two things seem to be necessary to originate *esprit de corps*, though, once originated, there are a thousand which may promote or retard its healthy development. Men must be bound together in some way. The tie that binds them must be one which they can honour or love.

You, of course, get no *esprit de corps* among

men who are in no way bound together by any tie. It is absent from among the passengers of a ship, though it may exist in the crew. There is none of it among the travellers by a train, but it may be very strong in its hold on the guards and porters of the railway or the engineering staff. There is no *esprit de corps* in the inhabitants of a village: organise the villagers into a regiment, give them a colonel of whom they can be proud, drill them, and march them to the wars, and you will soon begin to find *esprit de corps* at work.

Again, not only must there be a tie, but the tie must be one in which men can take a pride, or towards which they can feel an affection. No man who hates or despises the tie which binds him to his comrades has a spark of *esprit de corps*. It is quite dead in the soldier or the sailor who has no heart for his calling, and it can be crushed out, even when it exists, by making the service unbearably irksome or disgraceful to the men. It does not need that I should go back many years in the history of recent wars to illustrate this. We have only to contrast the intense devotion of the soldiers of the first Napoleon to their military duties with the bearing of, let us say, those of the same race and nation under Bazaine at Metz, to understand what a difference a commander who is admired and loved can make in the temper of mind of his army.

Illustrations could be multiplied to any extent; but probably it will not be felt necessary that more should be brought forward in order to establish my contention that when *esprit de corps* is developed, there must previously exist, first, the tie to bind men together, and, secondly, some noble or lovable quality in that tie to rouse their enthusiasm.

This temper of mind, as you see it in a high-spirited soldier or sailor, is a very noble thing. The ruling passion of such a man is zeal for the service,—one of his most marked characteristics is a frank cordiality towards his comrades. No sacrifice is too great, no exertion too arduous for him to make, if duty or the good of the regiment calls for it; and every fellow soldier or sailor is felt to have a certain claim to good-will on account of his being in the same service,—a good-will which exists notwithstanding a vast amount of professional jealousy and a most keen rivalry in the race for promotion. A man may have no personal liking for a brother officer,—may, may resent bitterly his having been promoted over his head; but he would be none the less sensitive to any attack upon his comrade's honour as a soldier, and ready to resent it; while the greatest outrage which either could endure would be some stigma unjustly cast upon the regiment or the corps.

It is now necessary to inquire how far, as a matter of fact, professional life in other walks than our own has given rise to an *esprit de corps* at all resembling that by which the soldier and the sailor are so fully animated. It is hardly necessary to say much as to the advantage which the members of any profession derive from the existence of such a temper of mind; but whatever need be said on such a subject will, perhaps, be most appropriately introduced as we glance rapidly at one or two different departments of professional life.

Putting aside exceptional professions, such as diplomacy, Parliamentary and political life, and the civil service of the Crown, let us come at once to the case of those which somewhat resemble our own,—law, medicine, church, art, literature, and engineering. Each of these can contribute something of use to our inquiry; and commercial life if we had the time and opportunity to examine it, might yield some amusing contrasts by way of practical commentaries on the negative side of the question.

Taken all in all, the Bar is the foremost profession in England. The highest official position which a subject can hold is its great prize, and the lesser prizes, with all the fame, fortune, and social status belonging to them, are numerous and brilliant. There is much, too, in the intellectual nature of a large part of the work which has to be done to induce a barrister, who has any success, to take an interest and a pleasure in his work. Barristers form a very definite body, strongly detached from other professions. They do the most conspicuous part of their work in one another's presence, and as the bulk of them are university men, and many of them public school men, they have the advantage of early association to a considerable extent. Here then the two conditions supposed by us to be favourable to the growth of *esprit de corps* seem

fulfilled to a remarkable degree; and supplemented by favourable circumstances. As a fact, we find professional feeling at the bar to be conspicuously energetic and healthy, perhaps more so than in any other calling.

There is no barrister who does not feel that his profession is an honour to him, and there is hardly one who could be induced by any temptation to do an unprofessional thing; while any man guilty of a dereliction from his duty as a member of the bar, would be immediately and unsparingly expelled from it. I do not believe that barristers are much different in their nature from other men; but, thanks to *esprit de corps*, they act much better than most others, for it is notorious that among them when a thing is recognised as one which ought not to be done, it is not done. I quite admit that the discipline exercised by the Inns of Court is the primary agent in maintaining this high standard of professional propriety, but nothing except a vigorous *esprit de corps*, and a highly-pitched enthusiasm for the profession itself, could possibly cause that discipline to be endured.

Among men who are constantly engaged in keen conflict, who feel that the road to wealth and distinction lies open for him who can oftentimes snatch a victory from his opponent, it is indeed remarkable that a higher tone of professional etiquette should exist than anywhere else; and this, in spite of certain temptations which the profession of advocacy may be fairly assumed to present towards a more or less lax tone of morals. The man who as a matter of business will do his best for an atrocious swindler or forger, and will save him, if he can, from the condign punishment which he knows him to deserve, may yet be safely trusted to refrain from misleading a formidable rival, or attempting to interfere with his legal connexion. A strict code of professional honour, to a large extent an unwritten code, governs each member of the bar. He well knows that against unfairness of a certain sort he is perfectly safe, and that he is bound in honour to be himself equally fair to his brethren. How great the advantages are which this high professional tone procures for the bar of England, and indirectly for all their clients, we can each one of us appreciate, and we need hardly seek any better illustration of the nature and value of professional *esprit de corps*.

The practice of various branches of the fine arts has developed some amount of the kind of spirit I am referring to. Actors and musicians are very much thrown together; they form a distinct body of men, who constantly work in concert, and who have a great enthusiasm for their professions; and they possess as a rule plenty of *esprit de corps*, marred sometimes by strong personal rivalry. Painters are little thrown together in the pursuit of their profession, though they are all fond and proud of it, and there is, I think, less of professional spirit among them. Sculptors seem to be very deficient in *esprit de corps*, and this may perhaps be traced to the facts that they happen to work in a very isolated way, and that however eminent individuals may be, the position of their art, as a whole, in public esteem at the present day, can hardly be regarded by them as a thing to be proud of.

Letters are, as a rule, pursued by isolated men working in their own studies, and though literature is an acknowledged profession, or rather group of professions, it is not easy to define the extent to which *esprit de corps* prevails among literary men. They have not so much an enthusiasm for literary work as for the various subjects and aims towards the study of which their writings are a means; and though they are many of them thrown much together, that occurs chiefly in connexion with their special studies. Journalists occupy a rather different position; but as a whole the literary world in this country is too ill compacted, too little homogeneous for *esprit de corps* to flourish among its members. In France, where the profession of literature is more definitely recognised, and where it enjoys higher social distinction, there is a strong *esprit de corps* among men of letters.

Civil engineering is an occupation in more than one respect closely akin to our own. In the case of this profession, though the individual has much to be proud of in his calling, and has a good deal to throw him into contact with his fellow engineers, there exists the drawback that everything is extremely new, the organisation, as we see it, having sprung into existence within a lifetime. Here also the interests of individuals are often very conflicting, and their stakes very

large; while anything like professional usage has hardly had time to grow up, and has had some special obstacles to contend with. Taking these things into account, the amount of *esprit de corps* among civil engineers may be fairly admitted to be considerable, and very usefully manifested, and will, I believe, be felt to be decidedly in advance of what exists among ourselves. Several circumstances contribute obviously to this result. Civil engineers are more thrown together, and better organised than we; their profession has reached a high social status, and the public and other works entrusted to it are of imperial importance and magnitude, and consequently a civil engineer has great cause to take a pride in it. The circumstances of a large work, such as a railway, require not merely large staffs of clerks in the lead engineer's office, but the engagement of a considerable number of younger men as resident engineers and sub-engineers, and in this way the members of the profession are thrown together into groups. They have one immense accidental advantage over us, in being nine-tenths of them fixed within a stone's throw of Great George-street when they are in London, a circumstance in itself sufficient to promote the *esprit de corps* to no small extent, and one which has led to the organisation of an Institution which forms a more central rallying-point than our Institute has been or can easily become. In several respects their central society is more powerful in its authority over them than ours: the leading men devote time to its management, and attend its discussions with a zeal remarkable, when we consider the money-value of their time; and if I am not misinformed, its control over the proprieties of professional life is vigorously exercised. All these things tend very much towards the compact organisation of the engineers into a definite body, animated with high professional feeling.

In connexion with this mention of the Institution of Civil Engineers, it may be of some interest to note how widely these different callings, to which we have made allusion, vary in the mode in which they are governed or brought together. The engineers and solicitors each have a powerful central society. The barristers have their different Inns of Court, and are also very much directed by expressions of opinion from the Bench. The medical profession have their College of Physicians and of Surgeons. In the church Convocation has little real influence, the government of matters being really personal and in the hands of the bishops. Artists have the Royal Academy, but are not cordial towards it. In the civil and military services of the country, the direction of the affairs is personal, and in the hands of the head of each department, or the commanding officer, as the case may be. There does not, therefore, seem to be any rule as to what form of organisation best promotes *esprit de corps*, only it is to be noted that the professions where public spirit is most manifest, seem on the whole to have the most vigorous central ruling power, whether personal or a society, and to possess the most strongly-marked and most strictly-kept boundaries.

In each case that has come before us, there exist for the members of the profession alluded to definite professional publications, and it may perhaps be pardoned to one who was for some time responsibly identified with the architectural professional press, if I dwell for a moment on this as a conspicuous element in the diffusion and formation of any professional public opinion. It is very difficult to say how much or how little any individual letter or article, published by the press, has to do with the formation of the general opinion of the mass of readers; but one thing at least may be advanced, without doubt, namely, that whatever of weight or of reason there may be in the thing said, the newspaper at least secures it a fair hearing; while certainly, when anything of real importance has to be brought before the members of any profession, there are no other means of doing it so extensively or so readily. Were any token of the influence of the professional press required, it might, I think, be found in the ostentatious way in which people, who set up for taking an independent course, from time to time declare that they are not influenced by it, and even go to the extent of writing in one journal to inform the public that they rarely, if ever, read another. Now, I believe that this influence is too powerful and too important to be safely neglected, and I am convinced that the men who are entitled to be listened to, would do well to occupy this field more frequently than they do. A letter or a

signed article from the pen of one of those members of any profession who has made his name known, is read with attention by the whole of that profession, and may produce a permanent and sensible change in public feeling on a disputed point. Such a communication, if directed to obtain a definite and attainable reform, would be the most powerful agency possible towards securing such a reform.

We have hitherto examined *esprit de corps*, so to speak, from the outside; we have named a very few of the advantages which it procures to the individual members of the professions where it prevails, and if I do not refer to those advantages more in detail, it is because they are obvious and well known to you all. There are, however, corresponding advantages to the public, and here, I think, comes in the leading distinction between genuine *esprit de corps* and its spurious counterfeit, trades-unionism; the one is honourable to those who possess it, and advantageous to their clients and themselves alike; the other seems to consider notions of honour superfluous, and only aims at being of advantage to one side.

The professional man has been described as a tradesman selling his own time and skill; but the comparison is not just, because his relation to his client is not that of selling some ware to him, but of doing some act for him: he represents his client. We, for example, do not simply sell a building to a client; if he wants to buy he goes to the auction mart. He comes to us to take charge of such ideas as he has, and such requirements as must be met under our charge, to mature them, work them out, carry them into execution, and represent him by doing for him what he cannot do for himself for lack of the required architectural knowledge and skill. It is the same, *mutatis mutandis*, with solicitors and counsel, or with medical men. Now it is of infinite importance to the individual that the person who represents him,—his vicarious self, so to speak,—should represent him in the best possible way, and the man who pays a high fee to a distinguished barrister does it with the desire that he may make his temporary appearance before the court in the character of a person of complete knowledge of the law and high intelligence. It is also of importance that to this should be added a character for high honour; and professional *esprit de corps* secures that the client shall be temporarily clothed with such a reputation. The parties to a suit may bear, each of them, a very indifferent character; but it smooths the transaction of the business to an untold extent, if the judge knows that each is represented by counsel who will not overstep the bounds of legal propriety. So in our own profession, a client employing one of ourselves has in professional *esprit de corps* a safeguard, on the one hand, that his interests will be attended to, and his work well done and fairly charged for; and, on the other hand, that he will have the advantage in negotiations, such, for example, as arise about party-walls, rights of light, &c., that, however indifferent his own personal character may be among his neighbours, the matter will be argued as one in which right will be done, because it is in the hands of a respectable professional man. The employment of men having a high standard of professional honour prevents many base things being done, and *esprit de corps* so becomes a public advantage. Were our judges corruptible, our counsel base, what untold injustice would be perpetrated which is now left unattempted, or utterly defeated? Were there no high tone of feeling among our medical men, how much of cruel neglect, of infanticide, and of other sorts of murder would be quietly accomplished; and were there no professional honour among architects, many a bad brick and rotten stick would find its way into works where, if professional superintendence was paid for, on the one hand, professional hindness would be handsomely fed, on the other.

Trades-unionism has been mentioned, and it is in this direction that the danger of all combinations of persons engaged in business lies. I should not like to say that every organisation which has profit for its sole aim must be wholly bad, or that every one which professes to secure honourable ends is entirely good, but in each case the presumption lies in that direction. This subject, however, I will not pursue, or it would take us over too much ground; but it would unquestionably be instructive, did time permit, to devote a little attention to what professional *esprit de corps* is not, as well as to what it is. We are, however, at least agreed that it is not a

combination for the purpose of securing unfair remuneration for the members of the profession, or for hampering any one in his legitimate competition in the race of life, for screening any member from the effects of his own willful misconduct, or in any other way for exalting selfishness above honour and justice,—in one word, it is not a trade-union.*

POPULAR EDUCATION IN SCOTLAND.

THE EDINBURGH HOSPITALS.

When the school boards of England and Wales have got well through with their preliminary labours, which it is most desirable they may everywhere accomplish speedily, and have entered with zeal and assiduity upon their real mission, it is to be hoped that they may be successful, within a reasonable time, in doing much to wipe out the discredit that attaches to the largest, wealthiest, and most important section of the United Kingdom, in the matter of popular education. England has a long leeway to make up before the mass of the rising generation are abreast in educational advantages with the children of Scotland, which has enjoyed the advantages of a system of national education for nearly two centuries, whereas England has had no system worthy of the name. Before the Reformation the parochial system was adopted in Scotland for educational as well as ecclesiastical purposes, and numerous schools,—good, considering the mental light and culture of the time,—were in existence, and accessible to the children of the poor. It was not, however, until after the Reformation that the parochial system was fully adopted. In 1616 the Privy Council enacted that "in every parish in this kingdom where convenient means may be had for entertaining a school, a school shall be established, and a fit person appointed to teach the same, upon the expense of the parishioners, according to the quality and quantity of the parish." From the unsettled condition of public affairs, it was seventeen years before the enactment was ratified by Parliament. The Act still remained in abeyance, and it was not until the celebrated statute of William and Mary, 1695, was passed that the Scottish parochial school system came fully into action. It provides "that there be a school founded, and a schoolmaster appointed, in every parish (not already provided), by the advice of the presbyteries; and, to this purpose, that the heritors do in every congregation meet among themselves, and provide a commodious house for a school, and modify a stipend to the schoolmaster, which shall not be under 100 merks (5*l.* 11*s.* 3*d.*), nor above 200 merks (11*l.* 2*s.* 2*d.*), to be paid half-yearly at two terms." In 1803 the minimum salary of the parish schoolmasters was raised to 300 merks Scots, and the maximum to 400 merks; the heritors, or landowners, being required to provide also a dwelling-house for the schoolmaster, with at least two apartments, and a fourth of an acre, Scots, of ground for a garden. There was provision made for further increase of salary, and in 1828 the salaries had reached from 25*l.* 13*s.* 3*d.* to 34*l.* 4*s.* 4*d.*, with the small fees often as low as 1*s.* and 6*d.* per quarter; nominated poor children being taught free. There was thus an important educational work prosecuted in Scotland as early as the seventeenth century, at a time when England and Ireland were left in comparative darkness. The prevalent use in the educational action of those days of the dead languages, of Latin in particular, engendered in Scotland respect for the classical element, and raised, so to speak, the educational tone of the people, and enabled them to appreciate, probably, the value of a higher kind of education than that given in the common parish schools, such as is now spoken of, and looked for, as given in the "middle-class schools" of London and other places. To this cause it seems natural to attribute, in part at least, the numerous endowed schools and burgh schools of Scotland,—the one class founded by benevolent donors leaving funds or property in trust for educational and other benevolent objects, the other by corporate bodies devoting corporate funds and property to the provision and maintenance of good and cheap schools. Burgh schools, under the control of corporations, existed prior to the introduction of the parochial system, and many of them have flourished simultaneously with the parish schools, with constantly augmenting vigour. Dr. William Chambers tells us, in his

charming memoir of his brother Robert; how, after he had passed his first stage of schooling under the care of the widow, Kirsty Craunton, in the small town of Peebles, he was entered at the burgh school, the master of which was James Gray, author of an arithmetical class-book popular in Scotland for generations. Thence he was able to advance to a still higher stage,—to the grammar-school (also of Peebles) in which the classics were taught for marvellously low fees. Dr. Robert Chambers says:—

"My first two years of schooling were spent amidst the crowd of children attending Mr. Gray's seminary. On the easy terms of 2*s.* 2*d.* per quarter, I was well grounded by the master and his helper in English. The entire expense must have been only about eighteen shillings—a fact sufficient to explain how Scotch people of the middle class appear to be so well educated in comparison with their southern compatriots." "For a small fee (in the Peebles Grammar School it was only 6*s.* a quarter), a youth gets a good grounding in Latin and Greek, fitting him for the university; and it is mainly, I believe, through this superior education, so easily attained, that so many of the youth of our northern region are inspired with the ambition which leads them upwards to professional life in their own country, or else sends them abroad in quest of the fortune hard to find at home." "The good education that has enabled me to address so much literature, of whatever value, to the public during the last forty-five years, never cost my parents so much as ten pounds."

The school education of Dr. William Chambers was "finished" when he was thirteen years of age, and had cost, books included, somewhere about 6*l.* It can scarcely need to be said, in view of his distinguished and useful after-career, that his real education commenced after he left school.

The influence and teaching of the great Scottish Reformer, John Knox, did much to lead up to the adoption of the parochial school system, although he did not live to witness its establishment or beneficial results. It is evidence of the existence in Scotland of efficient schools in the early part of the sixteenth century, that Knox received such a grounding in classical education as fitted him for the university in the burgh school of Haddington, a venerable institution that remains to this day, and at which several living men that could be named have been educated, who have achieved in various departments of usefulness, even more than national reputation. The school is in three divisions,—English, or elementary; the mathematical, or commercial; and the grammar, or classical schools, each conducted in a separate, although contiguous, building. Two of the divisions are conducted in comparatively modern buildings; but the English school, which is adorned with a panel in a central pediment, containing a goat, the arms of the "guid auld toom," in alto relievo, has sufficient evidence of antiquity to induce the belief that it is the identical building, in so far as the carcass goes, in which Knox learned to read Sallust and Virgil. The Haddington Burgh School is not, however, an evidence of the perfection of the system, or of the efficiency of the control exercised, under all circumstances, by the magistrates and council. It has unfortunately occurred in its history that a stiff-necked, wrong-headed rector has been able persistently to defy the governor, and render the school all but worthless; but such misfortunes are happily rare among the burgh schools of Scotland, nearly 100 in number, some of them flourishing in "county towns" of 3,000 and 4,000 inhabitants.

The Grammar-school era commenced in England also about the time of the Reformation, when so many schools were founded that it became evident that their regulation, rather than an increase in their number, was the chief educational desideratum. Many of these schools were free at first, as designed by their founders, but abuses crept in; funds were misapplied, and not a few of these schools sank to decay through egregious mismanagement, and ceased to be of any advantage to the children of either rich or poor. The parochial charity-school era may be placed as from 1700 to 1800. This system is only partial in operation, and the cost involved in clothing as well as educating the comparatively small number of children it embraced restrained its extension. The free charity-schools for "Grinders" (*vide* Dickeus), and the grotesque dresses of the hoy old men, and girl old women, admitted to them, are peculiar to England, and are more numerous and notable in London than in any other city or town.

The administration of the funds of some of the most wealthy educational foundations of London has long been a favourite topic, of seldom favourable criticism, and the provision of efficient middle-class schools for London is a vitally important subject that has of late years de-

* To be continued.

servely received much attention. The present aspect of educational affairs in Edinburgh bears upon both points. A brief notice of the educational and scientific institutions and agencies for which Edinburgh is renowned would occupy more space than can be spared to the subject. It has its celebrated High School, dating from the beginning of the twelfth century; its Academy, incorporated by royal charter; Pettes College, housed in one of the most ornate and superb educational buildings in the United Kingdom; its training colleges and normal schools, and others too numerous and various to mention.*

FROM EDINBURGH.

MISS WALKER'S trustees, after some difficulty as between the designs for the new cathedral of "Fidelitas" and "Auld Lang Syne," have fixed upon the latter, which are found to be by Sir Gilbert Scott. The services of an architect eminently qualified for such a work have thus been secured; but neither the accepted design nor any of the others (fine as some of them are) are upon such a scale as to possess the dignity which may naturally be looked for in the cathedral of a city like Edinburgh. Two courses still remain open to the trustees. The funds at their disposal are large, amounting, we understand, to upwards of 200,000. The main object contemplated by the testatrix was the foundation of a cathedral, and a much larger sum than the 65,000, voted for the purpose may, we think, with propriety be set aside for the building, and a design upon an extended scale be procured from Sir G. Scott. If, however, it may not be thought judicious to exceed the sum already voted, there remains the alternative of building a portion only of the extended design, leaving the remainder to be dealt with in the future. Such was the usual practice in Medieval times; but, now-a-days, we are in too great haste to accomplish every object, and it would be of advantage to art were the practice of our ancestors sometimes followed.

Operations have commenced for the erection of an Oldfellows' Hall in Forrest-road, from the designs of Mr. J. C. Hay, architect. The building is to be in keeping with the adjoining buildings, which are designed in the old Scottish style of street architecture. The front elevation only will be seen from the street. It will be of three stories, finished by a gable having a figure of Charity at the apex. On the ground-floor the entrance is flanked by shops, which are divided from the first floor by a cornice, terminated by brackets at each end, and in the centre is the insignia of the order, under a hood. The first floor is lighted by three circular-headed windows, and is ornamented by an alto-relief, emblematic of Faith, Hope, and Charity. The third story rises from a corbelled course, and on each side are turrets of different design.

A large hall in the rear is approached by a passage 8 ft. wide; it will be 61 ft. long, 47 ft. broad, and 30 ft. in height. A gallery is carried round three sides of the hall, on light iron columns, which run up to the roof in the manner of an arcade. In the front over the shops will be another hall, capable of accommodating 300 persons, and the remainder is occupied by committee-rooms, and a house for the keeper. The total cost is estimated at about 5,000.

Sunday, the 24th of November, was the tricentenary of the death of John Knox, and in most of the Presbyterian churches throughout the city special reference was made to the life and character of the great Scottish Reformer, and of his influence upon the religious and civil institutions of the country.

No memorial of Knox has been erected in Edinburgh, with the exception of a paltry church adjoining the house which he occupied—which quaint building is still carefully preserved. This church has a somewhat ornate Gothic front, but the body of the building is of a nondescript style, and unworthy of the name it bears.

A meeting has been held with the view of raising funds for the erection of a suitable memorial as to the nature of which numerous suggestions were made, and much difference of opinion seemed to exist. A memorial window in St. Giles's church, in which the Reformer ministered, was generally considered of too limited a nature, and even a simple statue was not thought of sufficient importance.

A lofty column, with a statue on its summit, was likewise proposed, an idea which can hardly

be entertained by any man of taste,—such a monument already existing in the city, and one such being quite enough. Another suggestion, which appears to meet with some support, is the erection of a memorial hall. Ample funds will be required to give such a structure a monumental character, to secure which the useful must be subordinated to the grand or ornamental.

We understand that the trustees of the Royal Infirmary have resolved to delay the erection of new surgical wards, and to proceed only with the medical portion of the building. As we stated in a former notice, the basements of all the pavilions have been constructed, a course which seemed to us to be unwise in the circumstances.

ENLARGEMENT OF THE CHELSEA WATERWORKS.

THE Chelsea Waterworks Company contemplate a considerable enlargement of their existing premises and works, and for this purpose the company have given the necessary Parliamentary notices for powers which they intend to seek in the next session. The proposed works include the construction of three new reservoirs, one of which will be in East Moulsey and Thames Ditton, being 485 yards in length, and occupying an area of 20 acres. A second will be wholly in Thames Ditton, and will be 480 yards in length, and 19 acres in extent; while the third reservoir will be situated on the company's land at Putney, close to the aqueduct, where the existing mains are carried across the river, near Putney Bridge.

SOCIETY OF ARTS' REPORT.

We abstract from the report read at the recent opening meeting a few items of special interest.

National Training School for Music.—The Council have reason to hope that the actual establishment of national scholarships for music, to be competed for in many of the counties of the United Kingdom, will take place in the course of the ensuing year. From the list of upwards of eighty subscribers may be named the following:—Sir Titus Salt, bart., has promised to devote 1,000l. to the foundation of a scholarship, when the National Training School for Music is established, to be called the Saltire Scholarship. Mr. F. Morrison will subscribe 500l., for five years, for an Invernesshire Scholarship. Mr. C. Minton Campbell will give 500l., for five years, for a Staffordshire Scholarship. Mr. Hawksbarrow, C.E., promises 250l., for five years, for a Sussex Scholarship. Mr. H. A. Hunt promises a donation of 1000l. The Marquis and Marchioness of Westminster will subscribe 150l. annually. The Marquis and Marchioness of Lansdowne, 50l. 5s. annually. The Musical Committee will be requested to advise in reference to the necessary details for regulating the holding of these scholarships, and the Council have special satisfaction in announcing that H.R.H. the Duke of Edinburgh is personally interesting himself in the plan.

Improved Stoves and Grates.—Through Sir William Bodkin, from a gentleman who does not wish his name to appear, the Council has received the very liberal offer of 5000l. [as already mentioned in our pages], to be used in such a way as they may consider best, for some means of economising the use of coal for ordinary domestic purposes, without diminishing its efficiency. The great rise in the price of coal has again brought this question more prominently before the public, and the Council cannot but express their admiration of the practical philanthropy which has urged a private individual to contribute so handsomely towards an attempt at its solution. It is not intended to entertain any proposals which are suitable only for the mansions of the rich, or have relation to cooking for large numbers, but rather, taking a room as the place of experiment, to offer prizes for grates suitable for existing chimneys, which shall fulfil the conditions of warming and ventilating, or of cooking in combination with these. But though thus inviting the manufacturers of grates, among others, to compete, it is obvious that any widely-spread and real improvement depends mainly on the designers and builders of houses. Year after year we hear of the same result, owing to the extravagance and waste of valuable material, in producing a miserable substitute for warmth and comfort in ordinary dwellings; and year after year we see the same type of enormous fireplaces and chimneys, in many cases constructed without

even the application of the form which experience shows to be the best, rising up on every side. However much we may hope that builders will, some day or other, have the courage to strike out a new line altogether, we can only at present advise, with regard to the money entrusted to us, that it be awarded in connexion with the arrangement of houses already built, and that the improvements should be of such a character that the dwellings of the many shall be able to profit by them.

Incombustible Paper.—The Gold Medal, in furtherance of the terms of Dr. Pöbergill's will, is this year offered for the production of an incombustible paper, so as to render the ledgers of commercial men, bankers, &c., ordinarily indestructible by fire.

Cameo-cutting by Females.—On several occasions the conductor of this journal has sought to lead the attention of female art-students in this direction. It is satisfactory to find that the Silver Medal, in furtherance of the will of Mr. John Stock, is this year offered by the Society of Arts to female artists, for the best cameos designed and executed on any of the shells ordinarily used for that purpose.

PROPOSED NEW BRIDGE ACROSS THE THAMES.

AMONGST the Parliamentary Bills seeking powers to execute new works, which will be investigated in the course of the ensuing Session, a project is included for the construction of a new bridge across the Thames. The proposed undertaking, which is described as the "Tower Bridge," is intended to commence near Fair-street, Horselydown, on the Surrey side of the river, crossing the Thames in the direction of the Tower, and having its terminus on Little Tower Hill. In connexion with the bridge, it is proposed to construct four tunnels or subways along the line of the bridge, these tunnels to be on or under the bed of the river, and it is further proposed to connect these tunnels with a footway on the side of the bridge by means of shafts to be constructed in the piers of the bridge. The tunnels are to be 150 ft. in length, and to be 200 ft. from the centre of the Thames. It is not stated in the Parliamentary notice what the height of the bridge above high-water mark is to be; but, inasmuch as vessels of large burthen come up to the wharfs close to London Bridge, the probability is that the Admiralty authorities will insist upon a height of more than usual altitude before giving their sanction to the project. It is reasonable to suppose that if the proposed bridge can be erected without unduly interfering with the navigation of the river or the shipping of the port, it will be a great convenience to the residents on both sides of the Thames east of London Bridge.

NEW SCHOOL BUILDINGS FOR THE LONDON SCHOOL BOARD.

THE School Board for London have just given notice of their intention, under the provisions of the Elementary Education Act, to take compulsory possession of plots of land in different portions of the metropolis for the purpose of erecting new schools on each site. The total number of schools which the Board propose to build is 56, on a corresponding number of sites, and the aggregate area of the land to be purchased is 112,452 square yards, or upwards of 23 acres, 64,281 square yards of which are for schools to be erected in Middlesex, 41,665 square yards for schools in Surrey, and 6,556 square yards for schools in Kent (Greenwich). The schools to be erected in Middlesex are 35 in number, 10 of which are in the Finsbury division, viz., 3 in St. Luke's, 2 in Islington, 2 in Clerkenwell, 1 in St. Giles's-in-the-Fields, and 1 in St. George-the-Martyr's; 8 in the Hackney division, of which 3 are in the parish of St. Leonard, Shoreditch, 3 in St. Matthew's, Bethnal-green, 1 in Hackney, and 1 in Bethnal-green; 7 in the Marylebone division, all in the parish of St. Pancras; and 10 in the Tower Hamlets division, of which 3 are in St. George's-in-the-East, 1 in Stepney, 1 in Shadwell, 1 in Ratcliff, 1 in Limehouse, 2 in Poplar, and 1 in Mile-end Old Town. In Surrey the number of schools to be erected is 18, of which 12 are in the Lambeth division, viz., 4 in Camberwell parish, 4 in St. Mary's, Lambeth, 3 in St. Mary's, Newington, and 1 in Clapham. In

* To be continued.

the Southwark division the number of schools to be erected is 6, of which 2 are in the parish of St. George-the-Martyr, and 4 in Bermondsey. In Kent 3 schools are to be built, all of which are in Greenwich.

SCHOOL BOARDS.

London.—The report of the works committee was brought up at last week's meeting. The committee recommended the acceptance of the revised tender of Mr. W. Shepherd, for the erection of a school for 837 children in Kender-street, Hatcham, at a cost of 6,471*l.*, which was agreed to. The committee also recommended the acceptance of the tender of Messrs. W. H. & J. Mansbridge for the erection of schools for 825 children, in West Ferry-road, Millwall, at a cost of 6,070*l.*, which was agreed to. The tenders have already been given in our lists of November 9th and 16th. At this week's meeting, the Works Committee reported that they had invited tenders from builders for the erection of a school providing accommodation for 1,213 children on the site in New Winchester-street, Islington. The committee recommended that the tender of Messrs. Down & Co., offering to do the work for 9,328*l.* be accepted. The recommendation was agreed to. The committee had also had tenders before them for the building of a school on the site in Gloucester-street, Stepney, capable of accommodating 1,038. They recommended that the tender of Messrs. Roberts, amounting to 8,371*l.*, be accepted. This was also carried. The tender of Messrs. Cooke & Green, for the erection of a school for 788 children in Creek-road, Deptford, was in accordance with the recommendation of the Works Committee, and was agreed to. The amount was 5,758*l.*

Okehampton.—The Okehampton School Board have chosen Mr. Charles Pinn's design for the new schools. There were eight competitors. The schools are to contain 250 children, with master's house, and are Geometrical in style. The cost will be about 1,000*l.*

Wraybury Schools Competition.—The design of Mr. Fred. W. Albury, of Reading, architect, has been selected by the local School Board. Twenty-seven designs were sent in.

"THE CHISEL."

At the Birmingham Royal Society of Artists, Mr. J. H. Chamberlain has delivered the third of a series of lectures entitled "Means and Results," the application of the subject being devoted on this occasion to "The Chisel." The lecture consisted of a review of the progress of chisel-work from the Middle Ages to our own time, showing the various influences that have existed, locally and otherwise, to affect the operations of architects and workers in stone. Thus it was that in earlier times men built walls thickly and roughly because of the abundant supply of stone at their command, presenting strange contrasts to the brick walls of the present day, which may be built up evenly and strongly, and presenting as much solidity, with half the thickness of the old stone walls. Mr. Chamberlain treated of his subject in three sections,—masonry, carving, and sculpture. Birmingham, with all its wealth,—with respect to which ancient cities were not to be compared,—possessed not a tenth of the number of statues which an ancient city only a quarter its size had been known to contain. The statues of Sturge and Attwood were pointedly alluded to as furnishing instances of the application of modern sculpture built up in pieces instead of worked out of the solid block. The reason why there was no national school of sculpture was principally because we would have no common art; everything in the way of art, as far as it could be, should be great and noble. Greek sculpture was composed of the representations of life, consisting perhaps of the wars of the people, their fames and legends; and if they came to Mediaeval times, they met with even representations of their trades. There was nothing ideal in any of their sculpture. Having noticed how difficult, or rather *outré*, it would be for sculptors to deal with such subjects in modern times,—say, for instance, the portrayal of a Foresters' or Odd Fellows' procession, after the manner of the ancient Greek sculpture, the lecturer passed on to notice that there was nothing about the public buildings of this town in the way of sculpture to indicate the purposes for which they were erected. Especially was this the case with

the Market Hall,—supposed to be a copy of the Grecian Doric order of architecture,—the Fish Market, which does not even possess a carving of a lively fish; whilst the athletes of Birmingham met for the practice of their feats of strength, &c., in Bingley Hall, a damp, monidly, and nasty piece of architecture. The remaining portion of the lecture was devoted to the technicalities of the subject.

ANALYSTS UNDER THE ADULTERATION ACT.

The first prosecutions we have heard of under the Adulteration Act have occurred at the Borough Police-court, Liverpool. Two cow-keepers were charged with selling adulterated milk; the adulteration in one case was to the extent of 30 per cent., in the other 10 per cent. The magistrate inflicted a fine of 40*s.* and costs in one case, and 20*s.* and costs in the other. The adulterant, we suppose, was water. The analysts, however, have higher game to aim at than mere water, or merely diluted milk.

The Camberwell Vestry have appointed Dr. Bernays, the professor of St. Thomas's Hospital, as their analyst. He is appointed for one year, and payment for that period is to be by fees.

A committee of the St. Martin's-in-the-Fields Vestry have suggested that one analyst should be nominated for the whole of Westminster.

A letter from the Local Government Board to the St. Saviour's District Board of Works, referring to the recent appointment of Dr. Bianchi as analyst, requests to be informed of Dr. Bianchi's qualifications for the office, and that testimonials on the subject should be referred to the Local Government Board. Mr. Thorne stated that Dr. Bianchi would furnish the necessary testimonials: he had been their medical officer for over sixteen years.

ARCHITECTS IN THE ANTIQUE TIMES.

SIR,—With reference to the articles which the *Quarterly* has recently allowed to appear in its pages, permit me to say, whatever may be thought of the value of the writer's special criticisms on things as they are,—and it is not to be denied that in many points they are trenchant and just,—it is with his one *pet theory* that architects are most concerned, *viz.*, that it has been left to modern days to develop an architectural profession, upon which, though an architect himself, he pours all the vitals of his contempt as "spurious," &c., and the fruitful source of what he considers the present deplorable condition of things. To support this view, he is very great in Greek quotations, with the pretence of showing that anything like an architectural profession was unknown to the Greeks, and that apparently their buildings must have grown up under their hands, and been evolved stage by stage out of the inner consciousness of the "workman." The absurdity of this is so apparent to any one who will consider what a Greek temple is as a *perfect whole* (a repetition of parts constructed on identically the same mathematical principles, adjusted to each other by the nicest discrimination of optical relationships, all needing to be grasped and combined as a whole before the work could proceed), that it needs little refutation; but as the flourishing of these Greek quotations, in which the word "architectones" is made to play so prominent a part, might deceive some minds, it may be worth while to offer just one other Greek quotation which is directly fatal and destructive to his whole view and theory. I am indebted to another source,—an article in a contemporary dealing with the architectural controversy in an able manner, and in part devoting itself to the views propounded in the *Quarterly*,—for this quotation, which is as follows:—

"The pay of a common builder was five or six mims, but that an architect would require more than ten thousand drachms."—*Plat. Epistola*, ed. Serraw, t. i, p. 135.

This quotation from Plato will probably be enough to settle the question for most minds as to the validity of the writer's great point about the absence of an architectural profession in the past, and resolves all that he otherwise says into the easy task of fault-finding and ultra-criticism, without practically showing that "more excellent way" for a truer and nobler art than we now possess, which is the desideratum of all earnest minds equally with his own.

ALPHA.

THE OLD MASTER OF WORK.

SIR,—In connexion with the great controversy which has been going on of late regarding the portion which the old workmen had in either designing or carrying on the work, the following extract from the old Burgh Records of Aberdeen may be interesting. The duties of the master of work as here recorded may have been more in accordance with German, than with either English or French custom; but your readers can judge of that for themselves:—

4th May, 1384.

"The 3ij day of May, anno lxxxiiiij, Maistre John Gray, mason, was resault be the alderman, bailies, counsail, and communitie of the burgh of Aberdeen, in maistre of work, to the bigging of Sanct Nicolace Wark (or church), quhilk has taken upon him to be continuall labourand diligent for the springing of the said wark, and to do all ear concerning the said wark, that accordis til a maister of wark, bairn in labouring of his awyn person, deuying, he seyng and ourseyng of thairis masons and workmen that sal be under him, for all the dais of his lif, to the finale completing and ending of the said wark, at al his possible and power, the best wyse that he can. For ye quhilkis thingis to be done he has, in the presence of the bailies, counsail, and communitie forsaids, gevin the gret bodily aith, to be leld and trew to the said wark for all the dais of his life, vnto the completing and ending of the same. And the said maister of wark sal labour himself, and get thairis masons and workmen under him labour daily and continually, efter the Act of Parliament made thairupon. For the quhilkis labouris and services to be done he the said maister of wark, the saidis alderman, bailies, counsail, and communitie has promissit to gif yerly to the said maister of wark, for his fil (or fee), twenty pundis and fyre merkis, til a propyne in al costage andur and al the dais that he has to lif quhilk the said wark be complete. And the day of his entra to the said wark the day of this present writte. And this said some of scill lib. xvi. s. vi. he yerly, to be paid til him at four termes in the yere, proportionally, as thal and he sal accord best thairupon."

The chief point of interest in the foregoing extract appears to me to be in the word "deuying." How much does this word "deuying," or designing, comprehend, and to what does it refer? W. P. B.

BRITISH ARCHÆOLOGICAL ASSOCIATION.

On Wednesday, Nov. 27, Mr. II. Syer Cuming, V.P., in the chair, twenty-three members were announced as having been elected by the council, and thanks for numerous presents were returned.

Mr. J. W. Baily exhibited many specimens of articles recovered from Victoria-street, London, including two skulls of the *Bos longifrons*, which were exhumed from a depth below the Roman stratum, and were found amongst piles,—several examples of Samian and British ware, one of the latter of the fourth century,—a time when it now becomes difficult to determine whether they are Roman or purely British; but this specimen, from its large mouth, must unquestionably be British;—a spotted vessel, somewhat later, but still British;—a chafing-dish of the sixteenth century, pertaining to a barber's shop.

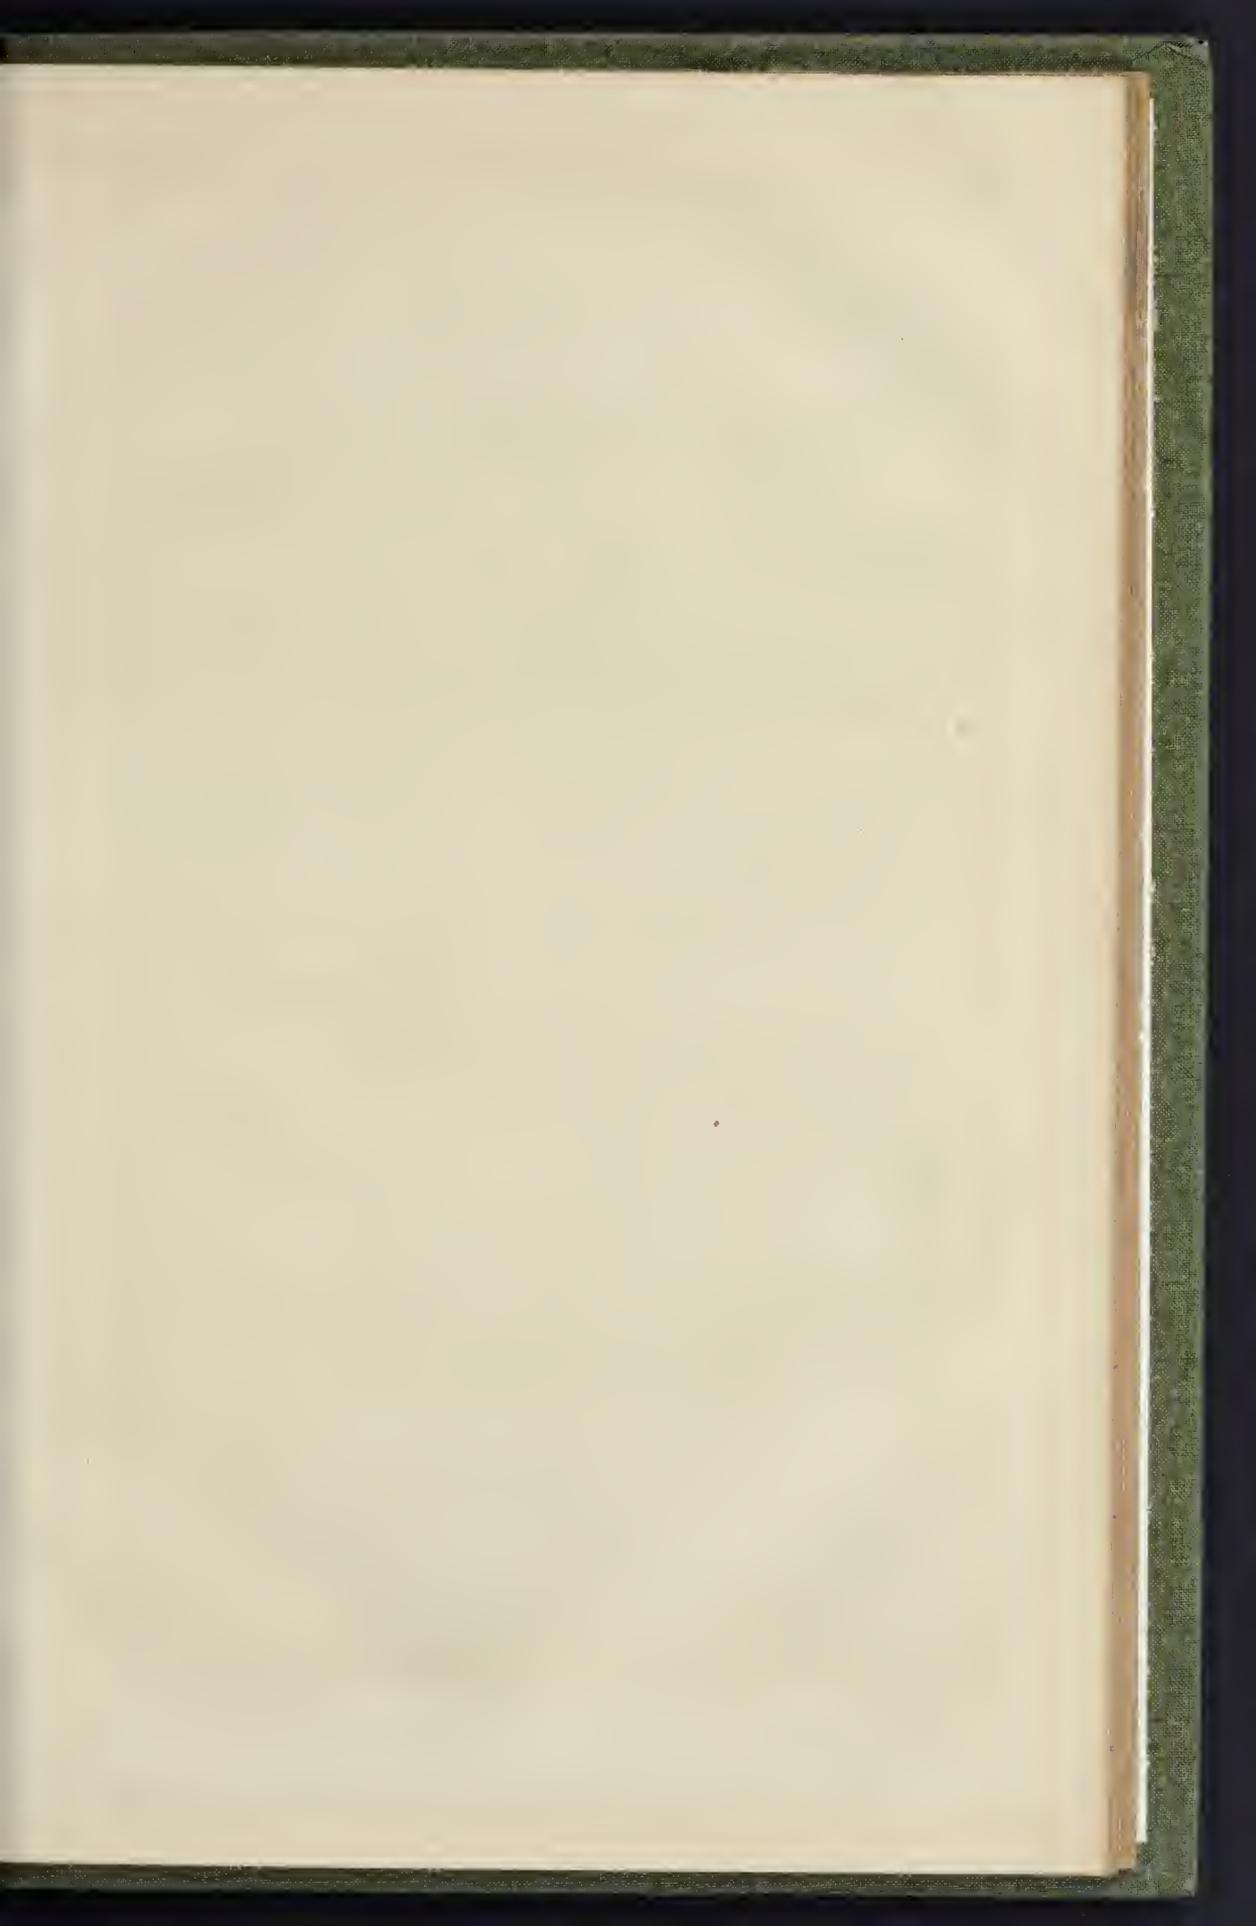

The Rev. Mr. Home exhibited a cambric collar of Charles I., given by Charles II., to a member of the Byron family, in 1660, and marked, "A Gift from King Charles." Dr. Kendrick exhibited a piece of embroidery (embossed appliqué), showing the story of Hero and Leander, circa 1670, for the panel of a casket.

Mr. Roberts exhibited a series of curious knives found in Thames deposits. The Rev. Mr. Hodgson sent an account of discoveries at Monkwearmouth Church, and especially of a monument of a priest, Eberic, formed out of a previous Saxon tomb, and the name erased, and probably contemporary with Bede. Mr. Crickmay, of Weymouth, exhibited drawings of a Roman pavement at Preston Weymouth, not previously illustrated.

Mr. Stainbank exhibited two volumes of drawings, showing inscriptions on bells, taken from rubbings,—the earliest dated bell being 1296, at Cloughton, Lancashire.

Mr. J. W. Grover read an account of a Roman villa recently discovered at Teston, Kent, and compared it with that at Chidworth, in Gloucestershire.

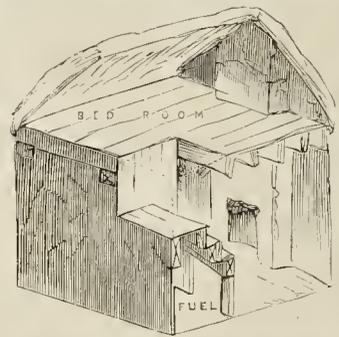

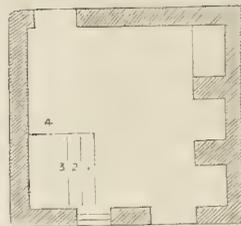

Mortuaries.—A committee has been appointed by the Vestry of St. Martin's-in-the-Fields for the purpose of considering the desirability of erecting a mortuary for the parish in Drury-lane burial-ground. Such accommodation is greatly needed in the district, and it is not creditable to the parochial authorities that they should have deferred taking action in the matter until the present time.

THE HOUSING OF THE BRITISH LABOURER.

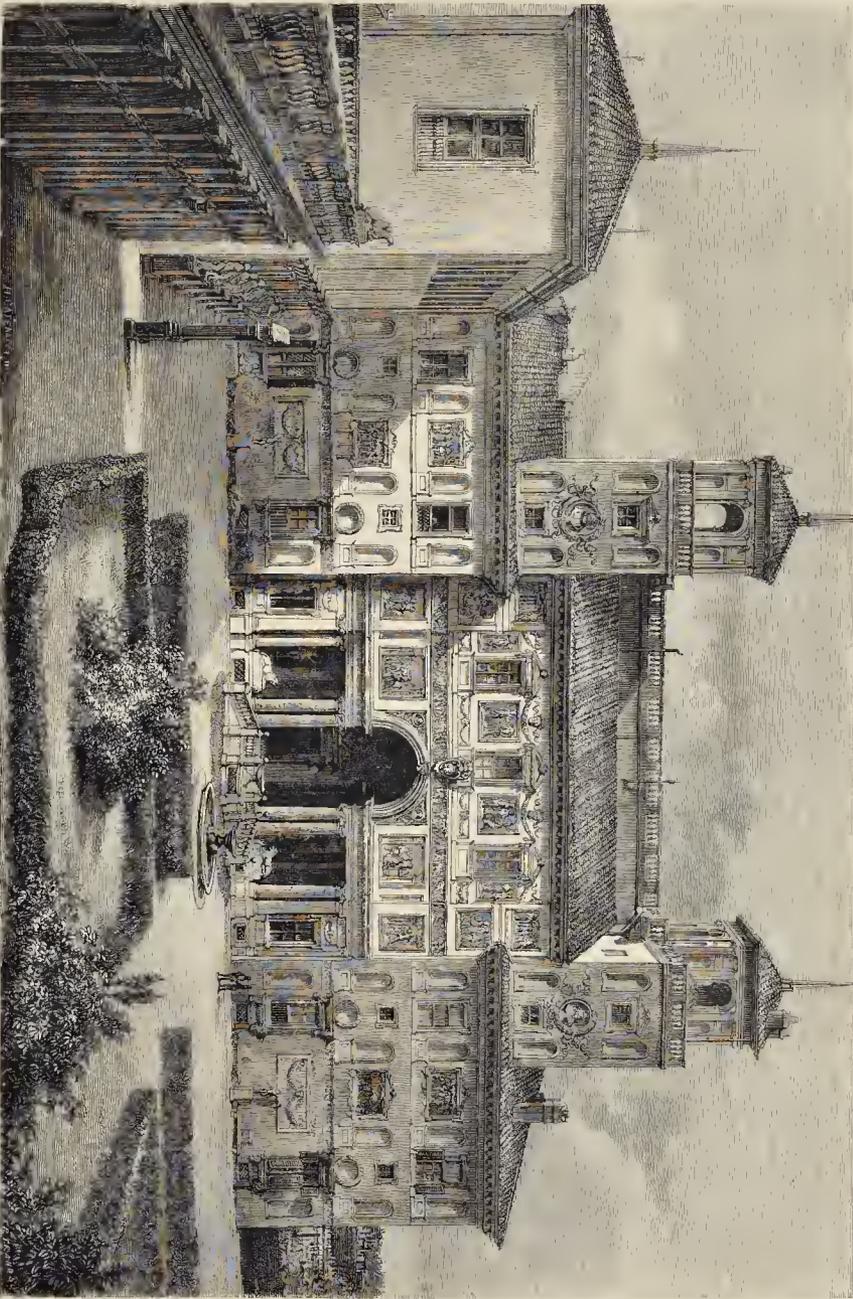

The Home of Twenty-six Christian Souls.

THE VILLA MEDICI, ROME: GARDEN FRONT.

THE VILLA MEDICI, ROME.

We complete our illustration of Rome, noticed in our last,* by reproducing, with consent, the view given in it of the Villa Medici, the residence of artists sent from Paris; and some of the particulars he has given. It is elevated on the hill of the gardens whence it dominates city and fields, and is masked by the two pavilions rising out above the trees, over the facade. From the exterior side which faces towards Rome, the building has a cold look; windows of tolerable simplicity and very spacious; a very high doorway crowned by a balcony,—such is the most noteworthy arrangement adopted in 1540, by Annibale Lippi, when he erected the palace for the Cardinal Montepulciano. It was intended to make of the opposite side a gem of architecture enriched by a collection of bas-reliefs, the precious fragments of antique sculpture. This facade, with its portico sustained on columns, and watched by lions, is in strong contrast with the other, of which the design has, without the slightest proof, been attributed to Michelangelo.

It is probable, for the rest, according to M. Wey, that the plan was modified when Cardinal Alessandro de Medici acquired possession of it, and gave it a name. He amused himself by decorating it in the few periods of leisure which he was allowed under Clement VIII. from the negotiations with which he was charged at the courts of various sovereigns, and among others at the court of the Béarnais, Henry IV. On the death of Aldobrandini, the Cardinal having been chosen Pope on the 1st of April, 1605, he took the name of Leo XI., and died only twenty-seven days after, leaving as many regrets as he had inspired hopes. The Cardinal de Medici commenced collections which, under the Florentine sovereigns, continued to enrich the villa on the Pincian. On the vase placed in front of the steps was once seen the Mercury of John de Bologna.

It was Benedict Suvée, appointed director of the French Academy in Rome, who, in 1603, obtained the transferance of the Villa Medici as the home of French artists. The most remarkable of the domestic apartments is the dining-room, adjoining a kitchen, whence issues that disturbing and too familiar odour of such offices in lycæums and boarding-houses. This fine refectory is vaulted, and the arch has been divided into compartments, in which since 1811 the portraits of those crowned by the French Academy have been placed by their comrades.

The building is scarcely so well kept as it should be, and has the consequent aspect of neglect.

BEHAVIOUR OF GRANITE AND BRICK UNDER FIRE.

The Boston correspondent of the *New York World* sends some notes on this subject, which will interest our readers:—

The Post-office is of granite; the columns at two corners have been burnt out of shape, and one or two of them almost out of existence, by the fervent heat so near it. But here it stands now as on Saturday, with all its openings uncovered, and with a network of light wooden scaffolding, which these openings exposed to fire over the whole interior of it. The fireman kept it so drenched that the flames which burnt away the woodwork within; but in this very praise there lies a reproach. If this building, which thus invited destruction by fire, not only stands unconsumed, but is the bulwark which held back the fire from eating up the whole of Boston, why is it that a stand was not made on one of the many burnt buildings, which were not only by structure, but by equipment and preparation, intended to be fireproof? From here, for a stretch of almost half a mile southward, were solid squares or polygons of granite, with here and there a building of marble or of brick. Of these granite buildings, it may be said, with almost literal exactness, that there is not left one stone upon another that is not torn down; and not only so, but the massive stones thus disjointed are disintegrated. I picked up and pocketed a piece of marble and of granite, of equal size, which lay alongside each other. They had been subjected to the same tremendous test. The granite crumbled under my fingers like baked rice; the marble was as firm as when it was quarried.

* See p. 917, ante.

All over this tract you may see what must amount to millions of bushels of grains of granite, the size of blasting-powder, reduced to this state,—not by concussion, mark you; for granite splits, and does not disintegrate, when it is struck, however hard,—but by mere heat. It looks as if there had been a hailstorm of adamant. Meantime, in this wreck of granite, the marble building at what was, as near as I could make out, the corner of Lindall and Congress streets, stands erect and in structure uninjured. The facade has not a fissure in it. These warehouses were all superbly built of vast blocks. There is scarcely anything left by which we may judge how goodly they were. Most of these great stones have gone to powder, as I said; but some of them remain to show Cyclopian buildings. They are all seamed. Pick one of these seams with your fingers, and off come whole laminae, 4 ft. or 5 ft. long. A boy can kick one of them to pieces. And here are brick piers standing unscathed to the height of 15 ft. or 20 ft. in this waste of granite. The spacious granite fronts have dissolved and disappeared; the brick partition-walls and piers stand often uninjured,—always uninjured when good mortar has been used to join them. From a brick vault I saw a man, precariously perched upon a ladder, extracting his books in perfect order, while of the granite which had hidden the brick, barely enough was left upon the ground to show what it had been. In one place a brick wall, four stories high, and in extent the whole side of a warehouse, stands above and perfect. Of course, the next high wind will blow it down; but while it stands it is an eloquent witness to the excellence of the material of which it is made.

BUILDERS' BENEVOLENT INSTITUTION.

An election of four pensioners on the funds of this institution (two male and two female) took place yesterday (Thursday) at Willis's Rooms, King-street, St. James's; the president, Mr. Edwin Lawrence (Lawrence & Sons), in the chair. There were five male and eight female candidates. The poll opened at 12 o'clock noon, and closed at 3 p.m., when the scrutineers (Messrs. T. Stirling, Matthew Hall, and R. K. Burstall) announced that the successful candidates were:—Males, J. W. Annis and Matthew Satch; females, Ann Budd and Frances Sears. The chairman having formally declared the results of the election, votes of thanks to the scrutineers (proposed by Mr. Thorn and seconded by Mr. Richardson), and to the chairman (on the motion of Mr. Burstall), brought the proceedings to a close. The Institution has now forty-five pensioners on its funds—twenty males and twenty-five females; the males receiving 25s. per annum, and the females 20s. per annum, each.

SEWAGE UTILISATION, BORROWING POWERS, AND GOVERNMENT INSPECTION.

Sir,—About twelve months ago, the Corporation of Weymouth engaged the services of Sir John Coode, of Portland Breakwater fame, to devise a scheme for more effectually draining the town and disposing of its sewage, which has hitherto been discharged into the tidal backwater or estuary. In the course of the spring Sir John accordingly produced elaborate plans, which embraced, among other things, an enormously expensive dam and drain across the said backwater, in order to concentrate the sewage in one pumping-station, from whence it was proposed to be carried a mile and a half, and disposed of by irrigation on clayey land. This mode of disposal has subsequently been set aside pending the experimental trial of one of Austin's strainers at the mouth of a main drain; yet notwithstanding this fact, the contractor has been pushed on to commence the dam, which will be altogether unnecessary should the strainer or any other new method of treating sewage in the meantime be found successful.

The estimated cost of Sir John Coode's scheme, which avowedly leaves the drainage of the town incomplete, is 25,000*l.*, and that sum has recently been borrowed at the rate of 4*l.* 7s. 6d. interest per cent. per annum, repayable in thirty years. Now we have not been favoured with the visit of a single Government inspector to go into details and check the plans on the spot, and it is generally understood, on the authority of statements made in the town council, that Sir John Coode

has obtained the required Government sanction to his plans through the influence of his former official connexion with the Admiralty.

What a large number of ratepayers are anxious to know is:—

1. Whether the sum referred to could be legally borrowed by the Corporation, in the absence of a proper Government inspection?

2. If the rates can be lawfully charged with the money borrowed of an insurance company at the rate named, after the passing of the Act of last session enabling any Local Board of Health to obtain money from Government for repayment being spread over sixty years?

If we are in error in respect of that Act you will doubtless set us right.

TWELVE RATEPAYERS OF WEYMOUTH.*

THE TOWER OF THE CHURCH AT SIXHILLS, LINCOLN.

The tower of the church at Sixhills has been, and is, matter of serious dispute between the patron, Mr. Henage, and the vicar, the Rev. C. A. Wilkinson. The patron, upon the plea of want of funds, pulled down the old tower (said to have been built by the Gilbertine monks, in the time of Stephen),—very massive, and quite susceptible of restoration, without faculty, as we are informed, and without communication with ecclesiastical authorities. He spurned the vicar's remonstrance, broke up tons of the old stones for the walks of his own grounds and to mend the highway, and threatened to sell the fine peal of ancient bells. The vicar has been energetically engaged for the last fourteen months in getting subscriptions, and has collected 450*l.* The Architectural Society have taken the matter in hand, have made a grant of 5*l.*, and have approved the design of Mr. Fowler for rebuilding it.

The patron has caused his tenants-at-will to pass and record in vestry, "that no alteration whatever be made in the church; and he himself has, by his order, caused upwards of 100 tons of the stones of the demolished tower, that would have been used immediately for the new building, to be buried and jodded down in the field of one of his tenants.

So stands this matter at present. The vicar has entered his solemn protest to the authorities against this act of his patron. We do not express any strong opinion on the subject, our information being *ex parte*; but certainly, judging from the printed documents, the proceedings of the patron seem extraordinary, to say the least.

It appears likely that the vicar's efforts will be crowned with success, and that the tower will be raised again on that hill, which is one of the finest sites in the county, to stand for ages to the glory of God.

The vicar sends us a full statement, too long for publication, and begs us to add that the same will be sent to any address upon application by post-card.

THE TRADES MOVEMENT.

Birmingham.—A partial lock-out has occurred in the building trade. The Builders' Association issued notices to the effect that the working hours for all branches, both in workshops and out of doors, would be from seven a.m. to five p.m. on and after Monday, November 11, till February 18, 1873. This, the men say, is contrary to the rules as decided by Mr. Rupert Kettle, and they accordingly issued a counter notice that the short time would not commence till Wednesday. A large number of men were thrown out of employment.

Blackburn.—The operative bricklayers having given notice to their employers that they are not going to have their wages lowered this winter, the masters have met, and resolved that the old rule be adhered to, and that bricklayers should be lowered to 30s., and labourers to 20s. during the winter months.

West Hartlepool.—Fully 120 bricklayers and their labourers (chiefly employed on the new buildings at or near the West Hartlepool Rolling Mills), have refused to continue at their employment, because their employers declined to allow them to adopt the scale of wages which the master bricklayers of Middlesbrough recently conceded to their men.

* The signatures are forwarded.

TOKENHOUSE-YARD, CITY.

Slums and squalor vile,
Check by jowl with stately pile.
Some of the courts hereabout,—and these are many,—are only 4 ft. wide! In the event of infection or conflagration, it must spread. A fire would certainly do what the authorities should—make a fine opening from the Bank of England to Finsbury-circus. There can be no question about the ground being speedily occupied by commercial palaces. I hope our new Lord Mayor will Baron Hansmann these rookeries and slums, where the sun never shines. His business premises adjoin this remnant of bygone London; but would either of the above eventualities break or make him? A step in time may save nine, and be sure to gain renown,—equal to an Embankment, Bridge, or Viaduct. R. T.

DEFECTIVE SCHOOL BUILDINGS IN SOUTHWARK.

It has just transpired that the several school buildings in Southwark are in a very unsatisfactory condition, so far as regards their construction and arrangements. Canon Gregory, a few weeks ago, on the occasion of laying the foundation-stone of a school in Bermondsey, referred to the great disproportion between the increase of population and that of the schools in the district, adding that whilst the schools were deficient in number, several of them were also very defective in construction. Mr. Stokes, the Government Inspector of Schools, in a report just issued, confirms this opinion.

THE NEW GAIEITY BUILDINGS.

The enlargement of the buildings in connexion with the Gaiety Theatre, in Catherine-street, which have been in progress for the last two or three months, and which we have already noticed, are now almost completed, so far as regards the external architectural elevation. During the present week the scaffolding in front of the enlarged Catherine-street frontage has been removed, revealing a prominent architectural façade. The building now forms one continuous block from the Strand frontage to the rear of the theatre in Catherine-street. The added portion is uniform in its architectural features with that part of the restaurant and hotel at the corner of Catherine-street and the Strand, with the exception of the first story windows, which are square-headed, and the elevation has been rendered additionally effective by balconies in the centre of the building. The objection to be taken is, that the theatre is swamped in the restaurant; in fact, but for the illumination at night the presence of a theatre could scarcely be guessed.

BURLINGTON HOUSE, PICCADILLY.

A lofty story has been added to the old part of Burlington House, in accordance with the design of Mr. Sydney Smirke, as exhibited some time ago, Messrs. Jackson & Shaw being the contractors. Shrouded by the buildings next immediately intended for the Learned Societies, the addition has been made so quietly that it will take many by surprise. It includes three galleries for the purposes of the Royal Academy, one of which, we believe, is destined to receive the statues, casts, and other works of art left to the Academy by the late John Gibson, and concerning the neglect of which we have recently received more than one complaining letter from Rome.

ROMSEY.

At Porter's Bridge there stood until a few months ago some old premises and a brewery; these have all been removed, and the site converted into a garden inclosed within a wall. A public convenience has been effected by the road near Messrs. Stead, Tylee, & Potter's offices being widened. The architect for this work is Mr. James Jenvey, of the Abbey; and the contractor, Mr. John Crook, of Southampton. At the Abbey, adjoining the new hall, a building of a substantial character, intended for schools, class-rooms, &c., with a residence for a superintendent, has been erected on the site of some old dilapidated buildings. The works are in a forward state, and will be completed shortly after Christmas. The architect is Mr. H. J. Paul, of Manchester. Mr. Crook is the contractor here also.

PROPOSED SCHOOL BUILDINGS FOR BELFAST.

In reply to advertisement by the Belfast Board of Guardians, a number of designs for school buildings were sent in, and from these a set by Messrs. Young & Mackenzie was selected. On the 19th instant a deputation of architects who had submitted plans for the buildings, consisting of Mr. Thomas Jackson, Mr. F. Shirral, Mr. McKinnon, Mr. Hevey, and Mr. Whittington, and accompanied by Mr. J. McLean, solicitor, waited on the Board in reference to the selection made by the guardians. The complaint set forth was that the plans had not been properly examined, and that better designs had been passed over. The competitors, therefore, urged that all the designs should be referred to the Institute of Architects of Ireland, or to the commissioners' architect, for a fresh decision. After a discussion, the matter dropped; it being understood that Messrs. Young & Mackenzie would furnish an estimate of the cost of carrying out the work from their designs.

THE HARTLEPOOLS EXCHANGE AND CLUB-HOUSE COMPETITION.

In May last, about a dozen architects of South Durham were invited, by the directors of the Hartlepoons Exchange Company, Limited, to prepare designs in competition for the above buildings. Only eight responded to the call, and from these, three sets of designs, bearing the mottoes, "Compact," "Veritas," and "On Change," were selected for the premiums offered.

The Directors submitted them to Mr. Ridley, of the Lock Works, Middlesbrough, that he might prepare estimates of cost, and it was found that none of them could be erected for the sum stipulated in the conditions of competition.

As this was the case, the directors requested the three premitted architects to obtain substantial builders' estimates for the erection of the buildings according to their several designs.

The author of the design bearing the motto "Veritas," Mr. G. G. Hoskins, of Darlington, obtained an estimate from Messrs. Robson, of the same town, to erect the Exchange buildings for about 8,000*l.*, which was the stipulated sum, although Mr. Ridley's estimated cost for this design was above 10,000*l.*, and higher than that for either of the others.

After sundry alterations, Messrs. Robson's estimate has been finally accepted, and the other two premiums awarded.

In consequence of the lack of funds, the directors considered themselves compelled to give the work to Mr. Hoskins, because he obtained the lowest actual estimate, although the plan for the Exchange buildings was thought to be inferior to that submitted by one of the other premitted architects.

Having thus far adopted this principle of action, they felt bound on the same basis to award two other premiums to Messrs. Thompson & Garry, of West Hartlepool, and Messrs. Alexander & Henman, of Stockton and Middlesbrough.

All your readers who have perused the General Regulations for the conduct of architectural competitions, lately issued by the Royal Institute of British Architects, will be able to judge for themselves as to the fitness of this decision.

LOOKER-ON.

OBSTRUCTING LIGHTS.

The case of Young v. Shaper, before Vice-Chancellor Malins, was an application by Mr. Robert Young, spirit merchant, Old Haymarket, Sheffield, who asked for an injunction to restrain Mr. Shaper, eating-house keeper, Westbar, Sheffield, from proceeding with a building, which is being erected at the top of Water-lane, in such a way as to injure Mr. Young's property on the other side of the lane.

Mr. Glasse, for the plaintiff, said the buildings were two hotels, and they were separated from each other by a narrow lane known as Water-lane, and the fronts of each faced Castle-street.

The plaintiff's longer frontage was in Water-lane. There were twelve windows looking towards the east, all but one being ancient lights. Water-lane varied in width from 13 ft. to 14 ft., and the defendant was raising the wall complained of, a height of 22 ft., above what it was originally.

After an address by Mr. Cotton, Q.C., for defendant, the Vice-Chancellor said his experience of all such cases taught him that the plaintiff, in a case where ancient lights were interfered with, was apt to magnify the value of these lights; and on the other hand, there were always witnesses to be found, skilled and unskilled, ready to prove not only that there would be no damage, but that the plaintiff would derive great benefit from the proposed work being carried on. It had been urged in this case

that because the lights were not used for a very important purpose the defendant had a right to darken them; but he had to consider the purposes to which the light might be put hereafter, and that would involve a much more serious loss than at present would be experienced. The new building could not fall to prove a very serious injury by materially obstructing the light. The plaintiff had a right to those lights for any purpose he might choose, therefore the defendant had no right to erect any building which would materially obstruct light and air, which would overwhelm the plaintiff, and instead of light coming from the east, he would be completely blocked out. The plaintiff was entitled to the injunction. The plaintiff ought to be satisfied with compensation in damages, but he could not enforce his opinion. The injunction would be granted in the terms prayed for, to restrain the defendant from continuing the erection of the building above ancient level. Costs follow as a matter of course.

IMPROVEMENT IN STREET LAMPS.

Sir,—Having had my attention called, through the medium of your paper, to the new patent lamps on one side of Moorgate-street, I went to see them, and certainly hope they will contribute to general use. In one thing, however, I think an improvement could be effected; on the proposal offered to use wire gauze and chalk (which would constantly require renovation) to absorb the moisture, by doubling the lamp double-glass, in the common square lamp to have four panes of glass fitted inside, and about 2 in. or less from the outer four panes. When in cold weather the gas is alight, the heat, by transmission through the inner glasses, would warm the air between the two, and consequently the inner glass being kept warm on both sides, would evaporate any moisture on the inside; and as no steam could get between the two glasses, the outer one would also be kept clear and bright. CARLO F. JOHNSON.

WHITEHAVEN BATHS COMPETITION.

Sir,—You remember the caution I gave in your pages a fortnight or three weeks ago respecting the above competition. The enclosed post card now issued to competitors, who it may be presumed have nearly finished their drawings, forcibly bears out the views I then expressed respecting the character of the competition. May I ask you to print it? It is, no one will be so foolish as to try to do you sympathy for mispent labour. If one has been weak and erring, let him sorrowfully hide the sad fact. FORBES.

"Whitehaven, Nov. 26, 1872.
BATHS.

The ground indicated on plan sent, not being available, the project is for the present in abeyance.—Yours respectfully,
PRO JOHN JACKSON,—G. E."

ENLARGEMENT OF THE CONSUMPTION HOSPITAL.

As the Chelsea Vestry a letter was read from the Metropolitan Board stating that application had been made from the authorities of the Hospital for Consumption in the Fulham-road for permission to tunnel under the road, they having purchased some property opposite the road, and asking the views of the vestry on the subject. Mr. Symons moved that the vestry offer no objection. The Board be asked to amend that the Metropolitan Board be asked under what Act of Parliament they propose to grant the application. Supposing the authorities wished to light the tunnel with gas, who would be the authority to interfere? Mr. Dutton asked whether the Kensington Vestry had expressed any views on the question, as one half of the road was in that parish. After some further discussion, the vestry clerk (Mr. Lohel) said there was just this point, that one did not know under what statute the permission to construct a tunnel would be given. The point was novel. In the end the vestry adopted the amendment.

THE LIGHTING OF BLACKFRIARS BRIDGE.

Sir,—I believe several suggestions have been made connected with this subject, and I shall feel obliged if you will allow me space to submit another, which may, I think, be considered worthy of notice. I propose that the lamp standards supporting the lamps, which are constantly being broken (I presume by passing vehicles), be removed from their present very unsuitable position, and placed at the side of the bridge, close to the parapet, in the same way as on Westminster and other bridges; or, what would be still better perhaps, to have the lamps placed on the top of iron framings, fixed at different points over the footway (having a sufficient number of them to light both the footway and the carriage-way). By carrying out my plan, the present difficulty would be overcome. Blackfriars Bridge has a very cheering appearance at night, especially when the gas is lighted with the broken lamps, and the wind is blowing; the bridge has then a spectral look. N. WATERBALL.

SUGGESTION AGAINST FIRES IN MANUFACTORIES.

Sir,—After reading the deplorable accounts of the fire at Boston, in America, it discloses certain facts worth bearing in mind, viz.—That granite when exposed to intense heat crumbles like dust; and that steel and iron are equally subject to much destruction. Now, in the serious fire at the Corn Mills, Blackfriars, we still find a great destruction of materials, but that the brick walls still stood a great deal from the raging fire, although the walls cracked; but this might in some measure have proceeded, perhaps, from the immense iron beams giving way, which would act as a lever on the walls. Under these circumstances, one feels disposed to suggest such remedial measures as might in some measure counteract the sad destruction of property from fires. For this purpose would you allow me to suggest the following, viz.—That the great accumulation of refuse coal at the mouths of coal-pits,

which hitherto has been of little available use, might it not be applied with a portion of clay and ground flint, or even a small portion of sand, in making a fireproof material, either in the form of bricks and tiles, or even to apply this material to other purposes, such as steps for staircases, for floors, &c.? For staircases, could not steps and risers be formed in one, as the stone staircases; also to form floors of tiles made about 1 ft. 6 in. square about 3 in. thick, laid in mortar, and grooved over to fill all the joints, and laid on brick arches, also made of a fireproof material.

Again, why should not warehouse doors be faced with thin fireproof tiles in a similar manner as those to the outside of buildings? In fact, if a fireproof material of such as I have endeavoured to describe, it might prove a boon, either in this country or elsewhere, as I believe it has now been sufficiently decided that a material in the form of brick is the most secure of any. All shafts to warehouses ought to be rendered fireproof, as also all accidents from gas-pipes being used in brick drains, &c.

If a company were formed for such a purpose it might be a safe speculation. W. B. W.

THE SHAMELESS ADVERTISEMENT FROM CROWLE.

STR.—This reply has been sent to the kind invitation of the above Board, published in the *Builder* last Saturday:—

"To the Clerk to the Crowle School Board. Having noticed your Board's advertisement in the *Builder*, we think it must have escaped the memory of its members that architects are obliged to live as gentlemen? Would it not be well for your Board and other Boards and institutions whose ideas of fairness are defective, to purchase general instructions for the conducting of architectural competitions issued by the Royal Institute of British Architects, cost 3d. Is the 5s. in the advertisement a misprint? Should it not have been 50s.? If it is not the case, how can you expect honourable architects to accept your invitation?—We are, &c."

Would not the Institute be doing a charity to such consciences corporations as the above by sending each of them a copy of their general regulations for conducting competitions lately issued? And would not this be a legitimate and most useful way of expending a small portion of their revenue? The labours of the Institute in drawing up these regulations will be lost if they do not find some means of placing them in the hands of those who have to organise competitions.

ONCE BITTEN TWICE SHY.

FIRE AT THE CITY FLOUR MILLS.

STR.—At page 930 of last week's *Builder*, a modification of "Dennett's" floors is suggested for fireproof purposes. In the gypsum districts, the coarse rock, in which sand predominates, is roasted, roughly pulverized, and used for bed-room floors. It has this quality, that after being in use it can be broken up, burnt again, mixed with a little new, and re-used.

The "Dennett's" arch is composed of concrete, in which the above floor plaster is the binding material, and from its cohesiveness and cheapness, it is well adapted for many of the purposes for which it is used; but in the event of fire it would calcine with the heat, and burst on the application of water.

It is probable that slag, if cast in proper shapes, would make a fireproof material for steps and landings. Y.

DESTRUCTION OF MILLS BY FIRE.

The great fires in Boston, and Thames-street, London, have been of such magnitude that they have overshadowed those of lesser extent in the public prints. It may, however, not be amiss to chronicle in the columns of the *Builder* some of these minor events, all of which, with one exception, have taken place in Lancashire and Yorkshire during the past four weeks ending November 23rd, 1872, and all of them cotton or woollen mills.

October 26th, Waterloo Cotton Mills, Bolton; 30,000. Higson & Sharple's Cotton Mills, Blackburn; 6,000. November 14th, Dean's Cotton Mills, Swinton, near Manchester; 10,000. November 15th, Parker's Cotton Mills, Preston; 16,000. November 18th, Whatley's Cotton Mill, Huddersfield; 7,000. November 19th, Hadden & Sons' Woollen Mill, Aberdeen, 18,000. November 22nd, Bury & Heap's Cotton Mill; 10,000. November 23rd, Gomerall, Brothers', Woollen Mills, Dewsbury; 15,000.

Now, here we have an aggregate of eight mills burnt down within four weeks, and a total loss of property equal to 112,000*l.* and thousands of workpeople rendered idle, all of which, or nearly all, I boldly assert, might have been prevented by a proper construction of buildings; for in large and lofty mills, costing many thousands of pounds each, we have, as in cottage-houses, a vast deal of "jerry" work. The plan of nearly every cotton-mill is a rectangle, the length of which is some multiple of 10 ft. 6 in., that being the width required to run a pair of mules, and is called in reports, "a window." The width is various, but generally a multiple of 20 ft. or 21 ft. The walls are of brick or stone. The floors are invariably supported on cast-iron

hollow pillars, resting one on another, with sockets at their junction half an inch deep only, so that a single height of column, complete, resembles a huge fishing-rod. At the height of the several floors, from these project brackets to carry pine beams 16 in. by 8 in., into which are notched 7-in. by 2½-in. joists of spruce, and the floor is laid on these in two thicknesses, ¾ in. and ¾ in., overlapping so as to break joints. These are celled between the beams underneath. The heat at which the rooms in these mills is kept ranges from 80° to 100° Fahr., so that in a very short time after the mill is started running the wood becomes as dry as tinder. Add to this the continual droppings of oil from the machinery, so that in a year or two the floors are saturated, and as these are covered with light cotton at all times, it is evident you only want the lightest spark to inflame them, and when once alight, it is impossible to extinguish the flames by any known means. The roofs are mostly compounded, 7 in. by 2 in. or 6 in. by 1½ in., 20 ft. span, celled on joists underneath, and covered with slates; the windows, 2-in. or 2½-in. wooden sashes, or "sheets," framed, and with a ventilator; the staircase, usually in a tower outside; the steps, of stone, on cast-iron risers; the hoist, or lift, sometimes on stairs, sometimes in the building itself, forming an admirable chimney for the flames from one room to another.

Now, sir, I beg to submit that this construction ought not to be permitted; that the Legislature should compel mill-owners,—who have so many lives cooped up between four walls,—to use the very best materials and construction possible to prevent disaster. The difference in the rate of insurance ought to be enough to induce them to adopt such solid construction as brick or cement-concrete, instead of the wood for flooring, the said difference being nearly one-half. But the extra capital required in the first instance mostly determines the adoption of the lowest-priced construction, and nothing short of legislative power will, I believe, ever alter it.

E. G.

SLATED ROOFS ON PUBLIC BUILDINGS.

Your correspondents "N." and "J. S." have expressed opinions upon the use of slate with reference to its employment at Worcester Cathedral, but have gone into no detail upon the subject of the colour of slate, or of different kinds of slate. May I be permitted space for a remark or two on this subject?

Firstly, I would submit to the common sense of your readers, that the following is a fair description of much of the slate, of excellent quality as material, that is now to be found freshly prepared for use, namely;—hue, dark as a thunder-cloud; surface, as monotonous as a painted door that is waiting to be grained.

A slated roof need not necessarily be obnoxious to this description. I have especially in my mind's eye, in contrast to it, the roof of the old British Museum (Montague House). The hue in that case might be described as the soft grey of a sheet of Academy paper, on which, as with black chalk, the outlines of hips, ridges, and domes, were marked by the lead flashings. The monotony of surface seemed less, too, than in a modern roof; possibly through the edges of the slates being weather-worn.

Respecting lead roof-coverings: the soft pearly hue that we prize in an old country mansion or cathedral seems so much due to time and weather, that it could not be matched by giving an order to a painter for a new lead roof. Even the dome of St. Paul's Cathedral has not thoroughly acquired it; probably the hindrances may be London smoke as well as insufficient age.

G. M.

CHURCH-BUILDING NEWS.

Willesden.—The parish church of St. Mary, Willesden, Middlesex, was reopened on October 20th, after being enlarged so as to contain 287 additional sittings on the ground floor. A western children's gallery has been removed. The church, as it existed previously to the enlargement, consisted of a chancel, a nave, and a south aisle, terminating in a chancel-aisle at its east end, and in a tower at its west end, a south porch, and a modern vestry. The recent works, executed by Mr. W. Shearburn, of Dorking, consist of a north aisle, with an entrance and porch at its east end; a transept, containing the children's seats and an organ-loft; and a vestry, with stoker's room beneath it. The tower has, by the removal of the organ to the transept, been ren-

dered available as a baptistery, thus rescuing from concealment the ancient font. In taking down the north wall of the nave, the bases of three columns were found *in situ*, and stones of the shafts and capitals mixed up with what proved to be modern masonry and brickwork. These columns correspond exactly in detail with the Early English arcade opposite. The extension of the nave has necessitated an arcade of five arches opening into the new north aisle, but the recent works produce rather a restoration than an alteration of the old church. A sufficient number of sound stones was found to rebuild one column as a memorial of the original fabric, but, beyond this, care has been taken to make the detail of the new work quite distinct from the old. The other discoveries in the north wall include two heads of narrow Norman windows, the capital of a Norman nook-shaft, the remains of doors and windows of the Decorated and Perpendicular periods, and a piscina, with a very narrow shelf above it. This has been rebuilt in the south chancel wall, and sedilia have been formed in the adjoining window-sill. A reredos, with open tracery, through which the east window is seen, and a sacarium pavement of tiles and mosaic, have been recently given; and the whole has been carried out from the designs and under the superintendence of Mr. Edward J. Tarver, architect.

East Hardwick.—The foundation stone of St. Stephen's Church, East Hardwick, has been laid with full Masonic honours by the Marquis of Ripon, K.G., Grand Master of all England, and Provincial Grand Master of West Yorkshire, assisted by the Deputy Provincial G.M. of West Yorkshire, Brother Bentley Shaw, J.P., D.L., P.G.D. of England, and officers and brethren of the Provincial Grand Lodge. The old church, which is being superseded by the building at present in course of erection, was founded in 1653 by Stephen Cawood, yeoman, and, besides being somewhat decayed, is now found to be too small. The new edifice, which is being built according to plans furnished by Mr. Davis, architect, Leeds, will accommodate 230 persons. It is cruciform in plan, and the style of architecture is Early English. The chancel is to be 28 ft. in length and 18 ft. wide; the nave, 52 ft. in length and 21 ft. wide; and the cross transept, 58 ft. in length and 13 ft. wide. The estimated cost of erection is 2,100*l.*, of which 1,700*l.* are already subscribed.

Thornby.—The old church here has been taken down, and a new structure erected on the site. All the architectural features of the old building have been retained. A new chancel has been added in the place of the one destroyed in the last century. The tower has been rebuilt, principally with the stone used in the former one, and has within it a peal of bells. The new roofs are of oak, and covered with lead. The work has been carried out by Mr. Firm, of Leicester, under the direction of Messrs. Slator & Carpenter, the architects.

Matson.—The church at Matson has been reopened for divine service. The old pews have been cleared away; new benches, and a new pulpit and reading-desk of pitch pine, and a new font, have been provided; a warming apparatus, supplied by Messrs. J. M. Butt & Co., has been placed in the church, and a new floor of ornamental tiles laid. The renovation has been carried out, under the direction of Mr. J. E. Jones, architect, by Mr. W. Fream, jun., of Gloucester, builder.

Malvern.—It has been decided to enlarge Trinity Church by pulling down the north and south aisles, and reconstructing them so as to give additional accommodation of 104 sittings in the north, and 96 in the south aisles. In connexion with the north aisle a new vestry will be constructed, and the organ-chamber enlarged. The present north doorway will be removed and inserted in the west end. The alterations will be carried out in accordance with drawings prepared by Mr. Henry Haddon, of Malvern, architect.

Ratley.—The parish church of Ratley having for some time been undergoing restoration, and the work being now all but completed, it has been re-opened by the Bishop of Worcester. The church had long been in a very dilapidated state, and restoration having been resolved upon, the Earl of Jersey, who is an extensive landowner in the parish, gave 100*l.* towards it, and the Rev. A. Benefield, the vicar of Ratley, and family another 100*l.* The chancel was restored by Mr. Jones, farmer, at a cost of 220*l.* The total cost of the restoration was 600*l.* The restoration

consists of a new east window, which has taken the place of one in the Perpendicular style. The nave, aisle, and chancel, have been re-seated with open benches of pitch pine and yellow deal. The whole of the works have been carried out by Mr. Charles Claridge, of Banbury, builder.

Liverpool.—St. John's parochial church, Old Haymarket, which was erected in 1761, has been closed for alterations and improvements. The whole of the old high-backed seats have been swept out of the body of the church, and new pitch-pine open benches substituted. The three-decker has been dismantled, and a simple oak pulpit stands in the centre of the new chancel platform. The organ has been removed to the south-east gallery, and the old organ-loft removed from over the chancel, whereby the east window is quite exposed and the church made lighter. The chancel has been extended by the introduction of a platform, on which choir-seats and a reading-desk and lectern find places. This platform has been laid with encaustic tiles. The lighting of the church has been considerably improved.—The corner-stone of a new church in the district of St. Thomas, Toxteth Park, has been laid. The new edifice will be dedicated to St. Philemon. The site is in Windsor-street, near Northumberland-street and Dorrit-street, and is in the midst of a rapidly-increasing neighbourhood. The plans for the new building have been prepared by Messrs. Culsaw & Sumners, of Liverpool, architects. The church will consist of a nave, chancel, transept, and one side-aisle, which will be separated from the nave by five arches, supported by red stone columns, with carved caps and moulded bases. Adjoining the chancel on the west side will be a spacious organ-chamber, and on the opposite side a convenient vestry, having a private entrance from Dorrit-street. There will be a small gallery constructed to seat about 150 persons, and access to the gallery will be gained by a special staircase, leading from the main porch in Northumberland-street. In the basement occupying the whole area beneath the church floor sufficient provision will be made for a school-room, so that at any future time such an addition, if required, can be made at comparatively little expense. The architectural features of the church will be plain Geometrical Gothic, the architects having been obliged to turn their principal attention to internal accommodation. The walls are to be of brick, relieved by stone dressings and window tracery. In the gable of the principal elevation, which will face Northumberland-street, there will be a tracery window, and over that a bell gable. The church, when completed, will be capable of accommodating 800 persons comfortably, exclusive of the choir; and the total cost of the building, including the provision for a school-room, will be about 5,000l. Mr. John Corkhill, of Liverpool, is the sole contractor.

Kildermister.—The old parish church of St. Mary, Kildermister, has been re-opened, after undergoing some alterations and improvements. Formerly the organ was placed in a modern organ-loft under the tower, and two huge galleries encumbered the north and south arches, extending the whole length of the nave. Owing to bad construction they pressed against the outwalls, affecting their stability, and disturbing the equilibrium of the nave pillars. These galleries also prevented the decorated windows from being seen, and obstructed the light. All these encumbrances have now been removed; a spacious organ-chamber has been erected; all the galleries have been taken down; a new arrangement of the choir-seats has been effected; and the church has been adorned by a new stone pulpit and font. The work was directed by Mr. W. J. Hopkins, diocesan architect, of Worcester. The new organ-chamber is erected at the east end of the north aisle, and harmonises in style with the existing buildings, most of the details being precisely similar in character. The chamber opens into the chancel by means of a lofty arch, extending, one way, eastward from the chancel arch, and another arch is introduced at the east end of the north aisle, extending its whole width; an arched oak-boarded wagon-roof with moulded ribs forming the ceiling of the chamber. The lofty tower arches are now exposed to view, the spaciousness of the church is rendered apparent, and the traceried windows of the side aisles once more light up the interior of the church. The builders employed were Messrs. Binman & Son. The work of restoring different parts of the church has been going on for the last quarter of a century, and there still remains more to be done. A new organ is in the hands of Messrs. Hill & Smith, of London.

The exterior of the tower is in a sad state of decay, and this and other parts of the edifice still require to be seen to. The cost of the present restoration, including the purchase of new organ, is about 2,000l., of which a considerable portion has yet to be raised.

Burrington.—The parish church has been re-opened after a restoration. The work has been superintended by Mr. F. R. Kempson, architect. The chancel floor has been raised 1 ft. above that of the nave, and laid with Godwin's encaustic tiles; the reredos being covered with similar tiles, only of superior pattern. Much of the stonework and ancient carving, thickly coated with plaster, has been laid bare and well pointed. The lab and plaster ceiling of the nave and chancel has been replaced by a vaulted panel roof in pitch pine, intersected throughout by bold ribs in red deal. High-backed and closed pews have been converted into low, open seats; the choir-stalls in the chancel being entirely new. A light altar-rail in oak, with ornamental iron standards, decorated in blue and gold, spanning the entire width of the chancel, replaces an old balustrade. In progress of the works it was found necessary to rebuild the south wall, in which three new windows, presented by friends, have been erected in place of the large round-headed, modern windows in iron frames. A new chancel arch has been erected. Over this are the new gable, coping stones, and final cross, where none existed before. The slates which covered the roof have given way to Breckley tiles. The stonework of the west window is entirely new, and that of the east window nearly so, being in each case reproductions of the old designs. A screen, in oak, spans the lower portion of the tower arch, and does not interfere with a full and open view from east to west. The last window in the chancel is filled with stained glass, by Messrs. Ward & Hughes, as a memorial gift. The remnants of ancient glass found in the tracery of the east window have been inserted, with modern glass to match, in a small window on the south side. The two Norman windows on the north side of the chancel have been filled with stained-glass figures, of St. Philip and James, to whom the church is dedicated. These windows have been executed by Messrs. Ward & Hughes. An old Norman tomb, with recumbent effigy, has been carefully restored at the cost of the contractors, who have also fitted the west window with Powell's coloured quarry glass. The pulpit, of carved Bath stone, is a memorial gift. The entire cost somewhat exceeds 1,000l. The contractors were Messrs. Collins & Tullis, of Tewkesbury.

DISSENTING CHURCH-BUILDING NEWS.

Chapel-on-the-Frith.—The memorial stones, four in number, of a new Wesleyan Methodist Chapel, have been laid at Chapel-on-the-Frith, near Stockport. The building, which will be of the Gothic character, will be erected upon the site of the old chapel, which was erected in 1780. The estimated cost, exclusive of material from the old building, will be about 1,800l. or 2,000l., of which sum about 1,023l. have already been realised by subscriptions, &c. The new chapel will accommodate about 500 persons.

Northampton.—The memorial stones of the new Wesleyan Reform Chapel, Wellingborough-road, have been laid. The site of the new edifice is the same as the old one which it replaces, and faces the road. The new chapel will be set back about 10 ft. from the road, and will then occupy an area about double the size of the old one. The school-room will be underground, and will be reached by a flight of steps, the descent being 7 ft. 6 in. Two class-rooms are to be attached to the school-room. The chapel, the front elevation of which is 26 ft., will be entered by a flight of steps, the ascent being 1 ft. 6 in. The entrance is to be by two folding-doors, and the two folding-doors will communicate with a small porch, and the porch with two small aisles, right and left. There are to be three series of seats, and these will be open and of plain deal. Over the entrance-porch there will be a small gallery, six seats deep. There will be accommodation for about 350 persons. The chapel will be lighted with windows back and front, as it will be impossible to get light from the sides of the building, it being erected close to houses on either side. To relieve the monotony of the side walls, pilasters, with ornamental capitals, will run up either side. The ceiling will be in panels. At night the place is to be lighted by a gas star suspended from the ceiling, and also

with gas brackets on the side walls. The windows, the framework of which will be of iron, are circular-headed, with stone dressings. The pulpit is to have a sort of canopy, and beneath it a platform will be constructed, intended to be used for the baritone and choir. Over the pulpit, between the two south windows, will be a small circular window for the purposes of light and ventilation. The architect is Mr. Ingman, of this town; and the builder is Mr. Richard Smith. The cost is estimated at about 700l. The chapel is to have iron palisades in front. It is proposed to warm the edifice by means of a gas apparatus.

Newbury.—The Congregational Chapel here has been re-opened, after having been altered and improved, on plans by Mr. W. H. Woodman, of Reading, architect. The first attention of the architect was given to strengthening the walls, and, as far as possible, securing the defective foundations. The next step was totally to alter the shape and proportion of the interior of the building by throwing into it the old lobbies, erecting new ones outside the east end, and a large and deeply-recessed apse terminating in a semicircle at the west end; replacing the floor at a lower level, and reconstructing the galleries much nearer the floor, and of about half the original size. The entrance to the chapel is now through three lobbies, the gallery staircases being approached from the two end ones; folding-doors across the lobbies are arranged to separate the congregation from the body and staircases during egress, though both use the same lobbies for ingress; glass doors communicate with the ground-floor, which inclines about 18 in. from the entrance to the pulpit. The seating is arranged in three blocks and two aisles; the seats are all open, are low with sloping backs, have book-boards, and are to have hassocks. The communion-pew is arranged at the junction of the apse with the west end; is segmental in form, raised above the floor; and is inclosed with a cast-iron railing. The apse is the principal architectural feature of the interior. It has a domed roof, divided into panels by deeply-moulded ribs, which spring from carved trusses at a considerable elevation from the floor. The opening to the apse from the chapel is spanned by a moulded and panelled arch, supported on six carved and gilt brackets. The walls are also panelled, and in four of the panels there are circular windows, filled in with deep stained glass in simple geometrical patterns, and in the apex of the dome there is a circular lantern-light, glazed with ground and ruby-tinted glass. The organ is an entirely new instrument, built by Speechly & Ingram, of London. The system of ventilation which, upon the recommendation of the architect, has been adopted, is the same he has applied to many buildings in the north, and known as "Watson's syphon ventilator," made by Hill & Hey, of Halifax. Two have been considered necessary. Each has a long square shaft from the top of the roof to the ceiling inside, divided diagonally by a partition into two parts; fresh air descends one part, foul air ascends the other. Flaps to regulate the currents are attached just above the ceiling, and are opened or closed from the galleries. The heating apparatus, which has hitherto proved satisfactory, has not been altered. The artificial lighting is by two coronas, pendant from the main ceiling, and one from the junction of dome of apse with west wall. There are eight side brackets for the galleries, and ten on the ground-floor for the side aisles. They are all made of wrought iron and brass. The ceiling, which is very large, and was devoid of all ornament, is now filled with eight ornamental centre flowers, and two east-iron ornamental centre flowers, and the two east-iron ornamental gratings under the ventilators. The central flowers are all grouped together and formed into one large central panel by broad bands of colour: the central and important feature being a reproduction of the key-pattern in blue and white colour, the marginal tints being mauve and pink. From the centre panel, advantage has been taken of the segmental form of the ceiling to continue the bands of colour to the side and end walls—dividing the whole ceiling into eleven panels; the cornice which runs round the building has been distempered and tinted. The walls of the chapel are divided into panels, the colour being green, the border between, buff. Strong lines of crimson, and finer of mauve colour, are run round each panel, and an ornamental corner introduced at each angle. The panels of the dome of the apse are tinted pale blue, with gilt stars interspersed, the mouldings of the ribs being relieved with lines of pink

colour. The panels below the dome are pale green, the stiles between them, huff; the mouldings of the panels are French white, the prominent member being gilt, and the inner next the panel, pale pink. The organ-pipes are painted grey and gilt; similar colours are used in the gallery front and pulpit, pink being sparingly introduced in the mouldings. The iron columns and iron railings are all painted charret colour to harmonise with the metal gas-fittings, and they are relieved with ornaments of blue and white, and a few of the mouldings are gilt. All the pewing is painted light leather colour and varnished. Round the walls above the pewing there is a flat board to protect the walls, with an ornamental pattern painted on it. The contracts for plastering, plumbing, painting, glazing, gas-fitting, and smith's work, were taken by Mr. Joseph Hopson, of Newbury. The gas-fittings are of Medival style, and were supplied by Mr. E. Tuck, of Bath. The contract for bricklaying and carpentering was taken by Mr. Salter, of London. The probable total expenditure is not yet known.

Holbeach.—The new Nonconformist Chapel has been opened. The building is in the Romanesque style of architecture, and is divided internally into nave and aisles by two rows of iron columns, supporting semicircular arches. Over the arches is a clearstory, lighted by semi-headed windowing, arranged in couplets. The material for the walling is white Whiteleas brick and Bath stone. The front of the chapel has a gabled centre, containing in its upper stage a three-light semi-headed window, with detached shafts and moulded arches, and in the lower stage five semi-headed windows. The chapel, when the end gallery is added, will seat about 350 persons; and attached to it is a school-room, vestry, and out-buildings. The contract for the building has been executed by Mr. Chappell, of Holbeach. The architect is Mr. Tait, of Leicester.

SCHOOL-BUILDING NEWS.

Bexley (Kent).—The school accommodation in this parish has been increased by voluntary contributions, to obviate the necessity of a School Board. A piece of freehold land has been purchased in Station-road, Bexley Heath, and a new school erected there, for the accommodation of 150 children. In the hamlet of Welling (in Bexley parish) a new school, to accommodate 100 children, has been erected, at the expense of Mr. A. W. Bean, of Welling. The contract for the Bexley Heath Schools was carried out by Messrs. R. & J. Butler, of Bexley Heath; that for school at Welling, by Mr. Ashdown, also of Bexley Heath. The architect in each case is Mr. Joseph Hewitt, of London.

Wakefield.—The new school-rooms which have just been completed by the Wesleyans, at West Parade, have been formally opened. The building is of a plain character, of red brick, with stone dressings, and has been designed to harmonise with the adjoining chapel. The principal entrance, on the ground-floor, faces South Parade, and in entering, on the right, is the large school-room, or lecture-hall, 72 ft. long, 33 ft. wide, and 19 ft. 6 in. high, attached to which is a class or retiring room, 15 ft. by 13 ft. At the south end is fixed the platform, and from the south-west corner a staircase to the basement is placed, by which is reached a room fitted with boiler and other apparatus for tea-making or other purposes. By stairs from the entrance five classrooms are reached, about 14 ft. by 12 ft. average size, and a room 33 ft. by 30 ft. The latter is intended for the ladies' sewing-room and for other meetings. All the rooms are warmed with hot air, supplied by apparatus in the basement, by Blake & Co., of Coventry. The whole of the works have been carried out from the designs and under the supervision of Mr. William Watson, of this town, architect; and the following persons have been the contractors for the various works:—Messrs. George Fawcett, bricklayers and masons; C. F. Pywell, slater; Charles Driven, plasterer; Craven & Lloyd, joiners; William Woodhead, plumber, glazier, and gasfitter; Samuel Kirk, ironworker; and Charles Turner, painter. The cost has been £1,950.

Carleton.—The foundation-stone of a new school at Carleton has been laid by Mrs. Hetherington, of Burlington-place, Carlisle, who gives half an acre of land on which the school is being built, and also defrays the entire expense of the erection. Mr. Joseph Hetherington, of Carlisle, son of Mrs. Hetherington, is the architect; and

Messrs. Baty & Son, of Upperhy, are contractors for the mason work. It is intended also to hold religious services in the new school.

Stratham.—New schools, long needed in this parish, have been opened by the Bishop of Ely. We understand that the cost of the new buildings (including site) is between 1,300*l.* and 1,400*l.*, of which the rector makes up a deficiency of nearly 400*l.*

Rattlesden.—A new school, built by Mr. H. Luff, from plans by Mr. F. Barnes, architect, both of Ipswich, has just been opened at Rattlesden. The contract was 878*l.*, and accommodation is provided for 180 children. In addition to the school there is a residence for a master and mistress.

Great Yarmouth.—The new schools of St. James's, on the Queen's-road, and also the additions to the Priory schools, are now nearly completed. The St. James's schools (including the portion previously built), will accommodate about 500 children; and the total cost, exclusive of the value of the site, will not exceed 1,600*l.* The buildings are plain. They are of Gothic character, having open-timbered roofs, and comprise three large school-rooms, with class-rooms, lobbies, and offices. The additions to the Priory schools comprise new school-room, with lobbies, &c. Accommodation is provided for about 200 children, and the cost will be about 600*l.* These buildings have been carried out at the outlay of about 3*l.* per head. The architect is Mr. J. T. Bottle, of Yarmouth. The contractors for St. James's schools are Messrs. Leggett & Want, and for the Priory, Messrs. Jackson & Want.

VARIANTORUM.

"OUR Mother Church: being Simple Talk on High Topics," by Mrs. Jerome Mercier (Rivingtons), is addressed to girls, and contains much that is good to know, provided it be acquired in the right spirit. The priggish, over-clever young ladies whom such distillations have a tendency to create are the most disagreeable objects in creation. The following definitions will show the tone of the book, and help its sale with the party for whom it is written:—"Gallery, a modern wooden erection for the execution of Tate & Brady, or for increasing the accommodation for 'hearing' without reference to 'worship.'" "Tense—High pews were introduced by the Puritans, after the Reformation, to hide their disobedience to the command to kneel, and to show their disregard of all ideas of 'worship.'" It is right to say that the estimable authoress declines, in a foot-note, the responsibility of the first of these.—A second edition has been published by Messrs. Lockwood of Mr. Warrington Smyth's "Rudimentary Treatise on Coal and Coal-mining,"—an interesting and useful little book.

Miscellaneous.

Archaeological Discovery in Coventry.—In a field at Jeffrey Wood's Cross, workmen employed in digging clay have come upon remains of ancient masonry, about a yard below the surface, which, on being laid bare, were found to consist of a series of twelve arches, built of tile, arranged in pairs, and enclosed within rubble walls of stone, having two thicker arches at the western extremity. The west wall contained openings to a flue. The floor is of concrete, and the arches parabolic, somewhat resembling in elevation half an egg, with the smaller end upwards. They are constructed of tiles, tapering inwards. The thickness of each pair of arches is 7 in. The height of each arch from the floor (interior measurement) is about 2 ft. The height of the exterior wall, measured on the inside is 9 ft. There are no traces of cement having been used, the whole of the joints in the masonry being of clay. The inner surface of the walls and arches has been covered with a thin coating of clay, and it is considered probable that the tiles may have been placed in position in a semi-dried state, and all burnt together. Several archaeologists have no doubt of its having been used as a furnace for some purpose, or part of a warming apparatus for some building formerly existing here. At first sight it bears some resemblance to a Roman hypocaust or sweating-bath.

Institution of Civil Engineers.—On November 26, the paper read was "On the Ah-el-Walk Sugar Factory in Upper Egypt," by Mr. W. Anderson.

Sanitary Report on Salford.—The annual report of the General Health Committee of the borough of Salford to the local Council, for 1872, has been issued in a printed form. It states that the death-ratio for the first nine months of 1872 "has been much lower than it was for the corresponding period in 1871." And from an accompanying table this appears to be so; the weekly average to the end of October, in 1872, being 25.7 per thousand, while in 1871 it was 30.3. The averages for the quarter ending 28th September were very heavy in both years, according to this table; but those of the 1872 quarter ending 28th September do not accord with the Registrar-General's quarterly return of deaths for July, August, and September, 1872. According to this last return, the average death-rate for that quarter was 33.7; whereas, the very highest given in any one week on the local table for the same quarter was 33.7, in the week ending 14th September; and the lowest was 15.8, in the weeks ending 6th and 20th July.

Bad Building in Manchester.—Mr. E. Salomons, as President of the Manchester Society of Architects, points out that during the last five years the Society of which he is the president has made several attempts to induce the Corporation of Manchester to codify the various sections of their Acts of Parliament relating to the regulation of buildings as well as their building-by-laws, and to extend them either by framing additional by-laws or by procuring a satisfactory Building Act. He says,—"Communications have again recently been opened with a view to this end, and we are not without hope that ultimately a set of building regulations may be adopted and enforced by the Corporation which will have the effect of raising the character of the construction adopted in the large run of dwelling-houses, that will impose obstacles to the spread of fire from one property to another, and that will insure a greater amount of safety and facility of egress from places of public entertainment than exists at the present moment."

Manufacture of Oxygen Gas.—The manufacture of oxygen gas on a large scale by the Motay process is an established fact. The process, as we have before described it, consists in heating the manganese of soda in steam; oxygen is discharged, and water absorbed; caustic soda and oxide of manganese being the result. Upon heating this in a current of air, oxygen is taken up, and a manganese of soda reformed, which admits of a repetition of the process. The oxygen is thus being constantly extracted from the atmosphere. In Brussels a manufactory of this oxygen has commenced operations, and is now furnishing a supply of the gas, to aid in increasing the illuminating power of ordinary gas in the Galeric St. Hubert. The gas is compressed into iron cylinders, and thus rendered very portable. It may be used as a remedial agent, by supplying any additional quantity of vital air to the atmosphere of a sick room.

New Fountain at Patna, in Ayrshire.—A new fountain has been opened in Patna, a village about nineteen miles from Ayr, in Scotland. It has been provided by Major Walker, of Liverpool and Warrington. The Duke of Portland permitted the donor to bring a stream of pure water from Patna village to supply it. The fountain consists of a basement of polished grey Aberdeen granite, with two basins, into which the water flows through two metal spouts issuing from lions' heads. Above is a moulded plinth of Yorkshire stone supporting the shaft of the fountain, which is of polished Aberdeen granite. Above the shaft is a carved Gothic capital, with splayed angles surmounted by an open corona in Yorkshire stone, carrying a carved conventional fleur-de-lis. The total height of the fountain is 12 ft. from the basement to the top of the finial. The design was furnished by Mr. Henry H. Vale, of Liverpool, architect.

The Social Science Congress Visit to Norwich.—A meeting of gentlemen of the city of Norwich and county of Norfolk has been held at the Guildhall, under the presidency of the mayor (Sir Samuel Bigwood), to make arrangements for giving a proper reception to the Social Science Congress upon its visit to Norwich in the middle of September, 1873. The Bishop of the Diocese, the sheriff of Norwich, several M.P.s, and other influential gentlemen were present; and a subscription-list was opened, and 260*l.* at once subscribed. Four secretaries, two treasurers, and six committees to form a general committee, were appointed.

Mr. Ruskin.—In a letter to the *Full Mall Gazette* on "gratitude" as between employers and employed, Mr. Ruskin says:—"In all right relations between the employer and employed, each respects the other, because both deserve respect. But the feeling of deference is greater on the part of the person employed, because the person who directs him is (always supposing their relations right) the wiser of the two. Many invaluable facts relating to this matter under existing conditions of large employment may be found in Mr. Helps's 'Life of Mr. Brassy.' By the way, Mr. Editor, is that letter from 'Mater-familias' in the same number really written by a lady, or did you do it yourself? You will not tell, I suppose? All I can say is, if you did it yourself, write a little worse next time; if it is really by a Materfamilias, I wonder whether she has a daughter who would have any sympathy with the follies and amusements of an old gentleman of fifty-three?"

New Gas Company for Buenos Ayres.—According to the *River Plate News*, new gasworks are in progress at Buenos Ayres for the "Mutual Gas Consumers' Company." The excavations were out, the front and left side walls completed, and bricklayers and navvies pushing on as fast as possible. The site for the works is 90 varas front by 200 in depth, and situated in Calle Defensa, exactly opposite Genl. Brown Station, on the Boca line, and will be connected with the river by a tramway for five squares. The coal-store is 300 ft. long, and the gasholders will contain 500,000 cubic feet of gas when full, besides space for another to hold 400,000. The capital of the company is 200,000*l.*, in shares of 10*l.* each, the whole to be raised in Buenos Ayres. A London contractor undertakes the gas manufacture: Mr. C. H. Smith is his engineer.

Death of Mr. Jordan, of Electrotypes Fame.—Mr. C. J. Jordan died on October 5th. His name, like those of Mr. Thomas Spencer, of Liverpool (now of London), and of Professor Jacobi, of St. Petersburg, will be familiar to many in connexion with the invention of electro-metallurgy. Mr. Jordan was buried in Finchley Cemetery. He was from early life a journeyman printer, being last engaged in a large establishment in Red Lion-court, Fleet-street. He was of unambitious and simple habits, and died in poverty, leaving behind him, without the least provision for their support, a wife and three children, while the rent of the house he occupied for thirty years is being raised, and arrears of rent demanded.

Cooking.—A meeting of the Committee of Advice for the class of Cooking to be represented next year in the London International Exhibition, has been held, and it was resolved that cooking for agricultural labourers, artisans, upper and lower middle classes, as well as that most suitable for the army and navy, for paupers and for prisoners, should be represented as far as possible. It was also resolved to communicate with some of the principal makers of kitchen ranges, stoves, and apparatus, with a view of ascertaining whether they will exhibit apparatus in action. Arrangements ought to be made for a series of experiments on the subject.

Covered Sheds or Ventilating Barns.—These buildings save trouble in the field (by the crop being carted earlier than if it were to be placed in the old-fashioned closed barn); they allow corn to dry better than if packed in a stack; and especially they save cost of thatch and thatching. The cost of some such buildings is, it appears, from 8*l.* to 1*l.*, according to material used, for each cubic yard of contents. Thus, says a correspondent of the *Berford Times*, if 30 cubic yards were taken as the bulk from one acre, a shed to accommodate the produce of 100 acres would cost between 100*l.* and 150*l.*

Constant Water Supply in the East of London.—The East London Water Company have informed the Metropolitan Board of Works that, on and after the 25th of March next, they will give consumers, in certain parts of Bethnal-green and Shoreditch, a constant supply of water. Proper fittings, however, must be provided.

The late Mr. Morris, A.R.A.—The Burlington Fine Art Club proposes to form an exhibition of such works of the late Mr. Morris as they may be able to obtain. Owners willing to contribute, should communicate at once with the secretary of the club.

Cassars's Camp at Wimbledon.—The Court of Common Council have resolved, *nem. dis.*, "that it be referred to the joint Coal and Corn and Finance Committee and Board of Commissioners in trust to consider the desirability of preserving Cassars's Camp at Wimbledon as an open space for the recreation and enjoyment of the people, and with directions to place themselves in communication with the proper authorities to ascertain upon what terms and conditions this may be accomplished, reporting to this court from time to time."

Drainage of Oxford.—Men are excavating for sewers in different parts of the city, and an advertisement has been issued announcing that the Oxford Local Board propose to apply to Parliament next session for power to purchase lands for the construction of the main drainage works and the purchase of lands below the village of Ilfley for the purpose of a pumping-station and sewage irrigation in accordance with the recommendations contained in the published report of Mr. Bailey Denton.

Meeting on Behalf of Agricultural Labourers.—A meeting is to be held on the 10th of December, at Exeter Hall, under the chairmanship of the Right Hon. the Lord Mayor, at which several influential persons will attend for the purpose of considering the present deplorable condition of the agricultural labourers in the counties of Somerset and Dorset, having special reference to their wages, the overcrowding of their homes, and their social position generally.

The Vienna Exhibition and French Art. It is said that a project is now under the consideration of some eminent French artists in connexion with the great International Exhibition, to be held next year at Vienna, to attempt an exhibition—separate from the great one,—of all the most remarkable works that have been produced by the French school during the past ten years, in order to set French art before Eastern Europe with all possible *clat*.

Royal Architectural Museum.—It should be noted that the first session of art-workmen's drawing and modelling classes will be opened at this Museum on Monday evening, December 2nd. The payment is but nominal. The second session will commence after Christmas, when a course of practical descriptions of the figure sculpture in the Museum will be given by Mr. J. F. Redfern. Some practical lectures on metal-work will be delivered by Mr. Joseph Peard.

Mr. Rogers, the Carver.—We are glad to hear that her Majesty the Queen has been pleased to approve the *Primo Minister's* recommendation that a grant of 50*l.* per annum be made to Mr. Rogers on the Civil list, in consideration of the influence he has had in reviving the art of wood-carving in this country.

Housing the Pastor.—The *Rock* says that the congregation of Christ Church, Cloughton, have just presented a novel testimonial to the Rev. Dr. Blakey—viz., a parsonage-house, and a sum of 200*l.* to defray the expenses of removal thereto. The house cost 2,090*l.*, the total amount raised being 2,320*l.*

Schools for Paris.—The capital of France is to spend next year 18,000,000 francs on the building of thirty-five elementary schools. "This is the way," says a French paper, "to take a brilliant revenge on an empire that paid its schoolmasters so badly that thousands of schools are actually deprived of masters."

Library for Derby.—Mr. Bass, the senior member for Derby, has made a donation of 5,000*l.* towards the erection of a free library in Derby. Mr. Bass has already given a recreation ground, value upwards of 4,000*l.*, and public swimming-baths to the town within the past year.

Warning.—We are told that Messrs. Shilleto & Shorland, of Manchester, have completed an apparatus capable of being fixed to any grate, by which hot air can be circulated from one fire to a number of rooms; or to those constant sources of draught—the passages and staircases.

The Manchester Abattoirs.—The public abattoirs in Water-street, in this city, erected by the corporation, have been so far completed as to allow the butchers to occupy them. The first beast was slaughtered last week.

TENDERS

For one section of the Weymouth drainage:—	
Stephens.....	£1,895 0 0
Weakley.....	731 0 0
Brown.....	797 0 0

Note.—The responsibility of signed articles, and papers read at public meetings, rests of course with the authors.

Bath and other Building Stones of Best Quality.—**RANDELL, SAUNDERS, & CO. Limited,** Quarrymen and Stone Merchants. List of Prices at the Quarries and Depôts, also Cost of Transit to any part of the United Kingdom furnished on application to Bath Stone Office, Corsham, Wilts.—[ADVT.]

Ashton & Green, Slate, Iron, and Marble Merchants, and Quarry Agents, keep the largest and best selected Stocks of Bangor, Portmadoc, Green Roofing Slates, Slate Slabs, and every description of Slate Goods, Marble and Enamelled Slate Chimney-pieces, Stoves, Ranges, Rainwater Goods, and General Castings. A. & G.'s special Red Ridge Tiles. Drawings and prices upon application. Offices and Show-rooms, 14 and 15, Bury-street, St. Mary-Axe, London, E.C. Agents for sale of Whitland Abbey Green Slates in town and country.—[ADVT.]

TO ARCHITECTS, &c.
WANTED, by a Gentleman who has had seven years' experience as architect and surveyor, including a year at Chicago since the time, a POSITION as ARCHITECTS CLERK. He can get out perspectives, elevations, & colouring same.—Apply, stating salary, &c. to JAMES, Post-Office, General Post-office, E.C.

WANTED, EMPLOYMENT, by a CARPENTER and JOINER. Used to counting-house fittings, dilapidations, and has a good knowledge of plans, specifications, and accounts. Capable of taking charge of a job or a shop.—Address, Z. No. 31, Beborough-place, Finsbury, E.C.

TO CONTRACTORS, BUILDERS, DECORATORS, &c.
WANTED, an ENGAGEMENT, by a competent CLERK, with good references, or to give Temporary Assistance. Aged 34 years. Experienced in measuring up works, taking out quantities, estimating, and accounts.—Address, ALPHA, No. 10, Richmond-street, Hammersmith, W.

WANTED, an ENGAGEMENT, temporary or occasional in town or country, by a first-class QUANTITY TAKER, MEASURER, ESTIMATOR, and DRAUGHTSMAN. Well versed in dilapidations. Twelve years' experience. Highest references. Terms moderate.—Address, SURVEYOR, 94, Langford-road, Haverstock-hill, N.W.

TO ARCHITECTS AND BUILDERS.
WANTED, an ENGAGEMENT, as JUNIOR DRAUGHTSMAN, in an Architect's or Builder's Office. Town or country. Expedition in tracing; neat draughtsmanship; willing to make himself generally useful. First-class references.—Address, ARTHUR SMALL, 113, Shaftesbury-street, Hoxton, N.

TO BUILDERS AND CONTRACTORS.
WANTED, a RE-ENGAGEMENT, by a thoroughly efficient ESTIMATING and MEASURING CLERK.—Address, 976, Office of "The Builder."

TO BUILDERS.
WANTED, a RE-ENGAGEMENT, as GENERAL FOREMAN.—Address, A. B. 3, Hepe Cottage, as Clarendon-road, Hoxney, N.

WANTED, a RE-ENGAGEMENT, as GENERAL or SHOP FOREMAN. Ten years' work that employer. First-class references.—Address, H. B. 2, Bevis-hill, Barnsbury, S.W.

TO BUILDERS AND OTHERS.
WANTED, a RE-ENGAGEMENT, as GENERAL FOREMAN, or to Superintend Repairs, &c. on an estate. Good references.—Address, W. F. 27, Tudor-street, Langton-road, Stockwell, S.W.

TO BUILDERS AND CONTRACTORS.
WANTED, a RE-ENGAGEMENT, as GENERAL FOREMAN of a JOB, just completing his present job. First-class reference from present employer.—Address, No. 83, Office of "The Builder."

TO BUILDERS AND CONTRACTORS.
WANTED, a RE-ENGAGEMENT, as GENERAL OUT-DOOR FOREMAN or a SHOP FOREMAN Carpenter and Joiner by trade. First-class testimonials, with references.—Address, W. D. 23, Bennett's-grove, Queen's-road, Peckham, S.

WANTED, a RE-ENGAGEMENT, as SHOP FOREMAN, JOINER, or to Take Charge of a Job Town or country. Just completed a large job in the country. First-class references.—Address, W. F. No. 12, Norfolk-street, New North-coke, Islington.

TO BUILDERS.
WANTED, a RE-ENGAGEMENT, as WORKING FOREMAN or STAIRCASE HAND, or to Take Charge of a Job. Would do the staircases for the same. Can do hand-painting of any description. Is used to the management of men, and well experienced in London work.—Address, JOHN LEWIS, Finsbury, Kimmerly, near Oswestry, Salop.

WANTED, immediate RE-ENGAGEMENT, by an experienced WORKING FOREMAN of BRICKLAYERS. Well up in setting out all kinds of work. Can take entire management of a job, having had charge of a number of men. Will take piece work, or go abroad. First-class references, &c.—Address, A. B. Post-office, Woodfield-road, Harnway-road.

TO PLUMBERS, GAS FITTERS, &c.
WANTED, a SITUATION, as Improver to the above, for about two years. Age 22. Wages moderate. Address, A. B. care of Mrs. Blackings, Southbridge-place, Croydon.

TO BUILDERS.
WANTED, a SITUATION as OUT-DOOR FOREMAN, GENERAL FOREMAN, or the Management of a Branch Business, Aged 36. Good references.—Address, 960, Office of "The Builder."

TO SMITHS, BUILDERS, AND IRONMONGERS.
WANTED, a SITUATION as FOREMAN, having had experience in all kinds of smith's work, both ornamental and otherwise; painting; ball-bearing; steam, hot water, and bath work; and has held a situation in one of the best firms in London.—Address, A. D. 24, Oxford-street, London, W.

TO ARCHITECTS AND SURVEYORS.
WANTED, by an ASSISTANT EMPLOYMENT, who has had some years' experience. Is a neat draughtsman, and can prepare plans and details from rough sketches. Good references can be given.—Address, B. F. The Priory, Fratton Bridge, Portsmouth.

WANTED, as GENERAL FOREMAN or CLERK of WORKS, a SITUATION. Good testimonials and references. Aged 42. Carpenter and Joiner by trade. Country preferred.—Address, J. H. 3, Portland Cottages, West Bromley.

TO JOINING BUILDERS.
WANTED, by a young Man, a SITUATION. Handy at repairs, and a fair joiner.—Address, J. JOHNS, 35, Brighton-terrace, Brixton, S.W.

TO BUILDERS AND OTHERS.
WANTED, by a young Man, aged 22, a SITUATION, as JUNIOR CLERK, in the office as above; or as Time or Store Keeper. Six years in last situation.—Apply to ALPHA, 18, Clayton-street, Kensington Oval, S.E.

TO BUILDERS, CONTRACTORS, &c.
WANTED, by a young Man, a RE-ENGAGEMENT as CLERK. Efficient, and thoroughly conversant with the various duties and details of a builder's business. Recently had the management of a jobbing business at the West End. Excellent references. Salary moderate. Country not objected to.—Address, 804, Office of "The Builder."

WANTED, by a thorough GRAINER and WRITER, Permanent EMPLOYMENT. Aged 26. Good references. No objection to fill up time in painting.—Address, 934, Office of "The Builder."

WANTED, by a thoroughly experienced MACHINERY SITUATION, in Work involving Machine. General Joiner, &c. Can make cutters and do own repairs if required. Address, A. B. Mr. Newton's St, Ryhope-terrace, Ryhope, Sunderland.

WANTED, by a thoroughly good Plumber and Gasfitter, a SITUATION. Undertakes all kinds of hot-water, pump, bath, work, and plain zinc-work. Would not object to fill up time in painting. Good references. Town or country.—Address, R. P. No. 3, Hobbs-terrace, Five Anchor-yard, High-street, Peckham, Surrey.

TO BUILDERS AND CONTRACTORS.
WANTED, by a thoroughly practical Man, with twenty years' experience, who has successfully carried out extensive works in Town and country, desires a RE-ENGAGEMENT, as GENERAL FOREMAN or AGENT.—Address, 836, Office of "The Builder."

TO PLUMBERS, BUILDERS, &c.
WANTED, by a good PLUMBER and GASFITTER, a SITUATION or JOB, in Town or country. Used to first-class work in building or joining. Would fill up time at other branches. Good references if required.—Address, the PLUMBER, No. 26, Portobello-road, Notting-hill, W.

WANTED, by a first-class JOINER, a SITUATION to WORK JOINERS or CABINET-MAKERS MACHINERY. Has had great experience with various machinery—general joiner, moulding, slinging, planing, hand saw. Good sharpener. Address, J. PERCE, 34, Prince-street, Stamford-street, Lambeth.

TO BRICK MANUFACTURERS AND OTHERS.
WANTED, by an experienced Man, a SITUATION as MANAGER or FOREMAN in a BRICK-FIELD, or in any occupation as superintendent of cut-out labour. First-class references can be given as to character and capability. Address, S. T. Post-office, Hayes, near Uxbridge.

TO PLUMBERS AND BUILDERS.
WANTED, by an experienced young Man, a SITUATION as PLUMBER. Can plan zinc-work, willing to make himself useful in other branches. References if required. Address, FLUMBER, Post-office, Notting-hill-gate, W.

TO DECORATORS AND BUILDERS.
WANTED, by an experienced and practical Man, a SITUATION, as MANAGER or FOREMAN, in a Decorative and Building Office. Address, J. A. B. 37, Carlton-road, Kenilworth-town, N.W.

WANTED, by an experienced PLUMBER, HOT-WATER and GAS FITTER, Constant EMPLOYMENT. To take the entire Charge on a Gentleman's Estate.—Address, A. C. 21, George-street East, Grosvenor, Kent.

TO MASTER PLUMBERS, BUILDERS, AND OTHERS.
WANTED, by the Advertiser, a JOB or CONSTANCY, as PLUMBER or THREE BRANCH HAND, in Town or country. Good reference.—Address, R. C. 25, Overstone-road, Hammersmith.

WANTED, to APPRENTICE a respectable YOUTH CAPABLE of JOINING. Age 15. A weekly rate premium will be given.—Address, X. Y. Z. Easting, near Croydon.

TO CARPENTERS AND BUILDERS.
THE Friends of a YOUTH, aged 17, wish to PLACE him where he can thoroughly LEARN the BUSINESS. He has already been 2½ years at the bench.—Address, H. M. No. 233, Clapham-road, Stockwell, S.W.

TO BUILDERS, &c.
THE Advertiser desires a RE-ENGAGEMENT as CLERK to the above. Used to bookkeeping and accounts, preparing plans, estimating, &c. Has a practical knowledge of the trade. Can give good general assistance. Good references.—Address, H. W. 17, Essex-street, E.C.

SITUATION WANTED, by a young Gentleman, who has served his articles with an Architect and Surveyor in the City, and since been in the country. Good knowledge of drawing, and an excellent draughtsman. Desires a situation of employment. Aged 22. Quick and intelligent, and correct in figures.—Address, G. T. C. care of Mr. Hubbard, 44, Lupus-street, South Brompton.

TO THE PROFESSION GENERALLY, BUSINESSES CONNECTED THEREWITH, &c.
RE-APPOINTMENT WANTED, by a Gentleman of eleven years' experience. Possesses a serviceable acquaintance with the duties of a clerk in a building office, "associated" callings, in addition to good qualifications for business purposes. Any of these pursuits he therefore seeks to engage in, entirely according to requirement.—Address, V. S. care of Mr. Ingram, Newsgate, Gardeners-lane, Parliament-street, S.W.

QUANTITY SURVEYOR and MEASURER, upwards of twenty years' experience, practically acquainted with building, OFFERS ASSISTANCE. Is a most efficient quantity taker and measurer. Specifications prepared. Dispatch and other builders' concerns arranged. Quantities priced. Terms as agreed.—SURVEYOR, 28, Thornton-street, Britton-road, S.

DRAUGHTSMAN and GENERAL ASSISTANT, WANTED, by the Advertiser, a RE-ENGAGEMENT, as above. Town or country. Has been six years in an architect and surveyor's office. Can prepare and finish drawings, in the lead letter, from rough sketches, and drawings, balling, and all other work.—Address, A. 221, Kenilworth-town, N.W.

CLERK of WORKS.—A thoroughly practical and experienced Workman, wishes to take a SITUATION to a RE-ENGAGEMENT.—Address, THOMAS STAFFORD, 41, Wharfedale-street, Lloyd-square, Pentonville, W.C.

CARPENTER wants EMPLOYMENT at a BENCH or JOINING. Well used to all kinds of repairs and alterations. Wages moderate.—Address, J. W. 38, Canal-street, St. George's-road, Camberwell.

TO BUILDERS, STEAM JOINERY MANUFACTURERS, AND SAW MILLS.
AN energetic SHOP FOREMAN and MECHANICAL MANAGER of WOOD-CUTTING MACHINERY is DISENGAGED. Good draughtsman. Aged 31. Excellent references and testimonials.—Address, TEMPO, 105, St. Paul's-road, Remington Park, London.

A YOUTH, aged 19, son of a Builder, wishes for a SITUATION in an architect's or Builder's office, where he would get a thorough knowledge of the building trade. Salary not so much an object.—Apply, J. 12, of Mr. Lawford, Builder, Beccles, Middlesex.

TO CARPENTERS AND BUILDERS.
A YOUNG MAN (aged 23), Carpenter and Joiner, is desirous of getting EMPLOYMENT in the above trade. Wages 6s.—Address, G. L. 7, Drycut-court, Sloane-square, Chelsea, S.W.

TO ARCHITECTS AND SURVEYORS.
AN ARCHITECT and SURVEYOR, of a considerable practical experience, well versed in design, working details, specifications, &c., with high testimonials, desires an ENGAGEMENT on moderate terms.—Address, ARCHITECT, care of Mr. W. 288, Kenilworth-town, N.W.

TO ARCHITECTS AND SURVEYORS.
A SURVEYOR, whose time is partly disengaged, would be glad to give occasional ASSISTANCE.—Address, SURVEYOR, 3, Borough High-street, S.E.

TO ARCHITECTS AND SURVEYORS.
AN ASSISTANT desires an ENGAGEMENT. Has had two years' experience in an eminent Architect's office in London. References in London and Liverpool.—Address, J. D. Home Lea, Waterloo, near Liverpool.

A JUNIOR ASSISTANT desires a RE-ENGAGEMENT. Can prepare working drawings from rough sketches.—Address, 916, Office of "The Builder."

AN ARCHITECTURAL ASSISTANT wishes a RE-ENGAGEMENT. Nearly eight years' experience in the office of an eminent Architect in London. Assists in quantities, and usual office routine. Salary moderate.—Address, 923, Office of "The Builder."

TO BUILDERS, &c.
AN experienced PRACTICAL ASSISTANT is now open to an ENGAGEMENT upon moderate terms. Would not object to an engagement for part of each day. Good estimator, &c.—Address, Z. B. Deacon's, Lendenhall-street, E.C.

AN efficient BUILDER'S CLERK, well versed in Estimating, Measuring, Taking of Quantities, Prime Cost, and Accounts, seeks a RE-ENGAGEMENT. Good references.—Address, A. Y. Z. General Post-office, Brighton.

TO TIMBER MERCHANTS.
A CLERK seeks a SITUATION with an above, having had experience. A moderate salary at commensurate expected.—Address, 911, Office of "The Builder."

A COMPETENT CLERK, ESTIMATOR, and MEASURER (aged 33), having a thorough knowledge of the trade, and well up in the arrangement of projected and completed accounts, desires an ENGAGEMENT. Temporary, partial, or full time not objected to.—Address, A. B. C. 33, Spettisbury-road, Islington, N.

TO BUILDERS OR MASTER PLUMBERS.
A GOOD PLUMBER wishes to meet with a JOB. Good references to a good builder at the West End.—Address, H. H. No. 15, George-street, Fitzroy-square, Marlborough-road, W.

IMPERIAL FIRE INSURANCE COMPANY. Established 1864. No. 1, Old Broad-street, E.C. 4. Capital, £1,000,000. Paid up and invested, 700,000. JAMES HOLLAND, Superintendent.

COUNTY FIRE OFFICE, 50, REGENT-STREET, and 14, CORNHILL, LONDON. The County Fire Office was established in the year 1856, upon the principle that the interests of its Policy-holders and its own should be identical. A system of strict selection and caution has enabled the Directors to return to their Policy-holders a considerable portion of the premiums found to be in excess of the risks. These returns, which originally varied with the profits of the year, are now fixed at the rate of 25 per cent. They are paid out of a fund specially provided for the purpose, and take precedence of the claims of the Shareholders. The insured are exempt from all personal liability.

EXAMPLES OF RETURNS.

Policy No.	Name and Residence of Insured.	Bonus £. s. d.
138,140	W. F. Riley, Esq. Forest Hill, Kent	508 7 0
114,162	W. T. Coppell, Esq. New Broad-street, W.	154 7 6
320,459	His Grace the Duke of Beaufort	96 4 0
31,118	Edward Thornton, Esq. Princes-street, W.	70 15 4
90,219	Sir James J. Hamilton, Bart. Fortman-square, W.	83 9 0
219,245	Messrs. C. J. & C. Conder, Brighton	61 14 0
235,744	Messrs. Hunt & Rooker, New Broad-street, W.	52 10 0
382,981	The Right Hon. Lord Northwick	49 13 6
483,912	Charles Fraser, Esq. Chancery-lane, W.	6 9 0
292,683	John Hillman, Esq. Lewes	42 8 0
212,644	Messrs. Linnett & Son, Hoxham	40 15 0
297,941	The Right Hon. Earl Howe	40 15 0

Prospectuses and full particulars may be obtained upon application to the Agents of the Office in all the principal towns of the United Kingdom, and to the Secretary, No. 69, Regent-street, London, W.

GILT ROOM BORDERING.— £60,000 feet always on stock, from 1d. per foot. Very superior quality. Every description of Picture-frames at the lowest prices. Register at Trade Office.

GEO. REES, 67, DRURY LANE, W.C.

TO UPHOLSTERS, DECORATORS, CARVERS and GILBERS, BUILDERS, &c.— The most extensive and complete assortment of GILT BORDERINGS and MOLDINGS in London always in stock, or made to order from patterns or sections at the shortest notice, at the most reasonable prices.—JOSEPH ROGERS, 10, Broad-street, Bloomsbury, W.C. Established 35 years.

CARTS, LADDERS, BARROWS, &c.— GEORGE ELL & CO., Builders of Carts, Wagons, Trucks, Tractors, &c. Contractors and Builders. Faint LADDERS, BARROWS, TRUCKS, STEPS, SWINGING SCAPFOLD, PULLEY, HAYERS, HAMMER HANDLES, &c. Wheels made by Improved Machinery on the Premises.

Barrows, Hobsins and other carts, intended for exportation, are made by machinery so as to be interchangeable in their parts. Scapfolding, Ladders, Barrows, Trucks, Stepladders, and all ENGLISH TIMBERS, SPOKES, FELLOES, STOCKS, FENCING, &c.

Price Lists on Application.
GEORGE ELL & CO.
 EUSTON WORKS, 395 and 398, EUSTON ROAD, N.W. and BRIDGE WHARF, BISHOP'S ROAD, LONDON, W.

THE BRISTOL WAGON WORKS COMPANY, LIMITED, LAWRENCE HILL, BRISTOL. Beg to call the attention of Local Boards of Health, &c. to their REGISTERED TUMBLER CARTS,

Specialty adapted for the Removal of Slush, Street-sweepings, &c. Prices upon application.

The Builder.

VOL. XXX.—No. 1557.

The Water Supply Question: Manchester and other Corporate Towns.

ATELY we gave an instance,—Sheffield,—in which the water-supply is in the hands of a private company. We add now some cases in which the supply is in the hands of the town authorities. In his report to the Home Office, Dr. Pole says that the Corporation of Manchester were the first to carry out the recommendations of the Health of Towns

Commission,—that the supply of water to towns should be in the hands, not of private commercial companies, but of the public municipal authorities, and that the charge for water should be made as a public rate. At the time the Commission made that recommendation the water-supply to Manchester and Salford was afforded by an old private company, on the intermittent system; but the service being very deficient, and the company being unable to entertain any large scheme of improvement, the corporation bought up the company, and took the matter into their own hands. The works were designed for the corporation by Mr. Bateman. The water is obtained from the head of the river Eiberow, one of the tributaries of the Mersey, and is collected in seven large reservoirs, which have a drainage area of 19,300 acres. The water is brought by gravitation to service-reservoirs near Manchester, from which the town is supplied. The whole of the reservoirs taken together cover an area of 600 acres.

The town mains are not tapped for any purpose other than for hydrants to supply water in case of fire, and the water is always on in them under a pressure sufficient to throw water over any building without the aid of fire-engines. The service-reservoirs are elevated 250 ft., 223 ft., and 145 ft., respectively, above the lowest part of the town, and the whole district supplied is divided into three zones or levels, each of which is served by the reservoir corresponding to its altitude. The house-service pipes are connected with subsidiary or "service-mains," branching out from the arterial mains of the town, and connected with them by sluice-cocks, so that they can be shut off in small separate areas whenever desired, for repairs, or for laying on a new tenement, without interfering with the general supply. These service-mains vary from 4 in. to 3 in. diameter, and are also always charged under pressure.

The water was first introduced from the new works in 1851, and after a short time occupied in adapting the general arrangements to the change, the constant-service system was applied throughout the town. It has ever since remained in operation, except in portions of two

very drouthy years,—1868 and 1870,—when, in consequence of two new reservoirs then in course of construction not being completed, and in order to guard against the possibility of being unable to supply water for domestic consumption, it was determined, during a short period, to restrict the supply, and to shut the water off for some hours in each day.

The Corporation supplied in the year 1870 an average of 14,315,877 gallons per day to 123,371 houses, the estimated population of which was 685,334. These numbers give an average consumption of about 21 gallons per head per day. The trade supplies are large, being estimated at 7 gallons per head per day, leaving 14 gallons for domestic use.

The arrangements for extinguishing fires are very perfect in Manchester, and much saving has been effected in this respect since an ample supply of water has been available. Mr. Pole says that there is a very general impression that where water is constantly laid on under a tolerably high pressure, fire-engines are unnecessary; but this requires considerable qualification. In cases where small quantities only are wanted it is so; but at large fires quantity is the most important thing, and a large quantity can rarely be obtained without so much reducing the pressure in the mains as to leave but comparatively small force available. A single jet may be easily thrown up some 80 ft. or 100 ft., but a single jet would be of little use in a large fire, and when several hose-pipes are put on, the power of projection to any large extent is gone. The fire brigade at Manchester keep engines, both hand and steam, always in readiness. As soon as a fire is heard of a two-horse light cart is despatched, with all possible speed, with hose, jets, and all apparatus for attaching to the hydrants in the streets, and in nearly all cases,—that is, in about 97 out of 100,—this preparation is sufficient to extinguish the fire; but engines are always sent after the hose-carts, to be in readiness in case the fire should prove to be so large that the jet thrown directly from the pipes would be insufficient in quantity to extinguish the fire.

Seeing how largely the population of Manchester had increased, and what had house-fittings were in existence, which were the cause of great waste of water, and over which the Corporation had no sufficient control, they obtained an Act of Parliament in 1860 to enable them to prevent waste, misuser, or undue consumption of water, by themselves prescribing the size, nature, strength, materials, mode of arrangement, and repair of the pipes, valves, cocks, cisterns, water-closets, and other apparatus to be used; and these regulations seem to have been effectual, for, notwithstanding the growing population, it will be seen from the following statement that for five years after they came into force the quantity supplied was not much greater at the end of the five years than at the beginning. The daily average quantity of water supplied,—

In 1855 was	8,078,152 gallons.
In 1860 was	10,907,183 "
In 1865 was	11,156,433 "
In 1870 was	14,315,877 "

Mr. Pole says, "The relations between the authorities supplying water to any town and the plumbers trading in it have a most important influence on the efficiency of any arrangements which it is attempted to carry out for controlling the distribution. The co-operation of these traders will much facilitate such arrangements, while their hostility will render them difficult in an equal degree. It is notorious that, when left without regulation, the water-fittings supplied to the consumers in a town are very indifferent,—often lamentably bad. This arises partly from ignorance or carelessness on the part of the plumbers as to what are the best modes of con-

struction, partly from working too cheaply (to satisfy speculating builders and others who wish to limit the outlay), and partly from a disgraceful desire to make further work by repairs."

The respectable plumbers in Manchester are invited to sign an agreement, binding themselves to conform to the regulations of the corporation, and to execute all work, both as to material and workmanship, in such a manner as the corporation should approve, in consideration of which they should be formally appointed "authorised plumbers." No one is compelled to employ one of these authorised plumbers, but the advantage of doing so is that they, and not the consumers, are the persons held responsible by the corporation for compliance with the regulations.

Taps and stop-cocks are the chief articles to be attended to, water-closets in Manchester not being common in the lower class of houses. Out of 123,000 houses in the district, only about 10,000 contain them. Nevertheless, all valves and fittings to water-closets and baths are included in the regulations. The corporation require all water-fittings to be approved and stamped at their own warehouse before use; and these regulations are really in the interest of the consumer,—or, at least, of the owner of the house,—as well as of the corporation, inasmuch as they compel him to have good work, which will not only ensure the efficiency of his water-supply, but save him from the expense of frequent repairs.

The charges for domestic water-supply in Manchester are made on the principle that was recommended by the Health of Towns Commission, and are as follow:—1. A "public water-rate," to be levied on all property, payable by the owner. 2. A "domestic water-rate," to be levied on all dwelling-houses, payable by the occupier. The amounts levied can be varied by the corporation from time to time. At present the public rate is 3d. in the pound, and the domestic rate 9d. in the pound, estimated on the poor-rate assessment. No extra charge is made for one water-closet in a house; nor for private baths; nor for horses and carriages, unless used for business purposes.

From a "Memorandum on the distribution of water to the town of Leeds," furnished to Mr. Pole for the purposes of his report by the resident engineer and by the superintendent of the works belonging to the corporation, it seems that the average daily supply at Leeds to 260,000 inhabitants is about 6,000,000 gallons, being 23 gallons per head, of which from 4 gallons to 5 gallons are for trade and public purposes, leaving from 18 gallons to 19 gallons for domestic consumption.

All waste-pipes are authorised to be made to discharge either on to the nearest sink or such other suitable place as the officer of the corporation may approve, so that any waste may be visible. The weights of lead service-pipes to be used are to be as follow:—2-in. pipe, 38 lb. per yard; 1½-in., 26 lb.; 1¼-in., 21 lb.; 1-in., 13 lb.; ¾-in., 11 lb.; ½-in., 9 lb.; ¼-in., 7 lb.; and 3/8-in., 6 lb. per yard. No pipe less than ¾ in. diameter is to be used. The taps are to be of the same pattern and quality as those manufactured by Messrs. Guest & Chirnes, and numbered 27 in their list.

The kind of water-closet known in some places as the "pull-down" closet, which consists of a simple pan and trap, and a pipe (commonly made too small) leading down to it from a cistern overhead, is, in Leeds and elsewhere, called a "sanitary" water-closet. Every closet of this kind, and every closet of whatever kind, in houses not exceeding 10l. rental, is to be provided with a double-valve water-waste preventer, having a boot, or division, and having the valves so connected that both cannot be open at the same time.

The charges for water for domestic use are made on the gross rental, and the bulk of the

houses,—that is, those from 4l. to 20l. a year,—are charged at the rate of 5 per cent. on that rental. If the rental does not exceed 4l. a year the charge is 4s. per annum. Above 20l. the rate decreases until a 35l. house is charged 30s.; a 50l. house, 40s.; a 70l. house, 50s.; a 100l. house, 70s.; and above that, 4 per cent. on the rental, up to 250l. a year; above that, 10l., irrespective of rent. One water-closet is charged 5s. 4d. a year extra, and each additional one, 2s. 8d., except that where the rent is not more than 10l. a year the charge for one is 2s. 8d. each house. Horses are charged 5s. each per annum; washing carriages, 5s. for two wheels, and 7s. 6d. for four wheels; cows, 2s. 6d. each per annum. The rates are payable quarterly in advance.

The supply of water to Liverpool in the year 1870, according to Mr. Pole's report to the Home Office in 1871, amounted to 16,334,105 gallons per day, of which about 62 per cent. was derived from the Rivington reservoirs, near Chorley, twenty-five miles from Liverpool, and the remainder was pumped from deep wells sunk into the new red sandstone beneath the town. The population supplied with water in that year was about 625,000, and the above-named quantity gives an average daily supply of 26.1 gallons per head of that population, being divided thus:—

	Per head per diem.
For trade purposes.....	2.6 gallons.
For public purposes.....	2.0 "
For domestic supply.....	21.5 "
	26.1

From these wells was derived the old water-supply before the Rivington works were made, from which source water was brought into the town in 1858. These works consist of seven large reservoirs, which impound water gathered from 10,000 acres of moor and mountain land. The reservoirs contain together about 3,200 millions of gallons, and the top water-level in the lowest of the series is 428 feet above the Old Dock sill at Liverpool. The Act which authorised the Rivington works to be made directed that the corporation should afford from these reservoirs certain quantities of water, amounting on the whole to about 8,000,000 gallons per day, as compensation to mill-owners and others along the line of the impounded streams.

For several reasons, which we cannot now stay to notice, the supply of water from these works was in danger of falling short in 1865, and the old wells were again resorted to, and new ones sunk. In the following year the water-engineer of Liverpool, the late Mr. Thomas Duncan, reported to the corporation on various schemes that had been proposed, and in favour of one that had been proposed many years before by Mr. Robert Rawlinson, the River Dee, below Bala Lake; but having spent so much money on the Rivington works and otherwise, the corporation decided to improve and extend these as far as possible before going elsewhere. This they were doing at the date of Mr. Pole's report.

Previously to the year 1862, the mode of charging for the domestic use of water had been that ordinarily adopted by waterworks companies, that is to say, a per-centage on the rental of those houses to which water was supplied; but in that year the corporation obtained an Act of Parliament authorising them to alter the former mode of charging, and to adopt a different principle.

The following are the charges now in force:— 1. A public rate, called the "water rate," of 6d. in the pound, is levied on all property rated to the poor. 2. Water supplied to shipping is charged at the rate of 7s. 6d. per 1,000 gallons. 3. Water supplied to manufacturers is charged at 9d. per 1,000 gallons. 4. A "domestic water rent" is payable in cases where water is actually supplied. It includes baths and waterclosets, and is variable in amount, being fixed from time to time by the corporation. 5. Water for horses, gardens, &c., is charged for at rates fixed by the corporation. In fixing the amounts of 4 and 5, the corporation adopt such a rate as will make good the deficiency between the annual expenditure and the income derived from the first three sources. The "rent" usually varies from 5d. to 6d. in the pound.

The supply is not constant, being on in the service mains, from which the houses were supplied, only during the daytime, *i.e.*, for about twelve hours, and is shut off from them during the night; the chief mains, however, being always charged.

THE GRAMMAR OF ARCHITECTURE.

BY W. PETTIT GRIFFITH, F.S.A.

"To be rich without profusion, simple without barrenness, is the great aim of an architect."—*Ferrier.*

"The world is still deceived with ornament."

"Thus ornament is but the gilded shore
To a dangerous sea."

"—Plainness moves me more than eloquence."
Merchant of Venice.

It is an important inquiry as to the extent architects are justified in consulting their architectural classics, leaving a new style out of the question, without being denounced as copyists or plagiarists.

Sir W. Chambers accuses our greatest architects with having too much neglected the detail, it being the duty of an architect to attend to the minutest object, as well as to the most considerable. By so doing, he says, a practitioner may distinguish himself from the common herd of those who assume the title of architects. The most masterly disposition, incorrectly executed, can only be considered as a sketch in painting, or as an excellent piece of music performed by country fiddlers.

The study of architecture requires to be carefully and nicely handled, and it must not be overlooked that the mouldings form the very grammar of the art; without them all buildings would be senseless masses.

It is of more importance just now than at any other period, that the proper use of good mouldings should be encouraged, as powerful temptations are offered to force the employment of colour, in lieu of form, upon the architecture of the day. The folly of using soft red bricks is now deplored, and mosaics for external work are now proposed to be thrust upon the public attention.

During the Middle Ages, when people could neither read nor write, the religious teachings conveyed to the people through the medium of painted and stained glass windows, fresco, mural, or other paintings, encaustic tiles, &c., were most instructive; but, at the present day, the more light we receive in our churches the better. By all means preserve the mind-products of former times, but do not reproduce them. They have done their duty well, and deserve respect.

Sacred writ was not always truthfully exhibited, either on canvas, glass, stone or embroidery; it is a question, therefore, in these enlightened days as to the desirability of exactly imitating the old school. How often have the vices, particularly from Venice, been pointed out, of representing Scripture histories, after the most immodest and scandalous manner, without any sanction or authority of truth.

In the Middle Ages the mind was influenced through the eye. In the reformed church the mind is reached by the ear: hence the absurdity of over-decorating our churches.

The streets of London are filled with palaces, crowded into narrow thoroughfares, and not to be viewed without risk of dislocation of neck or loss of hat. The money wasted upon these edifices is to be deplored; as, in most instances, neat elevations, carefully proportioned, with moderate cornices, and suitable sculptures, would be more tasteful and answer all purposes. In many buildings, the mouldings are either clumsy and too large, or insignificantly small, spaces badly distributed, sculptures indifferent, columns ill-proportioned, and tasteless sensational ornaments everywhere.

Many architects exhibit a great desire for over-decoration, forgetting,—

"Beauty, truth, and rarity,
Grace in all simplicity,"
Shakespeare.

A well-distributed ornamentation produces a far better effect than a profusion crammed into confined spaces; and however the multitude may admire the rich confusion, it requires a well-regulated mind, as Horace says, to "prune all ambitious ornaments away," and to appreciate a duly proportioned and decorated production.

The relative surface proportions in which the primary, secondary, and tertiary lines harmonise with each other, have been clearly shown in a "Manna of Colour"; and there would be no difficulty in proving that relative surface proportions, plain and decorative, may be likewise harmoniously distributed, and thereby avoid that over profusion of ornamentation which destroys the appearance of many of our principal buildings. An ordinary intelligent eye can, without difficulty, discern between a good and had façade, for,—

"Beauty itself doth of itself persuade,
The eyes of men without an orator."

Real architecture does not consist of over-decoration, as practised by our Continental neighbours, but of a duly-proportioned edifice having its mouldings well adjusted, and its sculptures well balanced. To an uneducated eye clumsy mouldings appear bold and sensational; to the cultivated mind they are unbearable. Much may be learnt upon this subject by an observant walk through our principal thoroughfares, and the discerning architect will be astonished at the great absence of careful proportion: the projection of the cornices is either too great, so as to half conceal the superincumbent attic, or else too poverty-stricken; the pediments and the trusses to windows and doors too large and over ornamented; columns too tall or stunted, with a ridiculous entasis; and so throughout the compositions.

Errors of this kind are naturally common among civil engineers; their education, requiring a higher and more scientific development than that expected from architects, prevents them from paying attention to the formation of mouldings. This defect on the part of the engineers can be easily remedied by their seeking the services of an architectural tyro, who, though not perfect, still would create more reasonable details than they themselves are capable of producing. We are not bound to servilely copy former mouldings and forms,—

"A just and ample licence, which, if used
With fair discretion, never is relaxed."
Horace.

Every architect is acquainted with the exquisite purity of the architecture of ancient Greece; consequently whenever this style is consulted for future development, the grand point to be observed is to continue the spirit of its authors by following in their footsteps. Roman architecture, on the contrary, was nothing more than a garbled edition of the Greek style, and although the Romans have handed down to us some choice specimens, still it was left for the Palladian school to proportion, arrange, and to adapt their crude works for practical use. The grammar of architecture has been much advanced by the works of Palladio, the latter should be well studied, and not forgotten.

Judges in competition cases ought to demand an inspection of the detailed drawings, as well as the pictorial views, because, however well a building may be planned or designed, if the cornices, mouldings, &c., have not their correct projection and contour, the absence of these properties in them will mar the best proportioned building in the world.

It would be only reasonable, I think, that, when money is voted by Government from the public purse for public buildings, all competitions should be open to the profession. How is talent to be recognised, or architecture advanced, if competitions be limited to a handful of architects, selected without reference to their brethren's opinions of their merits, but merely because they have friends at court, or practise a fashionable style of architecture, generally possessing no other recommendation than eccentricity?

Upwards of thirty years ago, I stated, in *London's Architectural Magazine*,* that "it is well known that, by the officiousness of parties who sometimes have the management of erecting public buildings, the original intentions of the architect are often nearly, and sometimes, quite destroyed, to please the whims and fancies of these directors. Now, if these interferences were made by persons who had acquired some taste for the art, let that taste be ever so small, professional men might benefit by their suggestions. The importance of possessing a knowledge of architecture is, by many persons, never perceived until they are called upon to exercise an opinion on the subject; and yet there is scarcely any one who may not be solicited to join a committee to decide upon the merits of architectural designs for schools or other buildings connected with the parish in which he resides. The deficiency of persons often met upon these committees is pretty well known, and more especially by those architects whose drawings have unfortunately happened to fall into their clutches."

Since the above was penned, a great improvement has been effected: drawings are often publicly exhibited prior to a decision being pronounced, and in the *interim* the press is permitted to give an opinion,—consequently, if an ignorant decision be made, the best competitor may lose the premium, but not the merited honour. So far

* Vol. iii., p. 98.

an improvement in one direction. Curiously enough, as regards the committees, and the public in general, their knowledge of architecture was not advanced one jot. Ask them the difference between a Greek and a Roman capital, or between Early English and Decorated English, and you may be certain of the answer; plans and sections are enigmas to them.

It has been the fashion of recent times to denounce and ridicule precedent,—to repudiate those rules and architectural maxims which have occupied a thousand and more years to perfect. This retrograde movement was aided by men, professors of our art, who, having young men under their educational care, ought to have been more careful in giving vent to their opinions.

It would be well if architects guided the public taste, instead of rendering themselves slaves to it. Sensational architects are selfish persons, satisfied with a little temporary notoriety, and of whom posterity will know nothing. If Palladio, Inigo Jones, Wren, Chambers, and others had belonged to the above class, their well-proportioned and decorated productions, that are so justly admired, would not have afforded us that instruction and educational delight which they now do.

The common sort of builders in this country, observes Sir W. Chambers, are extremely fond of variety in the ornaments of windows, and, indeed, in every part of a building; imagining, probably, that it betrays a harnerness of invention to repeat the same object frequently. These inventive gentlemen would do well to give their attention to some professors of the mechanical arts, who, through exercising their talents on meaner objects, are nevertheless worthy of their imitation. No tailor thinks of employing seven or eight kinds of buttons on the same coat; a cutter will not make ten different sorts of knives for the same set; and if a cabinet-maker be trusted to furnish a room, he seldom introduces more than one sort of chairs. We do not discover, either in the works of antiquity or in those of the great modern architects, any traces of this foolish hankering after variety. The same object is frequently by them repeated a hundred times over; and this is one of the causes of that amazing greatness and that noble simplicity so much to be admired in their productions.

The public taste is easily formed and led,—architects have great power over it. The architecture of a city remarkably indicates the civilisation of its inhabitants: when buildings are seen composed of streaky red brickwork, twisted, ill-proportioned columns, adorned with cabbage-leaves and other trifles, you naturally find the same frivolous taste in all other matters of art. Turn to the musicals, which might, under proper direction, exercise a great influence over the general taste, by providing good, standard music, instead of such miserable episodes as "The Life of a Cadger, or he wants no Work to do"; "Petticoat-lane"; and many other popular songs.

There are certain maxims or canons enunciated for the guidance of correct taste in architecture: if these are founded upon truth, and admitted, then all departures therefrom are bad, and, of course ought to be avoided.

The present Gothic mode of roofing buildings may be compared to the extravagant style of head-dress in the fourteenth century, when it was built up in a couple of cones or spires, which stood so excessively high on each side of the head, that a woman who was but a pigmy without her head-dress, appeared like a colossus upon putting it on. Nature, says Addison, seems to have designed the head as a cupola to the most glorious of her works; and when we load it with such a pile of supernumerary ornaments, we destroy the symmetry of the human figure, and foolishly contrive to call off the eye from great and real beauties, to childish gawgaws, ribbons, and bone-lace.

Our architectural classics are valuable; but I think that more direct practical information is to be obtained from buildings themselves: for instance, take students, and personally point out to them, not the beauties, but the shortcomings, of city architecture, and those in the suburbs,—they will never forget them. I do not mean to say that all the absurdities are the fault of architects. Some people act for themselves. Builders, also, not for them,—engineers, if they can get a chance,—and so forth; nevertheless, the extraordinary blunders committed are such as to cause even a tyro in art to shudder. They occur in even the more important buildings. All these errors might have been avoided simply

by a knowledge of the grammar of architecture. We should not forget that,—

"The master-piece of knowledge is to know
But what is good, from what is good to show."

Reynolds says, that in our inquiry after simplicity, as in many other inquiries of this nature, we can best explain what is right by showing what is wrong; and, indeed, in this case it seems to be absolutely necessary. Simplicity, being only a negative virtue, cannot be described or defined. We must therefore explain its nature, and show the advantage and beauty which is derived from it, by showing the deformity which proceeds from its neglect.

New views are occasionally ventured. Recently "Symmetry from a Gothic Point of View" has been announced. The writer, an architect, speaks of the palace of the Archduke Michael, at St. Petersburg. "It was a purely Classic building, and one of the best modern erections in that style he was aware of. The two wings of the building were, externally, exactly alike; but, on consulting the plan, one wing consisted of a spacious apartment copying nearly the whole of it, while the other comprised a number of small rooms. This was certainly not true symmetry."

When the eye takes in at a glance an external view of a building, if the latter be symmetrical, it pleases the eye,—a building may, however, be unsymmetrical, yet agreeable to the eye, through having its parts picturesquely grouped. But to render the internal arrangements of a plan symmetrical, as suggested above, would be of no value, or even pleasing to the eye, because the eye could not discern all the rooms at one glance. Perhaps the writer proposes that a plan of the building should be hung in the hall, as the eye could not discern the plan at one glance of the building.

Quatremère de Quincy, quoted by Loudon,* says there exists in many plans a sort of mechanical correspondence, which consists in chalking out the arrangement of one side exactly by the other; a merit more imaginary than real, and which is a total loss to the spectator, as it can contribute but little to the effect of the whole.

An architect who copies existing styles is denounced as a mechanical fellow: this is correct, but seriously enough, how few there are who can copy,—the majority produce simply caricatures.

Asserted original attempts are often merely cloaks for ignorance,—there is much to be learnt from the former phases of art, and an architect who has studied the various styles of each country has an excellent opportunity of extending and working in the spirit of the style he selects. In the Greek architecture, the materials for design contrast wonderfully. There are the Parthenon and the Temple at Corinth,—who is to become the Greek Palladio, to reduce the architectural dissimulations to proportion and propriety? Of what value would the Roman remains have been to the profession if they had not been collected, compared, adjusted, and reproduced for practical purposes?

It is surprising how varied the matter which is set forth in a large volume of literature, the result of combination of the twenty-six letters of the alphabet, and the wonderful calculations produced by a few numerals. The same with architecture. The few mouldings of the different styles can be appropriately employed for further development in each style, and produce wonderful variety.

As practice makes perfect, this may hold good in some cases; but, as a rule, to ensure success in producing well-proportioned and harmonious mouldings, I would recommend a careful study and comparison of similar mouldings in the various styles, and then the adoption of forms suitable for the decoration of the building in contemplation.

Regular architecture is not guided by such arbitrary rules as people imagine; the contour of mouldings varies very much. Some architects deem themselves so gifted that, without reference to ancient authors, by taking a blackboard and a piece of chalk they can mark the mouldings off-hand as the works proceed.

There has been much unmeaning and idle talk concerning fine-art architecture, which has been in importance unfairly contrasted with the knowledge required for building, the latter being looked upon as a mere mechanical production, whilst the former has been upheld with a Royal Academic castle-building-in-the-air significance.

The truth is, that building is a science requiring more real headwork than is at the present time devoted to fine-art productions. Drest a cathedral of all its decorations, and you would still possess a scientific giant. I am not an advocate for deteriorating the value of fine-art productions, my object being to direct the attention of young architects to the intrinsic importance of devoting more attention to the science of building. The exterior of nature is lovely; how far more wonderful and scientific is the interior: in the production of the latter a real headwork has been exercised. And how much dependent is the beauty of the exterior upon the interior: ill-proportion your human frame, or a cathedral, or a church, and all the fine-art pleasures in the world will fail to render them beautiful.

Robert Morris, 1734, justly observes in his lectures, that a plain regular front, without dress or ornament, if justly proportioned, will better satisfy the taste of the judicious, and more immediately strike the eye, than all the gray dress and decoration of an ill-proportioned design: this has been confirmed by Cress, who says a building, though entirely devoid of ornament, may be rendered beautiful by the justness of its proportion, and the richest edifice wanting in this never can excite admiration.

We cannot be too anxious in designing our buildings, and in constructing them with the most durable materials. Of course, the air is the menstrum that consumes all materials whatever, till the earth shall be no more, and time itself shall end! But still, if the temples of Greece had been of Bath stone and red bricks, their remains would not have been spared for our contemplation and instruction; if therefore behoves us to create good architecture, and to execute it with the most suitable and lasting materials. Preliminary sketches, rough and vigorous, such as those by Prout, the Rev. L. Petit, and others, are excellent for conveying to the mind the general effect of buildings; but without neat and mechanical precision in drawing, little real architecture can be produced.

Much to the credit of the present age, we are seldom treated with philosophical inquiries into the nature of taste,—papers in which the writers "are continually discoursing of effects instead of developing causes; and after many pretinences, in very pretty language, do fairly set you down just where they first took you up."

The architect has to deal with material substances, to be fashioned into intelligence by his experienced mind. Let any one test his head against a stone column or a brick wall, and he will find the truth of this remark. Let the philosophical man place the hands of a builder or mason a specification of works proposed to be done, and it will be returned with a smile. We all of us know that, when young, if we are called upon to build a church, that without experience, when the cross is put on, or in a classic building a vase, it appears ridiculously small; and we take care afterwards, until we have had experience, to raise in wood the cross or vase to test the proper size for a given height. It will be found that philosophical inquiries generally treat of subjects of which the writers know but little, and their readers nothing.

The painter's ignorance of proportion is well known, particularly when buildings form a prominent feature. This is not to be wondered at when he is taught to be jolly and lively, and to ignore such dry studies. Ruskin says that "proportion was dull, to say the least of it; and he would ask men of genius on the proportionate system upon what achievement of the past would they in their old age look back with satisfaction?" "He thought they might abandon the theory of architecture being in proportionate lines, and find something better upon which to feast their fancy." "If architectural designing led to no pleasant journeys, if it did not excite life and emotion, and passion, it sank into a condition in which those who practised it were neither numerators nor denominators, but mere common fractions."

The principal causes of the differences of opinion among those who criticise in architecture, are owing to their different degrees of knowledge of the principles of the art; for critical taste does not depend upon a superior principle in men, but upon superior knowledge; it is the offspring of learning and a just education, and is always more or less within our power.

In 1734, Morris published lectures on architecture, founded upon harmonic and arithmetical proportion, designed "as an agreeable entertainment for gentlemen;" this sounds anything but dull!

* *Architectural Magazine*, vol. iii., p. 2.

A knowledge of geometry has, before now, led to profitable results. "Aristippus, the Socratic philosopher, shipwrecked on the coast of Rhodes, perceiving some geometrical diagrams thereon, is reported to have exclaimed to his companions, 'Be of good courage; I see marks of civilisation!' and straightway making for the city of Rhodes, he arrived at the Gymnasium, where, disputing on philosophical subjects, he obtained such honours, that he not only provided for himself, but furnished clothing and food to his companions."

There is no doubt that architecture is an art less understood, and worse practised, than any other. An architect is dependent upon an educated eye, perfected by long, laborious study; and does not rely upon sensations, feelings, affections, emotions, and romantic dreams. These we leave to the painter, while the architect rests satisfied to leave his works to the admirers of the beautiful, the grand, and the magnificent. Proportion being based upon, and sanctioned by, Nature's works, will endure for ever; while Venetian Gothic, red brick, Bath stone, and twisted, stunted columns, will decay in their author's lifetime, and form picturesque ruins for Ruskin and his satellites to muse upon, until the public have common sense to reject such unprofitable visions.

Some years ago an architect was ill-esteemed had he not travelled abroad; but bear in mind that at the present time there is more to be learned from the valuable measured works of Stuart and Revett, Taylor and Cressy, Bowman and Crowther, and others, than from any sketches to be obtained; besides which, recollect that your own tailor can visit the Continent with a camera, and vie with you in perspective views.

It will be well for architects to study, and to pay more attention to historical sculptures. Sculptors may occasionally realise living forms somewhat satisfactorily, but whenever they meddle with material form, either in designing pedestals, or other architectural features, they invariably raise a smile; and this is the result of their want of knowledge of proportion, mouldings, and other details.

In our ancient sculptures, historical and floral, the geometrical key-note exercised a great influence over the direction given to the living forms, foliage, and so on.

To those who desire to create beautiful buildings I would suggest that more time be devoted to the Grammar of Architecture: much expression depends upon the nice manipulation of the mouldings; and as in music, so in architecture, rhythm, uniformity, and simplicity are needed for a perfect development.

THE HITCH IN SANITARY REFORM.

It is a matter for serious regret that in the reports of a recent deputation to wait on Mr. Stansfeld on the subject of sanitary reform, the impression should have been given that a professional, rather than a comprehensive, standpoint was selected by the speakers. We are convinced that such was not the intention of the deputation. No intelligent person can either doubt or undervalue the primary importance of medical inspection in sanitary matters. It would be as ignorant to do this as it is to disregard the equal importance of engineering experience. The physicians and medical practitioners of this country would consider themselves extremely affronted if they were called upon by the Administration to inspect, to take up, and to re-lay drains! They would not consider that their knowledge of climatic influence, and of the character of that local climate which, as far as health is concerned, is a question, not of degrees, but of yards, was such as to fit them for dealing with the great question of watershed. They know, far better than it is for us to point out, the true limits of their own beneficent practice and special education. We wish to put the question to them whether, in their natural and proper anxiety that imperfectly-educated men should not be allowed to exercise strictly medical duties, they may not have given to the minister at once a false impression of the real object they have at heart, and an excuse for that persistence in doing nothing into which the Government has unfortunately drifted. When men are hard-pressed with work, or when they are enjoying a temporary rest from such pressure, it is not in human nature to resist taking advantage of any excuse for continued inaction. While the country is watching the Local Government Office

for signs which it does not give; while place after place is asking for inspectors who are not forthcoming; when the terrible typhoid is again selecting the noblest victims, and entering on a winter campaign which the mere passing of the stump end of one Act of Parliament, followed by no definite action, is not likely to check—it is a thousand pities that the minister should have an excuse put into his mouth which is that most fatal of all falsehoods, a half-truth.

If we could reconcile it to our sense of propriety to become the advocates of a class interest, in opposition, or even in priority, to that which is the true interest of the whole community,—if we were to consider it our first duty to "make work" for the architect, the engineer, and the builder,—we could not wish for anything better than the committal of the needed sanitary re-organisation of the country to the care of the medical profession, unaided by the proper skill of constructive science. But such a position would be like that of a physician who should advocate the unchecked sale of drugs of all kinds, poisonous or otherwise, or the free practice of the self-taught practitioner, on the ground that it would increase the activity of disease, and so, ultimately, make more work for the actual man of art. We know, and all practical men know, what comes of the work of the amateur, or of the non-building man, who meddles with bricks and mortar, with drains and pipes. To those whose object it is to "make work," and to draw the largest possible sum, in the long run, from the pocket of the customer, nothing is so welcome as to see him begin to save money (as he expects) by dispensing with specially-trained skill. And if we are to have this all over the country, if sanitary engineering is to be treated as an inferior branch of the art of the apothecary, we know both who ultimately will lose and who will gain, at least in a pecuniary sense.

If, again, instead of taking this purely selfish money-grubbing view, we were to regard the subject under the influence of *esprit de corps*, we might have a lance to break with medical men in an encounter in which numbers would be on their side, and reason and right on our own; for, after all, if the care of sanitary provision is to be single and not double, it is the proper province of the architect and engineer in preference to that of the physician. This statement is proved by one consideration. It is no reflection on the ablest physician to suppose that he is entirely ignorant of the skill and art of the builder. Indeed, if his time has been entirely taken up, as is the case with the most eminent of the profession, with study and with practice, such an ignorance is a necessity. It is in favour of, rather than against, the eminent character of the man. He may pronounce that a certain locality is unhealthy, that ventilation is requisite, or that drainage is requisite; but how this requisite should be supplied he knows no more than the architect knows what drugs to prescribe for a sick man. The physician can indicate the fact that the services of the builder are requisite. In the case of the most eminent physician, he neither can nor will do more.

On the other hand, it is a disgrace to an architect to build an unhealthy house, or not to know how to remove a nuisance. The knowledge of the medical man is in no way superior to his own, if he be fit for his own profession, as to the fact of certain arrangements being unhealthy; but as to the mode of removal of the cause, it is the architect alone who can be the judge. Thus, in the first instance, that of the observation of the evil, the two men are about on a par. In the second part of the story,—the remedy,—it is the latter alone who has anything to say. If only one man is needed, the engineer is that one man.

How is it, then, that men are fond to imagine or to admit a claim on behalf of the medical profession, to take charge of the physical sanitary arrangements of the country? There are two reasons for this error; and, as is often the case with a pair of reasons, one is good and the other bad.

It is the medical man to whom appeal is naturally made, in the first instance, on the outbreak of disease. It is his function to stem that outbreak,—a function often discharged with consummate skill and with great self-devotion. And what is almost the first question put by the skilful physician, when consulted, in nine cases out of ten? It is,—Where does the patient live? Is his disorder the result of poisoned water or of poisoned air? Is it arising from a damp house, or from a damp or ill-drained soil?

Often and thus will it occur that the able medical man then at once touches with a needle the very nucleus of the evil. "You must leave your house. You must quit that alluvial soil. You must seek or you must shun the sea air." Thus, as man naturally clings to him who has superior knowledge (when he wants the fruit of that knowledge), the patient will naturally say,—"Doctor, what must I do? Will a new roof keep my house healthily dry? Do you think that my drains can possibly be pestiferous?" Thus, in spite of himself, is the physician made into a sanitary inspector; and thus, if the proper man be not at hand, for the physician to call in, may be led to attempt special functions which are not his own, and which he knows that he can very ill discharge (or if he does not know it, so much the worse for all parties), as a mere forlorn hope in the rescue of suffering humanity.

This, then, is a good reason why the medical profession should have sensibly drifted into a position that is not their own, and which they can only occupy to their own detriment and to that of the public, with reference to the duties of the sanitary engineer. But we said that there is also a bad reason for the position which this question now assumes to the vulgar eye. It is this. The medical men are much more numerous than the members of the professions connected with building. Their voices are more audible,—the accumulated sound is incalculably louder. We blush to admit that, in the full blaze of the nineteenth century, the ministers of a country like this should base their conduct rather on the loudness and persistence with which a claim is made than on the right and reason of the claim. And yet! we eschew politics,—but can any one doubt that it is this very power of voice and power of numbers that in the press, in society, in Parliamentary debate, has led nine persons out of ten to believe that a doctor is a man naturally learned in water supply and in sewerage?

Let us take an instance as to which the present week, for the first time, has seen the collection of the statistics. What does London pay for her water supply? It is a simple, non-medical, engineering question. The reply is, London pays annual water-rent to the gross amount of more than a million sterling (the actual figures are 1,041,132*l.*). This rent is collected by eight companies, who have actually expended on their works, mains, and other appliances the gross sum of ten millions and an eighth (10,137,710*l.*). To maintain and to manage the system carried out at so large an expense, these eight companies pay more than four hundred thousand pounds per annum (411,965*l.*), being about 40 per cent. of their charges for the water supply. That leaves a return on the capital spent of about 6 per cent., which, considering the precarious nature of the property, and the depreciation and danger to which it is exposed, cannot be considered exorbitant. It is not such as should induce any very prudent man to seek to enter into competition with existing companies. The respective rates of profits of these companies differ among themselves, the Kent Company, for example, spending 22,000*l.* out of an income of 62,000*l.*, a little more than 30 per cent.; and the West Middlesex, spending 66,000*l.* out of an income of 116,000*l.*, or a little over 50 per cent.; but the average returns are the safest guide for our present purpose.

Now, the quality, the quantity, the frequency, and the level of this supply are subjects of extreme sanitary importance. Analysis of the water, which is now regularly conducted, is a matter, not of medicine, but of chemistry. It is the special duty of specially-educated men, the most eminent of whom have no connexion with therapeutics. Out of the four points requiring attention, then, there is only one into which the medical man is likely to be specially qualified to enter; and even this is out of his proper province. He may be an analytical chemist, as an engineer may be, or he may not. He will be none the worse fitted for his proper curative duties in the latter case; and, whatever be his chemical knowledge and skill, he will have recourse to an expert for analysis, if he have any patients worth mentioning on his hands. The other three questions are simple matters of engineering, controlled (as the first is also) by financial considerations. No one who remembers the great complaint made not long ago by a large district as to the extreme deficiency of the water-supply can doubt that this great engineering question will have to be resolutely tackled before very long. London is paying six shillings a head for water. The quantity demanded is daily

increasing. The quantity supplied is, in some instances, such as to be unfavourable to health. A good deal has to be done in the matter, and that by some authority, whether administrative or Parliamentary, that can grasp all the facts, and deal with all the interests concerned. It is a question eminently concerning the wise administration of sanitary law, but it is an engineering question, and one on which medical,—as distinguished from chemical,—science has nothing to say beyond truisms with which we are all familiar.

If sanitary improvement is to depend, as Mr. Stansfeld implied, on the gradual "rising of the local boards to the height of their new functions," the theory may be admissible; but, mean time, fever and pestilence will have their own way. Nor can we foresee that any real reform will be effected till some scathing misfortune wakens the country to declare that what it demands is, not gradual political self-education, but physical purity: not a policy, but a fact.

We see that the medical profession are alive to the great difficulty, to which we called early attention, of the inability of the country practitioners to hold their own against the parsimony of the local boards without the aid of proper organisation. Mr. Stansfeld recommends courage; but that is but cold comfort. What is required is, that degree of associated authority that organisation alone can give; and, in the absence of which, the best efforts of the best men are but too likely to be hopelessly frittered away.

In a word, the issue which we join with the minister is this. We are agreed as to the presence of a terrible foe, and the necessity of taking measures of resistance. We propose that such resistance should be organised according to our best resources, and that the Minister of Health should dispose of the two arms proper for the encounter. Of these, the medical profession may be regarded as the cavalry,—its first function being that of obtaining intelligence; the engineering profession forms the infantry and artillery, who are to attack and to occupy position after position. But Mr. Stansfeld proposes to make the attack by a cloud of volunteer skirmishers, to whom he refuses uniforms and officers. This is not a mere illustration, but a fair description of the difference between the two systems. Or again, we may say: we look to result; and we propose the best means of attaining that result; not for the sake of those means, but for that of the object. Mr. Stansfeld looks at the means for its own sake, and thinks more of how a reform is to be arranged, so as to educate the people in its progress, than at the end to be effected. In this he counts on one ally who is, in point of fact, his most fatal opponent: we mean Time. Allow decades or centuries to elapse, and country boards may "rise to their functions;" isolated medical men may find courage, and water-shod districts may shape themselves.

We see how the action of Time has already taken place. We can measure the progress made in the Sanitary Reform since the Royal Assent was given to the Bill of last session, but we must take the smallest unit known to English long measure for the purpose. Time, we repeat, is enlisted on the wrong side. The sanitary urgency is one thing, the political outcome another. We hold that sanitary measures should be primarily regulated by sanitary principles. If this one point be admitted, there can be no doubt as to what is requisite. The double organisation of the medical and the engineering staff, each in its own province, and each upon its proper principle of action, is essential to the scientific, which is also the truly practical, treatment of the case. As to the political aspect of the question, there is room for differences of opinion, into which we forbear to enter. We think it ought to be reserved, not on political, but on sanitary grounds. If this is the verdict of the country, there can be no question as to the general form of the organisation which is needed for giving fair play to the public health. We have no doubt that the ultimate course will be, but we should rejoice to see it adopted without further waste of time, of money, and of life, that is more precious than silver.

Borough Surveyorship of Burnley.

There were sixty-five candidates for this appointment, from which the committee invited three gentlemen for further consideration; and, after an interview, Mr. Edward R. S. Escott, of Halifax, was unanimously selected.

SOCIETY OF BRITISH ARTISTS.

The collection of pictures and drawings forming the present winter exhibition, at the Gallery in Suffolk-street, is of just such relative unimportance when compared with the chief annual display of the year, as custom and consent have settled for a proper distinctiveness, and that is as little as possible; even this difference will become more accidental and less incidental presently, and summer's ripeness will bring with it very slight improvements on the fruit of winter's growth so far as picture production is concerned. This may really be advantageous in some cases where maturity and full strength mean but stronger evidence of immaturity and weakness. A very off-hand sweep would skim the cream of what may be found here, not enough to churn into the butter of flattery, and give a thin layer of it to a tibia of the numerous contributors to this collection. Mr. Baxter sends two of his pretty female heads, that serve to recall how very pretty his fancy portraits need to be; his "Bride" (93), and her charming sister, of a yet untried fate, taking "The Stroll" (123), bear some evidence that these agreeable features of a long time's notoriety are not to become wholly things of the past; and, though no present portentous meaning is to be ascribed to "The Wreck" (83) of Mr. A. J. Woolmer, this subtly gorgeous combination of bright hues, rich shadows, sea-nymphs, and other mythic marvels, refreshes a long memory of similar remarkable effects conclusive in establishing Mr. Woolmer an old master beyond the reach of a new man. There was glamour in his art at a period when elaborate copyism was not considered the only food, and food enough for wonder. Now, Mr. W. Bromley's peasant children happily circumscribed in home-scenery, "Blackberry Picking" (6); "Watching the Bird-trap" (92), or "Angling" (186), though no high degree of finish is attained in their representation, are far more likely to secure admiration than anything that appeals to the imagination rather than conviction. This popular taste for simple, natural incidents is, as usual, well provided for, by Mr. T. Roberts's, "Is Baby asleep?" (70); Mr. J. Morgan's "Kiss! Baby" (76); Mr. A. E. Patten's "Hide and Seek" (108); Mr. W. Hensley's "Models criticising" (127), and many another cognate episode. Lovers and love-making are more powerfully than pleasantly illustrated in Mr. V. W. Bromley's reading of "Sir Lancelot and Guinevere" (152); by Mr. E. Radford's kneeling devotee making a rather ambiguous request, from "Waller's Girdle Song" (300),—

"Give me but what this ribbon bound,
Take all the rest the sun goes round;"

and by Mr. E. G. Girardot's "Lover's Gift" (331), amongst other instances; and a little more pleasantly, if not so powerfully, by Mr. J. C. Waite's comely damsel helped in the cogitation of a sweet address by her dicky-bird, "What shall we say?" (27); by Mr. W. Gush's similarly perplexed young woman, "What shall I say?" (57) with no such assistance to the tune of her answer; and Mr. Haynes King gives some insight to the difficulties attending such a matter by the careful study and neat performance shown to be necessary in the production of "Katie's Love-letter" (94). Mr. C. Banerle's child in rapt admiration of some "Flowers" (105) will be thought by many to be the gem of the collection, it is so thoroughly free from pretentiousness, so agreeable in colour, and so solidly painted. A brother and sister "Coming over the Heath" (220) do not fully share the best qualities that characterise the single figure. Mr. J. D. Watson works as easily with oil-colour as he does in any other medium: a weather-worn veteran lighting up for "A Quiet Pipe" (122) is a small but telling proof of how conspicuous real worth may be sometimes. He has also helped Mr. M. Fisher to very good purpose, for the "Jassie" paying "A Friendly Visit," with a laudible of vegetable offerings, to Mr. Fisher's capitially-painted sheep, adds very much to the completeness of one of the best pictures of its kind here; though Mr. T. F. Wainwright's cattle, "By the River-side" (41), is a very admirable work; and Mr. J. S. Noble, jun., may rank amongst the better depicitors of animal life, if his painters grouped during "A Rest at Luncheon-time" (188), and keeping watch over the dead game, be only an ordinary example of his skill. Talking of dogs, Mr. C. S. Lidderdale introduces such a beautifully ngly "pug" to do duty in his version of "Beauty and the Beast" (165), that the fact being a patent one, putting beyond all doubt of a pug's hideousness consti-

tuting its most-precious charm, it is only by the absurdity of the supposition that a suspicion of some confusion for a lady as to which was the best and which was the beauty could exist, is saved; however, the improbability is so monstrous, for the fair sex, as a body, are too ready to acknowledge superiority in any member of it, so long as the delicacy of self-consciousness does not stand in the way, and Mr. Lidderdale's Beauty has claim enough to the denomination by the steps he has taken to elevate her, so that identity, after all, must be easily settled. In any view taken of the subject, it is a very cleverly executed picture.

It is rather difficult to understand whether or not the one reclining lady of the two wooing the invigorating influences of "Sea Breezes" is an invalid, or if she who is upright stands in just as much need of restorative assistance. The wind is blowing its best, and the principal aspiration of the artist, Mr. G. E. Hicks, would appear to be literally involved in illustrating the definition of difference between hair and air. The ladies are handsome and ladylike, allowing for the effects of such rough treatment by the rude element, and the wish that they may be benefited by such a gale as they are facing is "father to the thought" of what a deal of fatigue the labour of combing and brushing will cost them presently!

"Presents from Japan" (13), by Mr. R. J. Gordon, of technical merit; "A Royalist" (102), and "A Puritan" (142), both female figures, by Mr. W. H. Weatherhead; "Happy Recollections" (168), by Mr. S. B. Clarke; "A Fair Critic" (179), very boldly and forcibly painted by Mr. J. Gow; "A Daughter of Italy" (196), by Miss M. Backhouse; "The Glass of Wine" (261), dismissed by an Elizabethan cavalier, very clearly and closely finished by Mr. J. W. Chapman; "Little Miss Prim" (282), by F. H. Potter; and "The Lotus Gatherer" (501), by Mr. J. Bouvier, are some of the most noticeable items selected from scores. The landscapes do not contain amongst them so many attractive works as so numerous an assortment would reasonably promise. Mr. J. Danby's "Boulogne Sands," under a gorgeous sunset sky (3); Mr. G. Cole's "Evening—the Timber-drag" (101), a favourable specimen; "In Chancery" (52), by Mr. C. A. Calthrop; "Port Newydd, on the Usk, South Wales" (58), by Mr. J. Peel; "Twilight" (110), and "On the Thames near Marlow" (235), by Mr. W. Gosling; "A Calm Sunset on the Coast" (143), very pure in colour and truthful in appearance, and "A Study of Moonlight" (254), both remarkable performances by Mr. H. Moore; and "Near Devonport" (150), by Mr. H. T. Dawson, jun.; "A Valley in the Gower Country" (176), by Mr. G. Sant; "Near Hampstead" (272), by Mr. A. Maclean; and "Peatmoor,—Loch Awe in the Distance" (303), by Mr. D. Cameron, deserve exceptional notice.

The water-colour drawings by Mr. E. M. Wimperis of "Welsh River" (430), "A Welsh Moorland" (461), and "An Autumn Afternoon" (577); "Carrying Corn in Kent" (375), by Mr. J. Price; "Porth, Towan, Cornwall" (382), by Mr. L. P. Wood; "Worcester" (383), by Mr. W. H. Jobbins; "Slipper-making near Rosen" (396), by Mr. J. B. Surgery; "On the Trees at Rokeby" (437), by Mr. A. Powell; "Cornfield,—Evening" (464), by Miss M. I. Grant; and "On the Torridge, North Devon" (465), by Mr. H. Sandcock; "Moonrise on the Thames" (589), by Mr. G. S. Walters; "St. Urban, Troyes" (608), by Mr. Wyke Bayliss; "Fittleworth Common" (646), by Mr. T. J. Soper; and "Old Houses at Whitty" (663), by Mr. C. Earle, give a very fair taste of the quality that does not predominate in this department.

ON PROFESSIONAL ESPRIT DE CORPS.*

AND now we come to the most interesting point of the whole inquiry. Turning to our own profession, we are now to inquire how we stand in relation to this very important subject. Let me ask (and in putting the question I am happy to admit that in not a few instances the answer would be what we should wish) does *esprit de corps* do for us anything like what it does for the soldier, the lawyer, and the doctor? And if so fine a profession as ours fails in some respects to command the social position which is generally accorded to the members of some others which I have named, is not our own deficiency in *esprit de corps* at the root of much of that failure? For, after all, we are somewhat

* By Mr. T. Roger Smith. See p. 940, ante.

deficient in this temper of mind, and we do need to cultivate it. Whenever we meet an architect is it a matter of course that he is a man with the interests of our profession at heart, and bearing goodwill to all its members, our respectable selves included? In any case of difference, disagreement, or dispute are we quite certain that no member of our own body can ever be found to uphold against us that which he knows in his heart is unprofessional and unfair? In any emergency or difficulty should we be wise, would it be safe for us, to call in, without a thought about anything beyond his practical experience, any architect who could be named as skilful? Should we be quite secure that our professional brother could not in the nature of things make an attempt to dislodge us, or would not listen to overtures which have for their object to substitute him for ourselves? Do we all expect that in a competition of architects all the perspectives will be fair, and all the estimates honest; that no one will divulge his own motto, or tout for influence, or disparage the drawings of his rivals? Nay, let me come nearer the root of the matter, and ask whether we ourselves feel that beyond our duty to our clients, there is a wider duty which loyalty to our profession and our brethren imposes on us? Are we even more anxious for the sake of the profession than for that of the individual employer that every step in our professional career shall be above suspicion and beyond reproach?

I have already indicated by implication what I should suppose your reply to these questions would be if you made one. I fear we should all of us admit that if things are as bad as they might be, they are yet far enough from being all that they ought to be among us. When a true and noble *esprit de corps* has taken full possession of our whole body; when each practitioner has a proper professional temper and a fitting professional pride, rules for the regulation of practice and the guidance of competitors will almost make themselves. A successful competitor will then receive the congratulations and support of those professional brethren, who in less happy days would, perhaps, have written damaging letters to the *Times*. When that time has fully come, we shall cease to hear complaints such as from time to time reach this Institute; we shall then also probably lose the edifying spectacle of a battle of styles and views, and an advocacy of the architect-working man, such as fill the journals with articles which have for the general public little interest beyond that which household strife always arouses in the bystander.

We meet, if we have any object beyond that of spending a pleasant evening and enjoying an interchange of opinion, to strive to raise the general standard of our profession, and to secure that the conduct of each member of it towards the others shall be equitable and fair. This can be better done by fostering a proper spirit than by attempting to lay down hard and fast lines, and guides within which we are all expected to run. Not that our rules may be superfluous or arbitrary, but they will only work well when men observe them spontaneously and cordially. Let us then see how we are off for professional *esprit de corps*.

Architects are, in the nature of things, so circumstanced as to be deprived of several of the accidental advantages which have been noted as tending to promote professional feelings in other callings. We are, unhappily, but few of us university men; if any of us have come from the same public school, it is a mere chance; we have no Haileybury, or Woolwich, or Sandhurst; we walk no hospitals, we draw in no *atelier*, and we pass no examination to admit us to practice; nor are we trained in colleges; with the exception of those who attend the lectures at King's College or London University, or the classes at the Architectural Association, there are few chances of studying together for us while we are learning our duties. We are generally brought up in offices where one or two, or some other small number of pupils associate with a somewhat larger number of clerks. This method has some great advantages; but the promotion of a large-minded *esprit de corps* is not one of them. We are not much better off when we begin to practise; there is little to throw us together, much to keep us apart. A brother architect in the same neighbourhood, or with the same connexion, especially in a country town, may be a dangerous rival; at any rate, there is a strong temptation to wish him out of the way, and dislike him accordingly, with no circumstances to lead us to overcome it. Then come the jostling

in the race of life, competitions where all but one must be disappointed, and where the successful man will have to run the gauntlet of all those who have failed. Nor do we, like the medical men, often consult one another, or work together: the association of a local architect with a leading one (like the resident and the engineer in chief of a railway) is a thing never so much as thought of. We do not even so uniformly admire the same things or work in the same taste as to be quite free from the temptation to disparage one another's performances. These are some of the unfavourable circumstances in our case, and they result in its being impossible for us to be considered a compact well-defined body of men, a misfortune which is very considerably aggravated by the fact that there is no kind of fence round our practice: any builder, decorator, or auctioneer may call himself architect, if so it pleases him, and though the nucleus of the profession may be very clearly seen, and indeed may be considered as present in this room, its edges are extraordinarily ragged and indefinite.

Notwithstanding such drawbacks as these, there are, however, many circumstances which would render it not unreasonable to expect some *esprit de corps* among us. First and foremost is the fact that although the boundaries of the profession are ill defined, the actual practice of an architect competent to carry on his business with success is a very definite and distinct matter, requires considerable technical knowledge, long experience, and a peculiar association of artistic, mechanical, and business powers, not easily broken in to run in harness together; and thus it comes to pass that an average architect is really very much educated by his work into a member of a special class, having a wide space between him and any other people with whom he mixes. We are, I believe, more closely assimilated than we seem, and, like elements which have a chemical affinity for one another, we only require to be properly brought together, and we unite readily enough. If, as it appears, the link which connects us together, though not very apparent, is very real, there is no doubt that in its nature it is one calculated to stimulate *esprit de corps*. Our profession is interesting enough to rouse a real liking in the minds of most men,—in some a passionate attachment. It is one of which any man may be justly proud. There is something to kindle enthusiasm in the thought of being, in however modest a degree, made one of the community to which belonged those illustrious men who from the east to the west have covered the earth's surface with the only tangible landmarks that a nation's progress can leave behind it. If the great designers, known or unknown, of the noble buildings of the past form a distinguished ancestry of artists with whom it is an honour to be connected, there is in addition much that is delightful both in the study and the exercise of the art. In no profession is there employment for a larger range of powers and faculties, in none is there so enduring a record of faithful, well-executed work; and no profession has so little to do with the griefs and miseries of men's lives. I am not, of course, blind to many drawbacks which exist, nor insensible to the want of fortune to which the architect must submit, or to the annoyances and vexations that beset his practice; but I think, even when difficulties are at their worst, very few of us would be willing to change places with a lawyer, or a doctor, or a statesman, if he could. There is, then, in the nature of the profession itself a strong basis for *esprit de corps* to rest upon. As a matter of fact, there is also a very great tendency in architects to fraternise with one another, when circumstances bring them together. No doubt it is more or less so with men of other professions; but of our own it is easier to speak from experience, and my own experience has always been that whenever I found an architect I found a man who was very ready to become a friend the moment we had established the existence of the professional tie between us.

Much as we decay them, we might have a means of strengthening this friendly feeling, instead of weakening it, in our competitions. These, rightly managed, would do something to draw us together, paradoxical though it may appear to say so. Men who, like harriers, are constantly in the habit of measuring their strength against each other in open fight are much more likely, if the fighting be only fair, to conceive a respect for each other than men who never meet in any way. Once made competitors fair, and you would render competitors friendly,

Perhaps, however, the main source of a healthy *esprit de corps* has lain (as certainly the only chance of giving to it the stimulus and the direction which it requires will be) in the existence of organisations like this Institute, the Architectural Association, and the various local societies. And among other chief reasons for this being the case is the fact that these societies afford a channel for the exercise of that personal influence which seems to have more power than anything else to rouse enthusiasm. Since we have had a professional friend here we have gained immensely in *esprit de corps*; and I firmly believe that what has been gained in this way has been secured, not by the influence of an impersonal entity, consisting of a council and a charter, a subscription-list and a library, but by the personal leadership exercised by a Cockerell, a Tite, a Donaldson, or a Wyatt. Long may the traditions thus happily inaugurated continue to act with constantly-accumulating power on the body at large.

We meet in this room, as the students meet in the room downstairs, on a common footing, and for common objects; and what we do here renders us more jealous of the honour of the profession, more determined to support one another, and more ready to co-operate for common purposes than we could possibly be otherwise.

A most important and gratifying proof of the genuineness of our *esprit de corps* is encountered by every one of us who is engaged in practice in London, as often as he comes into contact with a brother practitioner belonging to this Institute, in matters which involve personal negotiation. You meet, perhaps, on a matter in which the interests you represent and those which your colleague represents are at variance; yet the result will be (at least, my experience has been so, without one exception) that you are met in a spirit of friendly fairness which renders the dispassionate discussion of the business easy and possible. If a solution can be arrived at, it is found; and whether it be or no, the negotiation is conducted as between men who understand each other's circumstances, can enter into each other's difficulties, and are honestly disinterested, so far as may be possible without sacrificing a client's interests, to be of assistance to a professional brother. But though so much has been accomplished among the members of this Institute, there remains, even here, more to be attained; while among those members of our widely-scattered body who do not belong to us, or who seldom mix with us, there is great need of the promotion of *esprit de corps*. It is, of course, impossible to say that this or that definite thing ought to be done; but it is easy to see that an increase in that spirit will follow every accession of dignity, honour, or importance to the profession, however, or the diminution of any drawback or defect in consequence of which it may be disparaged; and notably will correspond to every extension of the link which binds practising architects together. One or two speculations as to what may be practicable in these directions may, perhaps, appropriately close our inquiries.

Every accession of dignity or of importance in public estimation to our profession will, as I have said, increase *esprit de corps*, and on this account, as on many others, it behoves us jealously to watch how we stand with the public, and to secure for the profession all the honour and credit which are its due. Now, without entering at any length upon this subject, I am inclined to doubt whether there is as much harmony between public feeling, as regards matters architectural, and our own as there ought to be. I cannot help the notion that we and the public are somehow a little out of tune. Could we establish a better concord, it would help us. I think, as one simple instance of what I mean, that, building, as we mostly do, for business men, we are habitually too lax in the business part of our undertakings. We look upon extras for example, as an inevitable attendant upon building contracts. We are sufficient forethought liberal preliminary estimates to be passed, and sufficiently large money provisions to be introduced, extras might disappear almost entirely from our practice. It would require a certain amount of energy and determined will, but the result, if it became general, would be to raise the value of architects a hundredfold in the eyes of the commercial world.

Again, men run about with sketches and designs, making themselves and their work cheap, not to mention the mass of competition labour

foolishly thrown away. All this discredits the value of an architect's services. Can we do nothing to stop this? Mr. Briefless does not go round Bedford-row touting for briefs. He might very likely get some if he did, but it would be unprofessional. Can we do nothing on our parts to keep up the public sense that our work is the work of educated, intellectual men, and is not to be had cheap, or for nothing, by enlisting professional *esprit de corps* on our side? Again, there can be no doubt that we do our professional standing a great deal of harm by disparaging one another. There can be no objection to strong things being now and then said in friendly ears; but to blurt them out before the public, when they really only represent half-truths, and the speakers do not mean them to be taken for what they will be supposed to mean by the hearers, is suicidal, and very different from that healthy, discerning criticism which is useful to art. Lastly, might we not really, as a profession, take some opportunity of expressing appreciation of great and difficult works when they have been successfully accomplished? We show a good many tokens of respect to the men whose careers and executed works demand our recognition; could we not, now and then, in some way, show our appreciation of an individual great building, even if it was only by hanging up the drawings of it in this room, and so showing that we take an interest in the undertakings of our colleagues. No civil engineer in charge of an undertaking of importance is willing to give an account of it to the press until he has done so at his Institution. How far this unfortunately is from being the custom among us is abundantly proved by your having to listen to a discussion of an abstract subject at the very beginning of the session, instead of papers on the important public buildings, cathedrals, restorations, and other large undertakings of last year, of which, most unfortunately, no particulars have been, or probably will be, furnished to this Institute. Let it be a matter of course to bring forth every really good building in this room, and you will create a kind of honourable distinction for good architecture, which will help in no small degree to advance what we desire to promote.

There are, however, some abuses which must be done away with, and some defects which must be remedied, ere *esprit de corps* becomes pure and powerful, even where it exists.

To begin at the beginning of all practitioners; the man who has a proper enthusiasm for his profession will be very careful what pupils he takes. There is some probability in the case of each pupil that he may become a practising architect; in every such case there is the intention that he shall be so. Every man who is asked to take a pupil ought to put this question to himself,—“Is this boy, with the education, and the capacity and the surroundings that I find him now to have, likely to prove, after a certain number of years, a cultivated, upright gentleman, with a sound knowledge of his profession, and fit to do it credit by his practice and his character?” In very many cases, an inquiry of this kind, honestly conducted, ought to lead a man to decline an offered pupil; and till we are every one of us prepared to do this and let the premiums go, whenever it is clear to us that the youth is not likely to do well, we cannot be said to have a healthy *esprit de corps*. A further step will be gained when it is a matter of honour with those who are really courted, who have, to use a homely figure, the key of the professional front-door in their keeping, to permit only the entrance of men of good general cultivation. There is no reason why architecture should not have a very large proportion of university men among its practitioners. As a matter of fact you may count the B.A.s and M.A.s on your fingers. And I do not think it too much to ask of those who can obtain high premiums, and are able to pick and choose, that they should stand out for a university education in their intending pupils.

Again, when the pupil is accepted, it is sometimes forgotten that he is a future colleague, and is to be fitted honourably to pursue our profession; and that it is not enough, with this aim in view, to make him trace and copy the specifications. A healthy *esprit de corps* will lead a man to feel that he has a duty to perform to the profession, as well as to the pupil, in this matter. It would also tend to raise the tone of scholarship were the present unfairly short term of pupillage lengthened. When men were apprenticed for seven years there was more useful knowledge communicated to them than now, when they go for three, or even two. I would

suggest that four years ought to be the shortest term of pupillage, and that five years would be a more suitable time; and were this reform carried out we should in five or six years see a marked improvement in the young men advancing towards the threshold of responsible practice.

Again, it seems pretty obvious that we shall not be quite as we ought to be till we have put some sort of fence round ourselves, and made a gate which no one can pass who has not a competent amount of elementary knowledge; and till we have established a tribunal with power to turn out any one who disgracefully misconducts his professional practice. This I find a peculiarity of all the professions where the *esprit de corps* is strong; and nothing is more natural than that it should be so. If the title “architect” is to become a kind of passport to a man from one end of England to the other, as that of barrister now is, there ought at least to be the certainty that an architect's attainments and his character are known not to disgrace that title,—a matter quite distinct from placing any limit to originality, or even eccentricity, of design, or from interfering with the student's licence to restrict himself to one style if he desires to do so.

Lastly, when *esprit de corps* has sufficient power to be real force in our profession, those things which it is understood men ought not to do, will not be done, and such a body as this Institute will not for a moment permit them to be attempted. I hope I am not using too much plainness of speech when I say that this is not so now. It is generally believed, for example, that persons practising as architects, some of whom might possibly be found to be beyond the reach of this Institute, are in the habit of receiving payments in respect of works from the persons towards whom they ought to hold a perfectly independent position; yet probably it would be thought rather unfortunate if a well-authenticated case of this kind were brought forward to be adjudicated upon here. If *esprit de corps* were strong among us, such a malversation would be very rare, and when it was heard of would be hunted down and traced out, and the offenders exposed with zeal, every man feeling that till this were effectually done, he, and the profession he belongs to, were sustaining damage and disgrace. In short, the feeling of its being necessary to keep up the honour of the profession whenever this or any other misconduct tended to tarnish it, would be keener than it now is. Men would, I think, even carry such a feeling into their artistic work, and would make it an additional motive for abstaining from the use of base materials and bad construction, and perhaps even from a style of architecture which they were pledged to oppose, doing these things for the honour of the profession as well as for their own credit. We should then be spared some at least of the sweeping condemnatory remarks which architects of one school have been known to permit themselves to make upon the works of another; and we should possibly even have in some rare instances the phenomenon of an architect admitting that there might be some merit in an architectural work which he did not quite understand, and which he felt unable himself personally to admire.

Here, where, thanks to the wise provision of those who founded this Institute, we are to a large extent sure that each member is a worthy brother practitioner, there exists, as I have tried to show, a very fair amount of *esprit de corps*, and as a result remarkable good-will prevails between the members. Why, then, cannot the whole profession be like one large Institute? Nay, why could not the scheme of the Institute be so enlarged that it should be to our profession what the Colleges of Surgeons and Physicians are to the medical, or the Inns of Court to the legal? If any actual step is to be taken, any one thing to be done in order to bring about an increase in *esprit de corps*, it is here, I believe, that the work must be performed; and it would be a lasting honour to this Institute, and an incalculable benefit to us all, if the recent Conference were to prove the germ of some simple but comprehensive scheme for affiliating every architect who is competent and carries on his practice respectably to this body, giving him a title and a position worth holding, and which it should be for him a misfortune and a disgrace to lose. The time may be distant when this shall be realised, or it may be nearer than we think. One thing is, however, certain: every step which can be taken to promote the general advance of the profession if it be well judged, will benefit each individual member; and every proposal

tending in that direction deserves to receive the best help which each of us can afford. It was not, however, I beg to repeat, in order to suggest any one or other definite act that this subject was brought forward. It was with the simple view of bespeaking for professional *esprit de corps* a place, such as the importance of its claims seems to demand, among the subjects which shall be here cherished and kept constantly in view. Let us be alive to the nature of the spirit animating us, as well as to the shape of our acts. It is well to stimulate research; it is well to originate combinations; it is well to concert action; in short, it is well to do the best we can to build ourselves up into a homogeneous, a shapely, a well-organised body. But let us remember that a body needs to live. An organised body without a spirit has nothing before it but speedy decay. Whatever else, therefore, is forgotten or remembered, let us not forget, I beseech you, *l'esprit du corps*.

SIR WILLIAM TITE.

ON Tuesday last, at a meeting of the Bath Town Council, a number of the admirers of Sir William Tite, who is the senior member for Bath, and who has now represented the city for seventeen years with great satisfaction to all the citizens, presented the corporation with a life-size bust of that gentleman, as a mark of respect for him and admiration of the manner in which he has represented the city. The bust is of statuary marble, and was executed by Mr. Theed, R.A.

The presentation was made by Mr. Alderman Murch on behalf of the subscribers, and he, in doing so, dwelt in eulogistic terms on the public life and munificence of Sir William Tite, and said it was thought by the subscribers to the presentation that the city would like to have some permanent memorial of its senior member. The respect for Sir William throughout the city was so great that persons of all parties were struck with a life which was so generous, valuable, and eminently useful, and had, therefore, freely subscribed for the bust. To appreciate a work of this kind it was necessary to have two things,—a favourite subject and a high-class artist. In each of these points they had been very fortunate.

Our esteemed friend and colleague is certainly earning “golden opinions” from all sorts of men. May his shadow never be less!

NEW BUILDING FOR THE BRITISH MUTUAL INVESTMENT COMPANY.

A PROMINENT block of buildings has just been erected in Farringdon-street, for the British Mutual Investment Company. The structure has two main elevations, one in Farringdon-street and the other in St. Bride-street, with another narrow elevation at the angle of the two last-named streets, which contains the chief entrance to the company's offices, and facing Ludgate-circus. The materials used in the construction of the building, which is in the Italian style of architecture, are the Farnham red brick, with stone facings. The Farringdon-street and St. Bride-street frontages are each 60 ft. in length, the building being also 60 ft. in height, to the ground level. There is a basement and also a sub-basement, and, including these, the building altogether consists of six stories. The ground-floor windows are segment-headed, the first and second stories having circular-headed windows, whilst the third story windows form a continuous arcade, and are mainly of stone. Above the third story is a cornice and stone balustrade, behind which are attics. The house-keeper's apartments are at the top of the building, the roof being a flat one, formed of asphalt on Pilkington's patent. The main ground-floor entrance facing Ludgate-circus is pedimented, and in the Farringdon-street and St. Bride-street frontages there are niches for statues. The ground-floor portion of the building will consist of the Board-room and general offices of the company, and will be exclusively devoted to the company's business, the several stories above being let for offices, as well as the sub-basement, the basement consisting of vaults, which will be occupied by a wine-merchant for storage purposes, and the entrance to which, as well as the entrance to the several offices, will be in St. Bride-street. The estimated cost of the building, exclusive of the land, which is held on lease from the corporation, is 6,000. Mr. Henry Currey is the architect, and Messrs. Brown & Robinson are the contractors.

THE HOUSES OF THE LABOURER IN
SOMERSETSHIRE.

CARRYING on our observations,* we have been inquiring as to the homes of the agricultural labourers in Chincock, Chiselborough, Montacute, and Stoke-sub-Hamdon, and we will now endeavour to describe something of what we have seen or learnt in these places. We give views of a couple of cottages by the roadside in Chincock. The only portion of these cottages now uninhabited consists of two rooms, a kitchen below, and a small bedroom above, whose windows are in the gable-end, with entrance-door up a passage. The height of the kitchen is about 6 ft. 3 in.; breadth, a little over 9 ft.; and length, 13 ft. The bedroom has a ceiling broken through in three or four places, through which the rain from the thatch above trickles down the walls. It is only in the central part of the bedroom a person of ordinary height can stand upright. There is hardly 3s. worth of property in the sleeping apartment in the shape of bedding. An old tick, with scarcely any stuffing, and a few rags, composed a bed, spread upon the floor in one angle of the room, and a wretched frame,—the caricature of a bedstead,—occupies another corner of the apartment. A few winding steps, scarcely sufficient in breadth for one person to pass up, lead from the kitchen to the bedroom, the sole sleeping-apartment of an aged mother of eighty-four years, an unmarried daughter of forty, two children, and a grown girl, who acts as a help in gloving and other work. The aged mother is an imbecile, and is otherwise afflicted. The average earnings of the household throughout the year could not easily be determined. Sometimes 5s. a week, sometimes 7s., at other times 2s. 6d., and, at times nothing. For these two rooms, the last corner of the two cottages which now affords a refuge for miserable creatures, 3l. have lately been obtained for the year's rent. We must be just to the landlord, who is a noble lord to boot: he allows the use of another small room on the opposite side of the entrance-passage, which is used as a workshop when glove-making is brisk; but we are in doubt whether the additional accommodation is wholly free or not. Our informant here was interrupted in his survey of these and the adjoining cottages by the owner's bailiff, who challenged his authority, not only to look within, but to sketch without; so the pursuit of knowledge was one under difficulties. Rags and semi-starvation mark the chronic condition of the people here and in the adjoining cottages along the roadside in the village of Chincock. In many of the dwellings there is only one sleeping-apartment, where the labourer and his wife, with families varying from five to eleven, the infant and the marriageable daughters or sons are all huddled together, even admitting there is no lodger. The rents vary from 1s. 3d. to 1s. 6d. per week, or more, but in the latter case there are, besides the kitchen below, two rooms above. The kitchens are flagged with rough slabs of Hambill stone, as they are all round the localities we traversed; but though we entered several of the homes we failed to find one in decent order; sunken here and raised there, and fractured into numerous fragments, showing hollows capable of holding no small quantity of water. In times of heavy rain and flood, many of the kitchens present the picture of a number of miniature lakes or pools. As to "conveniences," we found instances where one place of accommodation had to meet the wants of a whole row of cottages.

In the village of Chincock, the farm labourer's wife and daughters add a little at times to the income of the household, by glove-making; but it is a hard-earned and miserable pittance, one individual often spending from nine to twelve, and often fifteen, hours in earning 9d., and at times even as little as 6d.

Passing along from West Chincock, we soon enter the ill-fated village of Chiselborough. No external sketch of the habitations in this place could give a complete idea of the state and condition of the interior, or the deplorable life of the labouring inhabitants. This village is the home of an unhappy race of human beings whose frightful afflictions are unquestionably attributable to the place and circumstances. Several of the inhabitants are negro-like in aspect, save as to colour, misshapen not only in head, but in body, thick lips and flattened noses, heavy, and bloated,—in a word, altogether twisted and deformed in person. The worst cases are grinning, paralytic idiots. The maladies that these un-

fortunate creatures suffer from are goitre and cretinism. The existence of such a place as this is a disgrace to our boasted civilisation. Chiselborough is situated at the bottom of a rather narrow valley, and it is encompassed on three of its sides by towering hills. Being enclosed thus, it is roiled somewhat of thorough ventilation, and the temperature of the village is possibly milder than that of other Somersetshire villages. This, in itself, would not create the maladies; but coupled with the immemorial state, housing, and surroundings of the inhabitants, it may go a great way in perpetuating them. The houses, cottages, and other dwellings constituting the village form lines of irregular terraces, one over another, along the sides of the hill. The eaves of the roofs at the back of many of the dwellings are nearly on a level with the sloping hill-side, consequently it may easily be imagined how they stand in regard to the drainage of the hillside above them. A few inches below the surface of each floor must exist an eternal dampness, and not only dampness, but pent water. Where attempts have been made to build cottages with their fronts to the hillside and their backs towards the public road, a sort of fosse had to be sunk, a few feet wide, to give liberty of entry through the doors, otherwise there could be none, except through openings contrived in the roof. In times of heavy and continued rain the natural outfall of the drainage of the hillside is the floors of such cottages. Further, year after year, the contents of cesspools have been allowed to sink into and saturate the soil; the foul drainage in connexion with one set of houses percolating through the soil down under the walls of houses below them. The wells and other means of water-supply for the inhabitants in the lower portions of the village suffer necessarily from the foul filtration we have been describing.

The appearance of the cottages in Chiselborough, as well as in West Chincock, externally, is respectable, compared with their construction and accommodation within. Blackened, naked joists form the ceiling in the kitchen; a transverse beam, in many instances, supports these joists in the centre, thereby lowering the height of the room, which, independently of this obstruction, is dangerously low. The plan and sketch of bed-room given in our last issue are applicable, in many cases, to the cottages in Chiselborough, Montacute, and Stoke, with this difference, that the creaking stairs or ladders are more upright, and there are a greater number of risers. Hand-rail or protection there is none, and the edges of some of the beds above are within a foot or two of the well-hole or opening, so that a child creeping out of its bed upon the floor may have at any moment its brains dashed out on the stairs or the flagging in the kitchen underneath. The fireplaces in not a few of the cottages we entered are as primitive in form as any the fourteenth century could produce. A few loose bricks, two or three in height, form the three sides of the improvised grate upon the hearth. A pot or kettle is seen suspended from a chain and hook, and a few rotten kumblies, gathered in the roadside ditch, constitute the fuel. Only a few days ago a poor creature was marched off two or three miles to the residence of the local justice of the peace by the village constable, who charged her with picking up a few rotten windfalls from the trees. Had she not committed this grievous offence, she and her children might have had to eat a raw swede for dinner. In this the first week in December we find many hearths in which the fire has gone out, for fuel in the shape of wood is scarce, and coal can only be had in a sixpence-worth at a time, and then only when all the family are employed. The family is very well off indeed when it can afford to purchase a hundred-weight of coal; and when the cooking is done, a piece of stick supplies the place of the coal, which has to be economised for Sunday's use particularly. The ordinary farm-labourer gets from 9s. to 10s. a week; the ploughman and carter from 10s. to 12s. Not long since the wages of the labourer were from 8s. to 9s.; but last June, in consequence of a revolt, the wages were raised a shilling; but the two pints of cider previously allowed were stopped. No London labourer or beggar would drink this wretched stuff, which is especially brewed for the field-labourers, and which is nothing more than the final pressing of the apple-pulp flooded with water, with the addition of the skimming or fermentation from the first brewing. The lees of the exhausted casks used by the farmers are sometimes added. We tried to drink a wine-glassful of this liquid to test the

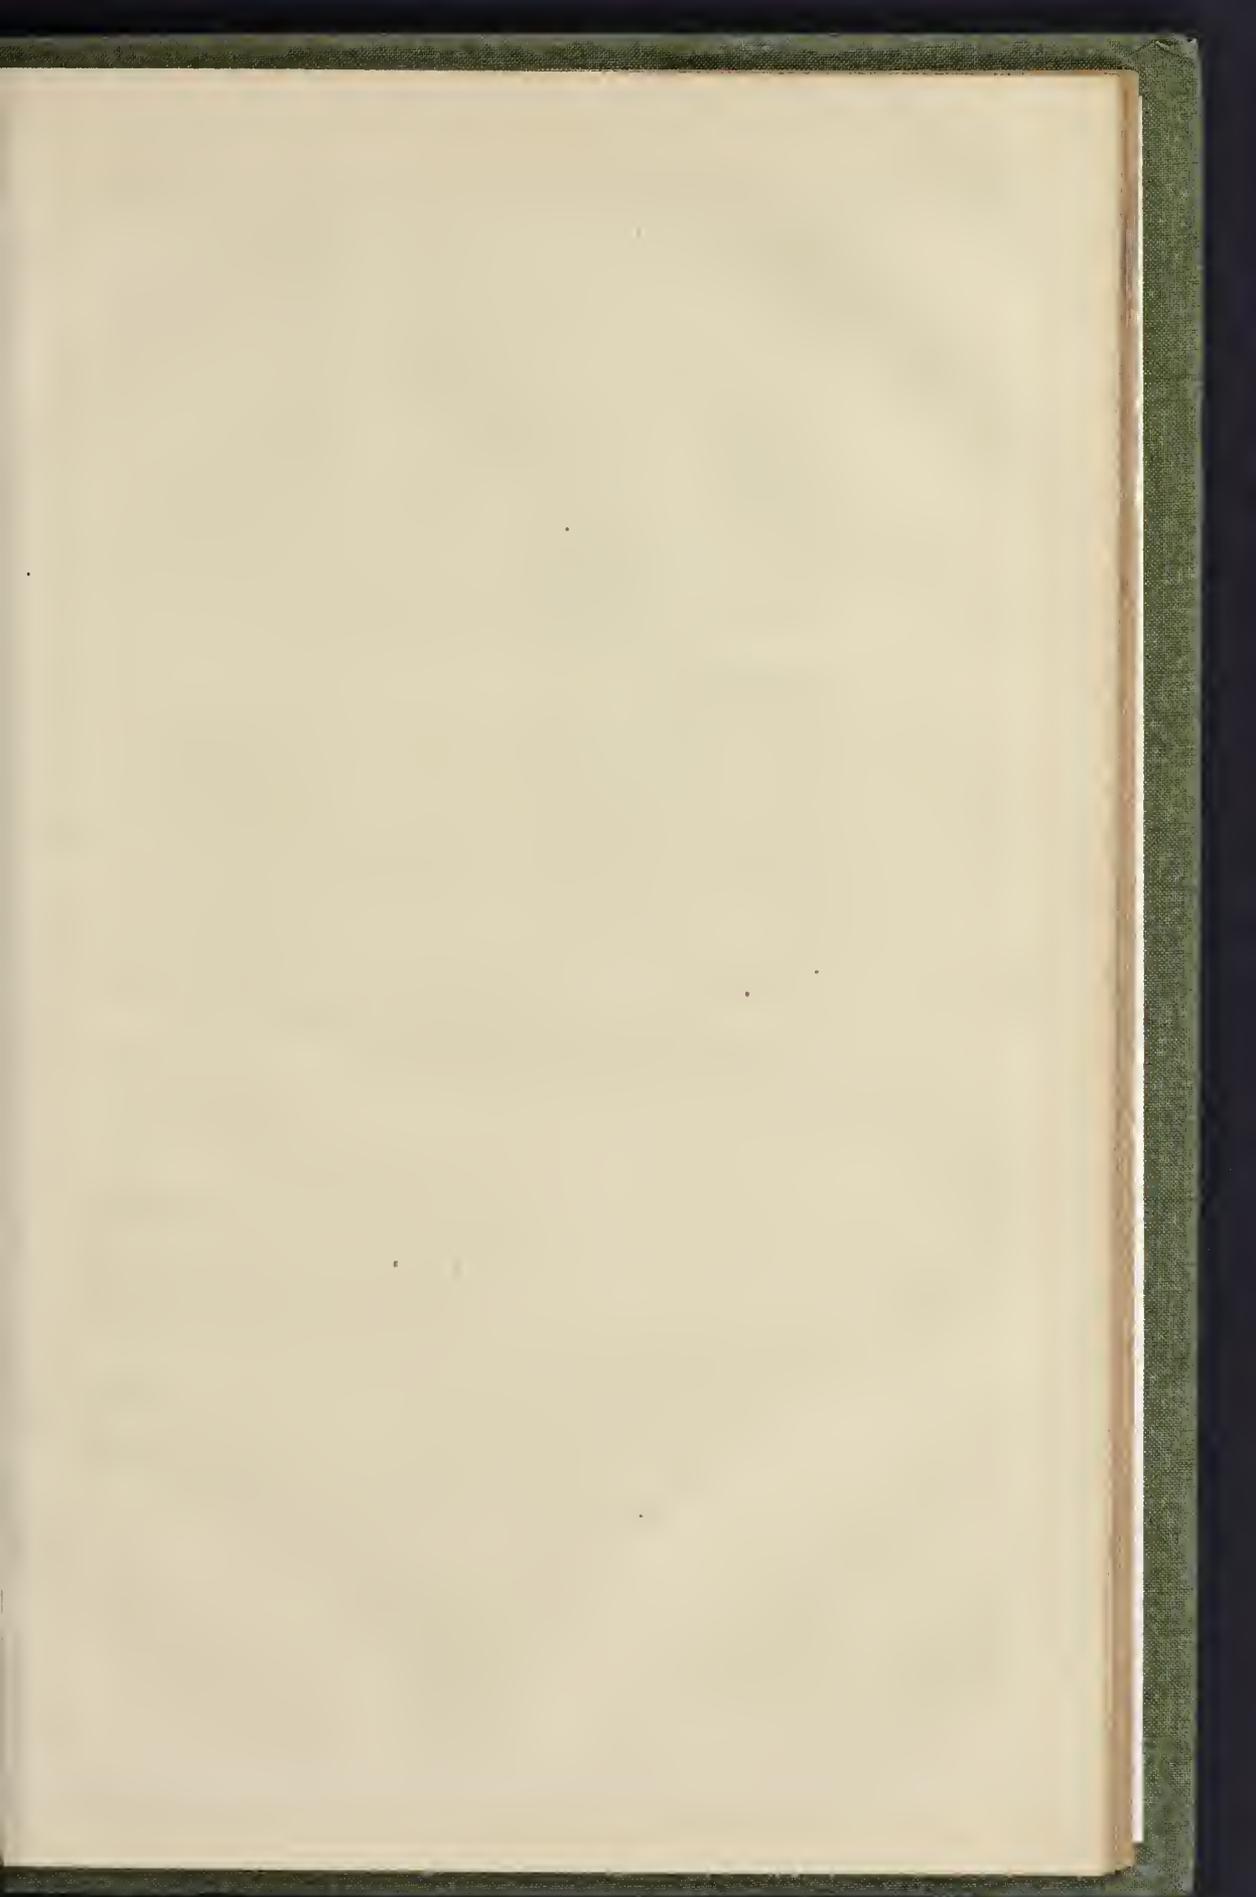

truth of what has been said in its favour; but we found it impossible to swallow the second mouthful. No vinegar that we have tasted was more sour. It is matter of wonder how agricultural labourers can get intoxicated on such abominable stuff. Yet this cider allowance is one of the boasted perquisites of the Somerset hind, and the farmers never forget to vaunt the gift. What a mockery of refreshment to the semi-starved, ill-clad, and worse-housed labourer! Female field-labour does not exist, either in summer or winter, to the same extent in the districts we are now describing as in other parts of Somersetshire. Taking a five-mile radius, with Yeovil for the centre, an intermittent employment at glove-making keeps the wives and grown-up daughters of the farm-labourers from the fields; but it fails, at the same time, from its precarious nature, to afford sufficient to keep body and soul together. It is a help, to be sure, when it comes, but it has the result of leading to the frightful evils of the overcrowding and huddling together in one room whole families, and often two or three families of the parent-stock. It is utterly impossible that morality or health can be preserved under such conditions.

In Stoke and Montacute we found some frightful examples of overcrowding in wretched rooms and attics, from which the blue sky could be seen above and the kitchen and its occupants below. Rotting rooftrees, bulged in, and decayed floors dangerous to tread upon, casements shattered or blown out altogether, and walls with a constant trickle from tile and thatch rusting their surface and coating it with an indescribable ooze. In a row of cottages lying at the bottom, or in the valley, at Stoke, a number of their inmates are in great want for lack of employment. The kitchens are cold, damp, and cheerless; and the bedrooms are destitute of any furniture save the miserable bedding which is strewn upon the floor, or gathered up in bundles in the corner of the rooms. One good or decent bedstead we did not meet with in any of the labourers' cottages we visited, nor a bedroom fit to sleep in, or in any way suited to meet the requirements of the inmates. Some of the houses were without hack yards, and the places of accommodation were far between and in a filthy and overflowing state. As in Stoke, so we found matters in portions of Montacute. Here, in a thoroughfare called Middle-street, we visited a row of cottages hacked against the churchyard. A few of them have had lately a wall built up at their rear about 6 ft. high, hiding the view of the graveyard from the under rooms, and allowing a space of about 3 ft. between the walls of the cottages and the churchyard wall. This space is the only hackyard these cottages have. The level of the kitchen floors is some feet lower than the surface of the churchyard soil. There is an absence of all ventilation here, and the drainage of the graveyard, of course, soaks under the floor of these ill-conditioned dwellings, and, added to these evils, there is one place of "convenience" for five or six houses.

In each of these cottages and some further down the street there is only one sleeping-apartment, the ceilings of some of them are bulged in, the rain comes down the walls, and dirt and ill-health reign. As many as three beds, or "shake-downs" upon the floor, are in one apartment of about 9 ft. by 12 ft., with scarcely standing room, and the bedding is the sole furniture. On the opposite side of the street a similar state of things exists as far as relates to sleeping accommodation, the condition of roofs, ceilings, walls, floors, and places of convenience, which are all in a state of ruin and rottenness. There are surface drains in this village, but in times of heavy rain they are unable to carry off the water, which often floods the kitchens of the cottages in Middle-street and in other portions of the village. The sewage in one place passes along an open ditch, immediately behind a row of the cottages, and winds its way into the fields, where it is absorbed in the soil. Overcrowding exists to a great extent, the members of some families being sufficient for the occupation of three bedrooms instead of the one or two used. When death takes place in any of these cottages the living must either cook, eat, drink, and work in the presence of the dead head, or sleep in the one bedroom with the corpse above.

We can proceed no further at this moment, though there is still much to be told concerning the condition of the agricultural labourer and his surroundings in Somersetshire. We have no hesitation in adding that some of the worst cottages we visited are the property of Lord Lichester and Lord Portman.

LABOURERS' HOMES IN SOMERSETSHIRE.

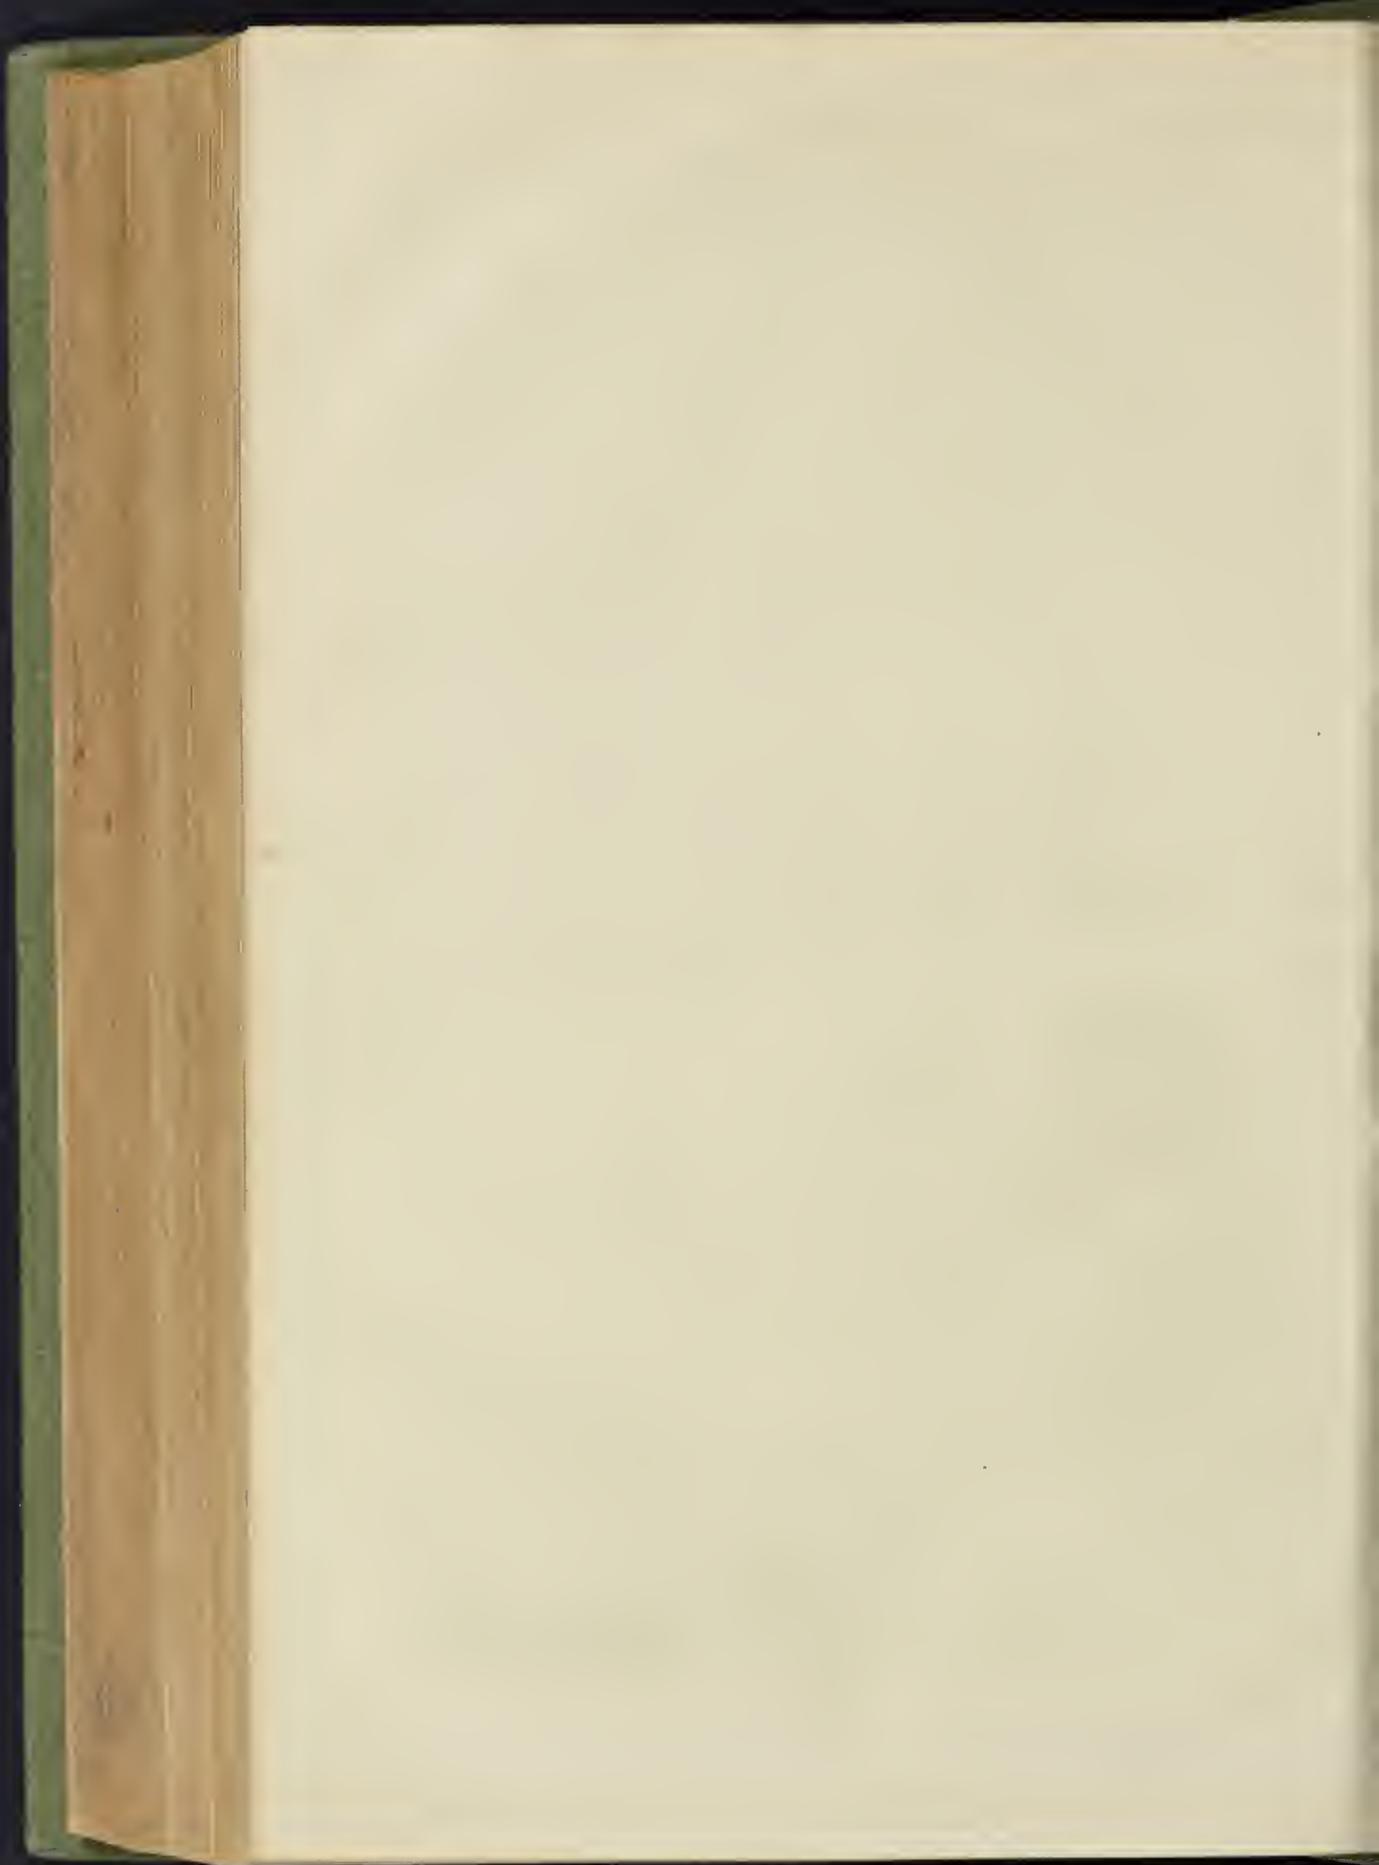

Sketches in Chincock, near Yeovil.

DESIGN FOR PROPOSED CATHEDRAL IN EDINBURGH.—Plan.

DESIGN FOR PROPOSED CATHEDRAL IN EDINBURGH.—By MR. ALEXANDER ROSS, ARCHITECT.

DESIGN FOR PROPOSED CATHEDRAL IN EDINBURGH.

We have illustrated the design for St. Mary's Cathedral Church, Edinburgh, submitted by Mr. Alexander Ross, of Inverness, to the trustees of the late Miss Walker, one to which when exhibited under the motto "Fidelitas," we awarded a considerable amount of praise in our review of the six sets of drawings exhibited in competition.* We extract a few paragraphs from the description forwarded with the design by Mr. Ross.

In arranging the plan, the comfort of the congregation was studied, and the architect endeavoured to provide for this by the introduction of a large narthex at the west end of the nave, entered through a triple porch, and by a roomy south porch into the south aisle (the necessity for subsequent inside wooden porches to prevent cold draughts being thus avoided).

The dimensions are stated to be as follow:—

	Length.	Width.
Length of nave	130 ft.	by 30 ft.
Length of aisles	110 "	" 15 "
Length across transepts	100 "	" 30 "
Length of choir	65 "	" 30 "
Chevet or circumambient aisle	75 "	" 15 "
Extreme length over all	265 ft.	
Width across west tower	82 "	
Width across transept	110 "	
Height of interior to groin	75 "	
Height to ridge	107 "	
Height of west towers	107 "	
Height of central towers	230 "	

It was proposed to seat the nave only with benches, the transepts being left clear for temporary seating by chairs or otherwise. The accommodation provided gave,—

Sittings in nave and aisles	1,082
" transepts	336
" choir	64
" stalls	24
Total sittings.....	1,506

"The architect has adopted the chevet, or mode of carrying the aisles quite round the choir, thus giving free access from the vestries and chapter-house to all parts of the building, without crossing the choir or chancel, and also providing a very suitable space for mural monuments and brasses, while at the same time it would immensely improve the architectural effect of the building. The chapter-house opens off the north side of this circumambient aisle, and is approached through a wide corridor, lighted on the east side by a rich arcade, and bounded on the west by the vestries for the clergy."

The chapter-house is in the form of a parallel-gram, 58 ft. by 26 ft., and capable of accommodating 150 people. The chapter-house was to be roofed with timber, and warmed by open fireplaces at either end.

The choristers' vestry is placed over that of the clergy, and is approached by a wide stone stair. By this arrangement a very large vestry, capable of accommodating easily forty choristers, is obtained, at a point quite detached from the other, yet adjacent.

A severe and comparatively early style of French Gothic has been selected, so as to avoid excessive detail and carving. The aisle walls have been kept perfectly plain, with the view of giving value to the richness of the clearstory, where the principal decoration has been concentrated, as being a leading feature outside and inside the building. It was contemplated to groin the ceilings throughout with stone ribs and chalk, or concrete filling, the latter presenting many very commendable features.

The walls of the building were designed to be in solid stone throughout, neatly dressed on both external and internal surfaces. This stone to be from the local quarries in the main; but in the columns and small piers a free use would have been made of marbles and native granites. Seatings in nave and choir in oak. The roof would be framed over groins, of red pine, boarded, and covered outside with Westmoreland green slates. Accommodation for the bells is provided in the north-west tower, and for clock in south-west tower.

The architect, after a careful estimate, is of opinion that the building could be well carried out for the sum indicated by Miss Walker's trustees,—£65,000.

The Institution of Civil Engineers.—At the meeting of this Society on Tuesday, the 3rd inst., Mr. Hawksley, president, in the chair, the first ballot for the Session 1872-73 was taken, when forty-seven candidates were hallooted for and declared to be duly elected.

THE WARMING OF HOUSES.*

THE usual appliances for warming houses, setting aside comprehensive systems, resolve themselves into open grates, close stoves, and, under special conditions, gas apparatus and pipes for hot air or water for warming halls and passages.

For the whole of these certain general rules may be laid down:—

1. More cannot be got out of any one of them than is put into it. This is an axiom which, truisim as it appears, is necessary should be impressed upon the public mind, which is apt to assume that engineering skill can multiply the heating power of fuel indefinitely. Thus, materials, like fire-clay, which are absorbent of heat and useful to prevent its escape, and retain it till needed, must abstract it first from the fuel before it can dispense it.

2. There are but 100 degrees of percentage. This simple fact should be kept in mind in considering methods of saving fuel, the inventors of which would otherwise persuade one that reference to coal merchants is a work almost of supererogation.

3. Some proportion of the heat generated must be expended in maintaining a draught in the flue, which is to carry off the products of combustion. This is by no means unprofitably lost since it promotes ventilation as well.

4. To minimise this proportion of escaping heat to as nearly as possible what is just necessary, and to take toll from it during its passage, as by warming the air which is to replace that abstracted by the flue, is the principal direction which efforts to economise fuel should take.

5. The products of combustion, being noxious, must be wholly removed, unless they can be chemically transformed. It is as barbarous to allow the fumes from gas to invade rooms, as it is to let the door be the sole outlet for peat smoke in an Irish cabin, or as it was to provide only louvres in the roofs of the halls of our forefathers for the smoke of their wood fires. The evil may be disguised, but the poison is the more insidious from being comparatively unfelt. The lungs of the living animals, as the leather of dead ones on the book-shelves, become corroded alike by their pernicious influence.

6. Warming and ventilation are so intimately connected that, although the latter is not my special subject upon this occasion, it is necessary that it should be kept in mind throughout, while treating of the former. In fact, infusing heated air is a more economical and pleasanter mode of warming houses than direct radiation, and it is only by their capability of combining the two methods that open fires can maintain ascendancy over stoves, and it is only by uniting proper ventilation with stoves that they ought to be tolerated.

Lastly, all appliances should be simple and as self-acting as possible. This is essential for those intended for the use of the poor, whose treatment of them is of the roughest, and who neither need nor understand anything complicated. If there be a damper to be drawn, or a handle to be turned by them, neither will be drawn or turned except occasionally the wrong way, and if there be any cover or part that is loose, it is safe to be lost. At the risk, therefore, of some waste, their scanty fuel must be consumed in the most primitive manner possible. With somewhat less force the same caution may be given to those who design apparatus for the upper classes. Everything even for them should be as self-acting as possible, for though individuals may for a time take a fancy to an ingenious arrangement that requires personal adjustment, they tire of it in time; servants in their succession are not to be drilled into its use, and the thing is soon left to itself, and failure is the inevitable result.

To proceed to the several appliances themselves.

In the race to attain economy it must be acknowledged at the outset that close stoves completely distance open grates, and that they in their turn are as far ahead of all gas-apparatus as at present invented; and yet all have some advantages as well as disadvantages peculiar to themselves, to which it is worth giving some consideration.

In stores the heat from fuel can be almost wholly extracted and utilised, and even the little that escapes with the gaseous products of combustion is heavily taxed when its ultimate exit is by the few insignificant pipes, or diminutive

chimney-stalks, which alone are suffered to peep above the roofs of houses on the Continent. English ideas of comfort will not, however, permit of the general introduction of the stove system into this country, and it is hardly to be desired that it should, unless great improvement be grafted upon that in vogue abroad, in which stiffness is ever an accompaniment of warmth.

Our British privilege, however, of being able to poke the fire, although purchased dearly by its concomitant dust and the labour it entails upon servants, is not likely soon to be relinquished, and the luxury of an open fire is a fact which no theory can demolish.

Still, the grates in common use savour of barbarism, and much can and should be done to gain further refinement, economy, and immunity from nuisance. There is no need, for instance, that our roofs should be disfigured by the ugly and even comical flue terminals which Dickens satirised in one of his latest Christmas publications. We ought not to be subject to vexatious down-draughts in windy weather, nor to chimneys that smoke unless a door or window be open. Our drawing-rooms should not be invaded by sooty chimney-sweepers, and all ought not to have to scramble for a place near the fire in a room to be warm, nor when there to have to rotate like a smoke-jack to prevent being frozen on one side while we are scorched on the other.

Such evils are to be obviated by simple means, and yet ninety-nine out of every hundred Englishmen submit to them slyly if not patiently. Whole streets, occupied by men of means, have their skyline fringed with demon-like excrescences which tell a sure tale of internal discomfort. Such was the case with that in which my own residence is situated. When I took my house upon lease, though it had been well built by an eminent architect for his own use, yet, in common with all its neighbours, it displayed a grim array of tall-boys and tortuous contrivances as chimney terminals. All these I swept away at once, without inquiry, feeling that whatever might be needed, they certainly could not be. I then introduced an air-pipe to each fireplace through the floors, and, as I expected, found no smoky chimneys to complain of, though my neighbours still grumble at theirs, as I do of their futile and unsightly expedients to remedy them.

So much depends upon the proper construction of fireplaces and their flues, without which no appliance in the shape of a grate can have fair play, that I shall in the first place describe the points to be attended to in the erection of these portions of a building, and in palliating evils in those which already exist.

The first essential to ensure a good draught is that the flue should be sufficiently raftered. For this purpose it is desirable that it should not be in an outer wall; but if it be necessarily so, the enclosing wall should be thick (at least 9 in. between the flue and the outer air) or else it should be protected by a double casing, with intermediate hollow space. Materials which absorb damp should be avoided for the construction, as they tend to the evaporation and loss of the heat generated; and the interior of the flue should be well pargetted, to further prevent the suction of external cold by the up-draught within. Another important point is that the flue be not too large, or currents of cold air descending will interfere with the ascending heated air. In old buildings flues are found of large size,—as 18 in. by 12 in.,—with wide throats, funnel-shaped, diminishing upwards. But the fuel used in them was wood, and abundant, and men were more hardy, and minded not the roaring of wind in the chimney, or cowered over the embers within the vast entrance of the fireplace, which formed an inner room of itself. There are those who would revive these large flues, on the ground that no cowl decorates their terminals. If, however, we are to recur to the practice of our ancestors, we might as well revert to that of a still earlier age, when the stately hall of Penshurst had its fire upon a hearth in the centre, and the graceful wreaths of smoke thence found exit by the lantern in the roof. We must needs then have the same goodly legs as fuel, and a supply which will enable us to afford the blaze that alone would suffice to rarify a cavern. The ordinary coal-fires of our apartments do not need a larger flue than a pipe of 9 in. in diameter. Mr. Richardson, in his work, states that the houses built by Cunit in Belgavia have flues 9 in. by 9 in. only, while others erected later have them 14 in. by 9 in., and that these are distinguishable outside by the absence or presence of

* See p. 657, ante.

* From a paper by Mr. John P. Seddon, read at the National Health Society, December 5th.

objectionable cowls respectively. Kitchen-flues must be larger, in proportion to their fires, or better, perhaps, doubled,—a practice for which old precedents may be found, and which seems calculated to avoid down-draughts.

For the avoidance of that particular nuisance, however, special provision should be made in every flue. This may be done by an enlarged space, wherein the force of gusts of wind may expend themselves upon, as if were, a cushion of air. If the first pipe above the chimney-mantel be a 9-inch pipe, let the next be a 15-inch one, and the flue above continued with 9-inch ones, and a somewhat similar arrangement has been proposed by Mr. Boyd for brick flues. He disconnects the vertical flue a few feet above the mantel with an enlarged space or pocket, and carries an inclined one from the fire-place into this on one side, and the down-draught thus meeting resistance at the bottom, eddies round the space, without being able to check the upward draught from below. Mr. Cubitt's continuation of the flue to the basement also obviously affords a resisting column of air to effect the same purpose. It may be impossible to make such cavities large enough to overcome the effect of every down-draught, but these provisions against them will generally effect this desired end if combined with ample provision of air to the fireplace.

The use of pipes for the lining of flues has the advantage of compelling a good and non-porous finish, which would otherwise be neglected by careless workmen, who often will not take the trouble to properly parge and core the flues in stone and brick walls. The interior of the pipes, however, should be rough, and by no means glazed, or their inability to give any means of adherence to soot will be found a nuisance, in consequence of its continual dropping. The old funnel-shaped throat left a large space above the grate filled with cold air, which checked the draught. This depends much upon the grate itself; but, generally speaking, the flue should be contracted to its smallest size as soon as possible above the mantel. Iron frames for this purpose, serving as mantel-bars as well, such as Gibbs's registered fireplace-lintel, are useful appliances. A concrete block may be made of the shape required at perhaps the least cost.

The construction of the fireplace itself is of the most importance. The contraction of the flue immediately over it is the first point to be looked to, and next the provision of a proper supply of air for the combustion of the fuel. To illustrate this in the simplest manner, I may refer to a small room with a large fireplace in it, belonging to a friend, which was complained of as simply uninhabitable by reason of the draughts that invaded it from all sides. A piece of iron pipe, with lower end protruded through the outer wall, the middle brought through the fire, and the upper end open to the room, stopped all cause for complaint. The reason for this is so obvious that it seems hardly credible that a vast majority of dwellers in houses are enduring continual torture for want of this pipe or some equivalent simple appliance. One looks in vain along the walls of our streets for any signs of air-hicks or other inlets of air, and, with closed doors and plate-glass windows, one wonders where the air comes from to feed the fires within. There are but few available sources, which are these: 1. The joints of the window-frames and chinks round doors, through which cold blasts whistle as they are sucked in, so that these are pasted up, and as far as possible this means of supply intercepted. 2. Unused flues of other rooms down which air pours mixed with smoke; and 3. The soil and waste pipes, the water in the taps of which cannot hinder the precious element from coming even by such undesirable channels, in obedience to the powerful suction of the several fires in the house. These failing, there are positively no other sources. Then, fortunately, the fires begin to smoke, and doors and windows are perforce opened to abate that by far the smallest and least dangerous nuisance of the whole.

The remedy for this is to provide a sufficiently ample supply of pure fresh air in such a manner that it may come in moderately warm, and from such quarter that it be felt as a draught. There are several means of doing this, each holily maintained by its partisans to be the only fit and proper one. The bottom, the centre, and the top of the room are each pointed out as being specially adapted for the purpose by those much-enduring laws of nature, and the course of the currents of air demonstrated by flights of the most obedient and flexible arrows. This cer-

tainly may be taken for granted: if openings be made in any or all of the positions indicated, the laws of nature will make a beneficial use of them, but it will be capriciously, one moment as an inlet and one as outlet, as the occasion may need. The fire being the motive power of the currents, the direction that the air will take if it can will be in a straight line to the fireplace, and therefore, to obviate disagreeable draughts, the air-inlets must not be placed so that currents thence must necessarily impinge upon the inmates of the room, as in the case of the undesigned ones of the chinks round the doors and windows. Again, they should not be so near and below the grate as to rush direct to feed the fire, and thus not only not aid to ventilate the room, but absolutely take from the fire that valuable office. By far the best mode, in my opinion, is to introduce the air below the hearth and carry it thence through warming-chambers at the back or sides of the grate, and allow it to issue into the room above the fireplace, or from the outer sides from the chimney-piece, so that it must ascend and mix with the air in the room before it finds its ultimate exit by the fireplace or outlet-flue. In fact, the fireplace itself should be the fountain of warmed fresh air to an apartment, since no draught thence can be annoying to any of the inmates of the room. The air may be brought, according to its position upon different floors, from below, by air-bricks inserted in the walls between the joists, or from above the roof by a flue constructed for the purpose; and if this flue be carried in close connexion with the chimney-flue, whether in the use of Boyd's metal tubes or ordinary brick, the air drawn down by the suction of the fire will have the temperature considerably raised above that of the outer atmosphere, the coldness of which, entering by windows, is unendurable.

WEYMOUTH SEWERAGE.

WITH reference to the letter from "Twelve Ratepayers of Weymouth" printed in our last week's issue, we have made some inquiries, the result of which we will briefly state. The plans, sections, estimates, and details, prepared by Sir John Cooke, were adopted by the Corporation of Weymouth, who, we suppose, represent the ratepayers. These plans and details were submitted to the Government Board in London, and were minutely examined by its engineer, who reported upon them, recommending the required sanction.

The scheme provides for more than sewerage, as the dam across the backwater is to prevent the continuance of a large area of stagnant, and, at times, putrid water. The "strainers" spoken of would, we suspect, be worse than useless.

A local inquiry was not necessary, legally. The sanction to borrow was obtained before the passing of the Public Health (1872) Act.

The Government may, under this Act, lend money for as low as 3½ per cent, and may also, in certain cases, spread repayment over sixty years. This may, it appears, however, did not at the time apply to Weymouth.

Sir John Cooke's connexion with the Admiralty had nothing to do with the case. The Corporation seem to have acted legally throughout, and have apparently done all for the best as affects the ratepayers. The prosperity of Weymouth depends upon its sanitary condition. We know personally what this condition has been, and are disposed to believe that the completion of Sir John Cooke's works will add 20 per cent. to the value of house and town property in Weymouth.

THE DRAINAGE OF OXFORD.

Sir,—The paragraphs which have appeared in the newspapers respecting the drainage of Oxford are calculated to mislead. It is stated that "men are excavating for sewers in different parts of the city." This has given many persons the idea that the works have commenced. Such is not, however, the case, and the only excavation has been a few holes, to ascertain the condition and level of some of the existing sewers. It is also said that "an advertisement has been issued, announcing that the Oxford Local Board propose to apply to Parliament next session, for power to purchase lands for the construction of the Main Drainage works, and the purchase of land, for the purpose of a pumping station and irrigation works."

Now, the advertisement is to the effect that

application will be made to the Local Government Board (not to Parliament) for powers to purchase a site for pumping station, and irrigation lands recommended in the report by Mr. Bailey Denton, to which you have alluded, and not for the construction of the drainage works proper, powers to proceed with which the Board already possess, and the working drawings for the first contract are in course of preparation in my office at the present time.

Oxford Local Board. WM. HENRY WHITE.

BUILDERS' CLERKS' BENEVOLENT INSTITUTION.

A GENERAL meeting of the subscribers was held at the office, 27, Farringdon-street, on the 26th ult., for the purpose of electing one pensioner on the relief fund. This election had created much interest, on account of one candidate (the widow of a former pensioner) coming up for the second time, having been unsuccessful at the last election; and the other candidate being the widow of one of the most active promoters and supporters of the Institution, great exertions having been used on her behalf to obtain sufficient votes to ensure her election.

The scrutineers were Messrs. Arthur Cates, Matthew Hall, and Thomas Stirling, and the result of the poll was for Mrs. Jefferys, 424 votes; for Mrs. Spencer, 361 votes.

Mr. Arthur Cates, in declaring the result of the poll, stated that this election was remarkable, as showing the benefit arising to widows' clerks from being subscribers to the Institution, as Mrs. Jefferys was elected by the exact number of votes to which she was entitled, on account of the subscription her clerk had paid. Had he not been a subscriber, there would have been a tie, as the voting stood.

Rule 4, section 5, referred to by Mr. Cates, states, "That should any deceased builder's clerk or his widow having been a subscriber, become a candidate, he or she shall be entitled to ten votes for each guinea subscribed for all elections at which he or she shall be a candidate." Had Mr. Jefferys not been such an active promoter of the Institution, he would have been comparatively unknown to the members of the committee and chief supporters of the Institution, who would not, therefore, have made such exertions to get his widow elected; and as Mrs. Spencer brought forward 177 votes from the last election, there is every probability that she would in that case have been elected by a large majority. Fortunately, by the rules of the Institution, Mrs. Spencer retains one-half of her husband's pension, to which she has been entitled since her husband's decease. There are eight pensioners now on the list.

STEAM LAUNDRY.

SOME extensive premises have just been completed in Carlton-road, Peckham, for Mr. James Hayes, of Thornford-road, Lewisham Park. They consist of sorting-rooms, boiling-house, mangle and calendering room, ironing-room, stove-room with stone floor, chimney-shaft, boiler and engine house. Stalling is provided for four horses, with harness-room and loft, and living-rooms over. A large tank to hold 4,000 gallons is formed over the boiler-house, carried on brick arches and iron girders. There is also a well with a plentiful supply of water, and a lift in the main building. The upper floor of the latter is arranged to serve as a drying-room in wet weather, the surplus heat from the stove-room being utilised for this purpose. The plans and specification were prepared by Mr. H. Staines, of Lewisham, and the work, including a dwelling-house adjoining, has been carried out by Messrs. Staines & Son, of Great St. Helen's.

THE REGULATION OF COMPETITIONS.

Sir,—The recent lamentable instances of public competitions, offered under conditions of the most humiliating character, would seem, more than ever, to call for interference on the part of the Institute, or for some decided action by the Conference committee who draughted the "Regulations" agreed to in June last. There were, as may be readily understood, no meetings of our committee during the autumn; but your readers may like to know that the first meeting was held a few days ago, when several resolutions were passed, which, having now obtained the sanction of the Council of the Institute, we are about to put into immediate execution.

We propose to send copies of the "Regulations" not only to those promoters of competitions whose advertisements may appear in the professional press, but also to those of whom we know beforehand that they intend to issue such invitations; and it is here that we ask the cordial co-operation of all who have an improvement of the present state of things at heart. Architects, therefore, who may know of the intention of any committee or promoter to ask for designs in

public competition, will do much good and will greatly assist the cause we all have at heart, by forwarding the names and addresses of such promoters to the secretary of the Institute, 9, Conduit-street, in order that copies of the "Regulations" may be forwarded to them before their instructions are finally decided upon. We are persuaded that promoters err in this matter not intentionally, but from want of knowledge of what, in the opinion of architects, constitutes a fair competition. If, after they have received such information as will enable them to draw up instructions and conditions in accordance with the dignity and just claims of the profession, promoters should issue such advertisements as have appeared of late, architects will doubtless know how to abstain from responding to their kind invitations. ALFRED STRONG, Hon. Sec. of the Conference Committee on Competitions.

AN OBJECTION TO SLAG.

IRON SLAG ROADWAY.

DR. LANKESTER, in his report to the St. James's, Westminster, Vestry, says:—"I have received a letter from Mr. Jennings, of Tichborne-street, complaining of a smell which I have no doubt arises from the slag used to pave the road. This substance evidently contains phosphates and sulphates which, slowly decomposing, give out phosphoreted and sulphureted gases suggestive of sewer contamination." The surveyor (Mr. Howell), on the same subject, says that Tichborne-street was coated with iron slag;—"and whether the material was defective, or the weather unfavourable, or there was want of skill on our part, I should not like too hastily to decide; but I certainly should not recommend a repetition of the experiment in the present state of our information on the subject. In addition to rapid traffic, as exists in St. James's, some kind of chemical action was set up. This produced a most offensive and oppressive odour, perhaps not dangerous, but most unpleasant. I feel bound to state that this is truly due to the slag, as it never existed before and is very nearly gone now, as is also the slag. The two disappearing together is decidedly suggestive that there was a close connexion between the two, so that, without wishing to throw any discredit on the material, it is certainly unfit or not calculated to be useful here."

SOUND.

SIR,—I feel unable to altogether agree with the remarks of "J. K. C.," in page 930, upon this subject. I can easily imagine that "cockle-shells" or "broken crockery" can be of little value; but if, instead of them, the battens between the joists be covered 1 in. thick with "deafening," made up of sand with a little lime in it,—simply coarse plaster,—then I consider that said plaster deafening does help to keep back the sound. A great improvement I think could however be made if, before the flooring were laid down, the tops of all the joists were covered with long strips of thick woollen cloth, indiarubber, or kamptulion. This being done, a non-conductor would thereby be placed between the flooring and the joists, which would prevent the easy passage of the sound from the one to the other, while between the flooring and the ceiling below we would have the "deafening" and two air-spaces. B.

I can entirely corroborate what "J. K. C." says on the subject of sound. I am living in a house built with walls 22 in. thick, and with floors of the most substantial character, and the joists well pugged. Notwithstanding, the slightest sound above is readily heard in the rooms below, and the only remedy seems to be some very thick covering for the floors above. C. H. B. H.

SCHOOL BOARDS.

Leicester.—The Board met to receive and consider a report from the architects' committee as to the plans for the school in Slater-street, and the elevation of the school in Oxford-street. Ipswich.—Mr. Smith requested to be allowed to correct mistakes in his tenders which were accepted for the California and St. Clement's infant schools. The desks and boundary walls had been omitted from the tenders for the St. Clement's school buildings. There would be 104l. 10s. increase on the 582l. 9s.; making the whole 686l. 19s. He could not carry out the contract without serious loss, but could reduce the total to 675l. As to the California school, he said he was entirely out of court: an item of 443l. ought to have been doubled, increasing his tender to 1,103l. The next lowest tender, that of Mr. Cunliff, for 680l., was then accepted for St. Clement's schools; and Mr. Luff's, of 993l. 16s. 6d., for California schools was accepted.

Bradford.—The Works and General Purposes Committee reported that the committee had decided to recommend to the Board that the tender of Messrs. Wilson & Sons, for the erection of schools at Barker-end, at a cost of 12,300l., should be accepted, and that Messrs. Duggan and Coates be dismissed. Mr. Neill then moved that the Board accept the tender of Messrs. Wilson & Sons, but an amendment, referring the tenders back to the committee for revision, was carried.

STOCKTON EXCHANGE BUILDINGS COMPETITION.

In July last the directors of the Stock Exchange Company publicly advertised for designs, but eventually the competition was limited to local architects. About eight sets of drawings were submitted, from which three were chosen, bearing, respectively the mottoes "Nota Bene," "Art and Commerce," and "Practice." In consequence of a lack of funds, none of these designs could be carried out, and the authors thereof were invited to prepare other plans in competition to suit a reduced site. Messrs. Alexander & Henman and Mr. C. J. Adams responded to the call, and the result is that Messrs. Alexander & Henman, of Stockton and Middlesbrough, have been appointed to carry out the buildings, while a premium of 50l. has been awarded to Mr. C. J. Adams.

The selected design comprises an Exchange Hall, which can also be used for public meetings and entertainments, and is capable of comfortably seating 1,700 persons, retiring-room and cloak-rooms being provided,—twenty-two business offices and a club with reading, billiard, letter-writing, [coffee, and smoking rooms, kitchen, &c. The site is a long and somewhat narrow one, with an entrance to the High-street, of only 14 ft. According to the original scheme, the frontage was to have been about 68 ft., and consequently allowed of a much more imposing facade to the High-street.

The cost of the buildings is to be 9,000l., and it is expected that they will be commenced forthwith.

HARLEPOOL'S EXCHANGE AND CLUB-HOUSE COMPETITION.

SIR,—I observe a letter on the above subject, signed, "Looker On," in last week's *Builder*, which contains several misstatements.

In the first place, it is not correct that the design bearing the motto "Veritas" is by Mr. G. G. Hoskins, of Darlington. That selected for the first premium bears the motto "On Change," and is by Mr. Hoskins. Neither is it true that "sundry alterations" have been made in the designs or estimates. The building will be carried out precisely as at first designed, except that some of the offices, which were laid out in large blocks, may, if thought proper, be divided into sets of two; and to provide for this an additional tender was obtained from Messrs. Robson & Son, of Darlington, the contractors for the whole of the works. There is no lack of funds for carrying out the work, nor is it true that "the plan for the Exchange buildings was thought to be inferior to that submitted by one of the other premiated architects." I can safely say that it was the general opinion of the directors of the Exchange Committee (not one of whom I believe, was personally acquainted with Mr. Hoskins) that the design bearing the motto "On Change" was in all respects the best, and consequently it was selected for the first premium.

I may here state that, as I have been consulted by the directors, from time to time, on several matters connected with the undertaking, and having also an interest in the same, I feel called upon to reply to the letter of "Looker On." CHAS. T. CASEBOURNE, C.E.

DECISIONS UNDER THE METROPOLITAN BUILDING ACT.

"NECESSARY REPAIRS."

MESSRS. PHILLIPS & SON, builders, appeared, on the 16th ult., at Marylebone Police Court, before Mr. Mansfield, to answer a summons obtained by Mr. J. Jennings, district surveyor of South Marylebone, for irregularity in raising certain walls without constructing the same of brick, stone, or other hard and incombustible material, contrary to rule 1, schedule 1, of the said Act.

Evidence was given to the effect that the builders had been engaged in executing extensive repairs to No. 10, Henrietta-street, Cavendish-square, and in course of these operations it was found that certain bay-windows projecting from the face of the external walls, extending from the first-floor level to the ceiling of the second-floor, and constructed of wooden framing, covered with lath and plaster (described in the summons as being) had become very much out of repair, and the surveyor under whose superintendence the works were being carried out, considered it expedient to relieve the substructures of the bays of so much of the weight of their roofs as possible, and with that object substituted framed heads, 15 in. deep, in place of the original solid heads. The district surveyor sought to prove that this was a raising within the meaning of the Act; whereas it was contended that

* A deceptive account of this decision was sent to us by one who ought to have known better.

new heads were only a necessary repair to an old building, and consequently not within the operation of the said Act.

The magistrate decided that this was only a necessary repair, to which the rules of the Act did not apply. Notice of appeal was given.

RAILWAY ARCHES.

Mr. Rendell was summoned to the Wandsworth Police Court by Mr. Jennings, Jun., district surveyor of part of Battersea, for not having given him notice of a building, as required by the Act.

Mr. Jennings said it was an irregular building, composed of wood, which had been erected under a railway arch in the Queen's-road, Battersea. He read a letter from the defendant, who expressed surprise at the interference of the surveyor, when there were so many thousand railway-arches covered in with wood.

Mr. Brewer (Baxter, Ross, & Norton), who appeared for the defendant, argued that it was not a building, as the real building was a railway, which was among the exceptions in the Act. He said it was a case of great importance to the Brighton Railway Company, as they derived a revenue of about 7,000l. a year from the letting of their arches. The defendant was their tenant, who had fitted up the arch in the way described. What he had erected was a mere fitting in the arch, and not a building. He then read a case in point which was decided in the Court of Queen's Bench in 1858, the South-Eastern Railway Company having let one of the arches of the North Kent line for a stable, the judges ruling that it was not a building.

Mr. Jennings said the two cases were not exactly the same.

Mr. Ingham said in the face of that decision he could not convict. He adjourned the summons, to give the district surveyor an opportunity of consulting the Metropolitan Board of Works as to whether they would take a case.

A BERMONDSEY CURIOSITY.

SIR,—There is in the parish of Bermondsey a small street, which bears the name of *West-street, North, South, East*; the parish authorities having supplied the "West" and "North," and the Postmaster-General having kindly added the "South" and "East." It is a very useful little thoroughfare leading from Jamaica-road by a short cut to Spa-road; that is, its main line,—about fifteen houses,—does this. But the street has this second singularity (I hope that "second singularity" is not a bull): it is not eminent with running a straight course; but at about the middle of that straight course it strikes off at right angles a longish spur, so that the street altogether forms a figure something like an irregularly-shaped capital T. But it has lately acquired this third singularity, it is now an "eminently" muddy street, even for Bermondsey, the mud in it being very high. Can it be possible that the root of mud is middle? PED.

POWERS OF BOARDS OF WORKS.

THE case *Chippenden and Others v. The Metropolitan Board of Works* raised a question of considerable importance as to the exercise of the very stringent powers given to local boards, as to their control over the erection of new buildings and the right of parties to compensation. A full report of the judgments delivered will be found in the *Times* of Nov. 30.

McCandlish v. The Board of Works for the Lewisham District, tried before Vice-Chancellor Sir J. Wickens, [Nov. 26, concerns the laying-out of streets and the right of hoards to compel the setting back of buildings. A report will be found in the *Metropolitan* of Nov. 30.

FIRE-PROOF CONSTRUCTION.

RECENT events render this subject more interesting than ever. Mr. Lewis Hornblower, of Liverpool, in a recent circular as to his new system, to which we have before alluded, says—"The disastrous fire at Chicago [to which may already be added that of Boston,—not to speak of the late fire in Thames-street], and the numerous extensive conflagrations in this country, add to the pressing importance of the subject of fireproof construction. . . . After many experiments, Mr. Hornblower tried a combination of sheet iron, fire-clay hollow tubes, and Portland cement concrete. The sheet iron and fire-clay tubes formed, as it were, the skeleton to the structure, while the concrete acted like the tendons and muscles of the human frame, knitting the whole together in a firm and homogeneous mass. Experiments were made, and the result proved a decided success. The hollow tubes forming the framework of the floor also solved the question of ventilation. The space taken up by the floor is not greater than that of ordinary joists and boards,—in fact, only 9 in. The same principle of construction is applied to walls, roofs, and partitions. Staircases can also be readily formed by this combination of mate-

rial. The question of cheap, warm, and strongly-built cottages is thus set at rest, for this invention is applicable to all classes of building."

CHURCH-BUILDING NEWS.

Purton.—The church here has been restored and reopened for divine service. Mr. Butterfield was the architect employed, and Mr. J. Phillips, builder, Swindon, gave in a tender which was accepted. The interior of the church was in a manner completely blocked up with woodwork—galleries, organ-loft, &c., and the pews were in the old horse-box style. The pulpit, in an awkward position, was an old three-decker, the seat for the clerk, the reading-desk, and the pulpit, being one over another. The roof, flooring, vestry, &c., were also in a very unsatisfactory state. The flooring has been completely replaced with the modern church tile, and the roof of the nave cleaned of the plaster which disfigured it, bringing out the timbers. The walls have been cleaned, discovering traces of wall-paintings and inscriptions in ancient characters. The arches from four of the pillars are being picked out in colours,—restored to their original decorated style. The chancel has been renovated, the windows cleaned out, two niches—one on each side of the communion-table—restored, and the old picture of the Last Supper placed in another position. From the chancel, on the northern side, a small low door formerly led into a kind of chapel; this has been walled up, and another entrance opened from the north aisle, with a carved oak screen. This will now constitute the vestry-room. The roof of this apartment has been lowered, and restored to its original state. The northern window was blocked and barred up in an extraordinary way. Seventy pounds weight of lead were removed from it, and it has been conjectured that the place was at one time or another used as a dungeon. In the corner of the wall nearest the communion-table, the workmen found a skeleton, which was examined by Mr. Sadler, and pronounced as the bones of a female. Two heads, one of a warrior and the other of a priest, are placed one on each side of the screen. The old vestry-room was over the southern porch, and very cramped in space. The organ is now placed near the chancel, on the south side of the church; and the pulpit, a new oak structure, a little lower down on the same side. The old pews are entirely swept away, and replaced by the low modern oak benches. Externally, the steeple has been repaired, and the ground lowered round the church. This church is remarkable for having a steeple and tower—the steeple at the east end, and the tower at the west. The village tradition is that the church was erected through the gifts of two old women, one of whom wanted a steeple, and the other a tower: so, as they could not agree, they each built what they fancied.

Horncastle.—The church of High Tornton, near Horncastle, has been rebuilt by Mr. R. Young, of Lincoln, from the designs of Mr. E. Christian, of London, for about 880l. It consists of nave, 43 ft. by 20 ft.; chancel, 16 ft. 9 in. by 16 ft. 10 in.; small vestry on the north side; and a tower, with octagonal belfry and slated spire, at the south-west corner, the lower floor of the tower forming a porch. The roofs are covered with Cornish slates and red ornamental ridge-tiles; the timbers are stained and varnished, the spaces between the rafters and the wall-surface to the interior being plastered. The inside apertures have quoins, sills, and arches, which, with the outside dressings, are of Ancaster stone. The walls are of the local green sandstone, hammer-dressed. The pulpit, reading-desk, lectern, altar-rail, and doors are of oak; the latter hung with wrought-iron foliated hinges. The floors of the sittings are boarded with oak joists and sills. Accommodation is provided for 100 occupants on comfortable open benches. The standards of the altar-rail are by Skidmore; the chancel floors by Maw & Co.; the alley and porch are paved with blue and red tiles. The late church was erected in 1772, and during its demolition some ancient masonry was discovered, suggestive of two previous churches on the same site, and probably on the same foundations. It consisted of fragments of Early English windows in Ancaster stone, with relics of very early Norman work. The existing foundations are now used again, for apparently the fourth time. A sufficient number of these old stones were used for the inner arch of the vestry window, and for a discharging arch over the south doorway. Messrs. Clayton & Bell have

designed a memorial light of stained glass in the south-east window of the nave, at the cost of the vicar, and have some in hand for the west window, to be presented by Mr. John Maddison and friends.

Arthingworth (Northampton).—St. Andrew's Church, Arthingworth, was reopened on the 6th November, by the Bishop of Peterborough, after its restoration and partial rebuilding, which have been carried out almost entirely at the expense of the rector, the Rev. H. R. Rokeby, of Arthingworth Manor, by Mr. James K. Colling, of London, architect, and Mr. Robinson Cornish, of North Walsham, Norfolk, builder. Unlike most of the old churches which have been handed down to us, the stones of the walls of this church were found to have been put together with nothing but mud,—clay and mortar—having no cementing qualities whatever. This discovery necessarily made the restoration somewhat more extensive than was originally contemplated. The nave, piers, and arches, south aisle and the south porch were found to be in a very insecure condition, and had to be almost entirely taken down, and new portions, in many cases, supplied the places of the old; although, wherever it was possible, the old work was simply cleaned and re-erected. A new oak roof, of steep pitch, has been put over the nave; the curved ribs spring from carved stone corbels, containing birds, foliage, and fruit. It is covered externally with Whitland Abbey green slates, having ornamentally cut bands at intervals. The east end of the chancel, which had no architectural character whatever, has been removed, and the new work erected in the position of the original foundations of the chancel, which were found 7 ft. or 8 ft. beyond the wall, taken down. The east window has been made of three lights, with geometrical tracery; and three new side windows (two on the north side and one on the south), and a chancel doorway on the north side have been added. The chancel is covered with a new roof, of the same pitch as the roof of the nave, having a ceiling of polygonal form, divided into panels by oak moulded ribs, with carved bosses at the intersections. The nave and aisle have been rescaued with oak open benches, with carved hench-ends, having foliage conventionalised from nature, consisting of the oak, hawthorn, maple, holly, trefoil, ivy, and rose, besides many other varieties. The reredos is of Caen stone. It consists of an arcade of five arches, enriched by the half-dog, supported on Devonshire marble shafts, having carved stone caps; the spandrels between the arches containing carved designs of the wheat and vine, the passion-flower, and lily. The east window has been filled with stained glass, the subject of which is the Crucifixion, executed by Messrs. Heaton, Butler, & Bayne. The church is heated by one of Porritt's underground stoves. The total cost is somewhere about 2,000l. In the evening of the day of opening, the workmen who had been engaged upon the work of the church were entertained at a dinner given by the rector, who complimented them on the quiet and orderly manner in which each had gone about his work.

VARIORUM.

SPEAKING OF JAPANESE AND CHINESE ARTS, the *Art-Journal* says,—The Japanese are a highly progressive race. From their intercourse with China they have learned much. If they have imparted little in return, the fault lies not in them, but the natives of the flowery land. The insular people have shown a wonderful power of adapting themselves to circumstances. From the Chinese they have learned to make paper, and to prepare tea. Nor have they been content with learning alone. They actually import ceramic articles from China to adorn with their own inimitable lacquer. They study the latest improvements of Europe, instead of at once despising and fearing the "foreign devils." A European official once presented to the Japanese minister a beautifully-finished rifle. His Excellency received it with courtesy, and examined it with care; but quietly remarked that he was of opinion the needle-gun was the weapon of the future! No wonder that such a people, alone among Orientals, readily attempt to intersect their islands by railways.—"Little Kate Kirby," the serial story going on in *Cassell's Magazine*, increases in interest, and is creditable to its author, Mr. F. W. Robinson.—"On the Physical Characteristics of the Missouri River and the Means used for Directing and Controlling its Channel at St. Joseph, Mo. By E.

D. Mason. Printed by St. Joseph Printing Company, 1872." This is a reprint from the local *Railroad Gazette*, of October 5th, 1872, of a paper read before the Civil Engineers' Club of the North West, September 10th, 1872. It shows what can be done in controlling a great river. "The problem was to stop the river where it was, at St. Joseph, and drive it 3,000 ft. east, and through the bar and against the clay bank which was its eastern shore ten years ago. Work was begun for this purpose in October last [1871], and by the 1st of August following all of our objects were accomplished." To give protection to the west approach to the bridge now building over the river, and to insure the passage of the channel of the river through the draw at all times, were the ends to be gained; and the works consisted of dykes and shore protection. The river had theretofore wandered at will over a channel sometimes two miles wide, and often three or four, and there was a fear of its leaving St. Joseph inland altogether.

Miscellaneous.

The Liverpool Labourers' Dwellings Company's New Buildings.—These buildings are now far advanced towards completion. They are being erected on land purchased by the company at the north-west junction of Ashfield and Latimer streets, were erected a few years ago by the corporation, and cover an area of nearly an acre of ground, consisting of two blocks, comprising in all 132 tenements. The frontage to Ashfield-street is 344 ft.; that to Latimer-street being 110 ft. Of the tenements forty-eight are houses containing a living-room and three bedrooms each, twenty-eight contain a living-room and two bedrooms, and forty-eight a living-room and one bedroom. On the ground-floor, facing Latimer-street, are four shops; and four basements are devoted to baths and washhouses. Each house is supplied with a water-closet. The sizes of the living-rooms range from 12 ft. 10 in. by 12 ft., to 12 ft. 2 in. by 11 ft.; and those of the bedrooms from 14 ft. by 10 ft., to 9 ft. 9 in. by 8 ft.; all rooms being 9 ft. high. The floors of the houses in the basement are all laid with cement, as are also the scullery floors, all the other floors being boarded. The buildings are mostly four stories or flats high. On each flat there is a stone balcony communicating with the staircases. Dust-shoots are provided, one between every couple of entrance-doors. There is an open space, or court-yard, between the two blocks, 270 ft. long and 48 ft. wide. The elevations are of common grey North Shore bricks, with Runcorn stone dressings and cornices, and chimney corbellings of patent red brick. The balconies and staircases are of York stone. The architects are Messrs. H. & A. P. Fry; the contractor is Mr. W. Thornton; and the clerk of works Mr. James Peers. The cost of the buildings will be about 18,000l., exclusive of land. The rents have been fixed at from 4s. to 7s. per week. There is already a large application for the houses.

"Godwinia Gigas."—This extraordinary plant has now been somewhat imperfectly known for nearly four years, having been discovered by the late Dr. Scemann in the Chontale Mountains of Nicaragua, in January, 1869. Though living specimens of the root-stock were at once sent to this country, it has not flowered till the present year; specimens, however, soon threw up their single gigantic leaves, one of which in a London nursery attained the extraordinary dimensions of 13 ft. in length. The flower has been looked for with much interest by botanists, and some two years ago a single plant showed signs of flowering, but owing to the negligence of the gardener, it was allowed to rot off. The flower, which comes up by itself, after the single leaf has entirely died off, was expected at the meeting of the Royal Horticultural Society on Wednesday last, but when the day arrived the bud had not opened. This single unopened bud was, however, shown, growing in a large pot; and the following are the exact dimensions:—Length of stalk, 1 ft. 6 in.; length of flower-bud, 1 ft. 3 in.; circumference, 9 in.

St. Peter's, Cornhill.—Considerable works have been executed here under the direction of Mr. J. Drayton Wyatt, and the church was re-opened by the Bishop of London, on the 1st inst. We will give some particulars hereafter.

Fire and Water.—The *American Artisan* says:—Is it possible to build sure? Can a totally fire-proof building be made? To believe that this is impossible would be greatly to depreciate the mechanical and scientific resources of the age. Nothing can burn till heated to the temperature at which it combines with oxygen; the problem of fire-proofing will then be solved when we discover the means by which the temperature of combustibles can be kept from reaching the temperature of combustion. We can apply the most intense heat to steam-boilers without burning them. Why? Because each atom of water they contain is a swift vehicle to seize upon and carry away heat. Let us make up the partition of walls of building in a manner analogous to sectional steam-boilers, and no fire would be communicated from one building to another. A thing so evidentshould have attracted the attention of architects long before this. In this way, iron, which by itself is not a fire-proofing material, can, by the most economical use of water, be made to withstand the severest ordeal. The iron-enclosed water-spaces need not be more than 1 in. in thickness, and need never be subjected to a hydraulic pressure of more than 3 ft. or 4 ft. head. These walls can, therefore, be made of thin metal. They can be supplied with water from the common water-service or from tanks placed at the tops of buildings. In case of fire, the turning of a single cock would supply them with water, and the temperature of the partitions could never rise above 212° F. till the water had all boiled away. In this way, not a tittle of the water now vainly used to extinguish such fires as those of Chicago and Boston would be needed to preserve a whole city.

Accidents.—By the fall of a mill-floor an accident has occurred at Newton Mills, Huddersfield, which resulted in the death of Mr. Fawcett, joiner and builder, and serious injury to a cotton spinner. A fire had occurred at the mills, and considerable damage was done. Since the firemen have been engaged in removing the rubbish from the garret of the mill on to the floor of the fourth story. Mr. Fawcett went to the mill for the purpose of valuing the premises. He entered the third story, and had not been in the room very long before the floor immediately above gave way with a loud crash from the large quantity of material thrown upon it. Mr. Fawcett was completely buried. A gentleman with him was injured, and Mr. Fawcett was killed. An inquest was held, when the jury found a verdict of "accidental death," and passed a resolution of condolence with the wife and family of the deceased gentleman. Mr. Fawcett was a member of the Huddersfield Town Council.—Four men were working on a scaffold at the new Church schools in Bolton road, Pendlebury. Whilst a piece of timber was being raised from the ground by means of a rope, the scaffolding gave way, and the men were precipitated to the ground, a distance of 15 ft. Two of them escaped unhurt, but the other two were badly injured. One has since died.

The Polytechnic College.—Lord Lytton presided, on Friday in last week, at the distribution of prizes and certificates to the members of the evening classes of this college, which is established in connexion with the Polytechnic Institution, and in union with the Society of Arts, the Science and Art Department at Kensington, and the City of London College. A report, by the Rev. Charles Mackenzie, Prebendary of St. Paul's, and honorary manager of the college, was presented. Mr. Mackenzie stated that the classes had been attended with great success, and that 115 certificates had been awarded by the three institutions with which the college was connected. Those of the students who had particularly distinguished themselves would receive books which had been chosen by the young men and women themselves. Lord Lytton distributed the prizes and certificates.

Institution of Surveyors.—At the ordinary general meeting, held on Monday, November 25th, a paper was read by Mr. Arundel Rogers, entitled "Minerals and Minerals." A vote of thanks was unanimously given to the author of the paper, and the discussion was adjourned. The next meeting will be held on the 9th inst., when a paper will be read by Mr. W. Sturge, entitled, "Statistical Notes on the Prices of Agricultural Produce, Labour, and Rent, from the early part of last century to the present Time, with Remarks on the present Aspect of the Labour Question."

Opening of the Workmen's Hall, Rivenhall.—This hall, which has been recently built through the kindness and liberality of Dr. Dixon, of Dorward's Hall, for the benefit of the working men of Rivenhall, Kelvedon, Braxted, and Witham, has been opened. The hall is situated in the parish of Rivenhall. The hall will be well warmed and lighted; daily and weekly newspapers and magazines, &c., will be placed upon the table; refreshments (minus intoxicating liquors) will be supplied at reasonable prices; smoking will be allowable; and arrangements are also made for bagatelle, chess, draughts, dominoes, &c. There is also a library of about 300 volumes. An excellent pianoforte has been presented by Lady Tite, and Sir W. Tite, M.P., for Bath, has presented a handsome clock, a bagatelle-board, and also a donation of 10l. The books are mostly gifts.

The Anglo-Swedish Steam Cutting Mills Company, Limited.—This new company has been incorporated under the Companies Acts, 1862 and 1867.—It is to have a capital of 200,000 (with power to increase), in 10,000 shares of 2l. each; the share list to be closed on 15th Dec. inst.; 5s. per share to be paid on application, 15s. on allotment, and the balance in two equal instalments of 10s. at three and six months thereafter. The general manager is Mr. Henry Fairman, late of Stockholm, Sweden; and the temporary offices are at 27, Leadenhall-street. The company is formed to manufacture in Sweden, and supply the trade in England with ready-made doors, window frames, mouldings, and other goods used by builders; packing-cases, boxes, and similar goods; firewood and lathwood; and to trade generally in all descriptions of wood.

The Smithfield Club Cattle Show.—On Wednesday evening the arrangements for the Smithfield Club Cattle Show at the Agricultural Hall were finally completed, under the able direction of Mr. Brandreth Gibbs, the energetic hon. secretary of the club, and Mr. Sydney, the manager of the hall. The whole of the space for agricultural implements in the galleries, and for carriages and other domestic and useful articles, will be occupied, and the demands for it were doubtly in excess of the amount of accommodation. On Monday next, the judging-day, the public will be admitted to the galleries, at a sort of private view, till 2 p.m., and then into the body of the hall. The general show will open on Tuesday, and close on the following Friday.

New Masonic Lodge in Leeds.—On Thursday night, the 21st ult., the Fidelity Lodge of Freemasons, 289, inaugurated their new premises erected in Carlton-kill, Woodhouse-lane. The new building has been erected from designs drawn by Mr. Bakewell, of the Fidelity Lodge. On the ground-floor there is a banqueting-room, 34 ft. by 27 ft. 8 in., and 12 ft. high. Adjoining this are the tyler's rooms, communicating with the kitchen, so arranged that the whole of the household is isolated from the Lodge. On the first floor are the instruction and preparing rooms and the Lodge-room. The latter is of large proportions, with open roof; dimensions, 40 ft. by 27 ft. 8 in., and 16 ft. high.

Reduction in the Price of Welsh Iron.—At a meeting of the principal ironmasters of Monmouthshire and South Wales, to consider the present position of the trade, it was unanimously resolved that notices be issued for a reduction of 10 per cent. in the rate of wages. This step has been decided upon in consequence of the scarcity of orders for manufactured iron, it having been found impossible to keep the works going at present prices. The ironmasters also decided upon reducing the price of rails from 30s. to 40s. per ton, or from 10l. 10s. to 8l. 10s. or 9l. This reduction will affect not only the iron-workers, but the colliers employed by the ironmasters.

Poltimore Hall, Exeter.—The new wing and dining-room and other alterations at Poltimore Hall, designed by Mr. Ferrey, F.S.A., of London, and carried out by Messrs. H. & F. Burridge, builders, of Exmouth, are now complete, and Lord Poltimore, as a token of his approval, has presented the foreman (Mr. James Baker) with 5l., also 5s. to each of the workmen, numbering seventy-four. Mr. Lang, the steward of Lord Poltimore, has superintended the work.

The West Ham Local Board of Health have declined to receive any payment from the Government towards the salaries of the medical officer and inspectors of nuisances.

The Antwerp Competition.—The Hon. Sec. for Foreign Correspondence at the Institute of Architects announces that he has received from the Belgian Legation particulars of a competition, inviting designs for a new hospital at Antwerp. Three premiums, viz.,—3,000 francs, 2,000 francs, and 1,000 francs, were offered. The drawings must be sent in before the 1st of May, 1873. A pamphlet containing a plan of the site and the various conditions of the competition has been forwarded to the Institute.

All Hallows Village Hospital, Ditching-ham.—A few days since the roof-raising here was celebrated by a dinner given, through the liberality of the superior of the House of Mercy, to the tradesmen and their workmen, numbering upwards of eighty, employed in erecting this building. The chair was occupied by Mr. John D. Botwright, the contractor for the whole of the work, supported by the several tradesmen associated with him. The architect is Mr. R. J. Withers; the clerk of works, Mr. Laidler, of London.

Cottages at Wincanton.—Sweetman's local *Monthly Illustrated Journal* writes,—“What can we say to the tale told us by the *Builder*? For the sake of God and humanity, let those amongst us who can, do all we can to alleviate the sorrows, and make comfortable the homes of our 'poor brethren.' Is it not possible, when the cottages of the very poorest fall into decay, and are destroyed, to build others in such a way that no loss will fall on the proprietor? If it is not possible, and no one will build and sustain cottages at a loss, what are the poor to do? Can this be an unimportant question to ask?”

Parks.—Mr. Fras. Peek offered to give 7,500l., provided that the governors of Dulwich College would dedicate for the public use 150 acres of their estate, and form and maintain the same as a park. The governors of Dulwich College came to the conclusion that they would not be able, under their Act of Parliament, to apply any portion of their estate as desired. They are ready, however, to work with the vestry in securing the means to obtain a new park for the increasing and populous neighbourhoods of Walworth, Camberwell, and Dulwich.

Society of Engineers.—At the meeting of the society held on Monday evening last, Mr. Jabez Church, president, in the chair, Mr. W. H. Fox read a paper on "Continuous Railway Brakes."

TENDERS

For the erection of schools, Woodpecker-road, Newcross, for the London School Board. Cubic contents of the buildings, 250,000 ft. Mr. F. Warren, architect. Quantities by Mr. W. G. E. Bag.—

Perry, Bros.	£5,777 0 0

CASSELL'S TECHNICAL EDUCATOR. The following are amongst the distinguished Writers who are Authors of various Subjects in "CasSELL'S Technical Educator":—
 PROFESSOR BALL, LL.D. CHRISTOPHER DREYER, Ph.D.
 PROFESSOR CARMON, M.D., M.D.
 J. M. WIGGERS, B.A.
 PROFESSOR CHURCH, M.A. ALEXANDER WALLACE, M.D.
 PROFESSOR WYATT, M.A. W. H. WHITE, Fellow of the Royal Society of Naval Architects.
 PROFESSOR THOMAS ROBERTS. SAMUEL HOSLEY, F.R.G.S.
 PROFESSOR F. H. DE LA MOTTE. GEORGE GLADSTONE, F.R.S.
 PROFESSOR ALEXANDER. G. G. BATHURST, G.C.

Now ready, complete in 4 vols. price 6s. each; or 3 vols. half-cloth, 31s. 6d.

CASSELL'S TECHNICAL EDUCATOR—AN ENCYCLOPEDIA OF TECHNICAL EDUCATION. With Coloured Designs and numerous Illustrations.

OPINIONS OF THE PRESS.
The Educational Times.
 "An unique work, which is, indeed, a valuable storehouse of information upon subjects of a technical character. There are few manuals connected either with art or industrial occupations in any of their branches, which the reader will not find treated of in this work, and that, too, in a very complete and exhaustive manner. In view of this character it is of the highest importance that the information it supplies should be thoroughly reliable; and, in an age which is so rapidly advancing, should be brought down to the present time, so as to embrace all the most recent inventions and improvements in mechanical industry. We have therefore to commend this work on conditions are provided for in the fact that all the articles are written, not by amateurs, but by men who have acquired, by special study, the necessary knowledge to speak and write upon the several subjects they treat of. We have little doubt that the 'Technical Educator' will soon become as widely appreciated as its well-known predecessor, the 'Popular Educator.'
The Leeds Mercury.
 "A great and magnificent work. We have no hesitation in affirming that it surpasses in comprehensiveness, thoroughness, and real practical utility, anything of the kind which has ever appeared in this country. Indeed, we know of no work at all comparable to it. The illustrations, which are very numerous, are exceedingly valuable."
Engineering.
 "A most valuable addition to our educational works, which we can heartily recommend to the notice of all who are studying the subjects of which it treats."
Scientific Review.
 "The various subjects are dealt with in such a manner that will enable the novice to acquire a thorough acquaintance with the scientific aspects of the various arts referred to."
Scottman.
 "It is a work that is urgently required, and will no doubt pass with the success it deserves."
 Professor LEONE LEVI writes:—
 "By the publication of such a work you confer the greatest possible service on the cause of technical education."
Lloyd's News.
 "Will do incalculable good in the advancement of Technical Education among the people."
Birmingham Post.
 "One of the most valuable Educational Works issued from the modern press."

CASSELL'S TECHNICAL EDUCATOR contains Coloured Designs, and is richly illustrated. The Work contains an Analytical Index to nearly 5,000 subjects, and is now published complete in 4 vols. extra crown 8vo, 1,600 pages, cloth, price 6s. each.
 CASSELL, PETER, & GALPIN, Ludgate-hill, London, E.C.

UNIFORM WITH CASSELL'S TECHNICAL EDUCATOR. New and Revised Edition, complete in 6 vols. price 4s. each.

CASSELL'S POPULAR EDUCATOR. An entirely New and Revised Edition of the *POPULAR EDUCATOR* has been published, in which all additions and improvements demanded by the great advances made in the various departments of knowledge are perfected by men distinguished in their several branches.
 CASSELL, PETER, & GALPIN, Ludgate-hill, London, E.C.

PERFECTION in BOOKKEEPING.

Builders and others desiring a ready system can have a SET OF BOOKS for BUILDING BOOKS by DOUGLE ENTRY, to which was awarded the Prize offered in "The Builder," No. 1,150, and which has been adopted by many large firms. Also, a modified arrangement by Single Entry, suitable for small Builders.—Address, E. A. & S. George's-road, Roper's-hall, London.

TESTIMONIALS.
"I have tried your system of bookkeeping, and like it very much.—G. D.
"Your system seems thoroughly to meet our requirements."—J. E. H.
"I like your system very much, and shall adopt it."—W. W.
"Having adopted your system of bookkeeping, we can recommend it to the builders generally. Having had it in use over twelve months, we find it takes much less time to keep the accounts than formerly."—R. & M.
"I received yours in due course. They appear to show an excellent mode of bookkeeping. Your directions are most explicit, and sufficiently explanatory."—A. G.
"Messrs. R. & S. have examined your system, and consider it simple, clear, and very satisfactory."
"I greatly appreciate your plan and system of keeping builders' books, and I consider that it has only to be made known to be generally adopted."—T. H.
"Last June we had your improved system of bookkeeping. Since then we have been securing the accounts according to it. I consider it 'ne plus ultra.' It meets the requirements of contract work effectively."—R. E. H.
"I received your models. They fully meet my expectations."—B.
"Your system of bookkeeping appears to me to be excellent."—G. C.
"Your model form of books you sent me is very good."—G. C.
"Your plan of bookkeeping has given me many good ideas."—J. B. C.

LONDON AS IT WAS AND AS IT IS.
ON DECEMBER 31st, will be published, Part I. price 7s. CASSELL'S OLD AND NEW LONDON.

By WALTER THORNTON. Profusely Illustrated.
A history replete with incidents as startling and romantic as those of the wildest fiction.
Proceeds to all Booksellers, or post free from CASSELL, PETER, & GALPIN, Ludgate-hill London.

Bound in cloth, 1s. 6d. or post free for 20 stamps.
STABLES and STABLE FITTINGS.
Includes a considerable amount of useful information on the subject of which it treats.—By J. H. B.
ST. FRANCIS LEWISWORK COMPANY, Old St. Pancras-road, London, N.W.

WORKING PEOPLE and IMPROVED HOMES.

The new and illustrated edition of "The Dwellings of the Labouring Classes," by HENRY ROBERTS, Esq., F.R.S., author of "Home Returns," and "The Physical Condition of the Labouring Classes," will find a summary of the efforts at home and abroad to secure "Healthy Homes" for working men and women.
A most valuable handbook.—By J. H. B.
To be had at the Office of the Society for Improving the Condition of the Labouring Classes, 21, Essex Hall, Strand, Price 7s. Also Designs for Cottages, numbered on sheet, with specifications, &c.

Recently published, cheap 8vo. strongly bound in cloth, with 156 fine Woodcut plates, price 12s. (postage 6d.)

PRACTICAL GEOMETRY for the ARCHITECT, ENGINEER, SURVEYOR, and MECHANIC.

By E. WYDIELL TARN, M.A. Author of "The Science of Building."
No book with the same objects in view has ever been published in which the clearance of the rules laid down, and the illustrated diagrams have been so satisfactory.—By J. H. B.
An excellent treatise, of value not merely to students, but to practical men.—By J. H. B.
London: LOCKWOOD & CO. 7, Stationers' Hall-court, E.C.

MATHEMATICAL INSTRUMENTS.

Their Construction, Adjustment, Testing, and Use; Comprising Drawing, Measuring, Optical, Surveying, and Astronomical Instruments.
By J. F. HEATHER, M.A. Author of "Practical Plane Geometry," "Descriptive Geometry," &c.
Enlarged Edition, for the most part entirely re-written. With numerous Woodcuts.
London: LOCKWOOD & CO. 7, Stationers' Hall-court, E.C.

THE RULE of the LAW of FIXTURES.

Second Edition, embracing References to English, Scotch, Irish, and American Decisions.
By ARCHIBALD BROWN, M.A. Edin. and Oxen, and B.C. Oxon, of the Middle Temple, Barrister-at-Law.
London: STEVENSON & HAYES, Bell-yard, W.C.

IMPERIAL FIRE INSURANCE COMPANY.

Established 1825.
No. 1, Old Broad-street, E.C. and 17, Pall-mall, S.W.
Capital, 1,000,000. Paid up and invested, 700,000.
JAMES HULLAND, Superintendent.

DEATH or INJURY from ACCIDENT.

with the consequent LOSS of TIME and MONEY.
Provided for by a Policy of the RAILWAY PASSENGERS ASSURANCE COMPANY.
Against Accidents of all kinds.
Annual Payment of 2s. to 6s. per Insured, 1,000, at Death, or an allowance at the rate of 6s. per week for Injury.
By J. F. COXHEAD, 10, REGENT-STREET, LONDON.
WILLIAM J. VIAN, Secretary.

BUILDERS' CLERKS' BENEVOLENT INSTITUTION.

At a General Meeting of the subscribers and donors, held at the Office on Tuesday, the 26th inst. for the Election of Officers for the Relief Fund.—Messrs. Arthur Cotes, Matthew Hall, and Thomas Stirling, secretaries.—The following was the result of the Poll.—
Mrs. F. C. Jefferys (elected) votes 124.
Mrs. Finch Spencer, " " " " " 264.
Copies of the Report, list of subscribers, forms of application for relief, copies of rules, and all other information, may be obtained upon application to any member of the Committee: or at the Office, to F. J. MILLETT, Secretary.

BUILDERS' BENEVOLENT INSTITUTION.

AN ELECTION of FOUR PENSIONERS, TWO MEN and TWO WOMEN, was held on 26th ult. at WILLIAMS' ROOMS, 11, King-street, St. James's, EDWIN LAWRENCE, Esq. President of the Institution, in the chair.

Table with 2 columns: Name and Amount. Includes Mrs. Litch (1748), Mrs. Sears (2674), J. W. Annis (2184), Mrs. Bidd (2577), F. London (1496), Mrs. Hambrook (1809), D. Thomas (412), Mrs. Bear (273), R. Bibby (745), Mrs. Williams (404), Mrs. Freeston (1485), Mrs. Silcock (284), Mrs. Lambert (604).

Dec. 6, 1872. A. G. HARRIS, Sec.

CONCRETE BUILDING.—INFORMATION WANTED.

CONCRETE BUILDING.—INFORMATION WANTED. CONCRETE HOUSES built prior to and early in 1863. Payment will be made for information.—Address, 368, Office of "The Builder."

W. H. BARBER, Surveyor, 12, Buckingham-street, Strand, will receive applications for the above and Messrs. Maudslayi & Co. OFFICES to be Messaged. Quantities and Estimates prepared, and every kind of architectural and engineering work undertaken. DISCOUNTS AND INTEREST ALLOWED ESPECIALLY ATTENDED TO.

MR. ARCHIBALD D. DAWNEY, C.E. CONSULTING ENGINEER AND SURVEYOR, 23, Waterloo-calculation, DESIGNS, and ESTIMATES PREPARED FOR IRON GIRDERS, ROOFS, COLUMNS, BRIDGES, GASWORKS, &c. LEVELLING & SURVEYING. Professional Assistance generally.

TO ARCHITECTS, BUILDERS, AGENTS, METAL WORKERS, and OTHERS.—DRAWINGS PREPARED FROM ROUGH SKETCHES, or Instructions for Buildings, or Alterations in any style; also Wrought-iron Work designed in Modern and Italian Styles; Details, Specifications, &c. on Moderate Terms.—Address, ARCHITECT, 18, Sturton-street, Bedford-square, N.W.

PERSPECTIVES, COMPETITION, or OTHER PLANS and DRAWINGS, PREPARED and Etched or Coloured in the best style. Terms strictly moderate. Also, OCCASIONAL ASSISTANCE, in or out of Office.

TO ARCHITECTS or BUILDERS. TWO first-class experienced DRAUGHTSMEN undertake WORK at their own rooms at very moderate terms.—Address, M. K. Post-office Gower-street, Euston-road.

GEO. W. WINGROVE, FRENCH POLISHER TO THE TRADE. No. 24, MOORE-STREET, BRYANSTONE-SQUARE. Builders' Work done on reasonable terms. Gas-fixture maker.

PARTNERSHIP WANTED, in a well-established BUILDERS' BUSINESS. Could introduce capital and connection or would be willing to PURCHASE a BUSINESS.—Address, 99, Office of "The Builder."

AN ARCHITECT, in large practice, has a VACANCY for an ARTICLED PUPIL.—Address, CHARLES NOEL ARMFIELD, York Diocesan Surveyor, Architect, Whitley.

A FIRM of ARCHITECTS, SURVEYORS, and ESTATE AGENTS, in good practice, have a VACANCY for a PUPIL. Must be one who has been well educated and has a taste for drawing, &c. minimum required.—Address, L. G. Post-office, Newport, Monmouthshire.

PUPIL.—A CIVIL ENGINEER, the son of a clergyman, holding an important public appointment, and having charge of an irrigation farm, together with water, drainage, and other works, in view of obtaining an ARTICLED PUPIL, to gentlemen who intend taking up public appointments the above offers unusual advantages to be had, having opportunities of making himself thoroughly acquainted with hydraulic and sanitary engineering, together with the general routine of a public office's office.—Address, No. 114, Colclough-street, Birmingham.

ENGINEERING PUPIL.—A Gentleman, C. E. in the North of England, is prepared to receive a PUPIL into his office. Considerable professional advantages, both as regards scientific training and practical experience are offered.—Address, 10, 12, Leadenhall-street, London, E.C.

INSPECTOR of GAS LIGHTING, City of London.—The Commissioners of Sewers of the City of London desire to employ a fit and proper PERSON to fill the above Office, at the wages of 45s. a week. Age 25 to 35 years. A general statement of the duties can be seen at this Office.—Applications and testimonials from all persons desiring to be considered for the office, with certificate of age, must be addressed to the undersigned, and delivered on or before the 1st of JANUARY, 1873, at TWO o'clock. The person selected must give up his whole time to the duties of the Office. JOSEPH PAUL, Principal Clerk. Sewers Office, Guildhall, November 28, 1872.

BOROUGH of LEEDS.—WANTED, by the Council of this Borough a thoroughly efficient person to undertake the Office of ENGINEER and SURVEYOR, and to carry out and perform the following duties:— 1. To superintend the laying out and levelling of all new streets, and the paving, flagging and levelling of all streets ordered to be paved, &c. and to prepare all necessary plans and specifications. 2. The laying down and execution of sewers and drains, in which the Corporation have to make or connect. 3. The carrying out of all requisites under the Sanitary Acts, Local Acts, or order of any legal tribunal so far as regards structural works relative to sanitary arrangements and nuisances, including non-pollution of streams. 4. The superintendence of construction of privies, subpits, and the like. 5. The ventilation of sewers. 6. The compliance with standing orders of Parliament as to plans and sections in respect of Bills in Parliament introduced by the Corporation, proving compliance with same, and giving evidence, &c. 7. The preparing of the requisite plans, valuations, &c. for the purpose of enabling the Corporation to purchase property by agreement, and the requisite evidence and other matters under the direction of the Town Clerk in cases where the Corporation purchases by compulsion. 8. The suggesting of improvement in street and corporate buildings, and superintending the same if and when ordered to be done. 9. The management as Engineer, when and if required, of the waterworks supplying the town, so far as they are completed and when completed, and if required, the management of all the works. 10. All other duties which may be required of him by the Council or the Committees thereof, and which, in the opinion of the Council, they may consider within the duties of his appointment. 11. To devote the whole of his time to the duties of his office, and not to be engaged in any other office, business, or employment whatever. Salary 600 per annum. The Corporation will in addition provide any necessary clerks and other assistants, offices, stationery, and other working materials. Applications to be addressed to the undersigned, endorsed "Application for Appointment of Borough Engineer and Surveyor," and sent on or before SATURDAY, the 21st DECEMBER, instant.—By order, CAPEL A. CURWOOD, Town Clerk. Leeds, 4th December, 1872.

WANTED, a TOWN TRAVELLER, of good address, well acquainted with Engineers, Architects, Surveyors, Contractors, &c. Applications to be addressed to the undersigned, by letter to Messrs. A. H. BAILEY & CO.'s, Royal Exchange-buildings, E.C.

WANTED, in a Builder's Office, a BOY, who can write a good hand, and is quick at Figures.—Apply, in own handwriting, to A. B. 305, Pall-street, Finsbury, E.C.

WANTED, immediately, in a Country Saw-mill, a competent MAN, to attend to VERTICAL, CIRCULAR, and BAND SAWS.—Address, stating wage and where last employed, 51, Office of "The Builder."

TO PARENTS and GUARDIANS. WANTED, a respectable YOUTH, as INDOOR APPRENTICE to the PUMBLING and FITTING, &c. Premium required.—Apply at the Office, Messrs. HOWARD & GANTLEY, 45, Winchester-street, Finsbury.

WANTED, a BUILDER'S CLERK. A young man of bookish Works, Meadow-row, New Kent-road, any morning at Ten o'clock.

WANTED, a CLERK to a Firm of Land Agents and Surveyors, in the country, who is a good Land Surveyor, Accountant, and Correspondent.—Apply by letter only, stating age, salary required, &c. to St. Wimpole-street, London, W.

WANTED, a thoroughly efficient PRIME COST CLERK, who is also generally up in the details of a builder's office.—Apply, by letter only, stating age, salary required, and previous engagements, to HESSEK, Roberts's Library, Arrol-road, Finsbury.

WANTED, temporarily, in a Country Office, a competent ASSISTANT, who must be a good draughtsman, and well acquainted with church architecture.—Address, stating age, references, experience, and salary required, to No. 27, Office of "The Builder."

WANTED, a clever DRAUGHTSMAN (half-timbered Gothic style), for a short time, in a City office. State experience, terms, and last engagement, to E. S. THOMSON, Leadenhall-street.

WANTED, by a Gothic Architect in London, a DRAUGHTSMAN, able to prepare and finish drawing and details from notes, understood perspective, and able to do from pen-and-ink sketches. He must also be competent to perform the duties required in an architectural office.—Address, with references and terms, to ARCHITECT, care of Mr. Pileher, Gray's-inn-road, W.C.

WANTED, immediately, a good Hand as BELT-HANGER, LOCKSMITH, and GASFITTER.—Apply to GILBERT & CO., Jamaica-road, 74, High-street, Tunbridge Wells.

TIMBER TRADE.—An Importing House requires the SERVICES of a Gentleman to act as OUT-DOOR MANAGER and SALESMAN for various kinds of timber.—Address, with references, Box 16, Post-office, Gt. Malvern.

CLERK WANTED, in a Builder's Office in the country.—Address, stating terms, &c. to 3,003, Office of "The Builder."

A GOOD PLUMBER WANTED. One with knowledge of all the modern practice. A constant job for a suitable person.—Apply to Mr. JACKSON, 233, Wapping, E. before Ten in the morning.

GENERAL EMPLOYMENT, by a GENERAL good JOHNSON PLUMBER, 40, Abchurch-lane, LONDON, GLAZIER, and ZINC WORKER. Well up in general house repair, and jobbing work. Will make himself generally useful, and will do up any kind of work.—Address, 40, Abchurch-lane, London, E.C.

WANTED, CONSTANT EMPLOYMENT, as ZINC WORKER, &c.—Address, T. F. 58, Henry-street, Deptford, Kent.

WANTED, an ENGAGEMENT, as JUNIOR ASSISTANT, for a draughtsman and fair colourist.—Address, No. 10, Office of "The Builder."

TO BUILDERS and CONTRACTORS. WANTED, an ENGAGEMENT, as CLERK in the above. Tried to book-keeping and accounts, preparing plans, taking out quantities, measuring up work, and supervision of men. Aged 22. Good references.—Address, W. 8, Post-office, St. Ives, Kent.

WANTED, a RE-ENGAGEMENT, as SHOP FOREMAN of JOINERS.—Address, T. G. 10, Alfred-street, Colebrook-row, Hillingdon, N.

WANTED, a RE-ENGAGEMENT, as GENERAL FOREMAN or CLERK of WORKS, Carpenter and Joiner by trade.—Address, T. 6, Baynes-row, Coldbath-square.

TO ARCHITECTS. WANTED, a RE-ENGAGEMENT, by the Architect, as JUNIOR ASSISTANT.—Terms moderate.—Address, T. C. 2, Ring-street West, Hammarismit, W.

TO ARCHITECTS. WANTED, a RE-ENGAGEMENT, by an Architect's DRAUGHTSMAN. Eight years' experience.—Address, H. 4, Lubbock-street, S.W.

WANTED, a RE-ENGAGEMENT, as GENERAL or SHOP FOREMAN, by a thoroughly experienced Man. First-class references.—Address, W. P. 4, Lovings-row, Caledonian-row, N.

TO BUILDERS and OTHERS. WANTED, a RE-ENGAGEMENT, by a Builder's CLERK. Well up in prime cost, jobbing accounts, estimating, and superintending men. Ten years' character from best employers.—Address, A. B. 4, Jane-street, Commercial-road, E.

WANTED, a RE-ENGAGEMENT, as OUT-DOOR FOREMAN, by a thoroughly practical JOINER and STAIRCASE BAND. Age 34. Well up in setting out all kinds of work.—Address, W. H. BLUNDIE, 3, Dunoon Cottages, City-road.

TO ARCHITECTS and SURVEYORS. WANTED, a RE-ENGAGEMENT, by an ARCHITECTURAL ASSISTANT, of eight years' experience in both London and provincial offices, who has a fair knowledge of quantities, and not a knowledge of epigraphy. Salary moderate. Terms moderate.—Address, W. D. 115, Cottenham-street, Upper Brook-street, Manchester.

TO GENTLEMEN, and BRICK, TILE, and DRAIN-PIPE. WANTED, a RE-ENGAGEMENT, by a practical Man, to DIG, MAKE, and BURN, and take the entire charge of a BRICKFIELD at per 1,000, in close or Scotch kilns, or clamp work. Over twenty years' experience. Good references.—Address, A. B. 24, High-street, Tunbridge Wells.

WANTED, immediate RE-ENGAGEMENT, by an experienced WORKING FOREMAN of BRICKLAYERS. Well up in setting out all kinds of work. Can take management of a job, having had charge of a number of them. Will take piece work, or go abroad. First-class references, &c.—Address, B. 3, Post-office, Wexham-road, Harrow-road.

WANTED, immediate RE-ENGAGEMENT, as SHOP FOREMAN and a good SHIP FOREMAN.—Address, with references, to Mr. MACHINIST, whose system of working shop and mill in conjunction greatly economises labour. No objection to the exclusive management of entire department or fill up time in the office. (Joiner). Salary moderate.—Address, J. M. J. No. 105, St. Paul-street, Waltham, London, W.

TO BUILDERS and OTHERS. WANTED, CARPENTERS or JOINERS' WORK, with or without material.—Apply, H. GLOVER, No. 13, Percival-street, E.C.

The Builder.

VOL. XXX.—No. 1558.

Building Stones.

PROFESSOR

Hull's book* will be received with welcome by those whose knowledge of the distribution of the many kinds of stone is but limited.

Mr. Hull has had unusual opportunities of acquiring information on the distribution of stones and of their qualities from a geologist's point of view. The book would have been much improved if the author could have added to

this description of the qualities of stones their strength to resist pressure; but this he does of only two kinds,—those of granite and sandstone, the former of which he says will resist a pressure of from 2,300 lb. to 13,400 lb. per square inch rather than the experiments made by Mr. Wilkinson on the granites of Ireland show that it requires those weights to crush cubes of 1 inches, the strongest coming from Newry, county Down, and the weakest from Ballyknockan. The stone from Killiney and Kingstown gave good results. To those whose knowledge of geology and mineralogy is somewhat rusty it will be news to hear that the quartz of granite contains minute cells partially filled with water. Primarily granite consists of quartz, felspar, and mica, and Mr. Hull shows how its composition varies into five different forms. Syenite contains two of the elements of true granite, viz., quartz and felspar, but varies from it inasmuch as it contains hornblende instead of mica; and syenite itself varies in its constituents in two ways; thus, when the free silica (or quartz) disappears, the rock passes into diorite, and when, in addition to quartz, felspar, and mica, hornblende appears, it becomes syenitic granite.

The specific gravity of granite varies from 2.6 to 2.9, and it contains from 65 to 81.7 per cent. of silica. Taking the specific gravity of ordinary granite at 2.66, a cubic foot weighs 166.2 lb., and a cubic yard as nearly as possible 2 tons,—just about twice the weight of a cubic yard of coal. It contains about 0.8 per cent. of water, and is still capable of absorbing about one-fourth more, or 0.2 per cent.; so that a cubic yard of 2 tons contains in its ordinary state about 3½ gallons of water, and some specimens can absorb nearly a gallon more. It is important, in selecting specimens of this rock for structural purposes, to observe the quantity of water they are capable of absorbing, as the influence of frost on stone is in proportion to the quantity it takes up. The pillars of the Carlton Club-house and the Fishmongers' Hall, in London, are of Peterhead granite (Aberdeenshire), also the columns of the interior of St. George's Hall, Liverpool, and those of the Provincial Bank of Ireland, in Dublin. This granite weighs 165 lb. 14 oz. per cubic foot. It is quarried at Stirling Hill. The granite used in the Liverpool, Birkenhead, Newport, and Swansea docks is from Craigairn and Cretown, in Kircubrightshire; also the Liverpool Borough Bank; it is of a greyish colour. It was once supposed that granite is the oldest of rocks, but

it is now known that granites have been formed at several geological periods. The granite of Cornwall and Devon is of more recent formation than the carboniferous system, and that of the Alps of Savoy more recent than the Jurassic (oolitic), while that of the Eastern Pyrenees is more recent than the white chalk. On the other hand, the granites of Scandinavia, the Highlands of Scotland, Donegal, and Galway, are of great antiquity, being older than the Devonian rocks. The granites of Devon and Cornwall are of an age intermediate between the lower carboniferous and Triassic periods. Of this stone the following works are built, wholly or partially:—London Bridge, Waterloo Bridge, Westminster Bridge, the Thames Embankment, and the Tomb of the Duke of Wellington in St. Paul's Cathedral. The syenitic granite of Mount Sorel, in Leicestershire, is of a warm rose tint, and much esteemed for ornamental purposes, but it is extremely hard and difficult to work. It makes very good paving-stone. The granite of Shap, in Cumberland, is a very handsome porphyritic stone. Its prevailing colour is a rich reddish brown. It takes a fine polish, and is now systematically worked by a company, who have set up machinery for cutting and polishing by the side of the Lancaster and Carlisle Railway, near Shap Station. In Ireland granite is found in Donegal, Galway, Mayo, Wicklow, Wexford, Down, and Armagh. The use of granite for architectural purposes, says the author, "is splendidly illustrated in the city of St. Petersburg, to which it is brought from Finland. Here, not only the Imperial palaces and public buildings are constructed with this material, but even ordinary dwellings are partially or wholly built of it; so that St. Petersburg may be considered a city of granite."

The granite of Syene occupies large tracts in Upper Egypt between the first cataract and the town of Assouan, the ancient Syene. It was extensively quarried by the Egyptians 1,300 years before the Christian era, and fashioned into columns, obelisks, sarcophagi, and colossal statues, which are now scattered over Europe, embellishing the cities and galleries of France, Germany, and especially Italy. The marks of the pick and chisel are still fresh in these ancient quarries.

Serpentine, highly esteemed for ornamental purposes in architecture, has a specific gravity of from 2.5 to 2.7, and contains from 38.49 to 44.22 per cent. of silica. It is not suitable for out-door use, especially in the atmosphere of towns; for, being acted on by hydrochloric and sulphuric acids, it is liable either to decay or to become tarnished.

Marble is crystalline limestone, capable of receiving a polish, and, in Great Britain, is derived from the Devonian, carboniferous, Purbeck, and Wealden formations. The specific gravity varies from 2.6 to 2.8.

Gypsum is a hydrous sulphate of lime, consisting of 32.56 parts of lime, 46.51 of sulphuric acid, and 20.93 of water. In its crystalline form it occurs as selenite, which is translucent and colourless; or as satin spar, or fibrous gypsum, also colourless.

Anhydrite is a variety of gypsum, free from water. Its composition is lime 41.18 parts, sulphuric acid 58.82. Its specific gravity is from 2.8 to 3, and it is much harder than gypsum. The chief source of gypsum in this country is the new red marl of the Triassic formation, and the locality that probably yields the largest quantity is Chellaston Hill, near Derby. It is chiefly used in the manufacture of plaster of Paris. Other localities are Orston, near Grantam; the neighbourhood of Newark-on-Trent; Fauld, near Tutbury; St. Bee's Head, near Whitehaven; several localities in Nottinghamshire and Staffordshire; Aston, in Cumberland; and in the vicinity of Watchet, in Somersetshire; also in the isle of Purbeck, in Dorset-

shire. The author also treats of many of the rarer ornamental stones, as fluor spar, rock crystal, malachite, &c., and then proceeds to the calcareous group of building stones, which, in this country, are derived from the carboniferous Permian, and oolitic formations.

The carboniferous limestone is the foundation on which has been reared that great superstructure of sedimentary rocks, which in Lancashire attains the enormous thickness of 18,600 ft., and includes the Yoredale rocks, the millstone grit, and the coal measures.

In Derbyshire, the limestone consists of very pure granular or crystalline carbonate of lime, of grey or bluish colour, with occasional bands of a siliceous stone called "chert." Its upper beds are dark, and produce black marble. The whole mass is about 5,000 ft. thick, and appears to be composed of the remains of corals, crinoids, and molluscs. Its chief use is for mortar, cement, marbles, and for fluxing iron ore. The grits and sandstones of the millstone and Yoredale series generally occur in the neighbourhood of the limestone, and are preferred to the limestone as a material for building. In Denbighshire and Flintshire the limestone is similar in appearance and composition to that of Derbyshire. In the south-west of England it forms an encircling zone round the Somersetshire coal-field, and rises into the table-land of the Mendip Hills.

Excellent building stone is procured from the magnesian limestone of the Permian formation. Near Mansfield, in Nottinghamshire, there is an upper and lower bed of magnesian limestones, with intermediate marls and sandstones. The lower bed is the more important, attaining a thickness of from 70 ft. to 100 ft. It is variable in quality, and at Mansfield passes into a white calcareous sandstone. The compositions of the white and red Mansfield stones (siliceous dolomites) are nearly alike, the white containing 51.40 per cent. of silica, and the red 40.40; of carbonate of lime the white contains 26.50 per cent., and the red the same; of carbonate of magnesia, the white contains 17.98 per cent., and the red 16.10 per cent.; but of iron, the red contains 3.20 per cent., while the white has only 1.32 per cent.

The stone from the Mansfield Woodhouse quarries is a crystalline limestone of a fine yellow colour, in some places speckled with black. Southwell Minster is built of it (twelfth century); so is the Martyrs' Memorial at Oxford. Bolsover-moor stone is very similar; it is a yellowish-brown dolomite, compact and fine grained, but variable in quality, and requires careful selection. The stone from Anston, in Yorkshire (of which the Houses of Parliament are built), includes some stone of good quality. The front of the Museum of Practical Geology, in London, is built of it. The other important quarries of magnesian limestone are at Brodsworth, Cadeby, and Park Nook, near Doncaster; Huddlestone, near Sherburne; and Sonawse, near Tadcaster. Bolsover stone contains 51.10 per cent. of carbonate of lime, 40.20 of carbonate of magnesia, 1.80 of oxide of iron and alumina, and 3.60 per cent. of silica, the remainder being water and loss. Mansfield Woodhouse stone is similar, containing 51.65 per cent. of carbonate of lime, 42.60 of carbonate of magnesia, only a trace of iron and alumina, and 3.70 per cent. of silica. The specific gravity of a dry mass of Bolsover stone is 2.316; the weight of a cube of 2 inches in the ordinary state is 4800.8 grains; when dried, 4881.4 grains; when saturated with water, 5042 grains. One specimen from Cadeby absorbed one-fourth of its bulk of water.

The oolitic limestones are generally soft when first quarried, but harden afterwards, uniform in texture, white, cream-coloured, or yellow, and are composed of fragments of shells cemented by calcareous oolitic material, or else of small grains, or oolites, of carbonate of lime firmly bound together. It is owing to this structure

* A Treatise on the Building and Ornamental Stones of Great Britain and Foreign Countries. By Edward Hull, M.A., F.R.S. Macmillan & Co. 1872.

that the formation has received the name of oolite; but as these strata are largely developed in the Jura mountains, geologists are now inclined to adopt the name of Jurassic in preference to oolitic. In the Bath and Cheltenham oolite, the spherical grains are either hollow or contain as a nucleus a grain of sand, or a fragment of a shell or other foreign substance. The size of the spherules is generally about that of the roe of a small fish. There are four distinct formations of oolitic limestone.—1. The lower oolite; 2, the great or Bath oolite; 3, the coralline oolite, or coral rag; 4, the Portland limestone. The first is found in the Cotteswold Hills more largely than elsewhere. This stone has probably been used in Gloucester Cathedral; the Abbey Church, Tewkesbury; Sudely Castle, and other buildings in the Vale of the Severn. The principal quarries are at Bourton, Broadway, Guiting, Stanway-bill, Clovecloud, Painswick-bill, Sheepscornhill, Stryford, Brockhampton, and Longborough. The Painswick stone is of specially fine quality, approaching the Caen stone in texture. The Bath oolite is divisible into two members,—the lower, including the Stonesfield slate and oolitic freestones of Burford and Tainton; the upper, being formed of a compact white, brittle, or chalky limestone, not suitable for architectural purposes, in Oxfordshire. The most important quarries are situated along the range of the Somersetshire hills, at Sincobomb, Minchinhampton, Bathampton and Bath Bayton, Chippenham, and Douling. Of this stone has been built the Abbey Church at Bath, Glastonbury Abbey Church (eleventh century), and Wells Cathedral (twelfth to fifteenth century). A sample of Bath stone from Box contained of carbonate of lime 94.52 per cent.; of carbonate of magnesia, 2.50 per cent.; iron and alumina, 1.20. The coralline oolite seldom produces a building material.

The Portland limestone, forms the uppermost member of the Jurassic series. It is nearly a pure carbonate of lime, and containing 95 per cent. of this mineral, and 1 per cent. each of silica and carbonate of magnesia. It is superior to the oolitic limestones in hardness and durability in a smoky atmosphere, and it is less absorbent of moisture. When dry it absorbs 8.86 per cent. of its weight of water.

The sandstones are chiefly derived from three geological formations,—the old red sandstone, or Devonian; the carboniferous; and the Triassic; but of these, mostly from the carboniferous series of rocks. Sandstones are less injuriously affected by the acids contained in the atmosphere of towns than limestones are, whether proper limestones or oolitic; but some of them are very porous, and a careful selection of them in this respect is as necessary as with limestones in other respects. From experiments made by Mr. Wilkinson, it appears that some sandstones absorb as much as 11 lb. of water per cubic foot, while others take up no more than 1 lb. As a general result, it may be assumed, says the author, that sandstones of ordinary porosity absorb from 5 lb. to 6 lb. of water per cubic foot. Mr. Wilkinson found the crushing weight to vary from 1,680 lb. to 14,600 lb. for a cubic inch.

An account of the situation of the many sandstone quarries is given by the author, and he reprints the table of the weight per cubic foot of nearly every kind of stone prepared by the late Mr. C. H. Smith.

Another volume, by a practical hand, is still wanted, and many fresh experiments are needed.

ON THE PRICES OF AGRICULTURAL PRODUCE, LABOUR, AND RENT.

FROM THE EARLY PART OF LAST CENTURY TO THE PRESENT TIME.

THIS was the subject of a paper by Mr. William Sturge, read at the ordinary general meeting of the Institution of Surveyors, on the 9th inst.; Mr. E. N. Clifton, president, in the chair. After a series of statements as to the prices of agricultural produce, labour, and rent, from the early part of the last century to the present time, the writer went on to say,—“For the purpose of illustrating the fluctuations in the value of land during the last 100 years, I divide the century into the following periods, viz. :—

1st. Twenty-three years ending 1794, during which there was no great increase in the price of produce, but a gradual advance in rent.

2nd. Twenty years, from 1795 to 1815, when a range of high prices of all kinds of agricultural produce prevailed, consequent on the

French war, and (during a great part of the time) an unconvertible paper currency. I believe I am not far wrong in stating that during this period the rent of land doubled.

3rd. Seven years, from 1817 to 1822, during which prices rapidly fell, notwithstanding a corn law intended to maintain wheat at 80s. per quarter. This relapse, consequent on the exhaustion caused by the long war, and the resumption of cash payments, reached its culminating point in 1822, when the price of produce fell fully 50 per cent. below its maximum ten years before. This was a period of great agricultural distress. Landlords struggled to maintain their advanced rents. Tenants were unable to pay them. The information at my command leads me to the conclusion that the fall of rent from its war maximum may be estimated at about 33 per cent.

4th. Twenty-six years, from 1823 to 1848, exhibiting a gradual recovery in the prosperity of the country and in the prices of produce, and a recovery of say 10 per cent. in rent.

5th. Four years, from 1849 to 1852, exhibiting a very low range of prices of all articles of agricultural produce, consequent on the repeal of the Corn Laws. Rents were generally reduced about 10 per cent. In some cases landowners were obliged to submit to a reduction of 15 to 20 per cent.

6th. Twenty years, from 1852 to 1872, during which an unexampled extension has taken place in trade and manufacture, and the consumption of all kinds of agricultural produce, has enormously increased. The price of corn has been kept down to nearly its previous average by foreign competition, but the prices of meat, stock, and dairy produce have advanced upwards of 50 per cent. The rent of dairy, grazing, and stock farms has advanced 33 per cent., and is now as high as it was during the French war. The rent of arable farms has advanced 10 to 20 per cent., but it has not generally reached the maximum attained during the war; nor is this surprising, when we recollect that during the twenty years, from 1800 to 1819, the price of wheat ruled more than 50 per cent. higher than it has ruled during the last twenty years. The present high prices of meat and dairy produce are no doubt mainly due to the increase of the population, and to the greatly increased consumption of the working classes, and also, though in a less degree, to decreased production caused by the droughts of 1868 and 1870.

It will be seen that during the period of a century and a half included in the foregoing pages, agriculture has had its ups and downs, its lights and shadows, its times of prosperity and adversity. The pages of contemporary writers are pregnant with allusions to periods of agricultural distress. Evelyn, in 1703, says,—“Corn and provisions so cheap that the farmers are unable to pay their rents.” “The Landholder's Companion,” published in 1734, says,—“The interest of our British landowners has been declining several years last past; it has been a general observation that rents have been sinking, and tenants unable to make as good payments as formerly. . . . Before farmers can pay their rents, wheat of middling goodness ought, I think, to sell for about s. 3d. per Winchester bushel, barley for 2s. 6d., and oats 1s. 6d. I know in former times less prices were sufficient; but as circumstances alter the same thing is altered; iron, timber, harvest people, and servants being much dearer than heretofore, corn farms will not yield sufficient profit to the occupiers of them, unless they can have such prices, particularly as cattle, sheep, pigs, butter, and cheese are now one-third part cheaper than formerly, and what is called a living price.”

Arthur Young, writing in 1790, says,—“In the years 1776-77, prices fell considerably, and in 1779, so low that very general complaints have been heard of ruined farmers and distressed landlords; and at the time I am now writing, the fact holds that there is a considerable fall in all products, and great numbers of farmers ruined. I have the prices of wool for forty years now before me; and that which from 1758 to 1767 was from 18s. to 21s. a tod, is for 1779 only 12s., and was in 1778 but 14s. We must go back to 1754 to find a year so low as the last. Wheat and all sorts of grain are greatly fallen.”

Some of our members have doubtless a personal recollection of the collapse of 1822. My own experience does not go back to that date, but I have a vivid remembrance of the difficulties attending the low prices of the years 1849 to 1852, and the anxieties of the land agent during that period.

It is, however, only by a comprehensive survey of a long course of years, that the broad facts can be ascertained and the results fully appreciated. Such a survey I have endeavoured to take in this paper, and if my statistics have been somewhat wearisome, I trust they have not been without interest, and that they will be useful and instructive for future reference.

The general result—the progress of a century—may thus be summed up: a rise of 25 per cent. in the price of wheat, notwithstanding an enormous foreign importation; of 46 per cent. in that of barley; of 33 per cent. in that of oats; of 140 per cent. in those of meat and dairy produce; of about 50 per cent. in that of labour; and of 200 to 250 per cent. in that of rent. It is beyond the scope of this paper to allude to the greatly increased produce of land during the same period, consequent on the improvements of modern agriculture, a subject well worthy of a paper from some member of our institution competent to do it justice.

With the aid of the light of the past, let us now turn our eyes for a few moments towards the future. It cannot be denied that a cloud looms on the horizon, fraught with elements of anxiety, if not of danger: I allude to the labour question. Far be it from me to grudge the agricultural labourer a share in the general prosperity. It cannot be said that his condition has been satisfactory, whether as regards his wages or his habitation, and we must not be surprised at his endeavour to better himself. Labour, like other commodities, must in the long run be regulated by the law of supply and demand. Combination, for the purpose of reaping the benefit of an increased demand for labour is legitimate, and need not be feared were it conducted on fair and proper principles, with a board of conciliation and arbitration, to settle disputed questions without resort to the disastrous system of strikes. But, unfortunately, trade-unions are conducted in a manner utterly opposed to the principles of political economy, and to the interest of the capitalist and the working man. To say nothing of the attacks upon capital, the rules of the unions are destructive to the liberty of the artisan. All other classes in society have full scope for their energy, industry, and skill. The union forbids the strong, able-bodied, skilful man to benefit by his superior strength and skill, by limiting the amount of labour to constitute a fair day's work, that limit being measured by the capabilities of the weaker and less skilful bands. All are thus reduced to one dead level, and a loss is sustained both by the labourer and by the community at large. If similar principles are to be applied to agricultural labour, it is hard to see how farming operations are to be carried on, dependent as they are upon the weather, and requiring to be done precisely at the proper time. If the man is not left at liberty to make his own bargain with his master for piece-work, and if in the critical time of harvest the union is to dictate the price of harvest work, and to order a strike if its terms are not complied with, the position of the farmer will be anything but enviable. Let us hope that by reasonable and timely concession, the labourer may be deterred from submission to a bondage as hurtful to his own interest as to that of his employer.

What further advance may be realised is matter for speculation; but my impression is, that in the course of a year or two we shall see wages ranging from 15s. to 18s. per week, according to locality. It is to be hoped that higher wages and better food may tend to raise the labourer's physical powers, and that thus he may become worth his increased pay. Certain it is, that in those counties in which the highest scale of wages prevails, the men are superior in power and skill to those in the lower waged counties,—a difference partly due, perhaps, to race, but partly, no doubt, to better food. The use of agricultural machinery not only effects a direct saving in labour, but also acts, indirectly, in sharpening the wits and quickening the movements of the labourer. If the men have the good sense to avail themselves of these advantages, without submitting to union interference with freedom of contract, and dictation as to the price of piece-work and the hours of labour, not only will their condition be improved, but the farmer, though he may suffer some temporary loss and inconvenience, will, ultimately have no reason to regret the change. The landlord need fear no reduction of rent, except, perhaps, in the case of heavy clay farms. He will find it necessary to provide better cottages, as the condition of the labourer improves;

but, on the other hand, the labourer will be able to pay an increased rent, so as to afford a moderate percentage on the outlay; thus, it may be hoped, that both landlord and tenant may learn,—

"Out of this nettles, danger,
To pluck the flower, safety."

We have seen the great increase in the value of agricultural produce, rent, and labour, that has taken place during the last century. Is this progressive increase likely to continue? The increase during the last century has not been exceptional; but it is a type of the gradual advance which has been silently but surely going on for centuries past. The same causes that have led to this advance,—increased population, increased demand, and, above all, increased amount of realised capital,—are still operating, and appear likely to operate with greater force than ever. The supply of money has increased, still increases, and will continue to increase, and its value; its purchasing power, will therefore continue to decrease. In other words, the prices of produce will continue to rise, with the exception of articles like wheat, which can be supplied in almost unlimited quantities. It may, I believe, be safely predicted that should our Institution exist and flourish, as we all hope it may, until 1972, the surveyor of that date, whose lot it may be to chronicle the progress of another century, will have to record an advance as great in the value of produce, rent, and labour, as that which I have endeavoured to lay before you.

After a few remarks from members the debate was adjourned to January 27th.

THE EDINBURGH HOSPITALS.*

The financial history of George Heriot's Hospital is remarkable. Heriot, jeweller and goldsmith to James I. of England, died in 1624, and bequeathed the residue of his property, 23,925*l.*, to the erection of a hospital "for the maintenance, relieve, bringing up, and education of poor fatherless boys." The foundation stone was laid in 1628, but owing to the civil war the building was not opened till 1659, the cost having exceeded 30,000*l.* One hundred and eighty boys are maintained in the hospital, where they are taught, in addition to the ordinary branches of English education, French, Latin, and Greek, mathematics, drawing, vocal music, and dancing. Those who manifest talents, and a desire for the learned professions, are sent to the University of Edinburgh, with an allowance for four sessions of 30*l.* a year. Ten outdoor bursaries of 20*l.* a year are likewise bestowed on deserving students in the college. On leaving the hospital, the boys are provided with an outfit of clothes, and a suitable assortment of books. Such as are bound apprentices are allowed 50*l.* in annual sums of 10*l.* during the five years of their apprenticeship, with a present, if merited, of 5*l.* for good behaviour at the end of their apprenticeship. Notwithstanding all this beneficent work, the governors find themselves in possession of large "surplus funds;" they are not quite as rich in money, it may be, as the governors of Christ's Hospital, or Dulwich College, but they certainly seem as abundant in good works as either of those bodies. With their surplus funds, the governors of Heriot's Hospital are planting elementary free schools all over Edinburgh. They have already established thirteen of these schools,—eight juvenile and five infant. They are open, first, for the children, in poor circumstances, of deceased burgesses and freemen; second, for the children of burgesses and freemen who are unable to provide for their support; and third, for the children of poor citizens and inhabitants of Edinburgh residing within the boundaries of the city. The governors are empowered "to allow to any of the boys, in the course of their education at such schools, being sons of burgesses and freemen, such uniform fixed sum of money in bon and place of maintenance, and such uniform fixed sum for apprentice-fee, after their education at the said schools is completed, as shall be determined." About 4,000 children are under instruction in these schools. The annual revenue of the hospital is about 16,000*l.*

The governors of George Heriot's Hospital, as has been seen, devote their attention to the provision of elementary free schools for the instruction of the children of the poor. Their labours in this direction have been attended with the

most complete success. The good they have effected in the course of the last twenty years, and the knowledge and healthy influence they have diffused, are beyond conception. Other workers are occupying, worthily and successfully, another part of the educational field, in making provision of a superior middle-class education at moderate cost.

George Watson, accountant to the Bank of Scotland, who died in 1723, left 12,000*l.* to be invested and expended in much the same way and for the same objects as in the Heriot bequest. A hospital was built on "the Meadows," and opened in 1741. It had accommodation for from 90 to 100 boys, and that number was maintained in it. The youths brought up in George Watson's Hospital had an additional benefit conferred upon them, if deserving, in a sum of 50*l.* presented when they reached twenty-five years of age. A few years since the hospital and its grounds were bought for a site for the new Edinburgh Infirmary, and the administration of this hospital and other endowed institutions was remodelled, and, under the authority of a Provisional Order, which duly received Parliamentary sanction in 1870, their management was entrusted to the Edinburgh Merchant Company, in connexion with the Endowed Institutions (Scotland) Act.

The Merchant Company's Schools include,—
1. The Edinburgh Educational Institution for Young Ladies. The course embraces all the branches taught in the best institutions and boarding-schools for young ladies, and includes French, German, and Latin, lectures on literature and science, algebra, mathematics, drawing, vocal music, instruction on the pianoforte, drill, calisthenics, dancing, and needlework. The fees for the entire course are from 12*s.* 6*d.* per quarter, in the elementary department, to 2*l.* 10*s.* for the advanced division of the senior department. 2. The George Watson's College Schools for young ladies, with a precisely similar course and the same fees as the preceding. 3. The George Watson's College Schools for Boys, in which a course is pursued that qualifies for commercial or professional life, the Civil service, or the universities. It embraces English, Latin, Greek, French, and German; in addition to ordinary branches,—algebra, mathematics, drawing, vocal music, botany, natural history, natural philosophy, chemistry, drill, gymnastics, fencing, and dancing. The fees for the course range from 10*s.* per quarter, for the elementary department, to 2*l.* 10*s.*, for the most advanced. 4. Daniel Stewart's Institution for Boys, in which the course and fees are the same as in the preceding; and 5. James Gillespie's Schools for Boys and Girls. These are primary schools, and profess to provide a superior education, the course including all the ordinary branches, with vocal music and drill, mechanical drawing being taught to the boys, and sewing and knitting to the girls. The fees are 3*s.*, 4*s.*, and 5*s.* per quarter, and 6*d.*, 9*d.*, and 1*s.* per quarter for writing-materials and the use of school-books.

The rewards at the disposal of the governors are numerous and valuable, including sixteen presentations to the foundations; 154 school bursaries, each of which respectively amounts to the cost of the successful competitor's school fees for session 1873-74; and six bursaries of 25*l.* a year, tenable for four years. The governors also award twelve free tickets for the class of Professor Hodgson, of Edinburgh University, on Commercial and Political Economy and Mercantile Law.

In connexion with the George Watson's College Schools, a large house has been recently purchased in Lauriston-lane, Edinburgh, and converted into school-rooms. It is adjacent to the present school-buildings, which were formerly known as the Merchant Maiden Hospital. The new acquisition was of three stories, to which a fourth has been added. The entrance is from the present school-ground, by a new doorway, leading into the new playground, which is 130 ft. by 100 ft. There is also a playroom, 30 ft. by 17 ft., and 20 ft. high, lighted from the roof. The new class-rooms are 20 ft. by 16 ft., and 18 ft. by 15 ft. Two rooms on each of the floors, in addition to master's room, small class-rooms, another play-room, &c. The new upper floor is not divided, and gives a spacious room, 40 ft. long by 26 ft. wide. It has a lofty ceiling with two roof lights. It has also six lofty side-windows.

A spacious playground is attached, for the exclusive use of the elementary scholars, for whom a large hall for recreation is also provided.

The governors have also commenced the erection of a new lecture-hall, capable of accommodat-

ing 1,200, for the use of the senior pupils. It is in the Greek style, treated with something of the freedom of the Renaissance. It is 83 ft. long by 51 ft. wide, 42 ft. high to the cornice, and 62 ft. high to the top of the lantern-light. The added space will accommodate 808; but two other large rooms may be used with it, by the opening of sliding-doors.

When the additions have been completed, the accommodation and appliances of the George Watson's College Schools will be unsurpassed; and it is not to be wondered at that the applications for enrolment should be as numerous as the master and governors can desire, or that the utmost eagerness should be displayed to take advantage of provisions for a course of instruction and training of high order, at a cost little more than nominal.

MEDIAEVAL ARCHITECTURE IN PARTICULAR DISTRICTS.

At a recent meeting of the Architectural Association, the Prize Essay was read by its author, Mr. F. P. Johnson; the subject being "The Special Characteristics of Mediaeval Gothic Architecture pertaining to Particular Districts of the United Kingdom." Of this essay we give a short abstract.

These special characteristics (said the author) may be traced to (1) foreign influence,—priests and nobles from different parts of the Continent at and after the Norman Conquest introducing the artists of other countries, fetters brought by missionary monks and caught up on travels to Rome by hishops, &c.; (2) individual taste,—determining the application of the special forms at any time generally prevalent, the influence of the personal preferences of certain leading original artists moulding for a time at least the architecture of considerable districts; and (3) the nature of the materials obtainable,—the power of obtaining without stint the very best materials of every sort, or, owing to difficulties of transport, restraint in the use of desirable materials, or even the restriction merely to those produced in the locality.

In the Norman style, many essential features appear which, though rare in Normandy (a), may be met with in Burgundy (b), Lorraine, the Netherlands (c), the Valley of the Rhine (d), and even in the north of Italy (e). The following are examples of the illustrations given by the essayist:—

(a) Of peculiar features common to Normandy and England (as one instance among many), the two aisles to the transept at Winchester are connected across the end (a somewhat similar arrangement occurs at Ely), also at St. George de Boscherville (near Rouen).

(b) At Gloucester Cathedral, the columns of the nave (not the arches), the columns of the chapter-house bearing the wall-arcade, together with contemporary works at Tewkesbury, Malvern, and Pershore, resemble the general character the Abbey of Fountains in Burgundy. The chevet in St. Bartholomew the Great, London, is very similar to that of St. Menou, near Moulins. The west doorway at Rochester, and others in Kent, and the Prior's Doorway at Ely,—without chevrons, but with signs of the zodiac and other designs in the arch-mouldings, vesicae-pisces in the tympanum, with figures at the sides, have an almost exact counterpart in the west end of the Cathedral at Autun. Fragments at St. Benigne at Dijon, St. Ayout at Provins, and the Church at Avallon, show also a similar style of decoration.

(c) The west front of Lincoln Cathedral (1073-94) is a screen, afterwards completed in a different manner, but probably in its original design similar to the screens at the west fronts of Belgian and North German churches at this date. The Abbey Church of St. Edmundsbury, Suffolk, is triapsidal, a common arrangement in Belgium and North Germany.

(d) At Waltham Abbey and Durham Cathedral,—at this period held conjointly,—the piers are alternated square (grouped) and round, and the vaulting was originally intended to be quadripartite,—one bay of the nave to two bays of the aisle,—as in the great cathedrals of Worms and Spire, in the Rhine Valley. The arched corbel-tables, supported at intervals by small columns, at Peterborough, and the continuous interlacing arcades, and numerous square and circular turrets there (also parts of the central tower at Norwich Cathedral), are suggestive of details at such churches as Reims and Marston, in the southern portion of the Rhine Valley.

(e) At Worcester, in the nave, transept, and chapter-house, the Lombardic practice of working with two differently-coloured stones is very prominent.

In the Early English Style, the existence of several distinct schools of architecture may be traced,—such as (a) Canterbury (William of Sens, architect, 1174); (b) Winchester (Godfrey de Lucy, bishop, 1185); (c) Lincoln (Godfrey de Meiers, architect, 1186); (d) Yorkshire (John de Eber, abbot of Fountains, 1204).

(a) After the destruction by fire of the choir at Canterbury, in 1174, William of Sens adapted the design of the choir of Sens Cathedral, in the erection of the choir now existing. Here hexapartite vaulting sprung from the level of the triforium capitals, filled arches, the breaking off of the vaulting shafts on a line with the capitals of the

* See p. 942, ante.

when the question first came to the front. With the advantage of this large amount of experience, not only of the actual requirements to be fulfilled, but also in the many shortcomings of the means hitherto adopted, what is there to prevent the immediate commencement of efficient action, even though only on the basis of the apparently unappreciated Act passed last session? Shown of its details though it be, that Act provides for the organisation of the necessary local authorities, and appointment of their executive officials, medical and engineering, and defines in some measure the degree of central supervision which is to be exercised over them. It also provides for the payment of half of the salaries of the local sanitary officials out of the imperial revenue in those cases where the locally-constituted authorities are not bigoted and vain enough to suppose themselves able to cope with dirt, disease, and death, in entire independence of central instruction and control.

Now do we find that these provisions are being availed of in such a manner and to such an extent as the intent and spirit of the Act presupposes? After all the agitation which preceded the introduction of the Bill, and all the discontent which manifested itself when the proposed Act was obliged to be clipped of its details, one would have supposed that, acting upon the principle best expressed by the adage, "Half a loaf is better than no bread," the town and rural district authorities would have created such a stir as had never before been witnessed in a similar cause. It would be supposed that the health authorities would have eagerly availed themselves of the means afforded them by the consolidation of all previous legislation into one comparatively simple enactment, providing unprecedented facilities for the appointment of medical and engineering officials of high talent, to set their respective houses in order. But, giving all due credit to those towns who have so far been wise enough to do so, it must be confessed that their name is far from legion; for in a far greater number of cases valuable time has been frittered away in acrimonious and deadening discussion; while in a still larger number of cases scarcely anything whatever has been done, the authorities seeming content to let matters slide on in their primitive, humdrum fashion, to the end of the chapter.

This is far from an encouraging aspect of the state of sanitary reform, but no good can possibly come of closing our eyes to the actual facts of the case, and that those who are represented I am confident will be confirmed by others who take up the lance in this cause. England, above all other countries, should be active in the furtherance of these measures, for she has hitherto led the way in their prosecution, and is even now on the point of being used as a model in the framing of the new Public Health Bill of Prussia,—one of the greatest sanitary authorities of that kingdom, Dr. Varentzapp, having been commissioned to report as to the provisions to be contained in that Bill.

Your remarks as to the means for the proper combating and dispersion of sanitary evils are well worthy of the earnest consideration of the Minister of Public Health, in whom is vested a responsibility greater than that held by the commander-in-chief of an army, inasmuch as the health, and consequently the lives, of the entire nation are placed under his supervision. And I venture to predict that it will be a bad day for sanitary reform when active and efficient central supervision is withdrawn from the proceedings of the local authority. Local government,—an excellent principle in itself,—carried to the extent of absolute authority, is worse than the old French system of absolute central power; and it is especially in the selection and appointment of local officials where the central authority should exercise an approving and ratifying influence. Far too little attention has hitherto been paid to the qualifications of local officials, who are in many instances appointed in utter disregard of the duties which ought now to become of an important office, either in connexion with or immediately under the control of the engineer of the town or district, is, in too many cases, devoted to persons who are ready, for a low rate of remuneration, to fill the post, but whose training and qualifications are far from being such as to fit them for the discharge of the detecting and remedial duties of such an office. Hence the discreditable state of the sanitary details of many towns, which, perhaps, pride themselves upon possessing a well-organised and zealous sanitary staff. A higher scale of remuneration,

coupled with a more searching examination of a candidate's previous training, and of the nature of the posts he has already filled, would secure the appointment of a much higher class of public engineering officials than is at present the case.

With regard to medical officials,—the light cavalry, as you properly designate them,—there is not nearly so much difficulty in obtaining talented aid, as the medical officer will, in the great majority of cases, be a practitioner in the district for which he is appointed, having daily opportunities in his practice of becoming intimately acquainted with the sanitary condition of the population, and of reporting from time to time, at stated periods or otherwise, thereon. He would thus work in harmony with the engineering officials, and especially with the sanitary inspector, who should be a man having preferably a sound engineering education, and be especially accustomed to the detection and removal of the class of evils popularly known as nuisances. With officials of this standing, possessing not only professional ability, but also professional zeal, and placed under the supervision of a central authority more disposed to guide and instruct than to command, but with full powers for independent action whenever necessary, sanitary reform would rise triumphant from the bog of petty discord into which it seems falling, and we should at last be on the road to the accomplishment of the object which we have so long been bent on attaining.

As to further legislative powers, it will be well to hear in mind the opinion of an authority like Dr. Acland, who recently expressed a hope that the passing of the complete Sanitary Act might be delayed a session or two, so as to afford time for the development of the leading principles involved in the Act already passed. It leaves all local authorities, therefore, to avail themselves of this breathing-time to the best advantage, by using to the utmost and to the best purpose the powers already available, and thus qualify themselves to be heard when the more detailed Bill is brought forward. This they can only do by the immediate appointment of the necessary talented officials, and by modestly placing them and their own deliberations under the eye of the Health Department and its minister, in conformity with the spirit of the Act.

The Health Department must also do its duty fairly and effectually, by exercising its most extensive powers with discretion and firmness, and thus ensure to the nation the fullest and immediate advantage of the aids which past experience and modern knowledge can bring to bear upon the vital questions entrusted by the nation to their superior care. SANTALMAN.

DAMAGES FROM THE RECENT GALE.

CONSIDERABLE damage has been caused by the violent gale of Sunday night last in the south-western suburbs of London. At Richmond a brick wall, 9 ft. high, of over 100 ft. in length, situated at the side of the road leading from Warple-way to King-street, belonging to Mr. Sims, a builder, was blown down across the footpath, and a large quantity of hoarding, 12 ft. to 14 ft. high, adjoining the railway-station yard, was blown completely across the high road to the new station-yard. Some trees in Richmond Park were uprooted. At Twickenham the south side of a brick-and-tile built cottage, which was fortunately "to let," situated near Railway Junction, was blown in, the debris falling through the ceiling of the upper rooms to the floor. At Staines a portion of the roof of a house, belonging to Mr. Denyer, was blown off. At Brentford several of the old houses, situated by the river side, were much damaged.

A large building in Brompton, which was being erected for business purposes, was so shattered by the wind that it will have to be rebuilt. In fact, in all parts of London the damage has been more or less severe.

The gale was nowhere felt with greater severity than at the Crystal Palace, but the building remained firm, and (with the exception of a few squares of glass) uninjured.

At Ramsgate, the most serious part of the damage occurred at the Granville Farm, the property of Mr. Welby Pugin. The farm buildings, which stand near the Cranville Hotel, comprise a long range of stabling. About seven o'clock in the evening, when the gale was at its height, the wind uplifted about 80 ft. of the slated roof, and carried it several feet northwards, tearing

away a considerable portion of the brickwork. Some men and horses had a narrow escape.

Considerable damage has been done in various parts of the city of Oxford. At Oriel College the wall and pinnacles of the chapel were blown down, and at the Great Western Railway the new goods station in the course of erection was completely wrecked. In innumerable instances the boardings erected around buildings have been blown down. Great fears were entertained that the spire of All Saints' Church, which is now being taken down, having been declared unsafe, would not escape, but with the exception of the displacement of a few loose stones it withstood the gale.

One of the pinnacles of St. John's College Chapel, Cambridge, was blown down, within a few feet of the street, and the stone (weighing about 2 cwt.) was embedded in the earth. Similar damage was sustained by New Court, of the same college. The gable-end of a house was blown in in Barnwell, without doing any personal injury.

In Bristol, houses were blown down, scaffolding of new buildings was hurled across the streets, church pinnacles were carried through the roofs, and the top portions of private dwellings were either blown away or carried down through the roofs, inflicting upon the inmates serious injuries, and in some cases resulting in loss of life. The most serious calamity was caused by the wind forcing in the roof of a dwelling-house in Trenchard-street, by which two persons lost their lives, and a third was dangerously injured. The immense carriage factory of Rogers & Co., in College-place, near Brandon-hill, has been almost wholly destroyed, and the loss is estimated at about 3,000. At Christ Church, Clifton, one of the massive pinnacles falling through the roof, above the organ-gallery, did damage to the extent of about 600. Pinnacles of other churches were also blown down, but the damage was not so extensive as in this last case.

At Exeter, three pinnacles of the tower of St. Thomas's Church have been blown off amid a severe gale of wind and rain. One of the pinnacles fell on the roof, which it smashed in, and caused a large quantity of the ceiling to fall on children and other people assembled at divine service. The congregation hurriedly left the church.

At Cork the storm was terrific, and was accompanied with thunder and lightning. Glass in private houses was smashed, and part of the roof of the new granary belonging to Victoria Docks, Passage West, was blown away. Great loss of property is reported, but no loss of life as yet.

DARLINGTON INFECTIOUS DISEASES HOSPITAL.

THE foundation-stone of the proposed Infectious Diseases Hospital at Darlington has been laid by the Mayor (Mr. C. Ineson). The building will be situated a little back from the Yarn-road, opposite the workhouse, and approached by Houtden's-lane. The front will face the south, the length being 218 ft., the extent of the building backwards 192 ft. The site contains two acres of land. The pavilions or wards for the different diseases are apart from each other, but connected by a corridor. The pavilion for cases of small-pox will be at the west end of the structure, and will contain fourteen beds, twelve being for ordinary cases, and two for special cases requiring separation. The pavilion consists of two stories, the upper being for males and the lower for females. The enteric fever pavilion will be placed about the centre of the building, and divided in the same manner as the small-pox ward. The scarlatina ward is to be at the north-east angle, and will contain twelve beds—six for females, and six for males. At the south-east end, adjoining the scarlatina pavilion, will be erected a ward for special separation cases, and it will contain four beds. Each patient will be provided with 2,000 cubic feet, or 144 superficial feet, of air in accordance with the requirements of the Medical Department of the Local Government Board. The administrative department is sufficiently large to accommodate a staff capable of working the hospital if extended to double its present size, apartments for a resident surgeon, matron, and porter being provided. In connexion with each pavilion will be a room for the nurse, with a window looking in upon the patients. The separation case rooms are provided with glass doors.

The material of which the building will be

constructed is brick, relieved by stone dressings. The ordinary open fire-places will be used for heating the wards.

The architect from whose plans the hospital will be erected is Mr. G. G. Hoskins, of Darlington; and the contracts have been let to the following:—Excavating, brickwork, stonework, and plastering, Messrs. M. Watson & Son; carpenter and joiner, Mr. T. Smith; slating, Messrs. J. Atkinson & Son; plumbing and glazing, Messrs. Russell & Co.; painting, Mr. W. Dryden. It is expected that the building will be completed in about eighteen months.

In a town of similar size to Darlington, in the West of England, Mr. Backhouse said on the occasion, the people commenced to build a hospital for forty beds, at a cost of 20,000*l.*; while they at Darlington contemplated building a hospital for forty-four beds, which would only cost 9,000*l.* or 10,000*l.* It was absolutely essential that when they were building a hospital of that kind, they should meet all the requirements of the present day, and erect it according to the scientific medical knowledge of the day.

MIDDLETON BRANCH OF THE UNION BANK OF MANCHESTER, LIMITED.

THE directors of the Union Bank of Manchester have for some time past sought to add to the convenience of their clients by opening various branch banks in towns around the head-quarters. A few years ago they purchased some property in the Market-place, Middleton, and in it established one of these branch banks, subsequently altering and re-adapting the premises, to make them more convenient. The alterations consisted in removing the lower portion of the elevation fronting the Market-place; and substituting in its stead a dado of Yorkshiro pierpoint stone, having a moulded cornice, that also forms the sill for an arcade of windows above, and which have columns, caps, label-mould, and arches (with semicircular intrados and pointed extrados) of polished Yorkshiro stone. At each intersection and extremity of the label-mould of this arcade is an escutcheon carved with the armorial bearings of one of the Lancashire towns in which the Union Bank of Manchester has establishments, viz., Manchester, Salford, Bolton, Oldham, Middleton, Royton, and Tyldesley. To the entrance-hall, the arch of the doorway corresponds with the arcade of the windows; the floor is laid with encaustic tiles, having on them in yellow letters in the centre, "Union Bank of Manchester, Limited," upon a chocolate ground, surrounded with a bordering in various colours; glazed swing-doors lead through a vestibule into the telling-room, and there is also a glazed screen and door separating the business portion from the residence of the local manager.

The improvements have been designed and supervised by Mr. James Redford, of Manchester, architect; and have been satisfactorily carried out by Mr. John Grundy, stonemason, as general contractor; with Messrs. Turner for carpenters and joiners; Mr. Ogden, bricklayer; Mr. Dean, plumber, glazier, &c.; and Mr. Fitzgerald, plasterer; all of whom belong to the district.

ALL SAINTS', STAUNTON.

THE Church of All Saints, Staunton, in the Forest of Dean, has been re-opened for divine service, after considerable works of restoration, both externally and internally. The portions now remaining of the old church are certain portions of the arcades, which are of Norman date; the rest of these arcades of the succeeding transitional period, the arches being pointed; and the base and first stage of the Norman tower. No remains of the foundations of the north and south walls of the ancient aisles were found during the excavations, and there are not any indications of the existence of Norman work visible in the chancel, which is now of Decorated work. During the later periods demolitions and alterations have been perpetrated, until at length the fabric assumed the form of a nave, with a south aisle absorbing the transept, and with a continuous roof from west to east. The north aisle was swept away, with the exception of 17 ft. of its length, which, however, like the south aisle, has been thrown into the north transept.

The works of restoration,—commenced ten years since upon the chancel, which was then partially put in order,—have now been followed

by a new open roof upon the nave; the old oak roof upon the south aisle proper has been opened out, the roof of the south transept has been placed in its position, and the south gable, with three-light decorated window (hitherto in the east wall), has been rebuilt. The porch has been newly roofed; all the old rotten plaster has been taken out, and the walls made good; the old pews have been replaced by new open benches of red deal; the organ is placed in the remaining portion of the north aisle; a prayer-desk and lectern of walnut-wood stand in the two eastern angles of the nave; the north transept is now the vestry; the windows are newly glazed; and the floors are all paved with Godwin's tiles.

The architect employed was Mr. J. W. Hugall, of Oxford; and Messrs. Wall & Hook, of Brimscombe, were the contractors.

Many years since, at a depth of 7 ft. below the level of the churchyard, a remarkable font was found: it is rectangular in form, being 2 ft. 5 in. high, and 1 ft. 9 in. in diameter. It has very little ornamentation, the side having two triangular forms, 9 in. long approaching each other. There is not any base. The upper member, which is 9 in. high, consists of three very depressed circular mouldings and a line of beading. This font has staple-holes on two sides. There is a drain in the centre of the bowl, which is roughly hewn out, and the upper edge is much broken. It is now placed in the south transept for preservation. We cannot ascribe it to any other than the Saxon period, for it is entirely unlike any Norman font, and bears upon it the impress of an earlier origin.

THE GREEK CHURCH AT WOLVERHAMPTON.

To the small number of places in England which has a Greek church Wolverhampton has been added, the only other towns out of London (in which there are two) where a building for the celebration of the worship of that Church exists being Liverpool and Manchester. The structure which has been opened is a very humble one, having been built upon a small scale by the Primitive Methodists. It is, however, of sufficient dimensions to accommodate the anticipated congregation of Greek Church worshippers, who are not expected to number more than fifteen. The church owes its origin to the zeal of an English convert,—Mr. G. W. Hatherly,—who at one time was organist at Tetterhall Church. After his conversion, he advertised for any fellow-believers residing in the district, was written to by Mr. A. J. Claddo, the Greek consul at Birmingham, and a movement commenced which resulted in Mr. Hatherly becoming first, deacon, then priest, to minister in the adopted building in the Waterloo-road, Wolverhampton. The peculiarity about minister and building is that Mr. Hatherly is the first Englishman made a priest of the Greek Church, and the building just opened is the first in which the service of that Church has ever been said or sung in English.

The interior is as plain and as simple as the outside of the building—small, square, the walls plainly coloured, plain windows with stained glass borders, and the boarded floor covered with cocoa-nut matting, with a few forms on the right and left respectively for males and females, the sexes being kept separate in Greek churches. The larger portion of the floor before the eastern side of the church is left vacant, and at that side part of the floor is raised, gaily carpeted, and upon this dais is placed the Iconostasis, or place of pictures. It is a screen upon which are hung three pictures. The centre one is placed so high as not easily to be seen from the floor; that on the right is a full-length figure of the Saviour, the head surrounded by a halo, having within its circle an inscription in Greek. On the left is a copy of the picture of the Virgin and Child in the Razan Church at St. Petersburg, the complexion of mother and child being more swarthy than would be conceived by an English painter, and the effect of the whole being strange and uncounted. On each side of the Iconostasis and the dais on which it stands is an open screen of stained wood also hung with pictures. One hears the representation of the patron saint of the Church, the prophet Elijah. The artistic figure and drapery are marred by a glaring background of gold. The principal picture on the other screen is said to be a portrait of St. Nicholas; hut, with the exception of the hands

and face, it is wholly covered by a massive silver plate, of a rude style of art, the effect being anything but pleasing. Two other pictures on this screen represent—one the Baptism of Christ, the other his descent into Hades. The Iconostasis itself serves the purpose of the veil of the Jewish temple, and conceals the most holy place, into which the priest only is permitted to pass into which the sacred doors, and that only at certain times and on particular occasions. Within the doors of the Iconostasis the greater portion of the ceremony of consecrating the church was performed, the doors being closed and the performers invisible. In the reading of divine service, the officiating priests were as gorgeously arrayed as Roman Catholic priests at High Mass. The service was a lengthy one, and had to be conducted by the priest fasting.

For these particulars we are indebted to the *Staffordshire Advertiser*.

THE ROTHERHITHE NEW INFIRMARY.

THE Local Government Board and the St. Olavo's guardians have for some time been at issue respecting the building of a new infirmary at Rotherhithe. The Local Government Board requested the guardians to erect an infirmary distinct from the workhouse, which the guardians opposed on the ground of expense, but expressed their willingness to build one attached to the present workhouse.

At the meeting of the guardians held last week, a communication was received from the Local Government Board to the effect that the plan as suggested by the guardians would be sufficient, but that immediate steps must be taken for the building being at once proceeded with, as the Board would have to adopt a more peremptory method to compel them to do so. In deference to this decided intimation from the central authority, the guardians resolved that plans should be at once prepared for the erection of the new building.

NEW OFFICES FOR THE HOLBORN BOARD OF WORKS.

THE Holborn Board of Works have taken a lease of premises in Little James-street, Bedford-row, for twenty-one years, at a rental of 190*l.* a year, which they are about to convert into a new board-room and offices, together with a large hall for holding public meetings in connexion with the district. At the present time there is no public hall in the district in which such meetings can be held. The lower portion of the building is intended to be utilised for the works department, by which a saving to the parish will be effected.

THE NEW CIVIL SERVICE CO-OPERATIVE STORE BUILDINGS.

THE large and prominent block of buildings now in course of erection at the western angle of Queen Victoria-street and Bennet's-hill, for the Civil Service Supply Association, is now so far externally completed as to be ready for covering in. The building consists of two principal elevations, the chief facade being the Queen Victoria-street frontage, which is 63 ft. in length and 61 ft. in height from the street level to the top of the cornice, and contains three stories, besides the ground floor and basement. The ground-floor of this frontage, up to the window-sills of the first story, is built with Portland stone. On each side there are spacious entrances, pediment-headed, with trusses on either side of the doors and granite bases, whilst over the three windows in this part of the elevation there are massive carved figure-heads. The rest of the elevation is of Bath stone, there being five large and handsome windows in each story. Moulded pilasters with Corinthian capitals rise from the bottom of the first to the top of the second story windows, with panels over the windows of the first story, the second story windows being segment-headed. Over the last-named story is a band or string course, and above this the third story, having double semi-headed windows, between which are cast-iron columns, the elevation being surmounted by a moulded cornice, supported by consoles. The whole of the windows in the elevation will be glazed with plate glass. The return frontage in Bennet's-hill extends 107 ft. in depth from the Queen Victoria-street elevation, with which it is uniform both in design and

material to the extent of 42 ft., consisting of Portland and Bath stone, the rest of the elevation, to the extreme rear of the building, being of maln brick, with Suffolk stone dressings and moulded quoins, the windows being also uniform with those in the other portions of the structure. In this elevation there are three entrances, two being intended for the admission of goods, and the third a private entrance. The apartments in the interior of the building are very spacious. The basement will be exclusively set apart for stores and goods of different descriptions, whilst the ground-floor and the first and second stories will be appropriated for the sale of the various articles in which the association intend to deal. The principal sale-room on the ground floor, and those on the first and second stories, which will be approached by a spacious stone staircase, 11 ft. in width, are of large dimensions, being 52 ft. in length by 52 ft. in width, at the rear of which there are also other sale-rooms, each 49 ft. by 35 ft. The apartments in the third story will be exclusively set apart for the executive business of the association and domestic purposes, and will contain the board-room, committee-room, and offices, together with the housekeeper's rooms, kitchen, and other conveniences. In the basement of the building, at the rear of the Bennet's-hill frontage, there are two lifts for the raising and lowering of goods from the ground-floor to the second story. The windows on the ground-floor of the building will all be fitted with iron shutters. The estimated cost of the building, exclusive of the land, which covers an area of about 6,000 square feet, is 20,000. The architect is Mr. E. Saunders, and the contractor Mr. Brass, Mr. J. Barnes acting as clerk of works.

THE ROMAN BATH IN THE STRAND.

It is well worth remembering that, close to the busiest part of modern London, is to be found one of the earliest remains of Roman construction in the metropolis. A hundred yards down Strand-lane, close to the Strand Theatre, is to be found a bath constructed some 1,500 years ago, in which the water is now flowing as freshly and as freely as it did at that time. It is capital water, and King's College and other establishments in the neighbourhood are supplied from this source, which is constant and unvaried. At a guess the bath is about 14 ft. long and 8 ft. wide, rounded at the west end of it where the water is deepest,—say 4 ft. the bottom shelving towards the other end. It is at the deepest end that the spring rises, and the water is so plentiful, probably supplied by the Highgate hills, that it runs away at the rate of about 10 tons per day. As it runs, however, it passes, before going into the Thames, into an adjacent cold-plunge-bath, which thus has a continual change of water for bathers. This latter bath, too, has a story, for it is said to have been formed by the Earl of Essex, Queen Elizabeth's favourite, from whose mansion here a neighbouring street is named. The house, however, we are disposed to think, must have been at some distance from this bath.

The sides of the more ancient bath are formed mainly of thin bricks (about 9 in. long and 1½ in. thick), and mortar. In between the construction of this bath and to-day comes the whole History of England.

PARTIAL FALL OF THE CANTERBURY NEW SEWAGE HOUSE.

AN unfortunate occurrence has happened at the outfall of the Canterbury new drainage works on the Broadwalk-road. The men employed in the filtering-houses were about to enter at seven o'clock, a.m., according to the *South-Eastern Gazette*, when they heard a crash inside, and in a moment the greater part of the building fell in. The portions of the structure which fell were the two chief roofs, 120 ft. in length and 19 ft. each wide; one being over the filtering department, and the other over the settling-tanks, which were supported by the centre wall. This wall gave way, and with it of course the roofs came down. The cause of the unfortunate occurrence, which has entirely put a stop to the workings, is due, says our authority, to the building having been badly constructed; the walls much too thin, and the general construction of them, as well as of the whole building, had. The sewage, always passing alongside the 9 in. walls, has had the effect, or rather the acid

from it, of eating away the lime, and leaving nothing but the sand, and the immense length of the walls, 160 ft., could not stand long under such circumstances. The building was erected by the contractors of the drainage works, under the supervision of the engineer. The city surveyor (Mr. Hall) had some knowledge of the insecurity of the structure, but not the remotest idea of any such mishap as has taken place, nor had the men regularly employed at the works reported to him anything to lead him to suppose such a thing was likely to occur yet. The parts remaining are the walls inclosing, and the roofs over, the storage department, and the first tank. The estimated amount of damage is between 600l. and 700l. Mr. Hall has made arrangements for ranning the sewage into a ditch until he receives instructions as to the course to be pursued, and he was to present a report upon the subject at a special meeting of the local board.

HALIFAX INFIRMARY.

THE alterations and improvements of this Infirmary are progressing; Mr. J. W. Wilson being the mason, Mr. Plant the joiner, and Mr. Walsh the plumber. The excavation for the new ward has nearly been made. On the principal front improvements are being carried out. The narrow passage running around, and thereby darkening all the basement windows, has been done away with, and a wide slope of grass substituted. The roof of the portico has been re-lead and made water-tight, and by lowering the wide footpath leading from the front gates, two additional steps will be added to the broad flight of steps leading to the great doors, and thus more dignity will be given to the Doric front of the building, heightened as it also is by the clearing away of the basement passage. The portion of the New Assembly-rooms taken into the institution, and upon which great alterations have been made, is now nearly ready for use. Out of these rooms a dispensary for out-door patients has been formed. Altogether this part of the establishment, according to our authority the local *Guardian*, will be most complete. The expense incurred upon this part of the extension will exceed 300l. When the new ward is built, and the other rooms are converted into wards, the indoor accommodation will be raised from forty-two to seventy beds, and each patient will have a surface of at least 1,500 cubic feet, a great advance upon the present. When completed the total cost of the alterations will exceed 3,000l.

SANCTUARY REPORT, WHITECHAPEL.

MR. JOHN LIDDLE, medical officer of health, in the course of his report for the quarter ending September 28th, says with reference to *underground rooms illegally occupied*.—"The attention of the sanitary officers has, during the last fourteen years, been directed to this matter, and, as is recorded in my quarterly reports, numerous cellars and underground rooms used as dwellings have been discontinued for such use. There is, however, considerable difficulty in dealing with these cases; for it frequently happens that no sooner has one family been compelled to remove, than, in the course of a short time another, or perhaps the same family, again occupies the room. The inspectors, on visiting several new houses which have recently been erected in this district, found that the underground rooms therein were not fit for habitation, yet many of them were occupied by families as sleeping-rooms, contrary to the provisions of the Building Act. It surely would be much better to get enacted a clause, in the proposed new Building Act, to prohibit the letting of any new house, unless all the rooms therein were fit for habitation, than to allow houses to be built with rooms unfit for habitation, and then, when such rooms are found to be occupied, to empower the Local Board to proceed against the persons using them as sleeping apartments."

Mr. Liddle makes some strong remarks on the condition of the *bakehouses* in his district, and adds:—

"From the above return there will scarcely be a difference of opinion regarding the desirability of effecting a sanitary reform in the bakehouses. In these bakehouses which are situated underground,—where there is a want of daylight; where gas is burned to a great extent; where ample provision is not made for carrying off the products of combustion and the heated air which is combined with the sulphurous acid gas

given off from the oven fires; and especially where adequate means are not provided for the admission of fresh air,—it may reasonably be expected that men remaining in such places for fourteen hours daily will suffer in their health. In addition to these evils, the men are exposed to the inhalation of the fine particles of flour, which act as a mechanical irritant to the lungs. We need not therefore be surprised to find that consumption is a common complaint among the journeyman bakers. Nearly all the men whom I saw at work were pale and unhealthy-looking. On entering the bakehouses, I found in one or two instances such a difficulty of breathing that I could not remain in them longer than a few minutes; and I learned that, whenever a window was opened to let in light and air, the men, who are generally in a state of perspiration, cannot bear the cold draught which then poured in upon them; and they find it more comfortable to work in a heated and ill-ventilated place than to expose themselves to the painful effects of draughts of cold air."

THE RESTORATION OF SALISBURY CATHEDRAL.

THIS restoration is progressing. During the past year the painting of the choir roof has been restored by Messrs. Clayton & Bell. These paintings, specimens of thirteenth-century work, were covered, like much of the rest of the cathedral, by colour wash, which could not be removed without the destruction of the paintings, which, however, were plainly discernible beneath it. Drawings were made, and the paintings have been reproduced. The design of the roof is said to be foreign. In the centre is a large figure of our Lord within the vesica piscis. He is surrounded by the four Evangelists and twelve Apostles. East of this figure, towards the altar, are designs of the twelve months of the year painted in medallions, six on either side. West of the centre figure are twenty-four figures in medallions, in four rows,—six in a row,—of prophets, each bearing a scroll with a Messianic prophecy thereon. Besides the four greater and twelve minor prophets are Job, Abraham, Isaac, Jacob, Moses, David, Zacharias, and John the Baptist. One bay of the choir wall on the south side, and the east wall, have been painted as a specimen of what existed beneath the wash, and as an inducement to complete this part of the work. The old thirteenth-century stalls, the only fittings of the choir which could be kept, have been cleansed from their paint, and wait for proper canopies to be placed above them. The pavement of the choir, which is to be a mixture of encaustic tiles of the old patterns, and of black and white marble lately in the choir, has been ordered by the committee. This will leave very little in the treasurer's hands, whilst the committee have still to provide all the fittings for the choir. These have been estimated at 8,000l., and do not include the reredos and choir screen, which are promised. A lady of the diocese has promised 1,500l. towards the canopies of the stalls, estimated at 3,000l., on condition that another 1,500l. can be raised for the same purpose by Christmas, 1873.

PROPOSED CONVERSION OF PECKHAM RYE INTO A PUBLIC PARK.

THE Camberwell Vestry contemplate forming Peckham Rye into a public park, adding to it a quantity of land at One Tree Hill, Nunhead, which it is proposed to purchase. The proposal has arisen out of the scheme of the Commons Preservation Society requesting the Governors of Dulwich College to dedicate to the public 150 acres of the college estates for the construction of a park in South London. The subject was discussed at the meeting of the Camberwell Vestry last week, when the proposal of the Commons Preservation Society as regards the appropriation of the Dulwich College estates was unfavourably received. It was objected that 150 acres in one piece could not be found on the estate, and that there was a doubt as to the power of the Governors of the College to sell the land for such a purpose, and that, even admitting that they had the power, the cost would be so enormous as to prevent the proposal of the Commons Preservation Society from being carried out. It was urged that according to the present value of land in the neighbourhood of Dulwich the purchase of 150 acres belonging to the college estates would involve an outlay of

150,000l., and it was further pointed out as an objection to the purchase so far as the parish of Camberwell is concerned, that the College estate will in all probability in a short time be occupied with valuable houses, from which a large revenue will be drawn by the parish.

The desirability of a public park in the district was warmly supported by the Vestry, who appear to be unanimously of opinion that Peckham Rye should at once be converted into a park, together with a quantity of land adjoining, up to One Tree Hill, at Nunhead, which should be purchased for the purpose.

Mr. Shields proposed a resolution to this effect, in the course of which he stated that from his own knowledge this land could be purchased at a fair valuation.

The matter was ultimately referred to the favourable consideration of the finance committee, with instructions to report as to the best means of carrying out the object.

ACCIDENTS.

Fall of a Saw-mill.—Extensive stone saw-mills, just constructed by the Portland Stone Company, at Portland, have fallen, injuring several workmen. Some supports gave way whilst a heavy block was being raised.

Fatal Scaffold Accident.—In Traleo, a scaffold erected on the roof of O'Sullivan's Hotel, has given way, and the contractor, Mr. Driscoll, and a man named Cusack were killed on the spot. Another had his skull fractured; and a boy had his wrist broken. One man escaped by putting the claw of the hammer he was using into a hole in the slating, and holding on by it.

Fatal Accident in Newcastle.—A fatal accident has occurred to a master builder, named Barron Robson, at the Osseburn, Newcastle. He was standing on a ladder, repairing the roof of a house at Millar's Hill, when he overbalanced himself, and fell to the ground, a distance of about 18 ft. He sustained serious injuries to his head and hip. The unfortunate man died in the infirmary. Deceased was sixty years of age, and had resided at Osseburn.

CHARTER-HOUSE SCHOOLS.

The 12th of December is known by Carthusians as Founder's Day, and gives special appropriateness to the illustrations in our present issue. On that date, in the year 1611, died Thomas Sutton, a wealthy citizen, who established what Bacon calls a "triple good,"—a hospital, chapel, and school-house,—on the site of a monastery of the Carthusian order (*Chartreuse*) next Aldersgate-street, completed in 1370. After the Reformation the site of the Charter-house was granted by Henry VIII. to John Brydges, yeoman, and Thomas Hale, groom of the King's tents, as a reward for the safe-keeping of his royal pavilions which were deposited there, as "government" to Smithfield. On their surrendering this grant, the king presented the place to Sir Thomas Audley, Speaker of the House of Commons, from whom it passed to Sir Edward North, serjeant-at-law, afterwards Lord North, who was remarkable for keeping on good terms with the winning side all through the political and religious changes of the Tudor era. After some other changes, it came into the hands of the second son of Thomas Howard, Duke of Norfolk, who afterwards sold it to Sutton for 13,000l. Sutton died soon after he had commenced his work and obtained a charter from King James, and some of his relatives sought to set aside the will by which he endowed the establishment, but were defeated.

The hospital was to consist of two parts—the one being eighty "poor brethren," and the other being the forty "scholars," "collegers," or "gown boys," as they were formerly called, who from that day to this have formed the nucleus of the Charter-house School. The former were to have rooms rent free, with certain allowances, and a small pension, and also dinner daily in the Great Hall. They were to be, according to the statutes made by the governors, "gentlemen by descent and in poverty; soldiers that have borne arms by sea or by land; merchants decayed by piracy or shipwreck; or servants in the household of the king's or queen's majesty, and not under fifty years of age, unless they had been wounded in the king's service," when they were eligible at forty. The scholars were also to be "poor scholars," in the sense of boys whose parents needed help towards their

education. These were to be chosen between the ages of ten and fourteen, and educated, fed, and clothed at the expense of the founder. On leaving school they were to be provided with houses or exhibitions of 16l. a year, in order to help them to meet their expenses at Oxford or Cambridge; or, if they declined to go to the University, they were entitled to a grant of money towards their apprenticeship in other walks of life.

According to a recent account in the *Times*, the number of "poor brethren" or "pensioners" has never been increased from its original number (though their stipends have been raised), and the "poor scholars" remained at forty until some fifty or sixty years ago, when as the nominations to the College had come to be matters of favour and interest, it was resolved by the Governors, at the instance of Lord Grenville, we believe, to add four more, in whose case the election should be made by competition. To show how carelessly such matters were handled by a corporate body in the days of "the Georges," we may mention here that the resolution in favour of the addition of four more boys was carried, but that the condition was accidentally postponed to a second meeting, when it was—perhaps conveniently—forgotten, and the result of Lord Grenville's admirable and foresighted resolution was to increase by four the nominations, and, therefore, also the patronage of the governing body.

About thirty years ago, however, the step then taken was carried out, in spirit, at least; for the Governors resolved to add every year to the College or foundation two boys, chosen by competition, under the age of fifteen years. The competition, however, is limited, for a boy must have been in the school for a year at least, either as a boarder or a day-boy, before he can be admitted to compete.

A few years ago removal was determined on; about seventy acres of an estate near Godalming, formerly belonging to the Deanery of Salisbury, were purchased, and the old site was sold to the Merchant Taylors' Company, the amount received sufficing, we believe, to pay the greater part of the cost of the new buildings, as well as for the land.

The site obtained for the Governors by their architect, Mr. P. C. Hardwick, has special advantages which could scarcely be found elsewhere. It is high and commanding, and yet it has a large level area, and, what is of equal advantage in a sanitary point of view, it has a satisfactory subsoil; thus the ventilation and drainage may be made as good as the most scrupulous can desire.

A cricket-ground several acres in extent overlooks the valley of Godalming, and on its northern boundary is a slightly-raised terrace which extends the whole length of the buildings now erected, and what are proposed hereafter.

The present buildings comprise three houses for masters, with accommodation for 160 boarders, and a central building, which is the general school-room, with six class-rooms attached to it. This has been in use for some months.

The houses are similar in general arrangement, and in addition to the several rooms in a gentleman's house, have a series of rooms set apart for the boys, and those more immediately connected with them. The boys have two rooms on the ground-floor: one for seniors and the other for juniors; and on the upper floor they have large dormitories, each boy having his own "cubicle," all having communication with the external air by means of a wood casement. The senior boys have in addition a separate study.

Closely connected with the above are rooms and a study for an assistant master, and rooms for a matron.

Each house is well furnished with bath-rooms and other accessories.

The chapel is now fast approaching completion, and in no part will the careful painstaking of the head-master be more conspicuous than here. Stained glass, by Messrs. Clayton & Bell, will fill the windows from various donors, commencing with her most gracious Majesty.

The infirmary, or sanatorium, is already commenced, and there is but little doubt that no long time will elapse before two other houses, the sites of which form part of the general scheme, will also be commenced, which will give accommodation for 100 additional boys. Another house could be built on the north side of the cloister court, but this site will possibly be appropriated as a common hall; ample room can be found on the estate for any number of school-houses that the most prosperous establishment may require.

The floors of all the buildings are formed with iron joists and concrete, so as to lessen the danger of fire.

The face-work generally is of local Bargate stone, quarried on the estate, with Bath stone dressings.

We may add to the early part of our notice that the draught of a new scheme proposed for "the Regulation and Government of the Charity called Sutton's Hospital, in Charterhouse, in the county of Middlesex," has just been printed and circulated among the officers of the establishment and the eighty "poor brethren," who still remain, for the present, at least, in their old quarters, in spite of the removal of the school. According to this scheme, the charity and its endowments are to be administered henceforth by the newly-appointed Board of Governors, who are to take measures, under the sanction of the Charity Commissioners, to sell the outlying estates belonging to the Charterhouse, and to invest the sum so realised as part of the principal endowments of the Charity. They are then to divide the clear income annually into two equal parts, the one to be applied to the purposes of the school (including the defrayal of such part of the purchase-money of the new site at Godalming as may not be met by the sale of the playground, &c., in London, to the Merchant Taylors' Company), and the other to the purposes of the "Hospital." The "poor brethren" are to be, as heretofore, "deserving men of good character, widowers or unmarried, in decayed circumstances, being or having been officers in the army or navy, clergymen, merchants, or persons engaged in trading, professional, agricultural, or other similar occupations, who have become reduced by misfortune or accident without their own wilful default, and who shall not be less than sixty years of age at the time of appointment, unless the Governors shall see fit in any special case to relax the restriction as to age in favour of a candidate otherwise duly qualified." Each of these brethren is to have a room or set of rooms in the hospital, with an annual stipend of 36l., and a daily allowance of bread and butter (which the Governors, if they see fit, can commute for an additional payment of 6l.), as also a gown or cloak, a "reasonable supply of household linen, fuel, and candles," and a dinner in the Common Hall. These advantages, however, in the lump, the Governors may commute for one fixed annual payment of 80l. in any particular case; and if the funds of the charity shall permit, they may bestow annual pensions of 40l. or 50l. a year upon certain other deserving persons as out-pensioners.

The old building is disappearing. Within the last week the part known as "Gown-Boys," because it was devoted to the residence of the boys upon the College foundation, these boys having hitherto borne that name, has been removed. The building had but few pretensions as having been the early home of many persons who afterwards rose to high distinction in Church and State. Together with the "Gown Boys' Hall" has disappeared also the adjoining apartment, which formerly served as the chief school-room, but which more tokens of having originally formed part of the town mansion of the Howards. We may add that certain arches, with names of the "boys" deeply cut, have been carefully taken down, and will be refixed in some conspicuous portion of the new building, so that the names of the old boys may not be forgotten in the new home.

GRATES AND STOVES.*

As regards grates, the varieties of which are endless, I can only deal with some of the more prominent points of those at present before the public, and note the principles which are or should be observed in them.

The more that fire-brick or fire-clay enters into the composition of the part which encloses the fire the better. It absorbs heat which would otherwise escape, and can communicate it to air passing through spaces in contact with it, without the unpleasant, and doubtless unwholesome, sensation caused by air which is overheated by contact with iron.

The depth from front to back should be small, sufficient that the body of fuel be not too soon exhausted, but no more, or much of the heat generated within the mass of fuel, being prevented from radiating, will be lost.

The form of the back, by what is called the Milner plan, described in a letter to the *Standard* by Mr. W. H. Wheeler, C.E., being in shape like the angular part of the letter K, projecting inwards, about 1 ft. above the grate-bottom, and then returning back, is good, as the angle catches the flame and reflects it into the room, and the smoke curling round the projection comes in contact with the red-hot fire-clay, and thereby is partially consumed. The bottom of the grate by this plan is raised not more than 4 in. above the hearth, and is of solid fire-bricks or a fire-clay slab; the fire made on which gives greater heat and consumes less coal than in ordinary grates.

The slow-combustion grate, advertised by Clark & Hunt, has the fire so placed on a low slab, and inclosed by fire-brick, but would be improved by adding the Milner back. Existing grates may be brought partly under the same conditions by fitting plates of sheet-iron over their gratings at the bottom, to prevent air entering from below. The grate should be half filled with nuts of coal, and the fire made upon this stratum of fuel and allowed gradually to burn down to it. Dr. Arnott's grate is upon this principle, having a box with supply of coal beneath, which is lifted as required upwards to the fire above. The principle would be still further carried out by having the fire beneath, instead of above the grate, if proper draught could be insured; but systems of descending flues are seldom to be depended upon.

There is, without doubt, economy in the plan of thus burning coal downwards; but it demands patience as well as care, for it takes a long time for the fire to become a good one, and it is apt to become dull, so that when really cold a poker frequently disturbs its stratification. Then, though some description of coal can so be wholly consumed, other ashes of other qualities cannot, and thus the fire becomes choked.

To inclose the space underneath the bottom formed by an iron grating would answer the same purpose of preventing air feeding the fire from below, and yet allow ashes to fall through, and these could be removed daily by the servant, by means of a removable door.

The late Mr. Pierce's (now Penfold's) fire-lump grates, and those of Mr. Edwards and others, are good in having the fire surrounded by fire-clay, and the backs grooved behind for the passage of air to be warmed and conveyed where desired. They would be improved by one or other treatment of bottom suggested, and by the Milner form of the back, as also by the provision of a larger space for warming air behind. The invention by Messrs. Young, of Queen-street, Cheapside, recently described in a letter to the *Times*, for introducing fresh supplies of coal when needed into ordinary grates and ranges, into the bottom instead of on to the top of the fire, has the same desired end of making the smoke pass through an already beated mass of fuel, and so becoming consumed, and loss of heating power prevented. Mr. John Taylor, of Whitehall, has an extremely ingenious patented arrangement by which the smoke, after it has risen from the fire, is diverted by a damper, and made to pass round and re-enter the grate at the lower part of one side, and pass through deep bars, of which the bottom is composed, so that the smoke is consumed, and only gaseous products of combustion escape through the other side to the flue proper. Thus the fire is intensified and made brilliant, creation of soot in the flue to a great degree prevented, and fresh air is admitted from the front of the grate through chambers in the substance of the fire-brick sides,

which have had the heat passing entirely round them. Mr. Taylor has recently at my request simplified its details, so that it should be as self-acting as possible, which I consider essential.

Captain Galton's stove has excellent merits in a roomy accessible heating chamber behind; in the proper connexion of the flue from the grate with the brickwork flue above, so that smoke cannot leak into the hot-air chamber; in the facility of introducing the warmed air through any part of the chimney-breast, or to other rooms; and in the shape of the back being concave, so as to have the same effect as the Milner back; but it would, in my opinion, make this grate more economical to shut off the air from the bottom, and feed it only from the front and top.

Mr. Boyd admits warmed fresh air copiously by an ornamental panel above the fireplace opening, whence it rises into the room. This, or the sides of the chimney-breast, are as good positions for inlets as can be chosen; but, if the air enter by the hearth or sides of grates, it will be drawn at once by the fire, and defeat the purpose of ventilating the apartment.

Such grates and arrangements, however, seldom find their way into the bulk of the houses of the middle class; it may be well, therefore, to state that, of ordinary ironmongers' goods, those which have regulating louvres or small doors to the flues at back are economical of heat, minimising the portion that escapes to the flue. Provision of air, however, must in some shape be secured, unless health is to be sacrificed.

Greater economy and more heat will be obtained if those who confine their metal-work to the front bars, and simply construct the rest with fire-bricks or fire-clay slabs.

Even ordinary grates may be improved by getting common pipeclay and modelling it to the shape suggested, covering bottom, sides, and back, and lighting a fire of sticks within to dry it. This will last from two to three years with care, and is not costly to replace.

It is possible, however, while saving at the spigot to lose at the hunchole; or, while careful about the parlour fire, to draw unduly at the coal-cellar for the kitchen range. The ordinary close range, though one of the best inventions of the age, is usually greedy of fuel. If it have, as it may, to aid in warming the house, and ventilate by extraction of foul air, and to heat water for baths, as well as to cook, it will need to be correspondingly fed. The Cromer range has been arranged specially, at my suggestion, to meet the varied demands of cottage and mansion with the smallest expenditure of coal, by Mr. John Barber, engineer, of Leeds, to whom I am in the habit of sending all problems of this kind which arise in my practice to be worked out.

Gas, at present, with the appliances in use, does not contrast favourably with coal in point of economy as a means of warming houses where the work is continuous, but may yet be made very serviceable, and even economically so upon occasion. It can be turned on at a moment's notice, and its full effect attained speedily; it demands little attention and causes no work, and is extinguished as suddenly as it was kindled. These qualities commend it for studies, bed and dressing rooms, and wherever heat may be needed quickly and for a short time only. It can be made cheerful in appearance, making lumps of asbestos, &c., glow with heat as red-hot coals.

Mr. Hammond, gas engineer, of Chandos-street, informs me that, according to experiments he has made, a coal-fire maintained by 20 lb. of coal at a cost of 9½d., when the price is 30s. per ton, will produce as good a result as the combustion of 200 ft. of gas, which costs 9d., at 3s. 9d. per 1,000, both fires being ten hours in action. But he states that when the work is occasional, intermittent, or for short periods, and the waste in lighting up taken into account, gas is not only more cleanly and convenient, but far cheaper than coal, and when coal-fires necessitate extra cost for attendance, this will frequently make gas the cheaper heating agent. Mr. James Thompson found, by an average of thirty-six experiments, that he had to consume 4½ lb. of coals—value, with lighting-wood at present prices, nine-tenths of a penny,—to raise one gallon of water to boiling-point; 4 cubic feet of gas, costing two-tenths of a penny, doing the same work at less than one-fourth of the cost.

There is a grate of French invention in which a ring of gas, burning out of sight above the opening, throws a brilliant glare upon a polished

reflecting metal bottom and back, which radiate heat well, and have a pleasing effect. The cleanliness and beauty of this would make it very applicable to secondary fireplaces in a suite of saloons.

George's Gas Calorigen cleverly disposes of the products of combustion by the same pipe which admits the air supply for the purpose, and provides the apartment with fresh air warmed in passage through another pipe heated by a ring of gas-jets.

All these gas-stoves, as indeed gas-illuminating burners, should, if to be tolerated, have flues to conduct out of the house the products of combustion; but Dr. Taylor claims to have invented a "self-purifying gas stove," with a chemical substance by which the noxious products passing are decomposed. For these, Messrs. Hodge, of 100, Hatton-garden, are agents, and if their promises be realised, they solve a difficult problem, and may tend to the wider introduction of gas as a heating medium for houses.

Gas-stoves constructed with rapid circulation like Gill stoves, disposing satisfactorily of the products of combustion, and warming the air by the inlets to be provided for general ventilation, would, I believe, warm houses cheaper than coal fires at the present price of gas, when account has been taken of the saving in cost of building, furnishing, and maintaining in order, all the provisions and appliances necessary for ordinary grates and stoves.

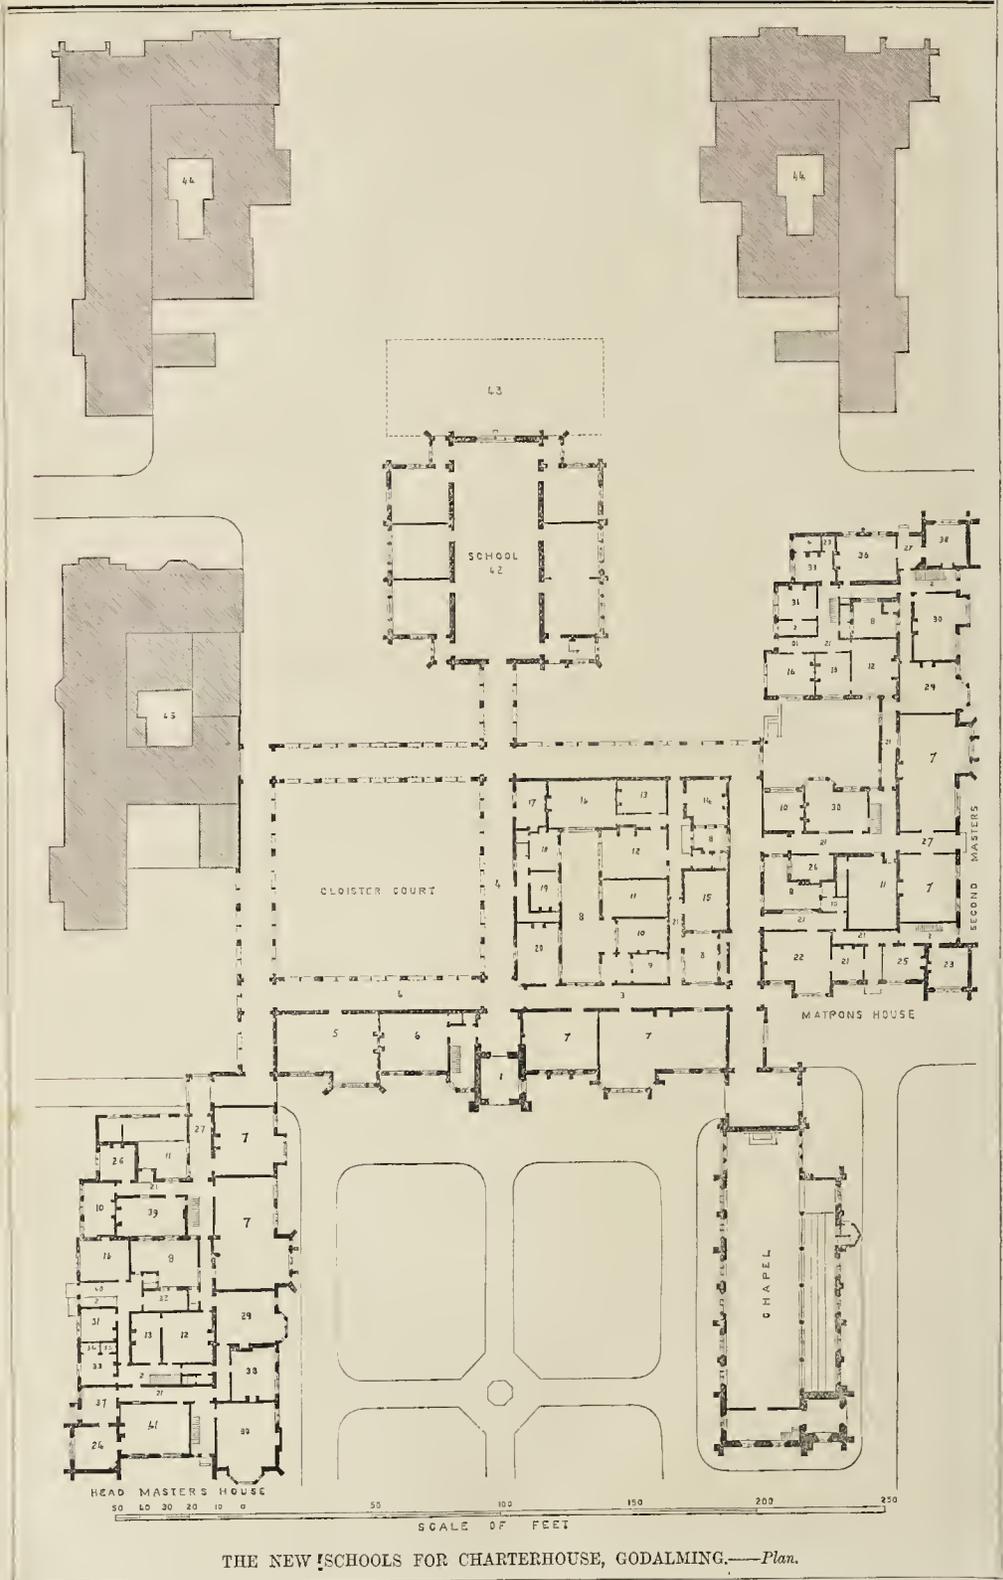

THE ANCIENT ACCOUNT OF THE DELUGE.

In the paper read at the Society of Biblical Archaeology, Mr. Smith commenced by describing the discovery of the tablets containing the text of the Deluge, which date from the reign of Assurbanipal, king of Assyria, B.C. 668. These tablets were copies from more ancient tablets, which Mr. Smith placed 1600 B.C. The Deluge text forms part of a series of legends belonging to the reign of a king named Izdubar. Mr. Smith describes how Izdubar, falling ill, went to seek Sisit, the Xanthus of the Greeks, who was supposed to have been translated. The legend describes Izdubar as seeing Sisit, who, in answer to a question from Izdubar, relates the story of the Flood. Sisit states that the gods revealed to himself the coming deluge, and commanded him to build a ship and put his family and all the seed of life into it; the ship was then to be launched into the sea. Sisit relates how he finished the ark, coated it with bitumen, and placed his treasures and family, his servants, and the beasts of the field in it; he then gives the command of Shammas to him to enter the ark and shut the door, followed by his obeying the command and the commencement of the Flood.

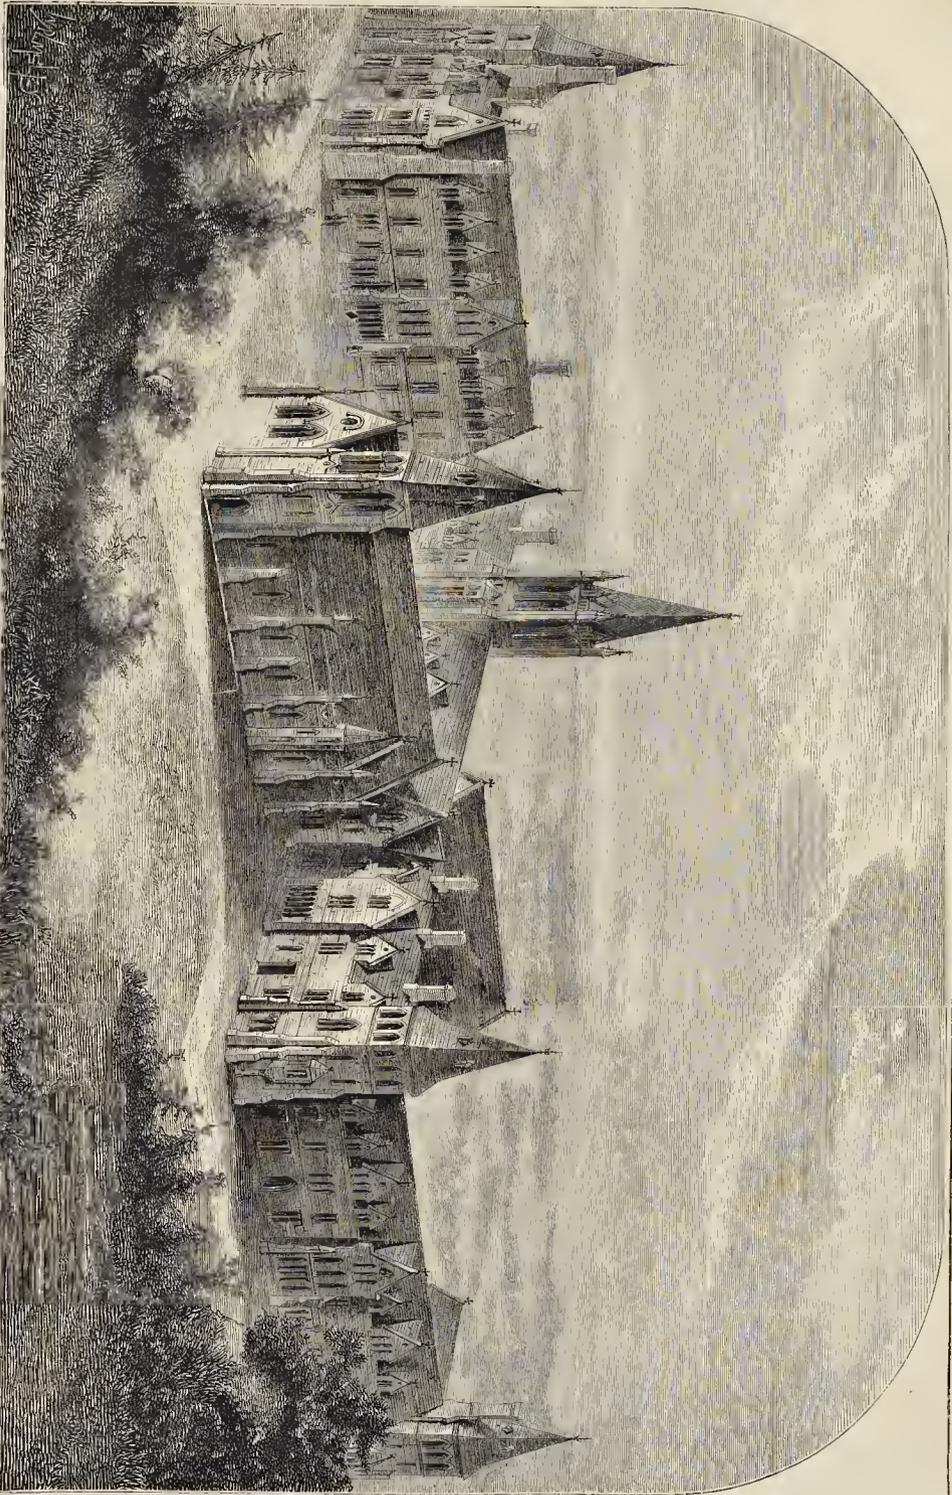

After the description of the Flood, the story described the stranding of the ship on a mountain in Nisir, east of Assyria, and the sending out from it by Sisit first of a dove, next a swallow, and last of a raven. The animals were afterwards sent out of the ship, and Sisit built an altar and offered sacrifices.

At the conclusion of the reading of Mr. G. Smith's paper, the chairman, Sir H. Rawlinson, offered some remarks on the probable age of the Babylonian legend of the Deluge. He showed grounds for believing that the historical chronology of Babylon ascended to a period at least 5,000 years before the Christian era. There was a recorded date in the inscriptions of B.C. 2280 for the conquest of Babylon by the Medes, and the number of kings assigned by Berossus to the dynasty which preceded that event would place the commencement of the historical era in about B.C. 5150. The deified Sage to whom Mr. Smith had given the provincial name of *Izdubar*, and who in his search for immortality had learnt the legend of the Deluge from *Sisit*, must be placed beyond the historical limit, but how much beyond it was of course impossible to say. The Greeks, who had picked up the early traditions of Babylon, appeared, however, to indicate a date by placing the Proto-Patriarch, from whom the Babylonians had acquired the knowledge of astronomy, astrology, magic, and genealogy, 6,000 years before Plato, or 5,000 years before the Trojan war, that is, above 1,000 years before the commencement of the historical period. If *Izdubar*, the first civiliser of the Babylonians, lived about B.C. 6400, they would still have to ascend to a much earlier period for the age of *Sisit*, who was the hero of the Flood, and from whom the legend professed to come.

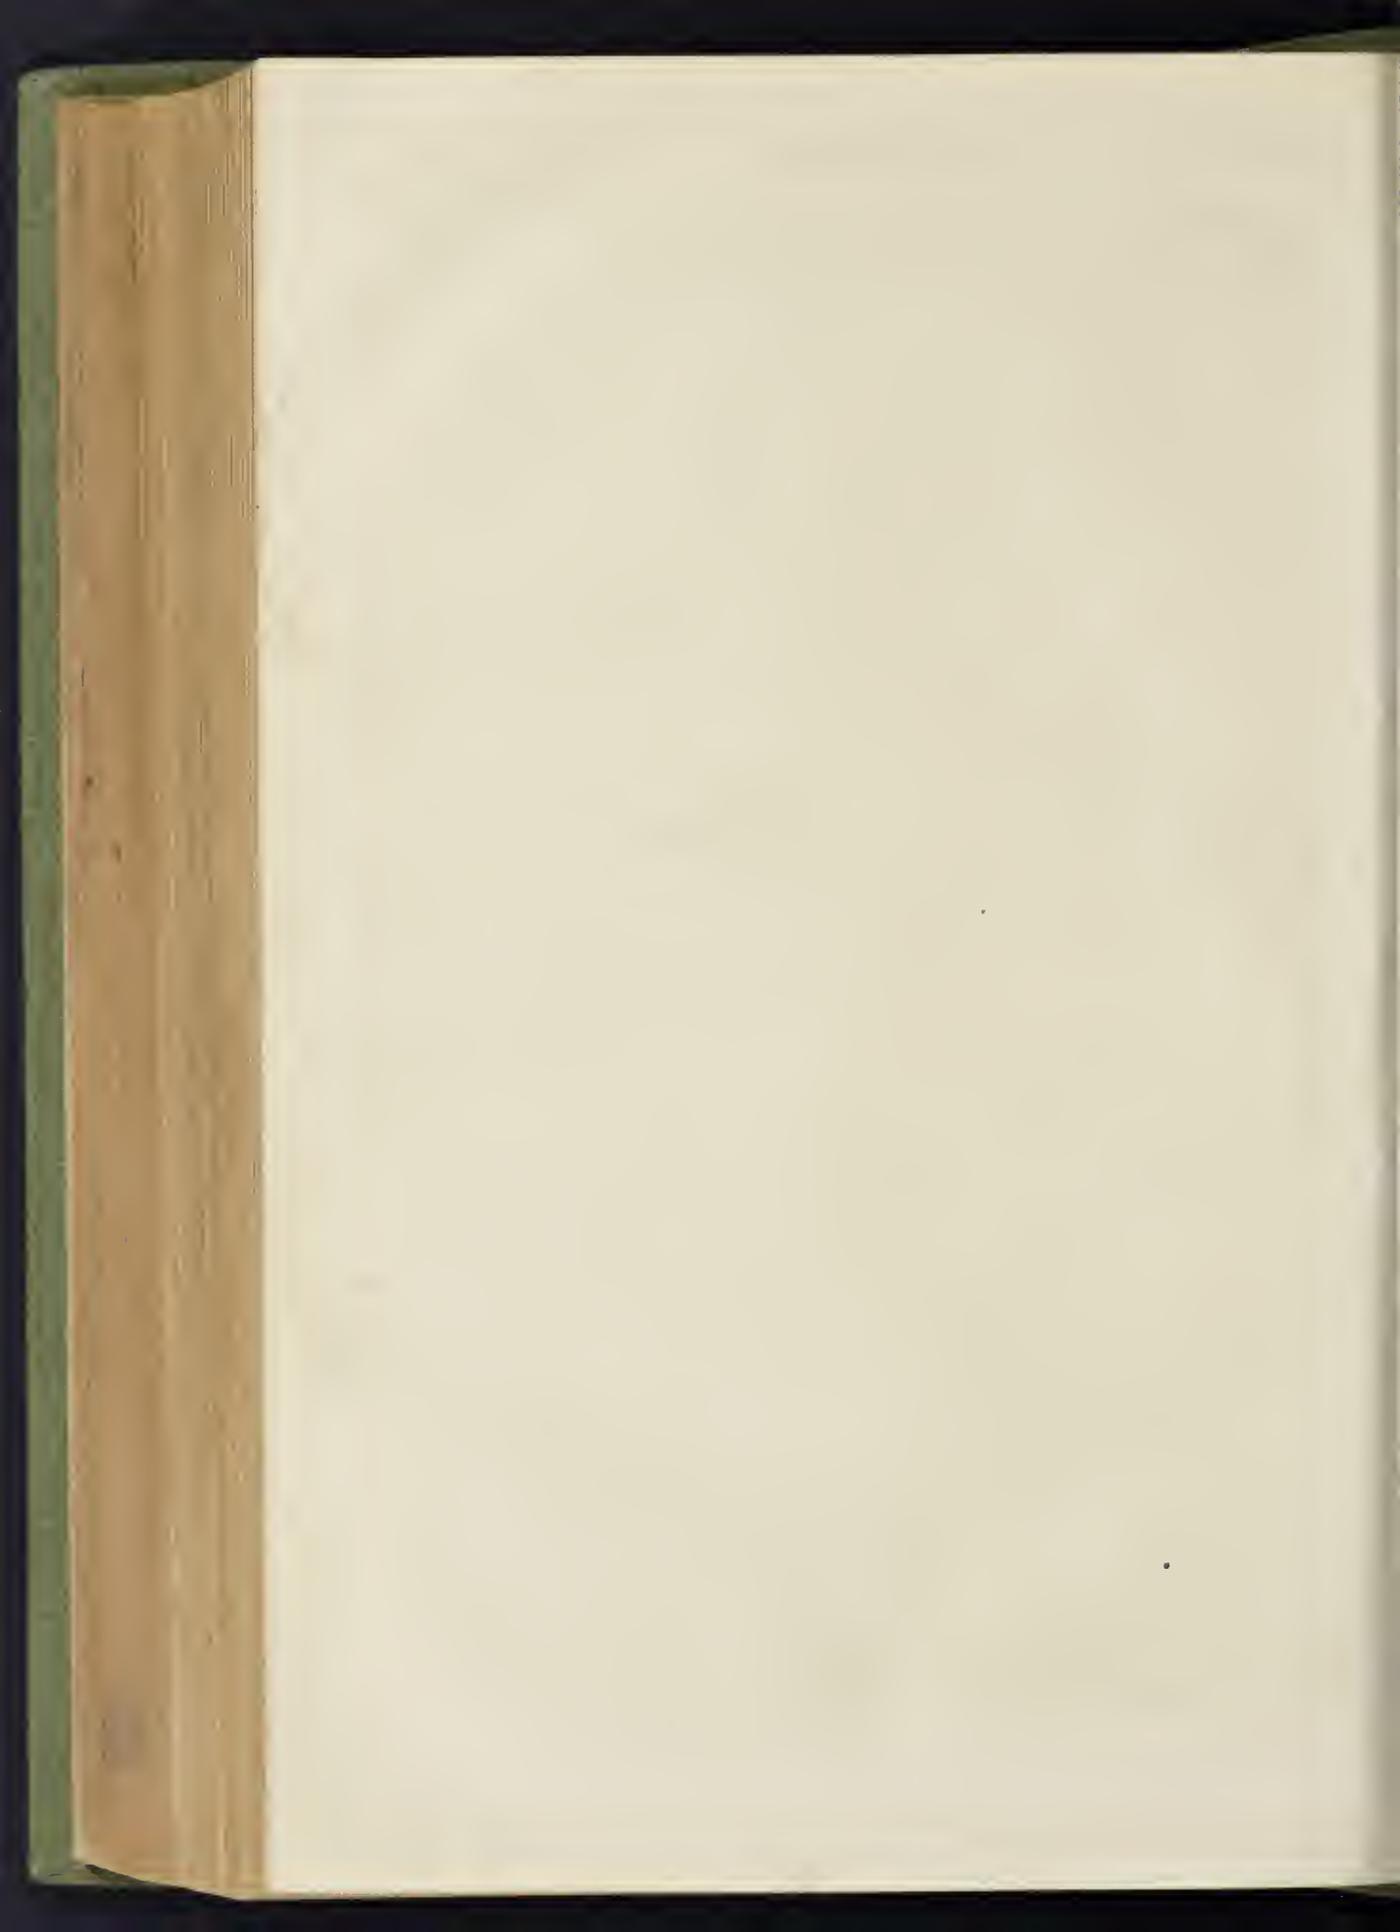

* By Mr. J. P. Seddon. See p. 969, ante.

THE NEW SCHOOLS FOR CHARTERHOUSE, GODALMING.—Plan.

CHAPELHOUSE SCHOOLS, GODALMING, SURREY.—MR. P. C. HARDY, ARCHTCT.

SCHOOL BOARDS.

Ipwich.—The chairman said he had had under consideration the rules issued by the Royal Institute of British Architects, which had been sent by Mr. Eyton, architect for Argyll-street School, in support of an application by him for payment to him of 5 per cent. upon the instalments paid to the builders, or half the commission on signing the contract and the remainder on the completion of the work, and it seemed that those rules supported the claim. The rules, however, were not in any way binding on the Board. It was agreed that 25l., 5 per cent. on the instalment paid to the builder, be paid to Mr. Eyton.

Carlisle.—The clerk reported that there had been a meeting of the Sites Committee, at which they examined six sets of plans sent in for the new schools proposed to be built. These were from Mr. D. Birkett, Carlisle; Mr. Crosby, Hetherington, Carlisle; Messrs. Schools & Cory, London; Messrs. Brabe & Smales, Kendal; "Spes," and "Knowledge is Power," whose letters containing names and addresses are not yet opened. As there were only six sets the committee had left the decision to the Board. After a brief conversation it was decided to exhibit the whole of the plans to the public before any decision were come to. The plans were to be hung in the School of Art, Fisher-street, for public inspection.

Liverpool.—Mr. Whitty moved a recommendation of the Sites and Building Committee, that the Board adopt the plans of Messrs. Read & Goodison, for the proposed temporary schools. He explained that other plans were brought in competition with these, but the cost would be 100l. more. The school might be moved anywhere. In the event of a site not being obtained the plan would not be proceeded with. The cost was estimated at 1,500l. The recommendation was agreed to.

We have engraved views and plans of a number of the schools which are about to be erected for the London School Board, and shall take early opportunities to publish them.

NEW DWELLINGS FOR THE POOR AT THE HOLBORN VIADUCT.

The Holborn Board of Works are taking steps to compel the City Corporation to erect dwellings for the poor near the Holborn Viaduct. The clerk to the Board last week wrote a letter to the Corporation, to the effect that the City municipal body have failed to comply with the Holborn Improvement Act, by which it is provided that they are to build dwelling-houses for the working classes, in room of those taken down to complete the Holborn Viaduct works. It appears from the reply which has been received to this communication from the Corporation, that the subject is now under the consideration of the Improvement Committee, with the view of the buildings in question being proceeded with.

PAYMENT OF ARCHITECTS.

WITH reference to recent observations on this subject, it is, I think, a moot point whether 5 per cent. is a proper and sufficient remuneration for the ordinary professional man. It used to be considered so, and is still, by a large section of the building public, if one may judge by the magnificent offers one sees now and then in your advertising columns. Still, the advance would not lack a precedent. Another professional man has just succeeded in getting an advance of 5 per cent.—I mean our respected relative, the "pawbroker." Whether architects and engineers would like to be associated in the same category I cannot say; but I must confess, I never could, in his case, see why his gains should be increased from 20 to 25 per cent. per annum, at the expense of perhaps the most unfortunate section of our community. Whether there is sufficient cohesion in the architectural profession to compel a general advance, is also, I think, a very doubtful question. I know there are architects who now never get 5 per cent., except on occasional small jobs; and I could name one who commands the work of one of our town corporations in the North, who, some months ago, offered to design and superintend the erection of a large building for a company, and pay the wages of a clerk of works, out of 1½ per cent. on the outlay.

I am very glad indeed to hear from so good an authority that, "not only the cost of living, but the very salaries of clerks and assistants, are so

materially increased." As I belong to that class, and have heard many inquiries on that point, I may say, that in my case, and as far as I can ascertain generally, salaries to clerks and assistants have not increased in nearly the same ratio as the cost of living. I wish they had. That is about the last thing architects think of doing, with rare exceptions. I know that, unless an advance is made on the present remuneration of my class, one, at least, will "do his endeavour" to emancipate himself from that position. There are great numbers too many of us.

E. G.

Your correspondent, "Stentor," has already been answered. He is surely not likely to assert that the price of building has not increased at so high a rate as has the price of provisions, clothing, and the like? In Mr. Brassey's "Work and Wages," however, there is given a statement on this point (p. 197), furnished by Messrs. Lucas, which, if correct, places this view out of the question. I append it:—

"We find," they write, "for some years previous to September, 1853, that the rate of wages was as follows:—"

	For Mechanics, Masons, Bricklayers, Carpenters, and Plasterers.	Labourers.
Previous to 1853	5s. per day of ten hours	3s. per day of ten hours
From Sept., 1853, to March, 1861	5s. 6d. per day of ten hours	3s. 4d. per day of ten hours
From March, 1861, to Sept., 1865	7d. per hour, or 6s. 10d. per day	4d. per hour, or 3s. 6d. per day
From Sept. 1865, to May, 1869	7½d. per hour, or 6s. 3d. per day	4½d. per hour, or 3s. 9d. per day
From May, 1869, to present time	8d. per hour, or 6s. 8d. per day	5d. per hour, or 3s. 11½d. per day

And we consider that the price of building is twenty-five to thirty per cent. more now than it was in 1853."

This calculation was made, of course, before the advance in wages of this year, which would make this per-centage higher still—say, roughly, forty.

F. H. A. H.

NEW LUNATIC ASYLUM FOR MIDDLESEX.

AT the last general meeting of the Middlesex magistrates, a report was received from a committee appointed on the 30th of November, 1871, to procure plans and estimates of cost for the erection of an asylum for the reception of chronic patients to the number of 1,700. The committee recommended that the block system in use at Levensham should be adopted, and that plans should be prepared, and the committee instructed Mr. K. H. Pownall to prepare plans and estimates for the erection of an asylum on the block system, to contain about 1,600 patients, but capable of enlargement so as to receive 2,000. Mr. Pownall had submitted plans and estimates for the reception of 1,700 patients, and recommended that they should be carried into effect at an estimated cost of 1,40,000l., including commission.

The plans and estimates submitted were approved by the court, subject to the consent of the Secretary of State. The committee were authorised to take the necessary steps to carry the plans into effect, and to enter into contracts for the erection of the asylum. The committee were also authorised to accept a tender from Messrs. Estions & Anderson for sinking a well and providing a pump on the site, at a cost not exceeding 3,560l.

WORKMEN'S SOCIETIES.

AT a recent public meeting of the Birkenhead branch of the Amalgamated Society of Carpenters and Joiners, the sum of 100l., accident benefit of the society, was presented to George Latham, one of their members, who has been disabled by disease from following his employment. The presentation was made by Mr. J. Todd, the secretary of the local branch, who enumerated the benefits to be gained by workmen becoming members. Since its establishment in 1860, the society had paid away not less than 95,000l. in benefit donations, of which 39,000l. were for men out of work, 30,000l. for sick members, 3,000l. for loss of tools, 5,000l. for funerals, &c. The local branch had been formed in 1863, with eleven members, and it now had 150, with a balance in the bank of upwards

of 200l.; the general society had over 10,000 members, and funds in hand of nearly 17,000l.

At a similar meeting of the Bradford Operative Stone-masons' Society, a gratuity of 50l. was presented to Nathaniel Watts, a disabled member of the society. The Mayor (Mr. Thompson) presided. The Mayor addressed the meeting. He expressed his entire sympathy with the benevolent objects of the Operative Masons' Society, and also expressed his approval of every legal effort made on the part of trade-unions to obtain a reasonable advance of the wages, but strongly condemned the strikes of the London gasworkers and that of the London police as being perfectly unjustifiable, as well as all unfair and violent attempts to prevent non-unionists from following any occupation they thought proper.

"ARCHITECTS" IN ANCIENT TIMES.

SIR,—I was glad to see that your correspondent "Alpha" had called attention to the unsoundness of view and false deductions of the writer in the *Quarterly*, founded chiefly upon imperfect quotations from Greek literature, as to the absence of anything like an architectural profession in ancient times. The quotation from Plato is so peculiarly direct that in his time, at all events, there was such a distinction of the "architect" as is known to our time, that, as the writer of the articles referred to by your correspondent, it may be interesting for me to say that the quotation as used by me is from the late Lord Aberdeen's work on "The Principles of Beauty in Greek Architecture," published at one time with Stuart & Revett's "Athens," but since as a separate publication (Weale).

J. H. B.

OLD LONDON.

A CORRESPONDENT writes,—In getting out the ground for Messrs. Hilditch's new silk warehouse, at the corner of Cheapside and Old Change, the workmen employed by Messrs. Sharpington & Cole, the contractors, under the direction of Mr. Stephen Rolfe, the general foreman of works, at the depth of 26 ft. below the pavement, dug up a quantity of bones, amongst which was the skull of a wolf; some deer's skulls, with the horns attached, in a perfect state of preservation; several fragments of broken skulls and horns; and what were evidently the fore-arm and some ribs of a human body. In digging for the foundation for the centre column, some fragments of pottery,—ancient water-vessels,—were dug up: on the handle of one was a name,—supposed the maker's,—and on the handle of another, the number "912." In underpinning the party-wall of the adjoining premises, at a considerable depth below the old foundation, some unmistakable evidence of the Great Fire was brought to light,—several pieces of burnt and blackened stone, which at some time had formed part of the mullions and jambs of a large window.

ARCHITECTURAL COMPETITIONS.

SIR,—In reference to Mr. Strong's letter on this matter in your last issue, may I raise a question on the policy and practical results of this course?

Is it not a fact that, as a rule, employers, or would-be employers, resent professional interference and suggestions as to the course that they should pursue as an impertinence? Architects commonly do so with builders and those they employ.

Is it not a fact that the most prominent result of this trade-unionism (for such, in truth, it is) has been to induce committees to append such a note as this to the advertisements they issue in your columns: "The committee to be the judges of the designs"?

Are committees so obtuse that they can so remove the torrent of abuse poured out upon them equalled only by the self-glorification of the architects?

Is it not a fact that, owing to the ill-advised action of the Institute in the matter of the drawings for the Houses of Parliament, the Office of Works drew up a "memorandum of terms of appointment of architects for public buildings," of which clause 17 provides that "no rules of the R.I.B.A. or any other society shall be held binding upon the Commissioners in reference to the works or matters herein referred to"?

Is not the Institute regarded as an Institute of meddlesome people continually interfering with the business of others, and fancying itself abridged by those who decline or resent its advice?

Is it not obvious that we are gradually arraying the public bodies against us? That by trumpeting forth our honesty, integrity, and self-sacrificing qualities, we are suggesting the opposite ideas?

These are signs of the times that it would be well to take to heart; and if, instead of cavilling at the outside world, who need our services, but distrust our capacity, we were to talk a little less, and study a little more, we should leave less room for builders and upholsterers to practise architecture and build, as they do, some of the largest mansions for the "upper ten."

It would be interesting to know how many of the 250 Fellows of the R.I.B.A. write their own specifications, or are capable of doing it. Quantity surveyors and builders will bear me out in this dubious point. These are the men who aspire to be arbiters on all disputed accounts, and to dictate to their brethren and to their employers what they shall do, and what they shall not do. I do not wish to cast any slur upon the "upper ten" of the Institute—their ability and high position are unquestioned, and lesser men feel a pride in being associated with them, and we never bear them cavilling on the question of competitions.

Let us leave trades-unionism to gas-stokers and building operatives, and note its results, but let us have free trade: merit needs no recommendation, or to be fenced about by bye-laws. If we must fight for our living, let us fight, and let those who cannot do so stand aside. We shall not always have to fight—some will get to the front. Let us, at all events, cease arguing about our ill-treatment, and this unseemly quarrelling with our employers.

THOS. CHAS. SOBBY.

STREETS IMPROVEMENT.

Sir,—Whatever may eventually be the beauty or otherwise of the new offices now being built for the Provident Institution Savings' Bank, at the north end of St. Martin's-place, Charing-cross, it must strike all who pass that way (I am thankful I seldom have occasion to do so), that it is simply a blocking up of what ought to be a fine opening into St. Martin's-lane, and thus losing an opportunity for starting a wide street from Charing-cross to Oxford-street and Tottenham-court-road, which has so long been wanted, and much talked about.

The new buildings now being erected are certainly set back a few feet (say 7 or 8), from what was formerly the line of old houses; but what is this trifle compared with what ought to be done, viz.—the pulling down and setting back of all the west side of St. Martin's-lane, to form a street as wide as St. Martin's-place? I need not occupy any more space in arguing for so desirable an object, but must express wonder that it has not before been attended to by the proper authorities, whoever they may be.

W. H. E.

ARCHITECTURE AND CONCRETE BUILDING.

In the report lately given in your journal of the meeting of the Northern Architectural Association, at which the discussion turned upon the uses of concrete in building, it is remarkable that points were raised which have, from time to time, been already shyly discussed by various correspondents in your pages. Mr. Oliver, at the meeting referred to, remarked, "that assuming the adaptability and suitability of concrete for building purposes, it would yet remain destitute of aesthetic and architectural character, and that resort must still be had to stucco and painting." Now, this is just the one conclusion which your correspondents have pointed out need not be arrived at, but on the contrary, that if the durability of concrete is established as free from contraction and expansion, it offers a wide field for the employment of a mode of architectural decoration, already coming more and more into vogue, and which is yet destined, probably, to play a very important part in city or town architecture, with the best and most pleasing results. I refer, as in a former communication, to encaustic tiling, which would be admirably adapted for facing concrete buildings, whether as an internal

or external decoration. What is sought at present for architectural effect in relief of parts, special features, and carved surfaces, but which is so ruinously thrown away under the dirt-producing and corroding influences of a city atmosphere, would be more than supplied by the gradation of colour, arrangement of pattern, &c., of which encaustic tile decoration would be susceptible. I am persuaded that one good, thoroughly artistic attempt at this would go a long way to initiate a much-desired change in our present overdone styles. The conditions of success, however, would be, first, to have good and simple proportions in the mass of the building, and in its subordinate parts, a sufficient variation of surfaces, i.e., not all one dead level, and then a well-studied and skilful arrangement of colour and pattern in the tiling for the respective parts of the building. All should be of an architectural character, and designed and executed specially for the building in hand, and not selected merely from already made patterns, unless these fully answered to that artistic thought which we want to bring into all our architecture, and for the lack of which we have so much that has neither vitality nor originality. The beautiful patterns already produced in encaustic tiling for minor purposes show its thorough capability, as also the remarkable skill and success in design and colour which this species of English art has attained to. Its variety and extended use are endless, and need not stop short of all here indicated as a most pleasing and effective exterior decoration, which would have the charm of novelty, variety, light, and cleanliness, in a remarkable degree, and which would set at rest for ever all questions of decay of material, re-lacquering, or repainting, which at present afflict all city architecture.

NEMO.

GENERAL ASSOCIATION OF MASTER BUILDERS OF LONDON.

The first general meeting of this Association was held on Tuesday last, at the Westminster Palace Hotel, Mr. Hennen in the chair, and was well and influentially attended. A code of rules, previously prepared by a committee, was adopted, and the following were elected officers and committee:—

President—Mr. B. Hennen (Holland & Hennen).
Vice-Presidents—Mr. C. Lucas (Lucas, Brothers); Mr. G. F. Trollope (George Trollope & Sons).
Treasurer—Mr. G. Dines (Dines & Bandrett).
Honorary Secretary—Mr. Stanley G. Bird.
Committee—Messrs. W. Nassau, R. C. (B. Colls & Sons), F. Dove (Dove, Brothers), J. M. Hawkins (Henshaw & Co.), T. R. Hill (Hill & Sons), Horner (Asby & Horner), C. W. Jackson (Jackson & Shaw), J. M. Macey, Manley (Manley & Rogers), G. Myers (Myers & Son), T. F. Rider (Rider & Son), Robinson (Brown & Robinson), Scrievener (Scrievener & White), J. Sewell (Sewell & Son), H. G. Smith (G. Smith & Co.), Waller (Waller & Son).

The Association at present consists of 352 members, usually employing about 35,000 men.

HINTS TAKEN.

Some of my letters to the *Builder* are doing good for the public, viz., public-house traps are being renewed without the conical stand-up bottoms; coal-cellar plates are receiving attention; india-rubber scrapers are now used in the City to clean the pavements; the rotary blast-fan is being adopted in coal-mines; gluey water for watering streets; and many other suggestions of mine that have appeared in the *Builder*. Thanks to Mr. Editor, or my ideas would never have been known.

R. T.

HIGH WAGES AND LOW LIVING VERSUS LOW WAGES AND HIGH LIVING.

Sir,—Wandering through a portion of a neighbouring town the other day, where every house in the locality is occupied by members of the working class, I could not help being struck by the appearance of the residences of men earning nearly two pounds a week, and contrasting it unfavourably with the homes of the many unskilled clerks and assistants, professional and otherwise (whose income is about the same as the above), or the homes of the much-pitied agricultural labourer, who earns a half, a third, and in some cases a fourth, of the wages of the skilled labourer.

In the first case, we find neglected rows of tenements, mostly dirty, ill-ventilated, unwholesome, and unsanitary within and without, in keeping with the personal appearance of the women and children. In the second, rows of well-kept dwellings, at a moderate rent, in a "cheap" suburb, neatly furnished, with an appearance of comfort, not forgetting the sometimes objectionable piano, suggestive of evening amusement. The third case offers, except where generous landlords have been content to receive a very small return for a very large outlay, a cottage dwelling, often aptly termed a "bovel," yet so tidy, and so made the most of that the interior at least is generally sweet, clean, and inviting.

Why will the skilled workmen, with these examples before him, disgrace himself by living as he does? His answer

may be, "We cannot get buildings to live in which we can take a pride; to which I reply, "It is not so." Had workmen quarrel with their trade, it is not speculative building; all alike suffer from that curse. It is in the method of keeping them in order.

It is true the clerks and assistants aforesaid do not pay tribute to the "union," nor are they liable to all the sucking processes of that excellent institution, neither do they go on strike or often get intoxicated, but they are obliged by the position they hold to dress themselves and their families decently, and keep their homes respectable, on 100*l.* a year in most cases. Again, I ask, why cannot the working man do the same? Is it from want of proper education or of that refinement, as necessary to the individual who forms a unit in any civilised society as it is to the character of the work put into his hand? Is it quite impossible for him to rise from his self-degradation, purify his conversation, and improve his mind in these times of "shorter hours" and "higher pay?"

J. J. A.

BUILDERS' RESPONSIBILITIES.

PEARSON V. JOHNSON AND ANOTHER.

In this case, tried at Manchester before Mr. Justice Mellor and a special jury, the plaintiff was an engine-driver on a travelling crane used by the defendants, a firm of builders in London, and the plaintiff's employers, a firm of stone masons in London, the new Tower-hall in Manchester, for which they were the contractors; and he brought this action for the defendants' alleged negligence in respect of the status of the crane, and the defendants' reason of which it broke, and he, together with the engine, stone, and whole apparatus, were precipitated to the ground and suffered most serious injuries, by which he sustained a fracture of the spine, and the crane lay in the rottenness of the "beam," which the plaintiff and his witnesses said was evidenced by a crack which was noticed in it some time prior to the accident, and was known to several of the plaintiff's fellow-workmen, and also to the managers of the works in Manchester.

At the end of the plaintiff's case the defendants' counsel applied for judgment on the ground that there was no personal negligence in the defendants themselves, which was necessary to render them liable to their servant in an action for negligence; and that in respect to supplying their employers with liability for negligence, superintendents or managers of works are but fellow-servants with those engaged upon the works themselves, and the masters cannot be made answerable for the negligence of their workmen. He cited "Wilson v. Merry" (*Law Report 1, Scotch Appeal 337*), "Feltham v. England" (*Law Report 3, Queen's Bench 33*), and other cases.

The judge declined to stop the case, but gave the counsel leave to move upon the point.

The latter then said that the plaintiff's injuries were so serious that he was not able to stir in view of the facts spoken to as the origin of the accident; but he would call the two managers of the works with a view to showing that their position was in reality only subordinate, and this was done. The jury assessed the damages at 500*l.*, that being the only question left to them.

RESPONSIBILITY OF BUILDING COMMITTEES.

In the Court of Common Pleas, Dec. 2 (sittings at Nisi Prius, in Middlesex, before Mr. Justice Keating and a special jury), the case of Whillier v. Roberts and Others, came on.

The plaintiff in this case was a builder in the City, and he sued the members of the building committee of Christ Church, Lower Clapton, to recover 27*l.* 2*s.*, balance due for the work done in erecting that structure. All the members of the committee suffered judgment by default except Mr. Roberts, who disputed his liability.

The evidence for the plaintiff was that Mr. Roberts had attended two meetings of the committee, and at one of them, held on the 26th of November, 1869, he seconded a resolution that the secretary be directed to communicate with Messrs. Whigginton & Morris that their plan for building the church was accepted, subject to certain terms and alterations. One of the terms was, that the contract should not be for more than 5,500*l.* The contract actually entered into was for 5,565*l.*, and the cost of the building, including extras, was 6,624*l.* 2*s.*, of which all but the balance now claimed had been paid, a large part by members of the committee. It further appeared that Mr. Roberts had early retired from the committee.

Mr. Garth submitted that there was no case for the jury, because Mr. Roberts was no party to the contract for 5,500*l.* More than this amount had been paid.

Mr. Justice Keating said that he would leave the case to the jury, but reserve the question of law for the full Court.

The case for the defendant was that the church was to be paid for by subscriptions, the committee incurring no personal responsibility.

Mr. Justice Keating, in summing up, said that the question was whether the defendant had held himself out, or had authorized other people to hold him out, as liable to pay the sum claimed.

The jury, after an hour, found a verdict for the plaintiff, the defendant being liable in references only to the original contract and the alterations necessary in it.

Leave was reserved to move to enter a verdict for the defendant, or a consent, or to reduce the amount of the verdict.

FIRE-PROOF FLOORS.

Sir,—In the *Builder* of November 30th, your correspondent "X," commenting upon Mr. Sorby's suggestion, to construct fire-proof floors with a stout timber-framed floor, filled in with or embedded in Dennett's concrete, says that the floor-plaster which is used as the binding material of that concrete would, in the event of a fire, combine with the heat, and burst on the application of water.

Floor-plaster is, as "X," states, a preparation of the coarse gypsum rock; but, instead of being merely roasted or boiled, as the ordinary plaster of Paris is usually prepared, it is thoroughly calcined in kilns.

Concrete, or other compositions formed therewith, present greater resistance to fire than any cement prepared from carbonate of lime (ordinary limestone), and this results from the greater affinity which exists between the

chemical constituents of gypsum, viz., sulphuric acid and lime.

Of course, any material used for building purposes may be injured, and practically destroyed, by a fire of sufficient intensity and duration, but extra materials may be selected in preference to others for their fire-resisting qualities and convenience of application.

In my opinion, Bennett's concrete fulfils these conditions. It may be applied in a variety of ways, to suit constructive and decorative requirements, and the highly-calced gypsum, which forms its binding element, has great fire-resisting power, as well as being one of the best non-conductors of heat, and hence forms an effective protection from the action of fire on the wood or iron portions of the construction.

I am therefore of opinion that gypsum cement or concrete, properly applied, is a most valuable material for the construction of fire-proof floors; and I should be glad to see its use extended, and the iron or steel girders and joists, in conjunction with the material, these really being the weak points, as proved by recent experience of so-called fire-proof buildings.

CHARLES BARRY.

GAS LIGHTING.

The method of lighting gas by galvanism, patented by Mr. J. B. Booth, of Preston, and already noticed in our columns, has now been more fully described in a local paper:—

"The apparatus constituting the invention looks like a moderately-sized globular instead of glass, attached by a tube to the same material, with a metallic top. Over this liquid, and within the glass tube there is a plate of zinc, with a piece of graphite, or gas-coal, and between these and a thin coiled platinum wire, fixed over the cap of the general vessel, into which a gas-burner is inserted, and ignited, almost instantaneously, in the following way.—A pipe to be screwed to that up which the ordinary gas-supply flows runs through the base of the vessel to about the centre of the surrounding tube; pressure brought to bear upon the gas in this pipe causes, by some collateral opening, a simultaneous depression upon the chemical solution, which occupies a lower level in two side-tubes; the gas occupies the vacuum caused by the displaced liquid, and ascends to a higher chamber in connection with the burner, while the displaced liquid is pressed into two side-tubes; the gas comes in contact with zinc and graphite, generating galvanic activity, which is communicated to the wire, and exciting the catalytic power of the wire, which, when exposed to the ascending jet of gas, results in immediate, almost instantaneous, ignition. The mechanism is of the simplest construction, and can be applied to any kind or number of gas-pipes, either remote from or proximate to the works, to street as well as to office or shop lamps, and the light can be extinguished as easily as it can be ignited."

Successful experiments with it have, it is said, been recently made at the Preston Gasworks.

We may here incidentally express our hope that the metropolitan gas companies will not quite exhaust the patience and the sympathies of the public. Their gas has not been good for years, but it still continues, to our experience, in the almost unusable state in which it was some time left it, although it is now full time it were at least as good as it was before they went off.

THE EMBANKMENT AND THE THAMES.

SIR,—It is a source of great regret to all who visit the Embankment of the Thames to see that it should present such an unsightly growth of green upon the granite-surfaced walls towards the river. The very bearded mask of Father Thames over Essex façade seems to regret that its waters, had as these may be, should be so encompassed. Nay, further, the insidious seeds of the mosses and fungi tend every year to increase to such a growth that in less than two generations others will see the mica has left large pits, recording the gradual but certain wreck that is being made. Our ancient mariners owe their existence to the present day, for our edification, wholly from the circumstances of that "which was worth doing well was well done,"—that was, by thoroughly polishing the surfaces. Now, if this could be done, as I hold it can, with great advantage and effect, these seeds could be precluded from nesting on the granite ground wherein they germinate. Not only does each cavity give a safe lodgment, but it is also a retaining source of moisture that helps to grow these "greens."

Portland Harbour has had its crowning stone put on in a most princely manner, and is so far considered to be completed. Why should not some of the best convict labour be employed, as a national work, to polish up the basin of the

Thames? In proposing such, it is in conformity with that which we are now doing,—to make such men learn to earn their livelihood by fair means,—a thing in time telling as a double good. We have said at our feet for the purpose, with such steam appliances as should reduce the excessive labour, and repay for effective undertaking, thus 'giving satisfaction to ourselves, as it might hereafter to that unknown "New Zealander" who may visit and view from the bridges the bright and classic works of ancient days.

HENRY GRAFTON, C.E.

A BRIBE.

"TO ARCHITECTS."—A liberal 'cash in advance' share of commission is offered by an experienced quantity surveyor, having offices in the City, upon all work placed in his hands. Highest references for efficient and expeditious performance of work.—Address, 'Surveyor,' 16, Lothian-road, Camberwell-New-road, London, S.E."

Sir,—The above disgusting circular has been sent to me as "F.R.I.B.A.," and I forward it to you for public reprobation. Doubtless the quasi-surveyor has got hold of a list of the members of our Institute, and is endeavouring to catch a few gudgeons. He is, to a certain extent, wise in his generation; for he naturally omits to offer the highest and any reference for integrity.

HENRY BAKER.

No. 108, Gower-street.

GROINED RECESS AT THE EAST END OF FAIRSTED CHURCH, ESSEX.

Sir,—A clergyman has recently sent me a sketch of a groined niche recently discovered in the above church. It is formed in the thickness of the main wall, and was entirely concealed by lath and plaster, and much mutilated. He is desirous of knowing to what purpose it was formerly assigned. Could it have been a shrine to the Virgin? or can any of your readers assign any other purpose for it?

The new pulpit is placed in it at present (which, by the way, might give a useful hint for such a purpose in modern churches, and would assist sound).

W. B. W.

THE RAILWAY-ARCH QUESTION.

PROCEEDINGS AGAINST THE SOUTH-EASTERN COMPANY.

The nuisance arising from the percolation of water through the arches of the several railway companies crossing the thoroughfares in South London was last week again under the consideration of one of the local boards. It appears that the St. Saviour's Board of Works having been unsuccessful in their endeavours to induce the South-Eastern Company to remedy the evil complained of, as regards the arches and bridges on their line, have resolved to prefer a bill of indictment against the company, with respect to the bridges crossing over the Borough, in High-street, Southwark-street, and Blackfriars-road. Similar proceedings have already been taken against the London, Chatham, and Dover and the South-Western Companies by the Lambeth and Wandsworth Vestries, but now stand over, in order to allow the respective companies to execute promised improvements at the bridges connected with their lines.

THE ARCHITECTURAL UNION COMPANY.

The report submitted at the fifteenth ordinary general meeting of shareholders, held at their house, 9, Conduit-street, on the 4th inst., showed that the galleries and premises generally have been profitably occupied during the past year. The number of shares on the register remains the same as last year, viz., 1,037, upon which 10,370l. have been paid, and the directors were able to recommend the payment of a dividend of 11s. per share, free of income-tax, amounting to 570l. 7s., leaving (in addition to 21l. 12s. belonging to the auxiliary donation fund, and 7l. 8s. 3d. unclaimed dividends) a balance in hand of 292l. 5s., of which 49l. are set apart to meet the fine of 98l. due every fourteen years (payable in March, 1880), and 243l. 5s. are carried forward to the next account. This meeting confirmed. We hear with sincere regret that Mr. Charles Mayhew has been compelled to withdraw from the direction in consequence of ill-health. Professor Hayter Lewis has been chosen to fill the vacancy in the board thus occasioned.

ST. PAUL'S CATHEDRAL.

SIR,—Will you allow me to suggest to the Dean and Chapter of St. Paul's, through the medium of your columns, that the reading minor canon, in order to be distinctly audible to the congregation, should sit immediately below the Dean's or Archdeacon's seat? Last Saturday afternoon I attended the service, when a gentleman with stentorian voice, but not a particle of articulation, intoned the prayers from, I think, the Treasurer's stall, and the result was that, to the congregation, these and the exhortation consisted of one terribly long dreary monotone, most provocative of sleep. Were the plan followed out that I suggest, it would be simply a return to the ancient custom, when the minor canons, as part of the choir, always sat in a line with the vicars choral. The labelling of certain stalls, "Minor Canonics I," "Minor Canonics II," up to twelve, is a modern invention; it only dates from the time when the organ-screen was removed from the entrance to the choir.

X. Y. Z.

CHURCH-BUILDING NEWS.

Wotton-under-Edge.—The church at Kingswood, Wotton-under-Edge, has been re-opened. The present additions, reparations, &c., comprise at the entrance at the west end the removal of a pair of Tuscan columns, connected with a spandrel top, and in its place a porch has been erected, glazed on each side, and standing on a stone plinth, with overhanging eaves and galle entrance-floors. Inside the porch are glazed doors to the church. At the angle of the chancel and transept an organ-chamber, about 17 ft. by 13 ft., has been built. Access to this is gained by ascending a few steps, and underneath is the vestry, to supply the one taken down. The latter is reached by a few steps down from the chancel. Owing to the damp in the new work, the organ is not yet put into its place. The organ-pipes will face the chancel, which part is wholly open, except a low balustrade of varnished deal and red cloth panels. One of the windows which has been taken in from the transept for the building of the organ-loft has been filled with open ornamental trellis-work, instead of glass, and serves to allow the sound of the organ to fill the church. The rest of the windows which had not been re-glazed are now being completed, the two in the east end having, together with stained glass, the emblem of the Holy Trinity; also emblems of Alpha and Omega, the monogram I.H.S., and other designs in coloured glass. The chancel and the sacarium have also been raised, the latter forming five sides of an octagon. The front side, elongated, come out from the east wall. The altar and the lectern in oak, are from the church of Dursley. The whole of the church has been re-pewed. The cost of this has been about 3500l. Mr. C. F. Pritchard, of Wotton, architect, gave the services to the work. Mr. Hart was the carpenter, Mr. Lovell, the mason, and Mr. Britton, the plasterer, &c., all of Kingswood; and Mr. Daneyce, of Wotton, was the plumber, glazier, and painter.

Westbromwich.—The works in connexion with the restoration of All Saints' Church having been so far completed, the reopening and dedication festival services have been held. The total cost of the alteration and restoration will be 7,000l., towards which about 5,000l. have been realised. This is the fourth church which has occupied the same site, and the last church which has been demolished was inconvenient, out of repair, and inadequate for the requirements of the district, and hence, about the middle of last year, the restoration and enlargement were decided upon. The tower of the old church, which was erected chiefly in the fourteenth and fifteenth centuries, has been retained, but now forms the extremity of the southern aisle. The general plan is very similar to that of the older building, saving that the single aisle is now on the south side instead of on the north. The nave is 92 ft. in length and 30 ft. in breadth; the chancel is 26 ft. wide and 43 ft. long; the total internal length of the church being 135 ft. On the south side of the chancel is a side chapel, forming a chancel to the south aisle, which is of equal length with the nave, and 14 ft. in width. This portion of the church will be more particularly appropriated to the daily services. As in the older church, there is an aisle on one side of the nave only. The western end of the south aisle is terminated by the old arch leading into the tower, an arch which was always intended to form a leading feature in the architecture of the building. The

altar, prominently raised upon a flight of five steps, occupies the main portion of the eastern wall of the sanctuary. The work has been carried out by Mr. C. Burkitt, of Wolverhampton.

Quarndon.—The foundation-stone of the new church here has been laid by Lady Scarsdale. The site is at the top of Quarndon, adjoining the new schools, and, when erected, the edifice will be seen for many miles round. It will consist of nave, two side-aisles, chancel, with organ-chamber and vestry, tower, and spire. The extreme length of the building is 82 ft., and width, 50 ft. The height of the tower and spire to the top of the vane will be 80 ft.; the height from the floor to the ridge will be 40 ft. The tower will be placed at the south-west angle, near to the high road. The entrance of the church will be through a porch on the right side. The vestry will be on the same side, having a separate entrance. Beneath will be the vault for the heating furnace. The land slopes very much towards the east end, so that under the chancel, &c., will be space for storage, if required. Under the floors will be arches throughout. The nave-roof is to be supported on each side by a series of stone moulded arches, with labels, on stone columns, and will be formed with framed principals and purlins; the spaces between showing as panels boarded and moulded, all being exposed to view. The chancel-roof is to be boarded under the timbers, and divided into panels. The roofs to aisles correspond with that of the nave. All the roofs are to be covered with Westmoreland slates. The sittings will be open benches placed on raised wooden floors, and the aisles paved with ornamental tiles. Accommodation is provided for 360 persons. The style is Gothic, of the fourteenth century. The design was prepared by Messrs. Giles & Brookhouse, architects; and the works are being carried out, under their direction, by Mr. Edwin Thompson, contractor, all of Derby.

Reading.—The first stone of the new parish church of St. John the Evangelist, Reading, has been laid. The architect is Mr. Dixon, and the builders are Messrs. Niblett & Son, of London.

Chesterton.—St. Chad's Mission School Church, Red-street, in the parish of Chesterton, has been opened. The building is in the Pointed style, and is built of red bricks, with blue brick facings, and will accommodate about 120 persons. It was designed by the builder, Mr. Wm. Lea, of Chesterton. The edifice comprises a school-room 35 ft. by 20 ft., with a chancel, which is raised two steps above the main room, and will be separated therefrom on week-days by a movable wooden frame-work, rising to the spring of the arch, and a class-room, which will also serve the purpose of a vestry on Sundays.

Gateshead.—Christ Church, in the parish of Gateshead, has been consecrated by the Bishop of Durham. The church was commenced about two years and a half ago, and was completed ready for use last November. But as no church can be consecrated on which there remains a debt, the promoters were obliged to ask the Bishop's consent to license it until the amount of the deficiency, some 1,500l., should have been raised. When this became known, Mr. Edward Joicey generously offered 700l., and the balance was quickly obtained. The church is now entirely completed. It was designed by Messrs. Adams & Kelly, of Leeds, who have been employed by the Leeds Church Building Society. The roof, instead of being divided into bays or compartments, consists of uniform rafters, placed rather more closely to each other than usual. The east end is apsidal, with five tall gables, each containing a window. Beneath these is a row of Caen stone and marble, with panels containing the Commandments, creed, and the Lord's Prayer. The floor is laid by Sopwith, with parquetry. The chancel stalls are carved, and the organ is contained in a case designed by the architects. Its chamber is on the south side of the chancel. The pulpit and desk are of Caen stone, carved, and relieved with pillars of different coloured marbles and stone. The carving was by Fielding & Dark, of Leeds. The Early English type has been adopted. A band of relieved carving is carried round the whole chancel above the reredos. The font is of carved Caen stone and marble. The windows contain stained coloured devices, and are surrounded by floriated borders in colours. Those of the east and west gables are further ornamented, and the clerestory windows are of the same design. Messrs. A. Gibb & Co., of London, were the artists. The church is lighted at night by a row of gas-jets on either side at the level of the eaves, which runs from east to west, and the architects have

run a porch across the whole western front, below the window. Over the central gable of the porch is carved a floriated cross with two guardian angels. A small light bell-turret rises at the north-west angle. The cost, exclusive of the ground, the organ, and other special gifts, has been 6,100l. Accommodation has been provided for 600 persons.

SCHOOL-BUILDING NEWS.

Hampton.—The corner stone of the new school at Hampton, near Evesham, has been laid. The site adjoins the village green, and the edifice will be in the Gothic style. The school will be built of red bricks, with stone dressings, and covered with Brocley tiles. The school-room will be 41 ft. long by 18 ft. wide. There will also be a class-room for infants, 18 ft. square. There are two tracery windows in the main school-room, and one in the class-room. Separate lavatories will be provided for the boys and girls, and over the former there will be a wooden bell-cot. The gables are finished with ornamental barge-boards and turned wood finials. There will be good playgrounds for boys and girls. A teacher's residence will be erected; the lower portion will be of red brick, and the upper part will be in half-timbered work with oriel window. The school will provide accommodation for about 100 children. The building has been designed by Mr. Geo. Hunt, architect, Evesham. The work was thrown open to public competition, and the lowest tender, namely, 890l., sent in by Mr. Harvey Hunt, of Harington, contractor, was accepted.

Ardrick.—The dedication stone of a new girls' school, which is being built in connexion with St. Thomas's Church, Ardrick, has been laid. Schools for boys and infants, in connexion with the church, were erected two years ago, at a cost of 4,200l., and the school for girls now in course of erection will complete them. The site of the new building lies between the church and the boys' and infants' schools. The space obtained enabled the architects to design a commodious school, and at the same time to arrange spacious playgrounds both for the new schools and the boys' and infants' school. The building, which is two stories high, is of Gothic architecture. It will accommodate 300 girls and 70 infants. The contract for the building (without furniture or fittings) is 2,450l., but with the cost of the land, furniture, and other incidental items added, the undertaking will cost about 4,000l. The drawings have been prepared by Messrs. Royle & Bennett, architects, and the works are being carried out under their superintendence by Mr. Robert Ellis, of Hulme.

TO ARCHITECTS.

At the special request of the Committee of Conference on Competitions we give a place to the following:—

The Conference Committee on Competitions will be glad to receive from provincial architects the earliest possible notice of proposed competitions, in order that the committee may in sufficient time transmit to the promoters of such competitions, for their guidance, copies of the regulations passed at the general conference of 1872.

Communications to be addressed to the Secretary of the Committee on Competitions, No. 9, Conduit-street, Hanover-square, W.

Books Received.

Manual of Book Work and Marquetry, with Practical Instructions to Carvers, and Ninety Coloured Designs. By W. BEMROSE, Jun. London: Bemrose & Sons, Paternoster-row, and Derby.

As a sequel to the two works, "Manual of Carving" and "Fret-cutting," already favourably noticed in the *Builder*, and which have been so well received as to call for several editions, the author has been induced to add this other manual for the sister arts of book-work and marquetry, neither of which has, as yet, been practised to any great extent by amateurs, for whom this manual is intended. The tools and the instructions are simple, and this interesting and elegant art looks as if it were easily acquirable.

VARIORUM.

In the "Companion to the Almanac" for 1873, Mr. John Plummer, in an article on "Capital and Labour in 1872," writes,—

"With every increase in the number of workmen, unless accompanied by a corresponding increase in the demand for labour or in the amount of the wages fund, the difficulty of artificially controlling the rate of wages becomes more and more perceptible. But this is a fact which trade-unionists generally refuse to recognise; hence their numerous failures. To them, as to the greater portion of the labouring classes, the doctrines of political economy appear to operate unfairly, to be intended as an instrument in the hands of capital which to tyrannise over labour. One effect of this lamentable prejudice has been to prevent workmen from availing themselves of the lessons to be derived from the study of the fundamental principles on which the doctrines of political economy are based, and thus avoid the disastrous errors committed by them in their ignorance of the inutility of the policy so often recommended by their leaders. It may appear a truism, but the one great truth which the labouring classes have yet to learn is, that no efforts, however powerful or persistent, on the part of their trade organisations, can permanently raise the rate of wages, unless the increased scale of pay be accompanied by a proportional increase in the demand for labour; and that, on the other hand, no combination on the part of employers, however wealthy or influential, can prevent wages from rising when a decrease takes place in the amount of surplus labour.—In other words, when the demand for labour begins to overtake the supply. An illustration of this latter fact is to be found in the present state of industrial affairs in this country; the demand for labour being so great that good workmen experience little or no difficulty in obtaining employment at remunerative wages; indeed, the dearth of labour is so extensively felt, that more than once it has been recommended that a supply of labour should be obtained from those parts of the Continent in which the labour pressure is less perceptible. To whatever causes or causes may be ascribed the astonishing degree of national industrial activity and prosperity which has led to the present increased demand for labour, there can be no question that it constitutes one of the great social events of the present century, and is destined to play an important part in the elucidation of more than one of those important social and industrial problems, the solution of which has so frequently baffled the earnest efforts of our most thoughtful men."

Is it quite certain that the demand for labour is so great as the writer states?

Miscellaneous.

The Drainage and Water Supply of Hornsea, in Yorkshire.—A special meeting of the Hornsea Board of Health has been held, Mr. J. A. Wade, the chairman, presiding. The chairman referred to the late inquiry commission, stating that the wisest course the Board could pursue would be to comply with the requirements of the commissioner, Mr. Harrison. He therefore moved, "That the Board take immediate steps to construct an efficient system of sewage and water supply." Attempts were made to put off the question of water supply, but the chairman said he thought they would be very foolish if they did not pass a resolution to do all that was required. To his mind the commissioner was as determined on the subject of the water supply as on any other, and a great point was made that the water supply was polluted by the sewage. He had evidently got the impression that the ground around the wells had been contaminated, and if it was as the commissioner supposed, it would take a generation to wear out that contamination; in fact, the contamination would be brought nearer and nearer to the well by the flow of water through the ground. After some further conversation, the chairman's resolution was put and carried unanimously. He further stated that he had asked Mr. C. F. Butler, as an engineer, for a statement of his terms. Mr. Butler had written stating that should he be engaged by the Board he was fully prepared to carry out an effective plan of drainage for the Hornsea district, and to obtain the approval of the Local Government Board for the same. His terms would be 5 per cent., with 20l. for travelling expenses. After some discussion, it was resolved "That the offer of Mr. Butler to design and carry out the drainage works of the Board, as contained in his letter of the 25th inst., he accepted." It was also resolved "That the surveyor be requested to ascertain the position of the water-wells and the sewage-tanks, and generally to report whether the houses have been carried out in accordance with the deposited plans and the bye-laws."

Assistant Surveyor to St. Pancras Vestry.—An assistant surveyor has been elected from the following candidates, nominated on the 20th ult.—George William Brunell, William Henry Moxon, and Thomas Rust. The voting was by ballot, and resulted in the appointment of Mr. George William Brunell by a large majority.

The Demolition of St. Martin's Church, Birmingham.—The demolition of old St. Martin's Church is being vigorously proceeded with. At the east end the massive masonry has been broken into, and two fine windows, about 20 ft. in height, of the Decorated period, have been discovered,—one on the north, and a corresponding one on the south side of the chancel. The tracery of these has been carefully removed. At the east end of the north aisle part of the moulding of an altar window has been laid bare. The old monumental effigies have been moved from their modern brick bases in the windows; and a Jacobean monument of abaster, with a shrouded bust surmounting the tablet, which was found built in the north wall, has likewise been transferred elsewhere for security. An interesting piece of painting has been brought to light in a roof-beam, which spanned the nave at a point about midway of the church, and which probably formed the top of the rood screen. On the front of this beam appears a painting (of the fourteenth century) of the head of Christ, wearing a crown of thorns, with surrounding nimbus; the uplifted hands, showing the marks of crucifixion, bear a scroll in each hand, but the Latin lettering on them is much defaced. Workshops for the new building are in course of erection on the north side of the yard. Mr. Chawlin, the architect, has made a plan of the inside of the church, so as to ensure the proper relaying of all the memorial tablets.

The Largest Yield of Coal on Record. A new method of working coal-mines was brought before the South Midland Institute of Mining, Civil, and Mechanical Engineers, at the meeting of that association, in Wolverhampton, on Monday week. Mr. John Gitting, who has the practical working of certain collieries at Wednesbury, showed that, by a system known to the coal trade as long work, in preference to square work, he had been enabled to bring up no less than 4,000 tons per acre, more than had before been realised. This he had now obtained 1,300 tons per acre, statute weight, and at the present price per ton of the mineral the colliery yielded 1,600, per acre more as the selling price of the product than it would yield if square work were still adopted. Mr. E. Jones, the mining engineer of the Lilleshall Company, who is the president of the Institute, asserted that Mr. Gitting's figures showed he was obtaining the largest yield upon record at any colliery throughout England and Wales.

Chambered Barrows in France.—Last week a paper was read by the Rev. W. C. Luke, at the Society of Antiquaries of London, Somerset House, the title of which was "On certain Prevailing Errors respecting French Chambered Barrows"; Mr. Overy in the chair. There were certain opinions respecting the rude stone monuments or dolmens of France which he was convinced, after forty years' experience, were quite erroneous, and which it was important should be corrected. The writer then proceeded to support the theory that these dolmens,—even those that were now exposed,—were at one time surrounded by barrows, or envelopes, and that their exposition in the present day was due to the ravages of time. There was scarcely one of them that did not show traces of the envelope. Mr. Luke explained in detail the structure of the monuments he visited, and appealed to drawings which he made, and which were suspended on the walls, for confirmation of his view. He did not believe in the opinion that they were Christian structures.

The New Buildings at St. Luke's Workhouse.—The Local Government Board are again taking steps to compel the Holborn guardians forthwith to erect the new block of administrative buildings at St. Luke's Workhouse, which the guardians themselves some time ago proposed, and which was approved by the Central Board, but which the guardians subsequently refused to carry out, on the alleged grounds of a decrease of pauperism, and the liability of the workhouse for assessment to the rates of the parish of St. Leonard, Shoreditch. The Local Government Board have just forwarded a communication to the guardians, containing a pe-remptory request to them at once to proceed with the erection of the buildings, the total estimated cost of which is upwards of 25,000l.

The Steam-roller in Marylebone.—At the last meeting of the vestry a discussion arose on a report of the surveyor in favour of steam-rollers or roads. It was agreed that the advantages of the new system outweighed its disadvantages.

The Woolwich Steam-Hammer.—The largest of the massive iron plates intended to form the foundation of the immense steam-hammer about to be erected in the Royal Gun Factories, Royal Arsenal, Woolwich, has been cast in the Dial-square. The casting, which has consumed about 100 tons of metal, being an open one, presented a striking appearance. The operation, which required great care, was successfully performed under the direction of Mr. Vinicombe, principal foreman of the Dial-square. The molten metal having been collected in three enormous cupels, at a given signal the whole was simultaneously poured into the mould. The heat from the molten metal, which covered an area of 24 ft., was so powerful as to break the glass in the open windows of the workshops. The large anvil-block for the same hammer, which was cast about three months since, is not yet cool enough for removal. This casting is the last required for the foundation of the steam-hammer.

Memorial Window.—A baptism window has been recently erected in the church of St. Lawrence, Jewry, Gresham-street, City, in memory of John Andrew Back, who, with a mutual friend, in the year 1867, urged upon the Rev. B. M. Cowie, that advantage should be taken of the Pan-Anglican Synod then about to assemble, to create a fresh interest in missionary work in foreign lands. Its framework is an architectural composition of Renaissance character, with festoons of flowers and foliage and scrollwork, and with figures in niches. This encloses the two main subjects,—“The Passage of the Red Sea” and “The Baptism of Our Lord.” The figures in the niches on each side are those of David and Aaron. The window is from the works of Messrs. Cox & Sons, of Southampton-street, Strand, and was exhibited in this year's International Exhibition at South Kensington.

Nottingham Architectural Association. An interesting paper was read by Mr. F. Bakewell, on Friday evening, November 29th, before this association, entitled “A Few Days in Belgium.” At the close of the paper, an animated discussion took place, in which the president, Mr. T. C. Hine, Mr. Evans, Mr. Tarbotton, Mr. Norris, and others took part. The president, in continuation of some remarks by the author of the paper upon the size of Mediaeval bricks, advocated a reduction of the thickness of bricks as productive of a more satisfactory appearance; and Mr. Norris called attention to the value of old English brickwork, and the beauty of the tints of the examples found in the southern part of England. Mr. Tarbotton regretted that Mr. Bakewell had not been able in the limits of his paper to give them more particulars of the brickwork of Bruges, alluding to several fine specimens there.

Scheme of Street Improvements in Sheffield.—Mr. Flockton has made a report to the town trustees, on the most eligible mode of improving the streets of Sheffield. He says, “It will be evident that a mere widening of existing streets (although that is very desirable on their own account) will not remedy the defects, nor supply the wants indicated. This can only be done by the opening out of fresh lines of road, and dividing the traffic, catching it before it reaches the heart, and tempting it by shorter distances, easier gradients, or other conveniences, out of the old routes into the new ones; and what may be called the internal circulation of the town must be provided for by new streets and improvements in the central portion. The scheme laid down on the plans is an endeavour to show how these views may be carried out.”

Reclamation Scheme.—An Anglo-Italian company has been formed for the purpose of reclaiming the expanse of water in Northern Italy known as the Ferrara Marshes, covering nearly 200 square miles of what was once the most fertile land in Italy. Plans for accomplishing the work were solicited from hydraulic engineers in this country and on the Continent, and the choice fell on Messrs. John & Henry Gwynne, of Hammersmith, to whom the contract for the whole of the machinery has been given. The body of water to be drawn off the land is over 2,000 tons per minute.

Going to the Root of it.—A Connecticuttetter proposes to prevent the falling of leaves by the artificial warming of trees. He has invented a system of steam-pipes twining among the roots, and kept warm by steam from an ordinary furnace boiler.

The Japanese.—On Tuesday last the Japanese ambassador and suite inspected Butcher's Wharf, Shad Thames (the largest bonded warehouse in the port of London), and spent several hours in traversing the floors and examining the various classes of goods stored. They expressed their admiration of the new warehouses, and seemed much interested in watching the building works in progress, having ascended to the highest scaffolding for the purpose. This wharf has a frontage of over 600 ft., or about one-tenth of a mile on the river, with a landing-stage the whole length for large steam-vessels. The storage area exceeds ten acres. At the close of the inspection, Mr. F. L. Hutchins (Murray & Hutchins, Birch-lane) introduced the architects, Messrs. Tolley & Dale, who handed a perspective view of the wharf and buildings to the visitors.

The Crown Co-operatives Society.—Under this title a new society, with half a dozen directors of known respectability, is being formed to carry out the system of co-operation, by which articles of general consumption and utility are supplied at wholesale prices. It is intended to open stores in the first instance at Hyde Park, W., near the terminus of the Great Western Railway, in the centre of a neighbourhood where there is every chance of securing a large number of shareholders. Families also residing on the Great Western line, and in the West of England, will find these stores a great convenience. It is, likewise, in contemplation to establish branches in other parts of the metropolis where the want of such stores is most felt. Judging from the past, this Society would seem to have a good prospect of success.

Manchester and Salford Building Trades' Institute.—The annual meeting of this Institute, for technical education, has been held in St. John's Schools, Garside-street, Mr. Isaac Holden in the chair. The report read by Mr. John M'Lean, mentioned that during the past year the efforts of the committee had been successful. The balance-sheet showed that the income had been 60l. 17s. 7½d. and that, after paying expenses, there was a balance in hand of 1l. 13s. 4½d. Mr. Thomas Lawton, in moving the adoption of the report, said he was at a loss to know why the union did not establish an institute for technical education. Mr. Thomas Spelman seconded the motion, which was passed. Professor Greenwood, after distributing the prizes, made a few remarks. Other gentlemen addressed the meeting.

The Sanitary Act in Warwickshire.—A special meeting of the rural sanitary authority for the Warwick Union has been held at Warwick, to arrange for the provisions of the new Sanitary Act being carried out in the district. It was decided to appoint a committee, under the 13th section of the Act to discharge the duties of the sanitary authority for the current year; and to invite all the sanitary authorities in Warwickshire, with the exception of Birmingham, to a conference respecting the Act, the appointment of medical officers of health, and inspectors of nuisances, and the districts to be assigned to each throughout the county. The conference will take place at Warwick early in January.

Hastings Pier.—An apparatus for warming the Pier Pavilion, by hot water, has just been fitted by Messrs. Cumming & Edmonds, hot-water engineers, of Lillebridge, Fulham, from the plans and under the superintendence of Messrs. Cross & Wells, architects, at a cost of 500l. A furnace has been fitted under the floor, and the pipes, coils, &c., have been carried to different parts of the structure. The coils will be covered with marble plates. Another improvement is the erection of lobby doors, inside the pavilion, at four of the principal entrances, so as to modify the in-rush of cold air from without. The heating apparatus will enable the directors to carry out the proposal to introduce a larger number of exotic and hot-house plants and flowers, and thus to give an improved appearance to the interior.

Camberwell Vestry has decided to put in force the stringent clauses of the Artizans' and Labourers' Dwellings Act in the cases of the premises, 18 and 19, Alpha-street, and 1 to 15, Bexley-court, Peckham, which the surveyor declares to be unfit for human habitation. Notices will be immediately served upon the owners, who will be cited to appear before the vestry, to show cause against the proposal to demolish the buildings.

Breach in the Sea Wall at Fambridge.—The work of filling up a serious breach in the sea wall at South Fambridge, has not yet progressed so far as to stay the flooding of the adjacent land, but measures to remedy the evil have been vigorously taken up. Mr. Aire, of London, engineer, has the superintendence of the works, which are being carried out by Mr. Sutcliffe, also of London. The breach has continued to get larger each succeeding day, until now there is a gap of between 40 ft. and 50 ft., through which the water rushes, as the tide reaches its full flow, carrying away further fragments of the wall, and then spreading itself rapidly over the land, to the extent of some 150 acres and to a great depth.

Unveiling of the Neptune Fountain at Bristol.—The old metal statue of Neptune, erected so long since as the year 1558, by a citizen of Temple parish, has been removed (for the fourth time) from its position, and re-erected as a drinking-fountain in a commanding situation nearly opposite the entrance to the church, in Victoria-street; and has been publicly unveiled and opened for the use of the public. The figure faces towards the railway station, and stands on a pedestal of Pennant stone, with polished granite panels. The front and reverse slabs are fitted for jets of water, and galvanised iron cups are provided for the use of wayfarers, whilst beneath are troughs for dogs.

The Royal Academy.—On the 23rd inst there will be an election of a member of the Royal Academy, in the room of Mr. Pickersgill, now on the honorary retired list. It would seem to be time for adding a sculptor to the list of Academicians, and we shall be glad to see Mr. Joseph Durham selected for the vacancy. As the author of what we must consider the best out-door monument in London, excepting the great work in Hyde Park, viz., the Memorial of the Great Exhibition of 1851, in the Horticultural Gardens, not to mention many other admirable productions, Mr. Durham has high claims to the suffrages of the members.

The Collegiate Church, Wolverhampton. We are glad to hear that it has been resolved to remove the north and south galleries in this fine old church, and to reseat the nave under the direction of Mr. Christian. The observations made during the visit of the British Archaeological Association doubtless gave an impetus to the movement. In reseating the church the old woodwork will be used as far as possible, and no material change will take place in the present form of arrangement. The total cost will be from 1,000l. to 1,200l., and the estimate of Messrs. Higham has been accepted for the work.

The Mansion House, London.—When is the justice-room at the Mansion-house to be properly ventilated? asks the *City Press*. "At present the atmosphere is simply poisonous; and some of the officials who have to stand it day after day have suffered in consequence. It is simply a question of money; there ought to be no difficulty about it." We made the same inquiry some years ago, and were assured by the then City architect, Mr. Bunning, that it was more than a question of money. Surely, however, the difficulty cannot be insurmountable.

New Inventions: London International Exhibition, 1873.—The Committee on Recent Scientific Inventions and Discoveries have suggested as special subjects for exhibition in the class all new modes of preserving stone, or of rendering wood incombustible, or of purifying water, or of copying forms in wood or metal by machinery, &c. The applications for admission, it is arranged, must be sent in before the 31st of January, 1873.

Sculpture at the International Exhibition, 1873.—A meeting of sculptors, presided over by Mr. Durham, A.R.A., was held a few days ago at the Royal Albert Hall to inspect the space proposed to be devoted next year in the East Picture Gallery to British sculpture. After visiting the spot, a resolution was passed approving of the same. The committee adjourned to the 9th of January.

Prize Cabs and the Exhibition, 1873.—The Society of Arts have notified to her Majesty's Commissioners, that the time during which cabs submitted for competition for prizes must have been running in London and other towns, has been reduced from three months to one month. The prizes offered are, as has already been announced, one of 60l., two of 20l. each, and two of 10l. each.

Scientific Lectures in Shore-ditch.—A series of scientific lectures are to be delivered in the Shore-ditch Town-hall by Professors Carpenter, Norman Lockyer, and Simmons, during the winter. The object of the lectures is to give the working population some scientific instruction at a nominal charge. The vestry have unanimously granted the Town-hall for the purpose at a reduced rental.

Monument to a late Governor of Jersey.—The Jersey States, at a special meeting, have agreed, without a dissentient, to a vote of 1,000l. for the erection of a monument in memory of General Don, who twice occupied the post of governor of that island, commenced the erection of Fort Regent, and planted the military roads, for which Jersey is so well known. The monument is from a design by M. Robinet, a French sculptor.

The Birkenhead Theatre Royal.—This theatre, which was built by a limited liability company, has been sold by auction at the instance of the mortgagees. The property originally cost 20,000l., and was knocked down to Mr. Elias Gaskell, one of the shareholders, for 8,000l.

St. John's Wood.—On Saturday, 7th, the Princess Christian laid the foundation-stone of St. Mark's Parochial Schools, Hamilton-terrace, St. John's Wood. A large marquee was erected on the site, and this was crowded by a congregation composed almost entirely of ladies.

TENDERS

For additions to the Castle, Woodside, near Torrington Park Station, Finchley, for Mr. W. B. Jones:—

Blease	£800 0 0
Lewis	846 0 0
Holding	789 0 0
Strange	791 0 0
Hingston	749 0 0
Foley	725 0 0

These Grates give a considerable Heat with a small consumption of coal.

EDWARDS & SON, STOVE, GRATE, & KITCHEN-RANGE MANUFACTURERS, No. 49, Great Marlborough Street, Regent Street, W.

Prospectuses forwarded, per post free, on application. Prospectuses may also be had relating to the additional Branches enumerated below.

GRATES.

Improved Economical Grates, constructed on thoroughly sound principles for Economising Fuel, diffusing Heat, and preventing inconvenience from smoke.

Porcelain Tile Grates, in which Iron is rejected in favour of Fire-brick for the interior of the Grate, and Tiles or slabs in Porcelain, Encaustic, or Majolica Ware are used for the Decoration. The prices of these Grates allow of their introduction in any Chamber whatsoever where a fire is required to be used.

Improved Independent Grates and DOG GRATES, in very great variety of Medieval and other designs, the interior of the Grates being lined with Fire-brick, and the Tile Slides and Tile Hearths provided for the decoration of the Fireplace.

Improved Fire-Lump Grates, specially adapted for use in Charitable Institutions, Schoolrooms, Workhouses, Railway Stations, Servants' Offices, &c.

Improved Smokeless Grates, adapted to prevent the formation of Smoke, to Economise Fuel, to burn for many hours without attention, and to avoid chimney sweeping.

Stephens & King's Patent Grates, Steel and Ornich Grates with Fire-lump Interiors, Improved Sham Grates, Berlin black and fine cast Medieval Grates with Fire-lump Interiors.

Improved Ventilating Grates, for furnishing in the Apartment a supply of fresh Warm Air. CAPTAIN GALTON'S VENTILATING GRATES.

STOVES.

Patent Gill Air-Warmers, for Warming the Halls and Staircases of Dwelling-houses, and for Warming Churches. Made of a capacity to heat from 3,000 to 60,000 cubic feet, and to burn with either ascending or descending Flues, and through the night, if required, without attention.

Porcelain Tile Pedestal Stoves, with open Fires, handsomely decorated with Porcelain, Encaustic, or Majolica Ware, for use in Halls, Shops, Cabins, &c. These Stoves are now made at much less price than formerly.

Pierce's Pyro-Pneumatic Stoves, with Fire-brick interiors and Warm-air Chambers, made to give a supply of fresh and wholesomely-heated Air.

Dr. Arnott's Slow-combustion Stoves, for use in Halls and Show-rooms, where a Fire is required to be kept perpetually burning. They require attention twice in the course of Twenty-four Hours only.

Goldsworthy Gurney's Stoves, for use in Churches and other Public Buildings.

COOKING APPARATUS.

Greatly Improved Kitcheners, constructed with Tiled Doors and Tiled Surfaces, and especially adapted for Economising Fuel, for effectually Heating the Ovens and Hot-Plate, for enabling Roasting to be done in the most unexceptional manner in the Roasting Ovens, but in front of an Open Fire if desired.

Also for effectually Ventilating the Kitchen, and preventing the old inconvenience to Servants of excessive heat.

Steam Cooking Apparatus, on very economical arrangements for Cooking for from 100 to 1,000 persons, and adapted for use in Hospitals and other Charitable Institutions, large Wholesale or Retail Establishments, Public Schools, Prisons, Workhouses, &c.

Open-fire Kitchen Ranges, of excellent manu-facture. Smoke Jacks, Pastry Ovens, Steam Closets, Hot-Plates, Stewing Stoves Cottagers Cooking Stoves, Nursery Boiler Stoves, &c.

ENGINEERING.

Warm Baths, erected with Hot, Cold, and Waste Pipes, Hot-water Cisterns and Circulating Pipes heated from the Kitchen Boiler so that a Bath may be had at any moment of the day. Hot Water furnished, if required, by the same system, to Wash-hand Basins, Housemaids' Closets, Sculleries, or made to circulate through coils of Pipes for giving Heat to a Hall, a Conservatory, or a Billiard-room.

Hot-water Circulation, for Heating Churches and other Public Buildings, and for Conservatories; also for the Halls, Staircases, and Passages of large Private Residences, and for contributing Heat, if required, to Drawing-room, Dining-room, Library, and Billiard-room, with handsome Ornamental Cases to cover the Pipes.

Laundry Apparatus, erected for the entire operations of Washing, Drying, and Ironing the Linen of Large Houses and of Public Establishments. Washing Coppers and Ironing Stoves of all kinds.

Lifts for Hotels and other Large Establish-ments; also on a small scale, as admirably adapted to add to the convenience of Private Families.

Lavatory Apparatus, with the latest Improve-ments, for Clubs, Restaurants, &c.

Messrs. EDWARDS & SON FURNISH ESTIMATES GRATUITOUSLY for the Erection of Works in any of the branches they have enumerated, and they include Carpenters' and Plumbers' work if preferred. They send to any part of the Country for the purpose of preparing Estimates, and giving those who consult them the benefit of their experience and advice; and they guarantee that whatever they undertake shall be signalled by excellent workmanship and efficient action.

MR. EDWARDS'S PUBLICATIONS ON WARMING AND VENTILATION.

Our Domestic Fireplaces. A New Edition, entirely re-written, enlarged, and adapted for Popular Reading, the additions completing the Author's contributions on the Domestic Use of Fuel and on Ventilation. By FREDERICK EDWARDS, Jun. Royal 8vo., with 149 Illustrations, and a Portrait of Count Rumford. 12s.

Smoky Chimneys: their Cure and Prevention. Sixth Edition, revised. Royal 8vo. with 40 Illustrations, price 3s. 6d.
"Attention to the facts Mr. Edwards has indicated will save landlords and householders a deal of trouble, expense, and anxiety."—*Building News*.

The Ventilation of Dwelling-Houses and the Utilisation of Waste Heat from Open Fireplaces. Out of print.

Royal 8vo. with 47 Illustrations, 5s.

The Extravagant Use of Fuel in Cooking Operations.

With an Account of Benjamin, Count of Rumford, and his Economical Systems, and numerous Practical Suggestions adapted for Domestic Use.
"Mr. Edwards writes excellently, without technicality or obscurity, and may fairly say that he has done his part towards making the subject intelligible to unscientific persons."—*Pall Mall Gazette*.

Post free on receipt of six penny stamps.
Some Observations on Fireplaces, Stoves, and Ventilation. By Messrs. FRED EDWARDS & SON, Stove and Range Manufacturers, and Hot-water Engineers.

LONDON: LONGMANS, GREEN, & CO. PATERNOSTER ROW.

PERFECTION IN BOOKKEEPING.—Builders and others desiring a really good system, can have a SET OF MODELS FOR BUILDERS BOOKS, by DOUBLE ENTRY, to which was awarded the prize offered in "The Builder," No. 138, and which has been adopted by many large firms. Also a Modified Arrangement by Single Entry, suitable for small Builders.—Address, E. A. S. GUYER, 2nd, Regent's Park, London.

Recently published, demy 8vo, strongly bound in cloth, with 125 fine Woodcuts, price 12s. 6d. (postage 5s.).

PRACTICAL GEOMETRY for the ARCHITECT, ENGINEER, SURVEYOR, and MECHANIC. By F. WYNDHAM TARN, M.A. Author of "The Science of Building."
"No book with the same objects in view has ever been published in which the clearness of the rules laid down, and the illustrated diagrams have been so satisfactory."—*Scotsman*.
"An excellent treatise, of value not merely to students, but to practical men."—*Engineering*.
London: LOCKWOOD & CO. 7, Stationers' Hall-court, E.C.

Recently published, 12mo. cloth boards, price 5s. (postage 5d.).
MATHEMATICAL INSTRUMENTS: Their Construction, Adjustment, Testing, and Use; Comprising Drawing, Measuring, Optical, Surveying, and Astronomical Instruments.
By J. F. BEATHER, M.A. Author of "Practical Plane Geometry."
Enlarged Edition, for the most part entirely re-written. With numerous Woodcuts.
London: LOCKWOOD & CO. 7, Stationers' Hall-court, E.C.

IMPERIAL FIRE INSURANCE COMPANY. Established 1827.
No. 1, Old Broad-street, E.C. and 18 and 17, Pall-mall, S.W.
Capital, £1,600,000.
JAMES HOLLAND, Superintendent.

COUNTY FIRE OFFICE, 50, REGENT-STREET, LONDON.
The County Fire Office was established in the year 1808, upon the principle that the interests of its Policy-holders and its own should be identical. A system of strict economy and caution has enabled the Directors to return to their Policy-holders a considerable portion of the premiums found to be in excess of the risks. These risks, which originally varied with the profits of the year, are now fixed at the rate of 25 per cent. They are paid out of a fund specially provided for the purpose, and take precedence of the dividends to the Shareholders. The insured are exempt from all personal liability.
EXAMPLES OF RETURNS.

Policy No.	Name and Residence of Insured.	Bonus.	£ s. d.
138,416	W. F. Ripley, esq. Forest-hill,	800	7 0 0

Prospectuses and full particulars may be obtained upon application to the Agents of the Office in all the principal towns of the United Kingdom; and to the Secretary, No. 50, Regent-street, London, W.

PARTNER WANTED, by a Builder and Surveyor, with about 1,000l. in whom 2000, a year will be guaranteed.—Address, A. B. C. Post-office, Forest-hill, London.

PERSPECTIVES, COMPETITION, OR OTHER PLANS AND DRAWINGS, PREPARED AND Etched or Coloured in the best Style. Terms strictly moderate. Also, OCCASIONAL ASSISTANCE, in or out of Office.
Address, T. H. 14, Argyll-street, Angle-square, W.C.

MR. ARCHIBALD D. DAWNEY, C.E. CONSULTING ENGINEER AND SURVEYOR, 25, Walmor-CAULCATIONS, DESIGNS, AND ESTIMATES PREPARED FOR IRON GIRDERS, ROOFS, COLUMNS, BRIDGES, GASWORKS, &c.
LEVELLING & SURVEYING. Professional Assistance generally.

TO ARCHITECTS, BUILDERS, AGENTS, METAL WORKERS, AND OTHERS.—DRAWINGS PREPARED from ROUGH SKETCHES, or Instructions for Buildings, or Alterations in any style; also Wrought Metal Work designed in Medieval and Italian Styles; Details, Specifications, &c. on Moderate Terms.—Address, ARCHIBALD D. DAWNEY, 25, Walmor-street, Blandford-square, N.W.

CONCRETE BUILDING.—INFORMATION WANTED OF CONCRETE HOUSES built prior to and early in 1865. Payment will be made for information.—Address, 369, Office of "The Builder."

AGENCY WANTED, by a Gentleman having a position in the City. It is connected with the Building Trade, and its Branches, although not exclusively.—Address, H. S. 37, Fish-street-hill, London Bridge, E.C.

GEORGE WINGROVE, FRENCH POLISHER TO THE TRADE ONLY.
No. 24, MOORE STREET, BRYANSTONE-SQUARE, Builders' Work done on reasonable terms. Estimates given.

AN ARCHITECT, in large practice, has a VACANCY for an ARTICLED PUPIL.—Address, CHARLES NOEL ARMPFIELD, York Buildings Surveyor, Architect, Whitby.

A FIRM OF ARCHITECTS, SURVEYORS, AND ESTATE AGENTS, in good practice, has a VACANCY for an ARTICLED PUPIL, well educated and best qualified for drawing. A premium required.—Address, L. G. POTTER, Newport, Monmouthshire.

PUPIL.—A CIVIL ENGINEER, the son of a clergyman, holding an important public appointment, and having charge of an Irrigation Canal, together with water, drainage, and other works, is desirous of obtaining an ARTICLED PUPIL. To gentlemen who intend taking up public appointments regard to extra annual advantages as he would have opportunities of making himself thoroughly acquainted with hydraulic and sanitary engineering, together with the general routine of a public official's office.—Address, A. B. No. 114, Wheelers'-road, Edgbaston, Birmingham.

ENGINEERING PUPIL.—A Gentleman, in the North of England, is prepared to receive a PUPIL into his Office. Considerable professional advantages both as regards scientific training and practical experience are offered.—Address, O. J. 29, Leadenhall-street, London, E.C.

TO PARENTS AND GUARDIANS. THERE IS a VACANCY for an Articled Pupil in the Office of an ARCHITECT and SURVEYOR, with special opportunities for obtaining a practical knowledge of the profession. Address, Mr. CHARLES BALLY, 16, Market-place, Newark-on-Trent.

WANTED, AN IMPROVER, in the Office of an ARCHITECT and SURVEYOR.—Apply, with testimonials, to Mr. CHARLES BALLY, 16, Market-place, Newark-on-Trent.

INSPECTOR OF GAS LIGHTING, City of Westminster. Several of the Londoners are in WANT of a fit and proper PERSON to fill the above Office, at the wages of 45s. a week. Age 25 to 35 years. Good testimonials giving full particulars as to past employment, and certificate of age must be addressed to the undersigned, and must be received on or before TUESDAY, the 31st day of DECEMBER, 1872. Candidates will have to attend a committee of the Board on the 1st day of JANUARY, 1873, at two o'clock. The person selected must give up his whole time to the duties of the office.
J. H. B. Esq., Municipal Clerk, Sewers Office, Guildhall, November 29, 1872.

BOROUGH OF LEEDS.—WANTED, by the Council of this Borough a thoroughly efficient person to undertake the Office of BOROUGH ENGINEER and SURVEYOR, to carry out and perform the following duties, and giving evidence, &c.:—
1. To superintend the laying out, kerbing, and leveling all new streets, and the paving, flagging, and leveling of all streets ordered to be paved, &c., and to prepare all necessary plans and specifications.
2. The laying down and correction of all sewers and drains which the Corporation have to make or order.
3. The carrying out of all requirements under the Sanitary Acts, Local Acts, or other of any legal tribunals.
4. To make and cause to be made all sanitary arrangements and nuisances, including non-pollution of streams.
5. The superintendance of construction of privies, ashpits, and the like.
6. The ventilation of sewers.
7. The compliance with standing orders of Parliament as to plans and sections in respect of Bills in Parliament promoted by the Corporation, proving compliance with same, and giving evidence, &c.
8. The preparing of the requisite plans, valves, &c. for the purpose of enabling the Corporation to put into effect any agreements, and the requisite evidence and other matters under the direction of the Town Clerk in cases where the Corporation purchase by completion, and superintending the same and when ordered to do so.
9. The superintending of improvements in streets and corporate buildings, and superintending the same and when ordered to do so.
10. The management of Engineer when required, and of the waterworks supplying the town, so far as they are completed and in operation, and to require the necessary repairs, and when completed, and other duties which may be required of him by the Council or the Committees thereof, and which in the opinion of the Council they may consider to be within the duties of his office, and may be engaged in any or all of the above duties, and such other as may be required of him.
Salary, 600 per annum. The Corporation will in addition provide necessary clerks and other assistants, officers, stationery, and other working material. Applications to be addressed to the undersigned, and sent to the Agents for Appointment of Borough Engineer and Surveyor, and sent on or before SATURDAY, the 21st DECEMBER INSTANT.—By order, CAPEL A. CUKWOOD, Town Clerk, Leeds, 4th December, 1872.

TO ENGINEERS, SURVEYORS, AND OTHERS. THE Town Council of the Borough of Dorchester desire to procure a competent Person to discharge the duties of BOROUGH ENGINEER and SURVEYOR, and to be required to make within the borough, and superintend the management of the Corporation's waterworks, and to design, carry out, and repair of drains, and water supply, and to design, carry out, and record all such works on the Council. Plans of the waterworks, qualifications, and salary required. To be made in writing, and delivered at the Office of the Town Clerk, in Dorchester, on or before the 6th of JANUARY next.
Dated December 11th, 1872.

Candidates are requested to send applications in their own hand writing, to the undersigned, stating age, residence, last and present occupations in the City, to be received by the undersigned on or before FRIDAY, the 21st day of DECEMBER INSTANT.—By order, W. M. REYNOLDS, Clerk.

WANTED, immediately, a MAN, competent to work a STEAM MOUNDING and PLANING MACHINE.—Apply to Messrs. ATCHSON & WALKER, Fortham, York, Willamson-street, St. John's Wood, with upper particulars and references.

WANTED, a DRAUGHTSMAN, accustomed to free-hand design and ornamental metal-work.—Apply, by letter only, to Mr. C. A. NEGUS, Stationer, 14, Charles-street, St. James's, S.W.

WANTED, in the Suburbs of London, a thoroughly experienced MAN, to take charge and superintend the working of SAWING and JOINERS' MACHINERY.—Apply, by letter only, stating age, salary required, and references, to A. J. care of Mr. W. N. Froy, 146, King-street West, Hammer-smith.

WANTED, a MANAGER, for STONE-WARE PIPE-WORK.—Applications to be addressed, U. 5, 6, 54, Mr. Frederic Algar, 8, Clemin's-lane, Lombard-street, London.

WANTED, by a London Builder and CONTRACTOR, a thoroughly efficient MANAGER and REPRE-SENTATIVE. Must have a thorough knowledge of the business in all its branches, and capable of estimating, managing, &c. One who has filled a similar situation preferred. A liberal salary would be given.—Address, stating age and full particulars, to "The Builder."

TO BUILDERS, CLERKS. WANTED, by a Builder, in the country, a YOUNG MAN, to take charge of all matters relating to the management of the business, and where long in last employ, with references, to 107, Office of "The Builder."

WANTED, a WORKING SHOP FOREMAN, of JOINTERS, CARPENTERS, and COOKERS, measure up materials, &c.—Address, stating age, salary required, and where long employed, to S. C. PARMENTER, Railway-street, Dalmeida, Essex.

WANTED, a good JOINER, one used to hard wood work.—Apply by letter only, to T. W. 12, Maiden-lane, W.C. Nuse need apply unless first-class, quick work.

WANTED, in a Builder's Office, a YOUTH, to KEEP FILES, and send generally.—Apply, in own handwriting, stating salary required, to S. 23, Upper Thames-street, E.C.

WANTED, a YOUTH, for Taking Time, Keeping Plans, and Working Drawings of Encaustic Tile Floors, Calculating Quantities, &c. He must write a good hand, and be conversant with the use of the TONGUE, GALLEY, and other tools.—Address, "The Builder," 12, Maiden-lane, W.C.

TO SAW-SHARPENERS.—WANTED, a YOUTH, to assist MACHINERY SAW-SHARPENERS, for a constant.—Apply, with references and full particulars, to JOHN PERRY & CO., Fretting Works, Bow, E.

PAPERHANGINGS.—WANTED, an energetic Man, of good address, to wait upon customers, and to decorate and put up PAPERHANGINGS. Liberal terms will be offered.—Address, B. 6, Office of "The Builder."

BUILDER'S CLERK (Junior) WANTED. Age about 23.—Apply, by letter only, to W. B. 47, Old-street, E.C.

WANTED, by a DRAUGHTSMAN, the RE-ENGAGEMENT. Thoroughly conversant with the duties of an architect's office, including perspective.—Address, "The Builder," 12, Maiden-lane, W.C.

WANTED, a SITUATION AS JUNIOR ASSISTANT, in an ARCHITECT'S Office. Age 19.—Address, W. C. RIDDICK, Edin-road, Brixton, S.W.

TO BUILDERS AND CONTRACTORS. WANTED, an ENGAGEMENT, by a JUNIOR CLERK, well versed in the general routine of a builder's office. Good references.—Address, J. E. F. care of Mr. Edgar, No. 2, Blomfield terrace, Blomfield-road, Bow Common, E.

WANTED, immediate RE-ENGAGEMENT. Apply, by letter only, to Mr. J. H. B. Esq., Municipal Clerk, Sewers Office, Guildhall, November 29, 1872.

TO BUILDERS. WANTED, a RE-ENGAGEMENT, as GENERAL FOREMAN, Carpenter by trade. Good references.—Address, ALMA, 3, Hope Cottage, Clarendon-road, Hoxton, E.C.

WANTED, a RE-ENGAGEMENT, by a respectable young Man, aged 19. Write a good hand, and is used to the general routine of an office. Good references.—Address, E. T. Spruce, 12, Maiden-lane, W.C.

TO CIVIL ENGINEERS AND OTHERS. WANTED, a RE-ENGAGEMENT, as CLERK of WORKS or MANAGER, by a thoroughly practical Man, well up in tunnelling and heavy building operations.—Address, C. L. 1, Suffolk-place, Pall-mall, London.

TO BUILDERS, CONTRACTORS, &c. WANTED, a RE-ENGAGEMENT as CLERK. Age 29. Accommodated to all the duties of a builder's office. Good accountant. Excellent references from large London firms.—A. 40, Helyear-street, Walworth-road, S.E.

WANTED, a RE-ENGAGEMENT, to Dig, Make, and Burn BRICKS, TILES, &c. at per thousand (Labour only, in close or Scotch kilns, or clump work. Twenty three years' experience. Good references, and security if required.—Address, A. B. care of Mr. Pearce, 24, High-street, Finsbury Wells, London, E.C.

TO ARCHITECTS AND SURVEYORS. WANTED, a RE-ENGAGEMENT, by an ARCHITECTURAL ASSISTANT of eight years' experience in both London and provincial offices, who has a fair knowledge of quantities and practical knowledge of construction. Satisfactory references. Terms moderate.—Address, W. D. 115, Tottenham-street, Upper Brook-street, Manchester.

TO BUILDERS, PLUMBERS, &c. WANTED, by a good PLUMBER, &c. a JOB or CONSTANCY. Good references.—Address, C. BAKER, No. 25, Brompton Park-road, Hammer-smith, W.

WANTED, by a steady young Man, a CONSTANT SHOP. Is a good PLUMBER, and would fill up time in other branches of the trade.—Address, 53, Office of "The Builder."

WANTED, by a practical BUILDER and HOUSE DECORATOR, twenty-five years' experience, the ALTERATION or REPAIR of HOUSES, or FLECKWORK, either old or new. With or without materials, and security if required. One to carry out any job may undertake.—Address, 102, Office of "The Builder."

WANTED, by a Builder, an opportunity to recommend a young Man as JUNIOR, in a first-class Builder's Office. Well up in estimating, assisting book-keeping, and general office work; knowledge of perspective. Salary moderate.—Address, U. B. 21, Brownlow-road, Dalston.

The Builder.

VOL XXX.—No. 1559.

A Sanitary Survey: What is it?

LOCAL Sanitary Authorities are issuing advertisements for inspectors of nuisances,—taking the name from the new Public Health Act, although “local sanitary inspector” would have been a more appropriate name, and they say that one of the duties will be to make a sanitary survey of the district. It has occurred that this term has been misunderstood at both ends of the line which connects the persons sought with those who are to appoint them; and, in such things as these, what has been may be again. On a recent appointment, two at least of the half-dozen selected candidates were in much doubt as to what they would be expected to do to fulfil the requirement of a

sanitary survey. It is not defined in the instructions issued by the Local Government Board. The advertisement set forth that the salary offered was intended to include all expenses. But that cannot be. That it should include all personal expenses, travelling and other, is proper enough, and it is an arrangement that will save many small troubles to both the authorities and the officers. There will be expenses, however, incurred by the inspector of nuisances in the discharge of his duties, which must be paid by the Board as they arise; such, for instance, as the employment of occasional assistance, rendered necessary to enable him to carry out special orders of the Board; and it was apprehended by some of the candidates that these might amount to something serious. In connexion with the sanitary survey, however, there are few, if any, beyond personal expenses.

The inspector will personally observe the existing state of the premises of every house in the district, and note down his observations in a book on the spot. He will ascertain the position of the well or other source of water-supply, and take a gallon away with him as a sample for analysis, for this purpose requiring from the Board a stock of stone jars, the corks of which are to be sealed on the spot as soon as the sample has been taken. He will extend his observations of the state of the surface, and what may be upon it, to a distance all round the premises the drainage from which he may judge to have any influence on the well or other source of water supply. He will ascertain, both by inquiry and observation, the nature of the ground upon which the premises are situated, whether on clay, gravel, or rock, and the direction of the

dip of the strata, if any. He will ascertain and note down the distance from the well of any cesspool or other receptacle of refuse organic matter, and whether it is on the side of the dip or on that of the rise of the strata, in respect of the well. He will see in what manner the slops and sewage of the house are conveyed away from it, and where to. If there be a water-closet in the house, he will ascertain whether any provision has been made for carrying off the sewage gases to some place where their escape will be harmless. (If required to do so by the medical officer of health, he will inquire also into other particulars.) He will ascertain the number of pigs kept upon the premises, and the distance of the sty from the house. Comparing the evident size of the house with the number of persons living in it, he will exercise his judgment in desiring to see and to measure the rooms of the house, and distinguish living from sleeping rooms. This part of his duties may easily become disagreeable to the tenant, if not exercised with judgment and discretion. It must, nevertheless, be done wherever there is a reasonable supposition of overcrowding.

Having made such a survey of the premises of every house in the district, the inspector of nuisances is to make a report to the Board of the sanitary state of the district. Either at the same time or afterwards, upon being asked to do so by the Board, he is to suggest such remedial measures as may seem to him proper for removing all nuisances from the premises of the houses, and suggest such works of a permanent character as in his judgment may be necessary to prevent the recurrence of nuisances. These, so far, relate to every dwelling-house in the district. In addition, he will inspect and report upon the condition of every slaughter-house, and every place of business where the trade carried on is of a noxious or offensive character. Nothing less than such a survey as this will be of any avail. More might be included. To take the items *seriatim*.

1. The well or other source of water-supply. If it is situated on the rise of the strata with respect to the situation of any cesspool or other receptacle of organic matter, it will be less likely to be polluted; if, on the other hand, it is situated on the dip, it is almost certain that the water in it will be polluted. It is necessary to supplement this information by a concurrent report of the analyst as to the actual condition of the water at the time of the survey, for which purpose the inspector will deliver to him a sample. If both the inference to be drawn from the position of the well and the analysis are favourable, it will be a happy state of things for all parties; but if the dip of the strata would lead to the inference that the water would probably be bad, and the analysis confirms the inference, then, clearly, either another source of supply must be sought, or else the source of pollution must be done away with. It must be observed that to judge of the permanent quality of water by the analysis of a sample alone is not sufficient, for a sample (over a whole district inspected by only one man) can be taken but seldom, and the occasion may happen to be a favourable one or the contrary, in respect of any long time, such as a year. The physical characteristics must therefore be considered, as well as those which are chymical.

2. The house slops, and how they are conveyed away. If the ground be porous, as gravel or sand, or sand rock, it will often be found that the slops are conveyed into the cesspool, there to be contained until they soak away. This is the very worst form in which they can be dealt with. Almost as bad is that in which they are thrown out of the back-door on to the surface, thence to soak away and evaporate. The only thing in which this way is better than the other is, that the slops do not convey into the sur-

rounding ground the organic matter of the cesspool. Again, the slops may be drained away to a ditch, at more or less distance from the house; but here, while the soaking will be less, the annoyances from evaporation will be greater, and the offensiveness more concentrated. But there may be proper sewers into which to drain the house slops and other sewage. In this case it is sufficient to see that all openings at the ground level (near the house) into the drain communicating with the sewer are properly trapped, and that the gases which necessarily arise from the decomposition of the sewage are led away by one or more pipes to a place where their escape cannot contaminate the air breathed by the inhabitants; and that place will in general be above the roof of the house, providing that the place chosen be not in proximity with bedroom window. For this purpose also, the soil pipe of every water-closet should be carried straight up to a point some 2 ft. or 3 ft. above the roof, and there terminate with an open end. Fanciful cowls, hoods, or other obstructions to the escape of the gases are generally worse than useless. The size of these ventilating pipes should not be less than 3 in. diameter, but the larger the better. The drains should not be taken into the house if it is possible to avoid it; but should terminate outside the wall in a proper trap, and the slop-water should be led by a pipe into that trap.

3. Pigstyes are a great nuisance near a house, and yet it is a manifest hardship to interfere with the keeping of a pig, or even of several. Many inspectors, and amongst them some of the best, are of opinion that pigs may be kept so as not to be a nuisance, if the sty be not nearer than about fifteen or twenty yards from the house; and providing that, at whatever distance, it be kept as clean as a stable or cowhouse is kept when properly attended to.

4. It is probable that in every district to which inspectors of nuisances are now to be appointed, some houses, and often many, will be found to be overcrowded. Overcrowding is relative as to space. It is a very wide question, and one not to be hastily dogmatized upon. It is one that will cost every inspector a great deal of trouble, a great deal of investigation into the opinions of the best authorities, and a great deal of thought on his own account. It is true that he may, and ought to, throw the responsibility of deciding these things upon the medical officer of health, and ultimately be made to do so; but before he can make a report on his survey he must either understand this question himself, so as to be able to say that this or that house is overcrowded, or he must report the number of people in every house, and leave the medical officer to decide for himself.

This sanitary survey does not touch upon—rather it is beyond and outside of—the ordinary duties which are set forth in the instructions issued by the Local Government Board, such as attending meetings of the Sanitary Authority when so required; visiting any spot on receiving notice that a nuisance exists there; visiting and inspecting shops kept or used for the sale of butcher's meat, poultry, fish, game, flesh, fruit, vegetables, corn, bread, or flour, or as a slaughter-house; and examining any animal, carcass, meat, poultry, game, flesh, fish, fruit, vegetables, corn, bread, or flour which may be therein; and in case any such article appear to him to be intended for the food of man, and to be unfit for such food, he is to cause the same to be seized, &c.; communicating with the medical officer on the occurrence of any contagious, infectious, or epidemic disease; disinfecting articles to prevent the spread of disease; entering from day to day in a book particulars of his inspections, and of the action taken by him in the execution of his duties; keeping other books as a continuous record of the sanitary condition of each of the premises in respect of which any action has been

taken under the Sanitary Acts, and any other systematic records that the sanitary authority may require; producing his books to the medical officer when required, and rendering to him such information as he may be able to furnish; superintending and seeing to the due execution of all works which may be undertaken for the suppression or removal of nuisances; and, in general, that he shall observe and execute all the lawful orders of the sanitary authority, and the orders which may be hereafter issued by the Local Government Board.

In the discussions which have already taken place in various parts of the country, at meetings of boards of guardians, since the regulations of the Local Government Board have been issued, there has been considerable difference of opinion as to what would be the respective duties of the medical officer of health and of the inspector of nuisances; some members of boards being of opinion that the medical officer would have little to do but to confirm the reports of the inspector of nuisances. Without going into the question of what the particular duties of the medical officer may be, we may yet say that we think he will have very much to do if he is a really efficient medical officer of health, and if his chief attention is turned to the prevention of disease, by bringing those sciences which relate to the subject, physical and chemical, to bear upon this great question of the public health; for it is not so much to the reduction of mortality that he is to attend, as to the prevention of sickness and the contraction of those diseases which tend to deterioration of race; and, on the other hand, to insure that those who live shall live healthily. It is the responsibility laid upon him.

It is observed that the several Government inspectors appointed to advise local authorities under the new Act, do not all recommend the same action on the part of the inspector of nuisances in making his reports. Some advise that he shall report to the board, and some to the medical officer. This discrepancy may be due, not to any abstract and general difference of opinion, but to local circumstances. It is, probably, of little importance in which way the reports shall be made. The one thing above all others of importance is a thorough agreement between the two officers to promote the health of the people. Neither can possibly in this case aggrandise himself at the expense of the other, and the only way in which either can possibly be useful is to sink minor personal questions in the great public one.

THE GOTHIC BUILDERS YET AT THEIR WORK.

THERE are so many differences between the old system of things and the new of to-day as regards art and architecture, that there would be no small difficulty in fixing on any one difference conspicuously prominent. The old arts and architectures, as a rule, rose up into existence we hardly to this hour know how; they went on, and progressed, and at last for the most part died out, and became extinct, and gave place to new styles of art. Gothic architecture and fine art in this country exemplify this in a remarkable and not a little instructive manner. The growth of the Early English Gothic, to use the ordinary and so well understood terms, its expansion or development into the Decorated, and its fall, as most people think it, into the Perpendicular, and its final death in Elizabethan, all went on as perpetual change in an almost imperceptible way. No one, and certainly not those who worked out the great problem, could draw a hard and fast line between the one phase of this style, and the other next to it, and following it. There is, as all know, a sufficiently marked distinction between the Early English, and the style which succeeded it, the Decorated; but there is no particular time at which a point can be fixed as the exact changing turn in them. The styles never struck the hours. All went on in a gradual and unnoticed way. Nothing seems to have been needed but the native capacity of those who worked out the several styles, each in their own age and generation.

So much by way of reminder as to the old Gothic art and architecture, and the methods of their production. But how different was it to our modern system of bringing Gothic forms and architecture into existence. Let us consider it for a few moments, and note the difference. Before the modern Gothic movement, by a sort of accident, there occurred an architectural interregnum. Brick-and-mortar construction took the place of art and architecture, and

the Gothic that sprang by slow degrees into existence was, as all know, directly copied, as nearly as could then be, from "examples" of the old Gothic remains and ruins. The way in which this was done, and the special phase of Gothic, the "Perpendicular," which was at first fixed on as a something "Gothic," and as containing "tracery" to copy, need not now detain us; we only want to direct attention to the fact of the copying or imitation of old examples of Gothic art, and to the distinction to be observed between the old way of producing Gothic and the modern system. The one was, as we have noted, a growth; the other is as a replanting; the one was as a growth of natural plants; the other is as a copying of these natural plants in new materials, and in a modern way. Let us note, too, in passing that this new and artificial reproduction of the old forms of Gothic has not been, and is not confined to one particular phase of Gothic, but all phases of the style, and all countries have been, and are yet, drawn upon for fresh and ever new "precedent" to go by and to follow. There are many other causes at work besides this primitive one, which absolutely prevents the production of a Gothic building in the same way and in the true spirit of the old work.

But now the question occurs, and a curious one it is, what would have been the position and nature of Gothic art and architecture, had the style gone on and progressed from the Perpendicular to the present time, as it did go on and progress without any disturbing influence from the Early English to the Perpendicular? and is there anything that is constructed in the present day that is, in like manner, a following on from the old Gothic days? It would be vain, we think, to look round for any such object. All things have changed; for not only have most of the old objects of use been superseded by new and improved ones, but even those things which have not been so superseded are changed in form and in details. The old Gothic art is really, and in sober fact, as dead as the extinct animals of the pre-Adamite age. But yet there is one object to be seen by the eyes of modern Londoners,—not, it is true, in the streets, but on the river that runs through London,—which not only recalls the old Gothic forms and ways of work—the "Medievalism" of the past,—but is in truth a *bona fide* remnant, so to speak, of it. We allude to those strange-looking boats which some readers may have noticed, not too genteel to look at such out-of-the-way things, called "gallioti." These vessels are fishing-boats, and in them are stored up in water-tanks the eels which supply the London markets. They are of Dutch build, and manned by Dutch sailors, and are well worth the attentive looking at by those who take general views of art. It would be difficult, if not impossible, to describe them. They lie low in the water, and are round and tubby enough both in stem and stern; they are decked boats, with huge lee-boards, and with short single masts. Turner delighted in them, as well he might, for nothing can surpass their fitness and attractiveness as boats for the painter. They are not painted, but the natural wood is allowed to show itself; and the colour of the sails, whether in sunshine or out of sunshine, must always remain the despair of the painter, however imaginative, and buy his colours where he will. It must have been in just some such boat as this that brave Columbus and his companions sailed into that then fabulous and mysterious ocean which is nowadays crossed with as much ease and certainty as men go to Gravesend. Much has been gained, but a little something has been lost! But to the structure and mode of design and working details of these boats. They are real and *bona fide* "Gothic" boats, and are, doubtless, the traditional remains of the old Gothic or Middle-Age system of boat-building. Nothing can surpass the neatness of their build, and the carefulness with which they are put together. The mouldings and timber ornaments, and spays, show real artistic feeling, and wherever the main constructive timbers end, and show themselves, this is to be seen, as in the rudder and rudder-post. Indeed, generally, we may affirm that no modern "improved" steam-packet boat, with every possible help, and with the best materials, has any place by the side of one of those quaint vessels as an artistic performance, and as a picture. Let us repeat that these things must be seen, if not in reality, at least in pictures,—say, in one of Turner's, who never missed opportunity of putting them into his boat pictures. They are famous sea-boats, and last out many a modern craft, and come safely sometimes into harbour when other more

improved vessels come to grief. We are not going to advocate the going back, even for artistic purposes, to this style and method of boat-building, any more than to plead for a return to the coach-building of the days of Queen Elizabeth, as shown in our Lord Mayor's state-coach, as compared with a modern improved carriage or tram-car; but of the artistic difference between them there can be no manner of doubt. What, we may here ask, is the loss and gain,—an "improved" boat or carriage without art, or an old-fashioned boat or carriage with art? Can both be joined? What, for instance, can be done with a modern New York tram-car to give it a place in a picture in the same way of fitness as the old gilt coach of Elizabethan fame serves? Here is a modern problem of no small importance, significance, and difficulty.

We have thus called a little artistic attention to these curious things while they yet last, for there are signs of their disappearance into that gulf of progress which is truly absorbing everything that is of the past; and we have adduced it as a singular instance of the past in the present. The old Gothic workmen, and their mode and style of work, yet live in the present for a little time longer. What would our architects, and antiquaries, and art societies, think, if, in some solitary and out-of-the-way London bye-street, there should be not only, as there are, things out of date, and of past ways of construction and ornament; but that there should be found, yet working in the old methods and traditions, a few workmen as an object long since supplanted elsewhere by more modern and improved constructions? Or, to put it yet more significantly, what would be thought of a new chapel building up in some out-of-the-way place, by the old workmen of centuries back, in their own way, with all their prejudices and quaint ways of work, without hook "precedent" to go by, for they would need none, and but with the single purpose of use, the art being all the while simply instinctive? The past in the present! All this seems strange enough, and hard to realise; yet it is a practical reality in the case of these Dutch fishing-boats in the river Thames. They are, as we have said, probably the only things now being built, and we have seen them in process of building, timber by timber, in modern civilised Europe at least, which can be said to be, in the true sense of it, really "Gothic," not copied Gothic, or a reproduction of the old forms in new materials and by living hands; but the old work itself, and the ways of that work, still going on traditionally by it, is true, modern hands and heads, but just as though nothing had stepped in between the days of genuine Gothic art production in Gothic times and now. It is genuine and true work indeed, and the traisim of Darwin is evidenced in art as well as in nature; that while any amount of change may be going on in a race of beings in nature, the old primitive forms may yet, in some rare cases, endure and perpetuate themselves, in spite of those changes. It surely is so in these queer and quaint Dutch fishing-boats. May they last yet a little while longer!

It is hardly possible in these few hasty remarks on a new art-subject to do more than glance at it. To go into detail adequately would be impossible; but there is one speciality about these curious constructions that is well worth some attention. We refer to the drawing and character of the mouldings, i.e., the timber mouldings. It may seem curious to talk of mouldings at all in connexion with ship or boat building. Engineers and ship-builders are not much given to mouldings; but in these Dutch boats not only are there mouldings, but they are surpassingly good, and thoroughly well and carefully drawn. The ends of the timbers, where they show themselves, as we have before said, are noteworthy, and evidence how much is to be done in the way of what some might think insignificant details. There is a neatness, too, about these quaint boats for which we must give the Dutchman full credit: a little of the spirit in it and about it of that which produced the Dutch paintings, so much admired by some, and as much abused by others. Unfair abuse; for the Dutchmen have left us, not what they could figure to themselves of Italians, but what they themselves really looked like, and thought, and did! We say nothing of the quaint cabins in these boats, or of many other things in and about them, or of the men, with half Gothic lingo, who man them. But a good deal might he said. Efficient for the day and for us is the art and the architecture of it.

HISTORY IN STAINED GLASS.
ARCHITECTURAL ASSOCIATION.

At the last ordinary meeting, held on Friday evening, the 13th instant, Mr. J. D. Mathews, the President, called attention to the arrangements that have been made for the benefit of country members;—enabling them to obtain books from the circulating architectural library, and to take part in the studies of the class of construction and the two classes of design. A prize is also offered for an essay to be competed for by country members only. It is hoped that a fair number of students in the provinces will avail themselves of the opportunities thus afforded of sharing with other members the benefits of the educational work of the Association.

A lecture was delivered by Mr. C. Baily "On History illustrated by Stained Glass, as exemplified in the Windows of Long Melford Church, Suffolk." Drawings reproducing many of the Windows in their actual size and colour were hung round the walls. The Church of the Holy Trinity at Long Melford was rebuilt in the fifteenth century under the direction of John Clopton,—a representative of an old English family located from a very early period in the neighbourhood. It is one of the numerous churches of this period in which the county of Suffolk, particularly its south-eastern portion, is very rich,—the wealthy families of the district rivaling each other in endeavouring to erect grand buildings.

The history of the rebuilding of the church is told in inscriptions cut in the stone parapets outside the building; one inscription giving the date 1494, by which year the church was probably in the main completed. The people who assisted with their money and their goods in the rebuilding are commemorated,—e.g., "John Pie and Alys his wyf of whos goods yve arch was made and yes tway wyndows glaid," &c. John Clopton, thus assisted, filled all the windows with stained and painted glass, the church and its several chapels containing no less than ninety-six glass windows. Some of this has in the church at the present time, although but a small quantity compared with the large amount originally in the building, and, having regard to the ill-usage which it has received during the space of four centuries, the figures now remaining are in a tolerably perfect condition. In 1862 the whole of the then remaining painted glass was taken from the original situations, collected together, and reglazed in the east window and in two windows at the west of the aisles of the nave,—a course strongly condemned by Mr. Baily as reducing the value of the remains, especially in the case of a number of ancient fragments, each of much value in its original position, now brought together in patch-work and rendered worse than useless. The glass is of two different kinds:—

I. Figures of saints and subjects relating to sacred history; "Our Lady of Pity" (a figure of the Virgin holding the dead Christ in her lap); St. Edmund, king and martyr; St. Dominic, the founder of the great order of Mendicant Friars, a figure rarely found in English churches; also a figure of Peter Martyr (the disciple of Dominic), perhaps the only example in England,—represented with a deep gash in his head, and the blood trickling from it; a closed book in his right hand, in his left a sahe with which he was struck down,—a dagger or short sword is also stuck through his heart. II. Representations of secular persons, members of some great families of England, who have played conspicuous parts in the times in which they lived, and whose deeds are recorded in the history of our country. As works of art, the figures may not, perhaps, claim a very high position, much of the drawing and execution being of a rude character; but as illustrating the history of fifteenth-century art in England, and throwing the light they do on the peculiar costume of the time, as well as confirming many otherwise doubtful questions of a genealogical character, they are of real interest and value. John Clopton, in selecting the persons whose effigies he wished to place in the Melford windows, appears to have included those illustrious families with whom he could claim connexion either in blood, by marriage, or by political sentiment (J. C. was a zealous Lancastrian); for in most cases where information can be obtained respecting the persons represented, something appears which indicates a connexion with the Clopton family. Thus, owing to relationship to the Howard family, we have a Lady Howard in the west window; elsewhere Elizabeth Howard (wife of John de Vere, Earl of

Oxford, the Master Philipson of Scott's "Anne of Geierstein"; Elizabeth Tilney (wife of the second Duke of Norfolk, the hero of Flodden Field); Sir William Howard ("Chief Justice of England," reg. Ed. I.), but this latter figure (represented in judicial robes) being executed nearly 200 years after that time, cannot be considered a portrait. There is a marked difference in the execution of the portraits of non-contemporary persons, the individuality noticeable elsewhere being exchanged for tame drawing of conventional features. This renders it additionally probable that the portraits were studied from the living originals, where possible. Two Lord Mayors of London appear,—Sir John Godney (1427), Sir Ralph Jocelyn (1464 and 1476), both connected with Clopton by marriage; also John Haugh, serjeant-at-law and (1487) judge of assize, the giver of some of the stained glass,—a portrait especially valuable as an illustration of Chaucer's Prologue,—

"A Serjeant of Lawe, war and wys,
That often hadde ben atte parrys,
* * * * *

The rood but hoodly is a nedled [malley] coote,
Gird with a seynt [sirdle] of silk, with barres smale;"

A relic of the old custom (of wearing striped or rayed gowns,—parti-coloured, blue and green, and blue and brown) yet remains. On the first day of term the serjeants wear purple robes; at sittings in law, black cloth gowns; and on State occasions and Lord Mayors' dinners they appear in scarlet. The coif, which shows as a little patch on the modern judge's wig, is here in its old form of a white cap above the wig, and tied under the chin. A figure of Richard Pygot, facing that of Haugh, illustrates a somewhat mechanical manufacture of figures for such positions; the features are different, showing that each is intended as a portrait, but the outlines of the figures are almost identical, being merely reversed; the leaded lines exactly coincide. A similar instance occurs at Nettleshead Church, Kent; St. Stephen, with stones in one hand and a book in the other, is balanced against St. Lawrence with a gridiron,—the two figures being repeats (except the faces) as to the emblems and dress colours. Mr. Baily took in this way the several portraits (of which there remain thirty-one in all), calling attention to the genealogy, the personal and other connexion with the Clopton family of the different persons, their connexion with the history of the Government of the nation, as in the struggles of the Wars of the Roses; the specialities of their costume, or of the heraldry depicted thereon; and of the architecture and church furniture and fittings also shown. As treating more at length of the genealogical details necessary to the comprehension of the scheme of this interesting and probably unique series, he mentioned a paper read by himself before the London and Middlesex Archeological Society, session 1871.

INSTITUTE OF PAINTERS IN WATER
COLOURS.

To compliment very highly the Institute of Water-Colour Painters on the present show arranged for exhibition in their gallery, would be to stultify former recognition of the high position its members have attained in establishing a comparison between the resources of their chosen medium and any other that might be adopted as sufficient means of achievement for nearly any result the painter could look for. There is no hiding the fact that these resources, year after year, are made to appear more restricted to a humble service than former application of them made it reasonable to believe would be the case. It may be said that this is quite appositional,—a mistake proceeding from a wider-spread, a more common ability to diffuse such claim to the admiration that was formerly concentrated on the few that excited it; and that artistic excellence was never so ripe or so sure of acknowledgment as it is now. This may be answered syllogistically. An ability so widely spread must be common indeed, and acknowledgment so cheaply obtained, of little beyond to-day's worth,—acceptance of show. However, neither fashion nor photography is likely to inhibit the ready provision that abounds to feed their vanity, and these are the presiding deities that an artist's pencil swears by, nowadays, and that everybody else swears by, in exemplification of a seeming wise discretion between what should be seen and what could be seen. Everything with a colourable excuse will make a picture now, so long as the colour includes the

pink of demand; and art will sleep in its dictionary bed,—a word to signify "cunning, skill, knowledge, a trade." Let it be said that art's appearance is as evident as ever,—even in twenty shillings change for the pound we should miss the presence of the sovereign; and to hold the great coin many would hesitate who think small change small change, though great change, before they identified the equal worth, and would like to change. It is a shilling age, and a chilling one for those who would think it golden if they could.

Messrs. L. Haghe, E. H. Corbould, and Henry Warren, with whose names the celebrity of the Institute is so closely associated, are amongst the members not assisting on the present occasion. Mr. J. Abshon sends numerous examples of his rapid, dexterous, and agreeable style; heads all glorying in one complexion; single figures in the costume of hygone ages—of which the most pretentious "Geneva" (39) will not be many be voted the best. Mr. G. G. Kilburne's pretty page, "Viola" (46) may be read for Shakespeare's or not; but it is the best study amongst others here that he has worked at. Mr. J. D. Linton is at a loss for a title, by which he could make good his claim to valuable property; his presentation of three odd personages is nearly as funny as it is finished (230). Finish, to a very admirable completeness, is the predominating excellence of Mr. A. C. Gow's interesting picture of "The First Provision Boat for the Besieged Town" (58); there was more colour of a sort to such an incident 200 years, or more ago, and of this advantage Mr. Gow has made great and good use. The work only fails in its want of the intensity that later experiences have proved to belong to the subject; the depth of such colour by which recent fact makes pale all past account and fiction. Crowds, cleverly crowded, are hailing the arrival of the boat into port; it might carry hay or fireworks, so far as may be learnt—beyond the catalogue. The preserver loth in easy indifference to any exciting course beyond the pleasure of taking a long shot to pot a possible purmer; no hastily scramble for loaves to disturb the good behaviour of the hungry; no starved wretch plunging into the quiet water, clamouring and clamouring up the vessel's side for the speediest help; need gives wide latitude to the necessitous. There is nothing gannet or greedy to hint at the cruelty of want, no ugly strength in this pleasant illustration of painful truth; though it gives room for the imagination,—a great thing for a picture to do, as pictures go nowadays, when matter-of-fact not of the right kind so frequently shuts out all the suggestiveness by which very much is attained towards its real worth to lead thought, by its canvas, through and beyond it, if text were as much cared for as texture. It is a very meritorious production, notwithstanding the objection. Mr. C. Green's sketches are, as usual, careful and clever, whether in pen-and-ink (158) or stippled up and cross-hatched on bright tints, as in the view he takes of a well-worn theatrical hussiness at a side wing (195). One of the multitude of little sprites, more learned as to the heels than the head,—fairies of pink tights, golden hair, and a season's creation and evanescence, that give a special interest to the boards—the London School Board included,—at pantomime time, is graduating by dancing steps to the degree of knowledge a pretty face and figure make so easy of attainment: an admirer has thrown her "Her First Beauquet." Mr. F. J. Skille's "Broken Children" (141) are not of the fairy order; a score of his examples give opportunity for a wide acquaintance with them here, but they are all (clever as they are) too much alike. "The Sisters" (2); "Morning—A Hayfield" (104); "Sunny Hours" (116); and "The Little Pitcher at the Well" (302) are amongst the best. Mr. W. L. Thomas's thirty sketches in one frame, made during "A Tour in the Pyrenees" (12), indicate a great appreciation of colour; and this is seen more convincingly in a little bit of home scenery, "Near Petit, Sussex" (5), to make it noticeable even when so many instances of a similar gift, applied to more learned workmanship, are to be found. Exquisite colour is the nominative charm of Mr. H. C. Hine's drawings; it would be difficult to simplify such object, as he makes subject enough in "Herring-boats, Eastbourne" (19), or indeed in any other of half a dozen proofs here; and yet, by his treatment, what is ordinarily visible with ordinary effects becomes quite new matter for admiration. Mr. E. Warren's single contribution, "West Dale Sands, St. Bride's Bay, Pembrokeshire" (202), looks

the more chilly and hard by reason, no doubt, of innate consequences to proper representation; a prevailing blue being one of them, and rocks—the antithesis of many things to be mollified,—another. The sun was kinder in the vicinity of "St. Mary's Isle, Northumberland" (179), enabling Mr. J. Mogford to streak his sea with puce and emerald shadows, besides lending such warm light to the rippled countenance of the "green one," or blue one, as makes it the more agreeable for those who do not like it much at such times. "Heave and Away" (36) comes in such expressive sequence, that one would just notice how well Mr. W. May points his advice by rolls of lumpy waves,—and take it! the more especially as his luggers, colliers, or whatever they may be, so far as a passing glimpse may show, have no more than signs of comfortable cabins.

"St. Mawes, Cornwall" (96), by Mr. J. G. Philip; "On the Orwell" (112) and "Dawn" (220) upon Druidical remains, surrounded by the mist and mystery of old, by Mr. Harry Johnson; "Castle of Rheinfels, on the Rhine" (134), with a good deal of its romance about it; "Hills near Loch Awe—Twilight," by Mr. T. Collier (210); "Evening," and "Sunset" (224 and 241), by Mr. W. L. Leitch, with Mr. McKewan's clever depiction of what is out doors and in, are some of the leaders of many cognate works that form the bulk of this exhibition, to which Messrs. Fahey, Whympier, Maplestone, Hargett, Mole, Pidgeon, Reed, Telhin, Rowbotham, Mitchell, Orrock, Sherrin, and Small, lend such help as their names would promise. The promise of a name is seldom so well realised as in the case of Mr. E. H. Fahey. Unnaturally and naturally he heats his father and a great many more at the "Study of a Head" (22); but, then, he speaks very loudly of the valuable direction that could educe such forcible views of cottages, with wild tamed to cultivated garden-produce, in his "Sketch from Nature, Dorchester" (81), or more quietly and as soundly in the "Sketch from Nature, Groombridge" (180), or in that of "Cookham-on-Thames," which give in rich and deep tone a promise of even better things to come.

With apposite notice of Mr. Carl Werner's learned representation of the "Fountain of the Apostles between Jerusalem and Jericho" (78); Mr. T. H. Cromek's "Crypt of St. Peter's Church, Toscanella, Italy" (176), and Mr. L. J. Wood's pleasant Prout-like drawings of old Continental buildings, these remarks end with a question.

In observing the similarity of winter and summer exhibitions, is not the likelihood of the later show becoming too like the earlier, rather than *vice versa*, a real cause for fear?

MR. PARKER'S LECTURES ON ROME.

MR. J. H. PARKER, C.B., M.A., Keeper of the Ashmolean Museum, at Oxford, has given two lectures in the museum. The first was on the results obtained by the recent excavations in Rome, as giving archaeological evidence of the general truth of the old legendary history of that city as given by Livy and Dionysius; and the second was on the Tombs and Catacombs.

In the first, he commenced by observing that the excavations in Rome during the last few years had thrown quite a new light on the early history of the Eternal City, and had gone far to prove that the old legendary history of the foundation must be substantially true, if archaeological evidence could be relied on, and he believed that it could for the main facts. The earliest wall in Rome in architectural character was the one at the north end of Palatine Hill, built against the cliff at the top. It was built of large blocks of stone, each $\frac{1}{2}$ ft. long and 2 ft. thick, and the same width,—that is, oblong, or two squares united,—and each of a ton weight. These stones were laid alternately lengthwise and crosswise, and are supported by their own weight only, with very wide vertical joints between them. The wall can be traced around three sides of an oblong space at the north end of the Palatine; on the fourth side it is concealed by the remains of the palaces of the Caesars. In the part immediately opposite to the hill of Saturn there are remains of towers against the cliffs and the walls. The northern side of this oblong space is a wide and deep fosse or valley, perhaps partly natural, but with vertical cliffs, exported in places by walls of tufa, as in all other parts. It is probable that the tufa stone

used to build these walls was taken out of this fosse, which was at least partly made. He pointed out that this fortified oblong space was naturally the arx or citadel of the Palatine Hill as a separate fortress, such as settlers might be expected to make who had to defend themselves upon it against an enemy on the opposite hill. He thought they might fairly call this oblong space by the old name of Roma Quadrata. Behind the earliest part of the wall of Romulus, at the north-west corner of the Palatine, is a cave reservoir for rain-water, cut out of a soft bed of tufa, between two hard beds. This reservoir has conduits leading into it from different parts of the hill. In the hard bed of tufa which forms the vault over it are several wells for letting buckets down into the water when it was full. Under the same corner of the Palatine, but at a very low level, only just above the ordinary course of the Tiber, is a cave with a stream of water gushing out of the rock into it, the source of what is called the Aqua Argentina. This cave might very well have been a wolf's cave at the time of the foundation of Rome. On the top of the Palatine, in the same corner, during the year 1871, the foundations of a very early temple were found, with a grand flight of steps leading up to it from the direction of the Lupercal and the Circus Maximus. The construction of this is exactly the same as that of the wall of Romulus; and if they were to believe the legend, this could only be the Temple of Jupiter Feretrius, built in the year 4 of Rome, and the steps of Cacus (*scala Caci*), built about the same time.

Mr. Parker next proceeded to refer to the second wall of Rome, built after the peace with the Sabines, when the two hills were united, and the Hill of Saturn was made the Capitol of the united city. Of buildings of the first period there were very slight remains. The houses were all of wood for a very long period, probably for the first 700 years of Rome, or longer. The city of Rome burnt by Nero was a wooden city almost entirely, and even after that time the upper stories of the palaces were of wood. The Golden House of Nero himself was all on one level, vaulted over, and the vault covered with earth, upon which gardens and woods, and the *thermæ* of Titus, Domitian, and Trajan were made. Such a palace could not be burnt. The pavement of the old street is often now found in the cellars of the houses, at a great depth. Mr. Parker dwelt at some farther length on the structure of the buildings, &c., and concluded by saying that the magnificent buildings of the Empire were so numerous and so important in Rome that it was quite impossible that he could enter into the subject here. He had given a general sketch of the history of architecture in Rome, as historical evidence, as concisely as he could.

NOTES FROM RIO JANEIRO, S.A.

THE Brazilians are decidedly peculiar in their acts of politeness. Meet a native acquaintance twenty times a day you must shake hands; no difference between male and female friends. Enter a room, the same process must be gone through. Smoking is quite fashionable, every room impregnated with tobacco-smoke; but chewing is discarded altogether. Coffee and light wines are always offered to callers, and they generally partake of them.

Intoxication is seldom seen, so far as your correspondent can judge; during nearly five weeks he never saw one drunken man. Every householder seems to be musically inclined; a piano I noticed in every house I called at. The wives of the business people I called upon seem to be slatternly and indolent, poor housewives; and the business people have peculiarities in regard to meals. The servant brings a cup of coffee to your bed, then you rise, go to business, work until eleven o'clock, breakfast, return to work, and then have a good square meal between five and six; one good meal a day is the general household "fixing." The better half of a well-to-do Brazilian rises about nine, remains in her dressing-gown until time to "fix up" for dinner. The women are not handsome—of a tawny complexion, coarse featured; but have wonderful eyes. There are a great many coloured (negro) folks in Rio, who, unlike those of the United States, mingle together in company at the opera or receptions; and for the first time during my stay in America, I came across a real coloured mechanical professional: the chief engineer and constructor of works, whom I had business with, was a negro. Rio has no buildings to boast of,

except cathedrals; lots of indifferent *cafés*, but no real decent hotel; and if a joint-stock concern wish to make money, let them "go for Rio," and build an American or European hotel. Rio has lots of public gardens, parks, and sea-side promenades. The Botanical Garden, about four miles from the city, has one of the finest avenues of palm-trees I have ever seen; these beautiful trees, stretching out their big leaves, make the walk a pleasant place in the hot sun. Fancy an avenue of tapering palms, about 70 ft. or 80 ft. high to the first branch, and in the centre of the avenue is a splendid fountain.

Rio has a very modest English church; as, also, one for the Presbyterians (I think for the American), the Roman Catholic faith predominating, whose cathedrals are very fine. There is no Sunday kept in Rio. Horse-racing, theatres, and the shops are in full swing, and more retail trade seems to me to be done on Sunday than any other day; the only difference I could see was a few more clean shirt-fronts exposed.

Only one railroad runs out of Rio, but the place is lined with coasting and foreign steamers. In regard to hotel accommodation, I learnt that the wholesale dealers generally provide sleeping accommodation for their country buyers.

The second Sunday I spent in Rio I must plead guilty to witnessing a horse-race, and had the honour of seeing the Emperor and the royal family. Don Pedro Secundo is about a 6 ft. well-proportioned gentleman, genial and oval face, full beard, half black and half grey, dressed in simple black. My acquaintances say his donship is given to much staidy, and rather an advanced philosopher.

Monopolies seem to me the order of the day in Rio. One concessionist monopolises all the cartage for supplying the city with water. Another necropolis the burning of the dead, for the dead must not remain out of the ground longer than six hours.

Slavery exists in Brazil, though in a somewhat modified form. Hereafter, children born of slaves will be free; so death to slavery will take place in the next generation. My business in Brazil took me a greater part of the time among the planters, and the slaves appeared to me to be treated very harshly, working from daylight to dark, neither age nor sex seeming to be of any consequence. Probably the sugar-making season being on hand brought great pressure to labouring hands. Carrying loads is quite a curiosity; everything is done on the top of the cranium, from a sheet of paper to a piano,—the women carrying just as heavy loads. The amount of dress is also scanty,—an old canvas sack ripped open at the bottom and two holes for the arms, or a pair of overalls.

The country around Rio is mountainous, abrupt, and admits of very little culture; to get into the interior must be done by mule exercise.

The fashionable resort is the town of Petropolis, about thirty miles from Rio. The route is by steamboat some twelve or thirteen miles, by rail five miles to the foot of Seirao, thence by diligence to the top of the mountain, some 4,000 ft. The road up the mountain reflects great credit on its constructor: it is zig-zag in its formation, and one is compelled to go a dozen miles to get to a three-mile point. The scenery up the mountain is magnificent and beyond description, but the air becomes rarified, and it is hard work to breathe much. A diligence with four persons takes as many hours to ascend the mountain, and requires the aid of six mules. Petropolis is the resort of the Emperor in the very hottest months of the year; it is situated in a little valley on the top of the mountain, and contains about 3,000 persons.

The Emperor's Palace is a large building, void of architectural beauty, but the grounds are in the very highest state of culture, and adorned with everything beautiful in the horticultural line.

The slaves of Brazil seem to me a poor, uneducated kind of creature,—very obedient, and scarcely one passed me but his hat was taken off and a most obedient bow made, and muttering of a few words followed, which, interpreted to me, was "Praise be the Lord. Your blessing, master." Slaves are allowed to work for themselves, provided they pay their master about one dollar a day and support themselves: so by that means many from their savings are able to free themselves in a measure.

Hat-making is learnt by every negro:—at corners, garden fronts, and out-of-the-way places the coloured people seem to use every spare minute in braiding palm-leaf plaids for hat-making, which they afterwards sew together,

and construct the hat. Sickness is not very prevalent, but the Yellow Jack fever is often a visitor,—not more so, I am told, than in other parts of Southern America.

Altogether, my visit to Rio Janeiro was one of extreme pleasantness, and now that I am settled down for a short time in my old bachelor quarters in the Northern part of the United States, I hope these few jottings of a wanderer will not be altogether uninteresting to the readers of the *Builder*.

QUERCUS.

VENTILATION AND THE FACULTY.

SIR,—In an interesting paper "On the relative frequency of disease between the right and left sides of the heart," by Dr. Black,—published in the *Lancet*,—the following passage occurs:—

"Architecture has much to undo, much to learn, before it can satisfy the simple laws of nature. In ignorance of these laws houses are built, stately edifices erected, and no thought or care is taken to render the air within as pure as the air without. It is nevertheless easy to accomplish this desideratum, but blind unyielding ignorance claims death in every room."

No greater benefit could be conferred on mankind than the teaching them the necessity of ventilation, but that lesson is more likely to be learnt if it comes from the doctor than from the architect.

I think Dr. Black rather underrates the difficulty.

When there are both lighted gas and a fire it is easy, a hot chamber-stove supplied by fresh air from without will give a sufficiency of warm air, and one of Rickett's ventilating gas-burners will remove the carbonised air; but to apply this to a single room will cost, from 30*l.* to 50*l.*, and few persons are willing to incur this expense. In addition to this, when there is only a fire without gas burning, the cold air is apt to come down from the ventilating tube of the gas-burner.

In houses already built, where gas is not burnt, it is difficult to get rid of the carbonised air; the smoke that comes through Arnott's valves so blackens the walls and ceilings that the valves are not infrequently removed; and in bedrooms where there is neither fire nor gas simple ventilation by means of gauze or finely-perforated zinc is generally pasted up. To supply the whole house with warmed air, and to remove the carbonised air, requires a more or less costly apparatus, which is generally objected to on the score of expense, and which is still more costly and troublesome to execute if required for a house already built. Where an architect proposes any system of warming and ventilation, the reply usually is that the owner "is perfectly satisfied with an ordinary open fire-place and sash windows, and that he does not see the necessity of going to the expense of other means of ventilation which he understands does not generally answer."

Severe colds in the head and an increased outlay are tangible evils, while the gradual deterioration of health by living in ill-ventilated rooms is looked upon as a visitation of God.

It must not be forgotten that hitherto ventilation has been usually a failure: the costly mistake of the House of Commons is one grand stand-point of objection.

In the first quarter of this century the subject of ventilation attracted much attention, but the practical promoters were so incapable of applying it satisfactorily that people became disgusted with the expensive failure, and as no serious injury was known to be caused by the want of ventilation, all attempts to secure it were abandoned. Architects can only be supposed to know the immediate inconvenience of the want of ventilation, and not its ultimate effects on the human frame.

If my recollection serves me, in a paper on "Railway Travelling" in the *Lancet*, we were informed that greater evils resulted from persons catching cold (by having the windows of railway-carriages open) than by the diminished circulation caused by the carriages being unventilated.

A very large room in the city of London, that was built about the year 1828, was put into the hands of Dr. Arnott to warm and ventilate. On his failure, the schemes of Walker, Perkins, and others were tried, and all without the smallest success; the constant complaints of the clerks who were annoyed by the hot air, and of those who got colds and rheumatism in the head from the cold air coming in where the hot air ought to have gone out, so annoyed the secretary that at last the ventilators were blocked up, and

the clerks who complained of cold were supplied with hot-water tins for their feet.

I have seen dozens of cases in bedrooms where the perforated zinc or gauze was blocked or pasted up, which had originally admitted fresh air. My last experience of drainage and ventilation as applied to a stable may be instructive. An old stable was altered. Light was admitted at the dark end by a large shaft, the soaked soil was removed, the whole stable concreted, the floor paved with adamantine clinkers, the stable-drainage carried on the surface to the outside, the warming was obtained by means of hot-water pipes in the coach-house communicating with the stable, the ventilation by means of one fixed open louver at the top of the light shaft, by a perforated zinc tube over the mangers leading at both ends to the open air, and by an imperious pipe also open to the air at both ends supplying air to perforated plates under the mangers. The stable was no sooner occupied than the surface-drains were removed and the stalls drained by horse-pots into the general soil-drain, and directly the cold weather set in the fact of one horse having a cold was sufficient to cause the owner to have the ventilator in the light shaft permanently closed, and both ends of the other ventilating pipes blocked up.

Until the faculty can convince people that their life is shortened and serious diseases are brought on by want of ventilation, architects have no chance.

GEORGE ANCHISON.

THE LEEDS SCHOOL-BOARD.

A DIFFICULTY has arisen between the Educational Department of the Government and the Leeds School-Board in respect to broad and narrow plans. The nature of the difference will be seen, if we quote from one of the letters from the Educational Department respecting a set of the plans in question, which the local Board purposely required the architects to prepare on the broad system:—

"Their lordships' architect reports, 'These plans are very unsatisfactory. All the principal schoolrooms are 30 ft. wide, and from 45 ft. to 49 ft. long only. The class-rooms have in most cases their fittings placed so that the children would have their backs to the light, and both school and class room are so crowded with fittings that teachers would find great difficulty in managing the classes; the chief point, however, to object to is the wide school-rooms. I wish to add that the design is most unnecessarily extravagant.'"

Sir Andrew Fairbairn (chairman of the Board), Mr. Beckwith, Mr. Gaunt, Mr. Long, Mr. Kendall, and Mr. Woolley, have been appointed a deputation to wait upon the vice-president of the council relative to the demer of the Department to approve the plans of the Board on the ground of the width of the principal school-rooms.

REBEKAH.

In catering for the tastes of their subscribers, the council of the Art-Union of London, whilst generally successful in producing good art, are, apparently, anxious to vary, as much as possible, from year to year, the subject of the work provided for general distribution; thus having for last year engraved a series of plates of "Coast Scenery" from drawings by deceased British artists, they give us this year a work of a totally different character,—"*Rebekah*," from the fine picture by F. Goodall, R.A., very well interpreted in black and white by the late William Holl.

Who does not know the charming and graceful picture, by Horace Vernet, treating the same subject? It may, perhaps, be allowed that there is something in it rather more theatrical in the action, where the damsel balancing the water-pitcher on her right arm, proffers its mouth to the thirsty messenger, than in Mr. Goodall's more simple and bonely rendering.

There is, to be sure, far more scope for sentiment in the latter picture, seeing what a revolution of feelings has taken place, in the few minutes intervening between the incidents depicted, in the bosom of her who was destined to be the "mother of thousands of millions." In the former, *Rebekah* merely sees an ordinary dusty and wayworn traveller, who begs for water for himself and his camels; in the latter she is being asked to be the wife of her father's brother's son, of the possessor of "flocks and herds and silver and gold;" she sees an immo-

date escape from a single life, ever held as a kind of disgrace by the daughters of Judea; and we may assume that she had some sort of divine inspiration teaching her the destiny awaiting her descendants, that "in her seed should all the nations of the earth be blessed."

The artist has happily caught the expression of these varying emotions in the maiden's face, while the man, proceeding to place the bracelets on her wrist, "wondering at her, held his peace; or wit, whether the Lord had made his journey prosperous or not." This touching representation of an event of such vast importance in the great scheme of human redemption must have a high interest for all believers; and, whilst tending to lead to solemn and momentous thoughts, it is conceived and rendered with artistic grace and beauty. We cannot but endorse the anticipations of the council that "the plate will meet with great success."

PROPOSED FLOATING BATHS ON THE THAMES, AND THE PURIFICATION OF THE RIVER.

At their meeting last week, the Corporation took the preliminary step towards the establishment of floating-baths on the Thames for the use of the inhabitants. Mr. Deputy Stapleton said it was highly desirable that the Corporation should construct and maintain baths of this character in the interests of the health of the citizens, and in support of a proposal to that effect he remarked that there were only twenty-four public baths in London, most of which were very limited in size, and totally inadequate to the sanitary requirements of the population. He suggested that large floating-baths, not less than 150 ft. long, and 40 ft. wide, should be stationed at various parts of the river, and added that it was not necessary to wait for the purification of the water, inasmuch as there was a process by which it could enter the baths filtered. He moved a resolution to the effect that it be referred to the General Purposes Committee to inquire into the cost of construction and the probable annual outlay for maintenance, with power to confer with the Thames Conservancy Board, and to report generally on the subject. The motion having been seconded, it was objected by one or two members that the proposal was premature, and that the construction and maintenance of baths was not an appropriate task for the corporation to undertake. The feeling of the members generally was, however, warmly in favour of the proposal, and in the course of the discussion Mr. Bedford incidentally observed, that in three months the whole of the sewage of the City would be intercepted, and that the river would probably then be as pure as it would ever be. Mr. Stapleton's motion was ultimately carried, after several members had spoken in its favour.

HOLDENHURST CHURCH, HANTS.

The Church of St. Swithin, Holdenhurst, near Christchurch, Hants, has been enlarged by the addition of a chancel, with apse, and a vestry. The body of the church has also been re-seated. The building to which these alterations (built some thirty-five years since) have been made consisted of a nave, 28 ft. 6 in. wide, with a recess, serving for a chancel, and a south transept. The vestry, &c., were at the west end, and over them was placed a gallery. This arrangement has been abolished, the gallery pulled down, and the font now stands where the staircase formerly was. Owing to the limited site available at the east end, it has been impossible to make the total length of the chancel more than 18 ft., the width being 14 ft. The walls are mainly built of Swanage stone with Box-ground Bath quoins and dressings externally, and Corsham Down internally. The timbers of the open roof are of fir, and the external covering is Bangor slating. The body of the church has been seated with low, open, deal, stained benches, with shaped ends. The chancel seats are of wainscot, with open pierced book-board fronts. The pulpit is of oak, the upper panels being perforated: the base is of Bath stone. The nave passage is paved with Maw's 4½-in. red and chocolate tiles, laid diagonally in ornamental patterns. The chancel is laid with encaustic tiles, those within the sanctuary being of richer design than the others. All were supplied and laid by Messrs. W. B. Simpson & Sons, Messrs. Maw's London agents.

The reredos (executed by Mr. J. L. Jaquet, of London) is composed of brown alabaster, dove marble, yellow Mansfield stone, and marble inlay. A variety of curious pieces of mosaic, marble, and stone, collected by the vicar, from Italy, the Holy Land, and elsewhere, have been worked into the design. The church is warmed by one of Porritt's underground stoves. All the windows in the chancel are filled with painted glass, by Messrs. Lavers, Barrand, & Westlake. The total expense of the work amounts to upwards of 1,000*l.*, the whole of which has been borne by the vicar, the Rev. F. Hopkins. The contractor was Mr. J. Landon, of Barton, near Christchurch. The architect was Mr. Ferrey, F.S.A.

OBITUARY.

THE LATE MR. R. E. BANKS, ARCHITECT.

We record with regret the death, on Saturday, the 14th inst., at his residence, Dulwich Wood Park, of Mr. Robert Richardson Banks (of the firm of Messrs. Banks & Barry), aged 59. Mr. Banks had been the partner of Mr. C. Barry since the year 1847, and was, before that, nine years an assistant in the office of the late Sir Charles Barry, who had, justly, the highest opinion of his ability and integrity.

THE LATE MR. WILLIAM SLATER.

With equal regret we mention the death of Mr. Slater, of the firm of Messrs. Slater & Carpenter, which took place on the 17th instant, from complete prostration of strength, caused by a complication of diseases, from which he had suffered some years. The end was most unexpected at the last, but his partner and friend was able to be with him. The partnership in this case,—and it was the same with Messrs. Banks & Barry,—was not merely a business arrangement, but one of mutual pleasure and satisfaction. We may have more to say at another time of both these estimable men, and able architects.

LONDON CITY MISSION COMPETITION.

New official premises being required for the London City Mission, the committee invited Messrs. Spalding & Knight, Messrs. Searle & Sons, Messrs. Habershon & Pite, and Mr. Bell, to send in designs; the three architects not employed to be paid 15*l.* each for their designs, then to be considered the property of the society.

The maximum cost of building was limited to 7,000*l.*, this sum to include the extension of the vaults and footway required, stoves, bell and gas fittings, speaking-tubes, and arrangements for warming, ventilation, and carrying off gas by zinc tubes; the building to be constructed of brick, with stone dressings.

The design was to include a large-sized room for storing and distributing Bibles, tracts, &c.; a lecture-hall, to seat from 400 to 500 persons; and a library to hold the books lent out to the missionaries, with a capacity of about 50 ft. by 20 ft.

Designs having been submitted, the committee have just now decided in favour of Messrs. Spalding & Knight. The chosen design is in the Italian style, with a façade of brick and stone, and is to be erected forthwith upon a prominent site in Blackfriars, opposite the Ludgate Railway Station,—a part of the former site of Radley's Hotel and the Bridewell.

THE LONDON SCHOOL BOARD.

On the recommendation of the Works Committee, it has been resolved that the tender of Messrs. Henshaw & Co., of 13 to 15 Wharfs, City-road Basin, amounting to 5,285*l.*, for the erection of a school providing accommodation for 707 children, on the site on Eel-brook-common, Chelsea, be accepted; that the tender of Mr. W. Shepherd, of 101, Bermondsey New-road, S.E., amounting to 6,250*l.*, for the erection of a school providing accommodation for 878 children, on the site in Woolpecker-road, Greenwich, be accepted; that the tender of Messrs. L. H. & R. Roberts, of 34, Rheidol-terrace, Islington, N., amounting to 6,370*l.*, for the erection of a school to provide accommodation for 830 children, on the site in Binnell-street, Islington, be accepted; that the tender of Messrs. Henshaw & Co., of 13 and 15 Wharfs, City-road Basin, amounting to 8,975*l.*, for the erection of a school to pro-

vide accommodation for 1,388 children on the site in York-road, Finsbury, be accepted; and that the tender of Mr. G. S. Pritchard, of 108, Paul-street, Finsbury, E.C., amounting to 6,144*l.*, for the erection of a school to provide accommodation for 1,127 children, on the site in Hamond-square, Hoxton, be accepted.

PADDINGTON BATHS AND WASH-HOUSES.

A LIMITED competition of nine architects was resorted to in order to obtain a design for this building. The Commissioners met on Tuesday last, when they awarded the first premium, of 100*l.*, to Mr. Lewis H. Isaacs, of Verulam-buildings, Gray's-inn; the second, of 75*l.*, to Mr. H. H. Collins, of Queen-street, Cheapside; and the third, of 50*l.*, to Mr. Bridgman, of London-wall. Mr. Isaacs is to be instructed to prepare the contract drawings forthwith. The estimated cost of the building is 20,000*l.*

THE COST OF THE FOREIGN CATTLE MARKET.

PROPOSED ADDITIONAL BUILDINGS.

At their meeting, last week, the Corporation complied with a recommendation of the Cattle Markets Committee for the raising of a further sum of 20,000*l.*, for the payment of 14,000*l.*, which had been incurred in excess of 210,000*l.*, already granted for the construction of the Foreign Cattle Market at Deptford, leaving the balance of 6,000*l.* for such other works as might be necessary; and it was stated that this last-named sum would probably be required for the erection of additional slaughter-houses.

OXFORD IN THE RECENT GALE.

The damage done at Oxford was more extensive than last week's accounts indicated. According to the local *Journal*, at Christ Church, about 90 ft. of the parapet of the Deanery were blown off to the lead roof, which was severely damaged thereby. A small portion of the parapet adjoining "Tom Tower," in St. Aldate's, was also blown down. At Magdalen College, the pinnacle and weather-cock on what is known as the Founder's Tower were blown off, as were also the top of a chimney in the Chaplain's Quadrangle, and some battlements from the president's house. A portion of the end wall of a house, situate in New Inn Hall street, fell. The end wall of a house in the parish of Cowley St. John also fell. A portion of one of the small pinnacles of St. Mary's Tower was blown off, but no damage was done to the church. Some ornamental work on the wall in front of Pembroke College was blown down, as was also some from the Independent Chapel in George-street. About one hundred-weight of lead was blown off from the roof of a house in Isis-street, St. Aldate's. Four brick walls in the front gardens in Prince's-street, St. Clement's; one in William-street, Cowley-road; one in Filley-road; and one in Observatory-street, St. Giles's, were blown down. A square of glass was blown out of the roof of the Corn Exchange. In Church-street, South Hincsey, the gable end of a house fell in while the occupants were in bed. All escaped. Two garden walls were also blown down. Many fine trees have been destroyed, and chimneys and roofs damaged.

THE PROVIDENT INSTITUTION SAVINGS BANK NEW BUILDINGS.

An extensive block of new buildings for the Provident Institution Savings Bank has for some months been in course of erection at the corner of St. Martin's-lane and St. Martin's-place, immediately facing Charing-cross, and are now externally approaching completion. The structure contains two main frontages, the principal façade facing Charing-cross, and the other elevation being in St. Martin's-lane, with an entrance frontage at the angle of St. Martin's-lane and St. Martin's-place. The height of the building from the street level to the main cornice is 42 ft. 6 in., above which is a balustrade resting on a plinth. The elevation facing Charing-cross is 60 ft. in length, and contains two stories and dormers in addition to the ground-floor. The material used in the external construction of the building is Portland stone. The ground-

floor, up to the base of the first-story windows, is rusticated. The windows of the ground-floor are circular-headed, with carved figure-headed keystones, and coved recesses. At the base of the first-story windows, immediately under which a cornice runs across the elevation, there are sunk and moulded panels, the windows on each side having ornamental fluted pilasters, with carved capitals, and architraves, surmounted by pediment heads. The second-story windows are of a more simple character, without any attempt at ornamentation. Above the second story there are five dormers in the roof between the balustrades, which are of a bold and prominent character, and materially add to the architectural attractiveness of the elevation. These windows vary in construction, being alternately pediment and circular-headed. The St. Martin's-lane elevation, which is 40 ft. in length, is uniform in construction with the Charing-cross frontage. The principal entrance to the bank premises is at the St. Martin's-lane and St. Martin's-place angle, the first-floor window over the doorway being circular-headed, whilst on each side of the dormer window above, uniform with those in the two main elevations, there are ornamental finials.

The business of the bank will be conducted on the ground-floor of the building, which, in addition to the general office or banking premises, a large apartment, 46 ft. in length by 32 ft. in width, also contains vestibule or entrance-hall, secretary's offices, strong-rooms, and other conveniences. That portion of the premises immediately over the banking department, from the ground-floor to the top of the building, is entirely open, and the bank will be lighted by a square lantern above.

The first floor, which, with the rest of the building, is approached by a private door and staircase in St. Martin's-lane, will be exclusively set apart for the directors and board of management, and will contain the board-room, ante-room, and offices; whilst the second floor and dormers above will contain a full suite of apartments for the manager's residence.

The cost of the building, exclusive of the land, for which a large sum was paid, will be upwards of 10,000*l.*

Mr. D. Brandon, of Berkeley-square, is the architect; and Messrs. Brass & Sons are the contractors.

LIGHTNING CONDUCTORS.

NOTES on "Some Phenomena produced by Lightning," published by Father Secchi, in *Les Mondes*, are quoted in the *Telegraphic Journal* of the 6th inst., and deserve the attention of those who are engaged in the protection of buildings from the effects of lightning. Father Secchi writes:—

"Eight years ago some lightning conductors had been erected under my direction on the cathedral and on the Bishop's Palace of Alatri, situated at the summit of the Acropolis of that town, which, by its elevated and solitary position, was exposed to frequent ravages from storms. It was not long ago that a flash of lightning demolished a great part of the belfry, and damaged the organ of the church. In the erection of this lightning conductor there arose a great difficulty proceeding from the nature of the soil, which at the depth of some centimètres turns out to be entirely of solid calcareous rock.

In order to remedy this defect, that part of the conductor which enters the ground has been made very long, more than 4 metres, and has been provided with a great many couples of points, 5 centimètres broad, 5 millimètres thick, indented on the edges, with the addition of a thick copper wire twisted among the same points, to help to multiply the points of contact between the rod and the soil. The foot of the lightning conductor is entirely of copper; the rod is also of copper up to a metre above the ground, and there it is joined to the iron conductor in the ordinary receptacle made in the heart of the wall to preserve it from disturbance at the inferior parts. The ditch, into which the foot of the lightning conductor has been sunk, is 5 metres long, 0.60 metre wide, and it was dug until it came upon the roots of some neighbouring trees; a layer of cinders was then placed to a height of 20 centimètres, which extended over the whole lower surface of the ditch. Thus the surface of contact between the metal and the carbon and of the latter with the soil, was such that one would suppose it to

be more than sufficient, and the presence of trees, although they were not large, raised the hope that there would be always enough moisture. Moreover, as the edifice had two culminating points, viz.—the belfry and the hinder portion of the choir, two rods were placed with points and feet, and the two rods have been joined together on the roof by a conductor, so that, in the case of a discharge on one of the points, the lightning would find two ways for spreading itself in the soil."

These precautions produced a good result, since in this interval the tower having been struck at least four times, the edifice has sustained no damage. Water-pipes, at some distance from the foot of the conductor, however, were destroyed, and of the circumstances attending this, the writer gives an account, drawing the obvious inference, that it is necessary to devote great attention in the erection of lightning conductors, that we must allow them a large surface for discharge; and that there can never be too much of it. The surface of the foot of this lightning conductor was certainly superior to what has been judged sufficient by Matteucci for the discharges of telegraphic conductors, and yet it has not sufficed. Further, it is a confirmation of the necessity of making the neighbouring metallic masses communicate, and especially with water-pipes or gas-pipes.

BELFAST ARCHITECTURAL ASSOCIATION.

A MEETING of this society was held at the Museum on the 9th inst., Mr. Thomas Turner in the chair.

A paper was read by Mr. Samuel P. Close, on "Measured Drawings," showing the advantages to be gained by the measuring up, and close study of, good examples of ancient architectural work. The paper was illustrated by a large number of drawings.

Some of the members present added to the interest of the evening's proceedings by discussing various matters connected with the subject.

SCIENTIFIC AND MECHANICAL SOCIETY MANCHESTER.

THE adjourned half-yearly general meeting of this Society has been held. From the half-yearly report it appears that the receipts had risen to nearly three times the amount of the preceding session. The report was adopted, a new set of rules and bye-laws agreed to, and the following gentlemen elected to form the council:—

President: Sir W. Fairbairn, bart., C.E., LL.D., F.R.S., &c.

Vice-Presidents: Professor O. Reynolds, M.A., C.E., Owen's College; H. W. Hartman, M.I.M.E., A.L.C.E.; J. Shepherd, C.E.

Treasurer: Charles S. Allatt, M.E.

Hon. Secretary (re-elected): A. Hildebrandt, C.E.

Members of the Council: W. Bowker, M.E.; F. C. Lynde, M.E.; R. L. Messenger, C.E.; C. J. Allport, M.E.; J. C. Edwards, M.E.; A. Ross, C.E.

The next meeting was to be held on (this) Saturday, at the Trevelyan Hotel, to receive the inaugural address of the president, who would afterwards be entertained at dinner.

A NEW POST-OFFICE FOR WOLVERHAMPTON.

ON the south side of Queen-street, nearer to the centre of the town than the site of the old office, a new Post-office building has been erected. It has been designed by Mr. T. Williams, the architect for the new buildings of the General Post-office, in London. It may be described as Græco-Italian, with a frontage of 48 ft., and an elevation of over 60 ft., in which there are three stories, and a basement. In the lower story there are two doors, with two windows opening between them. Beneath the sill of the window at the east end will be the slits for receiving the letters and papers. The first and second stories have a range of four window-openings to each. The first-floor windows are pediment-headed. Surmounting the building is a cornice and balustrade parapet, not unlike those of the Oxford and Cambridge Club-house, in Pall-mall. A moulded balustrade string-course divides the ground from the first story, and an enriched string-course the first

from the second story. The whole of the front is built of Hollington stone. By reason of the line of frontage, there is an open pavement-space in front. The public will enter by the west door, into a lobby, with glass doors, inscribed and indicating the post-office, and telegraphic department, savings-bank, and telegraphic departments. The post-office proper is an apartment 35 ft. in length by 23 ft. in breadth, and 13 ft. in height. Extending from this room is the office in which the mail-bags are received and made up, and the letters are assorted. It is 60 ft. in length by 30 ft. in breadth, and from the floor to the raised skylight that runs the whole length of the room the height is 25 ft. From this office there is a way into the mail yard, between the building and Castle-street.

The doorway at the east end of the front will lead to the post-master's office, on the ground-floor, and, by a stone staircase of four flights, to the first and second stories. The first story will be devoted to the business of the inland revenue department; and the second, to the practical business of the telegraph department. In a well-lighted, spacious room, running the whole length of the front of the building on this second floor, eleven telegraph clerks will receive and despatch the telegrams by forty-seven wires.

In respect of Post-office accommodation, Wolverhampton is now considered to be equal to Sheffield, Nottingham, and Derby. The contractors were Messrs. Parnell & Son, of Rugby. The new office has just been opened for the use of the public.

THE PROFESSIONS AND SANITARY REFORM.

SIR,—The perusal of a suggestive article in the last number of the *Builder*, entitled "The Hitch in Sanitary Reform," leads me to inquire whether, in the writer's very just estimate of the equal necessity for the scientific engineer and the skilled medical officer of health in sanitary administration, he may not have somewhat misapprehended the line taken by the leaders of the progressing medical movement against Mr. Stansfeld's blundering attempts at legislation and administration.

To a certain extent, as that writer alleges, the object of this movement is professional,—so also is his object. But I might easily adduce many proofs of the breadth of view taken by sanitary reformers in advocating the proper official employment of engineers and architects.

1. To quote the Report (1871) of the *Joint Committee of the British Medical and Social Science Associations*, a body more than three-fourths of which are medical men:—

"(§ 18.) The last important reason which we shall adduce for wider administrative areas is, that they would supply a superior machinery for the appointment of scientific officers, whether medical or engineering, of high and special qualifications."

Again (§ 40):—"In every such (inspecting) circuit, it might be advisable, for efficient administration, that the central authority should act through three inspectors with different qualifications—one legal, one engineering, and one medical or scientific."

2. Mr. Michael, the legal secretary of the Joint Committee, in an able paper read at Plymouth, recommends for each principal district the appointment of three officers,—the clerk, as legal adviser and public prosecutor; the skilled surveyor, as engineer; and the specially-trained medical officer of health.

3. In my recent "Summary of the Principles of a Comprehensive Measure for the Improvement of the Sanitary Laws" (§ x. *Special Qualification for Chief Officers*), I urge that "this true safeguard of administration should apply to engineers, surveyors, public analysts, officers of health, and medical jurists"; and I say (§ xix. *Inspecting Circuits*),—"To each of these circuits should be appointed one legal, one medical, and one engineering inspector."

I might multiply such references, but it is needless, for the establishment of a complete scientific machinery is the demand alike of the whole educated community, of the learned professions, and of a suffering people.

Mr. Stansfeld's greatest error has been his acceptance, on political grounds, of the fanciful theory, that local and union Boards, which were constituted for other objects, and which have fully proved their incompetency for, and their indifference to, sanitary action, may be trusted "to rise to the height of their new functions."

As the writer in the *Builder* very truly says respecting this self-education of local Boards for duties of urgent and immediate necessity,—
"Time is enlisted on the wrong side."

But now that a visionary and fallacious principle has been adopted in the formation of sanitary authorities, the main point to which public attention ought to be directed is the necessity for a high and special qualification for officers. I saw, therefore, with pleasure an advertisement in the *Builder*, of October 5th last, giving notice that the Royal Institute of British Architects would grant a *certificate of competency* for the duties of District Surveyor under the Metropolitan Buildings Act, to any candidate who passed a two-days' examination, written or oral, to be held at the Rooms of the Institute. The value of such a diploma would be greatly increased if the Institution of Civil Engineers were associated with that of architects in an examination which should be required for the office of District or County Surveyor throughout England.

No one who has critically observed the execution of so-called sanitary improvements, can doubt that a number of very incompetent surveyors are employed,—men whose knowledge, whether of engineering or architecture in the sanitary department of those arts, is lamentably defective. The extravagant blunders that have been made, the useless and even positively injurious works that have been constructed, at enormous waste of time, labour, and money, show that in future no one ought to be permitted to direct great sanitary undertakings, without having gone through special study, training, and examination. That system is utterly unreliable which commits the selection of such officers to local Boards, of easy virtue, unguided by authoritative certificates of qualification, and liable to be swayed by piles of amateur testimonials.

While urging these considerations upon the professions represented in the *Builder*, I cannot avoid remarking that the scientific basis of every measure for wholesome alimentation, for water supply, for the removal of refuse and excreta, for drainage, for ventilation, and for house-construction, was in the first place laid down by the physiologist, the pathologist, or the physician; and that the precise cause of injury to health, through defective or badly-constructed works, has been generally detected by the medical expert, e.g. in the recent inquiries at Loundeshorough Lodge.

The history of the aetiology of disease must not be forgotten. It places indisputably the medically-educated philosopher in the van of the sanitary movement. We may, nevertheless, fully admit that the principles of sanitary architecture and engineering must be worked out scientifically by architects and engineers; just as the skilled analysis of air, water, and food, must be committed to chemical and microscopical experts.

Captain Douglas Galton, R.E., C.B., F.R.S., has stated the relative position of the two professions very clearly in his remarkable address at Leeds on the construction of hospitals. "My part," said he, "has been to endeavour to show how the architect must shape his building so that it shall be in accordance with what the physician has declared to be necessary."

HENRY W. RUMSEY, M.D.

OPENING OF THE NEW CONVALESCENT HOME AT SALTBURN-BY-THE-SEA.

WE now give a few particulars in addition to the announcement we made of the opening of this institution. The Pease family have not only defrayed the entire cost of the new building, amounting to upwards of 12,000*l.*, but will also be at the whole expense of its continued maintenance for the injured and sick amongst their workpeople. The services of Mr. Thomas Oliver, of Newcastle, the architect of the Prudhoe Memorial Convalescent Home, at Whitley, having been secured, and a design adopted, not altogether on the plan of the Prudhoe Memorial at Whitley, but somewhat after the celebrated Convalescent Home at Vincombes, a contract was entered into in 1870, and the works have been pushed forward since that time. The site selected is on an elevated situation, with easy approaches to the sea-beach, and facing more immediately into the Hazel Dene Valley. It is dry, comparatively protected and warm, and with cheerful views from the principal fronts. The outline is broken into distinct groups, the horizontal lines at intervals by the transverso

lines of the gables and the central block, which is raised above the whole of the other blocks, and from the middle of which springs a clock-tower, terminated by a truncated roof. The style of architecture adopted is domestic Gothic, freely treated, and the materials employed throughout are white brick, with warm cream-coloured stone dressings. Green Westmoreland slates have been used for the whole of the roofs, and the ridges are finished a deep red colour. The groups of chimneys, which have ventilating-flues attached, form a conspicuous feature in the elevation.

The frontage of the building is about 200 ft. long, the building itself being formed in two parallel lines reaching about 100 ft. from front to back, the front line being appropriated to the patients, while the back is appropriated to kitchen offices, wash-house, laundry, and snook-like purposes. The whole of the walls have been built hollow; the floors of the corridors are of coloured tiles in artistic patterns, while the floors of the dormitories, day-rooms, and sick wards are laid with pitch pine. The staircases are all of stone, and practically the building is fireproof. The encaustic tile pavements have been laid by Messrs. Minton, Hollins, & Co., of Stoke-upon-Trent. Over the large central window, and filling in the spandrels, are carved busts representing Faith, Hope, and Charity. These have been executed by Messrs. Burstall, of Leeds, who also executed the carving throughout. The building is approached by a raised stone terrace. The fittings generally in the sick wards have been furnished by Mr. Jennings, of London.

Accommodation is provided for fifty patients. The warming is secured by open fireplaces, with Gill backs which supply warm air from openings in the front of the grate; and the ventilation is secured by means of these stoves, as well as by Sheringham valves, for the inlet of fresh air, and ventilating flues in connexion with the fire flues for the outlet of the foul air.

The furniture has been executed by Mr. Sopwith, of Newcastle, from designs furnished by the architect. Messrs. Robson & Son, of Darlington, were the sole contractors for the building works; and Messrs. Walker & Emley, of Newcastle, for the engineering works. The sub-contractors were as follows:—For the carpenters' and joiners' work, Messrs. Bridges & Robinson, of Hartlepool; for the plumbers' and gas-fitters' work, Mr. Johnson, of Darlington; for the plasterers' work, Mr. Ormerod, of Carlisle; for the ironfounders' work, Messrs. Walker & Emley, of Newcastle; for the painters' and glaziers' work, Mr. T. C. Tomkins, of Salthurn. Mr. R. Robinson, of Darlington, was clerk of the works.

THE NEW ADULTERATION ACT.

THE new Act, to which we have already referred on several occasions, gives power to the courts of quarter sessions and town councils in England to appoint analysts of all articles of food and drugs, and these bodies are compelled to appoint the analyst when called upon to do so—in England, by the Local Government Board. The analysts having been appointed, the local authorities are to employ the inspectors of nuisances, of weights and measures, or of markets, to procure samples of suspected articles and hand them to the analyst to be analysed. Should the analyst certify that the articles are adulterated, then the inspectors will make a complaint before a magistrate, who will thereupon issue a summons.

The offences and punishments are as follow:—1. Any person adulterating, or causing others to adulterate, any article of food or drink, by the addition of any injurious or poisonous ingredient, or who shall in any way adulterate any drug, is to be fined 50l. for the first offence, and on the second conviction to be imprisoned for not more than six months with hard labour. 2. Any person who knowingly sells any article of food or drink mixed with anything injurious to health, or any kind of adulterated food, drink, or drug, becomes liable for each offence to a fine not exceeding 20l. and costs; and on a second conviction the name, address, and offence are to be published, at his expense, in such newspaper or in such manner as the justices shall direct. 3. The addition of any substance whatever to any article of food, or drink, or any drug, in order fraudulently to increase its weight or bulk, without the fact being clearly stated, shall be deemed to be adulteration. There is also a provision in the Act that the analysts shall make monthly reports of the adulterations they have detected. The

analysts may also give certificates of purity or adulteration of any article of food or drink to private purchasers on the payment of a fee.

Curious results are already showing themselves under the anticipative influence of this Act. Thus, at Sheffield and elsewhere the price of milk is being raised; so is the price of beer in London. At Sheffield the ingenious admission was made that it was on account of the passing of the Adulteration Act that the price was raised. The adulteration of milk with water, however, is a harmless sort of adulteration compared with that of "maddening drink" with *Cocculus Indicus*, strychnine, or grains of "Paradise," or rather of Pandemonium, which it is to be hoped, although they are organic poisons, will not escape detection.

THE SOMERSETSHIRE LABOURER.

SIR,—As you have thought the state of things at Chiselborough of sufficient importance to deserve a notice in the *Builder*, you may, perhaps, be not unwilling to insert a few modifying facts:—

1. Your readers will doubtless be pleased to hear that instances of the *gottre* are becoming exceedingly rare. I know of but four remaining, and there has been no fresh case for the last half-century, nor is there any lack of intelligence amongst the rising generation or the people generally.

2. Our schools are well attended. Out of a population of 419, by the last census, we have at day-school, 77; evening-school, 34; Sunday-school, 105; and all have been highly commended, both by her Majesty's and the diocesan inspectors. A large singing-class assembles weekly in our capital new school-room, and the benefits of our clothing and other clubs are fully appreciated.

3. As to the outward aspect of the inhabitants, your correspondent's notions may be peculiar or he may have been specially unfortunate. I should have said that so large a proportion of hearty, healthy men and handsome young girls could rarely be met with elsewhere.

4. Some of our cottages are doubtless faulty; some of the worst belong to the occupiers or to owners equally poor. Most have either gardens or allotments.

5. As to the general healthiness of the people, I can vouch for this, that the deaths since last January have been but four,—three infants and but one adult.

C. FREDK. NEWELL,
Rector of Chiselborough.

"Hazelbury, Crewkerne, Dec. 11, 1872.

In an article in your paper of the 7th inst., 'On the Houses of the Labourer in Somersetshire,' you mention Lord Portman's name as the owner of some of them. I beg to inform you that his lordship has no house or cottage in either of the parishes you mentioned.

MR. FAKORS, Steward of the Estate."

* * * We were distinctly informed on the spot by the tenants that some of the houses visited were on the property of Lord Portman. We shall not fail to inquire into the cause of the discrepancy.

CEASE THAT KNOCKING AT THE DOOR.

SIR,—I reside in an off street; some people would think it secluded and quiet, but it is not so.

In the dark hours of early morn the police are knocking up the half-past four; if no reply is vouchsafed, rap-bang go the knockers again; then a short lull, a respectful repose, and it is repeated later for others. The night police rouse out day police most vigorously,—eight bells with them,—but we are not all in their watch. It is very annoying to be so knocked up; to be woken up by the cats is trying, but you can retaliate with the water-jug.

The postman might drop our letters through box-apertures quietly; but no, he cannot resist the knocker-rat-tat starters to nervous invalids and babes in the wood. It is seriously wrong. Very early risers should have a door-bell, and thus avoid disturbing their neighbours.

R. T.

THE ORIGIN OF WOOD-WORKING MACHINERY.*

No art seems to have been so fully developed, or so nearly perfected at one time and by one man, as that of wood-cutting machines by Sir Samuel Bentham, of England, brother of Jeremy Bentham, the celebrated writer on political economy.

In 1779 Bentham was directed by the Government to make a tour in the north of Europe to examine the progress of ship-building and other

* "A Treatise on the Construction and Operation of Wood-working Machines, including a History of the Origin and Progress of the Manufacture of Wood-working Machinery." Illustrated by numerous engravings. By J. Richards, Mechanical Engineer. Spon: London and New York.

arts. During this tour, while in Russia, he invented the first *planing-machine* for wood, at least the first that could be called an organised operating machine. There is no doubt but that this was the original conception of a machine for smoothing the surface and giving dimensions to wood. It is to be regretted that no accurate description of the invention, so far as perfected at that date, has been preserved. Whether it operated by what, in his subsequent patents, he terms "rotative" motion, or whether it was a reciprocating machine, is, so far as the author of the work before us, Mr. Richards, can learn, left to conjecture. It would, however, be inferred from his first patent in England, of 1791, that it worked upon the later principle, for "planing and making mouldings" by some means that bore a close analogy to the hand operations of the times, and corresponds to the one described in the patent cited. Bentham, with that regard for his country's interest that is common with all Englishmen, communicated his invention to the British Ambassador at St. Petersburg, who advised him to keep his invention for England, which seems to have been done, as there is no account of his having made any public use of it while in Russia. He afterwards accepted a military commission in Russia, with the rank of Lieutenant-colonel, and became the manager, or commandant, of extensive factories for the production of glass, metals, cordage, works in wood, &c. His very successful management of these works would, from accounts, lead us to suppose that he invented many new and useful machines; but of these there seems (in England) to be no record. He returned to England in 1791, about which time his brother, Jeremy Bentham, had received from the Government an appointment to introduce industrial prisons in England. This kind of labour being almost devoid of skill, the talents of his brother would make the labour more profitable, and at the same time replace, to some extent, the want of skill of the convicts. To construct these machines, most of which were for working wood, the residence of Jeremy Bentham at Queen's-square-place, Westminster (now a part of London), was, with its capacious outhouses, converted into the *first manufactory of wood-cutting machines*. Seventy-eight years ago this factory was established, and, as we are informed, was not found to be sufficiently large, and a building, No. 19, York-street, was also occupied, which would lead us to suppose that a great many machines were made, and that the extent of the business fully entitles it to the distinction of being called the first general factory of such machines. Professor Willis, in a lecture before the Society of Arts in 1852, states that

"there were constructed machines for all general operations in woodwork, including planing, moulding, rebating, grooving, mortising, and sawing, both in coarse and fine work, in curved, winding, and transverse directions, shaping wood in complicated forms, and further, as an example, that all parts of a highly-finished window-sash were prepared, also all the parts of an ornamental carriage-wheel were made, so that nothing remained to be done by hand but to put the component parts together."

These machines were examined by members of His Majesty's administration, and received official notice and commendation in the House of Commons in 1794. Bentham (Sir Samuel) was next commissioned to visit different dockyards, and to determine how far his machines could be applied to facilitate ship-building. At this time he refused a flattering offer from the Emperor of Russia, in order to accept this commission, choosing rather to give his country the benefit of his services than to reap a greater pecuniary reward that awaited him in Russia.

His report was, no doubt, very favourable, as to the employment of machines, but it was not until 1797 that the Admiralty consented to their introduction. It should have been mentioned that during the time of his manufacture of machines at Westminster and York-street, patents were taken out describing all the different operations performed. After the Admiralty deciding to adopt his machines, in 1797, they were manufactured under the direction of Jeremy Bentham, and forwarded from time to time to Portsmouth and Plymouth, where they performed, so far as any record shows, all that was claimed for them.

The mills specify lathes, saws, machines for cutting, tenons for boring, also for boring bits and squaring tools, "and many other machines for different kinds of work." Machines were also devised by Bentham to facilitate block-making, an operation that is yet classed among the most difficult. His machines, however, for

this purpose did not seem to be perfect, for in 1810 he was joined by Brunel, who had invented a machine for "shaping block-shells." Brunel was at that time employed under Bentham to assist in the various operations, and to perfect his own machine, which must have had the endorsement of Bentham. In 1803 Sir Samuel, as Inspector-General, advised the Admiralty to adopt many additional machines that had already been approved, and to permit the erection of steam-engines to drive them, and they were accordingly ordered. The several dockyards were fitted with engines for sawing, planing, boring, tenoning, mortising, &c., and, apart from better construction and greater experience in their use, it is fair to infer they had nearly all the functions found in modern machines for these purposes. Their labour-saving capacity is sufficiently attested by the fact that Brunel, who had perfected and assisted in their construction and operation, was rewarded by being allowed, as a premium for his inventions, the estimated savings of one year's work over hand-labour in the dockyards, which amounted, as Mr. Richards is informed, to the very large sum of 16,000*l*.

In 1813, arbitrators were appointed, on the part of the Government, to settle with Jeremy Bentham, and who, after the examination of numerous witnesses, allowed him the sum of 20,000*l*. for machines furnished to the dockyards and penitentiaries. From the testimony given before this commission we learn that "Sir Samuel Bentham prepared a system of machinery for the employment of men without skill, and particularly with a view to utilising convict labour. In 1793 patents were taken out on these inventions to secure their exclusive use for the prisons. The testimony states that no skill was required in the use of these machines: they were introduced into the dockyards, and worked by common labourers." The use of the machines saved *nine-tenths* of the labour. "A table could be made at one-half the expense by their use," &c., which goes to show that the machines were, at least, effective,—a claim that cannot in many cases be made for those of more modern manufacture.

The machines and appliances for working wood that were invented and practically applied by Sir Samuel Bentham previously to the year 1800 are enumerated by Mr. Richards as follows:—

"Machine for planing and forming mouldings; improved planing and moulding machine (rotary); wedging-guard for circular saws; segmental circular saw; circular cutters for dovetail grooves; unloading carriage, to form saw mouldings; compound cutter-heads, to work two or more sides at once; the *slide-rest*; tubular boring implements (core-boring); crown saws (or cylinder saws); reciprocating mortise-machine; rotary mortising-machine; radius arm for sawing segments; tracer guide for sawing irregular forms; bevel and curvilinear sawing machine for grinding saw blades; taper-gauge for sawing; grooving-machine; vertical adjustment of saws in benches; T mortising-machine; sectional cutters; pivoted table for rebating-machines; forked or double-mortise chisels; sawge-lathe, with slide-rest; rotary cutters for forming screw threads on wooden screws; double-grooving saws; rack-feed for planing-machines; with many other things."

The slide rest for turning is very fully and clearly described in Bentham's patent of 1793, and it ranks with the greatest, as an invention in engineering implements. It gave us the engine lathe, without which our modern practice in machine-fitting could not be carried on.

The facts adduced will be sufficient to show that Sir Samuel Bentham is entitled to the distinction of being called the "Father of wood-working machines" in England, at a date that precludes any probability of his inventions having been anticipated in other countries.

Mr. Richards, after giving these and other particulars as to the introduction of wood-working machinery, proceeds to speak of other inventors, and of many inventions and improvements, both in this country and in America, since that period. Of American wood-working machines he says,—

"It can be safely asserted as a fact that there are throughout American factories but few wood-machines that have been running for ten years, and if any such exist there is a good and sufficient reason for abandoning them. The life of most machines used in joinery is not on an average more than six years, under any special modification. So general is this rule that in the sale of patents for wood-cutting machines their value is based upon a monopoly that will not exceed that time. For this reason it is easy to see that manufacturers who use such machines do not care to make large investments in machinery that will in so short a time be out of use."

It is to be regretted that there are no statistics at hand to show the amount of wood-machinery that is now made by the several engineering firms who make this kind of machinery a speciality; but it could, no doubt, says Mr. Richards, with safety, be set down, for the last

year, in England and America, at a value of not less than 500,000*l*. sterling. Besides, it cannot be reckoned in its importance on the same basis as many other branches of manufacture, that of monetary value: it has a deeper significance in connexion with the material advancement and welfare of the country. All the machinery of this kind made in America, and a large portion of that built in England, is for home use, to assist directly in developing the resources of the country, in building houses, ships, furniture, and thousands of articles of convenience and necessity. In fact, there is no branch of manufacture that has a more intimate connexion with the interest of all than wood conversion.

Wood-working machines were at first made, as a rule, by carpenters and not by engineers or machinists. This was especially the case in the United States twenty years since, when nearly all makers of wood-machines were themselves wood-workmen. Machinists could not, of course, build machines the functions of which they did not understand: geometrical drawings, to embody the ideas of the wood-workmen were in this, as in other branches of industry, almost unknown. Hence the carpenter, cabinet-maker, and ship-builder set about to construct machines that would perform by power what he had before done by hand. Iron was to him a new material. He had not in his mind constants, or rules for proportions, like an engineer or machinist, but blindly supplied a shaft here, a pulley there, with bolts and framing to support them, very much as he would have made a house. The movement and application of the cutting edge was the prime object,—everything else unimportant. This same fact accounts fully for the peculiar designs which we see in the framing of American wood-working machines.

In America a village of 2,000 or more inhabitants, with the surrounding country, is said to be large enough to support a planing-mill; which then means a regular wood-working manufactory, equipped with saws, planers, lathes, tools for mortising and boring,—in fact, all operations in wood-work. So general is the want of such work in America, that there is not, perhaps, in the whole country a village of the size mentioned without its planing-mill, and perhaps a half-dozen other establishments making specialities for the general market, or ploughs, wagons, furniture, &c., for local trade. Very little hand-work is done,—in the language of the country, "it does not pay." A man costs from fifteen to twenty dollars a week, but a "man-power" in a steam-engine does not cost as many shillings: hence the steam is the cheapest, it does not strike, is always at its post, and is easier controlled. The intelligence it lacks must be supplied in the machines. This is the American idea of wood-work in general. Prices are uniform all through the country, and hand-work is out of the question. Wood-cutting machines are made in all the cities in America, besides numerous shops scattered over the country, that make more or less; but, as said, there is no special centre for this kind of work, either in America or in England, where the same rule holds: wood-machines are made in various parts of the kingdom.

A fault common among builders of wood-machines is the jealousy that exists, and the inclination to keep their shops closed, or their plans secret,—an error that prevails with all kinds of manufacture when undergoing change and improvement. It, however, disappears as an art becomes more perfect, and will, no doubt, be so in this case.

From about the year 1815 to the Universal Exhibition of London in 1851, the manufacture of wood-working machines in England remained but a limited business, and no advance was made that at all compared with what was effected in other branches of engineering. Many machines for special uses were, no doubt, made and used that combined both skill and ingenuity; but, upon the whole, wood-machines may be said to have lain dormant in England for a period of forty years.

During the Exhibition of 1851, the performance of the "wood-framed" American machines was such as to create astonishment. English engineers at once proceeded to clothe the "ideas" these machines suggested in a mechanism more in keeping with their purpose and the true principles of machine-construction, and out of it grew, as we may say, a large share of modern practice in England.

In following the history of wood-machines, it might be said that, from 1835 to 1852, the

development of the art was transferred from the Old to the New World. The American people, without iron, or the means of adapting it to the many uses to which it was already applied in England, adopted instead the wood of their forests, applying it to all conceivable uses in the construction of buildings, ships, machines, roads, and the framing of steam-engines, for which purpose it is even yet, to a large extent, used. Necessity, which has been termed the mother of invention, coupled with a strong ingenuity and boldness of plan that has always characterised the Americans, led to a rapid development of an entirely new system of wood-machines for sawing, planing, boring, mortising, tenoning, &c., besides hundreds of modifications of special machines adapted to the manufacture of carriages, ploughs, furniture, joiners' work, bent work, &c.

Since 1850, the inventions in wood-machines have followed each other in rapid succession in America. The most complicated forms in wood of regular or irregular outline are produced at a cost, and with a degree of accuracy, which cannot be attained by hand manipulation. Engineers and inventors, in both Europe and America, during two or three years, have been giving to wood-machines such attention as they demand, and the wants of the market have forced out. Within the past two years the art has been raised to the dignity of recognition among other branches of engineering; the scientific journals of England have given more space to wood-machines than for the previous ten or even twenty years; and regular engineering establishments are springing up in England, America, and on the Continent, which give their attention to wood-working machines as a speciality.

The manufacture of wood-working machinery is now chiefly carried on in England, America, France, and Northern Germany.

Having consecutively followed the leading operations in wood-conversion through sawing, planing, mortising, and tenoning, which Mr. Richards illustrates with numerous and elaborate engraved views of machines of many kinds, he concludes his valuable treatise with accounts of some of recent origin,—such as shaping machinery, under which head can be classed all operations involving irregular lines, or, to state it otherwise, all operations that involve other than straight or circular lines. This class of wood-cutting machines is of recent origin, when compared with those for working straight or cylindrical forms, and yet, from the endless adaptation that the principle is capable of, it comprehends a greater variety of machines than is directed to either sawing or planing.

Down to about the year 1830, all operations in wood-work that involved irregular lines were, without exception, performed by hand; and it would be no exaggeration to say that even at the present time the general principles upon which such machines operate are but imperfectly understood.

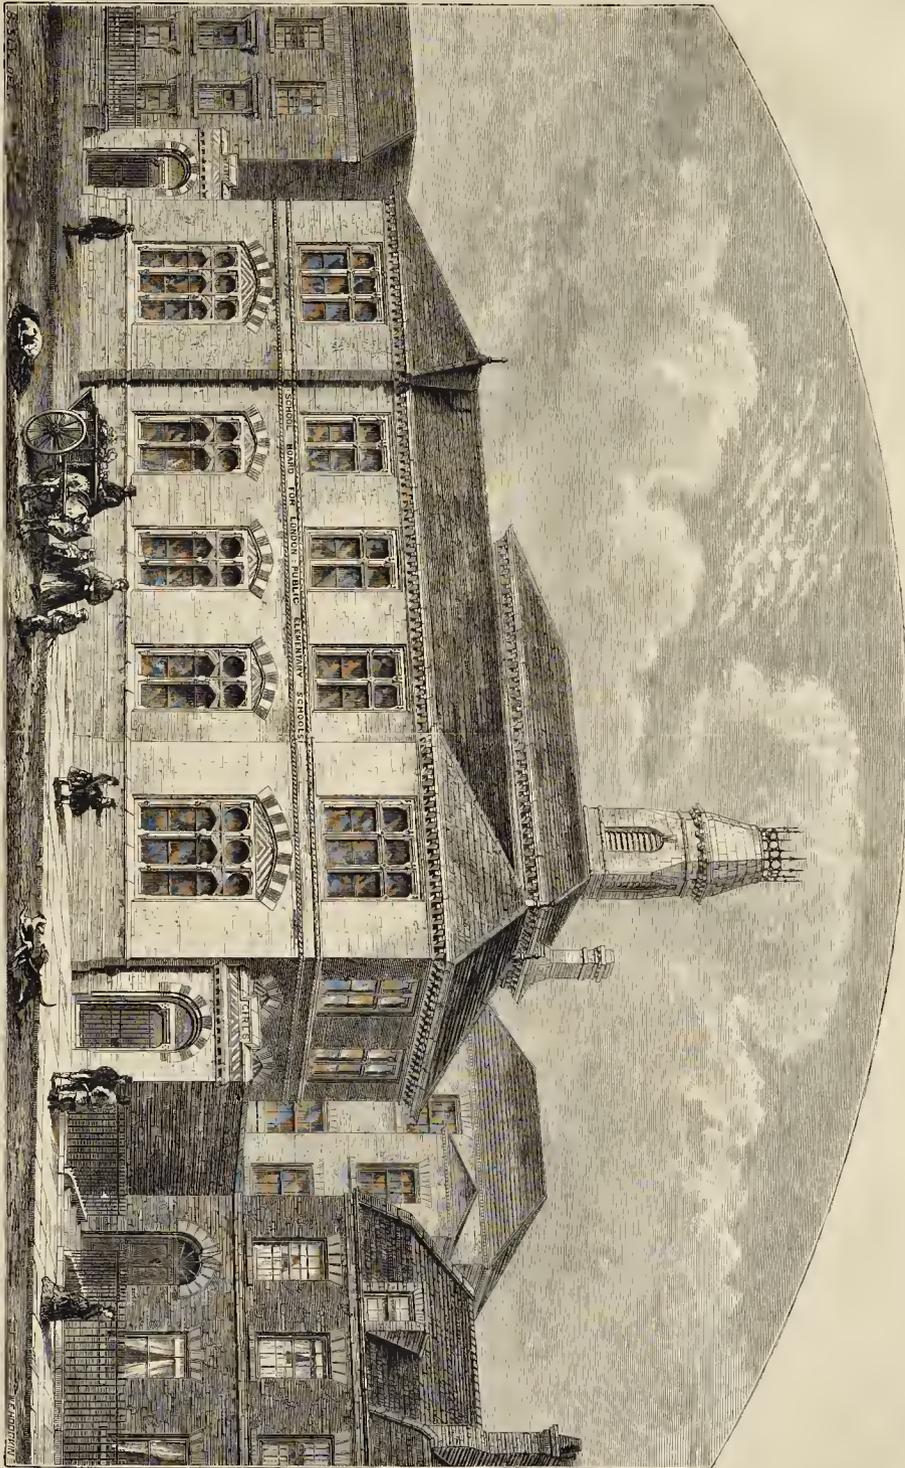

There was, in fact, such an air of improbability about the cutting out of shoe-lasts, gunstocks, &c., by machines, at the beginning, that the impression has not yet passed away.

The mechanism involved contributes to this impression: it is of a character more complicated than that for straight lines or curves,—so much so, indeed, that in some cases the plan of operating is with great difficulty explained to the unskilled.

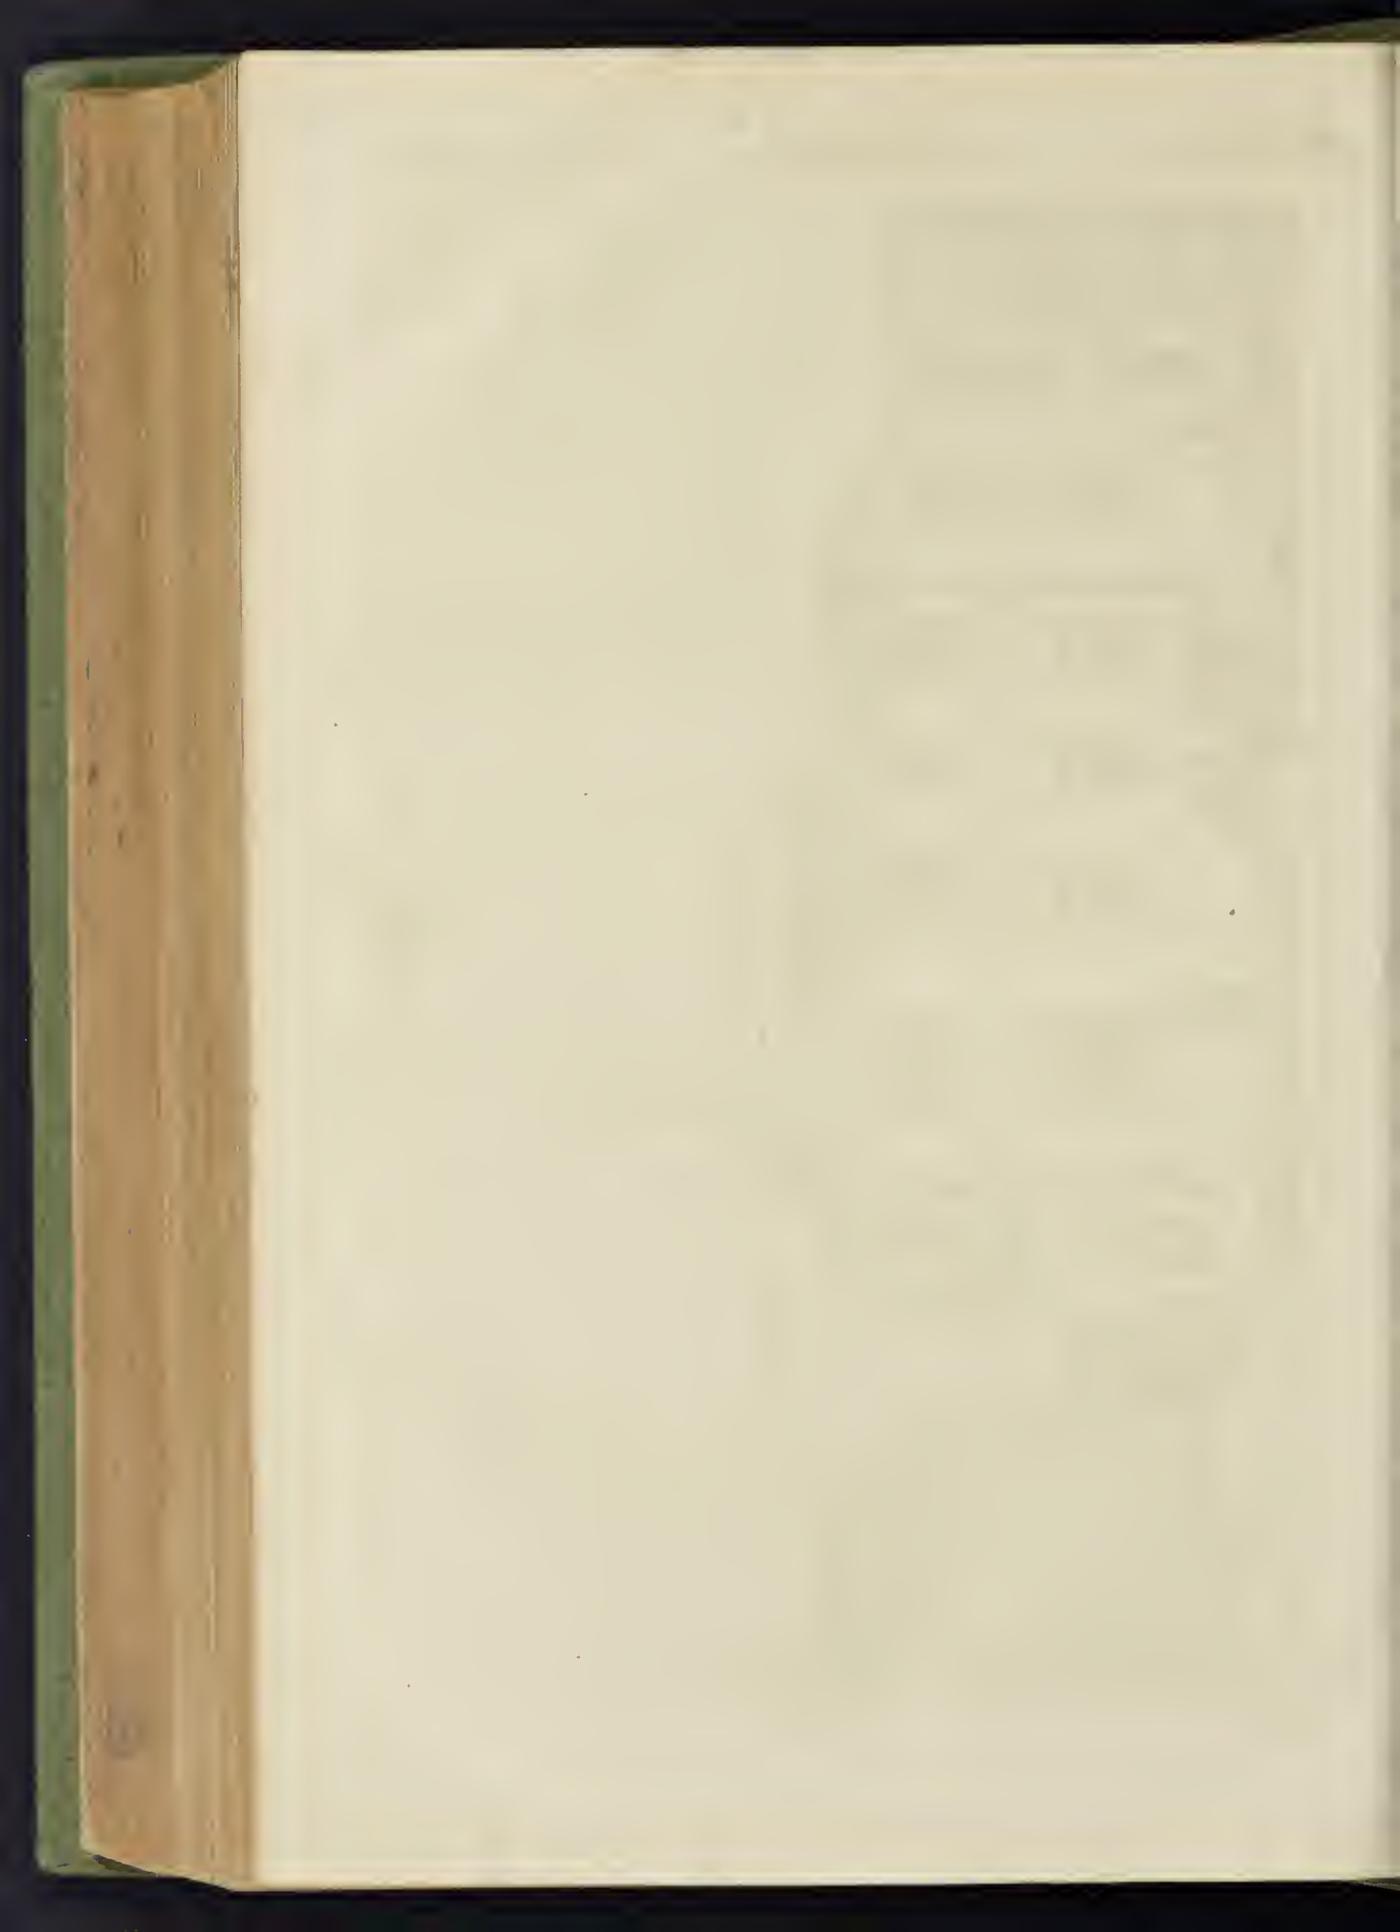

Shaping-machinery, in the sense in which the term is here employed, comprehends turning-machines for irregular forms, carving-machines, and machines operating in one plane only, such as the moulding-tables with right and left spindles. The operation of all these machines can be described, in a general way, as "working from a pattern," duplicating forms already produced, from which and by which the action of the tools is directed.

The part in contact with the model can be termed a guide, between which and the cutting-tool, or the blank itself, there is coincident movement. In all the various modifications of machinery for shaping we find the same mechanical equivalents, although, for the better understanding of them, they can be divided into two classes,—those that adjust or move the tools, and those that adjust or move the material so as to receive the action of the cutters on its different configurations.

Another recent invention connected with wood-working is the pneumatic conductor for dust and shavings, and clearing workshops, which has lately come into use in America.

SCHOOL BUILDINGS FOR THE LONDON SCHOOL BOARD, WINCHESTER STREET, FINSBURY.—MR. CHARLES BARRY, ARCHITECT.

SCHOOL BUILDINGS FOR THE LONDON SCHOOL BOARD, WINCHESTER-STREET, FINSBURY.

Our engravings illustrate the design by Mr. Charles Barry which has been selected for the school in Winchester-street, Finsbury. The builders are Messrs. Downs & Co., of Union-street, Southwark, and their tender is 9,325*l*. The schools were proposed for 1,040 children, but will accommodate 1,150. We take a few passages from the architect's original description of his design. The site, having reference to the number of children intended to be accommodated, is so small that even limited play-space could only be obtained apparently by having nearly the whole area under the boys' and girls' school formed into covered space for this purpose. This necessarily raises the lower floors—levels of the schools in each case of boys and girls about 10 ft. above the general ground-level. But as this is considered objectionable in the case of the infants, they have been accommodated in a separate block of building fronting to Winchester-street, and only two steps above its level.

The entrances for infants and also for the girls are placed in Winchester-street, while that for the boys is through the present house in Southampton-street, the ground-floor and street-front of which is to be slightly altered to evidence its character as part of the School Board's property, and the upper part of this house is proposed to be given to the care-taker for a residence.

The two infants' schools for 200 each will thus occupy the whole front in Winchester-street. The boys' school will be accommodated in two schools (senior and junior), one over the other, with covered play-space under the lower one. The girls' school will be similarly treated.

Each department is designed in a separate block of building, having between them an open court for light and air to each block, and to the play space, with a view to depend for light as little as possible on adjoining open spaces, but which are not the property of the Board.

A drawing-class room, separately approached from the senior schools of the boys and of the girls, is placed on the upper part of the centre building, in the rear portion of it, and will be lighted from the roof and from the north side. This room will be also available as a managers' room when such is required, and is therefore also approached separately by continuing the staircase of infant school to the top; a private w.c. has also been provided for the use of the managers.

Masters' and mistresses' private rooms are provided adjoining each schoolroom.

Every school and class room is lighted from two different sides of the room, and so as to ensure side lights to the class-rooms and through-ventilation in all.

The materials proposed are, for all walls except those of the front building in Winchester-street, ordinary grey stock bricks. The window openings are in wrought-iron, galvanised, with openings for air in every window.

The building in Winchester-street is proposed to be faced with red bricks; the cornices, stringers, and so on, are in white moulded bricks; and the windows in Ransome's patent stone, fitted also with wrought-iron casements.

The roof of the front building is to be covered with Taylor's patent tiles, and the other buildings will have ordinary slates.

The staircases are to be of stone, the outer ends of the steps and landings being carried on wrought-iron girders fitted to the necessary shapes.

The finishings to the walls inside will be painted to a height of 5 ft. 6 in. from the floor, and distemper above that level.

The water-closets and lavatories within the building are planned one over the other, for economy in construction and in the plumbers' work, as also for simplicity of outfall to drainage. The water-closets for the children's use are grouped all together for the sake of ready and efficient drainage. They are to be fitted with Jennings's patent trough school-closets in solid pottery, the water in each closet being always at a given level; while each range can be flushed out as frequently as found desirable by opening a valve at one end of the range and turning on a service of water at the other. The valve and service-cock will be in a locked compartment, so that the children cannot interfere with the arrangement. The drains are to be kept outside the building.

The warming will be carried out on the prin-

ciple adopted by Messrs. Haden,—a combined system of warm air and warm-water pipes. The warm air will pass by horizontal channels under the ground-floor of the schools, being admitted into the rooms either by the skirting or floor-gratings. A supply to the upper floors will be taken by flues in the walls, and admitted, in like manner, by the skirtings. This is the first school, we believe, to which this system has been applied. The class-rooms will be warmed by hot-water circulating pipes slightly raised above the floor-level, and the flow and return pipes to these will pass through the warm-air horizontal channel above mentioned, thereby assisting in keeping up its temperature.

The boiler and heating apparatus will be in the basement, and the flue of the boiler formed of iron plate will be taken up the centre of the ventilating-shaft.

As to the ventilation, from every school and class room there will be gratings near the ceilings communicating with horizontal channels formed in the floors and roofs, and all terminating in a ventilating-shaft carried above all the roofs. A strong up-draught will exist in this shaft, both from its height and also from the aid given by the warm flue from the boiler passing up its centre. In summer weather, when warming is not required, a small pilot-furnace at the foot of this flue will keep up its action in aid of the extracting power of the shaft.

The cubic contents of the buildings, including the covered play-spaces, are called by the architect 392,669 ft.

ANOTHER VIEW OF PROFESSIONAL ESPIRIT DE CORPS.

SIR,—Mr. Roger Smith's interesting paper on *Esprit de Corps* deserves the attention of all your readers, for it deals with a subject of the first importance, both to the profession and to the public. The advantages to be expected from intense *esprit de corps* are ably put forward—always of course from a professional point of view, and some of them would probably be found to result. But is there not an obverse to the medal? Is it clear that nothing worse than "fitting professional pride," courtesy of *dona*neur, increased general culture, and the extinction of "universalism" amongst architects would ensue? Or is there not cause to fear that "a homogeneous, well-organised body" strong enough to bring all this about, might be sometimes tempted to use its strength on behalf of selfish interests? Mr. Smith asks,—

"Does *esprit de corps* do for us anything like what it does for the soldier, the lawyer, and the doctor? And if so fine a profession as ours fails, in some respects, to command the social position which is generally accorded to the members of some others which I have named, is not our own deficiency in *esprit de corps* at the root of much of that failure?"

The professions named are significant, for it is precisely in these that the evil results we fear are conspicuous. The obstruction offered by "the colonels" in the House of Commons to the abolition of purchase, when our Constitutional forms were strained until they were ready to crack, will not soon be forgotten. The nation was then scandalised by the spectacle of an unseemly struggle for pounds, shillings, and pence, which any one of the gentlemen concerned would have been shot rather than be guilty of for himself, but gloried in it because it was for "the service."

Even the *Saturday Review* has recently declared the action of the authorities at Edinburgh in the case of Miss Jex Blake and her friends to be "discreditable," and the conduct of the Society of Apothecaries scarcely deserves a milder epithet; and Mr. Stansfeld has called down from the faculty a perfect storm upon his head, because he declines to deliver us into the hands of an army of doctors,—all which should warn us that even individual freedom is held subordinate to professional advancement. A perusal of the Act of 1858 reveals also the curious fact that persons holding eminent foreign diplomas, not only cannot be registered as medical practitioners in this country, but are unable even to make good a claim to be examined with a view to registration.

But it is in the law that we best see how powerful and how obstructive a trade-union of educated men may become. It is not too much to say that the public welfare is consistently sacrificed to the presumed interests of that profession. There is no reason why land should not be as saleable as Consols; and there is no reason against a fusion of equity and law; there is every

reason why "the law's delay" should cease to be a proverb, and legal education a farce. It remains to be seen whether Government will undertake with better success than private members the task of reforming the first of these matters. But we know that successive chancellors and law officers of the Crown have not attempted, or have failed, to remedy the second and third, and even Lord Selborne's character and position have not as yet sufficed to make any improvement in the last. It is not denied that a change is called for by the public good. Why, then, do we see no change? A writer in the *Spectator*, agreeing here with the Attorney-General, gives the answer. It is because the *electors* are not sufficiently aroused to insist upon it. This is for our purpose the most significant point of the whole matter. It does not occur to any one that the profession will attempt to reform itself. We all assume that acknowledged abuses must continue until they can be removed by overwhelming pressure from without. Much might be added to this, but I fear to trespass further on your indulgence. Those who desire more information should read Mr. Fitzjames Stephen on "Codification," in the current *Fortnightly*, and Mr. Vernon Harcourt's letters to the *Times*. Enough has been adduced to show that the fact that the members of a society are men of culture and social position, affords no guarantee that its organisation will not be used for purposes of the most naked selfishness. And not only so, but while the power of professional corporations alone renders these abuses possible, their position and prestige give them an air of respectability which prevents us from knowing them for what they are.

Mr. Smith would hope to obtain in a union of architects the unquestionable advantages he points out, without the evils which some of us think more than counterbalance these. Architects, however, are not made of different clay from other men, and we have no reason to believe architects in the future would show more public spirit than doctors and lawyers in the present and the past. One of the headings for clauses of contract which the council of the Royal Institute of British Architects, about two years ago, recommended to the members of the Institute for adoption, has the gnomie trade-union flavour. This clause relates to the settlement of disputes by arbitration, and contains the following proviso:—

"The arbitrator being an architect and a Fellow of the Royal Institute of British Architects, agreed to by the parties, or appointed by the president for the time being of the Royal Institute of British Architects."

We are blind indeed if we do not see here the "temper of mind" we deplore. The spirit is there,—the machinery alone is wanting. If Mr. Smith's idea were taken up with zeal, and the profession "fenced round" and built up into "a homogeneous, a shapely, a well-organised body," the *esprit de corps* which that gentleman invokes would soon pass beyond the limits he would wish to impose on it. In no long time we should have a new trade-union in our midst, as formidable in its way as any of those which are now only tolerated because they exist.

F. H.

WEYMOUTH SEWERAGE.

SIR,—Allow us to thank you very much for your courtesy in inserting our previous letter, and for taking the trouble to answer it; but, in justice to ourselves, we are desirous of joining issue on two or three points of your reply, which we think are open to question.

The Corporation of Weymouth did, no doubt, represent the opinions of the ratepayers at the time ago, but whether they do so now is very doubtful indeed. We accept your opinion that a local inquiry by a Government Inspector was not *legally* necessary; but we still think it was usual, proper, and desirable before sanction was given to works of such importance. That the experimental "strainer," which is to cost 750*l*. will prove useless is very probably a true prophecy; but are there not other methods of filtering or deodorising sewage than by this particular "strainer," or the method of irrigation proposed by Sir John Gooch? As to your statement that the dam will prevent the continuance of stagnant and putrid water, we can only say that the remark must be *opere valent*; for it is surely not consistent with common sense that to dam water up will make it less stagnant or putrid. Under present conditions the tide flows over and scours the back-water twice a day.

Referring to the borrowing question, we may observe that most precipitous and unnecessary haste was exhibited by the Corporation in entering into an agreement to borrow the 50,000*l*. on such terms as they did, long before the money was wanted. We find that the Public Health Act was passed on the 10th of August, 1872, but the works were not at that time commenced, and the money was not actually borrowed until six weeks afterwards, the first payment to contractors on account of the works not being due until the middle of October. It cannot, therefore, be said that it was too late to take advantage of the Act.

With these facts before us, it is impossible to agree with you that "the Corporation has done the best" for the ratepayers, seeing that the repayment of the loan

will fall more than twice as heavy upon the latter as it might have done if the Corporation had only acted more deliberately. We anxiously desire to see the town in a perfect sanitary state, but think you will agree with us that a choice of competing plans would probably have enabled the town to get a more satisfactory scheme than the one which has unfortunately been adopted. The Corporation and Sir John Coode, moreover, both seem by their actions to have little faith in the plan; else why after obtaining sanction, &c., are they now trying a totally opposite system, besides having inquired into other systems subsequent to the publication of Sir John Coode's plans?

TWELVE RATEPAYERS OF WEYMOUTH.

Mr. Charles E. Austin demurs to our remark on his strainers, and sends us an account of the good effects attending their use elsewhere. We must adhere to our expressed opinion, but desire to add the particular observation referred to applies only to their proposed use at Weymouth.

"ALMS CUPS."

Sir,—Will any of your subscribers kindly give me some information concerning the above, as I should like to know if they are a local peculiarity or not? I send you a sketch of one given to its present owner by the son of a former vicar of Harwich, who died at the age of 90 years; and as it belonged to his father before him, I presume it is rather old. It is supposed to have once belonged to Harwich Church. The cup (vase-shaped) is made of oak, and the heads are blacked, standing, to the top of the stem on the lid, 6 in. high.

A few days ago I saw another at Harwich, twice the size, differing in shape only in having three heads at the stem instead of one. This specimen was not perfect, having a part of its lid broken. From what I can learn, they used to be placed at the end of the benches for the people to put their alms into.

G. V. B.

ARCHITECTURAL COMPETITIONS.

Sir,—Though a "non-professional" I can from experience confirm the remarks in Mr. Thos. Chas. Sorby's bold and many letter in your last week's impression, so far as south-west Yorkshire is concerned.

Committees look upon "architectural trade-unionism" either with fear or something worse; hence it has become the rule to insert, "Committees to be judges of the designs." How has this come to pass? Have there not been too much "talk talk" and too little practical knowledge manifested by the "upper ten"?

STEPHEN SEAL.

CENTRAL ASSOCIATION OF MASTER BUILDERS OF LONDON.

We mentioned in our last the first general meeting of this Association, and gave the names of the committee. In reply to inquiries, the objects of the Association are set forth as follows:—

"The object of the Association will be the promotion and protection of the interests of the building trade of London generally, and of the members of the Association in particular, by the following amongst other means:—

1. Unity of action in the settlement of all questions arising between employers and their workmen, with a view to prevent lock-outs or unjust strikes against individual members of the Association.
2. The general adoption of equitable conditions of contract such as have recently agreed to by the Royal Institute of British Architects.
3. The interchange of information and mutual co-operation, when desirable, with other kindred societies throughout the country.
4. The collection and circulation amongst its members of statistics and other information considered to be for the general interests of the trade.
5. The keeping a register at the offices of the Association, of foremen and others who can be recommended for employment."

FOOT BRIDGES FOR CROWDED

CROSSINGS.

Sir,—I believe it has several times been proposed to construct subways to the thronged crossings, such as those at the Oxford and Focality circuits, but I do not know whether bridgeways have been suggested. The complex arterial system of gas and water pipes militates against the subway, and at first thoughts the notion of foot-bridges would be condemned on account of the space required for their approaches, staircases, &c.; but on reflection it will be seen that the supposed insurmountable difficulties might be easily got over by recessing the approaches into house space, and making the bridge ways debouch from the level of the first floors. This would, of course, involve the purchase of house property; but the outlay for this purpose would be quite insignificant to the Metropolitan Board.

To realise the suggestion at the Oxford-circus, four houses would be required to furnish the necessary space for the construction of the staircases and abutments. From the height of the first floors, I propose that the iron footways should pass diagonally, and receive, at their

* Apparently eighteenth-century work.—Ed.

intersection in the centre, support from below. At this junction point, and above, there should be the lamp support, which might be combined with the pier beneath, in such a way as to form a very handsome architectural feature, and which would, in conjunction with the footways, become novel and picturesque objects in some of our metropolitan vistas.

W. CAVE THOMAS.

. The proposition has been often made (first, we believe, in our own columns), but has never yet taken such a shape as to commend itself to authorities. Drawings illustrating the idea were submitted to one of the City Boards last session.

"I'LL BRING AN ACTION."

The *Builder* is probably the most good-natured journal in Europe. We never go out of our way to say an unkind word; we leave unsaid many disagreeable observations which might justly be made. Nevertheless, month by month (we might even shorten this period) we are informed by some irascible individual or other that unless we instantly make an apology, a writ will be served. These letters are ordinarily consigned to the waste paper-basket, and the writer escapes further notice. Patience, however, has its limits, and the limits of ours have been reached. We therefore print the following letter:—

"STOCKTON EXCHANGE.

Stockton-on-Tees, Dec. 13, 1872.

Sir,—Our client, Mr. _____ of this place, has consulted us with reference to your libellous remark contained in your impression of the 7th December, 1872, foot-note at p. 971, which reflects in an injurious manner upon our client's character. As the imputation of deceit is wholly unwarrentable, we trust you will at once withdraw the charge and apologise in your next issue; for unless you do so, we are instructed to take action against you forthwith. DODDS & TROTTER."

What we said was that a deceptive account of the decision (in the competition) had been sent to us by one who ought to have known better. If Messrs. Dodds & Trotter know who sent us the particulars alluded to, they must have obtained their knowledge from some other source than our pages. We repeat that the account received by us was, whether intentionally or not, deceptive (as we could prove in two minutes, if it were necessary), and we must, with all respect, leave Messrs. Dodds & Trotter to take just what action against us they think fit.

ASBESTOS.

Sir,—I have several wooden buildings, which are at present very cold for cows and horses. I can board them on the inside, and leave a space of about 2 in. between the outer and inner boarding, which I propose to fill in with ground asbestos, as a good non-conductor. Will any reader tell me where to purchase it or anything that will be equally efficacious? C. E.

CHURCH-BUILDING NEWS.

Rotherham.—The chief stone of a new church has been laid at Eastwood. The site is at the junction of St. Ann's-road and St. Leonard's-road. The church will be in the Decorative style of the Geometric period. There will be a chancel, 28 ft. by 22 ft.; nave, 80 ft. by 25 ft.; south aisle, with tower and spire at the west end, 78 ft. by 11 ft.; north aisle, with porch at the west end, 80 ft. by 11 ft.; organ-chamber, opening into chancel and south aisle by arches, 15 ft. by 13 ft.; vestry in north-east, 15 ft. by 13 ft.; and warming chamber under vestry. In the interior, the church will be divided into nave and aisles by octagonal stone shafts, supporting stone arches, above which are the clearstories, pierced with two-light tracery windows. The aisle windows will be of two-lights each, and traceried. The east window of the chancel will be of five lights, with geometric tracery. The west window will be of four lights, also with tracery. The roofs, which are of high pitch, will be open-timbered. The chief entrance will be through the tower, which will supply the place of a south-west porch. Pew accommodation is provided for 600 adults in the nave and aisle, and for twenty-four choristers in the chancel. The church will be built of local stone, with dressed quoins and other ornamental features; the facings will be of the same stone, rock faced. The internal portions will be of Hooton stone. The contract for the whole of the works has been let to Mr. Ripley, of Rotherham, for 3,600l. The architects are Messrs. Thomas D. Barry & Sons, of Liverpool.

Leicester.—The foundation-stone of the (Earl) Howe Memorial Church of St. Peter has been

laid. The style is of the early part of the thirteenth century. The edifice will consist on plan, of nave, north and south aisles, north and south transepts, chancel, with an apsidal eastern termination, western tower and spire, and organ-chamber and vestry north of the chancel; there will be a clearstory above the nave. The principal dimensions internally are:—From east to west, 137 ft. 6 in.; across nave and aisles, 51 ft.; across transepts, 61 ft.; length of nave, 105 ft.; length of chancel, 32 ft. 6 in.; height of nave to apex of roof, 50 ft.; height of chancel to the boarding of roof, 40 ft. 6 in.; height of transepts, 27 ft. 6 in.; height of aisles, 19 ft.; height of tower and spire to top of stonework, 150 ft. The materials of the church will be Little Eaton stone for walling, and Douling stone for all dressed masonry. The plain walling inside will be plastered. The nave and aisle roofs will be open-timbered, and those of the chancel and transepts boarded and panelled,—all of Baltic fir. The seating of the nave and aisles will be of Savanah pitch pine, and the seats and stalls in the chancel of wainscot, and screens of the same material will divide the chancel from the nave, vestry, and transepts. The eastern portion of the church as far as the centre of the first bay of the nave, west of the transepts, is alone included in the present contract. Mr. Street is the architect, and the contractor is Mr. Roberts, of Weoston, the amount of whose contract is 4,727l.

Kingston.—The new church of St. John the Evangelist, Spring-grove, has been consecrated by the Bishop of Winchester. The building stands on a piece of ground which the late Mr. W. Mercer, of Surbiton, made over to trustees for the purpose, and which is situate at the corner of Springfield-road. The materials used in the construction are Kentish ragstone for the walls, with Bath stone for windows, doors, and internal arches. The roofs are covered with strawberry-colour Broseley tiles, with ornamental tiles cresting to the ridges, a superior kind being fixed on the chancel. On plan, the church comprises nave and aisles, south porch, transepts, chancel with apsidal east end, north chancel aisle, vestry, and tower in angle of chancel and south transept. As yet it is only carried up to the eaves of the chancel, and is covered with a temporary roof. The nave is 27 ft. wide, and divided from the aisles by four moulded arches, resting on piers clustered and circular alternately. Wider and more depressed arches open to the transepts. One of the caps in the nave has been carved, and it is hoped that others may be finished in like manner. This one is the gift of Mr. Shaw, of the firm of Jackson & Shaw, contractors for the works. The chancel, raised three steps, opens from the nave by a lofty arch, having shafts in the angles of the jambs; the inner order of mouldings resting on responds, supported on corbels. The choir-desks are of oak, with a prayer-desk on each side; a brass lectern, presented by the architect, stands on the chancel steps. The apse, of seven sides, is raised two steps above the chancel level, and is entered through a second arch corresponding to that between the nave and chancel. Light is obtained from five two-light windows with tracery. The centre window is filled with stained glass, given by Mr. E. H. Bedford; it is the work of Messrs. Ward & Hughes, of London, and represents the Crucifixion and St. John taking the Virgin to his own home, being one of a series of subjects. The central light of the west window of the nave is likewise of stained glass, executed by Messrs. Cox & Sons, and given by Lieutenant-Colonel Law. Both windows are memorials. The warming is effected by means of hot air passing from Gurney stoves under north transept. The church is lighted by gas cones of brass and painted iron, on each side of the nave, and one larger one of polished brass from the centre of the chancel roof. A bell, weighing 4 cwt., the gift of Mr. John Shrubsole, hangs in a temporary wooden bell-cage on the wall of the tower. The seats throughout are uniform in character, being open benches of deal, stained and varnished. Sittings are provided for 827 persons, the south aisle being free. The architect is Mr. Arthur J. Phelps, and the works have been carried out by Messrs. Jackson & Shaw, of Westminster. The cost, including lighting and warming, is a little over 7,000l. The carving has been executed by Messrs. Farmer & Brindley; the gas-fittings and metal work supplied by Messrs. James & Willis, of London and Birmingham.

Elmswell.—Elmswell Church has been reopened after a restoration and enlargement. Mr. J. Drayton Wyatt architect having been

consulted, designs were prepared for the complete restoration of the nave, and for the addition of a north aisle to correspond with that on the south. The contract, amounting to 1,150*l.*, was taken by Mr. W. Woods, of Elmwell.

Brandon.—The ancient chapel of ease to the mother church of Hough-on-the-Hill has been reopened. This antique place of worship having been found to require a complete restoration, the Right Hon. Earl Brownlow, who owns part of Brandon, determined that a suitable place of worship should be made for the inhabitants of the village. The entire cost for the work was about 500*l.*, which his lordship has entirely defrayed. The architect was Mr. Kirk, of Sleaford, and the contractors were Messrs. Rudd & Son, of Grantham. The seats in the body of the edifice will accommodate 100 persons.

Brighthelm.—St. Leonard's Church was rebuilt some few years ago from the designs of Messrs. Slater & Carpenter, of London. The fine old tower, however, remained standing, but having become unsafe has been pulled down, and under the superintendence of some gentlemen a new tower, similar in detail to the original structure has been erected. The Rev. Mr. E. Stanbrough, the rector, under the guidance of Mr. Wiggall, the foreman, assisted by Mr. Harry Hems, of Exeter (the sculptor of the decorative part of the works), lowered the spire terminating the spire of the turret. In the evening the whole of the workmen employed upon the works were entertained to supper at the Pheasant Inn. The chair was taken by Mr. Wiggall, and the vice-chair by Mr. Harry Hems.

Bradshaw.—The new church of St. Maxentius, Bradshaw, near Bolton, has been consecrated by the Bishop of Manchester. Mr. Paley, of Lancaster, was the architect. The cost of the church is 4,300*l.*, exclusive of the site and burial-ground. Accommodation is provided for nearly 500, being more than double that afforded in the old church adjoining.

Southampton.—The dedication-stone of the proposed Millbrook New Church has been laid. The church is to be built upon a site given by Lady Barker Mill, immediately opposite the Old Manor House, and has been in course of erection for some time, and considerable progress has been made with the outer walls, which are several feet above ground. The church will be in the Early English style, with nave and side aisles, chancel and chancel aisles, vestry, tower and spire; but we believe the realisation of this as a whole is not at present contemplated. The church will be of Swanage stone, with Farley Down stone dressings, and will be 170 ft. long; the chancel taking 38 ft. and the nave 132 ft. The height of the nave roof will be 53 ft. The church will accommodate 700 people, and its total cost is estimated at 7,000*l.*, but contracts to the amount of 4,800*l.* only have at present been entered into. The architect is Mr. Henry Woodley, of Guildford; and the builders are Messrs. Newman & Son, of Winchester. The works are under the superintendence of a nephew of the architect, Mr. Coussmaker.

Wimlington.—The foundation-stone of St. Peter's Church, in this parish, has been laid in the presence of the Bishop of Ely, by Lady Frances Russell. The church will be in the Decorated style of the thirteenth century, with nave, chancel, octagon apse, and a tower, 18 ft. square, and about 120 ft. high. The amount of the contract is about 4,000*l.* Mr. T. H. Wyatt is the architect, and Messrs. Holland & Hannen are the builders.

Spring-grove.—The new church of St. John the Evangelist, Spring-grove, has been consecrated by the Bishop of Winchester. The edifice is built on ground given by the late Mr. Mercer, of Surliton, who was also the donor of 2,000*l.* It was erected to supply the wants of the still increasing neighbourhood of Spring-grove. The cost of the building, exclusive of the architect's fees, &c., has been 7,000*l.* The church is built of Kentish rag stone, with dressings of Bath stone, except the quoins, which are worked in the rag stone. The roofs are covered with Beverley tiles, of the shade known as "strawberry," and the ridges finished with tile cresting, that on the chancel being more ornate than the others. The plan consists of nave with aisles, south porch, transepts, chancel with north aisle and vestry, and a seven-sided apse. The tower is on the south of the chancel, opening into it and the south transept. At present the tower is only built to the height of the eaves of the chancel roof. The principal entrance to the church is through the south porch. The nave, 87 ft. by 27 ft., is divided from its aisles by

moulded arches, springing from piers alternately clustered and circular. All shafts throughout the building have the square abacus. One capital has been carved at the expense of Mr. Shaw, of the firm of contractors, and it is hoped that the others may be by degrees finished. The chancel is the same width as the nave. The centre window is filled with stained glass by Messrs. Ward & Hughes, of London; it is the gift of Mr. E. H. Bedford, and represents the Crucifixion and St. John taking the Virgin to his own home. The centrelight of the west window of the nave is also filled with stained glass, presented by Lieut.-Col. Law, and executed by Messrs. Cox & Sons. Both gifts are *in memoriam*. The building is warmed by hot air passing from Gurney stoves placed under the north transept, through one large grating in the north aisle. Accommodation in open benches is provided for 827 persons; the south aisle being free. The works have been carried out by Messrs. Jackson & Shaw, of Westminster, at a cost, including lighting and warming, of a little over 7,000*l.* Mr. Arthur J. Phelps is the architect. The carving has been executed by Messrs. Farmer & Brindley. The gasfittings and other metal work were supplied by Messrs. Jones & Willis, of London & Birmingham.

Hedon.—The nave and aisles of the old parish church, which for some time past have been undergoing restoration, being completed, are now opened to the public. In July, 1869, the restoration of the south transept was completed, the south front being entirely rebuilt, and an open roof replacing the old one; at the same time the floor of the nave was lowered about 16 in., bringing to light much work at the bases of the clustered columns that have been hidden from view for a number of years, and other improvements were added, the architect, Mr. Street, supplying the plans, the work being carried out by Messrs. Shafts & Barry, of York. The cost of these works was upwards of 2,000*l.*, and of this sum 1,000*l.* were given by Mr. Christopher Sykes, M.P., thus leaving upwards of 1,000*l.* to be provided by the committee. This sum was quickly subscribed, and the works commenced. Being completed, the restored portion was publicly opened by the Archbishop of York, on July 30th, 1869. The vicar selected the western portion for restoration, as the one to which his next efforts should be directed, and in a short time the funds were provided. The western portion, now completed, consists of a nave and aisles, 85 ft. long and 48 ft. wide. The works have been carried out from the designs and under the superintendence of Mr. J. T. Webster, of Hedon, architect. Mr. Charles Atkinson was the contractor for the various works, the woodwork being executed by him; the stonework and carving (the principal features of the work) being given to Messrs. Wilson, Brothers, of Hull. Mr. Smith, Hull, executed the plumbers' and painters' work. The organ, under the hands of Mr. Outhbert, of Hull, has been considerably enlarged and improved in compass and tone.

Skelbrook.—The newly-restored little church at Skelbrook has been reopened for divine service. The tower is the only portion of the structure which has not been rebuilt, though even this part has undergone considerable alteration, and has been carried about 6 ft. higher. The stone used for the wall facings and dressings (except that provided from the old material) is Ackworth, Ancaster, or sound grit of hard description. A surface drain is made round the entire walls of the tower, nave, chancel, and vestry, formed of patent vitrified bricks, 18 in. wide, with a fall of not less than 2 in. in 10 ft. The new roof is of pitch-pine, and the ironwork is joined with pins and screws. The accommodation now afforded consists of 110 sittings, all free. Part of the chancel, and the steps leading to and within the altar-rails, are laid with polished ornamental tiles, while the rest of the chancel and the nave are floored with Leicestershire tiles, all supplied by Messrs. Whetstone & Co., of Coalville. The church is warmed by means of three heated with hot air. A stained-glass chancel-window, a memorial of the late Mrs. Percy Neville, is from the establishment of Messrs. Houston, Butler, & Bayne, of London. The subject portrayed are the Good Shepherd, and some of the more notable incidents in our Saviour's life. The font is formed of Moor stone and Derbyshire spar. It is carved. The windows inserted in the Neville Memorial chapel are all to be filled with coloured glass. Only one, however, at present is completed, the subject being taken from Revelations,—Alpha and Omega, the first and the last. The stonework both of the interior and

the exterior of the edifice has been, in various places, carved; the woodwork, too, in several instances, displays the work of the carver's tool. The carver of the stonework was Mr. Soriven, of Doncaster, and of the wood, Messrs. Threlley & Mease, of Hull. The architect for the building was Mr. Joseph Goddard, of Leicester; and the contractors for the re-erection and restoration, were Messrs. Shillito & Morgan, of Campall. The cost at the present time, from the many extra charges, cannot be accurately ascertained. It is expected, however, to range between 1,500*l.* and 1,800*l.*

DISSENTING CHURCH-BUILDING NEWS.

Halifax.—The New Connexion Wesleyan Methodists in Halifax have just completed a new place of worship in the town, which has been formally opened. The designs have been by Messrs. Hill & Swann, of Leeds and Sheffield; and the following have been the contractors:—Masons, Messrs. Dixon & Oates; joiners, Messrs. Smith & Brier; plumbers, Messrs. Walsh & Son; plasterer and slater, Mr. Ambler; and painter, Mr. Birns. The chapel is in the Early Decorated Gothic style of architecture, and the principal front faces North Parade. The front entrance is surmounted by a wide stretch of mullioned windows, consisting of a four-light window, having on either side and joined up to it a two-light window. The head of each window is filled with geometrical tracery. On either side of the door is a lancet window, and the lofty gable at its summit is crowned by a floriated cross in metal-work. On the east side of this large gable is the gabled roof of the side entrance, a carved pinnacle being between. On the west side is a similar gable, while instead of a pinnacle rises a lofty spirelet, carved and crocketed, and finishing in a metal cross. All the seats are in pitch pine, low upon ones (no pew doors), and those beneath the side galleries incline slightly towards the pulpit. The galleries run around all sides of the chapel, that behind the pulpit being intended for the organ, when it is provided. The open roof has its timbers stained, and the spaces between filled in with plaster. The gallery-fronts are pierced with quatrefoils. The supporting pillars to the galleries, which are carried up to the roof, are coloured dark chocolate, and have their capitals relieved by colour and gilding. The small circular window at the north end (which will be over the organ), and the single-light window on either side, are filled in with quarried glass. The windows in the partition from the vestibule are similarly treated, whilst the tracery headings to the great window over the principal entrance are filled in with stained glass. All have been supplied by Mr. Barnett, of Newcastle. The chapel is lighted by ten gaseliers in brass, each having eighteen lights, and suspended, five on either side, and between the supporting pillars, to the roof. Beneath the galleries are large brackets, each with four lights. All these are from the works of Messrs. Hibbert & Co., of Manchester. The total accommodation gives 900 seats. In rear of the pulpit are large vestries and robing-rooms, and a covered arcade leads directly into the large schoolrooms, built some years ago, behind the old chapel. The total cost of this chapel will be between 4,000*l.* and 5,000*l.*—South Parade Wesleyan Chapel after being closed for many months, during which time extensive alterations and improvements have been made both internally and externally, has been formally reopened. The alterations, which are extensive, involving an expenditure of over 2,300*l.*, have been carried out under the superintendence of Messrs. Ives & Son, architects. The old building has been so handled that all its leading features are retained, whilst at the same time the requirements and taste of more modern days has been fully met. Built in 1776, it is a plain edifice, having in its principal front two entrance-doors, with a square-headed window between, and one on the side of each door. Over these, in the second story, are windows to correspond; and along each side are five windows in each story. Formerly there were three rows of windows, the upper ones being small and square. These have been removed, and the gallery-windows lengthened, and converted into circular-headed ones. At the east end of the chapel a large apse or organ-recess has been thrown out, resting upon stone pillars, placed so as not to interfere with the graves. It is in the interior of the chapel that the greatest alteration has been made. The whole of the eastern gallery (which

held the organ) has been swept away, as well as the pulpit and its surroundings. The recess spoken of opens into the chapel by a moulded arch, having supporting pilasters on either side. Its dimensions are 22 ft. by 16 ft., and its height 18 ft. 6 in. to the spring of the roof. The new organ, now building by Messrs. Forster & Andrews, of Hull, will shortly be placed in it. In front of this recess, well advanced, and standing upon a broad platform two steps high, is the pulpit, 8 ft. in height. Round the raised platform is a mahogany rail, enclosing the communion space. The whole of the pews have been repainted and varnished, and the walls repainted in warm tints. The gallery-fronts have been painted, all in neutral tints, the prevailing colours being light grey, drab, and light blue, the panels being filled in with scroll-work, and the running moulds slightly gilded. On the ceiling, each of the large panels is filled in with a floriated design, and the large ventilators (nine in number) are decorated. Around the sides is a deep scroll-mould. Five coronas (supplied by Messrs. Foster & Son, of Woolshops) are suspended from the ceiling. They are in brass and wrought iron. The central one has eighteen lights, and the four others twelve lights each. Beneath the galleries, running on the three sides of the chapel, are fourteen brackets, of four lights each. All the old glass of the windows has been removed, and now each light is in a single sheet of figured glass, having the Pompeian key-mould around the edges. In rear of the chapel, and on a level with the apse, is a large new vestry, whilst the old school-room beneath has been reboarded and panelled, and a new class-room formed out of it. The large school opening into the chapel, and which was built a few years ago, needed no alteration. Mr. Pickles has been the mason, Mr. Townsend the joiner, Mr. Ambler the plasterer, Mr. Naylor the plumber, and Messrs. White & Stringer the painters and decorators employed.

Chester.—Pepper-street Methodist New Congregation Chapel has been re-opened for divine service. This place of worship has undergone extensive alteration from its former half-primitive, half-modern appearance. The old benches in the body of the chapel have been removed, and supplanted by new pews, in harmony with the gallery and sides of the building. The pulpit has been lowered 1½ ft., and the stairs at the back are superseded by a flight of winding stairs on either side. Behind the pulpit are two Corinthian pillars supporting a semi-arch of the same style. No alteration has been made in the gallery, with the exception of the removal of the old perpendicular gaslights, which has been done in every part of the building, and sunlights or side-brackets introduced in their stead. The ceiling is beautified by an ornate smilight, with centre flowers. The pews and the pulpit have been repainted, grained, and gilded. The whole of the work has been executed by Chester tradesmen, Mr. Robert Ellis doing the painting, Messrs. Farrimond & Co. the woodwork, and Mr. Bird the gasfitting. A double set of hot-water pipes run along the whole building. The accommodation which the chapel will now afford is sufficient for 1,200 persons, and the cost of the alterations, &c., amounts to about 350l.

Andover.—In the Congregational Chapel, old-fashioned high pews have been replaced by open seats of Oregon and red pine, varnished. The aisles have been laid in encaustic tiles, from the works of Mr. R. Minton Taylor, of Fenton; and the few old tombstones which were brought to light during the alterations to the boarded flooring are relaid in the aisles. The pulpit has an apparatus for transmitting the voice of the speaker to any part of the chapel, by means of tubes. The expense attending the alterations has been covered by the subscriptions, although there are a few incidentals towards which contributions will be asked at some future time. The work has been executed by Mr. Frank Beale, of this town, builder, who also prepared the plans and specifications.

Norrmanton.—A Methodist Free Church has been opened here, and is a substantial red brick building, with stone dressings, open stained roof, and stained deal fittings. It will seat 200 persons. Mr. William Watson, of Wakefield and Doncaster, was the architect; Mr. John Foster, of Norrmanton, was contractor for the whole work, for 710l.

Alverthorpe.—The building committee have instructed Mr. William Watson, architect, to prepare a design for a chapel and Sunday-schools for the Methodist Church of this place.

Belper.—The new Congregational Church has

been opened for divine service. It is in the Gothic style of the Early Decorated period. The extreme dimensions are 84 ft. in length by 40 ft. in width; the height from the ground line to the ridge is 40 ft., and from the ground-floor to the ceiling, 38 ft. There is a nave, with entrance vestibule and staircase in front, and a chancel at the east end, 18 ft. by 14 ft., in which are the organ and choir. On either side of the chancel are vestries, &c. There is a gallery at the west end, and the building is so arranged that side galleries may be added hereafter if found needful. The principal entrance is in the centre of the west gable. A tower, in which there is another entrance, rises from the south-western angle of the building, and is surmounted by a spire, terminated by a metal finial, the total height being nearly 120 ft. At the south-eastern angle there is a staircase tower, with slated spire. The walls are of stone, and both ashlar and dressings are from local quarries. There are sittings for 550 persons. The seats are open. The total cost of the church will be about 4,000l. Mr. Woodhouse, of Bolton, is the architect; and Mr. Cash, of Duffield, the builder. The windows, which are cathedral tinted, and bordered with stained glass; and the gasfittings, which are of polished brass, and Mediaeval in character, have been supplied by Mr. S. Evans, of Derby. The masonry has been done by Messrs. Walker, of Wirksworth; the carpentry and joinery by Mr. Cash, of Duffield; and the painting by Mr. Holland, of Duffield.

Stockton.—The corner-stone of a new Unitarian Chapel has been laid in Wellington-street, Stockton. The new chapel will be 60 ft. long, by 38 ft. broad. There will be sitting accommodation, in open pews, for 300 persons. The style of architecture is Early Gothic. Behind the chapel there will be a school, 47 ft. long and 24 ft. broad. Mr. Eugene E. Clephan has undertaken to build the chapel and school for 1,845l. The total cost of the new buildings, including all furnishings and the land, is estimated at about 3,000l.

Maidenhead.—The foundation stone of a new Baptist Chapel (on the Marlow-road) has been laid. The dimensions are 51 ft. by 31 ft.; the accommodation will be for 280 persons on the floor, and the gallery another 200. There is also to be a lecture-room, large enough for 80 people, together with a vestry. Space is provided for a pastor's house and a school-room. The architect is Mr. Vardy, and the builder is Mr. Woodbridge.

Cheetham (Manchester).—A new Wesleyan Chapel, in Queen's-road, Cheetham, has been opened for divine service. The erection is nearly completed. It is built in the Early Gothic style of architecture, and will accommodate 550 persons. The total cost of the building will be about 5,500l., and of the land, 2,000l. The architects are Messrs. Clegg & Knowles, Manchester; and the builder is Mr. Mark Foggett, Cheetham.

Reading.—The ceremony of laying the two memorial stones of the new Wesleyan Chapel, in the Queen's-road, Reading, has taken place. The new chapel will be built in the Early Gothic style, having a tower and spire, 130 ft. high, at its north-east corner. The main entrance will be approached from the Queen's-road. The chapel will be 80 ft. long by 50 ft., and the chancel 21 ft. by 26 ft. The building will contain sittings for 900 persons. At the south end a long school-room will be built for 100 scholars. There will also be an infant school-room, four class-rooms, and vestry. The total expenditure, including the purchase of land, will be about 7,000l.

Hull.—The foundation-stone of the Latimer Congregational Church, in Williamson-street, has been laid. This church is to be erected in an early style of Gothic architecture. The materials for the construction of the exterior are red stock bricks, black bricks being introduced in the bands and arches. The stone work to the windows and doors throughout is in Idle stone. The church is approached by three entrances leading into a spacious vestibule, and consists of nave, 34 ft. in width and 66 ft. in length, and transepts, 23 ft. 6 in. in width and 10 ft. in depth, affording accommodation on the ground-floor for 454 persons. There is a front gallery which is approached by a staircase in the tower, having additional accommodation for 88 persons. The roof is to be open-timbered, having framed trusses and curved ribs, and will be plastered on the underside of the rafters. The seats are to be of red deal, having cut ends and panelled framing. All the woodwork exposed to view is

to be lightly stained and varnished. The building is to be lighted in the front by a three-light central window, and two side lights over the gallery; the nave with six two-light windows, and each transept by five single lights, and a large rose-window in the gable. The square portion of the tower is carried to a height of 54 ft., and is surmounted by an octagonal spire, which is slated in bands of blue and green, reaching a total height of 92 ft. to the top of the vane. The gas-lighting is to be effected by means of coronas, suspended from the roof, and brackets, all of Mediaeval design. Attached to the back of the church is the minister's vestry, over which is the orchestra. The contracts have been let to Messrs. B. Musgrave & Son, brick-layers and plasterers; M. Raven, joiner; R. Waller, mason; P. T. Harrison, plumber and glazier; Messrs. Wilde & Son, slaters; Messrs. King & Co. ironfounders; and A. Wright, painter. The architect is Mr. Samuel Musgrave, of Hull.

SCHOOL-BUILDING NEWS.

Higham Ferrers.—The foundation has been commenced to be laid for the new Board Schools by Mr. John Piggott, of Rushden, the contractor for the masonry. Mr. George Smith, of Higham Ferrers, is to do the carpentering; and Mr. Albert Laughton, Rushden, the painting and glazing. The expenditure will be 2,000l. in addition to the purchase of the land. The schools will face Wharf-lane, and have a playground in front. They are to be completed by Midsummer next.

FROM SCOTLAND.

Edinburgh.—The Tron Church has had its walls painted and the large west window filled with stained glass. The large east window, containing six upright lights, was filled two years ago with stained glass, containing six illustrations of the life of our Lord, viz., the Annunciation to the Shepherds, the Worshipping of the Wise Men, the Presentation in the Temple, Christ among the Doctors, the Baptism, and the Sermon on the Mount. The large west window, which has just been executed, contains also six illustrations, viz., Christ raising Lazarus, the Last Supper, the Agony in the Garden, the Crucifixion, the Marys at the Tomb, and the Ascension. In the top tracery of the one window is the *Agnus Dei* in the centre, with angels in side-lights; and in the tracery of the other is, in the centre, the Pelican, with angels in the side-lights. The remainder of both windows is filled with ornamental work, in accordance with the style of the architecture. The walls of the church have been painted a neutral green, diapered with borderings of brown and dark green. The ingoings and facings of the windows are of a drab colour, and these are also diapered with borderings in keeping with the glass in the windows. Messrs. Ballantine & Son decorated both the walls and the windows. The west window has been subscribed for by the Marquis of Tweeddale, Lord Landerdale, and by relatives and friends of the late Rev. Dr. Hunter.

The operations connected with the erection of the new infirmary in Lauriston were recently all but suspended. The explanation is, that the builder had nearly completed the work embraced in the first contract, which was limited to the foundations and basement. Before entering upon a further contract, the managers deemed it expedient to obtain a report from Mr. Bryce, the architect for the buildings, showing in what way the design might be curtailed, so as considerably to reduce the estimated expenditure without prejudice to the ultimate carrying out of the plans in their entirety, so soon as it may seem desirable to do so.

The foundation-stone of the new Watt Institution and School of Arts, now in course of erection in Chambers-street, has been laid by the Earl of Rosslyn, Grand Master Mason of Scotland, with full Masonic honours. Opposite the main entrance to the Museum of Science and Art there will be an extended open space. The site of the new Watt Institution and School of Arts is at the west corner of this open space, and the building, which is to be in the Italian style of architecture, corresponding with the remainder of the buildings to be erected on the north side of Chambers-street, will therefore possess the advantage of having both a south and east front. The building will be two stories in height, except at the west end, where there will be a pavilion carried one story higher. The

front, or that facing the Museum of Science and Art, will be rusticated on the ground floor, with balusters under the first-floor windows; while the second-floor windows will have architraves, trusses, and cornices, and the pavilion will have pilasters at each side, and decorated windows. Over the first floor will be the main cornice, furnished with dormer windows, which are intended as a feature in lighting the large lecture-hall. The main entrance will be at the west end, under the pavilion, and will be approached by a projecting porch, supported on pillars. The porch will be crowned with the statue of James Watt, after Chantrey's model, which at one time decorated Adam-square. The main entrance will lead to a spacious hall and grand staircase, from which access will be had to the lecture and class rooms, directors' room, library, masters' room, and keeper's house. The principal lecture-hall will be 88 ft. long, 33 ft. broad, and will be capable of accommodating 500 persons. It will be lighted by four large windows on either side; while in the division between the richly-decorated cone and the ceiling will be a row of lunette lights. At the east end of the hall will be a platform for the lecturers, and at the west end a gallery seated for 180 persons. The ceiling will be decorated with panelling of a rich character. Another hall for lectures and large classes will be 34 ft. long and 33 ft. wide, and the remaining accommodation will consist of a chemical class-room, 33 ft. by 23 ft.; a chemical laboratory and apparatus-room for mechanical philosophy; and two spacious class-rooms, for general purposes. The architect for the new institution is Mr. David Rhind, F.R.S.E., and the contractors are Messrs. David Sutherland & Son, Edinburgh.

Leith.—The United Presbyterian Church, St. Andrew's-place, Leith, has been undergoing an overhaul, and the congregation have taken advantage of the opportunity to place in the building permanent memorials of the two pastors with whom the history of the church is identified. The re-painting has been executed by Mr. Paxton, of Edinburgh. A brown tint on the walls affords a background for the work of the decorator. The panels of the ceiling are painted in pale blue with gold stars. A ventilator in the middle of the ceiling takes the form of an elaborate centre-piece, painted in brown and cream colour, and gilded. The windows are encircled with hands of diaper-work, the glass being obscured by being painted in light colours or a corresponding pattern. In the case of the two large windows flanking the pulpit, the ornamental border takes a more ornate form, with gilding. The front of the galleries is painted in wainscot, the surface being diversified with various mouldings and scroll ornament. The two large windows behind the pulpit have been turned to account to enhance the decorative effect, while serving as memorials of the pastors. Furnished with new stone mullions, which form in each case two round-headed lights, surmounted by a small circle, the windows have been filled in with coloured glass by Mr. Barnett, of Leith. In addition to the memorial window, a mural monument has been erected to the memory of Dr. Smart, in the lobby of the church. The work was designed by Mr. Brodie, R.S.A. Over a simple plinth, supported on two square corbels, rises a plain slab, in the centre of which, within a deeply-moulded circular panel, is placed a medallion of Dr. Smart in high relief. An outline resembling that of a Grecian pediment completes the monument at top. The whole is in marble, but the architectural portion is blue-veined white, and the medallion pure white. While decorating and improving their church, the St. Andrew's-place congregation have taken steps for providing themselves with a hall in which Sunday school and prayer-meetings may be conveniently held. A new building, designed by Mr. Paterson, of Edinburgh, is being erected in close proximity to the church, with which it corresponds in point of style. Internally its principal, indeed only, feature is a spacious and lofty apartment, well lighted from two sides, and capable of comfortably seating about 300 persons. Waiting-rooms are provided behind. A new vestry is also being built in rear of the church.

Broxburn.—The memorial stone of a public hall and working-men's institute for the village of Broxburn has been laid. Mr. R. Bell, of Broxburn Lodge, and a number of the leading men in the village, instituted some time ago a working-men's club, with the view of providing the somewhat restless mining population means of harmless and agreeable amusement.

The club proved a great success, and, encouraged by this, Mr. Bell, Mr. MacLagan, M.P., and other proprietors and employers in the neighbourhood, projected a public hall and institute on a somewhat larger and more imposing scale. Plans were accordingly procured, and operations commenced, and the memorial stone of the institution was laid with full Masonic honours by Lord Cardross. The site of the building is near the centre of the village, and will form a prominent feature in its one long straggling street. The erection will be a simple oblong building, with Gothic details. The main front will show a gable end towards the street, having a tower at the south-west corner rising to a height of 50 ft., finished with a wedge-shaped roof, tipped with ornamental cresting. Access will be gained to the building by two entrances,—one leading to the billiard and reading rooms, which will be situated on the ground floor, and measure 31 ft. by 26 ft. The other entrance will be placed at the basement of the tower, and give immediate access to the hall, which will be placed on the first floor. Extending to 60 ft. by 31 ft., the hall will be seated for 500 persons, and provided with a platform. The architect is Mr. James Fairley, Edinburgh; and the contractors are,—for the mason work, Mr. J. Rennie, Newbridge; and for the joiner work, Mr. W. Brown, Dechmont. The cost of the entire building will be about 1,300*l*.

Glasgow.—The foundation stone of a United Presbyterian Church has been laid in Glasgow. The new building is being erected in Elgin-street, off Eglinton-street. The church is in the Gothic style of architecture, and is constructed so that a spire may be added if required. It is about 70 ft. square, exclusive of the session-house, vestry, &c., which abut on the east side. The interior of the church will be ornamental. A spacious gallery will run round the sides and back, and underneath it the ground seats sweep round in the form of a horse-shoe. The body of the church is divided by two aisles. Underneath are the halls, the roofs of which are supported by cast-iron pillars. The building is estimated to accommodate 1,100 persons, and when completed will cost about 5,000*l*.

STAINED GLASS.

All Saints, Wath-on-Dearne.—An addition has been made to this parish church by the erection of two stained glass windows in the south aisle. They are of two lights each and of large size, and are designed in the style of the Tudor period. In one window, on a foliated ground, are shields and other heraldic devices, while in the other, on likewise a rich ground of foliated work, are medallions of angels holding texts. The windows have been made by Lavers, Barrand, & Westlake, of London, from a design by Mr. Bentley. The stonework of these windows has been restored, the whole having been directed by Messrs. W. Hatfield & Son, the architects, whom the donor, Mr. G. P. Nicholson, of Wath-on-Dearne, employed on the work.

All Saints, Aton.—Three of the windows in the east bay of this church have been filled with stained glass, in memory of the late Mrs. Mary Anne Dunn, the mother of the vicar (with the exception of the centre window, which contains the Ascension and Crucifixion of our Lord, with canopies and bases, and with the Majesty in the treasury). The subjects chosen are characteristic of different saintships; for instance, under the head of the saintship of Infant Innocence, we have Christ receiving little children, and the infant Saviour disputing with the doctors; for the saintship Self-renunciation, St. John the Baptist preaching and baptising in the wilderness; for the saintship of Motherhood, the salutation of the Virgin and the nativity of our Lord; for the saintship of the Gift of God, St. Peter and St. John healing the man at the gate called Beautiful, and the descent of the Holy Ghost. These windows are from the studio of Powell, Bros., of Leeds.

Bath Abbey Church.—The last of the windows of the north aisle of this church has been filled with stained glass by Messrs. Clayton, Bell, & Co. The window is the gift of Mr. Thomas Gill. It is divided into five lights, with tracery above, the central light being occupied by a figure of the prophetess Miriam, and the four other subjects are Hannah praying in the Temple, the finding of Moses, Mary at the feet of our Lord, and the Marys at the Tomb.

Milton Church.—A new stained-glass window has just been placed in the east window of the

parish church, the gift of Mr. James Packe, of The Lodge. The window is a three-light Gothic, with geometric tracery. There are six subjects, two in each light, representing the "Last Supper," the "Agony in the Garden," the "Betrayal," "Bearing the Cross," the "Crucifixion," and the "Descent from the Cross." The whole of the groundwork is filled with designs, and the lights are surrounded by a foliated border, and have respectively at the top of the sacred monogram the interlaced triangles of the Eternal Trinity, and the X P C, or Greek monogram of Christ. The tracery above the lights is filled in with floral, foliated, and geometric devices. The work was done by Messrs. Ward & Hughes, of London, who, we understand, received a *carte blanche* as to price from the donor.

St. Clement's, Cambridge.—This parish church has just been enriched by a stained-glass window, made and presented by Mr. W. H. Constable. During the summer this work of art was exhibited in the International Exhibition.

Leesfield Church.—The single-light window on the north side of the chancel of this church has just been filled with stained glass in memory of Mr. Higson. The subject represented is the parable of the talents. The window is from the works of Mr. Shaw, of Saddleworth. Another stained window, also from the works of Mr. Shaw, has been placed under the gallery at the west end of the north aisle of the church. It consists of two short lights. In the first light is a circle surrounded with a wreath of vine-leaves, inclosing the monogram "I. H. S." In the second light is a similar circle, inclosing a cross. Running round the two circles are the words, "Him that cometh unto me I will in no wise cast out." The ground-work of the window consists of oak-leaves and acorns.

Cirencester Parish Church.—A window has been placed in the lady chapel of this church by Mr. T. W. C. Master, of the Abbey. The window represents the principal points in the histories of the Marys mentioned in the New Testament, and has been executed by Messrs. Hardman & Co., of Birmingham.

Books Received.

A Handbook of Chemical Technology. By RUDOLF WAGNER, Ph.D., Professor of Chemical Technology in the University of Wurtzburg. Translated and edited from the eighth German edition, with extensive additions. By WILLIAM CROOKES, F.R.S. With 336 illustrations. London: Churchill, New Burlington-street, 1872.

In this valuable and important work there is a great variety of topics, many of them of special interest to our readers. The technology of glass, limes, and mortars; the preservation of wood; the latest methods of preparing iron, zinc, lead, copper; and technology of beating and illumination, are among these; and there are under these and other headings many subjects dealt with, such as the manufacture of bricks and tiles, terra-cotta, &c.; of porcelain and other wares; oils and resins; colours; varnishes; picture restoring; cements; glues; dyes; and many other materials in the technology of vegetable matters, such as paper-making; bread-baking; beer-brewing; and of animal matters, as of silk, wool, and preservation of meat.

We shall on another occasion give some extracts in a separate form on the subject of glass, as a specimen of the thorough mode of treatment which seems to be adopted throughout the work.

VARIORUM.

A USEFUL little volume, titled "Sanitary Science," has been published at a moderate price by Mr. R. Scott Burn (Glasgow and London: W. Collins, Sons, & Co.), on the principles of sanitary science. Starting with a motto which is taken from Lord Derby's recent speech at Liverpool, that "sanitary instruction is even more necessary than sanitary legislation," he proceeds to develop briefly, yet perspicuously, the general sanitary conditions of town and country districts; adding a separate essay on the various subjects involved, such as healthy construction of houses; heating and ventilation; the smoke nuisance; water supply; and disposal of sewage. The illustrations, as far as they go, are appropriate and well selected.

Miscellaneous.

The Metropolitan Water Companies.—In accordance with the Act of Parliament passed last session, the water companies of London have issued their balance-sheets for the last year, and these have been embodied in an official return. From this it appears, says the *Times*, that the capital of the West Middlesex Water Company is 885,712*l.*; gross revenue, 125,915*l.*; net revenue, 85,197*l.* The gross earnings were thus 14*l.* 4*s.* 4*d.* per cent. on the capital; 32*l.* 6*s.* 9*d.* per cent. of the gross receipts were absorbed by the working expenses, of which 23*l.* 9*s.* 3*d.* were for maintenance, and 8*l.* 17*s.* 6*d.* for management, leaving 67*l.* 13*s.* 3*d.* per cent. on the gross receipts available for division, which is at the rate of 9*l.* 12*s.* 4*d.* per cent. on the capital. The capital of the Kent Water Company is 477,011*l.*; gross revenue, 62,130*l.*; net revenue, 40,815*l.* The gross earnings were thus 10*l.* 12*s.* 9*d.* per cent. on the capital; 35*l.* 2*s.* 3*d.* per cent. of the gross receipts were absorbed by the working expenses, of which 27*l.* 2*s.* 8*d.* were for maintenance, and 7*l.* 19*s.* 7*d.* for management, leaving 64*l.* 17*s.* 9*d.* per cent. of the gross receipts available for division, which is at the rate of 8*l.* 9*s.* per cent. on the capital. The capital of the New River Company is 2,651,975*l.*; gross revenue, 311,664*l.*; net revenue, 196,251*l.* The gross earnings were thus 11*l.* 15*s.* 1*d.* per cent. on the capital; 37*l.* 0*s.* 7*d.* per cent. of the gross receipts were absorbed by the working expenses, of which 27*l.* 11*s.* 9*d.* were for maintenance, and 9*l.* 8*s.* 10*d.* for management, leaving 62*l.* 19*s.* 5*d.* per cent. on the gross receipts available for division, which is at the rate of 7*l.* 8*s.* per cent. on the capital. The total capital of the eight companies of which details are given is 10,008,310*l.*; gross revenue, 1,058,566*l.*; net revenue, 666,608*l.* The gross earnings thus averaged 10*l.* 11*s.* 6*d.* per cent. on the capital; net earnings, 6*l.* 13*s.* 2*d.* per cent.

Metropolitan Assessments.—The Lewisham Board of Guardians, according to the *Metropolitan*, have submitted a series of questions to the clerks of the Assessment Committees of the metropolitan parishes and unions respecting the Valuation (Metropolis) Act, 1869. To the question, "On what principle is property held on lease without premium, assessed, as distinguished from property held from year to year?" the clerk of Camberwell replies, "By adding 10*l.* per cent. to rent." In Chelsea, "the rent paid of a recent letting, and considered the fair market value, is taken as the rateable value, and the value of repairs, &c., added to ascertain the gross value." In Hampstead, "5*l.* per cent. is added to rent." In Islington, "each case is considered on its merits." In Kensington, the practice is "to add 5*l.* per cent. to rent, except on new properties of 40*l.* and upwards." In Paddington, "the estimated cost of repairs is added to rent." In St. Pancras, they "add 5*l.* to 10*l.* per cent. to rent, if lease is granted within seven years; and the value of an old lease is judged from adjoining property." In Shoreditch, "no hard-and-fast line is adopted; the property in the parish is of a varied character, and the gross value is arrived at in the best way we can." In Fulham Union, the assessment is made "on the assumption that the real does not represent the gross value." In Greenwich, "10*l.* per cent., if repairing lease; if not, 5*l.* or less, according to circumstances." In Hackney Union, "the rent is deemed to be rateable value, and the percentage fixed by the Act is added to it to ascertain the gross value." In Holborn, "a fair average amount is added for repairs; the amount paid for insurance, and the average of the landlord's taxes paid by tenant."

The Canterbury Town Sewage.—The Local Board have received three tenders for taking a concession of the sewage, in only one of which anything was offered for the sewage, and that was conditionally, that if any profit resulted, the Board should have 10 per cent. of that profit. The tenderers in this case were Messrs. Shelford & Robinson. In the other two cases the tenderers required annual payments to them of 750*l.* and 1,000*l.* respectively. The Board, after some further discussion, agreed that the tenders of Messrs. Anderson & Goodwin and Messrs. Banks & Walker be not entertained, and that the meeting should be adjourned for a fortnight, in order that the surveyor might report upon the remaining tender. Messrs. Shelford & Robinson propose to introduce the Dugald Campbell patent manure system.

Aspect for a Conservatory.—I have often heard the remark, "I would build a conservatory, but have no proper place for one,"—meaning, no south aspect. Now, however right it may be to build fruit-houses with an aspect direct south, I think it is the worst possible one for a conservatory. In the first place it certainly does not add to the pleasure of any one looking at plants in a glasshouse to be exposed to a hot sun, and still less to those working amongst them. Then, again, flowers, even when shaded by blinds, soon drop their petals in such a house, and many plants, as camellias, ferns, &c., seldom do well, however shaded. About two years ago, I built a house 100 ft. long, with an aspect due north, and a high back wall about 10 ft. This house has been full of zonal geraniums which have been in bloom ever since last April, and have been the admiration of all who have seen them; and though it is now November, and they have been blooming more than half a year, they are still in full beauty. The question is, would they have done so well in a house facing the south? I think not; though perhaps such a house would suit them better during the winter. If such sun-loving plants as geraniums will do well in a north house, there are but few plants which could not be cultivated in it. Were I to build a camellia house, I would face it to the north-east, so as to avoid the afternoon sun even, as few plants dislike a hot sun more than camellias do. Some may, therefore, be glad to know that a south aspect is not necessary for every kind of glass house.—*The Gardener.*

House Property in Melbourne, Australia. The prices realised at a recent auction sale, says the local *Argus*, show the value of freehold property here. An allotment in Flinders-lane, near Elizabeth-street, of 26 ft. frontage by 96 ft. in depth, on which is erected a bluestone store, was sold for 7,050*l.* or about 270*l.* a foot frontage. Premises in Flinders-lane, near Market-street, which possess a frontage of 59 ft. by a depth of 129 ft., fetched 6,000*l.* Two shops in Little Collins-street, near the Police Court, were sold for 2,450*l.*; and the Emisicorthy Hotel, in Little Bourke-street, with a frontage of 27 ft. by 40 ft., realised 1,650*l.* The allotment at the corner of King and Little Collins streets, 94 ft. by 99 ft., brought 3,300*l.*, or 35*l.* per foot frontage. The buildings on this ground were but of little value. Other property in Little Collins-street was sold for 17*l.* per foot. A piece of land, possessing a frontage of 62 ft. to Spencer-street, and 112 ft. to Dudley-street, was sold for 1,255*l.*, and 60 acres of the Yat-Orrong estate, at Tonrak, subdivided into building allotments, fetched 10,000*l.* There was a spirited competition for the various properties, and the sale realised over 35,000*l.*

The Improvements in Holborn Valley.—It appears from the report presented to the Court of Common Council by Mr. Shaw, chairman of the Improvement Committee, that from the date when the tenders were accepted until the undertaking was completed the time occupied was just three years and a half, and that the entire cost amounted in round numbers, to 2,500,000*l.* Of this sum only 355,166*l.* were expended on the actual works themselves; the remainder of more than two millions sterling was laid out chiefly in the purchase of land, and compensation to tenants. It is calculated that the value of the land now in the hands of the corporation is not less than a million and a half. There has therefore been really sunk upon the improvement a million. Already the corporation are beginning to receive an income from the property. In January last the total rental was no more than 7,000*l.* a year; now it is as much as 29,000*l.* a year; and, as a matter of course it will rapidly increase every year.

Interesting Discoveries in the Aleutian Islands.—Dr. W. H. Dall, of the U.S. Coast Survey, has been making explorations of late among the Aleutian Islands of Russia, in the North Pacific Ocean; and has discovered various ancient remains of natives, such as lamps, knives, spoons, arrow-heads, hearthstones, and skeletons. Around the sites of ancient villages he found several specimens of peculiar ways of burial. In certain places a sort of cave was formed under overhanging rocks, and here were put the bodies of the dead, preserved, attitudinised, and gaily dressed out. Some of them were covered entirely with wooden armour. Occasionally the cave had a theatrical appearance: the bodies of renowned hunters were placed in canoes, armed, and apparently rowing. Women were represented engaged in the labours of their lives,—sewing, dressing skins, or holding their children.

Alleged Protection of Crops from Frost. The manufacture of artificial clouds is reported to have been resorted to in the French wine-growing districts, to protect the crops from frost. Tin receivers, filled with a peculiarly prepared tar, were disposed over an area of many acres, and when the tar was ignited thick white clouds rose into the atmosphere, and, spreading out evenly over a large region, remained suspended several yards above the soil. In seasons when frost is feared, the tar clouds would interpose between the crops and the sky, thus checking the night radiation which often causes such ravages in vineyards and gardens, both in spring and harvest time. By the way, we hear no more of the alleged protection of the hop crops from hail, which was talked of, and said to be practised some years since.

Fall of a House in Kensington.—Preparations for the erection of new buildings for postal, money-order, and telegraph purposes in Young-street, Kensington, have necessitated the demolition of a large house in the street, and the excavation of a deep foundation. The majority of the houses in the street are very old, but as the contractors had pined and shored them up, they still continued occupied. One of these houses was occupied by a greengrocer and his family, and at about half-past two in the morning his wife was awakened by a creaking noise. She had just time to arouse, and get out her husband (who is partially paralysed) and her family, when the house fell, burying their furniture and stock-in-trade in the ruins.

Society of Engineers.—At the annual general meeting of this society, the balloting lists were handed to the scrutineers, who ultimately reported that the choice of members had fallen on Mr. Church as president; Messrs. J. H. Adams, W. MacGeorge, and V. Pendred, as vice-presidents. Eight other members of council were also elected. Mr. A. Williams was re-elected hon. secretary and treasurer; and Mr. J. Walker was elected auditor. It was announced that the council had awarded premiums of books to the following members for papers read by them during the past session, viz.—Mr. E. G. Bartholomew, Mr. W. H. Fox, and Mr. H. Davey.

Bath Abbey.—The eighth annual meeting of the subscribers to the Abbey Restoration Fund was held on Monday afternoon, the 9th, at Bath, the Mayor presiding. A very satisfactory report was read, and the chairman congratulated the subscribers upon the approaching completion of the work, and hoped the sum now necessary would be raised in the ensuing year. The third and last portion of the work is estimated to cost 6,000*l.*, which sum would be somewhat exceeded. Other special works are also projected, such as Corporation pews and stained-glass windows, but it was hoped that the choir would be open for worship in the spring. The usual resolutions were adopted.

Experiments with Acids on Stone.—At a recent meeting of the Manchester Literary and Philosophical Society, Dr. R. Angus Smith, F.R.S., said that he, like others, had observed that the particles of stone most liable to be in long contact with rain from town atmospheres, in England at least, were most subject to decay. Believing the acid to be the cause, he supposed that the endurance of a silicious stone might be somewhat measured by measuring its resistance to acids. He proposed, therefore, to use stronger solutions, and thus to approach to the action of long periods of time. He tried a few experiments, and he says with promising results.

A "Right of Way" Question.—A communication was raised in the parish of St. Michael, Cornhill, last week, from an attempt on the part of the trustees of the parish, to raise a strong barrier across a part of St. Michael's-alley, with a view to obstruct a disputed "right of way." Resistance of a similar nature, says the *City Press*, was brought to bear, each party having forty to fifty workmen engaged in the struggle, mostly bricklayers and carpenters. On an application to the City inspector of pavements, he had a detachment of the City police brought on the ground, and they stopped violence.

Rotterdam.—It seems likely that a new town will be built on the other side of the river. The Rotterdam Commercial Company (with a capital of fifteen millions) offers to buy grounds on the other side of the river to the extent of 4,000,000 acres, and to pay for them a sum of 2,600,000 florins.

The Proposed New Metropolitan Water Supply.—It appears that the proposed Colne Valley Waterworks, for obtaining a supply of water from Bushey, near Watford, for the North London district, was brought forward some twenty years ago, when it was defeated by the New River Company. The present proposal, which involves the sinking of wells at Bushey, and which will be submitted to Parliament next session, is for supplying the district of Harrow, Stanmore, Edgware, Hendon, Kingsbury, Willesden, Elstree, Aldenham, and the surrounding locality.

Industrial and Fine-arts Treasures Exhibition at Wigan.—The opening of the new infirmary premises at Wigan, which have been erected at a cost of nearly 30,000*l.* is to be celebrated at Easter by an exhibition on rather an extensive scale. The inhabitants of this part of the country are making great efforts in connexion with the undertaking, having already raised, by voluntary subscriptions, nearly 25,000*l.* An industrial section, to include machinery in motion, is also being formed. A special exhibition of coal-cutting machines is talked of.

The Site for the Municipal Buildings, Leicester.—A meeting of the municipal buildings committee, consisting of the whole council, was held last week in the town library. A long discussion took place as to whether the municipal buildings or the sewerage of the town be first gone on with, and it was ultimately decided, by a majority of 25 to 18 votes, to sell the Friar Lane site, and proceed at once with the erection of municipal buildings on the Cattle Market site. What has become of the competition designs?

Wall-Painting in St. Martin's, Birmingham.—An interesting discovery has been made in the course of the removal of the chancel-walls at St. Martin's Church, Birmingham, namely, a wall-painting of St. Martin, the patron saint of the church. The saint is mounted on horse-back, and is in the act of dividing his cloak between two beggars; the legend peculiarly associated with his name. The painting was found upon the chancel-wall, near one of the side windows. The period is believed to be early in the reign of Richard II.

Gratifying, if correct.—The medical officer of the Westminster Board of Works says, in his annual report (the sixteenth),—"From the vigilance that is exercised by your sanitary inspectors in constantly visiting the dwellings of the poor, I am at once informed of any infringement of the Act relating to overcrowding, and I am happy in being able to inform you that during the past year the cases have been so few as hardly to render it necessary to refer to them in this report."

Indian Views at the Society of Arts.—The lecture-room of the Society of Arts has been crowded by an interested audience, attracted by a series of views of Indian temples, idols, and illustrations of every-day life, exhibited by means of the magic lantern. The photographic views, which have been taken by Captain Lyon, late of the 86th regiment, during a stay of six years in India, include, it is said, every type of note in the great Indian empire.

Discovery of a Painting in St. Joseph's, Axbridge.—During the repairs to the roof of the ancient church of St. Joseph, Axbridge, some lead had to be replaced, and underneath, to support the old lead, two perfect paintings of St. Paul and Zacharias were discovered. Some hedge-carver had divided the panels, upon which the paintings appear in excellent preservation, into three parts, and had then nailed them to the lead. The paintings appear to have been done in or about the fifteenth century.

Reading Architectural and Archaeological Society.—The opening meeting of the season was held on Wednesday evening, the 4th inst., at the Athol-nunn. An address was delivered by the newly-elected president, Mr. Joseph Morris, after which a paper was read by Mr. C. Holmes upon "Mechanical Appliances considered as Building Improvements." Captain Kennedy and Mr. Clapton C. Rolfe have been elected members of the Society.

The Shaft at Leavesden.—The chimney-shaft at the Leavesden Schools was blown down during the recent heavy gale of wind. The bricks fell on the roof of the boys' playground, and destroyed it. A correspondent thinks some explanation is needed.

Fall of a Factory in Bristol.—A serious affair has occurred in the vicinity of the Great Western Railway Terminals at Bristol, in the sudden fall of the roof and three floors of the great factory just erected by Messrs. Brock & Bruce, builders and contractors, for their own workmen. The circumstances are so peculiar that we hope to be able to obtain some further information on the subject before we say more about it.

Fire at a Chapel in Tewkesbury.—On Sunday before last a fire broke out in the Independent Chapel, Tewkesbury. The stove in the class-room, in the front part of the chapel, had become heated and had set fire to the wood-work. The fire was subdued by the active exertions of those who had assembled in response to the crier's bell, and who were fortunate in having a good supply of water near at hand.

Surveyor for the County of Montgomery. A correspondent states that Mr. Sweetenham, of the firm of Powell & Sweetenham, of Newtown, has been elected. About fifty candidates sent in testimonials. Another correspondent forwards a letter for publication which would subject us to an action for libel on the part of the Board.

Winchester Cathedral.—In the recent gale the parapet of the east end (south side) fell, and very seriously damaged the roof of the southern aisle of the choir, the lead being crushed and beaten into holes, and even the massive rafters were in two or three cases snapped. The repairs are being executed under the eye of Mr. John Colson, the cathedral architect.

An Exportation of Labourers.—The largest sale of land ever made to one person has just been effected by Gen. Carr to Mr. G. Grant, of London. The land is said to consist of seventy square miles, adjoining the territory of the Kansas Pacific Railroad, and will be let out in farms to labourers who will emigrate from England next spring. We are sorry to hear it.

The Albert Gold Medal of the Society of Arts.—The Prince of Wales, as president of the Society of Arts, has presented to Mr. Henry Bessemer the Albert Gold Medal, for his eminent services in developing the manufacture of steel.

Female School of Art in Bavaria.—We are glad to hear that a plan has been arranged with the sanction of the king for establishing a school of art and industry in Bavaria for female students.

Local Boards' Engineers.—The West Ham Local Board, London, have unanimously granted their engineer the privilege of private practice in addition to a salary of 500*l.* per annum.

Ely.—At a meeting held on Wednesday last, Mr. R. Reynolds Rowe, F.S.A., of Cambridge, was unanimously appointed to the office of surveyor to the Dean and Chapter.

Horfield Barracks, Bristol.—We hear that the plans have been adopted for the enlargement of Horfield Barracks, and that the works will be almost immediately begun.

Salisbury Cathedral is being provided with an efficient supply of water, and hydrants are being erected for use in case of fire.

TENDERS

For road-making and drainage works, at Shepherd's Bush, for the British Land Company, Limited.—

Ames	42,850 0 0
Chamberlayn, Bros.	1,614 0 0
Harris	1,460 0 0
Bloomfield	1,487 0 0
Haynes	1,420 0 0
Jackson	1,400 0 0
J. & S. Williams (accepted)	1,300 0 0
Neave & Son (too late)	1,250 0 0

For business premises, at Penge, for Mr. F. Andrews, Messrs. Spalding & Knight, architects. Quantities by Mr. Fleetwood:—

Brass	21,837 0 0
Carter & Son	1,832 0 0
Scribner & White	1,784 0 0
Temple & Forster	1,790 0 0

We are compelled to decline pointing out books and giving addresses. All statements of facts, lists of tenders &c., must be accompanied by the name and address of the sender, not necessarily for publication.

Notes.—The responsibility of signed articles, and papers read at public meetings, rests of course with the authors.

NOTICE TO SUBSCRIBERS.

Subscribers within the United Kingdom can be supplied with THE BUILDER direct from the Office at the rate of Nineteen Shillings per annum, PAYABLE IN ADVANCE.

The Publisher cannot be responsible for TESTIMONIALS left at the Office in reply to Advertisements, and strongly recommends that COPIES ONLY should be sent.

NOTICE.—All communications respecting Advertisements, Subscriptions, &c., should be addressed to "The Publisher of the Builder," No. 1, York-street, Covent Garden. All other Communications should be addressed to the "Editor," and NOT to the "Publisher."

Bath and other Building Stones of Best Quality.—RANDELL, SAUNDERS, & CO. Limited, Quarrymen and Stone Merchants. List of Prices at the Quarries and Depôts, also Cost of Transit to any part of the United Kingdom furnished on application to Bath Stone Office, Gresham, Wilts.—[ADVT.]

Ashton & Green, Slate, Iron, and Marble Merchants, and Quarry Agents, keep the largest and best selected Stocks of Bangor, Portmadoc, Green Roofing Slates, Slate Slabs, and every description of Slate Goods, Marble, and Enamelled Slate Chimney-pieces, Stoves, Ranges, Rainwater Goods, and General Castings. A. & G.'s special Red Ridge Tiles. Drawings and prices upon application. Offices and Show-rooms, 14 and 15, Bury-street, St. Mary-Axe, London, E.C. Agents for sale of Whitland Abbey Green Slates in town and country.—[ADVT.]

Bills of Quantities, Specifications, &c., Lithographed by ROBT. J. COOK & HAMMOND, 29, Charing-cross, S.W., with accuracy and punctuality. Plans and Drawings Copied, Traced, or Lithographed.—[ADVT.]

The Builder.

VOL. XXX.—No. 1560.

Sculpture, Criticism, and Record.*

E owe to German writers the best works on Greek art. The enthusiasm with which the German mind throws itself into special branches of pursuit is extraordinary. The advantage to be derived from the principle of subdivision of labour, or of specialisation of pursuit, is nowhere more distinctly manifest than in the monographs and detailed studies that we owe to the literature of Germany. Thus we may find men to whom all that possesses any genuine or overmastering interest, as a matter of contemplation, is contained in the brief period of a century and a half, or at the utmost two centuries, of which the era of Pericles forms the central portion; and while the literature of this time is familiar to them, even to the position of an accent, it is only as illustrative of one art,—of the great Attic school of sculpture,—that they care even for classical literature.

It is thus that we have attained an insight into much of the inner spirit of the art of Greece at which we might otherwise yet have been far from arriving. At the same time, we have to deal with a difficulty, and to suggest a caution—Greek can be translated into German with far greater ease, elegance, and precision than into English, but the result is still a translation. So the most elaborate view of Grecian art to which we can refer is yet a German view. It is not purely Greek. It may, we do not deny, take a loftier standpoint; but it is not the classic standpoint. German art-writers see things in ancient art which,—we do not say are not there in truth, but which,—were not intended or comprehended by Greek artists. Again, they do not see things which those artists did see,—or, rather, feel.

For here lies the secret of the difference. The Greek was a sensuous artist; the German is an intellectual critic. While the first had a vision or an inspiration of beauty, which he clothed, he hardly knew how, in a material raiment of marble or of bronze, the latter seeks to analyse the method by which the former instinctively wrought. Not only so, but he is only too liable to suggest some predominant influence as ruling over the studio, of which the sculptor had no notion whatever. Thus the latest German writer who has had his very beautiful essays on sculpture translated into the English language, imports his own political opinions into Greece, and sees them reflected from the marbles of the Parthenon. It was the spirit of freedom, he thinks, that produced the excellence of Greek sculpture. This is a thoroughly Northern idea. Those who are most familiar with the population

and the habits of Southern Europe best know its extreme divergence from fact. That the finest period of sculpture coincided with a time when Greek society was in a state of seething transition is no doubt true. But from the petty and mischievous disputes of the former, the artist held ever apart. Thriving most, in all periods, under the beneficent protection of some great prince, whether he were called Pericles or Alexander, Cosmo or Leo, art has for the most part shrunk and withered when politics have absorbed the public mind. In Greece we know that there were artists who lived in extreme poverty, while devoting their whole soul to some noble triumph of their art; just as there were philosophers, who descended to servile toil in order to gain that daily bread which would support a life mainly devoted to speculative thought. Thus Herr Lübke enters the temple of Greek art somewhat by climbing over the wall, instead of approaching by the proper avenue.

The history of sculpture, indeed, is a subject too vast and grand,—we will not say to be attempted, *inter alia*, by one man,—but certainly to be comprised, in any but a very imperfect manner, within the limits of two such volumes as these, which do much credit to the enterprise of Messrs. Smith, Elder, & Co.

Thus the introduction, and the account of Indian, Egyptian, and Assyrian sculpture, are all contained within fifty-seven pages. Not only is a space so limited entirely disproportioned to the geographical province reviewed, but it is so small as to preclude that species of technical investigation which ought properly to precede any philosophical attempt to appreciate Greek sculpture. The direct influence of the long-established traditions of Egyptian art is, we think, undervalued. The great Nilotic people had one strong characteristic in common with the younger Semitic tribes,—that is to say, horror of change. Permanence was an attribute of the divine nature. Innovation, therefore, was sinful, and a cause of misery. With the Aryan people, on the contrary, novelty has always been the chief charm. It is thus that we find the periods of highest excellence in Greek sculpture to have been so brief and ephemeral. The greatest pupil of the greatest master was not content to follow that master's footsteps. Even from Phidias to Polyctetus there is a wide step. But while acknowledging a mental constitution which caused art to spring up like a flower, to blossom into the utmost glory, rapidly to transform itself, to wither, and to decay; we must still bear in mind the long ages through which the elder people, from whom the sacred fire was really caught, toiled with unshrinking diligence. And even in the very severity of Egyptian sculpture are to be traced the phenomena of growth, of over-growth, and of decay, although they have occupied millenniums instead of decades. Herr Lübke does not recognise the great decline that took place under, and down to, the Ptolemies, or appreciate the wonderful grandeur with which the works of the great eighteenth dynasty illustrate the golden period of Egyptian art. The subject had better have been altogether omitted, than treated of in a chapter in which the author evidently thinks each word a mere waste of time, until he arrives at the shores of Greece.

We wish to exhaust our objections to a work at which it is impossible to look without admiration, or to peruse without sympathy and delight. The real motive of the book is Greek art. To this, however, only 272 pages, out of the whole work are devoted. The result is, that justice is hardly done to any part of the subject. This is more especially to be noted in the crowded sequences of individual names. A man need not be thoroughly familiar with the whole encyclopædia of artists at all to follow the writer in many places. The indication of a name may often be quite enough for a student; but for an ordinary reader, it is a mere hieroglyphic. When we add

to this, that references are almost entirely absent, except to one or two books which are themselves of an encyclopædic nature, it will be seen that a great deal has to be done before a history of sculpture, worthy of the title, is forthcoming.

In some places we are left in doubt whether it is the author or the translator who is altogether at sea. Thus we are told that "Glancus, of Chios, is said to have devised the art of soldering iron, about the beginning of the seventh century." As no such art is known to the metallurgy of the present day, we are left in some doubt as to what is meant. "The ancients," continues the author, "justly attached great importance to this advance in technical skill, which at once undoubtedly was applied to the working in bronze." It is evident that the translator here is not to be alone blamed. We concluded at first that the word "solder" had been used in technical unacquaintance with the subject, instead of the word "weld." But as this is inapplicable to bronze, it is difficult to read the riddle. Hammered work, cast work, and the peculiar qualities of iron and of the alloys of copper, are regulated by principles so different, that it is impossible for an author to write intelligently as to sculpture in metal without some elementary knowledge of the procedures of the forge and the foundry.

It is unsafe to allow a popular and easy translation of a work on a technical subject to leave the press without the proof-sheets having passed under the eye of a classical scholar,—we might, indeed, add, of a master of English composition. The passages are numerous in which we are left in doubt, as we have said, whether it is the author or the translator who is to blame. Some points seem to depend exclusively on the latter. Such are the irregular modes of spelling adopted. Some words, Greek, indeed, in their source, but familiar to English literature as introduced through a Latin medium, and as spelt in all English classics in the Latin form, are made to assume a quasi-Greek dress. Such are *Peirous* and *Peirichous*. At times we are introduced to an old acquaintance in such a form as to be almost utterly unrecognisable, as in the instance of *Gæo Curotrophus*. On the other hand, the Greek name of the Goddess of Victory is hardly to be recognised when we read of the Temple of *Nice*. Both this word and others, such, for instance, as the architectural term "*metope*," are used indifferently in the singular and the plural. Sometimes the meaning which the words convey must be the opposite to that which the writer had in view. Thus, when we read, "This more vigorous position corresponds letter with a champion goddess, as the people styled her, than the calm bearing of a *Promachus*," it seems that the writer is unaware of the fact that a *Promachus* is a champion. One of the most unpardonable of these blunders is to be found in p. 160 of vol. i., which speaks of "the parting of Orpheus from Eurydice after he has seduced her into the lower regions." It is with fear and trembling that we proceed in a work in which we stumble upon revelations like these.

Apart, however, from the account which the author has to regulate with the translator, we take definite issue with Dr. Lübke upon some important points of artistic criticism. We select those on which we are able to speak, not as a mere matter of difference of opinion, but as guided by those exact laws of Grecian sculpture which an English writer has recently wrought out into complete and demonstrated system. We may, indeed, take exception to such expressions as "Bronze, however, is less adapted to ideal figures." No evidence is offered in support of an assertion which such artists as Benvenuto Cellini would certainly have directly contradicted, and for which no reason is adduced. But we entirely disagree with the notice given of one of the most perfect and admirable bronze

* History of Sculpture, from the Earliest Ages to the Present Time. By Dr. Wilhelm Lübke. Smith, Elder, & Co. 1872.

figures in the world, the "Wearied Mercury" of the Museum of Naples. This figure is highly naturalistic in its treatment, while the closely-cropped curling hair, and the deformity, common now to the races of the Magna-Grecian blood, of large up-pricked ears, date it as post-Alexandrine. But the main character of the statue,—its absolute motive,—is the breathless, panting exhaustion, which is evident, not in the face alone, but in the pose of the entire figure, and in the perfectly consistent relaxation of the entire muscular fabric. The photograph of this beautiful figure, which is to be obtained at the Museo Borbonico, is a very inferior production. But the woodcut in the "History of Sculpture" fails to give the slightest idea of the subject. The expressions, "the head is slightly bent forward, with an intelligent expression of countenance," and "it presents a fresh picture of elastic youth, resigning itself to a moment's easy repose after preceding effort," show that the critic has altogether missed the motive of one of the most wonderful pieces of pathognomic expression within the range of antique art.

Again, under the head of the Attic School, and within the period "from the freedom of Athens to the death of Alexander," we find a criticism on the marble now in the Louvre, known by the inappropriate name of Apollo Saurictonis. It is merely the figure of a boy about to transfix a lizard running on a tree. If the name of any member of the Pantheon is to be ascribed to the slight youthful figure, it is that of Cupid, not of Apollo, of whom it presents neither lineament nor attribute. The confusion of the ordinary lizard of Southern Europe with the python connected with the oracular Sun-god, is not new; but it should not be repeated by any critical writer. But, what is of more importance is, that the actual proportions of the figure, when reduced to a tabular form, betray its late date, and are perceptibly faulty; the length from the forehead to the nipple of the breast being much in excess of that proper to the pure Greek scale. Nor is this a disproportion that is likely to have crept in by the slovenly copying of an originally symmetric figure.

In speaking of Praxiteles, the Correggio of sculpture, in connexion with a work that shows the influence of Lysippus on a declining art, the critic attributes to that sculptor the magnificent Cupid at the British Museum, to which we have, on a previous occasion, called attention, with reference to the faulty restoration of the left foot. From the spot where it was found, from the marble, and from the style of the work, there is every reason to attribute this exquisite relic to Phidias. The very low relief in which the belt, or rather ribbon, that suspended the quiver is indicated across the bust of the figure, is enough to show that it is not from the chisel of Praxiteles. Mention is made of, although scant justice is done to, the Cupid of Centocelle, now in the Vatican, which is one of the most beautiful relics of the purest Greek art in existence. There is a east of this Cupid at the Crystal Palace, and an even more perfect representation of it is furnished by the beautiful photograph of the Berlin Photographic Company. As clearly as any artistic fact can be proved, in the absence of a direct pedigree, this figure is a copy of the famous Cupid of Praxiteles, which that sculptor prized above all his other works. It is worthy of such an estimation. There exists in the Museum of Naples the broken figure of a Psyche, parts of which have been sawn off (no doubt after the fracture of the statue in consequence of being thrown from its pedestal by an earthquake), which is a fit companion for this Cupid. It speaks highly for the taste which has presided over the collection of sculpture at the Crystal Palace, that the casts of these two precious relics are thus brought together in the court.

It is evident, however, that a very popular, a very instructive, and a very charming book may be written on sculpture by an author who is not in the very foremost rank of criticism. And such is, no doubt, the case. The illustrations are not of the first merit, but they are passably good. Altogether the work is one calculated to become a great popular favourite, and to turn the attention of the reading public towards that noble art for the full development of which our climate is not the most favourable. We can hardly blame Herr Lübke for his unacquaintance with English sculpture (or with sculpture in England, which is not altogether the same matter), owing to the fact that no works exist on which he might have based his acquaintance with the subject. And yet to write a history of sculpture in which the name of

Flaxman is almost the only one which belongs to English art, is something like writing a history of Europe in which the existence of the United Provinces is ignored. Among "modern sculptors, from Bernini to Canova," it is strange to find no mention of the artist of whom Flaxman was the pupil and the godson; whose "Newton" was considered by Canova the finest work in the country,—a man whose brief career influenced his successors so powerfully as that of Roubillac. Again, Bacon has left a name not to be omitted; and Westmacott should not be passed over. In short, there is a chapter of art of no mean significance which is entirely ignored by the German critic. For this there can be no excuse. But it remains an opprobrium to the art-literature of this country that no competent work exists which catalogues, to say nothing of critically appreciating, our historic monumental sculpture. Not only in our two metropolitan *campi santi* of the abbey and of the cathedral, in the well-known precincts of the Temple, and in many a time-honoured site that is not ecclesiastical, exist some monuments of artistic merit, and others of great historic value; but throughout the country, scattered wide if not thick, are to be found portrait statues, the faithful delineation of which would illustrate at once the history of sculpture and the history of England. The bronze monuments of Westminster Abbey alone afford materials for a most instructive chapter. The mortuary chapel of the Dukes of Bedford, at Chenies, Bucks, contains beautiful effigies of the Tudor times, as well as relics of crusading date. In the church of Great Bedwyn, Wilts, is a statue of Sir John Seymour, the grandfather of Edward VI, which is remarkable, not only for its heraldic enrichment, but for depicting a phase in the series of modifications by which mail passed into plate-armour, which is of great interest and value. We might pass from county to county (even as we did a year or two back with reference to the stained glass of early date) and constantly light upon monuments of greater or less importance. It is extremely desirable that an index of all effigies now existing in the churches and cathedrals of England should be compiled. With every year that elapses, the task will become more difficult properly to execute. For with every year the work of church repair and restoration is extended. And in how many instances a cruel and ignorant neglect, or a still more cruel and ignorant attempt to smarten up and restore ancient monumental effigies, is dilapidating irrevocable records of the past. The index completed, the work of the illustrator should commence. This is one of the subjects which is admirably adapted for photographic representation. Photographs of marble sculpture are more truthful and more beautiful than those of any other objects. Even the distortion which occurs is, to a certain extent, within the reach of calculation to avoid, or, at least, to estimate. A work of this kind would be truly national. It is to be regretted that the attempt made by the Society of Antiquaries to commence such a task has not called forth a more worthy response. But the scope and range of that effort were not sufficiently wide. The work should be exhaustively undertaken. There are, of course, monuments of a high character, and others of very low merit. But we ought to have a list of all. It is never certain how much light may be thrown on any branch of study by a single fact, however simple, when once arranged in its proper place. A headless, cross-legged effigy, in an obscure village churchyard, may furnish to the historian or to the genealogist the very clue of which he is in search. It ill becomes a nation which calls itself civilised to be without one national and reliable account of either its public monuments or its historic effigies.

We shall do good service to those of our readers who feel an interest in Greek art if we take this opportunity of mentioning a subject which, though not directly applicable to sculpture, yet is illustrative of the art. One single specimen of what may be called easel-painting among the antique masters is known to exist. It is called the Muse of Cortona, and is preserved in that city. What we have to mention with reference to it is, that a very good engraving of it is to be found in the Italian periodical called *L'Arte in Italia*, for the year 1870, a work which publishes many beautiful illustrations. Physiognomically speaking, the pointed form of the upper lip is not correct for a Muse. But the face is one of rare beauty. The treatment is thoroughly sculptural, and our appreciation of the range of Greek art is enhanced by the study of the engraving.

SANITARY SCIENCE AND STATISTICS IN IRELAND.

If with the advance of sanitary opinion and knowledge corporate and public action kept pace, Ireland in general, and its capital in particular, might be congratulated on some progression. Within the last two years, and notably within the last twelve months, the sanitary question has been receiving more than the customary attention accorded to it in the sister kingdom. Throughout the provinces, in several places where local matters are attended to, or supposed to be attended to, by the town commissioners, there appears to be yet a lamentable amount of ignorance on the part of officials as to their precise duties, and an indifference as to whether this necessary knowledge is acquired or not. Between sanitary inspectors of Local Boards on the one hand, and relieving officers of Poor-law unions on the other, matters are either continually clashing, or remain in a state of neglect. When neither town commissioners nor Poor-law guardians will take the trouble of informing themselves of their duties, we need not wonder at the curious decisions given sometimes by the magistrates at petty sessions, the said magistrates curiously enough being often both guardians and town commissioners. Despite the existing middle, we are glad to bear evidence to the growing desire to manage things better in various quarters of the island. No country has suffered more terribly for the criminal neglect of its corporate and local bodies than has Ireland within the last five-and-twenty years. Epidemics have visited Ireland with as startling a constancy and accuracy as eclipses. They have been almost periodic every ten years during the present century, and the probability exists that Ireland will soon feel the effect of another visitation, which, though it may not be possible to entirely prevent, yet it might be robbed of its severity by timely precautions. In matters of this kind we would rather that events would prove us to be false prophets than otherwise, for we have no desire to witness a spectacle that all honest hearts must mourn, though they at the same time must censure the administration that rendered such spectacle almost inevitable.

In the month of May last some professional men and other citizens met together in Dublin to consider what steps should be taken to improve its deplorable sanitary condition. The corporation previously were repeatedly appealed to, on behalf of the citizens, to perform their obvious duties, but the corporation was too intent on promoting political or partizan objects, or projecting sinister Bills for Parliamentary powers, all tending to harden the city, benefit private individuals, and eventually to end in smoke. After some deliberation on the part of the individuals who convened the meeting to consider the sanitary state of Dublin, an association was formed, called "The Dublin Sanitary Association," with the following objects:—"First, to create an educated public opinion in regard to sanitary matters in general. Secondly, to direct attention to those points in which the existing powers for the maintenance of the sanitary condition of the city are either not duly exercised or are inadequate, or in which the machinery at the disposal of the sanitary authorities is insufficient. Thirdly, to watch the course of sanitary legislation on behalf of the public. Fourthly, to form a body in whom the public may have confidence, and through whom they may, if necessary, act." A prospectus, setting forth these objects, was issued, inviting at the same time the sympathy and assistance of the citizens. Now, all these objects were undeniably good, and pressing, and the endeavour to effect them was most commendable. The association was founded, appointed its own officers, and performed the voluntary work of sanitary inspection by the aid of its own officers or members, and has been the means of leading, since its formation up to the present, to some reform.

At a general meeting of the Dublin Sanitary Association, held recently, the working committee brought up their report, giving a detail of the labours of the Association since its formation in May. It appears that the committee from time to time furnished weekly reports of inspection of nuisances to the Public Health Committee of the Corporation. The Corporation were ready enough to avail themselves of the assistance of the Sanitary Association, but pleaded their usual excuse, inability to financially assist the Association in any way, although the volunteer body were actually carry-

ing on a course of sanitary inspection at their own cost and loss of time that the Corporation itself should have performed. The Public Health Committee admits there are in the city more than 1,000 houses unfit for habitation in their present state, also many houses deprived of the means of drainage owing to their defective construction. The Public Health Committee of the Corporation found to add that the Corporation maintain in five districts of the city five monstrous aggregations of filth, or manure and sewage deposits. These depôts of manure have been for a length of time chronic institutions with the local authorities, and are retained for the purpose of coining money. In keeping this filthy manure in the heart of the city for sale, the Corporation is at the same time killing the inhabitants. How can the Corporation of Dublin consistently proceed against individuals retaining filth or manure in their back yards, when they show such a bad example to the citizens?

From our own knowledge of the city, we can safely say that, instead of 1,000 houses unfit for habitation, the number might be safely tripled; and instead of extending neglect on the plea that the houses are badly constructed, which, no doubt, many of them are, the defect is more for lack of proper drainage in the city than in construction. If a proper system of town-drainage existed, house-drains could soon be provided, and their outfall procured.

Dr. Grimshaw, at the meeting of the Sanitary Association, holdly said that certain houses in the city were dens of fever. He traced, some time ago, himself, 1,825 cases to these haunts of fever, and found that a large number of them originated from a small number of houses, 125 houses having furnished 517 cases. These were all on the south side of the city. During the last fifteen years Dr. Grimshaw, who is a practicing Dublin physician, found that there had been admitted into two city hospitals 42,534 cases of fever, and this number was exclusive of the fever statistics of the *Mater Misericordie*, Stevens' Hospital, the Meath Hospital, St. Patrick Dun's Hospital, and the Baginbun-street Hospital. Fifteen hundred citizens of Dublin died of small-pox alone, which is one of the most easily preventible of diseases. There are few sensible men who will not agree with Dr. Grimshaw when he says, "The greater portion of the disease that we have amongst us is preventible, and has arisen from directly violating the laws of God."

Notwithstanding the terrible exposure which the report of the Dublin Sanitary Association, as well as the proceedings of their general meeting, have given of the management of the city, the corporation has nothing but excuses to make on the one hand, and promises by indicating the teach the science of health by inculcating the laws for the prevention of disease, instead of the laws of the cure, was at one time considered heresy, and is still adjudged such in more than one quarter of the British islands. *Preventive medicine before curative*. If it be a schism to preach this doctrine, it is a glorious schism to die in defence of. Let Ireland be inoculated with this schism, let it be the lymph of her sanitary vaccination, and her posterity will rejoice in their strength. Be it remembered at the same time that sanitary education, like scholastic, if it will not be accepted where it is necessary for the interest of the commonwealth, must be made compulsory, until it takes root in the habits of the people and the mind of the age.

TECHNICAL EDUCATION AT THE CRYSTAL PALACE.

MUCH has been spoken and written of late years concerning the contrast presented between the United Kingdom and different countries of Western Europe, little Switzerland inclusive, regarding the means provided for technical instruction, but comparatively little has been done as yet in the way of remedying the defect. True, there are the Royal School of Mines in Jermyn-street, the Royal School of Naval Architecture at South Kensington, the Department of applied Sciences at King's College, a Department of Civil and Mechanical Engineering at University College, London, and engineering classes in the Universities of Edinburgh, Glasgow, and Dublin, at Queen's College, Cork, and Queen's College, Manchester; but none of these "chairs" or provisions have the rank or capabilities of the Continental *Écoles Polytechniques*, and are only fit, if they can do as much, to qualify students to enter such Institutions. The lectures and text-

books of the English schools may be unexceptionable, but to practical as well as theoretical technical instruction and training they make no pretension.

It is gratifying to know that a really practical school of mechanical engineering, available for London and the districts near it, is about to be opened under the auspices of the Crystal Palace Company at Sydenham. Last week a number of gentlemen were invited to the Palace to inspect the drawing-offices, pattern and fitting shops, smith's shop, foundry, &c., that have been fitted for the use of the students. These shops are on three floors at the base of the south tower, with the exception of the smith's shop and foundry, which are to the north of the tower, and on the ground immediately adjoining. The tower is practically circular, and 48 ft. in diameter. The smith's shop and foundry has a furnace suitable for such comparatively small castings as will be undertaken; for smithy purposes it is furnished with two smiths' fires and two anvils. The basement of the tower will be used for stores, and the first-floor for engine-fitting, principal's office, timekeeper's box, and so on. The machine tools, which have been specially designed and ordered for the shop, include shaping, planing, slotting, drilling, and other machines, with three lathes, and a beam engine to supply the necessary power. The second floor is of the same dimensions of course, but divided across the centre, one half being for pattern-making, turning, and wood-working generally; the other half being a drawing-office. The third floor is also divided across the centre, and one half devoted to the lecture-theatre; the other half being intended for a mess-room, for such of the students as may wish to use it. It need scarcely be said that benches with vices for metal work, and benches for sawing, planing, and working wood, are supplied in the respective shops, which, being glass all round, have abundance of light, and are in other respects well adapted for the uses to which they are to be applied.

It is intended to divide the year into three terms of fifteen weeks each, and that the students should devote one term of the course to the study and practice of mechanical drawing, one to pattern-making and foundry work, and the third to fitting and smith's work. In the drawing-office the students will be employed in making drawings of machinery and constructions from sketches; in tracing and getting out quantities and estimates; and in calculating the strength of materials. In the pattern-shops they will be engaged in preparing patterns or models of engines or machinery. In the fitting-shop they will fit and erect engines of from 3 to 6-horse power, or in other work suitable for the market. In the smith's shop and foundry they will forge and mould and make small castings. Examination by eminent engineers will be held at the end of each term, and certificates will be granted to such students as have attained the requisite degree of proficiency. In case of students not having obtained the three certificates at the end of the course, they may remain as students on payment of a proportionate premium for each, or any, of the departments in which they may have failed. Lectures on engineering subjects will be delivered twice a week; the students are expected to take notes of these lectures, and will be required to work out examples from them between the date of one lecture and the next; they will also be examined upon the subjects of the lectures at the close of each term. Lists showing the students' order of merit will be exhibited. The hours of work will be from 10 a.m. to 1 p.m., and from 2 p.m. to 5 p.m., except on Saturdays, when the school will be closed at 1 p.m. A sufficiently rigid degree of discipline will be maintained. On entering students will be required to see that their names are inscribed in the attendance register. Those who enter late will be required to pass through the principal's room, and to explain the cause of their irregularity. Application must be made to the principal for leave of absence, or for permission to write a letter during school-hours, or to do anything out of the regular course of institution work. Inattention and misconduct, if they should be chargeable, will expose the student to work after hours, and to restriction for such time as may be determined. A warning-bell gives fifteen minutes' margin to clean and put away instruments and tools, cover up drawings, and clean and arrange machines and benches ready for inspection, which takes place before the bell rings for closing.

Mr. J. W. Wilson, associate of the Institute of

Civil Engineers, is principal of the school, and will have under him a competent superintendent for the several departments. In Mr. Wilson the students will have the advantage of a teacher who can not only tell them in perspicuous language how and why a thing can and should be done, but one who can also show them how to do it. Mr. F. K. J. Shenton, superintendent of the School of Art; and Mr. Grove, the accomplished joint manager and secretary of the Crystal Palace, have devoted their best energies to this new enterprise, which is, in this country at least, as yet, *stui generis*, and which ought to prove a great success.

WATER-BEARING STRATA.

The late Mr. Samuel Hughes wrote a treatise on waterworks for "Weale's Series" of rudimentary books, of which there is now a new edition.* A work which shall fully describe the whole practice of supplying towns with water must be of greater magnitude than this one; but in so far as the water-bearing strata are treated of, and the machinery for and cost of pumping water from them go, this is a tolerably complete little work. The nature of springs is fully elucidated, which requires a constant reference to the science of geology; but in the short notice we can give of Mr. Hughes's book, we must pass over this part of it and proceed to consider the water-bearing strata in order downwards from the surface,—downwards, that is to say, in geological order of precession. Water is everywhere found in the drift gravel and superficial sands, in quantities sufficient for individual wants, but not for the supply of towns. In the open and comparatively uninhabited country, the water from shallow wells is often of sufficiently good quality for domestic use, but it never is so in or near a town, even if the quantity obtainable were sufficient. It is to strata at considerable depth that attention must be turned for a supply of water. These are often overlaid with impermeable ground, and have their outcrop at considerable distance from and height above any probable place where a well would be required for the supply of a town. In such a case the clay or other impermeable ground being penetrated, the water rises in the well or borehole, sometimes to or above the surface, and more often to within some short distance of it. The name of Artesian is given to such a well, from the success with which the great well at Grenelle, in the French province of Artois, was sunk, where the water rose many feet above the surface.

The first water-bearing strata arrived at after passing through the London clay are the tertiary sands, which overlie the chalk. These have their outcrop at considerable height along the edge of the basin, and in some cases yield large quantities of water. For instance, in the valley of the Wandle there are about fifteen or twenty artesian wells, which yield a daily supply of from 800,000 to 1,200,000 gallons from the tertiary sands; and in the valley of the Lea, from twenty to thirty such wells yield from 120,000 to 200,000 gallons per day. There are few instances of a single well yielding more than 100,000 gallons per day from these sands.

The chalk, which underlies these tertiary beds, yields large quantities of water. On passing through the chalk, a bed of marl is arrived at, which, in general, holds up the chalk-water, and prevents it penetrating the "upper green sand" which lies immediately below it. The upper green sand yields a few springs in the district west of a line from Farnham to Petersfield, but in general it does not yield much water. Selborne is situated on the upper green sand, west of Woolmer Forest. The wells at Selborne are said to average about 63 ft. in depth. "When sunk to this depth, they seldom fail, but produce a fine limpid water, soft to the taste, and much commended by those who drink the pure element, but does not lather well with soap" (quoting from White's History of Selborne).

The gault clay, which lies immediately under the green sand, overlies the "lower green sand," a famous water-bearing stratum. The common mode of procuring water for towns situated on the gault, is by sinking through it into the lower green sand. When a boring is thus made the water generally rises nearly to the surface, and sometimes overflows it. Wells and borings through the gault are common at Cambridge,

* Waterworks for the Supply of Cities and Towns. By Samuel Hughes, F.G.S., Civil Engineer. Lockwood & Co. 1872.

Higgleswade, Shefford, and all the line of flat clay country through Leighton Buzzard into Wiltshire.

A considerable number of towns are situated either on the lower green sand, or in such contiguity to it that this formation may not improbably, says the author, be resorted to for a supply of water, either now or at some future time, amongst which he mentions St. Neots, Potton, Higgleswade, Bedford, Shefford, Buckingham, Fenny Stratford, Leighton Buzzard, Aylesbury, Thame, Oxford, and Abingdon. Similarly situated are the towns of Wellington, Chard, Fomton, Arminster, Sidmouth, Colyton, Axmouth, and Charnmouth. Mr. Prestwick has been led by experiments to suppose that each cubic foot of the lower green sand is capable of absorbing two gallons of water.

Below this water-bearing stratum lies the Wealden clay, and below that the jurassic or oolitic series of alternately porous and impermeable beds, which circumstance gives rise to innumerable springs all over the oolitic country.

Passing through the oolite, and the lias which underlies it, we arrive at the Trias, or new red sandstone formation, the upper part of which consists of clayey beds; but in the lower or more arenaceous part large quantities of water are found, as at Liverpool, Birkenhead, St. Helen's, Birmingham, and Coventry.

Below the new red sandstone lies the Permian series, or the magnesian limestone, into which wells are sunk at Sunderland.

Below this formation we come to the old and tilted rocks, from which but little water is derived; but from their elevated surfaces large quantities of water are caught in reservoirs, and supplied to towns by gravitation. The millstone grit and the mountain limestone, as well as the still older slate rocks of the Silurian and Cambrian formations, shed water for the use of neighbouring towns. The millstone grit itself has scarcely any towns situate upon it, but is very important, especially in Lancashire and Yorkshire, as furnishing the drainage area which supplies water to several of the principal towns in the kingdom by gravitation. Lancaster, Preston, Liverpool, Manchester, Stockport, Bradford, Leeds, and many other towns, are all supplied from the united springs and surface water of the great millstone grit formation.

Mr. Hughes proceeds to well describe the means of pumping water out of these water-bearing strata and the cost of it, and here ends the originality of the book; but he quotes the recognised authorities on the gauging of rivers and streams and the flow of water through pipes. As there is nothing new in these, however, we had better refer the reader to the original writers whom the author quotes.—Coulomb, Prony, Du Buat, Bossut, Comptet, Dr. Matthew Young (and Dr. Thomas Young), Girard, Wollmann, Panck, and Brunning; Eytelwein and Weisbach; Dr. Hutton, Mr. Beardmore, Mr. Blackwell, Mr. Neville, and M.M. Poncelot and Leshros; also M. D'Aubuisson and M. Genieys. These are authorities on the flow and conveyance of water. Mr. Hughes is rather an authority on where it is to be found, and how to raise it to the surface, for the use of towns.

PADDINGTON BATHS AND WASH-HOUSES COMPETITION.

WHEN the parish of Paddington rightly determined to have a proper establishment of baths and wash-houses, the Commissioners who were appointed took pains to obtain information on the subject from other localities, and came to the conclusion to invite not less than six, nor more than ten, architects to submit plans, and to offer premiums of 100*l.*, 75*l.*, and 50*l.*, for the best, second-best, and third-best designs. The instructions to architects included stipulations,—

"That the Commissioners shall be the judges, and shall decide as to the respective merits of the plans sent in, and shall determine as to whom the prizes (premiums) heretofore mentioned shall be awarded; and their decision shall be final, and without appeal therefrom.

"That the successful competitor shall, if required, carry out the works for a payment of 600*l.*, exclusive of the amount awarded as prize-money, but he is not to be entitled to any prize or payment whatever, unless a substantial contractor will undertake the work at a price not more than 10*l.* per cent. above his estimate of the cost, which estimate must be sent with the plans.

The payment of the sum of 600*l.* shall include all travelling expenses and attendances, and the supply of all plans, working drawings, sections, &c. that may be required. All plans of the successful competitor are to be the property of the Commissioners."

"Every part of the building is to be of the plainest design, consistent with the same being thoroughly substantial and suitable for the purpose required.

The architect is to provide for all gas, water, and drainage; for all necessary steam-engines, boilers, and machinery, wringing and drying apparatus, tanks, mains, and fittings, and the delivery over of the building in a complete state, with all engines, boilers, machinery, apparatus, tanks, mains, and fittings in good working order. The Commissioners will appoint and pay a clerk of the works until the completion of the building, who will act under the Commissioners and the architect.

The Commissioners (if they decide on taking out the quantities) are to approve of the surveyor selected to take out the same, and the scale of payment. The party employed is being responsible to the contractor for the accuracy of his quantities.

Accommodation to be provided for—a Board-room, superintendent's office, two day-rooms for superintendent, four bedrooms, a kitchen and a scullery, and a residence for engineer, next to or over the wash-houses.

Three Swimming-baths.—One first-class men's, 90 ft. by 40 ft.; depth, 5 ft. 6 in. to 3 ft. 6 in. One second-class men's, 70 ft. by 30 ft.; depth, 5 ft. to 3 ft. 6 in. One third-class men's, 70 ft. by 30 ft.; depth, 5 ft. to 3 ft. 6 in. Reserve space for a women's bath, 45 ft. by 24 ft.

Single Baths.—23 men's first-class, 64 men's second-class, 10 women's first-class, 12 women's second-class, waiting-rooms for each class of baths.

Hot-water.—Provide 70 compartments for washers, with two troughs in each, supplied with steam. Sufficient drying apparatus. Sufficient wringing apparatus. Sufficient mangling apparatus."

No amount was named, so that competitors worked somewhat in the dark. But the amount of remuneration offered to the architect who carried out the design, 700*l.*, seems to point to about 14,000*l.*, as so respectably a parish as Paddington would scarcely propose less than the ordinary rate of payment to its architect, especially when that architect had run the risk of getting nothing at all for a considerable expenditure of skill, time, and money.

A certain number of architects were then invited, and the following is a list of those who competed, in the order of the estimates accompanying the designs:—

Mr. H. H. Collins, "Non quis sed quid,"	230,000
Mr. C. Eales, "O,"	30,000
Mr. Saunders, "Little Dulci,"	24,000
Mr. Wilkinson, "Ippissima Conditiones,"	23,238
Mr. Edw. Roberts, "Utility and Economy,"	22,354
Mr. Gundry, "Nator,"	20,000
Mr. Lewis II. Isaacs, "Courthope,"	20,000
Mr. Bridgman, "Cleanliness, Convenience, Comfort,"	19,500

Of these, two put themselves out of court by inattention to the instructions.—Mr. Eales (who is well acquainted with the subject, and submitted a plan well deserving consideration), by adopting a smaller scale than that stipulated; and Mr. Gundry, by not sending his drawings until the morning after the date named for receiving them, and the estimate and particulars later still. The Commissioners, therefore, had only six to deal with, and from these they selected, in double quick time, the design by Mr. Isaacs for the first premium, as we mentioned in our last number; that of Mr. Collins for the second; and Mr. Bridgman's for the third.

An entirely different view of the problem to be solved has been taken by the architects to whom the first and second premiums respectively have been awarded, one having sought to straighten the accommodation as much as possible, compatibly with the instructions (in some cases, probably, it may be found, scarcely meeting them), and the other making it his endeavour to produce a complete establishment, with something like a monumental character. Some expressions in a report made by a sub-committee of the Commissioners might perhaps be taken to justify this latter view.

Modern Italian is the style used by all the competitors except Mr. Edward Roberts, who has adopted and modified the Gothic style, producing therewith a very satisfactory result; the back-front, though simple and inexpensive, is especially agreeable. We must commend, too, his plan, which seems well calculated for economical working,—a matter of considerable consequence, in the long run.

Without wishing to cast the slightest slur upon the Commissioners, who seem to have desired to act in a fair and proper manner, we must express regret that they did not call in professional assistance, and give a longer time than was spent in the consideration of the designs, before coming to a decision. Even now such assistance would be useful.

Considering the time and thought which the competitors have bestowed upon the work, we venture further to submit that the Commissioners would set a good example if they were to advise the payment of a fee to each of the unsuccessful, in part payment of the expenses incurred.

Sir,—I have had a glance at these plans, but not sufficient to enable me to do more than express astonishment that the Commissioners should have ventured (I had almost written dared) to determine in a few hours what any professional man, however skilled, would have taken at least as many days to have decided upon. As the first premium was awarded to a design of which the estimate

is 20,000*l.*, and the second to one of 30,000*l.*, it cannot be assumed that the price had anything to do with the decision; but the result of the matter will be watched with interest, because the "instructions" are most explicit as to the execution of the works for the sum estimated plus 10 per cent. What will the Commissioners do if the tenders for No. 1 should exceed the stipulated amount, or if it should be found that the building when erected is not complete? Will the miserable 3 per cent. commission (which is all that is offered as to No. 1, or 2 per cent. on No. 2) be withheld, or will the architect of No. 1 be called upon to pay the expense of the "quantities" if the tenders be unreasonably above his estimate? But I presume that the premiated designs have been paid for, and there the matter ends for a time. The Commissioners should take counsel of some surveyors, who should examine the whole of the designs, and when they have given a rough report of the probabilities of expenditure, then the Commissioners should call in an experienced, unbiased architect (which they should have done at first) to guide them, inexperienced as they are, in the selection of a design such as they desired,—plain, cheap, and useful.

A PARISHIONER.

THE SCHOOL BOARD NEW BUILDINGS AND THE VESTRIES.

AT the meeting of the London School Board last week, the Statistical Committee presented a long and elaborate report in answer to the charges brought against them by several of the metropolitan vestries, to the effect that they are extravagantly and unnecessarily spending large sums of money in the erection of new schools, and also in the proposed new offices on the Thames Embankment.

The committee endeavour to show that there is no foundation for such charges, and that so far as regards the expenditure in the erection of new schools, it is obligatory upon them under the provisions of the Education Act. They state that the Board has satisfied itself, from a house-to-house inquiry, that provision is needed for 104,000 children over and above that afforded by existing schools, and that the schools in course of being built and to be erected will not provide for the education of more than that number. As regards the Board's new offices about to be built on the Thames Embankment, the committee remark that it is only owing to the courtesy of the corporation that the Board have been able to hold their public meetings during the last two years in the Guildhall, and that they cannot expect to have the accommodation much longer extended to them; and they add that the two houses in New Bridge-street which they rent from the corporation up to Christmas of next year, are at the present moment entirely inadequate for the business of the Board.

With reference to the site, which has been objected to as unnecessarily expensive from its situation, the committee contend that as the School Board represents the whole of the metropolis the offices must necessarily be in some central spot, easily accessible by rail, not only to members of the Board, but also to all those who have business to transact; and that the site which the Board has selected is less costly than several others in a central position which had been examined. The committee further state that instead of the cost of the building amounting to 80,000*l.*, as has been asserted by some of the vestries, they have reasons to believe that it will not cost one-fourth of that sum. The committee also state in their report that the new arrangement made by the Board in July last in the architect's department in reference to the planning of the new schools, will have the effect, during the next two years, of saving upwards of 20,000*l.* The report of the committee was affirmed by the Board.

ON THE ART OF PAINTING.

MONSIEUR CAPEL (popularised by "Lothair") has recently delivered a lecture on the "Art of Painting." In the course of his observations he said:—Long discussions had taken place as to whether painting held the first place in the Fine Arts; but, be that as it might, one thing they must be convinced of—that painting represents more truly than spoken language all that is associated with what he might call universal language. Since the division of tongues, we were obliged to learn the languages of different peoples in order to communicate with them; but it was otherwise with painting. The Turk, the Creek, the Italian, the Spaniard, the German, the Frenchman, the Englishman, all looked upon a picture, and to all it spoke the same language. Not only did painting differ from language in its universality, but it delineated with much more precision everything that was to be said upon canvas than it could be said by language. There was no written or spoken de-

scription, however minute, that could possibly be so graphic as that produced by the pencil of the painter. While it was a precise language it was a detailed one. The whole art of painting, and the study of painting, as such, must necessarily be associated with our outward sense of sight, and with our inward feelings, using the word in its broad sense. Painting had distinct elements which would constitute the interest in examining pictures. They had commonly heard persons in a picture gallery, stopping before some subject or portrait familiar to themselves, exclaim "How wonderfully like this is." That was what painters was external to himself. But that mere imitation of what was to be found in the outer world did not constitute that which was embodied in the idea of fine art. Yet they must not entirely reject the mere imitation itself, but while examining what was mere imitation they must cultivate a facility of comparison of the thing represented with the representation before them. It was difficult for those who lived under western skies and European civilisation, and who were familiar with a wet climate, to realise what was meant by the burning sky, the clear atmosphere, and the strange costume of those who lived in the East. Their duty as to that, therefore, was not only to observe, but to extend their own personal knowledge by reading and inquiring about the countries and peoples of whom they knew nothing. Under the general head of Imitation must be included landscape painting. All art began with imitation, but when man began to study nature, and the mind developed itself, there came what might be called the second element in art. It was no longer the mere reproduction of the object the painter saw, for he thought he could always see in his object a defect, and thought there was some object of beauty beyond that. There was in his mind, under such circumstances, not man as he saw him, but man with his imperfections removed. So in like manner with landscape. They would remark that the productions of the ideal had two elements in it—the object upon which the mind rested, and also the mind of the painter; and these two combined produced a third element which took its character from them. This was so striking that in all master of ideal pictures the early associations of the painters' lives would invariably rest.

LEPERS' WINDOWS.

TEMPLE CHURCH, BRISTOL.

MR. NICHOLLS, of the Bristol City Library, writes, with reference to works now going on at Temple Church, in that city;—There is a small niche or window under the large east window of the chancel. Another and larger one exists, also walled up, under the east window of the weavers' chapel. It has been matter of great conjecture what purpose these windows could have served. They were not for use; the larger windows gave already, if anything, too much light. They were not for ornament, that is tolerably certain, for they must have been a perpetual eyesore to any educated eye that chanced to see them, which, perhaps, was but rarely, as they were at the end of the church that was seldom visited outside, and, being behind the altar, they would scarcely be seen at all by the worshippers within. A few days since I met with a statement that a certain church had a grated "lepers' window" at the east end, and I immediately thought of these inscrutable windows in the Temple Church of Bristol. I have visited, and, through the kindness of the vicar, closely examined them, and am satisfied that both these windows were constructed for the purpose of giving to persons outside in the churchyard a view of the altar and the elevation of the Host,—in short, that these were "lepers' windows," giving to those miserable an opportunity of joining in the worship in this obscure corner of the churchyard, which they were by law forbidden to do in the great congregation. Of all the churches in Bristol that of the Holy Cross would have been the one selected for such a means of grace to a class so terribly afflicted, for there can be little doubt that the Crusaders brought the loathsome disease from the East into this country. There were several hospitals for lepers in Bristol and its suburbs; one of these we know for a certainty was on the west side of Redcliff-hill, just two furlongs through the gardens from Temple Church. The sill of each of these windows is about 5 ft. from

the ancient level of the outer ground: hence a person standing outside would look up and with ease see the action of the priest, and have a good view at the back of the altar. Each window had a grating, but there is this singularity in connexion with the larger one in the weavers' chapel, that it had, it seems to me, an inner as well as an outer grating. But whatever the inner bars might have been, whether window or grating, the horizontal bars were about an inch higher than those on the outside, so that they did not interfere with the line of sight from a person in the churchyard who wished to observe the ceremony at the altar. Had they been level these bars would have been a great obstruction to the view. The window in the weavers' chapel is larger than that in the chancel, and its filling in may be plainly seen from the inside. The fair inference is that during the interim between the building of the church and the erection of the weavers' chapel, the increase in number of the afflicted demanded more room. The fact, too, that the chancel overlapped the chapel, thus giving a retired, solitary corner, where curious eyes could not annoy the sufferers, or they themselves be a nuisance to others, may have had somewhat to do with an increased attendance, and created the necessity for the later window to be the larger of the two.

THE LATE MR. R. P. BROWNE.

We have to record the decease of Mr. Robert Palmer Browne, architect, which took place suddenly at his residence, Royal-place, Royal-hill, Greenwich, on Tuesday last, the 17th instant. The immediate cause of death was disease of the heart. Mr. Browne, who was, we believe, in his seventieth year, was originally intended for the Bar, and did not receive any regular training for the profession he afterwards adopted. He enjoyed for many years an extensive practice, and was remarkable for the scrupulous care he bestowed upon his architectural works. He erected several private residences, and had only just completed, at the time of his death, an extensive mansion,—"Redleaf," near Farningham,—for Mr. Hills. He built the wharf belonging to the General Steam Navigation Company at London Bridge, Greenwich Workhouse, and other buildings. He was for many years district surveyor for Greenwich, but resigned that appointment a short time since. He was also surveyor to Huggons's Almshouses, Northfleet. He was a man of varied accomplishments, including music, and will be greatly regretted by all who enjoyed his acquaintance. Mr. Browne was unmarried.

BRICKWORK AND MASONRY IN IRELAND.

The president of the Institute of Architects of Ireland said, at the close of his address, of which we printed the earlier portion recently:—We, the architects of Dublin, occupy a most unfortunate position. When we proceed to have our designs carried out (presuming that both architect and employer have got beyond the compo stage), this difficulty at once arises, and has to be got over as best it can,—we have neither bricks nor bricklayers, we have neither good stone nor good stonecutters. This is, perhaps, a startling statement, and one which at first sight does not command ready assent; but a little steady and unprejudiced reflection will, I think, show you that it is only too true. As regards the bricks, there can be no second opinion. If we want good facing bricks, we import them; but the art of laying them is lost. If you will look out a really good specimen of brickwork in the city, you will find that it is 100 years old. The fact is, our bricklayers have become demoralised by the bestial and pernicious system of wiggling down the fronts of our brick buildings, and naturally so. It is his and his employer's interest to expend as few bricks as possible in facing a given surface, and to make his mortar-joints as wide as possible; and when the whole face is raddled over, and the joints are filled in with brick-coloured mortar, and nice neat white lines are drawn upon them, who is to be the wiser? And to this vile and utterly abominable practice we do architects have been consenting parties. I do hope that, having had your attention called to it, you will consign wiggling to the same limbo as stucco and all other such pretensions and tamable devices, and use your best endeavours to get external brickwork so done as to bear inspection, without any after patching and

cobbling. As regards stone and stone-cutting, my thoughts were principally directed to our granite. Of its utter failure in durability our buildings give painful proof. It is a most worthless stone; and, in giving this opinion, I include the Wicklow stone, which is so generally used by us. There is granite of fine quality at Dalkey and Kingstown, but it is used only locally. I only know one building in this city where Dalkey granite is used, and there the difference between it and the Wicklow stone, which is used in the same building, is most striking. The stone commonly used is not merely bad in itself, but, from its peculiar friability, it has led inevitably to slop-work; arrises are anything but sharp, mouldings are merely approximated to, and the whole surface is left mealy and stunted. Compare the material and workmanship of the granite wall of the Thames Embankment with the enclosure wall of Trinity College, and it will be evident to any one that there is reason for saying that, as far as granite is concerned, we have neither stone nor stonecutters. At our opening meeting last year Mr. Harte, county surveyor for Donegal, exhibited to us some specimens of red granite from Donegal. I understand that the quarries there of red and grey granite are about to be worked on an extensive scale by a limited liability company; and as the cost of water-carriage from Donegal would not exceed, and probably would not equal, the cost of land-carriage from Wicklow, it is worth our consideration whether it would not pay, not to mention other advantages, to use it in preference to the granite we are now using.

THE NORTHERN ARCHITECTURAL ASSOCIATION.

The ordinary quarterly meeting of the members of the Northern Architectural Association was held at the Old Castle on the 19th inst. Mr. T. C. Ebdy in the chair. Mr. M. Thompson was re-elected president, Mr. Ebdy vice-president, Mr. J. Hogg treasurer, Mr. Thos. Oliver hon. sec., Mr. G. W. Hodge hon. solicitor, Messrs. F. Charlton, J. Johnston, F. R. Wilson, W. Henman, W. J. Shotton, E. Thornhill, Geo. Connel, T. Reay, and Sept. Oswald the committee.

Mr. Oliver, the secretary, read a paper on "The Newcastle Town Moor Schemes." He referred to the various schemes which have been before the town for improving the moor, and spoke in terms of praise of Mr. Hancock's first scheme. He (Mr. Oliver) maintained that it was better to build in a sanitary way upon open spaces, than to have such spaces for generations unsewered and undrained in the neighbourhood of a large town.

RECKLESSNESS OF WORKING MEN IN REGARD TO ACCIDENTS.

If the coroners' black lists of deaths of workmen occasioned chiefly by their own carelessness and indifference to life and limb were published in the newspapers it would be a startling record; but it is only occasionally that London editors can find space for a report of a fatal accident. The workman, however, know it, as when a man killed leaves a family, a subscription goes round amongst his mates to help the widow and to bury her husband.

London house-painters are, perhaps, as a class the greatest sufferers from building accidents, and this too frequently arises from little masters not providing safe scaffolding or sound ladders.

Still, builders, architects, clerks of the works, and foremen may lavish capital, care, and skill on insuring, as far as human power can do so, the safety of the workmen, and all will be of no avail when the men themselves break rules and set danger at defiance. The pipe and the glass have much to answer for in cases of accident, and in none more so than in mining disasters. A coroner's recent investigation in the north of England, by which no fewer than thirty-four lives were in question, disclosed the reckless indifference of men in pits. The "Morley Mine" was, from its immunities from serious disasters, looked upon as a safe pit, and both masters and pitmen seemed to consider they dared do anything. The blow came at last, and need it be wondered at? The evidence showed that gas was allowed to accumulate; all preventives were set at naught; gunpowder was constantly used for blasting; naked lights were burnt; and the miners smoked, struck matches,

and forged keys to unlock their safety-lamps. In the pockets of those who were killed at Morley Main Colliery, there were found tobacco, lucifers, and vesuvians. When such conduct as this is carried on, neither laws nor rules are of avail against accidents.

THE BUILDINGS AND WORKS IN THE METROPOLITAN BOARD'S AREA.

IMPORTANT STATISTICS.

At the meeting of the Metropolitan Board of Works last week, Mr. Dresser Rogers, chairman of the finance committee, in bringing up the estimates required for the ensuing year, made some interesting statistical statements in reference to the property under the control of the Board, and the works which had been effected by it. He stated that the Board represented a population of 3,266,987 persons, and that there were at the present time 419,642 houses in the metropolis under their charge. There were 416,511 householders within their district, and the present area over which they had administration was 75,490 acres. The area of taxation over which their precepts took effect, was 117 square miles; the rateable value of the property 20,367,281. and a penny rate over the whole of the metropolis at the present time amounted to 81,8687. 11s. 10d. The total length of sewers in the main drainage system completed was 82 miles; the total length of local sewers constructed by vestries and district Boards since 1856, and sanctioned by that Board, was about 700 miles. He further stated that the Board had now determined to take charge of the embankments, which would cost about 3,0007. a year, and that various other open spaces had also been brought within the Board's care during the present year. They had also paid during the past year for the land fringing Victoria Park, which had been thrown into the park at a cost of 20,5507., but that as the Government had taken upon themselves the care of the land, the Board was relieved from any further charge in the matter. He added that the Board had incurred liabilities during the past session of Parliament for the carrying out of improvements, which would entail a gross capital expenditure of 2,500,0007., or a net expenditure of 2,000,0007.

THE NEW BRIDGE AT PETERBOROUGH

On Friday, the 13th instant, the new bridge from the designs of Mr. John Fowler, C.E., obtained for the town by the joint subscriptions of the counties of Huntingdon, Northampton, and the Liberty of Peterborough, was formally opened. The structure is Gothic in character. It consists mainly of three arches, two of 35 ft. and one of 70 ft. span, supported on four cast-iron columns, each of 3 ft. diameter, and terminating in abutments of cement concrete, faced with asblar.

Projecting from the girders are cast-iron cantilevers, carrying the footway and parapet. The bridge is 30 ft. wide and 150 ft. long, and from the Huntingdon side of the river Nene is approached by a bank and retaining walls, some 210 ft. in length, from the designs of the county surveyors.

The cylinders were sunk by excavation and the use of caulkedge, and an old road, upwards of 3 ft. thick, was met with in their descent to the rock foundations; also some good examples of coin of the time of Charles II. were found, and some date stones, which point to the tenth and seventeenth centuries, as the probable date of the origin and restoration of the old bridge, now removed.

The works have taken some nine months to complete, but have been much retarded and disturbed by the excessive floods during the late summer and autumn. They were carried out under the inspection of the surveyors, Messrs. Law & Hutchinson, by Messrs. Handyside & Co., Derby, and under the immediate supervision of Mr. Woulf Brennan, the resident engineer. Mr. Thackeray, of Huntingdon, was the contractor for the masonry and brickwork.

Purchase of the Dublin Gas Works by the Corporation.—The works, plant, and business of the Alliance Gas Company have passed into the hands of the Dublin Corporation, which body, from the 1st of July next, will be gas-makers for the city.

ANCIENT STONES NEAR STORNOWAY.

The stone circles at Calhornish are comparatively little known. A writer in the *Standard*, who has recently visited them, says:—"At Calhornish the Druidical enclosures are two in number, the first and more important, a group of forty-three venerable pillars ranged in a cruciform manner, with a circle at the point of intersection. In the very centre of this circle stands an altar-stone, beneath which is a tank of heath granite that one can scarcely help supposing was once a receptacle for the blood of the victims slain. So far as I could calculate, the long limb of the cross extends north and south 600 ft., the transverse line 200 ft. Half a mile away to the west, on an eminence nearer by some four hundred yards to the waters of the loch, is another group of these same inscrutable obelisks, disposed, I think, into two concentric circles, but much less distinct in their arrangement, and much more deeply imbedded in moss. Within a space of several miles round these immemorial remains are cairns and monumental stones innumerable. Were the circles themselves places of the old Pagan Celtic worship, and the outlying districts the burial-ground of priests and warriors? Curiously enough *cleichen* is the Gaelic for stones,—such stones as those of Calhornish, Stornis, in the Orkney Islands, and Stonehenge; still more curiously to go to the *cleichen* is the Gaelic vernacular for going to church. The stones of Calhornish were in all probability erected where they now stand long ere the moss deposit had commenced, and this, according to the calculation of competent scientific authorities, who can see in the different layers of the velvet parasite the signs of centuries past and fled, must have been at least two thousand years ago."

QUERY AND ANSWER.

SHALL we have pills or paving stones?

Shall we have drugs or drains?

Shall we have air or stifling moons,

And poison'd hearts, and aching bones,

Or homes without these pains?

Is prevention better than cure?

Illness better than health?

Shall we battle, or still endure,

And fain believe our lives secure,

While plague creeps on by stealth?

While doctors differ, let us agree,

To build well, drain, and pave;

Thus we'll stamp out impurity,

And make the poor man's dwelling be,

His home and not his grave?

When we give light and air to man,

Water ample and pure;

Homes fit to live in; then we can

Prove in spite of the world's lan,

PREVENTION IS BETTER THAN CURE.

ROOF COVERINGS.

STB.—I see from your columns that the restoration of Worcester Cathedral has called up the much-debated question of the comparative advantages of slates and lead as the roofing material for large churches. So far as appearance goes, I think there can be no doubt as to the superiority of the latter. The defenders of slates support them on the more tangible grounds of cheapness, convenience, the absence of danger from the "careless plumber," and the like. And there can be as little doubt as to the reason of this marked difference in appearance. It is the broken and jointed appearance of slates that mars them, more especially the unavoidable horizontal divisions. Lead has much fewer joints, and those are all vertical. Will, then, the architects and other professionals pardon a more amateur student of architecture, who knows very little about construction, and generally prefers to judge works of art by their appearance, if he ventures to make a suggestion on this important point? Could not the roofs of large buildings be covered with a kind of cement, which would be without the chief objection to lead roofs,—the "careless plumber,"—and the second objection,—their enormous cost; which would be cheaper at the outset, and would require less frequent repairs, than either lead or slate; which would be lighter, and what is of great consequence, a worse conductor of heat, than either; which could be repaired with the

greatest expedition, and by the simplest means, when it became defective in any point; which would be free from the pettiness of the jointed slate roof, and might be left in one unbroken expanse, or, if it were thought desirable, might receive some vertical divisions, like those which add lightness to the effect of a lead covering; and which might, at the architect's discretion, be made of such a colour as would best harmonize with the tint of the stonework of the building, as slaty blue certainly does not always do. Details of construction and the like I will not venture to speak about, my architectural studies being purely artistical; but, supposing it to be a constructional possibility, I am convinced that, with an appropriate cresting, such a roof would have an effect far better than one of slate, and, at least, as good as a leaden one. To the architects, then, I leave to decide what my suggestion may be worth.

IN STATU PUPILLARI.

BRITISH GOODS SENT ABROAD.

A SUBSCRIBER in Rio de Janeiro (Mr. T. E. Parker), who says he obtained from England a certain wool-working machine, in consequence of a notice of it in our pages, writes to us very strongly to complain of its incompleteness and the want of proper instructions accompanying it. If this paragraph should meet the eye of the manufacturer he will doubtless inquire into the matter. Our correspondent says, at the conclusion of his letter, and there is much truth in the observation,— "If my workshop had been in London instead of Rio de Janeiro, I know perfectly well that I should have had no cause to trouble the *Builder* with any complaint of this sort. And this, a most important matter, should be remembered by all who have an interest in British manufactures. If you will not care or interest yourselves in goods sent to a foreign country, you may depend upon it there will soon be others who will."

LOCAL BOARD'S LIBERALITY.

A CORRESPONDENT writes:—"The 'Standish-with-Laughtree Local Board' have offered by advertisement 207. a year for a 'professional engineer and surveyor to the Board.' I hope you will draw public attention to it, showing the absurdity of such an appointment with such a salary, when I tell you that the population of the district is close upon 4,000; the area, 3,264 acres; the rateable value, 19,5007. yearly; and the length of roads repairable by the Board between ten and eleven miles. The poor engineer and surveyor is to be paid at the rate of 7s. 8½d. per week! What next?"

LADIES' SANITARY ASSOCIATION, MANCHESTER.

THE annual meeting of the Ladies' Sanitary Association was held on the 18th inst., in the Mayor's Parlour, at the Town-hall. The Bishop of Manchester occupied the chair; and amongst the other gentlemen present were Mr. Hugh Birley, M.P., Dr. Crompton, Mr. Alderman Davies, and Dr. Syson.

The Secretary (the Rev. C. Keeling) read the annual report, of which the following is an abstract:—"With increased income, and additional ladies willing to give personal superintendence, the Association had been able to extend their operations and to carry out some of the plans sketched in former reports. Beginning the year with four mission women, the committee felt they were justified in increasing the number to nine directly after the annual meeting. These ladies had been at work throughout the year, and the committee were thankful to be able to say that they had never had any reason to think of retrenchment lest the necessary funds should fail. All of these nine women had been, with two exceptions, permanently located. This was better than the old plan of changing them from district to district, for the work now became permanent, and the good could be followed up. Ladies had also by this means been encouraged to take up a poor town district permanently. The work had been carried on through the whole year in the following districts: St. Michael's, Angel Meadow; St. Oswald's, Collyhurst; St. Matthew's, Campfield; St. Luke's, Chorlton-on-Medlock; St. Silas's, Ardwick; St. George's, Oldham-road; two districts in Salford, suggested

and marked out by the medical officer of health, for nine months in the year in St. Peter's, Oldham-road, for three months in St. John's, and St. Ann's, Deansgate, and Jeakinson-street district, Oxford-road. In all these cases the mission woman had been superintended, and more or less accompanied, by a lady. Domestic teaching of almost every kind was being carried into the homes of the people as heretofore. The disinfecting powder and the medical soap were the keys by which doors and hearts were opened. There were so many irritating and degrading discomforts against which these simple remedies secured them, that the poor were most grateful for the agents' visits, and showed every willingness to profit by their teaching. Large quantities of disinfectants had been distributed, and it had been noticed that the districts in which this had been most done had been unusually free from fevers and similar disorders. Special attention was given by the committee to the districts visited by the Medlock foods. The balance-sheet of the society showed an excess of income over expenditure of 100*l.*, of which, however, 75*l.* was the balance from the previous year. The total donations and subscriptions included in the income amounted to 371*l.* 12*s.* 5*d.*

Mr. Hugh Birley moved the adoption of the report.

Dr. Crompton seconded the motion, which was carried.

Mr. Alderman Davies next moved,—"That this meeting recognises thankfully the extension during the past year of the home sanitary work, and appeals to the ladies of Manchester and Salford for increased support." This was agreed to.

SANITARY MATTERS.

St. George's, Hanover-square.—Dr. Corfield, the new medical officer of health, reports to the local works committee that he has instructed his inspector of nuisances to order the waste-pipes of drinking-water cisterns to be disconnected from the traps and soil-pipes of water-closets, and to be diverted so as to discharge into the open air, either over the surface of the roof or yard, or into a rain-water pipe not connected with a sewer.

Bucks.—A conference of the sanitary authorities of the county of Bucks has been held at the Police court, Aylesbury, to discuss the advisability of combining in the appointment of a medical officer of health under section 10 of the Public Health Act. Delegates were present from Amersham, Buckingham, Newport Pagnell, Winslow, High Wycombe, and Slough, rural; and Aylesbury and Buckingham, urban. Sir Harry Verney, M.P., presided in the absence of the Duke of Buckingham. Mr. J. Henley, Poor-law inspector, said he had called the meeting in pursuance of a requisition received from the Aylesbury Local Board. There were in this county seven urban and seven rural authorities, and fifty-one districts, with each a medical officer. He strongly urged that in order to secure independence, efficiency, and economy, two or more sanitary authorities should combine in the appointment of a medical officer. Oxford and other counties had taken advantage of this part of the section of the Act, and several other counties were about to do so. The Rev. G. Phillimore opposed Mr. Henley's scheme. He thought the object of the Act would be best secured by the appointment of the district medical officers. The combination of districts as suggested by Mr. Henley was negated by nine to eight.

Gloucestershire.—A conference of representatives of the urban and rural sanitary authorities in the county has been held at Gloucester, to discuss the appointment of medical officers under the Public Health Act. Mr. Longe, Poor-law inspector, suggested that the county should be divided into three areas, and a medical officer appointed for each district. The first district comprised the unions of Gloucester, Wheatlanurst, Dursley, Westbury-on-Severn, Newport, Chipping Norton, and Tewkesbury, with a population of 119,000. The second district, Cheltenham, Stroud, Cirencester, Northleach, and Tetbury, with 130,000 inhabitants; and the third district, Clifton, Thornbury, and Chipping Sodbury, with 163,000 inhabitants. Stow-on-the-Wold and Winchcombe unions he proposed to connect with either Shipston-on-Avon unions. He suggested that a medical officer should be paid a salary of 800*l.* per year,

and said he had estimated this would involve a cost of from a farthing to a halfpenny in the pound. Ultimately the following resolution was carried by a small majority:—"That the opinion of one medical officer to superintend the sanitary arrangements of the whole county; and that this opinion be communicated to each union for their consideration."

SCHOOL BOARDS.

London.—The Works Committee received the following tenders for the erection of a school to provide accommodation for 954 children, on the site in Cottonham-road [not the York-road site, of course], Finsbury:—Newman & Mann, 7,249*l.*; B. E. Nightingale, 7,189*l.*; Williams & Son, 7,160*l.*; Wicks, Bangs, & Co., 6,980*l.*; L. H. & R. Roberts, 6,911*l.*; Adamson & Son, 6,911*l.*; D. King & Son, 6,892*l.*; J. High, 6,790*l.*; Patman & Fotheringham, 6,710*l.*; Niblett & Son, 6,630*l.*; Scrivener & White, 6,471*l.* The committee recommended the acceptance of the lowest tender, that of Messrs. Scrivener & White, amounting to 6,471*l.*

North Walsham.—The choice of a plan for the new buildings came before the Board. Mr. Pilson, of Norwich, architect, was present to advise as to the relative merits of the different designs presented. After going through the whole, the difficulty was to decide between the plans numbered six and twelve, which, when the notes explaining the mottoes were opened, proved to be those of Mr. Bottle, of Yarmouth, and Mr. Gaymer, of North Walsham. It should be understood that Mr. Scott, though a member of the Board, acts as honorary clerk, and in this capacity was able to gather from the correspondence he had carried on with the competitors, and from the personal calls which had been made upon him, who the gentlemen were that had sent in plans, and with this knowledge he gave the Board to understand that he should not vote upon the question, and accordingly did not do so. The choice has fallen upon the plan sent in by Mr. Bottle, of Yarmouth.

THE ANCIENT DEFENCES OF SOUTHAMPTON.

At the head of the inlet known as Southampton Water, between its two principal tributaries of the Test or Anton and the Itchen, intervenes a considerable neck or tongue of gravel, which is thus bounded on three sides by water, and is a position of considerable natural strength, and the more valuable that it overlooks a fine roadstead, having the Isle of Wight for its breakwater. By whom this spot was first occupied is unknown. Bittern, an unquestionable Roman station, under the name of Clausentum, is nearly two miles farther up the Itchen, and upon the opposite bank. Even the origin of the present name of the town is a subject of dispute. The "Anton" presents a tempting source, but it seems most probable that the name means simply "the town of the southern dwelling," as opposed to Northam, a place close to the Roman station. Certainly the name has no reference to Northampton.

"Hamfunsire" is mentioned in the Saxon Chronicle in A.D. 755, and the town was a Saxon place of some mark, coining money in the reign of Athelstan, and occasionally plundered by the Danes. Canute held it, and his experiment upon the advancing tide is said to have been tried in Southampton Water.

Southampton is named in Domesday, and the Normans found it a convenient port both for military and commercial purposes. It was visited and maintained by the Plantagenet monarchs, who here mustered and embarked their troops for Normandy. Hence the town was fortified from an early period, both after the Saxon and the Norman fashion.

The walls enclosed a roughly rectangular space, averaging about 370 yards east and west by 770 yards north and south, but in actual circuit about 2,200 yards, or 1½ mile. This area is divided lengthways by the main street, but the western is the larger moiety, partly because it contains the older castle, and partly because of an irregular projection upon what is called the "tin shore." The north and south gates were upon the main street. There was an east and a west gate, but not at all opposite to each other, nor were the roads cruciform. There is no reason for attributing to he moderately rectangular plan a Roman origin.

It was probably dictated by the general figure of the ground.

The surface of the area varies from 15 ft. to 35 ft. above the adjacent sea level. The northern half is higher than the southern, the western than the eastern. The highest ground, therefore, is in the north-west quarter, where was the castle.

In consequence of this, the wall of this quarter, towards the west, is built against a scarped bank, and is a revetment 30 ft. high, whereas elsewhere the wall is built upon ground nearly level, or at best not above 3 ft. or 4 ft. higher on the inner than the outer side. Beyond the castle there is no considerable earthwork, and no reason therefore for attributing the defences of the town proper to a period earlier than the incoming of the Normans.

The earthworks of the castle are, on the contrary, considerable. The naturally high ground was scarped and pared and somewhat raised, and near the centre of the area the highest point was surrounded by a circular ditch, the contents of which, thrown inward, converted the raised platform into an artificial mound. This, beyond doubt, was the Saxon fortress.

The later rectangular area was also well defended. It had the sea for its ditch nearly at the foot of the wall along the west and south fronts. Along the east a broad and deep ditch, wholly artificial, and in part, at least, admitting the sea, ran along the foot of the wall, and divided the town from a strip of lower land, which slopes towards the Itchen, and is now covered by an important suburb. Along the north front a ditch, also artificial, was cut across the ridge; it is said, too, a ditch allowing it to be filled from the sea. As this would involve a depth of about 40 ft., with a corresponding breadth, the tradition is probably an exaggeration.

The north and east walls, least affected by any irregularities of ground, and nearly straight, are in length about 318 and 790 yards. The south and west fronts are curved and broken to suit the ground, and measure about 320 and 650 yards. The south-west angle is largely rounded off. Of recorded gates, there were the north or Bargate, still standing; the east gate, removed; the spur gate, remaining; the south, or water gate, removed; the west gate and the postern, preserved; Biddies, or Brillo's gate, gone; and the castle water-gate, closed up.

The mural towers were chiefly drum, or half-round. The north front is flanked by two drum towers, and west of the Bar is one, and east of it two, half-round. Upon the east wall, north of the east gate, was one; and, south of it, six, of which one remains, half-round, and one rectangular. At the south-east angle, the south wall was prolonged eastwards as a spur tower, covering the ditch; this remains. Upon the south wall there were six towers, including the south flank of the spur gatehouse, and, on the opposite flank, the Bugle tower. All but one are half-round. The west wall had many buttresses, and few towers. There was one where the south wall of the castle joined the town wall; and near the north end is a fine half-round tower,—an addition.

Passing to the details, the north gate, called the "Bar," is a large handsome structure, about 60 ft. broad by 60 ft. deep in the centre. It is of two stages, pierced below by a central and two lateral passages, and contains above a chamber, 52 ft. long by 21 ft. broad, used for public purposes. In each wing is a staircase. That to the east is old, that on the west may have been so. The side passages are modern. They communicate with the central roadway by two cross arches on each side, of which the two next the north are original, and probably led into the flanking towers. An examination of the central passage shows the original gate to have been Late Norman; at least a round-headed portal there placed is probably in that style, though it has rather a Decorated aspect. Then in the Early Decorated time two bold half-round flanking towers were added, and still remain. At this time the rear was probably re-facced, and four windows and a centre niche inserted, and the council-chamber enlarged, and probably the east staircase added. The Norman gatehouse had an upper room, of which a round-headed door, with a foliated head, remains. Next, in the Perpendicular period, a bold projection, three sides of an octagon, was added to the front. The gateway thus advanced is flanked by two bold narrow buttresses, which run up to a very bold corbel table, having six machicolations in the central face, and three in each of the oblique lateral ones. The battlements are good Perpendicular, and carried round the rear towards the town; one embrasure is occupied by an alarm-bell

This gate has been much injured by restorations. The openings to the rear, archways and windows, have been re-faced; but they preserve much of their old type, and have a Decorated aspect. The main passago has been cut away and widened, and the portcullis grooves are gone. When the ditch in front was filled up, a century ago, all trace of the drawbridge was lost.

West of the Bar much of the wall remains, but is so blocked in by houses as to be invisible. Forty-six yards from the gate is the site of a half-round tower, beyond which the wall extends in a straight line to Arundel tower, so called from Sir John Arundel, an early governor. This is a drum, 22 ft. in diameter, which caps the north-east angle of the town. This tower is 50 ft. to 60 ft. high, and seems to rise out of a rectangular mass of masonry, possibly added to strengthen it. Here the internal level is 30 ft. or more above the external, being a part, no doubt, of the old earthworks.

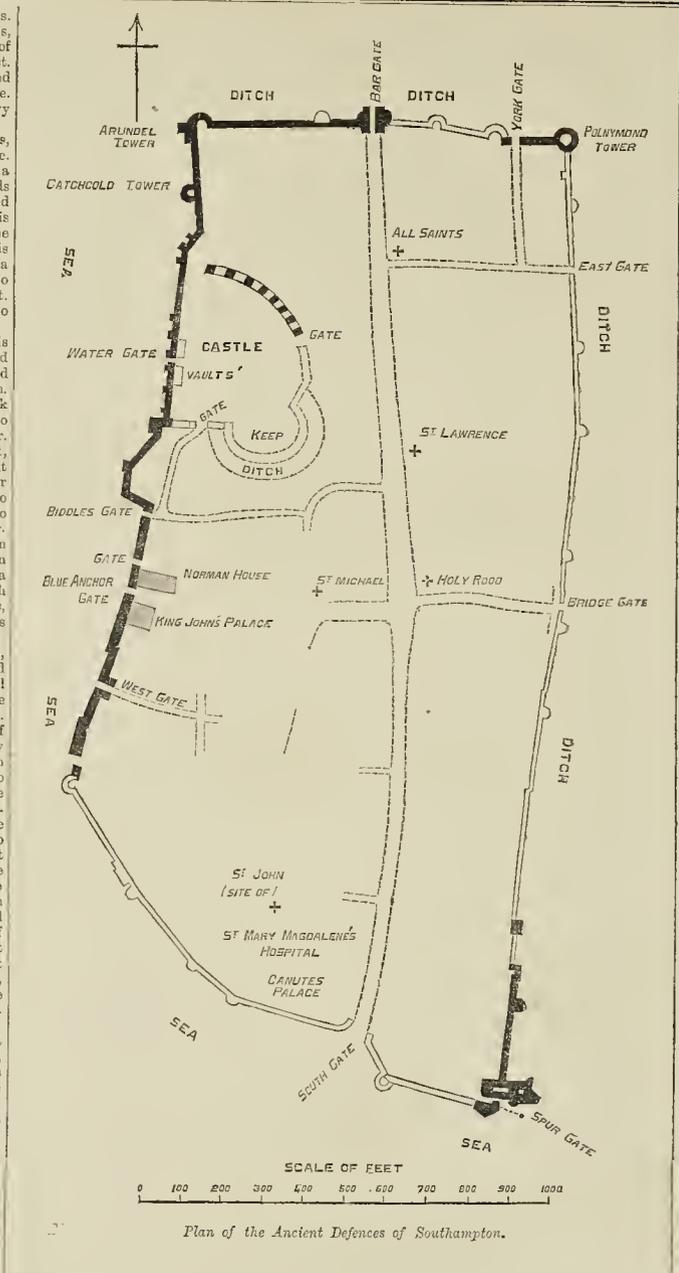

Continuing along the west wall, at 763 yards is a bold half-round tower, 20 ft. diameter, and 30 ft. high, of excellent rough ashlar, with bold machicolations at the level of the adjacent curtain. This is Catchcold Tower. Built against the bank it looks solid, or like a bastion, but it is said to be hollow, though how entered does not appear. This tower, with the adjacent wall for some feet, is apparently a Perpendicular addition to what seems to be a Decorated wall. Beyond the tower is a flight of steps, modern, ascending 30 ft. to the summit of the wall, which is there common to both town and castle. The wall then runs forward obliquely, probably to allow of the inclusion of the earthworks of the castle. It seems in substance Norman. The salient is capped by a rectangular buttress, the hollow angles of which on each side are crossed by low pointed arches, pierced as garderobes, as at Porchester. This buttress tower is of Decorated date.

Then follows about 13½ yards of straight wall, probably Norman, about 38 ft. high, and backed to the summit with earth. Upon it a small rectangular buttress marks the junction of the north wall of the castle with the town-wall. Further on are five rectangular buttresses of various dimensions. The three first are evidently additions upon the Norman wall, the rest seem original. Part of the wall here is divided into two stages by a bold horizontal bead. Below are two narrow windows of about 18 in. opening, resembling large loops, and which seem to have had square heads. Above are traces of two windows, apparently round-topped. There must have been an interior chamber, now closed. The central buttress is broad and flat, and here are traces of the old water-gate of the castle, which must have been reached by steps, the ground behind being above 30 ft. high. Close north of this water-gate is a large vaulted chamber, built against the town-wall, and now closed. This part of the wall ends in a rectangular projection, probably the root of a tower, and marked the junction of the castle south wall with the town-wall.

From hence the wall is low and thin for about 33 yards, marking the end of the castle ditch, and on the rising ground of its counterscarp is the root of another square tower, marking the recommencement of the regular town-wall, which then turns inwards so as to protect Biddles Gate.

This gate, now removed, opened into a steep and rather narrow ascent called Simmel-street, out of which, on the north side, opens Castle-lane, thought to represent an old entrance to the castle.

At Biddles Gate commences a very curious part of the wall, which, as far south as a little beyond Blue Anchor postern, is unlike anything known in England. The original wall, here about 30 ft. high and 4 ft. thick, with the soil nearly level within and without, seems to have served not only for the town-wall, but for the wall of several dwelling-houses within it, the doors and windows of which are visible in the wall, though now closed up. These openings show the wall to have been Norman, and of a moderately early period. This wall was not found sufficiently strong for the purpose of defence, and a second wall, also 4 ft. thick, was built against it on the outside. But this second wall was built like an aqueduct, as an arcade, upon tall and slender piers, about 2 ft. 2 in. broad, from which, at 10 ft. 6 in. high, spring arches mostly semicircular, but some pointed, and two very flat and probably much later, above which was the parapet. The arches are about 12 ft. span. The result was to increase the rampart to a walk of 5 ft., with a

parapet of 2 ft., and probably a rear wall of 1 ft. Of course, an arcade so placed afforded great shelter for those attacking the wall from without; but to obviate this, while the piers touched the wall, a space like that for a portcullis, a chase about 2 ft. broad, was left between the arch and the wall, by means of which any one standing at the base of the wall could effectually be molested with missiles or a long pike. Eighteen arches of this arcade remain. The arrangement is a very curious one, and supposed to be singular. This masque or outer wall may be of late Norman date, but is possibly Early English. The piers interfere much with the earlier doors and windows. The wall where double is 35 ft. high. There are traces of some kind of building outside a part of the wall.

A hole broken through the wall into Blue Anchor-yard, shows the rear of the wall, and a little further south is Blue Anchor postern, an original archway in the wall, much cut about and enlarged, but of which the portcullis chase worked from the battlements, still remains.

From the postern a very steep winding narrow lane leads up into the town, between lines of ancient houses, of which two, one on each side, next the gate, are Norman. Both are curious, but that on the south side especially so. It is the shell of a Norman house, of the age of the older part of the wall. It is called locally King John's Palace, but is in truth an ordinary Norman private house, and a very curious one. The principal room was on the first floor. The roof is gone, but the door and windows remain.

These are coupled, small, round-headed, and divided by a short column, with a slightly sculptured capital. The space within the walls is 45 ft. by 45 ft. There is a good Norman fireplace, with hood and flanking columns. In the south and part of the east wall is a mural gallery. The house on the northern side of the lane is 44 ft. by 15 ft. There is a good view of the town wall, and a plan of the two houses, in Parker's "Domestic Architecture of the Twelfth Century" (p. 34).

South of the postern the wall ceases to be double, and is all of one date, and about 6 ft. thick. In this part is a fatisht rectangular mural buttress tower, much blocked in with houses, but having its south hollow angle crossed by a garderobe. Near this is a high pointed doorway, evidently an insertion, of 2½ ft. opening, leading into Collis-court, and about 60 ft. further is the west gatehouse.

This is a perfect and plain rectangular gatehouse, 30 ft. deep by 24 ft. broad, without buttresses, flush with the wall outside, and of bold projection within. It is pierced by a high pointed vault, of 12 ft. opening. The passage has been a good deal mutilated with a view to widening it. Near the centre was a good recessed doorway, the profile of the head of which is still traceable where it has been roughly cut from the wall. Between this and the inner face are two square porticulis grooves, and just within the inner entrance is a chase, 18 in. broad, over the head of the arch. In the vault, in front of the central door-case, are nine holes, about 4 in. square, three in the crown line, and three along each haunch. These latter converge towards the central line.

The gatehouse has a porticulis chamber on the first floor, and a second floor above this. An open stair against the south side leads to the battlement, from which a door, an insertion, opens into the porticulis chamber. These upper rooms are plastered and papered, and nothing can be seen in them.

South of this gate the wall gradually sinks, and finally has been pulled down and removed. It may be traced as far as the site of a half-round tower, and some remains of an arch. Beyond this, also, the line of the wall may be traced as far as the site of Bugle tower, 180 yards from the west gate, and which caps the south-west angle of the town.

The south wall is almost wholly destroyed, and the foundation either removed or covered up by the broad and handsome quay which now increases between the base of the wall and the sea. This front was more or less convex, or rather polygonal, the angles being capped with drum towers. There are some traces of the south gatehouse. In the rear of this part of the wall are the site of St. Mary Magdalene's Hospital, and in Porter-lane what was called Canute's Palace. A representation of the south gate before 1784 is preserved by Grose. It had a low, broad Edwardian arch, with bold machicolations above, and toward the east it was protected by a long flanking wall, parallel to its approach. It was removed 1830-40.

Forty yards from the south gate was another half-round tower, and thence the wall ran straight east for 83 yards, when it reached the south-east angle of the town. In the rear of this part of the wall, in Winkle-street, is "God's House," a Norman church, now restored very badly, and converted into a French Protestant place of worship.

At the south-east angle of the town, in the end of the east wall, is a gate, called God's House Gate, or South Gate, but which should be called Spur Gate, as it opens upon a work of that class. This gate-house is rectangular, quite plain, and without buttresses, having two upper floors. Its dimensions are 28 ft. broad by 23 ft. deep, and the south end projects as a low salient of two faces, upon the south wall, now removed. The passage is vaulted with a high pointed arch 12 ft. broad. Like the west gate, it had a central recessed doorway, now much cut away, and two porticulis grooves. The vault in front of the door is supported by two, and in rear of it by three, cross-ribs. Altogether in substance this gatehouse resembles that of the west gate, and is of Early Decorated date. Its front may have been rebuilt when the spur tower was added.

The spur work projects from the northern flank of the gate of the gatehouse for about 80 ft. It is composed of a sort of lofty gallery, or curtain, terminating in a rectangular tower, about 22 ft. square, with buttresses capping the two east or outer angles diagonally. It is of three stories,

and is built across the eastern ditch, no doubt to contain and protect its sluice communicating with the sea, which originally flowed up to the wall of the tower. There are seen large arches in the north and east faces, which look as though there had been a passage for boats; but these seem really to have been arches of construction only, intended to throw the weight of the building upon the corners, which probably are more deeply founded than the curtain. In the north face is also a large modern arch, a relic of the canal which was to have been carried beneath the tower. The spur-work and the gatehouse were long used as a Bridewell. All still bear marks of that degrading occupation. The whole spur-work is good Perpendicular. Leland calls this the south gate, and the spur tower the Castellot. Grose gives a view of it about 1770. From the Spur-gate the town wall is tolerably perfect as far as the first half-round tower, 60 yards. From hence the wall may be traced 35 yards to a flat buttress, 14 ft. broad and 3 ft. deep, of which there are some remains. Beyond this, at 37 yards, is the site of a rectangular tower, 30 ft. broad and 24 ft. deep. These two are said to be additions of the time of Edward VI. They look much older.

From hence to the north-east angle of the tower the wall has been pulled down, but its line may be traced, partly by occasional foundations, partly by its materials which have been used in the houses built on its site, and partly by the direction of the lane called "Back of the Wall," which runs along its rear, and by the parallel road which runs along the counterscarp of the ditch, and is called "Canal-walk," from an abortive canal which was carried along the line of the ditch at the commencement of the present century.

The east gate spanned East-street, and was taken down in 1772. Grose gives a drawing of it, and attributes its erection to the year 1330, 13 Ed. III. Between this gate and the north-east angle is one mural half-round tower.

Of Polymound Tower, which caps the north-east angle, there are considerable remains. It is a three-quarter drum tower, about 28 ft. in diameter. From it to the bar, 160 yards, the wall, or part of it, remains, but so clustered with buildings as to be inaccessible to ordinary visitors. Here are remains of two half-round towers, and a breach in the wall, called York Gate, probably representing a postern.

The east ditch is marked by a depression, in part due to the canal. The north ditch is completely obliterated and built over, and its breadth is not recorded, and has not been ascertained by probing. If Hanover-buildings mark its counterscarp, it was 46 yards broad; but if, as is much more probable, its limit is marked by Cold Harbour, it was only 24 yards, which tallies with that along the east front.

THE CASTLE.

The castle was very probably the oldest, and perhaps the only pre-Norman fortification connected with the town. It occupied nearly the whole of the north-western quarter of the walled area, and included also the highest ground. In plan it was a rough semicircle, the chord of 124 yards being the town wall, and the arc measuring about 300 yards. There is, however, also a considerable knoll, on the south-east of the area, of about 45 yards diameter, about half of which lay outside the curved *enceinte*.

This was the keep. Leland calls it the dungeon (*donjon*), and the "glory of the castle." "It is," says he, "both large, fair, and very strong," both by works and by the site of it; and other writers describe it as a lofty mound. As usual, in forming such works, advantage was taken of high ground to make it the base of an artificial mound encircled by a deep and broad ditch. The keep, no doubt a shell of masonry like Arundel, towered above the rest of the works. Of the curved wall of the *enceinte* a part remains to the north. It was built on piers about 8 ft. square and 9 ft. apart, a round-headed arch with a tendency to a point connecting these. The tops of these arches were about 12 ft. above the base of the piers, and upon them rested a wall, which carried the battlement. The arches were buried in a bank of earth about 15 ft. high. This bank has been removed to allow bonnets to be built up to the wall, which now, therefore, stands like a Roman aqueduct. The foundation is excellent, so that this plan was adopted solely to save material and to profit by the older work. The roughness of the masonry shows the height of the haul,

above which the remaining wall rises about 4 ft. It is much to be regretted that this curious piece of Norman wall has been so badly treated. About 90 yards of it remain, including eighteen arches. It stops at the Castle-lane, where was the main gate of the castle, removed at the end of the last century.

The wall, beyond the gate, was continued up the mound to the keep, and beyond it till it reached the southern gate, whence it was continued till it again struck the town-wall. Thus the keep was upon and formed part of the *enceinte*, as was usual. From the south gate, also removed in the last century, a winding road, commenced from the wall, led down to Simnell-street, a few yards within the postern.

Besides these two gates, the castle had a small water-gate in the wall towards the shore, reached probably by a flight of steps or a subterranean passage, as the outlet was so far below the platform of the castle. To the north of this gate is a large subterranean vault, now closed; and, judging from the openings in the wall, there was a corresponding vault to the south. Probably these were connected with the gate.

The whole area of the castle is high, and much of it has been still higher, the mound having been lowered, the ditch partially filled up, and the bank along which the wall was built having been removed.

To judge from the material evidence afforded by an inspection of the works, it would appear that the castle represents the Saxon or Danish earthwork, probably the earliest strong place, and was composed of a truncated mound, its circular ditch, and a bank of earth encircling an area, of which the mound or a moiety of it made part.

The Normans, probably in the reign of Henry I, enclosed the castle and town in a rectangular wall, and dug the east and north ditches. Also the castle was enclosed with a wall built in part on arches, and a shell keep placed on the flat summit of the mound. The wall of the castle, and much of the west wall of the town, and the two houses in Blue Anchor-lane, may be attributed to this period.

Then it became necessary to strengthen the town wall, and this was probably done in the reign of King John, who, it appears, remitted to the citizens 2000. out of their *fac-farm* rents for the enclosure of their town and the thickening of the wall, and perhaps the west and spur gates were begun at that time.

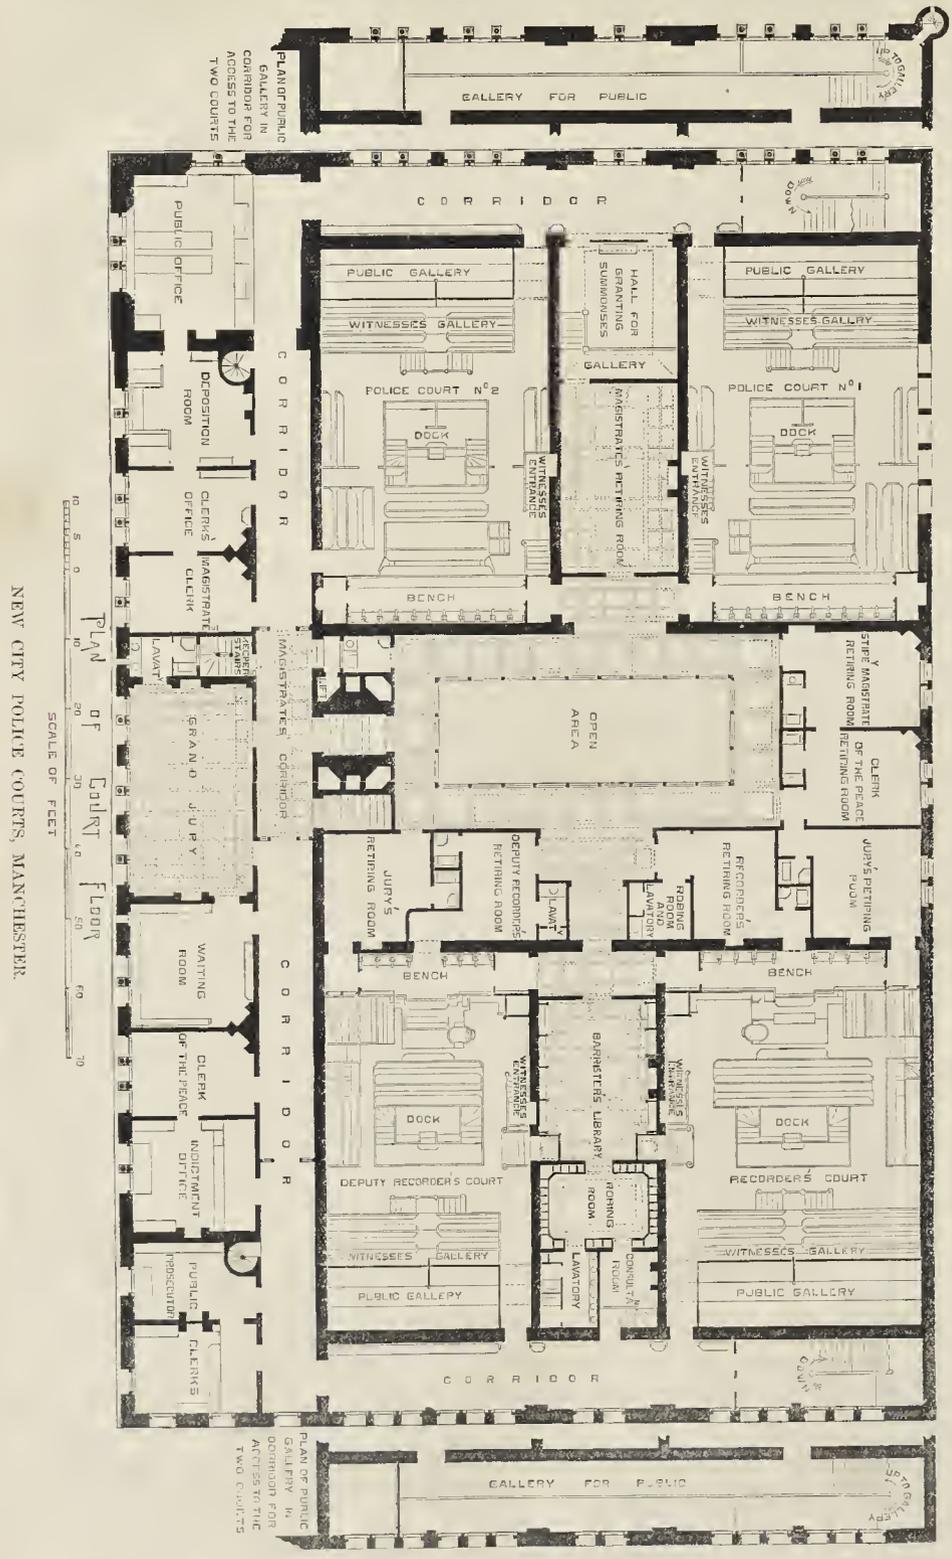

Much must have been done to the fortifications during the reign of Henry III. or Edward I. To this date are probably due the older drum towers and much of the wall connected with them, and the recessing of the Bar-gate and the addition of its flanking towers.

It appears that the town was attacked by pirates and sacked in October, 1338, 12 Ed. ward III, and in consequence it was strengthened in the next year. The south and east gates may have been of this date, and the spur tower and its gallery, unless this latter he, with the completion of the Bar-gate, the work of Richard II. This king seems to have done much to the castle.

The vault indicated on the plan as on the north side of the water-gate is at present wholly under ground, being built against and within the exterior wall, its floor being about the level of the footing of the wall. The vault measures 55 ft. 3 in. north and south, by 19 ft. 6 in. east and west, and is about 25 ft. high. Sir H. Englefield says it has much the air of a chapel. Others call it a guard-room to the water-gate. A chapel would scarcely have stood north and south, and a guard-room, especially so large a one, however necessary for a main gate, would be quite out of place beside a mere postern. The vault was entered a few weeks ago through a long closed-up opening in the west wall, but the writer has been unable to learn what was then observed.

To the south of the water-gate is, or was, a similar vault, indicated by the openings in the wall, one 3 ft. and one 1 ft. from the ground, both long since built up. Probably these two were the substructures of two buildings which formed a part of the exterior wall, and were used for stores or cellars.

It is difficult to speak too highly of the large scale-plan of Southampton executed under Sir H. James, upon which the lines of the old wall, and position of other objects of antiquity, are shown in a manner which leaves nothing to be desired.

PLAN OF PUBLIC GALLERY IN CORRIDOR FOR ACCESS TO THE TWO COURTS

PLAN OF PUBLIC GALLERY IN CORRIDOR FOR ACCESS TO THE TWO COURTS

MANCHESTER POLICE COURTS.—MR. THOMAS WORTHINGTON, ARCHITECT.

MANCHESTER NEW CITY COURT-HOUSE.

In the early part of our present volume we gave descriptive particulars of the Manchester Court-house then in progress.* We now publish a view and the plan of the principal floor. The building, which fronts Minshull-street, comprises accommodation for the daily police, for the City Quarter Sessions, and other magisterial business. We repeat a portion of the account already given. The style adopted, it will be seen, is that type of Gothic architecture of which examples abound in Florence, Verona, Siena, and other cities of Northern Italy. At the angle of Minshull-street and Bloom-street is a lofty tower, the lower portion of which is occupied by offices, and the upper by the clock. The principal entrance into the building, for the use of magistrates and persons officially connected with the courts, is in the Minshull-street façade. From the entrance a broad flight of steps leads to a corridor parallel with Minshull-street, which is about 6 ft. above the footwalks, and gives access to barristers' dining-room, porters' room, and various other apartments on this floor. In the centre of the Bloom-street façade is the entrance to the public hall, connected with the police-courts, which is 81 ft. by 40 ft., and contains rooms for witnesses in waiting, separated by low glazed screens. A staircase from this hall admits the public to a corridor on the court-floor, which gives the witnesses and officers access to the two courts. From the corridor a short flight of steps leads to the balcony connecting the public portion of the two courts, and gives admittance to that portion which is reserved for spectators only, who are entirely separated from those having business to transact. Opposite to the entrance in Bloom-street a staircase from the public hall admits witnesses immediately wanted to a gallery which is raised 8 ft. above the hall floor. The remaining portion of the ground-floor is occupied by the rooms for prisoners awaiting trial, which are reached by double flights of stone steps from the cells below, and have each a separate stair leading to the docks. These waiting-rooms on the session side are separate from those on the police side by a large open area, 86 ft. long by 44 ft. wide, with entrance for the police-van to drive into for the purpose of discharging prisoners, and a large courtyard for the police.

The four courts, two of which are appropriated to the police business and two to the sessions, occupy the centre of the building, and are surrounded by the offices and corridors before mentioned, an arrangement by which the noise of the adjoining streets will be materially lessened. Each court is 53 ft. by 33 ft., and 36 ft. high, and is lighted by sixteen windows, and has a ceiling of pitch-pine, panelled and perforated for ventilation; the walls are also panelled to a certain height. The magistrates' stalls on the bench are covered by a canopy the full width of the court. In order to give increased facilities for the rapid despatch of business in the two police-courts, speaking-tubes and bells have been arranged to communicate from each of the magistrates' clerks' seats and the two docks to the general office. Similar provision has also been made for communicating with the officials in the basement. A corridor, 15 ft. wide, extending along the back of the building, and two shorter passages at right angles with the main corridor, give access to the cells, which are of various sizes. The windows in these corridors are large and numerous, glazed with obscured plate-glass. The warming and ventilation of the courts is a subject to which special consideration has been given, and provision is made for passing heated air from the basement through a series of cavities or flues into the court-rooms and corridors. Air-ducts are arranged, so as to convey a supply of fresh air to the courts, and secure a constant change in the atmosphere. Heating-chambers and boiler-house are placed in the basement, and large channels are constructed under the former to convey fresh outer air thereto, which, after being purified and warmed, passes into the courts at the time in use.

The general contractors for the main building and the fittings of the courts have been Messrs. R. Nail & Sons; the ironwork was done by the Fairbairn Engineering Company; the heating and ventilating, by Messrs. Haden & Son; the carving, by Messrs. Earp & Hobbs; the gasfittings, by Messrs. Thomason & Co.; the stained glass by Messrs. Lavers, Barrand, & Westlake; the clock and bell, by Messrs. Cook & Sons, of

York; the grates and chimney-pieces, by Messrs. Wilson & Co. Mr. Samuel Taylor acted as clerk of the works, and the whole of the works have been executed under the direction and superintendence of the architect, Mr. Thomas Worthington, of Manchester.

The works have been substantially carried out, and the cost of the building will be about 45,000l.

The fittings of the four courts, which are executed in pitch-pine, and necessarily of very intricate nature, together with furniture and fixtures of various kinds, will probably cost about 10,000l. additional. The principal part of the furniture is in black oak, substantial, and in accordance with the architecture of the building.

FIREPROOF FLOORS.

If the author of a letter on this subject in the *Builder*, p. 990, will heat a piece of old plaster floor, or of a plaster cast, in the fire, and then place it under a water-tap, he will have reason to change his opinion about the fire-resisting properties of manufactured gypsum.

The terms "roasting," "burning," and "calcining," are practically synonymous when applied to the conversion of minerals; and it is self-evident that unless the gypsum is subjected to the proper heat, it cannot be made into plaster floors. No person placing his bare feet on one of these on a winter's morning will dispute your correspondent's assertion that it is a non-conductor of heat, and its non-liability to ignition, makes it so far fire-preventive.

The "Denmett" arch is a clever adaptation of a cheap and useful material, and it is a pity the mistaken zeal of its advocates should tend to mislead, by crediting it with properties it does not possess. It will not resist a fire. Such an event would make the material red-hot, completely destroying its tenacity; and the effect of water poured upon it in that state would be to reduce it to "utter rottenness."

The best protection for iron in a building on fire would probably be an adaptation of the American scheme mentioned in a recent number of the *Builder*; by making the girders hollow, and keeping them and the columns constantly filled with water, with proper supply, expansion, and escape pipes. This would involve considerable expense in fitting, but there can scarcely be two opinions as to its effect in preserving the iron in its original shape and position.

Supposing this could be done, then brick arches and lime concrete spandrels would probably be found most suitable to resist the spread of fire.

SCHOOLS OF SCIENCE AND OF ART.

Nottingham Mechanics' Institution Science Classes.—The annual distribution of prizes gained this year by the students at these classes has been made in the lecture-hall of the Mechanics' Institution, by Mr. T. Hawkesley, president of the Society of Engineers. There was a large attendance of students and their friends. Mr. E. Gripper presided. The chairman, in opening the proceedings, said he was glad to tell them that these classes were rapidly increasing. Four or five years ago the number of classes was only four or five, whereas now it was sixteen, and he looked upon that as showing that the efforts of the committee to place the classes on the best possible footing had been appreciated by the town. Mr. Hawkesley, in his address, said,—The inhabitants of Nottingham have been for long past, and are still chiefly, although not exclusively, occupied in the production of textile fabrics, limited, for the most part, to articles of lace and hosiery. But, although the production of these articles will, for many years to come, and, perhaps, always, constitute an important portion of the trade of Nottingham, yet, I feel assured, that the time is not far distant, nay, is fast approaching, when Nottingham, following in the holder steps of Leeds and even in the feather steps of Derby, will begin to turn its attention to the realisation of the no longer hidden treasures which a beneficent and an even prodigal nature has placed at its immediate and easy disposal. If my anticipations be correct, Nottingham will become in a few years hence a great centre of the coal and iron trades, and (her manufactures no longer confined to lace and hosiery) will emulate in wealth and enterprise the prosperous towns of Glasgow, Newcastle, Leeds, Sheffield, and Birmingham. I recognize in the scheme of tuition of the rising generation

adopted by this Institution, much that is valuable as an educational training, and much that is well fitted, if properly directed, to help on the attainment of the important object to which I have asked your attention. Yet I am not without apprehension, lest our modern system of competitive examination should bring to the front all the clever lads full of "cram," and leave in unmerited obscurity the young men of greater abilities and sounder acquirements, but so far, unfortunately, of a more deliberate and less showy activity. Avoid cram, for cram is but scientific gossip, which goes in one ear only to go out at the other, and be lost for ever. With preliminary knowledge the student of the science classes connected with the Nottingham Mechanics' Institution will be well prepared to assist, with no common advantage to himself, in the developing and utilising of the natural resources of his country, in few places more abundantly displayed than in the circle of twenty miles radius which has Nottingham for its centre.

The Ryde School of Art.—The president's conversation has been held at the town-hall. About 800 ladies and gentlemen attended. The walls were almost entirely covered with a collection of oil and water-colour paintings, crayon drawings, etchings, pyrographs, photographs, &c. Mr. R. J. Jones read the report, which showed that the number of persons in the artizan class at present on the books was thirty-five. At the examination thirty-five out of fifty-seven candidates obtained certificates, eight passed in the third grade, and eight in the second; and no means a bad average. After the distribution of the prizes, the president, in allusion to the master of the school, Mr. J. C. Swallow, said that he had come to Ryde with the highest testimonials from South Kensington, and in January next, he was pleased to announce, Mr. Swallow would deliver a course of lectures on the progress of art, which he knew would be well worth attending.

The Projected Stafford School of Art.—The members of the committee have had several meetings and discussions, and Mr. Buckmaster has been addressing them, and other gentlemen at a meeting recently held. The address is being circulated in a printed form. The success of the experiment now depends entirely on the interest taken in it by the inhabitants.

The South Kensington School of Art.—The annual distribution of the prizes awarded to the students of this school took place in the Lecture Theatre at the South Kensington Museum, Lord Ronald Leveson-Gower, M.P., in the chair. His lordship was introduced by Mr. Cole. The prize winners were the students of the two schools at South Kensington—one for male and one for female students, the schools being in competition with each other, and with all those of the United Kingdom. The competitors did not, however, include all the students of the schools, those in training for future teacherships and the national scholars not being eligible to compete for the school prizes. The medals and books to be distributed represented only the higher grades of distinctions obtainable by students, the minor honours not being included. They consisted of two gold medals, nine silver medals, nine bronze medals, and eighteen Queen's prizes of hooks, all won in the national competition, besides forty prizes of hooks won in the local prize section. These included the whole of the prizes gained at the great annual competition.

Newcastle School of Science and Art.—The annual meeting of the friends and supporters of this institution has been held in the Guildhall, was largely attended. The walls of the room were adorned with the works of the students, which were numerous. The chair was taken by Mr. C. M. Campbell, who was supported on the platform by the Mayor of Newcastle and others. The hon. secretary read the reports. The committee said "They have much pleasure in stating that there is a decided increase in the attendance of students, as shown in the increased amount received for fees. They are encouraged not only by the satisfactory progress of the school, but also by the improved state of the income."

The Manchester School of Art.—At the annual distribution of prizes in connexion with this school, the Bishop of Manchester was present. His lordship said he had not had much opportunity of judging of the state of art in Manchester. He had, of course, the privilege of an *entrée* into many mansions, the walls of which were hung with magnificent productions of modern artists; but those, or most of them, were not the products of Manchester artists.

* See p. 162, ante.

The main phenomenon in Manchester that presented itself to his mind was the beautifying of churches, and he must confess that, if Mr. Mickleby could introduce a higher and a purer taste in this matter, he would have done something which he should rejoice to see.

EXPERIMENTS ON THE OXIDATION OF IRON.

PROFESSOR F. CRACE CALVERT, F.R.S., in the *Journal of the Society of Arts*, gives an account of some experiments, the results of which we may state in a condensed form:—Some two years since, Sir Charles Fox inquired of me if I could give him the exact composition of iron-rust, viz., the oxidation found on the surface of metallic iron. I replied, that it was admitted by chemists to be the hydrate of the sesquioxide of iron, containing a trace of ammonia; to this he answered that he had read several books on the subject, in which the statements referring to it differed, and, from recent observations he had made, he doubted the correctness of the acknowledged composition of rust. He further stated, that if he took a bar of rusted wrought iron, and put it into violent vibrations by applying at one end the fall of a hammer, scales would be separated, which did not appear to him to be the substance I had described.

This conversation induced me to commence a series of experiments.

The specimens gave the following results when submitted to analysis:—

	Conway Bridge, Llangollen.	
Sesquioxide of iron	82.900	83.694
Protoxide of iron	6.177	6.810
Carbonate of iron	0.617	0.935
Carbonate of lime	0.293	0.293
Silice	0.121	0.196
Ammonia	trace	trace
	100.000	100.000

These results clearly show the correctness of Sir Charles Fox's statements, that the composition of the rust of iron is far more complicated than it is stated in our text-books. Therefore, the question may be asked, is the oxidation of iron due to the direct action of the atmosphere, or to the decomposition of the aqueous vapour; or does the very small quantity of carbonic acid which it contains determine or intensify the oxidation of metallic iron? To reply to these queries I have made a long series of experiments, extending over two years, which I hope will tend to throw some light on this very important question; and, although it appeared to me an easy matter to solve, still I have had many difficulties to overcome.

The results prove that, under the conditions described, pure and dry oxygen does not determine the oxidation of iron; that moist oxygen has only a feeble action; dry or moist pure carbonic acid has no action; but that oxygen containing traces of carbonic acid acts most rapidly on iron, giving rise to protoxide of iron, then to carbonate of the same oxide, and lastly to a mixture of saline oxide and hydrate of sesquioxide.

As these facts tend to show that carbonic acid is the agent which determines the oxidation of iron, I am justified in assuming that it is the presence of carbonic acid in the atmosphere, and not its oxygen or aqueous vapour, which determines the oxidation of iron in common air. Although this statement may be objected to at first sight, on the ground of the small amount of carbonic acid gas existing in the atmosphere, still we must bear in mind that a piece of iron, when exposed to its influences, comes in contact with large quantities of carbonic acid during twenty-four hours.

These results appeared so interesting that I decided to institute several series of experiments.

One series, on the action of oxygen-carbonic acid on iron in presence of water, confirms the previous ones, that carbonic acid is a most active agent in determining the oxidation of iron.

Another, on the action of carbonic acid on iron in presence of water, further illustrates that carbonic acid is the real determining agent of the oxidation of iron.

Whilst I was engaged in the above experiments, it occurred to me that it might be useful to make a series with the view of throwing light, if possible, on a fact stated by Berzelius, and well known to alkali and soap manufacturers, viz., that caustic alkalis have the property, even when dilute, of preventing the oxidation of iron.

I was much surprised to find that the carbonates and bicarbonates of the alkalis acted in the same manner as their hydrates, in preventing the oxidation of iron, not only on that part of the blade immersed in the solutions, but also on that which was exposed to a damp atmosphere of common air. Previously to obtaining these results, I was inclined to believe that caustic alkalis prevented the oxidation of iron by absorbing the carbonic acid of the atmosphere; but, as carbonates, and even bicarbonates, act in a similar manner, it is evident that this view of the action was erroneous.

The series of experiments confirms the opinion that the iron exists in a passive condition, and that this condition only attains sufficient power to resist oxidation by atmospheric oxygen when there is 5 per cent. of either hydrate or carbonates of alkalis in solution.

I have made many experiments with the view of discovering the cause of the interesting preservative action which alkaline solutions exert on iron, but have failed. Knowing the destructive influence which sea-water has on iron, and the serious injury done on iron ships through the action of bilge-water, a series of experiments were made with sea-water, to which was added such a quantity of caustic soda, or potash, or their carbonates, that, after the salts of lime and magnesia were decomposed, there still remained in the solutions 1 to 5 per cent. of alkalis or the alkaline carbonates; and when iron blades were introduced into such liquids, they gave the same results as when iron had been dipped partially into an alkaline solution of Manchester water. I would propose, in conclusion, that a certain quantity of soda-ash should be introduced from time to time into the bilge-water of iron ships, as by so doing a great saving would be effected, as it would prevent the rapid destruction of such ships.

As iron ships are rapidly destroyed when used for conveying sugar from the colonies to this country, I instituted a series of experiments. Blades of iron were partly immersed in a solution containing 10 per cent. of sugar, and in similar solutions to which had been added 2½ to 5 per cent. of caustic and carbonate of soda; after a month the same results were obtained with the saccharine as with the aqueous solutions. A piece of zinc covering about a fifteenth part of the blade preserves the iron from rusting in that part of the blade immersed in the sugar solution. The use, therefore, of plates of zinc fixed on the sides of an iron vessel, or, perhaps better, the employment of galvanised iron plates in the construction of ships, deserves the attention of shipowners.

EXTRAORDINARY IMPROVEMENTS.

A BRICKLAYER, John Hurren, was brought up on a warrant, at Hammersmith, charged with maliciously damaging premises during his tenancy.

Mr. James Gutteridge said the prisoner had occupied a house belonging to him in Peel-street, Kensington. The tiles had been taken off, and a hole made through it, letting in the water, and causing considerable damage. He found the staircase window taken off the brickwork removed, and a dog placed in the opening, leading to a considerable fall. The cistern had been shifted, and the wash-house wall pulled down and left open. He estimated the damage to the house at 84, besides 144 for rent.

Mr. Ingham: All these alterations might be considered tenant's improvements? Did he send in a bill for them?
Witness: No, sir; he could not, as the place was not inhabitable: the prisoner said he intended the works for improvements. He termed the hole in the roof a "dormer." He took out the staircase window for an improvement, as he intended to put in a glass door. He altered the wash-house to live in it in the summer time.

Mr. Ingham said the alterations seemed to have been made to make the house a pleasant one for the summer. He did not see any reason for saying that the prisoner was out of his mind, only that he had that man's father for changes which was to be found in other men. He ordered him to pay 84, and 42, costs, and in default of distress, to be imprisoned for one month.

LAW OF CONTRACTS.

THE following extracts from the index to the *Lavo Journal Reports* may be usefully noted. The cases to which they relate have been already referred to in our pages, but the decisions are here put in a more precise manner:—

Builder and Architect: Rectification: Negligence; Extra Work: Arbitration: Undisclosed Agreement.—A builder made a tender undertaking to sign a contract to execute for a certain sum certain works described in some rough sketches and verbal explanations of an architect. The architect subsequently sent by special messenger to the builder a contract to perform the sum named the works delineated and described in certain plans and specifications thereto annexed. These differed materially from the works described in the rough sketches and verbal explanations on which the builder had made his tender. The builder,

however, signed the contract without any examination, and completed the works according to the plans annexed to it. He then filed a bill claiming to have an account taken of the works executed by him on the basis on which he had made his tender.—*Held*, that as the mistake under which he signed the contract was due to his own negligence, and he had not taken proceedings for rectifying the contract as soon as he discovered it, he was not entitled to any relief in this respect. (*Kimberley v. Davies*, appointing the architect arbitrator in respect of extra works; the architect had guaranteed to his employer that the total cost should not exceed a certain sum, but that fact had not been disclosed to the builder, he was not bound by the submission to the architect's arbitration, and the Court would perform the part of arbitrator in the matter.)

—1 L. J. (N. S.) C. 38.
Liability of Builder on Building Contract by Civil Code of Lower Canada.—By the Civil Code of Lower Canada, Article 1,688, it is provided that, "If a building perish in whole or part within ten years, from a defect in construction, or even from the unavoidable nature of the ground, the architect superintending the work and the builder are jointly and severally liable for the loss." The appellant, a builder, entered into an agreement with the respondent, the rector of the cathedral of Montreal, to build a new cathedral on foundations which had already been constructed by another builder. Shortly before the completion of the work, a defect in construction, and other damage occurred, owing to the insufficiency of the foundations.—*Held*, that inasmuch as the contract did not limit the appellant's liability to his own work, he was liable for the damage caused by the insufficiency of the foundations. (*Wardley, Belauze*.—1 L. J. (N. S.), F. C. 1.)

ADULTERATION OF COALS.

Sir,—Although I quite admit that one should not feel the slightest astonishment at any phases of development in the most popular of the present day—the coal-trade, adulteration.—I must candidly confess that I was not prepared to see the extent to which it could be carried in the matter of household coals. Mixtures of inferior qualities, of course, have long and systematically accustomed to. I am not going to complain of that, for I understand so much of the principles of political economy as to know quite well that the price of such a commodity is not to be universally with its quality. Even if I did complain, I suppose it would turn out to be a work of supererogation, and I am too old a hand to commence carrying coals to Newcastle. It is what I do complain of, however, and I think it a most justifiable complaint. In the last cellarful of coals which I stored (or, rather, which were stored for me with the utmost despatch and celerity), it turned out that they were mixed with stones, in the proportion of about a hundredweight to the ton. Surely this is too bad. I would not, perhaps, have been, even now reluctantly, driven into print, had the quarry selected by the coal-masters not consisted of a hard, laminated, and schistose rock, which, in place of silently crumpling into powder and dust, by the action of heat, does not melt but splinter and splur and splur out of the grate the whole evening, to the great annoyance of my temper and the damage of my carpet. Indeed, I was actually hit on the face, last night, by a red-hot splinter of the same nature, about the size of a Turkey-bean. For the sake of honesty, and truth, and fair dealing, pray let us have a sharp denunciation of such villainous malpractices in your respected columns. A HOUSEHOLDER.

FALL OF BUILDINGS.

Fall of a Factory in Birmingham.—A large factory at Balsall Heath, near Birmingham, belonging to Messrs. Daveport & Cole, jet ornament manufacturers, has fallen, leaving only the warehouse standing. The factory adjoined the river Bae, which overflowed its banks and undermined the foundations. Indications of weakness were observed some hours before, and the work-people left the premises in time.

Fall of a large Wall at Mexbro.—A large wall recently built by the Manchester, Sheffield, and Lincolnshire Railway Company, in connexion with a new road from the town of Mexbro' to the station, has fallen. The part which fell, owing to the ground giving way, was about 50 yards in length, and the damage is estimated at 800l.

Fall of a House in St. Miles's, Norwich.—The house had been uninhabited. Mr. Moran, the city surveyor, was quickly on the spot, and at once determined that the adjoining house, which was in a most critical condition, should also come down. For this purpose, two scaffolding-poles were used as battering-rams, and a rope was passed through the chamber windows. The house was struck at from the churchyard, and in a few minutes the ruinous old structure fell down. A gable belonging to the first house that fell, and which was left standing, was also demolished. The houses had previously been condemned by the surveyor as dangerous and uninhabitable.

Royal Academy.—Mr. Edward Armitage was on Monday night elected a Royal Academician in the place of Mr. H. R. Pickersgill, retired. Mr. J. Durlman, A.R.A., was next to Mr. Armitage in the ballot. The election for associates will be held in January.

CHURCH-BUILDING NEWS.

Penninghame (Galloway, Scotland).—All Saints' Church, Penninghame, has been consecrated, in presence of a crowded and fashionable congregation. There was previously no Episcopal place of worship in the neighbourhood before Mr. and Mrs. Stoford Blair, of Penninghame, caused the one under notice to be erected,—the nearest for Newton Stewart being the chapels in Galloway House and at Gally, sixteen and eighteen miles distant respectively. The church consists of nave and chancel, wood porch on stone base, and gabled organ-chamber and sacristy. Three bells are hung in a wooden bell-cot at the eastern end of the nave. The edifice is simple in its design, which is Early Decorated of the thirteenth century. It is built of blue limestone, with white freestone dressings, and is lined throughout with Bathstone ashlars. The east and west windows are three-light, with plate tracery, and the others are single lights, with trefoil heads. The seats are open, and all free. All the roof is wrought and moulded, and in the nave is exposed to view, being plastered between the rafters, the plastering to be tinted sky-blue, with gilt stars. The aisles, chancel, and sacristy are laid with encaustic tiles, by Mr. M'Colla, of London. The chancel is raised above the nave, and is separated therefrom by a low wrought-iron screen, worked by Messrs. Hart & Peard, London; and the organ-chamber is enclosed by a moulded screen of wood. The cross, candlesticks, and vases for the altar were presented by Sir Thomas Dick Lauder, bart. The windows are filled with tinted cathedral-glass, the east window and three side windows being stained by Mr. G. Gibbs, of London. The three latter are "In Memoriam." The church measures 70 ft. by 22 ft. internally, and has been erected, with the exception of 500l. from Mrs. Blair, at the sole cost of Mr. and Mrs. Stoford Blair, of Penninghame House. The architects are Messrs. W. G. Habershon & Pite, of London; the clerk of the works, Mr. Park, Newton Stewart; and the builders respectively, Messrs. Murray, Girvan, and Annandale, of Edinburgh; whilst the pulpit, font, and wood screens have been made by Messrs. Cox & Sons, London; the bells, by Mr. Mears, London; and the organ, by Messrs. Telford, of Dublin.

Tortworth.—The small parish church at Tortworth, after undergoing considerable restoration, has been re-opened for public worship. In every possible way the materials employed in the old building have been replaced in the new. The building is, in fact, the same. The entire cost is estimated at about 5,000l., and the whole of this sum is the gift of Earl Ducie. The work has been done under his lordship's direction, and under the superintendence of Messrs. Carpenter & Slater, of London, architects. The actual work has been managed by Mr. John Groves with regard to the carpentering; by Mr. T. Hudson executed the mason's work; Messrs. Gay, of Bristol, were the glaziers; and Messrs. Clayton & Bell, of London, have supplied the stained glass. The ironwork of the church has been done by Messrs. Chew, of Stroud; the painting by Mr. J. Tillot, of Winterbourne; the plumbing by Mr. J. Isaac, of Wickwar; and the tiling by Minton, of London. The tower has been partially restored; it was pulled down about 30 ft. from the top, and the pinnacles have been restored as they originally were. The body of the church has been entirely rebuilt. The walls are of sandstone and Box freestone. The seats in the church are for the most part of pitch pine. There has been an addition to the bells, which are now six. All have been re-hung, and there is a new treble bell, while the second has been re-cast. This portion of the work has been done by Messrs. Taylor, of Loughborough. The organ, on the south side of the chancel, was built by Mr. W. G. Fowles, of Bristol. The case was designed by the architects of the church restoration. The monuments that were in the former church have been replaced in the new.

Watton Fitzpaine.—The ancient parish church of St. Paul, which has just been almost entirely rebuilt and generally restored, has been consecrated and re-opened for divine service. In 1871 it was proposed to re-roof and re-seat the church. An architect, Mr. G. H. Birch, from Messrs. Christian, Malford, & Co., was consulted, and condemned the whole building as ruinous and insecure. The chancel, nave, and south aisle have been taken down and rebuilt, and the north transept and vestry restored. It is built in the Early Decorated style of architecture, and con-

sists of nave, chancel, south aisle, north transept, vestry, and tower. It will accommodate 200 people. The windows are all plain, except two,—the east, and one in the south aisle. The east has borderings of stained glass around the lights, and in the head are the Royal arms of the arms of the diocese, and those of the Drew family. The other window in the east end of the south aisle has been erected by Mrs. Luttrell to the memory of her brother, Mr. Ross Drew, and of her son, Mr. R. F. Luttrell. It contains, in three lights, the Virgin and Child in the centre, with the Shepherds and Magi on either side. Above the altar is a reredos in mosaic, consisting of three panels, the central one containing a white jewelled cross on a gold ground, and in each side panel is an angel bearing a scroll with the word "Alleluia" inscribed on it. The chancel stalls are of oak, with their ends carved. The nave, south aisle, and north transept are seated with open benches, of stained deal. The roof is of stained deal, covered externally with slates. At all the gable ends of the building are carved crosses. There is at present only one bell in the tower. The whole expense of the restoration has been defrayed by Mrs. and Miss Luttrell, of Wotton House, and Mr. and Mrs. Bosanquet, with the exception of the new north transept and vestry, which will be, or have been, paid for by subscription. The reredos was presented by Mrs. Bosanquet, and the altar and altar-rails by Miss Luttrell. The architect was Mr. Birch; and the contractor Mr. W. Langford, of Lyme Regis, under whose superintendence the whole of the works have been carried out.

Sheepscombe.—The church here has been reopened. The building had undergone various alterations and additions, under the superintendence of Mr. F. Niblett, of Gloucester, architect, Messrs. Wall & Hook, of Brimscombe, being the contractors. The length and width of the nave, which has not been extended, is 39 ft. 8 in. by 22 ft. 6 in. It had originally a flat ceiling, which has been removed, and the timbers of the roof are now shown—painted, stained, and varnished. A large western gallery projected into this nave to the extent of some 13 ft. This, as well as the external steps leading to the same, has been removed. A kind of aisle, 14 ft. 6 in. by 12 ft., existed on the south side. All this has been removed, and the space thrown into the present south aisle, which has been extended westward 17 ft. The new chancel is 13 ft. 6 in. by 10 ft. 6 in.; and a new vestry has been built adjoining and open to the chancel by an archway. The east window has been filled with stained glass, by Constable, of Cambridge, erected to the memory of the late incumbent, the Rev. George Gibbon, M.A., the cost of which has been defrayed by subscriptions collected by his widow. The chancel floor is laid with encaustic tiles, in pattern, by Gerwin. The new stalls are of oak and pitch pine mixed, of open work, carved, stained, and varnished. The whole of the interior has been re-pewed with open settings. The church is also now warmed with stoves by Mr. Hill, of Stroud. The finish to the bell-turret should be improved.

Tolleshury (Essex).—Tolleshury Church has been reopened after having had a sum of about 2,000l. expended upon its restoration. The works include the rebuilding (last year) of the chancel, in stone, at the cost of the lay rector, Mr. E. R. Benyon; the removal of an old gallery at the west end; the opening of the tower into the church; the removal of the old box pews, and the substitution of benches of a modern pattern; a new chancel arch, moulded; new open-timbered roofs, and a general strengthening of the walls in various parts. The works have been under the care of Messrs. E. Habershon & Bruck, of London, architects; and, so far as they concern the tower and nave, have been executed by Mr. H. Rannacles, of Halsted, at a cost of about 600l.

Halifax.—An influential meeting has been held in St. Augustine's Schools to consider the practicability of commencing the building of the church of St. Augustine, which has been long in contemplation. Col. Akroyd presided. The following resolutions were unanimously passed:—"That it is desirable that St. Augustine's Church should be commenced in the early spring; that the architect be instructed to draw out working and detail drawings and specifications, with a view to letting the tenders; that the gentlemen present form the building committee, with power to add to their number." We understand that a sum of 3,427l. has been already promised towards the church.

Levenshulme.—The Church of St. Peter, Levens-

bulme, which consists of nave, aisles, and very short chancel, has been altered and decorated from designs supplied by, and under the superintendence of, Messrs. Maycock & Bell, architects, Manchester. A new reredos has been fixed, having moulded arcading in Caen stone, with alabaster shafts and panels. There are new choir-stalls, together with reading-desk and pulpit, in pitch pine, having arcaded fronts, with walnut-wood shafts. Hood-moulds have been placed round the nave arches and east and west windows, springing from heads modelled by Messrs. Williams & Millson, who also executed the reredos. The roofs throughout have been cleaned down, and varnished. The decorations have been carried out by Mr. J. Owen, of Bowdon. Messrs. Sidebottom & Co., of Blackfriars-street, have executed the pulpit, choir-stalls, and other joiner work.

Hadfield.—The foundation-stone of a new church for the district of Hadfield, in the parish of Glossop, has been laid. The new edifice, which is dedicated to St. Andrew, is estimated to cost 2,500l. The church, which will be erected on a site purchased from Lord Howard, of Glossop, will be built of stone, ornamented with a spirelet 60 ft. high, and accommodate 500 persons.

Kirby Knowle.—The present owner is making very extensive alterations on "New Buildings" of Kirby Knowle castle, from the plans of Mr. G. F. Jones, of York, architect, under the supervision of his clerk of works, Mr. G. Harrison, of York. In connexion with this restoration, and by the same contractors, viz. Mr. Palliser, North-alerton, mason and brickwork; Mr. W. Belleby, York, joiner and carpenter; Mr. Varvil, York, plumber; and Comptroller Rawling, York, plasterer,—there is also the restoration or rebuilding of the church at Kirby Knowle, and which is of very ancient date. The foundation-stone was laid recently, by the present owner of the estate, Mr. Charles Easley. In commemoration of the roof of the first new wing, and the laying of the foundation-stone of the new church, the owner gave the contractors and workmen connected with the two works an excellent dinner, at which upwards of forty sat down.

Hull.—At a meeting of the Burial Committee of the Local Board of Health, the surveyor (Mr. J. Fox Sharp), agreeably to the committee's resolution of the 9th of August last, submitted a plan for draining and laying out the new Hedon-road Cemetery, together with an estimate of the cost, and of the two chapels, entrance lodge, shed, and other requisite buildings, and of palisading and fencing the same, amounting together, including the cost of the land, to 18,000l.; and the same having been examined, it was resolved that the plan be approved, and that the surveyor advertise for carrying out the same.

New Hincsey.—The suburb of New Hincsey, which has become a populous neighbourhood, has now a church and schools. During 1870 a building was erected from designs prepared by Mr. E. G. Bruton, architect, Oxford, to serve the purposes of a school-room as well as a place of worship, and which continued to be used as such until last October twelvemonth, when proper school premises were completed, and formally opened. The chancel of the church was the only part that had been consecrated, and as the nave was no longer required for secular purposes, the earliest opportunity was sought to invite the bishop of the diocese to consecrate it, which ceremony has now been performed.

Newcastle-under-Lyme.—At a meeting of St. Giles's Church Rebuilding Company, it has been unanimously resolved "that the plan and perspective drawing of the proposed addition to and restoration of the parish church of Newcastle-under-Lyme by Sir George Gilbert Scott, now before the committee, be accepted and adopted and this committee pledges itself to use every effort to carry the execution of them to a successful issue."

Wolverhampton.—At a meeting of the committee for the interior restoration of St. Peter's Church, it has been resolved "that an appeal be made to carry out Mr. Christian's plans, and that while the open seats are being constructed temporary ones be used to prevent the church being closed." In re-seating the church, the old woodwork will be used as far as possible, and no material change will take place in the present form of arrangement. The new seats will be like those at St. John's Church. The total cost will be from 1,000l. to 1,200l., and the estimate of Messrs. Higham has been accepted for the

SCHOOL-BUILDING NEWS.

Wargrave.—The new buildings erected at the Wargrave district schools have been opened. The schools are for the accommodation of the children sent from the Reading and Wokingham Union, and for some time have been out of repair, and have been reported by the Government inspectors as unequal to the requirements of the children. The managers (under the advice of their architect, Mr. Charles Smith, of Reading), have remodelled the whole of the buildings, and taken down two of the wings which were very low and in a dilapidated state, and built two wings, one containing the schools and classroom, and the other the superintendent's apartments, stores, the Board-room, &c., the whole forming a complete set of school buildings, and equal in cubical space to the Government requirements for 180 children, both as to schools and dormitories. The accommodation is as follows:—Boys' and girls' schools, each 43 ft. by 18 ft. and 12 ft. in height; class-room, 18 ft. by 15 ft., pay-rooms, dining-hall, bath-rooms, &c. The dormitories, which are in all 260 ft. in length, are so arranged that the master and governess have respectively oversight of the children. New farm buildings are also in course of erection on the land in connexion with the schools, the labour on the farm being principally done by the children. The building works have been carried out by Mr. Woodbridge, of Maidenhead.

Colchester.—St. John's district school, Colchester, has been opened. The building is close to the church, on a site given by the Countess Cowper. The new school is of red brick, with Bath stone windows, oak blocks, and open-timbered roof. In addition to the school-room, there is also a class-room and gallery, and it is fitted up with desks, &c., in the customary manner. The cost of the building, which was designed and executed by Mr. J. Grimes, builder, Colchester, is estimated at 350*l.* or 400*l.*, and very nearly the whole, if not the whole, sum has already been raised. The school will accommodate ninety children, and it is to be hoped that it will be well attended.

Loughborough.—The memorial stones of the new schools in connexion with the Wesleyan Methodist body have been laid. The site of the new schools is in Leicester-road. The architect is Mr. Hodson. The Leicester-road front is designed in the Gothic style of the Decorated period, and is to be built of Mountsorrel granite, with quoins, string-courses, &c., of Bath stone. The central feature of the elevation is a porch with gabled doorway, giving access to the main building. On either side is a large lance window of Bath stone, with red Mansfield stone columns and carved capitals. Access to the schoolrooms and offices is also gained through a side entrance porch, the uniformity being retained by a class-room on the south side. The plan provides for a main schoolroom, 50 ft. by 30 ft., an infant schoolroom, two class-rooms, and in the basement a large kitchen and storeroom. Internally the building will be 17 ft. high to the top of the wall plate, the roof being carried on hammer-beam principals, ceiled at the collar, the enclosed space being used for ventilation. Provision is made for the heating and ventilation of the building by hot air. The erection will cost nearly 1,000*l.*

Brentwood.—The memorial-stone of new Congregational Sunday schools has been laid at Brentwood. The schools are to cost 800*l.* The schools are so far completed as to admit of the principal beams being raised for the roof. They are built of stock bricks, with red brick courses and mouldings, a free adaptation of the Geometric style of Gothic being adopted. The roof will be surmounted by a bell-turret. The principal room is about 30 ft. by 50 ft., and will accommodate about 300 children. An infant school, in which ninety children can be taught, is attached.

St. Austell.—The new schools erected by the St. Austell School Board at Mount Charles have been opened. These are the first schools built and opened in the Western Counties by a school board under provisions of the Elementary Education Act, 1870. The old British school-room will be still used as the infant school-room. The new rooms were erected, from the designs of Mr. S. Trevail, of Par Station, by Messrs. John Paul (carpenter) and Henry Edc (mason). The new buildings, separate rooms for boys and girls, a class-room being attached to each room, will accommodate 375 children, and have been erected at a total cost, including desks, forms,

cupboards, &c., of 945*l.* Over the boys' entrance is a tablet in Ransome's patent stone, bearing the inscription: "The site of these schools was presented as a free gift by the family of the Veales to the parish of St. Austell."

STAINED GLASS.

Eye Church.—A window has been placed in the south transept of this church. It was painted and presented by Lady Caroline Kerri-sou. The subject is, "Christ blessing little children."

Petworth Church.—A stained-glass window has been placed in the chancel of this church by Mr. H. G. Brydone, in memory of his late wife and children. It is a double window, and represents the parable of the good Samaritan. The top of the window is a representation of our Saviour in the act of delivering his injunction,—"Go thou and do likewise." Messrs. Clayton & Bell, of Regent-street, executed the stained glass.

FROM SCOTLAND.

Rutherglen.—A new R.P. church has been opened for divine service, by the congregation which assembled for nearly three years in the new town-hall. The church is designed in the Early English style of architecture. The front elevation presents a large gable, in which there is a four-light window filled with tracery; the entrance-door is in the centre, with deeply-moulded jambs and shafts, with bases and capitals supporting the arch, which is also moulded. There is a tower and spire at the south-west angle of the building, rising to the height of 128 ft. Internally the church is divided into nave and aisles by columns with carved capitals supporting moulded arches. The timber trusses of the roof are exposed, and varnished. Light to the interior is derived from the large front windows, four windows on each side-wall, and a rose window (12 ft. in diameter) in the back wall over the pulpit, and filled with tracery and painted glass. The tracery of the large front windows is also filled with painted glass, and all other windows throughout the building have coloured border panes. The pews are of open framework, with stall-ends, and the entire timber-work of the church is stained and varnished. Seatings are provided for 750 persons. The architects were Messrs. G. P. Kennedy and R. Dalgligh, Glasgow. The contractors were:—for the mason work, Messrs. Thomson & Martin; wright work, James Council; slater work, Wm. Meikle; plumber work, A. & J. Tuff; plaster work, James Jordan; glazier work, G. & J. Rae; smith work, D. Somerville & Co.; heating apparatus, James Comho & Son; gas fittings, Kenny & Brown; upholsterer work, Joseph Gow; bell-founders, Wilson & Christie, all of Glasgow; and the decorations were executed by Mr. Andrew Clark, of Rutherglen.

Galashiels.—A new suburb, with a population of about 500 people, has lately been built along the Edinburgh-road, and on the foot of Buchholm-hill. It is beyond the burgh boundaries, and consequently the local authority of Galashiels has no control over its sanitary condition. In Halleyburton-place, the houses are mostly new, and have been occupied as soon as the plaster was on the walls. There is neither lighting nor cleaning, no foot pavement, and no Macadamised roadway, and the nightsoil and ashes are laid out on the small garden plots at the back. The drainage is bad, and the water worse, and as a consequence fever generally prevails, and has resulted fatally in a number of cases. The Galashiels local authority has called the attention of the local authority at Melrose to the circumstances. In one block of eight houses the families are supplied with water from a well about 3 ft. deep, into which a large quantity of filthy surface-water finds its way.

Stirling.—At a meeting of the Town Council it has been agreed that a small granite block be erected beside the Roman stone on the Govan Hill, to receive a copy of the original inscription, and that an iron post be placed above to point out the locality of the stone. The following inscription can be traced:—"IN EXCV. ANTI. LEO. II." (*In ex cubicis egredientes legiois secunde*). At the same meeting Provost Christie intimated that Sir William Stirling Maxwell intended to present the three oak carved heads which he had in his possession to the Smith Institution, to be placed in the ceiling of the library of that Institution. The provost suggested, and it was

agreed, that the eight heads which were at present in the Justiciary Court-room should be placed at the disposal of the Smith Institution Trustees, for the same purpose. These heads were carved in the reign of James V. [and first of England], and formerly decorated the ceiling of the Presence Chamber of the Palace within Stirling Castle. Several of the heads having fallen from the ceiling, they were all stripped off, and it was only by accident that some were rescued from destruction.

Arbroath.—A mission meeting-house in connexion with the Ladyloan Free Church, Arbroath, has been opened. The house has been erected in East Grimsby-street, from plans by Mr. Aitkenhead, architect. It is in plain Gothic, and consists of a hall and vestry. There is a recess or apse at the east end. The hall is seated for 275 persons. The cost of the building, including the price of the ground, is between 500*l.* and 600*l.*

Forfar.—Plans of the new county buildings for Forfarshire have been prepared by Mr. Wardrop, Edinburgh, and approved of by the Forfar County Commissioners, by whom the committee were empowered to obtain further subscriptions and confer with the subscribers on the works. The convener of the committee is Lord Dalhousie, who subscribed 1,000*l.* towards the buildings. It is proposed to erect them in connexion with the new Sheriff Court-houses at Forfar, and the plans embrace a county hall, 65 ft. by 35 ft., with committee-room adjoining, 26 ft. by 21 ft.; entrance-hall, cloak and retiring rooms, with all necessary conveniences; and rooms which may be turned into account either for a keeper's house or for chambers for the clerk of supply. The estimated cost, exclusive of architect's fee, which will be little if at all over 200*l.*, and the cost of the site and furnishing, are estimated not to exceed 4,000*l.* To provide a strong room for the records, some slight modification of the plans will be necessary. The sum already subscribed for the buildings amounts to 3,386*l.* 5s.

Aberdeen.—The Harbour Commissioners of Aberdeen have made their annual inspection of the New South Breakwater, and other works at the harbour. Nearly 2,000 ft. of the entire length of the breakwater have been finished. The construction will be suspended as usual during the winter.

VARIORUM.

AMONGST the Christmas books comes to us "William with the Ring," a rhymed romance from the graceful pen of Mr. J. R. Planché.* The principal incidents in it formed originally the plot of an opera book written by the author for Mendelssohn, but which, from circumstances, was not set by him. It is a deeply-interesting story, admirably told, with the *faulx*, according to some critics, of being thoroughly lucid and understandable from first to last, and suggesting Scott rather than Browning. We can honestly praise it warmly.—"Manual of Mythology" (Asher & Co.), by Alexander S. Murray; and "Næmia Cornubie," illustrative of the Sepulchres of Cornwall, by W. C. Borlase, F.S.A. (Longmans & Co.), will have proper notice in due time.—The capital little story, "Marion Lee's Good Work," by the author of "A Trap to Catch a Sunbeam," showing how a powerless child built a church, and which we praised warmly when it first appeared in a periodical, has been issued in a separate form for a few pence (Cassell & Co.), and ought to have a very wide popularity.—The new little almanack issued by the Art Union of London will be found to contain information on art matters not elsewhere collected in one publication.—Messrs. Do la Rue & Co. publish, as usual, various sorts and sizes of pocket-books and diaries, all distinguished by excellence of workmanship and completeness of finish.—We take a paragraph from the first number of Mr. Thornbury's "Old and New London," just published, concerning a "House with a Story":—

"No house in Fleet-street has a more curious pedigree than that gilt and painted shop opposite Chancery-lane (No. 17, south side), falsely called 'the palace of Henry VIII. and Cardinal Wolsey.' It was originally the office of the Duchy of Cornwall, in the reign of James I. It is just possible that it was the house originally built by Sir Amyas Paulet, at Wolsey's command, in resentment for Sir Amyas having set Wolsey, when a more parish priest, in the stocks for a brawl. Wolsey, at the time of the ignominious punishment, was school-master to the children of the Marquis of Dorset. Paulet

* Tinsley, Catherine-street, Strand. 1873.

was confined to this house for five or six years, to appease the great cardinal, who lives in Chancery-lane. Sir Anyas rebuilt his prison, covering the front with badges of the cardinal. It was afterwards 'Nando's,' a famous show-house, where he now picked up his great life. One night Thurlow, arguing here keenly about the celebrated Douglas case, was heard by some lawyers with delight, and the next day, to his astonishment, was appointed junior counsel. This case won him a silk gown, and so his fortune was made by that one lucky night at 'Nando's.' No. 17 was afterwards the place where Mrs. Salmon (the Madame Tussaud of early times) exhibited her waxwork kings and queens. There was a figure on crutches at the door; and Old Mother Shipton, the witch, tickled the astonished visitor as he left."

—Cassell's "Household Guide" gives a few hints on carpets:—

"Stair carpets should be in length a yard longer than is needful for each flight of stairs, so that when they are taken up for shaking (not beating), they may not be put down again in the same creases, and thus at a trifling expense the carpets will wear as long again as by the usual method of exact measurement. The length required is ascertained by allowing half a yard for each stair, and adding to this the length needed for their landings. Brass stair-rod's of the ordinary kind are not expensive, and the same are purchased by the dozen. Parlours with folding-doors are the most convenient for a small house, as the doors may be closed at pleasure; but both rooms should be similarly furnished as far as an carpet, chairs, and curtains are concerned. The patent 'felt' carpet is to be had in suitable tints; it is not expensive, and is easily made, and, when good, will wear tolerably well. There are many advantages in the felt carpet; not the least is, that when it is worn out in the centre, the sides which are good can be cut off, bound, and arranged for use as a carpet. There is also a machine which serves instead of buying hose-bladder, for cleaning door-steps, kitchen-hearths, and other rough work."

—The *Lithographer* says, as to staining and spotting of paper:—"Ink-stains, from common writing-ink, can best be removed by the use of chlorine-water, a solution of chlorine gas in pure water. The engraving should be wholly immersed in a very dilute solution, and, as soon as the marks disappear, be freely washed in pure water. Vegetable stains of most kinds will also yield to this treatment. As chlorine-water cannot always be obtained, we may use, especially for mere local spots, a dilute solution of the hypochlorites of soda or potassa, the so-called Labarraque's fluid, or *eau de javelle*, or, in default of either (but less suitable), a solution of ordinary bleaching-salts, hypochlorite of lime. In all these cases, there must be free washing with pure water. Grease-spots may be removed by the various kinds of hydro-carbon known as benzine, or in worse cases sulphide of carbon must be used. In such instances, great care must be taken, for these solvents not only remove extraneous grease, but they attack the oil of the printing-ink, and if they act too long or too powerfully they set loose the whole of the material of the ink, and the print or engraving will be destroyed."

—The Metropolitan Management Acts: Board of Works for the Westminster District. The Sixteenth Annual Report of the Proceedings of the Board, 1871-72. Mitchell, Parliament-street.—"This report has been issued in a printed form. Amongst other points of interest, the reporters record an outline of the costly litigation with Lord Auckland, in which the Board were worsted as regards the line of frontage in York-place. Allusion is also made to the case as to the line of frontage at the corner of Bridge-street, in which the certificate of the superintending architect of the Metropolitan Board of Works was quashed by order of the Court of Queen's Bench. The attempt is also referred to of the Board to obtain the consent of Government to the demolition of the houses in front of the Government offices between Charles-street and Downing-street, but which were required for temporary offices till the new offices were completed."

Miscellaneous.

Destruction of Wick Breakwater.—The effect of the waves in a gale on the new breakwater has been seriously to damage the works, which were executed on a new principle, with huge blocks of concrete. One of these, weighing, it is asserted, about a thousand tons, was laid down at the seaward end of the building, and so constructed as to give hope of resisting the most severe storms of winter. These hopes, however, have proved to be delusive, for this ponderous block was hurled from its place, leaving exposed to the fury of the storm the masonry on its landward side, which continued to be swept away as each successive wave dashed against and over the breakwater. Strong iron bars, measuring about 8 in. by 3 in., by which the masonry was secured, were twisted into all shapes, and broken.

A Ferry Steamer.—Illustrations are given in the current *Engineer*, of a steam ferry, for the conveyance of railway trains across the Little Belt, which has been recently built for the Danish Government railways by Messrs. Wigham Richardson & Company, of Newcastle-on-Tyne. The Danish Government have long had this service in contemplation, being desirous of making all the traffic of Scandinavia converge upon their country as well as the mail service from Finland. The ferry was to be so constructed as to cross the Little Belt in all weathers and at all seasons of the year. Usually the surface of the water is very calm, but occasionally in north-easterly storms there is a heavy sea running. Further, it was stipulated that the steamer was to be capable of taking on board 100 first and second-class passengers, 300 third-class passengers, and at the same time six of the largest trucks possessed by the railway administration, all fully loaded. The connecting bridges were also to be capable of supporting the heaviest locomotive engine and tender. Messrs. Wigham Richardson & Company have well carried out these conditions. The steamer is 110 ft. long, 26 ft. beam, and draws 7 ft. of water when loaded. It has been working uninterruptedly now for many months without any hitch. The last report from the engineer was as follows:—"I may state that the ferry and the whole arrangements are a most perfect success, and have been greatly admired by the French, German, and Russian engineers who have been sent by their respective Governments on purpose to see the arrangements."

The Master Builders and the London Carpenters.—It will be recollected that one of the clauses in the agreement signed between the Master Builders' Association and the carpenters and joiners in October last, expressed that 8½d. per hour should be the standard rate of wages for skilled men in London. A case came before the judge in the Southwark County Court last Saturday, in which a joiner, named Jepps, sued a master builder of the name of Jocelyn for 1s. 7d., being the balance between 8d. and 8½d. per hour for 39 hours' work. The defendant pleaded that he had several men working for him at 3d. per hour less than the standard rate of wages, and further declared he was not bound by the agreement with respect to the advance in wages, as he was no party to it. The judge said no master builder could plead ignorance of the agreement, and if he wished men to work for him for 8d. or 7d. per hour, he must make a special agreement to that effect. As there was no agreement of that nature with the plaintiff, he should give judgment for the amount claimed, with costs: in all, 7s. 1d.

Liability of a Workman for Damages owing to Carelessness.—At the Small Debt Court at Edinbrough, James Clark, house painter and decorator, sued John Monk, painter, for 11. 15s., as loss and damage sustained by pursuer in consequence of defender, by wilful carelessness or fault, breaking a pane of plate-glass while painting the sashes. In support of the claim, pursuer explained that defender was ordered to paint the cupola of a saloon, but not the lead by which it was bound. He painted the sashes and the lead, and, when nailing down the lead, broke the glass. Defender said there was no woodwork to paint, and he had to lift the lead to paint underneath it in order to prevent the rain from coming in. The sheriff said the fact of defender's not saying anything about the matter at the time looked as if it had been done through his fault; therefore the presumption was against him. Decree for the full amount was passed.

The Temple Gardens.—The Metropolitan Board of Works have had under their consideration the question of removing the ugly fencing front of the Temple Gardens, on the Barbican side, and replacing it with one of ornamental iron and stone. The design at first submitted by the engineer of the benches was considered extravagant, but a second design, presented to the parks committee of the Board, was approved, tenders submitted, and that of Messrs. Gibbs & Co, for 7,000*l.*, was accepted.

Indian Views at the Society of Arts.—Captain Lyon has fulfilled his promise of showing, by means of the camera, another series of photographic transparencies illustrative of the Indian Temple architecture. Having on the former occasion seen the principal views of the South, the audience was this time conducted, *via* Malta and Alexandria, to Madras and the North.

Fire at St. Andrew's Church, Southport. This edifice, which was consecrated so recently as July 23rd, took fire, on a recent Sunday night, after the heating apparatus, of course, had been at work. Some two months ago, the hot-air apparatus by which the church is heated set fire to the joists, but on that occasion it was happily discovered in time to prevent the destruction of the church. Since that time the vicar, instead of using this apparatus, has heated the church morning and evening by means of gas. On Sunday the apparatus was brought into requisition, the consequence being the entire destruction of the south-east end of the church. The apparatus being placed immediately below the organ, which was opened a few weeks ago by Mr. Bost, of Liverpool, that instrument has been entirely destroyed. The building and the organ, &c., are fully insured.

Professorship of Fine Arts, Cambridge. The Professorship of Fine Arts, on the foundation of Mr. Felix Slade, is vacant, and the election of the new Professor will be held on Wednesday, the 29th of January, 1873. The Professor is required to give annually in the University, in full term, and free of charge as regards members of the University, a course of not less than twelve lectures on the History, Theory, and Practice of the Fine Arts, or of some section or sections of them. The Professorship is tenable for three years, and the Professor may be re-elected. The Professor will receive by way of stipend the dividends of a sum of 12,000*l.* Three per Cent. Consolidated Annuities. He is not required to reside at the University. Candidates are requested to send their names to the Vice-Chancellor on or before Friday, January 17th, 1873.

Bishopsgate Ward Schools.—The opening of the new schools, between Skinner-street and Primrose-new, in Bishopsgate Ward, took place in the presence of the Lord Mayor, who presided; Sir William Tite, M.P., Mr. Alderman Lawrence, M.P., Mr. Lyall (governor of the Bank of England), and many others. The school now completed will accommodate 800 children. There will be an upper school and a lower school for boys, an upper school and a lower school for girls, a school for infants, besides a place in which religious services and lectures will be conducted. In all the schools there will be space for 1,500 children. There is also to be a Board school in the adjoining district. It is hoped that the school will be self-supporting, when the debt of 1,250*l.* is wiped away.

Builders in Birmingham.—A meeting of the master builders has been held to take into consideration the notices received from the men asking for an alteration in the working rules. The men, in these notices, demand an extensive rise of wages, and the carpenters and joiners require a reduction of hours as well. These are the principal points, but there are details as to working hours, &c. At the meeting the master builders agreed upon a new set of rules, which they will issue as a counter notice. The representatives of both parties will meet to discuss the points at issue, and in the event of their being unable to agree, the dispute will be, it is hoped, referred to arbitration.

New Bank, Swindon.—The County of Gloucester Banking Company have just opened a new branch bank at New Swindon. The building, which is from designs by Mr. William H. Read, of Swindon, is in the modern Italian style. On the ground-floor there is a hall, bank-room, strong-room, lavatory, and back parlour. On this floor in the rear are also the usual offices of a residence. The floor above consists of drawing-room, four bedrooms, and lavatory. The interior of the bank is fitted with wainscot polished oak. The exterior of the building is ornamented with some carving, executed by Messrs. Chapman & Stillman, of Bath. The contractor for the erection of the building is Mr. G. Wiltshire, of Swindon.

Telegraphic Improvement.—Some experiments have been made by the postal telegraph staff to ascertain the possibility of sending simultaneously two messages in opposite directions on the same wire. Mr. W. H. Freese, engineer of the Post-office, has spent fifteen years in experiments and study to perfect the process. The trial is said to have been a success. Messages were transmitted at the same moment both ways between London and Penzance, a distance of 330 miles, with perfect distinctness, and at the ordinary speed. Mr. Sendamoro and other officials were at the ends of the wire.

Restoration of the Church of St. Burian, at the Land's End.—This church has been unusually neglected, and is in a most deplorable state. An effort is now being made to collect funds for substantial repairs. The building has been examined by Mr. Butterfield. He reports that the church is in such a state that it must rapidly become a useless ruin, unless extensive repairs are made. It is in a peculiarly exposed situation, four miles from the Land's End, swept by winds from all quarters. At least 3,500*l.* are necessary to put the church in thorough repair. The *Cornish Telegraph* says that Mrs. Paynter offers 400*l.*; the Rev. John Tonkin, 200*l.*; Rev. T. B. Conlson, 200*l.*; &c.

Opening of a New Military Theatre at Chatham.—The new military theatre, which has been building for some time, and may be considered an offspring of the soldiers' institute, has been formally opened by Major-general Browning, C.B., the commander of the district. The small building is erected out of the spare funds of the institution, and cost considerably under 1,000*l.* There are a pit, a dress circle, and a gallery, calculated together to hold between 600 and 700 people. The interior is very simple. The seats are comfortable and the ventilation is said to be good. There is a communication between the stage and the billiard-room, which makes the two buildings one.

Right of Way at Bromley.—A practical protest, in the form of a demolition of 300 ft. of oak-fencing, has been made at Bromley, in order to test a right of way which it has been attempted to close up. As remarked by the *Bromley Telegraph*, "this may have been an exhibition of brute force, but it possessed this advantage over legal proceedings—that it was prompt and reliable, and it threw the onus of proof upon the adjoining owner. Should that gentleman intend to punish those who tore his palings to atoms, he must first prove that his fence had a legal right in the position from which it has been removed."

Art Lectures.—In a recent lecture at the Taylor Institute, Oxford, Mr. Ruskin described his recent visit to the Gustave Doré Exhibition, which he called the abomination of desolation—a mass of devils, corruption, and death: no life, no motion, nothing but the vilest art, and the vilest conception. After a bitter philippic against Doré, his admirers, and imitators, he closed the lecture by reading an address to his pupils, in which he told them that humility was one of the first rudiments of art, and that they must understand not only the technicalities of the great masters, but must have in them the spirit of that religion which called forth all the masterpieces of Medieval art.

American Journalism at the Vienna Universal Exhibition, 1873.—It is proposed in the United States that through and by the periodical Press of the country, the American system of common school education be thoroughly represented, both in its aim and its results. To that end, a single specimen number of every newspaper, magazine, or review issued in the United States, it is wished, should be exhibited; the collection also to embrace all periodical publications circulated gratuitously by tradesmen and others.

Combustion at the Gasworks, Marlow.—The overturning of one of the gasometers during the recent furious gale, occasioned much consternation in Marlow, as it caused the whole of the gaslights in the streets and private houses to be suddenly extinguished, and the gas on escaping from the gasometer became ignited and rose in a large volume of flame high into the air. The gasometer contained nearly 5,000 ft. of gas, but fortunately the flames were exhausted before any of the surrounding property became ignited.

Election of a Borough Surveyor for Durham.—At a special meeting of the Durham Urban Sanitary Committee held lately, a successor to the late Mr. Collinson as borough surveyor was appointed. There had been originally 39 candidates for the office, and out of that number four had been selected. The choice of the committee ultimately fell on Mr. Brunton, of Sunderland, who had a large majority.

Art in the 1873 International Exhibition.—The Commissioners have resolved to include in each annual Exhibition of the Fine Arts a representation of the works of one or more artists who have died in the preceding ten years. In 1873, the works of Messrs. Phillip and Creswick will be exhibited.

Fall of a Mission Hall.—At Salford a disaster has occurred in which a considerable number of persons were much injured, and the lives of over 200 placed in jeopardy. A tea-meeting was being held in the Mission-hall, the floor of which gave way, precipitating the mass of people into a large coal-cellar beneath. Naturally the panic was extreme, and it was some time before the struggling men, women, and children could be extricated.

Industrial News.—It is announced that a new half-crown monthly magazine is about to appear under the title of the "Practical Magazine." It will be "an illustrated cyclopaedia of industrial news, inventions, and improvements, collected from foreign and British sources, for the use of those concerned in raw materials, machinery, manufactures, building, and decoration." It is to be published for the proprietary at Printing House-square, next door to the *Times* office.

New Sewer at Weston-super-Mare.—The tenders for constructing a new sewer from Orchard-street to Clarendon, Weston, were—Ritson, London, 5,410*l.*; Neave & Sons, Bristol, 4,301*l.* 18*s.*; J. Harvey & Son, Torquay, 4,250*l.*; Stradling & Son, Weston-super-Mare, 3,995*l.* 15*s.*; W. Merrywear, Bristol, 3,825*l.*; G. Taylor, Weston-super-Mare, 3,245*l.*; J. Hand, Weston-super-Mare, 3,150*l.* The last-named tender, being the lowest, was named for acceptance to the Board by the local Drainage Committee.

Boring the Wealden at Battle.—Mr. Henry Willett (hon. sec. and treasurer to the exploration fund) has issued his first quarterly report upon the sub-Wealden boring. The recent bad weather has, it appears, rendered the work unusually heavy and tedious: 96 ft. is the total depth reached. The diameter of the bore is proceeding at the stipulated minimum (9 in.). Mr. Willett intends to try to get the originally proposed diameter (6½ in. to 7 in.) adopted; otherwise, he says, 2,000*l.* will not do it.

Monument to the late Sir Thomas Winnington, Bart.—A plain monument has just been erected in the churchyard at Stanford, over the vault in which are deposited the remains of Sir Thomas Winnington, bart. The lower stage consists of three chamfered stone plinths, on the uppermost of which rests a coped tomb of Sicilian marble, bearing a floriated cross. The monument is from the atelier of Mr. Joseph Stephens, of Worcester, who has contributed to the Cathedral, to the Cemetery, and places of sepulture there and elsewhere, many works.

The Bristol Assistant City Surveyorship.—Mr. Pape, of Manchester, has been chosen by the Bristol Improvement Committee assistant to Mr. Josiah Thomas, the city surveyor, at a salary of 200*l.* a year. Mr. Pape held a similar office in Manchester. Mr. Munro, of the Ordnance Department in Bristol, received seven votes to Mr. Pape's eight.

A New Church in Paddington.—The foundation stone of a new church about to be erected in Paddington, has been laid by Lord George Hamilton, M.P. The intended new church is situated in Desborough-terrace, Harrow-road, in the immediate vicinity of Westbourne Park, where the large increase of the population has rendered a new church necessary.

Opening of a New Town-hall at Wirksworth.—A new town-hall has been opened at Wirksworth. The building was designed by Mr. Bradley, of Liverpool, the contract being let to Mr. Thompson, builder, Derby. The design is semi-Gothic, freely treated, and comprises large assembly-room, shop, reading-room, billiard-room, sundry offices, and a covered market-hall. The total cost is about 7,000*l.*

Raising a Building.—An American paper states that more room is needed in the Washington Post-office, and, as a proposition to put another story on the top of the edifice met with opposition, the architect has decided to raise the entire building 20 feet from the foundation, and make the required enlargement from the base.

Mortuary for St. Martin's-in-the-Fields. The Vestry Committee appointed to consider this question, reported recommending that a mortuary be erected upon the burial-ground in Drury-lane, and the report has been adopted.

The Late Mr. Weightman.—The death of this architect, late of Sheffield, is announced. It took place at South Collingham. Mr. Weightman was in the 71st year of his age.

TENDERS

For Weston-super-Mare drainage. Mr. William Gas-	
kell, surveyor—	
Ritson	£5,410 0 0
Neave & Son	4,301 18 0

IMPORTANT SCIENTIFIC WORKS.

SCHELLEN'S SPECTRUM ANALYSIS, in its Application to Terrestrial Substances, and the Physical Constitution of the Heavenly Bodies. Translated by JANE and C. LASSELL; Edited, with Notes, by W. HUGGINS, LL.D., F.R.S. With 13 Plates (6 coloured) and 223 Woodcuts.

8vo. Price 28s.

AIR and RAIN: The Beginnings of a Chemical Climatology. By ROBERT ANGUS SMITH, Ph.D., F.R.S. F.C.S. Government Inspector of Alkali Works. With 8 Illustrations.

8vo. Price 24s.

THE SUBTERRANEAN WORLD. By Dr. GEORGE HARTWIG. With 3 Maps and about 80 Illustrations. Engraved on Wood by G. PEARSON, including 8 the full size of the page.

8vo. Price 21s.

THE SEA and its LIVING WONDERS.

With Several Hundred Wood Engravings; and an entirely New Series of Illustrations in Chromo-xylography, representing the most interesting Objects described in the Work, from Original Drawings by HENRY NOEL HUMPHREYS. By the same Author.

8vo. Price 21s.

HARTWIG'S TROPICAL WORLD: A

Popular Scientific Account of the Natural History of the Animal and Vegetable Kingdoms and the Equatorial Regions. With 8 Chromo-xylographic Plates, and about 800 Woodcuts. New Edition.

[Nearly ready.]

HARTWIG'S HARMONIES of NATURE;

or, the UNITY of CREATION. With 8 Full-Page Engravings on Wood, from Original Designs by F. W. KEYL, and about 200 Woodcuts in the Text.

8vo. Price 18s.

HARTWIG'S POLAR WORLD. A

Popular Description of Man and Nature in the Arctic and Antarctic Regions of the Globe. With 8 Chromo-xylographic Plates, 3 Maps, and 85 Woodcuts.

8vo. Price 21s.

OUTLINES OF ASTRONOMY. By Sir

J. F. W. HERSCHEL, Bart. M.A. Eleventh Edition; with 9 Plates and Numerous Diagrams.

Square Crown 8vo. Price 12s.

OTHER WORLDS THAN OURS: The

Plurality of Worlds studied under the Light of Recent Scientific Researches. By R. A. PROCTOR, B.A. Hon. Sec. R.A.S. Third Edition, revised and corrected; with 14 Illustrations.

Crown 8vo. Price 10s. 6d.

The SUN: Ruler, Light, Fire, and Life of the Planetary System. The Third Edition; with 10 Plates (7 coloured), and 107 Woodcuts. By the same Author.

Crown 8vo. Price 14s.

PROCTOR'S NEW STAR ATLAS, for

the Library, the School, and the Observatory, in Twelve Circular Maps (with Two Index Plates). Intended as a Companion to "Wehli's Celestial Objects for Common Telescopes." With a Letter-press Introduction on the Study of the Stars, illustrated by 9 Diagrams.

Crown 8vo. Price 5s.

THE ORBS AROUND US: A Series of

Familiar Essays on the Moon and Planets, Meteors and Comets, the Sun and Coloured Pairs of Suns. By RICHARD A. PROCTOR, B.A. Hon. Sec. R.A.S.

Crown 8vo. Price 7s. 6d.

ESSAYS on ASTRONOMY: A Series of

Papers on Planets and Meteors, the Sun, and sun-surrounding Space, Stars, and Star Cloudlets, and a Dissertation on the Approaching Transit of Venus. By the same Author. With 10 Plates and 24 Woodcuts.

8vo. Price 12s.

LIGHT SCIENCE for LEISURE HOURS:

A Series of Familiar Essays on Scientific Subjects, Natural Phenomena, &c. By RICHARD A. PROCTOR, B.A. Hon. Sec. R.A.S.

Crown 8vo. Price 7s. 6d.

THE ORIGIN of CIVILISATION and

the PRIMITIVE CONDITION of MAN; MENTAL and SOCIAL CONDITION of SAVAGES. By Sir JOHN LUBBOCK, Bart. M.P. F.R.S. Second Edition; 25 Woodcuts.

8vo. Price 16s.

THE ANCIENT STONE IMPLEMENTS,

WEAPONS, and ORNAMENTS of GREAT BRITAIN. By JOHN EVANS, F.R.S. F.S.A. Honorary Secretary of the Geological and Numismatic Societies of London, &c. With 2 Plates and 476 Woodcuts.

GEORGE WINGROVE, FRENCH POLISHER TO THE TRADE.
 No. 54, MOORE STREET, BRYANSTONE SQUARE, Golden Square.
 Builders' Work done on reasonable terms.

TO ARCHITECTS IN PRACTICE OR MANAGING ASSISTANTS EITHER IN LONDON OR THE COUNTRY.

AN ARCHITECT, of extensive practice in London, who is declining in health, requires the immediate ASSISTANCE of a young man, of mature age, of a good command of energy, energetic, and industrious proclivities, thoroughly qualified in every branch of his profession. References will be given and required. Names need not transpire until answers have been returned in the form submitted in the particulars. For particulars, address A. Z. under cypher, to any address the applicant may state, care of Nissen & Parker, 43, Mark-lane, London.

TO BRICKMAKERS and OTHERS.—WANTED, a Gentleman with about 2,000, as FACTOR (Sleeping or Active) in an established BRICKFIELD near Southend, in Kent, on Thames. The brick-works is a capital business, and for which there is a good local trade. Money wanted to pay off any advance and for working expenses, and to be used for the sole control of the firm.—Address, L. M. care of J. C. CANE, Esq. 13, Queen-square, Bloomsbury, W.C.

A FIRM of ARCHITECTS, SURVEYORS, and ESTATE AGENTS, in good practice, for a PUPIL. Must be one who has been well educated and has a taste for drawing. A premium required.—Address, L. G. VANCEY, Newport, Monmouthshire.

ENGINEERING PUPIL.—A Gentleman, C.E. in the North of England, is prepared to receive a PUPIL into his Office. Considerable professional advantages both as regards scientific training and practical experience are offered.—Address, 40, St. Dunstons-street, London, E.C.

BOROUGH OF RYDE.—Notice is hereby given that the Corporation of Ryde require a fit person to execute the duties of BOROUGH SURVEYOR, under the Local and Sanitary Acts, within the borough of Ryde. The Officer to be appointed must possess a thorough and practical acquaintance with works of drainage, sewerage, waterworks, road-making, and paving, and he must be competent to superintend the execution of all works of the kind above referred to or which may fall within the duties of a Surveyor to a Local Board. The Waterworks of the borough being vested in the Corporation, the Surveyor will be required to direct and superintend the management of the Works. The Surveyor will be required to devote his whole time to the service of the Corporation, and he will be paid a salary of 1500, per annum. Any further information respecting the duties of the office may be obtained on application to the Town Clerk. Candidates must send written applications to the Office, with testimonials as to qualifications and competency, and with particulars of age and previous occupations, and all applications must be sent to the Corporation, care of the Office of Surveyor, &c. on or before FRIDAY, the 10th JANUARY next, at ten o'clock, and the successful candidate will be named on FRIDAY, the 20th, 1872.

PADDINGTON.—WANTED, in the Surveyor's Department, a THIRD ASSISTANT SURVEYOR. He must be thoroughly conversant with the management of the repair of roads and the paving of streets, to prepare estimates of paving works, to keep accounts in relation thereto, and to perform all other duties under the direction of the Chief Surveyor, &c. on or before FRIDAY, the 10th JANUARY next, at ten o'clock, and the successful candidate will be named on FRIDAY, the 20th, 1872. Applications may be sent to the Office of Surveyor, &c. on or before FRIDAY, the 10th JANUARY next, at ten o'clock, and the successful candidate will be named on FRIDAY, the 20th, 1872.
 VESTRY-HALL, HARROW-ROAD, DECEMBER 23, 1872.

TO ENGINEERS, SURVEYORS, and OTHERS.
THE TOWN COUNCIL of the Borough of Dorchester desire to procure a competent Person to discharge the general duties of SURVEYOR to the Council. He will be required to render and superintend the management of the Corporate property, the waterworks, highways, and general works of drainage, and water supply, and to design, carry out, and record all such works on the General Plan of the Borough, and to make any arrangements, and salary required, to be made in writing, and delivered at the Office of the Town Clerk, in Dorchester, on or before the 31st JANUARY next. Offered December 11th, 1872.

PARISH OF CHELSEA.—INSPECTOR OF REGISTERED LODGING-HOUSES and DUST INSPECTOR. Notice is hereby given that the Vestry of this parish will, at their meeting, on TUESDAY, the 31st inst. consider applications for the appointment of INSPECTOR OF REGISTERED LODGING-HOUSES and DUST INSPECTOR. The salary, including travelling expenses, will be 500 a year. The person appointed will be required to square and cube dimensions, to reside in a central part of the parish, and to devote the whole of his time to the duties of his office. A statement of the duties (subject to additions and variations from time to time), with other particulars, may be seen here. Applications, in the candidate's own handwriting, with testimonials of recent date, as to character and fitness for the office, and of his own industry, number, may be sent in until TWELVE o'clock on the day above mentioned, and must be sent in under cover, indorsed "Application for the Appointment of Inspector of Registered Lodging-houses and Dust Inspector." For full and authentic particulars, apply to the Vestry on the day above mentioned, or to the Clerk of the Vestry, at the office of the Vestry, at the Town Hall, Chelsea, S.W., on or before the 31st JANUARY next. The expenses of application will have to be defrayed by the applicants, as not travelling or other expenses will be required. By order of the Vestry, CHARLES LAURE, Vestry Clerk, Vestry Hall, King's-road, Chelsea, S.W., December 18, 1872.

MADEIRA, S.W.—THE PUBLIC HEALTH ACT, 1872.—Notice is hereby given, that the Royal Sanitary Authority of this Union, in consequence of the Local Government Board at their Meeting, on the 17th inst. have resolved to appoint an INSPECTOR OF NUISANCES for the whole of the Union. The Inspector will be required to reside in the Union, and to devote his whole time to the duties of his office, and to superintend the execution of the Local Government Board. The number of inhabited houses in the Union at the census of 1871 was 6189. The appointment will be for one year, to be made forthwith, from the 17th JANUARY, 1873, at a salary of 4s. 6d. per week, which salary includes travelling and other expenses. Applications, with testimonials, to be sent in on or before the 10th JANUARY next, and the Candidates selected will receive notice to attend on the day of election. By order, HENRY BOYCOCK, Clerk, Ironbridge, December 17th, 1872.

RURAL SANITARY AUTHORITY.
 AN INSPECTOR OF NUISANCES is required for the Rural District of the Forth Union, in the counties of Montrose and Salsburgh, comprising an area of about 72,800 acres, including the town of Montrose, which may be considered to be one of the most populous of the United Kingdom. The salary will be at the rate of 2000, per annum, and the person appointed will be required to devote the whole of his time to the duties of his office, and to keep a horse at his own expense. The duties will be—1. To inquire, to make a sanitary survey of the whole of the Union, and to furnish a report thereon to the Sanitary Authority; and 2. To make such other duties as are contained in the Order of the Local Government Board, and by the regulations of the Board, as may be contained in such other orders or by-laws as that Board may from time to time issue or sanction. The appointment will be subject to the approval of the Local Government Board, and in the first instance be made for a term of three years. Candidates are requested to send applications in writing to the Clerk, at his Office, at Montrose, stating age, residence, past and present occupation, with recent testimonials, as to qualifications and character, on or before SATURDAY, the 11th day of JANUARY next. By order of the Sanitary Authority, WM. WILDING, Clerk, Montrose, 18th December, 1872.
