---	--

Nine to eight. This was done, be it remembered, with reference to St. Paul's Cathedral; and serves to show the usefulness of the committee as a body for the nationally important work in hand. If the question had been between the election of Mr. Burges and Mr. Somebodyelse, the vote would be perfectly understandable and probably quite right, notwithstanding the feeling of contempt for Wren's works which Mr. Burges has publicly expressed. But, stated as it was, it is positively beyond excuse. The mere fact that such a question was seriously put and debated should of itself lead the subscribers immediately to call upon the committee to resign. The composition of the body is entirely wrong. It should consist of painters, sculptors, and architects, with a certain number of laymen, as representing the general public. Amongst those who voted there is not a single painter or sculptor!

Mr. Fergusson, who is a member of the committee, but refrained too late to take part in the discussion, would have voted with the minority had he been present.

We are informed by a letter signed, Sills Joo. Gibbons (Lord Mayor), William Tite, James Fergusson, G. Cavendish Bentinck, John Murray, that, "considering that as regards Medievalism the voices of the committee were, in fact, equally divided; considering that Mr. Burges has limited his study and practice exclusively to Medieval works, and has not scrupled to express openly his contempt for the architectural works of Sir Christopher Wren (having, by his own admission, styled such works 'abominations'), certain members of the executive committee have resolved to call a general meeting of the subscribers to the fund, in order that they may have an opportunity of expressing their opinion on the course to be pursued under the circumstances."

Since the above was written, the Dean has denied in the *Times* that the question between a "Medieval" and a "Classical" architect for the work was debated: it must be obvious, however, that a certain number of the committee viewed the discussion in that light, or they would not have asserted it in public.

We willingly insert a letter addressed by Mr. Burges to the Dean with reference to his expressed opinion on the works of Wren:—

"With reference to my appointment at St. Paul's, may I be allowed to observe that any opinion I may have expressed in public upon the comparative merits of styles had reference to our present and future architecture, but not to the preservation and completion of the works of past ages?"

Thus, I have been employed in the completion of the chapel of Worcester College, Oxford, by decorating it in the cinque-cento style, and I may also observe that I have studied coloured decoration in Italy and Classic architecture at Athens.

As an artist I quite appreciate the privilege of being consulted as to the completion of the cathedral of London; and, whatever opinion I may hold respecting his details, I have never been so blind as to deny Sir Christopher Wren his just position as one of the greatest of our architects."

What has the Royal Academy done with reference to this national work? We should be glad to hear that the council had appointed a committee to consider the matter, and report upon it. It would not be more than the public has a right to expect from them.

THE PRESERVATION OF NATIONAL MONUMENTS.

In continuation of observations we have already printed, Mr. Young writes,—I find from a valuable communication of Mr. Kinahan in 1869, that the most interesting early buildings on the Connemara Islands are rapidly perishing. Of Ardullain, he says, "The ruins are all shattered and broken; tradition says they were in good keeping when The Martin held the wilds of Connemara. His successors look more to what can be taken out of the country than what is in it." "One cross only is in a good state of preservation—all the others and any carved stones are more or less injured." Of Innis Boffin he says, "The ancient buildings are all but swept from the face of creation, only a fragment of St. Colman's Abbey remains of all the buildings this island once possessed."

To turn to earlier and ruder monuments than these, we find that everywhere the earthen forts, raths, and megaliths are being swept away rapidly. The great series of cromlechs at Carronmore on Knocknacraugh Mountain, in Sligo, associated as they are in such an interesting way with the writings of Beranger in 1791, and Dr. Petrie in 1837, are being destroyed wholesale. Oh for an Irish Lullhook to step forward and save them! Curiously enough, the French authorities do not seem to recognise these objects (at least everywhere) as of sufficient value to protect them, for we now hear that in Brittany and Finisterre, and especially at Carnac, a great many are being destroyed. Nor are matters much better nearer home. For the following case I am indebted to a friend who has been in the neighbourhood. I mentioned the risk of being destroyed to which Avebury was exposed, and its now undoubted security, and it may be interesting to record that our Giant's Ring, with its central cromlech—a work only inferior to Avebury in importance, had even a narrower escape some twenty years ago.

The late Dr. Drew having paid a visit to Ballylesson, was taken to the top of the church tower for the fine prospect which it commands on every side. Being pointed out the Giant's Ring at Drumho, to his amazement and horror, he beheld men busily digging into the mound, and removing the materials to another place. He hurried into town, and wrote a strong-voiced

letter to the *Ulster Times*, a copy of which was sent to Lord Duggan, the owner of the soil. His lordship instantly directed that the circle should be inclosed with a proper stone wall, and no further interference with it permitted; and this came not a day too soon, for it then transpired that the leveling of the earthen mound or ring was only a portion of the *improvement* which the tenant had contemplated on the premises. He had entered into a bargain with a local road contractor, to bore, and blast with gunpowder, and then break into road metal, the huge trap boulders composing the cromlech, commonly called the Druid's Altar.

But sad as was the want of taste and feeling for antiquity at Drumbo, a more melancholy and deplorable case of this kind happened at the famous Con O'Neill's castle at Castlenegh. The owner (I believe the grandfather of the present Marquis of Downshire), hearing the old castle was much dilapidated, wrote to his agent to inclose the castle field with a wall. His orders were obeyed, but imagine his vexation and anger (for he had a strong desire to protect the old ruin) when he found, on visiting the spot that every stone of the old pile had been removed and used in erecting the wall, for which piece of economy his agent expected much commendation.

It would be unjust not to admit that there has come about a greatly improved state of feeling on these matters within the last thirty years, and specially is this true of the more cultured classes in England, although it is not confined to them. In Ireland, considering that only one association has been doing any active service during the last twelve years or so, it is much to their credit the large amount of valuable work they have effected with such limited means. I refer to the late Kilkenny—but now the Royal Historical and Archeological Association of Ireland—and may mention the following buildings of great interest, which, chiefly through the exertions of the zealous secretary (Mr. Graves), aided by members of the association, have been, by judicious repairs, placed in a state of security; viz.:—The Abbey Church of St. Francis, in the town of Kilkenny; the Round Tower of Clonmacnoise; the churches, crosses, and Round Tower at Monasterhose; and it is also proposed to effect similar repairs, as far as can now be done, to the remains of the seven churches at Glendalough, county Wicklow. But, making due allowance for improved public feeling, and for all that these private associations can undertake, it is painfully evident that there are at present no adequate means of dealing with the whole question of national monuments and their due preservation, such as the urgency of the case demands.

The first tangible recognition of the duty of the State in this matter is contained in the 25th section of the Irish Church Act of 26th of July, 1869. It provides "that where any church or ecclesiastical building or structure appears to the commissioners to be ruinous, or, if a church, to be wholly disused as a place of public worship, and not suitable for restoration as a place of public worship, and yet to be deserving to be retained as a national monument by reason of its architectural character or antiquity, the commissioners shall, by order, vest such church, building, or structure in the secretary of the Commissioners of Public Works in Ireland, to be preserved as a national monument."

The Act is manifestly incomplete, in not providing for a properly-qualified inspector being appointed, who would examine and report upon the buildings that should be considered national monuments. Perhaps it is as well that nothing has yet been done under this 25th section of the Irish Church Act, as Sir John Lubbock has given notice that he will introduce a Bill this session for the Preservation of National Monuments, both in Great Britain and Ireland; and I trust this 25th sec. may be repealed, and all the buildings worthy of being cared for placed under the one control.

From a draft of the Bill which has been kindly sent me by its author, I find a very simple machinery is proposed to be set up, resembling pretty closely the method pursued in France. Commissioners are to be appointed, who are to be vested with all the powers necessary to carry out the objects of the Act. Inspectors to be appointed by them, who will be charged with the duty of making out the lists of monuments worthy of coming under the operation of the commission. Provision made for compensating all owners whose private rights may be interfered with.

THE LATE PROFESSOR WESTMACOTT.

By the death of the late Professor of Sculpture in the Royal Academy we have lost an esteemed friend and valued contributor. Richard Westmacott, son of Sir Richard Westmacott, R.A., was born in London in 1799. His desire was to be brought up to the Bar, and it was only in accordance with Sir Richard's earnest wish that he became a sculptor. He studied under his father, and in 1820 proceeded to Italy, where he remained six years diligently occupied in examining the remains of Greek and Roman art, and investigating their history. The works of Mr. Westmacott are in many respects not unlike those of his father; graceful and tender in conception, with something of classic severity in the style, and never-failing purity of feeling,—but his genius was of a graver character, and he excelled in monumental and devotional subjects, and in fancies of a thoughtful and reflective cast. He was especially happy in the treatment of *relievi*. Among his classical and academic works may be noticed his *relievi* of "Venus and Ascanius," and "Venus instructing Cupid," executed for the Earl of Ellesmere; a seated statue of the "Cynthia Player," the property of the Duke of Devonshire; "Venus carrying Cupid," the statue of "Ariel;" "Paolo and Francesco," an admirable bas-relief executed for the Marquis of Lansdowne. More original in style are his fantasies the "Bluethel," and the "Butterfly," two bas-reliefs executed for the Earl of Ellesmere (1836-38). As examples of his monumental works, we may instance his recumbent figure of the Archbishop of Canterbury in Canterbury Cathedral, and that of Earl Hardwicke at Wimpole; and the Ashmolean monument, especially the grand figure of the "Angel Watching." Of his religious works we may mention the statue of "David as the Slayer of Goliath," "Prayer and Resignation," and the bas-relief of "Go and sin no more." Of late years Mr. Westmacott had been chiefly occupied on the execution of monumental and portrait sculpture. He produced busts of Sir F. Burdett, Sydney Smith, Sir R. Murchison, Lord John Russell, and other celebrated personages; but he was, perhaps, most successful in female busts. The group in the pediment of the Royal Exchange is from his chisel. Mr. Westmacott was also distinguished for his literary attainments. He has contributed several valuable papers to various serial publications; among others, the articles "Sculpture" to the "English Cyclopaedia," and the "Encyclopaedia Metropolitana," as also to the *Builder*, and he had delivered courses of lectures on the principles of sculpture at the Royal and London institutions. He also wrote one or two farces for the stage. He was elected F.R.S. in 1837; A.R.A. in 1838; R.A. in 1849; and succeeded his father as Professor of Sculpture in July, 1857. Mr. Westmacott died on the 19th ult., at his residence, 1, Kensington-gate, Hyde Park, after three days' illness, aged 73.

About a year before his death an accidental fall rendered his right hand useless; it was characteristic of his energy that he applied himself vigorously to make his left hand supply its place, especially in writing, and succeeded well.

THE BETHNAL GREEN MUSEUM.

It appears from a statement made last week by Sir Antonio Brady, at a meeting of the Whitechapel Literary and Scientific Society, that it is probable the new museum, which has been for some time in course of erection, in Bethnal Green-square, will be opened in the course of a few weeks. Sir Antonio Brady, who, along with the Vicar of Bethnal-green, and some other gentlemen, purchased, as our readers know, Bethnal Green-square, and gave one half of it to the Government, on the understanding that they would erect and maintain a museum upon it in connexion with that at South Kensington, complains very bitterly of the many difficulties which Mr. Lowe has interposed in carrying out the intention on which the East London Museum was granted by the Committee of Council on Education. He states that he holds the Chancellor of the Exchequer solely responsible for the delay in completing the building (which has now been in progress about four years), although to some extent he has been successful in battling with him, and he is now "sanguine enough to express a belief that within a month the building will be opened," and that her Majesty may be induced to take a part in the opening ceremony. Sir Antonio

has also another ground of complaint against the Government as respects the utilisation of the museum, in regard to which he imputes to them a breach of faith. He states that they have only granted 2,000l. for the maintenance of the museum during the first year, which is hardly sufficient to pay for the gas. He further states that he has reasons to believe that it is intended to open the museum only one week-day evening, and he expresses his determination to oppose this arrangement by mandamus, if necessary, as a breach of the agreement by which he, as one of the trustees of the land, transferred it to the Government.

The museum, which is built of red brick, in three spans or bays, is 190 ft. in length by 150 ft. in width; but the entire extent of the grounds is about 330 ft. by 190 ft., covering an area of 6,930 square yards, or something like an acre and a half, which is enclosed by iron railing, furnished by the Metropolitan Board of Works, and which, until recently, formed a portion of the railings of Hyde Park. At each side of the building there are thirteen windows, above which are mosaics, uniform with the frieze at the Albert Hall, and representing the several branches of industry, in manufactures and agriculture, together with the arts and sciences, as well as sculpture, astronomy, chemistry, music, and other studies. Running parallel with the west part of the building is a porch, composed of brick, glass, and iron, and this will be the principal entrance into the museum. It is intended to have the grounds around the building ornamentally laid out and planted, and amongst other objects of attraction will be the majestic fountain, which was one of the most prominent features of 1862. This specimen of art, which has been transferred from the Horticultural Gardens, is now in course of reconstruction, in front of the museum, opposite to the vestibule.

On the main approach, through the western entrance, leads into the central hall, which commands almost a complete view of the whole of the interior of the building. The floor of the central hall is paved with black and white marble tiles, in squares of about 1 ft. each. Eventually it is intended to place sculpture and other works of art around each side of the hall, which is very spacious. The different lays in the interior are respectively set apart for distinct specimens, in the various departments, and everything may now be said to be in its place ready for the opening, the arrangements in this respect having been completed about a fortnight ago, with the exception of the hanging of the pictures, which are more than 600 in number, mainly contributed by Sir Richard Wallace, and which is a remarkably fine collection. Sir Richard Wallace also contributes a considerable quantity of sculpture, bronzes, Sèvres china, and other rare and valuable articles, and the whole of the pictures and the last-named specimens have been conveyed to the museum, and are now being hung and arranged in the galleries solely at his expense.

The south bay of the building is devoted to the exhibition of animal products, which has for some time been stored up at South Kensington, but which has not hitherto been exhibited in consequence of want of space. The north bay also contains specimens from South Kensington, consisting of a good collection, whilst at the east end is displayed the "Museum of Economic Entomology," formed by Dr. Andrew Murray, late secretary to the Horticultural Society. The basement of the building is intended to be set apart for refreshment-rooms, apartments for the officials, and other similar purposes; but a portion of the space will be appropriated for sculpture, and also for the establishment of a library and reading-room.

THE STEPNEY SCHOOL COMPETITION.

At the usual weekly meeting of the London School-Board, on Wednesday last, the design submitted by Mr. T. Roger Smith was selected, and that gentleman was appointed to erect the school, with certain alterations.

With reference to an observation made in our notice last week of the designs for the Johnson-street School, that several of the class-rooms in Messrs. A. & C. Harston's design were approached from the central hall, those gentlemen write to say that they sent a second plan, in which none of the class-rooms are entered from the central hall. This is doubtless true, but it was not of the second plan that we were speaking. Com-

menting on the design of another competitor, they go on to say,—"If it is right that class-rooms should be entered from the central hall, then all the class-rooms should be so entered. If on the contrary it is wrong, let the whole have distinct entrances. We approve of your suggestion that the committee should take evidence upon these points before selection, as either scheme is better than a compromise, which neither combines the boys' and girls' rooms, nor thoroughly divides them, and to effect which all nity in the departments is sacrificed, and supervision rendered impossible."

ROSS WORKHOUSE COMPETITION.

Last week the Ross Board of Guardians met to select a design for their proposed new workhouse from five sets sent in competition.

The Chairman said, in reply to some observations made, that he did not think it would be worth while to take into consideration the probable cost of carrying out any of the plans, as such estimates, roughly made, were apt to be very fallacious. The Poor-Law Board would not sanction the adoption of any plan which was not drawn up on the basis of an estimated cost of 34l. per head of the inmates. That was the minimum cost sanctioned, and the Poor-Law Board did not like to entertain any proposal which was framed on an estimated cost of less than 40l. per head of the inmates. It seemed to him ridiculous in that case for an architect to propose to erect an entirely new building, to accommodate 300 persons, for 7,000l. At Mommonth, the estimated cost of the new Union buildings had been 11,000l., whilst the actual outlay amounted to 15,000l., and he thought they should confine their attention to selecting the most suitable plan, without reference to cost. There was also another provision rendered imperative by the Poor-Law Board, namely, that the cost should be sixpence per cubic foot of the entire building.

The merits of the plans were then discussed. "The set marked 'Idoneum' were framed at an estimated cost of building, according to No. 1 scheme, of 2,200l., and according to No. 2 scheme of 10,500l. The set marked with an 'intersected triangle' were based upon an estimated cost of building of 7,015l. The set marked 'Convenience' were at the following estimated cost of building:—Scheme A, 9,150l.; scheme B, 6,900l."

Ultimately the set marked "Idoneum" was selected, and was found to be by Messrs. Haddon, Brothers, of Hereford and Great Malvern.

The design marked with "Intersected Triangle" was found to be by Messrs. Lawrence & Goodman, of Bristol and Newport, Monmouthshire; and that marked "Convenience," by Mr. E. Power, London, and Mr. George Smith, Ross.

The clerk was instructed to communicate with Messrs. Haddon.

COMPETITIONS.

Chester.—The design of Mr. W. Botterill, of Hull, was selected in a limited competition a short time ago for a Wesleyan chapel to be erected on the City-road. The style adopted is the Geometric, and the design embraces a tower and spire. The contract has just been entered to with Mr. J. Stringer, of Sandbach, for 445l. 10s. The building is to be of Hambridge one. The accommodation is for 800 persons. The contract does not include the spire, and is so exclusive of lighting and heating.

New Church at Blundellsands.—In a limited competition of local architects for this new church, the committee, after consulting with Mr. E. G. Paley, of Lancaster, have accepted the designs prepared by Messrs. Hay.

Workshop.—The plans for schools selected in an competition have been approved by the committee of Council on Education. The design for larger boys' school is by Mr. J. F. Sinclair, of Orkney; of the smaller boys' school by Mr. H. Evergrove, of Buckingham-street, Strand, London, who is also author of selected design for 'Is' school.

Chorley Townhall.—The Improvement Commissioners held a special general meeting on Sunday evening, to receive the report of Mr. Ley, architect, Lancaster, as to the persons entitled to the premiums of 80l., 30l., and 20l. for the first, second, and third best designs for a new townhall. The clerk read Mr. Paley's report, which amounted to 10,000l. (the sum fixed by the commissioners), was quite insufficient to cover an area of more than 1,500 yards with substantial and well-constructed buildings, such the commissioners might be expected to erect

for the town of Chorley. In selecting the three best plans, Mr. Paley had therefore not taken cost into consideration, but carefully kept in view that the award should be given not to the finest architectural design and composition, but to the plan that shows the best appropriation of the ground, combined with the most suitable elevation; in fact, the competitors who have best studied the ground, and designs were selected as the best.—"Cotton," "To be or not to be," "Let Chorley flourish." Set No. 1. It was resolved to award the prizes in accordance with Mr. Paley's report, and the envelopes containing the addresses were opened.—"Cotton" is designed by Messrs. Ladds & Powell, of London; for the second, no address or name could be found; "Let Chorley flourish," is by Mr. J. J. Bradshaw, of Bolton.

THE BERLIN COMPETITION.

THE Berlin correspondent of the *Telegraph*, after commenting in not very flattering terms on the designs for the proposed German Houses of Parliament, submitted by French, Italian, and German architects, says,—

"The English competitors have not been trammelled, like their German rivals, by an accurate knowledge of Fatherlandish characteristics. The conditions give them *carte blanche*, and they have taken full advantage of the privilege granted. It may be, even if they have gone to extremes in the way of ornamentation, and rather designed fiery castles or 'mansions in the skies' than sober, business-like Houses of Parliament, destined to be erected in the most matter-of-fact city in the world. But they have erred, for the most part, on the side of beauty,—though there are one or two painfully ugly drawings. I regret to say, hearing English engineers, which is more than can be said for the majority of their country fellows. It may be, however, a subject of legitimate congratulation to British artists to know that incomparably the noblest in conception and most artistically carried out of all the designs exhibited is that of Mr. Wm. Emerson, a London architect, whose 'perspectives' are simply two of the most charming. His pictures that have been seen in Berlin for many a day; and I am informed upon first-rate professional authority, that the internal arrangements of the glorious Gothic building, which so grandly realises the prescription of the official programme in 'embodying the idea of a House of Parliament for Germany in a monumental sense,' are as practically excellent as its elevation is ideally magnificent. Next in attractiveness to Mr. Emerson's Waballs is a stately pile, surmounted by a lofty dome, that owes its being to the creative genius of Mr. Scott. The third and fourth honours, will, I fancy, be assigned to the designs of a Berlin and of a Hamburg architect; and the fifth prize may possibly fall to the share of another Englishman, whose drawings are hung between those of Mr. Emerson and those of Mr. Scott. The jury, I fancy, would be sorely puzzled to select from the remaining ninety-six 'Entwürfe' a sixth design that, if put into stone or bricks and mortar, would be pronounced by the world's verdict to be worthy of the great purpose to which the greatest nation on the continent of Europe has resolved to devote several of the millions it has won in the great game of war."

CAPPING REDCLIFF SPIRE.

A BRAVE LADY.

On the 9th inst., Ascension Day, the capstone and finial were placed on the spire of Redcliff Church, Bristol, in the presence of a vast number of persons gathered below to watch the proceedings. The ceremony was performed by the Mayor, Mr. W. Proctor Baker, and greatly increased interest was excited by the fact that the Mayoress accompanied her husband in the somewhat dangerous journey. Heavy rain, with thunder and lightning at the hour fixed, two o'clock, postponed the event, and would have daunted many. Not so, however, with Mrs. Baker. After the lapse of half an hour the rain ceased, and preparations for the ascent were renewed. The Mayor and Mayoress took their seats in the "lift," raised by a steam engine which has been used during the erection of the spire, accompanied by the clerk of the works. As soon as the hoist began to move, the vast crowd commenced cheering heartily, and the Mayor took off his hat and bowed his acknowledgments. The cheering continued all the time the hoist was slowly rising, and until its occupants were safely landed on the first stage, a height of 160 feet above the level of the hill. From this point to the summit of the spire the usual ascent is by means of ladders, but a special contrivance had been brought into requisition for the occasion. This consisted of a second hoist, worked by hand. It was merely two square boards, one over head and the other under foot, like the top and bottom of a box, with a rope at each corner, covered on three sides with a flag. Into this the Mayoress got, and was hoisted by the workmen to the top of the spire. Men were stationed at different points to prevent it swinging too much. Nevertheless, it did swing, and that sufficiently to make those below nervous. His

Worship showed his pluck by mounting the ladders, and he was not long in reaching the top. The next party hoisted up were the vicar of the parish, the Rev. Canon Randall, with his churchwardens, Messrs. C. B. Hare and Mervyn King. In the third hoist were the Rev. F. Auchmuty, one of the curates, and Mr. Edmund King. The whole party having been deposited at the top, the signal was given to raise the capstone, which had been placed in position early in the morning; and Mr. Baker assisted by the Mayoress, at once commenced to lay the mortar with a silver trowel. This done, the stone was carefully lowered, and the Mayor laid it in its place, in the name of the Father, Son, and Holy Ghost. The little group then gave a hearty cheer, and the men waved their hats. The people below caught the sound, and took it up, and a hearty and prolonged cheer announced the completion of the interesting ceremony.

A few words of congratulation and thanks were said by the Vicar, who remarked that the present proceedings were merely preparatory to those of the Cannynge Society's anniversary, fixed for the 28th of this month. The conclusion of the ceremony was the signal for the bells in the tower to ring out, and while the party descended joyous peals were given forth. When the Mayor and Mayoress reached the ground they received the deserved congratulations of a large body of friends.

The spire is octagonal in shape, with pannelled bands at intervals, and ball-flowers up all the angles, and from the summit of the tower to the top of the vane, not yet fixed, will be above 180 ft. in height, while the tower itself is about 110 ft. high, making a total of nearly 300 ft. It is built of Dundry stone, but the capstone is of Portland stone. This stone weighs about a ton, and is 13 ft. in girth, and 2 ft. in thickness; it is very fully moulded, fitted to meet all the angles of the spire, and a very excellent piece of masonry.

The work has been done from the designs and under the superintendence of Mr. Godwin (the conductor of this journal), by Mr. William Riee, the resident clerk of the works, and the men under his direction. The vane has been made by Messrs. Hart & Co., and is now ready for fixing.

PROPOSED SEWAGE FARM AT WALTON-ON-THE-HILL.

THE internal sewerage of the township of Walton having been completed, according to plans of Messrs. Reade & Goodison, civil engineers, of Liverpool, the local Board instructed them to select suitable land for a farm upon which the utilisation of the sewage as originally provided for could be carried out.

The land selected lies in the valley of the river Alt, about two miles below the present outfall into Fazakerley Brook. It contains 104 acres which, with the present population, gives about an acre of land for every sixty inhabitants. The whole area can be commanded by gravitation from the present subsidence tanks, and it is proposed to construct a storage reservoir on the farm sufficiently large to contain twenty-four hours' supply of dry weather sewage. The sewage is to be conveyed by a sewer 2 ft. diameter, at an inclination of 1 in 1750, and thence from its termination by an 18 in. diameter cast-iron pipe taken under the Alt, in the form of a syphon, and discharging into the storage reservoir. The estimated cost, including sewer, distribution, land, tenants' compensation, &c., is 26,600l.

On May 3rd, an inquiry was held at the Black Horse Inn, Walton, by Mr. Robert Morgan, the Government inspector, with reference to the proposed compulsory purchase of the land selected for the farm. Mr. Gallely appeared for the Board, and Mr. Potter, for Lord Sefton, the owner of the land, who opposed the granting of the application.

Messrs. Reade & Goodison, in evidence, stated that they were well acquainted with, and had frequently examined, all the land in the valley of the river Alt available for sewage purposes, including that in the scheme brought forward by Lord Sefton, and were of opinion that the land selected was, as regards soil, subsoil, and levels, the best attainable, and admirably fitted for the purposes of a sewage farm. That the subsoil being mostly a sharp clean sand, free from pebbles, and lying upon the boulder clay, with a maximum depth of from 12 ft. to 15 ft., would give ample opportunities for efficient under-

drainage. They estimated the cost of distribution, and laying out the land as a sewage farm, at 20s. per acre, and considered that 160l. per acre would cover the cost of the land, including all compensations and expenses. The whole could be commanded by gravitation from the storage reservoir.

Mr. M. O. Tarbotton, borough engineer, of Nottingham, gave corroborative evidence.

On behalf of Lord Sefton, Mr. A. Orridge, the surveyor to the West Derby local Board, produced a counter scheme for the utilisation of the sewage of Walton, on a portion of the Fazakerley Hall estate, and Mr. Hope supported his views, and condemned the Walton Board's scheme.

CO-OPERATIVE BUILDING SOCIETY AT BARROW.

THE new town and port of Barrow-in-Furness, which has so rapidly grown, and the population of which is constantly increasing, has on more than one occasion been noticed in the columns of the *Builder*. The very great demand for house accommodation on the part of the daily influx of new residents brought to Barrow by the new works which give employment to such a large number of artisans, has led to the establishment of a co-operative building society on a rather novel scale. The society, which has been named the "Barrow Co-operative Building, Investment, and Land Society," has for its objects the buying and selling land, the erection of dwelling-houses and other buildings, the buying and selling of property, and the lending of money to members on the security of real and personal property, and already a large number of shares have been taken. The society includes in its operations the purchasing of houses which members may desire, by paying according to the cost.

THE NEW PUBLIC ROOMS, TUNBRIDGE WELLS.

THIS building has been opened. It is in the Byzantine style of architecture, from the designs of Messrs. Wilson & Wilcox, architects, Bath, the builders being Messrs. Willcombe & Oakley, of Tunbridge Wells, and the cost amounted to something like 11,000l. It is composed of two wings, with large hall at the back, and the material used in building is white brick, with Bath stone dressings. The approach at the front is by a vestibule, 12 ft. wide. The wings have Mansard roofs, with ornamental iron railing round the top, and with dormer windows. The wings are built suitable for other purposes than the public rooms, and have private entrances at the sides. The rooms upstairs are approached by a staircase, with large horizontal light over, connected with the club-room, the reading-room, and the library over the vestibule. On the ground-floor there are eight windows in addition to those in the wings, and each wing consists of five floors with three windows on each floor. The circular-headed windows are separated by pilasters with carved caps and key stones, and ornamented with moulded bosses. The extreme length of the building is 114 ft. from outside wing to outside wing, and the extreme depth of the frontage of the wings to the back room is 109 ft. The great hall is 100 ft. long, 42 ft. wide, and 35 ft. high. It contains a movable platform with orchestra, the platform being divided into three compartments. It is therefore of some width (about 22 ft.), and a depth of 40 ft. The ceiling is divided into thirty-six panels, each of which is decorated, some with large (ventilating) centre flowers and others with flowers to harmonise. The walls are also divided into panels with pilasters—moulded caps carrying the ribs forming the panels. For a height of 9 ft. the walls are decorated with painted drapery. The room is lighted with a large chandelier in the centre, and two smaller ones at the ends, with eight still smaller ones intersected, the large one having 63 jets, the two smaller 90, and the remaining eight 192, making a total of 345. There are three retiring-rooms for professionals, with ladies' and gentlemen's cloak-rooms. The reading-room is 49 ft. long, 34 ft. wide, and 22 ft. high; the billiard-room is 25 ft. long, 18 ft. wide, and 16 ft. high; the club-room is 46 ft. long by 16 ft. wide; and the library 15 ft. long by 16 ft. wide. In front of the main building, and extending the whole length, is a stone balustrading and façade over the *portes cochères*.

THE NEW USE FOR SOLID DEPOSIT OF SEWAGE.

THE new use to which the solid contents of sewage is being put, for the sake of experiment,—viz., making it into a first-class hydraulic cement,—by General Scott, is thus spoken of by the London correspondent of a Manchester paper, who has seen the process:—

"General Scott, to whom the public is indebted for the erection of the Albert Hall, and much of the arrangements in connection with the International Exhibition, has made a very remarkable discovery, which is likely to solve the problem of what is to be done with town sewage. His process is to be seen in actual working at Ealing, a town of 10,000 persons, about five miles from London. I have just paid a visit to the works; and a description of them may be interesting. Near the end of the town, a mixture of eight parts of limo and one of clay is thrown into the sewer, and is allowed to run down the sewerage to a piece of land, about half a mile from Ealing. The mixture here passes into a long tank, and the solid matter having been deposited in the tank, the water passes off almost clear, and free from smell. The deposited sewage looks like mud. It is taken from the tank to a drying place, not unlike those used in a Cornish china-clay works. There it is dried by a fire, is then passed through a pug-mill, and then passed through a brick-machine. The bricks are finally placed in a kiln, and calcined; and the result is an hydraulic cement, equal to any Portland cement in the market, and saleable at a considerably lower price. By a little alteration in the precipitating ingredients, other cements may be obtained. The sewage contains such a large quantity of hair, rag, straw, and other combustible substances, that it supplies, to a large extent, its own fuel; and coke and inferior coal may be used in the kiln. But cements are not the only produce which is obtained from the sewage. By treating it with limo, a serviceable manure is obtained. General Scott and his brother (Mr. Thomas W. Scott, late of Plymouth, who is superintending the works) hope to do even more than this. It is well known that the most valuable fertiliser in manure, the ammonia, passes off in the water; and the question is if this can be extracted. As it would be worth 60s. a ton, there is clearly room and inducement to experiment. Two of the three Commissioners appointed to inquire into the pollution of rivers,—Dr. Frankland, the chemist; Mr. Morton, the well-known agriculturist (the third Commissioner, Sir William Denison, is dead),—have been to Ealing, and come back highly delighted. Deputations from Leeds and Birmingham have also been greatly struck by the process. It has, of course, been patented, and probably a company will be formed for the purpose of working it, either directly or (more likely) by granting the use of the patent on a royalty."

THE NEW SHOREDITCH INFIRMARY.

ON a site close to the Shoreditch Workhouse, in Kingsland-road, the local guardians have erected a new infirmary for the sick poor. The building is connected with the adjoining work-house, and the frontage faces Ilkerton-street. On one side the building is bounded by the parochial relief offices, and on the other by the row of dilapidated cottages called Reeve's-place. The frontage is ornamented by a vestibule, with Corinthian columns, bearing a feeble representation of a Corinthian capital. The portals having been passed, the visitor finds himself in a spacious apartment, surrounded by a skirting of encaustic brick of vermilion hue, and polished like a mirror. Surmounting the skirting stands the interior of the gault brick wall,—that material being perhaps better known as Burham brick, from the fact that it is extensively used in the construction of London sewers.

The cornice of the apartment consists of a variegated belt of encaustic and Burham brick, which gives a slightly appearance to the reception-room, which is upon the ground flat, with a palisading of metallic rails, enclosing the area of the basement story. This entrance-hall, which is about 24 ft. square, leads along a corridor, with consulting rooms on each side, to an apartment fitted up designedly as a receptacle for drugs, surgical instruments, &c. Along the range of the building through which the corridor extends are rooms for the accommodation of the medical superintendent, matron, nurses, and the ordinary staff of auxiliaries. All is arranged

upon a methodical and economic scale, devised by Mr. Lee, the architect of the establishment. Messrs. Hill, Keddell, & Waldram were the contractors, at a little over 16,000l. A. B.

SCHOOL BOARDS.

St. Austell.—At the meeting of the St. Austell School Board, on Saturday, the 11th inst., the competitive designs of Mr. Sylvanus Trevail, of Par Station, were adopted for the Pentewan and also for the Town or Central Schools. The former is to be a mixed school, to accommodate 100 children. The latter will be the central schools for the St. Austell district, which are to provide accommodation for 500 children, and will comprise boys' and infants' schools, each 60 ft. by 20 ft.; girls' school, 40 ft. 6 in. by 20 ft.; two class-rooms and a board-room, each 20 ft. square; a teachers' residence, containing nine rooms, with all necessary entrances, offices, &c. The designs of Messrs. Dwyer & Sons, of Plymouth were considered to be the next in the order of merit.

Bridgwater.—The Bridgwater Board has resolved to apply to the Education Department for the loan of 2,800l., to pay the cost of erecting new schools in the eastern portion of the town. It is in contemplation to erect another set of schools in the western part, to meet the requirements of the department.

Braford.—At a meeting of the Board, a deputation was received from Little Horton and West Bowling, praying the Board to proceed with the erection of Ryan-street school. The memorial was referred to the Statistical Committee. It was agreed that the plans of the following schools should be again presented to the Education Department for approval, and with a request that the department recommend the Public Works Loan Commissioners to advance the necessary funds:—Feverham-street schools site and buildings to cost 17,982l.; Bowling Back lane school, site and buildings to cost 9,250l.; Ryan-street school, site and buildings to cost 11,300l. Plans of the following schools were adopted and ordered to be forwarded for the approval of the Education Department, with a request that the Loan Commissioners be requested to advance the necessary funds:—Infant school at Horton Bank Top, the buildings to cost 3,465l.; Whetley-lane school, the erection to cost 7,800l.; and Lily Lane school, the building to cost 7,700l., and the roads and drains 250l. In addition to the price already paid for the land.

Epworth.—The question of the plans received for schools on the Wherstead-road and Argyll street sites has been discussed. A suggestion was made that a selection of the best two should be made, and the chairman observed that he thought it would be comparatively simple to reduce the plans to that number. The Board then considered the plans in committee. The designs for the proposed schools on the Wherstead-road and Argyll Estate sites, which have been submitted to the School Board, have been opened to further inspection in the library at the Town-hall.

Brighton.—Some discussion took place at the meeting on the recommendation of the General Purposes Committee, "That the Board do issue advertisements inviting architects to send designs for the new schools to be erected between Sussex-street and Richmond-street, after the contract for the purchase of the site has been signed." Mr. Hack suggested that the Board should make known to the architects their views as to the arrangement of seats in the Board schools; and he also thought it advisable that the seats should have backs, and that not more than two scholars should sit together at a desk. After some discussion the chairman suggested that this and other minor matters should be embodied in a report, and considered at a future time. Mr. Hack moved that, in accordance with the permission already given, and without waiting for the reply to the amended report to the Board, immediate steps should be taken to provide infant schools where most needed. Mr. Hack said that, according to the original statement, accommodation was needed for 2,000 infants; but the conversion of the Circus-street School would reduce this number by 250, and the new Ivory Lane School, when built, about 250. This, however, was only 500 out of 2,000. There was a great deficiency in District No. 2, and he proposed that, if possible, there should be a school in the neighbourhood of the Queen's-road, where there were 400 or 500 small houses and no infant school. He would also propose

that another be placed at the bottom of Gloucester-street or Trafalgar-street. In District No. 3 there was a deficiency of 215, which one school would supply, and it might be placed near the London-road. In District No. 5 there was a very large deficiency (981). This would partly be relieved by the new school in Ivory-place, which abutted on the district, but there was ample room for a school higher up the hill, where the houses are increasing very fast. When accommodation for 1,000 infants had thus been provided, they would be able to get to work better. The subject was referred to the committee.

"NATIONAL HEALTH SOCIETY."

A MEETING was held at the rooms of the Social Science Association on Friday, the 10th, to confer with some ladies, who have formed a society for the cultivation of the knowledge and practice of sanitary laws. Among the ladies of the society are Miss Twining, Mrs. William Grey, Miss E. Blackwell, Madame Parkes-Belloc, Baroness M. de Rothschild, Madame Bodichon, Mrs. Kingsley, and Miss Goldsmid. Among the gentlemen present were Mr. George Hastings, Mr. Ernest Hart, Mr. E. Chadwick, C.B., Dr. Steveling, Dr. Corfield, Mr. Westlake, Mr. Pears, and Dr. Hardwicke. A lucid statement made of the objects of the society showed that it proposed to assist in the formation of local societies, to induce schools to include sanitary instruction in their teachings, and to form an office for answering questions from private individuals and others as to the proper modes of procedure in cases of sanitary difficulty, and to establish a reference library, with plans, models, and papers. In the discussion which followed, several of the ladies spoke of the great difficulty they had themselves experienced in their endeavours to apply sanitary laws, and they mentioned the desire which many ladies had to assist in this properly home work. Mr. Hastings, Mr. Hart, and Mr. Chadwick spoke with regard to the means of organising, and as to the practical means of working such a scheme; and it was understood that the National Health Society would formally apply to be admitted as an affiliated society to the health department of the Social Science Association. The new society has a fund of several hundred pounds, and a fair list of members, and the general opinion of the meeting was that by a judicious and active maintenance of its programme it would render assistance in an important movement.

SHRINES.

SIR,—In restoring the shrine of St. Alban it would be interesting to compare it with the remains of the shrine in the church in Dorchester, Oxon. The portion existing comprises the groined covering to the ten niches: it is of quite as elaborate a character as that at St. Alban's, and the arrangement is identical: the covering is constructed in four stones jointed over the three partitions between the niches, the entire length being 7 ft. 6 in. I regret that I had not time when at Dorchester in 1867 to make a drawing. I could have offered to illustrate the subject; perhaps since then other portions may have been discovered. S. J. NICROLL.

MODEL DWELLINGS, CLERKENWELL.

THE building of a block of model dwellings, Rawstone-street, by the Brewers' Company, mentioned by the *Clerkenwell News*. The latter says,—“Bronchitis and affections of the throat and lungs have—say the doctors,—been prevalent in buildings of this kind, by reason of the openness of the staircase and landings. The Brewers' Company's dwellings are erected with a view to obviate this discomfort, the slips and landings leading to the different tenements being either protected from the inclemency of the weather. At the same time there is sufficient ventilation and air. The block in question is four stories high, and consists of three distinct rows in a row, with three separate entrances. After ascending a stone staircase, we reach a landing, which divides two distinct sets of rooms sufficient, in size, to accommodate two families decently. The number of tenements provided is eight in each house, or twenty-four altogether; each set contains a living-room, 13 ft. by 10 ft., and two bed-rooms, respectively 10 ft. by 10 ft., and 9 ft. by 7 ft.; a scullery, water-closet, pantry,

a place for coals, a shoot for dust, with all the necessary fittings. The building is of fireproof construction throughout, and has a flat roof overlooking Northampton-square, which is admirably adapted for a drying-place. Its altitude will no doubt render it a pleasant lounging retreat in the spring and summer months. Mr. E. H. Martineau, architect, Lincoln's-inn-fields, has designed the building, and the contractors are Messrs. Cubitt & Co.”

A MILLINER OF A MILLION.

WE have often admired, on the person of a charming little lady of our acquaintance, the tasteful draperies provided by Madame Louise, the Court milliner of Regent-street; but it never occurred to us that we should have to give this *artiste* public praise. However, so it is. Hanover Church, in Regent-street, designed by the late Professor Cockerell, has long been in a miserably dilapidated condition, both inside and out; and, unless we are misinformed, the lady in question has undertaken to defray a considerable portion of the cost of putting it into repair. It is to be hoped the work will be confided to good hands.

GUERNSEY.

WE hear that the building committee appointed by the States, of which Mr. Henry Tupper is chairman, have determined on re-arranging the present Fish and Vegetable Markets, and adding an extensive wing to the existing building. The work has been entrusted to Mr. John Newton, architect. £6,000 have already been granted by the States towards this object, but it is expected that the necessary alterations will considerably exceed that amount. The work of demolition of the old buildings is progressing with a view to clearing the site, under the local superintendence of Mr. Duquemin, the States surveyor.

THE TRADES MOVEMENT.

LONDON.—On Saturday and Monday last meetings of carpenters and joiners have been held, the first meeting being of delegates, and the last a general meeting, to determine on the course to be taken in consequence of the masters having refused to comply with a memorial requesting that the hours of work be reduced from fifty-six hours and a half to fifty-one hours per week, and that the wages be advanced from 8d. to 9d. per hour, making 1l. 18s. 3d. per week. The meeting was numerously attended, St. James's Hall being quite full. Mr. Lloyd Jones occupied the chair, and opened the proceedings by an address on the economical phase of the question, contending that the men were perfectly justified in their endeavours to attain the objects they desired. Mr. Wright moved the first resolution:—“That this meeting fully approves of the course taken by the delegates from the carpenters and joiners in the London district in the memorial to the employers for a reduction of the hours of labour from ten to nine hours a day, and for an advance in the wages from 8d. to 9d. an hour.” The motion was seconded by Mr. Pensum, supported by Mr. Hurry, and unanimously carried. Mr. Sadler read the proposed new rules, the principal of which were, that the hours of work should be nine per day, except Saturdays, when they should be six hours, making fifty-one hours per week; that the wages be 9d. per hour; that overtime be paid for at the rate of time and a half, and double after certain hours, but be discontinued; that piecework be totally abolished in the London district (the meeting showed their high approval of this particular rule by cheering loudly when it was read); that no alteration be made in these rules without six months' notice; and that any proposed alteration be submitted to the arbitration of an equal number of masters and men. He moved a resolution approving of those rules. Mr. Hilley and Mr. Butler spoke in support of the resolution, which, like the former one, was agreed to unanimously. Mr. Sinclair moved the following resolution, which was afterwards carried:—“That this meeting views with dissatisfaction and regret the position taken by the Master Builders' Society in refusing to receive a deputation from the carpenters and joiners of London to discuss the terms of their memorial, having thus ignored our claims and disregarded our overtures, leaving us the only alternative for adopting the necessary means for

enforcing what we believe to be a just and reasonable demand; and this meeting is of opinion that we should take action on the 1st of June, by ceasing work in such firms as the delegates shall decide, unless in the meantime the employers made known their willingness to accede to our demands; and we hereby pledge ourselves to give all the moral and pecuniary aid in our power for the furtherance of the movement.”

Stafford.—An advance of wages and the nine-hours system for winter work have been conceded to the carpenters and joiners of North Staffordshire.

Conington.—The strike of bricklayers, joiners, carpenters, and other branches, for the reduction of time, namely, half an hour per day, has come to a termination. The masters held a meeting, and agreed to grant the concession required, but in the event of any further demand or alteration, six months' notice to be given by both masters and men. The workmen have returned to their employment.

Morpeth.—The master builders of Morpeth (with the exception of Mr. James Middlemas), having declined to reduce the working hours to fifty per week, the working masons of the town met, and resolved to strike at once, and remain out till their demand, of which the masters had two months' notice, is conceded. The strike, however, has since terminated, the masters having agreed to the terms asked by the men.

Durham.—The journeyman painters of Durham turned out on strike in consequence of the masters having declined to accede to their request for the nine-hours movement. Hitherto the men, who are paid by time, worked 56½ hours for a fraction within 26s. per week, and this time they have asked to be reduced to 54 hours per week, without any corresponding deduction in their wages. After remaining out for a couple of days, one or two of the masters acceded to the application of the men, and we understand that the others have since agreed to their terms, and the men have consequently returned to their work.

Dundee.—A short time ago the journeymen plumbers of Dundee memorialised their employers for an increase of wages from 5½d. and 6d. to 6d. and 6½d. per hour. Six of the masters complied with the request; but in the other shops, both in Dundee and Broughty Ferry, the men came out on strike.

Waterford.—The Waterford carpenters, masons, and plasterers went out on strike for an increase of wages to 2s., and the master carpenters conceded the advance.

Berlin.—The united master masons, builders, and carpenters, have met, and the conditions as to time and wages granted to the Eastern trade-unions of the journeymen masons and builders were unanimously conceded. By these conditions the day work is to consist of ten hours, and the rate of payment to be from 1 l. 3 of a thaler to 1½. It has, therefore, been determined to resume work at once.

Copenhagen.—A daily paper, called the *Socialist*, has been established, and also an International Society, with a person called Pio as “Grand Master.” The International arranged a general strike of the masons and bricklayers, who had their wages increased seven or eight months ago. Several hundreds left work, and were followed by the majority of the masons. The strike has now gone on for five or six weeks, and no other workmen can be got. It was arranged in the midst of some unpleasantness with the authorities, to have an open-air meeting, but this has been prevented.

THE THREATENED STRIKE IN LONDON.

SIR,—I observe in the reports of the meeting of carpenters and joiners at St. James's Hall, that complaint is made that the Builders' Society declined a discussion with a deputation of their body. The only reason for such refusal is that there was really nothing to discuss. The Builders' Society had only just seen a deputation of the Operative Masons, and it appeared that there was but one point of difference, viz., whether the employers would increase the wages from 8d. to 9d. per hour. The employers consider that 8d. per hour is a liberal rate of wages for an ordinary mechanic, and declined to increase it. The operatives said that they would not have less than the present hours, viz., fifty-six and a half per week, unless the wages were raised to 9d., so that there was no use in going into the discussion of hours at all. The present

hours of builders in London are, as you are aware, fifty-six and a half in summer and fifty and a half in winter. The engineers and other trades have recently agreed to work fifty-four hours all the year round. The question of hours therefore can be no grievance, and is really mere moonshine, and designed only to throw a mist over the subject. The strike of the carpenters and joiners, if it take place on the 1st of June, will be for a rise of 12s. per cent. in wages, and for that alone. Moreover, one of the speakers at St. James's Hall (Mr. Wright) expressly said, when they had got the 6d. they could go in for something more. Considering as we do that 8d. per hour is a liberal payment, it will be our duty on this occasion to resist to the utmost a rise.

A MASTER BUILDER.

SIR,—A short time since we received circulars from the Masons' and Joiners' Societies asking for a concession of the fifty-one hours per week and rise of wages from 8d. to 6d. per hour. We considered this an unreasonable demand, and, on a conference with our men, they unanimously accepted our offer of a working week to consist of fifty-four hours, and wages at the rate of 8d. per hour; and the joiners, masons, and metal-workers in our employ have for some weeks been paid on this scale. This is a compromise which we believe master-builders in London would willingly give, and we also believe the large majority of men would gladly accept if they were allowed to do so by those who profess to represent them. The hardship and misery entailed on the working classes by these unfortunate strikes, is incalculable, and we do hope the present dispute will be amicably settled without recourse being had to any extreme measure.

Cox & Soxs.

THE DOCK AND WATERSIDE LABOURERS.

An organisation or union, embracing the dock wharf, waterside, and general labourers, was formed a few days ago, and already counts several hundred members. The object sought is to obtain a uniform rate of pay for all, at the rate of 6d. per hour while employed. The condition of the dock labourer has for a long time been very wretched indeed, and nothing is more pitiable than the sight of numbers of men in cold and many weather, standing outside the dock gates, shivering with cold and hunger, anxiously waiting for "a call." Scarcely when a sympathy has been expressed for the cabman and his horse, and efforts are making to afford him a covered stand while waiting for a "fare," the dock authorities ought to be moved with a Christian feeling to provide even a temporary wooden shed, with seats, somewhere within the dock gates, for those labourers who are in the habit of being employed by them.

There is not the least difficulty in the way, and the act would conduce to the respect of the dock management, and put an end to a rather dismal street exhibition.

GENERAL MEETING OF THE ROYAL INSTITUTE OF BRITISH ARCHITECTS.

The annual general meeting of the Institute was held on the 6th inst., Mr. T. H. Wyatt, president, in the chair, when the annual report of the Council for the current year was read and adopted. The report mainly reviewed the past, with which our readers are already acquainted. The following gentlemen were then elected office bearers for the ensuing year:—

President,—Thomas Henry Wyatt. Vice-Presidents,—Horace Jones, A. Waterhouse, John Gibson.* Ordinary Members of Council,—G. Aitchison, B.A., W. Burgess, T. T. Bury,* Z. C. Clarke,* H. Dawson, Professor Kerr, E. H. Martincau,* Harry Oliver,* W. Papworth,* R. L. Rommie, J. P. St. Aubyn, R. J. Withers,* W. M. Fawcett, J. Fowler, E. Sharpe, M.A., Honorary Secretary,—F. P. Cockrell (foreign correspondence). Secretary,—C. L. Eastlake (home duties). Auditors,—Ewan Christian, Fellow; E. J. Tarver, Associate. Honorary Treasurer and Banker,—Sir W. R. Farguhar, Honorary Solicitor,—F. Conry.

The following gentlemen were appointed as a Board of District Surveyorship Examiners:—

G. Aitchison, B.A., J. Belcher, W. A. Boehm, H. Dawson, C. Fowler, C. F. Hayward, F.S.A., E. F. Anson, F.R.G.S., J. Jennings, Professor Kerr, J. T. Knowles, Professor Lewis, F.S.A., E. Nash, C. C. Nelson, F.S.A., H. Oliver, E. W. Tarr, M.A., J. Winchcomb, F.S.A., S. Wood, and the Hon. Secretary.

Mr. C. C. Nelson, F.S.A., related the circumstances under which the portraits of Mr. Beresford Hope, M.P., and Professor Donaldson, had been painted by Mr. Charles Martin, and gave the following statement of receipts and disbursements on account of the subscription fund:—Cost of the two portraits and frames, 172l. 4s.; amount of subscriptions received (from sixty members), 124l. 18s.; amount still

* Newly-elected Members.

required, 47l. 6s. A vote of thanks was passed to Mr. Nelson for his services as honorary treasurer to the fund.

Mr. C. F. Hayward, in reference to a suggestion of the Council that the expenses of the next Conference should be met by subscription, said that if this were necessary he thought a fixed and uniform charge should be made to all who attend the Conference meetings; but he had hoped that the sale of papers read at the Conference would have covered its expense. Mr. C. L. Eastlake, secretary, stated that although they had been duly advertised only a few copies of the Conference papers had been sold. The cost of the late Conference, including the printer's account, was 132l. 12s. 7d. Mr. C. C. Nelson said he hoped that the printer's account would be less this year. The papers read at the late Conference were numerous, and the discussions very lengthy. He suggested that the range of subjects should be limited to questions of professional practice, and that the discussions should not be printed *in extenso*.

THE INTERNATIONAL EXHIBITION, 1872.

SIR,—In the article on the above in your issue of May 4th you speak favourably of our exhibits—No. 1,064, the west window of St. Paul's, Dock-street; No. 2,781, an ebonised cabinet; No. 2,772, a carved bookcase and cabinet; No. 2,771, a fire-place with painted tiles, oak cornice and framing; but in no one instance do you mention our names as the manufacturers. For some years past we have fallen in with the suggestion which many manufacturers still decline to act upon—that in exhibitions the names of the designers of the work should be made known; but while we are glad that due credit should be given to the artists, it is hardly fair that we, the manufacturers, who have expended over 1,000l. in the production of our exhibits, and whose practical experience and suggestions have contributed something even to the success of the designs, should be entirely ignored. We hope that you will find space to insert this.

Cox & Soxs.

CITY GUILDS.

SIR,—Allow me respectfully to note that your "Hint to the City Guilds" is likely, by its general terms, to defame the fair character of some of these bodies upon insufficient grounds. I know, from experience, that the funds of many of these companies are honestly, beneficially, and wisely applied. They are of two sorts, Trust and Corporate, and the moneys that belong to trusts are scrupulously spent in the direction for which they were bequeathed; and, moreover, large sums are frequently drawn from corporate funds to fill up deficiencies in trust moneys; and thus the charitable gifts are augmented out of the private funds of the company. I see no more reason for carping at the riches of a corporation than for doing so at the riches of an individual. Individuals are allowed to give "expensive dinners," and to have "portraits taken," and to do other honest things for themselves, if they do it with their own money. Besides, too, the corporate,—that is to say, the private funds,—of a company are often spent ungrudgingly in charitable and lofty aims, such as education; and surely a moderate fee may be paid out of those private funds for transacting important business at a court, while the same is done at insurance offices, banking corporations, and other business companies. I might notice much more; but I will conclude with the remark that reform where reform is needed is desirable, but that change where change is not needed is revolution.

EDWIN NASIR.

TECHNICAL TERMS.

I JOIN with others in desiring to see a good dictionary of terms used in the building and engineering trades, setting forth the variations, according to the locality, &c. Other terms than those that have been mentioned come to mind. Mortar, composed of lime and sand, is always called mortar in London and the south, but in South Lancashire and the West Riding of Yorkshire it is always called "lime." Purins, also, in South Lancashire, are called "pans;" in the West of England, "side-pieces." Rafters are called "spars" in Lancashire; principal rafters are called "backs." But these should appear in tabulated form, and a very good beginning of

a dictionary might be made by one person at least in every locality sending you, sir, the local name of the various parts or operations in a building, leaving it to you to dissect, tabulate, and publish in the *Builder* all local idioms. And this need not be confined to our own country, or even to our own empire. We do building and engineering for every nation almost under heaven, and it will not only be useful but highly instructive to compare words and trace derivations, through the languages of all the great races of the human family.

E. G.

METROPOLIS WATER ACT, 1871.

REGULATIONS AS TO CONSTANT SERVICE.

The Board of Trade, taking action as empowered by the 17th and 22nd Sections of the Metropolis Water Act, 1871, have nominated his Grace Charles Henry, Duke of Richmond, K.G., to preside at the necessary inquiry to take place under the powers of the said Act; as also, Mr. Robert Rawlinson, C.B., and Captain Tyler, late Royal Engineers, to advise and assist at such inquiry. It will be remembered that the Duke of Richmond presided as chairman at the Royal Commission which recently inquired and reported on water supply.

At the meeting of the Board of Works, Mr. H. L. Taylor in the chair, the Parliamentary Committee presented a report on the regulations for a constant supply of water, made by the Metropolitan Water Companies, and submitting a series of amended regulations to be proposed to the Board of Trade, in substitution for those made by the companies. Mr. Dalton said the regulations proposed by the companies were of such a restrictive character that if they were adopted there would in fact be no constant supply. The regulations did not become law till they had received the sanction of the Board of Trade. That Board had referred the regulations for the opinion of this Board. He moved the adoption of amended regulations, which would secure to the inhabitants a constant supply of water. Mr. Newton said this was a most important matter, because, if the companies should succeed in passing their regulations, they would defeat the object the Board had in view. The motion was carried.

A COUNTRY HOUSE: OAKLANDS, HALSTEAD.

THE house at Halstead, in Essex, of which we give illustrations to-day, is built of local bricks of yellowish white colour. Some moulded stone has been used for window-heads and columns of windows, and for the porch.

The internal woodwork of staircase, hall ceilings, and passages adjoining is carefully designed and well worked out in deal and oak, being furnished with only slight staining and varnishing.

The entrance vestibule and the conservatory have been laid with tiles from the Poole Potteries Company.

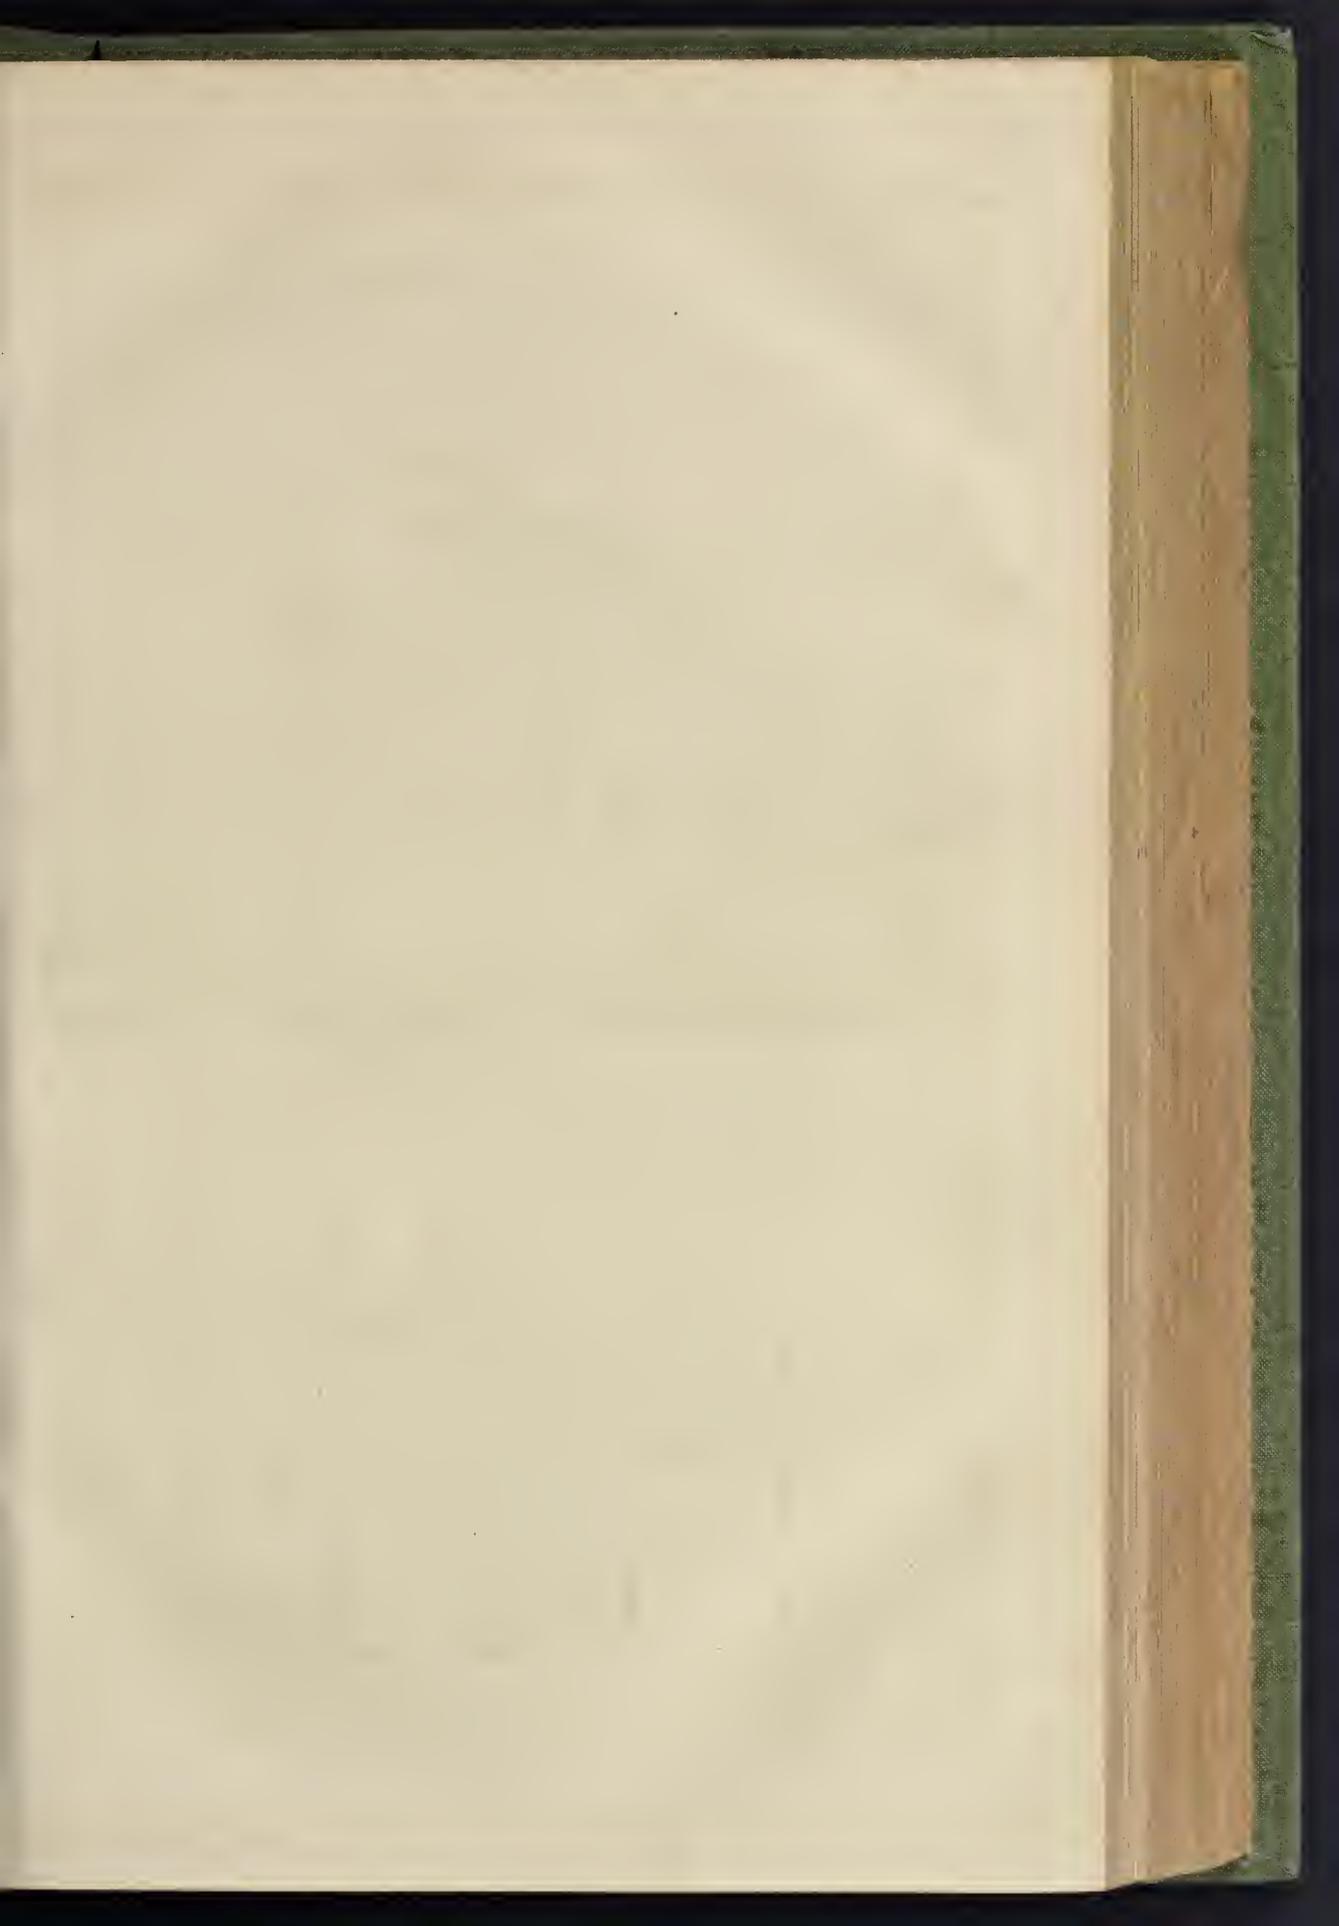

The chimney-pieces are good specimens of solid Devonshire marble from Plymouth.

Mr. C. F. Hayward, F.S.A., was the architect under whose superintendence the work was carried out by Mr. J. Sudbury, jun., of Halstead, at a cost, inclusive of fittings, of about 3,000l.

THE UNITED STATES POST-OFFICE AND COURT-HOUSE, NEW YORK CITY.

THE new post-office in New York City, U.S. is a building of large size, having a frontage of 280 ft. on the Park, and 222 ft. on the Broadway and Park-row. It has been built from the designs of Mr. A. B. Mullett, Supervising Architect of the Treasury, and will cost, it is estimated when fully completed, about one million sterling. In our volume for 1871, we gave a view of part of the building from such materials as were available, and some descriptive particulars to which we refer those who desire further information. The view, however, did not give a satisfactory idea of the building, and at the request of some of our readers on the other side of the Atlantic we now publish a view of the north-west front. The ground-floor will be devoted to the post-office. The glazed projecting roof is for the protection of the mail wagons while receiving or delivering the mails. The upper stories contain the United States Courts and their dependencies. The material used for the exterior is the Di. Island white marble.

A COUNTRY RESIDENCE HOUSE AT HALSTEAD, ESSEX.—MR. C. F. HATWARD, ARCHITECT.

Plan of Ground Floor.

UNITED STATES POST-OFFICE AND COURT-HOUSE, NEW YORK CITY.—North-East Front.—Mr. A. B. MULLERY, ARCHITECT.

A VISION OF THE FUTURE.

After reading the "State of English Architecture" in the "Quarterly Review."

Time, 1882. Season, Summer.

SCENE. House in course of erection. NOBLE WORKING MAN discovered sitting with child in hand; standing by his side, his SON.

Son. Well, father, you do not make much progress!

N. W. Man. How ridiculously you prattle! Am I not waiting for an idea?

Son. Well, that is a pleasing way to spend time; why did you not let me learn your art instead of making me a shoemaker?

N. W. Man. My son, I may tell you now. Hitherto I have only said I did so because it was for your good; now I feel I may be more explicit, as my day is near its close. You have noticed that I have lately been willing to shorten the time that the "soft-handed gentlemen" should serve me. Stop, I must explain from the beginning. Sit down and listen, and you will learn much. Some ten years since I was a common mason, when there appeared an article on architecture, in a well-reputed journal of that day, stating that instead of noble working men such as had existed in the fourteenth century, a so-called architectural profession had sprung up, which comprised "a number of soft-handed gentlemen," and that consequently there was "no motive for expression in the work, and none of that 'handing,' the evidence of the artist's presence and effort, which is as valuable in building," &c. In another part it said, "The best buildings of all ages have been made, not by professional gentlemen and their drawing-clerks, but by labouring handicraftsmen of various schools of art."

Son. How well you seem to remember what the author said.

N. W. Man. I should think so! Why I have read nothing else. I have formed myself on his words. I call that article my prophet, my guide. I refused at once to work under any architect, or for any one who employed a surveyor. The novelty took, and I became the true artist, as my guide calls it, and told all my clients (I like the word, though it is modern) that I work only to please or satisfy myself (his words again) regardless alike of the public or patrons; and in setting myself against all the learning of the profession, I say, quoting again my prophet, that till I started, "The fact was we had no such thing as a building art. This had been entirely lost. We had what was called the profession of architecture, which, as it pretended to the practice of art, was in the nature of an imposture." So have I thriven.

Enter YOUNG LAWYER.

N. W. Man (aside to SON). Here comes that scamp of a common-sense man who will not believe in me.

Young Lawyer. What! not yet up to the first floor: surely even you cannot justify such delay. Why, under the old system with architects, the building would have been at least covered in.

N. W. Man. Contemptuous, as usual, of art. You forget all the dogma. I am the "master worker," the associated "chief master," and superintendent of "creators;" my work is, as our guide ten years since so ably expressed it, "simply a delight to me;" it is the "outward form and expression of a mind sympathetic and serious, but not in the slightest degree superstitious or debased."

Y. Lawyer. I confess I do not understand this twaddle. Since the time you mention science has made rapid advances. The railways,—so much thought of then,—have become almost like the old stage-coaches were to the people of that day. We now glide through the air, without fear of accidents or any jolting, and perform the distance in one-fourth the time. The post-office system is almost antiquated, messages being sent instead, as you know, at a charge of 1d. each all over the kingdom; and the charge for a telegram to India is 3d., which then cost 3l. The postal charge is reduced to 0½d., which tempts the very poor still to use it. The bottom of the sea is so covered with wires, laid in all directions, that I believe the very fish must be afraid it is a huge net put there to catch them. Fireplaces are things of the past, and every house is warmed and has hydraulic power in use therein supplied by public companies, which would surprise people who lived in the last decade as much as gas would have surprised their predecessors; and you only go backwards.

Your building seems as if it would never be completed: you draw large sums of money, and yet make no show or progress therewith; and when I complain that you are ruining my client, you simply answer you cannot help it; you are creating and building a monument: that you are trying to improve until you equal the work of the fourteenth century,—and such contemptible humbug. Fancy my talking such nonsense about my profession—that I was trying to arrive at the system pursued by King Alfred! I should be laughed at and lose all my business. By the bye, see what progress there has been in the law. No chancery—only one court, one law; no long vacation; county court able to deal with nearly all matters; one superior court. Judges always sitting, and while there are no more judges than there were ten years ago, each judge has his vacation, just as clerks and partners in great commercial houses. Why, now the law is simple and understood, and in ten weeks any suit may be concluded, even if there be an appeal, which, at the time you speak of, would have taken from ten to twenty years. What can I say to my client, Sir John?

N. W. Man. Say what you please. He dares not leave me. I am the leader of the day, and what I say is law. Sir John wants me quite as much as, ten years since, he would have wanted Gilbert Scott. Now I think of it, what have you done as to the house he occupies till this is finished?

Y. Lawyer. Why about that he bade me consult you. They will not let him remain unless he will take another lease for seven years at least.

N. W. Man. Say he had better take it. But I will do all I can that he may get in. I and my associates will live on the most generous diet,—at his expense, of course,—to incite our inventive talents; but under such pressure our brains may give way, and rest may be necessary.

Y. Lawyer. I see no inventive genius yet displayed. The building is quite barren of ornament. The only ornament is broken in pieces on the ground, and which you told me was experimental.

N. W. Man. You forget one of our dogmas. I must remind you, "Nothing is more remarkable than the way in which opportunities for decoration are neglected. The builder goes on working in the quietest way until he has a worthy idea to express, and then he does it in the most unobtrusive manner." And again, "How many a village church can be brought to mind where there is not even an external plinth, but the rudest unornamented wall, a stumpy 'ungraceful' but very sensible and useful tower, and scarcely a moulding or ornament about the building, until in some unobtrusive doorway or aisle window we find a gem of thought that gives dignity and refinement to the entire work." True, I am nearly ready as you say for the first floor joists, and not anything appears but plain walling; but I and my creators have waited days and days for ideas, and they will come to us yet as they did to those glorious men of the fourteenth century whom we strive so closely to follow.

Y. Lawyer. I will tell you what I have done. Behaving you are robbing my client, I saw a quantity surveyor. Poor fellow, he had a large business ten years since: now he tells me he has nothing to do, because you and your class, who have superseded architects, will not allow that your work can be computed by any one: and he has, for years, been measuring, over and over again, the house he lives in, as he tells me, that he may remember how to do the work when the public shall be sick of your nonsense. I stated what I wanted; but told him I believed you and your associates would kill him if he were discovered. His answer was, that the pleasure of doing real work and earning money thereby would make him brave any risk. He chose his time, and I hold here his calculation. He has added 20 per cent. to what he would have allowed when in practice, and states that it is almost unfair to do so, because now so few building materials are used by you and your associates that the price thereof is almost nominal; still, the value of any kind of labour must be more, because of the expensive style of living that you adopt. The result will surprise even you. It comes to but one-fourth of the money you have had.

N. W. Man. I am not surprised. Ours is no mercenary trade. One last quotation from the founder of our grand system will perhaps convince you. He has said "The workmen then were quite at ease. They worked among intelligent and sympathising friends. For three hundred years we have been trying to build

from above downwards. The connoisseurs have pretended to teach the public how to build, and the public fail to learn. Can we not ask the working man to show us what to do?" I, the leader of that noble band, ask you to watch. Think you in ten years we could undo the great evils of three centuries? No. It is for you to wait at least another decade; then you will be the first to proclaim the grandness achieved by the noble working men, unfettered by architect, untrammelled by quantity surveyor or thought of money.

Y. Lawyer. Shall I? But I have no time for discussion, or I would ask you if you think you have yet reached the fourteenth century. My lady wished me to ask whether you have arranged for the day and night nurseries, and what aspect they will have. She thought there must be some plan or drawing, showing what rooms there would be; but I explained that there were none in the new system of building, but that I had no doubt you could tell me.

N. W. Man. I cannot; it is too small a thing to engage my attention. I doubt not there will be some rooms that could be adapted; if not, we can easily throw out a wing somewhere.

Y. Lawyer. Could you not, as a great favour, find out, so that the wing, if necessary, might be now commenced, otherwise her ladyship's children will be grown up before it could be erected.

N. W. Man. It shall have attention.

Y. Lawyer (going). Oh! by-the-bye, Sir John desired me to ask in what style the building is supposed to be? He had an old friend dining with him, who asked the question, and Sir John replied, he thought the Fourteenth century Gothic; but he really did not know, as there had never been any drawing, and, though you had been five years at work, nothing could be seen except plain walling, and very little of that.

N. W. Man. You seem to enjoy repeating his spiteful remarks! How true that art has ever suffered by contact with cold-blooded men of the world!

Y. Lawyer. Well, you seem to have made plenty of money, and I suppose you consider yourself the embodiment of "art," and the houses you have bought (not built) must be very profitable, now that so long a time is taken to erect new ones. I should not wonder if this is also a portion of your scheme.

N. W. Man. Go on, sir. I shall not be the first martyr to my noble cause.

Y. Lawyer. Humbug! [Exit YOUNG LAWYER.]

Son. He does not seem to like you.

N. W. Man. I told you he did not; and his common sense, I am afraid, will be too much for my glorious ideas: still, Son, there is some comfort. I have done well, and can retire now on a very sufficient income. I should have liked the idea to continue, however, somewhat longer; so that I might receive adulation for the rest of my life, and grand articles in the papers when I quit this sphere. The latter seems absurd, you will say, but I think you are wrong; it must be a pleasure, even on one's death-bed, to know that your country will on the morrow resound with your late greatness.

Curtain drops.

B. F.

THE THAMES EMBANKMENT CASE OF THE DUKE OF BUCCLEUCH.

In the House of Lords Appeals, on April 30th, before Lord Chelmsford, Lord Westbury, Lord Colonsay, and Lord Cairns, judgment was given in the case of the Duke of Buccleuch v. The Metropolitan Board of Works.

In this case, the Duke of Buccleuch sought to recover compensation from the Metropolitan Board of Works for construction of the Thames Embankment between Monagu House and the River. The matter having been referred to arbitration, the umpire, Mr. Chas. Pollock, Q.C., awarded to his Grace the sum of 8,325*l.* This sum the Metropolitan Board of Works declined to pay; and on his Grace endeavouring to enforce the award by action, they called as a witness on their behalf the umpire, who stated that his award had been arrived at as follows:—For loss of causeway, 200*l.*; for structural damage to walls, 60*l.*; for capitalised rent of garden, 2,475*l.*; expense of building a wall, laying out the garden, and other matters, 600*l.*; and for loss of privacy and other amenities, 600*l.* The verdict passed for the plaintiff, subject to the opinion of the court above, on the questions whether the evidence of the umpire was admissible; and, secondly, whether if it were it had disclosed that the umpire had based his calculations of the amount to be awarded on matters which he had no right to look at in assessing the amount of compensation due to his Grace. The Court of Exchequer were unanimous in their judgment that the plaintiff was entitled to retain his verdict, but were not agreed in their reasons, the Lord Chief Baron and Barons Martin and Channell being of opinion that the evidence of the umpire was admissible, but that it showed that the umpire had proceeded on a right ground, and that the award was good; while Baron Bramwell was of opinion that certain parts of the evidence of

The umpire were not admissible, but that if they were he was inclined to think that they showed that the award was made on a wrong principle, although he doubted whether the finding of the umpire could be reviewed. The Court of Exchequer Chamber by a majority of four to three reversed the decision of the Court of Exchequer, on the ground that the evidence of the umpire was admissible, and showed that he had proceeded on an erroneous principle in estimating the amount of the compensation that ought to be awarded to the defendant.

The case was argued last year before their lordships, assisted by six of the learned common-law judges, when the latter, after taking time to consider, by a majority of five to one gave opinions in support of the award.

The counsel who argued the case before their lordships, were Sir Roundell Palmer, Q.C., and Mr. Kemplay for the appellant; and Mr. Hawkins, Q.C., and Mr. Phillimore for the respondents.

Their lordships having taken further time to consider their decision, gave judgment.

Lord Chelmsford, in course of his remarks on the case, said, there can be no doubt, and none has been entertained, that the plaintiff is entitled to compensation in respect of the taking away the causeway and landing-places, and the injury arising to his house and premises by depriving him of access to the river. The only question upon which there has been a difference of opinion among the judges arises upon the award, viz. whether the umpire had any power to give compensation for the damage by the depreciation of the mansion-house, lands, tenements, and hereditaments by the otherwise injuriously affecting the same by the execution by the Board of the said works, and by the exercise of the powers of the Act. Now, he was authorised both by the special Act and by the Lands Clauses Act, to give compensation if the premises were injuriously affected, a fact which it was the duty of the umpire to ascertain and determine. He has determined it, and awarded compensation in respect of the damage thereby sustained by the plaintiff, and I see nothing in the case to impeach the correctness of this award. I think, therefore, that the judgment of the Court of Exchequer Chamber must be reversed.

Lord Westbury entirely concurred with the view taken by the majority of the learned judges as to the admissibility of the evidence of the umpire, and as to the limit beyond which the right of the examining the umpire ought not to be carried; but upon the other point, as to the principle upon which the umpire was to assess the amount of compensation, he must concur, on this, as on several other occasions, he took a different view from that which was entertained by the majority of the learned judges and by his public and learned friends. It would, however, be needless to discuss the question further, and he should, therefore, concur in the judgment about to be pronounced.

Lord Colonsay agreed in the view taken by Lord Chelmsford.

Lord Cairns, in giving his reasons for concurring in the judgment of the House, expressed the obligations that their lordships were under to the learned judges who had been called in to assist them in determining this difficult and important question.

The judgment of the Court of Exchequer Chamber was reversed, and that of the Court of Exchequer, upholding the award, was confirmed.

A SUGGESTION.

Sir,—If the employers would consent to an advance of wages from a fixed date not far distant, and ten hours' time, as at present, for those who like to work, and the limit of hours for the objectors, guaranteeing at the same time that no "sacking" will take place in consequence, and place notices on their works to this effect, I believe they would thoroughly take the wind out of the sails of the promoters of the nine-hours movement, thereby in the end saving themselves a great loss, and the men a deal of misery; for few are sanguine enough to think that present arrangements will be of long duration. A. B.

INTERFERING WITH CHIMNEY DRAUGHTS.

In the Margate County Court a case (Williamson v. Edwards) important to builders has been tried, Mr. Towne for plaintiff; Mr. Gibson for defendant.

In his opening statement, Mr. Towne said this was an action to recover 7*l.* by his client, a widow, residing in Addington-street, from the defendant, Mr. Edwards, a builder, carrying on an extensive business in Margate, for damage done to plaintiff's property. Mrs. Williamson is the owner of two houses in Addington-street, in one of which she resided herself, and which had existed there fifty years. Adjoining this property was a small house, belonging to Mr. Edwards, and this house had now been devoted to a story above Mrs. Williamson's houses, the consequence of which was that the smoke from these two houses refused to go up, and, in fact, the houses were rendered uninhabitable. When applied to in the matter, Mr. Edwards, through his solicitor, Mr. Gibson, replied that he could do as he liked with his own property, which he believed was to be the defence to the action. Now defendant had a right to carry his house up, but he had no right to take away the light or air from a neighbour's house, nor to drive the smoke down the chimneys. Mr. Edwards had been called upon to carry plaintiff's chimneys up higher; and hereupon, he had then been called upon for the amount, plaintiff having been compelled to do it; and Mr. Edwards refused.

His Honour: It is a well-known maxim that you may build up as high as you like, but you must do it in such a way as not to annoy your neighbour.

Mr. Gibson: My client, Mr. Edwards, says that he knows of no such custom here.

His Honour: I do not say the custom exists here; but it is in consonance with the usual maxim; a man must not do anything to the annoyance of his neighbour.

Mr. Gibson: But any such decision would be very serious, and would prevent Mr. Edwards or any one else from building. My objection is that no such action will lie. And another objection I shall raise is that the plaintiff ought to have proceeded by injunction, and this would have been her remedy.

His Honour: She might have had such remedy, but because she did not I do not know that that deprives her of any right to appeal to this Court afterwards. I may say at once that I have a strong opinion that the action

will lie, and that if the nuisance is proved the plaintiff will be entitled to a verdict.

Mr. Towne, in reply, called by Mr. Towne, stated that since he had been subpoenaed on this case he had taken a run through the town and had found out three cases where the owners of new or raised buildings had paid for the raising of adjoining chimneys.

Mr. Edwards: I do not think there is an instance in the town where it has been compulsory to raise adjoining properties.

His Honour: I must find for the plaintiff in this case; and the only question now is Mr. Gibson's objection, whether the action will lie, if it is not a deprivation of easement. I think it will.

Mr. Towne: Mr. Gibson talks about an injunction as our only remedy, but that is absurd.

His Honour: I do not generally give an opinion if I reserve judgment, but in this case my opinion is strongly in favour of the plaintiff.

Mr. Gibson pointed out to his Honour that Mr. Gibson had not stated it was compulsory in those cases he had mentioned. The case then terminated.

MR. T. C. EBDY v. REV. F. THOMPSON.

MR. T. OLIVER, who, in our report of this trial, was described as of Sunderland, instead of Newcastle-upon-Tyne, thinks our report makes it appear that he voluntarily stated that probably Mr. Street would have charged 200 guineas for such a report as the one in question; whereas, he continues, "I was asked the question in this form, 'Probably, if Mr. Street had prepared a similar report, he would have charged 200 guineas?' My reply was, 'I do not know.'"

STONE MERCHANTS AND MASONS.

Sir,—I beg the favour of your inserting the following. I want some one interested as much as myself in the matter to explain by the stone supply, ready worked for fixing, to builders, at a price that masons cannot compete with. The same merchants who thus treat the masons solicit and obtain their custom, and yet express surprise after taking from them their only chance, at their inability to pay their accounts for stone. To obviate this, and show that such merchants can be done without, I would suggest that the mason should get his stone direct from the quarry, when possible, and thus save the profit he has now to pay the merchant. This would enable him to hold his own ground, and prove that a mason is not to be done without just yet. A LOVER OF JUSTICE.

COMPULSORY TAKING OF LANDS.

An arbitration case, connected with the Leeds Waterworks (Gill and the Corporation of Leeds), is one of a series of arbitrations rendered necessary by the compulsory taking of lands by the Corporation of Leeds for the formation of their several reservoirs in the valley of the Wharfe. In this case the lands taken were the property of Mr. Mathew Gill, of Blubberhouses, and are situated in the township of Foston, where the upper reservoir for the supply of water to the town of Leeds is about to be constructed. The two lower reservoirs, now partly made, are situated at Swinney, and the reference was to assess the amount due to Mr. Gill for 9*as.* 1*2d.* surveyor, Huddersfield, was umpire, and Mr. Newsam, of the firm of Newsam & Sons, surveyors, Leeds, and Mr. J. D. Martin (Martin & Fowler), Leeds, were arbitrators respectively for the claimant and the corporation. Mr. James Powell, land agent and surveyor, Harrogate, valued the compensation due to Mr. Gill for the lands taken and compulsory purchase at 1,821*l.* 1*s.* 1*d.* and Mr. John Haanam, surveyor and farm engineer, York, estimated the amount due for land at the same sum, but (including a mill-site and water-power, which he declared was available) the amount of compensation he fixed at 1,561*l.* 1*s.* Mr. Scott, land agent, Grantley, Ripon, valued the tenant's claims for land taken at 60*l.* 13*s.* 6*d.* Mr. Fenny, surveyor and engineer, Leeds, and Mr. Horsfall, surveyor, Halifax, estimated the compensation due to the claimant at 675*l.* 17*s.* 4*d.*, including the tenant's claims, as estimated by Mr. Wordsworth, valuer, Black Gate, Leeds. The umpire reserved his award.

PURCHASE OF MORE SITES FOR NEW SCHOOLS BY TILE SCHOOL-BOARD.

THE London School-Board, in addition to the several new schools which they have recently agreed to build, last week resolved to purchase, from the trustees, Ebenezer Chapel, in Shadwell, which covers an area of 9,660 square feet, for the purpose of erecting a new school for the Tower Hamlets division, to accommodate 1,000 children. The premises consist of a chapel, school-room, and two vestries, and the purchase money is 5,000*l.*

In the Greenwich division they have also agreed to provide further school accommodation, and for this purpose they have entered into arrangements for the purchase of a quarter of an acre of land situated in Brockley-road, Lower Sydenham, from Mr. Edward Saxton, of Cheap-side, for 300*l.*

In the sub-division of Hackney the Board have decided to provide school accommodation for 2,000 children, and have agreed upon the purchase, from Mr. Charles Southby Shaw, of Hackney, of 60,000 square feet of land in Clarendon-street, Bethnal-green, with four dwelling houses and a large three-storied warehouse. The lease has seventy-three years to run, with ground-rents amounting to 17*l.* per annum, and the ware-

houses can be adapted for school purposes immediately, to accommodate 900 children. The purchase money is 3,500*l.*

The Board have also agreed to purchase between 5,000 ft. and 9,000 ft. of freehold land in Hammond-square, Hoxton, subject to the assignment to the Board of the Hoxton Ragged School House. On this site they propose to erect a new school in addition to the present Ragged School.

ASSESSING TELEGRAPH WIRES.

PROCEEDINGS AGAINST THE POSTMASTER-GENERAL.

The Marylebone Vestry have resolved to take proceedings against the Postmaster-General for the recovery of the rate assessed on the telegraph wires in their parish, which amounts to 5,000*l.* The Government have offered to pay 20*l.*, which was the amount at which the wires were assessed when the purchase from the companies took place, although they altogether deny their liability on the ground that the telegraphs belong to the Crown, and that the Crown is not liable for rates. The position of the Vestry, on the other hand, is that the Crown is liable, the section of the telegraphs Act stating that the Government shall be liable to pay local and municipal rates on all property to be purchased by them after the passing of the Act, provided such rates shall not be in excess of those for which the property was properly assessable at the time of the purchase. The Vestry contend that the wires were not "properly" assessed at the time they were purchased by the Government, and counsel has advised proceedings, which will no doubt ultimately go to the Queen's Bench after being before the magistrates. At the meeting of the Vestry last week, when the proceedings were resolved upon, Alderman Sir David Salomons, M.P., stated that the Government repudiated all liability to pay rates upon property purchased by them, except such as the property was liable to at the time of the purchase. They refused to pay for any increased value, and this rate they had carried out with respect to the property they had purchased at Westminster and elsewhere.

THE STRENGTH OF BUILDING MATERIALS.

ROYAL INSTITUTE OF BRITISH ARCHITECTS.

Sir,—I shall be obliged by your allowing me to state in your columns that the discussion on Captain Seddon's paper "On the Strength of Building Materials," read at this Institute on the 22nd ult.,* was adjourned until Monday evening, the 27th inst., at eight o'clock.

In connexion with the subject of that paper, Mr. David Kirkaldy has kindly promised to throw open his "Testing and Experimenting Works," at the Grove, Southwark-street, S.E., for the inspection of members of the Institute, who will be admitted on presenting their cards between twelve and four p.m. on Saturday, the 25th inst.

CHARLES L. EASTLAKE, Sec.

REFORM OF THE METROPOLITAN BOARD OF WORKS.

An influential meeting of noblemen and gentlemen, ratepayers of the metropolis, has been held at No. 1, Carleton-house-terrace, to consider the present constitution of the Metropolitan Board of Works. Col. Tomline, M.P., who was called to the chair, urged the desirability of sending a deputation to Mr. Bruce to impress upon the Government the necessity for an improved audit of the accounts and a reconstitution of the Board, so as to make it a direct representation of the ratepayers. Mr. Shann suggested the expediency of treating the two questions separately.

Major Lyon moved that a deputation should wait on the Home Secretary, to ask him to bring in a Bill to give an appeal from the auditor's decisions.

The motion having been seconded by Lord Fitzroy, Mr. W. H. Smith, M.P., warned the meeting not to expect an early reform in the local government of the metropolis; it could only be effected by putting a pressure upon the Minister, and until that was done the question would remain shelved. Any proposal to give direct representation, which he should be glad

* At this meeting a report on Professional Charges was accepted, and will be submitted for discussion and approval at the approaching Conference.—E.D.

to see, would always be met with the excuse that the Home Office had in preparation a general measure of municipal reform for the whole metropolis.

Mr. Julian Goldamid, M.P., said nevertheless, if the Government made no sign, he should next session endeavour to get a Bill passed to transfer the election from the vestries to the ratepayers.

The motion was carried unanimously, but the meeting negatived a second proposal that the right hon. gentleman should have his attention called to direct representation, and be invited to take up that part of the question also.

At the request of Dr. Stallard, it was agreed to solicit the vestries to join in the deputation.

CONFERENCE OF ARCHITECTS.

A COMMITTEE to arrange the proceedings at the approaching conference has been appointed by the Institute, and at its first meeting, held on Tuesday last, did good work. As we do not yet know whether secrecy or publicity is to be the order of the day, we content ourselves with saying that the first meeting will probably be held on the evening of Monday, the 10th of June; other meetings on the 11th, 12th, and 13th; and that a dinner on Friday, the 14th, will close the proceedings, as on the last occasion.

GLAZED SURFACE.

STR,—I want to know a substitute for *glazed bricks* for lining walls, that can be had at a reasonable cost, glazed bricks being now very high in price, and exceedingly difficult to procure for immediate delivery.

Wall tiles are rarely true, and generally dear. Most of the cements for plastering seem too liable to chip under hard usage. What I want is a hard glazed surface, at a small cost.

AN ARCHITECT.

CHURCHES AND OTHER BUILDINGS STRUCK BY LIGHTNING.

LAST year we pointed attention to the fact that lightning was then more destructive than it had been since the year before the great earthquake. Various physical commotions of serious import have occurred since that,—such as the earthquakes in California and at Antioch, as well as in Upper Asia, in Australia, and in Iceland. The commotion of Vesuvius, too, has been notable; and still we find hurricanes, as at Zanzibar and Madras, and the lightning in this country, more destructive than usual. The parish church of Rainham, East Kent, has been struck, as also the parish church of Mashbury, Essex, which has been set on fire. The spire and belfry, which were of wood, soon succumbed to the flames, which, fanned by a strong wind, travelled eastward along the roof of the nave, feeding on the timbers between the plastering and the tiles. The fire was beaten back, so as to preserve the church. The roof of the nave is destroyed, and some of the fittings damaged by falling debris, the damage being estimated at about 200*l*. At Bampton the lightning has struck the spire of the parish church, where five iron clamps are fixed. The spire is about 180 ft. high. The force displaced ten courses of stonework on the northern side, or about 15 ft. It also split the spire on the south side. It apparently passed over the bells, destroying the wires connecting the chimes with the clock. It is supposed about 40 ft. will have to be rebuilt. Several trees in the neighbourhood were also struck. Houses at various places, as at Tamworth and at Deptford, have also been struck by lightning.

UTILISATION OF ST. PAUL'S.

STR,—I presume that the authorities of St. Paul's have now discovered that it is impossible to utilise the whole of the church at one service. Two Sundays ago we had the Lord Mayor and the Judges present. The sermon was preached from the pulpit under the dome, where the crowd of worshippers were. The Lord Mayor and the Judges occupied their usual seats in the choir. The seats beyond that occupied by the Lord Mayor were vacant. Whether he or the Judges could hear the sermon, separated as they were from the rest of the congregation, I very much doubt. It would be well if they could be asked the question. I sat midway between them and

the preacher, and distinct as Canon Liddon is in his intonation, and clear and audible as is his voice, I with difficulty could follow him, and frequently lost what he said. But it was painful to see the Lord Mayor and the other authorities of the City, with her Majesty's Judges, put out, as it were, in the cold,—thrust away into the choir, and separated from the rest of the congregation.

The great mistake of the day is "monster" everything. Man is but a pigmy being. His powers of speaking and of listening are limited. If there is no limit to man's power of speaking and listening, let our monster cathedral be built for the whole metropolis, and do away with all the churches. Some of the churches built not long ago prove the folly of such a vain attempt. Very large churches no ordinary voice can fill. Take, for instance, St. John's, Waterloo-road. The object of the architect lately called in there has been to curtail its dimensions, and bring all within the hearing of the preacher.

Mr. Street has advocated, and I think, rightly, that the choir at St. Paul's ought to be separated from the nave; in other words, that there should be two places of worship, one for the ordinary and another for the larger congregations. This cannot be done till the organ is brought back to its old place, or nearly so, and the choir screened off from the nave.

The distance of the altar-table from the congregation assembled under the dome, and the long avenue of nakedness between the one and the other, has a chilling and deterring effect. This is evidenced by the smallness of the number of the communicants. I assisted two or three Sundays ago, when we had only seven; last Sunday, I am told, there were only three. Nothing more need be said, to show that the attempt to utilise the whole of the church at one service is a mistake.

In conclusion, I beg to ask, for what purpose the several handsome presents of communion-plate have been made, if they are not to be placed on the altar?

JAMES LUPTON, St. Paul's Cathedral.

THE LITERARY FUND DINNER.

AT the recent dinner, so admirably presided over by H.M. the King of the Belgians, the numbers present were 433 gentlemen, and 340 ladies in the galleries; and the amount actually subscribed, including H.M. the Queen's annual donation, was over 3,100*l*., an amount, we believe, unexampled in the annals of the Society. The King's speeches [were excellent; Mr. Disraeli's perfect in its way; Lord Stanhope and Lord Houghton particularly happy; the music singularly good; in fact, every one concerned deserves praise except the proprietor of St. James's Hall, who gave a very unsatisfactory dinner, shamefully ill-served. We propose to speak seriously before long as to the present condition of London in respect of public dinners, and try if anything can be done to improve it.

CHURCH-BUILDING NEWS.

Leicester.—St. Mark's Church has been consecrated. The building of a church in the district at the lower end of Belgrave-gate formed part of the plan of the Church Extension Society; but Mr. and Miss Herrick took the whole responsibility upon themselves, and the church now erected on the north of Foundry-square is more extensive in plan, and ornate and elaborate in its details, than it would otherwise have been. The site is of irregular form, and the building and its adjuncts have been so designed as to take advantage of its peculiarities with the least possible sacrifice of space. The church consists of nave, chancel, north and south aisles, organ-chamber, and tower at the south-east corner. The nave is 81 ft. 6 in. wide, and 62 ft. long, and 53 ft. high to the ceiling; the chancel is of the same width and height, and 37 ft. 6 in. long, terminating in a semicircular apse. The north aisle is 14 ft. 6 in. wide, and, continuing past the north arch of the chancel, terminates also in an apse, the eastern portion being screened off for a vestry. The south aisle is in three compartments, with gabled roofs, each extending beyond the other to meet the sloping line of the boundary-line of the site; the western bay being 12 ft. 6 in. deep, and the eastern one 25 ft. deep. The lower, which is 25 ft. square, projects still further south, giving thereby, between it and the chancel, an organ-chamber, of ample dimensions, clear both of chancel and aisle, but open by arches to both. At the western end of the

church is a vestibule, fitting up to the boundary on that side, having a width of 14 ft. at the southern end, and diminishing to the width of the doorway at the northern termination. The vestibule, which is external to the main building, affords a screen to the three western doors, two of which are hung to open outwards, and is entered from a porch, with double external archway, and double doors next the vestibule, also opening outwards. This provision is made for escape, in case of any sudden alarm. The tower has both internal and external double doors, giving access to the eastern end of the south aisle. The nave is divided into three compartments by three stone arches on each side, supported on pillars having shafts of granite from the Shap Quarries, and foliated capitals and moulded bases of Ketton stone. It is lighted at the western end by a large window of five plain arched lights, the central one rising higher than those at the side. The north aisle is lighted, next the nave, by two windows, each of coupled plain lights, and one of three lights; and next the chancel by a lofty window of three lights. Each compartment of the south aisle has a large three-light window. The chancel has, on the north side, within a larger arch, a double arch, supported in the middle by coupled pillars of Shap granite. Through this arch light is admitted to the chancel from a large north window. Opposite to it is the organ-chamber, which is vaulted with brick, the arch next the chancel being, in the centre 35 ft. high. The apse is divided into seven compartments, by corbel shafts of marble, starting from the base of the north arcade, and supporting the main ribs of the roof on carved capitals of stone. Between these, in the uppermost stage, is a range of windows, each of a single traceried light, enriched by shafted angles as in the clearstory of the nave. These windows, which range with those of the nave clear-story, are filled with stained glass. Below the windows, the sills of which are 26 ft. above the floor of the nave, there is a series of seven large cusped arches, each 10 ft. high, designed for decorative enrichment. All the seats, both in nave and chancel, are of oak, and the prayer-desk and lectern are of the same material. In the chancel fittings some carving is introduced. The walls are built of slate-stone, of fine colour, obtained from Mr. Herrick's quarries, near Woodhouse, with quoins of the same material; but all dressings, windows, doorways, &c., are of Donkling stone. They are lined internally with red brick, intermixed with Donkling and Derbyshire stone. The roof is framed of fir, covered with Switthland slate. All the eaves, gutters, and upper pipes are of lead. The exterior of the church, excepting the apse and the upper portion of the tower, is of simple character throughout. The spire is wholly of Donkling stone, except tracery-hands of Derbyshire red stone. The bell-chamber windows are all open, the bells resting on a floor covered with lead within the tower. The height of the tower to the parapet is about 80 ft.; of the spire to the top of the finial, 168 ft. The tower contains a peal of eight bells. The seven windows of the apse have been filled with the following subjects, executed in painted glass by Messrs. Ward & Hughes, of London:—The Angel announcing the Nativity to the Shepherds; the Adoration by the Wise Men; the Baptism; the Crucifixion; the Angel at the Tomb; the Sea of Tiberias; and the Ascension. Beneath, in the three centre compartments, is a fresco of the Last Supper, executed by Mr. Allen. On the south side of the chancel is the organ-chamber, in which is placed an organ, by Messrs. Hill & Son, of London. The roof and other parts of the church have been decorated by Messrs. Heaton, Butler, & Payne, of Covent Garden. Those of the ceiling of the apse are subjects representing the canticle, "Benedicite omnia opera." The seats are of oak, and are calculated to accommodate nearly 700 persons. The lighting is effected by a line of gas-jets under the clearstory windows, similar to that in St. Paul's, and executed by Mr. Coleman, Cheapside. The architect was Mr. Ewan Christian, of London; and the whole work has been carried out by the builders, Messrs. Osborne, Brothers, under the clerk of the works, Mr. James Nichols, of London. The heating apparatus was got from Haden & Son, Trowbridge. The plumbing and glazing has been done by Mr. R. W. Widdowson; the altar-railing and ornamental gaswork has been supplied by Mr. Skidmore, of Meriden; and the musical peal of eight bells, by Messrs. Taylor, of Loughborough. The diameter across the mouth of the largest bell is 15½ in.

SCHOOL-BUILDING NEWS.

Haresfield.—The new national school has been opened. The building has been erected from designs furnished by Mr. J. D. T. Niblett, who is the donor, with the exception of 40*l.* granted by the Diocesan Association. The style of architecture is Gothic. The school-room is 42 ft. long by 16 ft. broad, part of the space being taken up by the class-room, which is 16 ft. in length. The roof is open-timbered, and composed of pitch pine. The exterior materials consist of red, white, and blue bricks, with stone dressings. The roof is slated with red and blue Broseley tiles. Beneath the bell-turret are the words, "Non semper alteri," with the figure of a hare, and the word "field" written above it. On the capstone of the porch the emblems of the three Christian graces (Faith, Hope, and Charity) are inscribed. Over the door inside the porch is a figure of a tortoise cut in stone, with the Latin inscription on either side and above *Per se vera Persevera*, *Per se vera*, and on either side of the porch are passages from Holy Writ. The buildings, outbuildings, and playground occupy over half an acre. The builder is Mr. A. Bridgman, of Painswick, who has lately completed several extensive buildings on the squire's estate.

Long Sutton.—A new school is being built at Long Sutton, near Langport, in order to meet the requirements of the Education Act, without electing a School Board. The Duke of Devonshire gives the land, and is a liberal subscriber to the funds. The farmers do the hauling free.

Siddall.—A new school is about to be built, by Messrs. John Holdsworth & Co., on a site a little to the southward of the temporary iron church, at Siddall. The working drawings are being prepared. The schools will accommodate some 820 children, and are arranged to form three sides of a quadrangle. The central portion is allotted to the girls, and the wings to the boys and infants, with distinct entrances, lobbies, lavatories, and class-rooms. Open fireplaces are put in each room, and in addition to these a heating apparatus is intended to be put up. Ventilation has been attended to. Owing to the steep gradient of the site, that portion which would otherwise have been useless ground is converted into covered play-rooms. This has apparently been taken advantage of by Mr. Swindon Barber, the architect, for making the elevation, which commands the valley, of the most importance. The arcade under the boys' and girls' schools, with intervening buttresses, combined with the grouping of the circular turreted staircase in one corner of the quadrangle, are features which are said to suit the situation chosen for the building. Messrs. Holdsworth intend to build another and smaller school at Salterhebble, a site for which has already been purchased. Considerable outlay will be required also in this instance, in building a retaining-wall and levelling up the ground for building purposes.

Rowledge (Surrey).—The school just erected to meet the requirements of the newly-constituted and improving district of St. James's, Rowledge, has been opened. The building will accommodate 126 children, providing for a population of 250 persons within the civil parish of Farnham, as well as for sections of the old parishes of Binsted and Frensham. It is built from designs by Mr. Wannacott, by Mr. A. Shrubb, builder, Rowledge.

Sherborne.—The memorial stone of a new Sunday School, in connexion with the Wesleyan Chapel in this town, has been laid with considerable ceremony. The plans were supplied by Mr. Lauder, architect, Barnstaple. The contract for the building was taken at 1,419*l.* The site for the new school, &c., joins the chapel premises in a triangular form to a depth of 64 ft., and has a frontage of 90 ft. in the Abbey-road. The buildings are to comprise a school-room, 58 ft. long by 41 ft. wide; a board-room (for district and other meetings), 27 ft. by 20 ft.; two class-rooms, 18 ft. by 15 ft.; a library-recess, 14 ft. by 7 ft.; and separate yards and offices for boys and girls. Arcaded porches on each side are to form entrances to the large room from the Abbey-road, and porches will also be provided from the chapel premises, to give convenient access from the series of class-rooms into which the present school-room beneath the chapel is to be altered. The school-room is to be 32 ft. high to the ceiling, and will be lighted by four-light lancet windows in each gable, and six twin lancet lights on both sides, springing from double-moulded strings running round the room, with encaustic tile bands 8 ft. from the floor. The ceiling is to be boarded and fitted (octagonal sided), divided into

panels by the top chamfered roof timbers; and a pierced cornice will run round the room, the springing of the ceiling. Ventilation is to be secured by section-troughs and fans above the ceiling, and fresh-air inlets in the ground-floor. The latter will also be connected with the apparatus in the basement for warming the buildings. All the walls are to be luted with dado, 3 ft. 6 in. from the floor. The board-room is also to be lofty, and will be entered from the chapel side, while the entrance to the class-rooms will be from the school. The elevations are to be in local stone masonry, with Ham-hill dressings. The main features of the frontage will be the large four-light window, with blind arcading underneath, and the arcaded entrances on each side, with ornamental iron gates. The style of the building is to be Early English or First-pointed Gothic. The treatment will be simple. The work is to be carried out by Mr. T. Farrell, builder and surveyor, Sherborne, from plans prepared by Mr. Alexander Lauder, architect, Barnstaple, who is at present engaged on several metropolitan buildings, and whose designs have been adopted for various buildings in the neighbourhood, amongst which are the Wesleyan Chapel at Yeovil and the Chapel and Schools at Milborne Port.

North Shields.—The new schools, in connexion with Christ Church, North Shields, have been formally opened. The site adjoins the parish church-yard on the east, and was given by the Duke of Northumberland. It comprises an area of three-quarters of an acre. The north end is reserved as a site for a teachers' house. The buildings are arranged so as to face on to a new street running northwards from the Tyne-mouth-road (which is at present included in the playground of the schools). In plan the group forms a cross. The centre limb is the infant school, and measures 54 ft. by 25 ft. internally, and 19 ft. high to the ceiling. On each side of this are the entrance lobbies, giving access on the south side to the boys' school, and on the north, to the girls' and infants' schools. The boys' and girls' schools are 52'4 ft. by 20 ft. internally, and 18 ft. high, with class-rooms, 18 ft. by 15 ft. projecting from the east front. Accommodation is thus provided for 470 children. The materials employed are red bricks, and for arches bands of black bricks, with stone mullion and other dressings to the windows, &c. The walls are built hollow, as a security against damp. Internally the part below the windows is faced with glazed fire-bricks, the remainder being plastered. The woodwork of the principals of the roofs is visible internally. The windows are glazed with Hartley's quarry glass, and each of the side windows has a metal casement, for ventilation. All the woodwork is simply varnished. In the infant school are two large galleries. The contract for the entire building was let to Mr. R. Bolton for 2,065*l.* Mr. F. R. N. Haswell, of North Shields, is the architect.

Bristol.—The corner-stone of the new Schools in the parish of St. Simon, Baptist Mills, has been laid by the Mayor of Bristol (Mr. W. Proctor Baker). The building is situated in the rear of the church. It will comprise a girls' schoolroom, 60 ft. by 21 ft.; a girls' class-room, 21 ft. by 16 ft.; an infants' schoolroom, 60 ft. by 27 ft.; and an infants' class-room, 22 ft. by 20 ft. The structure is to be of brick, with free-stone dressings. The style will be unpretending. The roof is to be tiled, and the rooms will be lighted with a number of circular-headed double and treble windows. The main entrance will face towards Claremont-street and Pennywell-road. A piece of ground contiguous to that upon which the school is being built has been reserved for a mistress's residence. The building is being erected by Mr. J. P. Stephens, from designs by Messrs. Medland & Son, architects, Gloucester. It is intended to accommodate 250 infants, and 200 girls. The contract price is 1,244*l.*, and the site has cost 460*l.*

Hoby (Leicestershire).—The new school here has been opened, and is now in daily use. The building, which is Gothic in character, is of red brick and white stone dressings, and comprises two rooms, which are capable of being thrown into one, and forming a large room for parish meetings. There are ante-rooms, with lavatories and out-offices. Both school-rooms have open-timbered roofs, and the walls inside are of pressed brick, painted. The schools are warmed by open fire-places, and are well ventilated. The work has been well carried out by Mr. Whail, builder, of Frisby, under the superintendence of Mr. R. W. Johnson, architect, of Melton Mowbray and Ketter-

FROM SCOTLAND.

The Scott Monument at Edinburgh.—The committee of subscribers have ordered sixteen statues for the niches in the monument from the sculptors formerly selected, who have agreed to furnish them, executed in a satisfactory manner, for 50*l.* each, the committee furnishing the stone and fixing the figures in their places. The following is the arrangement:—The statues of Jeanie Deans, Laird o' Dumbiedykes, Amy Robsart, and Leicester, by William Brodie, R.S.A.; Flora M'Ivor, Baron Bradwardine, Glee Maiden, and Hal-o-the-Wynd, by John Hutchison, R.S.A.; Rebecca and Friar Tuck, by Clark Stanton A.R.S.A.; Magnus Troil and Minna, or Brenda, by Mrs. D. O. Hill; Queen Mary and Halbert Glendinning, by D. W. Stevenson; and Diana Vernon and Balfie Nicol Jarvie, by Mr. G. A. Lawson. Thirty statues are required to complete the monument, which, at 60*l.* each, including stone and facing, amounts to 1,800*l.*

Renfrew.—The new municipal buildings of Renfrew are making progress in their construction. The style of architecture is a combination of the French Gothic with the old Scotch Baronial. In addition to the council chambers, there will be superintendent's and witness' rooms, the town-clerk's public and private rooms, with police-office, cells, and a public hall capable of accommodating upwards of 800 people, besides ante-rooms and retiring-rooms for ladies and gentlemen. There will be a town clock with four dials, each 7 ft. in diameter, and a balcony, which may be adapted for hustings. The tower in connexion with the buildings will be upwards of 100 ft. in height.

Elgin.—New Roman Catholic Schools here have been opened. They are built on the east side of the chapel, and are composed of two distinct and separate apartments, with different entrances, the front one being from Institution-road, and the back one from Abbey-street. The front is in a line with the gable of the chapel, and the architecture is in keeping with that of the church. There is a large room in front, and another stretching backwards for nearly 40 ft., giving ample accommodation to upwards of 150 children. The whole internal arrangement has been carried out on the most modern and approved principles, and with an eye to economy, in placing and fixing the desks and other furniture. The total cost, including enclosing walls, gates, and railings, is about 500*l.* Mr. Melvin, of Elgin, was the architect. The contractors were:—Messrs. J. Young, mason; W. Hay, carpenter; Bain & Morrison, slaters; D. Simpson, plasterer; J. Gordon, plumber; and J. Kintrea, glazier; and for railing and gates, J. Ramsay, Fifehead.

Glasgow.—A new church is now finished, and was lately opened, at Whiteinch, near Glasgow, for the accommodation of families in connexion with the Church of Scotland, in that rapidly-rising locality. The building, which is in the Pointed or Gothic style of architecture, contains in the area 555 sittings; and when the galleries are added it will accommodate 800 seat-holders. The roof is open-timbered, stained and varnished; and coloured ornamentation has been sparingly introduced. Externally, the front is of an ornamental character, the side walls are divided by single-light windows and massive buttresses, and behind there is a circular window; the keystones of all the windows and the main doorway are carved with incised work, which is to be filled in with chocolate-coloured cement. The gable is surmounted by a bell-turret and spire, terminating with a metal cross. The angles are square pinnacled buttresses, terminating with iron finials. The architect was Mr. G. W. O'Donoghue, of Glasgow and London.

Arbroath.—The parish church of St. Vigan, near Arbroath, has just undergone a process of restoration, and been re-opened for public worship. The edifice is one of the earliest in Scotland still in use in public worship. It is known among antiquaries by its sculptured stones, supposed to be of a sepulchral character, and the latest date assigned to which is the end of the tenth or the beginning of the eleventh century. The church is believed to have existed long anterior to that date. The Bishop of Brechin, in his recently-published work on the Scottish saints, has identified St. Vigan with St. Fechin of Folbar, in Ireland, who died A.D. 664. The sepulchral monuments belonging to it are unusually numerous, and prove it to have been a religious site of the first importance in the district. During the progress of the works connected with the recent restoration,

stones with finely-executed mouldings of the finest Norman were recovered from a fifteenth-century wall, in which they had been used as rubble. Numerous ancient crosses and other stones were discovered.

Books Received.

Atchley & Co's Timber Merchant's Guide. By W. RICHARDSON, Timber Broker. London: Sprigg, Atchley, & Co., Great Russell-street. On the faith, of course, that its numerous tables are accurate, this is a very useful volume for building contractors, surveyors, builders, and all other trades connected with building. It contains valuable tables for all purposes connected with the trade; marks of wood; essay on the strength of timber; and remarks on the growth of timber.

Miscellanea.

The Pinsky Prebend Estate.—In the House of Commons on the 2nd inst., Sir T. Adland stood up to defend the dealings of the Ecclesiastical Commissioners of the Pinsky Prebend Estate; or, rather, to deny emphatically the truth and justice of the allegations which had been made concerning them. Under these circumstances, says the *Times*, we thought it desirable to ascertain the condition of the estate by actual inspection, and the result has been to confirm at all points the correctness of the Medical Officer's report. A few filthy and dilapidated hovels, although now closed and condemned, are still standing to bear silent testimony to the kind of habitations which the Commissioners have allowed to exist since they came into possession more than four years ago. . . .

Vib regard to new buildings, they are precisely such as Dr. Sutton has described. Not of any extraordinary height, they are placed so near each other that the intervening roadway becomes mere alley, and this alley is often serpentine in winding, or it has no direct outlet, so that its air remains unchanged. The buildings themselves are often workshops. They are built back to back, with no possibility of ventilation. Many shops are completed and occupied; others are in course of construction. In many cases were so placed as to occasion an insufferable nuisance; for the removal of which the sanitary authorities have been compelled to intervene. Upon the whole it seems plain that the Ecclesiastical Commissioners have done nothing which was not strictly within their rights, but they have failed to show either the intelligence or the public spirit which might be fairly expected from trustees for the public.

Tramway Car Windows.—In the Court of Common Pleas, Miss Wesley, sister of Dr. Wesley, the organist at Gloucester Cathedral, sought an action against the North London Tramway Company, to recover compensation for an injury received in one of their cars. The plaintiff had opened up a window, and had placed her hand upon the ledge, when the window fell, and hurt one of the fingers of her right hand, thereby seriously interfering with her profession as a teacher of music. The company contended that the accident was attributable to the plaintiff's negligence, but the jury awarded her 100*l.* damages. The windows in question, the writer thinks happens to know, are dangerous traps for fingers. They lift up instead of being pushed down, in opening, and are intended to be caught by a spring, but are often so stiff that they cannot be lifted high enough, and down they come of a sudden upon a too convenient ledge of hands or fingers. The cars have plenty of ventilation above and at the end: why not fix these trap windows (twenty in every car) altogether, and so end all danger and all squabbles to them. Selfish persons, for their own exclusive detection, open them, at the risk of rheumatic headaches to six or eight other persons, so often thus get colds without knowing how, on the continual strong draught which the vance of the car pours upon their heads and shoulders, through these open windows.

Works in the International Exhibition. A sideboard in the International Exhibition mentioned in our first notice (p. 339, ante) as being from the design of Mr. Tarver, was manufactured and exhibited by Messrs. Morant, Boyd, Blanford, of New Bond-street. It is an excellent piece of workmanship.

Turning on the Water at Kidderminster. The memorial stone of the engine-house of the Kidderminster waterworks has been laid, and the water temporarily turned on to test the works. The whole of the works when completed will cost the ratpayers something short of 1*l.* per head. There are 24,000 inhabitants, and the total cost of the works will not amount to more than 20,000*l.* Mr. Fairbank is the engineer, and Mr. Hilton the contractor. The reservoir is 200 ft. square by 12 ft. deep, and is estimated to hold 3,000,000 gallons of water. It was erected by Mr. Hilton, under the personal superintendence of his manager, Mr. Vale. Since then, Mr. Vale has become partner, and the new engine and boiler-house will be erected by the new firm. The engine-house, when erected, will be 90 ft. by 50 ft., and will be of the best red brick, with red and blue dressings. The chimney will be of white brick, and will cost in all 1,280*l.* The engine and boiler will be supplied by Messrs. Clayton & Co., of Preston. The well is now completed, and is in depth 150 ft., and its diameter is 8 ft. in the clear.

Kensington Church.—On the 14th the new parish church of St. Mary Abbots, Kensington, was formally consecrated by the Bishop of London, in the presence of a large number of the metropolitan clergy and laity. It is Geometric in style, and has been built under the hands of Mr. G. Gilbert Scott. It consists of a nave and chancel, each with side aisles, and, in addition, there are a second aisle to the chancel on the north side, and two transept-like projections from the aisles, north and south, thus increasing the width of the building towards the east end, where the tower and spire will eventually rise on the north side of the east window. It will accommodate about 1,600 or 1,700 persons, all on the ground floor, and it has no galleries. The seats are low and open, the pews having been abolished, and a certain portion of the seats is free. The cost of the building thus far may be set down as standing at about 24,000*l.*, towards which a considerable amount is still wanting. A view of the exterior and plan of this fine Church will be found in an earlier volume of the *Builder*.

Kent House Estate, Rutland-gate.—With reference to a paragraph in our last, mentioning the sale of part of this estate in the Kensington-road for the erection of residences, Mr. Sang wishes it made clear that a considerable portion of it still remains for sale. It will give some idea of the rise that has taken place of late years in the value of land in this neighbourhood when we mention that for a front plot of 5,580 superficial feet, the price asked is 18,000*l.* Lady Ashburton gave this amount for a similar plot to Mr. Mitchell Henry, M.P., the then proprietor. Another front plot, situated between Lady Ashburton's and the first mentioned, and containing 5,619 superficial feet, is priced at 17,000*l.*

The Stratford-on-Avon Museum.—A book-case made of old oak timber, found in Shakspeare's House, and carved by Mr. John Marshall, has been placed in the upper room of the Stratford Museum, where it is ready to receive the valuable collection of Shakspearian books, comprising about 300 volumes, liberally presented by Mr. Halliwell-Phillips. This collection has arrived at the birthplace, and is temporarily deposited in the Record-room, but it will shortly be arranged in the book-case. A main feature in it consists in voluminous unpublished annotations on the text of Shakspeare, illustrated by many thousand cuttings from old black-letter books, as well as by numerous early engravings. The collection will not be thrown absolutely open to the public during the lifetime of the donor, but permission to consult it for special objects will be freely granted.

Street Watering.—The Westminster District Board has accepted the tender of Messrs. Braby & Son for supplying four water-carts with springs, and fitted with their improved distributor pipes, which enable the flow of water to be adapted to the width of the streets and to the varying degree of moisture of the road, at the sum of 28*l.* each.

Position of Public Lamps.—The Westminster District Board of Works have declined to undertake the lighting of sixteen new lamps which have been erected in front of the Albert Mansions in Victoria-street in lieu of the ordinary lamps, considering that the proper position for public lamps in such a thoroughfare is the edge of the kerb.

Land Sale, Bristol.—Last week the Hampton Court estate was offered in lots, and realised satisfactory prices. Lot 1, a piece of freehold pasture land, near the Ashton Vale Iron Works, containing 1 a. 2 r. 2 p., was sold for 185*l.* Lot 2, a close of freehold pasture land, containing 1 a. 2 r. 2 p., was bought at 290*l.* Lot 3, a similar close of land, containing 2 a. 2 r. 4 p., was sold for 390*l.* Lot 4, another close of pasture land, containing 4 a. 0 r. 20 p., was knocked down for 900*l.* Lots 5 and 6, two closes of arable grazing land, containing together 10 a. 2 r. 18 p., were sold for 935*l.* Lots 7 and 8, two plots of building land, having frontage in West-street and Back-lane, Bedminster, containing 3 r. 10 p., were sold to Mr. H. B. O'Donoghue for 1,000*l.* Lots 11, 12, 13, and 14, other plots of building land, containing together 1 a. 2 r. 39 p., were sold to Mr. H. B. O'Donoghue, for 1,450*l.*

The New Market Buildings in the City. The extensive new premises, consisting chiefly of large suites of offices, which have just been erected in Mark-lane and Mincing-lane, and now fast becoming occupied, have been named Market-buildings. The new premises form a prominent feature in the neighbourhood. The Mark-lane elevation is built of red brick, with stone facings around the spacious windows in the elevation, the ground-floor being of stone, with Tuscan pillars. The Mincing-lane elevation is much in the same style of architecture as Mark-lane, but differs in appearance from the latter in so far as white bricks have been used instead of red.

The Right Thing must be Done the Right Way.—A short time ago a clerk in the Admiralty, named Roffery, submitted to the Admiralty some suggestions as to iron ship-building. Though it is admitted that these suggestions were of a valuable character, Mr. Roffery has been suspended for twenty-one days, he having offended official dignity by writing direct to the Admiralty, instead of forwarding his communication through the head of his department, Captain Chamberlain. Nelson, if we remember rightly, was once reprimanded, after winning a battle, because he had fought it against orders. It cannot be helped. Authority must be maintained.

Harbours at Jersey.—The foundation-stones of two new harbours were laid on the north side of the island of Jersey last week, the one being at Bonne Nuit, and the other at Grève-de-Leucq, both of which places are extensive fishing stations, which hitherto have been without the least shelter for the numerous craft that frequent them. In addition to the primary object of its construction it is intended to utilise the harbour at Grève-de-Leucq for the shipment of the Mont Mado granite, which is found in that part of the island.

Llynvi, Tondy, and Osmore Coal and Iron Company, Limited.—This company has been formed for the purpose of acquiring three properties, in South Wales, now in active operation, which together will form one of the most extensive coal and iron works in the kingdom. The capital of the company will be 550,000*l.*, partly in 7,000 shares of 50*l.* each, making 350,000*l.*, and the remainder taken by the vendors.

Explosion of Dynamite.—An alarming explosion has taken place on Durdham Down, Clifton, where some railway works are in progress. About 4 lb. of dynamite in a chest exploded. Fifty men were in a shed, about twenty yards from the chest, when it occurred, and the explosion broke innumerable windows in the neighbourhood, and was heard in the remotest parts of Clifton; but no one was injured, though many men were blown off their seats.

Dinner to Workmen at Leicester.—The completion of St. Mark's Church has been celebrated by a dinner given to the workmen by Mr. W. P. Herrick, at whose expense the church has been erected. The dinner took place at the George Hotel. After the cloth had been drawn the Rev. Canon Burfield was elected to the chair, and was supported by Mr. A. Ellis, Mr. Osborne, Mr. Nichol (clerk of the works), Mr. Walter Lindley (foreman), J. Cox, J. Onehy, and several others connected with the firm.

Cottage Hospital Movement.—It is proposed to erect a cottage hospital at Chippenham, to promote which an industrial meeting has just been held, when appropriate resolutions were passed, and a committee appointed to promote the object in view.

A Skeleton in Every House.—*Fun says.*—"Our excellent contemporary the *Builder* contains an advertisement which, compared with sensational tales as a rule, may be described as several stories high.—"Two skeletons in Hampshire, 20 miles beyond Southampton, are required to be immediately completed." At first, we were inclined to think that the services of an able anatomist were required by some modern Frankenstein; but our own residence—we live in a modern villa—soon reminded us of the fact that unfinished houses are often spoken of as skeletons, and that many of them retain their claim to that title even after they are supposed to be finished, for the wind blows through them as if they were mere bony structures."

The Congregational Memorial Hall.—The Memorial Hall, of which we gave a view in our last, came into existence from a desire expressed in many quarters to celebrate the 29th of August, 1862, when more than 2,000 ministers of the Church of England were ejected from their charges because they could not conscientiously subscribe to the Act of Uniformity. Other objects were contemplated, and a fund of 250,000*l.* was raised. In the first instance a site was found in New Earl-street. Ultimately the site was disposed of to the Metropolitan District Railway, and the present site, a part of that of the old Fleet Prison, was procured, to the extent of 9,000 ft., for the freehold of which 28,000*l.* were paid.

Raffaello's Cartoons.—With a view to preserve accurate copies of the cartoons of Raffaello, the Lords of the Committee of Council on Education, acting through a committee, propose to select nine artists to make preliminary studies of given parts of three of the cartoons. Artists will first be required to complete an accurate copy either in water-colours, tempera, or oil, of a photograph, full size, of a head selected from the Beautiful Gate. These will be sent in to the Secretary of the Science and Art Department by the 31st of July, 1872. From the candidates so competing, nine may be selected to make accurate coloured copies from the cartoons themselves of portions set out by the committee as a final test.

Report on Works in the City.—The usual Report, for 1871, of Mr. William Haywood, Engineer and Surveyor to the City Sewers Commission, has been issued in a printed form. In respect to the proposed widening of the public way on the western side of St. Paul's Churchyard, it states, the negotiations had not materially advanced at the end of the year. The inhabitants on the lines raised objections, and so did the Cathedral authorities on behalf of those going to the cathedral, and the matter at the end of last year remained at that stage. The experiments with asphalt paving were being continued; wood paving was also again in hand in an improved form.

The Idiot Asylum at Knowle.—The foundation stone of the Midland Counties Middle-class Idiot Asylum has been laid at Knowle, a village midway between Birmingham and Warwick. The ceremonial took place with full Masonic honours. The asylum, when finished, will cost 20,000*l.*, but a portion only will now be erected, affording accommodation for twenty patients of each sex. Lord Leigh, in laying the foundation stone, used the identical mallet with which Charles II. laid the foundation stone of St. Paul's Cathedral.

The Protection of Children under the Factory Act.—At Chorley, Mr. J. Quin, a manufacturer of india-rubber, has been summoned by the Government Inspector for a breach of the Factory Act. A youth named Salisbury had been engaged in the mill, and on the 23rd and 24th of April he worked thirty-two hours "at a stretch," without cessation, except at meal-times. At the end of the thirty-two hours the lad fell amongst the machinery and was killed, and it was believed that the accident was due to exhaustion. Mr. Quin was fined 10*l.* and costs. We wonder he was not tried for manslaughter.

Casbel Rock.—A Bill to vest the Rock of Casbel in trustees, for the purposes of the restoration of the cathedral and the preservation of the historical ruins, is now before Parliament. The Duke of Norfolk, Archbishop of Casbel, Marquess of Clanricarde, Earls of Denhig, Fingall, Granard, Kenmare, and Limerick, Viscount Southwell, and other men of note, are among the proposed trustees.

The Losses at Chicago.—The "Fire Marshal" of Chicago reports the aggregate losses by the great fire to have been upwards of 190,000,000 dollars, there being 51,500,000 dollars on buildings, and the remainder on personal property. The fire, he states, burned over 2,000 acres, destroying 25,000 buildings. The amount of insurance was about 90,000,000 dollars.

The Public Park Movement at Ashton.—The committee organised for the purpose of procuring a public park at Ashton-under-Lyne, have within the past week purchased the Highfield estate for 2,000*l.* On receipt of the money Mr. H. T. Darnton returned 500*l.* as his subscription.

Rust's Vitrifed Marble.—In our "Notes at the International Exhibition" (p. 357, ante), we mentioned the "Head of Daniel" in mosaic, from a design by Mr. Stephens. We are asked to add, and do so willingly, that this work is exhibited and executed by Mr. Jesse Rust (in his patent vitrifed marble material).

Society of Arts' Conversazione.—The Society's Conversazione is fixed to take place at the South Kensington Museum, on Wednesday, the 19th June.

TENDERS

For the erection of new printing and publishing offices for the *Surrey Advertiser*, Market-street, Guildford. Mr. Henry Peak, architect:—

TO BUILDERS, CONTRACTORS, AND OTHERS. WANTED, a RE-ENGAGEMENT, as PRIME-COST CLERK, BOOKKEEPER, or ARCHIEVER. Advertiser has a practical knowledge of the trade, and is well versed in all the duties of the office.—Address, ALBERT, 9, Beaufort-road, Cashland-road, South Hackney.

WANTED, a RE-ENGAGEMENT, by a JOINERS. Good draughtsman. Able to set out every description of work. Well acquainted with the system of working machinery. Salary moderate.—Address, T. M. 25, Douglas-street, Deptford.

WANTED, a RE-ENGAGEMENT, by a FOREMAN, of twenty years' experience in the management of all branches. Can prepare a set of plans, measure up, &c. Moderate terms for a permanency.—Address, MR. DEER, 4, Ann-street, West Ham Lane, Stratford, E.

TO ARCHITECTS. WANTED, a RE-ENGAGEMENT (after June 1st), by a GENERAL ASSISTANT, who has had experience both in Town and country practice. Unfurnished surveying.—For references and terms, address, J. E. 14, Finsbury-lane, E.C.

TO BUILDERS AND CONTRACTORS. WANTED, a RE-ENGAGEMENT as GENERAL FOREMAN of WORKS by a thoroughly practical and energetic man, who has considerable experience in building construction. Can make out all necessary details for the guidance of workmen. Carpenter and Joiner by trade. Good references.—Address, C. 24, Old Kent-road, S.E.

TO ARCHITECTS AND BUILDERS. WANTED, a RE-ENGAGEMENT, as CLERK of WORKS or GENERAL FOREMAN. Just finished a large job. Joiner by trade. Aged 39. Good references.—Address, G. W. 120, King's-road, Chelsea.

WANTED, a RE-ENGAGEMENT, as SHOP FOREMAN, GUTTING FOREMAN, or GENERAL FOREMAN, by a thoroughly practical Town BUILDER'S FOREMAN, Joiner and staircase-maker by trade. Aged 24. Good draughtsman, and well up in piecework and machinery of all kinds. No objection to call up line in the office or at the bench. First-class testimonials.—Address, C. 24, Old Kent-road, S.E.

WANTED, a RE-ENGAGEMENT, either as CLERK of WORKS or GENERAL FOREMAN of WORKS. Has had twenty years' experience in all kinds of public and private works; has just completed a three years' engagement on large works in the City. Has had great experience upon land or seaside sewer works.—Address, 42, First-class references from last and previous employers.—Address, B. 2, Alexander Cottage, Fairfield-road, Bow, E.

TO CIVIL ENGINEERS, &c. WANTED, a PERPETUOUS ENGAGEMENT as DRAUGHTSMAN. Has been engaged for the past six years on plans, &c. of large public works, water, and drainage works, and well up in piecework and machinery of all kinds. No objection to call up line in the office or at the bench. Good references, &c.—Address, C. E. 24, Stockbridge-terrace, Finsbury, London, E.C.

TO ARCHITECTS AND SURVEYORS. WANTED, by the Advertiser, aged 19, an ENGAGEMENT, as ASSISTANT. Five years' experience.—Address, WM. WOODING, House Agent and Valuer, 397, Bethnal Green-road, E.

TO BUILDERS, &c. WANTED, by the Advertiser, a SITUATION as GENERAL CLERK, or CASHIER (London preferred). Is a good bookkeeper, used to precise costs, and thoroughly versed in Office work and accounts. Five years in last situation. References undeniably as to ability, character, &c.—Address, W. 66, Friars-street, Oxford.

TO SURVEYORS AND BUILDERS. WANTED, by the Advertiser, aged 24, a SITUATION, in an Office. Has a thorough knowledge of Joiner's work, practically and theoretically. For the past twelve years has devoted all his time to study of all kinds of building.—Address, J. J. Post-office, Terre, Terquay.

TO CONTRACTORS, &c. WANTED, by the Advertiser, a RE-ENGAGEMENT, as CLERK or GENERAL ASSISTANT. Thoroughly conversant with the office routine, price cost, taking of quantities, and measuring up works; is a good draughtsman. Town or country.—Address, aged 40. Good references and testimonials.—Address, No. 53, Office of "The Builder."

WANTED, by the Advertiser, a RE-ENGAGEMENT, as JUNIOR ASSISTANT, in an Architect and Surveyor's Office. Neat draughtsman, &c. Moderate salary.—Address, 215, Post-office, Birmingham.

WANTED, by a practical CARPENTER, Piecework, CARPENTRY, or Fixing of a Mission in Church. Labour only.—Address, A. B. Post-office, 206, Abchurch-lane, London, E.C.

TO JOBBING BUILDERS. WANTED, by an energetic Man, aged 35, a RE-ENGAGEMENT, as GENERAL JOBBING HAND.—Address, C. L. R. 14, Circus-street, Portland-road, Regent's Park, W.

TO BUILDERS, CONTRACTORS, &c. WANTED, by an energetic and competent CLERK, a RE-ENGAGEMENT, in Town or country. Can prepare plans, specifications, and estimates, measure up and superintend works, and thoroughly acquainted with accounts. April 30.—Address, 215, Office of "The Builder."

WANTED, by a good CARPENTER and JOINER, all kinds of CARPENTER and JOINERS' WORK, STAIRS, and RAILS, by Contract, Labour only; or Situation as Working Foreman.—Address, D. 25, Union-street, St. Paulina.

TO BUILDERS AND CONTRACTORS. WANTED, by a thoroughly competent Man, Mason by trade, a RE-ENGAGEMENT as FOREMAN of MASONRY, or to TAKE ENTIRE CHARGE of a JOB. First-class references.—Address, A. S. 29, Auchland-street, Vauxhall, London.

TO BUILDERS AND TIMBER MERCHANTS. WANTED, by Matted Man, a SITUATION as CLERK, SALESMAN, or FOREMAN in a YARD. Ten years' experience. Well up in measuring and converting both English and foreign measures. Has had considerable experience in English and foreign.—Address, GEO. BROWN, at Mr. Carter's, Builder, Aminta Cottage, Waltham-green.

WANTED, by the Son of a Builder (aged 21), a PLACE as IMPROVER in CARPENTRY and JOINERY. Four years' experience. Can give references. Will be in London.—Address, A. E. BARNETT, 2 South Crescent, Walton-on-Naze, Essex.

WANTED, by a good DRAUGHTSMAN, an ENGAGEMENT...

WANTED, by a good DRAUGHTSMAN, an ENGAGEMENT...

WANTED, by a Young Man, a SITUATION as IMPROVER in the PLUMBING, PAINTING and GLAZING...

WANTED, by a Middle-aged Man, a SITUATION as TIMEKEEPER or CLERK...

WANTED, by an experienced FOREMAN of MASONRY, a JOB in London or vicinity...

TO BUILDERS AND DECORATORS. WANTED, by an experienced Man, a SITUATION as WORKING or SHOP FOREMAN...

WANTED, by an experienced BUILDER'S CLERK, a RE-ENGAGEMENT...

WANTED, by a respectable married Man, a SITUATION as JOBBING or HOUSE FURNITURE...

The Builder.

VOL. XXX.—No. 1529.

*On the Origin of
the Element of Grandeur in
the Antique.*

THE actual conditions of life among the ancient Greeks directly tended, as we have attempted to show,* to produce that breadth and grandeur of character of which both the art and the literature of Greece give the faithful reflection. It is no less important to

investigate those details of physiognomical treatment, both of the face and of the form, which concur to produce the unrivalled beauty we speak of.

A critical analysis of the physiognomical characteristics of antique sculpture enables us at once to point out the main difference between the outline of the Grecian face and form, and the general contours both of the most civilised nations of Europe, at the present day, and of savage or even animal tribes.

If we describe, on the profile view of any face a circle, of which the centre is in the orifice of the ear, and the radius equal to half the height of the head, or, more accurately regarded, to one-sixteenth part of the whole height of the figure when standing erect, the radii of this circle will furnish apt means of comparative measurement.

In the negro profile, the circle thus described intersects the outline of the face at the brow. The bridge of the nose falls within the circle; but the lower part of the face projects enormously before it, the lower lip advancing beyond the arc by one-fourth part of the length of the radius. The longest diameter of the head is that which is taken at thirty degrees from the horizontal, or from the chin to the occiput. The same proportions, in a somewhat exaggerated form, prevail in the anthropoid apes; the chief difference being in the greater depression of the upper part of the nose in these animals.

A well-proportioned modern European profile approaches much nearer to a circular form than does that of the negro, although the centre of the limiting circle does not coincide with the metric centre in the orifice of the ear. If we cut out in paper a circle of the radius previously given, and fit it to the profiles of which we are speaking, we shall find that, in the negro, the skull proper is depressed and flattened, so as to come within the circular outline, while the entire lower part of the face, from the root of the wings of the nose to the angle of the jaw, appears without the disc. In the modern European head, the coincidence of the skull with the circle is approximately close, and the projection of the lower part of the face much less than in the African. But in the Greek head, the skull is compressed instead of depressed; the anterior and posterior

parts of the outline come within the limiting circle with which the upper part of the skull coincides, and only the extremity of the nose, and the chin, from the upper lip to the juncture with the neck, project beyond it. The diameters of the profile, taken at different angles through the ear, differ but little from each other. The longest radial line is that which is drawn to the upper part of the forehead, at sixty degrees from the horizontal. This is a seventh part longer than the radial height to the brow, which again exceeds that drawn to the outline of the nose. In the modern European head, the two latter radii nearly coincide, and are but little shorter than the distance from the ear to the top of the forehead. These details may be summed up by saying, that in the negro profile the mouth and jaws form the most conspicuous part; in the modern European profile the nose, eyes, and brow; and in the Greek the forehead, which thus casts a deep shadow over the cavity of the eyes.

The physiognomical interpretation of these great distinctive traits appears to be this. In the negro tribes the animal passions are so conspicuously developed, as to form, it may be said, the key to the character. In the modern European head, observation of the material world, and disposition to the energy of individual action, are indicated. In the Greek, we find reflection, imagination, and a superiority of the moral and intellectual development over that of either the passionate or the industrial and accumulative propensities. If we compare the doctrines of Plato with those of Adam Smith, we shall find a pregnant illustration of the truth of this comparison.

Such being the general character of the Greek head, the several types representing the different gods, heroes, and chief subjects of the sculptor's art, composed so many distinct varieties of the same general theme. In dealing with this branch of the subject, it is evident that the great Greek sculptors were bound by exact and well-considered laws. The physiognomical indications of certain ideal impersonations were arrived at by careful study, and, no doubt, by careful induction from observation. Once attained, the type became fixed. The Greek sculptors were not in the habit of producing in an undraped figure the copy of any casual model, and then indifferently naming it an Eve, a Venus, or Musidora. The vague lawlessness of modern sculpture was, happily, unknown in Greece. A definite idea, and, for the most part, a grand and beautiful idea, was embodied in every statue. The greatest sculptors wrought as men who had seen the gods. So brief was the period in which the sculptor's art arose, attained its zenith, and commenced its decadence, that it seems probable that adequate study may hereafter enable us to determine, with extreme precision, the date of all the most famous relics discovered, or to be discovered. The work of the sixth century before our era, as illustrated by the metopes of Selinus, and the Apollo of Tegea, was rude, rigid, and recalled very strongly the Egyptian type. By the middle or latter third of the fifth century B.C., sculpture had attained its utmost grandeur. The works of Phidias, in 432, and of Polykletus, some ten years later, comprise the most famous productions of the Greek chisel, and probably the most noble human works yet produced. The former sculptor, in addition to the grandeur of his conceptions, and the magnificent breadth of his style, possessed, in perfection, that scientific instinct of the sculptor which enabled him so to introduce into his work the equivalent of that which in drawing is called fore-shortening, as to adapt each statue to the position and point of view for which it was intended. In this religious period of the art, that which we may call chancel sculpture appears to have been little known, as far as least as full-sized works in the round are concerned. The story of the contention between Phidias and

Alcamenes, the work of the former receiving the chief applause of all when seen in the studio, but presenting no approach to the excellence of that of Phidias when erected in the place it was destined to occupy, is confirmed, in its main truth, by a seated figure from the pediment of the Parthenon now in the British Museum. The thighs of that grand statue,—thought with justice to personify one of the Fates,—are altogether out of truth if regarded from the level of the eye. It would have been well for some of the persons who have been so perplexed by the attempt to design a seated figure for the Hyde Park monument that should be other than atrocious, to study this great lesson left by the Athenian sculptor. Of Polykletus we have the tradition, not only of the grandeur of his work, but of the exact and exquisite geometric proportions of his canon of the form.

It is possible that the pathognomic expression of the face was carried to the highest pitch of excellence somewhat later than the age of Phidias. The Cupid discovered at Lo Cento Celsi, and now in the Vatican, is probably the most beautiful relic in the world, and there can be little doubt that it is a genuine copy of the famous Cupid of Praxiteles. The name of Enphranor is given by Pliny as that of a sculptor who gave greater proportionate size to the head and limbs than to the trunk. Something of this treatment may be traced in the Juno of Melos. With Lysippus, the contemporary of Alexander the Great, the very opposite style of variation was attempted, the head being made smaller than the canonical proportion. Of the influence of this school, the Venus de' Medici affords the most striking example.

During this grand and unrivalled age of art, while the modifications at which we have hinted were in course of development, the great characteristic that the sculptor worked by law, and not by chance or caprice, was absolute. We may detect the hand of a Roman copyist of a Greek statue as much by the slovenly inaccuracy of his proportions as by the less sculptural feeling thrown into the finish of the work. Such we lately noticed in the statue of a Greek handing a fillet round his head, recently purchased by the British Museum. In the Greek work, certain exact proportions are to be remarked. The various types of figure had each a normal law. The foot was the modulus of girth, and the proportion of the length of the foot to the height of the figure was thus the key to the character of the latter. Thus we find in the Venus de' Medici that the length of the foot is exactly the seventh part of the height of the statue, when reduced to the erect posture. In the Juno of Melos, again, the foot is very nearly 5.32nds of the height. But in each statue the girth of the waist is exactly three times the length of the foot. In the former, the girth of the shoulders and of the loins, which are less easy to determine in the latter, are each exactly four times that length.

From the detection of so unsuspected an exactitude, which has so long mutely testified to the possession by the Greek sculptors of geometric laws, and of physiognomical rules, now altogether lost or ignored, may be drawn an inference of a character yet more important than any discovery of a merely artistic character. The philosophy of Greece, its mathematics, physics, metaphysics, rhetoric, poetics, politics, were all not only wrought to system, and taught by sophists and philosophers, but were reduced, at least in outline, to writing. It is not too much to say that almost the entire outline of Western philosophy is based upon the works of Aristotle. But of the art of Greece no such record exists. Nor is it likely that the rules of art were ever thus placed within the grasp of the profane. This silence is not peculiar to Greece. It prevailed universally, almost to our own time. When, as in the more stable

* See p. 237, ante.

empires of old, occupations were hereditary, the value and the sanctity of the oral tradition of art may be readily comprehended. As the circle of innovation extended, and as the artist became able to adopt pupils, or to instruct strangers in the art, the mystery of each craft was not less rigidly guarded. In cases where written instructions, apart from example and actual training, are to a great extent in operation, secrecy can not be practised. We thus see how, among a highly-cultivated people, the functions of historic teaching were divided from those of oral tradition. Each had its appropriate province. Each has ever retained it. To fix the site of a battle, the name of a king, the authorship of an unsigned book, oral tradition has proved itself to be altogether trustworthy. Events can only be entrusted to the recording muse of history,—to the pen or to the chisel. On the other hand, any attempt thus to stereotype the living learning of art must fail. One of the few Medæval treatises of the kind that we possess, that of Pico della Mirandola, "Majolica," is already almost unintelligible, though written with the evident purpose of instruction. With the fall of the liberty or the autonomy of a country will perish not only its art, but the traditions of its art. It is only while the oral legacy is handed down, in the studio, at the forge, and at the bench, that art lives.

One of the most striking peculiarities of the sculpture of the purest Greek art is that of the pose of the figure, especially the inclination of the head. The contrast between heroic representation and Roman iconography is here most marked. The subject should be regarded not only from the pictorial or sculptural point of view, but as a physiognomical indication of no little value. We must not be induced, from distaste towards those dogmas of phrenology which are not only unproved, but, in the opinion of most persons competent to judge, opposed to physiological science, to overlook the great importance of the contributions which Gall and his disciples have made to the study of positive and of comparative physiognomy. No writer, with the brilliant exception of Camper, has done so much to elucidate this important branch of art, of philosophy, and of ethnology, as have several disciples of this school. The large collections of busts, including those of remarkable criminals, that have been made by phrenological students, have a value that has not yet been fully realised. No indication of this class has been more pregnant than those which regard what has been unfortunately termed the natural language of the organs of the head. All accurate observation, whether of man or of beast, proves the certitude with which emotion or thought is translated into visible expression by attitude. The position of the head is the most striking detail of the general pose. The habitual carriage denotes the ordinary habit of thought; the momentary pose, the ruling emotion of the moment. The stealthy crouch of the cat when about to spring, the timid glance of the hare, the broad gaze of the stag, the depressed ears of the horse when meditating mischief, are unmistakable. Scarcely less so are the steady, open gaze of the honest man; the sly, reverted glance of the coward; the sideway toss of the head of the vain person; the lofty bearing of the proud. In each of these, and in numerous other instances, the actual angle at which the head is borne on the neck is one of the most distinctive elements of pathognomical expression. In exterior nature, as in the mind itself, habit is formed by repetition of similar acts. The proud man or the courageous man, while more liable than the servile or the timid to the excitement of the respective emotion, and to its concurrent momentary expression, is likely to acquire a bearing habitually expressive of that tendency. There is not only a psychological, but a mechanical, mode of regarding this part of physiognomy. The position of the head, when at rest, is, as we have said, characteristic. It is also determined, to a great degree, by actual form. The projecting jaw and correspondingly elongated occiput of the Negroid races determine an habitual position of the head that throws the face towards the sky. The contrary form of massive forehead and rounded chin produces the opposite bearing, that downcast glance which artists have agreed with poets to call pensive. Camper, who first in modern times laid the compasses to the profile, has called attention to the question of form. But he has not sufficiently regarded the concurrent question of pose. In some of his diagrams he has attributed to the former what is actually due to the latter. He has given an

angle as anatomical, while it is, really, only habitual. For in the profiles which he draws to illustrate the facial angle of 100°, which he attributes to Jupiter and similar heads, it will be seen that the radial lines do not start from the orifice of the ear. The artist must be more readily guided by pose, than by form, independent of pose. The former strikes the eye at once, the latter requires investigation of a minute, or even of an anatomical, character. It is, therefore, with a double-truth that the pensive pose common to Greek heads reflects the grandeur of the Greek character. Achilles, nursing his wrath in his tent, listening with repressed longing to the distant din of war; Ariadne, and Andromeda, deserted and downcast; Jupiter, sitting silent while Thetis embraces his knees, and pleads for her son,—are impersonations wholly Greek. They are faithfully represented by Greek sculpture. Both the character and the plastic embodiment are foreign to modern life. We might as well expect to see Aristotle take the leadership of the House of Commons, or an endeavour to recall or to embody the ideas of the epic and tragic poets, or the epic and tragic artists, of Greece. Here is another element of antique grandeur.

What may be the future development of the personal beauty, of the intellectual vigour, or of the moral grandeur, of any branch of the human family, is a question for the elucidation of which data are altogether wanting. We can only speak of what is, and of what has been the case; and we decline speculation as to what may be in store. As matter of history there seems good reason for the opinion that races of men, like their predecessors in the animal kingdom, have passed through the phases of infancy, maturity, and decline; race replacing race, but no declining people ever regaining their earlier vigour. In what quarter to look for the hope of the present age it is not easy to say. Marks of decline meet us almost everywhere. In the most martial and most cultured of European nations the very general use of spectacles betrays an enfeebling of the reflective nervous system. In France stature has been reduced by many inches, in consequence of the wars of the first empire and other causes; nor is it the physical man alone that shows marks of extreme degradation of type. In Italy very wide-spread disease saps the brilliant beauty which yet lingers in certain narrowly-limited districts. In England, the prosperity of dentists, and other symptoms easy to indicate, tell of anything but a vigorous vitality, especially in the young. In Australia the English race has bloomed into a new and delicate beauty; but it is as fragile as it is attractive. In America, the hard, pained, drawn, expression of the native Red Indian tribes has been communicated, without intermixture of blood, to the descendants of the European immigrants. Of the one ancient race, which, in its own Syrian country, still possesses some relics of its former beauty, the European representations do not give any very hopeful promise. No human beauty is historically more famous than that of the royal and sacerdotal lines of Judah, of Benjamin, and of Aaron; but the prohibition of iconography, which formed part of the ancient law, and which is reflected by that of Islam, has left us altogether without the means of forming any adequate idea of that wonderful grace that was equally admired in the East and in the West, that was found fairest among the women of Persia, and that made Herod the Great tremble lest Mark Antony should behold the children of Antigonus.

On this view of the case, it follows that the great period of Greece was one of the culminating epochs of race, and that in the most beautiful race of which we have any graphic record. It is beside the mark to contend that in this or that detail we ourselves, or any other nation, are or are not immeasurably superior to Homer's heroes. Let it be so, or not, it does not interfere with the truth of the determination, that in the relics of the works of the great Greek artists, from Phidias to Praxiteles, we have the reflection of the highest human beauty, expressive of the utmost grandeur of human character, that iconographic history denotes as hitherto attained by any family of mankind.

Subsidence of Turnmill-street.—Mr. Clutton, the arbitrator appointed by the Board of Trade to inquire into the cause of the subsidence of Turnmill-street, which has formed the subject of a dispute between the Clerkenwell Vestry and the Metropolitan Railway Company, has mulcted the latter in 1,600*l.* damages.

A NEW HOSPITAL IN LIVERPOOL.

ON Tuesday last a new hospital on a large scale, which has been in course of erection between three and four years, and which has involved an expenditure of more than 30,000*l.*, was formally opened by Prince Arthur during his visit to Liverpool this week. The proceedings were of a highly interesting character, about a thousand invited guests being present. The foundation-stone of the building, which is situated at the south end of the town, in the immediate vicinity of the line of docks, was laid between four and five years ago by the late Earl of Derby. It is called the "New Southern Hospital," and its erection has been rendered necessary in consequence of the existing hospital having been found altogether inadequate to the requirements of the district. Before the opening of the building an address was presented to the Prince by Mr. G. H. Horsfall, the president of the hospital committee, after which he was conducted through four of the principal wards, upon each of which he bestowed a name, and then declared the hospital open. The address presented to his Royal Highness on the occasion was in illuminated vellum, enclosed in a silver casket, and bore the following inscription:—"Presented to H.R.H. Prince Arthur, on the occasion of his Opening the New Southern Hospital, May 21st, 1872."

The building, including airing-yards, occupies a piece of land, in the form of a parallelogram, 300 ft. by 80 ft., and has what may be termed four frontages, being bounded by Caryl-street on the west, Grafton-street on the east, Hill-street on the south, and Cameron-street on the north. The plan of the building is arranged on the "pavilion" system. The administrative buildings occupy the frontage to Caryl-street, with the principal entrance in the centre, and the pavilions (or wards) occupy the frontages to Hill and Cameron streets, leaving a space between the administrative block and the wards free for ventilation, and the distance between the pavilions of 100 ft., which is open to Grafton-street, and used for airing-yards. The general disposition and isolation of the building is best seen on the first floor, on which story the hospital proper may be said to commence, the spaces between the blocks on the ground story being filled up with one-story buildings, except the spaces left for areas and airing-yards. The building is of a simple Gothic character of architecture. It is constructed of grey brick, with stone sills and strings, the horizontal lines being marked with blue brick in bands. The entrance-porch is of stone, with a deeply recessed and moulded arch, having the tympanum left for sculpture. A certain form of ornament has been expended on this doorway, the carvings being composed of foliage designed from plants such as the poppy, and others having medicinal virtues. The gable is intended to be finished with the figure of an angel, and the tympanum with a bas-relief representing the parable of the Good Samaritan. The roofs form a good feature in the design, the ends of each ward having two towers each, and the centres also show high-pitched roofs, all finished with wrought-iron cresting and finials; and it is worthy of note that the roofs are not merely ornamental, but eminently useful, and important parts of the hospital. The administrative block is only two stories high in the centre, and three at the ends, so as to cause as little obstruction to a free current of air between the ward blocks as possible. It comprises on the ground floor a large entrance-hall, to the right and left of which are placed the medical and general board-rooms. Behind these a corridor runs parallel to the street, from which are entered, on the right, the senior and junior house-surgeons' sitting-rooms, and on the left, the house dining-room, and matron's sitting-room. The patients' entrance is at the south end of this corridor. On the first and second floors of the administrative block are the surgeons', students', matron's, and nurses' bed-rooms and bath-room, as well as several patients' wards.

The hospital accommodation provides about 200 beds, and consists of accident wards on the ground-floor, and three tiers of wards for twelve beds, and two for twenty-six beds in each pavilion, besides many smaller wards for special cases and private wards in the administrative building. The wards and beds are spacious, and attached to each ward adjoining the staircase, are nurses' sitting-rooms and sculleries, food lifts being provided from and to each scullery, and foul-linen shoots on each landing

to receptacle below on the ground-floor. On the ground-floor, on the east of the corridor between the ward blocks, are placed the *post mortem*, dead-house, dispensary, and laboratory, the access and exit from dead-house and *post mortem* rooms being so arranged as to be quite private. In the centre of the corridor to the east, on the first-floor, is the chapel, and to the west the operating theatre. The patients' food is prepared in the serving-room, in which there is a hot table, and from this the trays are supplied, and sent to each floor of the wards by "lifts." A hydraulic "lift" for patients from the ground-floor to each floor of the wards is also provided.

The architects for the building are Messrs. Culshaw & Summers, of Liverpool; the chief contractor being Mr. George Rowe, also of Liverpool.

MORE NOTES AT THE ACADEMY.

WANDERING through the eastern and less frequented quarters of the Academy galleries, the visitor comes with a sense of sudden refreshment upon the three pictures by Mr. Boughton, hung in a row in gallery VII.: "Spring-time," the "Flight of the Birds," and the "Coming of Winter" (579, 580, 581). This artist, pretty well known already by his pictures of English figures and manners of the period "when the first George was king," is one who has struck out a path of his own, wherein the present contributions show a marked advance, both in feeling and breadth of execution. These are of that type of work of which, in a quite different manner, Mr. Walker furnishes examples, wherein the feeling of landscape and figure is blended so that the one seems inseparable from the other in its effect on the mind. "Spring-time" shows as a single youthful figure in a nearly white dress, flowers opening in the grass at her feet, and in the middle distance a grove of trees with the early foliage beautifully indicated; the figure is charming in its fresh and simple grace. The companion picture, of the same type, is not less good in its way; but the larger one, the "Flight of the Birds," is still better. A wild moorland, a cold grey bit of sea on the left, two figures in the centre of the composition, one seated and the other standing, gazing with varied expressions of melancholy at the scene—these are the elements of a picture which is full of suggestive poetry, beyond its general excellence as a painting. Mr. Boughton has not struck so deep a tone before; we shall look with interest for his future works.

M. Alma-Tadema is another of the artists with a specialty, who travelled out of his usual path last year, and has acknowledged a comparative failure by returning to it in this year's Exhibition. He, at least, has lost none of the powers which gained him his reputation; and his Egyptian interior, "Komar, Period" (524), with a mourning party watching around the mummy, is as fine and highly-finished in its architectural detail and surface, and reflected light, as any of his earlier works; the large tropical plants, showing as a back-ground through the architecture, give a peculiar tone and richness, by contrast, to the warmer tints of the marbles, and a distinctive character to the composition. Among pictures showing a strong individuality in the treatment of a well-worn subject, is Mr. B. Rivière's "Daniel," standing with his back to the spectator, in the den, with a group of lions crouching before him with various attitudes and expressions of baffled rage and blood-thirstiness. As in his "Circus and Swine," last year, the figure is a comparative failure; the animals form the picture; the long bony form of the crouching lioness on the left is admirable. Of Mr. Watts's large picture of the "Curse of Cain," we could better speak if it were finished. We do not think either the subject or the treatment very happy, nor, so far as we can at present judge, the colour; there is some learned drawing in it. Among the few foreign pictures hung are one or two clever ones in the same room as the last-mentioned work; "Escadron de l'Armée de la Loire," by G. Reguany, is a clever thing, with a grim and certainly not patriotic humour in it; a row of extemporé cavalry soldiers in motley garbs, and mounted on scarecrow-looking horses standing with their backs to the spectator. M. Tissot has two pictures in his well-known peculiar light scale of colour, "An Interesting Story" (389), and "Les Adieux" (614); the latter, a tender leave-taking of two young people through an iron gate, is most successful; the face of the

young girl is charming in sentiment and execution. Among other figure-pictures of sufficient interest and originality to challenge remark, may be mentioned F. Goodall's "Bedouin Mother and Child," lighted by the "after glow" (of course: how tired we are getting of that expression!); Miss Edwards's "Goodbye" (651); "A Moorland Road in Brittany" (311), by Mr. J. Knight, a set of figures straggling up a road through a mist of heavy rain, very clever and suggestive; "Age and Infancy" (373), by T. Israels, a powerfully-painted old man and child, well worth looking at; and "Woman's Work" (1,089), a fine, impressive, though exceedingly simple picture, by Mr. J. D. Watson, of two (Breton?) women in the centre of a dark fat moor, laboriously piling up straw to cover some heaps of potatoes. We pass over sundry well-painted pictures, of Spanish subjects, by Mr. Burgess, an artist who is so far to be regarded, we fear, as an example of the fact that clever, careful, painstaking work will not in itself avail to give interest to pictures, unless the artist has something of his own mind, his own individuality, to give to them likewise. The one painting by Mr. Burgess, which has left its mark on our memory, is his single life-size figure, called "Hyacinthe," exhibited the year before last: cannot be put some of the same feeling and individuality into his more ambitious works, and render them something more than mere groups of figures in Spanish costumes?

"What is the object of landscape painting?" is a question to be suggested by the two paintings with which Mr. Millais has followed up his last year's *début* in this branch of his art. The crowds which the painter's good name draws around these are not discriminating on this point. "It is a landscape by Millais, and we must look at it," is about the extent of the criticism in most of these groups. If the object is merely an accurate transcript of nature, and nothing more, the success of one, at least, of these pictures, "Flowing to the River," and "Flowing to the Sea" (56 and 71), is complete. In the former the swirl of the swollen brook, the look of the drugged and straggling underwood, the damp from recent rain on the yellow leaves of the tree in the foreground, are given as well as any painting could give them, and with no look of labour or over-finish. The other picture is less striking in detail. In giving the trees on the further bank, the artist shows something of the same manner of painting the foliage in large, broad masses, with scarcely any attempt at breaking it up into "leafage," which some of the French landscape-painters have carried to perfection in middle-distance trees. Yet do we opine that these pictures do not quite fulfil what we really want from landscape art, or sniply what we shall yet get from Mr. Millais; that, while such successful reproduction of nature is both a difficult and a valuable achievement, it is valuable as a means rather than an end; and that the real end of landscape-painting is to create a sentiment, to speak to our feelings through the medium of pictorial representation. It may be said that a realistic representation gives us the same feeling as the scene in nature would impart. We doubt it in any case, because absolute realism is impossible, not to mention that the great element of motion does not exist in a painting.

Two landscapes by Mr. Raven, "A Hampshire Homestead" (84), and "The Monk's Walk" (657), are praiseworthy because they convey to us the poetry and the sentiment of nature rather than the material facts. In Mr. MacWhirter's "Isle of Skye" (248), an impression is sought as much in the choice of subject as in the manner of setting it forth; if the artist depended entirely on his powers in the latter capacity, his pictures would take a lower place in public interest than they do. With a taste for grand natural subjects, he has acquired a capacity for treating them with an accordant force of style which tells powerfully; but an artist with such a subject as this, the mere elements of which are so impressive, has an immense advantage over one who, like Mr. Raven, aims at rendering simpler and quieter subjects impressive: in the former case the individuality lies in the scene, in the latter it resides in the artist alone. This picture, however, is a fine specimen of Mr. MacWhirter's powers; it is worth noting how much, we might almost say how completely, the real power of the composition results from the introduction of the black angular mass of crag which juts up near the foreground, and forms the salient point in the painting. Mr. Vicat Cole, in his fine view

over an expanse of forest, "Noon" (110), has fortunately dropped that use of brilliant sunlight effect from one side of the painting which was degenerating into a receipt, and gave his pictures somewhat too much the look of a finely-conceived scenic effect; yet it may be doubted whether this picture can be regarded as entirely free from sensational treatment: there is a straining after an exaggerated effect of hot sunlight in the contrast between the golden lights and the strong blue of the shadows in the middle distance: every painter's eye will see hue in such shadows under such circumstances; but it never can be in nature so nakedly apparent as it is shown to be here. The artist's other quiet and less pretentious picture, "Dewy Eve" (550), though less generally admired at present, has, we think, more of the qualities which give permanent value to a painting. Mr. J. C. Hook is in great force this year; to comment on his four paintings would occupy too much space here, but we point to the best of them, "As Jolly as a Sand-boy" (390), not only as a capital example of this artist's powers, but as a notable illustration of doctrines advanced in our columns as to the necessity of "conventionalism" in painting, as well as in other arts. Mr. Hook's treatment of sea and sand is in reality conventional; but how? In this way, that no attempt is made for a moment to cheat the eyes of the spectator by minute imitation of texture; the water is not realistically like water, nor the sand like sand, but what he gives us is,—all that painting can fully and completely give,—the tone, the air-tint, the peculiar "run" of the sea, without any attempt at minutiae which cannot adequately be given in painting: the representation is really a conventional one, but through this conventionalism he achieves what is in fact the best and purest naturalism which painting of this class can arrive at. Mr. Peter Graham's "Cradle of the Sea-bird" impresses one at first sight as one of the greatest things its author has yet produced: an immense rocky precipice rising perpendicularly from the sea to the right of the painting, and going off in sharp perspective from the foreground; a second study suggests the doubt whether this is equal to some of the painter's former less startling productions; and here, too, there is not a *souçon* of the scene, painter's art in the composition and arrangement at least. There are some fine sea-pieces by Mr. Brett, about whose merits and defects of style there is likely to be for some time a division of opinion, to result, we anticipate (if the painter is true to himself), in universal acknowledgment of his remarkable ability. One other landscape, by a veteran artist, Mr. J. Linnell, compels attention from the very powerful effect of the sunlight which has been aimed,—"The Ford" (661). We cannot think this a success: the colour is true and fine, but the "light" element is wanting; it is palpably pigments, and not light.

Mr. Millais's figure-subjects are entirely confined this year to portraits, one at least of which has by this time been more written about, looked at, and discussed, than is the case with most portraits in these degenerate days. The painter seems determined to show how he can be, in manner of execution as well as in choice of subjects, the very reverse of the young artist who won his fame by a very different order of paintings. Those who thought at the time that the so-called pre-Raphaelite school was, in its most marked features, but a temporary aberration or exaggeration, may fairly accept the practical testimony of one of its original leaders to the same view. Whether in his present leanings towards full, free, and "thick" execution, this remarkable and admirable painter has not given up some of the qualities, in execution at least, which make the value of a painting (as a painting) may be questioned; distinction of texture, for instance, is less marked in the portraits of the Misses Armstrong than one could wish to see it in a picture so largely filled with stuffs and other accessories. The different characters of the three sisters are capriciously contrasted and discriminated, and the flesh tints, especially in the figure on the left, are a splendid success in the most delicate problem of colouring. In his other portraits, as in landscapes, Mr. Millais acts us thinking,—what is a portrait for? That of Sir James Paget (554) is one of the most purely realistic representations (and one of the most successful, as such) ever shown; viewed as a composition, exception would be at once taken to the unbroken expanse of lecture-board which fills the larger part of the canvass and

forms the background to the figure. The painter has aimed here at putting the able surgeon and surgical lecturer before his friends exactly as they have been accustomed to see him in the lecture-room, without any attempt at producing, either by costume, pose, composition, or colour, anything more of a picture than the real scene of his every-day work afforded. The portrait of the Marquis of Westminster (567) is very much in contrast to this, and is in fact almost more noticeable for its fine and unusual tone and harmony of colour than as a characteristic likeness. The first work would be valued chiefly by those who know the subject, and wish for a memorial of him; the second would be valued as a picture by those who did not know even whom it represents. On the whole, is not the latter principle the best on which to make portraits,—to make them pictures as well as portraits? We should have thought the question could never have admitted of one answer had not Mr. Millais in the *Page's* portrait so boldly and ably challenged admiration for pure realism. The question involved is, whether we are to make the representation of an individual the first object, or whether we are to use him or her, so to speak, as an opportunity and excuse for an impressive pictorial composition; whether, in short, humanity or art is to be the greater. Perhaps it will depend a good deal on the idiosyncrasies of the subject of the painting. Mr. Watts gives a very charming example of the poetic and idealised portrait in his likeness of Miss Dalrymple (215), sitting, in a green robe, by the side of a brook; but is there not here rather too obvious an attempt at effect, almost bordering on the theatrical? Mr. Watts is one of those artists upon whom benedictions should be showered, for that he has done much towards rescuing portrait-painting from the hopelessly tame compartments into which it had sunk with us, and which still form the majority in the Academy and elsewhere. But he has achieved the union of portraiture with high art, in other works, in a way not quite so ostentatious as this (if we may be pardoned the term). To blend the ideal with the real, to let the artistic fire shine through the verisimilitude of the sitter, as if it were a necessary part of the conception and inseparable from it,—that is the triumph of portrait-painting; a triumph which the artist referred to has achieved elsewhere, but not quite here. The "portrait" is merged in the "picture." This cannot be said of the portrait of "R. H. W. Dunlop, Esq." (266). Mr. Watts has been fortunate in his subject here, and has given us a remarkably good delineation of a striking and, in every sense, strongly marked physiognomy, which required little more than successful and bold realistic treatment to make a picture. The arrangement of the light, however, so as to bring out the subject in the most effective manner, is truly artistic. There are also the same artist's portraits of Mr. Prinsep and Mr. Calderon (the painters have taken to portraying one another of late), and Mr. Calderon in turn has painted Mr. Marks. Mr. Calderon's "Mrs. Cazale" (610), a full-length small-sized portrait, is the most powerfully painted work which the artist exhibits this year: the lady is represented standing by the fireplace in an interior, in a gown of mainly a strong deep-red tint; the effect is unusual, but scarcely pleasing. These, with one by Mr. J. P. Knight, are the noteworthy portraits of the year: and there is Mr. Sant's "Mrs. Haldane Chimney" (264), in a black dress and carrying a basket; painted with all the artist's usual good taste and refinement, but not in the whole his best portrait; the difficulty of the mass of black dress in a life-size portrait has not been quite got over. A characteristic and pretty child portrait is that of "Mauille. A. B., Petite-fille de l'Artiste," by M. Gallait (908); the little lady, about three or four years old apparently, stands, with one hand in the pocket of her pelisse, in an amusingly self-possessed and important attitude. Mr. Goodall's portrait of the "Right Hon. Sir T. McNeill" (545) is a successful painting of a fine, thoughtful, characteristic head; and many besides the readers of this journal will find interest also in the likeness "T. L. Donaldson, Esq., Past-President of the Institute of Architects" (584); a very good likeness by Mr. Charles Martin. The same painter has a striking portrait of "J. R. Planché, Esq., Somerset Herald," which is less successful as a likeness in the lower part of the face than the upper, where it is excellent.

On the whole, portraiture is well represented

this year, the proportion of portraits which are really interesting being greater than for two or three past years of the Academy Exhibition.

GOSSIP FROM PARIS.

THE *Exposition des Beau-Arts* opened on Friday, May 10th, to the public, with upwards of 2,000 works in painting, drawing, and sculpture; these being the selection made by the "jury" from the 5,400 sent in. The labours of the aforesaid jury must have been enormous; but all visitors to the *salon*, excepting the disappointed artists, will thank them for having so far diminished the feast they place before the public; for, rich as it is, it needs must satiate when in such excess of the powers of human nature to appropriate.

The Exhibition is very good indeed, as regards the works of art themselves: many of them are first-rate, and very few could well be spared; the building containing them, the *Palais des Beaux-Arts*, the shell of this rich nut, is not so worthy of commendation.

After two days spent therein, the impression left on my mind is, that it is inconveniently arranged, ill-cleaned, meanly decorated, badly lighted, and awfully draughty. I remember having felt exactly the same towards the French galleries in the great International Exhibition at Paris in 1867. To be sure, this said Friday was the wettest day of a wet week; but why have blinds that cannot be removed in dull weather? In a little conversation I had with the guardian of one of the rooms I remarked upon the bad lighting, and his reply was immensely characteristic of his nation: "Oh, no! it is the weather that is so bad." "Yes," said I; "but what a pity to have blinds that cannot be drawn back on a dull day." "No,—it is not the fault of the blinds," he insisted, "it is entirely the fault of the weather." "Any one or anything but yourself for the scapegoat," thought I; and as I remembered the ease and rapidity with which the glass ceilings of our English picture-galleries have their linen blinds drawn across them or removed as shade or sunshine necessitates, I felt that this was yet another example in which "they" do not "manago those things better in France."

But to return to the pictures, which we must take according to the alphabetical arrangement of the artists' names, this being de rigueur in a French catalogue. Allongé,—a charming "Vue de la Ville du Pay"; Alma-Tadema, who is *hors concours*, which means that the artists so specified are beyond receiving any medal save the *Médaille d'honneur*; "Un Empereur romain," exhibited in London last year, and a "Fête intime"; Anker, a clever and painfully true representation of Bonbrach's soldiers in a stable, and cared for by Swiss peasants; Antigna, "Aragonaises d'Anso," with its play of sunshine and shade on the fine head of the tall girl who leans gracefully against a wall; Armand, "Défense de St. Quentin," with cleverly-painted trees; Appian,—excellent effect of early morning light on "Flotille de Barques Marchands"; Asselberg, "Clever" "Coquelicots et Bluets"; Aubert, "Le Fil rompu," a young girl spinning her thread of life, when Love comes up suddenly and snips it in two; Baader, "La Toilette," an admirable old man clipping a large white poodle, and interrupted by a black intelligent-looking spaniel, which lays its paw on his arm; Bant, "Portrait de Mlle. N.," *dessin*; Baudry, "Portrait de M. E. About," very clear, but so flat against its blue background; Berteaux, "Arce eos Amis-là pas de Déception," a studio with the lay figures dressed as men and women; Berthon, "Loin du Pays"; Bertrand, "Folie d'Opédie," where she is dressed in white, and elose beside it, but black-robed; "Mort d'Opédie"; Betsellere, "L'Oublié," painfully real, the poor soldier having fallen insensible, face downwards, on the snowy, gory battlefield, he returns to consciousness, and half rises, to find himself left alone for dead; Bidau, "Le Printemps," charming lilac and other flowers; Bonnegrace, portrait of M. Despléchin and of Mlle. M.; Boungereau, "Faneuse"; Bréton, "Un Soir d'Hiver"; Broehart, *pastel*,—"Position Critique," a lady escaped from an *nspeet* carriage, in a very bandit-suggesting landscape, and carrying her child in her arms; Cabanel, "Giacinina," portrait,—*costume Florentin du 15me siècle*; Cambon, "Portrait du Marquis d'A.," Caraud, "Jeune Fille portant un Chat"; Cassagne, "Le Printemps dans la Forêt"; Castan, "Soleil couchant en Hiver"; Castres,

"Ambulance internationale par un Temps de Neige"; Chapuis, "Portrait du Capitaine L."; Charney, "La Leçon d'Équitation"; Chem, "La Visite de Noces,"—winter scene, the bride about to re-enter a country cart; Chintreuil, "La Clute du Jour"; Ciappori-Puche, "Notre Dame des Arts et des Sciences," beautifully draped figures,—*dessin*; Claude, E., "Curiosités"; and Claude, J. M., "L'Antichambre," sold for 1,500 francs; Clément, "Marchandes d'Eau et d'Oranges, Égypte"; Coeffier, Mlle. M., two portraits; Comte-Cailix, "La Leçon de Géographie," a youth of gentle blood, said to be the Comte de Paris, tracing PARIS on the sand for a pretty country maiden; Coninck, "La Pêche," an Italian boy, and a sweet-faced fair-haired girl; Cot, "Le Jour des Morts au Campo Santo de Pisa," the girl stooping to get a light from one of the lamps affixed to the graves; Couture, "Le Damoclès," in chains, surrounded by every luxury, a classic-looking fine thing; Daubigny, "Moulin à Dordrecht"; David, J., "Le Laissez-passer," *épisode du siècle de Paris, 1870-71*; Delort, "Une Embuscade," four brightly-dressed 16th-century figures at the foot of an old grey tower; Déportes, "Mon Portrait"; Dieudonné, a pretty young girl in white; Dubos, "Le Papiillon," a lady examining it through a magnifying glass; Dubufe, portrait de Mlle. H. S.; Faure, "Portrait de Mlle. J.," in puce silk dress and black lace; Feyen, "Les Glaneuses de la Mer," exquisitely delicate and minute; Feyen-Perrin, "Le Printemps de 1872"; Faucanourt, "Vae de l'Éterné"; Galliac, "Echo perdu," two men, possibly army surgeons, endeavouring to reach an ambulance to succour a poor *grèvement* blessé; Garnier, "Le Droit du Seigneur," the leading away a country bride who comes out of church with her newly-made husband; Girard, "La Porte défendue"; Glaise, "Spectacle de la Folie humaine," a long canvas, decorated with painted scarlet drapery like a theatre. In the front stands the exhibitor in a 16th-century black dress; to the left is a bright-blue notice-board, which says, "The pictures of human folly are continually changing." Those before the spectator are "Tueries Bibliques," where Jews are seen killing the Ammonites; "Tueries Chrétiennes," where Romans are the slaughterers; "Tueries d'Hérétiques," in which Catholics are killing seceders of all sorts; and, finally, "Charlotte Corday and others going in a cart to the guillotine." This said satire might well have had a fifth *tableau* added, "Communistes de Paris burning their own City." M. Glaise also exhibits "Mort de Saint-Louis" and "Portrait de M. Ferrier," both admirable. Goethals, "Le Général Ulrich à Strasbourg"; Gontier, a garland of lovely roses; Goubie, "Du Bœuf à Paris, Décembre, 1870," six emaciated horses and one donkey. This picture sold for 2,500 francs; but surely not to a Frenchman—would he not rather buy forgetfulness than a perpetual reminder of so melancholy an episode in his country's history? Goupil, "Une Nouvelle en Province," another war picture, with a wonderfully-painted Cacherie in it; but why the handsome girls are habited in rich satins so early in the day is a mystery to all but French *modistes*. Gudin, "Le Navire 'Le Lafayette,' dans la Nuit du 18 Août, 1871,"—*pastel*; Guès, "Jeunes Pages jouants"; delicate and minute as any miniature, so smooth is the surface; Hardon, "Une Allée du Parc de Courquetaine"; Hébert, "Portrait de Madame la Marquise de J.," robed in white satin, the large wide-open eyes looking straight out of the canvas, and into the far-away future; there is no ring on the left hand, which is somewhat ostentatiously crossed over the right, as if with intention. The necklace of large pearls, each encircled by diamonds, and the strings of pearls on the head, all marvelously reproduced, show that to paint jewelry is rather a *forte* with the artist; therefore the absence of all finger-rings is the more noticeable. Utterly unable to solve the mystery, we applied for information to a gentlemanly Frenchman, who assured us that wedding-rings are not fashionable in France now! What next, I wonder? This seems the strangest of all the strange vagaries of this strange people. Some years ago, when the insertion of the words "No cards" began to be general after the wedding announcements in the English papers, Punch took exception to the growing custom, and grumblingly said, "He supposing there would be no bride-cake and no wedding ring next." If marriages were solemnised in Paris during the siege, surely no bride-cake

could have been made or eaten; and now with the banishment of wedding-rings, the prophecy of our phallic contemporary is curiously verified. Another instance of "how many a true word is spoken in jest."

Helmich sends an excellent picture, "Un Coin du Feu, 16me Siècle," in which a monkey and a dwarf are seen fencing for the amusement of a young, handsome couple, seated side by side in one spacious arm-chair, while their pretty page leans against the jamb of the quaint old mantel-shelf. A portrait in sepia of a child by Mme. Hercholt is very charming; as is also Hirsch's portrait of Mme. M.—; Hublin's "Jeune Luthière Bretonne" has a very easy pose and pleasant face; Huo's "Manon Lescaut" and "Les Apprentis" are both admirable; as is also Mlle. Jacquemart's "Portrait de M. Thiers, Président de la République." About this last a little anecdote is told. When Mlle. Jacquemart went to the *salon*, she found the portrait surrounded by brighter-coloured pictures, which utterly annihilated the sallow face and snuff-coloured coat of M. le Président; so, on her own responsibility, she had them all removed and replaced by somnre-hued landscapes, and now her work shows admirably well; it certainly is a fine thing, so calm and quiet, and looking a most excellent likeness. A "Pommier en Fleurs," by Kreyder, reminds of Millais' "Apple Blossom;" but instead of the melancholy-looking holiday-making girls below, the French artist has filled his foreground with a mass of most charmingly-painted wild flowers. Lahalle's "Obstacles d'un Soldat français en Captivité en Allemagne" makes one think it was very good of the "spiked helmets" to pay their captives so much respect. Landelle, "Almé," a beautiful creature in thin black net-like drapery; Laurens, "Mort du Duc d'Enghien" in the ditch at Vincennes, looks ghastly and real; his brother and pupil sends two excellent works, "La Mosquée bleue," and "Jardins abandonnés," both scenes in Persia. A large picture, by Lavraud, "Brigands et Captifs," is said to belong to the English Government; but why? The male captive bears a striking resemblance to the Marquis of Lorne: again, why? Lechevalier-Chevignard has a very excellent picture, in the stiff, rich-coloured manner, "Antonello de Messine et Giovanni Bellini," representing the latter habited as a gentleman, and having his portrait painted by the former, in order that he might watch the process of painting in oil, by which means (and meanness) he discovered the secret of the Messinese artists. Leclair's picture, "Fleurs," camellias, and yellow damask drapery, is excellent; as is also Leloir's, called portraits, two young officers sitting on some felled trunks of trees. In "Le Bac japonais," Lenoir has hit upon quite a novel subject—seven swimmers, whose heads only are seen above the water, draw the boat along. Lesaul's "Le Dégustateur" is a charming little picture, most carefully painted, a young cavalier, with a beautiful face and handsome black and yellow slashed dress, is testing the quality of a glass of wine, which he holds in his hand. The late Matthias Leyendecker's "Pardrix grise," apparently hung up against a board, and Paul Leyendecker's "La Lecture," are both good; as is also Lobrichon's "Château sur le Sable." In her pair of water-colour drawings, "Avant, 1870," and "Après, 1871," Mlle. Loire shows the melancholy contrast of war and peace. In the "Avant," a young country lad is seen carving his love's name, Julie, on a beech-tree; in "Après" he is returning home with a wooden leg, broken down and used up at twenty years of age. Loyeux, "Un Mignon" is a sad but fascinating picture; the *mignon* exquisitely painted, and in a charming costume of pink satin and white lace, is sinking mortally wounded on the steps of a house—possibly that of his lady-love—and is stretching up his hand to the knocker which he cannot quite succeed in reaching. Méry, "La Force primo le Droit!" Five apes are seen robbing a beehive, and getting fearfully stung by the bees en revanche; the one who has overturned the hive bears a strong resemblance to Prince Bismarck. This is known to be intentional, and the human bees crowd around the picture, whispering and smirking. It is said that several of the works sent in were thought by the Government to be likely to prove offensive to German susceptibilities. On this representation being made to the gentlemen composing the jury of selection, they suggested to the artists to withdraw them, which they very wisely and patriotically immediately consented to do. This fact shows great good sense on both sides, and is

a step in the right direction of conciliation. Mesdag, pupil of M. Alma-Tadema, sends two charming water subjects, views at Scheveningen, reminding of E. W. Cooke in his best manner. Moorman's "Le Dessert," and Monillon's "Les Bids," are both good; as is also Parrot's "Portrait du Général B." In "Jacques Cœur," Patrois preserves a worthy and patriotic act. Cœur, who lived in the fifteenth century, had acquired a large fortune as a financier. When the troubles and losses of his country occurred, he gave back his fortune to the Government, thus enabling it to raise a new army, by means of which the lost territory was regained. Pierns has two pictures, "Sancho fuyant la Cérémonie du Lavage," very excellent, and with a wonderful marble floor; and "Une Dame peignant," who has a charming face. Perignon's "Portrait de Mme. la Comtesse Peppi, née Alboni," is very good; and Perrault's "Le Mobilisé, 1870," is painfully real and dreadfully true. In "L'Autoncu," Pille shows a cleverly-painted old man, in a doorway, looking out at a dance. "La Moisson," by Potémont, is another of those heart-rending war-pictures. Wounded soldiers in a field of ripe corn, being searched for by the Geneva cross wearers. Protais, in "La Séparation: Armée de Metz, 29 Octobre, 1870," shows a large group of saddened French officers on one side, while on the other, long files of soldiers are being marched off under German mounted escorts. Some few of them are turning to wave "farewell" to their departed leaders. This is just one of the great charges in the present trial of Marshal Bazaine, the military judges declaring that on no condition whatever should any officer consent to be separated from the men under his command.

Queneset's "Portrait du Docteur Lacroze" is clever; as is likewise Ravel's "Un Soldat, 16me Siècle." Richomme, in "Vergiss mein Nicht," probably means that the departed German donor of the love-flower has consigned the pretty French peasant as well as her country. Rodakowski, in "Sigismond 1er Roi de Pologne vaincu par les Séditieux des Nobles," gives some most careful painting and admirable colouring, as seen especially in the black velvet robe lined with crimson satin. Saintin, in "2 Novembre, 1871," has reproduced another touching episode of the war; a sweet young creature in deep mourning visiting a tomb at Père-la-Chaise, inscribed "Honneur et Patrie." Saintpière's "Bacchante," semi-reclined on a panther skin, has a charming little face. Schenck's "Chevreuil, Effet de Givre," is very good. Schlesinger's "Peine perdue," a Spanish-looking lady whispering to a sweet innocent *bourgeois* as they come out of a church; Schopin, "Derniers Instants de Duguesclin"; and "Vision du Cardinal de Richelieu à son Lit de Mort," in which skulls appear mistily on the wall beside him; Schreiber's "Premier Tableau, Premier Amour"; and Sebroun's "Cheminée de la Salle d'Audience des Magistrats du Franc de Bruges," are all very good. The subject of the latter picture will be remembered by many as that of one of Louis Haghi's favourite works in our English water-colour gallery years ago.

Sirouy has a noticeable picture, "La Fortune." The life-size nude figure is too materialised, as she stands aloft poised on her wheel; but the groups below are admirable: the king, who tightly presses his crown on his head, while a semi-nude, savage-looking creature clutches at it; the queen, who stoutly strives to protect her child and her treasure-casket; and so on, while the wheel of Fortune crashes over all alike. Thirion's "Épisode de l'Éruption du Vésuve," illustrating the description by the younger Pliny, well depicts hopeless horror, and bears an especial interest just now; "Les Semeurs de Nrenberg," by Ullmann, is a quaint subject admirably executed; Van Elven's brilliant picture, "Hommages rendus à la Statue de Strasbourg, Place de la Concorde, pendant le Siège de Paris," will be remembered in the International Exhibition of London last year. Venot's "Portrait de l'Abbé — de St. Denis," is very good, as is also Vetter's "Mazarin épousé par la Pègre," taking leave of his works of art. Villeneuve's "Portrait du Général du Cissoy" is a fine thing. Von Thoren has a beautiful sky in his "Souvenir de Bade, Hiver, Soleil couchant"; Wallberg some excellent water, in "Vue prise sur les Côtes de Bretagne"; and Wylie, an American by birth, has a clever picture in "La Sorcière bretonne."

Several good specimens of painting on porcelain and other materials are exhibited in the gallery, to wit:—"La Marée basse,"—*Jatence*,

by Bouquet; "La Naissance de Vénus,"—*porcelaine*, Mme. Delphine de Cool; "La Belle Jardinière," after Raffaele, by Mme. Amélie Duburg,—*porcelaine*; both these ladies were born at Limoges; and "Néride,"—*d'après Rubens*,—*porcelaine*, Mlle. Djina Gomez. A. F. de Courcy has a fine enamel portrait of Mme. de S.; and Froullé a shell-cameo of "La Sainte Famille." Two cameo portraits on agate-onyx, by Papillon, are excellent; as is also the "Tête de Janon,"—*creux sur onyx*, with its *épreuve en creux*.

Among the architectural drawings, a very curious triangular knocker is shown; it is designated "Hecutoir trouvé dans l'Église," the *édifice* being that of the "Abbaye (Église, Pyrénées-Orientales." Two suggestions for memorials of the Siege of Paris, are anything but commendable; it is to be hoped neither will be carried out. The one, by Thierry-Ladrangé, is called "Antel de la Patrie," and consists of a square pedestal (with bas-reliefs on every side), surmounted by a huge terminal figure, on the shaft of which names are to be inscribed; the other is by Vaudoier, and is still more ugly; the form is a circular pyramid, consisting of a series of steps, the front of each step to bear names or other inscriptions.

Among the engravings, copies by Blanchard of two pictures well known to Englishmen, catch the eye: Francia's "Dead Christ" in the National Gallery of London, and Holman Hunt's "Christ in the Temple"; in the latter copy, the figures look dreadfully dwarfed and stumpy. Descending to the sculpture-hall, we find the various works tastefully disposed in the glazed garden of the Palais de l'Industrie. The flowering plants are an exhibition by themselves: masses of azaleas and geraniums with, interspersed between them at regular intervals, green aloes, small cactaceous trees, palms, and other green-leaf-bearing plants. The introduction of these amongst the flowers is very admirable; but the custom of massing white round green, and then clustering all shades and colours of red together, likewise in masses, is anything but tasteful or artistic. Certainly the arranging of flowers and flower-gardens is best understood in England.

A very pleasing group of sculpture,—but only in plaster,—is composed of semi-figures of Erekman and Chatrian, the well-known authors. They are portraits; both of them face the spectator, and Erekman's left arm encircles Chatrian's shoulders; the group is by Bartholdi. Chatrouse, in his "Projet de Monument aux Martyrs de l'Indépendance nationale," has introduced Joan of Arc and Vercingetorix clasping hands. Vercingetorix was a chief of the Gauls in the time of Cesar, and was conquered and led in triumph; so that, besides the chronological muddle, his career is no good angry for the modern liberators, any more than that of Joan of Arc. He seems, however, to be the favourite just now, for there is in the gallery an elaborate design, with four diagrams, of a proposed monument to be erected to him near Clermont Ferrand.

The present garden of the Exposition occupies about half of the enclosed space. The large coloured window at the other end, that nearest to Paris, is dreadfully shattered by the Communique shot and shell; fully three-fourths of the painted glass is absent, but men were busily at work upon it. The rapidity with which all traces of the struggle in Paris are being obliterated is perfectly marvellous. A great deal has already been done on the beautiful Place de la Concorde in the way of restoration, but one of the eight colossal seated figures, representing principal towns in France, is still housed over; while of the pair of handsome bronze fountains, that nearest the Seine is entirely absent,—doubtless removed for extensive repairs. *Galignani* says the works of restoration on the Place de la Concorde alone have cost the Government 210,708 francs. To what sum the enormous rebuilding required throughout the city will eventually amount, it seems almost impossible to estimate. I see that the northern tower of Notre Dame is said to be under repair; several fissures in the walls having rendered it unsafe, whether this is part of the same fenshish work I know not, but within the venerable pile we saw workmen engaged repairing the steps and paving in front of the altar, which were shattered by the Communists.

The painted dome of the Panthéon is much injured, several obus having forced their way through it, and the exploded stonework having scattered about and done still more damage.

Some shells fell within the Hôtel des Invalides, but none struck the dome. How the Sainte-Chapelle escaped when Paris was fired by the Communists is a marvel. It stands in the hollow of a square of buildings, the Palais de Justice at the east end being within 9 ft. of the apse. All these were burning at once, and yet the chapel remained untouched. The old *gardiens* told us he was there the whole of that fearful time: he would not leave, but "resolved to die with his charge, if it were destined to perish." It is useless to write of the Ministère de Finances, the Grenier d'Abondance, the Hôtel-de-Ville, the Tuileries, and other sad heaps of ruin. Everything has been said that need be said; but what a fearfully interesting "Guide to Paris" has now to be written for future visitors.

The pace *soutane* of poor Archbishop Darboy hangs in the same little closet in the sacristy of Notre Dame, in which are preserved these of Monsieurs Affre and Sibour. His is pierced through with the bullet that entered his chest and passed out at the back, and it is all discoloured and mottled, with blood and with the damp of the grave into which he was hurriedly flung. Of eleven Archbishops of Paris eight have met with violent deaths.

Two other victims, and, indeed, the two first victims of the Commune, General Clément-Thomas and Lecomte,—who were shot by their own soldiers when vainly endeavouring to regain those fatal guns, 200 in number, carried off by the rebels to Montmartre,—are buried within the small military practising-ground close to where they fell. A black cross, with the name inscribed, in a small garden, marks each grave. Belleville looks peaceable enough now, and well-to-do into the bargain; but walls are seen loop-holed, and houses specked with shot-marks, as we drive along.

The beautifully laid-out Butte du Chaumont was sadly devastated by the Communists, who pastured their horses and bivouacked their men there; but with careful attention this charming garden is completely restored to its former beauty. On the opposite side of Paris, taking the road to Fort Valérien, we come upon vast destruction of houses, levelled to prevent them serving as shelter to the Germans, or *les Prussiens*, as the French persist in calling them. The Église St. Ferdinand now stands completely isolated, in a desert of brick-and-mortar rubbish. Farther on the houses are fearfully shattered. At Courbevoie, the statue of the first Napoleon, which was brought thither from the *Colonne Vendôme* in the present emperor's time, is missing from its pedestal. During the siege of Paris it was dismounted, cutting it in half, the Seine, in the night, by, it is said, M. Jules Simon and M. Jules Ferry, assisted by the painter Cornet, and others. How much of this assertion is to be believed, I know not; but that this (literally in-Seine) act was committed by some persons is certain. Continuing our journey to Mont Valérien, we plodded upwards to the entrance, but found an order from the War Minister was necessary to obtain admittance. However, we were well able to judge of the masterly manner in which the fort commands the whole country round—looking up the Seine, and reaching even to Paris. We remembered how the Communists marched in innocent confidence beneath its walls, flattering themselves the garrison was friendly to their views, and how its murderous guns opened upon the very centre of their column, cutting it in half, and spreading death and dismay in their ranks. Then we descended and continued our way to St. Cloud—poor ruined St. Cloud—along the bank of the Seine. The short drive is a most lovely one, with the brimming river on the left hand, and a succession of handsome residences, surrounded by lovely tree-filled grounds on the right. It is said of St. Cloud, that not a single house but was hit by shot or shell, or both. It was first fired on by the Germans, and then by the French; but, strange to say, in the midst of all this destruction and ruin, the church stands up unharmed. Many houses are restored, but many more still remain melancholy witnesses of the horrors of war. One gentleman, in rebuilding his handsome villa, has inserted shattered stone in the pediment, and replaced in the hole the huge obus that destroyed his former home.

The châteaen is a mere shell; remains of internal decoration—painting, and gilding, and sculpture—still cling to the walls, making the desolation still more mournful; and tall columns of rare marbles stand upright in their place, with huge layers flaked off from their shafts by the fervent heat. The gardens look still very lovely

in their springlike wealth of green; but the artificial ponds, formerly one of the great attractions of the place, are dry and dank, and their leaden lining is contorted out of all shape and use.

Returning to Paris by the Bois de Boulogne, we came upon a great scene of gaiety. Hitherto we had felt that the erst "gay capital" was much quieted down and depressed by its recent heavy trials; but this day happened to be the grandest of the race-days, and the myriads of vehicles that had conveyed the spectators were a marvel to behold. Fully three miles of road must have been filled with carriages, many of them very handsome ones too, crowded together as thickly as safety would allow; yet all down the Champs-Élysées they were just as numerous as ever; and arrived on the Boulevards, the loungers seemed in no way diminished. "Where do they all come from?" was our involuntary exclamation. The Bois de Boulogne looks much the same as before the war, and, excepting in some small portions, is very little injured; it has lost but an inconsiderable number of its trees.

Now that the Assembly holds its sittings at Versailles, the greater part of the palace is closed to visitors; a new, though painful interest is open to them, however,—namely, to enter the court and hear the Communist trials. The day we were there, a tall, youngish man, with rather a lang-dog look, and thick, light hair plastered sleekly down, was being tried for the murder of a simple citizen, named Roussel, and for robbing the body. He denied every thing, and pleaded "mistaken identity;" but the poor victim's brother came in as a witness, and the culprit's conviction appeared certain. We did not wait to hear the end, but from what we were told a week later on a second visit to Versailles and the Trianons, we believe he was condemned. Satory, the scene of these military executions, is within a very short distance of Versailles. I should have liked to see the spot where poor young Lieutenant Rossel suffered so meekly the penalty of his mistaken patriotism; but the miserable weather prevented us from farther extending our journey. These executions still go on; four Communists were to be shot on the morrow of our visit.

The new grand Opera House in Paris is finished as to the exterior, but the interior remains uncompleted for want of funds. The inscription running along the main façade, which formerly read "Académie Impériale de Musique," has had the letters *Nation* substituted for *Impériale*; this alteration is perfectly visible from the slightly different colouring and thickness of the gilt-bronze letters. The "N" from the medallion above, has likewise been removed. This same littleness has gone on everywhere. In the *Pantheon*, the gilt wreaths, each enclosing an "N," have been taken down from the four corners of the transepts, leaving ugly blank spaces. At the *Hôtel des Invalides* at one end of the library is the copy of David's famous—but false—picture of "Napoleon crossing the Alps" (on a prancing charger, when it is well known he threaded the pass in the only possible manner, namely, on a mule); opposite this picture a portrait of Napoleon III. used to hang; now, a dark-green curtain fills the frame. The same eclipse has come over the semi-length portrait in the *Galerie d'Apollon* in the Louvre; so that its companion picture, Louis XIV., enjoys the undivided honour of presiding over this beautiful saloon of wondrous art-treasures. All the public buildings, even to the churches, have the sinister "*Liberté, Égalité, Fraternité*," painted on them in large black letters; and all are inscribed "Propriété Nationale."

Commenting one evening to a quiet, calm French gentleman on the hot haste with which Parisians, immediately one of their chronic fits of revolution seizes them, rush to alter names of streets, and to demolish statues and inscriptions of their last, but now deposed, demigod, he replied "*Nous sommes des fous*," and I think he was right. As I said to him, "However much they may break down and destroy, they cannot wipe out of French history the nineteen years in which the third Napoleon has ruled over them; nor would they, if they could, give up the advance in commerce, wealth, and civilisation they have made under his guidance; and what Government do they want now? The Republic will never satisfy them." "Nothing will ever satisfy them for more than about twenty years at a stretch," said he; "each generation, as it grows up, thinks it can make a better Government for itself; and as a generation grows up in eighteen

or twenty years, so every eighteen or twenty years we have a fresh revolution. But now, things have come to such a pass no one knows what they do want; and Paris knows least of all." Two other well-informed gentlemen, one a Frenchman, the other an English resident in Paris, both said on separate occasions, "The Emperor has only to land to be welcomed, and if he were to come to Paris to-morrow it would be all right, and things would go on just as if all this had not happened." One Parisian gentleman certainly did say, "Why rebuild the Tuileries Palace? There is no use for it now." But so far as we were able to judge, from conversation with persons of various grades, the general opinion seems to be, that the Empire will be restored, and that it will be well for France when it is so.

The efforts of England to succour the famished Parisians when the siege was raised, do not appear to have left any very definite impression on the Parisian mind. To test this, I made many opportunities of saying how sad we English people were to hear of the hunger and suffering in Paris; but not from any one person, gentleman, shopkeeper, or valet-de-plaue, did I elicit the ghost of a grateful remark for our intervention. I know not if the sentiments of the upper classes are reflected in the behaviour of the lower, but if so, the following incident, unimportant in itself, bears some weight. One evening, at the Café, one of the women-boxkeepers came to ask if we had paid for the little wooden footstools that are placed in French theatres. She was behind us, and three or four rows off, so we did not at first perceive that she was addressing herself to us. Presently she exclaimed aloud, "*Oh! comme ils sont imbéciles, ces Anglais!*" My English blood fired up in a moment, and, turning full round, I replied to her, also aloud, "*Non, madame; ils ne sont pas imbéciles, ces Anglais, mais ils ne vous ont pas bien compris!*" She was ewed immediately. And a French gentleman and lady who sat close behind us never interfered to stop her insolence or explain the matter to the strangers. So much for Parisian politeness!

A more pleasing topic is the "Book of Gratitude,"—if I may be allowed thus to designate it,—now lying for signature in the Rue Vivienne. As is known, this book is intended to commemorate the exertions of England in behalf of smitten France, both in giving her food for her famished people, and grain to sow her devastated fields. The separate leaves of the book consist of large sheets of cardboard, each having a handsome engraved heading, and which are to be filled up with the autograph signatures of persons of all classes who benefited from, and are grateful for, the timely help England bestowed. The whole of the shop is given up to this purpose, and large legibly inscribed notices, in terms most gratifying to English hearts, announce the intention of the originators of the book. R. F. H.

SCHOOLS FOR THE LONDON SCHOOL BOARD.

COMPETITIVE designs for no fewer than six schools, and all by different architects, have been exhibited, for a couple of days, to the competitors and others in the top room of the Sunday School Union building, just opposite Nowgate, in the Old Bailey. Whether or not the School Board intended to keep out the press we can scarcely say. If so, it ought to be made clear at once, so that the ratepayers might have their say upon it. We can scarcely suppose that such a decision could be arrived at by a popularly-elected body, including, for example, Mr. Hepworth Dixon; but certain it is that, so far as we are concerned, we received no invitation from the Board to view the drawings, and a wonderful discussion, at a meeting of the Board, has been reported as to whether or not the designs for the Stepney School, already referred to in our pages,* had been seen by "a member of the press." The Board seemed all at sea on the point, as they apparently are on some other points. When, by accident, we went into the room in the Old Bailey last week, there were, not merely a member of the press, but at least four persons connected with a press of some sort or other, examining the drawings, including the acknowledged reporter of one of the daily papers, who appears to have been betrayed into a very one-sided account. The Board are about to spend, and we are glad of it, thousands upon thousands

* See pp. 361, &c., ante.

of the ratepayers' money; and they will discharge their duty if they do this on unseen designs, framed on unventilated principles. On these six schools alone some 50,000*l.*, at least, exclusive of the cost of land, will be expended, with about 1,100*l.* more for the Stepney School, already decided on; and it would ill become them to attempt to do this and all that is to follow, with the public in the dark.

That considerable obscurity on several points prevails is obvious. The Board say, in the Rules to be observed in Planning Schools issued by them,* that the lighting of class-rooms should, if possible, be chiefly from the side; and yet, acting on supposed instructions to follow the Prussian system, several of the competitors here, as in the case of the Stepney competition, place the children with the light to their back.

Again, the Stepney School is made to include, at a considerable increase of cost, a large general room, or hall, capable of containing the whole of the boys and girls at one time. If this be desirable, why is it not provided for in these six other schools? If not desirable, why is it provided at Stepney? These circumstances seem to us to show that inquiry and discussion are necessary.

We give the names of the architects who have sent in designs for the several schools:—

St. Paul's-road, Limehouse.—Mr. Phéné Spiers, Messrs. Slater & Carpenter, Mr. Bracebridge, Mr. Alfred Porter, Mr. A. Williams, and Messrs. Spalding & Knight. The tenders accompanying designs range (not necessarily in the order of the names) from 5,950*l.* to 8,450*l.*

Mary-street, Bromley.—Mr. Lacy Ridge, Mr. T. H. Watson, Mr. J. W. Morris, and Messrs. Milsam & Kennedy. Tenders from 4,900*l.* to 6,740*l.*

Old Castle-street, Whitechapel.—Mr. E. C. Rohms, Mr. Aldwinckle, Mr. E. Biven, Messrs. Tarring & Son, and Messrs. Habershon & Brock. Tenders from 6,750*l.* to 8,500*l.*

Battersea-road.—Mr. Edis, Mr. Gordon Stanham, Messrs. W. M. Toulon & Cronk, Mr. J. Toner, and Mr. Coldwell. Tenders from 5,850*l.* to 7,000*l.*

Essex-street, Tower Hamlets.—Mr. Charles Barry, Mr. Hennell, Mr. Quilter, Mr. T. Lewis Banks, and Mr. John Young. Tenders from 4,850*l.* to 8,000*l.*

Kender-street, Hotham.—Mr. E. Wyndham Tarr, Mr. John Giles, Mr. Joseph Gale, and Mr. J. P. Soddon. Tenders from 5,400*l.* to 7,920*l.*

SEFTON PARK, LIVERPOOL.

PRINCE ARTHUR has been in Liverpool, and on Monday last opened Sefton Park, which, as our readers may remember, has been in progress since 1867. There was an enormous crowd, and the enthusiasm was remarkable. The streets were gaily decorated, partly by voluntary efforts and partly otherwise. We learn that the decorative committee, which was appointed some time ago, and of which Mr. Paris acted as chairman and Mr. Holden as honorary secretary, by the aid of liberal contributions on the part of tradesmen and other inhabitants, did a fair share in the decoration of the streets, especially in the neighbourhood of the Town-hall, Castle-street, Lord-street, Church-street, and Great George-street. In order that the display might be as excellent as possible, they contracted with Messrs. Pigott, Brothers, of London, who did part of the work of decoration in London on the occasion of her Majesty's state visit to St. Paul's Cathedral, and some of the materials used in the streets of the great metropolis upon that day were brought into use in the streets of Liverpool in the reception of her Majesty's son. The committee also engaged the services of Mr. Edward A. Heffer, architect, to superintend the decoration. The materials used were Venetian masts, 40 ft. high, painted blue, each mast being decorated with a trophy of five flags and a shield, and a hammeret floating over the top. Suspended from the masts were festoons of coloured paper roses, which were carried over the lamp-posts along the sides of the streets, the length of festooning being one mile and a quarter. At various parts of the route arches (ten in number) were erected, which were also adorned with trophies of flags, and about 200 trophies of flags and shields were affixed to the fronts of buildings. Some of the large street-lamps were also decorated by the committee.

We leave the park itself for a personal view, and add merely some statistics from the *Mercury*.

* See p. 349, ante.

Under the Improvement Acts for Sefton and Stanley Parks, the corporation obtained power to raise 575,000*l.*, and of this amount probably more than 400,000*l.* will be devoted to the purchase and completion of Sefton Park. The cost of the land was 275,865*l.*, and it is fully expected that about 145,000*l.* will be expended on labour and materials before the park can really be said to be finished. The late Mr. Newlands estimated the cost at 450,000*l.*, but it should be remembered that many of the most costly items in the design on which that estimate was founded have been entirely erased from the plans, and the most rigid determination, as far as possible, to economise, has been enforced by the committee, in consequence of the outcry of the inhabitants against the alleged extravagant expenditure. It will be remembered that when Birkenhead Park was carried out the building sites around it were sold for an amount which almost recouped the sum spent upon the park. It was therefore determined to adopt a similar plan with regard to Sefton Park, and it was fully expected that the corporation would be reimbursed at least 200,000*l.* Building plots, containing in the whole about 120 acres, were arranged on the outskirts of the park; but although the sites have been twice offered to public competition, only ten of the plots have at present changed hands.

Messrs. André & Hornblower were the architects and designers; Mr. Samuel Campbell was contractor for sewerage, road-making, and the heavier excavation; Mr. Dickon for the formation of plantations, slopes, &c., and the subsoil ploughing; Mr. Pearson Lee for the stone plinth-ing; and Messrs. Pollard & Canlife, of Barnley, provided the iron railings. About two years since, however, a dispute arose between the architects and Mr. Campbell, one of the contractors, and the contract of that gentleman was determined. Shortly afterwards the Improvement Committee determined the contract with Messrs. Hornblower & André; but the modified designs of those gentlemen have been carried out. The works have since been carried on by Mr. Dickon, under the immediate supervision of Mr. William Pearse, who has officiated as acting clerk of the works since their commencement.

SCHOOL BOARDS.

Walsall.—Mr. Bidlake, architect, attended the last monthly meeting with plans and specification for the erection of the Board school at the Wisemore, which were approved, and advertisements were ordered to be issued inviting tenders for the building of the schools.

Heckmonditch.—It has been resolved to erect a school on a site already chosen in Baitry-street, to accommodate 200 boys, 200 girls, and 150 infants.

Dewsbury.—The building committee have reported that they have instructed Messrs. Holton & Connor to prepare plans and specifications for the Education Department for three schools, one at Dewsbury Moor, one in Boothroyd-lane, and a third in Carlton-street. The estimated cost is 6,800*l.*, and the architect's terms are 5 per cent. on this amount, and no commission for extras. The report was adopted.

Tymemouth.—The Committee of the Council of Education have approved of all the schools built in all the villages by this Board, and it has been agreed to seek power to borrow from time to time 18,000*l.* to complete these erections.

Cantebury.—The following tenders were received for the erection of the master's house: John Chandler, 371*l.*; Gaskin & Golden, 330*l.*; Cozens, Brothers, 422*l.* 15*s.*; W. Gentry, 431*l.* A difficulty arose in connection with the tender of Messrs. Gaskin & Golden, owing to their stating that they would perform the work as set forth in the plans and specifications for the sum named, this sum to be added to their tender for the schools without deduction.

Liverpool.—At the last meeting the Chairman moved the following resolution, which was agreed to:—

"That the rules to be observed in the planning and fitting-up of schools, and the conditions of competition for school-houses, the one for 700 and the other for 1,000 children, as passed by the school organisation and management and the sites and building committees, be recommended to the Board for adoption, and sent to the Education Department for their approval."

The Chairman also proposed:—

"That in future the sites and building committee be authorised to draw up the conditions and particulars for the erection of schools on the basis of the aforesaid rules, and to issue them to architects without previously submitting them to the Board."

Mr. Hulback said he should certainly object to any more schools being built upon the basis referred to. It be understood it might, in schools for 1,000 children the largest room would be for 120 children; and in schools for 700 children the largest room would be for 80; but he thought that it was desirable that in Board schools there should be a room where the great majority of the children attending school could be assembled together. A very great benefit might be conferred upon the children thus assembled by lectures and amusements; but if a school were cut up into a great many small rooms the advantage arising from having an opportunity of bringing all the children together was lost. The chairman said that the passing of the resolution would not take away from the Board the careful examination of the plans which would be submitted for selection and approval. The reason why the resolution was submitted was that they had now sites for two schools, and they were expecting very shortly to have another. The Board had only committed itself at present to erect schools for 6,000 children, and before anything could be done in the way of purchasing sites for the building of schools, the Board would have to consider how much further they would go in the erection of schools. They could not wait to see those two or three schools erected before they determined to erect others, and therefore the resolution was placed before the Board in order that there might be no unnecessary delay. As to the plans for schools, the Board adopted a system of triple classification, and that was the system adopted by the London School Board. By that system there would be a classification of infants, juniors, and senior pupils. Thus the power of division and separate teaching would be greatly increased. He could not conceive that any great advantage could be gained by bringing infants, junior, and senior children,—all of different ages and different degrees of intellectual attainment,—together in one mass for any one purpose whatever. On the suggestion of Mr. Yates the following words were struck out of the resolution:—"And to issue them to architects without previously submitting them to the Board." The resolution was then passed as amended.

TURNER'S DRAWINGS.

THE interesting particulars furnished in a recent number of the *Builder*, of the extraordinary amount in the prices realised by Turner's drawings at the Gillett sale, as compared with the sums originally paid to the artist for "Bam-borough Castle" and "I presume 'Powis Castle'" (though the title is not given) must have fairly taken away the breath of "J. H. M.," their original owner. An advance from the first probate sum of 170 guineas for the two pictures to 4,360 guineas, does indeed seem a leap almost fabulous. Yet, great as this difference is, its proportions were reached in the cases of several other artists whose works were sold in the same collection. The small picture by Müller, entitled the "Chess Players," realised no less than 3,950*l.*, and there is excellent authority for stating that the artist himself received only 35*l.* for his labour. Again, from the small prices known to have been paid to David Cox in his day, it is more than probable that the painter did not receive a higher reward for the picture of "Peace and War" than Müller obtained for his "Chess Players," yet its possession was keenly contested up to the purchase price of 3,430*l.* Turner's picture of "Sheerness and the Isle of Sheppey," formerly the property of Mr. John Newton Hughes, of Maidstone, was sold by Messrs. Christie & Manson, in 1848, for 565 guineas; resold at the Gillett sale by the same auctioneers, this picture sold up to 4,350 guineas. The names of many other artists might be cited, who, when in the flesh, barely obtained a competency, but whose pictures, now that their epitaphs are out in stone, bring fortunes to their lucky owners. All this is startling enough, but it becomes almost sensational when "J. H. M." informs us of the discovery he made that the drawing which he had purchased from Turner for "sixty or seventy pounds," "had greatly failed" "in perhaps a year" after it came into his possession. Yet some one of "the over-rich collecting people" was found wild enough to secure it at the Gillett sale at the modest advance of 1,210 guineas. "Those who knew me, at the time when I made the discovery of the fading of the drawing in question," adds "J. H. M.," "know that I made no secret of it, but spoke

out at once to my numerous Turner-collecting friends," to dissuade them from squandering their means, no doubt, on anything so ephemeral and valueless as the drawings of Turner must become. I do not doubt for a moment the statement of "J. H. M." that the drawing named has suffered from some influence or other; but the general condemnation involved—of the want of permanency in Turner's drawings, and, by implication, of water-colour art,—may be fairly questioned. No doubt many of the early works of the founders of the water-colour school have given way from causes now well understood. We have only to turn to the "Manuals of Instruction," and "Modes of Preparing Colours," published at the beginning of the present century, to learn the number of fugitive vegetable extracts that were then employed. With no better materials at command, anything like durability could not be expected. But, as the young art gathered strength, so the manufacture of colours improved; and, the painters themselves advancing in knowledge and experience, cast out from time to time the less durable colours, for the more permanent pigments which were gradually introduced. The practice of Dewint may be taken as an example. In his early time he was particularly fond of a mixture of Indigo and Indian red, or Payne's grey, which he used very freely. The result may be seen in many of his works—the blue has entirely disappeared, and the Indian red alone remains, in foxy granules, on the surface of the drawings. Later in life, the artist discovered the cause of this defect, and avoided it in the future. It is now well known to every water-colour painter, that a vegetable blue mixed with Indian red will not stand the test of time. But it cannot be fairly reasoned that inexperience, in particular instances, touches the general question of the durability, or impermanency, of an art which, in some form or other, is probably the oldest form of painting known. The MSS. of the twelfth and thirteenth centuries, illuminated on paper, are in excellent preservation, and the materials then employed appear not to have been very dissimilar to those now in use. Raffaele's cartoons, in water-colours, have existed for nearly 400 years; and we know how little care had been bestowed on their preservation up to the time when Rubens dragged them forth from the cellar into which they had been cast, to adorn the Palace of Charles I. It may suggest some curious reflections on the recent prices paid for modern works of art to know that Raffaele only received 15*l.* each for his cartoons, which were executed for Leo X., about the year 1515-16, as patterns for tapestries. No doubt, there are many drawings to be met with which have suffered from special causes,—Turner's, amongst others,—but there is so much fine work of his remaining, pure, beautiful, and unchanged, that it is fair to presume that the fading is not often independent of the careless way in which they have been displayed,—too frequently on damp walls, or exposed to the direct rays of a blazing sun. Of the numerous fine works by David Cox, or of those of William Hunt, most perfect of their kind, it would be difficult to recall a single example evidencing signs of decay. The question of durability, however, is one purely relative, and of degree. And if we turn to the contemporary pictures, in oil, of the painters, blackened, bony, and split into destructive fissures, as so many of their canvases now appear on the walls of South Kensington Museum, the painters in water-colours may take heart, and even point with pride to Turner's drawings, as being, at least, as free from change as Turner's pictures in oil.

J. J. J., Garrick Club.

THE INDUSTRIAL HOME FOR DISCHARGED FEMALE PRISONERS AT WAKEFIELD.

This home has been formally opened. It is oblong in plan, with a frontage bow near the orchard of 163 ft., and a depth of 39 ft. The principal portion, being three stories in height, is arranged on each side of a wide central corridor, lighted by a large window at the end and staircase windows at the sides. The staircases are of stone, the one in the centre of the building being for the use of the inmates and visitors; the other for the matron. The ground-floor of the house is appropriated to rooms in which the actual work of the institution is carried on. At the north end is the wash-house, which has an open roof, skylight, and louver ventilator at the top. Adjoining this is

the drying-room, with clothes-horses, made to draw in and out from a heating-closet. Next in order are the laundries or ironing-rooms. The inmates' dining-room, kitchen, and scullery occupy the remainder of the garden-front, with store-rooms and cook's pantry on the opposite side of the corridor. An office for the matron adjoins the entrance, and has full command of the ingress and egress of the inmates. On the first floor, near to the principal staircase, is a large day or class room and dormitory. On the floor are placed the committee-room, clothing-stores, lady superintendent's sitting-room, and visitors' bedroom. At the south-east end of the building is a dormitory, with bath-room adjoining. The second floor, with the exception of the chapel, is devoted to dormitories, and it is so arranged that about half of the inmates shall occupy single bedrooms, and the remainder be placed in large dormitories, with a matron's bedroom adjoining and opening into them. The chapel is 18 ft. wide, and extends the whole width of the north end of the building. The extreme plainness of internal finishing observed in other parts of the building is also carried out in the chapel. The roof-timbers are all visible, and are stained a dark colour. The east window and arc stained glass, from the works of Messrs. Hardman & Co., Birmingham. The style adopted by the architect, Mr. Swinden Barber, of Halifax, is in character with many buildings we see in this part of the West Riding which were built about the latter end of the seventeenth and commencement of the eighteenth centuries,—low-pitched roofs, long ranges of mullioned windows, and continuous strings being the leading features. The principal difference between this and the old buildings is, that the latter were always built of stone; whereas this is brick and stone combined. On the question of style of elevation being discussed, Col. Akroyd offered to defray the difference of cost between a perfectly plain elevation, like the old Home, and that which we now see. The result of this outlay of 300*l.* is the only evidence of decoration in the building. The work was done by Mr. Green, builder, Wakefield.

THE PHYSICAL COMMOTIONS.

During a recent thunder-storm the lightning struck the steeple of Wadburst Church, splitting the ball, shattering the lead at the top, and tearing off a large quantity of the shingle at the north side, scattering it all over the churchyard; some of it being thrown a distance of 30 yards. The damage is estimated at close upon 100*l.* On the same day the tempest raged with great severity in Romney Marsh (near Rye), and a young man's sheep and a horse were killed, and a young man's clothes in front of his body crumpled like tinder, and his chest had the appearance of having been acted upon by a mustard-plaster.

Great alarm was caused among the volunteers of Dorchester on Monday by a startling occurrence during the manoeuvres of the corps on an open spot near that town. A high column, known as the Blagden Monument, stands on the plain, and the corps was mustered near to it, when a heavy thunder-storm burst over them, in the midst of which a vivid dash of lightning, accompanied by a fearful crash, struck the monument. Five volunteers who were in rank near to it, were struck to the ground, and found to be much burnt, two of them so severely that they had to be conveyed to their homes.

At a farm named Lomax's, occupied by John Nuttall, at Pilsworth, about two miles from Bury, and on the estate of Earl Wilton, the chimney on the western gable of the farm was struck, and damage amounting to between 100*l.* and 200*l.* was the result. The chimney-stack was completely demolished, the roof was smashed through, and nearly one-half of the thick brick-work of the gable-end was ruinously demolished or shaken. Other damages were done.

There has been a supposed earthquake at Sunderland, testified from several parts of the town and neighbourhood, "unless it was an explosion in one of the neighbouring collieries."

Several violent shocks of earthquakes have occurred at Accra, in West Africa, causing considerable damage. Many of the houses were rent to pieces, and completely destroyed, whilst others were cracked in several places. Fortunately, the most serious shock was preceded by minor ones, which alarmed both the European and native residents, who had time to pack up and escape before the houses tumbled down, and consequently but few serious and no fatal acci-

dents occurred, although the earthquake took place in the middle of the night.

Letters from Aleppo give a distressing picture of the state of Antioch. The town where the disciples of Jesus were first called Christians is now a mere heap of ruins; and as shocks of earthquake still continued, and the soil was, as it were, quivering with volcanic movement all round, people were afraid to approach the site to remove the large number of dead who lay unburied. The Turkish Government had sent 3,000*l.* for the sufferers from the earthquake at Antioch.

It is to be hoped that the dominant cause of the commotions which were increased last year, as in 1867, has expended its force, whatever that may be. If so, the human race will be saved another catastrophe, this year, such as that of 1808. In the present instance, although California has again been shaken, the commotions appear to be more vigorously manifested in the Old World than the New.

SALE OF THE POULTRY CHAPEL AND SCHOOLS.

On Tuesday the Poultry chapel and schools, well known as one of the oldest blocks of property of its kind in the City, and which is freehold, were disposed of by public auction by Messrs. Debenham, Tewson, & Farmer, of Cheap-side. The property occupies an area of 7,440 square feet. The first bidding was 30,000*l.*, which was quickly followed by successive advances, and ultimately the property was knocked down for 50,200*l.*, representing about 7*l.* a foot. It was stated at the sale that the gentleman to whom the property was knocked down represented the directors of the London Joint Stock Bank, whose premises adjoin the Poultry Chapel, and that it is their intention to erect a new block of buildings on the site in connexion with the bank. The trustees of the chapel have secured a large site near the Holborn Viaduct, on which they are about to erect a new chapel and schools.

CHELSEA OLD CHURCH.

Sir,—I happened to see to-day the paragraph in your paper of May 11th, on the "Progress of the Chelsea Embankment," in which it is stated that "next week an important sale of property required for the new Embankment will take place." That sale has been accomplished, and I am informed that one of its conditions is, that the houses sold are to be cleared away within a fortnight.

A host of your readers must be aware that this property comprises the archway of the two little narrow streets going westward from the old church of Chelsea to Battersea-bridge. They will also be aware of the prominence which this removal will give to the well-known church, so long, I may say, buried in obscurity, without one decent approach to it. I have accordingly thought it my duty to appeal to the public to assist me in preparing this most interesting edifice for the new position it will hold. Not that I want to modernise it in any way; such an idea is as far from my mind as it could be from that of any lover of antiquity, for the great charm of this church is its character as the old village church, and as long as it stands it must continue to recall the past history of Chelsea, whose pages will always have an honourable place in the records of England's literature. Associated with the old church are the names of Sir Thomas More, of Swift, of Attenbury, of Littleton, of Sir Hans Sloane, and others in the same category. Within it are monuments to families of note such as the Duke of Northumberland (of the Dudley line), Lord Derby, Lord Daer, Lady Chelyne, and Sir Thomas Lawrence. In fact, there is no professed antiquary who would not find connected with this church a source of contemplation all-sufficient to repay a visit.

When I was appointed to the incumbency in 1855, I set to work to repair the church, and make it what I found it not, a proper place of worship. Since then, however, time has done its work, and there is need of some substantial repairs, as well as improvements internally for the comfort of worshippers.

I have, therefore, again made a move to get funds for this object, and if you will kindly permit me, through your pages, to make my efforts known, I doubt not some of your readers who are acquainted with the church and its history will come forward to help me.

R. H. DAVIES, Incumbent.

178, Oakley-street.

THE BREAKWATER OF THE FUTURE.

811.—Having had an opportunity of observing, during the last three winters, the manner in which the harbour works now being constructed in the Bay of Wick have been attacked by successive storms, and the manner in which the various modes of construction adopted from time to time have successively given way, in a great measure at least, before the fury of the storm,—in consequence of the disinterested liberality of the British Fisheries Society, the tentative process is still to be carried on as heretofore; but the probability is that the money at the disposal of those generous experimenters may be exhausted before sufficient experimental knowledge can be obtained to enable a fair start to be made with brighter prospects for the future, could sufficient funds be forthcoming when the experiments have been completed.

Attempts have been made to bind the upper course of stones by longitudinal and transverse bars of iron let into the stone and cemented over; but these efforts have been as futile as the attempt to bind Samson with the seven green withs.

The experiments, as far as they have been carried out, have resulted in establishing the superiority, over the present mode of construction, of large blocks of Portland cement concrete under low water, and concrete deposited in mass as soon as possible above low water to the required height. This, however, may or may not be acted upon, should the works be carried farther seaward.

It would appear that the next experiment to be tried is, "To deposit blocks of cement rubble, 80 tons to 100 tons weight, outside of the wall, which would not only protect the wall itself, but tend to tranquillize the water inside of the harbour." How these blocks, deposited outside of the wall, can tranquillize the water inside of the harbour is not stated.

To deposit a considerable number of concrete blocks to seaward of the wall will virtually be forming a sea slope to the upright wall, and, should this experiment succeed, which, for obvious reasons, is not at all probable, it would establish the principle that the upright wall from low water to the top must be abandoned, and a parabolic or cycloidal curve adopted for the upper portion of the sea face of the wall. The slope, however, must be an integral part of the work combined in a homogeneous mass, and not laid up against the work as a sort of independent shield which will be used by the waves not as a shield, but as a battering-ram or wave-hammer, to pulverize the brittle slaty stone in the sea face of the work. The waves in the recent storm are said to have been *thirty feet high*. This will take some of the students of wave-ology by surprise: a 30 ft. wave in 30 ft. depth of water will be looked upon as a modern discovery, or as a modern invention.

Any careful observer of the action of the recent storms against the vertical wall must regret that the experiments have not been sufficiently varied to decide the question of an upright wall as against a wall with the sea face above low water rounded off as above proposed.

In the recent storms, the waves dashing against the upper portion of the upright wall, sent a dense column of water to the height of some 50 ft. or 60 ft. This column of water is the resultant of the wave-blow, and the reaction of the blow against the upright wall, and its height, is the measure of the intensity of the blow; but if this blow were deflected by a plane oblique to the line of impact of the blow, the intensity of the blow would be diminished in proportion to the increase of the angle of incidence. Ask the captain of an iron-clad whether he would like the shot of his antagonist to be delivered perpendicularly to his broadside, or obliquely to it; he would certainly prefer the latter, and the more oblique the better he would like it; but the hydraulic engineer says, let me receive the motion of this monster 30 ft. wave by a direct negative—the blow is delivered, the water flies upwards, and the wall tumbles downwards.

It is a pity that these experimental works have not been directed more particularly to the solution of this unsolved problem.

These remarks may serve as a sort of practical introduction to the following proposal for the construction of a harbour of refuge, composed entirely of concrete blocks. I propose that the blocks should be hexagonal, with the exception that they lock into one another and break joint. After a careful deposit of the lower course, the blocks could easily be lowered into their place,

and form a compact wall. Indeed, the outer joints could easily be caulked, and liquid cement injected into the internal joints, so as to consolidate the whole into one compact mass. The blocks should not be less than 200 tons weight, and formed on inclined planes, above high water, and launched into the sea, to be laid hold of by the twin barge. This barge should draw as little water as possible when loaded, and should be propelled by steam, with twin screws or detached paddle-wheels, and also supplied with steam lifting appliances. The blocks, of course, may be made of any form, provided that they articulate well into each other, break joint, and are easily deposited. ALEXR. DOULL.

COLTMAN-STREET WESLEYAN CHAPEL AND SCHOOLS, HULL.

This edifice has been opened for Divine Service. The plans of the new building were made by Mr. Wm. Botterill, of Hull, architect. One-fourth of the total estimated expenditure was, according to the rules of the building committee of the Conference, allowed to remain as a debt on the premises, leaving 5,925*l.* as the total sum immediately required.

The site of the new building is near to the centre of Coltman-street, on the eastern side, with a frontage of 100 ft., and an area of 2,880 square yards. The structure is in the Decorated Gothic style, built of Gainsborough white stock bricks, with Ancaster stone dressings. It is placed 27 ft. back from the street line, giving a spacious area in front of the principal entrances, enclosed by a dwarf wall, with iron railing, gates, &c. The principal, or Coltman-street, elevation exhibits three entrance doorways, having moulded pointed arches, or polished Aberdeen granite shafts, with carved stone capitals. The entrances open into a spacious vestibule, from which are lobbies, for intercepting draught, communicating with the aisles on the ground floor of the chapel. The vestibule is flanked by staircases of ample width and easy access to the galleries. Behind the chapel, and connected therewith, but of somewhat plainer character, is a block of school and class-room buildings, vestries, &c. The internal dimensions of the nave of the chapel are as follow:—Length 90 ft., and breadth 47 ft.; the transepts are 25 ft. by 15 ft. 3 in. each. There are galleries on three sides of the chapel, with four staircases, giving facility of ingress and egress. The roof of the chapel is open to the collar-beam, and is of hammer-beam construction, with the ceiling boarded. The height of the wall to the springing of the roof is 27 ft. from the chapel floor, and 46 ft. to the ceiling over the collar-beam. All the pews and fittings of the chapel are in pitch pine, varnished, with the exception of the pulpit, which is a costly piece of workmanship in English oak, elaborately carved, being a memorial of the late Mr. Thomas Holmes. In rear of the chapel are schoolrooms 48 ft. 9 in. by 28 ft., and 48 ft. 9 in. by 38 ft., together with 13 class-rooms and vestries. The whole of the buildings are heated by Perkins's hot water apparatus, and the lighting is by corona and bracket lights of medicinal design. There is accommodation in the chapel for 1,200 persons. The cost of the whole of the buildings will be about 8,000*l.*, of which a considerable sum has been raised. The works have been superintended by Mr. James Griffith; Messrs. W. & J. Hall being the general contractors, except for the slating, which has been done by Messrs. Dauber & Son. The stone carving has been executed by Mr. Thomas Firth, and the wood carving by Mr. Matson; the gas-fitting by Messrs. Stone, Settle, & Wilkinson; the painting by Mr. W. Wardell; and the wrought ironwork by Mr. W. B. Leaning, all of Hull.

BUILDING APHORISMS.

I.
The richest crop, for any field,
Is a crop of bricks for it to yield.

II.
The richest crop that it can grow,
Is a crop of houses in a row. A. H.

The Natural History Museum, South Kensington.—The drawings for this structure, to be erected from the designs of Mr. Waterhouse on the site of the 1862 Exhibition building, are now ready, and the "quantities" will be issued in a few days to those intending to tender.

THE SOURCE OF SAND.

Those of your readers who are interested in geological matters will readily admit the importance of a hint that will assist them in determining the source from which a particular bed of sand or sandstone has been derived. How to discriminate between sand produced by the breaking up of quartz, and sand produced by the breaking up of flint, does not appear to be generally understood. Chemical analysis gives no assistance, and when examined microscopically by ordinary light, no difference can be detected. Polarized light, however, discriminates these two substances in such a decided way, that where they alone are concerned no doubt can remain for an instant as to whether a grain of sand consists of one substance or the other. The quartz, as of course everybody knows, is resplendent with prismatic colours, while the flint shows a cold, steel grey surface covered with a peculiar marking, which I am obliged to call a species of reticulation for want of a term more exactly descriptive. This marking I consider to be indicative of something in the structure of the organism replaced by the flint. When once seen it is readily recognised. Some species of chert,—that from the Portlandian beds, for instance, whose formation is probably due to a similar cause,—show the same marking as flint.

The proportion of flint to quartz in the Thanet sands, in the Bagshot sands, and in other deposits may thus be readily seen.

M. HAWKINS JOHNSON.

THE LIVERPOOL SEAMEN'S ORPHAN INSTITUTION.

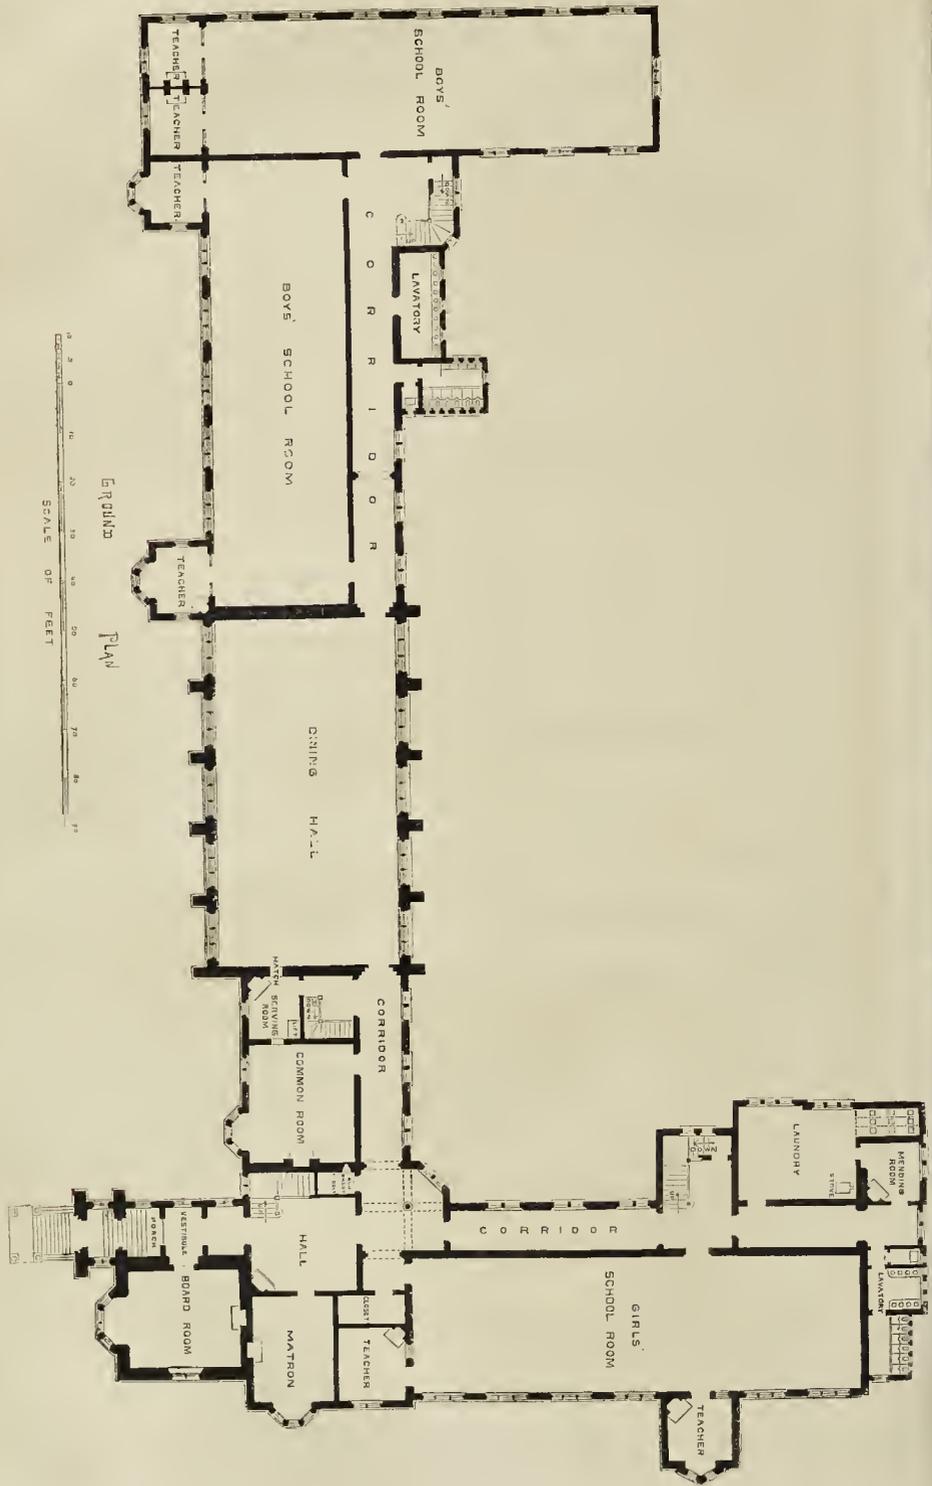

The new building, now in course of erection, for the Liverpool Seamen's Orphan Institution is situated near the eastern extremity of Newsham Park, upon a site granted by the Corporation. Its principal frontage, of nearly 300 ft., runs in a south-westerly direction towards the fine sweep of rising park-land which stretches in that direction towards the heart of the town.

The elevation is varied in outline; indeed, the architectural effect of the building will depend more upon its effective grouping than upon the elaboration of its details. At the southern extremity of the principal facade, and standing in advance of the rest of the building, will rise a tower, 25 ft. square, and about 120 ft. in height. Towards the centre of this front is the next most prominent feature in the elevation, the block containing the dining-hall, the principal apartment in the building. The roof of this block will be carried to a greater height than the adjoining roofs, and, to resist the thrust of the principals, buttresses will project between the windows. These windows are over 16 ft. in height, and are divided into three lights, both in width and height, the head of each light being trefoiled.

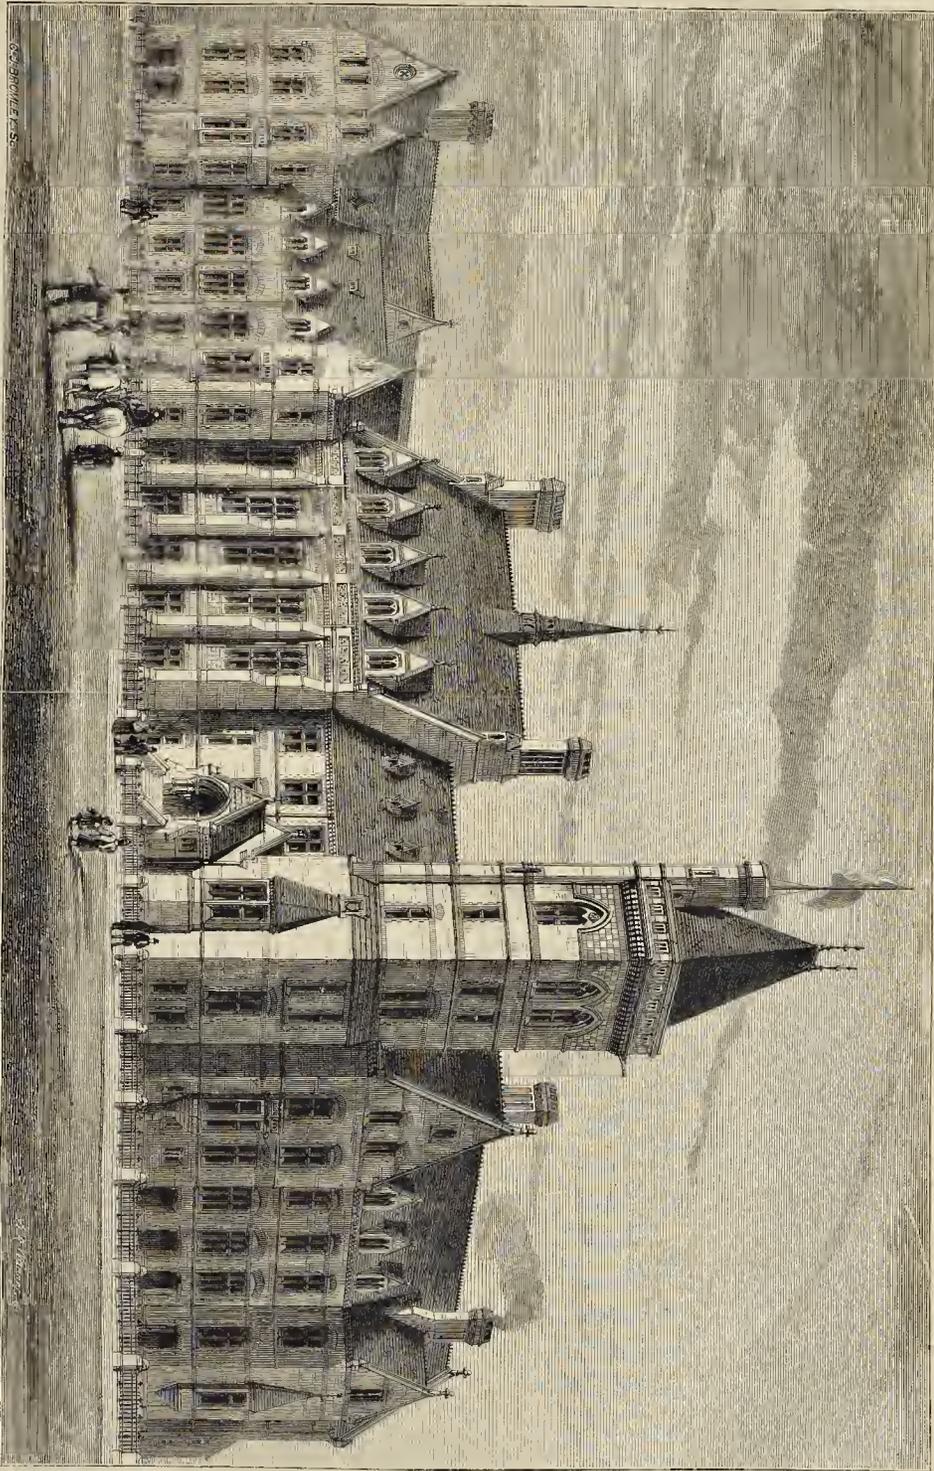

The materials used will be grey bricks, with red Runcorn stone dressings. Over the window-heads, which are generally square, there will be relieving arches in red bricks, and at the eaves of the roof a cornice of the same materials. The roofs will be covered with slates.

The building will be generally four stories in height, and will consist, roughly speaking, of a main block running parallel with the road, and at either end a wing at right angles with the main block. The basement floor, which it should be observed will be level with the surrounding grounds, will contain in the north wing a covered play-ground for boys, about 90 ft. by 30 ft., in the south wing a similar play-ground for girls, and the laundry department; and in the central block, the kitchen and other needful offices; a swimming-bath, and a boys' workshop of about the same dimensions as their play-ground. The main floor contains the dining-hall, 70 ft. by 86 ft., by 30 ft. high; two school-rooms for boys over their play-ground and workshop respectively; one similar school-room for girls, and the necessary accommodation for the administrative department. The first and second floors are mainly appropriated to dormitories, there being four dormitories for boys, and two for girls, each dormitory being capable of accommodating about seventy children.

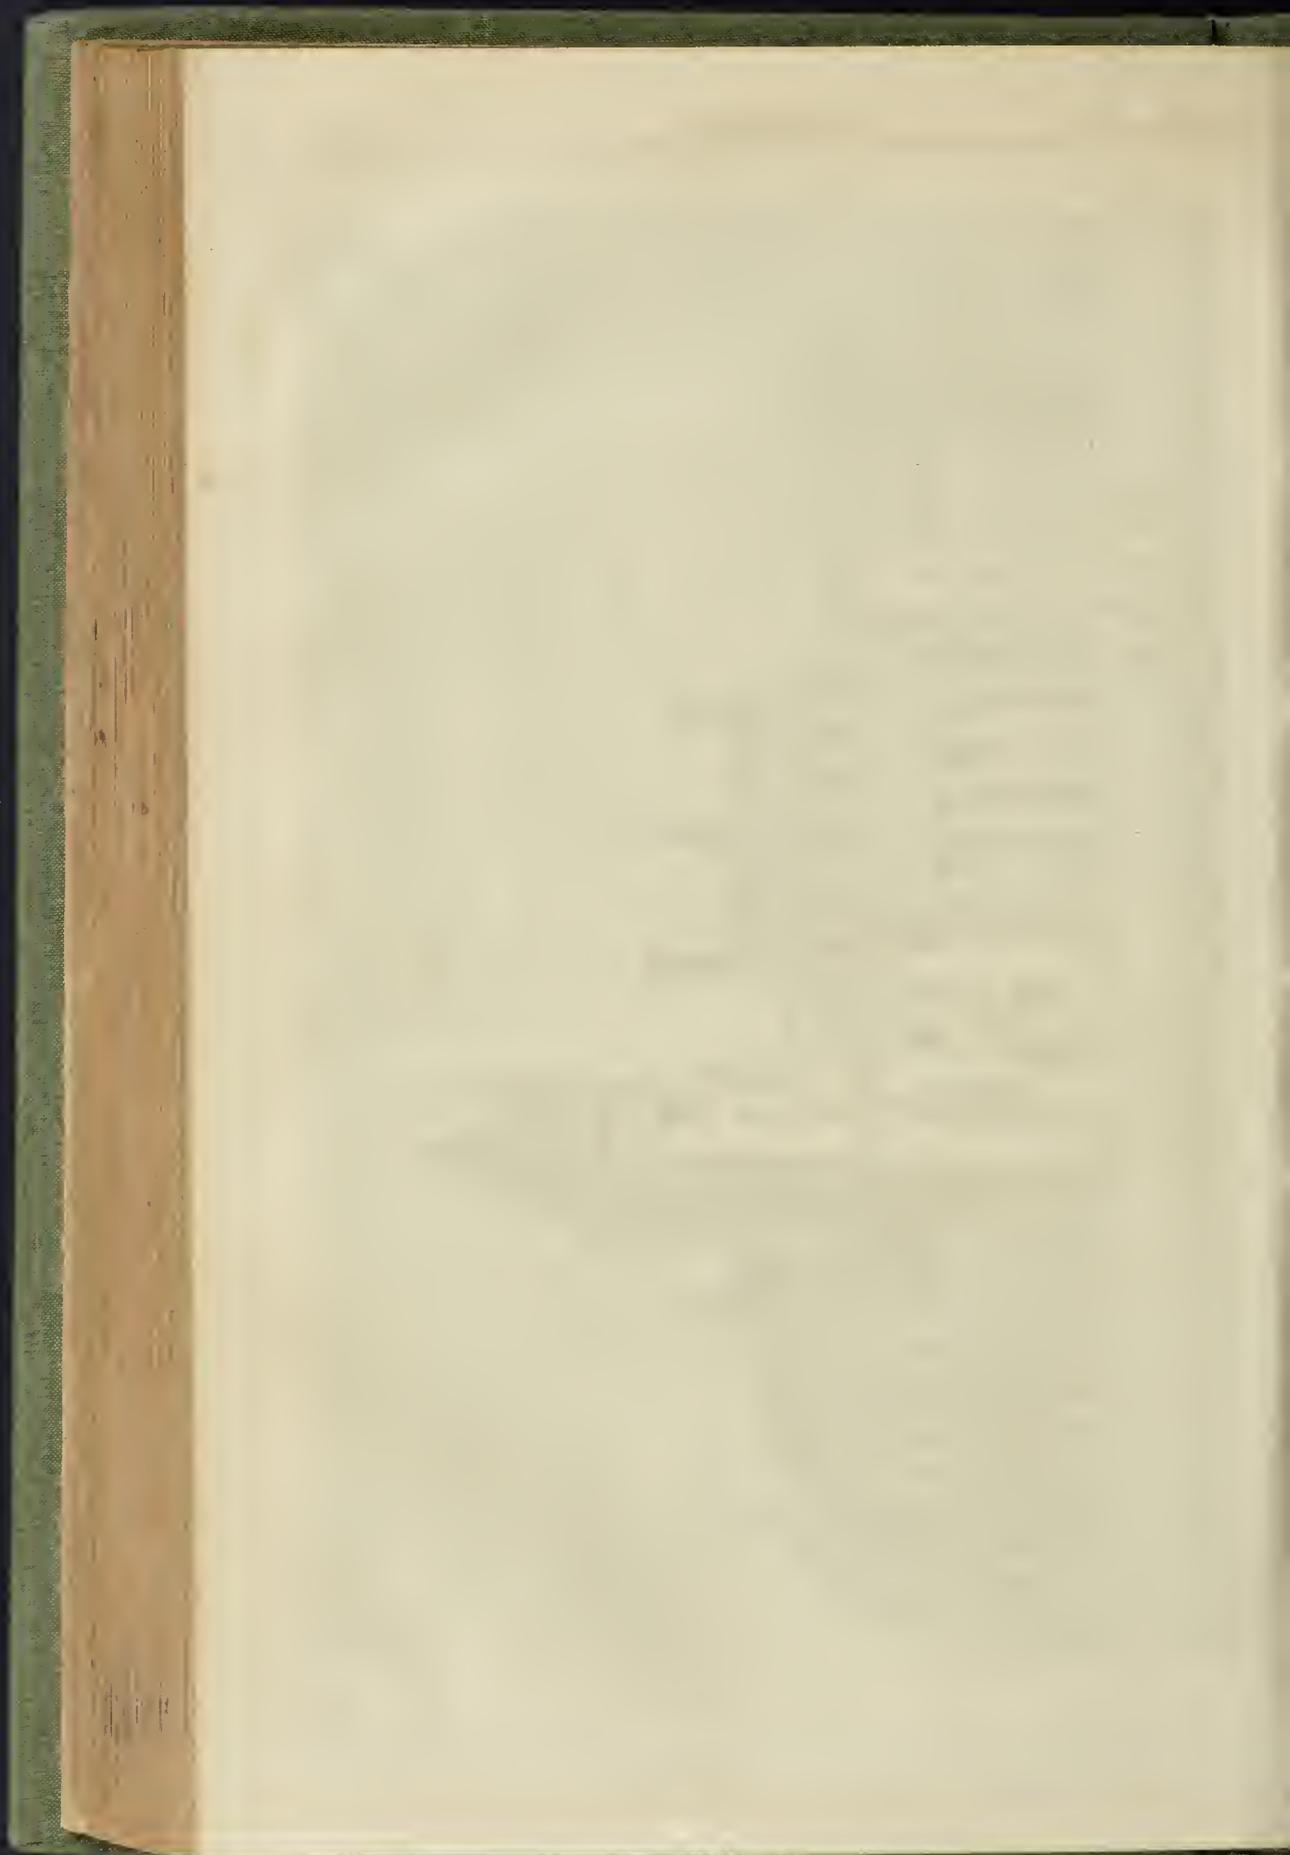

The cost of the entire structure will somewhat exceed 20,000*l.* The general contractors are Messrs. Haigh & Co. Messrs. Haden, of Trowbridge, will warm the building throughout by means of their hot-water system. The architect is Mr. Alfred Waterhouse.

THE LIVERPOOL SEAMEN'S ORPHAN INSTITUTION.—Plan of Ground Floor.

THE LIVERPOOL OLD SEAMEN'S ORPHAN INSTITUTION : NEWSHAM PARK.—MR. ALFRED WATERHOUSE, ARCHITECT.

THE TRADES MOVEMENT.

London.—On Saturday night last, a crowded meeting of delegates from the carpenters and joiners in the various London building firms was held at the Brown Bear, Bloomsbury, for the purpose of deciding upon the firms where the men shall be called out on the 1st of June next, in accordance with the resolutions adopted at the aggregate meeting of the trade in St. James's Hall, on Tuesday night last. Mr. Sadler occupied the chair. A report was brought up from the Nine-hours Committee on the present position of the movement, and recommending the names of several firms for the delegates to decide upon two out of the number, when action should be taken on Saturday, the 1st of June, unless in the meantime some overtures were received from the Masters' Association. After considerable discussion it was resolved that the workmen in the employ of Messrs. Jackson & Shaw, of Pimlico, and Messrs. Brass, of Old-street, St. Luke's, should wait, by deputation, upon their respective employers, and inform them that they should leave their employ upon Saturday, June 1, unless they complied with the terms contained in the men's memorial. The delegates from those firms stated it as their opinion that the decision of the meeting would be promptly complied with. It is stated that a meeting of the Associated Masters has been held since the meeting of the men, in St. James's-hall; and that after considerable discussion it was resolved to meet the withdrawal of the men from any particular firm or firms by a general lock-out so far as the firms connected with the Association were concerned. It is also stated that many of the members were in favour of a compromise by meeting the demands of the men for 51 hours per week at 9d. per hour, with a counter-proposition for 54 hours at 8½d. per hour, which would be a reduction of 2½ hours on the present working week, and 0½d. advance in the rate of wages per hour.

Sheffield.—The Sheffield masons, to the number of nearly 300, have struck work for a reduction in the hours of labour to 49½ per week.

Spwisch.—A meeting of master builders has been held. It being found that a large number of men would be unfairly dealt with by the resolution passed on the 9th instant, and taking into consideration the misunderstanding apparently existing between the masters and their workmen, it was thought best to submit the matter to arbitration, and that two gentlemen not connected with the trade should be appointed by the masters and two by the men, the mayor being invited to act as umpire. It was further proposed that Mr. P. D'Eve Burroughes and Mr. John Orford, jun., be requested to act on behalf of the masters, and that a deputation be appointed by this meeting to wait upon those gentlemen to solicit their consent.

Leamington.—The builders' labourers have struck for an advance of wages from 1d. to 4½d. per hour, equivalent to a rise of 2s. 4d. per week. The labourers had given notice, which had expired, and as the masters had not conceded their demand they refused to work. The principal builders held a meeting, and resolved to grant the required advance, and the labourers have subsequently agreed to resume work. The strike stopped the bricklayers and plasterers, and suspended business. Labourers received 18s. 10d., and will now have 1l. 0s. 2d.

CITY CHURCHES.

St. Mary.—Another City church is in progress of demolition, and in a very short time St. Mildred's, Bultry, will be a thing of the past. The difficulties in the way are said to have been very great. I would they had been insurmountable. It is that I pretend to think the loss great from an artistic point of view, but the Bishop of London has at the present time a Bill before the House of Lords to facilitate the destruction of City churches; and when once the Ecclesiastical Commissioners have tasted blood nothing will stop them. We have already heard from you of the danger that threatens St. Mary Woolnoth, and I shall not be surprised to hear that the quite campanile of St. Mary-le-Bow is to be removed, for the purpose of widening the passage. It is quite evident, from an observation made by the Bishop during the debate on the Bill, that a wholesale clearance will be made of the measure becomes law. His lordship is reported to have said that they must take care to be in too much of a hurry, lest the price

of land should go down in consequence of too many sites being thrown on the market at once. Let no one speak of the "narrow theological training" of our clergy after that. It shows that his lordship has a keen eye to business.

It is said that these churches are of no use, but the authorities of St. Lawrence Jewry have shown that they are of use if services at the right hours of the day are provided. I cannot help thinking that if the interior of Hawksmoor's church, above referred to, were altered, so as to be more in accordance with modern notions, and rendered less heavy than it now is, it might be made as useful as St. Lawrence Jewry.

Perhaps you will permit me to call your readers' attention to that most interesting specimen of Norman architecture in Smithfield. I am alluding, of course, to St. Bartholomew the Great. Perhaps they are not aware that this church is open every day from 11 to 4. I think that I am correct in saying that the restoration has been carried no further since the reopening in 1868, I suppose for lack of funds. I am, however, only speaking from memory, not having visited the church from that time until a few days ago. With the modern rage for "improvements," I should not be in the least surprised to miss the very beautiful archway (the entrance, probably, to the south aisle) which now stands in the line of the houses in Smithfield. It needs but a very little knowledge to see what this church would be if the restoration could be fully carried out. (See the *Church Builder* for 1863, p. 169.)

I am not an architect, but I derive a great deal of pleasure from the few remains which the City possesses. If things go on at the present rate there will scarcely be a house or building left to remind us that London has a history.

R. B. P.

"A GLAZED SURFACE."

A QUESTION such as we inserted in our last issue generally brings us replies that lead us a little out of our course. However, for once we submit. Messrs. Doulton & Co., of Grove-road, Victoria Park, offer an imperishable white glaze at 5s. 6d. per yard superficial. And Mr. Seacombe, of Acrefair, thinks there is no material of the kind for lining walls cheaper than his "Salt-glazed bricks," the same colour as a pipe, on rails at Raabon for 50s. per 1,000; the rate of charge to London being 15s. per ton, or 45s. per 1,000.

A MONUMENT FOR VIENNA.

Our advertising columns show that a committee has been formed in Vienna to erect there a monument to the late Vice-Admiral Tegethoff, and that it is inviting designs from artists of all countries. The competition is to be by models and three premiums; 300l., 200l., and 100l., are offered for the best three designs, irrespective of the arrangement to be made with the author for carrying one of them into execution. Some of our readers may find it worth while to look into the matter.

THE ARCHITECTURE OF GREAT CITIES.

Sir,—The *Pall Mall Gazette* recently contained an abstract of a letter by "a distinguished architect," addressed to the profession, on the self-evident failure of the materials at present mostly employed in the architecture of cities, and notably London; the various kinds of building-stone, of brick, cement, and terra-cotta, all yielding, sooner or later, either to the dirt-producing or destructive properties of a city atmosphere; paint being at present the only partial and imperfect means resorted to for meeting this and keeping up appearances. The expense of repainting, and the "essential meanness of paint," as Mr. Ruskin has it, from a fine-art point of view, make it less resorted to than occasion might seem to demand, architects preferring even to see their works become begrimed and decayed rather than to have them painted. The "letter" goes on to point out that in granite alone have we a stone capable at once of resisting the corrosive properties of a city atmosphere, and of taking a polish which presents a surface against almost all contraction of dirt and discoloration, or which would be almost self-cleansed by the weather, and completely so at very slight labour and expense. It is further

urged that in the employment of the different varieties of coloured granite we have a means of introducing a contrast and richness into our buildings, now very much a desideratum, and that it would give rise to a boldness of design, and simplicity of decorative detail, which would be a useful corrective of the present tendency to a profusion of somewhat bizarre carved decoration, which so quickly suffers, or becomes lost through dirt, weather, stains, and often actual decay. All this is very true and admirable, equally deserving the attention of the sculptor as of the architect, and there cannot be a doubt that much would be gained in all the essentials of durability, cleanliness, colour, and architectural effect, now so adversely affected by atmospheric conditions. Such instances as we have, whether in architecture or sculpture, seem thoroughly to bear out the superiority of granite in all the respects named. It is probable, however, that expense and other conditions would dictate its employment chiefly in large works, so that for the minor purposes of street and domestic architecture, we should be much where we are.

It has, however, long appeared to me that we are possessed of another material peculiarly suited to our climate, capable of the most extensive architectural employment, and which could be brought into use when granite could not. I refer to encaustic tiling (not of course in a highly-glazed form). In this we have a material not only defying the destructive influences of the atmosphere, and sufficiently durable in other respects, but capable of a various treatment as to architectural adornment in design and colour practically endless. Its use would perhaps involve the sacrifice of much on which the architect at present relies for effect in special features and carved decoration; but these would be more than compensated by the deliverance of our architecture from the dismal aspect occasioned by dirt and decay, and by the never-failing light, cleanliness, and variety of pleasing and artistic combinations of colour and design which might be secured, to say nothing of the change from the round of sameness in feature and detail in which we seem content to move. One building skilfully proportioned and designed for express adaptation to the encaustic tiling, with appropriate architectural ornamentation in design and colour, would very much recommend its adoption, and perhaps would even form the precursor of that "new style" whose approach has so long been heralded. It seems to present a wide field to our architects, and to be applicable through every gradation, from simplicity to the utmost richness. And, combined with polished granite for purposes of enrichment and relief by courses of elaborate coloured designs, or plaques in-laid, it might be made to produce beautiful and effective results, rivalling Giotto's famous campanile and the coloured marbles of Italy.

In regard to paint, on which for a long time we must more or less rely, it is surprising that so little is attempted to give it more life, by an artistic disposition of different shades.

NEMO.

ARCHITECTURAL ASSOCIATION.

At the meeting held on Friday evening, the 17th inst., after the ordinary routine business, the recommendations of the Conference committees were taken into careful consideration, in order to arrive at some distinct conclusions as to the views held on the various subjects by the junior practising members of the profession in London, who belong to, and are represented by, this Association. The discussion was understood not to be open to the public, so we are unable to give a report; except to state that the points of instruction to the delegates to the next conference have not yet been finally drawn out—the subjects coming on again for consideration at the next meeting on the 31st inst.

We have been informed that the excursion to St. Alban's, announced for June 1st, will probably be postponed, at least for a week, as a brigade drill of the Artists' Corps may prevent several members taking part in it. The detailed particulars of the excursion will, however, be announced shortly. It is to be hoped that the late spring-time may have then arrived, and call out a numerous party, to whom the use of their pencils shall not be made painful by chill winds. The central tower of the Abbey Church, now in great part cleared of its old patched and rotten cement coating for a thorough renewal of it (gaining greatly in apparent size, hy-the-bye, now the scale is given by the joints of the Roman

tile-work) is, at the present time, to be seen under circumstances necessarily fresh to many. The external scaffolds allow a close approach to almost every portion.

SYNTACTIC ARCHITECTURE.

EVERYTHING that is young in nature, or new in social economy, must be subject to strict rules to develop it and render it efficient. Young plants must be planted at regular distances, trained or nailed up to artificial supports. Children must be schooled and disciplined with regular hourly occupations, that they may grow up into men and women. Recruits must be drilled and disciplined to make them soldiers. The same principles apply to a new school in architecture, otherwise such a thing will never be developed. It must be syntactic, that is, must have its proper orders and ordinals. There is a fashionable piece of slang amongst architects of the last ten years called "feeling." I do not know what it means, but I suppose it means shutting our eyes and feeling our way in the dark. I am quite certain that it will not lead to what those who use it are so anxious to see: that is, a new school.

W. SCARLELL.

THE BRADFORD WATERWORKS.

THE new "Bryshaw Reservoir," at Horton Bank Top, constructed by Messrs. Fogg, for the Bradford Corporation, is now complete. It is situated some 900 ft. above sea level, and is supplied by water from Thornton Moor. It has cost £2,238l. 3s. 6d., and will furnish a supply of water to the high-level districts around Bradford. The immense storage reservoir, in course of formation by Messrs. Fogg, adjacent to the North Bierley Workhouse at Clayton, is making steady progress. The huge bank that will form in the water is being formed into a series of terraces. Up to the close of 1871 the sum of 45,241l. had been paid on account of this reservoir. The Oxenhope Tunnel is progressing under Messrs. Pearson's hands. When this tunnel is completed, the supply of water from Thornton Moor will be considerably increased. The works at Barden are progressing. Last year 17,030l. 15s. 7d. were expended at Barden; and the total expenditure so far on this costly work, which includes almost entire reconstruction, has been 121,057l. 18s. 9d. The Waterworks Committee recommended the Corporation to accept the tender of Messrs. Crabtree, Brothers, and Robert Sugden, of Kighley, for the formation of two compensation reservoirs at Leeming and Lees-shaw, Oxenhope, for 40,000l.

THE PROPOSED TRANSPORT OF CLEOPATRA'S NEEDLE TO THE THAMES EMBANKMENT.

IN our volume for 1851, pp. 478, 479, 480, is an elaborate article by the late Mr. Nathaniel Gould, in which he gave various plans whereby Cleopatra's Needle—a gift by the Pasha of Egypt to this country—could be removed to London, with estimates and various particulars. The *Times* took up the subject on the 9th of September, 1852, and Mr. Gould again wrote us as to it on 4th December, 1852, at a time when it was proposed to locate it at the Crystal Palace. These proposals, however, came to nothing. The Metropolitan Board of Works has just agreed to provide a site for it, and a renewed endeavour is to be made to have it transported to London, if it be still in a state worth removal, as it was in 1851. As to this there are differences of opinion, as well as in regard to its removal at all, even if worth the trouble. There can be no doubt, however, that it is now going to nter destruction.

Mr. Paley states the sum of one hundred thousand pounds for the construction of substantial, well-constructed buildings, suitable for the town. Considering that the population of the town does not exceed 20,000, and it is neither wealthy nor very thriving, I think this sum is very fair; and the very fact of the instructions stating that the front only must be in stone, the others in brickwork, is sufficient evidence in my mind that they did not wish for the erection of a costly building.

I certainly supposed that Mr. Paley's duty was simply to advise the commissioners in making the awards, according to the strict letter and meaning of the instructions, and that with the question of its cost he could in no way interfere, as that had already been decided by the commissioners, and observed by a great number of the competitors, whose designs were necessarily of a plain and unpretending character.

Mr. Paley assumes that 15,000l. is the least sum that would have been required for the purpose, and he argues that it is impossible to erect the buildings for the sum named; and then acknowledges that there are plans

removed; and, it is thought, would form a fitting ornament space near the Clarence Street Bridge, where it might advantageously be placed. The prostrate obelisk is 64 ft. in length, about 8 ft. square at the butt, and may weigh about 234 tons. A vessel could easily bring it over, towed, in fine weather, by a steamer. The engineer of the Board of Works, Mr. Barzalgette, C.B., has seen the plan in my possession for lifting and transporting the obelisk; but it was some time ago proposed by a foreigner, as the English did not seem to care for their gift, the prostrate obelisk (on which the hieroglyphics are well preserved), to break it up for building materials.

If the Metropolitan Board of Works would address the Government on the above subject, and ask that the obelisk be brought to England, the site on the Thames Embankment might perhaps be given.

On the motion of Mr. Runtz, it was agreed that Major-General Alexander be respectfully informed that the Board have no funds at their disposal for the conveyance of the obelisk to England; but if it could be brought independently of any cost to the Board, they would be happy to find a site for it.

"An Anglo-Egyptian," in the *Times*, in allusion to this letter, says,—

"In 1852 it was exposed and easily examined. It was found that the angles of the obelisk were more chipped than the hieroglyphics on one square almost entirely obliterated, and it was considered not worth the labour and cost of transport. It has since been covered up by the fortifications.

The only way to remove it would be that adopted by the French in the case of the Luxor Monolith (now in the Place de la Concorde)—viz., by removing part of the wall of the fortifications, and digging a canal deep enough to float a caisson, which must be built round it as it lies, and thus towed during fine weather to England. The east harbour is, unfortunately, shallow, and ships cannot approach within a quarter of a mile of its site, so that the transport and shipment of the Needle on board the vessel contracted with an opening to receive and a platform to carry it (as at the time proposed) would be matter of extreme difficulty.

On the whole, I continue of opinion that it is not worth the trouble in its present state, and I doubt if it is capable of restoration."

ST. MARY'S, NEWINGTON.

Sir,—In justice to myself, permit me to say that, owing to great pressure of business, I was compelled to postpone the preparing plans for execution till only a few days remained, and that no time was then afforded for more than sketches. These, however, represented a building that could have been honestly built for the money, and the drawings were correctly, though roughly, made.

WM. WINGLTON.

STONE MERCHANTS AND MASONS.

Sir,—The evil complained of in your last issue by "A Lover of Justice" arises principally from the masons themselves.

Probably quarry proprietors generally have little confidence in London masons, in consequence of non-punctuality in the settlement of small accounts; hence the trade has drifted into the hands of the merchants.

Railway facilities are now such that even small masons could hire direct from the quarries at a very great saving, if they had accounts opened with responsible quarry owners, and confidence established.

The masons in the Eastern Counties hold their own, and buy direct in truck-loads as cheap as the London merchants do in large quantities.

STEPHEN SEAL.

A TECHNICAL DICTIONARY.

Sir,—With reference to notes under the above heading, in your columns, may we be permitted to inform your readers that we have in preparation, under the able editorship of Mr. Robert Hunt, of the Museum of Practical Geology, a new and improved edition of the late Mr. Weale's well-known "Technical Dictionary of Terms in Architecture," &c. We hope to have this ready some time during the autumn, and we believe it will be found to supply the want felt by your several correspondents on the subject.

LOCKWOOD & CO.

THE CHORLEY TOWN-HALL COMPETITION.

Sir,—This competition is another added to the long list of competitive failures, with injustice to the competitors. My drawings were this week returned, on charge-paid, of course, but without thanks, or other acknowledgment of time and service rendered,—I may now say, wasted.

The commissioners have, however, presented the competitors with Mr. Paley's precious report an award of the prizes, as adopted by one-half of the commissioners who attended the special meeting for that purpose.

Mr. Paley states the sum of one hundred thousand pounds for the construction of substantial, well-constructed buildings, suitable for the town. Considering that the population of the town does not exceed 20,000, and it is neither wealthy nor very thriving, I think this sum is very fair; and the very fact of the instructions stating that the front only must be in stone, the others in brickwork, is sufficient evidence in my mind that they did not wish for the erection of a costly building.

I certainly supposed that Mr. Paley's duty was simply to advise the commissioners in making the awards, according to the strict letter and meaning of the instructions, and that with the question of its cost he could in no way interfere, as that had already been decided by the commissioners, and observed by a great number of the competitors, whose designs were necessarily of a plain and unpretending character.

Mr. Paley assumes that 15,000l. is the least sum that would have been required for the purpose, and he argues that it is impossible to erect the buildings for the sum named; and then acknowledges that there are plans

that had kept within the prescribed sum, but not one of them, with any claim to his consideration, can be carried into execution for the sum named, so that this most important condition as to excessive cost cannot be so used.

I think this argument will scarcely satisfy the competitors, who had a perfect right to expect the award to be made—as it can only be honestly made—according to the strict letter of the instructions, apart from the consideration or opinion of any person upon any design that may have been submitted, with full confidence of the commissioners at their abiding by their own adopted instructions and conditions.

Thus Mr. Paley complacently ignores the question of cost, and says he has carefully kept his views on the subject out of the contest, but what is stated in the instructions to the plan with the best appropriation of the ground, combined with a most suitable elevation (what about the 10,000l.?)

I am rightly informed by the notices of the plans which have appeared in the local papers, the designs which Mr. Paley considers the best appropriation of the ground, have shops in the Market-street front, with dwellings, back kitchens, yards, and back passage, through the most valuable portion of the plot, thus leaving an ugly unnecessary gap between the two blocks of building; and this is Mr. Paley's opinion of the utilisation of the best site in the town, which has cost some 7,000l. or 8,000l. to procure, and is similar to the arrangement suggested by the local architect, but which was stated in the instructions should not in any way interfere with or limit the full and free scope of the architect. The premiated designs have, however, failed to improve upon the general features of the most objectionable arrangement; but notwithstanding they have been approved by Mr. Paley, and adopted by the commissioners, who have probably spent as many weeks in examining the drawings as Mr. Paley has hours, and whose previous selection was totally different from Mr. Paley's award; and how they could be brought to approve of designs which were so much inferior to the public view recently and clearly given at a public meeting, I am at a loss to understand.

It is also to be noted that the drawings as they appear on the principal front, Market-street. The public accommodation varies from 700 to 1,300 in the large hall, when 1,300 was the number required in the instructions, and the cost of them can be executed for anything like 10,000l., and even supposing Mr. Paley's estimate of 15,000l. be correct, as the least estimate, it is more than probable that the cost will exceed 20,000l. in execution.

It may afford some satisfaction to the dissatisfied competitors to learn that it is not probable that any use of the premiated designs will be carried into execution, for there are sufficient reasons.

Mr. Paley's report is an injustice to those competitors who have kept the cost within the stipulated sum, and who, in the exercise of their own judgment, have selected the site that they have offices in lieu of backyards, kitchens, and back passages, and which arrangements, I believe, will be more commendable to the common sense of the public of Chorley than any showy elevation, with such interior defects as are said to exist in the premiated designs.

A COMPETITOR.

"EDWARD PEARCE."

Sir,—Can any of your readers inform me who was Edward Pearce, who published a work on Friezes, "sold by John Overton at ye white horse without Newgate, near the Fountain Tavern?" His name is not mentioned in Sadler's "Kinsler-Lexicon" nor Phillips' "Dictionary of Biographical Reference." The above work is copied in Cottam's style, and some of the letters and shades is much like Remond's school. There is no date to the treatise. Also, I should like to hear what is known of E. de Lorin, architect to James I. of England.

LEWIS SOLOZOV.

STAINING AND VARNISHING.

Sir,—I shall be greatly obliged by your allowing me to ask a question in your valuable paper, and shall be very pleased to see an answer to the same at once.

If an architect put in the specifications for the wood work to be stained and varnished, is it a usual thing to make always to give it one coat of size and one coat of varnish, and call it twice varnished? And would the architect pass it as *twice varnished* if he knew it had only one coat of varnish? One who WANTS TO KNOW.

* Certainly not, if he did his duty.

BUILDERS' BENEVOLENT INSTITUTION.

THE thirty-seventh election of pensioners in connexion with this charity, took place at Willis's Rooms, King-street, St. James's, yesterday (Thursday) afternoon, Mr. Joseph Bird, one of the Vice-Presidents of the Institution, in the chair. There were five male and eight female candidates, but the funds at the disposal of the charity only allowed of the election of one male and one female at present.

The names of the candidates were:—Males Francis Sandom (fifth application), Mark Minter (fourth application), Matthew Saich (second application), Daniel Thomas, and Richard Bibby Females: Frances Searc (sixth application), Jane Brothill (sixth application), Elizabeth Trevelthan (fourth application), Ann Budd (third application), Eliza Lambert (third application), Arabella Hambrook (second application), Sarah E. Bear (second application), and Ann William (second application).

Messrs. Thomas Stirling and Matthew Hall having been appointed scrutineers, announced the successful candidates to be Mr. Mark Minter and Mrs. Jane Brothill.

Mr. Walter Watson (Watson, Bros.) proposed and the Chairman seconded, a vote of thanks

be scrutineers. The motion having been carried, Mr. Stirling briefly replied.

The proceedings closed by a vote of thanks to the chairman, proposed by Mr. Thomas Smith, and seconded by Mr. Waldram (Hill, Kedwell, and Waldram).

The Institution has at present on its funds 42 pensioners,—19 men and 23 women,—the men receiving 24. per annum, and the women 20l. The amount of stock standing in the name of the institution is now 16,131l. 17s. 3d.

"CÆSAR'S CAMP."

I VISITED, recently, at Wimbleton, this relic of the olden time, which is denoted in the Ordnance Map as being placed about a mile to the north-west of the railway station. I walked round the embankment, which has not yet been altered by bricks and mortar. It is engraved in the *Archæological Journal*, vol. xxiii., and the area of the inclosure is stated to be about fourteen acres. Antiquaries seem to differ respecting this relic,—for Mr. W. H. Tregellas believed it to have been a British, Roman, Saxon, or Danish carthwork; Mr. Brayley deemed it to be British, as did Mr. Saul, the Rev. T. Hugo, and Mr. A. J. Kempe, F.S.A. Mr. Galo, Dr. Roots, and Mr. Bidon (see "History of Kingston"), believed it to have been a Roman camp; but a circular form is opposed to this idea. According to Mr. Lysons, Wimbaldis was a Saxon name, and this camp resembles the Saxon work at Mount Caburn, near Lewes. It is curious, and deserves inspection.

CHR. COOKE.

BRAMLEY UNION NEW WORKHOUSE.

THE new workhouse for the Bramley Union, comprising the townships of Bramley, Armley, Arncliffe, Gildersome, and Wortley, has just been completed and opened. Intended to meet the requirements of a district, with some 45,000 inhabitants, the works connected with the new buildings are necessarily upon an extensive scale. Sixteen acres of land constitute the workhouse estate, and situated in the high-lying district of Hill Top, near Armley, the block of buildings form a conspicuous feature in the landscape. The workhouse, which will accommodate some 220 inmates, has been erected, including the purchase of land, construction of porches, &c., at a cost of 15,500l. The opening of the building was celebrated by a dinner in the dining-hall, at which there was a numerous attendance of those interested in the construction of the new building. The accommodation provided in the workhouse is as follows:—Main building—Infirmen, 32; ditto, women, 32; able-bodied men, 10; ditto, women, 10; disorderly, 10; boys, 10; girls, 9; children, 8; married couples, spare bed-rooms, 10; ditto, 9—144. Entrance lodgings—Male probationers, 5; ditto, vagrants, female probationers, 5; ditto, vagrants, 6; Infirmary—Males, 22; ditto, imbeciles, 6; males, 16; ditto, imbeciles, 6; lying-in ward, 54. The outlay on the main building, bountifully, dining-hall, porter's lodge, board-room, offices, receiving and vagrant wards, and a necessary out-offices, is estimated at 9,275l.; on the infirmary and imbecile wards, &c., 55l. 10s.; on the entrance-gates, roads, architect's commission, and clerk of the works, 900l.; a total of 15,510l., or about 70l. per bed, including the site (2,579l.), but exclusive of about 500l. for furniture and fittings. The buildings generally are of plain design, with the walls in the Gothic style of architecture. The entrance is approached from the Bramley and Wortley road. Near to the entrance-gates has been erected a block of buildings 181 ft. in length, and containing porter's lodge, probationers' wards, vagrant wards, disinfecting apparatus (supplied by Messrs. Nelson, Leeds), offices for the clerk and relieving officers, and board-room. The main block of the workhouse consists of two stories in height, with a frontage of 13 ft., and a breadth of 47 ft. The principal entrance is surmounted by a turret or tower for a height of about 65 ft. The entrance divides the building into two wings, the left occupied by the males, and the right by the females. On each side of the entrance-hall are the apartments of the master and the women. From end to end of the principal passage runs a central corridor, from which the various wards are readily reached. On the ground floor are day-rooms and dormitories for the infirm, wards for children, lavatories, and other rooms; and on the first-floor other apart-

ments for the use of the officers and the accommodation of inmates. Opposite the principal entrance and in the rear of the chief block of buildings, is a dining-hall, the size of which is 50 ft. by 30 ft., and the height about 24 ft., the rest of the rooms being 11 ft. in height. It is intended to use this hall also for divine service. Immediately adjoining are a cooking kitchen, larders, and other domestic offices, the kitchen having been fitted up with one of Messrs. Benham & Son's (London), patent cooling-ranges. At the back of the building are paved and spacious yards, where the inmates can take exercise, whilst further to the rear is an infirmary, two stories in height. The architects are Messrs. C. S. & A. J. Nelson, Leeds and Derby. The contractors for the various works have been:—Messrs. Charles Walker & Co., Holbeck, bricklayers and masons; Mr. Jno. Tomlinson, Leeds, joiner; Mr. Jno. Senior, Leeds, plasterer; Mr. Jonas Grant, Wortley, painter; Mr. Edwin Thornton, Shipley, slater; Messrs. Sutcliffe & Wilkinson, Bradford, plumbers and glaziers; Messrs. Heaps & Robinson, Leeds, ironfounders. Mr. John Kershaw, of Bramley, has acted as clerk of the works.

THE POSITION OF ASSISTANTS.

SIR,—When there is so much talk of the professions of civil engineers, architects, and surveyors having a technical education, I think it should also be considered if the proper inducements are held out to secure that necessity.

For some time past the position of every member of these professions has been getting somewhat paradoxical; and sooner or later it will be the business of some of these big talking societies to untangle the mess, and lay down the law as to what a surveyor, or architect, or civil engineer really is, what is expected of him, and what he is to expect of his employers.

There is a class of men calling themselves civil engineers, architects, surveyors, and auctioneers, who will refuse nothing for money. There are men that will write a specification for a local Board's new broom, or stand up and sell fat cattle, undertake economical funerals, or large drainage works; they forget that any one of these branches, to be efficiently performed, is enough for one man.

SIR, there are carpenters and artisans that now get a little smattering of knowledge, and have never received any sound scientific training, who are literally undermining the market value of the genuine professional man, who has devoted his money and young days to make himself what an engineer ought to be, a natural philosopher. 20s., or 25s. per week is a very common remuneration as assistant for one like myself, who paid his 200 guineas for articles, and sat up night after night to study; and surveyors are actually offered 30l. or 40l. a year, by local Boards. What sort of professional experience do these Boards hope to get for this amount?

SIR, it appears to me that if a movement is not made by some protection society, or by such society as the Institution of Civil Engineers laying down definite rules as to the position and remuneration of each member, we shall be reduced to common artisans, as we assistants nearly are now.

ASSISTANT.

CHURCH-BUILDING NEWS.

Dunham Massey.—The re-decorating of the chancel of St. Margaret's Church, with the memorial windows that have been introduced, is now completed. The introduction of the two memorial windows in remembrance of the Rev. John Kingsley, the first incumbent of the church, left a surplus of nearly 60l., and it was resolved that this should form the nucleus of a fund for decorating the chancel. The entire cost has been about 500l., and the additional sum required was readily provided. The work of the windows, as well as that of the decoration of the church, was done by Messrs. Lavers, Barraud, & Westlake, of London and Manchester. The mural paintings consist of a series of angels and arch-angels, St. Michael, St. Gabriel, &c., at the east end over the east window, carrying legends, whilst those on the side walls are under canopies in the style of the edifice (Perpendicular). Between these, under the clearstory, there is a powdering of stars and flours-de-l'ys, and underneath these a conventional garden, with trees, each carrying a shield with some emblem of our

Lord's agony and death, and an enclosure to this garden is formed by a dado of red, diapered with an embroidery pattern such as may be seen in the old decorated screens of Norfolk and Suffolk. The roof is decorated with gold and colour, and the clearstory with a suitable powdered and diapered ornamentation. The work is pointed in a vehicle which is similar in effect to tempera, but said to be more durable. This necessitates some sacrifice of the bloom obtained by tempera work, but the artists considered that in such a humid climate, durability was to be attempted first. The reredos is gilded and picked with colours. The windows of the two lights, north and south of the altar, are also treated in the Perpendicular style of a rather late description. The subjects are placed under canopies of silvery white. The subjects represent, on the north, the annunciation of the incarnation by the angels, the salutation of the Virgin by Elizabeth, the birth of our Lord, and His baptism. On the south, are the Transfiguration, the Crucifixion, Resurrection, and Ascension. In one of the transepts a large window has also been inserted by the same firm. The subjects running through the upper lights is the charge to St. Peter; in the three lower, the angel and the three Marys at the tomb. This window has been inserted at the cost of Mr. Joseph Sidelotom, of the Beaches, Bowdon, as a memorial of his mother.

Mulling.—The memorial stone of a new chapel, to be built for the benefit of the inmates of the Malling Union, has been laid in the grounds of the workhouse by Lady Caroline Newell. The chapel will be built in the Early Decorated style, and the material used will be Kentish rag, with dressings of Box stone. Its roof will be open timbered, and covered with tile, and the building will seat 306 persons. The cost of the erection is estimated at a little over 900l. Mr. E. W. Stephens, of Maidstone, is the architect; and Mr. W. Church, the builder. The funds for erecting the building had been raised previously to within 100l. of the required amount, by voluntary subscriptions.

Brigg.—The consecration of Brigg Church has at length taken place. For some weeks it had been closed, and was undergoing considerable alterations and repairs. The old stained-glass windows at the east end have been removed and inserted at the west end of the church, and three new ones substituted in their places. A reredos has been erected over the altar, and is the gift of some members of the congregation. Above this, and on either side of the stained windows just mentioned, appear illuminated scrolls, with the words "It is Christ that died, yet, rather than be risen again, and is now on the right hand of God." These were the work of Miss Susan Paterson, of Brigg.

Ramsden.—St. James's Church has been opened for divine worship by the Bishop of Oxford. The church has been entirely rebuilt. Mr. Blomfield is the architect, and Mr. Groves, of Milton, the builder. The edifice consists of a chancel, with nave and south aisle. At the extreme north-west of the nave rises a tower and spire. The tower contains a chime of three bells, and it also forms the porch. There is accommodation for 300. All the adornments in the church are memorials of the late Mrs. Lowbridge Baker, wife of the vicar. The spire and east window are put up by the Rev. R. L. Baker. Relations and friends placed the reredos to her memory. A chancel window, executed by Hardman, of Birmingham, was put in by a brother. The parishioners contributed towards the erection of a small window in the transept, representing a figure of St. Thomas, executed by Messrs. Heaton & Butler, as was also the east window. The pillars of the font, which are of Cornish marble, are the gift of Mr. and Mrs. Borlase.

Bristol.—It is proposed, we understand, to close All Saints', Clifton, till about the first week in August, so as to allow of the removal of the temporary building over and around which the permanent stone nave has been built. The interior of the roof will be decorated from designs supplied by Mr. Street, architect of the church, and the whole of the windows, with the exception of two at the west end, will be filled in with stained glass, which is being prepared by Messrs. Hardman, of Birmingham, by whose firm the large east window was supplied. A reredos will also be erected of Caen stone, the subject of which is "The Saviour in glory, surrounded by saints." The gas fittings are by Messrs. Potter & Son, of London; and Messrs. Haden, of Trowbridge, are supplying the heating apparatus. The stone carving is being executed by Mr.

Earp, of London; and the encaustic pavement is to be laid down by Messrs. Godwin, of Lugwardine, who also laid the channel with tiles.

Mistead.—The restoration of the parish church is now shortly to begin. It will be enlarged and re-seated. The gallery will be taken away, and an old Gothic arch opened. The architect is, we understand, Mr. Butterfield.

Lincoln.—The new church of St. Martin is now advanced far towards completion. The tower is finished, and the steeple begun. The height from the tower to the top of the vane will be 80 ft., and the tower 76 ft., making the whole height 156 ft. This, with the position the church occupies, will make it a prominent object for miles. The interior is now nearly complete.

Dorking.—At a meeting of the committee it has been decided, in consequence of certain alterations in the architect's plans, that the builders who originally tendered for the work be invited to send in fresh tenders upon the reduced specifications. It is contemplated in the first instance to build the nave and transepts only, leaving the tower and spire to be completed at an after period, as funds accrue. The committee afterwards met for the purpose of opening the new tenders received for the construction of part of the proposed work, viz., the removal of the present tower, the rebuilding of the choir nave, and north transept, the addition of a south transept, and the laying the foundation of the new tower at the west end. There were in all seven tenders received, which may be classified as follows:—Messrs. Colls & Sons, Dorking, 8,367l.; Mr. Putney, Dorking, 7,514l.; Messrs. Gibson, Brothers, Southall, 6,391l.; Messrs. Wright, Brothers, & Goodchild, Croydon, 6,350l.; Mr. Shearburn, Dorking, 6,275l.; Mr. James Harris, Woking, 6,145l.; Messrs. Goddard & Sons, Farnham, 5,491l. The last tender being the lowest was therefore accepted, subject to the condition that the work be not commenced until the whole, or the greater part of the sum required for same be subscribed, and that the subscriptions already promised (amounting to about 4,050l.) be allowed by the donors to be appropriated forthwith to the completion of that portion of the work referred to. In accordance with this resolution, the vicar and churchwardens have issued a letter to the subscribers inviting their adhesion to the plan proposed. It is to be hoped the committee will be enabled to proceed continuously with the work to the completion of the tower and porch, for which, with the architect's commission, an additional sum of not less than 4,000l. will be required.

Books Received.

A Treatise on the Theory of Friction. By JOHN H. JELLETT, B.D., President of the Royal Irish Academy. Macmillan & Co. 1872. THE theory of friction, considered as a part of rational mechanics, has hardly received the attention which it deserves. Even in the most complete systematic treatises, the space accorded to its discussion is small compared with that bestowed upon questions in which the hypothesis of perfect smoothness has been assumed as the basis of investigation; and no doubt many students have been led to regard the discussion of this force less as a part of rational mechanics than as a correction to be applied before the investigations of that science can be made practically useful. It is under such considerations, and because the force with which this work is connected is subject to definite laws, as susceptible of mathematical expression as the force of gravity, that the author has made a distinct and separate treatise of it. The theory and plan of the work are stated in a preface.

VARIORUM.

"Statistics of all the Countries in the World." A compendious and valuable sheet table, containing numerous particulars as to area, form of Government, head of state, population, expenditure, debt, paper money, notes in circulation, standing army, navy, merchant vessels, imports, exports, chief products, money, weights and measures, railways, capitals and chief towns; compiled by Dr. Otto Hubner, director of the Prussian central statistical archives, has been prepared in the form of an English edition, with the sanction and co-operation of Dr. Hubner, by Mr. H. Sutherland Edwards, and published by Stanford, of Charing Cross.—"Criminal Returns: Metropolitan Police, 1871." The

usual returns of the number of persons taken into custody by the Metropolitan Police, and the results, in the year 1871; with comparative statements from the year 1832 to 1871 inclusive, have been issued in a printed form. Among the numerous tables is one showing the degree of instruction as well as the numbers of those convicted, the sex, &c., and, according to which, of 71,961 taken into custody, 48,306 were males, and 23,655 females; 8,741 males and 5,197 females could neither read nor write; 37,271 males and 18,329 females could read only, or read and write imperfectly; 2,225 males and 129 females could read and write well; and 69 males and no female had superior instruction. Of the whole 45,608 were summarily disposed of or held to bail, and 2,655 were tried and convicted, among whom were 1 female and 5 males with superior instruction.

Miscellanea.

American Plumbers.—A correspondent in the *Industrial Monthly* writes,—"The supply water-pipe which extends from the street, along the top of our cellar, to the sink in the kitchen, had a very small hole in one side, so that a stream of water spun out, not so large as a cambric needle. If I had known that the hole could have been remedied by placing the end of a tenpenny nail on the hole, and hitting it two or three light blows with a hammer, the knowledge would have saved me much trouble and expense; but I did not know that, and I had to get a plumber to stop the hole in a lead pipe can be stopped by baiting the metal just enough to close the orifice, therefore I went and called a plumber. Of course, he was employed by the day. He knew how to stop the issue in less than one minute; but he preferred to make a good job for himself and for his employer. He was too proud to be seen carrying his solder and tools along the street, hence a helper must be detailed to carry these appliances. His employer paid him 20 cents per hour, but charged 60 cents per hour for his services. He paid the helper 10 cents per hour, and charged 40 cents, whether they were loitering along the streets or at work. They looked around, lighted their pipes, smoked, and chatted, and used about 4 ounces of solder, for which the charge was 50 cents, and they reported they had used one pound. The plumber reported one hour each for himself and helper. Thus the cost of stopping one pin-hole cost me 1 dollar, 50 cents, when any one who can handle a hammer could have closed the issue in half a minute if he had thought of how to do it."

Opening of a New Police and Fire Station in Manchester.

—The new B Division Police and fire station in Golden-street, Rochdale-road, has been opened. The buildings cover an area of 1,480 square yards, and are bounded by Golden-street, Chadderton-street, Bannet-street, and Cross-street. The police offices, which face Golden-street, are 105 ft. long by 80 ft. broad. The portion occupied by the cells and the parade-room is only one story high. The superintendent's room, charge-room, and sergeants' room are likewise on the ground floor, but immediately over these the building rises to the height of four stories. In the upper stories accommodation is provided for six firemen and their families. The parade-room measures 61 ft. by 39 ft., and is lofty. The number of cells is nineteen. A ventilating shaft, 90 ft. high, and measuring 11 ft. by 8 ft., surmounts the buildings. The fire station is at the angle formed by Golden-street and Cross-street. The building measures 60 ft. by 20 ft., and is three stories high. On the ground floor are the firemen's room and inquiry office, with bath-room and store-room at the back. The total cost of the buildings amounts to 19,775l. The plans were prepared by Mr. J. G. Lynde, the city surveyor; and the contractors were Messrs. R. Neill & Sons.

Good News for Iron Masters.—The *Boston (Massachusetts) Globe* sounds a note of alarm at the threatening iron famine. It is stated that 2,600,000 tons were used in the United States last year, of which 2,000,000 were produced, and the remainder imported. A careful estimate of the increased consumption during the present year, and of the probable supply, demonstrates that there is too much reason to expect a very large deficit in supply. Prices of American and imported iron have advanced fully one-third within the last three months.

The Burning of the Theatre Royal, Melbourne.—By the Australian mail details have arrived of the burning of the Theatre Royal, Melbourne, on the 19th of March, as intimated in the *Builder* of the 27th of April. The Royal was the premier theatre of the Australasian colonies. On the eve of its destruction "The Streets of New York" had been performed, and shortly before twelve the vicinity of the dressing-rooms was found to be on fire. Alarm was instantly given, and help soon at hand; and at first there seemed a chance of saving the building, but the scenes caught the conflagration and the whole edifice was soon in flames. The *Melbourne Argus* says:—"The destruction of three large Australian theatres,—the Haymarket in Melbourne, the Prince of Wales's Opera House in Sydney, and now the Theatre Royal, in the brief space of eighteen months, seems a remarkable coincidence. The three events coming so quickly after each other have been a severe blow to the profession, and it is hoped that these disasters will lead to the introduction of an improved style of building for such places of entertainment. The Princess's is now the only theatre remaining in Melbourne, but it cannot be doubted that ere long a temple of the drama worthy the leading city of the Australasian group will rise in our midst to replace the leading theatre which now lies in ashes."

Restoration of Merton College Hall, Oxford.

—The Hall of Merton College is undergoing a restoration at a cost of upwards of 4,000l. Mr. Scott, architect, has been engaged to restore the building, and the whole of the work that Mr. Wyatt executed in 1790 has been cleared away. The design now prepared by Mr. Scott is in accordance with the original construction of the Hall, which is of fourteenth-century date. A new open-timber oak roof will be substituted for the present one, and the music-gallery and screens will be replaced at the west end, whilst at the east end there will be canopied seats raised upon a dais. The windows will be completely restored from the fragments which have been discovered of the original designs, and they will have seats in them the thickness of the wall. Mr. Scott has also designed new furniture, tables, and benches, to suit the period. The whole of the exterior of the hall will be renovated, and the sham buttresses have all been taken down, and new ones have taken their place. The Headington ashlar will be removed, and the walls will be refaced with Thynston stone. The porch will have new archways, with new steps and wing walls. The whole of the work is to be completed by the commencement of next Michaelmas term. Mr. Booth, of London, is the contractor, and Mr. Lee is the clerk of the works.

Charge of Perjury against a Building Inspector.

—At the Salford Town-hall, before Sir John Iles Manfell, Mr. Francis Drake, building inspector in the service of the Salford Corporation, was summoned at the instance of Mr. Joseph Blomley, joiner and builder, carrying on business in Broughton, upon the charge of having committed wilful and corrupt perjury on the 2nd of May. It seems that Mr. Blomley had been summoned on that date for a breach of the building regulations, and upon the evidence of Mr. Drake (the present defendant), was fined 50s. and costs. The prosecutor had recently erected some property in Broughton, and on his part it was sought to be shown that the defendant had made a false statement with respect to the length and dimensions of floor joists, in consequence of which he had incurred penalties for the represented infraction of the law. With the case was proceeding it was suddenly brought to an abrupt and unexpected termination by the inability of the clerk of court or any one to give evidence that Mr. Drake was sworn in the particular case in issue.

National Music Meetings at the Crystal Palace.

—It seems that the arrangements for these performances are now complete. The private preliminary hearings by the jury of each class of sopranos and tenors will take place on Wednesday, June 25. The contraltos and baritones will be heard privately on Friday, June 26. At these hearings (which are to be held in the concert-room of the Palace), those who are to compete in public will be chosen by the different juries. The public competitions will commence on Thursday, June 27. At two o'clock on that day the soprano singers will sing against each other, and after them the tenors will compete. At five o'clock a grand vocal and instrumental concert will be given, the programme of which will include the competitors.

London and Middlesex Archaeological Society.—A general meeting of this Society has been held in the newly-restored Chapter-house, at Westminster; the dean, in the absence of Lord Talbot de Malahide, presiding. Stained glass, he said, was absolutely necessary, both to make the building usable in bright summer weather, and to restore to it that solemn effect which in the Middle Ages it must have worn. A paper on the iconography of the Chapter-house, was read by Mr. J. C. Walker. A short paper was read by Mr. White, for Mr. John Franklin, who contended that we had an indigenous school distinct from that of Italy. Mr. Franklin criticised a more elaborate paper on the subject. A paper was read by Mr. Joseph Barré, on the records and Muniments of the Abbey, which, he said, were so numerous and complete that there scarcely a square foot of Mediaeval Westminster that might not be illustrated from them. The course of the afternoon the visitors were conducted over the Abbey, and interesting explanations were given by Mr. Scott, the architect of the Dean and Chapter. Amongst other well-known points which were visited, was a recently-discovered site of St. Catherine's pel.

National Safe Deposit Company.—A site, he said, having been secured in or about Lion House-street, a large building is to be erected, which shall be both burglar-proof and fire-proof. The building is to be ostensibly on, but something on the model of an armoured vessel. The walls will consist of a number of plates, varying in thickness from 1 in. to 2 in. These plates will be successively of hard soft metal (iron and steel), so as to render attempts of the burglar futile, and between the screw plates there is to be a packing material, of which latter material the higher parts of the building are to be mainly constructed. The packing between the armour plates will not only arrest the burglar but disperse the electric force in a thunder-storm should it strike the building. There are long corridors, one on the right and left, each marked and numbered. The simple act of withdrawing the key from the lock is described as locking each safe securely.

New Town-Hall, West Vale, Yorkshire.—Plans for the proposed public building at West Vale have been prepared by Messrs. G. H. Wardle, & Patchett, of Halifax. The principal front is to the Eiland and Saddleworth, and will be in two stories. The entrance is a porch beneath a tower 60 ft. in height, opening on one side a shop and dwelling-house, and on the other the public buildings. On the first-floor are six rooms to serve as local school-room, lecture-room, library, and classrooms for the Mechanics' Institute. A staircase, long by leads to the large room, which will be 30 ft. wide, 38 ft. wide, and 22 ft. high. At the end is to be a raised platform. The three-sided window at one side of the hall opens out on a balcony for out-door addresses. The basement story contains store-rooms, heating apparatus, and a fire-engine house, having large openings out directly to the road.

New Pulpit, Holy Trinity Church, Chester.—A new pulpit has been put up in Holy Trinity Church, Chester. It was designed by the architects, Messrs. Kelly & Edwards, and erected by Mr. Thomas Earp, of London. The pulpit, or rather open platform, is the gift of the late Dean Anson. It consists of a polished alabaster, the front being divided into three panels of open trefoil work, with scrolls in the centres. The panels are supported by green marble shafts, the capitals being part of, but standing out in bold relief from the alabaster cornice. In the middle panel a trefoil encloses a floriated cross of red marble, and the corresponding quatrefoils in the side panels, the sacred monograms "I.H.S." and "M.X.P." Above the base-moulding is a band of yellow marble, and the emblems of the Evangelists are introduced in the mouldings, the whole of the work is enriched by a gold leaf floor spar.

Pretty Portrait.—Messrs. Marion & Co. have published a charming photograph, by the late Robinson & Cherrill, from a medallion of Mrs. Scott Siddons, by Mr. A. Bruce. The accomplished original is at this time in the Theatre, in a clever, but curious piece, "Ordeal by Touch."

Mountain Railways in Yorkshire.—An experiment is to be made on the abandoned incline of the Whitley and Malton Railway, in Goathland. The road has been re-laid to a gauge of 3 ft. and 7 $\frac{1}{2}$ in., with a central rail laid 9 in. above the others, and edgewise. The object of the alterations is the testing of the first of a series of mountain-climbing locomotives built by Messrs. Manning, Wardle, & Co., of the Boyne Engine Works, Leeds. These engines are intended for a continuation of an existing railway in Brazil, and are projected to climb the mountains to the table-land of Rio de Janeiro, where the coffee is produced, and which produce is now only got to the seaboard on the backs of mules. The engine is limited to twenty-five tons, but contains two distinct actions, that of the ordinary locomotive, and a novel one having a direct action, by which four wheels worked horizontally can be put in use, grasping the edges of a horizontal rail at a pressure of forty tons when ascending an incline. By this means it is confidently expected that a load of forty tons can be worked up a gradient of 1 in 12.

Paper Car-wheels.—The *National Car Builder* describes railway car-wheels of paper. The material, it says, is straw-board, in all respects the same as that used in the manufacture of paper boxes, and may be made of wheat-rye, or oat straw.—"The wheels constructed of it possess some very requisite and desirable qualities,—a perfect form, considerable elasticity, great strength and durability, and a facility of repair which is entirely wanting in a chilled wheel. These points, together with the method of construction and the peculiar nature of the material, make these wheels worthy of attention." The tyre, however, is of steel, and covering the whole of each side of the wheel are two side-plates of Norway iron boiler-plate, which fit against a shoulder turned in the tyre. The paper framework is said to give elasticity to the cars in motion, and "deadens the jar." Trains have been run at the rate of thirty miles an hour with these wheels, which are said to be very strong and lasting.

The Patent Laws.—The Select Committee on the Patent Laws have agreed to a series of resolutions which they recommend as the basis of legislation on the subject. They do not suggest the granting of pecuniary rewards as a substitute for the temporary privilege conferred by letters patent, but they point out some instances in which the existing laws are defective and require improvement.—At a recent meeting of the Labour Representation League, Mr. R. M. Latham, the president, in the chair, the report just issued by the Select Parliamentary Committee on the Patent Laws was discussed. Much dissatisfaction was expressed with the report, and at the fact that members of the working classes had not been called to give evidence before the Committee, the constitution of which body was objected to on the ground that its composition consisted of two-thirds of manufacturers and parties representing interests antagonistic to those of inventors. It was also urged that a fair and complete inquiry into so important a subject as the Patent Laws could only be satisfactorily effected by a Royal Commission representing all the interests in the community; and steps were ordered to be taken with a view of insuring an exhaustive inquiry into the whole subject by that means.

Portable Railway for Common Roads.—Mr. Wm. Pidding, of Bedford-square, has, it is said, invented a system of portable rails, which secures to every carriage its own tramway, and which may be used with equal facility upon any ordinary road, whether macadamised, paved, or asphalted. The carriage wheels, which are only about 21 in. diameter, run upon the inside of the tyres of a second pair of wheels, of sufficient size to permit the small wheels to rotate below, between the tyres and the naves of the large ones. This larger tyre, which forms the portable railway, is made up of a series of long and short segments, each carefully shod with india-rubber, or which may be constructed of steel, formed into a hand chain, one or another portion of which is, of course, always in a position ready to receive the running wheel. The idea is not new, but this may be an improvement on the attempts made some years since to effect the object in view.

Monument to Mazzini.—The inhabitants of Syracuse are building a monument of white marble to Mazzini in the famous quarries in which 7,000 Athenians were confined after the siege of Syracuse by Nicias.

Wells and Sewers.—Last week a number of men employed in making a common sewer in Orr-street, Calton, Glasgow, came upon an old pump well which had been discontinued on the introduction of Loch Katrine water into the city, and since covered up. One of the labourers, Patrick Reid, went down the well to discover its depth, and after some time disappeared. Another labourer, becoming alarmed at his continued absence, went to his assistance, but he also did not return. Ultimately, a third man followed, and with a similar result. After a considerable time had elapsed, and none of the other men venturing to descend the well, grappling irons were procured, and by their aid the three men were brought to the surface insensible, and were with difficulty recovered. They stated that on descending they lost consciousness from the effects of foul gases. The incident is instructive.

The Artists' General Benevolent Institution.—The dinner at Willis's Rooms, St. James's, in aid of this very excellent and important charity, passed off with considerable éclat. The Marquis of Lorne presided with much geniality, and made a very sensible address. Mention was properly made of the liberal aid which has been given to the Institution by Mr. John Hengh, who replied in a feeling and manly speech. The treasurer, Mr. P. C. Harwood (to whom, in conjunction with Mr. Millais, hon. sec., the Institution is much indebted), announced that the subscriptions amounted in all to 2,552*l.*, including a donation of 500*l.* from a friend in the room whose name was not mentioned. The dinner was provided by Mr. Willis in excellent style, and formed a striking contrast with that furnished by the proprietors of St. James's Hall on a recent similar occasion.

St. John's, Hull.—The *Hull Packet*, in an able article on church restoration in that town, says it is contemplated to entirely remodel the interior of St. John's parish church, in accordance with designs prepared by Mr. Christopher Wray. The present cumbersome galleries are to be removed; the high-backed pews will be substituted by open benches of modern pattern, the ceiling raised, and the body of the church divided from the aisles by a colonnade of seven bays. The work, which is estimated to cost about 5,000*l.*, will, when completed, effect quite a transformation of the interior, which is now of the heaviest primitive style. The incumbent, the Rev. H. W. Kemp, is heartily supported by his parishioners, and trusts soon to bring the restoration to a speedy and satisfactory completion.

Proposed New Examination Schools, Oxford.—The delegates appointed by decree to inquire as to the advisability of building new schools on the Angel site, or of using that site for any other purpose, have agreed to the following, along with other resolutions, which are reported to Convocation.—That the only method by which the requisite accommodation, regard being had not only to the existing circumstances of the University, but also to the future, can be provided, is by erecting new schools on a separate site specially appropriated to the object. That the Angel site, though not so central as might be wished, is the only sufficient site which can be procured. That it is desirable to proceed at once to the building of the new schools on that site.

Proposed New Church at Crowthorne.—On Saturday afternoon last, a meeting was held in the School of Art, Wellington College, to consider the propriety of building a new church to supersede the present temporary structure at Crowthorne. Plans of the new church were exhibited and examined, and it transpired that the cost of the church will be 3,000*l.*, and that the architect selected for the work is Mr. Arthur W. Blomfield. Mr. John Walter, M.P., presided, and was supported by Dr. Benson, Head Master of Wellington College. Appropriate resolutions, promotive of the object in view, were unanimously passed, including the appointment of a committee.

The Sewage Works, Doncaster.—The foundation-stone of the irrigation works at the Holmes has been laid by the Mayor. His worship, after laying the corner-stone, jokingly remarked that finding that masons were continually reducing the hours of labour and increasing the amount of pay, and understanding that in a short time the masters were to do the work and the men receive the money, he thought the best thing that he could do was to join the society.

The "Anti-Mildew" Grain and Seed Protector.—The heating of corn in ships and warehouses, and of stacks of corn and hay, is a great evil; and to remedy this a simple invention by a Greek agricultural engineer, I. Metbodios Ioannides, late Greek Consul in Wallachia, has been patented in this country as well as abroad. It mainly consists of a cylindrical ventilator, with perforated branches which ramify through the holds, granaries, or stacks where the contents are liable to beat, and become mildewed.

Ice Machines.—The machines for manufacturing ice, either in small quantities for families, or on a great scale, by means of heat, with ammonia and chloride of calcium, seem to be ingenious and useful. They were patented in the United States by Messrs. Vaass & Littman last year, and are now sold in London by Messrs. Sladdon, Brothers, & Co. One pound of coal is said to produce three pounds of ice.

Civil and Mechanical Engineers' Society.—At a meeting held in the Rooms of this Society, Westminster-chambers, on Friday, the 17th inst. (the president, Mr. Arthur C. Pain, C.E., in the chair), a paper upon "Water-supply to Towns and Villages" (Part II.) was read by Mr. George V. Usell, F.M.S., Assoc. Inst. C.E., after which a vote of thanks having been awarded the author, a lengthy discussion took place.

Royal Architectural Museum.—A valuable addition has been made recently to the Museum by the gift of Mr. Charles Hudson of the large and fine collection of casts formed by his brother, the late Mr. Octavius Hudson, from the cathedrals of Salisbury, Chester, Lichfield and Hereford, and from other places visited by that gentleman.

The Surrey Theatre, Blackfriars-road.—Last week this property was put up for sale by auction, but no bid was made for it. The reserve price was understood to be 25,000l., 10,000l. less, if we are rightly informed, than its cost. The history of the rebuilding and the circumstances that grew out of it would be curious.

The New Dock, Berwick.—The Berwick Harbour Bill having received the royal assent on Monday night, it is expected that the work of making the new dock will be proceeded with almost immediately. Messrs. Stevenson, C.E., Edinburgh, are engaged in the preparation of the working plans.

New Act on County Buildings.—By an Act just printed county authorities may now borrow money for the purpose of building schools, halls, &c., and also judges' lodgings, for thirty years, instead of fourteen years, as previously provided.

Society for the Encouragement of the Fine Arts.—On Thursday, the 30th, a lecture will be given at Conduit-street, by Mr. G. Browning, on "The Poetry of Germany." Sir Digby Wyatt will preside.

Utilisation of Blast-Furnace Slag.—Mr. C. F. Claus, of Middlesbrough-on-Tees, proposes to treat blast-furnace slag so as to produce masses thereof of a cellular structure suitable for building purposes.

A Bright Idea.—A correspondent from one of the London districts tells us that the gas is so bad there that the inhabitants in some of the streets do not think it worth while to light it at all!

TENDERS

For a villa at Staplegrave, near Taunton. Mr. J. Houghton Spencer, architect:—

F. Fox	£1,452 16 0
C. Fox	1,431 0 0
Macey & Yandell	1,369 0 0
Hendell	1,350 0 0
Dinham	1,347 0 0
Woolfrey & Hartnell	1,325 0 0
Moss & Giles	1,320 0 0
Shewbrooks	1,253 0 0

For a school-house in Tangier, Taunton. Mr. J. Houghton Spencer, architect:—

Shewbrooks	£255 0 0
Moss & Giles	453 0 0
Manning	466 0 0
Dinham	390 0 0
C. Fox	395 0 0
Hawkins	394 0 0
Macey & Yandell	375 0 0
Woolfrey & Hartnell	355 0 0

For lodge at Corfe, Somerset. Mr. J. Houghton Spencer, architect:—

Davis	£378 0 0
Pollard (accepted)	312 0 0

For carpenter's work (labour only) for a farm-house at Sherford, near Taunton. Mr. J. Houghton Spencer, architect:—

Hartell	£120 0 0
Cosens (accepted)	115 10 0

Accepted for new bank at Blackburn, for Messrs. Brooks & Co. Mr. George Treadell, architect:—

Patteson (mason)	£8,066 0 0

The Builder.

VOL. XXX.—No. 1530.

The Sefton Park, Liverpool.

SEFTON PARK, in Liverpool, which was formally opened the other day, as we have already mentioned, by Prince Arthur, is, of course, still in a comparatively embryo state, only small portions being yet planted, and the whole wearing the raw aspect which always belongs to a newly laid-out park, and which it is the work of a good many years to wear off. Sufficient, however, is apparent of the general design of the grounds to indicate that this park, if adequately completed, will be a very successful piece of work, and form, perhaps, one of the most interesting and picturesque suburban pleasure-grounds in the kingdom. The general arrangement may be best indicated by saying that it includes an inner and outer "boulevard" surrounding the park, not however in regular circles, but in irregular curves, the two lines of drive occasionally meeting; the centre space, interior to these, being occupied partly by ornamental water, shrubberies, and foot walks to the west of the water, and open ground, to be used apparently as building land, towards the east and north. By a happy advantage taken of the natural dip of the ground at this point, the two boulevards form on the west side of the lake parallel promenades on different levels, the foot-walk by the lake-side forming lower down a third promenade below these, reached by steps from the inner boulevard: when the sloping banks above the lake-side are well planted, the effect, on a *fiête* day, of these three tiers of promenades rising one beyond the other (the two upper ones admitting of the passage of carriages) would be very gay and animated. The water in this, the southern extremity of the park, forms a large open irregular lake, intended to be devoted partly to the display of model yacht races. From the north end the water comes down to the principal lake through a series of smaller ponds and rivulets, falling occasionally in small cascades over artificial rocks, winding round islets occupied by flower-beds, and appearing to issue, at its source, not, like Coleridge's sacred river,—

"From caverns measureless to man,"

but from a pillared grotto sufficiently spacious to be a delight to children and nursemaids. All this is really very pretty, however, as a picco of ornamental gardening, and a very pleasant mimicry of the process of nature, if only the channels and cascades can be supplied with abundance of water; otherwise it will be, as at the time of our visit it appeared, an unfortunately ambitious attempt to do more than can be done for the money. It is to be hoped this will not be the normal state of things, lest the artificial river should echo the complaint of "Bruar Water" in Burns's poem,—

"That by a bard I should be seen,
"Wi' half my channel dry."

The arrangement of the lake side-walks, by the way, may be open to question: there is a natural impulse in the popular mind, certainly,

to get close to the edge of the water in a park, and there are effects of reflection to be had thereby, too, not otherwise attainable; but these will not quite compensate for the beautiful effect obtainable by carrying green shelving banks and foliage right down to the water's edge, after the manner to be seen in the park on the other side of the Mersey, at Birkenhead, laid out originally by Paxton. The general arrangement of the walks and contours of the ground is such as to be available, where the trees are planted and properly grown, for producing pleasing surprises of vista, and giving to the visitor that idea of extent which adds so much to the value of the space occupied in a park: this is not done, however, so completely and happily as we have seen it accomplished in some smaller works of the kind; but it may have been thought that with so much space at disposal any such attempt to increase the apparent extent were of minor importance. Of architectural embellishment the park has nothing as yet, except the abutments for a good sized bridge to carry the inner boulevard over one of the hollows; let us hope the bridge is not to be a "thing of beauty" of the modern engineering type, the reverse of "a joy" for ever. The smaller adjuncts, such as gate piers and railings, do not show any particular taste or novelty of design; and we saw with regret, dispersed about the grounds, those ludicrous travesties called "rustic" iron seats, or seats carried on cast-iron imitation of twisted branches and twigs. Is there no one to tell the corporation of Liverpool that such things are ridiculous, and an offence against common sense and artistic sense alike? That body have now, we understand, taken the oversight of the park into their own hands, from those of Messrs. André & Hornblower, who gained (and well merited) the first premium in the original competition. The reasons of the change we are not concerned with; but it is to be hoped the corporation will find some competent person to act for and advise them in matters (especially) affecting the architectural embellishment of the park. Much may be done in this way either to improve or to spoil a site which contains most of the materials for making a very beautiful suburban place for residence and recreation.

THE STRENGTH OF BUILDING MATERIALS.

THE paper recently read at the Royal Institute of British Architects, "Our present Knowledge of Building Materials, and How to Improve It," by Captain Seddon, R.E., contains some valuable matter. We print portions of it, and advise those who are interested in the subject to obtain it for themselves from the Institute.*

Engineers have, to a greater extent than architects, been compelled to study the nature and strength of materials, and especially of iron, which (used as it is by the former for every kind of work) has to be dealt with so as to economise both weight and material to the utmost, and to make the best possible use of its enormous powers of resistance to strains of every description. In fact, the extensive use of iron for constructive purposes may almost be said to have given birth to the profession of civil engineering as distinct from that of architecture, the result of which has, I think, been a tendency to too exclusive a cultivation of art on the one side, and of science on the other, to the manifest disadvantage of both professions.

Inasmuch as the architect aims at the beautiful in his constructions, as well as the useful, his profession is of a more elevated character than that of the engineer; for by assisting to cultivate the public taste he leads towards the source of all beauty and purity. Engineers confining themselves too closely to one idea—namely, the theoretical perfection of their work—have fully met the want that gave them birth, have shown how maximum results may be obtained from a minimum expenditure on labour and materials;

but in mastering science they have too much neglected art, and even at times justified the absence of any aim at the beautiful, by affecting to rise above such ideas into the regions of the stupendous and the grand; but, unfortunately in minor undertakings, in little works which cannot aspire so high, we still find the same absence of any attempt to please the more cultivated feelings of our nature; or if the attempt is there, it is mostly too evident that a given sum has been expended upon purchasing a mask to hide not the loveliest of structural details below.

The question which I mean to raise is, whether we are yet sufficiently acquainted with the properties and strength of the different materials in common use for building purposes to enable us to employ them to the best advantage, or to allow of our calculating with accuracy the amount of material necessary, in every part of a structure, to meet the different stresses called into play?

It may be said by some, What more information do we want than that already within our reach? There are handbooks enough, in all conscience, with copious tables, giving the strength of all kinds of materials under every description of stress, and formulae for calculating the requisite dimensions of beams, columns, &c., of different forms and under varied conditions: surely we are in possession of all the information any one could possibly require. Nevertheless, I think it must be admitted, on a little reflection, that the present state of our knowledge in these matters is, in face of the boasted enlightenment of the nineteenth century, by no means so satisfactory as at first sight might be imagined; or in any way sufficient to warrant our resting content without making any further researches.

Most of the data upon which calculations have hitherto been based, have been derived from experiments made on picked specimens, too small in size, and too free from such ordinary defects as are sure to occur in larger specimens, to give us very reliable grounds to go upon; the result being that we are forced to supplement our defective knowledge by using large factors of safety; or, in other words, by not straining the material used to anything like its estimated powers of resistance.

Timber.—Taking the subject of Timber first, I cannot perhaps do better than quote from a valuable little treatise lately published by Mr. B. Baker, C.E., "On the Strength of Beams, Columns, and Arches." At page 127 he says:—

"Unfortunately, most of the careful experiments of Tredgold, Barlow, and other early investigators were made on small pieces of timber, straight-grained, and free from knots and other defects; a condition favourable, it is true, to the comparison of the results of mathematical investigation with those derived from direct experiment; but, on the other hand, leading to errors of much greater moment in actual practice, since (as every workman knows) a piece of timber uniformly sound throughout can never be reckoned upon." He then goes on to show the percentage of loss of strength due to the inevitable defects in large scantlings, as follows:—A piece of English oak, 9 in. and 1 in. square, gave a result equivalent to a breaking weight of 8½ cwt. applied at the centre of a 1-in. square bar supported on bearings 12 in. apart, giving a calculated stress on the extreme fibres of the bar equal to 7½ tons, or 17,021 lb. per square inch, a surprisingly high, and, as far as practical cases are concerned, a palpably exaggerated result. Whereas, taking a larger scantling of oak, 11 ft. 9 in. long and 8½ in. square, the calculated stress on the extreme fibres, when rupture took place, was only five tons, or 11,200 lb., instead of 17,021 lb. per square inch; and a larger beam still, 24 ft. 6 in. long, 12 in. deep, and 10½ in. wide, gave a result equivalent to less than one-third of that given by the small selected piece. He then says:—"This reduced amount shows that the average strength of the timber in this large beam was less than one-third of that in the small selected piece; and we think no further illustration is required to show the necessity of neglecting the majority of experiments made on small scantlings of oak, when deducing rules for practical application. We find the same conclusions hold good with reference to Riga, Memel, pitch pine, and other soft woods; the standard bar, 12 in. by 1 in. square, giving a maximum stress on the fibres of 3½ to 4½ tons per square inch, whilst experiments on a beam 15 ft. long and 12 in. square give a maximum stress of only 2½ tons per square inch."

If we turn to Molesworth's "Handbook of Engineering Formulae," and Hurst's "Architectural Surveyor's Handbook," both of which are books purporting to supply all the latest information brought up to date each year, we find the value of the constant to be applied in the formula for beams under transverse stress, given as five for English oak, 5 cwt. being taken as the central load required to fracture a standard bar, 12 in. long and 1 in. square; although the tensile strength of oak in pounds, in Molesworth's Handbook, is given as 17,000 lb., which would give 8½ cwt. instead of 5 cwt., as the central breaking load. Professor Rankine, in his "Rules and Tables" gives 10,000 lb. to 19,000 lb. per square inch, as the tensile strength of oak, and 12,000 lb. to 14,000 lb. for fir or pine.

* Sessional Papers, 1871-72, No. 10.

Now let us glance at the crushing strength of timber, as given by different experimenters.

Rondelet gives the crushing strength of pine as 54 cwt. to 62 cwt. per square inch, and that of oak as 45 cwt. to 54 cwt.

Tredgold took 36 cwt. for both.

Rennie gives the strength of pine at 14 cwt. and of elm, as low as 11½ cwt. per square inch.

Hodgkinson gives 92 cwt. for elm, 90 cwt. for oak, and about 54 cwt. for pine.

Lastly, I have here the results of some experiments made by Mr. Kirkaldy, on two logs 20 ft. long about 13 in. square, one of white Riga and the other of red Dantzic fir, which show, in the first case, a resistance to crushing of 175 cwt., and in the last of 155 cwt. per square inch. Both balks failed by crushing, the lateral deflection not exceeding ¼ of an inch in either case. These results approximate closer to those made by Rennie than any of the others.

Here is a mass of conflicting evidence, notwithstanding the apparent simplicity of the subject; and yet it is by no means as simple as it seems. The conditions were, no doubt, very different in each set of experiments; the apparatus employed was different, there were different observers, and therefore it is not to be wondered at that the results arrived at differ. In fact, the seasoning alone of the specimens would at once account for a great part of the difference; for green timber, from the moisture in it reducing the lateral adhesion of the fibres, has not more than half the strength of dry timber, and yet if artificially overried, a considerable loss of strength would be the result.

With regard to the transverse strength of timber beams especially, though the same remarks apply to those of iron or any other material, what would appear to be an important element in their strength, though hitherto omitted from all calculations, is the lateral adhesion of the fibres to each other.

Iron.—I now come to the subject, and a most important one, of iron. Notwithstanding the great advance which has of late been made towards a more perfect acquaintance with the properties of irons of different classes, and notably by means of the numerous experiments made by Mr. Kirkaldy, and the stimulus which has been given to the manufacture of high-class irons, by the rival contests between iron guns and iron shields, it must be admitted, even by those who have made it a subject of special study, that there is very much yet to be learnt about iron; whilst, if we except a small circle, whose special employment has caused them to follow with interest in the track of every experiment which could throw any light upon the nature and properties of the material with which they are chiefly called upon to deal, there is a general lack of knowledge about the whole subject; besides much misconception, which the clear proof of practical experiment will alone be able to sweep away.

As a building material, iron is day by day forcing its way everywhere, and many, who not long ago would have set their faces against its use in structures aiming at a high class of art, no longer hesitate to call in its valuable assistance in order to solve constructive problems which would be beyond the reach of wood, brick, or stone,—at any rate, within any reasonable limits of expenditure. Such being the case, it is essential that its properties should be thoroughly understood by all those who are likely to make use of it for constructive purposes, and that they should not merely order a girder, for instance, to carry a given load, leaving the designing of it to the manufacturer or his agent, whose interest it is to run up the weight, and hence the price, at the expense of quality and good workmanship.

It may safely be said that there is no material so dangerous to trust to, without a full knowledge of its behaviour under different conditions, than iron; whilst there is none which varies so much in quality, or in the manufacture of which there is more knowledge, experience, skill, and care required, or which admits of more deception being practised upon the unwary by unscrupulous and dishonest manufacturers.

Now I think that, beyond the difference between cast and wrought iron, and the inferiority of the former, when exposed to the effects of sudden shocks, there is very little accurate knowledge on the subject of the properties and powers of resistance of different classes of iron under varying conditions of stress. Their behaviour under different circumstances, such as tension, compression, shearing, bending, torsion, either suddenly or gradually applied, varies so widely according to the description of the iron under

trial, that the strongest proof which could be adduced of the necessity for a far wider acquaintance with the subject is given by the ordinary formulae in use for calculating the strength of iron girders, &c.

* * * * *

Stone.—Passing on to another material, let us see whether we ought to rest satisfied with what we know about building stones.

Here again the majority of experiments made have been upon very small specimens, such as small cubes under compression, whilst the recorded results vary with each set of experiments, according to the amount of accuracy capable of being arrived at by the machinery made use of, as well as the skill and care with which the experiments were made and recorded.

If we take a stone which has been more largely used perhaps than any other, namely, Portland, we learn from Barlow that its crushing strength ranges from about 1,381 lb. to 4,000 lb. per square inch, whilst in the experiments made by this Institute, and recorded in your sessional papers for 1851, the mean resistance to crushing, per square inch, arrived at was, for 2-in. cubes, 2,576 lb.; for 4-in. cubes, 4,099 lb.; and for 6-in. cubes, 4,500 lb.

According to Romo its crushing strength may be taken as 3,729 lb. per square inch, which has been followed by Molesworth in his "Handbook," whilst in Hurst's "Handbook" it is given as 2,022 lb. per square inch.

Now the many varieties of Portland stone, apart from and different method or course pursued in making the experiments, and the amount of seasoning the blocks had undergone, all points which should be carefully recorded, would fully account for the manifest discrepancies between these results; in addition to which, the direction of the natural bed of the stone, which in a small block of Portland might escape detection, would no doubt make a considerable difference. For instance, turning to some experiments by Mr. Kirkaldy on the resistance to thrust of Donling stone (a Somersetshire dolite),* which I believe to be the only known experiments on this point—if we except two on York paving and Bramley Fall stone, recorded by Rennie, in which the crushing strength both with and against the strata are given as precisely the same, a coincidence too good to be true—the advantage of laying the stones on their natural beds is considerable, increasing rapidly with the increase in height of the block, in proportion to its sectional area; which, I think, is what we should naturally be led to expect, if we look upon the block as approximating, more or less, according to the amount of lamination in the stone, to a number of thin columns placed side by side. More experiments, on a larger variety of stones, are much wanted to throw additional light on this subject.

With regard to the supposition that the crushing strength of stone increases with the size of the blocks under trial, there has yet been too little proof put forward on which to lay down any law. In fact, the few experiments made by Mr. Kirkaldy, bearing on this subject, some of the results of which have been placed at my disposal, go to prove that there is no increase in the resistance to crushing, consequent upon increase in the size of the blocks.

With regard to another of the dolites, namely, Bath stone, there is, I think, a good deal of misconception, which a careful series of experiments would soon clear up. For instance, Parleigh Down, being a little more expensive than Box Ground stone, is very generally looked upon as the best and strongest description of Bath stone for outdoor use, and is accordingly very often insisted on in specifications, the fact being that, on account of the stone being more difficult to get out of the quarries, especially in large blocks, the price runs a little higher, whilst in strength or endurance it is not known that it can claim any precedence over Box Ground stone. From the experiments already referred to as recorded in your sessional papers, it would appear that Corsham stone is considerably stronger than Box Ground, though this is opposed to the results of other experiments. The durability of Bath stone mainly depends on its being placed on its natural bed, which can only be detected by an experienced eye, or by working the stone, though when not so placed it soon reveals the secret, especially where exposed to the weather, by its cracking and peeling away on the face.

Much also depends on its being well seasoned,

or air dried, before being put into the work; therefore the stone should only be got from quarry-owners who keep large stocks of seasoned stone on hand. If quarried in the spring of the year, and stacked at open order during the summer weather, it is doubtful whether Corsham stone is not well able to resist the weather, though it is generally considered only fit for indoor work.

Artificial drying, which has sometimes been resorted to, should not be allowed. In one case a large quantity of picked Bath stone, which had been dried by heat, had to be condemned, and, I believe, led to a lawyer's bill, in consequence of the breaking up of the stone under exposure to the weather, owing, I fancy, to the unequal contraction and expansion of the dried and hardened surfaces, and the soft and green interiors of the blocks. I have seen stone, which had worn well exposed to the weather, crumble away on being shifted to the inside of a house.

With regard to sandstones, the information contained in architectural and engineering handbooks is next to nothing; in fact, in Molesworth the whole subject of sandstones is comprised in the information that their crushing strength is 5,000 lb. to the square inch, which, being an easy round number to remember, might with equal reason be adopted as the crushing strength of all stones.

Very little is known with regard to the transverse strength of different kinds of stone, though there is no doubt that some are much more capable than others of taking a bending stress.

Stone is a material specially resorted to resist any stress except compression, and it is the true appreciation of the nature of stone as a building material, by the almost exclusive use of it to the best advantage, namely, under compression, by the Medieval builders, that, to my mind, marks their great superiority, as scientific builders, over their predecessors of more refined classic ages.

In practice, however, we constantly find stone subjected to loading stress, and that farther information under this head is required, struck me very forcibly some little time ago on seeing some stone stairs, two stories high, being carefully propped up with wood, many of the steps having split right across close up to the wall. The steps were feather-edged, of Portland stone, 1½-in. treads, and 6½-in. risers, and had been exposed to the ordinary traffic of an office for about sixty-two years. The treads being much worn, a mason had been at work cutting them down at the top, preparatory to fixing an iron nosing, and filling the treads up level with asphalt, when the step he was at work on cracked close up to the wall, probably from the jarring caused by the strokes of the chisel; shortly after, several of the steps above cracked too, being no longer supported by those below, and being evidently unequal to do the work suddenly thrown upon them. Stairs with the steps only supported in the wall at one end are of constant occurrence, and serious accidents have sometimes occurred from their sudden failure.

Enough has been said, I think, to prove that more knowledge is required as to the special qualities of different kinds of stone, and their applicability to particular uses; but there is still another point about which there is not at present any certain knowledge, namely, to what extent the shape to which stones are cut, and the manner which they are bedded, affects their strength.

I have the details of one or two interesting experiments to ascertain the effects of lead placed, as is frequently done, between the joints of cut stone columns, &c., with the object of distributing the stress uniformly over the beds of the stone. The experiments were made upon circular blocks of Bath stone (Box Ground and bottom-bed Corsham Downs) 3 ft. long by 10½ in., and 15 in. diameter, or one set twice the area of the other; the lead being cut 2 in. less in diameter than the beds of the stone themselves. The results point to the conclusion that lead so placed between the beds of the stones, reduces the bearing strength of a column to considerably less than that of a column, of only half its sectional area, in which the stones are completely bedded. On examining the sheets of lead used in the joints, they seem to have been under compression at a very few points only, and not to have in any way tended to equalise the pressure over the area of the joints. These experiments also seem to indicate that raking out the joints of cut stone work, to save the arises in cases of any compression of the joints, when bedded in mortar, should not be carried too far. Such questions are, at any rate, worth investigation.

* Given recently in our pages.—Ed.

In all experiments upon stone, it is essential to quarry the exact description of the stone, the quarry it came from, and, if possible, the particular bed in the quarry. The time the specimen has been quarried should be stated, as some stones when green will stand very little stress, but harden considerably, in a longer or shorter time, when exposed to the air. If the specific gravity, or weight per cubic foot, of the specimen were given, it would afford some clue to the state of the specimens experimented on.

While on the subject of stone, I may refer to an artificial stone, widely used in the present day, viz., concrete. I think you will agree with me that a series of carefully-made experiments on the strength of different kinds of concrete would be of great value, under varying conditions, as to the nature of the lime and cement used, the description of ballast, proportion of large and small stuff, and mode of mixing.

With good Portland cement, well burnt and well ground, I should use with confidence for ordinary foundations twelve ballast to one cement, provided I was sure of its being properly mixed; but with ordinary workmen, not properly drilled in mixing the materials, ten to one would probably be more advisable. It would be well to know how much the strength of concrete is affected by the different methods of mixing in vogue. For my own part, I should insist upon the mixing being performed as follows:—A yard-measure to be half-filled with ballast, then the measure of cement to be added, and the yard-measure filled up to the top with ballast. On removing the measure the ingredients get partly mixed, and the cement does not get blown about so much as when placed at the top of the heap; it should then be turned over twice dry, and shovelled into a third heap, each shovelful being sprinkled from the fine rose of a watering-can as it is thrown on the heap, whence it may then be removed to the trenches. This block has been broken with a pick out of a newly-built dock-wall, in which 12 to 1 Portland cement concrete, mixed in the manner described, was employed, and I think it is strong enough for any foundations. In making experiments, the mixing should be done in bulk, at least half a yard cube, being mixed at a time, and not in small quantities, which are more carefully prepared than would be the case in practice; and the blocks should be at least 12 in. cubes.

Passing from concrete to mortars, the results of some experiments made for the Patent Selenitic Mortar Company show that, in mortar made with common stone lime,—Burham, or grey chalk lime, similar to Dorking lime, was used,—3 sand makes a stronger mortar than only 2 sand, and stronger again than 4 sand; which is probably due to 3 to 1 being about the point at which more sand would weaken the cohesive and adhesive properties of the mortar to a greater extent than its setting or hardening would be promoted by increasing its porosity. With selenitic mortar, 5 sand was the best mixture to resist thrust, then 4, than 6 sand; but for adhesion and to resist tensile stress, 4 and then 6, and then 5 sand. From which we gather that 3 to 1 is the best proportion of sand to stone lime in common mortar, and 6 to 1 in selenitic mortar, since the latter gives a mortar possessing double the strength of common stone lime mortar. However, in using the selenitic mortar at Chatham lately, 6 to 1 was not found to give such good practical results as 4 and 5 to 1, which is being now used. Although the 6 to 1 mortar set very hard, it was so short that it took longer to work, the loss of time outweighing the saving of sand. The proportions now being used are 4 to 1 for exterior work, and 5 to 1 in the body of the walls. Mr. Street has, I believe, had some further experiments made with the selenitic mortar in connexion with the New Law Courts.

Results of Experiments to ascertain the Resistance to a gradually increased Thrusting Stress of Four Columns of Bath Stone.

Area, 175.68 square inches. Length, 34.92 in.*
97,920 lb., or 43.71 tons = 556 lb. per square inch. Very slightly cracked.

120,730 lb., or 53.00 tons = 687 lb. per square inch. Only one half of circumference cracked. Markings on lead prove that the ends had not been formed quite true.

Ex. 580.—

Diameter { 10.55 } = 10.57 in.
 { 10.59 }

Area, 87.70 square inches. Length, 34.92 in.†
122,250 lb., or 54.60 tons = 1,394 lb. per square inch. Very slightly cracked at one end.

130,810 lb., or 58.99 tons = 1,499 lb. per square inch. One end uniformly cracked all round, the other end but slightly.

The last two experiments reveal the startling and important fact that a column properly bedded is very considerably stronger than one of double the area improperly hedged.

THE FRENCH AND FLEMISH EXHIBITION.

The gallery in Pall-mall shows this year less of brilliant and striking achievements in cabinet painting than usual, but not less than usual of solid and admirable workmanship, as well as originality of conception, in the part, especially of some of the French contributors. The most important of the larger works exhibited is, however, neither French nor Flemish, but the work of (if we mistake not) a Russian, Mr. Munkacsy, though illustrating a French subject, and painted in a French manner. "The Time of War—making Lint for Hospitals" (452), is a long composition of figures seated along a table engaged in lint-making, but with their attention more or less directed from the work in hand by the interest with which they listen to a wounded soldier seated at one end of the apartment, on the left; this arrangement of the composition gives opportunity for a very varied display of interest and expression in the faces, one behind another, nearly all turned towards the narrator, or giving otherwise evidence of their attention. A fair-haired young girl in black is the most prominent figure among the listeners. Between her and the soldier sits, on the other side of the table, a boy of almost idiotic vacancy of expression, mechanically going

† Bedded with pine 1 in. thick, cut to same diameter as column, as always recommended by me.

on with his task, behind whom stands a fine-looking elderly gentleman, with thoughtful countenance, taking in every word of the story: the four form an admirably contrasted group; there are other figures that will well repay attention. The colour is low, which is perhaps suitable to the feeling of the subject; a little more concentration of the light would not have been amiss. Not far from this, "Faust's First Sight of Marguerite," by A. Liezenmeyer (140), gives us a beautiful and, in some degree, original treatment of the old story, which so many painters have vied with each other in illustrating. Marguerite, a sweet, modest-looking country girl, walks from the porch on the left, close in the foreground, her quiet graceful figure brought out by contrast with the disagreeable-looking old people who leer spitefully at her, behind; in the centre are Faust and the tempter—the latter a comparatively featureless, as usual, and looking rather mischievous than coldly scornful; Marguerite is in a dark dress, Faust chiefly in red, the colour-effect being rich and harmonious; the subordinate figures are painted in very flatly, in thin, low tints; the architectural background even more slightly, but with sufficient attention to form and light and shadow.

Among the leading and well-known French names, that of Gérôme is represented by an able and finished a painting as one could wish to see,—“A Street Scene in Cairo” (44),—though in this case the interest is rather in the verisimilitude of the representation than in the subject itself. The woman in a dark robe, with a veil of lemons, and backed by another in a blue robe, is, however, a splendid bit of colour. The little painting called “A Dispute” (56), on a very small scale, showing two men, in gorgeous Eastern costumes, disputing with a dark man, in a white linen dress, as to the lure of a camel, has more artistic interest, and is a masterpiece in composition as well as in execution. The light from the little traceried window, seen at the end of an arcade, really sparkles. The same painter's marvellous picture of “Eastern Women” is still on view in the upstairs-room, and looks as well as it did last year. Meissonnier has a “Vedette” and a “Standard Bearer” (47 and 61), in his usual manner, and with his usual finish. “The Doubtful Answer,” by Willems (79), a lady, in red jacket and white satin, with pen held thoughtfully to her chin, we notice, not only for usual technical execution of the costume, in which this artist, in every sense, “shines,” but for the pleasing fact that there really is character and expression in the face (a plain one), and that the figure is not here a mere clothes-horse to hang silks and satins upon. Aubert's “Miranda” (80), next to this, illustrates amusingly the total incapacity of the French native to deal with a female character so natural, fresh, and simple as Shakespeare's exquisite creation. Miranda is certainly “translated” here into French, and fares accordingly. The street Arab who “lives by his wits” (8) looks as if he had plenty to live by. This is a first-rate study by L. Knaus, apparently from life. It shows, however, what we may call the ostentation of dispensing with colour which a certain school of Continental artists affect: a red cap, or something to give a point of colour amid the prevailing dirty brown tone, would surely have done no harm. “Echoes of the Sea” is one of Bougereau's pretty peasant-girls, not equal to some we have seen. “He loves me; he loves me not” (54) is another single-figure subject, by G. Max,—a young girl sitting on a bench, in a pink pelisse, who has apparently resolved the question into a negative, for her eyes are closed sadly, and the flowers drop from her hand. The figure is “supported” by two white tree stems behind; there is much quiet beauty in the work.

“Market-place, Constantinople” (38), by Pasini, is another of the very minute paintings of which the French school furnishes so many examples, and is an admirable bit of composition, the light comes from the top at the left hand and falls upon a group of small figures arranged pyramidally towards the right; the colour increasing in warmth to the right; this is perhaps, rather too like composition by rule, but there is something in it very satisfactory to the eye. The same artist's larger work, “Up the Valley of Sweet Waters” (72), shows a motley crowd of figures of all nations, on the same minute scale, starting for the journey up the Nile (we conclude); it is a brilliant thing, full of glow and heat and sunshine. “Familienstück” (67), by J. Flüggen, is the largest picture in the room, and should really be looked at, it is such a comfortable exhibition of “domestic bliss” of the heavy-German school, breathing in fact all the moral virtues, but not (unfortunately) the

artistic ones. "On the Road to Naples" (93) is a picture every one will pause before on account of its individuality of subject and tone; it consists mainly of a nearly white sandy road going from the spectator and a yellow Noah's-Ark-looking *diligence* which seems to have come to grief, and to be "on the road" only in the sense that Gilpin's celebrated hat and wig were said to be. Lesompté's "Minnchaha" (99) is a fine life-size study of an Indian woman with a richly-coloured garment bound sash-wise around her; there is little character in it, however. Goupil's "Pleasant Reflections" (110) is in the painter's best way both in execution and expression; a richly-dressed golden-haired lady is seated in an easy chair, before a fireplace with a sumptuous red marble chimney-piece; the texture of the hair, among other things, is excellently and minutely rendered without degenerating into ropiness. Moreau's "Fireside" and Perrault's "Baby Brother" (115 and 118) are each interesting as specimens of their two very different styles. "The Cigarette" and "The New Song" (76 and 82) should be examined as specimens of a new manner,—new here at least; they are Spanish subjects, and by apparently a Spanish name, B. Madrazo. The latter is the larger, and shows an interior of a gorgeously tapestried room, a girl in yellow satin is singing "to the lascivious pleasing of a lute," two men in rich Spanish costumes listening with a kind of free-and-easy admiration; another equally richly-dressed young lady in the background looks on with a smile of jealous sarcasm. The style of execution of these paintings is remarkable, and in its way brilliant in the extreme; the general tone is very light, with much white, something like what we see in Tissot's pictures, but the execution is the very opposite of his, the colour being laid on in such thick masses as in some cases (in the coal-black hair of the male figures for instance) to produce almost an effect of relief; the jewels and ornaments of the dresses are given with the most hard and brilliant reality. The style and feeling of these pictures are anything but elevating, certainly; but it is impossible not to recognise the talent and originality displayed in their execution, and their thorough realisation of Spanish character and nationality of a certain type.

THE INTRODUCTION OF THE ANGIO-ITALIAN STYLE UNDER INIGO JONES AND SIR CHRISTOPHER WREN.*

THE first of the two names to which I desire to direct your attention is that of Inigo Jones, to whom we owe the introduction of Italian architecture in England. He was born in 1572. It has been said by one of his biographers that he derived his Christian name, Inigo, from some Spanish merchants settled in London at the time of his birth, and who had dealings with his father, who carried on the trade of a tailor, within the sound of Bow bells. Some have said that Inigo was apprenticed to a joiner; while others affirm that he was carefully educated for professional pursuits. All are agreed, however, that in early life he manifested a decided talent for the fine arts, and produced some very good landscape paintings, which are still preserved. To these high talents were united a character for great honesty and general intelligence, which gained him the confidence and patronage of several leading men of the time, among whom are mentioned the Earls of Arundel and Pembroke. By the latter he was sent to Italy to study landscape-painting about the close of the sixteenth century, where he profited greatly by the study of the master-pieces of that country, the cradle as it then was of the revival of the arts of painting, sculpture, and architecture. He proceeded to Venice, where the works of Palladio inspired him with a love for the study of architecture. Nor can we wonder at this, when we picture to ourselves the city of Venice, as it then appeared rising from the blue waters of the Adriatic, glowing with marble palaces, churches, and other stately buildings. When Inigo visited Venice, Palladio's name was paramount in architecture through Italy, if not throughout Europe, though he himself had been laid quietly in the grave some twenty years before, his works lived, and were becoming each day better known and more admired. Architects from all lands made pilgrimages to the shores of the Brenta and the Adriatic to inspect the

masterpieces of his genius,—a genius which appears the more astounding when we recollect that he had for his immediate predecessors such men as Brunelleschi, Leon Batista, Alberti, Bramante, Balbazan Peruzzi, San Michel, and San Gallo, all of whom had stamped an individuality upon the architecture of their country; but Palladio preferred to go back for his inspiration to the original fountains of antiquity, rather than to follow the fashion of the day, and pander to the growing thirst for novelty and elaboration that culminated half a century later, under the fanciful but meretricious pencil of François Borromini. The wealth and taste of the Venetian nobles and merchant princes found an exponent in the palaces erected by Palladio with so profuse a hand in and around the fair City of the Waters.

Under his hand a bare and uninteresting island became a shrine of art and a dream of the imagination for ever. Those who visit Venice now in its decay and desolation, can form but a meagre notion of what it was at the time of our architect's visit, flashing back the sunshine from its gilded spires, and, by its colour, and the beauty of its architecture, presenting a thousand pictures, which such a mind as that of Inigo Jones could so well appreciate and enjoy. Of Palladio it has been said, and said with justice, that "None of his predecessors, in imitating the antique, had so happily steered the middle course between exactness and pedantry, and given us severity without rudeness, liberty without license, and so well succeeded in popularising the ancient architecture of Greece and Rome, and drawing it in to serve the wants and desires of his own age and country." This does not apply to Italy alone, for it was from the works of Palladio that both Jones and Wren, both Gibbs and Chambers, drew so largely in their English buildings during the seventeenth and eighteenth centuries. Not alone in Italy and in England, but soon throughout Europe, the taste of Palladio became predominant. We can well understand how much our architect profited by his visit to Venice, then glowing, as we have said, with the gorgeous and beautiful works recently completed by that master-hand, a master who had also enriched the literature of his profession by a treatise on architecture, which proved his erudition to be equal to his artistic powers and antiquarian researches. This splendid hook went through three editions, and was translated into all the languages of civilisation.

Inigo Jones would doubtless also visit Rome, and see the grand frontispiece of St. Peter's, proceeding under Charles Maderne, and the many noble works then in progress by Domenico Fontana, much employed in the Imperial City, and the architect of the Palace of St. John Lateran, but in none of these works at Rome, or Venice, can we now trace anything which has been directly copied by Inigo Jones in his own productions.

During his stay in Italy, Inigo Jones attracted the attention of King Christian IV., of Denmark, by his great abilities, who thereupon became his patron, and invited him to his country, and on the occasion of Christian paying a visit to his brother-in-law, James I. of England, in 1606, Inigo Jones accompanied him, where he was induced to remain, having received the appointment of architect to the Queen, and subsequently to Henry, Prince of Wales. He was engaged in London until the death of Prince Henry, in 1612, when he decided again to visit Venice. At this period a new architectural star of that Republic was undoubtedly rising in the person of Vincenzo Scamozzi, who was employed to complete the unfinished works about the ducal palace, commenced by Sansovino, and also some of the master-pieces of Palladio.

Scamozzi had a brilliant intellect, which became developed at an early age. At seventeen he produced beautiful designs for the Counts Godi. He constructed a splendid country mansion for another Venetian noble when quite a young man. The Church of Our Saviour, just finished under another architect, was found to be insufficiently lighted. Scamozzi was called in to remedy the defect, which he accomplished in a most skilful manner, by the introduction of a lantern and three cupolas upon the roof, without at all interfering with the majestic proportions of the interior. Scamozzi, like Palladio, was a thorough archaeologist. He went to Rome, and made most careful studies of the Baths of Diocletian, and of the Flavian Amphitheatre, for the restoration of which he prepared a complete set of drawings and he stated that in the two years

he was occupied in measuring the works of antiquity among the ruins of the Imperial City, he learnt more than in ten years devoted to other studies. Scamozzi designed the Proscenium of the Olympic Theatre, at Vicenza, left unfinished by Palladio, but which his son and successor Sylla, was unable to complete for lack of special knowledge, and Scamozzi owes his ability to perform this difficult task entirely to his studies of the great Roman remains above referred to. The fault of Scamozzi seems to have been that of undertaking work in different localities, which he was unable to direct in person; hence his designs, beautiful and graceful in themselves, were often mutilated and caricatured in execution under unskilful hands. Even in the buildings opposite St. Mark's there seems to have been a change and falling off in the details as the work proceeded towards completion, mainly for want of due vigilance and supervision. He was an indefatigable writer on the history and science of architecture, versed in the ancient as well as the modern languages, and well fitted for the task of translating Vitruvius, which he successfully accomplished. Inigo Jones, in studying the buildings and books of such men as those we have referred to, and probably enjoying the society of many other artists of note, who then made Venice their capital, became thoroughly prepared for the great undertakings with which he was occupied on being called home about the year 1618 to fill the appointment of surveyor-general, which had just become vacant. You will doubtless remember the duties and emoluments of the surveyor to his majesty's works at the period now under notice, viz., to keep the royal residences in repair, at a daily wage of 8s. 4d., with 46l. a year for house rent, and a suit of livery once a year. I suppose a kind of beef-eaters' gold and lace historical costume, which possibly he was not compelled to wear, excepting on state occasions, and at the splendid pageants of which he was the designer.

James I., who had given him his appointment, loved masks and shows, but being poor, wanted them run up cheaply, and the fertility of Inigo's invention made him a useful and ready man for that kind of work. But the king also encouraged Inigo to plan out great and sumptuous works of architecture, that, unfortunately for the architect's fame, the king's purse could not compass, and the nation's would not; however, as architects, we cannot blame the enthusiasm which encouraged Jones in the production of his splendid design for a majestic palace at Whitehall, for these drawings remain to show us more than any of his executed works the grandeur and holdness of his genius. We should have mentioned that Jones, when appointed surveyor-general, displayed both tact and magnanimity, for the Privy Council having discovered that the former surveyor-general had left them encumbered with a heavy burden of debt, sought the advice of Inigo as to the best means of getting it liquidated. He, with a public spirit that does honour to his memory, immediately offered his own services gratis, and went further than that, for he persuaded his coadjutors to remit their emoluments also for a season, by which means the debt was soon entirely wiped out. Reverting again to the magnificent designs for the palace at Whitehall, we are not aware how these were received by the nation, but certainly, judging from the fact of so small a fragment having been carried into execution, we may fairly conclude that the idea was too great either for the taste or purse of the age, or both. In some recent investigations respecting the autograph drawings of renowned architects, certain facts have been educed proving the scarcity of such remains in the great museums and among the archives of learning abroad. We may presume that when the designers saw their parchment visions moulded into the realities of marble, stone, or brick, they cared little for the first draughts in miniature, that to us no means, now that many of their buildings have been swept away or perished, would possess more than ordinary interest and value. Then of those gorgeous pageants upon the production of which the genius of architects, painters, and sculptors were so freely lavished, we possess scarcely one scintilla of graphic evidence, for the magnificent decorations of the old imperial cities were swept away when the excitements which gave rise to them were over, and the talents of the designer became only an item, though certainly a beautiful one in the memory of the actual spectators. What a choice *répertoire* for coronation days, royal

* By Mr. H. H. Vale. Read before the Liverpool Architectural Society.

marriages, and public thanksgivings would emanate from Raffaele's, Michelangelo's, or Bernini's sketches prove! but alas, they are now beyond reach; sack and pillage have trampled them in the dust, or fire reduced them to ashes, long ago. Inigo Jones does not appear to have been equally gifted as an archaeologist as he was an architect and painter, for the treatise which he prepared in 1620 upon the remains of Stonehenge, at the king's instigation, has not been endorsed either by contemporaneous or subsequent authors. Jones seems to have been a man of his day entirely, and no lover of old Gothic forms, and no archaeologist. It is our private opinion that he thoroughly detested everything belonging to the English Pointed styles, otherwise he would never have placed that certainly sumptuous but most incongruous frontispiece of his in place of the splendid west end of old St. Paul's, which cathedral was, from all accounts, a marvellous piece of middle-age work, and in its design and the vastness of its dimensions, in our opinion, far too good to become food for powder, as it did shortly afterwards, during the surveyorship of Sir Christopher Wren. It was the old story: ideas of expediency arose, abetted by the voice of fashion, and the old crumbling cathedral disappeared for a worthy although thoroughly different successor, viz. the great master-piece of Sir Christopher Wren. But for the views of Holzer, no modern Gothic would never have been able to appreciate the correct taste of old St. Paul's; from these views, with all their stiffness, crudeness, and faulty characteristics, we may still eliminate subtle beauties and niceties of form and design, which may be of great assistance to us in our modern compositions.

To go back to Inigo Jones, who, we said, must have been a rare "good later" of everything Gothic. Of his frontispiece to St. Paul's, a leading foreign critic has written as follows:—"If the mixture of two kinds of buildings be discordant, above all, that of the Gothic taste united with the regular systematic ordinances of the Grecian, and put into opposition with the systematic irregularity of the former, could not fail to wound the spirit and offend the vision." It was not until after the death of James, and during the reign of his successor, Charles I., that Inigo Jones was enabled to realise even that small executed portion of his great Whitehall scheme, the designs for which had been made, as we have seen, under the patronage of the former monarch. He was continued in his office, and encouraged by the new king and his queen. We will not here attempt a description of the great scheme for the Whitehall Palace, the designs for which have become so well known by the published drawings. Palladio and his own early "antient studies" were doubtless fresh in the memory of our architect when he produced the designs and details for so great a master-piece; (so the Palazzo Pitti, at Florence, by Ammannati; the Château de Caprarola, near Rome, by Vigola; and the Picturesque Villa Pia, at Rome, by Pirro Ligorio, all new and beautiful at the time of Inigo Jones's visits to Italy. We do not mention these architects, and their picturesque designs by way of disparagement, for imitate though he might, Inigo Jones was always original; and here lies the essence, the secret of his power, and of the power of all great architects, both ancient and modern. He imbibed every line of his copy, but loved it far too much to become servile; he copied to revere and admire, not to appropriate by intention, and here lies all the difference between small and great natures. When we see niches, or windows, or capitals taken wholesale from books, and placed in modern buildings here and elsewhere, we smile at the poverty of the ornament thus unwittingly paid to the original designer, but our architect copied, in quite another fashion, other men's thoughts on passing through the medium of his refined and vigorous intellect, he came, by the subtle chemistry of taste, transmuted into forms both new and beautiful. As well as many other buildings of his, Inigo Jones conceived the original idea of Greenwich Hospital, which was carried out by Webb, his pupil. It was designed at first as a palace, either for King Charles or the queen mother. William III. caused considerable additions to be made to it, in the shape of a replica of a pendant, and appropriated the whole to its present uses. We will not stop to criticise this or any other of Inigo's productions too narrowly, but may only say of Greenwich Hospital, in passing, that although bold and vigorous in conception, it appears rather crude and hard in detail, and, after the choice fragment of the hau-

queting-hall, it is not required to perpetuate the fame of the architect. Kent made a collection of the designs of Inigo Jones in 1727 and 1744, as Ware and Leoni have since done. From these collections, however, it is not easy to discover which were executed works, and which merely ideal conceptions; but they all evince talents of a very high order of mind, and when we consider that it is exactly 220 years since Jones died, we are surprised to find how very suitable to the wants, and acceptable to the taste of the present day, his productions remain. If we compare the well-known front of the Travellers' Club-house, by the late Sir Charles Barry, with the front of the banqueting-hall, these facts will be better understood, for if we take away the portico and bay window from the former building, and the lower tier of columns from the latter, the two fronts become almost identical. Inigo Jones lived through part of the evil days of the English revolution, by which he suffered severely as a Royalist, and for his religious faith. Taking another look at that charming front in Whitehall, appealing to our sense of beauty and proportion as it ever does, are we not reminded once again that true genius lives not for an age, but for all time?

In addition to the buildings we have named, Inigo Jones designed old Surgeons' Hall, the plan of Lincoln's-inn-fields, Coleshill, in Berkshire. Colham-hall, Kent, Castle Ashley, Stoke Park, Shaftesbury House, and many other buildings in and out of the metropolis. The civil wars embittered his last days, as he could not brook the treatment of the Roundheads, who regarded art as idolatry. It has been said that he was often seen, when past seventy years of age, in the neighbourhood of Whitehall and St. Paul's, gazing sorrowfully at his unfinished works. He had now nothing left to live for. Cromwell's Protectorate was no protectorate of art; so in 1652 the old man went quietly to his rest.

The following verse, applied originally to Jacques Germain Soufflot, the architect of the Church of St. Geneviève, Paris, will apply to Inigo Jones:—

"Pour maître dans son art, il n'eut que la nature:
Il aimait qu'un talent on joignît la droiture;
Plus d'un rival jaloux, qui fut son ennemi,
S'il eût connu son cœur eût été son ami."

PAINTED METALLIC HANGINGS FOR MURAL DECORATION.

At the Society of Arts lately, Mr. George Clarke brought this subject before a meeting of the members. Mr. Clarke said, the mode of house painting I wish to make known to you is so simple that a short description will explain it. An easy way to bring the nature of it home to the comprehension is to compare it with paper-hangings, the form and application of which are familiar to all.

In justice to our intelligent neighbours across the Channel, I wish to mention that the new art, of which you see the beautiful specimens around you, is a French invention. The first conception of the principle was the idea of a journeyman painter, who saw damp walls, intended to be painted, covered with tinfoil, but he was unable to realise and give a practical form to his crude idea. A gentleman of mechanical genius, who aided the painter, imagined and produced the tools, and invented the *modus operandi*, without which the work and production could not be economically done. An eminent Parisian decorative painter associated himself with the undertaking, and brought his experience to bear on its practical application. Their combined industry, intelligence, and perseverance brought to its present state of perfection the invention, of which a description follows.

Tinfoil in sheets, the thickness of ordinary writing-paper, is the material on which this new style of mural decoration, including gilding, is executed. Tinfoil is pliable and supple, sufficiently tough not to be easily torn, and offers a smooth and uniform surface. It forms an excellent base for the work executed upon it. It also possesses the advantage of being water-proof, a property well known to architects and builders, who frequently use it to cover damp walls, on which without that covering any decorative work would soon perish.

The process of executing the painting on tin offers no difficulty. The sheets are manufactured of a width and in lengths suitable to their application on the surfaces to be covered. At

the manufactory in Paris the ordinary widths made use of are from 30 in. to 40 in., and the length 5 metres, or rather more than five yards.

The following are the processes, as I saw them carried out in Paris at the works of Messrs. Daniel & Co., Rue de Roeroy:—

A portable frame, corresponding in length and width to the dimensions of the painting intended to be produced, is placed on a solid table, made as true and level as a billiard-table. For the perfection of the work, the face of this frame is required to be perfectly level, hard, and smooth. A sheet of glass presenting these advantages in an eminent degree was at first made use of, but as this material is fragile and not safely removable, stiff card-board of the finest texture has been substituted for glass; and, after successive improvements, by using double card-boards of considerable thickness, with stretchers and braces between the two boards, an appropriate frame has been produced well adapted for the requirements of the manufacture, presenting a level, hard, and smooth surface, and conveniently portable. The sheet of tinfoil is carefully laid on and extended over the frame from end to end, and is smoothed down to the surface of the frame with a suitable tool, being secured at both ends to stretch and keep it from shifting. The coating of ground colour, whatever it may be, is laid on the tin sheet with a brush in the ordinary way of painting, so as to cover the metal with a good coat of paint.

This process being completed, the frame is removed into a drying-room, where a regular temperature of 80° to 90° Fahr. is maintained by a system of heating, which sends a current of hot air through the room, and speedily dries the coat of paint. For the next process, when the paint is quite dry, the frame is taken out of the drying-room and placed on the table before described. The execution of what may be termed the decorative coat of paint is produced by mechanical means, which may be familiarly described as stencilling and printing by means of sheets of tin copper for the former, and rollers for the latter, much after the manner of staining paper-hangings.

The exact nature and the mode of producing these two kinds of tools, which are the most important instruments for the artistic perfection of this new decorative work, I will presently describe; but to give an idea of the celerity and precision with which the process is effected, it may be mentioned that the stencil plate, of the same width as the sheet of tin, is placed over the ground coat, and the painter produces the pattern by painting with the brush over the stencil plate. Or if the roller be used, it is charged with colour, and being passed over the ground coat, produces in like manner the required pattern. Both these tools are sometimes alternately used to produce certain patterns or effects, but, as a rule, the imitations of wood are stencilled, and those of marbles printed. No grainer, however skilful, could attain the same perfection, or do the work in a tythe of the time. The best graining is not an imitation of nature, it is a conventional representation of wood or marble, but could hardly be taken for nature itself. Whereas the imitations are so exact that skilful judges might take them for reality. The frame is now again conveyed to the drying-room, and when sufficiently dry is brought back to the table, and the paint is covered with a coat of varnish; this again being dried as before, the painted sheet of tin is ready for use. If more highly-finished work be required, as in the case of imitations of the finest woods and marbles, a second coat of varnish is laid on, and this, again, after being dried, is brought to the highest state of finish by being polished on the frame. The painted sheets, of any degree of finish, are removed from the frame, and after being dusted with soap-powder, are rolled on cylinders, being now in a merchantable form ready for sale and application with the same facility as paper-hangings. But it is well here to observe that the difference between painted metallic hangings and paper-hangings is, that on the former the decoration is oil-painting, and when applied to any surface is more durable than painting on such surface by the ordinary method, whilst the base or lining being metal, the painted decoration is effectually protected from damp. These advantages make it superior, not only to ordinary painting, but, in a much higher degree, to paper-hangings, which are stained with water-colours of much shorter duration, and subject to the effects of damp both in the walls and externally.

The application of the painted metallic hangings to either wood, stone, plaster, or iron sur-

* To be continued.

faces, offers no difficulty. The operation is somewhat similar to putting up paper-hangings, with this difference, that with the latter the paper is pasted over at the back before being hung, and with the former the surface to be decorated is covered with a thin coat of adhesive varnish, on which, after it has been left to dry partially, the painted tin is affixed with great ease. So little is the difficulty that any skilled paper-hanger can, after a few hours' practice, do the work successfully. From the extreme flexibility of tin-foil, mouldings and cornices are covered with the metallic hangings in the most perfect manner, and with a smoothness of surface and sharpness of outline at the edges and mitres which the painter's brush cannot rival.

These last effects are obtained by covering undulating surfaces with the painted material, of dimensions slightly larger, say $\frac{1}{2}$ in. to $\frac{1}{4}$ in. in length and width, than the superficial measure. By this contrivance, when the painted tin-foil is affixed on any surface with the varnish, the excess of length or width is cut away along a straight edge with a sharp knife, which leaves the edge of the work clean, and invisible where two edges meet. It is thus that the close joints are obtained in mouldings and mitres as in the specimens exhibited.

The varnish used for fixing the material is of the nature of gold size, but more adhesive. Being of itself "hydrofuge," it adds to the protection of the paint against damp.

DOINGS IN DUBLIN.

THE opening of the Exhibition on the 5th of this month is looked forward to with interest by many, and an indifference by others. A feeling of dissatisfaction has already found vent through the pages of more than one journal in consequence of some unfavourable arrangements as to space allotted to native exhibitors, and particularly affecting the coach and carriage builders of Dublin. Fault is also found with the general manager and committee for giving or allowing most of the preparatory work of statuary, painting, decoration, and fittings to pass into the hands of London houses, without giving any chance to the Dublin firms by a competition, limited or otherwise. A grievance in Dublin is certain to win support, particularly when it is of the nature alluded to.

The exhibits of various kinds are still arriving, and it is not unlikely that as many objects will have to be admitted after the opening, to compensate for the rather tardy response that signalled the intending and half-hearted contributors in the beginning of the season. Sir Arthur Guinness, one of the promoters, contributes a good collection of china; and Earl Spencer's collection of similar ware is expected to be arranged before the end of this month. The loan collection from South Kensington has arrived, containing specimens of ancient china and gilt copper vessels. The Royal portraits are placed in position, as also are a number of the old masters.

The decorations are all but completed within, and the pleasure-grounds and gardens without are undergoing still further improvement.

There is one matter which will constitute a great drawback on the first and succeeding days after the opening,—the want of a catalogue. We are told gravely that it will be impossible to have the catalogue in readiness, from the number of items to be enumerated. There seems to be no valid excuse for its delay, and it is little less than bungling, or bad management, to open the Exhibition without having a printed catalogue to place in the hands of the visitors and exhibitors. There should be one, however incomplete it might be, and even though it necessitated a second edition, or an appendix.

The Corporation has allotted a site in Foster-place, College Green, for an intended statue to the late Field Marshal Lord Gough. We may expect to hear of its erection in another ten years. O'Connell has been dead exactly a quarter of a century, this month. Subscriptions were raised immediately after his death. Ten years ago a site was allotted, and Mr. Foley, the sculptor, was commissioned to execute the statue. Well it is but a little more than half finished, and it is now announced that it will be completed in three years more. The year 1875, when this statue of the "liberator" it is supposed will be finished, will be the centenary of O'Connell's birth.

The Convalescent Home, the want of which is

so severely felt, and which resulted in an indignation-sympathy meeting, some two or more months ago, is not yet commenced. The Corporation are in no hurry.

The Sanitary Works (Ireland) Bill is an attempt to exempt the Corporation of Dublin from paying rates for the water-works. The Bill is in reality no sanitary measure at all, and it professes to deal with matters which had better be left alone than treated in the manner they are. We cannot see how the ratpayers will be benefited; and if the Bill were passed, the exemption claimed by the Corporation would only embolden that body to pursue a more ruinous and extravagant scheme of taxation as soon as they were relieved. Every attempt made by the Corporation of Dublin during the last decade professedly to relieve or lighten the taxation of Dublin is said to have resulted in increasing the rates. The city is at present sinking under a taxation of nearly 10s. in the pound.

OPENING OF THE FINE ARTS EXHIBITION, IN NOTTINGHAM.

THE Midland Counties Fine Arts and Industrial Exhibition, in connexion with the South Kensington Exhibition, has been formally opened by the mayor, at the Exchange Hall, Nottingham. Since the preliminary opening, when the mayor gave three *conversazioni*, the display has undergone some modification, many things having been added and others removed. The ante-rooms, which were set off for the purpose of enhancing the appearance of the building to give a festive effect, have undergone an entire change. The floral and drapery embellishments have given way to objects of interest in the museum, so that what is lost in ornamentation is compensated for in sterling worth. Mr. Cole, and Mr. Wallis, of the South Kensington Museum, and most of the members of the corporation, as well as many of the principal gentlemen of the town, met in the mayor's parlour, and walked in procession with the mayor to the Exhibition.

After the mayor's address, Mr. Cole said they in Nottingham had a School of Art at the head of all other art-schools in the country; and it had seemed to him that they were bound to have a permanent museum. They had now got it, and he heartily congratulated them on having done so. He declared he never saw anything equally successful. It was altogether to see that those who had taken an interest in it had acted in such a catholic and admirable spirit. He had seen the museum at Lyons, and, in the way of lace, they had made in Nottingham as good a beginning in their own way as Lyons, with its hundred years' experience. It was true that South Kensington was becoming the storehouse of the country, and there were other public institutions which he hoped might also become storehouses. He trusted that the National Gallery would furnish an institution like that, with a great many of its superfluous pictures, and that the British Museum would send objects of art and science, for they were smothered with things that could not be seen. But it was all very well to bring these objects to the town, they must find a building to hold them. They had found a most excellent one, and, although it was small, it would lead to a much larger one whilst they had the guardianship of the chamber.

PICTURES BOUGHT BY THE ART-UNION OF LONDON.

THE following are the principal works already selected by prizeholders:—

From the Royal Academy.—Repairing the Old Boat—South Coast, J. W. Oakes, 262l. 10s.; A Love Spell, Fredk. Chester, 200l.; Through the Coverts of the Deer, W. Laker, 150l.; A Peep of Ban Venue, N. E. Green, 45l.; Caught in a Squall, W. J. Rolfe, 45l.; The Spindlo Rock, D. Cameron, 45l.; An Autumn Afternoon, W. Laker, 40l.; A Sunny Morning—Ullswater, A. Powell, 40l.; A Sunny Walk in Knowle Park, Sevenoaks, J. W. B. Knight, 35l.; A Stormy Day, J. B. Smith, 35l.; On the River Tamara, Cornwall, A. B. Collier, 31l. 10s.; An English Brook, J. Adam, 30l.; The Pet Lamb, J. Henzell, 30l.; The Path through the Wood, Cobham, Kent, M. E. Dockree, 25l.; Moonlight on the Adur—Lancing College, R. H. Nibbs, 25l.; The Swale, near Richmond, Yorkshire, C. Smith, 25l.

From the Society of British Artists.—Mill on the Lowther, Cumberland, Jas. Peel, 100l.; the

Secret Despatch, J. Gow, 75l.; A Summer's Morning—Early Sunrise, T. F. Wainwright, 73l. 10s.; Into Port—French Coast, J. J. Wilson, 60l.; Lullworth Cove, J. Danby, 45l.; The Gleaner, E. J. Cobbett, 42l.; A Passing Glimpse, A. Glasgow, 40l.; Hard at Work, G. A. Holmes, 40l.; Fisher Children—Sussex Coast, W. Hemsley, 35l.; A Country Lane in Hampshire, W. H. Hopkins, 35l.; Snowdon from Llyn-y-cwm, S. R. Percy, 35l.; Market Day—Winter, G. A. Williams, 35l.; A Summer Shower, T. F. Wainwright, 31l. 10s.; Fruit and Bird's Nest, C. T. Bale, 30l.; An American Autumn, J. C. Thom, 30l.; Lyn Peris, Llanberis, North Wales, J. J. Currock, 25l.; Patchwork, R. C. Green, 25l.; View on the Llugwy, Bettws-y-coed, North Wales, E. H. Holder, 25l.; A Spanish Lady, J. C. Waite, 25l.; "Turf" on the Eze—Entrance to Exeter Canal, J. H. Dell, 20l.; Mill at the Head of the Creek, near Gerran, Cornwall, W. Pitt, 20l.

From the New British Institution.—Kilchurn Castle, T. O. Hume, 25l.; Great Expectations, H. H. Coultery, 21l.; A Flower of Scville, T. K. Pelham, 20l.

From the Society of Painters in Water Colours. Green Hill, Borrowdale, Cumberland, P. J. Naffel, 40l.; A Mountain Stream—Morning, North Wales, C. Branwhite, 35l.; Farnyard, Serk, Paul J. Naffel, 30l.; Canale del Fonteco, Venice, W. Callow, 26l. 5s.

From the Institute of Painters in Water Colours.—Summer Afternoon—Low-tide, F. J. Skill, 42l.

From the General Exhibition of Water Colour Drawings.—Play-time, Edwin Bale, 25l.

SCHOOL BOARDS.

London School Board Competition.—With reference to the competitive designs received for seven additional schools, Mr. W. G. Goldwell has been appointed architect to carry out the Battersea-road schools; Mr. Joseph Gale, to carry out his plans for Kender-street, Hatcham, schools; and Mr. Lucy W. Ridge, to carry out his plans for the Mary-street, Bromley, schools.

Worcester.—The clerk read the minutes of the meeting of the Sites and Building Committee, held on the 13th instant, for the purpose of opening the tenders for the new school buildings, from which it appeared that a resolution was carried to the effect that the tender of Messrs. Wood and Sons, at 4,987l. 10s. 50d. for materials, be adopted. The following tenders were received:—

	Old Materials, Net.
S. Clerk, Bath	£5,069 .. 475 .. 24,994
E. Taylor, Worcester	5,000 .. 118 .. 4,972
Brown & Davies, ditto	5,365 .. 100 .. 5,265
Wood & Sons, ditto	4,987 .. 50 .. 4,937
J. Evers, Malvern	5,105 .. 100 .. 4,905
Thos. Dixon, Worcester	6,367 .. 100 .. 6,267
T. Hartley, Birmingham	5,590 .. 100 .. 5,490
T. S. Morland, Gloucester	5,087 .. 75 .. 5,012

The vice-chairman thought it necessary to state that the cost of these schools was somewhat greater than they had anticipated. In the first place, the short-hours movement and the advance of wages had contributed to this circumstance; and there was very little doubt that their difficulties subsisting between employers and their workpeople had prevented many of them from sending tenders. The clerk laid on the table the filled-in form required to be forwarded to the Education Department, containing exhaustive particulars respecting the accommodation of the new schools, together with the expenditure to be incurred by their erection, from which we make the following extract:—

Cost of site	£1,795
Legal costs and expenses of conveyance	175
	£1,970

Cost of building, including boundary-wall, outbuildings, and internal fittings, from the tender it is proposed to accept	4,987
Architect's commission, and other expenses of superintendence	382
	£7,289

It was explained that the original estimate did not include matters which have been recognised in the latter sum.

Southampton.—The Works and General Purposes Committee's Report stated that the plans of the architect (Mr. Howell), in respect to the Bevois Town schools were agreed to, and it was resolved to bring them before the Board for approval. The report was adopted, and the plans ordered to be proceeded with.

Derby.—A letter received from the Education Department was read, approving of the plans of

the Gerard-street schools, and recommending the Public Loan Commissioners to lend to the School Board a sum not exceeding 4,500*l.*, the repayment of the sum to extend over fifty years. The letter was received, and it was resolved to instruct Mr. Bridgart, architect, to commence operations immediately.]

Wolverhampton.—The first business of any importance was with reference to the proposed erection of new Board Schools on the Dudley-road, and after a short conversation it was decided to forward the plans and specifications, as prepared by Mr. Bidlake, to the Government Educational Department for approval, and with a view to save time it was also decided to announce advertise for tenders for the erection of the schools.

Scarbro.—Plans were submitted by the following architects for the schools to be erected at Falsgrave,—Messrs. Stewart & Barry, Scarbro; Messrs. Smith & Brodriek, Hull; Messrs. Alley & Wilson, Manchester; Mr. Wm. Watson, Wakefield and Doncaster; Mr. David Oldfield, London; and Mr. E. Egan, Loughton, Essex. The consideration of the plans was deferred, and it was ordered that in the meantime they be laid in the board-room for inspection.

Driffield.—The Board examined and considered the school plans as further altered and modified by Mr. Paul, the architect, to meet the views of the board. In the letter accompanying the plans, sections, and perspective, Mr. Paul stated that the arrangements were now simple and good, and as the Board required a plain type of building, he hoped the plans would now be approved of. It was arranged to have a meeting with Mr. Paul before sending the plans to the Educational Department for approval.

Lpswich.—The clerk read to the Board the minutes of last meeting, the latter part of which was held in committee in order to discuss the plans sent in by the competing architects. It appeared that the plan of Mr. Butterworth for school on the Wherstead-road site was provisionally accepted by the Board; a committee was appointed with reference to the matter. The clerk was instructed to write to Mr. Butterworth, informing him that his plans were accepted on the understanding that the building could be constructed in a sound and satisfactory manner for the sum he had estimated (2,500*l.*), and that such alterations as the Board might require might be made without the cost being increased. The plans of Mr. H. M. Eytton for schools on the Argyll Estate site were accepted in similar conditions, and a committee appointed. Mr. Eytton's estimate is 1,875*l.*

THE OPENING OF THE GREAT EASTERN EXTENSION RAILWAY TO STOKE NEWINGTON.

The opening of that portion of the Great Eastern Company's City Extension line between Bethnal-green and Stoke Newington, which took place on Monday last, brings into active use no less than six new stations lying between these two points. These stations are respectively Bethnal-green Junction, Cambridge Heath, London Fields, Hackney Downs, Rectory-road, and Stoke Newington. Some of these stations, more especially Cambridge Heath, Hackney Downs, and Stoke Newington, are large and handsome structures. The trains will for the present run from the Bishopsgate Station to the Bethnal-green Junction, but ultimately the extension line will run to the intended new station in Liverpool-street, altogether avoiding the Bishopsgate-street station, which it is said is to be converted to a goods station. We understand that the remainder of the extensions north of Bethnal-green, making in all about nine miles in length, will be opened in about a fortnight or three weeks.

ADGURATION OF STATUE AND BATHS AT BARROW-IN-FURNESS.

A BRONZE statue, by Noble, of Mr. Ramsden, mayor of Barrow-in-Furness, has been unveiled at Ramsden-square, in that town, by the Duke of Devonshire, amid great rejoicings. Baths, valued at a cost of 2,000*l.*, were on the occasion sent to the town by Mr. Ramsden, and a banquet was held in the Town-hall, under the presidency of the duke, supported by the Bishop of Carlisle, Lord Frederick Cavendish, M.P., F. S. Powell, M.P., Mr. Childers, M.P., &c. The portrait of Mr. Ramsden, by Mr. Knight, R.A.,

is to be hung in the hall. Mr. Ramsden, it is said, will shortly be knighted.

The first course of the pedestal of the statue is of grey granite, dressed, and is 10 ft. square by 2 ft. 5 in. thick; the second course, of similar stone, polished, is 7 ft. square by 1 ft. 10 in. thick; and the third course, weighing about 8 tons, being the heaviest stone in the pedestal, is of red Peterhead granite, and is 5 ft. 6 in. square by 3 ft. thick. The die is also of red granite, and is 4 ft. 10 in. square by 3 ft. 11 in. thick; and the capital, of a similar description of stone, is 6 ft. 2 in. square by 2 ft. 10 in. thick. The total height of the pedestal is thus 14 ft. The first course of the red Peterhead granite and the die are of an irregular octagon shape, and the cornice is moulded with a "blank and space" ornamentation. The total weight of this basis for the statue is about 50 tons. In the centre of the second course of the pedestal a bottle was deposited, containing the current coins of the realm, a printed statement of the reasons which induced the inhabitants of Barrow to erect the statue, &c.

The statue has been executed in bronze. It has been placed on the pedestal facing the west,—the docks,—and represents the mayor in his municipal robes and other corporate insignia. It is said to be a good likeness. To the right of the figure is a small pedestal, depending from which is a *fac simile* of the Charter of Incorporation, of date 1867.

A statuette, in white marble, a *fac simile* of the bronze statue just unveiled, also the work of Mr. Noble, is to be presented to Mrs. Ramsden.

THE MID-LONDON RAILWAY PROJECT AND THE LONDON AND NORTH WESTERN COMPANY.

It is confidently stated that the directors of the London and North Western Railway Company have resolved to use their influence in support of a motion which is about to be made for a recommitment of the Eastern Section Bill of the Mid-London Railway, being that portion of the project from the Marble Arch to Whitechapel, and against which the committee over which Mr. Harcastle presides decided on the ground that no satisfactory proof had been given that the large capital required for carrying out the scheme would ever be practically available.

ECCLIESIASTICAL DILAPIDATIONS ACT, 1871.

It was thought by some of the diocesan surveyors that it was very desirable to have a meeting, in London, of all the surveyors appointed under this Act, for the purpose of discussing the Act, and promoting uniformity of practice, and for discussing fees, and so on. A preliminary meeting was accordingly held on the 20th of May, at which were present the diocesan surveyors for Canterbury, the diocesan surveyor for Winchester, the diocesan surveyor for Oxon, the diocesan surveyor for Chichester, and the diocesan surveyor for Ripon; and it was determined to hold a meeting of diocesan surveyors at the Rooms of the Royal Institute of British Architects, on Tuesday, the 11th of June, with the view of forming an association of diocesan surveyors, and discussing the working of the Ecclesiastical Dilapidations Act.

DESTRUCTIVE EFFECTS OF LIGHTNING.

THE parish church of St. Mary, Beeston, Norfolk, has been set on fire by lightning, and destroyed. It was a specimen of fourteenth-century work, and contained carved and painted screens of that date.

The spire of St. Martin's Church, Birmingham, has been struck, but not very much injured. The flashes were painfully vivid, and the peals appalling. A man, while passing along New-street, was struck, and rendered speechless. Another man has been killed while going home from work: he was twice struck. In Great Russell-street another was knocked down by the lightning. Six men engaged in drainage-work at Frodingham, near Beverley, were struck by lightning on another occasion. One was killed, and the others were seriously injured.

Loss of life and injuries by lightning have been unusually frequent of late in various parts of the country. An old man was killed in a field near Guildford. At Tetford four sheep and

five lambs were killed while taking shelter from a storm; and at Sackley a ewe and a lamb were killed under similar circumstances. A barn has been burnt by lightning at Ufford.

The extent and frequency of fires last year and this may have had something to do with the active or ozonic state of the oxygen of the atmosphere during the prevalent physical commotions. Ozone is believed to be just as electrified oxygen.

Two hundred houses in the Russian town of Witepsk have been destroyed by a fire which lasted three hours. This town, of above 25,000 inhabitants, had only three fire-engines. By a great fire in Yedo, Japan, on the 3rd of April, 50,000 persons have been rendered homeless, and 250 to 300 have perished. Four square miles of the city (a very wooden one) and 10,000 houses have been devastated. In Scotland there have been destructive fires on a small scale. Explosions, sometimes unaccountable in their causes, have in this country also been occurring.

THE WORKS ON THE CHELSEA EMBANKMENT.

MR. WEBSTER, the contractor for the Chelsea Embankment, is pushing the works forward with much activity, and during the past few weeks considerable progress has been made, and sufficient has already been done to indicate what a great improvement it will be when completed. At the Old Brewery and at the Chelsea Hospital end the Embankment is almost finished, and the ornamental coping has already made its appearance in several places. Proceeding along the staging the facing of the embankment is seen just peeping above the water, with the rear filled up with concrete. A little beyond the brewery are the stores, where the granite, the concrete, and the other materials are kept; and here the large blocks of concrete which serve as the foundation are made. The existing embankment, near the Chelsea Bridge, will look small and unpretending by the side of the one now in course of construction.

THE TRADES MOVEMENT.

London.—The Builders' Society had a meeting on Thursday, in last week, at which the questions raised as to the "nine-hours movement" were discussed, and it was resolved to meet a deputation of the carpenters and joiners, at their request. The impression was that the state of trade does not warrant any advance of wages, but the employers were prepared to discuss the question in any form the workmen may desire. The feeling of the meeting was that if, pending these negotiations, any of the members should be struck against, the other members would do everything to support any one so attacked, even if it went so far as to involve a general lock-out, which, of course, they were most anxious to avoid.—The adjourned general meeting of delegates from the London Carpenters and Joiners was held on Saturday night last, in Bloomsbury; Mr. Sadler, the president of the nine-hours committee, in the chair. There was a crowded attendance, many delegates attending for the first time with the adhesion of their constituents to the movement. The chairman said the immediate object of the meeting was to receive the reports from the firms of Jackson & Shaw, and Brass's, with the result of interviews held with these firms by their workmen, conveying to them the information that, in accordance with a resolution of the delegate meeting, the men would leave their employ on Saturday next, unless they in the mean time conceded the terms claimed by the men in the memorial, and endorsed by the aggregate meeting of the trade held in St. James's Hall. The delegate from Jackson & Shaw's firm then stated that Mr. Jackson said he considered the demands of the men were unconscionable, but declined to enter into any discussion upon the subject, inasmuch as the Masters' Association, of which the firm were members, had appointed a committee to meet a deputation from the men to consider the whole question. The whole of the men in the firm, both those working in the shop and at the out-door jobs, were prepared to leave work on Saturday next, if it should become necessary. The delegate from Brass's firm made the same statement. Mr. Brass informed his men that he was appointed one of the committee of masters who were to meet the men's deputation. Mr. Matkin, the secretary, in reply to a question, stated that the number of men (carpenters and

joiners) who would cease work at the above two firms on Saturday next was about 300. After some discussion a deputation of seven delegates, with the chairman and secretary of the committee, were appointed to meet the masters' committee, if officially requested to do so. Another discussion ensued upon the instructions to be given to the deputation, and it was finally resolved "That the deputation have no power to refuse or accept any proposals made by the masters' committee, but to report the result of their interview to a special delegate meeting for its consideration."

Ipswich.—The Workmen's League have appointed Mr. A. A. Watts and Mr. F. J. Bugg to act as arbitrators on behalf of the League, and these gentlemen have consented to act. The men on strike have declined to return to their work in the mean time.

Sheffield.—Two hundred stonemasons have struck work at Sheffield, in consequence of their masters deciding not to reduce their working hours to fifty per week. They have been gradually obtaining employment, however, on their own terms.

Preston.—A meeting of the master carpenters of Preston has just been held, to consider the application of the men for shorter hours. After a short discussion it was resolved to reduce the working hours five hours a week.

Hawick.—Several of the journeyman masons in Hawick have struck work, in consequence of the refusal of the masters to concede the nine-hours limit. The strike, however, is not universal, and some of the masters retain nearly their whole complement of hands. Those who have struck are mostly young men, and many have left the town to seek work where the nine-hours system is in operation.

Cupar-Fife.—Most of the builders in Cupar-Fife and neighbourhood have now complied with the demand of their workmen for an advance of wages from 5s. to 5½d. per hour. With the exception of a few who had left the town, all the men employed when the demand was made are now re-engaged. The building trade in the district is at present in a very dull condition, and owing to the rise of wages and materials, a number of buildings intended to be erected this summer are to be delayed till another season.

Dundee.—A meeting, attended by delegates from Forfar, Arbroath, and other neighbouring towns, has been held at Dundee, at which it was reported that the nine-hours movement in Edinburgh, Glasgow, and throughout Scotland generally, was being carried on energetically, and that the petition in favour of Mr. Mundella's Bill had been very largely signed.

Glasgow.—A crowded meeting of operative masons of Glasgow and neighbourhood has been held in the Trades' Hall, Mr. Robertson in the chair. On the motion of Mr. D. Ferguson, seconded by Mr. A. Duncan, it was resolved that the unprecedented rise in the price of tools, since the last advance of wages was obtained, justified the request lately made to the employers for an advance from 6½d. to 7d. per hour. The meeting, on the motion of Mr. A. Boa, seconded by Mr. A. Easton, pledged themselves to use every legitimate means to obtain the introduction of weekly pays. The representative committee was empowered to carry out these resolutions.

America.—A telegram from Washington states, the strikes in favour of the eight-hours movement continue, and the trades are generally joining the Eight Hours League. The master masons, the carpenters, and the bricklayers have already acceded to the demands of the men.

THE CITY GUILDS.

I BELIEVE that many of your readers have read with much pleasure the articles in which from time to time you have noticed the "City Guilds." I for one have hoped that you would see your way to an expository statement, in a condensed form, of the purposes, sources of income, administration, and actual working result of the building guilds, and of one or two others that may be deemed fair samples of the rest.

The existence of these wealthy corporations, with considerable land and house property well held in hand and improved (in rentals), is probably mainly known by their fine large halls of meeting, by their vigorous insistence on the rights of ownership, and by their "magnificent banquets," and the "presentation of freedoms of

the company in handsome caskets of choice design and workmanship;" "of fine gold executed in the short space of a fortnight, and reflecting the highest credit on the producers, Messrs. —" &c. Members, and occasional visitors, in no Quixotic mood, chuckle with very natural satisfaction over these banquets, though some are stirred by a little innocent amazement at times when distinguished statesmen, and brave warriors, and royal and semi-royal personages, are among the receivers of mysterious documents; and the takers of bold "pledges to observe all the rights and mysteries of the company." Mr. Gladstone, it is true, hoped that his sense of duty would never require him to do anything that might not be usual in a respectable—shoemaker, let us say. Perhaps the state of parties, and of political life generally, may not allow it to-day or to-morrow, but surely sooner or later an inquiry must be ordered as to the functions and resources of the fully-owning trustees of the private public corporations, who have long been in frame of mind to cheerfully endorse the recent becoming language of the Duke of Cambridge at "a banquet," respecting "the maintenance of institutions which have made us what we are, and that will keep us what we are if we are only true to ourselves."

How can the withholding of the fullest information from the public be justified? In the case of "insurance offices, banking corporations, and other business companies," cited by a correspondent in the last number of the *Builder*,—the same secrecy is not observed. I need only mention "The Life Assurance Companies Act, 1870." A more striking parallel case would seem to exist in the pending inquiry as to the administration, revenues, &c., of the ancient universities,—against which hardly a voice has been raised, so thoroughly is the necessity of investigation recognised in these (wisely) "suspicious and searching days" when investigation is not made for insult, for idle curiosity, nor even for the sake of gibbering misdeeds in the past,—but in order that the accurate information may be accumulated on which alone legislative action or inaction can safely rest. Mr. E. Nash's judicious communication before alluded to defends the action of many of the companies, but omits any remark as to the necessity and duty of publicity; and one hopes that a slip of the pen only is responsible for the sentence:—"Individuals are allowed to give expensive dinners, &c., . . . if they do it with their own money,"—the conclusion pointed at apparently being that corporations also can "do what they like with their own." It would open, entirely unnecessarily, a tremendous question to state what looks like good reason for wishing little legal interference with private ownership; notwithstanding that, according to the best teachers, the riches of each man are *in foro conscientie* to be considered as held in trust for the least trustworthy and self-helpful brethren of human kind. But a corporation, taking to solid property in right of fulfilment of some special duties at one time of much moment, holds in the view of most of us,—not only this sort of trusteeship, but also one more tangible and formal, that is properly liable to criticism and to severe scrutiny: if not perfectly within the reach of this, by form and rule of law, they should be vigorously and speedily made so. But who, except a privileged and well-informed member, could take any action now? It is true one remembers the unimpeachable drollery of the law-suit, gravely maintained in our courts some years ago, against a vitreous company for damages for deprivation of valuable dinners,—and its lame conclusion. It is not often, however, that the bonds of amity are broken in these leagues.

The last sentence of Mr. Nash's letter also deserves a remark:—"reform where reform is needed is desirable, but change where change is not needed is revolution." Let us not habitually make an outcast of a word that may yet have chances to redeem itself from all its bitter taints. It becomes us least of all, in a country where, as we proudly boast, our *revolutions* are made peaceably by even process of law. May I, too, imitate the language of copybooks and moral primers, saying,—changes wisely planned and thoroughly carried out are, in important matters, properly deemed the best kind of revolutions. Revolutions are of all sorts.

But, perhaps, this after all, may be called mere word-fencing. The immediate point is that certain corporate bodies, said by some to be well governed, are by others subjected to (let us say) unworthy suspicion. In order to assist these bodies in their own justification, the well-mean-

ing, ignorant outsiders call for public statements or for complete inquiry. Those who confess they do not understand thoroughly the institutions of which they are talking,—who see behind the curtain the movements of mysterious shadows, accompanied by the jingling of equally mysterious money,—will at the conclusion of such inquiry, render back the old, and give fresh honour if need be. Or they may have to ask that, what were candidly termed by a distinguished person a few days ago, "the relics of old institutions, the importance of which, and their actual uses, to some extent, have passed away," shall be treated to reconstruction with definite objects and schemes for attaining them. Or it may be necessary that their existence shall be wholly terminated, and that the funds for centuries gathering in these reservoirs, may be led in fertilising streams, where the present generations of Englishmen may obtain the needed material for better nurture in those useful arts which so firmly maintain the habits of civilised life, which, eventually, if not made matters of mere mechanical routine, may become almost invariably the sources of pure unalloyed pleasure to all who engage in them. X.

THE RIVER ALT DRAINAGE.

IN consequence of the recent repeated flooding of the low lands drained by the Alt, the River Alt Commissioners engaged Messrs. Rendø & Goodison, civil engineers, of Liverpool, to report upon the condition of the drainage under their jurisdiction.

The result of the survey is embodied in a report just printed, which states that the general condition of the drainage is most unsatisfactory, and that the bed of the river is from 2 ft. 6 in. to 3 ft. 6 in. higher than it should be, along a considerable portion of its length. As a large tract of low-lying land between Liverpool and Southport is dependent upon the efficiency of the river, the consequence of this silting up of its bed is serious.

The course of the river being much affected by the north-west wind and sand-drift, the engineers think that special means will have to be taken to guide the river into a shorter channel, and afterwards preserve it from working back into its old course. They suggest, in the formation of the new channel, that the south bank should be protected with sheet piling for a considerable distance on the foreshore.

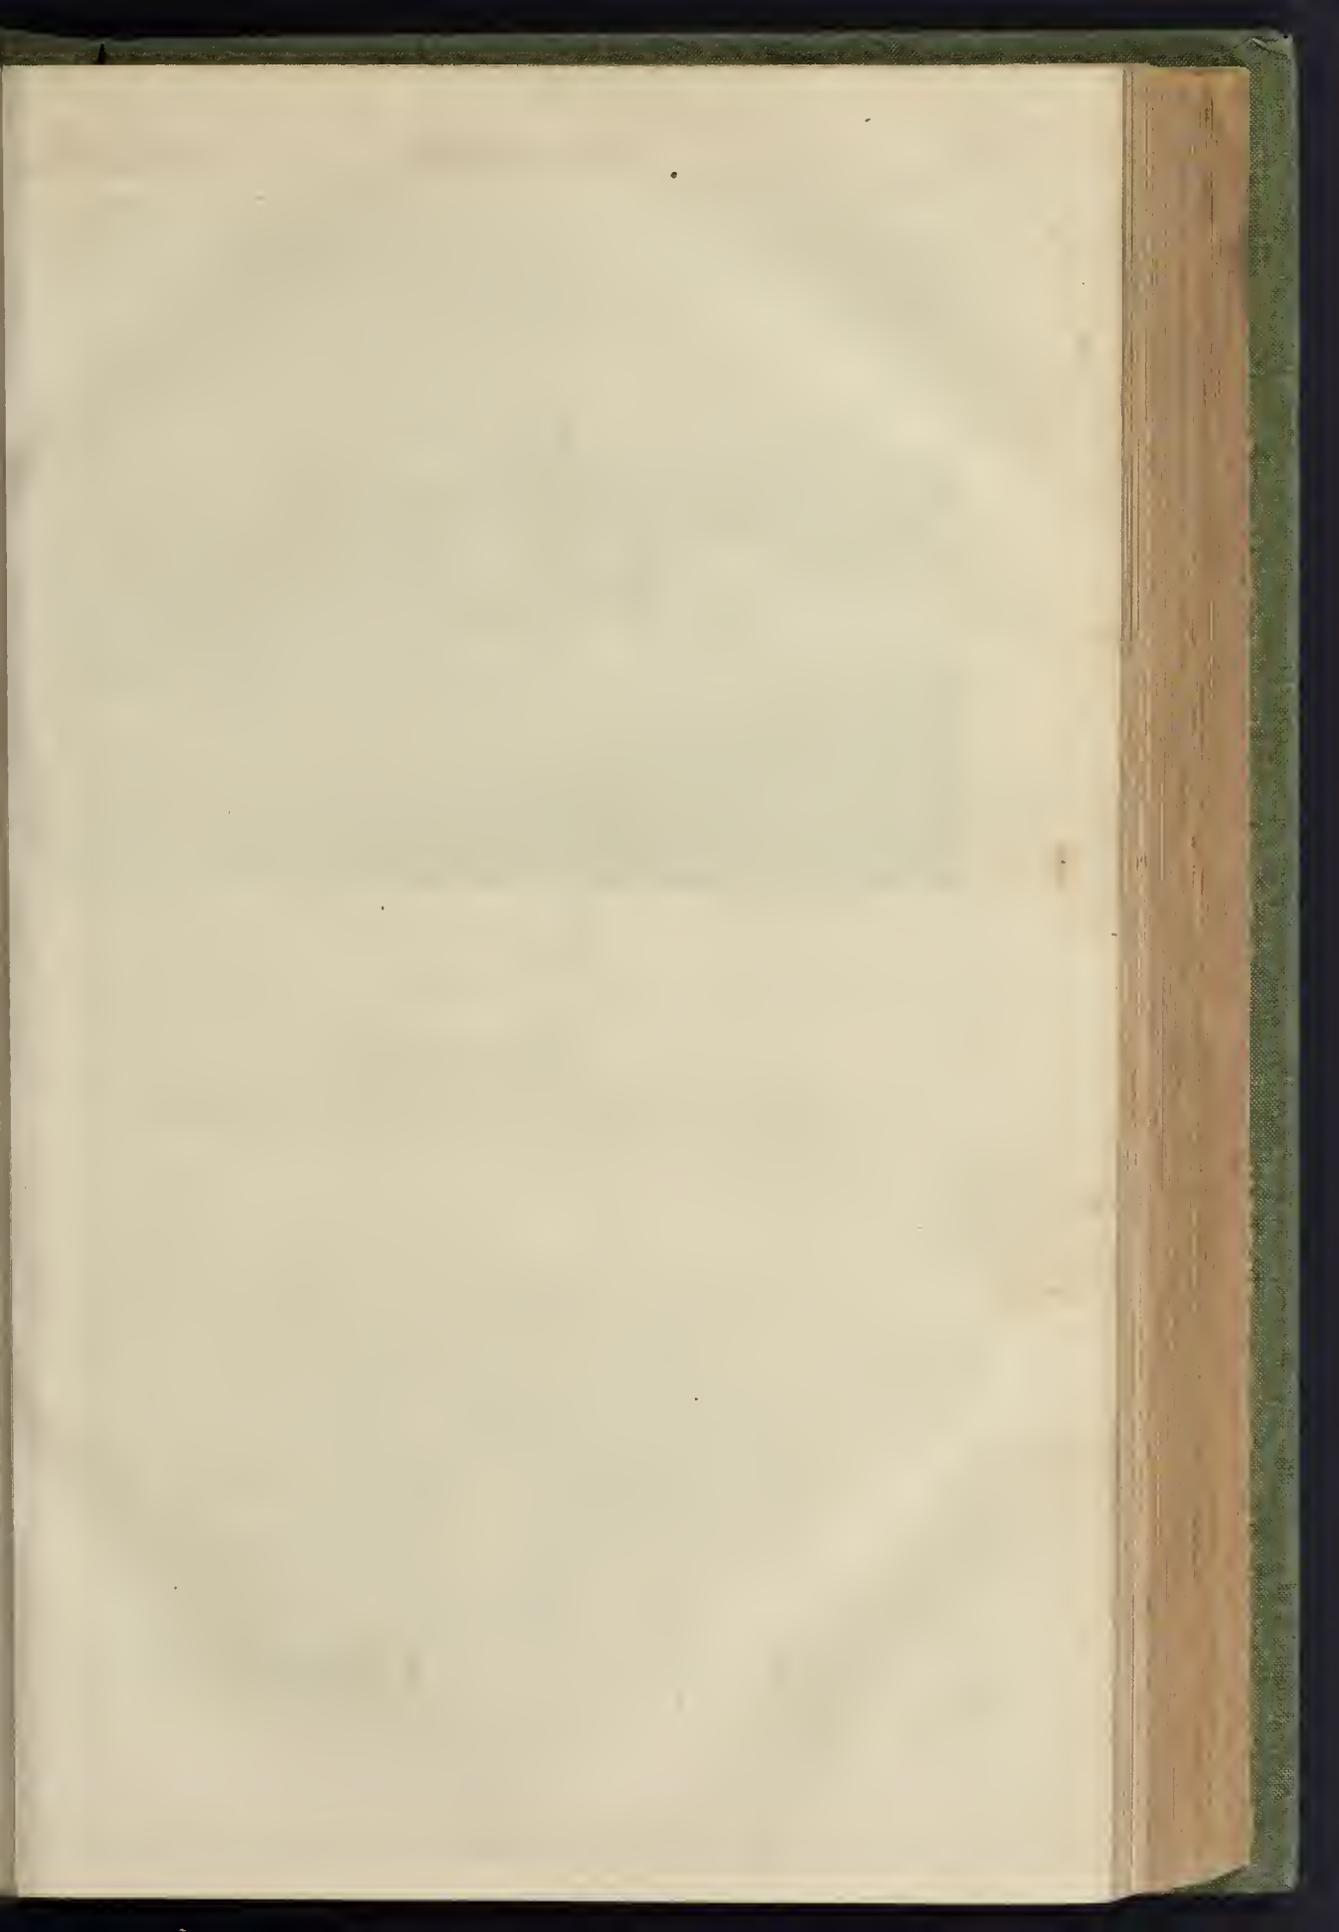

In connexion with this alteration, they also propose to make a new cut from the flood-gates, to the Alt Bridge, by which the present objectionable range of sand-dunes along the river, dividing it from the Altar Rifle Range, will be avoided, as well as the course of the river shortened inland about 6,000 ft. Machinery for holding back the water above the flood-gates, and using the power thus stored for flushing out the foreshore channel at low water, is also considered absolutely necessary.

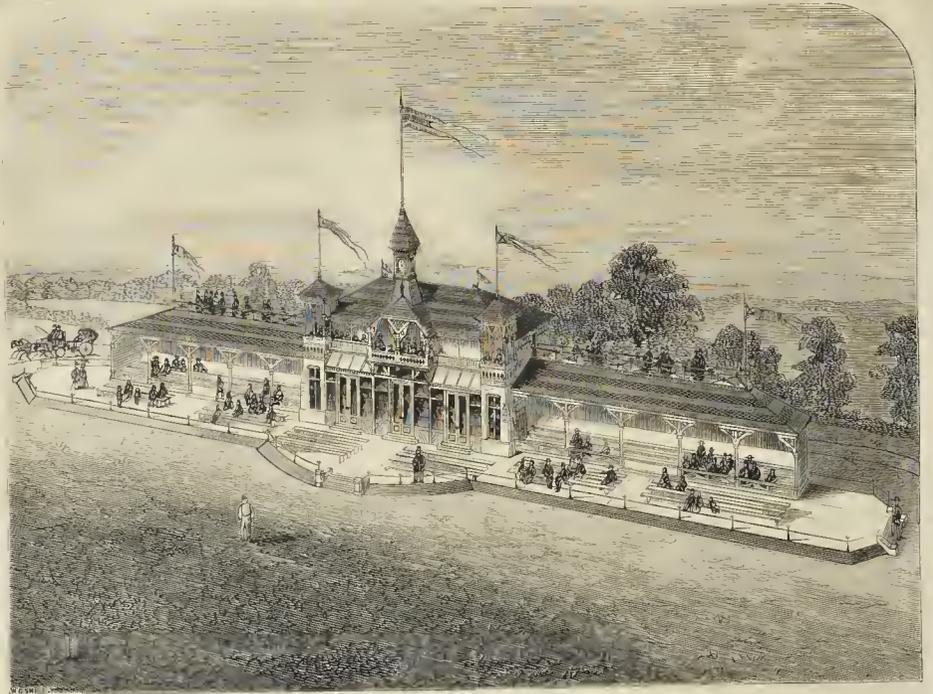

THE PROPOSED NEW PAVILION AT THE TRENT BRIDGE CRICKET-GROUND, NOTTINGHAM.

THIS building, intended to be erected from the design of Mr. S. Dutton Walker, F.S.A., will render the Trent Bridge Cricket-ground very attractive, and will be a great convenience to the subscribers and their friends. The central feature in the design is the Pavilion, two stories in height, the ground-floor being arranged for the purposes of dining and refreshment generally.

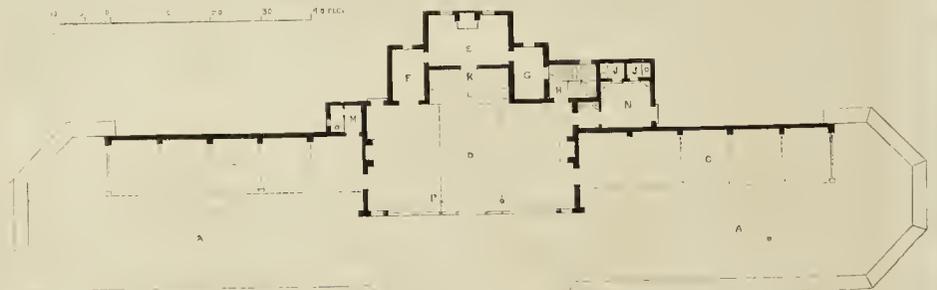

The upper apartment will form a balcony, from which a very excellent view of the whole cricket-field will be obtained. The covered wings on either side of the pavilion will be used when a match is being played, and will serve as excellent shelter from cold winds or rain. It is proposed to devote one wing to ladies. The seats in the wings are raised one above another as galleries. The front seats may be removable if required. In the rear will be kitchen and cricketers' dressing-rooms. A fine view of the cricket-field will also be obtained from the open galleries over the roofs of side wings, the floor of which will be on a level with the floor of the balcony.

Society of Engineers.—Mr. C. W. Harrison having resigned the secretaryship of the Society of Engineers, Mr. Perry F. Nursey, C.E., has been appointed to the vacant post.

PROPOSED PAVILION AT THE TRENT BRIDGE CRICKET-GROUND, NOTTINGHAM.
 MR. S. DUTTON WALKER, ARCHITECT.

CAEN WOOD TOWERS, HIGHGATE.—MESSRS. SALOMONS & JONES, ARCHITECTS.

CAEN WOOD TOWERS, HIGGATE.

CAEN WOOD TOWERS, erected at Higgate on the site of Fitzroy Farm and Duffryn Lodge, is the seat of Mr. Edward Brooke, nominated by the Lord Mayor to fill the office of sheriff of London at the next election. The plan of the house and a view of another part were published in the *Builder* of June, 1870. The building is faced with red Loughborough bricks, with sunk joints in black mortar, and dressings of Donkington stone. The chimney-shafts are of ornamental bricks of various patterns, from old examples moulded by Mr. Gunton, of Cossey, near Norwich. The roofs are covered with ornamental tiles in various patterns, and laid in bands. All the internal woodwork on the ground-floor is wainscot, and on the bed-room floor pitch pine. The doors and dado of halls and staircase have carved moulded panels on the solid. The floors are of parquetry. The ante-hall is laid with black and white marble. In the ante and inner hall are richly-carved chimney-pieces, executed by Mr. J. B. Philip from designs by the architects, with varied coloured polished marble shafts and dog-grates. The ceilings of dining-room, halls, morning-room, and library are of paneled wainscot, moulded and carved, with an elaborately-carved chimney-piece in the dining-room, also of wainscot, working up into the ceiling. On either side of the dining-room chimney-piece are windows looking into a conservatory, with fountains. The upper portions of windows above the transoms are fitted with stained glass, geometrical pattern. The staircase is of wainscot, covered with standards for gas on the newel, supplied by Mr. Verity, of Covent Garden. The staircase windows are filled with stained glass, the large one with the armorial bearings of the Brooke family for eighteen generations; the side lights, with subjects from Tounyson's poems.

The billiard-room windows are also fitted with stained glass, indicating different sports, such as hunting, fishing, coursing, shooting, croquet, archery, and so on. In the inner hall and upper landing leading to bed-rooms the windows are fitted with stained glass, with subjects from well-known fables. All the stained glass has been supplied by Messrs. Heaton, Butler, & Bayne.

The morning-room is lined with old Cordova leather, brought from Antwerp, and which was put up in a mansion there when Antwerp was under Spanish rule: it is in a fine state of preservation. The ceiling of this room is decorated to agree with the leather; the upper portions of the windows being fitted with stained glass, with designs of the seasons; the frieze of the cornice having heads modelled by Mr. J. B. Philip from Scriptural subjects. Off the dining-room is a picture-gallery leading into a conservatory, 80 ft. long, in ironwork. At the end of the conservatory is a pavilion with decorated roof, covered with ornamental pattern zinc, 50 ft. high to the vane,—the vane, a Mercury, in zinc. The floors of the conservatory, pavilion, and verandah are laid with ornamental tiles by Simpson & Sons, of the Strand. The drawing-room ceiling is paneled work, and decorated by Mr. Pollitt, of Manchester. The furniture throughout the house is made to agree with the architecture of the several rooms; the dining-room of pollard oak, the drawing-room of ebony and ivory, the morning-room of walnut.

The whole of the work, including the furniture supplied by Mr. Lamb, of Manchester, has been carried out from the designs and under the superintendance of Messrs. E. Salomons & J. P. Jones, architects; Messrs. Jackson & Shaw were the builders; and Mr. George Simmonds was the clerk of works.

AUCTIONS AND AUCTIONEERS.

SIR,—In reply to the statement that auctioneers' and estate agents' charges generally are ridiculously high in comparison with the knowledge or skill required, I would say, since houses have multiplied to such an extent, and are generally of such an inferior stamp to what they used to be when I first knew the business, it requires twice the skill to induce a man to trust his wife and family within some of them, and much more to induce him to pay the rents demanded and adhere to the surrendering clauses of present style of leases. It would be a capital thing if commissions were done away with altogether, and we were obliged to take out a licence at 25*l.* to enable us to practise, and then that we be permitted to charge for letters, attend-

ances, and some other portions of our business after the same scale as solicitors. All sales could be agreed for at a set sum, and I am sure our profession would not grumble, while your friend would have gained his point, and at the same time have given a deal of satisfaction to a very respectable class of the community. The *Builder* did not say whether architects get any pickings beyond the 5 per cent. mentioned. Do they put in ornamental work in plans that they know must be obtained in certain quarters? And what arrangements are previously made in those quarters? Perhaps it would be as well to inquire. AUCTIO.

SIR,—Can no remedy be found to purify auction sales, and suppress "knock-out" conspirators, who, by themselves and penniless hirelings, prevent private ladies and poor but honest dealers from buying?

At present, I avoid entering into the incompetency of many, who, forsaking their original callings, actually take out licenses as general auctioneers, but leave you to imagine how little these persons can possibly know of the value of property, in furniture, or stocks-in-trade, and how their clients' goods must be at the mercy of their dealers and buying brokers. We hear occasionally of the rostrum buying, selling, and money-leading, and of the absurdity of a heavily-furnished house being hammered down in two small rooms. Many buyers are in the front hall, unable to enter or see the auctioneer's eyes, and few indeed can glance at or handle the lots. Again, can any auctioneer, however skilled, upright, or strong-nerved, undergo the fearful fatigue of a long sale, the smothering dust of carpets and beds, the stench, heated rooms, the jeers and insults, without (from sheer disgust and exhaustion) being occasionally victimised by the low mob surrounding himself and clerk?

The remedy, I think, is easy. Let priced catalogues be sent to all (priced in plain figures) to be sent some days before the auction, to enable professional gentlemen and merchants, before and after office hours, to purchase peaceably, and save the fees wasted on officious and unscrupulous brokers. This plan would save the hard wear and tear of brain and body on the auction-sale, and enable the poor widow or needy owner to realise something, approaching fair second-hand value for oftentimes cherished goods parted with solely through death or debt.

My advice also is, employ only auctioneers bred to the profession—as a prey, to their honourable men,—and leave prices entirely to their skilled judgment and experience.

Make a small charge for the catalogues sufficient to defray cost of printing, paper, and compiling, otherwise, if gratis, improper parties would ask for and waste them. W. P. T.

THE BUILDING TRADE.

SIR,—Will you allow me space to make one or two remarks with reference to a letter that appeared in the *Builder* of the 15th ult., from the firm of Cox & Son, on the dispute in the building trade? I have no doubt the letter was written with the best intentions, but it is certainly calculated to leave wrong impressions, inasmuch as it is made to appear that the delegates are the only obstacle to an amicable settlement of the question. As a delegate representing the joiners of one of the largest firms in London, I do not think it is paying a very high compliment to the intelligence of the men to insinuate that they are prevented from accepting terms that they may deem satisfactory by a professional representative, who is working among and in daily intercourse with them. What the writer is pleased to call professional representatives are real representatives, elected by the men from amongst themselves in their shops and jobs. That the delegates are anxious for an amicable settlement is sufficiently shown by their endeavours to meet the employers by negotiation or effect such settlements, but it was unnecessary to do so, as the meeting at St. James's Hall sufficiently demonstrated. I am glad to see the firm of Messrs. Cox & Son so far admitted the justice of the claim for a reduction in the hours of labour as to immediately concede two hours and a half per week, with an equivalent advance of wages, with the understanding (I am informed by men in their employ) that they themselves would give the 9*l.* and nine hours as soon as other firms gave it, and entered into an agreement with the men to that effect.

The memorial referred to as coming from the Joiners' Society is an error, as it emanated from the delegates representing the carpenters and joiners of the principal building firms in London, embracing both society and non-society men, and may fairly be said to represent the collective opinion of the trade. A DELEGATE.

SIR,—I quite fell in with the remarks of "A. B.," the "Suggester." I found in your valuable paper of the 15th ult. I thought the practice of it would be fair and honourable towards the two classes; namely, those who are for the reduction of the time to 9*l.* or 8*l.* per hour, and those (and their name is legion) who advocate that number of hours which we think is a good, safe point of proportion from the minimum to the maximum of the time of labour. Excess is always dangerous; and, as we approach danger, the higher we go towards the maximum. It is best to stop at ten hours; and that number having been so long in practice, and by working hardy and ourselves and our employers, by the aid also of well-managed machinery, I feel certain (and I have had twenty-nine years of it) that no physical harm can arise from the custom. I am paid 8*l.* per hour; and, sir, looking at the state of society, the power of capital, the rights of masters, the difficulties of competition through the freedom of importation of joinery, and the low moral standard for jobs of some capitalists, which places great moral difficulties in the way of high moral exaltation who look to the lasting safety of their firms, I do think that 8*l.* per hour at my age of forty-nine is a beautiful wage, taking the market rate of labour into account. I do not like the idea of the reducing the hours of labour under the plea of (false labour) it is degrading, degenerating, drawing backwards, towards the minimum of time of labour; and *this is the plea to produce more leisure for the man employed*, at the expense of the capitalist. My fellow-workman in employ may indeed be filled with benevolent feelings towards his poor fellow-man who can get no

work to do; but he is not beneficent enough to give 8*l.* per day, or 8*l.*, to carry out into practice his benevolence. No; but he turns round and demands nine hours at 9*l.* per hour. I must exclaim with a master builder, "The plea is all moonshine!"

If sir, master builders grant an extra wage of 1*l.* per hour, with a promise of a future rise, then I think, with the suggester, that it would be fair to the one party and the other to let those go after nine hours or nine hours and a half, if they please, and those who are for the maintenance of ten hours' work to work that time.

I am certain that all unjust demands upon the employer tend to the injury of the employed. For my own part, I have always experienced goodwill, justice,—indeed, all that was right,—from my masters, and it has been my greatest delight to do all that I possibly could that was just and right between master and man. Do excuse the liberty I have taken. I thought it might cause some to think, and ask themselves, is the demand reasonable, moral, and just? JOHN ANDREW PARKINSON, Joiner.

SIR,—When will employers of labour take a hint from the acts of their own workmen, and by combining together meet the present strike mania on equal terms?

By an extensive system of amalgamation and mutual support, working men are enabled to bring the whole power of their union to bear on any one district, rendering individual opposition impossible. Even the Masters' Associations, as at present constituted, seem powerless to check the growing evil, simply because they have no organisation by which pecuniary support can be extended to the members during the prevalence of a "turn-out." It has occurred to me that the difficulty might be overcome by the establishment throughout the country of a masters' union, which should discuss all matters connected with the labour market, and compensate for losses during a strike against their decision.

If any one will calculate the sum total of the profits made by manufacturers, &c., throughout the country, he would at once perceive that, on the principle of fire insurance, a fractional per centage only would be necessary to meet all ordinary demands. Each policy would have, however, to be in itself a share to provide for any great strain, and, on the other hand, that it might receive back interest in the shape of dividend.

If this plan were adopted, masters would soon be able to have a word as to the regulations of their workshops, the character of their men or their foremen, the employment of free labour, and the worship of "Mary Ann."

J. J. A.

* We must let all sides speak; but the banding of class against class has no attraction for us.

SIR,—Will you allow me, by means of your paper, to suggest to the Master Builders' Association the necessity of their making generally known their address, there being a great many builders anxious to become members, who are prevented by the want of this information; and also to say that if the unreasonable demand made by the workmen is to be successfully opposed, it is necessary for the whole of the masters to act in unison, and to close their workshops immediately any firm is selected to be stopped. A BUILDER.

STAINING AND VARNISHING.

SIR,—Thanks for your answer last week to my question. Will you please allow me to ask another, viz., is it a universal practice with architects to allow the work to be done before varnishing, without stating the same in the specifications? Therefore size must always be used.

ONE WHO WANTS TO KNOW.
* Certainly not. If the work is to be thoroughly well done, size ought not to be used.

OBLIGING.

SIR,—If you can find a corner in your valuable paper for the enclosed, architects will be able to see how obliging their clients are. Is there no remedy for this? H. B.

* I have architect's plans of a very comfortable house, containing dining, drawing, and four bed rooms, kitchen, scullery, cellar, iron and back stairs, cost 500*l.*, which I should be pleased to lend to any reader of *Exchange and Mart*.—W. G.

THE RESPONSIBILITY OF RAILWAY COMPANIES.

SIR,—No doubt, many of your readers have had considerable experience in the transit, per rail, of materials used in building. Would some one of them kindly say what they find to be the usage of railway companies where a considerable quantity of the goods sent are found missing on arrival at their destination,—say one-third,—it being allowed that they were sent at "owner's risk," as was this entirely exonerate the company from all responsibility? I am specially referring to a case of stone-ware pipes being the articles conveyed. J. D. P.

COMPENSATION CASE.

A SPECIAL Petty Session has been held at the Police-court, Whitehaven, for the purpose of deciding the amount to be paid as compensation to the Whitehaven Cal and General Paving Company, and to Messrs. Shepherd & Leach, shipbuilders, by the trustees for the town and harbour, for the compulsory sale of a portion of the cab-company's premises, and the shipbuilding yard of Messrs. Shepherd & Leach, which are required for the wet dock about to be constructed at Whitehaven.

Mr. McKelvie opened the case on behalf of the Cab Company, who claimed 185*l.* 10*s.* 2*d.*, and afterwards called, as witnesses, among others, Mr. Wylie, architect, valuer, &c., Birkenhead; Mr. H. Hodgson, contractor, Workington; Mr. J. Shepherd, Joiner, Whitehaven; and other gentlemen, who gave evidence in support of the claim.

Mr. Howson addressed the magistrates on behalf of the trustees, and then called Messrs. Vevers (of the firm of Myers, Vevers, & Myers, Preston), and Job Buntley,

Kendal, who estimated the total amount to which the company was entitled at £4,381 10s. 10d. The magistrates decided to award the company 1,320*l.* As the company had made a large claim originally without substantiating it, and as the trustees had made no offer to settle the matter without referring it to arbitration, each party would have to pay their own costs. The claim of Messrs. Shepherd & Leech, shipbuilders, was afterwards gone into, and at the close of the hearing the magistrates awarded them 1,050*l.*

"CÆSAR'S CAMP."

Your correspondent does not overrate the interest attaching to this fine entrenchment; the title annexed to it, however, is a misnomer, for it is certainly post-Roman, and of different construction from British encampments.

The fullest account that I have met with calls it "Bensbury," or, more fully, "Cneben's-bury": *cneben* = knave, cf. Ger. *knabe*; A.S. *cneapan* = youth. It is a Saxon camp, and named after the said *Cneben*, who was one of Ethelbert's captains, killed here in battle with Ceawyn, or Cealwyn, of Wessex, A.D. 568.

It stands on Warren Farm, at the south-east corner of Wimbledon Common, in a commanding situation, immediately facing Combe Wood, on the rise of Kingston-hill. The outline of the embankment is marked by a circular grove of young oak-trees, the interior being used for grazing, and overrun with blackberry-bushes and yellow gorse now in full bloom. But, alas! Mr. Cooke has raised his *io pean* too soon; for I see by the papers that the whole area has been let, on building lease, for ninety-nine years, and is now being staked off in allotments.

I take this opportunity to direct attention to an older entrenchment, Romano-British in construction, that lies within easy reach of Town: it is called Arnesbury Banks, situated about one mile south of Epping, on the main road, facing Copped Hall. The place is little frequented, the whole site being thickly covered with a dense overgrowth of small bushy trees, that screen it from observation. It is not likely to tempt the cupidity of an avaricious landowner or building speculator.

It is very anomalous to find that while one rich man may be willing to expend thousands in providing an object that shall interest the present generation, and instruct posterity, his neighbour will be as willing and as ready to destroy such objects of interest as Providence has placed in his possession, derived from the industries of a former age. A. HALL.

A GLAZED SURFACE.

SIR.—This is a question that admits of more ventilation than appears on the surface. It is futile to plaster walls where steam or smoke is. You may whitewash your kitchen, laundry, and scullery every six months, and you never can have it clean; and you must, moreover, replaster it every three years. The perpetual heat of a kitchen or laundry rots, blisters, and breaks the flooring. I have never seen anything equal to vitrified bricks, which wash and clean like a good linen rubber. They have only one drawback, namely, the expense. They are excellent, too, for stables, as they do not absorb the ammonia as plastered walls do. I have seen fire-bricks tried to line stables, but they are almost useless for the purpose under consideration. What we want is a cheap lining that will repel steam and ammonia, and can be washed. I fear 5s. 6d. a square yard in town will hardly meet the emergency for the country.

ONE WHO BUILDS.

COMPETITIONS.

Worcester Guildhall.—Some time ago the Town Council advertised for plans for the reconstruction or rebuilding of their Guildhall, at costs which were stated in the conditions of competition to architects. Nine sets of plans have been received in response to this advertisement, and the Guildhall Committee have met to decide what steps should be taken relative to three of these sets which had arrived after the prescribed time. After some discussion it was agreed that the plans in question should be received, subject to the condition that if a premium were awarded to either of the three, the one should rest with the author thereof of proving that his plan was despatched in time to reach its destination, as per the conditions, in the ordinary course, and that the delay was due to detention by the rail-

way companies or others, for which the sender could not be justly made accountable. It is to be hoped that the town-council, who will have to settle this point, will rigidly adhere to their own conditions.

CHURCH-BUILDING NEWS.

Stratford-on-Avon.—Luddington Church has been consecrated by the Bishop of Worcester, in the presence of a large assemblage of clergy and laity. Some 800 years since a church stood here, and tradition reports that in it Shakspeare married his wife. The key and the font of the church are still extant; the former in the museum in Henley-street, and the latter in the graveyard attached to the church at Luddington. Two years since, Mr. Pickering, of Wilcote, Oxon, a native of the hamlet, expressed his intention to give 1,000*l.* as a building and endowment fund. It was equally divided, and Mr. John Baldwin, a resident of Luddington, set to work with such hearty goodwill that about a year since the Marchioness of Hertford laid the chief stone of the church. It has been erected from designs by Mr. John Cotton, of Birmingham. The style is Early Gothic. The inside is profusely decorated. The painted glass windows are all gifts of Mr. Pickering, Mr. Baldwin, and, one to the memory of the late vicar, the Rev. G. J. Graville. The font, of Armscott lias stone, was the gift of the Marchioness of Hertford. The plan of the edifice is in the form of a parallelogram, except that the projections of the chancel, porch, vestry, and bell-tower, break the exact uniformity of the figure. The church is placed upon the site with its axis almost due east and west. The blue lias limestone of the district, obtained from the Binton and Wilmoote quarries, has been used for the building, finished internally with trowelled stucco on a lining of brick. Corsham Down stone, which in colour contrasts with the blue walling stone, has been used for dressings to the windows and doors throughout, and for the tracery, which is of geometric character. The roof is covered with brindled Broseley tiles, with bright red and partly ornamented ridge cresting. The benches and woodwork of the church are stained in two tints, and varnished. A bell-turret, with slated spire, rises at the junction of the chancel with the nave, to a height of 60 ft., and is surrounded by a cross and gilded vane. The bell-stage contains three steel bells, which are rung from a recess in the lower part of the tower. These bells were the gift of Mr. John Baldwin. The east window, in stained glass, represents the Crucifixion. On the south side of the sanctuary is a window representing the Resurrection. The words below it are, "Why seek ye the living among the dead?" The two windows on the north side of the chancel were presented—one by Mr. Baldwin, of Christ blessing Little Children; and the other by Mrs. Baldwin, of Christ feeding the Multitude. All these windows in the chancel were produced by Messrs. Lavers, Barrand, & Westlake, of London. The stained-glass windows in the nave are the production of Messrs. Holland & Son, glass painters, Warwick. The western illustrate the events described in the 24th chapter of St. Matthew's Gospel, of the storm upon the sea, Christ walking upon the sea to His disciples in the ship, and His saving of Peter when sinking through want of faith. They were presented by Mr. J. Baldwin, to the memory of his brother. The south-west lancet window of the nave was given by Mr. William Sugden Armitage, of Manchester, and represents the good Samaritan pouring in oil and wine. The builders of the church were Messrs. J. & G. Callaway, of Stratford-on-Avon.

Woodhurst.—The Church of St. John the Baptist has been restored and re-opened for divine service. It is an edifice in the Perpendicular style, dating from about 1500. It consists of nave, chancel, small square tower, and south aisle, with a porch. The church was closed for the work of restoration last Midsummer. The architect was Mr. White; the contractors were Mr. J. Saint, of St. Ives, and Mr. Bunting. The north wall has been entirely rebuilt, a new roof erected to the south aisle, a new east window, and chancel fittings. The interior has been rescaled. The tower is a "bell cote," and has been covered with oaken shingle.

Sherfield-on-Loddon.—The parish church has been re-opened. It was in a very dilapidated condition. The rector took upon himself the duty of partially restoring the edifice. He subsequently decided to build a tower for the bells,

and to make it large enough to hold two more bells, thus increasing the number from four to six; and also to add a spire. The two new bells are the gift of Mr. Bramstone Stane, and the whole of them will shortly be placed in position. The works now completed consist of a tower and a spire, 95 ft. high, the latter being covered with oak shingles. The principal entrance to the church is through an archway in the tower, and the original doorway has been removed from the south wall, where it was shrouded by a miserable brick porch. A vaulting of stone forms the basement of the tower in the porch, in which is a carved tablet recording the fact of the rector having built the tower as a memorial of his brother. A carved figure of St. Leonard, in whose name the church is dedicated, is placed in a niche above the outer archway, and eight coupled belfry windows finish the tower. The rose-window has been removed to the north wall of the nave, and in its place a 3-light window has been put in, filled with stained glass, representing a baptismal subject, by Messrs. Clayton & Bell. The old font has been replaced by one standing upon a triple base, with eight Devon marble columns surrounding a central one of stone, with moulded bases and carved capitals. The western end of the nave, in which the organ lately stood, has been fitted up with benches in the north side, the font occupying the south-west angle. From the north-eastern angle of the nave a chamber has been erected, and in it the organ is now placed. The crowning work is the erection of a roodloft which is composed of Caen stone, with Devon marble shafts. In three panels above the Communion-table are the supper at Emmaus, and two attendant angels. In the four side panels are figures of the Evangelists. These panels are all of Salvati's mosaic. A variety of emblematical carving is introduced in the roodloft. The architect was Mr. J. West Huggall, of Oxford, and the works have been carried out by Messrs. Wheeler, builders, Reading.

Yatton.—The Church of St. Mary, at Yatton, after being closed for nearly two years, to undergo restoration, has now been re-opened. The principal items of the work are the rebuilding of the chancel; a new floor throughout the church, of wood and tessellated pavement; new west and other windows; new nave roof and parapet; new doors, seats of modern character, oak screens and stalls in the choir, communion-table and pulpit, and heating apparatus. The outlay has been about 3,000*l.* The aisle roofs and two chapels have still to be restored, but the work is postponed for the present for want of funds.

Burford.—The nave of Burford Church has been restored under the superintendence of Mr. G. E. Street, and a sum of nearly 3,000*l.* has been expended upon the work. There yet remain to be completed the restoration and the opening of the lantern tower, the restoration of the north and south transepts, and the chancel with its aisles, &c. About 4,000*l.* are required to finish this church. At present the work of restoration must stop, and the edifice be reopened, owing to lack of funds.

Eaton.—The foundation-stone of Christ Church, Eaton, has been laid by the Mayor of Norwich. About 1,600*l.* have been subscribed, but between 400*l.* and 500*l.* more are required to furnish the church with all needful fittings, and render it available for divine service. The foundations of the chancel have been laid, but for lack of funds this part of the church cannot at present be erected. The building is to be in the Gothic style of architecture of an Early period. It will be of a cruciform plan, and when complete will consist of a chancel, nave, transepts, and aisles, with organ-chamber and vestry on either side of the chancel, but it is at present only proposed to build the nave and transepts. The walls will be built externally with flint facing and Bath stone dressing, and internally stuccoed and relieved with bands and arches of stone and brick, and supported by buttresses. The window and door heads are to be in plate tracery, glazed with tinted cathedral glass. The roof is to be open-timbered, and covered with slate, and the floor laid with Staffordshire tiles. A light perforated stone spire will be erected for the bell on the south-east corner of the church. The execution of the work is undertaken by Mr. W. Wright and Mr. J. W. Lacey, builders, Norwich, from the designs of Mr. J. H. Brown and Mr. J. B. Pearce, joint architects, Norwich.

Chirbury (Shropshire).—The parish church of St. Michael was re-opened on the 22nd ult., after restoration. The church, built by the Austin

Friars, consists of a wide and lofty Early English nave, with narrow north and south aisles, extending to within 5 ft. of the east end, and a western tower of later date. There is no sign of a separate chancel ever having been intended; in fact, it is evident that a modern chancel arch, put in when the small brick chancel was built in 1733, occupied the place of the old east window, which was then removed into it. Previously to the recent restoration of the church the south aisle walls were in a dangerous state, and huge round-headed modern windows disfigured the walls; the flat roof over the nave, as well as those of the aisles, was concealed by a modern ceiling; there were high pews and a west gallery; also the small chancel arch with plaster moldings marred the effect of the interior, and the east gable of the nave above the wall-plate level consisted of a lath-and-plaster partition. A wide and lofty stone chancel arch has now been substituted for that described and various other works done, and a chancel has been formed by taking in the easternmost bay of the nave, and this is marked by a pierced stone screen next the nave, and high oak screens next the north and south chancel aisles; in the former of which is placed the organ; the latter is occupied by the school children. There is provision for 370 persons. The architect is Mr. E. Haycock, of Shrewsbury, and the builders are Messrs. Bowdler & Darlington. The glazing of the windows was executed by Messrs. Done & Davies; the carving by Mr. G. Landucci; and the warming apparatus was provided by Mr. W. Dodwell, of Shrewsbury. The total cost of the work is about 1,700l.

Uxcomb.—The restoration and repair of the parish church have now been completed, under the superintendence of Messrs. Slater & Carpenter, architects, London. The plan for the restoration included nave, chancel, with a south aisle, continued eastwards to form a chantry chapel, and westwards, to form a vestry, which constitutes a feature in the building, also a chapel on the north side of the chancel and nave called the Wandesford Chapel, a tower at the west end, and a porch on the south side. The Wandesford Chapel is separated from the chancel by oak parloises cut between two arches. The church is from twelfth to fifteenth century date. The tower is of the Kentish type, with an octagonal turret rising above it. The materials of the church are flint and rag stone. The new works comprise new roofs throughout, reseating, and repaving with tiles made from the designs of the Rev. Lord Alwyne Compton. The chancel is fitted up with oak stalls, and an organ has been presented. The total cost of structural works was 1,470l. 11s. 6d.; fittings, 900l. 14s. 7d.; architects' legal and incidental expenses, 229l. 0s. 9d.; total, 1,790l. 6s. 10d.

SCHOOL-BUILDING NEWS.

London.—The opening of St. Mary Magdalene Schools, St. Pancras, took place on Thursday, 15th ult. They adjoin the south side of the church; the building was originally a Dissenting chapel, called "Albany Chapel." It has been bought and converted to its new use, and is now capable of accommodating 1,000 children. The infants' department is on the basement, where there is also a large industrial kitchen, &c. The boys are on the ground floor, and the girls on the upper floor. Here the original coved roof, with its moulded beams and ribs, have been retained; the windows have, however, been changed from long lancets to two-light square-headed windows. The exterior is necessarily plain and unornamental. Mr. Allen is the builder engaged under the architects, Messrs. Slater & Carpenter.

Findon (Sussex).—A new school is being built here under Messrs. Slater & Carpenter, as a mixed school for boys and girls. It is constructed with flint, in cement walls, faced with hopped flints on the outside; the gables and dressings are of Caen stone, and the chimney shafts of red brick. By the special wish and help of the Marchioness of Bath, the details are of a rather more ornamental character than is absolutely necessary. The windows are of three cusped lights, with cusped circles and gables over each window, with burge-boards, &c. The eaves are of oak and lead, with a shingle spine; and the roof is open, with arched and cusped principals, and is plastered between the rafters. The builder is Mr. Barnes, of Brighton.

Codrington.—The memorial-stone of new parish schools has been laid here. The old school will be that of the more modern structure.

A plan, it is said, has been drawn by an architect, representing the new building to consist of two wings and a small centre spire. It is estimated that the cost of the work will be about 800l.

Acklam.—A new school has been opened at Acklam. A site was given for that purpose by Mr. Hustler, at whose expense the building, consisting of a school-room, with separate playgrounds, &c., for boys and girls, and a residence for the master, has been completed. The plans of the schools were by Mr. J. Sturdy, Middlesbrough, and the work was executed by Mr. J. Johnson, builder, Middlesbrough.

Lower Broughton.—The foundation-stone of St. Andrew's Schools, which are now in course of erection in Hough-lane, Lower Broughton, has been laid. The schools will contain a large room (64 ft. by 20 ft.) for 160 infants, and a mixed school-room (33 ft. by 17 ft.) for ninety boys and girls, besides class-rooms, porches, &c. There are two play-grounds. The style adopted is Gothic, of a plain character, with high-pitched roofs, small buttresses, and pointed windows. Internally the schools will be fitted in the usual manner, with desks and benches, the infant school having, besides, two galleries. The main roof-timbers, carried on ornamental stone brackets, will be stained and varnished, and the ceiling will be bordered by a small wood cornice, also varnished. Between each room, a principal ventilator will be placed. Mr. Tully is the architect, and whose superintendence the schools are being erected.

Southport.—Mr. John Fernley, of Southport, is building a school, to present to the Wesleyan Methodist Conference, at a cost of about 8,000l., to be devoted to the education of the daughters of Wesleyan Methodist ministers.

Newport.—The foundation-stone of new National Schools, to be erected at Newport, Salop, has been laid. The schools will be in connexion with the Church of England. The site is towards the south of the town, and consists of about an acre. Mr. Ladd, of London, was selected as the architect; and Mr. John Turnbull, of Cheswardine, as the builder. The schools will be built to accommodate 250 children—boys, girls, and infants. They will consist of a boys' school-room, 41 ft. 6 in. by 19 ft.; a girls' school, 33 ft. by 18 ft.; an infants' room of the same dimensions, with two class-rooms, and suitable offices. In addition will be a master's house. There will be a large playground. The premises will be built in domestic Gothic style. The facings will be of pressed bricks from Donnington Wood, with white and blue bricks for the bands and arches. The school-rooms will be faced inside with white bricks from Coalbrookdale. A prominent feature of the building will be a bell-turret. The amount of the contract is 1,493l., but incidental expenses and contingencies will, it is expected, bring up the total cost to 1,700l.

Southwick.—The foundation stone of new schools connected with the Roman Catholics has been laid by the R.C. Bishop of Hexham and Newcastle. The design is by Mr. J. Tillman, architect, Sunderland, and is in the Gothic style of architecture. Its length is 85 ft., and breadth 33 ft.

Highfield (Sheffield).—The eighth elementary school erected in connexion with St. Mary's Church has been opened in Alderson-road, Highfield. The site, valued at 700l., was given by Mr. Henry Wilson, and the scheme includes boys', girls', and infants' schools. At present only the infants' school has been erected, and for the time being it will be used as a mixed school. It is built at a cost of 800l. The large room is 34 ft. by 49 ft.; and there is a class-room attached, 18 ft. by 15 ft. There is also a large lobby, which will be used as a cloak-room for the children. Accommodation is provided for 240 scholars. The architect was Mr. Mitchell-Withers; the builders were Messrs. Chibley & Stringfellow; and the joiner was Mr. G. Oxley.

FROM SCOTLAND.

Edinburgh.—The Government are about to build new barracks for the married soldiers stationed in Edinburgh Castle. The site selected is on the south side of Johnstone-terrace. The building is to be of stone, with a slated roof, and iron verandahs overlooking the Grassmarket. The barracks will have three floors, and on each floor there will be accommodation for eighteen families, or a total of fifty-four families. Each family will have the entire use of a room 16 ft. by 14 ft. At present several families are accom-

modated in one large room, separation being secured only by screens. The upper floors will be approached by an iron staircase from the centre of the building, and each room will be fitted with a ventilating grate and cooking oven. Provision will be made for ventilating the rooms by means of fresh-air louvred inlets, and extracting shafts for foul air. A washing-house and laundry, provided with improved drying-closets, will also be built on a vacant piece of ground nearer the Grassmarket; and a portion of ground is to be laid out for bleaching and drying greens. The plans have to be yet approved of by the Dean of Guild Court.

The Prince Consort Memorial.—Since the selection of Charlotte-square as the site of the Prince Consort Memorial, arrangements have been in progress with a view to the satisfactory completion of this national undertaking. The square is intended to be laid out anew for the reception of the memorial. Instead of the present circular form of the enclosure, a square, with the angles splayed off, will be substituted. The memorial will be erected in the centre of the square, with the figure of the Prince looking towards the south, so that the leading object in the monument may be seen in profile from George-street. It was originally intended that the pedestal of the monument should be of free-stone; but during the progress of the work the committee came to be of opinion that granite could alone consort with the dignity and grandeur of the design. A subscription was accordingly opened for the purpose of securing a granite pedestal. It was stated at a recent committee meeting that his Grace the Duke of Buccleuch had guaranteed 2,000l. to the fund, and this had enabled the committee to commission a granite pedestal from Mr. Macdonald, of Aberdeen. A letter was read from the Marquis of Lorne stating that her Majesty had allowed the Princess Louise to subscribe 300l. to the pedestal fund, and it was agreed to add his lordship's name to the committee. It is expected that Mr. Macdonald will have the pedestal ready in about a year; and long before that time Mr. Steell will have finished the statutory portion of the memorial.

Musselburgh.—The want of a golf-house for the Musselburgh Golf Club has long been felt, but will soon be supplied. Plans have been prepared by Mr. Brown, architect, Edinburgh, for a building, which is to be erected at Musselburgh Links, a few yards to the north of the house belonging to the Hon. Company of Edinburgh Golfers. Consisting of two stories, the structure will be of a plain character, and will contain all the apartments requisite for a first-rate golf-house. The ground-floor will be taken up with the club-room, which is to be 37 ft. long by 18 ft. wide, dining-room, kitchen, lavatories, &c., while the upper floor will be set apart for a reading-room, two large and airy parlours, house-keeper's-room, and servants' rooms. The back wing of the house will contain a coal-cellar, larder, pantry, &c. There will be a sufficient number of windows to afford ample light to the whole. The building, which will have a projecting roof, with a window facing the east, will be so constructed that, in the event of increased accommodation being required at a future time, another wing can be easily added. The contracts are all taken up and operations commenced.

Glasgow.—The statue of the late Dr. Thomas Graham, Master of the Mint, by Mr. Wm. Brodie, R.S.A., destined to occupy the south-east corner of George-square, Glasgow, as a companion monument to that of James Watt in the south-west corner, has just arrived at Mr. Brodie's studio from the foundry of Messrs. R. Macfarlane & Co., Chelsea, where it was cast in bronze. The statue, which is a gift to Glasgow by Mr. Young of Kellie, represents Dr. Graham sitting in an easy, contemplative attitude. The massive head leans slightly forward; and the robe of a D.C.L. falls in sharp folds from the shoulders. The weight of the statue is 2 tons, and it was cast at one operation. It is finished, says the *Scotsman*, like a bronze for a mantel-piece. The statue is about to be placed on its pedestal.

Helensburgh.—A monument of Aberdeen granite is about to be erected on the banks of the Clyde at Helensburgh, in memory of the late Henry Bell, who first applied steam to navigation on that river. It consists of an obelisk 25 ft. long and 3 ft. square at the base, being the largest ever produced at the works from one stone. The block, which came from Messrs. Macdonald, Field, & Co.'s quarries at Stirlinghill, near

Peterhead, weighed 17 tons in its rough state, and, as now shaped and polished, it has a weight of 11 tons. The chelisk is to be set on a series of steps of the same material; and, with dado and plinth, the total height of the monument will be 34 ft.

Aberdeen.—Mr. J. Dickinson Brnnton, the inventor of the channel-tunnelling machine, says the *Scottsman*, having recently obtained a patent for a granite-turning apparatus, Messrs. Macdonald, Field, & Co., of the Aberdeen Granite Works, have purchased the patent for the large district north of the Forth and Clyde. The new machine has been started in the Aberdeen granite-yard. The patent proper is confined to a revolving steel disc, with sharp edge, inclined diagonally to the stone. There are two discs, one placed at the front, and another at the back of the stone. Each cuts off from $\frac{3}{4}$ to $\frac{1}{2}$ of an inch at a time, and moves over about 2 ft. per hour. The two discs thus applied to the stone—the one a little ahead of the other—reduce its size by $1\frac{1}{2}$ in. to 2 in. in an hour. It will do as much turning in a day as a mason can accomplish in a week, and the mason's tool-marks being avoided, the work comes out with a smoother surface, so much so that the first process of polishing is almost saved. The machine is capable of working stones of 16 in. diameter and under, but arrangements are in progress for extending its application to work of larger dimensions. Balusters, vases, pedestals, and all sorts of circular moulded work are said to be done very satisfactorily.

Books Received.

Air and Rain: the Beginnings of a Chemical Climatology. By ROBERT ANGUS SMITH, F.R.S., &c., Inspector of Alkali Works for the Government. London: Longmans, Green, & Co. 1872.

THE author of this work acknowledges that it is not one of a nature to be made interesting to general readers without sacrificing the large number of its facts. It is a strictly scientific work of its sort, but may be followed by another of a more popular character on the same subject. Many of the facts here recorded are of importance in the attempt to lay the foundations of a chemical climatology. Some of them show how short of the truth it was to say at one time that chemical experiment could not distinguish the air of Manchester from that of Helvellyn. There are indeed curious differences in the chemical and crystalline residual products at least of airs from different places—very different even to the eye, as in the engraved illustrations given by Mr. Angus Smith. Even the atmosphere of a railway carriage has been found to differ from other air, inasmuch as it was full of brilliant notes, which turned out in the microscope to be rolled or twisted plates or filaments of iron-dust, derived, no doubt, from the friction of the rails and wheels of the train, according to the yielding softness or resistive hardness of the iron or steel of which they may have consisted.

On the effect of the atmosphere on stones, bricks, mortar, &c., there is only a single page; but we shall quote this, although even it is a quotation from the author's own previous work "On the Air of Towns":—

"It has often been observed that the stones and bricks of buildings, especially under projecting parts, crumble more readily in large towns, where much coal is burnt, than elsewhere. Although this is not sufficient to prove an evil of the highest magnitude, it is still worthy of observation, first, as a fact, and next, as affecting the value of property. I was led to attribute this effect to the slow but constant action of the acid rain. If it affects the substance with so great an excess of silica, it is not to be expected that calcareous substances will resist it long; and one of the greatest evils in old buildings in Manchester is the deterioration of the mortar. It generally swells out, becomes very porous, and falls to pieces on the slightest touch. Some mortar in this condition, from a building behind the houses of the Literary and Philosophical Society of Manchester, was examined. 9.18 grs. of this gave 7.57 of BaSO₄, or 23.33 per cent. of sulphuric acid = 33.16 per cent. of sulphate of lime. It is not to be wondered at that iron oxidises readily, and that galvanised iron is valueless in a district where the acid rain converts it at once into a battery. It will be observed that this style of roofing is preserved in exact proportion to its distance from manufacturing districts. Iron by itself also becomes readily oxidised in this acid atmosphere. Bronze, too, is rapidly blackened, and articles of brass become affected to a great depth, losing their strength. I suppose the sulphurous acid forms on the surface a coating of sulphide of copper, whilst a sulphate is washed away if exposed to rain."

In treating of coal-smoke and the comminution of coal, the author says:—

"It may be asked why the vapour of water does not decompose in the presence of carbon, red hot as the carbon is, we suppose, before it issues in a black condition. There is a mode of consuming smoke which consists

in simply blowing into the furnace a jet of steam. The effect is instantaneous and remarkable. A clear flame is produced in a few seconds. This circumstance has probably induced many persons to attempt to burn steam. It certainly has the appearance of burning; but these people do not consider that water is already burnt. It is a product of combustion; chemically speaking, it is an oxide, and can burn as little as ashes can burn. The cause of the appearance is easily imagined. The water is decomposed by the heated carbon, whilst hydrogen and carbonic oxide, both combustible gases, are formed. These again come in contact with air, and then burn readily and clearly. The consequence is that no carbon appears in the smoke: it is burnt by halves,—by two processes instead of one; and the flame extends itself forward, as a little time is required for these operations.

By one method of employing steam there is a large amount of air supplied at the same time. The steam, however, without the excess of air brought by it, produces, as it appears to me, good results, but that must be in cases where there is already abundant air and heat.

Still the question arises, Why does not the steam formed by the coal prove sufficient? I confess this is not clear to me, and a little more information is required. The excess is an absolute mystery, as we can readily imagine an insufficient quantity to be one cause and the want of good mixture another. We do know that air and smoke may rush together through a fine tube unmixt for some time.

It may now be asked, What is the result of this? It is seen that the manufacturer's interest is not to make black smoke, because it is expensive. The public are interested in its removal, because it adds an unwholesome gas to those gases and solids already contained in ordinary smoke.

The excessive amount of air used entails an enormous waste of heat. This has not been calculated."

That there is a hitch in the chemistry of carbon and smoke consumption does seem to be evident. Chemists require to turn further attention to the subject; and, indeed, already certain not quite orthodox ideas as to carbon and its combustion are being ventilated. Dr. H. Vohl, of Cologne, supposes he has proved that the carbonic acid obtained by heating charcoal is not derived from the charcoal itself, but is carbonic acid occluded by that substance, being derived from the atmosphere. He states that charcoal freed from carbonic acid, and made to absorb oxygen, does not tend to 850 deg. Fahr.

The omission of the subject of ozone altogether, by Mr. Angus Smith, in treating of air and rain, in this "beginning of a chemical climatology" is surely a strange one. The author says he has not been able to make certain projected trials; which would have been a better excuse, we should think, for postponing the publication than for issuing the book without it. Exclusive of a due consideration of so essential an agent in all that relates to the air, what are experiments and facts relating to it worth, even from Mr. Angus Smith?

Hand-Book of Eastern Counties. London: John Murray.

WE have held back the *Hand-Book* last received from Albemarle-street, intending to check some of its statements and to find out a few of its weak points, but the opportunity has not come and the touring time has; so that we shall probably best serve our readers' purpose by at once mentioning the scope of the volume. It treats of Essex, Suffolk, Norfolk, and Cambridgeshire, is full of interesting matter, and is evidently based on personal knowledge. It includes a general map of the counties named, with separate plans of Colchester and Cambridge, and will be found the travellers' best companion in those districts.

History of the Old and New Trent Bridges, Nottingham. By M. O. TARBOTTON, Engineer. Nottingham: Allen & Son. 1871.

WHEN we illustrated the old and new Trent Bridges, we gave our readers some idea of the story attaching to the former, and described the construction of the latter. Mr. M. O. Tarbotton, the engineer of the new bridge, aided by Mr. S. Dutton Walker, F.S.A., has recently published a history of these bridges, and illustrated it with photographs. It makes a pretty volume, and will, doubtless, be found interesting by others besides the inhabitants of the district around the Trent, "the mid-barrier of England."

VARIORUM.

THE 1872 volume of Mr. John Timbs's "Year-Book of Facts in Science and Art" includes an engraved portrait and memoir of Sir William Thomson, F.R.S., the president last year of the British Association. The contents of the volume are selected, condensed, and arranged with Mr. Timbs's usual discrimination and skill; a permanent home is thus given to much information that would be otherwise fleeting, and the result is an interesting volume that can scarcely be taken up without advantage.—The same industrious author has produced a number of little books, such as "Characteristics of Eminent

Men," "Oddities of History," "Thoughts for Times and Seasons," under the general head of "Griffin's Stilling's Manuals, edited by John Timbs" (Stationers' Hall Court). We have found much to interest in these little books, especially in "Thoughts for Times and Seasons."

—The *Leisure Hour* tells its readers that,—"Montaigne House is on the point of being modernised; in other words, of parting with those characteristics which give it its historical value. We recall the days when it was the nursery of letters, the centre of fashion, the rendezvous of wit, the temple of the Muses, dedicated to the votaries of art and literature, the sons and daughters of genius—the daughters, perhaps, especially, as its ruinous walls were organised and presided over by a woman whose gifts and graces, whose taste and intelligence, while they fitted her to be the friend and companion of authors, statesmen, and politicians, impelled her to gather round her, with a generous contempt for the petty heart-burnings of rivalry, all the most distinguished and brilliant of her sex. Here Lord Lyttelton, Gilbert West, Johnson, Burke, Young, Mrs. Thrale, Mrs. Vesey, Miss Carter, Mrs. Boscowen, Mrs. Chapone, Mrs. Delany, Lord Oxford, and his daughter the Duchess of Portland, Sir Joshua Reynolds, and among a host of others not less eminent, Cowper, who has immortalised Mrs. Montaigne's "Feather Treasury," Hannah More, who versified the "Bas Bleu" club, and Benjamin Stillingfleet, whose blue stockings, it is said, gave their name to these unique reunions, habitually met, conferred, conversed, exchanged their ideas, reciprocated each other's sentiments, sharpened each other's wit, grew in each other's esteem, enjoyed each other's society—perhaps envied each other's successes—these floors have received their very footprints, these walls have contained their individualities, these mirrors have reflected their very forms, these precincts have witnessed their minutest actions, and echoed their spoken words."

The *Garden*, before describing the new cemetery in Philadelphia, says:—"The most creditable city improvements yet effected out by the Americans are their noble cemeteries. These are as great an advance upon ours as it is possible to conceive. They are in some cases as large as national parks, and as full of flowers and trees as a choice garden. Even small country villages have followed the example of the cities, and instead of the old-fashioned 'God's Acre,' where those who had been friends and neighbours in life were not separated in death, we see imitations of Greenwood, Laurel Hill, or Mount Auburn, with their drives, walks, and avenues; their select lots, railed in with stone and iron; their costly monuments, adorned with sculpture, and with other devices to rob the thought of death of somewhat of its gloom. In many respects the change is a beneficial one, especially in the matter of healthfulness. Nevertheless, when, about thirty-five years ago, the idea of such cemeteries was broached, it encountered great opposition. This soon gave way, and now, as we have said, every large city, and almost every growing village, in America has its cemetery. Many of the leading cities, indeed, have more than one. There are half a dozen or more within driving distance of New York; and now Philadelphia has lately consecrated that of West Laurel Hill, in addition to the old Laurel Hill Cemetery, which is one of the finest cemeteries in the world, and occupies a beautiful and commanding site."

Miscellaneous.

Employment of Children in Brickyards. At the Hull Police-court, Mr. Rickards, inspector of factories, applied to the police magistrate for an expression of his opinion with reference to the employment of children in brickyards. The work was let by the proprietors of the fields to persons who employed whom they thought proper, and it was desired to know who would be responsible for contravening the Act of Parliament, which provided that no children under ten years of age should be employed. In the matter, some of them only seeing their premises once a week. Mr. Travis said he had no doubt as to the decision he should give. All trades must be conducted according to law. The persons in whose behalf the application was made were manufacturers, and whether the work was carried on under their own supervision or not did not matter. The contractor to whom the work was let would also be liable.

The People's Gardens, Willesden.—The opening of these gardens for the season took place on Saturday, when about 500 persons, all members of the People's Garden Club, or visitors especially invited, were present, and passed a very enjoyable day and evening. These gardens, the property of an association of working men, known as the People's Garden Company, are about fifty acres in extent, situated on Old Oak Common, about five minutes' walk from Willesden Junction Station. The gardens are now laid out with flower beds, terraces, and gravelled walks. There are also cricket-grounds and croquet-lawns. Refreshment pavilions have been erected in various parts of the gardens, besides a large banquetting-hall, capable of dining from 800 to 1,000 persons, and which is also used as a tea-room. Swings, a gymnasium, and steam roundabouts have also been fitted up. A theatre, concert, and lecture-hall is in course of erection. The leading feature of the gardens, however, at present is its dancing platform, with orchestra in the centre, erected at a cost of about 1,000*l*. This platform is said to be the largest dancing platform in Europe, and is one-eighth of a mile in circumference.

Conversazione of the Institution of Civil Engineers.—On Tuesday evening last, Mr. Hawksley, the president of the Institution of Civil Engineers, and Mrs. Hawksley gave a *conversazione* at the International Exhibition, with the special characteristic of ladies attending. It was held in the British Picture Gallery and the machinery court. These departments of the International Exhibition building were prospectively decorated with plants and flowers. The company could not have numbered less than 1,500 ladies and gentlemen. Among the gentlemen were most of the leading engineers, artists, and literary men of the day. Mr. and Mrs. Hawksley received their guests at the northern entrance to the British Picture Gallery. Temporary refreshment-rooms, supplied with iced drinks and wines, were created on the outer gallery, the whole length of which, as the night wore on, was utilised as an open-air promenade. Other tables were spread in canvass compartments off the machinery floor; the Bior Garten was thrown open for smokers; the workpeople at the machinery were at their posts; and to the ether music was added the grinding of the machines. It was a brilliant entertainment.

Wingfield Convalescent Home.—This institution has been formally opened by Archbishop Clarke. The site of the building is joining the road leading from the Warwood asylum to Shotover, and about a mile from Oxford. Nine acres of land were secured for the purpose by the promoters of the undertaking. The building is erected to accommodate eight persons, four men and four women, and is so arranged as to be capable of enlargement at any future time if necessary. The designs were furnished gratuitously by Mr. Wilkinson, architect, Oxford, who added his personal superintendence to the work. The house comprises, on the ground-floor, a day-room each for the men and women, rooms for the committee and steward, separate apartments for each individual, laundry, kitchen, and the necessary offices, besides rooms for the matron, spare-room, &c. On the first floor are separate bedrooms for each. The walls are built with red bricks, and covered with osesley tiles. In front of the building is a paddock, for the accommodation of the patients. The contractor was Mr. Thomas Jones, of Oxford, and the cost of the building was 1,075*l*.

Oxford Architectural and Historical Society.—The members and friends of this society have visited All Souls' College, principally for the purpose of seeing the recently discovered in the chapel, which is now undergoing restoration. The company, which numbered about 100, met at two o'clock in the hall, where they were cordially received by Professor Burrows, one of the Fellows of the college. The President of the Society (the Rev. Mr. Trinity) said that at their present visit All Souls' College he had no doubt that they had received a great deal of instruction and assurance from the account Professor Burrows had given them of the chapel. Professor Burrows then read a paper on the history of the chapel. The company then proceeded to the chapel to inspect the retables, when Mr. James Carter addressed them. They then inspected the paintings that were recently discovered in the roof of the chapel, and the library of the college.

Brunel Outdone.—It is stated that a Mr. Burros, of Wisconsin, has issued a scheme for a railroad from the Atlantic to the West, to be built with a gauge of 30 ft. The road is to run from the East by the most direct line to Lake Erie. When it reaches the lake the road is to be built out into the water about 25 ft. below the surface for some distance, and thence end. It is to be operated with a machine which will navigate the water as well as traverse the land. When this amphibious locomotive arrives at the jumping-off place at Lake Erie, it is to slide gracefully into the water, and by slight transposition of its machinery, become a steam-boat. When it has arrived at Monroe it resumes its character of locomotive, and rolls off another broad-gauge road to Lake Michigan, whence it is to take water for Chicago. The machine is to be sufficiently large to carry a vessel of 500 tons, so that all necessity for ship canals will be done away with. The inventor expects to attain a speed of 25 miles per hour on land and 25 miles in water.

International Prison Congress.—Under the auspices of the Social Science Association, an International Congress for the Prevention and Repression of Crime, including Penal and Reformatory Treatment, will meet in London on the 3rd of July next, and will probably continue a fortnight. The object of the Congress is to collect prison statistics, to gather information, and to compare experience as to the working of different prison systems, and the effect of various systems of penal legislation, to compare the deterrent effects of various forms of punishment and treatment, and the methods adopted both for the repression and prevention of crime. The proposal to hold it comes from the Government of the United States. The English committee includes in its list persons belonging to all political parties, who are acquainted with, or interested in, prison questions. Contributions towards defraying the expenses are solicited, and may be forwarded to Mr. Edwin Pears, 1, Adam-street, Adelphi.

British Archaeological Association.—At a meeting, on May 22nd, the Rev. S. M. Mayhew and Mr. E. Roberts, F.S.A., exhibited interesting Roman and Medieval objects lately discovered in the excavations in Old Broad-street, City, and amongst the papers read was one "On the Origin and Early Use of Envelopes," by Mr. G. R. Wright, F.S.A., in which the writer sought to trace the use of covers and cases to decrees and letters from the days of the Egyptians, quoting in support of this theory various passages from the books of Kings, Esther, Job, and Nehemiah, down to Classic and Medieval times, when knights and ladies enclosed their epistles to one another in envelopes of silk and leather, bound round with ribbands (ribbed hands), tied in "love-knots," and oftentimes secured with a seal, thus proving that the use of a wrapper or envelope for royal despatches or letters was not the modern practice so generally supposed. The congress of the Association will be held on the 5th of August next, to the 10th, inclusive, at Wolverhampton, co. Stafford, under the presidency of the Earl of Dartmouth.

Improvements in Telegraphy.—At a recent meeting of the Inventors' Institute, Mr. F. H. Varley, F.R.A.S., read a paper on "Inventions relating to Telegraphy." After explaining the early attempts to establish telegraphy by Sir Francis Ronalds, and its practical introduction by Sir F. Cooke and Sir C. Wheatstone; referring to the improvements of Mr. Cromwell Varley in insulation, some of which were exhibited; and after attending to various systems of telegraphs, instruments of an entirely new construction, invented by the reader and his brother, Theophilus Varley, were exhibited, comprising a new form of key instrument for transmitting messages. An improvement in the ink-writing Morse instrument was shown, which consisted in the substitution of a self-feeding and repointing pencil, rotating by clockwork for the ink wheel arrangement.

Carving at St. Mark's, Leicester.—Mr. do Szymanowicz says, he "never felt so surprised in his life" as when he found that, in our notice of the works at St. Mark's Church, Leicester, we had not stated that he executed all the wood and stone carving there. We add this piece of information to our notice, and wonder whether Mr. Szymanowicz will say that he never felt so pleased in his life as when he found we had done so! The carving includes eight figures of considerable size.

Bursting of a Canal Bank.—The Birmingham and Worcester Canal has burst through its banks in the neighbourhood of Edgbaston, Birmingham. The end of the embankment gave way to the extent of about 60 ft.; and through the chasm 40 ft. deep the water poured into the field below. Several trees were carried away by the force of the flood, which swept onward across Whitley-road, over some other meadows into Pakenham-road. Here also several gentleman's villas, and against these the water broke. This was at a distance of nearly a quarter of a mile from the embankment. Eventually the water was dammed, and a large party of men at once set to work to build up a wall in the broken embankment.

New Lecture Hall, Working Men's Club, Wisbech.—Three years ago a committee of members of the Wisbech Working Men's Club and Institute was formed to carry out the erection of a new lecture-hall. On the extinction of their debt, in 1870, the committee invited designs, and those of Messrs. Adams & Son, of Wisbech, being selected, a contract was entered into with Mr. Girling, builder. The amount of the contract was 945*l*., half of which has already been paid. The new hall is 50 ft. in length by 31½ ft. The rooms on the ground-floor are intended to be set apart for a reading-room, a reading and conversation room, and a gymnasium. The hall has been opened for use.

A Submerged City.—The *St. Augustine (Florida) Press* gives an account of the discovery of a submerged City in that State.—During heavy gales which prevailed last Fall, it says, the tide was driven so low in the North River that a remarkable discovery was made. The remains of an ancient city were disclosed. Several wells, walled in with coquina, are now visible under water, but the foundations of the houses can only be felt with a pole. Further investigations have also brought to light a coquina quarry on this same site, but in the midst of a dense hammock. The rock is of a quality equal to any on Anastacia Island, and the quarry has been extensively used.

Fall of a Stand.—During the progress of the Ormskirk athletic sports, on Saturday, the 25th ult., an accident happened of a serious nature. A windmillor allowed about 200 persons, at a small charge, to occupy the stage round the mill. The stage suddenly gave way, and about fifteen persons fell to the ground, from a height of at least 30 ft. The spars and flooring of the stage fell upon them. The wounds of the injured were dressed, but several persons had received some of an internal nature. There were fourteen persons injured, six of them seriously.

Threatened Destruction at Tenby.—We have already condemned the proposal to destroy the interesting old gateway in Tenby, known as the "Five Arches," and were in hopes that the project had been abandoned. Another endeavour, however, to destroy the relics is to be made, at a meeting of the Town Council towards the end of this month, and we trust that those who know the value of such memorials, and the interest with which they invest a town, will rally their friends, and resist to the utmost the unwise endeavour.

The Proposed new Vegetable Market in the City.—A special meeting of the Common Council has been held to take into further consideration a report of the Markets Committee, suggesting the reconstruction of Farringdon-market at a cost of 150,000*l*.. A long discussion took place, resulting in the passing of a motion virtually shelving the recommendation of the committee, and leaving the whole question open for further deliberation.

The New Board-room of the City of London Union.—The guardians of the City of London Union held their first meeting on Tuesday in the new board-room, which, together with offices, has been erected in Bartholomew-close. The building, with its accommodation, is a great improvement upon the old offices in St. Mary Axe. In the evening the guardians celebrated the opening of the new building by dining together.

Statue and Vase found at Lucera.—A statue of Venus, of the best workmanship, has been found at Lucera, near Foggia, besides a vase 9 yards in circumference, and a mosaic floor. The usual dolphin is at the feet of the goddess, which measures 7 palms in height.

A New Bell for Cologne Cathedral.—The Emperor of Germany has just given to the Cologne Cathedral twenty-two cannons, taken from the French, which weigh over 50,000 lb., worth 90,000 francs. The bell which is to be formed from this will be 17 ft. high, and 13 ft. diameter at the base. It is to be called the imperial bell, and will be the largest in Europe, except the great bell of Moscow.

Fall of a Building.—On Saturday morning, the 25th ult., a large wing of the Clyde Steel Works, Sheffield, in the occupation of Messrs. Charles Osborn & Co., which is built on piers over the River Don, fell through the breaking of one of the metal girders. Fortunately only six men were in the place at the time, and they escaped with comparatively slight injuries, as the greater part of the roof went with the outside walls into the river.

Kensington Vestry Hall.—Last week the roof of this building was discovered to be on fire, but any great mischief was fortunately averted. Considering that this is the third time within the last two years, according to the vestry clerk, that a similar occurrence has taken place, it is necessary that immediate inquiry be made into the cause of such fires, and also to consider what steps should be taken to insure the future safety of the hall.

A Painted Window for Westminster Abbey.—The Captain Memorial Fund Committee, which was established at Portsmouth, has resolved to place a painted window in Westminster Abbey, commemorative of the terrible disaster off Cape Finisterre on the night of the 6th of September, 1870. The proposal has been sanctioned by Dean Stanley. It is to be hoped that an artist will be employed.

Purchasable Land in England.—Complaint having been made that there is very little land to be purchased in England, a correspondent of the Times states that one week's advertisements in that journal displayed announcements of the sale by auction of about 62,000 acres during the current season in twenty-four English counties and in Wales. This is exclusive of many small properties and of building land.

Sham Stained Glass.—A local paper describes in glowing terms the transcendent beauties of a window set up in All Saints' Church, Sheffield, by an oil and colour merchant of that town in memory of his father. It is produced by what is called the Diaphane process, and in its present position is simply an abomination.

Crystal Palace, Sydenham.—A new fountain has been opened in the broad space in the central transept of the Crystal Palace. It throws up a high jet, and the water falls in a graceful shower, which, when the sun shines on it, has a fine effect. This fountain is surrounded by flowers and foliage plants.

Southwark Bridge.—It is stated that 150,000l. are about to be spent in altering the gradients of Southwark Bridge, and considering the uncertainty that prevails as to the future requirements of the locality, it is urged by several parties that it is injudicious to incur such an expenditure, and that the work would doubtless have to be done over again before long.

A New Green Colour.—A new green has been discovered, which is said to be brilliant enough to replace the poisonous colour produced by arsenic. It is composed of twenty parts of oxide of zinc and one of sulphate of cobalt, mixed into a paste with water, and exposed to a red heat.

A Marine Aquarium for Manchester.—It is proposed to build a grand marine aquarium at Manchester, the funds for the carrying out of which are to be raised by a company. The building will be rectangular in shape, 120 ft. long and 70 ft. wide.

Royal Architectural Museum.—This museum will be open free to architects and their friends daily from ten a.m. to seven p.m. during the forthcoming architectural conference. On Thursday, June 6, at four o'clock, there will be an adjourned meeting of the council and employers of art workmen.

Opening of the Cottage Hospital at Savernake.—The cottage hospital just erected on the Marquis of Ailesbury's estate at Savernake, near Marlborough, has been opened by the Bishop of Salisbury.

International Exhibition.—Mr. Henry Casolari says that he designed and made the cartoon for the painted tile panel commended by us in speaking of a reredos No. 1,053. We followed the catalogue.

Ludgate-hill.—We understand that the carriage-way of Ludgate-hill is to be paved with American wood pavement, at an estimated cost of 2,247l.

TENDERS

For the erection of lace factory, with engine and boiler house, and other outbuildings, at New Basford, near Nottingham. Mr. Sydney R. Stevenson, architect:—

Fish & Son	£5,150 0 0
Mariotti, Wharney, & Scott	5,020 0 0
Wood & Son	4,980 0 0
Stevenson & Watson	4,960 0 0
Dennett & Co.	4,800 0 0
Vickers	4,550 0 0
Booker	4,540 0 0
Wilson	4,510 0 0
Middleton	4,312 0 0
S. & J. Cargill (accepted)	4,040 0 0
All exclusive of Messrs. Goldard & Massey's separate tender of 454l. for ironwork.	

For the erection of premises, 34, Cornhill, for Mr. W. Nash, Mr. T. T. Smith, architect. Quantities not supplied:—

King & Son	£3,360 0 0
Jacobs	3,335 0 0

For alteration, 111A, Aldersgate-street, for Mr. J. McCarthy. Mr. Sextus Dyalal, architect. Quantities by Mr. J. E. Orme:—

Cole & Son	£1,040 0 0
Kelly, Bros.	1,017 0 0
Paik	975 0 0
King & Son	923 0 0
Morier	882 0 0
Perry, Bros.	867 15 0
Browne & Robinson	837 0 0
Merritt & Ashby	815 0 0

For alterations to house and shop, Wadsworth-road, Messrs. Glasier & Son, architects:—

Watson, Bros.	£293 0 0
Cullum	450 0 0

For alteration and repairs at 55, Great Titchfield-street, for Mr. Budge:—

Stirling	£295 0 0
Watson, Bros.	197 0 0
White	185 0 0

For building and alterations, Easton-road. Mr. W. F. Petter, architect:—

Perkins	£1,067 0 0
Williams & Son	1,053 0 0
Kelly, Bros.	1,050 0 0
Watson, Bros.	1,048 0 0
Ayllett	940 0 0
Collins	908 0 0
Parks (withdrawn)	679 10 0

For alterations, Great Ormond-yard, for Messrs. Smith & Gale. Mr. F. Borcham, architect:—

Crabb	£359 0 0
Vaughan	247 0 0
Messrs. Budge	246 0 0
Blackmore & Morley	228 0 0
King (accepted)	179 0 0

For National Schools, Fawkham. Mr. F. Borcham, architect:—

Blake	£300 0 0
Tomlin	297 0 0
Leonard (accepted)	262 0 0

For the Wimbledon contract, sewers, &c.:—

Thompson	£877 18 0
Jones	602 0 0
Chandler & Son	589 5 0
Muston	620 0 0
Harris	619 0 0
Hancock	597 16 0
Peach	498 4 6
Wilson	487 10 0
Hulbard	481 10 0
Cole	481 10 0
Robins	430 0 0
Gregory	424 0 0
Woodham	421 0 0
Pazzy	395 0 0
Messrs. Budge	383 0 0
Jackson	375 0 0

For erecting villa residences, stables, and lodge, at East Sheen, Surrey, for Mr. E. W. Catt. Mr. Burden, architect. Quantities supplied by Mr. A. F. Gate:—

Parsons	House and Stables, Lodge, £2,780 0 0
Stonor	2,715 0 0
Carless	2,710 0 0
Stimpson & Co.	2,659 0 0
Servenot & White	2,635 0 0
Sims	2,600 0 0
Adamson	2,578 0 0
Cooke & Green (accepted)	2,442 0 0

For alterations and additions to Derwent Lodge, Roslyn Park Estate, Hampstead, for Dr. Underhill. Messrs. Spalding & Knight, architects. Quantities not supplied:—

Watts	£147 0 0
Servenot & White	904 0 0

For the erection of warehouses and business premises, at Guildford, for Messrs. Gill & Carling. Mr. Henry Peak, architect:—

Contract A.	
Swayne & Sons (accepted)	£504 2 0
Contract B.	
Loe	£376 0 0
Moan (accepted)	815 0 0

For a small house, at Guildford, for Mr. E. Williams	
Mr. Henry Peak, architect:—	
Strudwick	£244 0 0
Mason	243 0 0
Garnett	233 0 0
Pollard & Son	231 0 0
West	212 10 0
Swayne & Sons (accepted)	205 10 0

Laying out and forming roads on the Greenhill Estate, Hampstead, for Mr. G. H. Errington. Messrs. E. Fox Bousfield, surveyors:—

Watts (accepted)	£741 0 0
For new stabling, in Essex-road, Islington, for M. S. Norman. Quantities not supplied:—	
Taylor	£247 0 0
Strudwick	235 0 0
Smith	190 0 0

For completion of four semi-detached residences, on the Waldgrave Park estate, for Frances, Countess of Walgrave. Mr. Arthur E. Taylor, architect:—

Kilbey	£250 0 0
Morier	391 0 0
Palmer (accepted)	323 0 0

For Howell Harris Memorial Chapel, Trevecca College, South Wales. Mr. R. G. Thomas, architect:—

E. Williams	£3,126
Pritchard	2,800
Parry	2,652
Richardson	2,332
Moreland	2,368
Evan Williams (accepted)	2,050
J. Williams	1,712

For building a villa residence, at Dulwich, for Mr. Smith. Mr. Dudley, architect:—

Murray	£1,199 0 0
Sabey & Son	1,117 0 0
Saynell	1,099 0 0
Watson, Bros.	1,083 0 0
Stanley & Webster	1,043 0 0
Jarrard	1,009 0 0
Reed	949 0 0

Forschloe and master's residence, Warnham, Sussex. Inskip (accepted) £1,550 0 0

For alterations, &c., to premises, Bar Garden, Southwark, for Mr. Moss Isaac. Mr. J. D. Hayton, architect:—

Templey	£718 0 0
Baughey	735 0 0
Conter	735 0 0
Phillips	670 0 0
Cohen	625 0 0
Cooke & Green	620 0 0
Cressel	600 0 0
Nightingale	599 0 0
Dove, Bros.	565 0 0
Sawyer	578 0 0
Richardson	568 0 0
Elliot	567 0 0
Landfield	548 0 0

Proposed completion of works, Holy Trinity Church, Wadsworth. Mr. J. M. R. Halsar, architect:—

Parsons	£3,174 0 0
Higgs	3,070 0 0
Meyer & Son	3,083 0 0
Avis & Son	4,800 0 0
Nightingale	4,738 0 0
Perry & Co.	4,773 0 0
Jackson & Shaw	4,700 0 0
Dove, Bros.	4,675 0 0
Adamson & Sons	4,535 0 0

For rebuilding premises, for Messrs. Spencer, Turpin & Boldero. Mr. R. Parker, architect:—

Patman & Co.	£2,161 0 0
Longacre & Hargreaves	3,929 0 0
Merritt & Ashby	2,908 0 0
Temple & Foster	2,885 0 0
Nightingale	2,600 0 0
Morseman	2,594 0 0

For alterations and additions to Kirkbeck School, Kingsland. Mr. R. Walker, architect:—

Wood	£1,213 0 0
Crabb	1,195 0 0
Devoral	1,157 0 0
Silurmar	999 0 0
High	823 0 0
Kilby	817 0 0

For completion of residences on the Wellington Colliery estate, Berks, for the Rev. J. W. Sprinng, M.A. Edwin Clare, architect. Quantities supplied by Messrs. W. Wymouth & Son:—

Hill & Sons	£2,354 0 0
Dove, Bros.	2,125 0 0
Mansbridge	2,025 0 0
Rankin	1,830 0 0
Freedy & Son	1,850 0 0
Sawyer	1,839 0 0

TO CORRESPONDENTS.

W. F. P. (please send drawing or tracing, and answer she returned).—J. I. (not usually; but it would depend on circumstances).—G. L. (we decline recommending. The use of the w. h. it is desirable to have an inside handle to the doors of rail carriages).—H. S. (apply to patentee).—B. C. H. (we decline to take. Our correspondents must go their own way).—S. R. S.—Ed. T. M. R.—Ed. C. T. A.—S. M. B.—F. V. H. I. Builder.—A. J. J.—C. O.—H. K.—T. S.—W. B.—N. L.—E. G.—J. C.—H. V. L.—C. G. W.—Mr. L.—W. B.—R.—W. C. B.—A. G. T.—F. & M.—Mr. H.—P.—P. N.—A.—& Co. Messrs. W. C. C.—B. N.—H. I.

We are compelled to decline pointing out books and g. addresses.

All statements of facts, lists of tenders, &c. must accompany the name and address of the sender, not necessarily publication.

Note.—The responsibility of signed articles, and papers for public meetings, rests of course with the authors.

The Builder.

VOL. XXX.—No. 1531.

Masters and Men in London.

AN nothing be done to avert the threatened disruption of the building trade in the metropolis? A terrible crisis seems to be imminent, and it behoves every man who has the slightest influence to weigh the matter well, and to aid in bringing about a right conclusion by harmless means. The daily papers have made widely known the present position of parties. Let us briefly say that the delegates of the workmen, finding the Master Builders' Association declined to yield to their terms, called out the men employed by Mr. Brass, of Old-street (whose principal work is the New Post Office, St. Martin's-le-Grand), and by Messrs. Jackson & Shaw, who are

thus provided for. The argument is absolutely worthless. Carry it a little farther,—use it, as it may equally well be used, to justify working only five hours a day,—and this worthlessness becomes more strikingly apparent. The more straightforward assertion, "Our masters are making large profits, and we think we ought to participate in them," is less easily answered, excepting in the shape of counter-assertions, and these are not wanting. The cost of building in London and its neighbourhood has become very great, so great as, according to the master builders, to check it materially. Any further increase, they argue, is therefore to be deprecated, even admitting that it must be paid by the public and not by themselves; because it will further prevent building, or will drive it into the provinces, where wages are somewhat lower. As an example of this it is mentioned that the contract for the additions at the National Gallery has been taken by a country builder, who will prepare the work at a distance from Town, and send it up ready for fixing. It is reported that one of the deputations of joiners who met the Builders' Association said, when this probability was pointed out to them, "Very well; then, we must follow the work."

Putting out of view, the entirely selfish aspect of this observation, which ignores the fact that the London masters have large shops and establishments which they cannot easily remove, the trained operatives of the metropolis cannot wish seriously to destroy the London trade; the more clear-headed and sensible of them can scarcely believe that any advantage would result to them from such a course.

The diminution of the hours of labour and the increase in wages have been progressive. Some somewhat erroneous statistics having been published, an esteemed member of the trade, who remembers the lock-out of 1834, and that of 1859 (when the workmen unhappily starved themselves and their families for some twenty-five weeks, and gained nothing), has kindly looked through his books, and supplied us with the following correct particulars:—

	Working hours were per week.	Wages.	Per Hour.
40 years ago	60	27. to 30.	5½d. to 6d.
1847.	Left off at 4 o'clock	58½	30.
1853.	Advanced to 5 ½ a day	69½	33.
July, 1861.	Payment by the hour was introduced	56½	33.
Sept., 1865.		56½	35½
May, 1866.		56½	37 8

An advance in wages is not an unmixed good, and might go on simply bringing ruin to all. This has been found out in America. The recent report of the Massachusetts Bureau of Labour is regarded as affording a fair illustration of the general condition of labour in the eastern or manufacturing States; and in this view the facts embodied in the report are certainly not reassuring. The industrial classes are by no means represented to be in the prosperous condition that some of our politicians and legislators would have us believe. If they receive large wages, they are no better off for it, as they are compelled to pay them out again in increased prices for the necessities of life. The report seems fully to confirm the assertion that American workmen are now worse off than ever before, and are able to save less, and obtain fewer commodities, in exchange for their labour, than at any former period. The Tariff Laws, which are chiefly defended on the ground of their supposed protection of labour, injure rather than improve the condition of the working men, and the artificial enhancement of wages is more than neutralised by the increased cost of living.

So in England the rise in wages has necessarily led to the increase of the cost of commodities, and might be such, as we have suggested before, as to place England at a considerable disadvantage in competition with other countries

without corresponding advantage to individuals. However, we are by no means about to assert that the wise limit is yet reached; we are seeking simply to state quietly, dispassionately, and without one spark of partizanship, some considerations which deserve to be weighed by those who are about to commit themselves to a wasteful, costly, and barbarous struggle of endurance, from which, end as it otherwise may, all parties will inevitably retire losers.

And now what have we to suggest in order to prevent the national loss and the personal damage and privation that would result from a lock-out? We advise **COMPROMISE**; in other words, mutual concession. The time at present worked is 56½ hours, at 8d. an hour, bringing 37s. 8d. per week: the programme asked for by the men is 51 hours at 9d., or 38s. 3d. a week,—an increase merely of 7d. a week, so far as money gain to the men is concerned, though entailing a large increase in the cost of production, at least 12½ per cent. as regards the masters. What we propose is that men and masters should mutually agree to let the working hours per week be 54 (the hours agreed upon by the engineers), at the rate of 8½d. an hour. This would give exactly the same money result, 38s. 3d., and would more nearly follow the previous progressive improvements observable in the statement given above. Whichever side first proposes this concession will secure and deserve the sympathy and support of the outside public. Its joint acceptance would maintain good feeling, save money, and lead to the avoidance of much sorrowful sacrifice.

INDUSTRIAL DEVELOPMENT IN AMERICA.

An article in the *Penn Monthly* on the Census of Industrial Employment, Wages, and Social Condition in Philadelphia in 1870, shows in a remarkable manner the extent to which purely productive industry has been developed there, and asserts that an almost entire exemption has so far been enjoyed from the agitations and conflicts that have occurred elsewhere. No matter how large or how small the establishment, there is rarely or never an occasion for difference between employers and workmen. Some of the greater iron works almost approach the co-operative system in the harmony of masters with workmen, and in the frequent exchange of acts of kindness and substantial benefits.

Taking last year, 1871, it may be roundly stated that a city of 800,000 people produced four hundred millions of dollars' worth of actual fabrics, exclusive of all mere sales or exchanges; and that on this mass of fabrics produced, the net profit, in the sense of values realised above the cost for values paid out, was nearly one hundred millions of dollars.

The world, generally, has concerned itself with the profits of mere trade, far more than with the interests and profits of creative industry, and it is thought that wealth increases satisfactorily when a city is made a point through which exchanges pass. This is a mistake. The values produced here in manufactures pay a profit not drawn from the consumer; it is a created profit, the creation of the active brain and the skilful hand. It is the direct wealth of powers which might, but for such opportunity, have been wholly wasted in idleness. For this reason it becomes conspicuous for the benefits it confers, and it makes itself seen and felt in a thousand forms that are not consumed with the day's demand.

No adequate discussion of the true relation of wages to national prosperity has yet appeared, but we assume that no other single fact has such permanent and overruling importance; nothing is so vital to the prosperity and endurance of a highly-advanced nation, as that the productive industry of its people shall be fully employed, and at the same time liberally paid. To be fully employed, for the time, at wages merely sufficient to maintain existence on the part of the employed classes, is to place its interests on the very border of a gulf of disorder and of suffering.

The census details show amongst other things that, speaking of the commonest factory labour,

building the New Colonial Offices in Downing-street. In the case of the latter all have left, but at Mr. Brass's the men who work at machines remain. On this occurring the committee of the Builders' Association held a meeting, and, after a long deliberation, resolved to convene a general meeting of the trade for (this) Friday, June 7th, at the Freemasons' Tavern, Great Queen-street, when a general lock-out will be recommended unless the workmen return to the two firms named on the existing terms. This, we are told, was determined unanimously, not by hasty show of hands, but by written vote. It is easy to believe that the builders came to this determination with the greatest unwillingness: the loss to them will be terrible. One firm tell us they estimate the loss to them would be 100% a week. A second say 200%. Interest on capital embarked must be paid, rent, clerks, foremen, and others. They are most anxious, we can well understand, to avoid the general lock-out if possible, but they see no way out of the difficulty, believing that the advance asked for is not justified by the position of business, and feeling, moreover, that they have no security against a further demand next year. The men on their side profess themselves determined to listen to no compromise, and so the difficulty grows greater and greater. It would be agreeable to us if, following the impulse of feeling, we could conscientiously say to the masters, give the men "the nine hours" and give them the 8d. But would this feeling, would this saying enable the masters to do so, or make the act a wise one? We fear not. The large builders assert that they are not busy, and that there are plenty of men out of employ who have been anxious to come into their shops. The men themselves make it their argument for shortening the hours of labour that large numbers of artisans are out of employ, and that if they themselves only work nine hours instead of ten, and the same amount of work is to be done, a large number of those now unemployed must be taken on, and will

one young woman now attends two power-loom, weaving 10,000 yards each of dress goods per year; who formerly one person of greater physical strength, attended one hand-loom, weaving not more than half as much each per year, or one-fourth as much in all; and show that the improvements of the past fifteen years have fully doubled the productive power of every person employed, and, what is better, have enlarged the basis of employment so that twice as many can be effectively employed.

There is nothing heard of strikes, or of hostility between proprietors and workmen. There are 92,112 adults, or full men, in the lists of persons employed at wages in manufacturing pursuits in this one city; a productive force really enormous, working as it is with over 2,000 steam-engines, of the aggregate power of 50,000 horses. "Almost unconsciously to most of our citizens, this vast machinery does its daily work, making fabrics of iron, wood, and textile fibres largely exceeding 1,000,000 dollars in value for every working-day in the year.

Wages fell somewhat heavily in 1868 and 1869, from the high figures of the war, but since 1869 they have advanced rather than receded further. Many classes are paid 21 dolls. per week, or 3-50 dolls. per day; many other classes more than this, and skilled persons at piecework earn even 5 dolls. and 6 dolls. per day. Mere labourers, of course, decline to 12 dolls., 10 dolls., and 9 dolls. per week, which last is the lowest rate paid to any labourer assuming to do a man's work. All skilled labour is really high, showing that the door is open to a scale of wages affording abundant means of living to all who have the capacity to work with skill at all.

There is little or no living in rooms, or in tenement houses, except on the part of some wholly unskilled labourers. This city is conspicuous for its great number of dwellings of abundant neatness and comfort, owned and occupied by single families whose whole maintenance is from manufacturing industry. And these houses, if rented, pay 15 dolls. to 25 dolls. per month, and, if owned by the occupant, taxes, interest, and other expenses represent a close approach to the same annual expenditure. That all this, with the current cost of living and the frequent expenditures for other than mere necessities, is easily borne by our mechanic and workman, is sufficient proof that his resources from wages are comparatively ample. It is asserted that at least fifteen or twenty leading articles, in which the values made here now exceed half a million dollars each yearly, have been won in the last ten years absolutely as against foreign competition, and that the markets of New York, as of all other cities of this country, take now no other than the supply sent from Philadelphia manufacturers.

Reference is made to an iron-mill where the power of 800 horses and 1,200 men is directed to the production of a single description of wrought-iron work, exceeding 3,000,000 dollars in value in a year; and to another where 1,800 men and 600 horse-power finish a powerful railway-locomotive every working day of the year. In a third establishment nearly 800 power-loom, with 900 attendants, manufacture worsted goods at the rate of 10,000,000 yards per year; the aggregate value counting as many millions, nearly, as of the iron-works first cited. More than twenty establishments exceeding 1,000,000 dollars in annual production exist within the city, and at least ten exceed 2,500,000 dollars each, the highest closely approaching 5,000,000 dollars.

The writer claims that these establishments are essentially distinct from and beyond European establishments in all the characteristics of better-paid, more intelligent, and effective labour, and greater results in productive power. One of the proprietors spent a few months in England recently, visiting the districts and establishments making his own class of goods, and says that everywhere he found defective machinery, unintelligent workmen, and want of improvement very striking, in comparison with his own. "This contrast in progress is due to the fact that neither man nor master here stops to embarrass the other by needless contests, and neither rests for a moment in a routine of work that he may, by any ingenuity or any expenditure, improve. The whole body of productive establishments is full of life and progress: new and magnificent structures are daily rising to be filled with new machinery and better forms of labour." There ought not to be an hour's difference between employer and employed; but if the dead-level of starvation-prices is the basis, there can be no

rest: if there is no skill and no intelligence developed to be observed and rewarded and to stimulate the workman, there is also no rest or peace.

There is surely matter here for both men and masters in Great Britain to note and think over.

A SKETCH OF THE EARLY HISTORY OF RAILWAYS.

The introduction of the railway system into the United Kingdom is a subject of very considerable interest, both to the professional and the general reader, for it was rapid, and within a very few years it worked very marvellous changes. Under it not only was the whole breadth of Britain covered with works of construction of a magnitude and boldness before unheard of, but it revolutionised our whole social system, and paved the way to changes which have made the thirty years from 1830 to 1860 more memorable than any corresponding period in the material history of our country. With facilities for travel and transport came the penny post, free trade, telegraphy, practical knowledge of sanitary science, and vast changes in the residence and daily habits of the classes engaged in commerce and manufactures,—changes affecting the social, political, commercial, scientific, and financial progress of the country, all of which were prodigiously developed within that period by the agency, direct or indirect, of railways. Even our military and naval resources, our Colonial government, our tenure of India, our foreign loans, our trade with the extremes of East and West, have been pushed forward and expanded by the introduction of a free, cheap, and rapid intercourse between the several parts and dependencies of our own empire and of the world.

"Men" have "run to and fro," and "Knowledge" of many kinds "has been increased."

These developments, however, from whatever source derived, belong rather to the history of the period and of the country than to that of railways; but these, in their strictest and most narrow sense, have also their history, and one full of peculiarities, of anecdote, of interest, always of an amusing, and often of an instructive character, arising out of the sudden collision between the new and old ideas and persons,—those who pushed and those who resisted the change,—especially in the rural districts of the country. The success of the Liverpool and Manchester railway was so complete, and the speed acquired upon it so utterly unexpected, that the attention of all England was called to the subject, and the energies of the promoters and opponents of the system were strained to the utmost.

Also the demand for engineers and surveyors and others employed in the preparation for and construction of the lines of railway that were at once brought forward, was far in advance of the supply. The London and Birmingham, the London and Southampton, the Grand Junction, the Great Western, the Greenwich, were all brought forward, or all under construction about the same time; and, of the whole staff employed, there were scarce a score who possessed any practical experience of a railway, or who knew anything, even in theory, of the accommodations to be supplied, or the dangers to be provided against in construction. The Liverpool and Manchester, the Stockton and Darlington, and even the Canterbury and Whitstable lines were the subject of close attention by all whose duties allowed them an occasional absence.

Moreover, the men who were sent out to prepare the plans and take the levels found themselves among people of the deepest agricultural dye, for the most part vehemently hostile to the proposed undertaking, and resting their opposition upon the most extraordinary and baseless notions of what its effects would be. The landowners dreaded competition with their produce; the rural clergy feared lest men should run to and fro and secular knowledge be increased; heads of schools and colleges, especially of Eton and Oxford, predicted the destruction of discipline and the demoralisation of youth; sportsmen declared that game would be frightened from the coverts, and hunting become impracticable; the peasants were jealous of the high wages paid to the staff men; millers feared for their water-courses, and with farmers, corn-dealers, and maltsters formed themselves into associations to oppose "the Bill"; and all prepared to give evidence against it before the Parliamentary committees.

Most amusing were the stratagems had re-

course to effect or prevent the necessary surveys. The squire and the parson were usually the leaders in availing trespass, and the surveyor often had to work by night, or to observe what he could from some contiguous road or canal-bank, or some footpath traversing the demesne. On one occasion a Dorset squire and M.P., celebrated for his monosyllabic nicknames, captured a whole staff of surveyors and chainmen, and kept them all night in custody within a barn. Another time, it happened to be of vital consequence to the success of a Bill to have an accurate survey of a very complex demesne round a nobleman's house, in a county in which the Ordnance map was inaccurate, and afforded little aid. The tytho maps were then unknown, and the parish terrier was in the rector's study. There was no friendly canal, no convenient footpath, and all were on the alert. What was to be done? Time pressed, and the enemy were well aware that an error in the representation of the manner in which the railway would affect the house would be fatal. The chief engineer,—a man of more energy than taste,—waited on the peer, assured him first that the viaduct would not be seen, or that if seen it would be ornamental, and then offered to cover it with ivy, to paint it yellow, or with his lordship's arms upon each span. All was in vain. There was, however, a church with a very lofty tower, near the mansion, and a second, of equal altitude, about a quarter of a mile distant, beyond it. Early one summer's morning two innocent-looking antiquaries called at the two rectories for the keys of the churches, and were accompanied in one case by the rector, in the other by the clerk, to see the building. Questions were asked as to the date of the bells, and details of the tower, which were opened, and then, while the showmen were engaged in the chancel, the whole band entered the tower, wedged up the door, drew up the ladders, pitched their theodolites on the loaded roof, and proceeded to fix the principal points of the demesne, and to sketch in the details. The success was complete. The tower remained in a state of siege all day. The peer himself and his keeper visited the spot, but the door was strong, the tower high, the garrison well victualled, and when, after dark, they descended, the ground was left free, for resistance had become needless.

The Ordnance map, save those of Essex, in the counties north of London, was usually tolerably accurate, and of great use in laying down the general course of the line, but it afforded no aid towards obtaining the levels, or, as they were technically called, the sections. Here the canals were of great use, for the level of each pond was known and accurately laid down upon Bradshaw's celebrated canal map, the sale of which increased enormously. From the canal where access was denied, the levels were brought up to the nearest open ground, and then men were sent in at full speed to set up their stakes which were at once read, before the keepers could come up. Sometimes a shed of brick stood near, and the courses could be counted. Sometimes, to avoid suspicion, a man had a sea of feet pasted right up one leg and his back, and did duty as a staff. Once, where it was very important to get the height of one special and well-watched spot, in the midst of a grass field a horse happened to walk across the line of sight, and his shoulder to intersect the horizontal wire of the telescope. Boys were sent to pelt him off the field. The quadruped made for a gate. He was there attracted by a supply of apples caught, and measured, and the required level obtained, possibly with more ingenuity than accuracy! but the surveyor could declare upon oath before the Lords that the section had been actually taken.

The Great Western met with very vexatious opposition from the leading landowners near Marlborough, who were justly alarmed at the diversion of the Western traffic from the turnpike trusts and private property along the Bath road. It was proposed to punish this opposition by the conversion of a very celebrated, ancient and much-prized local monument, a white horse not the white horse, into a locomotive, the very idea of which was an abomination to the neighbourhood. Sketches were taken to scale, a large down fifty surveyors at nightfall to peg out the outline on the grassy slope, and then scraping away the turf, to transmit the quadruped into a magnificent engine, bearing G. W. R. in large letters on its boiler. The squires never knew how near they were to this dishonour. Fortunately for their peace of mind, the opposi-

was withdrawn in time, and the project fell through, to the intense disgust, if not of the original deviser of the joke, yet of the executive, one of whom, a well-known Bristol man, a retired naval officer, was the leader in all sorts of fun, as in all hard work. Of lesser mischief, such as painting gates red, serving false notices, and pranks somewhat in the Theodore Hook line, there was no lack, but in truth the opponents were so violent, and so seriously overstated their own case, that their account of their real grievances was not always credited.

Once, near Malmesbury, in the midst of a most bucolical district, the late George Hennet, while taking sections across a green, was pestered by a mob of girls, who, half from curiosity and half from love of fun, much impeded his operations. Calling the leader of them, he let her look through his glass, where she saw the staff-holder inverted. "There," said he, "if you do not go away I will turn my spy-glass upon you all, and see you on your heads, and then where will your petticoats be?" They all shrieked out and ran away, to the great delight of Mr. Hennet, who was very proud of his idea, and quite unaware that Niebuhr had got rid of the Arabs in the same way.

There is, or used to be, the mistress of a great establishment at Stroud, who was thrown into a state of serious agitation when told that the railway would be carried some feet above the roof of her brewery. The effect upon the town was also serious, and the fear of what might happen to their much-loved tittle was one of the causes of a local riot at one of the promoters' meetings. It was at Stroud that the Cheltenham railway lost most of its local support, by the statement of one of the engineers, that a tunnel would be driven through Saperton-hill much longer than the canal tunnel, and several feet below it. The thing seemed to the rural mind impossible.

The plans and sections were required to be deposited with the several clerks of the peace by midnight on the 30th of November, and great were the exertions made to secure this. The Bristol and Exeter railway, about seventy miles long, was proposed, a company formed, and the plans completed in about six weeks, the actual survey occupying about a fortnight. Fortunately the country was mostly level, and with few enclosures, and those of large area; but the line passed by Taunton, Bridgwater, and Wellington, and near to these towns, as to Bristol and Exeter, the work was intricate and laborious. Brunel was the engineer, and Gravatt, a man of great energy and skill, his chief assistant. Surveyors were brought from all parts, even from Lancashire; a central office was established in the great room at the Bridgwater Hotel, and there as fast as the work was knocked off, it was put together. The levels were checked by an instrument of unusual size and power, which read at very great distances. During the whole fortnight no man went to bed; they surveyed by day and plotted their work by night, sleeping as they could in postchaises or armchairs, and sometimes over the drawing-table. The day after the deposit the staff had a sumptuous dinner at Bridgwater, and several fell asleep at the table before the dishes were removed. The survey held good, though attacked by a very powerful opposition, led by a certain well-known Rev. Proctor Thomas, and by Mr. Merivale, whose residential property near Exeter was interfered with.

The Taff Vale, Brunel's only narrow-gauge railway, was also started upon short notice. There the work was put together at the Cardiff Arms, at Cardiff, and about eight o'clock on the night of the 30th, a serious discrepancy was discovered in the levels near Newbridge, eleven miles distant. Brunel was present. Instantly lanterns were purchased, chains ordered round, and twenty surveyors and staff-men bundled into them and sent off to Newbridge. On the way Brunel explained to his chief assistants what he wanted. Each man marched off to his post, fixed his staves and lanterns; Brunel himself ran over the ground, about a mile, with his level; the error was discovered and corrected, and the plans were deposited that night at Cardiff with six minutes to spare. It was upon this railway, opposed in committee with the utmost keenness by Lord Granville Somerset, that upon some suspicion of an error of section an eminent ironmaster proposed quietly to alter the ground, a cinder-tip, since the deposited plans could not be altered.

These combinations of rapidity and accuracy, and the reckless expenditure of money, bewildered the old-fashioned surveyors. The level was an instrument then but little known. Drain-

ing operations, not then very common, were carried on with an ordinary spirit level with two sights, and accuracy to within an inch was considered sufficient, whereas the new men levelled to three places of decimals. The most accurate land surveyor thought little of height. It is recorded that a well-known Welsh squire, descending upon his complete knowledge of his estate to a scientific officer, was asked, "Oh, you know Mynydd Garth, do you?" "I should think I did," quoth the squire, "and all about it." "Indeed! pray what is its height?" "Ugh!" grunted the discomfited squire, in a half aside, "What a question to ask of a gentleman!"

Architects, as a body, were in those days very ignorant of engineering knowledge, and incapable of calculating the strength of a beam or the thrust of an arch. The setting out of the lines for a skew bridge was an operation quite beyond them, or, with better excuse, the laying out the curves of a railway. In a suburb of London, rather an eminent architect came one day to the resident engineer of a railway, in great trouble: he was to build a crescent, or rather a semicircle, and his only notion of setting it out was by means of a long cord from a central peg. Unfortunately a church had already been built over the centre, and hence the difficulty.

The theodolite also was an instrument entirely unknown, even by name, save to the royal engineers, and a few of the leading civil engineers. On one occasion the late Colonel Everest was visiting a Warwickshire peer, and exhibiting and explaining what the ladies called his "theodolite." With t he mentioned that he had surveyed large tracts of country in India. "Indeed," said his host, "and can you survey a farm?" "Certainly," was the answer. "Then, colonel," said his lord, perfectly serious, "as you don't shoot, would you oblige me by surveying my home farm while we are out this morning?"

The construction of the book of reference in which each field or house was scheduled and described was claimed by the solicitor, who was, of course, more or less dependent in the matter upon the engineer. The solicitor, or rather his clerk, sometimes an underbred and rather presumptuous person, found little favour with the engineers' assistants, who were often gentlemen, fresh from a public school or college, many of whom took to their work half for the fun of it. On one occasion a clerk of a leading London firm, himself a thorough Cockney, was sent into Wales to make up the book of reference, whilst the survey proceeded. He thought the place and time suitable for a splash, so he came down to the inn in dandy costume, ordered a horse for his work, and, dining with the young engineers, boasted of his new boots and steel spurs. Unfortunately he put his boots outside his door. There they were of course filled with boiling water, and by no exertions could they be drawn on in the morning. The box-spurs were useless, and the gentleman had to set forth in shoes and stockings much crest-fallen.

On another occasion a short line between two western towns had been surveyed and was all ready save the book of reference. On the afternoon of the 28th this omission was discovered by the engineer in London. The attorney was out of town, so an assistant engineer was despatched by mail with directions to look up the local solicitor and land surveyor, and by hook or by crook to get the work done. It was a tough job, but the plans were good ones, the local information was very good, and the book was made and deposited by the prescribed time. The sub-engineer returned to London, and meeting the attorney, boasted how he had saved the project. The attorney was furious. "I wish, sir, you gentlemen would mind your own business," and then it came out that he had absented himself on purpose, wishing to postpone the project for a year, when he expected to be less occupied. On another occasion this gentleman, who was the head of a very important firm, came to a well-known and most upright Parliamentary agent, now a Queen's counsel. "I hear," said he, "B., that you have given the Speaker some advice about diminishing the expense of private Bills." "I have," was the answer. "Then, by G—d, I am ashamed of you. Here are you and I and some half-dozen of our friends coining money by the present system, and you must need go and knock it on the head." "But," said B., "the Speaker himself sent for me and asked my candid opinion. What else could I say, as an honest man?" "Candid opinion! honest man!" exclaimed the

lawyer, mad with rage; "what business have you, with a wife and children, to take such views?" and out he flounced.

No doubt, the temptation to safe dishonesty was in those days very great, and much given way to by all parties concerned in railways. The writer was once asked by the degenerate son of a great father which way it was proposed to carry a proposed line, in order that he might buy a farm on the route, and get compensation for the injury. On another occasion, a railway was to run within sight of the country house of a well-known man of influence. He was upon the Parliamentary committee, and determined that the Bill should not pass unless he got his compensation, some thousand pounds, for residential injury. The rest of the committee knew this, but were not honest enough to thwart him. The compensation was agreed to, and the Bill allowed to pass. Next year, being stronger, the directors came to Parliament for amendments, and, among others, for a deviation into tunnel off the claimant's land, and, of course, out of sight of his house. "Well," he said, "I do not care. Of course, you pay me my compensation." "No," they rejoined; "we do not injure you and shall not compensate." "You are a pack of rogues," said he. "You know very well that the money was not to cover an injury, but to buy off my Parliamentary influence." And no doubt he spoke the truth, though rather more plainly than most men would have had the assurance to do. Upon the Great Western, Lord Holland was one of the very few peers who took no advantage of his position, though for this he was rather laughed at than imitated. There was a peer, on the line of the Midland, under whose name it was proposed to carry a tunnel. He came to a director, a neighbour, and complained bitterly that the trembling of the ground would destroy his best pleasant preserve. The director wishing to oblige him, said nothing, but represented the case at his Board, and in committee it was decided to avoid the peer's land altogether. When he heard this, nothing could exceed his wrath, and it then turned out that his communication was by no means intended to get the line shifted, but to prepare the way for a claim for heavy compensation.*

ENGINEERING WORKS IN PROSPECT.

ADMIT that few, if any, great railways remain to be made in the United Kingdom, still, vast undertakings wait the attention of the engineer in the colonies and in foreign states. Proceedings have been already commenced, indeed, with some of these. At Auckland, New Zealand, Messrs. Brogden have commenced the construction of a railway that, as the Liverpool and Manchester was in this country, is destined to be the commencement of a complete system of railway communication for that prosperous colony. The prodigal waste of capital that has marked the tangled maze without a plan in the railways of the Great Britain of the north will, doubtless, be avoided, in laying out the lines of the Great Britain of the southern hemisphere, which will have, it may be hoped, a railway system worthy of the name.

Great things in railway construction are also to be accomplished, it appears, in Egypt. Last summer Mr. John Fowler, C.E., on the invitation of the Viceroy, went out for the purpose of advising his highness as to the railway or other engineering works best fitted to develop the resources of the country. Mr. Fowler is not a man of "timid counsels." A first result of his visit was to take out a staff of about thirty engineers, and assistants, and to put them to work upon the survey of a line of railway of about 600 miles in extent. The survey has been completed most satisfactorily; the plans and sections are being drawn; and there is the strongest probability that this great work will in due time be executed. The line will commence at Wady Halfah, on the second cataract of the Nile, and in 22° N.L. To Old Dongola, 18° N.L., the line will be on the inner edge of the valley of the Nile, and at an average distance of about three-fourths of a mile from the banks of the river, and so laid out as to be above the level of the annual inundations, in which the waters rise more than 30 ft. at some points. From Old Dongola, or a little to the southward, the line will strike across the desert of Bayda, keeping, with slight deviations, to the caravan-track. The distance across the desert is about

* To be continued.

160 miles, and the object in taking this route is to avoid the great bend in the river between Edah and the sixth cataract. In the latter locality, about 16½° N.L., the railway will again take the valley of the Nile, and proceed in a direction almost due south to Khartum, at the confluence of the Blue with the White Nile. Future extensions will probably be to the fertile valleys of the Blue Nile, and its numerous tributaries in Senaar and Fazoula; and in another direction, probably, to the south-west, to the provinces of Darfur and Kordofan.

But there are numerous other notable engineering projects on foot, some of which apply illustrate the felicitous speech delivered recently by Mr. Gladstone, at the annual dinner of the Institution of Civil Engineers. The Premier, addressing his hosts, said that they differed advantageously from her Majesty's ministers; in that the benefit of their performances was unanimously acknowledged. "There is," said he, "but one personage who, if she were gifted with a tongue, would raise her voice against you, and that is your ancient Mother Earth. Whatever benefits you have conferred upon her mankind, on her you have inflicted cruel suffering. The guilt of the matricide is great, but your iniquities are greater still, for you have mutilated and mangled your first parent without putting an end to her existence."

"The cataracts of the Nile are no longer secure. I believe the next step will be a railway across the Great Desert of Africa." We have just shown that the regions of the cataracts are to be invaded by the fire-fed iron steed, and that one of the lesser deserts is to be crossed.

The accusation might have been brought against the engineering profession for liberties taken with Father Ocean, as well as with Mother Earth. Mr. Fowler, by his international communication project, proposes to convey railway trains across the sea; by another scheme, "the Honduras Ship Railway," it is proposed to convey ships, 200 ft. long, weighing, with their cargoes, 2,000 tons, across the dry land! This proposed ship railway is to connect the Atlantic and Pacific Oceans. The carriage on which the ship is to be transported is to have 240 wheels, running upon six rails, of 120 lb. weight to the yard, and placed 5 ft. apart from each other. The carriage is to weigh from 600 tons to 700 tons, is estimated to cost 20,000l., and to require from four to ten powerful locomotives, according to the state of the rails, to draw it and its load. The capital required to attempt this wonderful feat, is fifteen millions sterling, the whole of which is wanted on or before the 10th September next; those who subscribe it would need the best advice of the most skillful and experienced engineers, and the counsel of the most astute and trustworthy financiers.

But engineers have more practical, practicable, and useful fields of enterprise open to them than sea-railways or land-navigations; and, happily, there are symptoms of awakening to a sense of the unspeakable importance of their cultivation. The number of projects for new railways in the United Kingdom is smaller than it has been; but the demands for an abundant and cheap supply of the prime necessities, gas and water, are becoming constantly more numerous and clamorous; and, as regards the cleansing of towns, communities are becoming impatient of the pernicious influence of matter that Lord Palmerston referred to as being "the right thing in the wrong place." Sanitary engineering presents an almost illimitable sphere for beneficent and profitable action to the profession,—a sphere that embraces almost all people and climes. In the present session of Parliament, Bills for sanitary objects occupy an unusually prominent place. At the commencement of the session there were petitions presented by corporations, local boards of health, and other local authorities, for twenty-eight Bills, most of which contained provisions for improved gas or water supply, or for a system of sewerage, some of them including all the three objects. In addition to these were petitions for seven sewerage Bills, and for thirty-six gas Bills, water Bills, or for gas and water combined. None of the Bills that have reached committee in the present session, the Mid-London Railway Bill excepted, have occupied nearly as much time, or excited anything like as much interest, as the sewerage Bills of Birmingham, Bury, and Rochdale. The sewerage-doctors are far from being agreed, it is true, but contention is better than stagnation, and continued discussion and agitation may be expected to settle satisfactorily, and ere long this conveyance and utilisation of sewerage ques-

tion, that so vitally affects health and disease,—even life and death.

There are at present other gratifying evidences, in addition to the number of Bills with sanitary objects before Parliament, of the growing attention and the sense of importance attached to sanitary questions. In these days many projects obtain Parliamentary sanction under general statutes, that formerly required special separate Acts. Of such are some pier and harbour, and tramway Bills, which are embodied in one Provisional Order Confirmation Act in each session. Numerous projects are also brought before the public and joint-stock companies are formed with limited liability, to carry such projects into effect, under the powers of the Joint-Stock Companies Acts of 1862 and 1867. There are ebbs and flows at irregular intervals, falling and rising to varying depths and heights, in the speculative tides upon which private Bills and joint-stock companies are floated. The flood-tide indicates that money is easy, and commercial confidence firm. Some of the projects launched at such times indicate, it may be added, that the credulity of capitalists is excessive. It is curious to notice, when there is a plethora of capital, what a number of "good things" are offered, at a price, to those who are ready to part with it, in the hope of a good return. Railway-ships and ship-railways, mines, rich as those of Golconda, and far more extensive, yielding profusely all sorts of useful minerals and precious metals; wharfs, foundries, warehouses, printing concerns, manufactories of all kinds, are pressed upon the acceptance of the public; and the peoples of the colonies and the foreign states make tempting offers as to the interest they are ready to pay for a share of the redundant capital. Some of the projects that have been announced in the course of the last ten days are curious alike in their names and objects. Taking them at random: there is a Welsh anthracite coal company that needs 100,000l. for its due development; a North of Ireland iron ore company that needs 200,000l.; a wagon company for the manufacture of railway and tramway plant, and agricultural implements, that desires to raise 100,000l.; a Welsh coal and iron company, that requires 550,000l. to work the minerals under 10,000 acres of freehold and leasehold land, to work 13 collieries, 9 blast furnaces, 115 puddling and mill furnaces, 4 forges, and 7 rolling-mills; the Knight, Treverbyn, and Resugga Haematite Iron Ore Company wants 105,000l.; the New Zealand Kupanga Gold Mining Company needs 100,000l. for investment in a field of enterprise that has achieved "marvellous success," to work an "exceedingly valuable piece of auriferous ground," from which "enormous dividends may be expected, that will yield 'astounding productions';" the Ruby Consolidated Mining Company proposes to raise 325,000l., and promises wonderful results from the Bullwhackery, the Dunderburg, the El Dorado, and other silver lead mines; the North Custerfield Gold and Antimony Mining Company, and the London and St. Arnaud Gold and Silver Mines of Victoria, require 50,000l. each; and the Great North Caradon Silver, Lead, and Copper Mining Company, of the parish of Advent, Cornwall, invites capitalists to invest the modest sum of 30,000l.; and the Mendota Mining Company, of Lake Superior, can put 750,000 dollars to good use. Mining operations involve engineering, but there are many speculative projects at present before the public that only indirectly, or slightly, "requisition" the engineer, civil or mechanical. Among such are the Patent British Asphalt, the Trident Marine Insurance, the National Printing and Publishing, the Patent Cotton Gunpowder, the Butler's Wharf, the National Safe Deposit (for the custody of valuable property and documents), Pavy's Patent Felted Fabric, the Anglo-German Express Transit Companies, and others. The city of Quebec bids 6 per cent. for a loan of 100,000l., and the Philadelphia and Reading Railroad Company offer the same interest upon 3,000,000 dollars. The Plymouth Kankakee and Pacific Railroad Company want 2,000,000 dollars to complete works, the investment to yield over 8½ per cent.; and the Porto Alegre and New Hamburg (Brazilian) Railway Company wishes to raise 292,500l., for which 7 per cent. is guaranteed.

The new companies proposed include several for sanitary and cognate objects. Amongst these are, the new Gas Generator Company, with a capital of 250,000l., to be raised for the purchase and working of certain patent rights, the handsome price of 100,000l. being proposed to be

paid for the English patent rights, and 120,000l. for the rights for foreign States, India, and the Colonies. The inventions must be valuable indeed, if they are worth even half the money. The British and Foreign Water and Gas Works Company, with a capital of 800,000l., has for its object the carrying out of water and gas works, and any other works in connexion therewith, in those cities and towns where the introduction of gas and water is demanded, and is certain to be attended with profitable results. It is not intended to lock up the capital of the company in the permanent retention of any of the works undertaken. Among the other new sanitary companies proposed are, the General Sewage and Manure Company, to work Dr. Anderson's system of precipitation, the British Chemical and Agricultural Manure Company, and Lawe's Chemical Manure Company.

Sanitary improvements are among the most urgent and important social requirements of our day; and it is a gratifying sign of the times that increased attention is given to them. On the engineering profession devolves mainly the duty of action as the champions of the people against pestilence. Let them enter the lists bravely and, hopefully, against an enemy of great might, with far-reaching outposts, and strong supports. Let them fight ever so good a fight, generations will pass away before they are reduced to the condition of Alexander the Great, of sitting down to weep because they have no more worlds to conquer.

"ARCHITECTURE."

An obliging correspondent has sent us some interesting arguments and conclusions drawn, as he states, from the last number of the *Seaguardian Review* (April 1st, 1872). As they have probably escaped the attention of others besides ourselves, we take this opportunity of presenting some portions of them to our readers, who may not otherwise have a chance of seeing them. The general resemblance, especially in the oburgatory details, to certain now well-known very remarkable productions may indicate something beyond the mere foundation and the earliest stages of a new school of art criticism. On this, however, it is difficult to speak with precision. The subject appears to be "The present State of Things in general."

Wherever we turn, the exhibition is melancholy and hopeless, almost without exception,—a complete *inferno* and a national disgrace. In politics; in diplomacy; in army reconstruction; in navy management; in the church, with its clergy without common sense, goodness, ability, learning, or eloquence; in the law, blasted by the learned-unlearnedness of lawyers; in medicine, given over to empiricism, routine, and endless innovation,—we should be able to show such samples, and even such combinations of inaptitude, inexperience, ignorance, and absurdity as it would probably be impossible to find on the face of the globe. Why need we complete the dismal tale of utter futility, by pointing out the existence side by side of elaborate show, and staring vulgarity, and despicable meanness? Literature we find given over to the intolerable self-assertion of authors, intensely eager for applause, writing down to their readers; or else their minds, being weakened by subordination to a vain imagination, become the feeble worshippers of their own poor work. In painting are shown the clear evidences of mental delinquency; in sculpture, a class of gashers for commissions, whose productions are a curse to the nation, and in various degrees of vileness a travesty of art.

We cannot, in the course of this paper, take each separate division of our national life, and show fully the shortcomings, the palpable failures, the ineffectiveness, and imbecility that, as we have stated above, are everywhere discernible to the instructed eye. There is, however, an art, of which similar things may be said with equal truth, that, for various reasons, may suitably serve as first body to be used in such an exposure. The profession of Architecture being weakened by internal strife and dissension, and long considered a mark for the almost constant assails of all other special professions and trades, the sympathetic condition seem in existence that will render quite unnecessary any manifestation of that weighing and deliberation, and that precise adjustment of praise and blame which weaken the utterances of which they form

a part. Delicate, almost imperceptible touches may produce a delineation that shall enable any eye to see things as they really are, or may even, by lifting the veil (so to speak), make evident unperceived, and therefore unvalued, excellencies; but a far grander and at the same time less difficult task is undertaken by the hand that, with boldness, broadens and deepens the shades and shadows; still, Rembrandt far outdone, luminous shade shall be in turn superseded by a terrible intensity; and, by evenly-spread layers of pigment from which no light can be reflected, is shown the unmistakable semblance of ebon night,—unflecked even by a single borrowed lunar beam, or by the faintest traces of a dawn to come. Thus, in the remarks which we feel it our duty and pleasure to make, we are mainly anxious to strike hard and home; and are influenced by no personal or professional reasons for reticence in doing so. This would indeed be out of place in a matter so far removed from consideration of individuals, as a living art practised by living men. In order to treat the subject adequately, a standpoint is required from which all the ages may be viewed, and, of course, all the prominent human objects, pray though they be, appear in long trains of shadow under the blinding light that the observer must throw upon the nearer portions of the scene, in order to reach at all its further boundaries. It will be necessary to carefully pick out special examples for pointed condemnation from the numerous works that have been produced of late years, in order to bring our work into narrower compass, and to secure support by the selection for comment of those that seem most likely to tell in favour of our aim, excluding all others. The buildings must be by men who are accepted as "eminent" (holding high position) in their profession, and of well-known personal ability, which will naturally suggest presumption of a certain kind to the discerning reader; they must also be familiar by name, and otherwise to everybody—a pair of conditions that limit us to some of the best known public works. Any generally acknowledged partial or entire failure will be particularly suitable, as it can be dealt with, if desirable, in a specially curt, decisive way. We shall also be the better able in such cases to readily suggest modifications, amounting in some instances to complete reconstruction. The ease and comfort of this part of our task will be added to, by taking care that execution and any subsequent unfavourable criticism shall both be well beyond probability.

For the sake of effective contrast it will be desirable to paint some minor subjects in bright and cheerful hue; which, placed in the midst of, and thus bordered by, the prevailing sombreness, may divert attention. Pictures of the workmen who produced our old national architecture, will be very serviceable for this purpose. In the absence of such autobiographical or other revelation, or of such fiction or drama, as would be an authentic guide—we can only fall back on our inner consciousness, and make good use of that most effective implement of investigation, with its really infinite possibilities, if thoroughly applied. Though not of modern discovery, nor little used in previous ages or other countries, some of the dominant influences of the present period of intense literary production have brought its use into more universal recognition. Like a tropic temperature acting on a plant too often stunted in growth by destructive chills and adverse circumstances, the warm popular breath has driven off and rendered harmless the blighting influences of undue caution or plodding precision. The mingled moan and whine of querulous discontent craving quoted authorities has, happily for us, become only a tradition of a base past now well forgotten.

We find it necessary that the handicraftsmen of old days shall all be men of high culture and powerful mind, and we are therefore bound to conclude that "their work was simply a delight to them,—the outward form and expression of minds sympathetic and serious, but not in the slightest degree superstitious or debased." Their method of working shall be similarly evolved. Let us regard in imagination for a moment "a village church where there is not even an external plinth, but the rudest, unsophisticated walling; a stumpy, 'ungraceful,' but very sensible and useful tower, and scarcely a moulding or ornament about the building." Here is no trace of stunted power, of incapacity to realise, or unwillingness to aim at a perfected art. The whole is, in truth, complete evidence of the

sympathetic circumstances of the workman. If by chance we see the single detail that gives some refinement and dignity to such a work, we see at the same time that it is clearly the work of the village mason, who also drew the plan, and executed with his own hands the walling around. We know from intuition that it cannot be from another hand fresh from the masonry of the great abbey on the way to the rebuilding of a cathedral choir. On this basis of fact we are able to decide that, in the golden age, the here and there)—perfection in its kind awaiting each almost effortless touch of his practised hands,—found absolutely no Gibbonites around him. We are thus able to confidently overcome any natural misgivings as to the universal prevalence of all the virtues, and most of the talents in one special age. The happy social surroundings and private life of the old workman, in such strong contrast with those in our own days, might be enlarged on at any length, if expanded in the fullest detail; but the result will be, for all practical purposes, the same, if for the sake of brevity we trust to each reader's fancy. We have preferred to treat of the mental and moral consciousness,—which is, after all, the most important matter, since they are always independent of all mere external accidents.

It is necessary, however, that a few words at least be devoted to the apparent consideration of our ostensible subject; though, in fact, by the use of simple nomenclature our purpose would probably be more easily carried out. All right-thinking people strongly dislike the system of division of labour, so bespattered with praise by the soulless chattering of the pseudo-science of political economy. The results of the existence of distinct occupations,—even though the persons who engage in them are specially educated and well fitted for their work,—superceding the necessity for each man's personal attention to all his various needs, require of course no condemnation. If we could recur to the period of pastoral life and single households, and the manufacture in each family of all its necessities, we should have gone far towards the realisation in the present of the dream-like happy past. And to this we can approximate more or less nearly, even if we find it practically difficult to bring it about in all its noble simplicity. At least we can denounce with all our might the existence of the several specialities,—the so-called "professions,"—ignorantly stated to be called into existence to suit the needs of our people, and that are maintained and obviously strengthened day by day. If some of these weeds of dainty egotism must remain to suit the insensate folly or the base ostentation we find so prevalent, let us as much as possible eradicate new growths, and crush,—or at any rate injure, if we can,—those that have not yet taken too firm a root. That a man should arrogate to himself the title of "a healer," and endeavor to undervalue or supersede the health-promoting habits of self-doctoring,—in better times the almost universal rule,—may admit to some minds a partial justification; but the right-minded will safely leave him to his pretentious attempt to limit the occupations of his fellow-men; and, in the worst event, will no result more painful than premature decay or crippled limbs. The same rule holds good throughout the whole of the affairs of life. Honest personal work would render us in all things equally independent. An architect is, however, so often represented as the combined artist and man of business, by nature and training the contriver of fitness and beauty, and by habit and knowledge able to set agencies to work so as to realise his schemes, that people are leguiled into scnering or sanctioning his employment, forgetting in their inconsiderateness that even in law any man may wisely be his own client. Let such be warned in time, and avoid the pitfalls in which they may otherwise find themselves.

If a man does not know his real wants and is anxious to obtain skilled advice thereon, he should rather in truth begin by learning well for and by himself. Life would thus be answering its main end in affording scope for mental and moral discipline. If in this way ignorant he should first become well informed,—just as the diagnosis of disease, at least, should never be the work entrusted to "the healer," but should be undertaken solely by the patient. . . . If eager to begin to build after slowly resolving, as, indeed, usually happens, why should he not commence at once without too close a care for

details,—even in a structure that will be considered fitting and complete only if it supplies provision for all the artificial wants of a feverish over-civilisation? His first eagerness will be certain soon to exhaust itself; and by patient abiding effort all may be brought into wonderful harmony—by a resort to emendations, to partial destruction and reconstruction if need be. The features by which such changes of intention are announced, or by which original defects are to some degree overcome, will always be interesting to the student of architecture in after generations,—showing those signs of growth that are always so charming. When that is found, the evidence of incapacity to conceive and to weld together at once a perfect whole is by all good judges accounted as mere dust in the balance.

Let any man of special tastes and with well-defined wishes endeavour himself to give them substantial existence. Failure will be more honourable thus, than success with the assistance of an "eminent professional man"; who, though tried by a high standard of course a miracle of dulness, may by practice and pains be able to produce verisimilitude in a masquerade,—but only by the sacrifice of all that is really valuable,—in other words, of that special refinement belonging to the work of the "amateur" or lover of anything. . . . Any one possessed of much good sense would probably not ask advice from us, perhaps not ask it at all. Knowing that "a true artist works mainly to please and satisfy himself, and that this is really the only sound method of practice,"—he might he actually disposed to accord a generous confidence to—, but we really need not extend our remarks. Our whole meaning is surely by this time as plain, and at least as well known, to our readers as it is to ourselves.*

STONEHENGE, AND MAN AS AN ARTIST.

In these days of rapid change, and in view of a so very uncertain artistic future, it is not a little interesting, and sometimes consoling, to go back in memory to primitive days and to simple ways of man's work, and to see how things were actually and in reality then done. We live in an age of printing and books, and to be civilised a man must be "book learned" and full of book knowledge and experiences; but the time was when books were not, and the knowledge and experiences of men were to be got, if got at all, from other sources than books. This may be fairly said to be a paper age in contradistinction to that old geological age which has been called the "stone age." Men now write upon paper, but then they wrote upon stone. The rude stone monuments of various countries take us far back into the past beyond the reach of books and printing, and even letters, but still not actually beyond writing of some kind or other, if it be but of the very rudest hieroglyphics or picture-writing. We have pondered a good deal on this interesting matter at divers times, and have still a few thoughts on it, and the result, crude as it is, and, indeed, must be, is that any theory which makes all these works modern must be wrong. It may help towards the understanding of this matter if we call attention to one or two facts hardly hitherto noted. It may also afford a hint or two in modern practice. We may remind the reader first, and it is important to bear it in mind, that the history of human society may be broadly divided into three epochs or phases; the *savage* state, like that of the North American Indian of the present day; the *barbaric* state, like that of the Chinese and Japanese; and the "*civilised*," as it is termed, of which we may consider ourselves as a type, if not the type. But Nature does nothing in vain, and certainly gives away nothing. Some sort of equivalent is demanded for all that Dame Nature ever bestows. If the civilised man is a great gainer by the fact of his civilisation, we may be quite sure that he loses something by the change from the barbaric to the civilised. Art, for instance, has never flourished so entirely as among what have been termed *semi-civilised* or "*barbaric*" people. Outward and visible show, as expressive of inward thought and feeling, is always necessary in such a phase of human existence, and outward and visible show it is that creates art and perfects it. The savage state has art too, and sometimes very expressive art, but rude and unpolished, but still real and true. It has remained for an advanced civilisation to "*manufacture*" art, and hand it over to

* Some more hereafter.

the dead machine. But what is the gain, wo may ask in passing?

The whole subject is not a little complicated, for not only must we distinguish between the "civilised," the "barbaric," and the "savage" states of human existence, and accurately define them, but we must consider as well that this primitive state of things and primitive stone building have come of many natural causes: geologically, from the facts of the existence on the surface of the ground, and so ready to hand, of the "boulders," or blocks of unshewn stone left there by the forces in operation at the *Glacial* epoch. No savage tribe of men, however rude, could be insensible to the influence and constant presence of these huge and isolated blocks of stone: *to see them was to utilise them in some way or other.* Next there was a theological cause at work, for these works were essentially Pagan, and that simply means that no authoritative revelation had been vouchsafed to the rude and simple men whose lot cast them into Paganism. Man was left to himself to find out, as Mr. Carlyle would say, "a something to wonder at," to adore, and to invent. A vast isolated block of rude stone in the centre of a barren heath would be certain, in the very nature of things, and in the very nature of the mind of man, to excite feelings of awe and wonder, as, indeed, they now do, and could not but become venerable and sacred. Next, and this is a most important consideration in such a rude state of society, there must be outward and visible evidence for everything, and for every thought, and hence it is that we find among all rude tribes of men a primitive and simple veneration for all natural and striking objects,—for stones, trees, water, rivers, even sand, the sun, and moon, and stars, indeed, almost every natural object has found somewhere or other its worshippers. To our mind this is a singularly attractive subject to contemplate; it is to get rid of one's prejudices, and to find a way for oneself, as these rude men were obliged to do. The earth, and what is on it, and the elements round it, are alike open to all to read as they will or can; and it would be difficult indeed to find a spot whereon to think out better such primitive and dark mysteries than among these colossal stones. People wonder why Stonehenge was built, but there is no need for wonder; it was, and must have been, the natural expression of the minds of thoughtful though savage men. Before there was amongst them any "architecture," in the usual acceptation of that word, there were the mental causes and necessity for it, and a feeling for some constructed work huge enough to fill the minds of rough men. Architecture became a want. Stonehenge is not peculiar to these islands, the huge stone circles are to be found everywhere, and they take us back not to the fifth or the sixth century, or to the tenth or the first, but to pre-historic times, far remote, indeed, from all written records, or even unwritten song and legend. In the very nature of the case it must have been so, for as soon as man on this earth began to think at all—and books are not necessary for this—he must have begun to express himself somehow or other in material. The thoughts and feelings of the very earliest of the race of men must have been much the same as our own, but differently expressed. We express our religious feelings through and by means of cheap churches, and, if that be possible, chamer chapels, with a minimum of material and labour. The old stone circle men evidently thought no stones of memorial huge enough, and no labour long enough, through which to express their superstitions or their religions. And a very strange thought it is that as you go back in time and get nearer and nearer to "ignorance," as it is called, you somehow or other get into grander and grander architecture or building, if that be the better word, and you may thus fairly start from the cheapest and the flimsiest of modern improved church and chapel buildings, back to Middle or Dark Age cathedrals; to Egyptian and Hindoo temples; and from them to stone circles, and monolithic memorials. All true work is religion, says a modern prophet. *Laborare est orare.* Work is worship! Of such was Stonehenge; and it is a great subject for calm contemplation.

There is one other point worth a moment's thought, as it carries us back not only to the earliest simple stone monuments, but to the earliest written records, to stone "writing,"—it is that of some discoveries recently made in a remote corner of tropical America, wherein are to be found rocks covered with concentric rings and other characters typically identical with those

found on British rocks. This guides us to a notion of old dates, for these identical markings go far to show that the men of America and the men of Britain were, at some enormously remote date, of the same race; and this could have been only at a time when the disposal of the land and water of the globe were somewhat different from what they now are. Dr. Berthold Seeman has given a most interesting account of these curious matters,—too long to quote,—in his book on "Nicaragua and the Mosquito Shore." To it we must refer the reader; but it may be interesting to note how soon man must have begun his artistic career. Nothing can well be ruder than these drawings or stone cuttings, carved on the smooth surface of rocks, and evidently meant as memorials,—writings,—the origin of writing indeed almost infinitely remote from this present time, but still identical with it; for writing is writing however it may be accomplished. There can surely be nothing more interesting than these records of a past time, so unlike the present, yet so like it; for man is always the same, with the same instincts and feelings, with the same soul and body to provide for. But here a thought occurs, and which may lead to some practical hint, for may not a great architectural lesson be learnt from rude and antique work? The primitive houses of those who built these huge stone circles were sufficiently rude, and were wanting, doubtless, in all those "comforts" on which the modern man so prides himself; in other words, the indoor life of the builders and thinkers of the Stone Circle Age must have been of the roughest, though not so entirely void of comfort as may at first view be supposed; but their outdoor life,—we are speaking, of course, of that part of it which made the stone circle a useful and practical necessity,—must at the same time have been characterised by grandeur and dignity of thought, and by a feeling for much that is always artistically interesting and attractive. The huge stone circle, as at Stonehenge, was built of the largest masses to be found, selected, as we must suppose, because they were the largest, and because by size only was that impressiveness to be found which the minds of our great, though rude, ancestors demanded. The aspirations of such men must have been great and noble, and have produced a truly noble architectural thought in such small works and small masses, however well or even artistically put together, produce the same impressive and sublime effect on the mind as great ones? We think not. Certainly the rude builders of Stonehenge and the stone circles thought so.

SANITARY CONDITION OF IRELAND.

A DEPUTATION, comprising members of the Irish Medical Association, the College of Physicians, and the College of Surgeons, waited upon the Lord Lieutenant, on Saturday last, to present a memorial, the object of which was to obtain a Royal Commission, through his Excellency's influence, to inquire into the state of the public health of the country, the working of the Medical Charities Act, and further to defer, if possible, the enacting of any system of sanitary legislation for Ireland until such a Commission had reported upon the subject.

From the views put forward by members of the deputation, it was shown that the existing sanitary laws applicable to Ireland were complex and to a great extent inoperative, and they were of opinion that a Commission was necessary and eminently calculated to form a sound basis for future legislation.

His Excellency thought that sufficient knowledge of the state of Ireland was already in the possession of the Government to frame a Bill on a similar basis to Mr. Stansfeld's measure, and he considered it would be impolitic to frame a Bill for Ireland until the discussion on the English measure had first taken place. After Mr. Stansfeld's was introduced, the Government, he said, would be prepared to state what they considered would be necessary for Ireland.

Dr. Stokes, who formed one of the deputation, and who is well known in Dublin as a leading physician, made a statement which seemed to take the Lord Lieutenant by surprise. He stated a known fact,—that for the last half-century or more, about every ten years a devastating epidemic took place in the sister country,—a state of affairs which, Dr. Stokes said, was quite unknown in England or Scotland, and nothing could be more important than that steps

should be taken to investigate the history and reasons, and the measures requisite to check it. In answer to the query of his Excellency as to whether these epidemics were to be attributed to the prevailing sanitary condition of the country, Dr. Stokes replied that the deputation did not adopt any theory as to the production, but of one thing they were certain,—that public health is promoted by sanitary reform.

One of the reasons advanced by the deputation for the appointment of the Commission was that the voice of the medical profession should be heard prior to legislation. It was also disclaimed that the medical profession had any pecuniary or personal interest in the matter. "They all held that preventive medicine was far beyond curative." This is a cheering admission, and, coming from such a man as Dr. Stokes, it has its worth, even in the eleventh hour, in the struggle of sanitary reform. The Lord Lieutenant promised finally to give every attention to the important statements laid before him.

THE DORÉ GALLERY.

AN important addition has been made to the collection of works by M. Doré, now exhibiting in Bond-street, in the shape of a very large painting, "Christ leaving the Preterium." It is apparently 20 ft. by 30 ft., includes a very large number of figures, and will serve further to astonish those who know what other work this fertile painter has done in the five years during which he is said to have been engaged on the picture in question. The composition is striking. The figure of Christ, draped in white, and descending the stairs, forms the central point of the painting, and in all four corners, the high-level of the buildings above permitting this, crowds of figures, here and there driven back by Roman soldiers, press forward to see Him. Looked at critically, much of it must be considered as mere scene-painting; some of the figures, especially on the left-hand side, are but caricatures (look, for example, at the man with the red hair and beard); still, it is a remarkable picture, and will, doubtless, attract, and deserves to attract, many visitors for some time to come. The most perfect work of the artist, the "Paolo and Francesca di Rimini," is still in the gallery.

THE ROYAL ACADEMY OF BELGIUM.

THE hundredth anniversary of the Royal Academy of Sciences, Literature, and Fine Art of Belgium, founded in 1772 by Maria Teresa of Austria, was celebrated at Brussels on Tuesday and Wednesday of last week, with considerable ceremony. The proceedings were inaugurated on Wednesday with a speech from the king, in which, with great felicity of expression, he welcomed the foreign visitors who had been invited to take part in the celebration. Three papers only were read each day, and these were chiefly of an historical nature, tracing the progress that had been made in Belgium since the institution of the Academy, and alluding briefly to the various distinguished men whose names were associated with it. On Tuesday the foreign visitors were entertained at a banquet given by the Academy, and on Wednesday the members of the Academy and their guests dined with the king at the palace at Laeken. The whole of the proceedings were of the most harmonious character, and the foreign visitors had every reason to be gratified with the reception they experienced. Special mention should be made of M. Quetelet, the permanent secretary of the Academy, who, by his energy and urbanity, contributed greatly to the success of the meeting. M. Quetelet is one of the oldest members of the Academy, his election dating back as far as the year 1820. He is the author of several works on scientific subjects, among which may be named a "History of the Mathematical and Physical Sciences among the Belgians," published in 1865; the "Meteorology of Belgium compared with that of the Globe;" and numerous essays, besides editing the Annals of the Royal Observatory of Brussels since 1834. The Royal Society of England was represented by Professors Owen and Miller; the Royal Academy of England, by Mr. J. Prescott Knight, R.A.; the Institute of Architects, by Professor Donaldson, Mr. Edward P'Anson, and Mr. G. Alexander.

It is worthy of note that three of the earliest members of the Academy, Nathaniel Pigot, the Abbé Needham, and the Abbé Mann, were Englishmen settled in Belgium, and all three distin-

gished themselves by their observations in astronomical and physical science. Pigott was a friend of Dr. MacKelyne, and was employed by the Government of the Low Countries to fix the position of some of the principal towns by observation. The Abbé Mann was the first permanent secretary.

MODERN FRENCH ARCHITECTURE. ARCHITECTURAL ASSOCIATION.

An ordinary general meeting was held on Friday evening, the 31st of May. In compliance with a request from the secretary of the Royal Institute of British Architects, a delegate to the approaching conference was elected to represent the Association,—the president, Mr. Rowland Plumbe, consenting to accept the office. A special meeting, for members only, was appointed for the 7th of June, in order to decide on the instructions to be given to the delegate. Thanks were passed to Mr. A. W. Blomfield, for the permission to visit his new church for the deaf and dumb in Oxford-street, now getting towards completion, of which some members availed themselves on Saturday afternoon, the 25th ult. The arrangements of the annual holiday, commonly known as "Mr. Sharpe's excursion," will be found in another column.

A paper was then read by Mr. G. H. West, called "Notes on Modern French Architecture," of which we give an outline. The subject was treated in three somewhat distinct, but of course allied divisions:—I. The usual student course of French architects. II. Memoranda as to general character and details of executed works. III. Conclusions as to the prospects of architecture in France.

I. The study in an *atelier*, the *École de Beaux Arts*, and system of academic teaching; the thorough, almost (for practical ends at least) over-refining, study of descriptive geometry; the opportunities for the acquisition of personal skill in the arts of drawing, in sciography, &c., were all first described. Then the training in design was treated of. It principally aims at the acquisition of facility in composing with the classical orders, putting before the student certain agreed upon models for imitation, aiding him to the study of the external form of everything accepted as of classical quality; requiring also constant and laborious imitation of the forms to which the eye and mind have thus become accustomed, till the power has been acquired by men of good natural ability of conceiving and delineating thoroughly the most wonderful imaginary compositions. The school of the new Louvre and the New Opera is now mainly in favour for original designs, which are, as usual, prepared to suit the supposed prejudices of the judges. The processes and the science of construction receive little attention, and, in the most finished delineation, a light tint of carmine expresses the hidden constructive detail. It is not the habit of those subjected to this training to design while constructing, or to construct while designing. The design is first completed, and then, if further steps be called for, the construction receives almost its first consideration. The highest honour attainable, the *Grand Prix de Rome*, gives the fortunate winner five years' study out of his own country; and he returns to enter on actual practice seldom younger than thirty, often at thirty-five years of age. The result of so laborious a preparation may be illustrated by an instance not altogether exceptional, in which, returning from Rome after his five years, the *Grand Prix* student was entrusted with a commission to build a house to cost about 1,500*l.*, and found himself obliged to ask with earnestness the counsel of a friend in practice as to the construction of ordinary doors and quarter partitions. The *École Centrale d'Architecture* was started to supply the defects of the *Beaux Arts*, but, from various reasons, is not now of much importance. The *École des Ponts et Chaussées* and the *École des Arts et Manufactures* give more distinct scientific training, and have, at least lately, devoted special attention also to architectural design, producing a class of men calling themselves "engineer-architects," aiming at new applications of materials and a thoroughly scientific use of them. The teaching of M. Violot-le-Duc, well known by this time in England by his "Entretiens," "Dictionnaires," &c., has a different point of departure from that ruling the *École de Beaux Arts*, and consequently promises different results. Treating architecture as the border-land between art and science, this teaching recognises the value and

necessity of constant innovation, the advisability of using all materials, only under the guidance of right reason, to which every problem, new and old, must be submitted for solution,—not in the outward form, but in its informing spirit, will a true revival of Gothic be made. Its principles will be found to afford the surest help in dealing with the complex buildings and the very numerous materials which require often the first successful essay to be made to-day. Trained in M. Violot-le-Duc's school, after experience at the *École de Beaux Arts*, Mr. West felt himself justified in expressing the sense of touching solid earth, that he had felt, when subjected to criticism, which dealt first with the requirements of actual life and with the use of materials, and looked further to the evolution of beauty therefrom, instead of looking only, or at least mainly, to the production of certain effects.

II. As to executed works, a repetition of the mass of details accumulated and recited in the paper will not be necessary. An instance will suffice, showing some of the character of much of the Parisian masonry,—one of the examples of the unconstructive character of their architecture. The *pierre tendre*, so largely used, could not be worked on the banker, and then hoisted, as is the case with the freestone used in London. It is, therefore, built into the work in block, and reduced by planes and scrapers to the required form. As, however, little care is taken to make the joints occur where good construction would require, and as the blocks used are of great size, in order to save labour in severing them, and working the beds and joints, the apparent design (what has been called the design of "superficiality") becomes a sort of scenic presentation. It has been the custom to pay the contractor by the cubic quantity of stone used, and by the area of visible face; the contractor is, therefore, liberal in his provision for the prominent architectural forms, uses some quantity of stone to waste, saves scaffolding, and at the same time too often scamps the beds and joints, and has as few of them as possible. After speaking of the Opera House, which he pronounced on the whole an architectural failure,—and a most costly one, seeing that 44,000,000 francs have been expended on it, and the finishings are not yet begun,—notices of the works of other architects followed; selections for commendation, as among the best modern French work, being made of some of the productions of MM. L. Vaudoyer, L. J. Duc, Baltard, and Duban, with reference on occasion to photographs, &c., exhibited at the meeting. Judging by the prevalent feeling, as far as he had been able to gauge it, he considered it most improbable that a Gothic revival at all resembling that of England would establish itself in France. Associated indissolubly with the feudal times, from any sympathy with which the bulk of the people are wholly severed by their every sentiment, it has been cast aside with the rest of those things that might, if living to-day, remind the people too pointedly of their ancestral slavery. The tendency is now towards a purer and simpler style than has of late prevailed; but there is no likelihood that, however much the work of the future may be leavened by the influence of Gothic, there will be any recurrence to its special forms.

III. As to the immediate present and the future of architecture, the vile and meretricious style of the Second Empire, the writer looked on as wholly done with. The excellent artistic feeling, displayed in many of the details of otherwise by no means successful works, shows no sign of exhaustion. Many French architects have aimed at being more decorators, and at the production of ostentation and surprise. When they uniformly regard architecture as a science to start with, not to finish with, there will be effected a revolution in their executed works, and changes in their school of art-teaching. The words of Bacon "On Building" are true of the buildings of to-day: they "are built to live in, and not to look on; therefore let use be preferred before uniformity, except where both may be had." Let architects anywhere forget this, and they may expect to be classed with alchemists and archemers, and other fossil relics of a bygone age.

Mr. R. P. Spiers said that his conclusions differed from those of Mr. West. He considered the system of academical education worthy of all the advocacy he and others had given it. The "École" in Paris supplies the finest preliminary education that can be had. While requiring to be supplemented by practical work, and by additional attention to the economy of construction, that education thoroughly and quickly

trains the student to the practice of design, and tends to make his work perfect in proportion and drawing; thus starting him at a point to which many English ones, with the no-system here pursued, never attain at all. The principles of construction are taught; but teaching by professors not in actual practice certainly tends to take away some of the useful reality and solidity of instruction. Any training can succeed only in what it aims at; and he thought Mr. West had been led unduly to depreciate the French academic teaching, by considering it as the sole education of the French architect; who, on the contrary, can at any time enter an office, and work at end study his art in its actual practice. In England, on the other hand, at least till lately, little effort has been made towards providing, for the ordinary pupil in offices in London, any advantages of the same kind that have been long the privilege of the students in Paris. After some remarks on the immense power and talent evinced in portions of the design and in the details of the Paris Opera House, Mr. Spiers was succeeded by other speakers.

In reply, Mr. West stated that he had set himself the task of pointing out some of the defects and results of a system, which, however excellent for some purposes, failed from want of attention to the first element of real success in architectural design—constructive decoration. The "design first, build afterwards," of the French *École*, could not deal properly with the difficulties of modern building. At the same time, he did not fail to recognise the genius, the enormous talent, and many really admirable modern productions of the French. That side of this question would also deserve a special paper. On this occasion, he had devoted himself to what could be said on the other side,—to consideration of the defects, in spite of which good men were trained, and successes were achieved.

ANOTHER ALPINE TUNNEL.

DIAMOND BORING AT CLIFTON.

The works of the railway between Switzerland and Italy, *via* the St. Gothard Pass, are in progress, and an experimental portion of the Great Tunnel is to be driven, we hear, by the diamond boring-machine of the company, of which Captain Beaumont, R.E., M.P., is chairman. This machine bores either vertically or horizontally, and at any required angle, but with a continuous straight bore, of course, at the inclination adopted at the beginning of the boring. The machine has achieved great success, from the rapidity and certainty of its action, in "prospecting" for iron, stone, and coal in the north-eastern and north-western counties. It is now also employed upon the tunnel of the Bristol Port and Channel Dock Railway. This tunnel, which is more than a mile long, is through the hard mountain limestone, under Durham Downs, Clifton. At the Stanghow Iron Mines, Cleveland, the diamond borer reached a depth of 680 ft. 4 in. between the 7th of October and the 14th of December last, a work for which two years would not have more than sufficed if the stratification had been pierced in the ordinary method by hand. In its work at Clifton, the borer is under totally different circumstances. In prospecting one vertical bore-hole is sufficient, but in the horizontal boring for the tunnel headway, the machine drills six or eight holes at a time, the drills making about 200 revolutions per minute, and advancing about 2 in. in that time. The drills are steel tubes, with an annular ring or crown upon the face, into each of which eight diamonds are set, in such positions as to work out a circular groove, leaving a clean core of the strata pierced in the inside of the tube, that gives precise information as to the nature of the material passed through in every part of the boring.

As in the working of the Mont Ceuis tunnel, so it is at Clifton, compressed air being employed as a motor, but in quite a different manner. M. Sommeiller and his co-labourers at Fourneaux employed the compressed air for percussive action on the drills, but at Clifton the air is employed to obtain continuous pressure, which, with the rapid revolution, effects the work. The machine in which the drills work is so constructed that they command every part of the surface of the heading, which is 10 ft. by 8 ft. The holes are drilled in perpendicular rows, the two rows in the middle approaching each other at their inner ends, so that the first portion of the rock that is blasted is wedge-shaped. After

an opening has been made in the middle, the portions of rock on each side are blasted inwards, and the remainder of the tunnel, to its full size of 30 ft. by 20 ft., is worked out in the ordinary method by hand. The boring-machine is executing the work at about five times the speed attainable by hand labour. The bore-holes are drilled to about 4 ft. in depth, the debris being washed out, and the drills kept cool by streams of water under pressure that play continuously upon the face of the workings. The core left by the machine is about an inch in diameter, and the total diameter of the bore-hole about 2 in. Dynamite is the agent employed for blasting, and does its work very satisfactorily. The machine has been at work for three weeks daily; the diamonds have given no signs of wear, or of getting loose in their settings in that time.

THE NEW BELL FOR COLOGNE CATHEDRAL.

In the *Builder* of last Saturday is a paragraph on this subject, in which it is stated that "the bell will be 17 ft. high, and 13 ft. diameter at the base."

Now, surely this is a mistake on the part of some British or foreign copyist. Be it as it may, I beg to say that if a bell be 17 ft. high, and only 13 ft. diameter, it can never yield anything like a fine tone.

I may take occasion to remark that other erroneous statements respecting the bell under notice have lately appeared in a daily news-paper.

THOMAS WALESBY.

COMPETITIONS.

Ipswich.—Four architects sent in designs for the proposed new church in St. Matthew's parish, and the committee provisionally accepted those of Mr. James Butterworth. The estimate of the architect for carrying out the building he had designed was 3,000*l.*, but on a closer examination it appeared that the cost would be nearer 5,000*l.* than 3,000*l.*, and the committee, having no hopes of raising such a sum, withdrew their acceptance of the design.

SCHOOL BOARDS.

London.—At the last meeting, with reference to the three designs selected for Battersea-road, Kender-street Hatcham, and Mary street Bromley, the committee gave a table showing the ethical contents and the estimated cost in each case—

	No. of Children.	Cable Contents.	Estimated Cost.	Cost per Child.	Cost per Cable Foot.
(i.) Battersea-road	720	240,000	43,850	43	2 6 5/8d.
(ii.) Kender-street, Hatcham	720	243,658	5,521	7	13 1 5/8d.
(iii.) Mary-street, Bromley	720	Not given.	5,300	7	7 2

In order that no time may be lost in preparing designs for further schools, the committee have gone over the list of sites which have been scheduled. In each of the three following cases there is no doubt about the precise area and figure of the site which will be ultimately secured. They accordingly recommend that in each case there be a competition of four architects, and that it be referred back to the Works Committee to select that number of architects, and to submit the plans prepared to the Board: 1. Monnow-road, Old Kent-road, for 1,040 children; 2. Hunter-street, Old Kent-road, for 1,010 children; 3. Gloucester-street, Stepney, for 1,200 children. This was agreed to by the Board.

Barnsley.—A letter was read from the Educational Department approving of the plans for the proposed schools in Park-road, with the exception of the height of the walls, which they considered too lofty. Messrs. Wade & Turner, the architects, agreed to reduce the walls 2 ft., and the plans were ordered to be returned for final approval.

Scarbro'.—The following report of the committee on the designs for the Falsgrave Infant School was unanimously approved and adopted: "Your committee have carefully examined the plans referred to them, and beg to report that, in their opinion, those submitted by Messrs. Stewart & Bury, of Scarborough, and by Mr.

Wm. Watson, of Wakefield, are the best adapted to the requirements of the Board. The committee therefore recommend that from these two designs the final selections should be made by the Board." It was then resolved that the plans submitted by Mr. Wm. Watson be accepted, in preference to an amendment in favour of Messrs. Stewart & Bury.

Westborough.—At the last meeting, a communication was read from the Education Department, stating that the total school accommodation required was for 9,393 children. The number of children for whom no accommodation was provided was 1,026. To meet that deficiency, her Majesty's Inspector suggested that a new school, of a superior character to the schools already existing, should be built at Greef's Green, for 350 children, and another at Holloway Bank (on the Wednesbury-road), for 200 more. The adoption by the Board of the Mayor's Green School, it was considered, would be open to objection, owing to its close proximity to the schools in Walsall-street and Bratt-street. The matter was referred to the General Purposes Committee.

LIBRARY BUILDING, NEW YORK.

The building occupied by the Library, and erected from the designs of Mr. P. B. Wight, architect, is 75 ft. wide on Montague-street, and 92 ft. deep. The public entrance is in the centre, and is approached by steps of Ohio stone, flanked by stone parapets and newels. The porch is arched with Ohio and Haverstraw stone, and the front of it supported on columns of polished Gloucester granite, with bases and carved caps of Ohio stone. Over the porch, the walls of which are brick, is a stone platform and parapet with carved gargoyles, crockets, and eagles at the angles. The front of the building is faced with Philadelphia brick, and trimmed with the two kinds of stone above mentioned. It is surmounted by three gables in the roof, which have stone copings and wrought-iron finials. The front part of the roof is covered with Peach bottom slate.

From the main entrance, passing through the vestibule, which is separated from the main hall by a screen of oak and plate-glass, and enclosed on the outside by wrought-iron gates, the visitor enters a spacious hall, floored with encaustic tiles. In front is the entrance to the general reading-room, and to the left is the ladies' reading-room, and to the right is the office, behind which is the main stairway, making an L with the main hall. This story is 16 ft. in height. The general reading-room occupies the greater part of this floor, and has windows on both sides. Unobstructed light for the rear of the buildings is thus obtained from the yards of the adjoining buildings on both sides, which are the property of the Library Association. The reading-room is furnished with reading-tables of oak and walnut (A), and racks for newspapers of all sizes. The central portion at the back of the room is raised off, and contains the desk for the attendant (C), and the case for files. This case is also intended to contain hooks of reference for the reading-room.

Three open arches connect this room with the ladies' reading-room, which is carpeted, and furnished with tables, chairs, and sofas. It has three windows looking upon the street.

Under the platform of the main stairway is a ladies' retiring-room, and in the panel work beneath the first flight is a door opening upon the stairway to basement. The main stairway from first (or ground) story to second and third stories is of solid oak, and finished without plastering on the under side.

The second-story hall is similar to that of the first story. The entrance to the library is over that to the general reading-room, and the library occupies the same space on the floor as that room, but is two stories in height, and occupies the whole space up to the roof, having a gallery on a level with the third story. The lower floor of this room has a central public space, in the middle of which is an opening to afford additional light to the centre of the general reading-room, surrounded by an iron railing, against which is a permanent reading-table (A), supported on wrought-iron standards. The alcoves are raised off, and the divisions between them are marked by the wooden columns which support the gallery and roof. The whole library is lighted by a large skylight of wrought iron and plate glass in the roof, and additional light is afforded to the deep alcoves at the ends of the room by means of side windows. The alcoves contain two tiers of

cases. The second tier is surrounded with light wrought-iron balconies, which are reached by straight stairs, also of wrought iron, placed in every alternate alcove. The gallery round the library-room, which is at present used only for storage purposes, is intended to be eventually arranged for books, in the same manner as the main floor, and will have the same capacity. It is approached from the main floor by three circular iron stairways (E), and has independent entrances from the third-story halls. The library has shelves for 60,000 volumes on the lower floor, and will accommodate double that number when the gallery is shelved and finished.

The conversation and book-delivery room is on the west of the second-story hall, immediately over the ladies' reading-room. It is connected with the library by a large arch opening into the south-west alcove, in front of which is a counter extending across the room, over which books are delivered to members.

Across the hall, on the east side, is the meeting-room of trustees and directors. This room is carpeted and appropriately furnished. On the third floor over the book-delivery and trustees' rooms, are two class-rooms. The attic is as yet unfinished, but will probably be fitted up as a school of art.

The private entrance to the building on the basement floor, at the east side, connects with a private hall and stairway from that story to the attic, which is for the use of officers and attendants, and inaccessible from any portion of the building open to the public. This stairway is supplemented by a lift, or elevator (D), which passes through all the floors, and is used for the transmission of books, coals, and other heavy matter to the upper floor. Alongside of the basement entrance is the bindery, and on the west side of the basement are the janitor's rooms. The whole of the rear basement, under the reading-room, is used for the heating apparatus and storage of fuel. The coal is brought in, and ashes are removed, by means of a railway connecting a vault under the side-walk with the cellar.

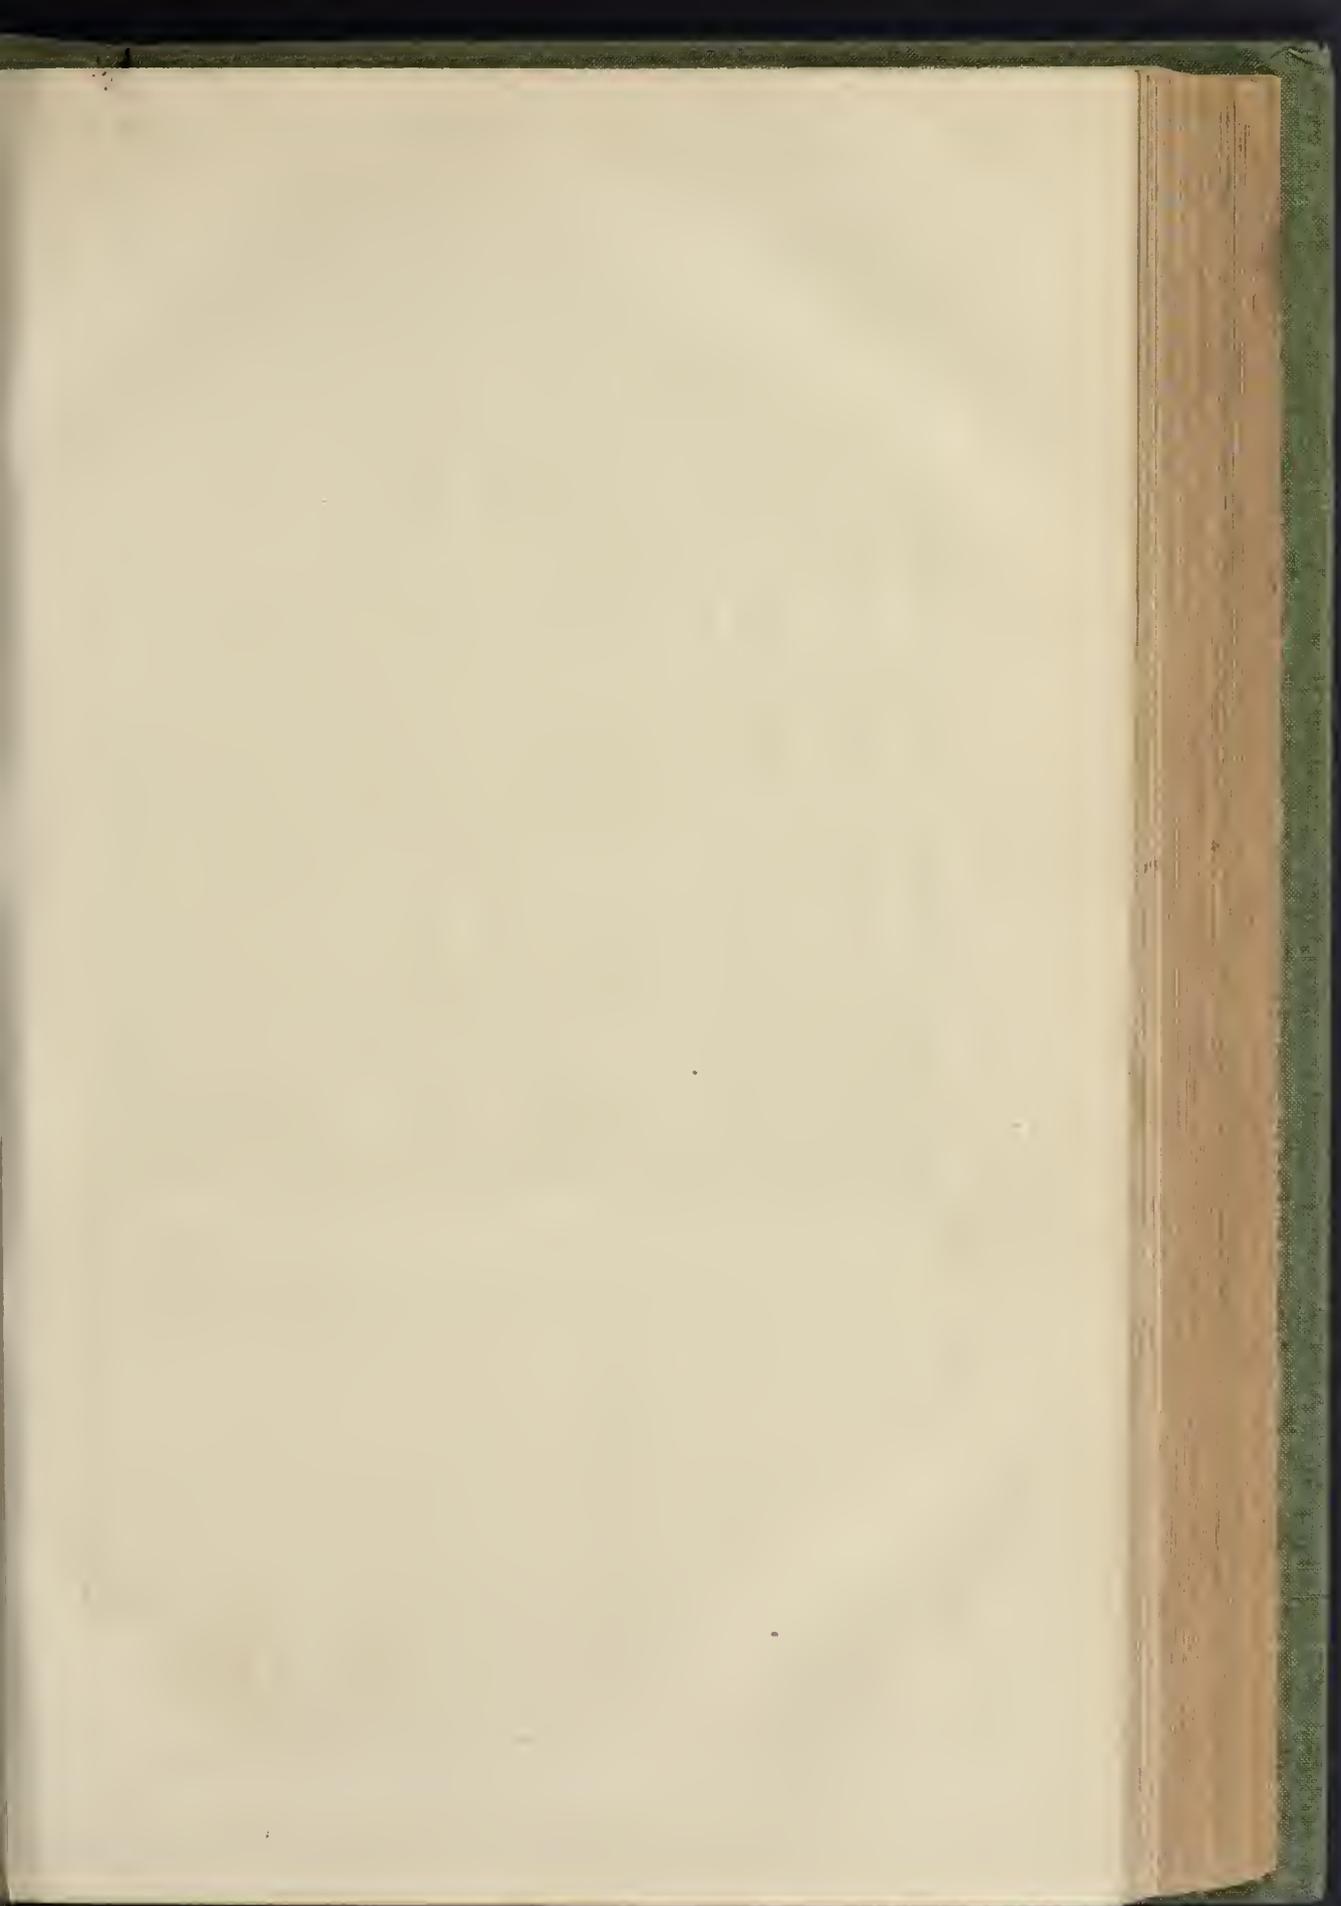

The closets are under the entrance steps. The janitor's rooms are supplied with hot and cold water, and water is supplied to all the principal rooms, which contain basins and water coolers. Provision is made against fire by means of fire-plugs, on the basement, first and second stories, to which the hose is always secured and ready for use.

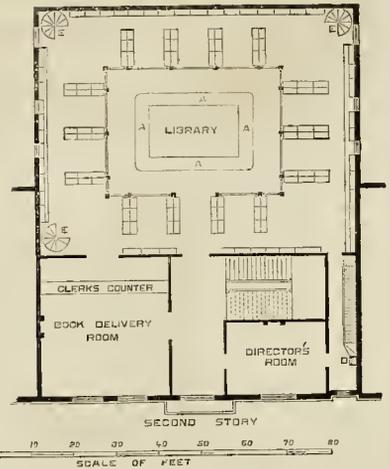

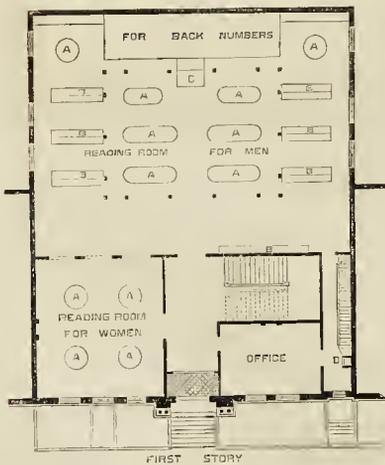

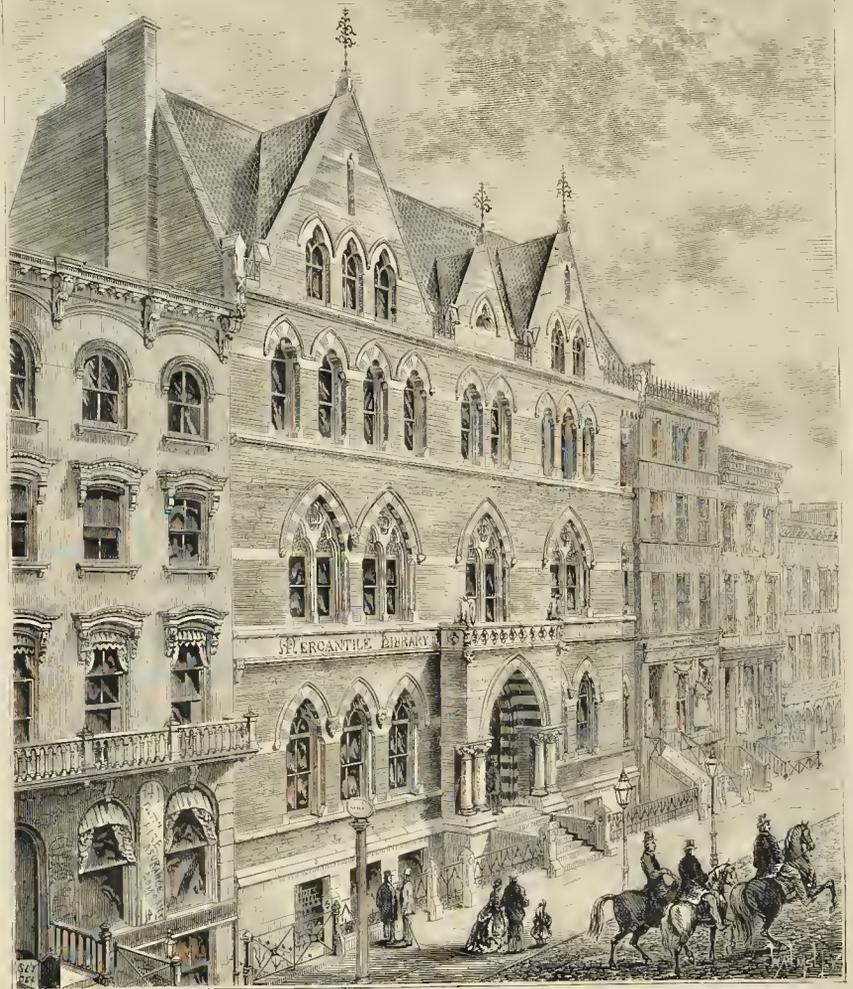

Particular attention has been given to the matter of heating and ventilation. The heat is supplied by one of Baker, Smith, & Co.'s safety pipe boilers, of 40-horse power. All the fresh air required for the rooms of the first story and the main hall, being those in which the greatest number of people congregate, is introduced through two openings on the sides of the building, and passes through radiating coils suspended beneath the floor, over which are iron gratings. The air is discharged through ventilating flues in the walls, which have registers both at the floor and ceiling. The library is heated by eight radiators placed under the small stairways in the alcoves, four of which are supplied with fresh air brought through registers in the sides of the building. All the other rooms are heated by direct radiation, and ventilated by open fireplaces and other flues.

The building is lighted at night by gas, which in the large rooms, is distributed as much as possible, in order to avoid shadows. The gas fixtures and furniture have been mainly designed by the architect to accord with the architecture of the building.

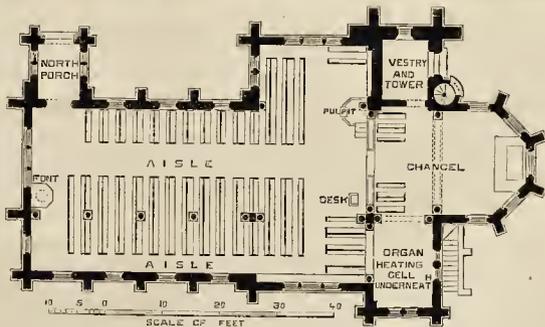

The architecture is thirteenth-century Gothic in style, modified to suit the necessities of modern times. Wrought iron has been used nearly everywhere in preference to cast iron. The walls and partitions are mainly of brick, and in the first and second stories entirely so. The floors are of yellow pine. The woodwork of the hall and stairway and of the doors is oak; that of the rest of the building is of white pine, and painted in parti-colour. All the columns used in the building are of white pine, and the construction is shown throughout. The plastering is what is called "sand finish," and the walls are now being decorated in polychrome from designs by the architect.

The contractors are:—John French, mason; Jeremiah Van Riper, carpenter; Jacob Outwater iron; Armstrong & Blacklin, plumbing and gas fitting; M. L. Curtis & Co., gas fixtures; Wm. S. Hunt, furniture; Miller & Coates, floor tiles; Henry Sharp, stained glass; and Baker, Smith & Co., heating apparatus.

THE LIBRARY BUILDING, NEW YORK, U.S.—Mr. P. B. WIGHT, ARCHITECT.

ENGLISH CHURCH AT THE HAGUE, IN HOLLAND.—MR. H. H. VALE, ARCHITECT.

ENGLISH CHURCH AT THE HAGUE,
IN HOLLAND.

This church, of which we give the ground-plan and a perspective view, is now in course of erection, for the use of the members of the Church of England resident at or visiting the Hague. It is built at the entire cost of Mr. John A. Tinné, Briarley, Aigburth, near Liverpool, and is erected in memory of his family, which is of Dutch extraction, and especially of his grandfather and father, who were natives of the Hague, and resided there.

The want of a permanent place of worship for members of the Church of England at this place has long been felt. For some years past they have occupied a wooden structure, now going to decay, and in an inconvenient situation. The position of the new church is on the south side of a handsome square, called "Van den Bosch," adjoining the Beemden-hout, well known for its many attractions, being on the side of the great wood, and contiguous to the Netherlands Railway and the Belle Vue Hotel. The site is not likely to be encroached upon, as there are pasture-fields open to the country behind it; and it occupies nearly the whole of one side of the Van den Bosch-square. Besides the land appropriated to the church itself, an additional space next to it has been secured, upon which a parsonage, school, or other building in connexion with the church can be erected, should such be hereafter thought desirable. The traces shown in the view are by no means ideal, but exist in reality, and are to be preserved.

The materials of which the church is mainly built are such as the immediate neighbourhood furnishes. A simple treatment has been adopted, and, in consequence of the difficulty of obtaining stone in Holland, tracery has been avoided, and natural stone used for the plinth of the building only. The operation of preparing the foundations is peculiar in this district, which possesses merely a substratum of bogsoil. A depth of about two yards being excavated, the soil is removed and sand filled in, which is brought in barges by canal, a distance of several miles. Upon this material the foundation-walls are built, of great thickness, up to the finished ground-line; by this means the necessity for the use of piles is entirely obviated. All the new residences in the Van den Bosch-square have been built in this manner.

The main walls are built of local bricks, in several shades of colour, from deep red to light buff. The bricks are very small, and only about 2 in. in thickness, and require great care in laying, but make very beautiful work when finished and pointed. The bricklayers are very careful workmen, but slow, which, together with the smallness of the bricks, greatly increases the cost of workmanship, it being more than double the price of English work. A sober tone of colour has been used for the main walls, with arches and bands of deeper colours. The particular system of brickwork is not new to the Hague, as there are evidences of this kind of treatment in some of the ancient public works dating from the sixteenth century, which may have been introduced by the Spaniards, as the treatment possesses something of the spirit of Moorish architecture, and such as has been recently adopted in England from Italian examples.

Many old brick buildings, both in Holland and Belgium, possess features resembling the "brick and marble" style of Italy, with radiating parti-coloured arches. A curious instance of this may be still detected in Antwerp, in the walls of the old Spanish Custom-house, built originally in coloured brickwork, which was doubtless the fashion of the day, and subsequently coated with cement or plaster, through the cracks and broken coating of which the richly-coloured bands of the original work may be seen; and probably the walling of the Spanish building, if exposed more fully, would present many interesting features.

In the church under notice, local materials have been principally used, but the slating in two colours has been sent from Wales. The decorative materials for the interior, such as granite pillars, serpentine shafts in chancel window reveals, encaustic tiles, the reredos, pulpit, and reading-desk, in Bath stone, and all the stone carved capitals and corbels have been sent from England; also the stained-glass windows, the ornamental and other ironwork, the pitch pine benches and roof-principals below the carved boarding. The small quantity of artificial stone used externally in quoins, sills, and

dressings, is of the local manufacture, called "Lindo's patent stone," which is said to stand the climate of Holland better than any natural stone, and is indurated under water for 100 days, after coming from the moulds. It has been largely used for monumental works in the country.

The church consists (as will be seen on reference to plan) of nave, single side-aisle, transepts, and chancel, with organ-chamber, vestry in tower, and porch. The roofs are boarded to a curved shape, and divided into panels by moulded ribs. The whole of the pitch-pine has been worked in England, the rest of the joiners' and carpenters' work has been done at the Hague.

The contractor is Mr. Van Zanten, Van den Bosch Straat, The Hague. The English contractors are Messrs. Holme & Nicol, of Liverpool. Mr. Joseph Rogerson, of Liverpool, is the carver, and has also supplied the pulpit, reading-desk, font, and reredos, and all the granite and marble used in the church. Messrs. W. H. Sullivan & Co., of Liverpool, are doing the stained glass. Mr. W. Orme Carter has furnished the slates; and Messrs. Maw & Co. provided the encaustic tiles.

The whole of the works are from the designs and specification of Mr. H. H. Vale, architect, Liverpool; and Mr. J. Waldorp, engineer-in-chief of the Waterstaat and Government Railways of the Netherlands, has kindly taken the local superintendence of the building, which is under contract to be finished during the ensuing autumn.

THE TRADES MOVEMENT.

London.—The operative house-painters and decorators of London have organised a committee and delegate meeting, for the purpose of co-operating with the carpenters and masons, with a view of securing the nine-hours system. They ask 8s. an hour as a minimum; the maximum to be fixed by arrangement.

Croydon.—At an adjourned meeting of the carpenters and joiners a long discussion took place, and ultimately it was resolved that the masters should be asked to give 7s. per hour on and after the first week in July next, and that a deputation wait upon each employer for an answer. Some of the men present were very sanguine that ere long 8s. per hour would be the price obtained, but thought that 7s. should be first got, and eventually the former sum would be easily secured.

Ipswich.—The arbitrators, Mr. T. D. Burroughes and Mr. J. Orford, jun., on the part of the masters, and Mr. F. J. Buggy and Mr. Watts on behalf of the men, with Mr. J. Worledge as umpire, are to sit at the Town-hall to dispose of the dispute.

Bristol.—The carpenters and joiners have offered to refer their difference with the masters to arbitration, and abide the result. The men ask for a reduction of the hours to 50½ per week, and a rise of wages from 6s. to 7s. per hour, and increased pay for overtime. The masters offer to reduce the hours, and a rise of ½d. per hour, viz., to 6s.½d., but will not alter the price of overtime.

Botham.—The master builders, acting under the pressure put upon them, have conceded the nine-hours limit to their men.

Halifax.—A numerous meeting of carpenters and joiners has been held for the purpose of hearing the decision of the employers on the application of the men for an increase of their wages from 2s. to 2s.8s., and of a reduction of the hours of labour from 52½ to 50. The Secretary read the answer, in which it was stated that the employers would grant the reduction of hours, but declined to give the increase of wages. After some discussion it was unanimously resolved to adhere to the original terms, and as the six months' notice given on the 13th of October last expired on the following day it was resolved to cease work at that time. It was stated that Mr. Joseph Bedford, of Horton-street, had acceded to the terms, and that five or six other employers were favourable to the proposition of the men.—The masons of Halifax have had their request complied with by their employers for an advance of 1s. in wages and an hour less on Saturdays.

Dunfriess.—The masons' strike in Dunfriess, which has lasted for six weeks, has terminated, and those of the men who had not left for other towns have resumed work. The dispute originated in the master masons employing slaters to do pointing work which could not be

done when buildings were erected in winter. The masters have now agreed that all new work shall be done by masons; and when, from exceptional causes, masons refuse to do it, the matter is to be referred to the Operative Lodge. The masters, at the same time, agreed to grant the nine-hours limit, but without any rise of wages. Their former offer was that the shorter hours should commence on the 1st of August, and ½d. an hour of advance.

Leeds.—The master bricklayers have conceded the 7½d. per hour demanded by the men. As soon as the question of overtime has been settled the men will resume work.

STRIKE IN THE BUILDING TRADE.

Str.—The strike which has already commenced in London, so far as the carpenters and joiners are concerned, seems quite unjustifiable, looking at surrounding circumstances. The hours now worked are 56½ in summer, and 50½ in the winter, or on an average of about 54 hours per week. The engineers have agreed to 54 hours per week all the year round, so have the printers and other trades. The carpenters now ask 51 hours in summer, and when the short days of winter are taken into account, there would be an average of about 48 or 49 hours per week.

Can the engineers, who are an intelligent body of men, consistently support a movement in direct opposition to their own rules? I think not, nor do I think the general public will do so. The workmen of Ipswich (as I see by the papers to-day) have agreed to 56 hours per week. If the building artificers had asked for a slight increase of wages, I could have well understood their object, but as the present demand would only increase their pay to the extent of 7d. per week, the present strike seems really got up for the sake of striking. A MASTER BUILDER.

We beg to contradict the statement, as reported in the daily papers, at the meeting of the Society of Carpenters and Joiners, that we had looked out our men before the final decision of the master builders. The facts are, we were compelled to discharge the whole of that trade on one job, through some conspiracies between the men, and their maliciously cutting up setting-out rods, and causing a general disturbance, beyond control. PERRY, BROS.

Str.—Will you kindly allow me to make a few remarks on the nine-hours movement, or the threatened strike in London? I observed in your paper a letter from a "Master Builder," where he distinctly states the carpenters and joiners, if they do strike, it will be for 12½ per cent. in wages, and that alone. I beg most emphatically to deny that, as the reduction of the hours of labour is far more thought of, and discussed than the subject of the wages; and I feel convinced, according to the amount of labour done by machinery, there must something be done to meet the demands of the operatives, carpenters, and joiners, otherwise we shall still have hundreds of our fellow workmen walking the streets in search of employment; while, if the hours of labour be reduced, that will be one step toward attaining the object of finding labour for more. One thing I fully believe, if the employers would consent to the reduction of the nine hours, and an advance of a halfpenny per hour at the present time, with the firm guarantee of the other halfpenny per hour at the end of the six months, which will then be 9d. per hour, it would be accepted. In the meantime it would enable them to complete some of their works already in hand, and they would at the same time be able to send in any fresh tender in accordance with the advance, and I think the public at large would be satisfied to pay the extra money if they themselves were convinced that the employers, one and all, were paying that rate of wages. One thing I don't much care if we could depend upon them all; some, I feel satisfied in saying, would fulfil their promise. If this rule was brought forward and carried out, I think it would put an end to the strike; and, sir, I beg pardon for taking up so much space of your valuable paper, only I do not like the "Master Builder," as he called himself, endeavouring to make the public believe that we want an advance of wages, and not the time, and that working men are always in the wrong. I think not this time. I feel justified in saying that, instead of sixteen men at twenty hours, and four walking the streets, to have the twenty men working nine hours, or even less, is nothing more than just and honest. W. M. H., Carpenter & Joiner.

GENERAL CONFERENCE OF
ARCHITECTS.

The programme of proceedings announces that the opening meeting will take place at eight p.m. on Monday, June 10th, and will be followed by other meetings on the 11th, 12th, and 13th. The proceedings will terminate on the 14th with a public dinner, to which non-professional guests may be invited.

All members of the Institute will have the right of attending the meetings. Other practising architects (British or foreign) who may desire to attend, are requested to apply at once

for cards of admission to Mr. C. L. Eastlake, secretary of the Institute.

The following members of the Institute have been appointed to act as hon. secretaries to superintend the arrangements necessary for each subject or section, viz. :—

Professional Practice.—E. F. Anson, fellow; T. Roger Smith, fellow; J. D. Maitland, associate; *On Modern Architectural Art*.—Professor Kerr, fellow; T. Talbot Bury, fellow; Thos. Wells, associate; *Construction and Materials*.—Professor Lewis, fellow; Edwin Nash, fellow; E. W. Tern, M.A., associate; *Exhibition of Practical Drawings*.—C. C. Nelson, fellow; J. Norton, fellow; H. L. Florence, associate; *Arrangements for Public Buildings*.—Horace Jones, fellow; O. Hansard, fellow; F. Marrable, fellow; *Arrangements for Visits to Public Buildings*.—T. Roger Smith, fellow; W. Papworth, fellow; T. H. Watson, associate.

MATTERS TO BE DISCUSSED AT SECTIONAL MEETINGS.

Professional Practice.—1.30 p.m. Tuesday, June 11th; Thomas H. Wyatt, president, or George Godwin, F.R.S., F.S.A., in the chair. Report of the Conference Committee on Professional Charges; report of the Conference Committee on the Employment of Surveyors; on "Esprit de Corps," by T. Roger Smith, fellow.

Architectural Art.—8 p.m., Wednesday, 12th June; Sir M. Digby Wyatt, fellow, in the chair. "On Modern Church Architecture in Scotland," by John Honeyman, esq.; report of the Conference Committee on Competitions* (with a draft form of conditions and notes of various members thereon).

Construction and Materials.—2 p.m., Thursday, 13th June; Sir William Tite, C.B., M.P., F.R.S., Past-President, or Horace Jones, Vice-President, in the chair. "On the Scientific Method of Treating Lime," by Major-General Scott, R.E., C.B.; "Notes on the Recent Conflagration in Paris," by R. W. Edis, fellow.

Final Meeting.—An adjourned meeting will be held (if necessary) at 11 a.m. on Friday, 14th June.

Delegates from the following Architectural Societies are expected to attend the Conference.—The Royal Institute of Architects of Scotland, the Architectural Institute of Scotland, the Glasgow Institute of Architects, the Glasgow Architectural Society, the Birmingham Architectural Society, the Liverpool Architectural Society, the Manchester Society of Architects, the Northern Architectural Association, the Nottingham Architectural Association, the Sheffield Architectural Society, the London Architectural Association.

FIGHTING FOR THE CHAIR AND MEANING THE TABLE.

THE office of Chief Artificer, or, in mundane words, Town Architect of Juteopolis, was submitted to competition a few days ago, under the auspices of the provost, bailies, and councillors. The candidates, four in number, having duly submitted their diplomas, the corporation proceeded to a decision. Now it so happens that for the last two years there has been a feud in that corporation on the subject of high and low heeled shoes, and this has accordingly divided it into two distinct parties. The advocates of high heels, successful last year in securing the smiles of collected national wisdom on their efforts; their opponents managed this year to provoke that smile into a frown, and obtain imperial authority for low heels.

Glowing with victory and smarting under defeat, the two factions ranged themselves on their respective sides; and as the office of Chief Artificer was a comparatively unimportant one, merely relating to the due administration of valuable town property, and other equally insignificant matters, it was determined by common consent that the choice should be considered as a contest of high and low heeled shoes, and be settled accordingly. One of the candidates having no nominator, was set aside; the senior and most competent withdrew, on hearing of "certain circumstances" (the impending battle of the fashions, probably); the contest was now, therefore, between the protégés of each party. The battle commenced, and high heels were slain; the senior candidate, who had just withdrawn, was thereupon ruthlessly seized by a high-heeled baillie, set erect and confronted with the low-heeled champion. But too late; he was neither blue nor yellow, simply an ably-qualified candidate for the office, and as such had no chance.

Need we say that low-heels won, and the provost and council went their way rejoicing or sorrowing, as the case might be. There were many aching heads on restless pillows that night, and in the troubled dreams of high and low heeled dignitaries alike, a vision of Dick Whittington mournfully touched the staple bells, and evoked the simple but monetary chime,—

"Please to remember the coming November,
And the City of Jute that was sold." B. C.

CAPT. SEDDON'S PAPER ON TESTING MATERIALS.

SIR,—Permit me to call attention through your columns to an error fallen into by Capt. Seddon, R.E., in his paper on the "Testing of Materials," read before the Royal Institute of British Architects, and partly reproduced in your paper of the 31st ult., in which he alludes to a discrepancy between the transverse strength of English oak and its tensile strength, as given in Moleworth's "Pocket Book" and Hurst's "Architectural Surveyor's Handbook." Capt. Seddon appears to have taken the figures for tensile strength from an old edition of Moleworth's book, and applies them to the rule for transverse strength in mine. If he had used recent editions, or had compared the figures given by myself in both cases, he would not have found the difference so wide as he endeavoured to make out.

Again, he calls attention to the imperfection of the formula for the transverse strength of wrought-iron girders given in my Handbook, p. 15, as being misleading. Capt. Seddon ought to have known that the formula he

* The subject of this report was transferred to the Sectional Meeting on Architectural Art, in order to leave time for the consideration of the reports from the other Conference Committees at the meeting devoted to professional practice.

refers to is the well-known formula of Sir Wm. Fairbairn, and that which he proposes to substitute is only a modification of the equally well-known formula used by civil engineers for large girders, but which is not a whit less one can see for himself, by applying both to girders broken for experiment.

Capt. Seddon appears also to have overlooked the fact that pocket-books are intended only for those who have had some previous knowledge of the subject, and for whom common-place explanations are unnecessary.

J. T. HEBST.

A GLAZED SURFACE.

I BELIEVE that common window-glass may be used for facing walls, if cut into geometrical shapes, as quarries, squares, hexagons, triangles, &c., and cemented on the plaster by some silicate cement. Any desired pattern could be produced on the glass in various colours, and very cheaply, if the demand were good. It might be largely used to relieve the monotonous drab of modern cement-fronted houses by being introduced in the friezes over the windows, in the architraves, string-courses, &c. Any common glass will do; and very thin glass might be applied to ceilings, which would be as easily cleaned as our windows. Glass when bedded solid will bear considerable wear, and, unlike paint or paper, can be repaired if damaged. Any broken squares can be picked out and replaced with new ones, and the whole is again perfect.

I enclose my card, and would give your correspondent further information if he desires it.

W. U. JAMES.

HAMILTON PLACE, PICCADILLY.

THE new month to Park-lane is extensively used, as was to be expected. Some low but ornate buildings that have been erected on the east side of it have led to many inquiries. The fact is, they are stables, in substitution of some formerly there, which were taken down to give increased width to the road, and are shared by the Earl Dalkeith, Sir Edward Antrobus, the Marquis Conyngham, and Mr. Barrington. The building—designed by Mr. George Vulliamy, the architect to the Board—has red-brick facing and Portland stone, some of the ornamental bricks being supplied by Mr. Richardson, of Vauxhall. Mr. Bradwell was the builder, and the iron joists and girders required in the construction were supplied by Messrs. Messures, Brothers, & Co., of Southwark-street. There is a turret at either end, 40 ft. high, and the centre of the building breaks forward a short distance before the flanks on either side. According to the *Metropolitan*, "the ground-floor is entirely occupied by stables, some portion of which have been fitted up by Messrs. Cottam & Co., of Winsley-street, Oxford-street, with their patent dove-tail wedge sill to the stall divisions. Also a patent vertical over-feeding hay-rack, with sliding grating and seed-box to the mangers, which will be fitted with their patent halter-guide and registered shackle. The back of the mangers is lined with enamelled files, of a light sage-green tint, from Messrs. Milton, Holbros, & Co. Another section of the stables has been fitted up by Messrs. Musgrave, of Belfast." Considering the fineness of the situation, it is to be regretted that a site for the stables was not found elsewhere. There is still some vacant ground at the Piccadilly end, on the eastern side, which forms a magnificent situation for one or more Town mansions.

ACCIDENTS.

Birmingham.—The roofs of three adjoining houses in Exeter-row, Birmingham, have fallen in, pushing the parapet about 4 ft. high and 60 ft. long, into the street. A man who was passing was struck by the falling bricks, and badly injured. The inmates of the rooms had to make a hasty escape from their beds, as the front of the house is bulged out. The houses were very old, and the roof, a heavy tiled one, is supposed to have been affected by the continued wet.

Sheffield.—At the Clyde Steel and Ironworks in the Wicker, belonging to Samuel Osborn & Co., the company were enlarging their steel foundry by erecting an additional shop, skirting the river Don. The building was about 36 ft. long, and 17 ft. wide. On Saturday morning, while the men were at work, the middle girder suddenly snapped in two, and the centre structure collapsed, and fell into the river. It was found that although four of the men at work were much cut and bruised about the head, no bones, fortunately, were broken. The building was being erected by Mr. James Fishman, and at first con-

siderable anxiety was felt by him and his workmen as to the cause of the accident. When they came to inspect the girder that had given way a flaw was found in it which it is said had been stopped up with lead. When the full weight it was intended to carry came to press upon it, it proved unequal to the strain, and suddenly snapped in the middle, and the centre part of the building came down. The damage is estimated at 200l.

London.—An inquest has been held at Lambeth, to inquire into the circumstances attending the death of a labourer who was suffocated by a quantity of earth falling upon him while he was working at the Lambeth Steel Works. The assistant storekeeper said that he was passing by a large opening from 25 ft. to 30 ft. deep, and 10 ft. or 12 ft. wide, which had been dug for the purpose of putting in the foundation of a wall. He saw the deceased and another man down in the opening; the deceased was knocking a prop as if he intended to knock it out. Deceased asked what time it was. He passed on, and in about ten minutes returned, and saw the earth had fallen in. Steps were taken for recovering the men who were believed to be in the hole. Ebenezer Meredith, plate-layer, said that the sides of the excavation were well shored up with timber, and secured. When found the deceased was in a stooping position, but from the fact of small gravel being closely packed round him, he must have been suffocated. Charles Lockley, foreman bricklayer, said that during the excavation had been open for five months, and some concrete had been placed at the bottom. Nothing else had since been done to it up to last Monday, when he set the deceased and another man to clear away the spoil that had dropped in, to be ready for the masons. It was no part of their duty to interfere with the props or struts. If the props had been knocked away, the earth would be likely to fall in. Some other evidence was given, and the jury returned a verdict of "Accidental Death."

MONUMENTAL.

Statue of Sir Humphry Davy for Penance.—The committee for carrying out the scheme have raised enough money to authorise them to order a marble statue from the Messrs. Willis, of Euston-road, London,—a statue the model of which was generally approved. The statue itself now approaches completion, and the last difficulty is as to the site. At first the statue was to be fixed between the pillars of the piazza of the Market-house. As a last resource it was resolved that it should be placed in front of the Post-office, on a cab-stand. Mr. T. S. Bolton, however, says the *Cornish Telegraph*, led the statue of Sir Humphry Davy should be placed in what a very large majority of persons consider an unsuitable spot, has now formally offered 25 superficial yards of his land south-west of the Public Buildings for the pedestal and figure. There are some conditions attached to this offer which will have to be carefully considered.

Memorial of Sir Thomas White, Coventry.—Mr. Poynton, of Messrs. Lester, Hodgkinson & Poynton, Midland Architectural Metal Works, has submitted a design for the proposed memorial. He suggested that the breadth of the base should be 8 ft., that the height from the platform should be 45 ft., and that there should be a statue of Sir Thomas in a sitting position, and which should be 5 ft. 6 in. in height. The following resolution as to it has been carried:—"The committee consider the same a highly artistic work and admirably adapted for the purpose." The chairman urged the collectors to be energetic in getting subscriptions to the fund. Mr. Poynton's design is now being exhibited.

MARKETS IN THE CITY OF LONDON.

SIR,—The discussion at the meeting of the Common Council of the City of London relative to Farringdon Market is perplexing to those not behind the scenes, particularly as while one member asserted that the Corporation was losing 5,000l. yearly on the Farringdon Market, another proclaimed that the market was so overwhelmed with business, gardeners' carts, and, therefore, amidst that confusion, every prudent citizen must rejoice that the Common Council had decided against the proposition of spending 150,000l. upon Farringdon Market, referring th-

report back to the committee for further consideration.

At this meeting the startling announcement was made that for new markets, and enlarging the old markets, the City of London had committed themselves to the amount of half a million of money: doubtless, it is the duty of a municipality to provide markets for the citizens, but, of course, the expenditure should be kept within prudent limits, avoiding a lavish architectural display on the market buildings as not required.

I will take this opportunity of alluding to the provision-markets within the City of London:—Spitalfields, for vegetables; Whitechapel and Leadenhall, for butcher's meat; Leadenhall, also for poultry and game; Billingsgate, for fish; Mark-lane, for wheat; Farringdon, for vegetables; the Metropolitan (Smithfield), for meat; the Columbia, for vegetables and fish; and out of the City, although the property of the City, the market for Foreign Cattle at Deptford.

Thus it will be seen that the City of London has provided eleven markets, a number not called for by the population of the City, which, I believe, does not exceed 100,000 persons, but calculated for the whole of London, which would embrace an area of at least fifteen or twenty miles round St. Paul's, and certainly the revenues of the City should not be mortgaged for the benefit of the world of London without some chance of its redemption. OLD JEWRY.

INSTITUTION OF SURVEYORS.

The annual general meeting of this society was held at 12, Great George-street, on Monday last. Mr. Edward Norton Clifton was elected president for the ensuing year, in place of the retiring president, Mr. Richard Hall. It appeared from the report that the society is rapidly increasing in numbers, and now includes in its ranks a large majority of the surveyors and leading land agents of the kingdom. Many valuable and interesting papers have been read at the fortnightly meetings of the past session, and have been printed under the "Transactions" of the society. It was announced that arrangements were in progress for the erection of a lecture-hall, library, and offices, and which, it is anticipated, will be ready for occupation by the commencement of the next session, in November. The annual dinner will take place early in July.

THE EXCURSION OF THE ARCHITECTURAL ASSOCIATION.

For the third annual excursion, under the direction of Mr. Edmund Sharpe, it has been decided to visit Northamptonshire. On Monday, the 19th of August, the meet will be at Stamford, about fifteen miles from the nearest point of last year's expedition. After devoting some time to the buildings of that town, and of its immediate neighbourhood, the party will proceed southwards, by Oundle and Wellingborough, to Northampton, visiting many of the very superior parish churches and other buildings to be found there; most of them not entirely strangers to those who know duly their Brandon, Johnson, Wickes, Cavelar, &c. On Saturday, the 24th, the final dinner will take place at Northampton,—the point nearest to London,—an arrangement that will enable the members to reach their homes, in most parts of England, that evening.

It is considered that the party should not comprise more than fifty persons, in order that the hotel accommodation at the towns visited may not be too severely taxed. Early application to the secretaries of the Association, especially on the part of those living out of London, may be desirable. Members of the Association will naturally have to be first considered, if any serious difficulty should arise as to numbers. It is not, however, wished to exclude non-members occupied in the study of English architecture.

The list of buildings to be visited, as it stands at present, comprises the four churches at Stamford (Lincolnshire), and St. Leonard's, close by; Tickencote, Ryhall, the two Castertons, and Ketton, in Rutland county; in Northants, Barnack, Oundle, Cottesbrook, Tansor, Fotheringhay, Warmington, and Polebrook; between Oundle and Wellingborough, the two Aldwinkles, Shrapton, Islip, Donford, Woodford, Ringstead, Raunds, Stanwick; from Wellingborough, Fineson, Irthlingborough, Higham Ferrers, Rushden, will be visited. Then the church at Kingshorpe and the churches the Eleanor Cross, the St. John's

Hospital, at Northampton. From the time of coming upon the river Nene, at Fotheringhay, in the north-east of the county, these churches are rarely a couple of miles distant from its course, which is thus to be practically followed all the way to Northampton.

The catalogue certainly has an inviting sound, and, with such weather as has been secured on other occasions, the old, over-present spirit of comradeship will secure, without fail, a week's good time.

EDWARD PEARCE AND F. DE LORINY.

Your correspondent, on p. 410, probably knows all that is to be learnt of Edward Pearce and F. De Loriny in what he has sent to you. The work by the latter was published in 1688, at Paris, in December of which year James II. retreated to France! WYATT PARFOWITH.

MAREZZO MARBLE.

This is an invention intended to popularise the use of imitative marble for indoor and outdoor decorative purposes, and an account of it was some time since given in the *Builder*. At a private exhibition of it at the works of the company, in Shenton-street, Old Kent-road, various architects, district surveyors, builders, sculptors, and other professional and practical men were present, and many commended the material,—some from personal experience, and others from what they saw. The advantages of the Marezzo marble, as explained by the manager of the works, M. Racotti, are its cheapness, the ease and rapidity of manufacture, and its applicability to all purposes of internal building decoration,—such as wall-lining, flooring, chimney-pieces, pedestals, columns, cornices, as well as statuary, fountains, and other out-of-door ornaments. During the visit two slabs, one of Sienna, the other of white-veined marble, were begun and finished ready for the polisher in somewhat less than three-quarters of an hour, the slabs being each about 5 ft. square. The process of manufacture is a very simple one. A slab of plate-glass is laid down, and upon that skeins of silk saturated with the dyes representing the colours and forms of the veins, in the kind of marble to be imitated are spread: upon this, cement, in a semi-liquidised state, is sprinkled to a thickness of about the eighth of an inch. This is left to be thoroughly impregnated with the dye from the silk, which is then removed. More of the liquid cement is added, until the slab acquires the requisite thickness; then it is left to dry (a process that usually occupies about twelve hours), and the slab is then lifted from the glass, and is ready for the polisher. The cost of this Marezzo marble is, we are told, about one-tenth that of real marble, and one-fifth that of scagliola for plain work; and the difference as regards marble in cornices, capitals, statuary, and other work of ornamentation, must necessarily be much greater, seeing that the material is all worked in a semi-fluid state.

EXPLOSIVE AGENTS.

At the last ordinary meeting of the session of the Institution of Civil Engineers, May 14th, the paper read gave an account of "Explosive Agents applied to Industrial Purposes," by Mr. F. A. Abel, F.R.S. In the course of it, the author pointed out some of the causes of the great difficulty experienced in arriving at anything approaching a precise estimate of the relative power and effect of different explosive agents. Taking dynamite as the type of the practically useful nitro-glycerine preparations, and as certainly one of the strongest, experience had shown it and compressed gun-cotton to be about on an equality in point of power, and to exhibit, in their most advantageous applications, a strength which was estimated at six times that of powder. The plastic nature of dynamite, and its power of resisting penetration by moisture, gave it advantages over compressed gun-cotton, as it could be used in wet blast-holes, and as very irregular holes, or holes terminating in fissures, could be more conveniently and heavily charged with it than with gun-cotton. On the other hand, the readiness with which dynamite froze, and its inertness unless thawed, or fired by special arrangements, and the unpleasant effects experienced occasionally by those using it, were inconveniences not shared by gun-cotton. The advantages presented by these materials in their general application as blasting agents,

were shown to consist chiefly in saving of time and labour, especially in tunnelling or in blasting in hard rock. They were also susceptible of advantageous employment as auxiliaries to gunpowder, in the rapid removal of large masses of rock, or of submerged wrecks; the violent explosive agent being first used to produce extensive rending and shattering effects, and the superior displacing effect of powder being afterwards brought to bear. It was pointed out that gunpowder could not be satisfactorily replaced by these violent explosive agents in some kinds of work, where its comparatively gradual action was a specially valuable feature.

CHURCH-BUILDING NEWS.

Wirksworth.—The first contract for the restoration of the parish church is now complete, and the part finished re-opened. This portion, which comprises the tower, transepts, and eastward, was commenced in July, 1870. Mr. George Gilbert Scott is the architect engaged; and the work has been executed by Mr. G. W. Booth, contractor, London and Gosport. The plan of the church is cruciform, and mostly dates from the thirteenth century, or Early English period of architecture. It has a central tower, supported on pillars, transepts with aisles attached; and a chancel, also with aisles. The nave with its aisles, now about to undergo restoration, is peculiar from being extremely short, and in very bad proportion to the rest of the structure; but it is hoped that as the work proceeds, funds will be forthcoming to carry out the wishes of the architect and the committee by extending the nave westward two or three bays, which would make this portion of the fabric in keeping with the rest. The roofs of the chancel and transepts are highly pitched, and the timbers are of wrought and moulded oak, covered with grey stone slate. The roofs of the aisles are also of oak, covered with lead. The tower has been generally repaired and pointed with Portland cement. The walls, some of which have been rebuilt, are of sandstone, with ashlar facing internally, except the transept walls, which are rubble inside, and have been cleaned and pointed. A new clearstory has been added to the chancel, pierced with six cinquefoil tracery windows. Many new windows have been inserted, all filled with moulded tracery. The five-light window in the north transept was given by Mr. James Wall, of Wirksworth. A new stained-glass window has been placed in the north chancel aisle, and was given by Mr. A. Macbeth, of Steeple Grange. The artists were Messrs. Edmunson, of Manchester. The floors have been laid with tiles, arranged in various designs. For the present chairs will be used for seating the church. The cost of the works to this time is between 5,000l. and 6,000l. During the progress of the works many sculptured fragments of stone, of the Saxon and Norman periods, have been found and preserved, also in some places portions of the Norman foundations. One portion only of that church still exists in the part of the north chancel called the Gell Chapel, the moulded base and walls of which are Norman, and have been preserved. A sum of 1,700l. is still required to complete the second portion of the work now in hand, in addition to the cost of lighting, seating, and warming the whole church.

Kings Norton.—The church, having been restored, has now been reopened for Divine service. The tower has been repaired. The north aisle has been rebuilt on concrete foundations, and the north arcade has also been rebuilt, the piers and arches being taken down, and the stones replaced in their original positions; a lean-to roof has been placed upon this aisle, surmounted by a parapet of the style of the fourteenth century (the date of the north and south arcades). The nave has been re-roofed, on the hammer-beam principle; the roof is open to the ridge, by which means 12 ft. of additional height have been gained. In the south aisle the bases of the piers have been renewed, and the foundations strengthened; the gables (seventeenth century) have been reopened, and the gable windows glazed. In the chancel a new floor of Maw & Co.'s tiles has been laid, and a small Norman "low side" window, discovered on the removal of the brick vestry, has been opened. By private liberality, figures have been placed in the niches of the south front of the tower, the stone corbels of the nave-roof have been carved, a stained-glass window, by Hardman, has been placed in the south aisle, and a sum of money has been given towards providing a retables of stone and marble.

The work remaining to be done is as follows:—The repair of the spire (much needed), the restoration of the western doorway of the tower, and the addition of an organ-chamber on the north side of the chancel. The amount expended is about £2,800, and a further sum of 500l. is required for the completion of the work. The organ has been removed from the tower, and placed at the east end of the north aisle, and an organ-chamber is greatly needed. The removal of the organ has made the western doorway of the tower available for use; but it requires thorough restoration, and this and the spire are included in the work yet to be done. Mr. Hopkins, of Worcester, is the architect.

Oldham.—St. Thomas's Church, Moorside, Oldham, which was to be consecrated on Whit-Monday, has been built at the sole cost of Mr. Thomas Melldow, of Moorside, from the designs and under the superintendence of Mr. H. Cockbain, of Manchester, architect. The church consists of nave and aisles, a chancel, with chapel on the north, and organ-chamber and vestry on the south; tower, south porch, and a sponsors' vestry on the north, near the font. The nave and aisles form a square of 52 ft., and are divided into four bays, having two-light windows in the aisle walls. The clerestory is lighted by three-light windows. The square or line from which the roof rises is 32 ft. above the floor line. The roof is open-timbered, the main timbers having mouldings; the height from the door to the ridge is 45 ft. The chancel is divided into three bays, and lighted by three windows on each side; four of these are rose windows, the other two are long two-light windows, with traceried heads and transoms in the middle. The east window is a large five-light, with traceried head, and contains 52 ft. of glass. The floor is paved with tiles. The steps in the sacristy are of marble, supplied by Messrs. J. & H. Patteson, each step being of a different kind. The top step, forming the dais for the Lord's Table, is of white Sicilian; the space between this and the table being filled with marble mosaic. The table is designed so as to be used either with or without antependium. The walls on each side are covered with a majolica and encaustic tile pattern, designed by the architect, and executed by Messrs. Minton, Hollins, & Co. Recesses (at present built up) are left in the walls for credence and sedilia. The choir is seated with a tier of stalls and two tiers of sub-stalls on each side. The chancel opens with two arches on the aisle, and one arch towards the church by open traceried screens; it is lighted by two two-light, square-headed, traceried windows, and a three-light tracery-headed east window. This chapel, which was designed with a special view to week-day services, early communion, and other occasions when the congregations would be very small, has its own entrance-door; and provision is made for a dais for communion-table, a credence, and sedilia. The seats proposed are movable, so as to allow of their being adapted either for use as a distinct chapel or as part of the main building. For the present this part of the building is fitted with benches for the school children. The tower, which is at the west end of the nave, is 20ft. 6in. square, and rises 92 ft. to the leads, and will be 116 ft. to the top of the final over the staircase turret, which is carried up at the north-east angle, and is covered with a spire. The lower stage of the tower opens to the nave by a lofty arch, and has a western door and a three-light traceried window over. Above this stage comes the ringers' loft, the clock-chamber, and last, the bell-chamber. The tower is finished by a pierced parapet and turret, 4 ft. in diameter at the angles. The pulpit is of oak, and carved by Earp. The font is of Caen stone, and was executed by Mr. Lunt, sculptor, Oldham. The organ was by Messrs. Hill & Son. The hot-water apparatus for warming the building was supplied by Scott & Brother, of Oldham. The large east window is filled with stained glass, by Hardman, and is the gift of Miss Bridge. The subjects represented are, "The Lord's Supper," which occupies the lower part of the three middle lights; and above and at the sides the spaces are filled with seven incidents from the life of Joseph and his brethren; the tracery and other portions being filled with emblematic devices.

Crumwell.—A meeting has been held with reference to the fund for rebuilding St. Mary's Church. The Bishop of Manchester occupied the chair. The Rev. Henry Cottam, the rector, said, that at a meeting held soon after the burning

of the church, a general committee and a building committee were appointed for raising money or for regulating the affairs of the rebuilding of the church. The result of their work was that 6,200l. had been raised; but that amount included 2,300l. from the insurance company. Mr. Crowther was appointed architect, and he had drawn the plans. Several tenders had been received, the lowest of which was 7,850l., sent in by Mr. Robinson, jun., of Hyde. In addition to the amount of the tenders there would be various other sums required, which would raise the total amount to 8,610l., without provision for an organ. To meet that there was in hand 6,200l., and subscriptions amounting to several hundred pounds more were expected to come in. The architect and the building committee had had a consultation under the circumstances, and had suggested other plans, the carrying out of which would cost altogether about 6,800l. The plan, however, was an imperfect plan; whereas the original plan was perfect, and the difference between the two was 1,880l. In other words, deducting 300l. insurance-money for the organ from the amount now raised, 1,200l. were required to carry out the imperfect plan, and 3,000l. to complete the perfect plan. A discussion ensued, and it was resolved "that the building committee be requested to proceed with the rebuilding of the nave, aisles, vestry, and restoration of the tower, estimated to cost 5,900l., and complete them according to the present plans and estimates, and to proceed also with the organ-chamber as soon as they have funds."

Leicester.—Trinity Church has been reopened for divine service. The church has been, to a great extent, rebuilt from designs by Mr. S. S. Teulon, London. The style is a compound of the Continental, closely approaching the Anglo-Norman and Early English in character. The additions are a west-end tower, over 50 ft. high, strongly buttressed, on which will shortly be raised a spire to the height of about 80 ft. over the tower. On either side of this are built two substantial turrets (containing the gallery staircases), each pierced with ten windows of an Early English character. Two ambulatories 4 ft. within run the whole length of the building, each lighted by sixteen windows of the thirteenth century model. The east end has been squared up, and contains an Early English window filled with stained glass, by Mr. Odell, of London. It consists of five lights, and a large centre window with two smaller windows on either side. An organ-chamber has been attached at the south-eastern corner, with opening into the chancel and church. The whole has been built of Luton brick faced with Box Ground stone. The body of the old church has also been cased in Luton, and finished off with a cornice composed of Diseworth white and Luton brick. From the west porch, the principal entrance passes under the tower. The galleries and ambulatories each have a separate entrance, the pavement being hard Yorkshire stone, and lined with white Diseworth brick. The doors are of oak, and the windows filled with quarries of opaque cathedral glass arranged in quaint patterns, with ruby and blue borders. The glazing has been done by Mr. Shardlow. The heating apparatus, planned by the architect, has been carried out by Messrs. Gimson & Co. The whole of the old sittings and fittings have been removed, and replaced by open seats. The bench ends and gallery front are pierced with an Early English design. The centre aisle and chancel are paved with Maw's Brosely tiles, and the ambulatories are in black and red Staffordshire quarries. The Italian roof has been decorated by the firm of Messrs. Heaton, Butler, & Bayne, of London. The body of the church has been lighted by four sunlights, by Messrs. Stroud & Co., of London; and they contain forty-two jets each, and are said to cast a beautiful subdued light. The ambulatories are lighted by sixteen pendants of original design by the architect, supplied by the Leicester Gas Company, under the superintendence of Mr. Hobson. The whole of the restoration has been carried out by Messrs. T. Hewitt & Sons, of London. The stone-work has been supplied by Mr. John Firm. Mr. Basford was clerk of the works. The cost of the alterations is over 5,000l., and the spire, which it has been resolved shall be erected, will cost 700l. more.

Decoration of St. Paul's.—The Dean of St. Paul's has declined to call a meeting of the subscribers to consider the recent appointment of a second architect. The request was signed by twenty-eight of the subscribers.

SCHOOL-BUILDING NEWS.

East London.—The foundation-stone of new school-buildings about to be erected in Burdett-road has been laid, in connexion with the Congregational Church there. It is intended to use the rooms likewise for lectures and public meetings. The cost of the proposed schools, including necessary fittings, is estimated at 1,400l., the builder's contract being 1,080l. There is no architect. Mr. Adm. Sheffield, of Poplar, is the builder.

Boston.—New public schools have been opened here. They consist of a boys' school, a girls' school, and two class-rooms, one of which is adapted for infants. The girls' school is 50 ft., and the boys' 58 ft. long, both being 20 ft. wide, and 16 ft. high, to the springing of the roof, which is left open to the ridge. The several rooms have accommodation for 300 children. Each school has a spacious playground attached to it. The building is constructed of red brick, relieved with white brick dressings, and terracotta springers and key-stones to the arches. The interior is built of white bricks, relieved with courses of red and black bricks and tiles. The lower part of the walls,—as high as the children reach,—is built with glazed bricks. In addition to the colouring to the walls, short sentences have been introduced, the letters being formed in encaustic tiles. The schools are warmed by means of open fireplaces, with Milner harks and stone fenders. Ventilation is provided by means of shafts running parallel with the flues of the chimneys, into which openings are built, covered with perforated zinc; also, by openings on each side of the roof, so as to create a thorough draught across the upper part of the school, where it cannot be felt. Ventilators have also been introduced into the ridge, which combine use and also ornament. The framing of the roof is a combination of wood and iron. It is open to the top, and boarded in. The wood-work is varnished, the iron rods and bolts being painted blue. The closets have been fitted up on the dry-earth system. The contract amount for the building was 1,194l., which is about 4l. per child. The architect was Mr. W. H. Wheeler. The contract has been executed by Mr. Samuel Sherwin.

Middlesbrough.—The Roman Catholics of Middlesbrough are about to erect new schools in Lawson-street, in the marshes. Messrs. Hunter & Carr are the architects, and the buildings will accommodate 300 children. The plans have been approved by the (R. C.) Bishop of Beverley, and, on some minor alterations being made, tenders will be advertised for. The principal promoter of the school is said to be Father Burns, the late Roman Catholic rector at Middlesbrough.

Books Received.

Dilapidations: a Text Book for Architects and Surveyors, in Tabulated Form. By BASISTER FLETCHER, Architect. London: E. & F. N. Spon. 1872.

In this little book Mr. Banister Fletcher gives the result of a good deal of careful reading on the subject of dilapidations. It must be supposed that his seventy-eight pages will render their possessor independent of the more elaborate works available, but the student who makes himself master of Mr. Fletcher's tabulated information will find it a very useful introduction, and be able with ease to look further into it with more elaborate exponents. The writer very properly remembers that tenants have rights as well as obligations. It is impossible to deny that some surveyors have a mistaken notion of their duties to lessors employing them, and often seek to obtain for them, to the loss and injury of the tenant, not an old building fairly attended to and kept up, but actually a new building.

VARIORUM.

UNDER the title "Landmarks in English Constitutional History," Mr. J. A. Picton, F.S.A., has printed a paper read by him recently before the Liverpool Literary and Philosophical Society. It is a particularly interesting communication. In some thirty-eight pages Mr. Picton shows graphically the early steps which led this England of ours to its present constitution,—how it became—

"A land of settled government,
A land of just and old renown,
Where freedom broadens slowly down
From precedent to precedent."

And this he does, not by repeating what other

men have deduced and written, but by the digest of public documents at successive epochs, affording contemporary evidence. It is quite delightful to see how well and profitably our old friend, having given up the struggle of professional life, employs his acquisitions and well-earned golden leisure.—According to the *Art Journal* the patent of the Metallic Compression, Casting Company is an American property, which under a company is now about to be worked in this country. "Its operations embrace a large class of utilities, representing a large and very important section in the hardware business, and in respect of the cost and beauty of the products offering extraordinary advantages over the results of the ordinary methods of manufacture now in use. The process of production appears to be adapted to a variety of uses, and only waits for development to show the extent of its application. We know that castings in bronze and other metals are never presentable in commerce until they have been dressed and trimmed with the chisel; but one remarkable advantage in castings by this process is that the most delicate traceries require no after treatment; and of this the best evidence is, that woodcuts and the most minute stereotypes leave the mould in a state so perfect that in working them immediately not the slightest imperfection is perceptible; and nuts and screws, which are among the most delicate of metal products, can be turned out of hand with rapidity and perfection of finish far exceeding the results of all ordinary means."

Miscellanea.

New Font in St. Luke's Church, Derby. A font has been placed in St. Luke's Church. This font stands near the west entrance into the church. It is made of various kinds of marble, worked together. The bowl, which is of veined Hanbury alabaster, is octagonal in plan, and is supported upon a base composed upon a central shaft of Serpentine marble, surrounded by eight smaller detached shafts of Serpentine and Irish green marbles alternately. These shafts have carved foliage capitals, and moulded bases of alabaster. Around the bowl of the font runs a sunk arcade, the arches of which are cusped and supported at each angle by small Derbyshire spar columns, with moulded alabaster caps and bases. The spandrels of the arches are filled with Serpentine marble and Derbyshire spar-bosses. The sunk panel on each face is filled with a carving in white Chellaston alabaster, the subjects being taken from Old and New Testament history. The font is surrounded by marble steps, the lower one of Derbyshire black-eyes, and the upper one Belgian red. The work has been done by Mr. Hall, of the Derby Marble Works, from the designs of Messrs. Stevens & Robinson, the architects for the church. The carving has been executed by Mr. Chambers, of Derby. The bowl of the font is lined with electro-gilding.

New Use for Water.—A contrivance that has been erected at a colonial foundry is worthy of notice. At present it is only used for blowing the ordinary blacksmith's fire, but eventually it will, no doubt, be used for the smelting-furnace. It consists of an empty barrel, or quarter cask, stood on end behind the fire, to the centre of which a blast-pipe, from 2 in. to 3 in. in diameter, is fixed. On the top of the cask is another pipe, the same size as the blast-pipe, some 6 ft. in height, with a funnel-shaped top. Just above this there is a horizontal water-pipe of the ordinary service size, with a nozzle, having an aperture of $\frac{1}{2}$ in. in diameter, fixed at right angles—that is, pointing down the pipe leading to the barrel, down which there rushes, with considerable force, a tin jet of water, which causes a rush through the blast-pipe that is far superior both in power and steadiness to any that can be obtained from the common blacksmith's bellows. The waste water, which is very limited in quantity, escapes through a pipe attached for the purpose to the bottom of the barrel.—*Adelaide Observer.*

The Rateability of the New Foreign Cattle-Market.—On the opening of the new foreign Cattle-Market at Deptford, the property is sought to be assessed to the parochial rates to the gross value of 11,400*l.*, and a rateable value of 9,500*l.* Against this assessment the Corporation of the City of London appealed, the suit being an agreement to reduce the original assessment to a gross value of 5,825*l.*, and a rateable value of 4,807*l.*

The Oxygenation of our Gas.—The supply of oxygen gas to the public—in the same way as ordinary gas, to be used for improving street illumination, or to become an instrument in our metallurgical processes,—is again talked of. M. Tessie du Motay's process for producing oxygen cheaply, consists of charging retorts with a mixture of manganate of soda and oxide of copper, from which large quantities of gas are evolved at very small cost, and it is offered to the public at one franc the cubic metre. Applications are made by the company to the Municipal Council to lay down mains, and to make the necessary arrangements for supplying the public with this gas. One would think, however, that the more simple and obvious way to improve our gas, is to compel the gas companies to give better gas. The vile rubbish usually given is really disgraceful. A second supply, providing oxygen gas wherewith to doctor it, will only enable the adulterators to give worse gas than ever; and they will certainly do this, should any such ponderous way of amending what can so easily and simply be improved be adopted. Amalgamations ought not to have been allowed. What the companies could do for the public behoof when amalgamated has turned out, as the *Builder* urged, anything but what they would do.

Ventilation of Dwellings of the Poor.—Mr. Liddle, the Whitechapel medical officer of health, says,—“In my report for the quarter ending Sept. 30, 1871, I drew attention to the defective ventilation of the dwellings of the poor, and I pointed out that there was an intimate relation between such defective ventilation and the mortality from tubercular and other diseases of a similar class; and I further showed, by the returns of the Registrar-General, that this class of disease, which is generally admitted to be caused by the breathing of impure air, has a greater mortality than the whole class of miasmatic diseases; the latter being 23.4 per cent. of the total mortality, while the former amounts to 27.8 per cent. Nothing to my mind is more clear than that the attention of the Board and the sanitary officers must be directed to the defective state of the ventilation of the dwellings of the poor; for consumption, and the whole tubercular class, viz. scrofula, mesenteric disease, hydrocephalus, convulsions, premature birth, teething, atrophy and debility, and tubercular meningitis, are chiefly caused by the defective ventilation of dwelling-houses, and particularly of sleeping-rooms, in which at least one-third of one's existence is passed.”

New Offices of the City of London Union. These offices in Bartholomew-close, the completion of which we have mentioned, have been erected from designs prepared by Mr. W. Hinson, architect, of Doctors' Commons, which were selected from those of six architects, who had been invited to submit plans in competition; and the contract was undertaken in July last by Messrs. Hill & Son, for the sum of 5,894*l.* According to the *City Press*, besides the general offices for the clerk and registrar to the Union, the building includes a Board-room, 45 ft. long by 31 ft., and 21 ft. in height; a room for the meetings of the Assessment Committee, 34 ft. by 20 ft., with waiting-rooms for appellants; also spacious and lofty waiting-rooms, with airy yards for the poor persons in attendance upon the Relief Committees; a residence for the messenger and housekeeper; medical officers' rooms, strong rooms for books and documents; and there is cellarge throughout. The room has been furnished by Messrs. Cooper & Holt. The benches are covered with dark green morocco; they are of oak, and the tables, &c., are, of course, made to match.

Derby Licensed Victuallers' Asylum.—The Mayor of Derby has laid the foundation-stone of the Derby Licensed Victuallers' Asylum, which is about to be erected on the Nottingham-road. The cost of the erection and endowment of the proposed building will probably amount to about 2,500*l.*, and it is proposed to allow each inmate 10s. 6d. per week. Messrs. Giles & Brookhouse are the architects, and Mr. Dusanfoy the builder.

The Canal Accident at Birmingham.—It is almost impossible to give an estimate of the whole damage done by the bursting of the Worcester Canal, announced last week, but it amounts to several thousands. It is roughly estimated that the damage done to one nursery amounts to 300*l.* The canal was made in 1797, and is 29 miles in length. Its breadth is 42 ft., and its depth 6 ft.

Laying the Chief Stone of Royal Engineers' Institute, Chatham.—The chief stone of the Royal Engineers' Institute, at Chatham, has been laid by the Duke of Cambridge. The new building, which, before it is completed, will cost upwards of 20,000*l.*, will present a front principally of brick, with stone and terra-cotta enrichments. In this new Institute will be gathered all the various schools of the corps; and the different studies of the officers and non-commissioned officers will be carried on under one roof. Among the things provided in the Institute will be a lecture-theatre, capable of seating some 800 persons, various rooms for museums, halls of study or class-rooms, committee-rooms, officers' library, rooms for photographic works, printing schools, chemical laboratory, &c. Captain Marsh, R.E., is carrying out the work, assisted by Sergeant Mayne, military foreman of works, under the sole direction of Colonel Lovell, the Commanding Royal Engineer of the district. Mr. George Solitt, of Strood, is the contractor.

The Artists' Benevolent Fund.—The anniversary dinner of this corporation is to take place this Saturday evening, the 8th, Mr. R. N. Fowler, M.P., presiding. This fund suffers, in the opinion of the public, from the impression that aid is given only to its own members. It ought, however, to be known that it consists of two distinct branches, the "Artists' Annuity Fund" and the "Artists' Benevolent Fund." While the Artists' Annuity Fund is wholly supported by the contributions of its members for their own relief in sickness or old age, and neither asks for, nor receives, any support from the public; the Artists' Benevolent Fund is a strictly charitable society, and has for its object the relief of such of the widows and orphans of members of the Artists' Annuity Fund as are left in need. This is supported by the donations and subscriptions of the patrons of the fine arts and artists, and the annual contributions of the members of the Annuity Fund. Mr. L. Young, the secretary, at 4, Trafalgar-square, W.C., will give any information that may be required.

The West Front of Chester Cathedral.—Another meeting has been held in the Town-hall, under the presidency of the Mayor, for the purpose of further considering the approach to the west front of the cathedral. The meeting was attended by the bishop, the dean, Canon Kingsley, Sir T. G. Frost, and others. The town-clerk had ascertained that there was little chance of carrying out the more complete scheme, which, it was said, would cost 4,000*l.*, and that the smaller one would cost 2,500*l.* As there were 1,700*l.* promised, however, the bishop thought the smaller scheme should be put aside, and Mr. Brown thought they should go on pluckily for the larger one. Eventually, the bishop, the mayor, Mr. Potts, and the town-clerk, were appointed a committee to obtain information.

An Iron Screen.—A new cast-iron sanctuary screen has been erected in the Roman Catholic Church, Newport, Monmouth. It is 51 ft. wide by 22 ft. 6 in. high in the centre, and divided into nineteen bays or compartments by ornamental shafts and arches, supporting foliated cresting and ridge, where passion-flowers are introduced. Over the centre compartment or bay, which is 4 ft. 10 in. wide, are three figures, each more than 3 ft. high, representing the Crucifixion, the Blessed Virgin, and a St. John. The screen has been cast by Mr. J. Nicholas, iron-founder, Newport, from full-sized drawings and under the supervision of Mr. E. A. Lansdowne, architect.

The Railway Bridges in the Metropolis. Works involving an improvement of an important character are said to be now in progress at the railway bridges and arches belonging to the several railway companies south of the Thames. The several bridges crossing over the various thoroughfares in Lambeth, Camberwell, Brixton, and other portions of South London, are now being covered above the footpaths with corrugated iron, to carry away the water. The South-Eastern Company's bridge crossing over the Thames Embankment, at Oving-cross, is also being similarly encased. An indictment against some of the companies is pending.

St. Michael's, Chester-square.—The Marquis of Westminster has laid the foundation stone of the new vicarage-house for St. Michael's, Chester-square. The house is being built in the Buckingham Palace-road, from designs of Mr. R. J. Withers, architect. The marquis gives the site and other assistance.

The Proposed New Schools, Oxford.—In a recent Convocation the decree was discussed which proposed to adopt the report of the delegacy recommending that new schools should be built on the Angel site, and the decree was carried by twenty-seven placets to four non-placets. It was stated by Professor Price during the debate that the probable cost would not exceed 40,000*l.*, and that the funds at the disposal of the University were able to bear that sum. A further decree should be appointed to procure a design and estimates to be submitted for the approval or disapproval of Convocation.

A Whole Family attacked by Typhoid Fever.—The family of Lady Caroline Haskell, sister of the late Earl of Kellie, and widow of the Rev. Joseph Haskell, have been attacked, at East Retford, Nottinghamshire, by typhoid fever of a very bad kind. Five of her ladyship's children were at once laid down, and one girl twelve years of age was quickly carried off. The others are now in a fair way of recovery. It is supposed that this fever arose from the town drains having been flooded and stopped, and then opened by the authorities without due precautions having been used.

The Electric Telegraph.—In connexion with an application to the Privy Council by Sir Charles Wheatstone for a prolongation of his patents on the electric telegraphs, it was stated that about 12,000*l.* had been paid to him out of the 177,000*l.* paid by the Government, and the sum of 7,000*l.* was in abeyance. An offer was made of 9,000*l.*, and, after a discussion, it was agreed that Sir Charles, in addition to the sum already paid, should receive, by payments, 9,200*l.* odd up to the year 1878, which should be deemed sufficient for his great invention.

Cumberland and Westmoreland Archaeological Society.—The first meeting for the year of this Society has been held at Kendal. The objects of the meeting were the visiting and inspecting of Kendal parish church, and hearing a paper upon it read by Mr. J. S. Crowther, architect; visiting Heversham Church and Hall, and Beetham Church and Hall, and hearing a paper on Beetham Church read by Mr. J. Bintley. The Rev. James Simpson, Kirky Stephen, was elected chairman. The Town-hall at Keudal was the rendezvous.

The Lyons Exhibition of 1872.—Complaints are made of the incomplete state of the International Exhibition at Lyons. The Paris artists altogether declined to send any of their works, being of opinion that the promoters did not offer sufficient guarantees that due care would be taken of pictures and statues. Several large German houses who asked for space were refused; but the two provinces lost to France are represented by a large number of exhibitors. Very few contributions appear to have been sent from Great Britain.

Druidical Decadence.—At the closing meeting of the "Annual Movable Delegation" of the Order of Druids, "Past Grand Master" Wood stated "that two-thirds of their lodges were insolvent, and he was prepared to prove it," and another delegate remarked that "every other Order was in the same position." This is a much more serious matter than many will think it. A proper inquiry should be instituted.

The Light of the Legislature.—The experiment of displaying a light on the clock tower of the New Palace at Westminster has been tried experimentally, and so far as could be judged, successfully. From the Athenaeum Club it appeared like a hybrid between a comet and a moon. It will soon become a familiar object in the metropolis.

Bethnal-green Branch Museum.—We mention with great gratification that his Royal Highness the Prince of Wales has communicated to the Lord President and the Vice-President of the Committee of Council on Education his intention of opening this National Museum on Monday, the 24th of June. The Prince will be accompanied by her Royal Highness the Princess of Wales.

Line of Front and the Metropolitan Board of Works.—Those who are interested in the determination of lines of front by the Board of Works, will find it useful to refer to a case recently decided in the Court of Chancery, Lord Auckland v. The Westminster District Board of Works. A full report will be found in the Times of May 30th.

"Condition of Sale."—The case of Torrance v. Bolton, just now decided in the Vice-Chancellor's Court, will probably be advertised for conviction that it is not safe to advertise property to be sold subject to conditions not in the printed particulars, but to be read in the auction room. In the case named the contract was cancelled, and the return of the deposit enforced, the buyer swearing that he had not heard certain statements read at the sale, and which affected the value of the property.

Charlton Kings Surveyorship.—Mr. Sadler having, in pursuance of the understanding upon which he was elected to the highway inspectorship of Cheltenham, resigned his appointment as surveyor of Charlton Kings, the Local Board of the latter place proceeded, at their meeting last week, to the election of his successor. Mr. J. Villar, jun., was the successful candidate.

TENDERS

For the erection of two malshouses, at Market Rasen, in the county of Lincoln, for Mr. Joseph Marriott. Mr. Charles Bailey, architect:—
 Pretwell & Mackenzie 4,275 0 0
 Huddleston 3,450 0 0
 Harrison 3,420 0 0
 Wallis (accepted) 3,250 0 0

For gasworks, West London District Schools, Ashford, Middlesex. Mr. H. H. Collins, architect; Mr. G. A. Berry, engineer. Quantities supplied by Messrs. Batstone & Hunt:—
 Veary & Sons 1,890 0 0
 Catter & Co. 8,815 0 0
 Porter & Co. 4,385 0 0
 May & Sons 3,350 0 0

For sundry works in the building of a pair of semi-detached houses, at Finchley, for Mr. James Sims. Mr. E. Shales, architect:—
 Patman & Fotheringham 4,579 0 0
 Kerry 899 0 0
 Anley 832 0 0
 Southcott & Widgery 730 0 0
 Slagg & Long 780 0 0
 Niblett & Son (accepted) 753 0 0

For the erection of girls' school, class-rooms, offices, teacher's residence, &c., at Sudbury, for the trustees of Girling's Charity. Mr. Salter, architect:—
 Elliston & Son 2,857 0 0
 Wanford 618 0 0

For school-room, class-room, &c.
 Grimwood & Sons (accepted) 320 0 0

For Teacher's Residence.
 Grimwood & Sons 257 0 0

For the erection of sixteen cottages, at Glensford, for Messrs. Kelle & Sons. Mr. Salter, architect:—
 Stevenson 42,570 0 0
 Grimwood & Sons 1,900 0 0
 Twinn & Son 1,580 0 0
 Adams & Debenham 1,362 0 0

For extension to Messrs. Phipps's Brewery, Northampton. Mr. R. Davison, architect. Quantities by Messrs. Curtis & Son:—
 Cosford 23,544 0 0
 Heshaw 3,260 0 0
 Smith 3,185 0 0
 Dunley (accepted) 2,940 0 0

For the granary, at Barking, for Mr. D. T. Ridley. Mr. Frank Whitmore, architect. Quantities supplied:—
 Holmes 21,696 0 0
 Crockett 1,449 0 0
 Brown 1,282 0 0
 Lacy & Torkington 1,269 0 0
 Kirk 1,180 0 0
 Mansbridge 1,154 0 0

For warehouse, at Poplar, for Mr. G. Burney. Mr. J. W. Morris, architect:—
 Harris & Waldrop 2,523 0 0
 Heiser 610 0 0
 Kilby 487 0 0
 Emor 488 0 0
 Linn 480 0 0
 Sall 476 12 0
 Sheffield 447 0 0
 Waits & Holland 445 0 0
 Tanner 439 10 0
 Atherton & Laits 435 0 0
 Abraham 419 0 0

For the erection of a gentleman's residence and stable buildings, at Hampstead. Messrs. Spalding & Knight, architects:—
 Peto, Brothers 22,939 0 0
 Patman & Fotheringham 4,769 0 0
 Jackson & Shaw 4,729 0 0
 Weeks, Bangs, & Co. 4,719 0 0
 Scrivenor & White 4,597 0 0
 Carter & Son 4,563 0 0
 Mann 4,559 0 0
 Stephenson 4,383 0 0

For coach-house and stable, Holmwood, Dorking. Mr. F. J. Dibble, architect:—
 Putney 4,124 0 0
 Lynn & Dudley 349 0 0
 Johnson 333 14 0
 Pledge 313 9 7

For infants' school, Falkland-road, Dorking. Mr. F. J. Dibble, architect:—
 Lynn & Dudley 2,690 0 0
 Clear 690 0 0
 Hamblin, Brothers 680 0 0
 Putney 653 0 0

For school and residence, at Ellen's-green, Ewhurst, Surrey. Mr. F. J. Dibble, architect:—
 Port (accepted) 2,563 8 0

For three new shops and houses, at Hampstead, for Mr. J. Colverhouse. Mr. W. Thompson, architect:—
 Brass 4,423 0 0
 Conder 4,359 0 0
 Nixon & Son 4,288 0 0
 Gammon & Sons 4,278 0 0
 Manley & Rogers 4,087 0 0
 Kelly, Brothers 3,983 0 0
 Newman & Mann 3,938 0 0
 Scrivenor & White 3,928 0 0
 Nightingale 3,873 0 0

For new laundry, at the St. George's Union Work-house, Kensington. Mr. H. Saxon Snell, architect:—
 Foster 21,856 0 0
 W. Howard 1,709 0 0
 Bridgman & Nuthall 1,557 0 0
 Manley & Rogers 1,527 0 0
 Gibson, Brothers 1,465 0 0
 Lathey, Brothers 1,459 0 0
 Simpson & Co. 1,455 0 0
 Wall 1,372 0 0
 Howard, Brothers 1,289 0 0

For Engineering Works and Fittings.
 Benham & Sons 1,245 0 0
 May 1,134 13 0
 Potter & Sons 874 0 0

For external painting, &c., at the Bethnal-green Work-house, for the Guardians of Bethnal-green. Mr. Williams Mundy, architect:—
 Cailet & Co. 6,669 0 0
 Thomerson 620 0 0
 Moore 595 0 0
 Thorpe 594 18 6
 Gribble 594 18 6
 Hocking, Brothers 457 0 0
 Blackmore & Morley 482 0 0
 Gough 459 0 0
 King & Son 449 0 0
 Young & Son 410 0 0
 Lovell & Co. (accepted) 398 0 0
 Richards 330 0 0

For villa residence, at Chislehurst, for Mr. J. L. Morgan. Messrs. Habershon & Pite, architects:—
 Carratt 21,897 0 0
 Moore 1,867 0 0
 Gumball 1,640 0 0
 Grover 1,625 0 0
 Cary & Co. 1,497 0 0
 Forrest 1,494 0 0
 Boden 1,463 0 0
 Prosser & Sons 1,430 0 0
 Blackmore & Co. 1,398 10 0
 Whiting 1,392 0 0
 Willis 1,344 0 0

For villas, Gold Tops, Newport. Messrs. G. Habershon, Pite, & Fawcaker, architects:—
 No. 1. No. 2.
 Weeds 21,330 21,356
 Miles 1,120 1,225
 Bewler 1,118 1,239
 Deakin & Sons 1,118 1,250
 Bearfield 1,115 1,200
 Linton 1,100 1,200
 Whitaker 1,107 1,100
 Richards 1,095 1,184
 Hasell 988 1,054

For villa residence, at Sydenham, for General Bayly. Mr. John Norton, architect:—
 Moore & Granger 24,940 0 0
 Bless 4,129 0 0
 Ward 4,390 0 0
 Aitchison & Walker 4,139 0 0
 Strepson 4,102 0 0
 Mansbridge 3,995 0 0
 Lovell 3,993 0 0
 Newton & Co. 3,870 0 0
 Crook & Wall 3,759 0 0
 Gooding 3,750 0 0
 Wright, Brothers, & Goodchild 3,695 0 0
 Gough 3,640 0 0
 Waterson 3,610 0 0
 Hedgeson 3,605 0 0
 Cooke & Groom 3,504 0 0

For rebuilding the parish church of Bulth, South Wales. Mr. John Norton, architect:—
 Diment 25,178 0 0
 Dove, Brothers 6,179 0 0
 Morland 4,971 0 0
 Walsh & Son 4,959 0 0
 Clarke 4,965 0 0

For alterations and additions to Brunswick-road Chapel, Gloucester. Chas. G. Searle & Son, architects. Quantities supplied:—

PLASTERING WANTED, as GENERAL FOREMAN, or to take Work by Contract. Labour only. Good references.—Address, J. A. B. 3, Blenheim-street, N.W.

TO BUILDERS, IRONMONGERS, &c.
EMPLOYMENT WANTED, by a practical PAPER-HANGER. (Can do all up his time.—Address, G. H. 1, Park-cottage, Crown-hill, Lower New-road.

COMMISSION can be given by an old-established London house for the SALE of FLOORCLOTH, RAMPFLOORING, &c. in Town and country. It would be good to employ any person who can obtain orders for these materials for the use of the various new buildings now in course of erection, and this is a most valuable and profitable trade. A suitable person engaged with—Applications can be made by letter, stating particulars of present occupation, &c. to D. B. Deacon, Leadenhall-street, London.

CLERK of WORKS—A Firm of Architects desire to recommend a thoroughly competent CLERK of WORKS.—Address, Messrs. BROWN, SON, & BERTHOUD, No. 27, Grosvenor Gardens, Westminster.

CLERK of WORKS—**WANTED**, a RE-ENGAGEMENT, as above, by a thoroughly competent party. Can immediately take up.—Address, (Clerk of WORKS, Jute Works, Harrow-in-Furness, Lancashire.

CARPENTERS and JOINERS WORK (piecework) **WANTED**, or a RE-ENGAGEMENT as GENERAL FOREMAN. Good references. Town or country.—Address, T. H. 1, Prospect-place, Notting-hill.

AN ARCHITECT, aged 30, who has had several years' experience in London and a good office, seeks a RE-ENGAGEMENT, as ASSISTANT DRAUGHTSMAN. Best references given. Only moderate salary required.—Address, T. B. No. 38, London-road, Lowestoft.

A FIRST-CLASS ARCHITECTURAL DRAUGHTSMAN and DESIGNER, who has had ten years' experience, working and detail draughting.—Address, ARCHER, T. care of Mr. Woods, News Agent, 1, Great Queen-street, Westminster.

A FIRST-CLASS DRAUGHTSMAN and DESIGNER, and thoroughly qualified ASSISTANT in every branch of the profession, and especially with compound work of every class.—Address, ARCHITECT, 34, Stanley-street, Euston-square, S.W.

AS ENGINE DRIVER. Accustomed to waterworks, saw-mills, &c. Life experience. Good references.—Address, E. P. 4, Church-road, Hamerton.

TO CONTRACTORS AND OTHERS
ADVERTISER, married, aged 29, wishes EMPLOYMENT, in coming home or otherwise. Good pen and work.—Address, (can measure, plan, or draw accurate or detailed drawings, and security). Moderate salary only expected.—Address, F. W. E. 11, Southampton-street, Cumberwell, S.E.

TO BUILDERS, PLUMBERS, &c.
A YOUNG MAN, who has been used to both Job and Office, seeks a SITUATION as PLASTERER or THREE-BRANCH HAND. Can do laying a plan zinc work.—Address, P. H. W. care of Mr. Will, 25, Frigate-terrace, Abbey-road, N.W.

TO BUILDERS AND CONTRACTORS (LONDON PREFERRED)
A YOUNG MAN, aged 21, a good Penman, Correspondent, and Accountant, and being thoroughly practical knowledge of the Building Trade, is now open to an ENGAGEMENT, on acceptable testimonials, and security, required.—Address, ESCA, Post-office, Woodhall-road, Harrow-road, Middlesex.

TO BUILDERS AND PAINTERS
A FIRST-CLASS GRAINER, SIGN WRITER, and Gilder, is in a constant SITUATION in London or Suburb. Can do all up time at brush-work well required.—Address, G. L. 13, Spruce-street, Hulse, Manchester.

A CARPENTER and JOINER WANTED EMPLOYMENT, to look after a weekly estate, and do general repairs of the premises. Good references.—Address, T. F. 41, Finsland-street, Hackney Wick, E. per work.—Address, T. F. 41, Finsland-street, Hackney Wick, E. per work.

A BONUS of 3% will be given to any one who can find a SITUATION as SALESMAN in a FURNISHING HOUSE of BUSINESS. He is of superior talents, and has a thorough knowledge of the business in its entirety. Has 10 years in a first-class firm, but has not been filled till the year ending. Age 31.—Address, B. B. Post-office, Cuthbert, Loughborough.

The Builder.

VOL. XXX.—No. 1532.

General Conference of Architects.

ON Monday evening last the closing meeting of the session of the Royal Institute of British Architects was made the opening meeting of the Conference: *Le Roi est mort! Vive le Roi!* or, as the President, Mr. T. H. Wyatt, put it, on taking the chair, "The Institute is closed: long live the Conference!" The meeting was numerously attended, and included delegates from the various architectural societies mentioned in our last issue. A member of the Austrian Delegation attended the President the Royal Gold Medal for 1871-72, awarded to Herr Ober-Baurath Professor Friedrich Schmidt, of Vienna. The Sonne Medalion, the Institute Silver Medals, and other prizes awarded were also presented by the President to the various gentlemen whose names we have already printed.

The President then proceeded to open the General Conference, by delivering the following Address.

Let me begin the few words I have to offer by reminding you that the Conference is repeated this year in order to bring up the Reports of the several committees appointed at our meeting of last year; but for the future it is proposed that these Conferences shall only take place biennially. The main difference between the programme of last year and the present is this, that in 1871 it extended over a wider field, and embraced more subjects. Five papers were announced for each meeting, but this was found to leave too little time for discussion, and our bill of fare this year will be less pretentious. The attention of the Conference last year was divided between architecture as an art and as a profession. The first elicited several interesting papers; but the latter resulted in some important resolutions, the offspring of which are the reports we have this year to consider, and which will necessarily give a drier and more business-like character to our meeting.

When I had the honour last year of welcoming you to London, in the name of the Royal Institute of British Architects, those members of the profession practising in the provinces who were not actually associated with this Institute, but whom we were anxious to bring into council with us on matters deeply interesting to our profession (and, let me add, hardly less so to the public), I felt it my duty to lay before you, at the first meeting, some of those points which seemed most important and pressing, and on which unanimity of practice was most desirable. The principal ones were, I think, subsequently discussed and considered in a careful and dispassionate spirit; and I venture to believe you will find that the three subjects which were then delegated to the consideration of separate committees have received their full care and consideration at the hands of the gentlemen forming those committees, though their labours have been so succinctly alluded to in one of the professional papers. Whether the various suggestions contained in those reports be generally accepted or not, of this I am quite certain, that the whole body of our profession

stands deeply indebted to the gentlemen forming these committees (and especially to those who acted as the secretaries) for the great amount of time and labour bestowed on these subjects.

Gentlemen, these reports will be officially submitted to you to-morrow and Wednesday for consideration and discussion, so as, in the words of your own resolution of last year, "to ensure (as far as practicable) the greatest unanimity of action and opinion amongst the whole body of professional men in the United Kingdom." On one of these subjects (viz., on the employment of surveyors) considerable difference of opinion will be found to exist, and to such an extent that the Council did not feel able formally to adopt this report. It, therefore, will come before you as the suggestions of the committee. Whether, on further discussion, this matter may be put on such a basis as to ensure something like uniformity of practice, or whether it had better be left to the individual action of members, remains to be seen. Happily, it is one involving no question of professional honour or etiquette; so that each architect may remain at liberty to adopt that course which under the special circumstances of his own case, he may think most conducive to the interests of his client.

The committee have, I believe, adopted the only practical course that was open to them. They have sought the opinions of large numbers of their professional brethren, and these opinions (bound together and now lying on the table) form a most bewildering mass of evidence, hardly less so than that recently laid before the public in the case of a celebrated Claimant. The secretaries (failing to find those tattoo marks which might throw clear light on the subject) have had to analyse and classify these conflicting views as far as possible, and upon the preponderance of those opinions, to a great extent have been based the reports. Many of the replies to these inquiries have been most considerate and suggestive, expressing readiness to act upon the views expressed by the majority at this Conference; one or two, on the other hand, dealing with the subjects on which their views were asked in a very selfish and opinionated manner, declining to be bound by the views of any majority, and threatening resignation if it was proposed that their views and practice were not to be sanctioned! I should wish these gentlemen to consider how they can reconcile such independence of action with the attainment of that *esprit de corps* which it is acknowledged on all hands is so much wanting in our profession.

Gentlemen, I have but to urge that we shall enter on these discussions with as much abnegation of self and individual prejudices as human nature is capable of; that we shall respect the opinions of others, though we may differ from them, and that we should not fail to remember how many difficulties architects practising in the provinces have to contend with, and in some instances how impracticable they may find it to assimilate their practice in all particulars to ours in the metropolis.

Nor is this all. We must remember that we have to deal with a public, who will be too ready to resent and resist any rules of practice or professional etiquette which are not based on honourable and equitable conditions. We live in days of energetic and constant competition; an incessant professional struggle, when there are almost as many architects as clients, and when in this (so-called) land of liberty every man is free to employ whom he fancies, be he builder, bricklayer, or architect; and being thus free is not likely to allow himself to be bound by professional rules which he considers one-sided, and which he will repudiate as a sort of "trade-union rule" to be resisted at all costs. A recent case, tried at Durlin, bears strongly on this view, and shows how ready the public (and the clergy not the least so) are to dispute professional customs and charges; but to my mind, the conflicting evidence given by architects at that trial was not the least painful part of the proceeding.

Since we attempted last year our first Conference, the American architects have held their fifth Congress; and with a "go-ahead" rapidity and energy which belong to that nation, but which, in spite of the gratuitous advice so freely given, I venture to think we shall do well not to attempt to imitate. Their Congress began at three o'clock in the afternoon of the 14th of November, and by the following evening they had read and discussed no less than twelve reports from the six chapters and committees of their Institute. They had an annual opening address from the president; three closing addresses from the presidents of Harvard

College, the Institute of Technology, and the late master of the Leeds School of Art; two other practical papers; sundry discussions, and general Institute business.

The conditions under which we should start in such a race of swiftness are thus described in a professional journal—"Bound down by the swaddling bands of red tape, impeded by precedent, choked by apologies and compliments, blinded by the dust of prejudice, and deafened by the monotonous buzz of self-gratulation, the architects of England have grown to be wearisome to the public." Thus weighted, gentlemen, how could we compete in such a contest: better far to assume at once the rôle of the tortoise, than attempt that of the hare.

I venture to believe that the American architects have found the question of competition quite as difficult to deal with as we may, and in the words of one writing on this subject, "it will be found that in the New World as in the Old, competition is attended by selfishness, jobbery, and iniquity." The most useful result of the American meeting will, I think, be found in the discussion on fire-proof construction, and in their recommendation "of thick solid walls, solid constructions in floors and partitions, brick or artificial stone rather than granites, lime stones or sand stones, and oak posts, rather than iron or stone columns."

Gentlemen, we do not meet under the brightest conditions: our profession seems as it were to be under a cloud, to be affected by some unknown influences as the weather has lately been by atmospheric ones: violently assailed both in the leading periodical of the country and in the most influential of the daily journals: we have in addition members of our own profession publicly joining in this unjust crusade, and indulging in personalities of a most painful and uncalled for nature; and, though last, not least, we seem about to have revived a sort of "battle of the styles," a feud which I at least had hoped was buried with that of the gauges. Whilst I think it would not be very difficult to show how unjust are many of the charges made in the former, how unsound its reasonings, or how impracticable its suggestions; or to find a motive for the animus displayed in the latter; it will be well for us to consider calmly why at this particular moment such a storm should burst over our heads, and why the works of British architects, which certainly are not thus discreditably esteemed on the Continent, should be so abused in England! Is it to be attributed to the defective professional education of the English architect; to the want of examinations and a diploma to practise as in the legal and medical professions? or to a higher standard of public taste, requiring works of a higher class and purer taste? I doubt if to either of these causes is due the existing state of things; but if education is defective, that I think will soon be changed, for I believe there are abundant means now within the reach of the diligent student in architecture, not only with reference to the study of the true principles of all design, but to the artistic and constructive parts of his profession.

I have great doubts whether the diploma could now be realised for our profession, and certainly I do not believe as yet in the great advance of public taste, or we should not see such monstrosities as now find favour and approval; but supposing the professional studies of young architects have much to be desired, what shall we say of the defective taste and information of the self-constituted architectural critics, who sometimes take the world by storm through the vehemence of their assertion, and the self-complacency of their dogmatism? This species of criticism by wholesale has lately been indulged in an annoying manner by the author of the article to which I have already alluded. I hardly know whether to compare the writer's assumption to the discovery of a mare's nest, or to the announcement of those quack doctors whose sole notion of argument is the indiscriminate abuse of the whole medical profession. The writer assumes that modern architecture is bad because it is the work of professional architects who make designs but do not execute them with their own hands, or under their constant personal superintendence as master masons or builders, and he fancies that the works of the Greek and Medieval designers were successful because there was with them no such distinction between the authors of the design and the persons who carried them out. Under our system he thinks there can be none of that real loving devotion to architectural fitness and beauty which he discerns (and correctly) in the works

of the Greeks and of the Middle Ages; but really this distinction between past and present customs is a quibble upon words, or, as has been well said of this article in a celebrated weekly paper;—"an analysis of the strange confusion of accredited criticisms and of original sophisms, pertly dished up as novelties." There is nothing but an increase in the division of labour such as has taken place in other branches of art and industry, rendered necessary to a great degree by the altered conditions of society, and by the undue haste with which everything must now-a-days be realised,—no time given for study or correction. If the details of our modern work are poor and weak (which is assuredly not always the case), it is not because the designer was not also a handicraftsman, but because he is a poor artist; and if the actual mason works like a carving machine, it is not because he works under a builder who is not the author of the drawings given to him, but because he wants the genuine artistic spirit; because he is fettered by trade-union rules, seeking to do the least possible amount of work for his day's pay, and that in the most careless and heartless way.

It would be as unreasonable to pretend that English painting is inferior to that of Raffaele and Titian, because English painters buy their colours ready made up from the dealers, whilst the great Italian painters had them ground up in their own studios, and under their own eyes. If we fail it is not, I repeat, because we are architects only and not builders, masons, or carpenters, but because our training has not been complete in the study of those fundamental ideas of proportion, harmony and truth of construction which underlie all the great buildings of the past, whether of Greece or Rome, of the Middle Ages, or of the Renaissance itself; and because we are not aided by the public as our employers in the exercise of such patience on their part as would ensure greater thought and study in the works they seek at our hands. There are few present, I feel sure, who have not felt this want; it is not in private practice alone, in works freely and individually given to our care, that there is this want of consideration. In Government and public competitions, it seems essential to secure the designs asked for with the least possible expenditure of time; and, as a natural consequence, with the least amount of thought and study, and without regard to the demands which our other professional engagements have upon our time. I am not clear that there is much consolation to be derived from sharing disgrace with others, but if there is, then must our suffering be much diluted for engineers, sculptors, dilettante, and connoisseurs, all come in for the general abuse so lavishly spread about by this writer. These gentlemen are, however, well able to take care of themselves, and I can only hope that the observations made for their benefit may have a more practically beneficial effect than those made upon our profession are likely to have.

I for one have good faith in the future of our profession; even now I believe that in the calm opinion of the educated and travelled public its status is held in fair and favourable esteem; the works of its leading members allowed to hold their own in European estimation, and the honour and character of the general body to be unquestioned. I think it rests with us to live down this small of prejudice; I believe that the violent and personal language now so freely indulged in by the literary and professional critic does not carry conviction with it, and though exciting or amusing at the moment, is not to the taste of those whose opinion or influence is of real value; but of this there can be no doubt that the violent personal attacks and criticisms now so often made by architects on the works of their professional brethren, are generally condemned: where is such abuse thus publicly attempted in any other profession and how would it be tolerated?

At the close of the address a cordial vote of thanks to the President, on the motion of Professor Kerr, seconded by Mr. Street, was carried unanimously.

Professional Charges.

The first sitting of the Conference for practical business, which took place at 1:30 on Tuesday, was, according to the programme, to have been occupied by the discussion of two very important subjects, professional charges and the employment of surveyors. As might have been expected, however, the former topic furnished full occupation for the whole of the available time, and

the latter was necessarily adjourned. The main object of the meeting, so far as the former subject was concerned, being to discuss the revised form of the schedule of professional charges and practice, first issued by the Instituto in 1862, the Chairman (the president of the Instituto) commenced the proceedings by reading over the resolution at the last Conference, dated May 26, 1871, referring the various questions connected with professional charges to the professional practice committee of the Instituto, with certain additional names, whose report, when sanctioned by the council and confirmed by a special general meeting of the Instituto, should be discussed at the next general Conference.

The Chairman subsequently read a letter from Mr. C. F. Hayward strongly deprecating any interference with the Instituto schedule as previously drawn up, on the ground that to change the rules and practices then agreed to, after they had been only ten years in operation, would argue a want of confidence in themselves and would be prejudicial to the Instituto and the profession at large. The previous intention had been, he said, only to revise the old schedule by appending notes to it, not by printing an entirely new one. Another letter was read from Mr. Jolly, of Derby, who went at some length into the disadvantages resulting from the present status of the profession, in being open to all who chose to take it up, and urged that it should be put on the same level as the medical and legal professions, and no one be permitted to call himself architect or practise as such who had not passed a formal examination. Some amusement was caused by the writer's wholesale propositions for the well-being of the profession, one of which was "to abolish all provincial societies," which by their local variations of practice prevented all possibility of united action. It would have been a better way to put it, to have urged that all such societies should be requested to connect themselves with the Instituto and adopt one general rule of practice; but the obstacle named by Mr. Jolly is certainly a serious one. These letters having been read, Mr. Godwin, referring to Mr. Hayward's communication, hoped that the meeting would fully consider the point raised therein before committing themselves to the idea of an entirely new schedule; the other schedule had worked very well for ten years, and it was a very hazardous step to rescind their resolutions and replace them by others at so comparatively early a date. Professor Lewis defended the consideration of the new schedule; and after some conversation it was resolved to proceed with it, viewing it, as in fact, simply a revision of the existing schedule.

A long and careful discussion of the various clauses was then gone into, in which, besides those already named, the following and other gentlemen took part:—Mr. Edmeston, Mr. S. Matthews, Mr. Hine, Mr. Street, Mr. H. H. Statham, Professor Kerr, Mr. Oliver, Mr. C. Fowler, Mr. Panson, Mr. Roger Smith, Mr. Waterhouse, Mr. Aitchison, Mr. Fogarty, and Mr. W. Burges.

We have before us a report of the discussion, but as this meeting was regarded as private, and properly so, as it seems to me, we will simply add that, before separating, attention was drawn to the fact that, in the new schedule, all reference to charges for the over-seeing and laying out of estates was omitted, although in that of 1862 there had been special clauses referring to this branch of work. Professor Lewis explained that as the usual terms for this work were contained in recognised auctioneers' scales of charges, it was considered unnecessary to embody them in a strictly professional scale like the one under consideration, as this was not necessarily architect's work. On the motion of Mr. Edmeston, however, it was decided that the question of the retention or omission of these clauses in the 1862 scale should be considered at the adjourned meeting, which was fixed for twelve o'clock on this Friday. Hereafter we will print the revised schedule for general guidance.

Visit to the British Museum.

At half-past two on Tuesday morning, in spite of very bad weather, there was a fair concourse of visitors at the Museum, to hear what Mr. Newton had to say in regard to the interesting fragments from the Temple of Ephesus, of which the investigations of Mr. Wood have put us in possession, and which have been already referred to, with illustrations, in our columns. The fragments at present in the Museum consist chiefly of an Ionic base, part of a volute capital, a large block with sculptured figures, and numerous small pieces of base moulds, bead and reel ornaments, &c. The general nature of the site, and the amount of excavation already undertaken, were indicated by a coloured tracing exhibited by Mr. Newton. On this the supposed outline of the temple plan has been indicated, so far as can be judged by two of the bases already found. Another base has not yet been communicated, so as to be placed on the plan, it was not possible to say how far it would confirm or negative the assumed position and extent of the plan. The portion of fluted base-mould shown gives a very large scale to the building. The fluting is in very good preservation on what has been the under side of the member. The upper side is much worn, and the profile nearly destroyed. The most interesting of the relics at present in the Museum is, however, the sculptured fragment referred to, which is conjectured to be a portion of one of the "columns ornamented with sculpture" mentioned by contemporary historians as existing in the temple. The block is about the same diameter as the base-mould here mentioned, or would be if its diameter were complete, and is circular in general form, with parts of life-size, and draped figures on it, in low relief. Whether, if this be really part of a column, it is the base or the upper portion; whether the sculpture was continued all up the column, or whether grouped at the head or foot of it, there are as yet scarcely data even for conjecturing. If the former, it was such a treatment as certainly could only be found in Asiatic Greek architecture; if the latter, Mr. G. G. Scott may find an unexpected precedent for the small groups of figures at the base of the window-shafts in the St. Pancras Hotel, which have been a good deal criticised. Several smaller base members of columns (perhaps belonging to the internal colonnade) have well-marked, sharply-cut inscriptions on them, evidently forming part of a general scheme. There are distinct marks of colour on many of the fragments, chiefly a reddish tone; but on one hit of ornaments sculpture blue is clearly discernible. It would appear, so far as can be discerned, that the colour had been applied with considerable minuteness of detail in bringing out the smaller features and fillets of the carving. All who have seen these specimens will look with interest for the result of further investigation. Mr. Watkiss Lloyd was present, and gave some additional information; but, owing to the confined space, it was impossible for all present to benefit by his remarks.

In replying to a vote of thanks to Mr. Newton proposed by Mr. Waterhouse, Mr. Newton observed that it was of importance to obtain an opinion to make public the opinion of qualified judges as to the value of these fragments, and the desirability of continuing the investigations, as it would only be in the event of the Government being fully persuaded on this head that any material assistance could be obtained towards continuing the investigations on a larger scale. Upon this it was moved by Mr. Cates that Mr. Waterhouse as a member of the council of the Instituto of British Architects, should be requested to bring the subject before them, with the view of their ultimately memorialising Government in regard to it; a proposition which met with the approval of all present. Some of the party subsequently went over the Assyrian and Egyptian collection in the Museum.

Modern Ecclesiastical Architecture in Scotland.

The sectional meeting on Architectural Art held at eight o'clock on Wednesday evening (St. M. Digby Wyatt in the chair), did not in reality include very much that bore directly upon art. Most of the evening was taken up with the discussion of the competition question. Previously however, to this discussion, a short and well-written paper was read by Mr. Honeyman, of Glasgow, on the subject of modern ecclesiastical architecture in Scotland, and in Glasgow more particularly; the subject having been suggested to the author by a member of the Instituto when on a visit to Glasgow. Mr. Honeyman gave a concise sketch of the ecclesiastical "situation" in Scotland, as influencing the development of the architecture of her churches, observing that the rigorous nature of the Reformation under Knox had led at the time to the demolition of Mediaeval churches to a great extent, and left open a wide field for rebuilding, and that it was probably to the connection of Mediaeval architecture, in the minds of the Scottish people, with the abhorred Papal worship

and rule, that a good deal of the preference for classic architecture in their churches might be traced. There were two large bodies, independent of the Episcopal Church, in Scotland—the Free Presbyterian and the United Presbyterian; the former having been an offshoot or secession from the latter as late as 1843; and the fact of this secession had given a great impulse to the building of places of worship. Until a comparatively recent period, church architecture in Scotland since the Reformation had scarcely had an existence in an artistic sense, partly owing to the ideas inculcated at the Reformation, but also to the fact that the building and repairing of the churches rested with the heritors, or landed proprietors of the district, and not with the people at large; and they executed their task generally as cheaply as possible. One or two sketches of the typical Scottish Presbyterian Church of last century afforded some amusement by the very unmistakable illustration they afforded on this point; and even a good deal later than this things were in such a state that there was record of a competition for the old College Church at Glasgow by two joiners, one of whom was said to have been assisted by "an itinerant London architect." The first specimen of anything that could be called architectural Gothic was a church erected by Rickman in 1825. In the present day the state of feeling was very different; the Free Presbyterian Church had no scruple about introducing any amount of ornament into their churches, and were desirous to render them architecturally beautiful; but in looking at the designs of these edifices, English architects must remember that the requirements and the principle on which the service was carried on were perfectly distinct from those which prevailed in the Episcopal churches of England. There was no special sanctity attached to any part of the edifice, or, indeed, to the edifice as a whole, except during the time of actual service; and, as the prayers were extempore as well as the sermon, the church was, in fact, an auditorium, in which the pulpit was the central and principal object. Generally an assembly-room for meetings was attached to the church, as well as retiring-rooms, waiting-rooms, &c. Mr. Honeyman then called attention to photographs and drawings of some modern Scottish churches, conspicuous among which were some of those by Mr. Thompson, of Glasgow, particularly St. George's Free Church and Queen's Park United Presbyterian Church. The former is remarkable for much originality of treatment in the modification of Greek architecture which the architect has made his own; the interior, it was stated, was entirely lined with yellow pine, no plaster being employed, and decorated in colour on the natural tint of the wood as a ground. The Queen's Park Church, less original and striking in detail, is an admirable composition as a whole, and a completely legitimate application of Greek architecture to modern building; the pediment in particular being really the finish of the slope of the roof behind it, and not, as in many cases of modern so-called Greek architecture, a mere mask to a roof of different outline and construction.

A domed church on a Greek cross plan, by Mr. Bushell, was among the buildings illustrated, and appeared a very good composition; but the acoustic effect internally had not proved very satisfactory. Some of the Gothic designs exhibited, including one or two by the author of the paper, possessed no ordinary merit and originality;—the omission of the chancel (which is not required by the Presbyterian ritual) giving also a certain novelty of effect.*

Mr. Street, in moving a vote of thanks to Mr. Honeyman for his paper, thought that as the Presbyterian churches were in reality halls of meeting, not churches in the commonly accepted sense of the word, the Scottish architects would take the best course in discarding the idea of a Mediaeval church altogether, and accepting openly the fact (which appears to have been done in some instances) that they were halls, and treating them as such. He also observed that there were still many interesting remains of Mediaeval architecture in Scotland, which were quite as interesting and valuable as those in England, but had not received the attention and study they merited from English architects. Professor Kerr seconded the vote of thanks, which was cordially endorsed by all present.

The meeting then proceeded to the discussion of conditions for regulating architectural competitions. The proceedings did not close till a late hour, and we must defer comment on this subject till our next.

"ARCHITECTURE" AND ITS MODERN CRITICS.*

We are forced to omit the lengthened and remarkable display of historical lore commencing at p. 314 of *The Scavengerian*, devoted to expansion of the subject. It will, perhaps, be sufficient to give the concluding summary of this division of the theme.

Thus we have only to regard the early stirrings of the art faculty,—shown in our barbarous ancestors, on engraved bones, to be seen in the Christy Collection and elsewhere,—and manifested by the youth of our own days (not yet "educated" in "art-schools") on barn-doors and, in less rural localities, on the portals of houses or the surfaces of pavements; and we are irresistibly forced to the conclusion that such acts were, and are, the outcome of delight in the wholesome exercise of natural powers. The carving of a savage's club or boomerang, the war-paint and trappings of the Red Indian, the tattoo,—all indicate the early uncorrupted tendencies of our race, and the same sense of keen enjoyment. Traced through the ages and all the stages of civilisation, the signs are equally interesting, and full-fraught with meaning to the apprehensive eye and mind. It is not till we arrive at a certain period, in the month of April, A.D. 1572, 14 Reg. Eliz. (three centuries ago), that we detect a sudden and apparently complete destruction of one of the most valuable gifts that humanity had inherited with existence. Then was irremediably choked at its source the healthy spring of pleasure that, with minds innocent and pleasant, creviche, had, as by lubrication, seemed to exorcise many of the difficulties of, and eventually to render delightful, even the most prosaic toils. Nature is bountiful to us no more in this regard. Nemesis has visited us to avenge our acts; and in every instance, as soon as the blighting influence of knowledge begins to destroy the earliest teachings of nature, in artificially training the huddling growths, there vanishes for ever the possibility of true satisfaction and happy content. These were, in happier days, the accompaniment of all honest labour, proportioned always to the nature of each man; but (to start a new simile) the bright blue sky has long been covered with a leaden lining. The world has become a dreary prison-house, in which all are performing, under the constraint of fear of retributive hunger, their miserable prison tasks. The use, in order to pain our fellows, of the sharpest goods that our skill and means can devise, is the only satisfaction reserved for the most honest hearts and cheerful minds,—in this woe-begone time of fearfully imperfect digestion, and of alternating madness and idocy. The moral appetite and palate have both become incapable of conveying sensation. In every occupation, in every art,—in that of building especially,—sheer weariness, despondency, and despair are the lot of all those who direct and those who work.

It may be here remarked that, in our profatory general view of the present condition of the world, we did not characterise the "engineering profession." This is accounted for by its close relation with that of architecture, amounting at times to absolute identity. Every mind, not quite disabled by the paralysing strokes of worthless modern wisdom, will perceive that we have intended and put no limit to our remarks. What has been said of architects might be applied word for word to engineers. The Menai and London bridges, created before the beginning of the baleful existence of "celebrated engineers," are "two of the most simple, dignified, and noble buildings in the world." In modern times, however, here, as elsewhere, things have changed; and this "profession," with its experiments, its blunders, and its imperfect intelligence,—is another Old Man of the Sea, seated amid an ever-increasing group of similar monsters on the broad shoulders of the most patient of modern Suddads. How purely unnecessary is this part of our poor country's load will appear from the simple statement that, with sufficient intelligence in workmen (or

others), we should by this time have had, besides other desirable things, a perfectly-developed system of judiciously-constructed lines of railway. Though of course open to some debate, it will probably be admitted by a sufficient majority, temporarily disentangling their minds from prejudice, that all which can be needed is the will and the power to act wisely.

But we must return, and complete the reasoning on which we have based our demand for the abolition of the architectural "profession." The happy personal results to be expected by employers have been shown; let us devote a few words to the certain effects on the buildings—in respect especially of a prevalent longing for vulgar display in certain sections of society. This is always hailed with acclaims, and heartily pandered to in architecture and other things by the whole body of "eminent" persons, who exhibit a sheer depravity—the more intense and hopeless in proportion to their "celebrity,"—compounded of imbecility and craven compliance, mingled with simious imitation and base-minded sympathy. The occasional yielding of the merely weak-kneed to dictation may be passed over, as less pernicious and less frequent than the willing accord of corrupted heart and mind. How clear that any workman would war successfully against influences to which members of "the profession" have naturally succumbed. An expression of refined luxury, combined with a certain sustained *hauteur*, redeemed from utter imposture and failure some of the works of the wildest French Renaissance, and similarly qualified praise might even be accorded to an occasional sumptuous (or even panderful) English building, deriving its gay splendour from an architect,—in the memory of every one a few years, at least, deceased. But though thus sparing judicious eulogy, we cannot give way to the loud demand for exact, rigid justice for contemporaries. It is better to temper justice with mercy, and only to deplore the universal constant sinking deeper and deeper in painful incapacity and uniformly grievous degradation. . . . Such works as "the Travellers' Club and the San Fire Office—the most beautiful work in Europe of its style and dimensions"—may, for the sake of contrast, be cited as specimens of what has been effected under happy auspices, where no single will controlled absolutely, and consequently marred, the whole and each part. The unity and variety,—the expression of well-hred grace, and its pure intelligent smile,—that we see there, resulted from the control of both general design and detail by the individual workman, and the entire absence of the smooth-handed men belonging to "a mock—we had almost said a spurious—profession."*

We do not feel called upon to deny ourselves the pure satisfaction of commenting on some recent, unfortunately somewhat singular, appearances in Jupiter and some of its satellites. Therefrom with Sidrophelic art we divine with confidence the existence of ill-conditioned masses of matter. Judging from the most coherent samples yet obtained,—much of the remainder, described in language of suitable piquancy, might obtain the attention it deserves. A surprising hereditary strain of feeling and utterance may be noted. In the "Contrasts" of to-day are signs of the deep draughts of inspiration from older sources. It is pleasing to recognise a kindred spirit,—for whom also let us hope the *debris* of Ishmael's conflict may serve as scaling ladders to reach and to occupy a place in the Temple of Fame. We must not be understood to make accusations of plagiarism or imitation. We all are imitators of a far older original. We, at least, are not unaware that historic renown—the repute that comes of an ancient origin or sanction—predisposes every one to a special consideration. We appeal then to the great father of Grecian song and his glorious roll-call of names. He has evoked, from out the historic mists, heroes who are, more thoroughly than any autobiographical personages, types of human character. Types discriminated with consummate art, but still possessing all the manlike passions,—not desiccated mummies deprived of the motions of the spirit and of the warm life-blood of humanity,—distinctions made more obvious by the withdrawal of what is common to all mankind. Among that goodly

* The most extraordinary of all the designs shown was one of a Classic church, the sides of which were formed by a colonnade, with plate glass between the columns, so as to leave the latter equally visible from inside and out,—a new, but scarcely a happy idea.

* But an imputation of want of genuineness of "professional" character might be misinterpreted as a covert recognition of similitude, with reference to architecture, which cannot happen while the word "mock" is kept to.

* See p. 440, ante.

pretension, the desire of mere display,—or a scanty, heartless, perfunctory,—instead of “a constant, careful, in a sense almost affectionate, performance of allotted tasks.” The honourableness and pleasureableness of all thorough handicraft and other work being taught and accepted, not as mere verbiage with mental reservations, but as a hearty universal belief and rule of action; as a consequence there must be for every man “a life of real work,—true, grateful, ennobling, and refined.” All anomalies, social difficulties, and dangers, and personal imperfections done away.—art is not an occasional utterance, with struggling articulation, but spontaneous and univocal; not the babbling of children, but natural eloquence streaming from the mind, and, in the technic arts, from the hand of man. . . . Having thus made pretty ample provision in most directions, and regarding such handiwork with some satisfaction, we are led to take one glance at that outer world from which we retired, and at the building-art that had ere while occupied us. . . . There we see at once that the refusal of commissions, by the most distinguished architects, could not seriously be expected; nor that they should attempt in any other way to limit their undertakings to what their own powers can properly originate, inspire, and direct. We even so that, if they puzzled the ordinary public by omitting to outrun, and at times to jostle, their fellows, their conduct could only proceed from a chivalry for the weaker, which would be wholly out of proper course, and in effect thoroughly pernicious. For who should thus dare to deprive the world of an object of reverence? Can any such sentiment be truly felt for a giant who has no lusty overplus of life within, prompting him to deal out a little death around him? . . . We are, therefore, of opinion that the simplest and shortest course will be to entirely remodel existing human nature, and to reconstruct society from the foundation, both on its spiritual and material sides. On looking back we cannot but be satisfied to find that not less than forty pages have been required for an adequate expression of this fundamental truth.

But we must stop. Curious persons may, we are told, find much matter of equal importance on reference to the original source. As our space is exhausted, we are forced to refer the anxious reader thereto. Our correspondent makes the following eulogic note:—“If not particularly new, it would be a pity that at least one or two of the underlying ideas of some of this should ever become antiquated and forgotten.”

NOTES ON PICTURES

IN THE INTERNATIONAL EXHIBITION.

We pointed out last year that an attempt to make the fine-art department of this exhibition an annual display must prove a failure, so far as any illustration of the art-progress of various nations is concerned, as it was impossible that a sufficient number of works of a high order could be supplied annually to fill these long galleries; and the attempt must degenerate into merely covering the walls with so many square yards of painting, begged or borrowed from any quarter which could supply the material. The present year's exhibition entirely confirms our prediction,—at all events, as regards the English school. There was too much even last year of mere wall-covering; and in the present collection not only are the majority of works of an old date and style, not representing the present state of the art, but too large a number of these are of very mediocre merit. The fact seems to be that the public will not attend, in sufficient numbers to pay for the undertaking, unless there are pictures to look at, and therefore pictures there must be, of some sort. It would be wrong to say that even in the collection now in the English gallery there are not works of real merit and interest, which are none the worse for being, some of them, old favourites; but the general impression is that anything which is not much valued by the painter or the purchaser, and which is in the way in the studio or the drawing-room, finds a resting-place in “Gallery No. VI.” of the Kensington building. This is not very satisfactory, in any point of view.

The most important new work in this gallery is the study, by Mr. Leighton, of a design to be executed on a larger scale in the Kensington Museum, representing “The Arts applied to War” (137). The painter has chosen to repre-

sent Mediaeval arts and arms. The composition shows a crowd of figures engaged in offering, inspecting, or trying on weapons of offence or defence, the right half of the picture being devoted to the former, while the left is occupied by figures trying on armour, spurs, and other accoutrements, and in the foreground by a group of women seated and engaged in the manufacture of “gentle armour,” not exactly of the kind which Leigh Hunt's knight wore, but presumably banners and scarfs. The background is formed by a composition of Gothic,—very Gothic,—architecture, of a nondescript, heavy, castellated description, capable of improvement. Through the slight gap which divides the two crowds of figures, we see through an open archway an indication of some of the pomp and circumstance of war in progress. As a composition, this is quite worthy of the artist's name: the manner in which all the numerous figures are discriminated in attitude and action, without confusion, and in apparently the most natural manner possible, must be the result of no little thought. Some of the single figures are admirable: we notice especially the youth on the left, supporting himself with one hand against a column, as he raises his foot to have the spur fitted. Why the Mediaeval period and costume should be selected for a building so completely modern in every sense as the Kensington Museum it would be hard to say; nor why the manufacture of Armour and Knapp guns should not afford as good a field for the painter's art as that of breast-plates and swords. Possibly, we are to infer that war is a thing fit only for a semi-barbarous age, and no worthy object of modern art and industry. If so, we thank the painter for the hint, and concur with our whole soul. Reverting to the other pictures (the majority lent by owners), we notice Mr. Spencer Stanhope's “Juliet and the Nurse” (28), painted some little time since, as one of the best and least mannered and conventional works of this disciple of Rosetti; very powerful in its contrasts of light and shadows, but a singular instance of the inability of this mystical school of painting to realise such ordinary flesh-and-blood people as the characters of Shakspeare: the figures here look like a thoughtful old abbess and a young nun; that of the nurse is the direct opposite of the vulgar, garrulous, scarcely decorous old woman we are familiar with in the play. Armstrong's “Summer Evening” (35; lent by Mr. Leighton), is an admirable little study of a single figure against a background of dark trees, an excellent typical instance of the flat, thin, conventional execution of a school which numbers some of our most original artists. Mr. Watts's “Daphne” (66) has been so much retouched as to come out with a new effect; in particular the articulation of the knees is more fully indicated, and the figure has less of that look of stiffness and conventionality which impressed us when it was shown at the Academy, and was somewhat overpraised by the artist's friends. Sant's “Mlle. de Bunsen” (79) still vindicates itself as a charming specimen of a natural and graceful portrait. Raven's “Midsummer Moonlight” (86), and the late L. R. Mignot's “Hoar Frost, Richmond” (92), are fine specimens of what may be called a somewhat scenic illustration of nature. A finer class of work is the little one by Mr. H. Moore (we think new), “Winter Evening” (139), a view over a cold grey sea, with a snowstorm coming up on the horizon: this is a notable little work, full of originality. Mr. Marks's “Plea for Education and Employment: Portraits of the same Boys before and after Training in the *Chilchester*” (208), is an instance of the use of painting to subscribe a “moral end”; but it hardly furnishes denial to the theory that moral teaching cannot be the primary end of art; the picture has been most carefully painted, yet in power and interest it falls far short of many by the same painter wherein no “moral” was inculcated. Sir E. Landseer's two studies of lions (339, 346), which were among the prominent objects in the Royal Academy of 1869 (and which a literary contemporary classed among the new works in this gallery), look as powerful as ever. Near these is another very fine landscape, by H. Moore, “Thunder-clouds Gathering—Harvest Time, Kenilworth” (345). Two small landscapes, by T. C. Farrer, “Moonrise after Rain” (391), and “The Last Moment of a Day” (399), should be noticed as instances of the true poetry of landscape, evoked from very simple materials, and thoughtfully treated; the latter, with a dark stretch of bank and trees across the middle of the composition, a faintly-lighted sky above, its tone more faintly repeated

in the water below, is a very pleasing specimen of composition on a very simple and natural motive. Poynter's “Orpheus and Eurydice” (129), and Watts's “Endymion” (416), we take to be comparatively early specimens of the respective artists; since then the hardness of the former artist has developed into brilliancy; the latter is a beautiful specimen of a classical subject romantically treated. Millais's “Ophelia,” and Sir E. Landseer's “The Sanctuary,” are among old acquaintances which one is glad to look at again. Naish's fine coast scene, “A North Devon Cove” (502), attracted some attention in last year's Academy. A little picture, by R. Leslie, “Caught on the Beach” (474), an evening scene, is masterly in colour and tone.

The Water-colour Gallery (No. VII.), comprising drawings, “chiefly British,” comprises also a great deal of which nothing need be said. Some sketches by Maclise are interesting for various reasons: “The *Debut* of Paganini” shows the violinist in front, and the members of the band behind, in various attitudes of astonishment or despair (a celebrated pianist of the day is said to have expressed the general feeling by the remark, “Thank God, I'm not a violinist!”). If these were made on the spot, they form a curious and interesting reminiscence of one of the most notable apparitions that ever startled the artistic world. Two or three of Mr. Absolon's best drawings are here—in particular, “The Last Load of Hay” (668), which it is pleasant to meet again. A portrait of the Marchioness of Lorne, by W. G. Wills (656), is a remarkably fine, broadly-executed drawing, and very good specimen of portraiture treatment in water-colour. There are several of Mr. Phénix Spiers's architectural sketches, and one or two of the small landscapes of Mr. Ditchfield should be looked at; “Near Cowes” (690), in particular. Who is A. L.? There are two very good drawings under this name, “Christmas Roses” and “Day Dreams” (698, 735); the artist need not be ashamed of his (or her) name. That masterly executant, J. M. Topling, sends some of his most brilliant achievements, in particular a Chinese (half-length) woman, under the title “Ching-a-ring-a-ring-Ching” (709), a splendid piece of colour. Mrs. Sparrall Stillman is represented by one of her single figures, “St. Barbara” (695); it is a pity this clever lady has given her adherence to a school whose defects rather than merits she has been able to illustrate: the colour in this is as usual very heated, and the hand is certainly not well drawn. Is J. D. Watson's “Book Lore” (716) here exhibited for the first time? We at least do not remember it; in real artistic power it is probably the finest thing in this gallery; it represents an old man studying in a library, in a bright red cloak, and a curious headress of the same colour, the background formed by a dark oak cabinet: it is a most powerful and effective work.

The reserve force which France always seems to have at command in painting is really remarkable. Last year, in the very midst of her unexampled misfortunes, she furnished by far the richest contingent to the picture galleries at Kensington; and in the present year, though there is nothing certainly like the remarkable array of works by Daubigny, Corot, and Dupré, which last year furnished means for quite a comprehensive study of the French landscape school, yet there is far more to look at here, far larger a proportion of good pictures, in Galleries XIX. and XX., than in any others; and no small number of these are dated “1871.” Some among these have direct reference to the events of the two previous years; for instance, the pathetic work of Protais, entitled simply “1870” (1,212), showing a group of three soldiers lying, wounded and helpless, in the midst of a plain, the scene of a recent battle, and encompassed by the fire and smoke from burning villages. Immediately above this hangs Perault's charming “Odalisque,” a semi-nude figure of singular delicacy of contour, half kneeling on a couch, her lower limbs enveloped in rich satins, her bright golden hair braided up, her face only seen in the mirror which reflects it: a beautiful embodiment of the more refined form of voluptuousness. Are we too fanciful in seeming to find somewhat of a moral lesson in the accidental juxtaposition of these two paintings? Is it not in the taste for sensuous beauty and sensuous enjoyment characteristic of the Second Empire, and typified in Perault's work, that we may look in great measure for the influences which have aided in bringing France to the melancholy situation shadowed forth in the more

recent work of Pratis? Another of the war pictures is the "Rue de Rivoli, May 21, 1871," of Leon Y. Escourea (1,146), a painting of remarkable maintenance of finish, and combining realism with effect, from the long deserted street and the mass of fire and smoke at the end of the vista, in a notable manner. In the foreground lies a dead Mobile in the centre of the street, and at the side under cover of a colonnade crouch a sketcher (the artist?) and a correspondent of an English paper, busily at work. For simple pathos, too, we may note Joulin's "Episode of the Bombardment" (1,263): a young girl of the middle class has been struck dead by a shell-splinter, and lies alone in the snow just as she has fallen, her head drooped on one side, her dress scarcely discombed by the fall; the snow is stained with her blood. This is a sad picture to look at, and yet it is well it has been painted, and well that its meaning should be realised. A melancholy interest attaches, too, to the "Portrait of Monsgr. Darbov, late Archbishop of Paris" (1,158), by Lehmann; a thin, gentle, refined face, answering to all we heard of the character of the victim of the Commune; the colour effect of the dress, a purple cape and flowered crimson sleeves, is very rich, if a little too warm. Leaving, however, the works which have this immediate historical interest, there can be no question that the central picture of the French gallery is the great work of Cabanel, "Francesca di Rimini" (1,230). This is a large life-size painting of the hapless lovers; Francesca is thrown back on a kind of settee, her face turned backward towards her lover, who kneels on the floor beside her, in an attitude somewhat awkward, but which has afforded the painter opportunity for a triumph of drawing and foreshortening; the spy looks in from behind a curtain to the right. Of the drawing of both the figures, and the finish and execution of the rich dress of the lady, one could hardly speak too highly; but these accessories are as nothing in comparison with the intensity and abandon of passion displayed in the faces and attitudes of the principal figures: there is something almost fearful in this unveiling of such a moment to the vulgar gaze; the British Philistine, however, true to his instincts, looks stolidly at it, reads the name of subject and artist from his catalogue, and passes on with his usual contented indifference. This picture was painted in 1870, and therefore shows the maturity of the artist's powers; such a realisation of Dante's celebrated line,—

"Quel giorno più non vi leggemmo avante,"—

we will venture to say has not before been put upon canvas. It is instructive, by way of noting the distinction between passionate and passionless art, genius and commonplace, to contrast this work with one illustrating exactly the same subject (1,263) by an artist not capable of entering into the situation or the feeling portrayed by the poet.

NEW SCHOOLS FOR THE GROCERS' COMPANY.

The Grocers' Company are about to convert a considerable portion of their large accumulated fund from non-educational to educational purpose, and under the Endowed Schools Act of 1869, have agreed with the Endowed Schools' Commissioners and the Charity Commissioners to hand over to a new governing body the whole of certain rent-charges, and sums of money, the latter amounting to 30,000*l.*, and to be called the "School Fund," for the establishment of middle-class schools in London or its vicinity. The new schools about to be erected under the agreement between the Endowed School Commissioners and the Grocers' Company, are to be built on some suitable site or sites, to be chosen by the new court of governors, within three miles of the city of London, and are to be in a single building, or otherwise as the court may determine. The schools are to be large enough to accommodate 500 day scholars, with a residence for the head master. The schools are in the first instance to be opened for boys, but the court is to have power at any time to convert them wholly or partly to the use of girls if deemed expedient. No fees are to be paid except such as are prescribed by the scheme or the court, but the head master, in addition to a fixed stipend of 200*l.* a year, is to receive a minimum sum of 1*l.* for each boy. The boys' entrance-fee is not to be more than 1*l.*, and the tuition fee not to exceed 5*l.*, no extras of any kind being allowed. The aim of the schools is

to give a practical education suitable for the children of that class who desire to educate their children up to the age of fourteen years. The new governing body under the scheme is to be the master, wardens, and court of assistants of the Grocers' Company for the time being.

NEW PUBLIC BATHS AND LECTURE HALL AT BRIXTON.

LARGE swimming and other baths, together with other buildings of a public character, are about to be erected at Brixton. A company, called the Brixton and Clapham Baths Company, Limited, has been formed for the purpose, and they have already secured a site for the intended new buildings on the land in Shepheard's-lane, in Brixton, known as the Peabody estate, situated between the Brixton and Clapham Roads. The buildings to be erected will be on a scale of considerable magnitude, and will comprise spacious swimming-baths, in addition to hot, tepid, and Turkish baths, possessing many modern, novel, and improved features. The objects of the company comprehend several features besides the baths, and the new building will also contain a lecture-hall, reading-rooms, billiard-room, and gymnasium.

A public meeting was held on the subject last week in St. John's Schoolroom, Canterbury-road, Brixton, at which there was a large and influential attendance, when Mr. Fowler, the architect for the intended new buildings, having explained their character and extent, a resolution was carried to the effect that the objects which the company had in view were worthy of the warm support of the public. The company has the cordial support of the borough members, Sir J. C. Lawrence and Mr. W. M'Arthur, and several of the most influential inhabitants, and already a large number of shares have been taken.

PRIZES, SOCIETY OF ARTS.

THE Albert medal has been awarded by the council this year to Mr. Henry Bessemer, "for the eminent services rendered by him to Arts, Manufactures, and Commerce, in developing the manufacture of steel."

His Royal Highness the Prince Consort's prize of twenty-five guineas has been awarded to William Pollitt, aged 20, Salford Working Men's College, clerk, who has obtained the following first-class certificates:—1869. Gorman—First-class certificate, with second prize; English History—First-class certificate, with first prize; 1870. Book-keeping—First-class certificate; Logic—First-class certificate, with second prize; 1871. Latin—First-class certificate, with first prize; English language—First-class certificate, with second prize. 1872. Domestic economy—First-class certificate, with first prize; Metric system—First-class certificate, with second prize; Mensuration—First-class certificate.

On a previous occasion the recipient of this prize implored us not to mention his name, as he believed it would be most injurious to him with his employers if they heard of it—more shame for them. We hope there is no fear in this respect in the case of Mr. Pollitt.

WEYMOUTH.

THE new Weymouth and Dorset County Royal Eye Infirmary, now formally opened, has been designed, as far as the funds at command would permit, in accordance with the modern ideas of arrangement and accommodation. It is of Gothic character, freely treated, and built with Portland stone. Due attention has been paid, as at the Royal Hospital, to the comforts of the patients, by providing lofty, commodious, well-lighted, and well-ventilated wards, and heating all the rooms by means of open fireplaces. On the ground-floor are the waiting-room, consulting-room, dispensary, bath-room, matron's room, kitchen, and offices. The first and second floors are wards, with accommodation for twenty-two patients. Mr. G. R. Crickmay is the architect for this building, and Mr. Samuel Stevens, of Southampton, was the builder.

In the Royal Hospital and Dispensary for in-patients separate wards have been provided, both in case of men and women, for accidents. The wards are lofty, and well lighted, and attention has been paid to the ventilation. Entering at the principal and central door, we find on the right of a wide and well-

lighted corridor the females' accident-ward for two beds, and the male accident-ward for four beds, and at the end of the corridor a kitchen and offices. On the first-floor, approached by stairs and corridor of fireproof construction, is a females' medical-ward for five beds, males' medical-ward for four beds, bath-room, library, matron's room, and committee-room; and on the second-floor are two bedrooms and a linen-room. For outdoor patients there is a waiting-room, consulting-room, and a dispensary, so arranged that they do not interfere with the in-patients. The building is faced with red bricks, pointed with black, and the front next School-street is of red and black bricks and Doulton stone. The grounds are laid out in flower-borders, grass-plots, and wide gravel-walks. The architect is also Mr. G. R. Crickmay, of Weymouth, and the builders were Messrs. England & Innes, of the same town.

SOUTHWARK BRIDGE.

IN 1869, after the purchase of the Southwark Bridge by the Corporation had been finally settled, the question of "improving the communication between the north and south sides of the Thames" was officially submitted to the Bridge House Estates Committee by the Common Council. Mr. Carr's plans for the widening of London Bridge and the improvement of Southwark Bridge by widening and lowering the existing arches were submitted to the committee; but, owing to the heavy expenditure then being incurred in rebuilding Blackfriars Bridge, nothing further was at that time undertaken. Now, however, the question is again brought forward, and is under consideration by the Bridge House Estates Committee.

Though it is a fact that the route from the Bank to the Elephant and Castle is shorter by Southwark than by London Bridge, still the steep approaches of Southwark Bridge deter heavy traffic, and the relief is not afforded to London Bridge that would otherwise be given.

The proposals before the committee at the present time are understood to be those of Mr. Leach, the engineer to the Thames Conservancy, and of Mr. Carr; Mr. Leach proposing to lower the summit of the bridge by the trifling amount that could be attained by reducing the thickness of road-material; Mr. Carr proposing to take down the existing cast-iron arches, and to replace them by wrought-iron arches, giving a headway underneath of 25 ft. above Trinity High-water,—the same as at New Blackfriars Bridge,—and lowering the summit to the extent of 8 ft., improving the gradients from 1 in 19 at the worst part to 1 in 40. Money laid out in the smaller work would be so much thrown away, if eventually it be found requisite to make the bridge such as would be required for a large share of the City traffic, and so to relieve the overcrowding of London Bridge.

COMPETITIONS.

Sevenoaks Cottage Hospital.—Four architects, more or less connected with Sevenoaks, offered, we are told, to give a design for the above; namely, Mr. J. M. Hooker, Messrs. Teulon & Cronk, Mr. Graham Jackson, and Mr. C. Petley. The committee suggested that each should send a design from which they would select the one they considered best suited to the purpose, and issued instructions accordingly. On the 1st of May two designs were sent in, one by Mr. J. M. Hooker, and the other by Messrs. Teulon & Cronk. Mr. Graham Jackson and Mr. C. Petley did not compete. On the 27th, at a general meeting of the subscribers, the design of Mr. J. M. Hooker was selected. The plans were open to the inspection of the public a fortnight before the decision.

Darlington Fever Hospital.—At a meeting of the Town Council held last week, the Town Clerk read the report of the Hospital Committee, which stated that the plans for the proposed new fever hospital had been forwarded to the Local Government Board, who had, however, declined to pass them, unless certain alterations recommended by their medical officer were made. Several alterations were made in the plans, increasing the accommodation, and rendering it necessary that a separate building should be erected, the cost of the hospital, at first estimated at 5,000*l.*, being thus increased to about 9,000*l.*, in return for which they were able to accommodate forty-four, instead of thirty-two

patients, as before. The Mayor remarked that the alterations suggested by the Local Government Board medical officer would add considerably to the amount of accommodation required and also to the cost. He moved the adoption of the report. Mr. Alderman Luck objected to the adoption of the report, and proposed that the plans should stand over for a month. With reference to the outlay, the first estimated cost was 5,000*l.*; they had then what he might term a hop to 9,000*l.*, and perhaps they would afterwards take a step to 12,000*l.*, and what the jump would be he could not tell. The motion was ultimately carried.

THE DEATH OF CATTERSON SMITH, M.R.I.A.

This artist was favourably known for many years in Ireland as an excellent portrait-painter. He was a Past-President of the Royal Hibernian Academy, and was lately engaged in arranging the collection of paintings now on view in the Dublin Exhibition. On Thursday in last week, while so occupied, he was taken suddenly ill, returned home, but never rallied. His remains were interred in Mount Jerome Cemetery, his chief mourners being his six sons. Several distinguished persons, noblemen, judges, artists, architects, and other professional gentlemen, attended his funeral; in fact, the concourse consisted of the majority of those in Dublin who are connected with artistic pursuits.

The walls of the Royal Hibernian Academy, in its annual exhibitions, were seldom without one or more of his successful efforts. Long connected with Dublin, and generally respected, his place will be missed among the few resident artists of note in the Irish capital.

TOMB OF LORD STANLEY OF ALDERLEY.

In designing this tomb, parts of which are to be seen just now at Messrs. Salvati's, in St. James's-street, Mr. J. G. Waller has taken a hint from that of Henry III. at Westminster; but where in the latter is a slab of porphyry he has introduced a brass, which contains figures of the widow and all her children, twelve in number, introduced with much skill. Nine of them are living, and portraits; viz., the present peer, Col. Stanley, Lyulph Stanley, Rev. Algernon Stanley, Mrs. Lane Fox, Lady Arlie, Miss Stanley, Lady Amberley, and Mr. Howard, in the order in which they stand. All these are distinguished by small enamelled coats of arms.

"Pouncing" is introduced for ornamentation, and the "hawthorn badge" on the sleeve of Lady Arlie. The whole is certainly unique. Means will have to be taken to prevent tampering. The geometrical mosaics which adorn the tomb are put in with studied irregularity and rudeness, to avoid a mechanical aspect; and as the brass is obviously and properly modern, a little incongruity results. The recumbent figure which the tomb will support is by Mr. George Nelson.

THE METROPOLITAN STRIKE.

At a meeting of the Master Builders, held on Friday, 7th inst., at the Freemasons' Tavern, Mr. Plucknett in the chair, the following resolutions were adopted:—

1. That this meeting is of opinion that it is advisable for the employers to do all they reasonably can to obviate the necessity of a lock-out, and expresses its willingness to submit the decision as to hours of labour and rate of wages to the Marquis of Salisbury and the Earl of Derby, whose decision shall be binding on both parties; but this resolution is upon the express condition that the workmen now on strike at Mr. Brass's and Messrs. Jackson & Shaw's works shall, until the arbitrators make their award, return to their employment at the present rate of wages not later than Wednesday next, the 12th of June.
2. That the builders now assembled agree to give notice to the men in their employ, that unless the proposition contained in the first resolution be accepted, the works and shops belonging to those builders in the metropolitan district will be closed on the 17th of June.
3. That the builders present do constitute themselves into a society, to be called the Central Association of Master Builders, the annual subscription of each member to be one guinea. Each member shall pay towards the extraordinary expenditure now required a reasonable contribution for each person employed in his establishment on the 17th of June. That the following gentlemen be appointed the committee of the Central Association of Master Builders, with full power to act in any way that they may consider conducive to the interests of the members of the association, and that the following gentlemen be the committee, with power to add to their number:—Messrs. S. Bird, Richardson, Smith, Trollope, F. Dove, Brass, Dines, and Jackson.

A circular, drawing the special attention of

master-builders to the third of these resolutions, and giving a full list of the committee of the Central Association of Master Builders, has been prepared, and is about to be widely distributed, requesting co-operation and subscriptions.

The following is the full list of committee referred to, five being a quorum:—

Messrs. G. Plucknett (W. Cuhitt & Co.); B. Hannen (Holland & Hannen); C. Lucas (Lucas, Brothers); H. G. Smith (G. Smith & Co.); W. Brass, Stanley G. Bird, R. Richard-son, G. F. Trollope (G. Trollope & Sons); G. Dines (Dines & Banderet); F. Dove (Dove, Brothers); G. Jackson (Jackson & Shaw); B. Colls (B. Colls & Sons); T. R. Hill (Hill & Sons); Scrivenor (Scrivenor & White); Head (Keyes & Head); Manley (Manley & Rogers); C. Aldin.

On Saturday night a crowded meeting of the delegates appointed amongst the workmen employed in the various branches of the building trade took place at the Brown Bear, High-street, Bloomsbury, for the purpose of receiving reports as to the feelings of the men in the different shops, and to consider the resolutions adopted by the masters at their meeting on Friday. The chairman read the resolutions adopted at the masters' meeting. The reading of the resolutions was received with marks of strong disapprobation. A large number of proposals were submitted to the meeting, but the following was adopted:—

That this meeting of delegates hereby expresses its approval of the principle of arbitration in the settlement of this question; at the same time we absolutely refuse to accept the conditions on which it is submitted by the master builders' meeting.

A resolution of the committee of the Central Association of Master Builders, inviting the Carpenters and Joiners' Nine-hour Delegation to nominate some of their number to confer with them upon the terms of an arbitration, was arrived at after long deliberation. Mr. Piper, their secretary, personally carried it to the Brown Bear Tavern later in the evening, when he ascertained that the men's committee were not invested with the requisite powers to act alone, and the delegation meeting stood adjourned until Thursday night, the 13th. Mr. Matkin, the secretary of the delegation, and the delegates from Jackson & Shaw's, were deputed to attend the masters' committee, at the Freemasons' Tavern, and explain the position in which they stood. It was thereupon arranged that an aggregate meeting of the delegates should be specially summoned for Wednesday evening, to elect four of their number to meet four of the masters' committee on Thursday afternoon, to settle the preliminaries or articles of reference, the two secretaries to act as *ex officio* members of the conference. It has since been decided by the workmen's committee that the delegate meeting of the carpenters and joiners will not take place on Wednesday evening, but on Thursday evening, at eight o'clock.

Meantime the Master Builders had a meeting, on Thursday afternoon; and the following copy of a letter to Mr. Matkin from Mr. Stanley G. Bird, as Hon. Sec., *pro tem.*, will show with what result:—

"I am instructed by the Committee of Master Builders to acknowledge the receipt of your letter of the 12th instant, informing them that the meeting arranged with your deputation to be held to-day must be adjourned to Friday, and to express their regret at this postponement of the meeting, having regard to the short time remaining for the pending negotiation. The deputation of Master Builders will be prepared to receive your deputation at the Freemasons' Tavern to-morrow, Friday, at two o'clock in the afternoon."

Messrs. Hill & Sons, of Charlton Works, Islington, wish us to state that the report that they had agreed to give the men in their employ the concession demanded is wholly untrue.

THE BERLIN COMPETITION.

A CORRESPONDENT from Berlin writes as follows:—

The plans for the New Parliament House of Berlin have at last received judgment, though none of them are likely to be executed. As I foretold so it has happened, and our homely German proverb has been fully applied, viz.:—

"The fattened pig was predestined to be killed for fatherlandish home consumption only."

In deed, the Berlin press openly declared their partisanship for those architects only who are *de facto* citizens of the New Empire.

The first prize was awarded to Professor Bohstedt, now living in Gotha (of the Berlin

Eclectic School); 2. Messrs. Kayser & Grosheim (of the Berlin Eclectic School), of Berlin; 3. Messrs. Mylius & Bluntzsch, of Frankfurt (Berlin School); 4. Messrs. Ende & Boettmann, also of Berlin; 5. Last, and not least, to Messrs. G. G. Scott & Son, of London, as a sop to English *amour propre* and national sensibility, Mr. Scott being personally well known to her Imperial Highness the Crown Princess of Germany, as the architect of the Albert Memorial, &c.

SURVEYORS UNDER THE ECCLESIASTICAL DILAPIDATIONS ACT.

On the 11th inst. a meeting was held in the Library of the Royal Institute of British Architects of the surveyors elected for various dioceses under the Ecclesiastical Dilapidations Act, 1871. Thirty-two were present. It was resolved to form an Association of the surveyors, which was accordingly constituted at once, with the object of securing uniformity in the duty. The following officers were appointed:—Mr. J. Clarke (Canterbury), president; Mr. Gordon M. Hills (London and Rochester), vice-president; Mr. Lacy Ridglo (Chichester), secretary for London and treasurer; Mr. C. Bruton (Oxford), secretary for the west of the southern province; Mr. Johnson (Durham), secretary for the northern province. A standing committee was appointed, consisting of the above officers, with the following gentlemen:—Mr. Barker (Winchester), Mr. Blackburn (Norwich), Mr. Chancellor (Rochester), Mr. Crikmay (Salisbury), Mr. Goddard (Lincoln), Mr. Pope (Bristol), Mr. southern province; Mr. Armfield (York), Mr. Bell (Manchester), Mr. Newstead (York), Mr. Nicholson (Ripon), for the northern province.

SCHOOL BOARDS.

Reading.—The committee report, as to the New Town and Early School, that it is premature to enter upon the consideration of the appointment of an architect, but as the purchase of the site has been sanctioned by the Education Department, the preliminary consideration of the question of what character the school buildings shall be may now be entered upon. As to the Silver-street School Scheme, they state that the plans, specifications, and estimate of cost, have been prepared and submitted by Mr. Morris. As the estimate exceeds the sum stated in Mr. Morris's memorandum, which was laid before the Board on the 3rd January last, the committee deem it right to present the plans, specification, and estimate for approval and adoption by the Board, previously to forwarding them to the Education department.

Wolverhampton.—At the last meeting of this Board, the purchase of 2,666 yards of land for the Red Cross-street schools was legally completed, the plans of Mr. Billake for the schools accepted, and tenders for the erection ordered to be advertised for. The tender of Mr. Horsman to build the schools in the Dudley-road for 2,540*l.* 16*s.* 11*d.* was accepted.

Walsall.—The following tenders for the erection of the intended Board Schools at the Wisemore, were presented at last meeting, viz.—Mr. D. Moore, Walsall, building, 1,979*l.*; boundary walls, 326*l.*; fittings, 148*l.*—total, 2,453*l.*; Mr. J. Rowley, Walsall, building, 2,172*l.*; walls, 319*l.*; fittings, 114*l.*—total, 2,605*l.*; Messrs. Stockton & Sons, Oldbury, building, 2,166*l.* 18*s.*; walls, 418*l.* 14*s.*; fittings, 154*l.*—total, 2,739*l.* 12*s.* It was resolved to accept the tender of Mr. Moore, and it was ordered that he be bound to complete the work within six months. The architect's original estimate of the cost of the work was 2,473*l.*, and, subsequently, additions had been made to the value of at least 100*l.* Mr. Billake attended with designs of schools to be erected by the Board in Tautarra-street, and at Bloxwich, and both sets were approved.

Hullian.—The Board has resolved to take over Sion Chapel day-school as a board-school for fourteen years, at an annual rental of 75*l.* The cost of altering the school to adapt it for the purpose will be 650*l.* Notwithstanding the intention of Messrs. Holdsworth to erect a school at Siddal, the Board have resolved to purchase land in that district for a school.

Huddersfield.—The design of Messrs. Walford & Pollard, of Bradford, has been agreed upon for the erection of a school at Stile Common; and that of Mr. F. Fowler, of Leeds, for one at Oaks, Lindley.

Leicester.—The report of the committee ap-

pointed with reference to the size and situation of schools, recommends that the following schools be erected by the Board, namely,—

1. On the site in Slater-street, a school for 438 girls, 219 boys, and 219 infants.
2. On the site on the Belgrave-road, a school to accommodate, in four departments, a similar number in each department as are provided for in the plan adopted by the Board for the school on King Richard's-road; and that the plans be so constructed as to admit of enlargement if necessary.

3. On a site near Maynard-street, a school to accommodate, in four departments, a similar number in each department as are provided for in the plan adopted by the Board for the school on King Richard's-road; and that the plans be so constructed as to admit of enlargement if necessary."

The report has been received and adopted by the Board.

THE ARTISTS' BENEVOLENT FUND.

At the anniversary festival of this institution, held at the Freemasons' Tavern on the 8th inst., Mr. R. N. Fowler, M.P., who presided, urged its claims. In his opinion, he said, and he had hopes that in the opinion of the public at large also, there was no class of persons more justified in looking to the public for assistance in the day of misfortune than the artists of the kingdom. A good deal had of late been said of public education. In this respect much was due to the artists of the country. A good deal had also been said of moral progress. He was not quite sure but that as much service had been done in this particular by the works of Titian, Raffaele, and others he could name, as by those who in the daily press endeavoured in the present day to improve the public mind. The literary labour in connexion with the daily newspapers was necessarily performed on the spur of the moment, and it could not be expected to be as perfect and effective in every particular as the work of those who had sufficient time allowed them to deal properly with the subject in hand. He considered that both the past and the present had benefited by the studies of our artists, and the results which had accrued from those studies. During the past year 49 widows and 9 orphans received annuities amounting in the whole to 947l. 10s. For many years the amount of each widow's annuity was fixed at 15l., with a further annual sum of 5l. for each orphan under the age of 16; but the committee, having been very earnestly entreated to increase the annuity for each widow to the sum of 20l., resolved to do so. Capt. Digilton retained thanks for the volunteers, and proposed the health of the chairman. Mr. Godwin, in proposing prosperity to the Royal Academy, and the other societies connected with the fine arts, referred to the great opportunity afforded by St. Paul's for the encouragement of mural painting, and called for the employment of the highest art that England could supply. When apartments of the Vatican were to be decorated, Raffaele was called in; for the Sistine Chapel, Michelangelo; and Leonardo da Vinci had made a new otherwise squalid room in Milan a shrine for pilgrims of all nations. Mr. W. Cave Thomas, who responded, said that although he was not a member of any of the societies, he felt quite able to say that all strove to do as much good as possible. He commented with some severity on the mode adopted in conducting artistic works in this country. If people were ill they called in a doctor; if they needed law they sought a lawyer; but if artistic results were desired, a number of gentlemen who, to say the best, had not made art a special study, were called a committee, and left to work their will. Various other toasts were drunk, Miss Emily Faithfull replying for "The Ladies," who on this occasion formed part of the guests at table. Mr. L. Young, the secretary, and Mr. C. J. Dimond, treasurer, announced donations amounting to something over 600l.

THE DORCHESTER MEETING OF THE BATH AND WEST OF ENGLAND SOCIETY.

This meeting has just been held. The Department of Arts and Manufacture was an attractive and successful feature. The applications for space were more than could be accommodated. The ceramic collection of Mr. Carey, from Bath, was a prominent part of the exhibition, as was that of cut and engraved glass candelabra, painted vases, and other manufactures in glass. There was some rich decorative furniture. The pianofortes and harmoniums were worth looking at; and the aluminium gold jewelry looked

"as good as gold." There were sewing machines in sufficient variety, and a quantity of cutlery goods.

THE ADORNMENT OF CHURCH WALLS AND WINDOWS.*

As a sequel to a paper which I read a year ago on Stained Glass, I would now draw attention to the adornment of the walls and windows of our churches. In propounding this thesis, all I hope to do is to moot the question, in order to incite thought and inquiry upon it, that artistic taste and godly edifying results may grow out of it.

Ecclesiastical architecture is the parent of ecclesiastical art: fifty years ago the former was as little understood as the latter is now. There was a time when art was national in England,—that is, in Pre-Reformation times. There was then in each great work of architecture and art in the land, a oneness of design in the general outline, and a perfect harmony in all details. All worked together with singleness of heart,—the trades with their handicraft, the arts with their poetry; each and all had one harmonious aim, to raise those beautiful retreats of learning, and shrines of devotion, which still even in their ruins form the models of our own taste. But unhappily and most mistakenly, art came to be put in the same category with the superstitious of Medieval times; so England came to despise it and discourage it; so it sickened and died.

But at last England has in this respect seen the error of her ways—poetic art has been rekindled into new life, and the revival has been so rapid, that the demands which have come to be made upon it have exceeded what it has been possible in good taste and true principles to supply. Is it not painful to see how imperfectly art, as applied to the development and so to the adornment of church architecture, is understood? It is not only too much a thing of trade instead of "art," but it is wanting in religious element; there is a hopeless confusion of the subjective matter,—a want of all harmony of plan, and the entire abnegation of that highest office of art, viz.—to incite religious thought and feeling, to soothe and comfort world-oppressed hearts, and to lift up the soul from earth to heaven. The very province itself of art in our churches is to raise the soul to an atmosphere beyond material things, and hence it needs a special devotion in its treatment, a heaven-ward breathing in all its aims and aspirations. In olden times the artist's pencil felt the heaven-inspired emotion of the artist's heart; it was the objective expression of subjective feeling, the outward reprint of the inner man, a transcript upon outward materials of "the hidden man of the heart." The mural and window decorations of our churches (like our very music and poetry in divine worship), have a high object to subserve, viz.—to tell on the thought and feeling, life and character of our brother man. Now, I claim all this power for art; for be it remembered, art is susceptible not only of artistic expression, but it is equally so of the motive-power of religion. The chisel and the pencil are as subtle as the pen, therefore their power over life and character must be great. And it is because they have this power over life and character that their application to our churches is justified. Art must, if rightly used, subserve the purposes of religion, and that not merely because of its power over man's heart, but even of its acceptability to God. Beauty and harmony have their prototype in the mind and essence of God himself. "He that planted the ear shall He not hear? Ho that formed the eye, shall He not see?"

Why, indeed, was the peep into the heavens given to St. John and the glory of it put into human words, and compared with material things which man could understand, if it were not to aid us in assimilating the earthly tabernacle of the Most High to the heavenly, and the worship of the church militant on earth to the church triumphant in heaven? It must lift up our hearts when we read of "the Holy Jerusalem," "whose light is like unto a stone most precious, even like a jasper stone, clear as crystal," "the walls of which are garnished with all manner of precious stones," "even the sapphire, and emerald, the sardius, the topaz, and amethyst;"

"whose gates are pearls and the street pure gold, as it were transparent glass," lighted up "by the glory of God," and "the Lamb is the light thereof." But instead of our material and earthly sanctuaries being in some degree a type of the heavenly, so that their hallowed associations may aid us in unfettering our earth-bound hearts, and lead our souls to mount up on high to commingle with the spirits of the blessed who bow before the throne, what have we only too often? Cold bare walls, rendered perhaps still more bare and more cold by having had the very plaster removed from the walls,—the very architectural flesh, that is, flayed from off the bones till the skeleton is laid bare in all its rugged and distracting anatomy. Even the windows, white with unsubdued transparency, look out into the strife and tempest of the outer world; or, if enriched with translucent colour, there is such an entire absence of all aim and object in the subjects treated, that the mind, bewildered by confusion, sees nothing, learns nothing, and we pass on unmoved and unimpressed. Even the very altar itself, perhaps, is not more significant with instruction than whatever else we have seen in approaching it. Is this as it should be? For in these days of popular education, do not men's souls need an alphabet of expression above and beyond the alphabet of common life?

First, look specially at our interior walls. The materials to which I am drawing attention are stone,—rough, uneven stone rubble; not ashlar, which presents all the principle of repose for which I am contending; but ashlar is costly; nor brick, although bare brick is almost as objectionable as bare stone rubble.

Can there be anything in the interior of a building of architectural pretensions more painful than the exposure of coarse masonry, in all its native and distracting ruggedness? Its angularity, its staring joints, its broken lines, its jagged forms, its harsh texture oppress the mind with a sense of unrest. All peace and repose are gone. All those grand definitions of architectural power, of moulded and carved ornament, and exquisite features of artistic design (which require the contrast of a smooth surface to give a sense of rest, while giving development to their poetic richness), all are unwarred and sacrificed by the staring, angular, defiant, distracting anatomy of the builder's materials. Great churches, the work of ancient piety, and designed in the spirit of peacefulness and religious beauty,—once so beautiful, once so full of repose and deep religious feeling,—once telling out so sweetly upon man's heart, lessons of reverence and godly awe, and Christian love,—the great and good work of these great and glorious churches has been reduced by ruthless modern hands to the cold condition, yes, of prison-walls. And why is this? It has all arisen out of the mistaken dread of sham. Extremes meet. The dread of Scylla has plunged the bark into the vortex of Charybdis. Let us avoid shams by all means, and with conscientious care, for they tell falsehoods, and not truth; but let us be careful to discriminate rightly between what in principle is false and what is real. But surely plaster, used simply to give a smooth, quiet surface to an interior wall, is no sham? If with plaster you imitate moulded forms or carved ornament, or if you score it with lines to imitate ashlar, or if you use it for exterior purposes, where solid strength and time-enduring materials are required, then let plaster be set at naught as what it is, a sham. To object to plaster, honestly and truthfully used, is to object to all device in colour and gold,—yea, and to sculpture itself. Plaster has a direct and positive office to subserve,—viz., to give a sense of comfort and repose, on the one hand, and on the other, to supply what is really the very best of all bases, for the future application of the artist's pencil. Whatever may be the forms which the artist's pencil may trace (on the semi-smooth surface), whatever colours he may employ to give effect to his design, all should lead up to some religious purpose, as the embodiment of the Christian's hope and belief. Every device should judicate some religious principle, or symbolise some Christian fact, or echo some abiding prayer, or tell the mind through the eye some precious revealed truth. Works undertaken in such a spirit must ever arouse a kindred sympathy; therefore, let the thing done be beautiful, but aim to render it something more,—it is the "House of God" which is being beautified; let us try to render it "the gate of heaven."

With reference to our church windows, so much of that which has been done within the

* By the Rev. H. Usher, M.A., Rector of St. Clement's, Saltfleetby. Read at meeting of the Lincoln Diocesan Architectural Society.

last thirty years has been so imperfect, its drawing so bad, its colouring still worse, and the poor thin watery texture of the materials worst of all, that I fear many of these windows must share the same fate at the hands of a succeeding generation as the high pews and winding pulpit staircases of a previous generation are now undergoing, viz., give place to better taste and more perfect harmony with all else around. The very first glimpse we get of our church windows from a subjective point of view (the point from which we are now looking at them) plunges one into a world of confusion, an indescribable chaos. Not, indeed, that the evil is without apology; for so sudden has been the revival of poetic art and the progress so rapid, that its application *in extenso* to our church windows was wholly unforeseen. Hence, isolated specimens were at first produced as though they were for ever to stand alone, without reference either to their suitability or any sequence of subjects which might hereafter be thought desirable. Hence they were thankfully accepted without ever dreaming of the spottiness of effect of styles so varied, and far more, of the loss of the opportunity they afford of throwing out in bold relief the grand principles of Christianity. For who, indeed, shall doubt that such grand object might and would be the legitimate result of a well-harmonised series of subjects, fresh and vigorous with deep religious life, when the feeling they produce and the thoughts they suggest flow on consecutively? Subjects from the Old and New Testament are commingled, reversed, repeated; and portraits of individuals and allegories are put in bold contiguity and no little confusion with most solemn scenes. Ill indeed would it become me to suggest the plan which should embody the subject matter to be delineated; but plan there should be,—yea, and a purpose and an aim likewise. It might comprehend subjects liturgical as well as Scriptural; but it should certainly consist of a regular series of graduated subjects which should delineate the whole body of the Christian's faith and hope. It should take us by the hand, as it were, from the beginning to the end of our *Zion*. It should portray the mysterious transactions, the types, the predictions of the Old Testament, with the corresponding realities and accomplishments of the New Testament. In short, it should be a complete, however brief, transcript of the whole Bible, embodied in living colours, speaking to the eye in brilliant and impressive characters, combining and displaying in one continuous and glowing prospect the dispensation of the Old Testament explained and enforced by the dispensation of the New.

It has ever been in this way that the church catholic has set forth catholic truth; why, then, should not our sacred windows and walls embody the same principle? Every window in our churches, whether adorned with geometrical design or subject-matter, and every mural decoration which admits of being rendered symbolical, and every structural part of the fabric itself (as the roof, triangular and equilateral), and every part of the furniture,—as the Christian altar, the lectern which bears the Gospel; the corona which pours down its light, and every ornament which is to contribute its share of the Christian surroundings, one and all should tell us of and point us to Him "who is God over all, blessed for evermore," "the author and finisher of our faith."

THE INTRODUCTION OF THE ANGLo-ITALIAN STYLE UNDER INIGO JONES AND SIR CHRISTOPHER WREN.*

UPON the death of Inigo Jones, Wren became the leading English architect,—not, however, immediately. Inigo Jones died in 1652, at which time Wren would be about twenty years of age. Whatever doubt may exist respecting the education and early years of Inigo Jones, it is quite certain that Wren was tenderly nurtured and carefully educated. His father was an English clergyman, of Danish origin, and rector of East Knoyle, Wiltshire, where Christopher Wren was born. From all accounts, he was a most intelligent, if not precocious, child. In his fifteenth year, Sir Charles Scarborough, an eminent lecturer on anatomy, engaged Wren as his demonstrating assistant. When twenty-two years of age, Evelyn writes of him in his Diary, July 11th, 1654, "I visited that miracle of a youth Mr. Christopher Wren," and elsewhere he

calls him "that rare and early prodigy of universal science." When he was twenty-six years of age he solved Pascal's Challenge Problem to the Scientific Men of England, and, it is said, proposed one, in return, that was never answered. He afterwards assisted Willis in his dissections for a treatise on the brain, for which he made the drawings. In his anniversary address to the Royal Society, in 1664, the comprehensive and profound character of his attainments was clearly manifested, and his future greatness foreshadowed. But with all his talents, and prestige, and ability, he was conspicuously modest and retiring. Steele, in his sketch of Wren, under the name of "Nestor," in the *Tatler*, says, "his personal modesty overthrew all his public actions." "The modest man built the city, and the modest man's skill was unknown."

We have now brought Wren's biographical sketch down to the year 1664. Being then a man of high scientific repute, he was placed upon a royal commission with Evelyn to consider the "upholding and repairing" of St. Paul's, that had fallen into a dilapidated condition during the civil wars. Charles II., on his restoration, was anxious that the metropolitan cathedral should be restored to its original grandeur, and Wren proceeded, in his capacity of royal commissioner, to draw up a careful and exhaustive report, or memoir, on the subject, illustrated with a number of explanatory drawings and designs, which were laid before the king. This memoir is much too long to give here, but it will amply repay perusal, and is especially interesting to us at this period, when the question of churches for the people is so frequently discussed, both by architects and by the press. Wren evidently places the Protestant worship in the paramount position, architectural adornments being drawn in to assist its dignity, but never to fetter its freedom. A large auditorium, with as few impediments as possible, seems to have been Wren's beau-ideal of a Christian Protestant place of worship. We may rejoice, however, that he had not the opportunity of erecting a great classic rotunda, as he suggested, in the centre of the same old Gothic cathedral to which, as we have seen, Jones had already been allowed to append his noble but incongruous classical portico and frontispiece. Nevertheless, out of this original idea of a rotunda eventually arose that glorious dome which now dominates so proudly over our great metropolis, and which is seen by the Londoner from so many points of vantage lifting its head on high. As a royal landmark, from Batterscaire-reen, from Hampstead-hill, or from the slopes of Greenwich, that soaring periphery of splendour arrests the vision and enchants the mind. By universal consent St. Paul's Cathedral has assumed the second place in the architecture of Europe; St. Peter's, at Rome, holding the foremost, as no doubt, from its gigantic proportions and splendid decorations, it is entitled to do; but had Wren been allowed to carry out his first plan for rebuilding St. Paul's, I doubt much whether it would have had a rival in the world. We are, however, anticipating. The king, wishing to restore old St. Paul's, as we have said, and around which clustered so many historical associations, Wren set to work to devise the best method of meeting the king's views. To this end, in 1665, he visited France, in order to become better acquainted with the art of architecture and the various approved manners of building. He resided some months in Paris, where he cultivated the acquaintance of the best artists of the day and the most celebrated men of letters; doubtless by these means he sought in some measure to make up for the absence of early artistic training.

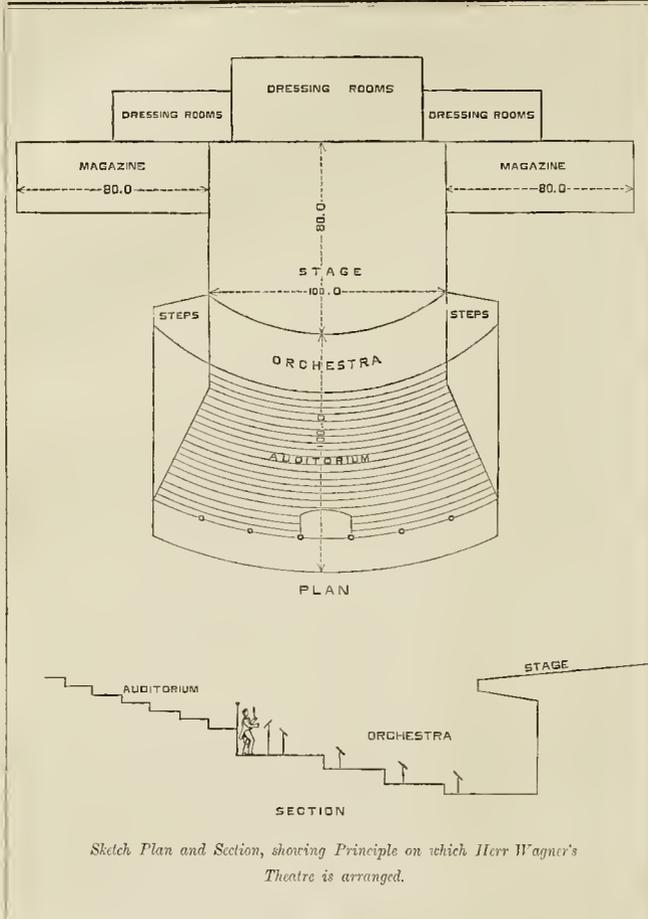

It may be interesting here to sketch some of the Parisian buildings in progress at the time of Wren's visit under the architects most in vogue, whose lives and works are so fully described by Quatremère de Quincy. Among others Jules Mansart, who distinguished himself as the designer of the dome of the Church of the Invalides. He would at the time of Wren's visit be a very young man; he sprang from a race distinguished in the arts, and Versailles and the dome of the Invalides proved that he was not unworthy of his illustrious ancestry. François Blondel, the architect of the Arc de Triomphe, de la Porte, St. Denis, Paris, would be forty-seven years of age at the time of Wren's visit; he had not studied architecture or any of the fine arts in his youth; having been brought up a soldier in the army of Louis le Grand, he profited

by what he saw of architecture and engineering in his various campaigns, and became fired with the ambition to excel in the practice of those arts. In the very year that Wren visited Paris, Blondel's talents became known to the king, who soon after appointed him to design all the public buildings in Paris. Another architect, then much in vogue, was Le Mercier, who died five years afterwards, and whose name mainly rests for its reputation upon the Church de la Sarbonne, which he produced under the patronage of Cardinal de Richelieu. The foundation-stone of this church was laid in 1629, so we may fairly suppose that Wren saw its graceful dome and cupola completed at the period of his visit in 1665. Claude Perrault was also in his glory then; the celebrated translator of Vitruvius, and architect of the colonnade of the Louvre, upon which no fewer than one thousand hands were employed, according to Wren, at the time of his visit, and where he spent a portion of each day, examining the materials and methods of construction.

If we compare this design of Perrault's with the façade of St. Paul's, as executed, a striking resemblance will be observed. The architect Le Veau and the painter Le Brun formed, under the minister Colbert, a council on public buildings about the time of Wren's visit. It was also in the same year that the celebrated Italian architect, Bernini, who designed the colonnade of Louis XIV., was induced, by the entreaties of Louis XIV., to visit Paris and give his advice respecting the rebuilding of the Louvre. The king sent Bernini his portrait, enriched with diamonds, together with a pressing letter of invitation; and he also wrote to Pope Innocent X. to permit Bernini to leave Rome for a season, his great works and his fame having made him the inalienable property of Rome. The life of Bernini would alone fill a volume. We have only referred to him and the other great men whom Wren would most probably meet during his visit to Paris, to show under what strangely advantageous circumstances that visit was made. As well as the buildings we have named, upon the types of which St. Paul's may have been modelled, Wren would see recently completed by De Brosse the Palais de Luxembourg, with its central dome and coupled pilasters; these and other public buildings then in course of erection, or recently completed, would doubtless have no small influence in moulding Wren's innate taste, which, as we have seen, had not received any systematic training in the arts; but whatever he saw in Paris, we have the satisfaction to know he was enabled soon afterwards to rival and eclipse in his great master-piece of St. Paul's. We are not aware that Wren prolonged his journey to Rome, but while he was in Paris he made an extensive collection of views of celebrated buildings, and we may suppose that the frontispiece of St. Peter's, at Rome, by Charles Maderno, who died in 1629, would not be unknown to him. We have mentioned this because, in Wren's first design for St. Paul's, there seems to be a general similarity of treatment to this design by Maderno, especially in the single tier of pilasters and the tall parapet above the main cornice, and the row of statues to break the level sky-line, with the roof kept out of sight. Of course it must remain a question of taste whether this treatment in Wren's first design, or that of the one finally adopted for St. Paul's, was the most suitable; certainly, as regards the dome of the final design, it is as much superior to the original one as the executed ground-plan is inferior to Sir Christopher Wren's original scheme for the same.

We have now traced Wren's interesting and eventful career down to the year 1666, the *anno mirabilis*, when the awful fire of London suddenly put an end to all ideas touching the restoration of Old St. Paul's, and gave Wren a *tabula rasa* for the exercise of his now matured genius; but, alas! that genius was doomed to be still fettered by the influences of those in power, and at the instigation of the Duke of York, he was compelled to abandon his long-cherished plan of a great open Protestant cathedral, and to devote his mind to the production of one which must be considered at best but a beautiful anachronism, viz.—a domed church connected with a purely Mediæval system of planning, more suitable, it has been asserted, for the gorgeous ritual of the Church of Rome than for the Protestant service. It was not until 1673 that Wren was commissioned to produce his designs for an edifice worthy the greatness of the nation, and calculated to rival every

* See p. 424, ante.

Sketch Plan and Section, showing Principle on which Herr Wagner's Theatre is arranged.

edifice of the kind in Europe, but with the unfortunate proviso that his plan should conform to the Mediaeval arrangement which he himself had been so anxious to set aside, for reasons before named. In 1674 the workmen began to clear away the ruins of the ancient Gothic cathedral, ready for the new foundations. The history of the pulling or battering down of parts of the solid old pile is one full of interest. The ancient Gothic work, although time-worn and decayed, was found to be tough and obstinate to the last, and we have no doubt, had it continued until our day, no modern Goths would have completely restored the old cathedral of St. Paul's, as much greater ruins have recently been made fit for worship, and many more may yet be, if the spirit of the present Gothic revival continues to spread. We are not about to quarrel with our architect for what he did, and only regret that he had not more of his own way in the matter, when it had been decided that the cathedral should be rebuilt; for if such had been the case, the thanksgiving service last week might have been witnessed by larger crowds with much greater pleasure and comfort. It is certainly worth while to refer to his first ground-plan, and see how very careful he has been to remove all needless impediments either to sound or sight, even to the extent of piercing the great piers of the dome, with that end undoubtedly in view. The first stone of St. Paul's was laid on the 21st of June, 1675, just twenty years after Wren's visit to Paris, and five years after the completion of the Louvre by Perrault, and in the façade of which we think we can trace some resemblance to the exterior of St. Paul's as executed, but not as first designed, by Wren, and over the abandonment of

his cherished conception Wren is said to have shed tears of bitter disappointment. The choir was finished in October, 1684, and on the 5th December, 1697, divine service was performed for the first time since the fire of 1666. In the year 1710, when our architect was seventy-eight years of age, the highest stone of the lantern on the cupola was laid by his son Christopher, attended by the venerable designer, Mr. Strong, the master mason of the building, and the lodge of Freemasons, of which Sir Christopher was for many years the leading spirit. Forty-four years since the burning of London, thirty-five since the laying of the first stone had elapsed, three reigns had terminated, and a dynasty had been changed and become extinct while this stately pile had been growing up into the blue heavens under his magic wand, to become the great centre and eye of the metropolis, the shrine of the nation's hopes and tears, the place of banners and rejoicing, and the muffled home of the mighty dead.—St. Paul's, whose great bell sounds for royal funerals, and whose massive portals are thrown wide for courtly crowds, and whose dome and aisles still echo with the pious of praise and the songs of thanksgiving. Wren must have felt very thankful when the topmost stone was laid, after all his troubles, all the malice of jealous enemies, and the petty interference of seeming friends, the account of which fills pages in his biographies, but which he bore with patience and in silence to the end. When funds were low, we find him giving 50*l.* out of an annual stipend of 200*l.*, to help him to carry on the works of St. Paul's. The commissioners constantly annoyed him with impracticable suggestions for improvements to the design, which in the first instance they had

assisted the Duke of York to spoil. When we compare St. Paul's with its great prototype, St. Peter's, we must remember that Wren, single handed, built the first in face of opposition, shortness of funds, and the malice of enemies, in thirty-five years; whereas the second was the work of some twenty architects, supported by the coffers of the whole of Christendom, and under the patronage and encouragement of nineteen sovereign pontiffs.

Had St. Paul's been the only work of Sir Christopher Wren, while surveyor-general, to which post he was appointed at the time of the fire, his skill and assiduity would have astonished us; but when we remember all the other works and duties he was called upon to perform, we are really constrained to say that he was indeed a giant among architects. To enumerate his works would fill a page,—the Monument, Temple Bar, and Chelsea Hospital, with many of the halls of the great companies, were designed and built under his direction, as well as some fifty churches and more, all over London, and these while he was actively engaged on St. Paul's. Of Sir Christopher it has been said that he had so equable a temper that, during a long life, reaching to ninety-one years, he never lost a friend. He was of a social disposition, and, although consumptive in early life, by moderation he managed to reach the above patriarchal term of existence. At the age of eighty-five he was, for some unexplained cause, probably owing to the machinations of foreign adventurers, deprived of the post of surveyor-general, when he retired to the country, and occupied the six remaining years of his life in reading and religious contemplation. He was buried beneath the glorious dome which his genius had raised,—fit sepulchre for kings, and noble resting-place for this king of the gifted sons of art.

H. H. VALE.

WAGNER'S GERMAN NATIONAL THEATRE AT BAYREUTH.

A VISITOR to the late festival at Bayreuth, inaugurating the laying of the first stone of Wagner's National Theatre, enables us to give a slight sketch plan of the projected building, as well as a section of the stage, orchestra, and auditorium.

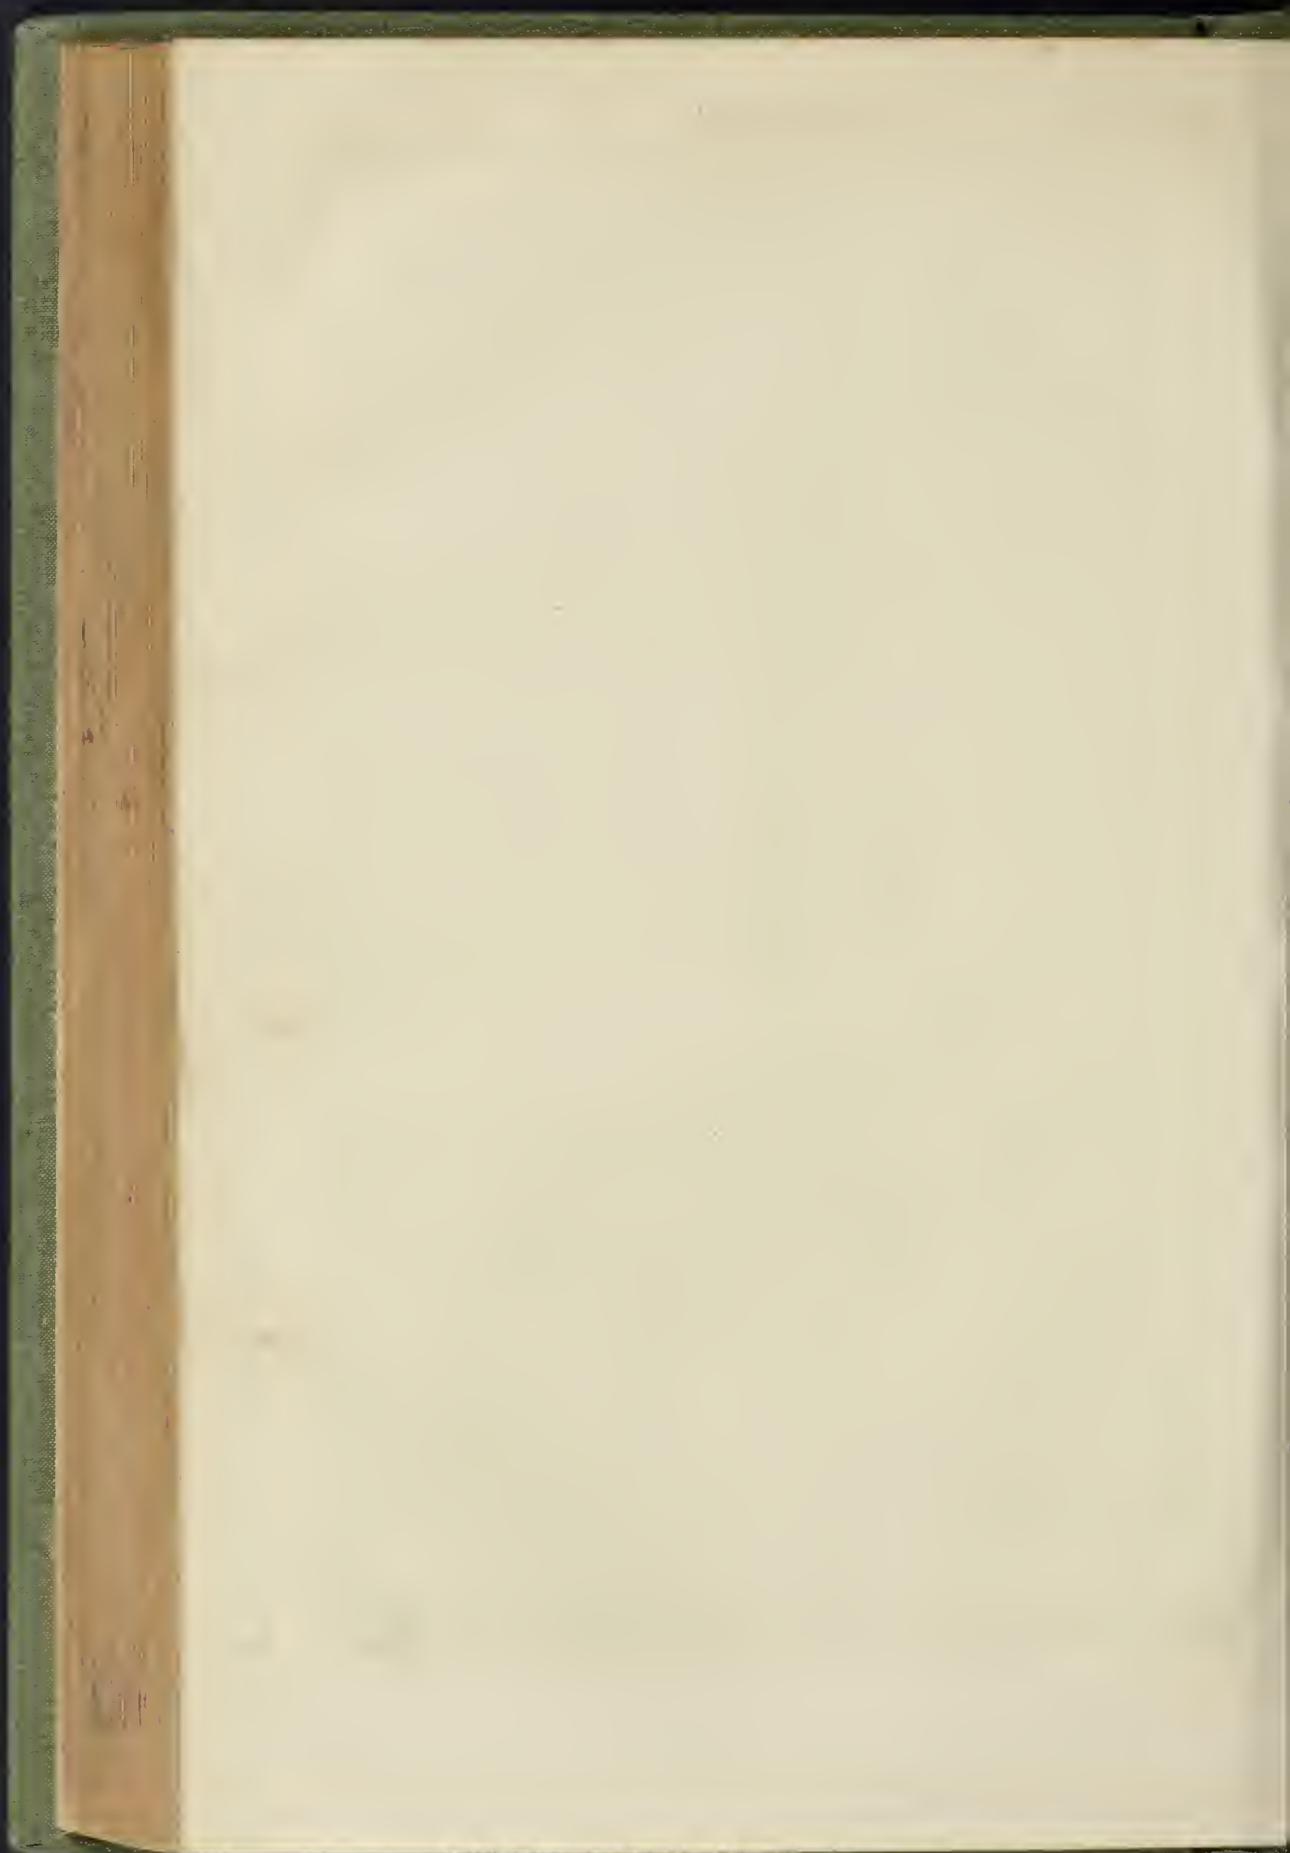

By reference to the latter, it will be seen that Wagner's long-cherished idea of an invisible orchestra will now, for the first time, be carried out in its entirety. Wagner maintains that a sight of the motions of the conductor and the forces he controls, is as disturbing in its effect upon an audience, as would be that of the scene-shifters and the mechanical appliances put in motion by them, if these were also visible. How often one has to complain that the voices of the singers on the stage are drowned by the instrumentalists, situated as they are at present in our theatres, is a fact but too familiar to opera-goers. Wagner's plan of sinking the orchestra some seven feet below the level of the stage, and arranging his auditorium after the fashion of an amphitheatre, without boxes, will have the double advantage of putting the band out of sight and of moderating its tone. By this plan the conductor will be the only person in the theatre who will have a view of both the stage and the band. It certainly seems to be one which deserves the consideration of future projectors of operatic theatres.

CHURCH OF ST. MARY OF THE ANGELS.

This church, now being built in Church-street, Dublin, from designs by Mr. J. J. McCarthy, R.E.A., architect, belongs to the religious order of the Capuchins. It is a "single span" church, several examples of which exist on the Continent, such as the Dominicans', in Ghent, and the Cordeliers', in Toulouse. They belong, for the most part, to the religious orders of Dominicans and Franciscans, who found them convenient for preaching and popular services. St. Mary's, Dublin, consists of a nave with lateral chapels, and apsidal chancel, with large sacristies. Its width in clear of the main walls is 45 ft., and including the chapels, 65 ft. Its total length is 160 ft., and interior height 73 ft. The walls are built of black calp, with white limestone dressings. The ceiling is paneled in wood. The contractors are Messrs. Hammond, of Drogheda, for the stonework; Messrs. Maude, of Dublin, for the roof and ceiling. Mr. C. Dromgoolle has acted as clerk of works from the commencement of the building.

CHURCH (R. C.) OF ST. MARY OF THE ANGELS DUBLIN. —MR. J. J. MCCARTHY, ARCHITECT.

THE PUBLIC MEDICAL SERVICE.

A PAPER on local medical appointments, and on the need of the separation of private practice from the public medical service, by Mr. Edwin Chadwick, C.B., has been read before the Social Science Association, at the Society of Arts, Adelphi.

In the outset Mr. Chadwick pointed out that the Public Health Bill, now struggling for attention before Parliament, should involve means for the best organisation that could be obtained of a preventive service for the removal of the clearly ascertained gross preventable causes of upwards of 120,000 premature deaths annually, together with a vast amount of disabling sickness, in England and Wales. The Bill should also provide means for the removal of forewarned defaults of administrative principle in respect to the union medical service, which is, primarily, solely curative, and indeed mostly unelaborative, by which administrative defaults, as he deemed them, large contributions are made to an annual excess of from three to four millions of paupering and demoralizing expenditure in poor rates. He was of opinion that the admixture of private medical practice with the public medical service and duty is detrimental to the general practitioners, by aggravating competition, and the local congestions of redundant service in populous districts, and by unnecessarily dividing and lowering the average amount of private professional incomes—that it acts injuriously upon the social professional status—that it is at the same time detrimental to the public local service, by dividing the main attention of the medical officer from his public service to his private practice, the chief means of his livelihood—by occasioning the service of medical relief to the destitute to be commonly performed, superficially and perfunctorily, and often neglectfully and cruelly; and that there can be no sound amendment of the medical practice of relief to the destitute that is not based upon its entire separation from private practice, and by confining it to properly-paid, specially-qualified medical officers of independent yet responsible position, giving their undivided attention to their public duties.

A discussion followed the reading of the paper.

PROVINCIAL TRADES MOVEMENT.

Bolton.—The brickmakers of Bolton have struck work for an advance of wages. They applied for an increase of 1s. 6d. per 1,000 bricks manufactured, the amount to be equally divided among the makers, the wheelers, and the clay-temperers. This the masters refused.

Huddleton.—The joiners of Middleton and district went out on strike through the refusal of the masters to comply with a notice sent to them six months ago, for a reduction in their working hours from 64 to 51½ per week, and an advance of wages from 29s. to 30s. per week. They also demanded an advance of 1d. per hour for overtime, which had hitherto been 7d. The refusal of the masters was unanimous; but the strike has come to a speedy end, a compromise having been agreed to by masters and men. The latter are to receive 7d. per hour, which is equivalent to an advance of 2s. 6d. per week. The building trade is unusually active in the neighbourhood just now.

Ipswich.—The arbitrators have made their report, and declare that the men shall work fifty-six hours and a half per week, leaving off on Saturdays at one; the mechanics to be paid 1d. per hour more, and the labourers three-farthings per hour more. This is to be independent of overtime.

Hullian.—At a full meeting of the master joiners and carpenters, it has been unanimously resolved that, seeing they had conceded the reduction of 2½ hours per week to the workmen, they would not, in addition, grant an advance of 1s. in the wages. They further resolved to open their shops on Monday morning, when all men willing to resume work on those terms would be at liberty to do so. Masters who have conceded the demands of the men are said to be not members of the masters' association.

Bristol.—A meeting of employers of carpenters and joiners has been held to consider the request from the men for an advance of wages along with the short hours of labour. Mr. J. Foster presided, and there were about twenty other gentlemen present. The chairman explained that the men had demanded 7d. per hour, along with the nine hours' work per day

(the latter having been conceded). The masters offered 6½d., the present wages being 6d., but the men declined this offer, and proposed to refer the matter to arbitration. A long discussion ensued, and various resolutions were proposed. One was, that the masters adhere to their offer; another was for giving the 7d. per hour; and another for arbitration. The last was eventually carried by the chairman's casting vote. It was agreed to submit the following names, from whom to select an arbitrator.—Mr. Brice, Alderman Abbot, Alderman Ford, Mr. C. J. Thomas, and Mr. F. Terrell. The following were appointed to represent the masters at the interview with the men—Messrs. J. Foster, Davis, son, Banner, Davis, jun., Coates, W. Baker, Grant, and Cross.

York.—The strike of the joiners has been brought to a successful termination. Six master joiners met six committee-men, to try to come to some arrangements respecting the long-pending strike. The men on the 1st of March last asked for an advance of wages and shorter hours,—53 hours per week and 6½d. per hour,—the masters offering the men the 53 hours and 6½d. per hour. The men have agreed with the masters to commence work at an advance,—6½d. per hour and 53 hours per week.

Leeds.—There has been a conference between the master huddlers and the operative hricklayers and labourers, with the object of endeavouring to arrange the differences between them. On the part of the employers, a resolution was moved that the hricklayers' wages from the 4th of June instant should be 7½d. per hour; that the rules as agreed upon at the last conference be adopted; and that six months' notice should be given by either party in case of any required change. At the last conference the employers agreed to allow overtime at the rate of time and half for the first two hours and for night-work and Good Fridays, and double time for Sundays and Christmas Days; and the apprentices should be legally bound for not less than five years. Now, however, the operative hricklayers objected to the two last-named rules being carried, and they also defeated the employers on the resolution promising the workmen 7½d. per hour. The strike, therefore, still exists, as it also does with respect to the hricklayers' labourers, who were offered 6½d. per hour at the same conference. The masters conceded the rate of wages and walking time, and the only remaining matter in dispute was as to overtime, to be paid as time and half. The masters wish it to begin at seven p.m., but the men at half-past five o'clock, that is, at the close of their regular day's work.

Barrow.—A large number of navies employed at the Buccleuch Dock, Barrow, struck work in consequence of their demand for more wages being refused. The men have been paid at the rate of 7d. per wagon, which has enabled them to earn from 28s. to 30s. weekly. The men demand 8d. per wagon, which was refused, and they refused to work. The stonemasons employed at the Ship-building Company's Works on Old Barrow, have struck work for an advance of wages. The demand of the men, which was an advance from 30s. to 33s., was granted, and work was resumed.

Newcastle-upon-Tyne.—The lock-out of the pressed flint-glass makers of the Tyne and Wear, which has now lasted for nearly three months, is substantially at an end, matters having been amicably arranged in two of the principal shops, those of Messrs. Sowerby & Co., of Gateshead, and Messrs. Gremer & Son, of Sunderland. In these places the men were to resume work as soon as the furnaces could be got ready, and part of the hands commenced on Tuesday. The smaller shops did not join in the lock-out. We understand that the men at the Tyne Flint Glass Works, South Shields, and at Carr's-hill probably will follow suit, and effect a settlement such as has been arrived at in the Gateshead and Sunderland Works.

Hawick.—The journeymen painters presented a request to the employers that the working hours be reduced from 60 to 57 hours per week, that wages be advanced 1d. per hour during ordinary working hours, and that time and half-time be allowed after 6 p.m., that men working in the country shall receive additional allowances; that apprentices serve in future six years instead of five, and all apprentices engaged during the last twelve months be dismissed. The employers have shown no intention of conceding any of these demands, and the men are continuing at their work as usual.

Glasgow.—A conference between a deputation from the employers and workmen in the mason

trade was held in the Trades Hall, Glasgow, Mr. Dempster presiding. The employes' demand was, that their wages be raised from 6½d. to 7d. per hour, paid weekly instead of fortnightly. The employers agreed to recommend to their association that the wages should be advanced to 7d. per hour. The masters expressed an opinion that the system of weekly payments would not prove beneficial even to the workmen. The employes, on the other hand, contended that it would place them in a better position in making purchases, and that it was the almost unanimous wish of the trade. The employers unanimously objected to conceding this demand. The masons resolved to strike unless their demand for weekly payments were conceded. The employers have given the advance. The building trade is very busy just now.

Ayr.—The operative masons gave notice that from 3rd of June they would ask a reduction of their hours from 56 to 51 per week, and also an advance on their wages from 6d. to 6½d. per hour. The men struck work, and the employers have since acceded to their demands, and work has been resumed.

Dundee.—Representatives of employers waited upon the slaters on strike, and offered them an increase of ¼d. per hour instead of ½d., as demanded. The offer was refused, and the strike continues.

Sir.—The wall masons have struck work at Plaistow New Cemetery, in consequence of labourers being introduced to do a portion of their work. In fact, all the wallers were retained for the building of the outside shell. The filling in was done by basketists by the labourers; the hassock with which it is built inside was also squared up by labourers. Mr. Kilby, of Limehouse, is the builder.

Signed on behalf of the men on strike,
J. GALLEY,
JOHN BARRATT,
HENRY WHITEHEAD,
G. PERRINS.

THE PEABODY ESTATE AT BRIXTON.

The estate, consisting of 16 acres of land situated in Shepherd's Lane, Brixton, between the Clapham and Brixton main roads, and which was purchased by the late Mr. George Peabody, for the purpose of erecting upon it houses for the poorer classes, was some time ago conveyed by the trustees to an enterprising gentleman, who has already erected upwards of 200 houses of a superior character, and several others are now in course of erection. The Metropolitan extension of the London, Chatham, and Dover line, skirts immediately alongside the line, and as it is thus easy of access both from the City and the West-end, the applications for plots are numerous. Several buildings of a public character are intended to be erected on the estate, amongst which is a Masonic hall, and it is expected that in a short time the estate will produce a large annual rental which, according to the terms under which the land has been conveyed, will enable the trustees to erect, from time to time, blocks of dwellings for the poor in different parts of the metropolis.

SEWAGE IRRIGATION REPUDIATED AT THE LOCAL GOVERNMENT BOARD.

ONE of the first acts of the new Local Government Board, acting under the advice of its inspecting engineers, has been to denounce sewage irrigation.

An irrigation scheme, propounded by the West Ham Local Board, has been refused,—first, upon the report of Mr. Rawlinson, chief inspector of the Local Government Board, January 30th, 1872; and, secondly, upon the report of his colleague, Mr. Harrison, May 18th, 1872.

The decision is so contrary to all that we have been hitherto taught by the Local Government Act Office,—now the Local Government Board,—as well as so contrary to all the reports issued by Parliamentary Committees and Royal Commissions during the last ten years, that a statement of the case may be of advantage to very many who are actively engaged in sanitary work.

The West Ham District contains a population of 70,000, adjoining the metropolis, from which it is separated by the river Lee, and bounded by the Thames on the south. The district was severed about twelve years ago by Mr. Rawlinson at a cost of about 100,000l., the discharge being into the river Lee, by gravitation at low water, and by pumping during the remainder of the day. In 1868, the Lee Conservancy obtained a new Act prohibiting the discharge of sewage. Clauses were, however, obtained, after a hard

fight in the House of Commons, enabling West Ham to continue to discharge the effluent water of sewage providing it were first purified, clarified, and disinfected, "by the best known practicable process." The West Ham Board, believing that the treatment of the sewage of a population of 70,000 in tanks, in a crowded neighbourhood, would be both a costly and an offensive proceeding, used every endeavour to arrange with the Metropolitan Board for the reception of the West Ham sewage, but without success. A sewage committee went throughout the country inspecting the various processes in operation in other towns, and came back unanimously of opinion that tank systems were everywhere a failure and irrigation was a success. The Board sought for land, and fortunately 850 acres came into the market, in Barking and Dagenham, away from a population, but within a reasonable distance, with the great advantages of a frontage on the Thames, and intersected by public roads and a railway. The Board, by agreement, secured 750 acres, provisionally, at the very moderate cost of 96l. per acre. The cost of the works, considering the extent and population of the district, was also very moderate, viz.—42,000l. In round numbers the farm and works would cost 120,000l.; repayment spread over fifty years. The money was offered at 4½ per cent.; and, further, responsible parties offered to lease the land, at 8l. per acre for seven years, the longest period allowed by the Local Government Acts. Thus the whole matter was arranged without any of that litigation or arbitration by which so many Boards have suffered. All that remained was to obtain the sanction of the Local Government Board. That sanction has been withheld upon the following grounds:—

1. That tanks may be used in a populous district "without creating a nuisance, or mismanaged so as to be intolerable."

2. That neither the result of the Rivers Pollution Commissioners' Report, nor the evidence produced at the inquiry from Croydon, Carlisle, Cheltenham, or Warwick, "affords a reasonable or fair prospect to the West Ham Board to enter upon an extensive scheme of sewage irrigation."

3. That "absolute necessity" would alone justify the Local Board in committing the ratepayers to the proposed scheme of sewage irrigation.

The Report contains a distinct denial of the commercial success of irrigation, which should only be adopted under the pressure of "absolute necessity"; and tank systems are recommended as far as possible. The general arguments will apply to every district besides West Ham. What is "absolute necessity"? The standards of purity recommended by the Rivers Pollution Commission, adopted by the Thames Conservancy, and included in Mr. Stansfeld's Government Bill, are all far above the results of "the best known practicable process" with tanks.

West Ham has lost its farm, for which it was offered a rental of 8l. per acre; it is driven to a tank system, at a great annual cost, in the midst of a population; and, in all probability, will be compelled to remove its works elsewhere, at a very great cost; the whole of which operations will result in dead loss and taxation.

If the decision be right, we ought to be grateful that a new light has been thrown upon the subject, and it is well that local boards and sanitary engineers should take note thereof, and thus avoid the waste of time, money, and anxiety which the West Ham Local Board and their engineer have undergone during the past four years, in endeavouring to follow the previous teaching of the Government.

LEWIS ANOELL, M.L.C.E.,
Engineer to the West Ham Local Board.

POCKET-BOOKS.

SIR,—I observe Mr. Hurst says, in reference to error in his Handbook, that "Pocket-books are intended only for those who have had (sic) some previous knowledge of the subject." But, suppose a man, like Captain Seddon, not only "ought to have known," but actually does know, when glancing at a pocket-book as much or more than its compiler, or suppose the case of a less learned reader, would it not be desirable to save trouble—the sole excuse for the condensation—that the editor should mention his authorities for such important things as formulas for calculating strength, &c.; for many hesitate whether a statement is established, whether it is the writer's own, or whether it is something

between the two, notwithstanding the pretence that these or other "common-place explanations are unnecessary."

Thus, sir, it seems to me that such vague pocket-books are in some sense perverse-books; because, clearly, it is *prima facie* questionable whether they lead or mislead. "Distilled books," Lord Bacon observes, "are, like common distilled waters, flashy things." They may become admirable if, besides presenting really reliable results, they indicate where varied and positive information can be obtained.

E. L. TABBUCK.

"DESIRABLE RESIDENCES" TO BE LET.

(From Messrs. Sexton, Headstone, and Hepitaph's Circular.)

No. 1.

A MANSION suited for a merchant retired, With an acre of ground, or more if a smallcroft; The soil very rich, shrubs take a deep root; For the land was formerly used as a "shoot."

No. 2.

A nice handsome villa, lately enlarged, And the incoming tenant will not be charged With cost of removal, for horse and cart lent; The taxes and all can be paid in the rent.

No. 3.

A semi-detached, three-story, quite new, Built for the owner, is open to view; Being a projected man of some wealth, He's advised to leave home for the sake of his health.

No. 4.

A dwelling, with coach-house, stables, and loft; A lodge in the front, at the back a smallcroft; A walk to the church through the churchyard in rear, A known noble lord very lately died here.

N.B.

The agents have houses like these full a score, And they now are engaged in building some more. Apply, please, at once, applications are rare, All tenants are sure to be settled for life.

DECORATION OF ST. PAUL'S.

At a meeting of the Executive Committee of St. Paul's Completion Fund, held on Monday, June 10, the following resolution was moved by Mr. Oldfield, seconded by Mr. Beresford Hope, M.P., and carried unanimously:—

"That it be an instruction to Mr. Burgess, in preparing his plans for the completion of St. Paul's, that he consider himself limited to a style of decorative design for which authority is to be found either in any such models or drawings of Sir Christopher Wren as may be in existence, or, failing these, in the best works of the Italian architects and artists of the first half of the sixteenth century."

WORCESTER GUILDHALL COMPETITION.

At a meeting of the Worcester Town Council on the 4th inst., the Buildings Committee reported they had

"Found that six sets of plans for the proposed Guildhall buildings had been received at the Guildhall, before five o'clock p.m., on the 15th ult. (the hour to which the time for receiving same had been extended), and that two packages of plans had arrived at the Guildhall after five o'clock on the same day, and one package on the following morning."

And, at a meeting on the 24th ult., it was resolved, *nem. con.*—

"That it be recommended to the Council to allow the three sets of plans to be opened, and placed in competition with the others, subject to its being hereafter proved to the satisfaction of this committee (if any of these plans should be selected) that the plans so selected were despatched from the office of the architect in sufficient time, but for delay in transit, to have reached the Guildhall by the hour fixed."

The adoption of this having been moved, The Sheriff said he had expressed a very decided opinion as to the course that ought to be adopted by the committee. They had advertised that they would receive plans till five o'clock on the evening of the 15th of May; and he did not think that they who made the rule should be the first to break it. He thought that they had not the power to open the three plans that came later, and that the question should be left to be decided by the Council.

After discussion, an amendment was moved and seconded, to the effect that the three designs delivered after time should be admitted to competition. The mover, Ald. E. Webb, said, if there was no practical unfairness, he did not see that there could be any cause of complaint. He was in Mr. Grainger's shop the day after the 15th, and Mr. Harlow, who was there, stated that he had been in the coaching-office at the Star that morning and saw a parcel there that apparently contained plans. He asked the person in charge whether the time was not past for delivering it, and it was sent off at once for delivery. The plans were really only a few hours late.

The Mayor, in rightly arguing against the possible injustice of the amendment, said the Town Clerk had invited, and obtained, the opinion on the point of the Editor of the *Builder*, which was as follows:—

"In reply to the inquiry you have addressed to me, I have no objection in saying that the competition should be rigorously confined to those designs which were delivered by five o'clock on Wednesday, May 15th. A departure from this course would be a breach of contract and would lead to controversy, if not difficulties."

"If one of the designs delivered too late should prove much better adapted for your purposes than the premiated design, another question might arise which would have to be dealt with separately, with due regard to the interests of the author of the premiated design.—GROVER GODWIN."

On a division, the amendment, to the effect that the whole nine designs be placed on the same footing, was carried by 1,—15 voting for it, 17 against it.

STATE OF THE COVERED MARKET AND TOWN-HALL, LONGTON.

At a recent meeting of the Longton Town Council, the Market Committee reported that:—

"After very carefully examining all the documents and papers relating to the building of the covered market and town-hall, and considering the report of Mr. Lewis on the state of the covered market buildings, and hearing Mr. Burrell's explanation in reference to the same, it is of opinion that the specification is generally, although not fully, carried out, and therefore only partial blame rests upon the architect in reference to this building; but with regard to Mr. Lewis's report on the town-hall and ancillary buildings, the committee adopted his report in its entirety, and is of opinion that the architect has shamefully neglected his duty, and deserves severe censure. The committee is recommended to be instructed to prepare specifications for the necessary repairs and alterations throughout the whole building, and that such repairs and alterations be immediately proceeded with."

Alderman Green said that the report of Mr. Lewis was one which was of a character calculated to create alarm. He referred to the specifications and the complaints which had been made, and said, with respect to the Market-house, it was shown that blame did not attach to the architect, who was restricted by the Improvement Commissioners (who were the local authorities when the work was done) as to the amount expended. But with reference to the Town-hall, he said the committee considered that there was great evidence of dereliction of duty on the part of Mr. Burrell. Some blame was, no doubt, due to others, but for some of the wrong-doing Mr. Burrell alone was responsible. The consequence was that the Town-hall was now in a very unsafe condition; and it was desirable to have the building repaired at once.

Mr. Farmer said the cost of the necessary repairs and alterations would be about 1,500l. He observed that soon after the building was erected a committee of ratepayers called attention to the state of the building, and it was then patent to everybody that there had been a violation of the specifications. If the architect was to blame, what must be said about the old Commissioners, who disregarded the complaints of the ratepayers' committee? He questioned whether it would not pay to take down the Town-hall and rebuild it, but the expense would be too great for the borough to incur at present.

The report of the Market Committee was adopted, excepting the latter part,—"that such repairs and alterations be immediately proceeded with."

PIECE-WORK.

SIR,—Please indulge me by inserting in your next issue a few thoughts from an artisan with reference to the present agitation in the building trade. It is clear that great dissatisfaction prevails among us, and I fear the attainment of the demand now made will not entirely remove it. I am diametrically opposed to one or two of the favourite rules of the "Unions." Instead of saying, "There shall be no piece-work," I say there shall be as little day-work as possible; and let us have a fair and just schedule of prices, to be agreed upon between masters and men. But it is objected, "Piece-work has already ruined the trade." "Men have taken piece-work at a low figure, and have worked like slaves to earn only as much as their wages at day-work and so, which is similar to what has been done at day-work, the master has turned upon the men for not doing it as fast as they did when at piece-work." Whatarranted knaves men must be to do it! If the trade is thus ruined, whose fault is it? I certainly do not advocate such piece-work as this; but let every man, as far as possible, work by the piece on a fair and just scale of prices, that would give the masters their reasonable and fair profits, and I believe that a trades-union having this as one of its principles, would do good. 1. It would give to us all more of that independent and proper feeling that is so wanting for ourselves. 2. Every man would then be placed upon his own merits; and who that is desirous of the noble name of a man can object to this? But if my wife be asked, are you a man already rewarded according to what they individually merit, certainly not. If, sir, you look into the shops, and on the buildings now in progress, you will find that, with the exception of improvers and apprentices, all the men are paid at the same rate, notwithstanding some are thoroughly efficient, and others are complete *slugs*. And too often, when hands have to be lessened (owing to the nearness to the works to com-

pletion), these *snuffs* are kept on, while really good men are discharged. Why is this done? Well, sir, do not tell the masters, for the foremen say they do not know. It is because a certain sum in hard cash, or a quantity of beer and spirits, usually called "tipping," or "lubbing," passes from those indifferent hands to the foreman, who, notwithstanding his position, is too often mean enough to take, and even demand it, though on the quiet. The consequence of this nefarious practice is too plain to require comment. I firmly believe that a general system of piece-work was the most, and more independent of the demand on the part of the foreman, though it would not, perhaps, entirely eradicate it. There is many a man who, by his first-rate ability and untiring industry, could and would earn more than six pence per hour, even if the price paid for a job of piece-work was just what it would cost if done at day-work. And why should he not have the opportunity of doing so? Would it not be better for master and man? It would be a powerful inducement to every man to improve, and add to his ability.

JOHN BUCKINGHAM.

CHARGE OF PERJURY AGAINST A MASTER BUILDER.

At the Birkenhead police-court, before Mr. B. Derbyshire, George Henderson, a joiner and builder at New Brighton, was the accused, & a summons charging him with having committed perjury in evidence given in an arbitration case before Mr. Preston, the stipendiary magistrate of Birkenhead. From the evidence, it seemed that Mr. Henderson was engaged by Mr. Edgar Swinton Holland to execute certain alterations and repairs to a cottage at New Brighton. The amount charged was £200, less 7d. The payment was disputed, on the ground that it was exorbitant, and an action for the amount was brought on at the Chester assizes in April last. Before the case was brought on at the assizes the record was withdrawn by Mr. Henderson, subject to a reference to Mr. Preston, the stipendiary magistrate of Birkenhead, who ultimately awarded Mr. Henderson 191s. 8d.

During the hearing of the case before Mr. Preston, it was ascertained that Mr. Henderson committed perjury by swearing that he had used 8,000 new bricks in the work at Mr. Holland's cottage; whereas it was stated on the other side that in the interior of the cottage only old bricks had been used, and that the number of new bricks was not more than 600.

The charge of perjury against Mr. Henderson was supported by the evidence of Mr. H. W. Biggs, solicitor; Mr. George Northcott, surveyor, Liverpool; Mr. W. Langley, builder, Liverpool; and other witnesses.

Mr. Henderson reserved his defence until the trial at the next Chester assizes, but admitted him to bail.

ON TESTING MATERIALS.

Sir,—In your issue of last week there is a letter from Mr. Hurst, C.E., which calls for a few words in reply from me.

In reference to the formula to which I took objection in my paper, I am perfectly aware how, and by whom, it was arrived at; but that has nothing to do with its being a good formula to give in a hand-book, without a word of explanation. It is a formula which no one who knew what he was about would be troubled with, for the simple reason that it only applies to iron of a certain strength, and is also objectionable on account of one of the terms being in feet and the rest in inches, which leads frequently to mistakes being made in working out calculations.

If, as Mr. Hurst says, the formula is only intended for those who have previous knowledge of the subject, I must be allowed to remark that those are the very people who, as far as my experience goes, never think of using it.

Another point which requires explanation in connexion with the formula is the use of the word "Hand-book," is whether the rivet-holes are intended to be deducted from the area indicated on the accompanying diagram.

I must be allowed to differ in toto from Mr. Hurst when he says that the formula recommended in my paper is not one which is less convenient or misleading than the other. The formula symbolically represents an actual value, such as inches or tons; whilst in the other, purely conventional, or rather manipulated, constant is made use of; so that the formula conveys no definite meaning to any one who has not taken the trouble to unravel it.

The mistake I made in quoting from an old, instead of the latest edition of Molesworth's "Pocket-Book," I am much obliged to Mr. Hurst for pointing out, though it does not affect my argument that our present knowledge of building materials is not what it ought to be.

H. C. SANDROS, Capt. R.E.

CHARLES J. LEVER.

The Irish novelist, who died a few days ago as Vice-Consul at Trieste, and whose name has been before the reading public for nearly forty years, was the son of a Dublin builder. He was born in the year 1809, and the writer of the present brief notice remembers the spot, nearly opposite to the terminus of the Dublin and Drogheda Railway, where his father's yard stood, but the concern has many years since been swept away by modern building improvements. The elder Lever was employed on public works by the Customs authorities of Dublin, and built much otherwise. Charles Lever was a student of Trinity College, Dublin, and on the 27th of February, 1827, took his degree of A.B., and in 1831 that of M.B. Afterwards the University conferred on him the honorary degree of LL.D. Lever did not go to Cambridge to qualify for the medical profession, as he was in early life artied to the celebrated Surgeon Cusack, of Madame Stevens's Hospital. He was reported to have exerted himself con-

siderably, and to have rendered actual and efficient service to the citizens of Dublin during the first great cholera epidemic in 1832. Some time subsequently he was attached to the British Legation at Brussels in the capacity of a physician. Some of Lever's best stories appeared first in the pages of the *Dublin University Magazine*, a monthly journal established in Dublin about 1833, and still in existence, though it has undergone many vicissitudes and changes of publishers. Lever acted as an editor to this magazine for a considerable period, and contributed to its pages while abroad. While at Brussels his first success, the "Confessions of Harry Lorrequer," was written. Then followed, "Charles O'Malley," "Jack Hinton the Cardsharp," "Our Mess," "St. Patrick's Eve," "Tom Burke of Ours," and numerous others. His most recent contributions were to the pages of *Blackwood*, in the character of "Cornelius O'Dowd," piquant and spicy. "Lord Kilgobbin," his last novel, has not been many weeks issued, and though there was not any novel written by name even among the Irish people to our recollection or reading, there is a noted old castle of the name in the county of Dublin, a hoary ruin to which many legends are linked, and notably that of the great Goban Seer, the mythical and traditional architect of the Round Towers of Ireland. There is a somewhat mournful and pathetic dedication attached to his last work, which runs thus:—

"To the memory of one whose companionship made the happiness of a long life, and whose loss has made me hopeless, I dedicate these volumes, written in breaking health and broken spirits. The last that was once my pride I have lived to find associated with my sorrow. It is not, then, without a cause I say I hope this effort may be my last."

His wish was literally fulfilled. Lever died suddenly of a disease of the heart, and he leaves many others besides his daughters to mourn his death. Personal friends he had many, literary and literary; and his admiring readers might be counted by thousands. Unlike many of his literary brethren and countrymen, from the days of Goldsmith to his own, he was not obliged to write for his support, for his appointment placed him in a position of not having to write for bread. To the kindness of the late Lord Derby he was indebted for the Vice-Consulship of Spezzia, in 1858, from which he was transferred, in 1867, to Trieste, where he breathed his last.

TRICKS OF PICTURE-DEALERS.

Sir,—When my father remarked—"You have feeling, and an artist is nothing without it," I submitted, and studied very closely, having the assurance he was by his attainments thoroughly capable of grounding me in art. In 1836 it was told by my servant that "a person called, wishing to see me." "Show him in," was my reply. On entering, and the servant leaving the room, he said,—"I am deputed to call upon you and offer you 500*l.* a year, if you will place your father's signature to such paintings as are brought to you." I put my hand to the bell, and told the servant, on entering, to show the man out of the house adding,—"If there were no seconds like you the world would not be so bad as it is, and if you do not go out of the room I shall kick you out."

A short time since a person waited upon me, with a request from Mr. Wornum, of the National Gallery, that I should see a painting in his possession, supposed to be one my father had painted, of "The Pilgrimage to Canterbury." On seeing it, the first glance proved to me that it had been painted thirty, not forty, years; the second, that it was only a copy; and the third, that it was got up for the parties who had offered me 500*l.* a year. The artist sent by Mr. Wornum must explain how it came into his possession.

ANT.

CHURCH-BUILDING NEWS.

Hunsdon.—The parish church of Hunsdon has been re-opened, after being closed about nine months, for repair and restoration. Externally the roofs of the church and the spire have been put into a proper state. Internally a new oak roof has been placed in the chancel; and the ceiling of the nave has been decorated. In both nave and chancel new open seats of oak throughout, have replaced the old-fashioned pews, and a new pavement of stone and ornamental tiles has been put down. But the chief feature of the work is the throwing out an organ-chamber on the north side of the chancel, at its junction with the nave; and the removal there of the organ from under the western arch. The throwing open of the western arch is an improvement. The carved pews in the chapel have not been removed. The restoration has been carried out under the superintendence of Mr. P. Webb, architect, London, by Mr. Redington, of Hunsdon. The cost was between 1,300*l.* and 1,400*l.*

Sedgley.—St. Mary's Church, Hurst-hill, Sedgley, has been consecrated by the bishop of

the diocese. The site of the church is a piece of land (given for the purpose by the late Mr. II. B. Whitehouse) at the top of Can-lane, at the side of, and sheltered by, Hurst-hill. This is in the lower part of the parish of Sedgley, distant nearly a mile and a half from the Mother Church, and is in the midst of a numerous population. The new church is in the Geometric style of architecture and stone built. Owing to want of funds only the nave and aisles are at present erected; and the former 72 ft. long by 28 ft. wide, the latter 14 ft. wide. The accommodation is for 500 kneeling; all the seats to be open and free. The architect is Mr. Bidlake, of Wolverhampton. The builders, Mr. Nelson, of Dudley, for the church, Mr. Hilton for the seating, and Mr. Hartland for the temporary chancel. The total cost of the church is estimated at about 4,000*l.*, but the expense of the work, so far as it has been proceeded with, will be about 3,000*l.*

Blakenall.—Christ Church, Blakenall, Bloxwich, has, after a delay of two years since its completion, been consecrated by the Bishop of Lichfield. The building is in the Pointed Gothic style, and the design requires to be completed by the addition of a spire at the north-west corner, where a square stone tower stands ready for its reception. The edifice is built of the local limestone, with Bath stone dressings and facings, the latter stone being also used in the interior, in the nave and chancel arches and nave columns, which are enriched with foliated capitals.

The seats, which will accommodate 500, are of pitch pine, stained and varnished, and are all free and unappropriated. The roof is of timber, open to the ridge—the joists and rafters being stained, and the intermediate spaces coloured. The pulpit is of oak. The architect was Mr. Naden, of Birmingham. His designs have been carried out by Mr. I. Highway, of Walsall. The total cost of the work will be about 3,500*l.* The site was given by the Lord of the Manor, the Earl of Bradford, who generously presented about two acres, being sufficient for church, schools, and parsonage. The mines beneath the site have been secured by Mr. J. E. Bealey, J.P.

Rousdon, Devon.—The old-fashioned parish church of St. Pancras, Rousdon, a little village situated on the eastern boundary of the diocese, about six miles from Axminster, which was in a dilapidated condition, has been re-erected and opened for divine service. Messrs. George & Vaughan, of London, were the architects. The design is Early English. The edifice has been erected on the old site. Messrs. Moas, of Exeter, have been actively engaged throughout the winter, and have completed their contract. The building is about 50 ft. in length, and capable of accommodating about seventy-five persons. The population of Rousdon is very small, there being only about twenty persons resident in the parish. At the west end of the building there is a square tower and bell turret, the upper part of the former being used as a vestry, which is approached from the church by a circular staircase. On the left-hand side of the entrance are two arcades. All the windows are of stained glass, and represent various scenes in the life of our Lord: among those represented in the east window being the "Triumphal Entry into Jerusalem," "The Saviour bearing the Cross," and "The Crucifixion." The whole of these were executed by Messrs. Lavers & Co., of London. Over the altar is the representation of "The Last Supper," and on each side of this are the Ten Commandments, the Apostle's Creed, and the Lord's Prayer. The whole of this, as well as the pavement of the chancel and the reredos, is formed of mosaic glass. The nave is paved with tile procured from the Poole Pottery Company, Dorset.

Around the pulpit are seven images, carved, and intended to represent the four Evangelists, David, Moses, and St. Paul. This was the work of Mr. Forsyth, of London. The seating, as well as the roof, is of oak. The Bath stone carving was performed by Mr. Hems, of Exeter; and the wood carving, with the exception of the pulpit, by Mr. Seddall, also of Exeter. The ironwork, including grills, was supplied by Messrs. Hart & Co., of London. The estimated cost is 4000*l.*, the whole of which will be defrayed by Mr. Peek, of Wimbledon.

Wednesfield.—The church here has been re-opened for a limited period, until additional funds are obtained to proceed further with the improvements that were decided upon some time ago. The pulpit and the choir seats have been brought forward some few feet into the body of the church, so as to give more room in the chancel, whilst the small half-circular open-

ings by which light to the chancel was formerly admitted have been considerably enlarged, and in their stead are three illuminating windows, the gift of Mr. J. E. Bealey, J.P., to the memory of his late wife. The subjects represented on the windows are,—"The Death of Christ memorialised in the Lord's Supper."—I Cor. i. This is in the centre over the communion-table. Then, on the right hand, the subject represented is the Baptism of our Lord by St. John; and in the window on the left side is the Unbelief of St. Thomas, after our Saviour's crucifixion. The bordering round each window represents branches of the grape and fig-tree entwined. The windows have been supplied by Messrs. Ward & Hughes, of London. Mr. John Bare has promised new churchyard-gates; and the Hon. Augusta Calthorpe, of Perry Hall, will give encaustic tiles for the chancel. To complete the intended improvements upwards of 300*l.* are newly wanted.

Sherburn (Durham).—The newly-erected parish church for the ecclesiastical district of Sherburn has been consecrated by the Bishop of Durham. The building is in the Early Decorated style, capable of accommodating a congregation of about 350 persons, and estimated to cost about 3,000*l.* The architect was Mr. Johnson, of Newcastle, and the builders were Messrs. Robson & Son, Durham.

London.—The Church of St. Benet, Stepney, the first of those to be erected under the Union of Benefices Act, has been consecrated by the Bishop of London. It is in lieu of St. Benet, Gracechurch-street, which parish is now united to that of Allhallows, Lombard-street. The church is situated at the eastern side of Bancroft's Hospital, Mile-end-road, and, in fact, is built upon part of the hospital property, for which the sum of 1,000*l.* was paid. The church is of red brick, and, in that respect, accords with the almshouses adjoining. Its architect is Mr. Ewan Christian, and its style thirteenth-century Gothic, very plainly carried out. It takes the place of a temporary church which was erected but eighteen months since, the parish being taken out of the larger one of Bow. There is a vestibule, capable of holding 200 people, from which the vicar will preach on fine Sunday evenings. The church internally is constructed of red brick, like the outside, and has a nave with aisles, and a clearstory above three arches on either side, which rest upon short columns, the base and capitals of white Douling stone, and the shafts of Pennant blue. The flooring is of encaustic tiles in red and black. All the principal windows are lance-headed, and glazed with tinted glass, that over the sacristy being five-lighted, and that over the vestibule being three-lighted. The font and the pulpit are of stone. The sum of 8,000*l.* has been received from the Ecclesiastical Commissioners, out of which the ground has been paid for; the church has cost 6,500*l.*, and an endowment of 300*l.* has been made. Towards the parsonage-house nearly 1,000*l.* have been promised from private sources. The bells (which were founded before the fire of London), came from St. Benet, Gracechurch-street, as did also the oak communion-table and plate.

Fallowfield.—The Church of the Holy Innocents, Fallowfield, has been opened for public worship. The foundation-stone was laid on the 4th of June, 1870, by the Hon. W. H. Egerton, M.P., D.G.W. of Cheshire, with full masonic ceremonial. The site upon which the church is built is, along with other adjoining land, for a parsonage and schools, and a large donation in money, the gift of Lord Egerton, of Tatton. Messrs. Price & Lindlater, of London and Manchester, were the architects of the new church. The architecture may be described as of the late Early English style. The church consists, on plan, of a lofty nave, 90 ft. long by 25 ft. wide, flanked on either side by aisles, about 13 ft. wide. Each aisle is connected with the nave by five arches, springing from white stone caps, resting on red stone columns. The south aisle is entered at the western end from a south porch, and immediately within the south door is placed a font, made of different-coloured stones and marbles. The nave is joined to the chancel by a moulded chancel-arch, springing from angle and corbel shafts, on the north of which, and in the nave, is situated a pulpit, composed, like the font, of different-coloured stones and marbles and coloured tiles, the gift of Miss Lucas, of Fallowfield. The chancel, which is about 35 ft. long by 22 ft. wide, and terminating in a circular apse, is approached by three steps. The whole of the choir-stalls have been carved, and are the work of Messrs. Winter &

Moore, joiners. From the reredos rises a reredos of three panels, the centre one being crowned by a gable, surmounted by carved finials and crockets. The panels are filled by painted decorations, including a large gilt cross in the middle, and are the work of Mr. Barsley, painter, from designs by the architects, and the gift of the latter. The heating-apparatus is under the organ-chamber, and Whittaker & Constantine's hot-air system is employed. The nave is lighted by a large west window, and also by coupled trefoiled-headed traceried lights in each bay of the clearstory. The aisles have two-light traceried windows. The chancel-apse has two-light traceried windows, under gables, supported internally by wall-shafts, and externally by ornamental buttresses. There are also traceried clearstory windows in the chancel, over the side-arches. The south chapel has a large east window of four lights, and traceried head, and a pair of two-light traceried south windows. The tower and spire are attached to the east end of the south aisle; but for the present the tower has been finished off by a temporary covering at the level of the aisle-roof. A bell-cote and bell, the gift of Mr. Hilton, is for the present placed on the south-east angle of the tower. The bell is eventually to be placed in a niche over the chancel-arch. The tower and spire, which will give the principal feature to the church, and without which the real size and character of the design are lost, will rise to a height of about 150 ft. Large funds are still needed for the completion of the church. Messrs. Ellis & Hincliffe, masons, put in the foundations; Messrs. Cordingley & Stopford the masonry and brickwork of the superstructure, and the roofs, flooring, and slating. They also executed the font and pulpit. Mr. Holt supplied the seats, Mr. Edmondson the glazing, Mr. Berry the plumbing, Mr. Conway the tiling of chancel, Mr. Hart the gas-pendants, Mr. Harwood the plastering, and Mr. Hindshaw the modelling.

Weston.—The parish church of Weston-upon-Trent, near Stafford, has been re-opened for divine worship, after being closed for some months, during which time it has undergone an enlargement and restoration at the sole cost of Miss Moore, of Wychdon. The work which has now been accomplished was regarded at the commencement as the completion of a previous restoration in 1860, but it has in its progress exceeded that restoration in extent and cost. The particular works included in it have been the raising of the roof of the nave by the introduction of a clearstory, the rebuilding and enlarging of the south aisle and porch, the re-arranging and re-fixing of the chancel, the re-ceiling of the tower space, the addition of a vestry, and the introduction of two new stained windows, together with a general restoration throughout. Of the new stained windows, that in the east of the chancel is by Mr. Gibbs, of London. The subject is the Nativity, and while the three lights are separated by a considerable breadth of masonry, the figures in all are parts of the same group. The other new stained window is a single light at the eastern end of the south aisle, and is by Mr. Wailes, of Newcastle. Its subject is St. John the Baptist. Miss Moore, the lay proprietress of the parish, was also the foundress of the new schools in the neighbourhood. The architect of the restoration was Mr. Bitterfield, of London; and the contractors were Messrs. Wood, of Derby; and for the stonework, Mr. G. Trubshaw, of Stafford.

DISSENTING CHURCH-BUILDING NEWS.

Gloucester.—The church and schools erected by the English Presbyterians to the memory of George Whitefield, in his native city, and on the site which tradition says is that whereon he preached his last sermon, have been opened. The church, designed by Messrs. Medland, of Gloucester, is in the Gothic style. It consists of a nave, 80 ft. by 40 ft., and 31 ft. high, and has a tower 140 ft. from base to vane. The walls, outside and inside, are faced with white Shropshire bricks, with hands and devices in red and black bricks; and the dressings are of Bath stone. The windows are filled with cathedral glass; and there is a gallery at the west end. The seats are of stained deal. The roof-timbers are exposed, and are stained. The panelling of the roof is colonaded, and the tie-beams are painted in colours, relieved by gold. The lighting will be by three large coronae suspended from the roof. Haden's heating apparatus has been used, so that schoolroom and chapel can

alike be warmed; and the ventilation seems to be ample. The school, underneath the chapel, has accommodation for at least 300 scholars, and there are also class-rooms, committee-room, vestry, and rooms for the chapel-keeper. The floor of the church is elevated 6 ft. above the ground level. A platform for the minister is placed under a wheel-window at the east end, and the space here can at any time be extended for the erection of an organ-gallery. The seat for preacher and choir are in front of the minister's desk, and near them is an octagonal font, with carved foliage in each front. Over the chief entrance is a bas-relief carved in stone, representing Whitefield preaching to the multitude. In the principal gable is placed the Presbyterian emblem, the burning bush, with the motto, "Nec tamen consumebatur;" and on the corbels on which the moulding over the entrance rests are carved the heads of Knox and Chalmers. The bas-relief, the burning bush, and the font are the work of Mr. Boulton, of Cheltenham, sculptor. The other carving has been done by Mr. Frith. The decorative work and painting have been carried out by Mr. Tanner, of Gloucester. The building has cost 4,000*l.* The builder is Mr. Meredith.

Bristol.—The new Baptist chapel, erected between Elm-grove and Southville-roads, Cotham, has been opened for service, though the contractor will not finish his work on the site for a week or two. The chapel has been built from designs by Mr. H. F. Price, of Weston-super-Mare, and is in the Gothic style. The front is at the Elm-grove-road end of the building, and the chief entrance has a turret, which is to be raised to a height of 70 ft. or 80 ft. Inside are provided stairs, which will lead to an intended gallery at this end of the building. The chapel consists of nave and transepts. From the front wall to the back of the gallery the chapel is 96 ft. long; the width in the transepts is 60 ft., and in the rest of the building 40 ft. The floor will accommodate 500 or 600 persons, and with the present temporary organ the gallery will furnish room for forty or fifty more. The material of the pulpit, gallery-front, and pews is pitch-pine, varnished. Under the gallery (which is reached by stairs from the back entrance) is a vestry, so arranged that it may be used as two separate and independent rooms. Behind these is a sort of kitchen, with large boiler and other conveniences, and the building terminates with a class or lecture room, 42 ft. by 25 ft. The outside walls are of Pennant, with freestone dressings. The cost of the building has been about 3,500*l.*

Bridlington Quay.—The Wesleyans of this fashionable watering-place are about to erect a new chapel to accommodate 500 persons on the site of the present chapel, enlarged by the acquisition of four adjoining tenements. The building is to be of white pressed stock bricks, with Whittby stone dressings. The style of the building, Italian. The architect is Mr. Botterill, of Hull.

Newcastle-upon-Tyne.—The newly-erected United Presbyterian Church in Westmoreland-road, Newcastle-upon-Tyne, has been opened. Mr. Thos. Oliver was the architect, and from his plans the edifice has been erected at a cost of 4,500*l.*, in addition to which 500*l.* were paid for the site; and in order fully to liquidate the cost, the sum of 1,500*l.* or 1,600*l.* is still required. The large school-room under the church was opened some time ago, and services have been conducted in it. The site on which the church is erected is in immediate proximity to the grammar-school new buildings and the group of erections in connexion with the Church of St. Mary Oving to the rapid fall of Maple-street, a school room and lecture-hall, 50 ft. long by 49 ft. wide and 15 ft. high, together with session-houses, vestries, tea-room, stoker, conveniences, and caretaker's residence, entered from the level of the side street, are provided on the basement floor, communication with the church being effected by means of two staircases. The lighting is warmed by a hot-water apparatus, lighted by seven double-light windows of large size, and ventilated by through and through openings in the pier-walls, as well as by specially-arranged ventilators in the windows. A site adjoining has been purchased for a manse. The church, which is an oblong building 90 ft. by 50 ft., is approached from Westmoreland-road by the main entrance. This entrance, which consists of a large projecting porch, with three doorways, is reached from either side by a broad flight of steps terminating on a terrace landing, an

inclosed on both sides by an ornamental pierced wall and stone piers. Between the porch and the church is a large central vestibule, also with doorways leading into the body of the building and on either side by staircases to the galleries and to the schoolroom. The front elevation is broken into three unequal portions, for the purpose of avoiding large gables, and also to record the longitudinal divisions of the interior; and at the same time advantage was taken of the extreme portions for the purposes of staircases, one of which, namely, that forming the abutting angle of the two streets, has been carried up in a turret fashion, with double-staged roof and arched open timber work. The spire of St. Mary's was appreciated by the architect as being overpowering, and he has made the grouping of the structural projections in solid masses throughout. The main gable over the porch is pierced with three lancet-headed windows, and an ornamental quatrefoil wheel window with vertical and horizontal mullions, having moulded caps and bases. The east elevation facing Maple-street has three rows of windows, the lower one, which lights the schoolroom, being specially separated from the two upper rows by means of a plinth course; while the two upper tiers, which light the ground floor and gallery of the church are grouped within the buttresses. The architecture adopted is after the early French Gothic prevalent during the thirteenth century. In the interior tiers of iron columns rise from the ground-floor up to the roof, with arches between. The pulpit is of platform fashion, and is designed and decorated according to its purpose. The walls internally are finished rough stucco, of a pale grey colour. Over the platform in the south wall of the church some plaster arcading has been introduced to break the plain appearance of the blank wall over the platform. The north windows are all filled with coloured glass in geometrical designs. Accommodation is provided for 800 persons in the church, with an additional 100 on hanging seats; and the school-room will hold about 600. Messrs. N. & R. Reed were the sole contractors for the works, and these have been executed by them and by the following sub-contractors satisfactorily to the architect. The sub-contractors were as follow: Slaters, Messrs. W. Pears & Co.; ironfounder, Mr. J. A. Somerset; plumbers, Messrs. R. B. Charlton & Co.; painters, glaziers, and decorators, Mr. Salmon; plasterer, Mr. T. Wallace; upholsterer, Mr. J. A. Porteous; the warming and lighting were done by Messrs. Walker & Emley; stone carving by Mr. Paterson; plaster and wood carving by Mr. Hodley; all of Newcastle. Mr. Robert L. Davidson acted as clerk of the works.

Miscellaneous.

The Leeds Central Market.—Some time ago the Corporation of Leeds determined to alter and improve the Central Market, but more particularly the east front, which now forms one side of New Market-street. The furnishing of architectural designs was thrown open to competition, and from the number sent in for approval an ornate drawing by Mr. William Swallow, of Leeds, was selected. On more deliberate consideration, however, it was thought that it would be injudicious to carry out external alterations of so extensive a character when it was in contemplation to improve the market internally at a subsequent period. A more economical course has therefore been adopted. The shop-fronts, which are now narrow, are to be modernised by the enlargement of the windows, the removal of the brick arches surmounting them, the substitution of large sheets of plate-glass for the existing meagre panes, and the introduction of recess-entrances and wooden cornices and pilasters. The upper windows will also be improved in shape, and surrounded with moulded architraves. The unsightly stove-pipes now spreading in nearly every direction over the front will be rendered unnecessary by the construction of flues in the shops. The front of the block will be plastered with cement stucco, in imitation of stonework. The cost in all will be under 1,000l.

Birmingham Architectural Society.—At the annual meeting of the Birmingham Architectural Society, held last week, the following officers were elected for the ensuing session:—F. B. Osborn, President; B. Corser, Vice-President; J. J. Bateman, Treasurer; and F. H. Talbot, Hon. Secretary.

Cheap Railway Travelling.—A conference of the members of the National Railway Association has taken place at Willis's Rooms, St. James's, for the purpose of considering the desirability of the Government acquiring the whole of the railways, and instituting a system of uniform fares for all districts, on Mr. Brandon's principle. Amongst others present were Sir John Bowring and Sir Charles Dilke, M.P. Mr. R. Brandon, the hon. secretary, read a statement of the objects of the association, and a resolution was carried to the effect that the time had arrived when, in the interests of the country and of the railway shareholders, it was the duty of the Government to acquire on equitable terms the ownership of all the railways in the United Kingdom, and to institute in place of the present irregular rates a system of uniform fares. The following resolution was also adopted:—"That petitions throughout the kingdom be at once collected and presented to the Houses of Parliament for the purpose of carrying out the first resolution, and that a national subscription be instituted, and that the co-operation of all classes be invited." The chairman, Mr. A. R. C. Johnstone, was requested to write to the Chairman of the Parliamentary Committee now sitting, and request that Mr. R. Brandon and three other members of the association should be examined by the committee.

Ammonia as a Motive Power.—This motive power (put to use by G. Bastianelli, of Florence) acts in the same manner as steam, and is as easily controlled; requires but a small amount of fuel to develop its immense force, the heat necessary for producing the pressure of ten atmospheres being limited to 131° to 142° Fahrenheit, and can now, it is said, be readily adapted to any machinery worked by steam, the new engine being quite simple in its construction. The saving of fuel is nearly 70 per cent. The complicated copper boiler, with its 150 tubes, is entirely dispensed with. The ammonia acts in continuous rotation, as it at once condenses and returns into the boiler, the quantity escaping being scarcely observable, and requiring only annual replacement. In sea voyages the saving of 70 per cent. of fuel is naturally of paramount importance, as, besides reducing by two-thirds the daily expense, it also allows of more space for freight. The inventor has laboured incessantly for twelve years in endeavouring to find out a practical mode of applying this new motive power. The machine exhibited in Paris at the International Exhibition was complicated and lumbering. The actual engine is said to be simple, and its advantages and expediency therefore obvious. The inventor has taken out a patent for Italy, and will insure to his invention the same privilege all over the civilized world.

Fall of a Bridge and a Hundred People. A serious accident has occurred at Ithaca, New York. The burning of a barn in this village was the occasion. Two fire-steamers and one hand-engine were promptly on the spot. Part of the Fall Creek was spanned by a wooden bridge, on which one steamer was placed. Dropping her pipe into the creek below, she at once began operations. Soon a terrible crash and agonising cries for assistance arose from the direction of the bridge, which had broken through from the unusual strain upon it. The water at this point is only about 3 ft. deep. At the time about 100 people were standing on the bridge, and many of them were now seen crushed under the planks and rafters or hemmed in and unable to move by the other debris. Measures were soon completed to extricate the unfortunate victims from the wreck, and all who were known to be injured were rescued. Nothing is said of those (if any) that were killed on the spot.

The Newbury Town Surveyor.—At a special meeting of the Newbury Town Council, the Finance Committee recommended that Mr. Sargent, the surveyor, should be paid 60l. per annum, this being an increase of 15l. It included 10l. paid to Mr. Sargent as inspector of nuisances, and it was understood that the duties of surveyor to the council should be included. Plans and estimates, however, required by the council are to be paid for as extras. Alderman Hickman said Mr. Sargent's duties were important, and he was entitled to the proposed increase of salary. The recommendation of the committee was accordingly agreed to.

Theatre Burnt in Michigan.—Another American theatre has met its fate. Squire's Opera House, at Michigan, was destroyed by fire on the 8th of last month.

New Dry Dock, Newport, South Wales.—The new dry dock was to be opened on the 3rd of June. It has been constructed from plans designed by Mr. A. Schenk, C.E., by Mr. Joseph Firbank. Herein vessels of the largest dimensions may be accommodated and undergo repairs. The walls are of Aberbeeg stone, which is of the same vein and precisely similar nature as the stones used in the erection of the walls, locks, and cills of the Alexandra Docks. The length of the dock is 300 ft.; width, 46 ft. 3 in. at the entrance; depth, 27 ft. 9 in. The average depth of water at neap tides is 10 ft. 9 in., and at ordinary spring tide 20 ft. 9 in. The blocks on which the vessel will rest were cast after a design by Mr. J. W. Bebell, the manager. The gates have been manufactured in the yard, and are opened and closed with comparative ease by means of chains worked by capstans and rollers. The height of the gates is 28 ft. 7 in.; extreme width, 54 ft., and they are made of pitch pine. They work upon a segment plate. The sluices are opened by means of a patent screw. On the top there are railed platforms to prevent danger in walking across. The mooring-posts are of oak, placed equi-distant on both north and south sides. A tramway will be laid down through the yard. The dock is to be called the "Alice" Dry Dock, in honour, we understand, of the daughter of the chairman of the company.

Restoration of the Churchyard Wall of Old Lambeth Church.—The churchyard wall of the old parish church at Lambeth, which was nearly 200 years old, has now been taken down, and a new wall is being erected. It is seldom that the formality of laying the memorial-stone of a churchyard wall is gone through; but in the case of Old Lambeth Church, which is associated with so many historical reminiscences, it was considered desirable that some exception should be made, and in accordance with this feeling the ceremony took place in the presence of the Rev. J. F. Lingham, the rector, the churchwardens, members of the Burial Board, and others. The wall will be of Caen stone and Kentish rag, corresponding to the stone of the church, and will be 4 ft. high. The railings, which will be 2 ft. high, making the wall 6 ft. in height altogether, will be of malleable iron, and handsome gates at the entrances will also be erected.

Prospective Abolition of Steamer Funnels. According to the *Swiss Times*, two Austrian marine officers and a marine engineer have discovered by united experiments a method of conveying away under water the smoke from the steam-engine, instead of through a funnel into the air. They make use of double ventilators, which compress the smoke and force it overboard. For propelling these ventilators they employ, according to circumstances, either water-power,—that is, the pressure of the water between the surface of the water and the place where this apparatus is fixed, or, for smaller vessels, steam power. A chief advantage of this discovery will be the greater security of ships of war, as, in armour-plated ships, the only vulnerable part, the funnel, will be taken away. For submarine and torpedo ships and monitors this discovery, it is said, will be of great value.

Economical Watering of Streets, Parks, and Market-gardens.—On the drive at the east end of Rotten-row, Hyde Park, a trial is being made of Brown's permanent system of watering, in order to show "that the services of one man would be ample, with this system, to undertake the watering of the whole park, which at present employs, as a rule, twenty horses and carts and twenty men daily." This portion of horse-and-cart watering is taken as the seventy-fifth part of that of London; showing that seventy-five men, at 20s. per week, for thirty weeks in the year,—equal to an expenditure of 2,250l.—would be about the outlay for labour in watering the whole of London upon Brown's system. The annual cost of watering London is estimated at about 135,000l. by the ordinary system, and 20,000l. by Brown's, which saves both time and water.

Gloucester Cathedral.—The Freemasons of Gloucestershire have undertaken, at their own sole charge, the restoration of the reredos in Gloucester Cathedral, the cost of which is estimated at 1,000l. Of this amount the greater portion has been already subscribed. The restoration of the reredos owes its initiation to Sir Michael Hicks Beach, bart., one of the county representatives, and a Past Grand Senior Warden of the craft.

Architectural Museum.—The Council in their report say they

"had fully hoped to have been able to forward to its supporters a copy of the new catalogue with this report; but the course of completion proved it to be a tedious and intricate work, owing chiefly to the difficulty in identifying many of the casts after their more than one removal from their original positions; still the MS. has been compiled, and so soon as it has undergone the supervision and received the suggestions of those to whom the collection is best known, it will be printed. The Council anticipates that it will not only be found serviceable as a key to those who are inspecting the museum, but that its value will be recognised as a record of architectural history exemplified in the typical examples which it reproduces. As such it may prove a valuable manual of reference to the student, the artist, and the amateur. In order, however, to make the collection as self-explanatory as possible, labels describing the larger casts have been recently placed about the museum."

Proposed Memorial of the late Professor Maurice.—A select and influential meeting, inasmuch as it was attended by some of the principal dignitaries of the university, has been held at Trinity College, Cambridge. The Rev. the Master of Trinity (Dr. Thompson) presided. The object was to raise a fund by means of which the memory of the late Professor Maurice may be most fitly perpetuated. It was unanimously agreed that Mr. Woolner be commissioned to execute a bust of the professor for presentation to the University, and that the surplus of the subscription be devoted to the foundation of a lecture, in the Working Men's College or elsewhere, by a lecturer appointed by the University of Cambridge.

The Bursting of the Canal Embankment, at Birmingham.—In consequence of the unfavourable state of the weather of late, the men employed in repairing the breach in the Worcester canal were not able to proceed with their work as rapidly as was anticipated. It was fully expected that the work would have been so far completed that the canal, which was empty for about a mile and a quarter, could have been refilled, and traffic resumed. The breach in the embankment was about twenty yards wide. To make doubly sure, the wall which has been erected across the breach is being extended on each side of the breach until it will, in its whole length, measure over 100 yards.

The Treatment of Sewage.—Mr. E. Brown's scheme for the treatment of sewage matter was put into operation on a small scale, as a trial of its efficiency, on the grounds of the Union Workhouse at Slough last week. A large tank of wood, of the following size, is made use of,—6 ft. in length, 4 ft. in depth, and 4 ft. in width, containing nearly 600 gallons. About 2½ tons of dry earth are placed in the tank, and the sewage matter, about 200 gallons, is put on it, and allowed to filter through it, which occupies about six hours. It is stated that the dry earth, &c., take up or absorb about half of the sewage, and that the solid matter left in the tank would be sufficient to manure a quarter of an acre of land.

Wisbech Working Men's Club and Institute.—The new rooms which have been added to the Wisbech Working Men's Club and Institute have been opened by the Bishop of Ely. Messrs. Wm. Adams & Son were the architects; and the erection has been carried out by Mr. Girling, builder; 945*l.* being the amount of the contract. The new building has not much pretension to ornament in its exterior. The gable end of the building is seen from the Nonc Parade. The new rooms are attached to the back of Alfred House, and run parallel with Scrimshire's passage, with a frontage of 52½ ft., and 36 ft. in height. The exterior is of red brick, with white brick bands and arches.

Tramway and Omnibus Junctions.—A "Co-operative Omnibus Association (limited)," has been started, with a set of newly constructed omnibuses, in conjunction with the tramways, and running from Westminster Bridge to Charing-cross and Oxford Circus, at 1*d.* as the charge. There are waiting-rooms at each rendezvous. The Camden-road and Tottenham-court-road tramway should, in like manner, be joined with Oxford Circus and the South Tramway system. The Camden-road tramway only awaits its continuation to the Holloway-road, to complete the junction of the Camden district with the City at Finsbury by tramway.

Restoration of Warwick Castle.—The contributions received towards Warwick Castle restoration fund now amount to upwards of 9,000*l.* and the committee propose to close the account, and hand the proceeds to Lord Warwick.

Monument to Shakspeare in New York. A bronze statue of Shakspeare, which has been erected in the Central Park, New York, was unveiled on the 23rd ult., in the presence of about 6,000 spectators. Among the speakers was the poet Bryant, who referred to Shakspeare as one of the most wonderful men that ever lived; a genius, great—far beyond all ordinary greatness, and destined to hold the admiration of mankind, through century after century, in the ages yet to come.

Poplar and Stepney Sick Asylum.—At a meeting on the 22nd ult. of the Board of managers of the Poplar and Stepney Sick Asylum, one of the new hospital buildings lately erected under the direction of the Poor-Law Board, it was unanimously resolved that the building having been completed in a satisfactory manner, and the accounts of all the contractors having been settled, letters of thanks should be sent to the architects, Messrs. Arthur & C. Harston, and to the builder, Mr. Robert Mann.

Vesuvius.—A friend writes,—"The mount is seen about five minutes in the day; lightning and thunder are very frequent. The town is indescribably disagreeable; a dense, smoky atmosphere, and very suffocating in feeling. The waters are out everywhere around. An awful inundation of the Po. Lugano overflowing its banks; Como ditto; boats instead of carriages doing part of the conveyance of passengers to the foot of the passes, which are, strange to say, open."

New Town-hall, Eyemouth.—A movement was recently initiated by the "Lifeboat" Lodge of "Good Templars" in Eyemouth for the erection of a town-hall, but the erection of a suitable building being beyond their means, a general committee of the public has been formed, and is in correspondence with Mr. Milne Home for a site. Mr. Gray, architect, Berwick, is to prepare plans of the building.

Belle Sauvage.—"La Belle Sauvage," of the *Spectator*, it appears, was only a myth after all. Messrs. Cassell, Petter, and Galpin, in raking over their title-deeds, have discovered that the name of the inn upon which their premises stand was formerly the "Bell on the Hoop," or "Savage's Inn," and eventually became contracted to "Bell Savage's Inn," or, shorter still, "Bell Savage."

The Newly-discovered Shrine.—Mr. H. V. Lemcngor, of Watford, has produced some very interesting photographs, which show the newly-discovered shrine as it is now put together, from three different points of view.

St. Giles's Cathedral, Edinburgh.—The restoration of St. Giles's Cathedral, Edinburgh, was commenced on Monday morning, and the work is being rapidly proceeded with.

Yeovil.—Mr. J. Tomlinson, Assistant-Manager of the Luton Water Company, was on Monday appointed Manager of the Yeovil Corporation Waterworks.

The Female School of Art.—The Lord Mayor will distribute the prizes to students at the Mansion-house, on Friday, the 21st inst.

TENDERS

For warehouse, Robin Hood-yard, Leather-lane, for Mr. Hodge. Mr. Reed, architect. Quantities by Mr. Goodchild:—

Shurmer	£3,379 0 0
Mathews	3,169 0 0
Bays & Barnage	3,050 0 0
Wagstaff & Son	3,050 0 0
Nield & Son	2,832 0 0
Atchinson & Walker	2,825 0 0
Kent	2,739 0 0
Howard	2,732 0 0
Langmead & Way	2,713 0 0
Grough	2,675 0 0
Sabey & Son (withdrawn)	2,385 0 0

For Wesleyan Chapel, Northwood. Messrs. Scrivenor & Son, architects. Quantities supplied:—

Jaskip, Brothers	£1,870 0 0
Cook	1,517 0 0
Mathews	1,405 0 0
Redfern, Brothers	1,425 0 0
Barlow	1,304 0 0
Hummersley (accepted)	1,355 0 0

For joiners' work, &c., to four houses, near Acton Green. Mr. Henry Lovegrove, architect:—

Butcher	£640 0 0
Thorp	637 0 0
Tull (accepted)	525 0 0

For the erection of a residence at Bourne, for Mr. J. Gibson. Mr. Chas. Bell, architect. Quantities supplied by Mr. H. Lovegrove:—

	£1,000	Old Credits
Richardson & Son	1,000	40 0
Patterson	1,050	100 0
Hobson & Taylor	1,041	83 0 3
Price, Brothers	1,041	84 17
Chalsons	915	40 0
Hinton (accepted)	865	40 0

For Fulwood Workhouse, Preston,—vagrant wards for thirty inmates, with attendants' rooms, baths, heating apparatus, and fittings. Mr. J. J. Bradshaw, architect:—

Exton, Brothers	£968 0 0
Hall	883 0 0
Barber	837 0 0
Bickerstaffe (accepted)	820 0 0

For additions to the residence of Mr. Emery, Plantation-road, Leighton Buzzard. Mr. Frederick Götto, architect:—

Adams	£390 0 0
Garside & Holdstock	798 0 0
Dendiehill	795 10 3
Edwards	768 0 0
Cook	749 0 0
Agutter (accepted)	740 0 0

For stoneware pipe sewers, Heath-street, for Hampstead Vestry. Mr. Chas. H. Lowe, surveyor:—

Crockett	£190 0 0
Wright	180 0 0
Culverhouse	135 0 0
Thurst	130 0 0
Watts	117 0 0
Killingback	107 0 0

For roads and sewer at Acton brickfields:—

Bloomfield	£653 0 0
Capper	615 0 0
Pizzey	449 0 0
Jones	420 0 0

For the erection of a detached villa, Staines. Mr. Robert J. Wooley, architect. Quantities supplied:—

Fynn & Lyons (accepted)	£324 15 3
-------------------------	-----------

Accepted for the erection of four model cottages, in Hill-street, East Dereham, for Mr. H. Wilson. Mr. Henry Ploorman, architect:—

Bone	£246 14 6
Mumford	176 10 0
Aldis	36 0 0

For Headcorn Board Schools, Kent. Mr. W. King, architect:—

Small	£1,875 0 0
Stentford	1,742 0 0
Bridge	1,690 0 0
Cox, Brothers	1,650 0 0
Peters	1,650 0 0
Wallis & Clements	1,648 0 0
Wright, Brothers, & Goodchild	1,636 0 0
Richardson	1,435 0 0
Harnett	1,410 0 0
Clifford	1,390 0 0
Fowler	1,340 0 0

For farm buildings, Wittersham, Kent, for Mr. J. Boddy. Mr. W. King, architect:—

Clifford	£430 0 0
Bourne	422 0 0
Smith & Saxe	417 5 0
Holt	409 11 2
Pennell	382 16 8
W. G. Peters	350 0 0
C. Peters (accepted)	345 0 0

For the erection of eight cottages at Market Harboro', for Mr. J. Symington. Mr. Chas. Bell, architect:—

Jennings	£1,175 0 0
Northam	1,065 0 0
Palmer	1,079 0 0
Sinayon & Son (accepted)	1,070 0 0

For residence in Warrnam-road, Croydon, for Mr. J. Hinton. Mr. R. W. Price, architect. Quantities supplied by Mr. W. H. Barber:—

Patman & Fotheringham	£1,780 0 0
Nightingale	1,777 0 0
Ward	1,735 0 0
Baxter	1,654 0 0
Smith (accepted)	1,645 0 0

For forming and making new road on the Churchfield Estate, Acton. Mr. Thomas W. Cuddey, architect:—

Jackson	£795 0 0
Hubbard	735 0 0
Bloomfield	653 0 0
Carter	620 0 0
Capper	611 0 0
Pizzey	449 0 0
Jones	400 0 0
(amended)	640 0 0

For an alteration to the Westminster Arms, Praed-street, Paddington, for Mr. Chipperfield. Mr. H. Cutton, architect:—

Kelly, Brothers	£893 0 0
Stead	875 0 0
Palmer	867 0 0
Bangh	696 0 0
Brown (accepted)	675 0 0
Bowman	479 0 0

For reinstatement of 30, Boundary-road, St. John's Wood, for building stable. Mr. H. G. Gribble, architect:—

Hunt (accepted)	£252 0 0

TO CORRESPONDENTS.

J. L. (we shall be glad to see photographs in due time)—L. & P. (cancelled, having appeared elsewhere)—L. E. (we postpone notice: send block)—City Guides (next week)—Covenant Garden Church (next week)—J. W. (take advice from one who can look into the matter)—

We are compelled to decline pointing out books and giving addresses. All statements of facts, lists of tenders, &c., must be accompanied by the name and address of the sender, not necessarily for publication.

Notz.—The responsibility of signed articles, and papers read at public meetings, rests of course with the author.

Bath and other Building Stones of Best Quality.—RANDELL, SAUNDERS, & CO. Limited, Quarrymen and Stone Merchants. List of Prices at the Quarries and Depôts, also Cost of Transit to any part of the United Kingdom furnished on application to Bath Stone Office, Corsham, Wilts.—[Advr.]

Ashton & Green, Slate and Slab Merchants and Quarry Agents.—Shippers, Merchants, and Contractors furnished with Price-lists of every description of ROOFING and MANUFACTURED SLATE, Railway-rates, &c. Agents for London and Country for the Sale of the celebrated WHITLAND ABBEY GREEN SLATES. Drawings and Prices of A. & G.'s BED RIDGE TILES, specially prepared for use with these Slates, on application.—Offices and Show-rooms, 14 and 15, Bury-street, St. Mary Axe, London, E.C.—[Advr.]

IMPERIAL FIRE INSURANCE COMPANY. Established 1859. No. 1, Old Broad Street, E.C. 1. Capital, £1,500,000. Paid up and invested, 700,000.

PERFECTION IN BOOKKEEPING.—Builders and others desiring a really good system, can have a SET OF MODELS FOR BUILDERS BOOKS, BY DOUBLE ENTRY, to which was awarded the prize offered in "The Builder," No. 1165, and which has been adopted by many large firms. Also a Modified Arrangement by Single Entry, suitable for small builders.—Address, E. A. St. George's-road, Strand, W.C.

THE STRAINS IN TRUSSES computed by means of Diagrams; with 20 Examples drawn up by Lecturer at the Harter Institution, Southampton; formerly Assistant Engineer on the Construction and Scholar of Gonville and Caius College, Cambridge. London: LONGMANS, GREEN, & Co. Paternoster-row.

THE SEWAGE QUESTION: Treatises by Mr. BAILEY DENTON, C.E. 1. Sanitary works, price 1s. 2. Sanitary Appliances, 1s. 3. Sanitary Engineering and Informational Filtration. Letters to Times, with Appendices, price 1s. E. & F. N. SPON, 48, Charing-cross.

ATCHLEY & CO'S TIMBER MERCHANTS GUIDE, for the use of Building Surveyors, Contractors, and Builders, &c. containing useful Tables, Marks of Wood, &c. published by ATCHLEY & CO. 106, Great Russell-street, Bedford-square, London.

TREDGOLD'S CARPENTRY. Fifth Edition, corrected and enlarged, revised to 25s. cloth.—In one large quarto volume, with 64 Plates (11 of which now first appear in this edition). Portraits of the most eminent Carpenters of the last century. THE ELEMENTARY PRINCIPLES OF CARPENTRY. By THOMAS TREDGOLD, C.E. Edited by PETER PARLOW, F.R.S. with an Appendix, containing Specimens of various Ancient and Modern Roofs. London: LOCKWOOD & CO. 7, Stationers' Hall-court, E.C.

THE CARPENTER'S NEW GUIDE; or, BOOK OF LINES for CARPENTERS: comprising all the Elementary Principles essential for acquiring a knowledge of Carpentry. Founded on PETER NICHOLSON'S standard work. A new Edition, revised by ARTHUR ASHLEY, together with Practical Rules on Drawing, by GEORGE SPYNE. PYNE'S PRACTICAL RULES on DRAWING (separately), with 14 Plates, 4s. boards, price 7s. 6d. London: LOCKWOOD & CO. 7, Stationers' Hall-court, E.C.

DILAPIDATIONS: A Text Book in Tabulated Form, with Copious Index, by BANISTER FLETCHER, Author of "Model Houses." E. & F. N. SPON, 48, Charing-cross.

NEW PRACTICAL SCIENTIFIC WORKS (publishing by R. A. SPRIEG, ATCHLEY, & CO. on Engineering (Civil and Mechanical), Architecture, Land and Building Surveying, Road-making and Domestic Ornament, Works on Tunnels, Upholstery, and Cabinet work, and on Monuments, &c.—No. 10, Strand, London, W.C. and 10, Bedford-square, London. A new list sent to order on one stamp.

MICHAEL & WILLS' LAW OF GAS AND WATER SUPPLY. Just Published, post 5s. 18s. cloth.

THE LAW OF GAS AND WATER SUPPLY, comprising the Rights and Duties as well of Local Authorities and of Private Companies in regard thereto, and including the Legislation of the last Session of Parliament. By W. H. MICHAEL and J. H. WILLS. With Copious Illustrations, and a Table of Cases. "An honest and a successful attempt to do with laws affecting gas and water supply."—Law Journal. "We feel thoroughly justified in recommending the volume to the attention of the companies, the public, and the profession."—Law Times. "On the whole, we can thoroughly recommend the work to those who require guidance on the subject."—Solicitors' Journal. London: BUTTERWORTHS, 7, Fleet-street, E.C. Her Majesty's Law Publishers.

MR. MURRAY'S ENGLISH HAND-BOOK for LONDON, 3s. 6d. BRISSEN, CAMBRIDGE, SUFFOLK, and NORFOLK, 12s. SURVEY HANTS, and ISLE of WIGHT, 10s. KENT and SUSSEX, 10s. SURVEY BRISSEN, and OXON, 7s. 6d. WILKS, DORSET, and SOMERSET, 10s. DEVON and CORNWALL, 10s. GLOUCESTER, HEREFORD, and WORCESTER, 7s. 6d. NORTH WALES, 7s. NORTH WALES, 6s. 6d. DERBY, STAFFORD, LEICESTER, and NOTTS. WESTMORLAND and CUMBERLAND, 6s. MAP of the LAKES, 3s. 6d. WEST-SCOTLAND, 9s. HANDBOOK—SCOTLAND, 12s. HANDBOOK—Ireland, 12s. with 300 Illustrations, arranged as follows:—Southern Division, 1 Vol., Eastern Division, 1 Vol. Western Division, 1 Vol., Northern Division, 2 Vols. JOHN MURRAY, Albemarle-street.

MR. MURRAY'S FOREIGN HAND-BOOKS. The following are now ready:—HANDBOOK of THE PYRENEAN MOUNTAINS, 12s. NORTH GERMANY and the RHINE, 12s. SOUTH GERMANY and the TYROL, 12s. SWITZERLAND and the ALPS, 12s. FRANCE and the PYRENEES, 12s. SPAIN and PORTUGAL, 12s. PARIS and its ENVIRONS, 3s. 6d. PLAN of PARIS, 3s. 6d. NORTH ITALY and VENICE, 12s. CENTRAL ITALY and FLORENCE, 10s. ROME and its ENVIRONS, 10s. SOUTH ITALY and NAPLES, 10s. SICILY and PALERMO, 12s. PORTUGAL and LISBON, 12s. SPAIN and ANDALUSIA, 2 vols., 24s. RUSSIA, MOSCOW, and ST. PETERSBURG, 15s. DENMARK, NORWAY, and SWEDEN, 15s. GREECE and PALESTINE, 2 vols., 24s. BOMBAY, 12s. MADRAS, 12s. TURKEY IN THE EAST and CONSTANTINOPLE, 15s. CRETE and IONIAN ISLANDS, 15s.

MURRAY'S KNAPSACK GUIDES. ITALY, &c. THE TYROL, &c. NORWAY, &c. JOHN MURRAY, Albemarle-street.

LITHOGRAPHED BILLS of QUANTITIES, SPECIFICATIONS, &c.—ROBERT J. COOK & RAMMOND have made such arrangements for this special description of Lithography, that orders to any extent are completed in a short time, under the personal superintendence of one of the firm, thus ensuring accuracy and promptness. Plans and Drawings of every description Copied, Traced, or Lithographed.—ROBERT J. COOK & RAMMOND, Draughtsmen, Lithographers, &c. 29, Charing-cross.

R. DIXON, GRAINER and MARBLER, 5, HUNTLY-STREET, Tottenham Court-road, London.

ESTIMATES FURNISHED. PERSPECTIVES, COMPETITION or WORKING DRAWINGS, PLANS of ESTATES, &c. artistically PREPARED by a first-rate DRAUGHTSMAN and COLOURIST, at his own rooms, on moderate terms.—Address, T. H. No. 14, Argyle-street, King's-cross, W.C.

AN ARCHITECT and SURVEYOR, well known, and having a good London practice, principally among Solicitors, including three Building Estates, but whose health is declining, and requires occasional relaxation, wishes to DISPOSE of the same, or to retain only a small share. His office also situated in one of the best neighbourhoods, and well fitted. To a country Architect and Surveyor willing to establish himself in London, or a constant resident near to start for himself, this is an unusually favourable opportunity, and it is particularly requested that those who possess with at least £1,000 at command will reply. Address, SURVEYOR, care of Mr. Nelson, Advertising Agent, 25, Boulevard-street, Fleet-street, E.C.

AN ARCHITECT and SURVEYOR requires a thoroughly competent ASSISTANT, accustomed to Gothic and general work.—Address, J. G. care of Messrs. Blades, East, & Blades, Abchurch-lane, City.

CLERK of WORKS.—WANTED, immediately. An experienced Man, who has acted previously in the above capacity, to SUPERINTEND the ERECTION of a number of COTTAGES and HOUSES in the North of England. Salary 3s. 10d. per week. Applications, with testimonials, to be forwarded to LEWIS HORNBY, Architect, Baltic-buildings, Redcross-street, Liverpool, N.B. As the whole of the houses will be built of general concrete no special apply who has not had experience in that material.

TO ENGINEERS and SURVEYORS.—In consequence of the Surveyor to the Alderholt Local Board of Health having through illness resigned his Appointment, the Board hereby invite APPLICATIONS from persons qualified to take the combined duties of SURVEYOR and COLLECTOR of all RATES levied by the Board. The person appointed will be required to devote the whole of his time to the duties of his office, and preference will be given to applicants who have held a similar appointment, or who can be recommended by a member of the Institution of Civil Engineers by whom they have been employed, or who are themselves members or associates of that Institution. The civil population of Alderholt is about 9,000, and the present rateable value is 74,000L. Lists of applicants, accompanied by testimonials of their qualifications, and salary required, to be forwarded to me on or before SATURDAY, the 23rd inst. W. H. BATLEY, Clerk to the said Board. Station-road, Alderholt, 7th June, 1872.

TO ACCOUNTANTS.—Required by the Government of Jamaica, a PROFESSIONAL ACCOUNTANT, for the Surveyor General's Department in that colony. The principal duties of the office will be the professional examination as to prices and quantities of all accounts, and pay lists sent in for payment; the comparison of such accounts with the details of estimates, and with the authorities for the work; the supervision of the entries in the "Ledger," in which a record is to be kept of the actual cost of each work, and of each part of a work; the supervision of the store books, containing an account of the receipt and issue of materials; the taking out of quantities from drawings in the preparation of detailed estimates, and many other analogous duties which can be properly performed only by a person who has been trained to the work in the office of a large engineering contractor. The salary attached to the office is of the value of 600L. per annum, with yearly increments of 20L. to a maximum of 900L. and a first-class passage to Jamaica will be provided at the public cost. Candidates possessing the necessary qualifications, may send in applications on or before the 23rd inst., accompanied by copies of testimonials (which will not be returned) to the Crown Agents for the Colonies, 12, Spring Gardens, London.

The Builder.

VOL. XXX.—No. 1533.

Concrete Houses in Folkestone.

SOME assertions reached us not long ago that a building erected of Portland cement concrete had proved damp, and had served to prevent the use of the material any further in its neighbourhood. This is quite opposed to our own experience and opinion of cement concrete, and we have little hesitation in saying that if the statement be true, the work was not properly executed. Good concrete, as we have said before, is an excellent material; bad concrete is simply rubbish.

Somewhat wearied and worn a few days ago, we cast about for an excuse to flit to the side of the sea for eight-and-forty hours, to try what an atmosphere with a little more oxygen in it than that of London would do for us, and recollecting the row of concrete houses at Folkestone, referred to in our pages last year, we allowed that to prevail, and found ourselves in due time housed in "The Pavilion." We hope the present manager, by the way, is not trusting to the former good reputation of this hotel? Certainly we have no praise to bestow on the feeding there provided during our stay. The season had not commenced, and the place was singularly desolate and doleful. A month, however, will change all this. New houses are going up; one of the churches is being enlarged; and, amongst other works, schools are being built near St. Peter's Church, from the designs of Mr. Slingsby Stallwood. The same architect is superintending some alterations in the chancel of the ancient parish church. A large mural painting here over the tower-arch, at the east end of the nave, was executed, we understand, by Mr. Andrew Donaldson, as a free-will offering, while staying in the town with a sick relative. Matters of this sort, however, are not our present purpose. What we want to say is that the five houses forming the commencement of Marine Crescent, close to the Bathing Establishment, and built of concrete, stand remarkably well, and are as dry as a bone from top to bottom. These are largeish houses, six stories in height, including the rooms in the roof; there are no wood lintels over the openings, the tenacity of the material being alone depended on. Each house has a bow in the front wall running up a certain height, and this is roofed, like some of the underground offices, with a thickness of concrete, with a skin of Portland cement over the face of it.

The builders and owners of these houses, Messrs. Pope & Howland, have unlimited confidence in the material, and maintain that walls of it one-third less in thickness than would be required for brickwork are ample.

They are forming an esplanade in front of the Crescent with concrete slabs about 3 in. thick, the slab being laid at 64. a foot superficial, and the curb at 9d. per foot running.

In the composition of concrete for the houses, the materials used were six measures of shingle, two measures of clean sharp pit sand, and one of Portland-cement. "Stuffing" was introduced in the thickness of the walls, such as pieces of chalk, broken bricks, and pieces of stone. In

making the thin slab, about four measures of shingle, smaller in size than that employed for the walls, is used with one of cement. As an evidence of the resistance good cement concrete offers to water, we may mention that there is a cylinder formed of it 2 in. thick, 2 ft. high, and 1 ft. 8 in. in diameter, which is kept constantly full, and allows none to percolate.

The face of the house-walls, we should say, is rendered with cement, and has the look of an ordinary cemented front. At some works now being formed by the builders close to the town, and where they are about to manufacture Portland cement, which promises to be of very good quality, the engine-house, erected of concrete, is left rough as from the mould, and nevertheless resists rain as perfectly as in the other case. The flues are formed with a mould, no pipes being employed, either here or in the houses.

At the works an engine-shaft is being built, which is formed of two thin brick casings filled with concrete, twelve of shingle to one of cement.

We must remind those who find themselves in a locality where cement concrete can be used with advantage, that the absence of a proper quantity of sand is fatal, and that intelligent supervision of the men employed is absolutely necessary.

The brightest things we saw coming back were the railway hedges of gorse, just past Chiselmhurst, glorious in gold.

THE ARCHITECTURAL CONFERENCE.*

Competitions.

At the final meeting of last year's Conference, May 26th, 1871, a resolution was passed empowering the appointment of a committee by the Council of the Institute to take into consideration the various proposals that had been made in regard to the conduct of Architectural Competitions, and to draw up a scheme of conditions to be proposed for acceptance by the Conference of 1872. In order to arrive at a better basis on which to found such a scheme, the committee, in November last year, addressed a series of questions to members of the Institute, to the Architectural Association, to the Royal Institute of Ireland, to the Glasgow Institute of Architects, to the Manchester Society of Architects, to the Birmingham, Glasgow, Liverpool, and Sheffield Architectural Societies, to the Northern and Nottingham Architectural Associations, and to various members of the profession not connected with any of the above-named bodies; the object of the circular being to obtain an idea of the general feeling of the architects of the country as to the points on which information was required. The sets of answers received, eighty-two in number, were scheduled, and upon them in great measure was based the formal proposal of conditions of competition which was laid before the recent Conference for consideration, as we mentioned, at the meeting on the 12th inst.

The discussion on these conditions, although at some points it became very "animated," did not on the whole give evidence of much diversity of opinion, in regard to any point of importance; the degree of unanimity obtained being, however, we must think, partly to be attributed to the rather too evident bias on the part of the chairman towards passing everything with as little alteration or delay as possible. It is certainly highly important that time should not be wasted, on such occasions, in over-much talking; but it was impossible to avoid a feeling that in one or two cases votes involving important principles were passed in rather too hurried a manner. The two first clauses of the proposed conditions (which we shall print hereafter in their revised form), recommending the appointment of professional assessors in each case to advise on the terms of the competition and on the relative merits of the designs when sent, and that any such assessor, and every member of the adjudication committee, must necessarily abstain from taking any part in the competition, were passed without question.

In regard to Clause 3, providing that definite instructions should be given as to the scale and number of drawings required, and as to the size and method of execution of perspective drawings

(if any), Mr. Alfred Smith urged that the perspective view was the most important part of the drawings, and that a fixed point of sight ought to be given for it, so that all could be easily compared. Mr. Street, on the other hand, thought this of little importance: for his own part, when adjudicating, he seldom paid any attention to perspective drawings in such cases, but studied the plans and geometrical elevations. We may add that the idea of taking all perspective views from the same point is very open to objection, because in many cases competitors are competent to take perfectly different ideas as to which shall be the principal front or point of their design; it all depends often on the view each takes as to the capabilities of the site. Clause 4 provided that the competitors should be allowed the option of sending in under their own name, or under a motto. Professor Kerr defended this clause on the ground that "anonymous" competitions were never really anonymous, inasmuch as the author's names in almost all cases got out, or were unfairly divulged; at the same time, there might be those among the competitors who preferred to conceal their names, or the reverse.

To this idea, there were strong objections made. Mr. Street said that in some large competitions in which he had acted as judge, he had not been able to form a conjecture as to the authorship of any one set of drawings, until the names were posted up; and that the anonymous system, when fairly carried out, had this double advantage,—that it not only prevented the adjudicator from being biassed against any competitor by personal feeling, but it also enabled him to do justice to a design which might happen to be the work of a personal friend, but which, if he knew it to be so at the time, he might feel a difficulty in recommending, from the very fear of being moved by feelings of partiality. Ultimately, on the suggestion of Mr. Papworth, the clause was struck out; and, to cover the subject, an addition to the 5th Clause was proposed (that the "Instructions should clearly state whether the amount named to be expended was to be strictly adhered to"), to the effect that the Instructions should further state whether mottoes or names were to be signed: the clause, with this addition, was carried unanimously.

We will add one view of the case in regard to signatures, which does not appear to have occurred to any of the speakers at the meeting: that, in the case of mottoes, a competitor of (what General Schreck we suppose would call) more "enterprise" than his fellows, may take a dishonest advantage by revealing his name to, and canvassing, those whom he thinks likely to aid him, and by using some newspaper to puff himself in, in a manner which more ingenious men would not stoop to; whereas, if all names are openly signed, all are on an equality, as any one might in that case draw attention to what he considered the merits of his own plans, openly and above-board. Clause 6, providing that designs should be excluded,—1. If sent in after the period named, accidents in transit excepted; 2. If in violation of any of the Instructions; 3. If they do not give the accommodation asked for; 4. If they exceed the limits of site; and 5. If the assessor, with or without the assistance of a surveyor determine that their probable cost will exceed by 10 per cent. the intended outlay, or the competitor's estimate,—was, after one or two suggestions, carried as originally proposed: so also was Clause 7, providing for a public exhibition of all the drawings after the award. The 8th and 9th clauses were also carried without alteration; the former provided that in every case (subject to compliance with the conditions previously mentioned) the author of the design declared to be the best should be employed upon the work if carried out. The 9th clause dealt with the question of premiums; the first premium not to be less than $\frac{1}{2}$ per cent. on the outlay, and not to merge in the commission, but to be subsequently increased by $\frac{1}{4}$ per cent. if the premiated design be not carried out; other premiums to be offered of an aggregate amount of not less than 1 per cent. on the outlay. In case of works under 10,000*l.* in value, these rates to be increased. In limited competitions, each competitor to receive payment. Clause 10 laid down the very important principle that premiated designs are *not* to become the property of the promoters. If the architects of England can only be got to agree to act generally upon this, they will do much to protect their own interests and to do away with the abuse of competitions; for in many cases the result of a competition lends to the supposition that the promoters really wished to obtain a design from an architect

* See p. 457, ante.

at one-fifth of its real value, and then to make their own use of it. The principle should be laid down and adhered to, that the premium is to remunerate the architect for time expended on the design (which in many cases it does not), and not a price for which he is to sell his property in his ideas. A further clause was added, in addition to those brought forward in the report, that "for small works the employment of an eligible architect or a limited competition is recommended."

Before, however, the code, thus revised, was put to the meeting for adoption, the chairman of the evening (Sir Digby Wyatt) proposed a very important and desirable alteration in the heading or title. It would, he thought, he admitted that, in general, architectural competitions were not a desirable means of dealing between the public and the architectural profession; and though the latter might formulate rules for protecting their own interests in such cases, it was not to be wished that this should be mistaken as an expression of the profession at large in favour of the system. He therefore proposed to add to the title, "General Regulations proposed by the Conference Committee for the conduct of Architectural Competitions," these words,—"in cases in which competition at all should be justified by the extent and importance of the work, or by other special circumstances," which was agreed to *nem. con.* The code of rules in this revised form is now recommended to the Institute and the other architectural societies (as well as to individual architects) of the United Kingdom for adoption; and though, of course, the meeting at which this code was adopted, can only be said in a qualified sense to represent the architects of Great Britain, we must express a hope that those who were not present will give practical proof of their appreciation of the labours of their brethren for the common good, by unanimously adopting the conditions passed at the Conference, and declining to enter competitions on any other terms. This is the only way to secure fair dealing in such matters, at the rate at which the competition system is being carried on now; and if the public find they cannot obtain the entry of any architect of good standing into a competition except on these terms, they must perforce either give up the system or so modify it that architects will be able to compete if they choose, without the conviction that they are going in for a lottery in which, whoever gains, they are pretty sure to lose.

We should mention that at the close of the meeting Professor Kerr read what he termed a "tentative" form of competition conditions or instructions, which he had been requested to draw up, together with the comments of several other members of the Institute on the various clauses contained. This, though rather too elaborate for practical use, contained some valuable and original suggestions.

Construction and Materials.

The sectional meeting for the consideration of structure and materials was held, at two p.m., on Thursday, the 13th, under the presidency of Mr. Horace Jones, and included, according to the programme, a paper from Major-gen. Scott, "On the Selenitic Method of Treating Lime," and one from Mr. R. W. Edis, "Notes on the recent Conflagration in Paris." The title of the first-named paper, however, was changed to that of "Clean Drains and Improved Mortar." This paper was of great practical value, and will doubtless be printed *in extenso*. It may suffice just now to say, that the subject was mainly the description of Major-gen. Scott's plan for depositing, deodorising, and utilising the solid inorganic matter held in suspension in sewage water, and which, under ordinary circumstances, ultimately becomes "sewage mud," and deposits itself in the inverts. The rapid precipitation of this solid matter is effected by the introduction into the sewage water of a mixture of lime and clay, the chemical result being illustrated to the meeting by the addition of a small quantity of this mixture into a glass jar of sewage water, comparatively clear to the eye, but which almost immediately became thick and muddy, leaving, ultimately, a deposit about an inch in thickness at the bottom of the jar. This deposit, thus formed, and consisting mainly of lime and clay in close connexion (five of lime to one of clay), Gen. Scott stated, contained all the ingredients necessary for a good hydraulic mortar; and the lime introduced acted so far as a deodoriser that the deposit was left with scarcely any unpleasant smell (here the noological inspection of a bottle of said deposit, handed round, appeared to elicit

some difference of opinion on this head); and after the calcination necessary to prepare the deposit for actual use in mortar-making, no vestige of "sewage" smell was apparent. The organic matter found in quantities generally of 20 to 25 per cent. in the deposit disappeared in this process, and in effect formed part of the fuel: the nature and origin of a large portion of this organic matter, so readily combustible, was indicated by the lecturer in an anecdote unfortunately a little too much to the point for repetition here. The best method of utilising the deposit, thus dried and calcined, brought the lecturer round to the subject originally announced in the programme. To make Portland cement from this preparation, though the materials for it were present, would require a very careful preparation and proportioning of those materials and good machinery, and it would probably not prove an economical method of procuring cement of this description. But for the manufacture of the selenitic mortar, with which General Scott's name has been identified, the materials here were exactly suited. The selenitic process, the details of which have been published already, was then briefly described. The advantage claimed for the whole process, however, lay not so much either in the production of mortar or the cleansing of drains singly, but in the fact that these two results were combined in the same process. The sewage mud was not wanted for irrigation purposes; at least the best authorities on irrigation concluded that it was rather an impediment than otherwise, and the farmers were emphatically of the same mind. It was desirable both to get rid of the mud and to deodorise the sewage; the introduction of the lime and clay as described effected the latter process, and at the same time produced a material admirably fit for the manufacture of a hard and stiff-setting mortar. Here there was a real "utilisation of sewage," distinct as that gained by irrigation with the more liquid portions. It was asked, why not avail ourselves of it? It was added that, by the simple introduction of the lime and clay preparation in a liquid state into the flowing sewage a little above the outfall tanks, the mixing of the materials and the deposition was effected as thoroughly as if done by mechanical means; the mixture flows along with the sewage, delects it, and at the same time produces the result, in great measure, of a scour on the sides of the drain.

Effects of Fire.

The paper of Mr. Edis, above named, consisted mainly of the result of the lecturer's observations as to the manner in which various classes of building materials had been affected, in the buildings destroyed by the Communist incendiaries. It is interesting to note that the results, in the main, went far to confirm opinions arrived at during the Conference of last year, as to fire-proof materials. The fires in this case, having been very carefully prepared, by the provision of combustibles and explosive materials, and being lighted in many places at once, furnished remarkable evidences of the effect of great heat on the various materials attacked. As a general rule, what was commonly understood as "fireproof" construction appeared to have signally failed; stone-work appeared to have been quite disintegrated by the heat, and the mouldings and other projections seemed to have been completely "licked off" by the flames. Stone staircases tailed into the walls had all cracked and fallen; but it was noticeable that those which were built in at both ends on solid wall had, in most cases, remained standing. Brick buildings protected by cement had, in general, resisted the fire, so far as the main structure was concerned. Ironwork on a large scale had proved totally unable to resist the heat; and not only had the large girders, as in some of the saloons of the Tuileries, given way as soon as, or sooner than wood, but they had, in twisting from the heat, assisted in the wreck of the buildings in a way which wood could never have done. This was strikingly exemplified in one or two of Mr. Spiers's drawings of the ruins made on the spot shortly after the fire. Brick and tile arches generally went by reason of the failure of the iron shrouments and supports. On the other hand, many beams and story-posts of wood were left standing, not burnt through. Plaster appeared, in most cases, to have acted as a great protection to the material it covered. On the whole, the result seemed to be that wood, and concrete and iron protected by plaster, had remained to a great extent fireproof; stone, and iron uncovered, had not.

Captain Shaw, commander of the London Fire Brigade, made some interesting and valuable statements in regard to his own experience as to fire-resisting materials, in general agreeing with the conclusions to be drawn from what had been seen in Paris. He had not in his whole experience known a single instance of unprotected stone resisting the action of fire. He had observed that hollow iron columns were generally much affected by fire, sometimes giving unexpectedly at a slight shock, when not much heated; but solid iron standards of a cross section would often resist fire successfully. The Chairman stated that he had found wooden uprights or beams, with a thin iron plate on each side of them, very difficult to burn through. Mr. Spiers mentioned that in the Palais de Justice, which was roofed by two long barrel vaults, the arches had been stored between the vault and the roof, but the weight of the cases having caused the vault to spread, a quantity of timber scaffolding had been got up there in order to repair the vault. As far as this timber extended the heat had brought the vault down; in the adjoining parts it appeared unburned; but some time after, when some commencement was to be made towards clearing away and rebuilding, the first workman who crossed the remaining portion of the vault fell through, the stonework, though apparently sound, having been completely weakened and disintegrated, by the action of the fire, from the adjoining portion of the building. A more extraordinary thing was that plaster seemed to have resisted the flames in many cases much longer than stone; and a photograph was exhibited by Mr. Spiers, showing part of an apartment, with the stonework all cracked and destroyed, and the plaster mouldings and ornaments adjoining it nearly intact. Mr. Peddie observed that he believed in some cases the iron wire used by the French architects in forming the ceilings had assisted in the destruction of the buildings; as, when the girders above lost their strength or were fractured and came to lean upon the wire, the latter under the pressure operated in pulling the walls in. Professor Kerr did not wish it to be accepted by the public, in connection of what had been said at that meeting, that timber was to be looked on as a fire-proof material; wooden columns might do well in an ordinary house, but not as main support in a large warehouse, for instance. Nature, he thought, it might be said, does not furnish us with "fire-proof" materials, but only with "building" materials; fire-proof or fire-resisting materials were usually of artificial construction. He should wish to know on this head how Ransome's artificial stone stood as a fire-resisting material? In reply, it was stated by a member that the only stone in Chicago that had proved fire-resisting was artificial stone of that nature. Gen. Scott, referring to what had been mentioned by Mr. Spiers as to the resistance of plaster to the fire, thought that in some of the cases alluded to, when the plaster was in connexion with the fireplace, it would be much protected by the in-draught which under the circumstances would take place through the chimney, and would carry away the heat from the fireplace. In-draught exercised a more important influence in such cases than was sometimes realised. He had always said, when asked as to the safety of the Albert Hall in a fire, that if a conflagration were to take place within the Hall, he had no doubt it would burn tremendously, but that he considered the people would be safe as soon as they got into the corridors and passages surrounding the hall, as the in-draught from without through the various openings would be so great as to keep all the heat and flames confined within the Hall. But another point that must be borne in mind in regard to plaster was that it almost always held a large proportion of water, which would be brought out to the surface by the heat, and as long as it lasted would contribute to neutralise the action of the fire; when that was exhausted, he imagined the plaster would succumb to the heat in the same manner as the stone. Mr. Waterhouse thought it important they should have some data as to the effect of fire on different kinds of stone; the stone used in the Paris buildings was mostly a rather soft limestone: what would be the relative effect on Yorkshire stone, for instance? Capt. Shaw stated that he had never seen any kind of stone which did not yield almost at once to the action of fire, except gneiss; and that yielded ultimately, and particularly if water fell on it. On the other hand, he repeated that he had never known an instance of a solid wooden post being burnt through so as to lose its bearing

power before a fire could be put out. This did not apply merely to the harder wood, but to such as pine, &c. A vote of thanks to Mr. Edis and Capt. Shaw closed a very interesting discussion. The latter gentleman, in replying, observed that the architects were the best friends of the fire-brigade, and that the more generally buildings were erected on sound architectural principles of construction, the less danger would there be in extinguishing fire, when it might break out. Subsequently, Mr. Hornblower, of Liverpool, exhibited and explained a section of a patent fire-proof construction invented by himself, consisting almost entirely of terra-cotta or earthenware chambers, bedded in concrete, what little iron there was in the construction being entirely shielded from the action of fire by the concrete. The construction, which could hardly be explained without reference to a diagram, appeared likely to answer, as to its fire-proof qualities, exceedingly well; the only question seemed to be as to its rigidity, when loaded, over a large area; on which point, however, Mr. Hornblower said he had amply satisfied himself by experiments.

The adjourned meeting for the purpose of further considering the subject of professional practice, and other matters not gone into at the meeting on the 11th from want of time, was held at twelve on Friday morning, the 14th. As this meeting was private in its nature, as far as the discussions are concerned, we content ourselves with mentioning briefly that, on the revised schedule of charges being proposed from the chair for adoption as a whole,—

Mr. Godwin moved, as an amendment, "that the schedule of 1862 be re-affirmed," and stated his reasons for considering that issuing a new schedule would prove a very injurious step. This was seconded by Mr. C. F. Hayward, and, after a vigorous discussion, was negatived on division, and the new schedule was adopted.

The argument which chiefly prevailed appeared to be this, that many of the provincial members had been assisted in discussing the new schedule had then left London, and that it would seem unfair to them to put that aside and return to the old schedule. We believe the step taken is an unfortunate mistake.

During the Conference the room of the Institute was hung with geometrical and practical drawings sent for exhibition; the array of these was, however, rather smaller than last year, and did not present anything particularly new. As far as we observed, they were entirely the work of London architects, no provincials having sent anything. It is to be wished that on a future occasion this exhibition might be more fully contributed to, and arranged in a systematic manner if possible, so as to give opportunity for comparing different methods of work from different quarters. Of the drawings that were hung, conspicuous were the very large ones for the St. Pancras Hotel by Mr. G. Scott, now well known in its main features. Mr. Street exhibited drawings of his All Saints' Church, Clifton, including the design for the metal chancel screen and the reredos, a sculptured bas-relief. Drawings were also there of the Bristol Cathedral additions (they can scarcely be called "restorations") showing the west end as it will be completed. The large section of Mr. Marrahe's Church of St. Peter, Deptford, showing the construction of the roof by what may be called solid brick arched principals, was one of the best; we had occasion to commend the perspective view of this building, if we remember rightly, in last year's Academy. Mr. D. Brandon's Carlton Club and Mr. John Gibson's National Provincial Bank afforded specimens of clear, precise elevation drawing on a large scale; and the section of the staircase of Dobroyd Castle, by the latter architect, was one of the best specimens of a neat, clearly-executed working drawing of an elaborate description that we have seen. There were drawings by other architects more or less known among us, but nothing of much note. The absence of large-sized ornamental details from the collection was to be regretted; these form the most interesting portion generally of such an exhibition.

Of the dinner which closed the Conference we give some particulars separately.

In taking leave of the Conference of 1872, we may perhaps say it was characterised, as we characterised the exhibition of drawings just now, by "absence of ornamental detail." The subjects entered into were almost entirely of a practical nature, and concerning the business working of the profession. Perhaps this is the kind of work which is best done by such a Con-

ference, and should be its main object; and there is no doubt that in this respect some good practical work was done last week. But how far this shall turn out to have been time profitably employed, must depend, we repeat, not so much on those who were present, as on those who were not present at the Conference. If they, i.e. the large mass of respectable architects, will back up the minority who have been working for their interests in London, by joining with unanimity in adopting the rules of practice then laid down, they will have made a great step towards placing the profession not only on a more profitable, but (we would particularly point out), on a more "respectable" footing. It is the unfortunate want of common feeling and *esprit de corps* among English architects which we fear may operate in neutralizing some of the good that might have been done; let us hope, however, that one good effect of the Conference has been to modify this feeling to some extent. And if we can avail ourselves of the practical advantages to be derived from the results of this year's Conference, we may be in a position to give larger attention, at the next similar meeting, to the more widely-interesting subjects connected with the progress and practice of architecture as an art.

ARCHITECTS AT DINNER.

THE Conference dinner took place on Friday, 14th June, at Willis's Rooms, King-street, St. James's; the president, Mr. T. H. Wyatt, in the chair. Among the invited guests were Mr. A. J. B. Beresford Hope, M.P.; Mr. Thos. Hawksley, president of the Institution of Civil Engineers; Mr. Chas. Manby, Sir John Gilbert, Mr. W. H. Barlow, Mr. C. Landseer, R.A., Mr. H. Carr, Captain Shaw, Dr. Percy, &c. There were noticed by us in the general company, Sir Digby Wyatt, Messrs. Salvin, G. E. Street, T. Bury, B. Ferrey, Calderon, R.A., John Gibson, Waterhouse, H. Jones, O. Hansard, Marrable, W. Burgess, J. Norton, T. R. Smith, Mitchell-Withers of Sheffield, Honeyman of Glasgow, A. Strong, J. D. Mathews, R. J. Withers, M. Wyatt, R. Plunbe, Beavington Atkinson, W. Papworth, R. Kerr, Bromhead of Glasgow, Law of Northampton, Chatfield Clarke, Shoppes, and numerous others. The menu and service were considered not unsatisfactory,—in fact, received, after the conclusion, a public expression of contentment from Mr. Octavius Hansard, the active secretary of the dining section, by whom the allotment of the seats and other services were performed.

The President commenced the second section of the business by giving "The Queen," and "The Prince and Princess of Wales and the rest of the Royal Family,"—all drunk with the usual cheers. The next toast, in honour of "The Army, Navy, and Volunteers," was responded to by General Scott. After stating that science does not absolutely require popular recognition, but may successfully pursue its aims silently and almost secretly; that the members of the Royal and similar societies need not work under the public gaze, nor within reach of the general voice,—he drew attention to the differing conditions required for the flourishing of the fine arts. They must have, as a necessity of their existence, a large educated public,—prepared by nature and culture to find delight in the recognition of the finer qualities in art-work. The yearly exhibition of the Royal Academy, mainly devoted to oil-painting, might, he thought, be usefully imitated for architecture by an exhibition comprehending drawings of all, or almost all, the works of importance throughout the country; held in a building in which numbers of people are, for other reasons also, sure to visit. Whether the Royal Institute of British Architects would undertake such a task, and use all possible influence towards its success, he was, of course, unable to say,—any more than whether the Commissioners for the South Kensington International Exhibitions would be willing to grant the Institute a suitable space under its own control if applied for; though he would confess that this course and place had been in his mind. Having thus ventured, notwithstanding the earnest expressions of dissent from his views proceeding from some parts of the room, to give this statement of them, he trusted that, as credit had of course been given him for a somewhat obstinate perseverance when his name had been received with cheers as a representative of the British army, no surprise would be felt at his further statement that he believed it would be possible to form such an annual exhibition of drawings of architecture in London,

as would actually put to shame the other nations of the world. After Mr. Barlow and Mr. C. Manby (as Lieut.-col.), had briefly responded for the Volunteers,—"The Artistic and Scientific Societies of England,"—elicited in reply a few kindly words from Sir John Gilbert; and Mr. Hawksley, Pres. I.C.E., representing science, enlarged on the recent services, in addition to the comfort of mankind, and to his mastery over his dwelling-place, rendered by the kindred professions of architecture and engineering,—confessing that architects had some justification, for their reproaches of engineers, in the ugly burdens they had laid upon their Mother Earth: he still claimed for his profession, new creation as it was, of the last half century, a power and resolution in grappling with new problems, and bringing gigantic projects into the domain of the possible, and even of fact, not seen afloat in all the history of the world. Engineers,—the children of the steam-engine, the pickaxe, and the shovel,—not ashamed of, nor forgetting such lowly origin, see in their own work that sense of equal service to mankind at large which gives it kinship with all the arts. Above all, in the special attention to the happiness and health of the great masses of the people, one of the aims of the architecture of the present and the immediate future, likely to distinguish this age from the times of monumental building in the nations of antiquity, and from the temple-building Mediæval times; in the endeavour to descend to the level of the lowest needs, and bring reason and order, and it may be beauty, into every domain of life,—the two professions may and should progress in thorough amity, with that intercommunication of knowledge and impulse which is certain to be beneficial to both.

The special toast of the evening was then given by the President,—"Success to the Conference and to the attempts to make it useful." He said that, in the actual hard work done by some that week in furtherance of this, endeavour had been made to concentrate and realise the suggestions of last year's meeting,—to bring into tangible working form statements which the greater number of the architects of the United Kingdom were prepared to recognise as the guides of their practice. This attempt to limit the business of the Conference,—not exclusively, but mainly,—to matters of professional practice, had probably made it less generally interesting than the last; but, in the presence of pressing practical questions, he was happy to state that general interchange of thought, marked by much cordiality of feeling, had also never been wanting.

Professor Kerr, on behalf of the Institute, said that he had in truth considered this year's Conference more interesting than that of 1871. Then we had discussion; now we have results. Without claiming so complicated a pedigree as Mr. Hawksley had drawn up for engineers, it might, nevertheless, not be amiss, especially on such an occasion as this, to imitate that proclamation of relationship, and acknowledge the fraternity existing among architects generally as a thing not wisely hidden, nor ever to be forgotten. Upon that he rested all his hopes of real success in the labours now being brought to an end.

Mr. Rowland Plunbe, on behalf of the delegates to the Conference, said he hoped that eventually a strong society would be formed, comprising all the properly-recognisable practising architects throughout the United Kingdom, with settled rules of practice conformed to by all the members.

Mr. Stangos, a member of the American Institute of Architects, on being called upon, responded for the foreign visitors. In America, he said, the architects look to the mother country for architectural guidance, and follow a long way off the examples set them of the application of forms of beauty to the service of modern needs. Though not wanting in hardihood, he did not dare to express fully his sense of the kindly reception accorded to him, on account of his nationality and his devotion to kindred pursuits; but when he returned home he would be careful to speak out heartily what he now felt, unspoken, to the imagination of his hearers.

Mr. Honeyman, of Glasgow, for the provincial societies, expressed the satisfaction felt by himself and by many provincial architects, in being called to attend the Conference. Knowing the immense importance to the profession of internal agreement and uniformity of practice on important matters, he felt it a considerable privilege, as well as a duty, to aid in the promotion of the solid results that had been agreed upon as the outcome of substantial accord, expressed with

personal cordiality. All architects practising out of London owed, in his opinion, a real debt of gratitude to the Institute for originating the Conferences and driving them towards definite and practical conclusions.

Mr. Beresford Hope, M.P., said that although a layman, having for two years been President of the Institute, and knowing therefore fairly well the condition of the questions settled at this Conference, he was entitled to heartily congratulate the present president, to whose exertions in no small degree the results arrived at might be considered due. The Institute, in matters affecting the welfare and honour of the profession, had never claimed supremacy; but in this Conference, as in other things, had found itself called to the leadership of the architects of the United Kingdom. As liberally accepted as it had been generously put forward, the Institute, in this position of leadership, had marked out clearly the principle that architects at large must assert and maintain an internal unity in order to effectually assert themselves before the world. The Institute, not deeming itself a mere club for the promotion of good fellowship, nor a mere battle-field of the styles, has aspired to plan the future binding together of the whole profession, and has actually seen a Conference held, at which has been drawn up what may come to be regarded as the Magna Charta of professional practice,—in itself the dawning of a better time,—to be followed, let us hope, hereafter by other measures that shall extend and consolidate the work of to-day. He felt bound, by the way, in the interest of the Medieval times to which his mind always reverted with pleasure, not to allow Mr. Hawksley to exult the present by too great a depreciation of the past. He remembered among old works of scientific skill many a great assertion of the empire of man over nature; and in thinking of the silent highways of Venice, the streets of Nuremberg, and our own Chester, he could not forget that one was forced to see there much more than mere convenience,—that in older days also a tender, delicate, and beautiful art moulded the general forms and the minutest details of the private dwellings of the people. But when he rose it was not for debate; on the contrary, wholly for good fellowship, to propose the health of the prince of good fellows,—of the President,—a man who, having for long years won the favour, approbation, and confidence of all with whom he has come in contact, has been elevated by the votes of the members of his own profession to the highest office they can bestow;—who, though most genial and bland, has shown that in difficulty he can be stanch and firm, and is, in a word, as fit for the chair he occupies as that chair is the right place for him.

Mr. Wyatt, who was most heartily cheered, after his health had been drunk standing, with vigorous hurrahs, briefly returned thanks, saying that he had always aimed at the independence and advancement of the profession to which he had the honour to belong. Architects generally had no wish to constitute anything resembling a trade union,—that should look mainly, or only, to the supposed interests of its members; putting out of sight the co-existing rights of their employers, and of the rest of the community. They wished, if possible, to keep alive a personal sympathy and good fellowship among the whole of the members of the profession, and to secure so much uniformity of action and practice as would enable them to take a fair and reasonably-assured position before the world. The real interests of the public were served by such coherence in a profession,—not based on merely selfish motives, but on a desire to know one's but such honourable rivalry as shall serve the useful purposes for which the profession came into existence. The rules decided on at this Conference stated, he considered, as nearly as possible, the customs generally prevalent at this present date. Such minor modifications had been made in one document as represented the changes growing up in our quickly-moving social state during the ten years last past. He thought it possible that at least as much alteration might prove to be necessary at the end of another ten years, under the influence of the constant change that must affect our profession as it does everything else. Changes need not however, be injurious, either to architects or to those who commit interests to their care. And changes in mere details of practice need never bring about the slightest change in that high spirit which he so gladly saw in the profession. When he left the chair he now occupied as President of the Institute, he should wish to leave to

his successor an example and a precept urging to such leading of the profession as would tend to its winning sure and lasting honour,—from all whose suffrages are worthy.

Sir Digby Wyatt gave "The Sister Arts and Literature," insisting that, as in the great time of the Renaissance, so now, no success will attend the attempt to undertake more than a man's wit can master, or his hand can do. For an architect, however, a complete understanding of the theory of all the arts, and of the method of amalgamating their productions into a thorough unity, he considered of primary importance. Mr. Street replied for Literature—his "Italy" and "Spain" having been alluded to as showing extreme aptitude in reaching new information, and conveying it with skill to a large and increasing audience. He said that he owed no small debt to the exact study which had been necessary in order to adequately describe buildings he had visited. The possession of a distinct purpose of this kind tenaciously clung to, must, he thought, be of much service to every architect who visited many buildings. He therefore never regretted that he had cultivated literature as far as the other pursuits of his profession would allow. He regretted, in speaking on this subject, that it was impossible, on occasions of that kind, to secure the presence of a man who, more than any one that ever lived, had extended the possible range of architecture, and given the contemplation of its works subtle and strong powers of affecting the observer—in ways that before Mr. Ruskin, with his courageous insight, undertook his expositions, were almost absolutely non-existent, at least for the mass of people, because so completely unspoken. He considered that the debt to Mr. Ruskin could never be repaid either by the architectural profession or the rest of his countrymen. He hoped, in future Conferences, literary and artistic disquisitions would assume their proper prominence; that it would be possible to lay more stress on the fact that architects are artists as well as professional men.

Mr. Calderon briefly replied for Painters, Mr. Beavington Atkinson for Art-Critics; Mr. Walter Thornbury for General Literature.

Thereafter, "The General Committee for Managing the Conference," was responded to by Mr. B. Ferrey; "The Secretaries of the Conference Committees," and "The Special Secretaries of Sections," by Mr. Strong and Mr. O. Hassard (who was responsible with Mr. Jones and Mr. Marmale for the dinner arrangements); "The Secretary of the Institute" (Mr. Eastlake), completed the list of toasts; and when all present rose, they were no longer Members of the Architectural Conference of 1872, which had come to the end of all the tasks, pleasant and irksome, to which its attention had been devoted.

EARLY HISTORY OF RAILWAYS.*

THERE were legislators who did even worse things than those we have mentioned. It was known that several members of the Commons took their five guineas daily from the railway secretary for supporting a Bill in committee, and one case came under the writer's notice of a peer, miserably poor indeed, and of a title now extinct, who refused a note for 50*l.*, saying he was engaged on the other side,—a curious mixture of honour and roguery. It was, however, understood, that there were but two members of the Upper House who were accessible to direct bribes, and the few who did so in the Commons were men of very bad general characters, who paid for their lodgings with franks and Parliamentary papers.

With such examples it can scarcely be marvelled at that solicitors created business, and engineers charged four horses and used two, and introduced other fictions into their charges. "I really must go and look at the line," said an engineer, now alive, who had been paid his expenses, and had given his evidence in aid of another engineer's Bill in the Commons. "You want me to go before the Lords, and there you know I am upon oath." Such practices indeed were very, very far from either Brunel, Stephenson, or Locke.

But the original vice was in the Legislature. A Parliamentary committee was never looked upon as an impartial tribunal. It was an assemblage of advocates. Few, indeed, were actually bribed with money, but scarcely any judged of the scheme upon its merits.

Most of the members had been canvassed by ladies or private friends, or public bodies, and men of the highest reputation or rank, Royal Dukes, Bishops, and great lawyers, came down, not to hear, but to vote. It was well known that the London and Birmingham scheme owed its first year's defeat, and the loss of many thousands of pounds, to the enmity of a great lady or leader of fashion, whom the Board had neglected to conciliate, and the Provost of Eton, in person, posted himself at the door of the House of Lords, and canvassed every Eton peer against the Great Western. The violence of the Eton masters descended to personal quarrels with the promoters; and the Oxford opposition, a few years later, was of the same character.

Indeed, nothing could well be more discreditable to a legislative assembly than the proceedings of the committees of either House upon Railway Bills, and of the Commons also upon election petitions. Sitting judicially, and dealing with important private interests, the election committees were mere trials of party strength, and the proceedings in railways seemed devised to put the applicants to as heavy an expense with as little result as possible. For some time a peers' committee was open to every member of their House, and men of high character, such as the Duke of Wellington, were not above voting in committees, of the proceedings of which they knew nothing. Nevertheless, the proceedings in committee upon a great railway, with a good chairman, able counsel, and intelligent witnesses, were of a most interesting character. Lord Wharfedale, long a Yorkshire chairman of Quarter Sessions, was by much the ablest chairman in the Lords, and the Great Western was fortunate in having him for the chairman of its committee, and the late J. C. Talbot, Lord Wharfedale's son-in-law, for its leading counsel.

In some railway projects the secretary was the leading spirit; in some the solicitor or a director; in others the engineer. This was remarkably the case with the Great Western; for although possessing, in their chairman, Mr. Sims, an excellent man of business, and in Mr. Saunders a first-rate secretary, in Mr. Talbot a most influential counsel, and in Mr. Burke a leading Parliamentary agent, in the committee-room Brunel was all and everything. The Great Western affected the property of an unusual number of peers, and the local opposition was peculiarly strong. The celebrated Dennis or Dionysius Lardner, at that time in the height of his celebrity as editor of the "Cabinet Cyclopaedia," was engaged to oppose on points of science. The influence of Windsor and Eton, represented by the Duke of Cumberland, was strong, as were certain other interests represented by the Bishop of Hereford. Brunel's duty was to show the precise course to be taken by the railway, and the manner in which it would affect the canals, roads, and private property. With the peers were the road surveyors, canal agents, and land agents, ready to suggest questions and criticise the answers; but Brunel, who had gone over the whole line, and possessed a wonderful topographical memory, was armed at all points; his knowledge of country was superior to that of a geologist and fox-hunter combined, and the landed interest told after him in vain. Besides a month spent in walking over the line, as soon as the committee broke up at four o'clock on Friday, he was off with four horses to the district next for examination, and appeared on Monday in the box, with the recollections of the points likely to be disputed brushed up and fresh.

The scientific opposition completely broke down. Lardner, really a clever man, though, as some think, a charlatan, endeavoured to bring his knowledge of mathematics and of the differential calculus into the field, and was great upon the impossibility of high velocities, the weakness of ropes upon the proposed Box incline, and various points connected with the theory of the locomotive. But Brunel was not only a skilled mathematician and a practical engineer, but he had been at school in France, and his power of mental calculation, great naturally by inheritance from his father, had been educated by that father to a marvellous pitch; and upon all points, whether right or wrong, he carried it off before him. The Great Western, in its first form, was fifty-seven days in the committee of the Commons, and was, after all, thrown out in the Lords, in 1834. In 1835 it again passed through a severe struggle, and was in the Lords' committee forty days. On one occasion, Brunel was eight days in the witness-box, with a whole host of professional

and scientific witnesses against him; and never did he need assistance, nor refer to notes or memoranda for his answers. People crowded to the committee-room, as to a high intellectual treat. Robert Stephenson, equal to Brunel in many respects, and also a very safe witness, never created so great an interest. Perfectly master of his profession, he was not much of a mathematician, and wisely confined himself to points of practice. George Stephenson was also a good witness, and his immense experience and thorough common sense gave him great weight. His Northern accent and habits also gave force to what he said, as did a certain simplicity and absence of finesse, mixed with a dry, caustic humour, and now and then a burst of feeling, and sometimes of temper. His answer about the "coc" everybody knows. On one occasion, he was pressed for his authority for some fact. "Authority?" said he: "I know it,—is not that enough?" "Well, Mr. Stephenson, but how do you know it?—do you know it of your own knowledge?—did you see it?" "See it! know it of my own knowledge! Why, my son Robert saw it, and he told me, and was he mistaken, think ye, man, or he telling me a lee?" The burst of paternal feeling, the pride and confidence in his son that lighted up his countenance, electrified the whole room.

Nothing could exceed his love for and pride in his son. When the Great Western was in progress, Robert Stephenson was requested by Brunel to try his hand at one of the new broad-gauge engines. Robert, opposed to the broad gauge, but determined to show what he could do as an engine-maker, loyally did his best, and produced the "North Star," and sent her to Paddington, with the well-known "Applyly," the best engine-driver in his employment. Soon after the Star was put upon the line, then open to Maidenhead, Stephenson was invited to meet the directors, and witness a trial of his engine. He came to Paddington, decided to accompany the engine himself, and, attended by Brunel and a tenderful of directors, started down the line. A few minutes later a cab drove up at a gallop, and out got George Stephenson, who had come to see his son's triumph. He was too late. However, though in a state of great anxiety, he remained, and wandered about the station, asking questions about the gauge, until, an hour later, the approach of the engine was signalled. As she came into the station, evidently having done her work well, and the figure of his son at the driving-handle came in view, the old man's excitement became almost ungovernable. As the engine stopped, Robert jumped down, and was greeted by his father, who, for a time, saw and thought of nothing else but his successful son.

The Parliamentary committee erred seriously in encouraging professional witnesses. Men of science,—especially Lardner, and many of the inferior engineers,—hired out their services as professional witnesses, and justified the practice by pleading the custom of the Bar. Of course, the cases are not analogous. The barrister is understood not to express his own opinion, not to assert his own facts: he is to argue from the evidence of others as best he may, and to be met by arguments on the other side. But the scientific or the medical witness, for both were employed, is dishonest if he accommodates his facts or opinions to the side on which he is engaged, as was notoriously the case before the early railway committees.

After the committee had reported and the House approved came the royal assent, and then, joy of joys! the actual commencement of the works.

The first step, while the lawyers obtained possession of the land, was to divide the line into lengths of from ten to twenty miles, according to the nature of the works, and to place a resident engineer in charge of each, whose duty it was to set out the boundary-lines, called technically half-widths, prepare the estate or property plans for the lawyers, take the levels with close accuracy, and calculate the quantities of earthwork. Stephenson left much besides this to his residents. In many cases, they designed the bridges and culverts, prepared the draft specifications, and had more or less to do with letting the contracts. Brunel, on the other hand, gave his assistants no discretion. They supplied him with the plans and sections,—the facts, that was all. He personally designed every piece of brickwork or masonry, whether bridge or culvert; took no man's advice upon any point; himself drew up the specifications, leaving to the lawyers only to approve the legal part of them; and the contracts were let in London, in his presence

only and that of the directors. Stephenson's residents had much to say to the Board; Brunel's seldom attended the central office, and scarcely even knew the secretary. They were his men, and his alone. The consequence was that Stephenson founded a school of engineers, and Brunel did not; but, on the other hand, Brunel's works have a stamp of personality upon them, a uniform character pervading the whole, which is not found in the works of any other railway engineer.

The designs completed and the quantities calculated, the next step was to let them, usually by public tender, to a contractor. The contractor of 1830-40 stood in a very different position to the contractor of the present day. There was no sham about the capital. The promoters found it themselves, and, subject to certain reservations, the work was paid for month by month, and often week by week, as it was executed. Contractors were seldom great capitalists, and when they were, like McIntosh, they were very independent, and often very troublesome. The early contractors, besides, were not clever in their arrangements: as they took contracts below the proper cost, and the work went on became timid, often tried to save money by scamping the work, and not unfrequently came to grief, especially under Brunel. The early contractors upon the Great Western had no idea of what the specifications really meant. The bridges were designed with arches so flat that, unless the joints were very thin, the compression of the mortar caused them to fall, as actually did very many of them. In the larger works, especially, the economy of material was so close, and its strength so nicely calculated, that it required to be of the best quality and put together in the best manner. A curious example of this occurred in one of Brunel's chief works, the bridge across the Thames at Maidenhead. This was to be a bridge of two arches, the pier being on firm ground in the mid-river. Brunel had not only designed this bridge, but had it modelled in plaster, and inserted into a landscape drawing, that he might fully judge of its effect. The arches were to be of brick, of large span and slight rise, therefore unusually flat and graceful, and, abutment being of immense importance, the thrust was calculated to a nicety, and distributed by a complex system of sub-arches and buttresses, which were for the most part concealed within the wing walls. The contract was taken by a builder at Windsor, whose idea of a bridge was probably derived from the existing one at Maidenhead. Once committed he began to quake. He discovered that the arches were broader and flatter than any brick arches existing, and he supposed that the material would be crushed by its own weight. In his distress he consulted the late Mr. Chadwick, then a great London builder. Chadwick called on Brunel, stated the difficulties, and entreated that his client might be let off, hinting that the design was impracticable. Brunel, finding that Chadwick, though no geometer, was a man of sense, took great pains to explain to him how safe the design really was, if properly executed, and proved to him that the maximum pressure on the bricks was very considerably less than upon the lower courses of the wall of the Fleet Prison, then a well-known structure. After an hour's conversation Chadwick was convinced, and himself accepted the contract and built the bridge. The subsequent history, however, is curious. The specification directed the arches to be turned in mortar, finely ground and laid in very thin joints. The arch was so built; the compression allowed for in the drawings took place when the centres were eased, and the structure stood, independent of mortar, in equilibrium. When another arch was about to be turned Chadwick got alarmed; he understood nothing about equilibration, but his experience told him that the flatband of a London window was more likely to stand if the principle of the arch were set aside, and the material converted into a rigid beam by the use of cement. He proposed to apply this experiment to the Maidenhead arch, and as he was rich enough to take the consequences, and very persistent, he was allowed to take his own course. He turned the arch in the best Portland cement; but this done, he forgot his beam theory, and eased the centres while the work was green. The cement, setting quickly where exposed, had converted the exterior shell into a rigid mass, while the interior work, still unset, yielded to the pressure, and the arch of course gave way. The result was expensive to Mr. Chadwick, who had to

make the crown good with York landing, besides pulling down much of the work; but he profited by experience, built the two fine bridges over the Thames near Stratley, and did a good deal of work for the company.

The Wharfedale Viaduct across the Brent at Hanwell was another great work in brick which tried sorely the means and skill of the contractors. This was a viaduct of eight main arches, each 70 ft. span and 17 ft. 6 in. rise, upon very lofty piers. The foundation was upon London clay, rather a treacherous material, and the piers rested upon a thick bed of concrete. As the piers were double, and as light as was safe, great care was necessary in their construction. With so broad a base and so enormous a mass of brickwork, the bricklayers could not be made to see that the bricks must be laid closely throughout. Their idea was to fill up the core with rubbish and grout it. Then when the piers were half height, the water appeared rising up round the bases, and alarmed the overlookers, who sank a well and began to pump at the risk of washing all the lime from the concrete. At last the arches were turned, and Brunel caused the centres to be completely let down, some feet from the work, which came down about 2 in. only. Nothing could exceed the beauty, or the apparent fragility of the eight light rings of brickwork, standing without sprandrel or parapet walls at so great a height. They were the first large brick arches Brunel had turned, and he took unusual interest in them and often visited the works. In reply to some remark as to their stability, he said one morning, "Well, they certainly do look slight, and I sometimes think I might have made them stronger, but I have calculated the material, and I know it is impossible they should give way." This was the self-confidence that impressed all about him, and allowed none of his subordinates to doubt their chief.

Each resident had a staff, often a very large one, of assistants, gathered from all quarters without the least regard to their social rank. Some were ordinary surveyors, some retired lieutenants in the navy, some more draughtman ambitious of field work, some pupils in engineering, occasionally the sons of county gentlemen along the line, and now and then sons or nephews of peers. When they went down to reside upon their work in country villages, the squire and clergy were much puzzled when they found them gentlemen. On one occasion a rather pompous county member came to look at the works, and asking for the engineer was shown a man in fen hoots up to his thighs in mud, giving directions about cleansing an old pond, just drained, in which he stood. The visitor's card was put upon a stick and handed across. The engineer in due time came to the bank, and very civilly accompanied his visitor over the works, explaining everything, but without altering his costume. The M.P. ought to have discovered by his conversation that his friend was a man of education, if not of birth; however, he thanked him in a patronising way, and seemed to doubt whether or not he should offer him a crown, which, however, he did not. Two days after his surprise was not small when he recognised his dirty friend as rather a well-got-up gentleman, with an "honourable" before his name, dancing with his daughter at a county ball. Some of these assistants married farmers' daughters and settled down as land agents, some took to drink and were dismissed. One or two of higher pretensions married heiresses; and others, on the death of elder brothers, inherited estates, and found their railway experience exceedingly useful to them.

The class of men employed in earthwork were very peculiar and very unlike the ordinary labourers of the country. They were called "navvies" from having been employed originally upon works of internal navigation, and they came from the northern counties, especially Lancashire. They were usually magnificent animals. Tall, broad-chested, heavy, but not stupid. Never drunkards, though often intemperate, rough rather than brutal, good-natured if treated kindly, but very unpleasant customers if affronted. They were fond of dogs, especially of a sort of cross between the tinker and the greyhound, of great use in capturing hares. Pouchers in the usual sense they were not, but if game came in their way it was welcome.

Such were the men by whom the railways of England were designed, carried through a somewhat unwilling Parliament, and executed. The railway engineer, though scarcely superior in ability to such of his predecessors as Smeaton,

Brindley, Telford, or Rennie, dealt with larger resources, and commanded the use of machinery of a far more powerful description. The surveyors and assistants employed were altogether created by the demand. Those formerly employed were little better than superior workmen. The contractors, indeed, already existed. Telford's great bridges, whether of stone or iron, and the docks at Hull and Liverpool, had been executed by a very superior class of contractors, in one respect greatly superior to their successors,—that they did not meddle with speculations in stock or shares. The navvies were called into existence by the making of the canals, and those employed on railways did not differ materially from their predecessors. But the general result of the new and marvellous demand was to create an ample supply, and for skill, for quality, and for quantity, the works executed during the first ten years from the commencement of the line between Liverpool and Manchester may be advantageously compared with the engineering operations of any country, at any period.

INTERNATIONAL ANNEXES: EASTERN AND WESTERN ORNAMENT.

THE French annex, which formed such an attraction last year to lovers of modern *bijouterie*, is now filled and arranged with the similar display for the present year, and makes a show scarcely inferior to the last, possessing the same merits and the same defects. The merits are, as every one knows, good workmanship and finish, and a certain amount of elegance in form and detail, especially in those smaller costly trifles which form the toys of the wealthier classes. The defects are, we fear, not so obvious to the taste and perceptions of the majority of the visitors, least of all to the young ladies who wander delightedly about characterising everything as "sweetly pretty." What makes these pretty toys less satisfactory to the philosophical eye, is the predominance of matter over mind which so many of them display; costliness of material and brilliancy of finish taking the place of artistic thought. Looking at the large and rich collection of Messrs. Susso Frères, for instance, one could pick out but a small proportion of these marble and gold timepieces, candelabra, and other articles, which have any value beyond the general appearance of costly glitter which appears to be the main object. There is no thought in the use of the material; no reference in the design to the end for which the object is made. We find what is apparently a paper-weight, in the shape of a bronze imitation of a dead bird, very well done, but looking completely purposeless in regard to such a use; there is a gold-branched candlestick with a figure on one side of the base running at full speed, with one leg out in the air looking as if it was meant as a means of upsetting the whole affair. This is the kind of thing we meet in French work of this class—brilliancy of material and manipulation shown merely for their own sake, apparently, and as an end in themselves. The work of Denière is much of the same class; so is great part of the splendid show of F. Barbedienne, round the top end of the saloon, by far the best part of his work being the bronze vases and platters, in which the material being less costly and attractive in itself, a proportionately greater amount of artistic thought has been bestowed upon it; an instance of what we have more than once remarked upon, that costliness of material often seems to prove the bane of artistic feeling and design in ornamental art, the mere money value of the thing being sufficient to recommend it to those who have money to spare. French notions of colour in these matters, too, seem to run in a very restricted groove, and to be confined mostly to a blending of blue and gold. It is curious to see among the last-named collection of Barbedienne a single Japanese vase (why there we know not), reading its unheeded lesson on colour-harmony to the Western ornamentist.

Nor can we say much, in an artistic point of view, for the porcelain work of Deck, which, however, is far less showy and pretentious than other work in the room, and shows some pleasant colour, but not good form. There is one firm represented which in fact seems to have nearly all the good taste to itself; that of Christoffe & Co., whose works are mainly in the large case in the centre of the room. Their bronze work, inlaid with arabesques in silver, is really charming, not only perfect in finish and execution, but evincing a true feeling for the treatment of material, and for style in ornament-

tal design, which we look for in vain in other parts of the room. The ornamental designs carried out in this silver inlay are not in all cases directly symmetrical, but show a very pleasing freedom and irregularity of treatment in many cases, without going so far as to lose the appearance of design. In their small vases, in coloured *cloisonné* enamel, they show also a feeling for harmony of colour quite different from the staring gold and blue we see so much of in French work of this kind; many of the designs are exceedingly happy in treatment of conventional foliage, and almost all good in outline, one of the points indeed in which on the whole the French are generally successful: it is rare to see a had or clumsy outline in their work of this kind, although one becomes rather tired of the continual over-elegant and somewhat emasculate curves into which they constantly run. Two sets of claret services, the glass ornamented with thin flower sprays in coloured enamel, are peculiarly elegant and refined. But in a general way it is sadly disappointing to find in this saloon so much splendid material and workmanship thrown away upon such commonplace, vulgar, and meretricious design. One or two of the drawing-room carpets hung up here are really fearful, and can only be pointed to as a warning. Matters are not better, perhaps rather worse, in the Belgian annex (entered through the machinery annex out of the east wing); the Belgians in their ornamental metal and furniture work seem to have all the faults of style of the French artists without their finish and elegance of form: the Compagnie Anonyme des Bronzes, which occupies all one end of the room, has scarcely an object worth attention for its purely artistic merits. There is some good woodwork in this saloon in the shape of one or two carved sideboards of somewhat nondescript style; and the ornamental lacework exhibited is, as might be expected, of very high elaboration and delicacy.

What is the real cause of the distinction at once felt between most of the work to be seen in these Belgian and French annexes, and that which we find in the Indian Court? It lies probably in two qualities found in the latter and not in the former. One of course is, natural feeling for harmony of colour; but a more important element is to be found in the appropriateness of design and treatment, in the Oriental work, to the material in which it is carried out. Take the carpets, for example; the Indian specimens, though palpably richer and more varied in colour than the Parisian, might by a hasty critic be said to be less artistic in design, inasmuch as lines of pattern are not strongly or carefully marked upon them, the pattern seems rather left to find itself, in a broken irregular manner, and with no main lines to define it strongly. But, in fact, this is just the kind of treatment which falls in naturally with the production of a woven material, and nothing else could well imitate the effect produced; whereas the Paris carpets, if their design could possibly be supposed to look well any way, would look as well pointed on canvas as woven. The same thing is notably the case with the silver and gold ornament of the Indian artists; there are no masses of lullion here attracting solely by their cost; the gold is in thin plates and inlays, the silver in frost-like and lace-like forms which bring out all the bright lustre of the material; the purchaser of such objects pays for art-work and not for mere material. Some of the silver work from Madras is of exquisite beauty, comprising ear-rings and bracelets as remarkable for elegance and originality of design (in the former articles especially) as for their wonderful delicacy and minuteness of execution; and in one of the cases against the wall there is a lady's silver belt (among the Bombay contributions), consisting mainly of minute chainwork of silver, with a joining plate in front covered with large projecting bosses symmetrically arranged, which is a perfect piece of work of the kind. The large octagon case in the middle of the room deserves particular attention; and, besides the more delicate works in precious metals, may be noted here the brass and copper vessels from Madras, some of them of almost Greek elegance of form, and in this respect superior to the productions of some other Eastern people who have been much run after of late. Then there are the sandal-wood carvings, enough to raise despair in the mind of the Western wood-carver, from their wonderfully minute elaboration combined with freedom of line and design. On the lower shelf at one end of the principal case of these works is a pair of cabinet doors,

each about 12 in. by 7 in. The amount of work crowded into this space is extraordinary, and mostly as beautiful as it is profuse; the little dainties in the niches, with heads no bigger than a pea, have their curious little twisted moustaches shown with almost microscopic minuteness. This specimen is, however, surpassed by the one above it, a small casket, representing in bas-relief on its top and sides "Huthee Sing's Temple" (whoever he may be): there is nothing much in the temple, which is rather the same sort of architecture that our designers put into stained-glass windows; but the flowing conventional foliated ornament which fills the spaces over and around it is really superb, both in freedom of line and in execution; the interspaces of the foliage are deeply cut, and the centres of the leaves considerably sunk, leaving the points and edges coming up to the original surface of the wood: the beauty of the whole, small as it is, is a thing to be seen and studied by all who are practically interested in ornamental wood carving. The general expression of harmony and richness of tone among even the coarsest of the fabrics exhibited, contributes to the satisfaction of the eye in going round this apartment, and to the pleasurable recollection one carries away on leaving it,—a recollection which raises a greater distaste than ever for the (in the main) flanneting, vulgar work of Belgium and France. This has been remarked before,—and will probably have to be remarked again.

COVENT GARDEN CHURCH.

THE visitor to Covent Garden Market will notice some bricks piled in the churchyard of St. Paul's, and various other signs, that the church is closed for repairs. It has been reported that the interior is to be remodelled, the galleries cleared away, and the closed pews replaced by open ones. We shall be sorry if this is true, because any such alteration would be in direct violation of the spirit of the building. The interior has few architectural characteristics, and when the oak columns that at present support the gallery are taken away, nothing will be seen but four bare walls.

All London has an interest in the proper preservation of one of the few memorials we possess of our great architect, Inigo Jones. Not many churches have such claims upon our notice as St. Paul's, Covent Garden; and in historic association with the celebrated dead, it is second only to Westminster Abbey, for more noted characters of the seventeenth and eighteenth centuries have been buried here than in any other church in London.

About the year 1630, Francis Earl of Bedford, planned out a building site on his estate of Covent Garden, behind his mansion, which stood where Southampton-street now is. The Piazza was built according to the designs of Inigo Jones, and soon after the church was erected by the same architect, at a cost of 4,500l.

"Where Covent Garden's famous temple stands,
That boasts the work of Jones' immortal hands,
Columns with plain magnificence appear,
And graceful porches lead along the square."

The story is very improbable that Walpole relates, to the effect that on the earl expressing his wish for a plain structure, little better than a barn, Jones replied that it should be, the handsomest barn in England.

The church was built of brick, with a portico at the east end, consisting of a pediment supported by four Tuscan columns of stone, the two outer ones being square. The chief entrance was at the west end, but there was a door on each side of the altar under the portico which led into the church; these two doors have, however, been bricked up in the present alterations. The roof was covered with red tiles, and at the apex of the pediment was originally a stone cross, which is referred to in R. Brome's "Covent Garden Weeded."—"Come, sir, what do you gaze and shake the head at there? I lay my life he has spied the little cross upon the new church yond," and is at defiance with it."

The ceiling was painted by Edward Pierce, senior, a pupil of Vanduyck, and an inhabitant of the parish. His works, which principally consisted of altar-pieces and ceilings of churches, are now very scarce, as they were mostly destroyed in the Fire of London.

The church was not consecrated till a year or two after it was finished on account of a dispute as to presentation between the Earl of Bedford and the Vicar of St. Martin's (Bray). The earl claimed it because he had built it at his own

expense; and the vicar claimed it because, not being then parochial, it was merely a chapel of ease to St. Martin's. The question was heard before the king in council, at Whitehall, on the 6th of April, 1638, and decided in favour of the east; therefore the church was consecrated on the 27th of September, of the same year, by Bishop Juxon. Political troubles, however, prevented an Act of Parliament being passed to make the church parochial, and it remained as a chapel of ease to the parish church of St. Martin until 1645, when the Lords and Commons, in Parliament assembled, made an ordinance, by which the district of Covent Garden was separated from the parish of St. Martin, and constituted a distinct and independent parish. At the Restoration this Act, and a subsequent one in 1657, were superseded as illegal, and the first ordinance passed by the Parliament of Charles II. in 1660, provided that thenceforth the church and parish of St. Paul, Covent Garden, should be separated from St. Martin's-in-the-Fields.

In 1674 Sir Peter Lely gave 5*l.* towards the expense of erecting a new gateway at the west end of the church; and in 1684 Captain Johnson surveyed the building, and made drawings of it, as it was, and as it was proposed to be altered. In 1688 extensive alterations were made at a cost of 11,000*l.* The walls of the church were cased with Portland stone, and the gateways at the east front which Inigo Jones had initiated from Palladio in brick and plaster, were rebuilt with stone. At the beginning of the eighteenth century, however, the church was again in a bad state, and in 1727 the architect-Earl of Burlington gave 300*l.* or 400*l.* to restore the portico, which had been spoilt by some injudicious repairs. The London atmosphere soon dirtied the stonework again, and the authorities, in 1770, tried to make the church look smart, as we learn from the *Public Advertiser* of that year, which describes the tasteless "improvements" as follows:—"The elegant portico of Covent Garden is now rendered visible, the pillars being painted white, and the pediment with all the rest of a royal yellow." In the same paper we are also told that at this time "the wooden rails in Covent Garden Churchyard, which casually admitted dogs and idle boys among the graves, are taken away, and a new parapet-wall, with an iron balustrade at top, is now finished, and is not only useful but ornamental."

The church escaped destruction at the time of the Great Fire of London, which did not come nearer than 970 yards; but on September 17, 1795, owing to the carelessness of some plumbers who were repairing the roof, the whole interior was burnt out. The roof, stained glass, some pictures (including one of Charles I. by Lely), and the monuments (amongst which was the bust of Sir Peter Lely, by Grinling Gibbons, on the north wall) were destroyed. The building was restored by John Hardwick, and on Aug. 1, 1798, it was consecrated by Porteus, Bishop of London. Dr. Bullock, the rector, preached the consecration sermon, and Dr. Calcott, the organist, played the voluntary on this occasion. The east front is a very familiar object to most Londoners from its position opposite to the market. It was sketched by Hollar, and is to be seen in Hogarth's print of "Morning." Until lately the vestments of the Westminster clerics were erected in front of the church. There is a very good view of the west front engraved by E. Rooker, after Paul Sandby, and dated 1766.

In 1641, a pendulum-clock, by Richard Harris, was placed within the pediment of the east front, which is stated in an inscription in the vestry to be the first one made; but this fact has been disputed. Previously to the Act of Parliament which constituted St. Paul's a distinct parish, the Vicar of St. Martin's had the power of appointing a curate, but the Earl of Bedford could also appoint a preacher to the church. In 1641 Archbishop Usher was accustomed to preach here, and it is recorded that Charles I., wishing for a consultation with his bishops, sent to St. Paul's, Covent Garden, for the Archbishop of Armagh. Usher came down from the pulpit and told the messenger that he was then employed about God's business, but when he had done he would attend upon the king to understand his pleasure. Obadiah Sedgwick, B.D., tutor to Sir Matthew Hale, at Magdalen College, Oxford, officiated as minister to this church during the Commonwealth. About the year 1654 he retired from the charge, and was succeeded by his son-in-law, Thomas Manton, D.D. After the Restoration, Manton would not read the

Liturgy, and left his church on St. Bartholomew's Day, 1662. He afterwards set up a chapel in Covent Garden, and died in 1677. The learned Simon Patrick, Dean of Peterborough, was appointed rector in 1662, and retained the cure until 1689, when he was promoted to the bishopric of Chichester. In 1691 he was translated to Ely. Samuel Freeman, Dean of Peterborough, succeeded Patrick, and was followed by the Hon. and Rev. Robert Lumley Lloyd, who petitioned the House of Lords, unsuccessfully, in 1724, for a writ of summons, as heir-at-law to the barony of Lumley. Charles Fough was the next rector, and was followed by James Tattersal, who was appointed and resigned, on obtaining the rectory of Stratham, in the same year, 1754. Dr. John Craddock was rector from 1754 to 1757, when he became Bishop of Kilmore. He was translated to the archbishopric of Dublin in 1772. Succeeding rectors have been the Rev. Richard Bullock, Rev. Mr. Vicary, Dr. Bowers (now Dean of Manchester), the Rev. Henry Hutton, Rev. C. E. Oakley, and the present rector is the Rev. Berdmore Compton. The notorious Dr. Dodd at one time officiated in this church, and large congregations (principally consisting of ladies) were drawn together to listen to his studied elocution.

Among those who have been baptized at this church, and have afterwards been distinguished, may be mentioned Lady Mary Wortley Montagu, and Turner, the painter. Covent Garden Church was the scene, in 1764, of a runaway match between Lady Susan Fox Strangways, eldest daughter of Stephen, first Earl of Ilchester, and William O'Brien, the actor. After the marriage the couple set out for the bridegroom's villa, at Dunstable.

We will now proceed to make good the assertion at the beginning of this article, by giving a list of the noted characters who have been buried in the church or churchyard. One of the earliest was the notorious Robert Carr, Earl of Somerset, who died in 1645. John Taylor, the water-poet (died 1654), was the next man of any note to be buried here. Then follows Dr. John Donne, junior, son of the famous Dean of St. Paul's (1662). Claude Duval, the highwayman, who was executed at Tyburn, on January 21st, 1669-70, is said to have been buried in this church at night, amidst a numerous train of mourners (mostly ladies), bearing flambeaux. Sir Henry Herbert, Master of the Revels to Charles I., and brother to Lord Herbert of Cherbury and the poet, George Herbert, was buried here, in 1673. Richard Wiseman, Sergeant-Surgeon to Charles II., was buried, on August 29th, 1676, at the upper end of the church, by the side of his first wife. He left, by will, 20*l.* to the poor of the parish. In 1680, three celebrated men were buried here,—viz., Samuel Butler, who died in Ross-street; Sir Peter Lely, who was living in the Piazza at his death; and Dr. Edward Greaves, Physician to Charles II. Richard Gibson, the dwarf painter of the reign of Charles I., in 1690; Sir Dudley North, in 1691; Dick Estcourt, the actor, in 1711-12; Edward Kynaston, the actor of female parts, in 1712; and William Wycherley, the dramatist, who died in Bow-street, 1715, were all buried here. Strype describes the interment of the body of Marmaduke Conwey, on December 23rd, 1717, as "of great remark and a little wonder." This man was said to have reached the great age of 108 years and some months, and to have died of sheer old age. He had been in the service of the royal family from the three last months of the reign of James I. to his death. He attended at the coronation of Charles I., and bore arms for the king during the whole civil war, in which his father and himself lost an estate of 1,000*l.* a year. At the Restoration, he was rewarded for his loyalty by Charles II., with whom he was much in favour, partly from his great skill in hawking. Pierce Tempest, who drew the cries of London (died 1717); Grinling Gibbons, the great sculptor and carver (died 1721); and Mrs. Susanna Centlivre, the dramatist (died 1723), found their last resting-place here. Robert Wilks, the famous actor, was buried here, in 1731. Eighteen years before, his wife, Elizabeth, had died, when he erected a monument to her memory in the church, with this inscription,— "The purity of her mind (which appeared in all the duties of a virtuous life) made her a good wife, daughter, mother, and friend. Her affection was like her piety, constant and unfeigned to her last moment." Henry Jerningham, a goldsmith and jeweller, in Russell-street, was buried in the churchyard, November, 1761, and

the following lines by Aaron Hill inscribed on his tomb:—

"All that accomplish'd body lends mankind
From earth receiving, he to earth resign'd;
All that e'er grac'd a soul from Heaven he drew,
And took back with him, as an angel's due.

James Worsdale, the painter, who died in 1767, was buried in the churchyard with the following inscription, which he composed himself:—

"Eager to get, but not to keep, the pelf,
A friend to all mankind except himself."

This epitaph was removed in 1818.

Dr. John Armstrong (the poet and physician (d. 1779); Tom Davies, the bookseller (d. 1785), and his pretty wife (d. 1801); Sir Robert Strange, the great engraver (d. 1792); Charles Macklin, the actor, specially distinguished for his *Shylock* (d. 1797); Thomas Girtin, one of the earliest of water-colour artists (d. 1802); Thomas King, the hero of Taylor's "Monsieur Tonson," and celebrated impersonator of *Lord Ogleby* in the "Clandestine Marriage" (d. 1805); and Dr. John Wolcot, more celebrated as Peter Pindar (d. 1819), must close our list of the distinguished characters who have been buried here.

The fire destroyed all the monuments, among which was the bust of Lely, by Grinling Gibbons. Some new ones have been set up since the restoration. There are two tablets erected by the Whig Club to the memory of John Bellamy, the father of the club, and of Edward Hall, M.D., its secretary. The memory of Mrs. Linley, the mother-in-law of Sheridan, and friend of Dr. Parr, is honoured by a tablet set up by her two sons.

The interior of the church is very plain, more especially the flat ceiling, which seems to require the painting that Edward Pierce made for it; but the oak fittings are handsome, of their kind. The altar-piece consists of four fluted Corinthian pilasters, an entablature, and a pediment, on which are two angels, sculptured by Banks, the Royal Academician, and called by Malcolm "vile imitations."

The set of communion-plate is large and handsome.

THE SANITARY CONDITION OF LAMBETH AND OVER-CROWDING.

ERECTION OF MORTUARIES.

SOME time ago the Lambeth vestry appointed a special committee as to the future sanitary administration and regulation of the parish. This committee desired the surveyor to report to them as to the condition of the sewers and house drainage, and also requested the medical officer of health to report on the evils of over-crowding in tenements, on the nuisance arising from dust-yards, and as to providing mortuaries. Both these officers have just reported accordingly, which has led to the vestry taking several important steps for improving the sanitary condition of the country, one of which is the erection of mortuaries in the parish.

The medical officer of health states that the various dustyards are in a filthy and unhealthy condition owing to large accumulations, and his statements as to over-crowding in various portions of the district are somewhat alarming. In dealing with this subject, the medical officer incidentally, by way of illustration, refers to the shocking condition as to over-crowding. Of certain other districts, "a very striking return," he states, "has been lately obtained by the vestry of St. George's, Hanover-square, from which it was found that in 25 houses in that district there were packed no less than 450 persons; or, in other words, allowing for each person 500 cubic feet, it was found that in the 25 houses referred to there was a surplus population of 252 people. From statistical returns bearing on the condition of St. Giles's, it appears that in one district there were 600 families, and of these 570 severally occupied but one room. In another of 700 families, 550 occupied but one room each. In one room visited in this parish, which was 12 ft. by 13 ft., and 7 ft. 6 in. high, eight persons lived, thus giving but 137 cubic feet to each individual. In continuation, the medical officer remarks, "Whilst I would hope that no such abominable state of things will be found existing even in the worst parts of this parish, there cannot, I presume, be any doubt but that we shall find several cases requiring to be dealt with, and which, if remedied, will produce a vast improvement in the healthiness and also the death-rate of the dis-

trict." He then proceeds to give several instances of overcrowding in the district, stating that in Princess-square Commercial-road, he found eighty families, comprising 450 persons, mostly occupying only one room. In one house there were seventeen persons in two rooms, and at one house with only four rooms there were twenty-four occupants. In Stamford-street he found as many as six, seven, and even nine persons, occupying one room, and several other streets named in the report in the same condition. As one remedy for the evils of overcrowding, he recommends the providing of mortuaries, observing that "the necessity for such places does not admit of a moment's hesitation, especially for those localities where the population consists of the poorer classes, occupying in many cases hut one, or at the most two rooms, where, if a person dies of an infectious or contagious disease, it is of the utmost importance that the dead body should not be left longer than can be avoided, poisoning the atmosphere of the rooms inhabited by the survivors."

In accordance with the recommendation of the medical officer, the vestry have decided to build mortuaries, one for the inner wards, and one for the outer wards of the parish, in places of easy access, and the buildings are to be at once proceeded with.

BUILDING ON THE WALWORTH COMMON ESTATE.

NEARLY the whole of the land on the Walworth Common estate, which has from time to time been disposed of for building purposes, has now been let, and almost the entire area is covered with buildings consisting of dwelling-houses, places of business, and other structures. Up to last week 918 plots on the estate had been let, realising ground-rents to the extent of 4,936*l.* per annum, and on Monday the eighteenth letting, which almost completes the land to be disposed of, took place at the Elephant and Castle Tavern, Newington, Messrs. Stuart, Barker, & Sons officiating as auctioneers. There was a numerous attendance of builders and others interested; and, as on former occasions, there was an active competition for the several plots offered, which realised average ground-rents. The amounts were as follow:—Six plots at 4*l.* each, fourteen at 4*l.* 5*s.*, two at 4*l.* 15*s.*, thirteen at 5*l.* each, one at 5*l.* 5*s.*, one at 5*l.* 15*s.*, fifteen at 6*l.* each, one at 6*l.* 10*s.*, one at 8*l.*, and one at 8*l.* 5*s.* per annum, being fifty-five lots, realising in the whole 281*l.* 15*s.* per annum, and bringing up the aggregate annual rental now received from the estate to upwards of 5,217*l.* Amongst the new buildings about to be erected on the estate, is a school for the London School Board, and a large church to seat upwards of 800 persons.

SCHOOL BOARDS.

London.—The committee have considered the designs submitted in the limited competition for the schools to be built on the site in St. Paul's-road, Bow-common, and also the designs submitted in the open competition for the schools to be built on the site in Beazley-crescent, Old Ford, and recommend that Mr. Phené Spiers be appointed the architect for carrying out the erection of the schools on the St. Paul's-road site, and that Mr. Keith D. Young be appointed architect for the schools to be built in Beazley-crescent, Old Ford; and that it be referred back to the Works Committee to draft specifications, obtain tenders, and bring up a contract in each case to the Board for sealing. That for the schools to be erected on the following sites there be a competition of four architects in each case, and that it be referred back to the Works Committee to select that number of architects, and to submit the plans prepared to the Board:—1. Finshury, New Winchester-street. 2. Finshury, Blundell-street. 3. Greenwich, Woodpecker-road. 4. Hackney, Turin-street, Bethnal-green. 5. Hackney, Maidstone-street, Haggerston. 6. Southwark, Russell and Riley streets. The Board have named Mr. Biven architect for the school in Old Castle-street, Whitechapel; and Mr. A. G. Connell for the school in Essex-street, Stepney.

Scarborough.—Mr. Watson, architect, attended at the Board, and submitted his amended plans of the proposed infant school at Falsgrave, and it was resolved that advertisements be issued inviting tenders for the execution of the work required, with reference to the school for the south-east district. A letter, dated the 30th ult., was read from the Education Department,

requesting that a plan of the enlarged site for the proposed school near Cook's-row should be submitted for inspection; it was thereupon resolved that the clerk be directed to give the necessary instructions to Mr. J. Petch, architect, for the preparation of the plan required, and that such plan when completed be forwarded to the Education Department for approval.

Wolverhampton.—The Board considered tenders sent in for the erection of the Dudley-road schools. Six tenders had been received. Ultimately it was resolved that the tender of Mr. Horsman, who built the town-hall, be accepted. The tender was, for the schools, boundary-walls, and fittings, 2,540*l.* 16*s.* Mr. Bidlake laid before the Board plans of the schools to be erected in Red Cross-street. The plans were approved of. The clerk was also instructed to advertise for tenders for the erection of the schools. The clerk was instructed to write to the Education Department with the view of obtaining a loan. The chairman said he thought it would be about 8,000*l.* The plans would first have to be approved of before they could tell the exact amount that would be required.

Staplehurst.—A public meeting has been held by the ratepayers for the purpose of memorialising the School Board, with a view to induce them to re-consider the proposed expenditure for building the new schools, as exorbitant and preposterous for a population of 1,700 inhabitants, and to ascertain the feelings of the parishioners on the subject. The Rev. T. Crick occupied the chair. The plan proposed by the School Board was tendered for on the 1st inst.; the following tenders were received:—Hanbridge, 4,621*l.*; Vaughan, 4,530*l.*; Cook, 4,527*l.*; Jarret, 4,500*l.*; Suall, 4,450*l.*; Richardson, 4,421*l.*; Wickings, 4,392*l.*; Reeves, 4,298*l.*; Cox, 4,275*l.*; Bridge (accepted), 4,200*l.* The matter was very warmly discussed, and it was resolved that the cost of the school should not exceed 2,000*l.*

ACCIDENTS FROM LIGHTNING.

THESE still continue to be beyond the average even at this time of the year. The spire of Chiddingfold Church suffered slightly in a recent storm; a large piece of stone near the summit was, it is supposed, struck by lightning, and came down in thirty or forty pieces. The tower of All Saints' School at Little Horton has been struck, but not seriously damaged. The north gable of Kibblesworth Wesleyan Chapel has been injured, a large portion of the wall and roof being torn away, and the plaster and woodwork scattered over the interior. The pulpit and preacher's seat were injured. A house at Doncaster has been struck, but not seriously damaged; and at Healdy-hill, Heywood, in Lancashire, three houses have been struck. Many accidents to persons and to live property are also occurring; and this week a series of unusually severe thunder-storms are reported anew from the provinces.

PROVINCIAL MUSEUMS OF SCIENCE AND ART.

THE question is not unfrequently asked, "Of what use is the South Kensington Museum to the provinces, and of what value is it to the great centres of industry throughout the nation which pays the cost of its establishment and maintenance?" This question has, no doubt, been answered over and over again to the satisfaction of the querist, whose only object was to show how utterly useless and valueless he, and those who thought with him, considered an institution which all are now pretty well agreed is a glory to England, and which even the cynics who cry *cut homo* would not like to see abolished.

Now, there is one point on which a serious misunderstanding has existed in the public mind. The museum at South Kensington has been placed in the same category with the British Museum and the National Gallery, both of which are essentially founded on the principle that all they are, and all they can be, is within themselves. They throw out no offshoots; they receive, but never give; and whatever may be the excess beyond the accommodation within their walls, or even above their absolute wants, it is never utilised outside, nor in any way rendered available for the purposes of any similar institution, even in the way of exchanges, still less in that of gifts or loans.

The action at South Kensington has been for many years past the very reverse of this; for so soon as a sufficient collection of articles had been got together,—in fact, within three or four years

after the establishment of the museum at Marlborough House,—a very interesting and instructive series of examples was set aside for the purpose of circulation in the provinces, and especially in connexion with the various schools of art throughout the country. For some years this collection was kept moving from place to place, until having so far fulfilled its mission, it was finally withdrawn, as a special selection of objects forming a travelling museum, and a very much larger and more general series of objects was set apart in the museum itself, to meet the demands of those localities which, from time to time, cared to avail themselves of the privileges thus afforded by the central collection of art objects got together by the Science and Art Department.

As may be supposed, certain conditions were attached to the advantages offered, such as the provision of suitable exhibition-rooms; the admission of the public at a very low fee, at stated periods in each week; and above all, the collection of objects from local sources, as a supplementary contribution to that afforded by the authorities at South Kensington.

There can be no doubt that the latter provision was a wise one, since it secured that amount of self-help which is always the best guarantee that the assistance given will be earnestly and intelligently utilised.

As a matter of course, people who do not care to take trouble, and who consider that if *anything* is done *all* should be done, and who generally leave the work to some one else to do, did not like a regulation which involved the necessity of a distinct effort on their part, and wondered why South Kensington could not do all that was required, even to the denudation of the central museum, of the use of which, to the provinces, they were sceptical; even when a portion of it could be brought to their own doors, if they would but take the trouble to render some little assistance to get it there.

Who may safely leave this class of people to their own devices, for happily there are others who, with well-directed energy and intelligent efforts have, from time to time, so mastered the subject as to see the advantages offered by the South Kensington authorities in the true light; and there is now a growing desire in many of our large provincial cities not only to have an occasional exhibition of works of science and art, supplemented by contributions from South Kensington, but to establish permanent museums, which shall, as circumstances permit, share in the advantages of the growing central museum, through loans of objects for more extended periods than mere periodical exhibitions would permit.

Birmingham has already commenced a permanent museum, the foundation of which was practically laid in 1868 by a pretty extensive loan of glass cases and objects sent from South Kensington. Sheffield has also moved in the matter, but from some local cause the effort hangs fire at present. Nottingham, as a central position in the midland counties, has recently made a most important beginning in this direction, which not only promises to result in a success which cannot fail to act as a valuable example to other cities, but to establish a healthy precedent on which the Government, acting through the South Kensington Museum, will see its way to the utilisation of a vast amount of national property at present out of sight in the British Museum, as also of pictures which are practically useless to the National Gallery.

Why this property should not be so utilised no one can tell. The only approach to a reason is that the trustees have not the power, as in the case of the authorities at South Kensington, to lend, still less to give, duplicates of objects or such articles as are not required in the central national collections. This being the case, surely Parliament, which votes the money to purchase the objects and sustain the institution itself, has the power to give the trustees the requisite authority; and certainly the time is fast approaching when this will have to be done. Nottingham has moved so seriously and so successfully in the direction of a permanent museum of science and art for the Midland Counties, that it may be well to give some further account of this important step, which cannot fail to have a great influence in other quarters, not only as regards the purpose of the movement, but as regards the mode of procedure.

In February last, the Mayor of Nottingham (Mr. W. G. Ward) and the town council, discussed the possibility, as also the desirability, of establishing a permanent museum of science and art in that town, and connecting it as a pre-

liminary step with the school of art, since it is well known that no institution of its kind in the country has had a more legitimate or more beneficial influence on the industry of the locality in which it is situated. The character of the designs for machine-lace, especially the designs applicable to curtains, have been completely revolutionised through the influence of the teaching of the school of art in Nottingham. Resolving to take advantage to the fullest possible extent of the privileges offered to this school in its connexion with the Science and Art Department and the South Kensington Museum, the town council, in conjunction with the committee of the school of art, proceeded to make arrangements for the inauguration of a local museum at once, the corporation authorities giving up a suite of rooms in the Exchange-buildings for the purposes of such museum. The result of this energetic course of action was that the South Kensington authorities were called upon to state distinctly what assistance they could render, and in March Mr. Cole visited Nottingham to discuss the whole question with the corporate authorities, and pledged the museum to an extensive and suitable contribution, to be ready early in May; and the efforts of the joint committee above named were at once directed to the necessary preparation of the building in which the collection was to be located, at least for a time, and obtaining loans of suitable objects to supplement the South Kensington contribution, which it was arranged should be lent for one year, and be changed at the end of that period if the effort proved as successful as its promoters anticipated. Lace being the great staple of art-manufacture at Nottingham, is of course largely represented in the collection; oil paintings, a series of water-colour drawings illustrating the progress of painting in water-colours in England from 1776 to the present time, pottery, ancient and modern porcelain, and metal-work, from the leading features of the museum in combination with loans of oil paintings, a superb collection of carved jade, agate, and crystal, lent by Mr. A. Wells, of Nottingham, and a miscellaneous collection of porcelain, earthenware, &c. As a matter of course, Nottingham lace is represented from its earliest to its latest development.

The important character of the experiment, and its probable bearing on the future, appear to have been fully recognised, and the direction of the arrangements was undertaken on behalf of the South Kensington Museum, by the keeper of the art collections, Mr. George Wallis. The Mayor of Nottingham, with a spirit and liberality which cannot be overestimated, decided to inaugurate the new museum by inviting his fellow-citizens, and the corporate bodies of the neighbouring towns, to a series of three *conversations*, to be held in the Museum rooms during the week prior to the opening of the collections to the public, which was fixed for Whit Monday.

This was a happy idea, carried out without stint, in a tasteful and effective manner. The mayor was enabled to distribute his guests over the three evenings, without inconvenience to them or himself, and thus some 1,500 persons interested in the success of the undertaking were brought into social contact amidst works of industrial and fine art, intermingled with plants and flowers as decorative adjuncts, with music and refreshments suitable for such an occasion. These gatherings formed a striking contrast to the usual corporation festivities of some of our large towns, which are frequently as useless as they are costly and ostentatious.

On the occasion of the opening to the public on Whit Monday, the corporation and committee of the School of Art formed in procession from the mayor's parlour to the large room of the museum, when the mayor, who presided, delivered an admirable address on the whole question, and very distinctly enunciated the intention of the promoters of the undertaking to follow it up until such an institution was located within the walls of Nottingham Castle, now in ruins, from the effects of fire on the occasion of the Reform riots in 1831.

The palatial character of this building, its remarkable situation, as overlooking the town and the surrounding country, the terraces and open space around it, so easily convertible into a public garden, and of ready access from the centre of Nottingham, together with the fact that the trustees of the present Duke of Newcastle wisely desire to utilize the site, all combine to make the proposal one of great interest to all who desire to see public institutions calculated

to elevate the taste and refine the manners of the people established in our large manufacturing cities.

The walls of the building are in sound condition. It is a very striking example of the school of Inigo Jones, being of unusually grand and noble proportions. At present it stands, as the grandfather of the present duke declared it should stand, so far as he and his family were concerned, a monument of disgrace to Nottingham. To secure it on a long lease, and restore it for such a purpose as that proposed by Mr. W. G. Ward, as mayor of Nottingham, would be a graceful act of justice on the part of the town, carrying with it its own compensation, in years to come.

Mr. Cole, who, with Mr. Wallis, represented South Kensington, at the opening ceremony, followed the mayor, in a speech declaratory of the policy of the Museum authorities in relation to these proposed provincial or local museums, as applicable not only to Nottingham, but to every important town in the country.

The local newspapers represent Mr. Cole as correcting the mayor upon an important point, the latter having stated that he, Mr. Cole, had specially offered the requisite assistance to establish the museum, on the occasion of a former visit. He said, "The fact is, we have been offering this to your town and to all other towns in the country for the last fifteen years. If you will only take the trouble to look into our blue-books, which we issue annually, you will find that we are bawling out to the people to get all the advantage they can out of the Kensington Museum and its instruction; therefore, it is not correct to say that the offer was made for the first time to Nottingham. The offer is always being made. We cried and howled, as it were, in the wilderness, but no one would listen to us."

Mr. Cole congratulated Nottingham as being "the first municipality of this country which has had the courage to tell the rate-payers that they would have to pay a little on behalf of an institution of this kind for the benefit of the town and themselves generally;" and showed that the collection was "not altogether a scratch collection, a harum-scarum bringing together of all kinds of things from heaven and earth, but one made for the distinct purpose of showing the application of fine art to industry." Alluding to the Lyons Museum, in its relation to the silk trade, Mr. Cole said that "though Lyons had been going on for 100 years, you have already made a beginning here, as bearing upon the industry of the locality, such as Lyons has only got after a hundred years' experience." Pointing out that the South Kensington Museum was gradually becoming the store-house of the nation in such matters, Mr. Cole urged that the locality had a great part to do in the business in hand, in providing a proper house for a permanent collection of objects, and the periodical loans from South Kensington and elsewhere; and gave it as his opinion that no better position in the Midland Counties could be found for the museum than Nottingham Castle, properly restored and fitted for the purpose.

The proper use of the museum was advocated by Mr. Wallis, in replying to a vote of thanks to Mr. Cole and himself for the manner in which the arrangements had been carried out, and pointed to the value of special study on the part of designers and the students of the school of art.

It will be thus seen that South Kensington is pledged to the future support, and to rendering not merely passive, but active assistance to localities, and especially municipal authorities taking up this question of local museums of science and art. Henceforth there can be no possible mistake as to the extent to which it is the duty of the custodians of the national property in the great "storehouse" at Kensington to assist all well-directed and properly organised efforts in this direction. Mr. Cole spoke distinctly in the name of the Lord President of the Council and the Vice-President, and stated that they had sanctioned his visit to Nottingham in March last, when the matter was fully discussed by the corporation.

We have deemed it desirable, with a view to promote the extension of the facilities for art-education amongst the people, to emphasize the facts connected with this successful and spirited effort at Nottingham, in the hope that it will be a salutary lesson to other towns, which by the proper use of local advantages and opportunities on the one hand, and the facilities held out from South Kensington on the other, may see a way to realise an important addition to the educa-

tional and refining influences of their respective localities, by the means of which those who labour may be lifted upward, and at least deprived of their present excuse for merely sensual enjoyments, by having brought within their reach places of public resort, which, whilst competing with the gin-palace and drinking-saloon shall give them the means of social intercourse, in which elevation, not degradation, shall result.

The question is a very practical one. It needs no speculation, nor any of the mystifying declamation which too frequently accompanies efforts to act upon the social habits and manners of the people. It is simply a question of doing, not of talking,—of placing before the people those counter attractions which cannot fail to gradually, and, no doubt, almost imperceptibly, but not the less wisely, tend to wean attention from vulgarising attractions, now all too powerful, to the quieter but eventually not less potent means of enjoyment of which the South Kensington Museum gives such strong evidence on its free evenings, Saturdays, Mondays, and Tuesdays in each week, and on all holidays of the people.

We cannot better conclude these remarks than by stating the arrangements for admission with which it has been considered expedient to commence at Nottingham, as the great purpose we have in view is to bring this effort forward as an example to other large towns. There is to be no free admissions, but the museum is to be open from noon each day to ten o'clock at night. The fee for admission on Mondays, Wednesdays, and Saturdays is 3d., and on Tuesdays, Thursdays, and Fridays, which are students' days, the charge is 6d. Annual tickets admitting families, as also single tickets, are issued at a moderate charge, and the sale, so far, has been very satisfactory.

THE ROYAL PATRIOTIC FUND: NEW BOYS' SCHOOL, WANDSWORTH.

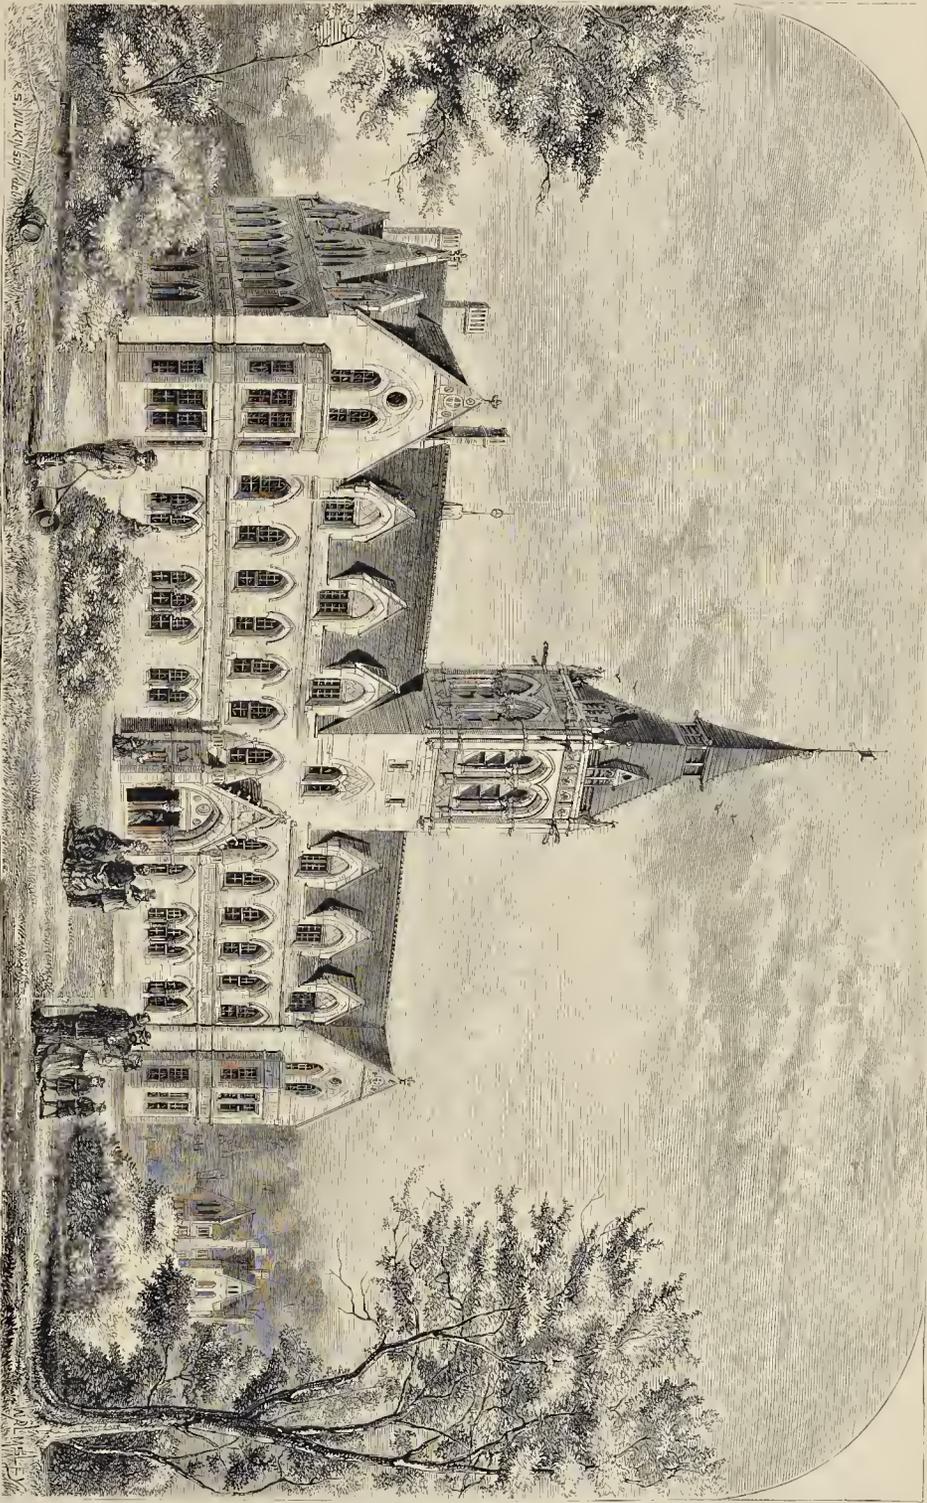

It will be remembered that, at the close of the last Russian War, a large sum of money was raised by public subscription towards the support of the poor widows and children of the soldiers killed during that sad struggle. The expenditure of this fund has been watched over by a commission, consisting principally of military and naval officers of eminence, and his Royal Highness the Duke of Cambridge its president. Provision has been made for all the widows whose husbands lost their lives in the Crimea, many of the children have been maintained and educated up to fifteen or sixteen years of age, and in other cases allowances have been made whilst they remain with their mothers. Some years ago a school for girls was established and endowed out of the fund, and the erection of the building, on Wandsworth Common, was entrusted to Mr. Hawkins, architect.

The success of this institution, under the eye of the secretary to the commission, Mr. W. Mugford, R.N., was such that the commissioners recently decided upon the erection of a school for boys, on an adjoining piece of ground; and as Mr. Hawkins's duties under Government precluded his undertaking the erection of this building, the commissioners had to seek another adviser. With this view they invited Messrs. Blomfield, Dawson, Giles, Saxon Snell, and Tasker to submit designs, and from these, after consideration, they selected that by Mr. Saxon Snell, the exterior view and plan of which we illustrate in our present number. The funds so liberally subscribed, and with equal liberality expended, have necessarily by this time much dwindled, and the new building is consequently more modest in its pretensions than its neighbour the girls' school. The latter building cost over 60,000l.; whereas the present new one will cost, when completed, with all its fittings, about 25,000l.

The new building is capable of accommodating 230 boys, who will be transferred from their present temporary school in a few months' time. The exterior is of red brick, with Portland stone dressings.

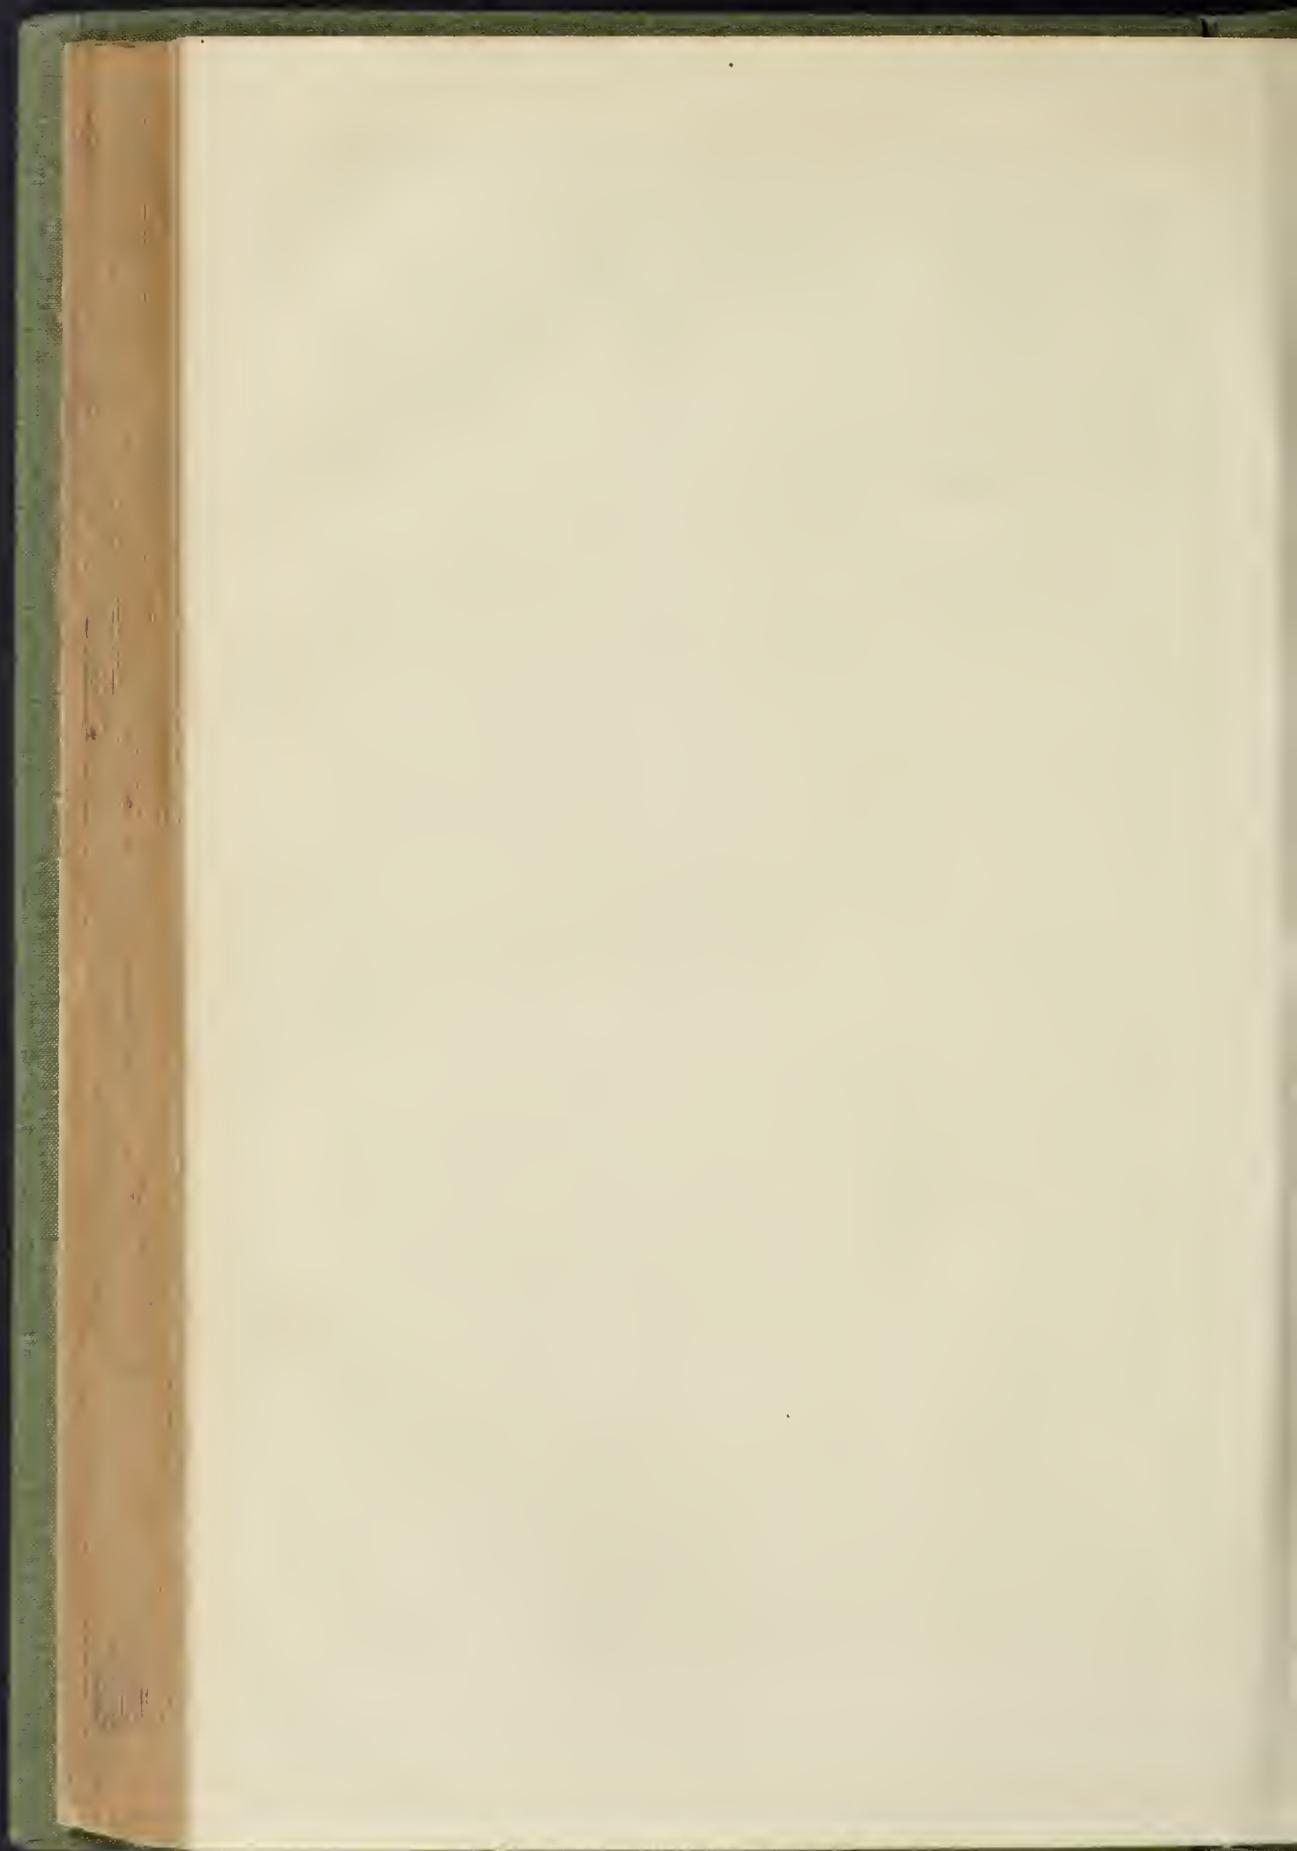

The sewage from the girls' school is conveyed to a tank about midway between the two buildings, and thence is pumped up and distributed over the land. The sewage from the upper closets of the new building will be similarly treated; but on the ground floor Moule's earth-closet system is to be brought into operation. The wisdom of this, with a system of drains ready to hand, seems questionable.

The contractor for the erection of the building is Mr. John T. Chappell.

THE ROYAL PATRIOTIC FUND: NEW BOYS' SCHOOL, WANDSWORTH, SURREY.—MR. SAXON SNELL, ARCHITECT.

5, 1/2 (1/2) 59/64

FURTHER OPENING OF THE GREAT EASTERN METROPOLITAN EXTENSIONS.

We understand that during the present week the Government Inspector has officially passed over that portion of the Great Eastern Metropolitan Extension Line which lies between Tottenham and Lea Bridge, and by which the Extension Line joins the Great Eastern Main Line at Cobham-mill Junction. The works having thus been officially inspected, and, as we learn, sanctioned by the Government representative, it is intended to open this portion in the course of a week or a fortnight from the present time, and that in the meantime the railway staff has all been arranged. This will make the second portion of the Extension Line which has been opened for traffic, the first length, from Bethnal-green to Stoke Newington, having been opened about six weeks ago; since which time the local traffic has enormously increased, and proved that when the line is completed to Liverpool-street, and the large station about to be erected there is finished and ready for opening, the local and suburban traffic of the Great Eastern will repay the company to a large extent for the heavy outlay which has been incurred in the Extension Lines. The traffic to and from the several stations between Bethnal-green Junction and Stoke Newington, namely, Cambridge Heath, London Fields, Hackney-downs Junction, and Rectory-road—has been very considerable since the opening of the section, and there is every reason for concluding that it will be materially increased when the resources of the extension are fully developed.

A NEW RAILWAY BRIDGE ACROSS THE THAMES.

Steps are being taken for the construction of a new railway across the Thames at Fulham, which will practically be an extension of the Metropolitan District Railway, and give that company access to Richmond by a junction with the South-Western Company. The new line commences by a junction with the Metropolitan District Railway at South Kensington; and, after passing through Fulham, crosses the Thames, and finally joins the South-Western line by a junction near Barnes Station, the entire length of the line being about three miles. The entire cost of the line is estimated at 2,000,000, one of the heaviest items in the expenditure being the bridge across the river, which it is proposed shall be of a substantial and ornamental character. Although not the actual promoters of the new line, the Metropolitan District Company are deeply interested in its favour, as being an important feeder to their present line.

BUILDING FOR THE LONDON SCHOOL BOARD.

The London School Board have secured a site on the Victoria Embankment for the erection of offices thereon. The cost of the land, as fixed by arbitration, is 17,920l., and it is estimated that the building itself will involve an expenditure of 25,000l. The Works Committee recommended that the preparation of plans should be entrusted to the Board's own architect, Mr. Tolson, and that competition should not be invited. Several members objected to this, and the consideration of the recommendation was eventually deferred to the next meeting.

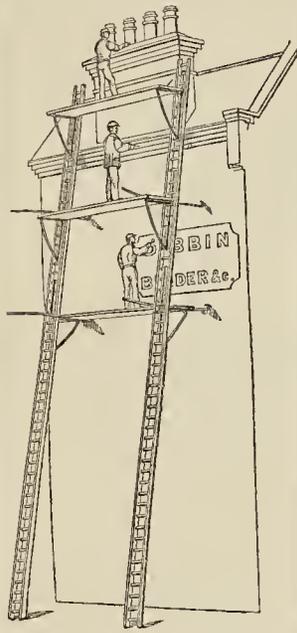

POCOCK'S BARREL MORTISE LOCK.

An ordinary mortise lock requires a large hole to be cut through the stile and middle rail of door, and the operation of properly fixing it occupies usually more than two hours. The barrel lock invented by Mr. Pockock (son, we may mention by the way, of Mr. W. W. Pockock, architect) may, on the other hand, be fixed in a quarter of an hour. It is simply a barrel about 1 in. long and 1 in. wide containing an ordinary spring bolt, convertible into a lock by the action of the key, which prevents the bolt from moving. The barrel is not exactly cylindrical, but flattened, and for this reason, the hole is formed for it with a centre-bit, and as it is not always bored quite true the shape of the barrel allows of a certain amount of accommodation, whereas if the barrel were circular it would have to follow the hole, and so might be thrown out of position. To prevent oscillation there is a

screw at the end of the barrel, which, worked by a spanner, passes into the wood beyond the hole made by the centre-bit and keeps it steady. The spiral spring used might be thought slight, but the inventor has set that question at rest by causing the bolt of one of them to be shot about 700,000 times, which, taking the average use of a door at forty times per day, represents the wear of over fifty years,—quite long enough for us.

We have very little doubt that Mr. Jas. Hill (Thames-street), who is the sole factor for this lock, will soon have a brisk demand.

DUBBIN'S PATENT LADDER-SCAFFOLD.

This ladder-scaffold will probably supersede the old ladder "cripple," and will save the use of scaffolding in repairing roofs, gutters, caves, fixing chimneys and sign-boards, cementing and painting houses, and so forth.

It consists (as may be seen) of two pairs of light iron brackets, which are fixed inside and outside two ladders, each bracket being made with three hooks, fastening respectively on to three staves of the ladder, in such a manner that the strain is vertical, and so distributed that the bracket cannot break, or become detached, and it also takes an equal pressure on the back and front of each ladder. The brackets have stays, which fix on to the pin of the bracket, and, placed against the house or building, straighten and support the ladder, thereby preventing it from bending or shaking. The invention can be seen in use near the London Bridge Station.

THE LOCK-OUT IN LONDON.

The result of the negotiations between the master builders and the carpenters and joiners, and the masons, arranged for since last week, is, we regret to say, that all hopes of an amicable settlement of the dispute have been disappointed, and that the men have refused to withdraw the partial strike, and hence the masters have ordered the general lock-out. It was stated that there were more than ten to one of votes against the men on strike from Mr. Brass's and Messrs. Jackson & Shaw's resuming work at once upon the old terms pending any arbitration that might take place, and about the same number in favour of a conference of masters and workmen to arrange a code of working rules. Upon the resolution to refer the rate of wages and the nine hours question to the arbitration of disinterested persons chosen by both sides there was a large majority against it, though it should in strict fairness be stated the minority was by no means insignificant; and some of the masters are not

contented to accept a mere assertion as to the result of these votings. It was also intimated that after the state of the poll had been declared to the delegates, it was moved that a deputation of four should be appointed to convey the result to the masters' committee, with power to make an offer to accept 8 1/2d. per hour for 5 1/2 hours per week up to the 1st of March next, and after that date the pay to be 9d. the hour, but that the delegates indignantly refused to entertain the proposal, and an amendment was carried by an overwhelming majority, directing the communication to be made in writing through a simple messenger. Subsequently a full committee of the Central Association of Master Builders held a short consultation upon the rejection of their overtures to the men, and it was finally agreed to issue the following circular, to be addressed to all the master builders in London, viz. :—

"Sir.—The carpenters and joiners and masons having refused to refer the question now in dispute between themselves and the master builders to arbitration, or to withdraw the strike at Mr. Brass's and Messrs. Jackson & Shaw's, you are earnestly requested to carry out the resolution passed at the meeting of master builders on the 7th of June last, by closing all shops and works belonging to you within the district over which the district surveyors have jurisdiction, from to-morrow, the 10th instant, until such time as Messrs. Jackson & Shaw and Mr. Brass shall inform the Committee of the Master Builders' Association that they have been able to resume their work. (Signed) STANLEY G. BIRD, Honorary Secretary."

The latter part of this notice was a good deal canvassed outside the trade. At the last great lock-out it was to last until "the dispute with the men, as a body, was settled;" but now it is only to continue in force until the two firms from which the carpenters and joiners have been withdrawn are able to resume work; and it is not impossible that such an event might happen within the next week. The committee sitting at the Brown Bear Tavern profess to see through all its meaning, and intend to take immediate action upon it, if, indeed, they have not done so already. There are fully 250 large building establishments, and of those a sufficient number may deem it expedient to close their doors, so as inevitably to throw at least 20,000 artisans out of employment at once.

The following are amongst the firms who have closed their shops:—Messrs. Holland & Hannen, Bloomsbury; Myers & Sons, Lambeth; Colls & Co., Camberwell; Renshaw & Co., City-road; Adamson & Son, Turreham-green; Ashly & Horner, Whitechapel; Cubitt & Co., Gray's-inn-road; Baker & Co., Stangate; Gammoun & Co., Lambeth; Manley & Rogers, Camden-town; Simpson & Co., Tottenham-court-road; Patrick & Sons, Westminster-road; Smith & Taylor, Pimlico; Freake & Co., Chelsea; Doves, Islington; Hill & Sons, Islington; Macey, Strand; Trollope & Sons; Lucas, Brothers; Dines & Co., Pimlico.

Discussion of the matter would seem to be useless; one side insists on certain terms before going to work, the other side declines to grant those terms unless disinterested persons, in the shape of arbitrators, say it ought to do so. The lock-out may end in a week, or it may go on for three months. Nothing that we can say will hasten or retard it.

THE TRADES MOVEMENT.

Rotherham.—Messrs. Logan & Hemmingway, the contractors who have undertaken the formation of a new reservoir at Ulley Brook, about five miles from Rotherham, for the supply of the town with water, are likely to have some trouble with the large staff of navvies, masons, &c., in their employ. On Thursday in last week the navvies excavating the trench for the foundation of the puddle wall suddenly ceased work. They made their way in a body along the valley, and succeeded in inducing the remainder of the navvies to desist working. Thus reinforced, the body of navvies proceeded to the working-places of the masons, who number about forty, and who are occupied in building the viaduct, and the bye-washes and sluices. The masons, after refusing for a long time, at last gave way. The quarrymen and a small gang of men who carry clay from a considerable distance up the valley to be used in the construction of the puddle walls were next induced to join them on strike. Several fights occurred between some of the navvies, but no general encounter took place. A large meeting of the men was then held on the works at Ulley Brook, when a resolution was carried that work should not be resumed until the whole of the concessions demanded had been granted. They want less work and more pay, but their demands vary.

Bolton.—The master brickmakers have acceded to the application of their workmen for an advance of 1s. 6d. per 1,000 bricks. The advance is to be divided as follows:—To the temperers, 3d.; per 1,000; molders, 3d.; wheelers, 3d.; carriers, 1½d.; wallers, 1½d.; kilners, 1d.; and burners, 2d.

Bradford.—A meeting of the carpenters and joiners has been held at the Secular Hall, to consider the propriety of asking for a reduction of one hour per week and an advance of wages, when it was resolved that, considering the increase in rent and the price of provisions, the meeting was of opinion that the present rate of remuneration was inadequate to the present requirements; and taking into consideration that the rate of wages in Bradford is lower than in many towns of less importance, they respectfully request that employers pay 7½d. per hour, or 11.9s. 10½d. for 49½ hours per week; that they request that this should be paid to all men of the trade as a standard rate of wages; that the foregoing alterations come into operation on the 1st day of June, 1873; that they commence work at seven o'clock a.m., and leave at half-past five p.m., and noon on Saturdays; and that these rules should be binding on both men and employers; and when any future alteration should be desired, six months' notice should be given by either party, and that the notice should expire on the 1st of March or the 1st of August.

Farnworth.—The bricklayers of Farnworth have been locked out in consequence of their refusal to accept payment by the hour instead of by the day, as heretofore. Three months' notice had been given of the intended change, but the men had, from the first, expressed their opposition to it, alleging that it was equivalent to a reduction of wages. Up to the present time their wages had been 36s. per week, and their masters desired to substitute payment after the rate of 8d. per hour.

Swansea.—The masons and carpenters employed by the principal builders of the town have been on strike, for a week or ten days, for the "Nine-hours movement." The employers, at the onset, said they were quite prepared to accede to the request of the men, but they required the fulfilment of the terms of an agreement solemnly entered into and signed by both employers and men at the termination of the last strike, to the effect that six months' notice should be given on either side, before any deviation of the terms then agreed to were made. The men only gave three months' notice of the present demand, and the employers consequently required three months more notice, but they offered to leave the whole question to be settled by arbitration. All these offers on the part of the masters were refused by the men; they would have the nine hours per day at all risks and at any cost. All means of conciliation failing, and the employers being pressed by contracts, they were compelled to yield to the demands made upon them, and gave in, and the men resumed work upon their own terms.

Belfast.—A strike has taken place among the employes of Messrs. McLean & Co., builders, of Corporation-street, Belfast. The men have been working sixty hours weekly, and on making a stand for the substitution of fifty-four hours, the firm consented to meet the men by reducing the hours to fifty-seven. This has been refused by the employes, and accordingly between sixty and seventy of them have quitted their employment.

A Confederation of United Trades of Scotland. A meeting of delegates representing the various trades throughout the principal towns in Scotland has been held in the Tontine Hotel, Glasgow, for the purpose of forming an association, to be designated "The United Trades Confederation of Scotland." The Glasgow United Trades Council, was represented by Messrs. Bennett, Campbell, Laing, Robertson, Inglis, Golly, Glen, Kirkwood, Goodwin, Hill, and Paton. A number of representatives from various other trades throughout Scotland were also present. Mr. John Holborn, Edinburgh, was appointed chairman, and Mr. Charles Laing, secretary. A code of rules was submitted for approval, which bore that the objects of the confederation are to render all moral and pecuniary assistance to the trades connected with the association. The confederation shall be governed by a president, secretary, treasurer, executive committee, and judicial council, always subject to a conference of delegates and the votes of the members. The executive committee, when benefit is claimed, shall levy on every society in the confederation, according to the number of its members, to meet the amount required so long as such dispen-

continues. The meeting was engaged during the day going over the rules. The conference was continued next day. A code of rules was adopted, and a president, secretary, and executive were appointed.

"TRICKS OF PICTURE DEALERS."

Sir,—I see my name abused in your paper of the 15th in a letter entitled "Tricks of Picture Dealers." I am sorry that this is not a very rare occurrence. I never sent any one to anybody for an opinion on a painting of "The Pilgrimage to Canterbury," or any other picture. I am very often applied to for opinions, which I do not give, but commonly refer the applicants to "some known dealer" for what they seek. Your correspondent might have applied to me before making such free use of my name in a public print.
R. N. WORKMAN.

RULES FOR PLANNING AND FITTING SCHOOLS.

THE Works Committee, of the London Board, have had under consideration the letter from the Education Department with reference to the rules which they had drawn up for planning and fitting schools.* To meet the objections raised by the Department, and also to embody certain amendments which appear to them desirable, they have drafted the following alterations in the rules sanctioned by the Board. In addition to the alterations which they propose, they subjoin an alternative scheme, to be adopted when desired in graded schools.

Infant Schools.

SUGGESTED ALTERATIONS.

1. An infant school should always be on the ground floor, in the case of a single school. Where a second infant school is intended, it may sometimes be necessary to place it above the other, approached by an easy staircase.
2. It shall never be without a playground of ample size, of which a portion must be covered.
3. It is not desirable that, in London, any infant school should be organised for less than 120. The maximum number may be taken as 240. And, where the number rises considerably above this, there should be more than one infant school.
4. In every case there should be two class-rooms, one for babies, and another for the most advanced infants. Up to 120 these should be arranged for 20 each. In the case of a school of maximum size, there should be a third class-room of larger size, and the two smaller class-rooms should then be capable of being thrown into one. In consideration of the noise caused by infant teaching, there should be no sliding or wooden partitions in infant schools other than those necessary for throwing these two smaller class-rooms into one.
5. The fittings should always comprise two galleries of unequal size. No gallery in a class-room for infants should hold more than eighty to ninety. The large gallery in the schoolroom should be capable of accommodating two-thirds of the infants at one time, for collective teaching. The advanced infant class will require a small group of benches and desks, and a cupboard for books, &c., about six feet high.

Graded Schools.

1. In arranging a school for children of seven years and upwards, the junior mixed school should embrace standards one to three, and the senior schools the three higher standards. In point of number, any multiple of thirty, thirty-five, or forty will be found most convenient. Forty, as a unit, is preferred in the class-rooms of the first four fifth and sixth.
2. A school of the largest size should have two double class-rooms, calculated at 8 ft. to 9 ft. superficial per child, arranged with sliding partitions, so as to be subdivisible into four.
3. The best width for the general school-room is from 18 ft. to 22 ft. (This allows for three or four rows deep of benches and desks ranged along one wall.) The lighting should be from the back. In all cases there should be "through" ventilation.
4. Five rows of benches and desks are allowable in a class-room. The lighting should, if possible, be chiefly from the side.
5. Generally an allowance of 20 in. on each desk and bench will be necessary, otherwise the children will be cramped in writing. The lengths will, therefore, be as follows, viz. —

For 4 children, a length of	6 3
" 5 " " "	8 4
" 6 " " "	10 0
" 7 " " "	11 8
" 8 " " "	13 4
6. For senior classes the provision should be 22 inches. Junior schools should have at one end of the general room a gallery for collective teaching, capable of accommodating about one half of the school at a time. Also provision in benches and desks for a double class of sixty to eighty. But the room should be so planned, that the removal of the gallery and the substitution of benches and desks can be easily effected hereafter if desired.
7. Senior schools, as a general rule, do not require the gallery.
8. Benches and desks are required for all the children (except for one class occupying the gallery), and they should be of various heights according to the varying ages. The desks should be very slightly inclined, and the seats should have backs. It is not necessary to fasten the fittings to the floor. They should be either placed on slightly raised platforms or (if made to move on casters) should themselves be graduated. Each of the six classes (or standards) should have a cupboard for books, &c., about 6 ft. 6 in. high.

School Residences.

In cases where the erection of a residence for the master or mistress has been determined on, it should contain a parlour, a kitchen, a bedroom, and three bedrooms, of not less than the following dimensions of superficial area, viz. —

	ORIGINAL.	Ft. In. Ft.
(a) For the parlour	12 0	13 0
(b) " Kitchen	12 0	10 0
(c) For one of the bedrooms	12 0	10 0
(d) For two other bedrooms	9 0	8 0
(e) The height to be in no case less than 8 ft. to wall-plate, if ceiled at the wall-plate; or 7 ft. to wall-plate, and 9 ft. to ceiling, if ceiled to the collar.		
SUGGESTED ALTERATIONS.		
(a) For the parlour	14 0	12 0
(b) " Kitchen	14 0	10 0
(c) For one of the bedrooms	10 6	8 0
(d) For two other bedrooms	10 6	8 0
(e) The height to be in no case less than 9 ft. to wall-plate, if ceiled at the wall-plate; or 7 ft. 6 in. to wall-plate, and 9 ft. 6 in. to ceiling, if ceiled at the collar.		

Alternative System for Graded Schools.

1. Each of the graded schools (whether junior or senior, boys or girls) should consist of three or more double class-rooms, according to the size of the department, and although the space per child will be greater than in the junior schools, one double class-room may be smaller, and the whole area the same.
2. The entrance should be by a porch to the largest and most central room.
3. As the number of children in Standards 5 and 6 will usually be one-fourth or one-third smaller than any of the lower standards, the smaller class-rooms should be devoted to these two standards. Thus, in the case of a department of 100 children, the double class-rooms should be 50, 60, 70, or 80 children, according to the size of the department.
4. The entrance should be by a porch to the largest and most central room.
5. Two of the larger rooms should be separated by a movable partition, so as to be thrown together for singing, collective lessons, or any section requiring accommodation for the whole (or a large proportion) of the department. As children are placed during collective lessons much closer together than usual, it is necessary only between so many as will admit all the children of one department to be closely seated at one time.
6. The entire area should not exceed 10 superficial feet per child.
7. Class-rooms may be planned with only three or four rows of desks and benches ranged along one wall.

DISTRICT SURVEYORS' FEES UNDER METROPOLITAN BUILDING ACT.

ARCHES UNDER PUBLIC WAY.

Power v. Wigmore.—The defendant had erected fifty-two arches under a public highway, forming four sides of a square in Newgate market, and the plaintiff, as district surveyor of the southern division of the city of London, summoned him before Sir Walter Carden for 25l. 10s. They were not arches attached to houses, but were built on a vacant piece of ground, ready for houses.

Each arch or vault was separated by a pier in brickwork, and open in front, and there was no internal communication or mode of access whatever from one vault to another. On the part of the plaintiff it was contended that each arch was a separate structure, and that he was entitled to a fee of 10s. for each. On the part of the defendant it was contended that the words in the schedule, "for inspecting the arches or stone floors over or under public ways, 10s." meant that the appellant was entitled to one sun of 10s. for inspecting any number of arches under or over any public way, and that a greater fee could be demanded. The magistrat was of opinion that the contention of the defendant was correct, and that the surveyor was only entitled to the sum of 10s.; and gave in determination against the larger claim, but granted a case for an appeal. The appeal was heard in the Common Pleas, Westminster, on the 4th of June, before Mr. Justice Willes and Mr. Justice Keating.

Mr. Justice Willes, in the course of delivery of judgment, said,—

"The point of law is this:—It may be represented that the question whether a number of arches are made under a public highway—whether a public highway of any length, or a public highway surrounding a square, whatever be the number of arches which are made, provided these arches are in one continuous public way, the surveyor is to be satisfied for the inspection of them all by a fee of 10s. only, under the second schedule of the Building Act, Part I.; whether the Act gives only one fee for any number of arches, provided these arches are all under one continuous highway, whether in a straight line or not?"

"Supposing a man gave notice to the surveyor that he was going to construct one arch over or under a public highway, and the surveyor inspected it, and sent in a bill for 10s., and proceeded before the magistrat, and the magistrat gave the bill for inspecting the arches in the plural, stone floors in the plural over or under public ways, would the surveyor be entitled to the fee of 10s. for inspecting the public arch? Would that be the reasonable conclusion to come to? or would the reasonable conclusion be to come to, that the schedule, although it speaks in the plural, is describing the genus, and that the 10s. are intended to apply to each individual com-

CONCRETE BUILDING AND THE METROPOLITAN BOARD OF WORKS. THE PEABODY INDUSTRIAL DWELLINGS AND THE CONTRACTORS.

On Saturday, the 15th inst., Messrs. Tall & Company, patentees and building contractors to the Peabody trustees, carrying on business at 8 and 9, Lawson-street, Great Dover-road, were summoned before Mr. Benson (Southwark) by Mr. E. Cheffins, hon. secretary, under the 56th section of the Metropolitan Building Act, for unlawfully erecting certain buildings, called the Peabody Industrial Dwellings, in East-lane, Bermondsey, without having previously sent in plans, specifications, &c., to the surveyors of the district; and secondly, with refusing and neglecting to pull down a certain wall of the same building alleged to be not conformable to the rules of the said Act.

Mr. Biron, instructed by Mr. Ward, solicitor to the Metropolitan Board of Works, supported the summonses, and Mr. Meadows White, instructed by Messrs. Ashurst, Morris, & Co., appeared for the company.

Mr. Biron, in opening the proceedings, said he was instructed to appear on behalf of the Metropolitan Board of Works to proceed against the Company on two summonses taken out by Mr. Hesketh, the district surveyor, under the 56th section of the 18th and 19th Vict., cap. 122, for erecting a block of buildings, consisting of twenty-eight rooms, called The Peabody Industrial Dwellings, in East-lane, Bermondsey, without having first sent in plans and specifications, for the approval of the Metropolitan Board of Works. There were other sections of the Act. If not properly done, the offenders came under the 45th section. The 47th section gave two magistrates power to inflict penalties, &c. The defendants caused these buildings to be erected contrary to the rules of the Act. A notice was sent to them by the district surveyor, and they were liable to a penalty of 20l. for every day they neglected to comply with the Act. The third or last rule in the miscellaneous portion of the Act sets forth that every building must be built in brick, stone, or other incombustible material, properly bonded together. The buildings complained of were not so. The walls were put together in a liquid state, which did not harden for twenty-four hours.

Mr. Benson observed that he had seen the buildings in question, and he thought the materials used were incombustible.

Mr. Biron considered they were not built of a hard substance, such as brick or stone. They charged the defendants for infringing the law by not coming to the Metropolitan Board of Works for their sanction, according to a notice served on the company by the district surveyor, according to the Act of Parliament, as follows:—"That the walls of such buildings are being formed with masses or lumps of hard materials, grouted with and embedded in Portland cement concrete, used in a semi-liquid state, to which the rules of the said Act are inapplicable, without the licence or authority of the Metropolitan Board of Works having been obtained, in accordance with the 56th section of the said Act; and I require you to take down the said walls, &c. Dated 8th of May, 1872." The company disobeyed that notice, and took the law into their own hands. Heretofore they had on all occasions applied to the Metropolitan Board for licences.

Mr. Meadow White contended that, under the circumstances, the company had no occasion to apply for licence from the Metropolitan Board, and the district surveyor had no authority to make a requisition upon them to pull down the walls.

Mr. Benson was of opinion that the first summons must fall, as he did not think the requisition was such as was required by the Act of Parliament,—"to pull down all."

Mr. Biron submitted to his worship's decision, and proceeded with the second summons. He called,

Mr. Macey. He said he had been thirty-five years a practical builder, and was perfectly acquainted with the Metropolitan Buildings Act. He visited the buildings complained of in the course of erection in East-lane, Bermondsey. He observed the way in which the packing was done, with pieces of broken bricks and stone among the concrete. They were all thrown in together.

Mr. Biron asked whether they were "bonded?" Mr. Meadows White objected to that question. Witness said they were not bonded, in the ordinary acceptance of the building terms.

In cross-examination, witness said a "rubble wall" was not bonded. With regard to the present building, it was softly put together, but he did not think such a system would be safe in other builders' hands except the company's. It was admirably put together. Witness added that he had not been in the company's works.

Mr. Walter Newhall, chief clerk in the Buildings Act Department of the Metropolitan Board of Works, said he had examined the buildings in the course of erection, and he did not think there was sufficient cohesion. Some of the bricks used seemed quite rotten.

Mr. Robert Hesketh, the district surveyor, proved that the defendants had not received his authority, and that they had refused to comply with the Act of Parliament. He thought the walls were properly bonded.

In answer to Mr. Benson, he said the concrete bonded it together. This was the first requisition he had served on a builder where concrete was used.

Mr. George Frederick Fry, surveyor to the Strand district, did not consider the work properly bonded together.

At this stage of the proceedings Mr. Biron asked for an adjournment, and after a short consultation,

Mr. Benson adjourned the further hearing until Saturday, the 29th instant.

RHYMING COMPLAINTS.*

Oh, why, my Muse, so vast a theme select? Can human words describe an architect! At his command do glorious cities rise, To give us shelter and delight our eyes. Yes, 'tis to him our very homes we owe, And how much more the world can never know.

First of professions, architecture stands: Its age sublime, our reverence demands; Oh, how can they from noble pride refrain, Who trace their line unbroken back to Cain? He first of architects went forth to build, Bearer'd a great city, and his brother kill'd; And, certain pamphlets made us think of late, Left to his followers his envious hate.

Go, ask the builder if he ever found The knowledge of an architect unbound? Go, ask the client if he ever knew One undertake a thing he could not do;

Or spend his money when he was not forced; Or under-estimate a building's cost? He'll answer, "No; and fain I'd pay them more."

Had not the Institute just fix'd the score?"

RESTORATION OF BURNT EDIFICES IN PARIS.

THE Municipal Council of Paris has determined on the reconstruction of the Hôtel de Ville upon its present basis,—that is to say, using all the portions of the building which remain uninjured by the fire. According to the "Journal of the Society of Arts," the work is to be thrown open to public competition. The rebuilding of the Tuileries, which had been announced in error as determined on, is not likely to be undertaken at present. It may seem surprising at first view that the architectural portion of the Salon now open contains no projects for the reconstruction of the Hôtel de Ville, and only one for that of the Tuileries. This is really not extraordinary, as architects who hope to compete for those works can scarcely be expected to lay their crude plans open to others, and the production of complete sets of drawings for such undertakings is a formidable undertaking. Two young architects, MM. Chardon and Lamhert, form, however, exceptions to the rule, they having sent in a series of elaborate plans for the complete restoration of the palace, with this difference, however, that they propose to make a grand public way in the centre of the new building, corresponding somewhat to the great porticoes of the Louvre, which would thus give direct thoroughfare from the Place de la Concorde to the Rue de Louvre, opposite the Church of St. Germain l'Auxerrois.

It is not often, happily, that the reconstruction of great public establishments is suddenly

* An architect (signing "C. C. O.") sends us some metrical complaints, of which we give a specimen. Like some with whom he properly finds fault, he casts stones upon his profession (in the course of his rymes), which, when made, ought to be proved. These we omit.

under the genus, or more properly species? I think the latter certainly is the proper conclusion. You say to a watchmaker, "What do you charge for your silver hunting watch?" "Six guineas." Well, that does not mean that a man is to have two watches if he pays six guineas, but it means that he is to pay six guineas for each watch. And so here, with respect to the arches or stone under or over public ways, 10s.,—not inspecting any number of arches in the plural, but 10s. for each of the arches mentioned in the schedule. Therefore, under the schedule, should be 10s. for each arch. That is said to be cut down, and I think it is cut down by the 49th section. It is cut down by the 49th section not in respect of their being under one highway, not in respect of their being in one notice, although they must be included in one notice to escape with one fee under the 49th section, but in respect of their being done for one building, in order to cut down the 10s. for each arch to 10s. for a number of arches. You must show that that number of arches is in one notice, and that it relates to some one building. Then you charge 10s. in respect of the arches under that building, not by reason of the schedule using the arches in the plural, but by reason of the 49th section cutting down the claim in respect of arches included in one notice in respect of works done upon any building."

"I think there ought to be an inquiry, which inquiry is to be one of fact, as to whether these arches which are considered as one building, or whether they should be distributed in two or three, or any other numbers, with respect to the buildings to which they belong. Are they buildings, or part of buildings, other than, and beyond, and besides the arches themselves? If they were a viaduct, do not only 10s. would have to be paid; but a viaduct would be one building; at least the magistrate might come to that conclusion. If there were arches of houses in course of construction round the square, they might properly be several buildings, and they might be divided according to the number of houses which the magistrate might consider to be attributed to the arches to be built. I think this will be the question—How much ought to be paid in respect of the number of buildings which the magistrate is satisfied these arches ought to be attributed to?"

The practical result is to declare that the district surveyor is entitled to receive 10s. in respect of the arch or arches appertaining to each house or intended house.

CHELSEA EMBANKMENT.

Table with 2 columns: Description of work and Amount. Includes entries for 1869, 1872, and 1871.

TESTING MATERIALS.

SIR.—Captain Seddon, R.N., deserves the thanks of the profession for his very interesting paper, and I do not wish to detract from its value, at least, but I still think that for girders which admit of a constant being obtained by experiment the formula he proposes has no advantage over that which he condemns, although would not claim for the latter more than it serves. This may be shown more clearly by expressing both formula in the same terms, and ranging them as follows:—

Hurst ... lw/ad = C
Capt. Seddon ... lw/ad = 4f

which differ only in the "4f" of the latter being substituted for "C" in the former. "C" representing a constant number obtained by breaking similar girders, a process which takes into account all imperfections involved in the construction of the girder, and which might be repeated for various classes of iron; while "4f," Captain Seddon's formula represents merely four times the tensile strength ascertained by breaking of specimens of the iron, or, as Captain Seddon has put it, "the limiting stress tons per square inch,"—a value which, in the present state of our knowledge, is only conventional.

Both formulae were fully investigated twenty years ago, during the consideration of the objects for the Britannia and Conway bridges; and those who wish to pursue the subject further need do better than refer to the description of these bridges, by Messrs. Clark and Fairbairn.

As regards my "Hand-book," I am well aware of its imperfections, and have been for some time engaged in preparing a completely revised edition.

Mr. Molesworth's book was thoroughly revised last year, and to my mind, at least, it leaves very little to be desired as an engineer's pocket-book. J. T. HURST.

forced upon a city, and the projects put forth under such circumstances cannot fail to supply valuable opportunities of study. The decision of the municipal council in favour of public competition in the case of the Hôtel de Ville adds to the general interest. Conditions are now being prepared.

VALUE OF LAND IN ROME.

In a fresh appeal for aid to purchase certain sites in Rome for excavation, Mr. Parker, C.E., says,—

"It is much to be regretted that my plan was not acted upon when first proposed in the spring of 1871: since that time the value of land in Rome has increased enormously. Mr. Spithover has just sold to a building company for 200,000L. sterling the same land for which he gave 5,000L. five or six years since (he had built a house on it and had added to the property; altogether he had probably expended 20,000L. at the outside upon it). Another large vineyard, on the eastern side of Rome, which had been bought for 500L. about ten years since, has just been sold to another building company for 10,000L. The property of Monsignor Di Merode, in the valley between the Viminal and the Quirinal, in the line of the new street, called the 'Via Nazionale,' is now being sold at the rate of sixty francs per square yard: it was not worth more than one franc the square yard ten years ago, when he first formed this project which is now being carried out."

Books Received.

The History of the Church of St. Mildred the Virgin, Poultry, in the City of London; with some Particulars of the Church of St. Mary Colechurch. By THOMAS MILBOURN. London: R. Smith, Soho-square. 1872.

ST. MILDRED'S CHURCH is now being destroyed; and this book is a fitting one for those who desire to have in their libraries a record of this church when it no longer exists. The associate church of St. Mary Colechurch was destroyed in the Great Fire of 1666. Mr. Milbourn was lately honorary secretary to the London and Middlesex Archaeological Society, and is the author of various papers on kindred subjects. The basis of this volume was a paper read at the London and Middlesex Archaeological Society in continuation of a proposed series of papers on City churches required to be removed to make way for City improvements.

VARIORUM.

"The Law relating to Vaccination. By Danby P. Frey, Barrister-at-Law. Fifth Edition. London: Knight & Co., Fleet-street. 1872." This small volume contains copies of the Vaccination Acts of 1867 and 1871, repealed statutes; the Local Government Board Act (34 & 35 Vict., c. 70), with notes; and the instructional circulars, orders, and regulations issued by authority; with introduction and index. The book is a useful one, even to those who disapprove of the law, which, so long as it is law, must be obeyed, however severely it may press upon those who conscientiously (but wrongly) believe that their duty to their children compels them to resist its enactments.—Messrs. King & Co. have commenced well "The Cornhill Library of Fiction," a cheap issue of good stories, with "Robin Gray," by Mr. Charles Gibbon. It has passed the ordeal of criticism in its original shape, and we need only say that it is a charming novel, full of interest and truthful touches.—The Rev. Jas. Harris's "Graduated Exercises in Arithmetic and Mensuration" has been adopted by teachers to a very considerable extent. Many of them will be glad to know that Mr. Harris has now issued a "Key" to the "Graduated Exercises" (Longmans, Green, & Co.), evidently prepared with care.—Messrs. Cassell, Petter, & Galpin will shortly publish a work on Applied Mechanics, by Professor Robert Stawell Ball, M.A., illustrated with numerous diagrams.

Westbury, Wilts.—Mr. A. Laverton has decided on erecting a new Literary Institution and Boys' School in the town. The plans have been furnished by Mr. Stent, of Warmminster, and workmen are busy levelling and preparing the site, which is on the side of a piece of rising ground.

Miscellanea.

Fatal Explosion at Godalming.—A short time ago complaints were made about the pollution of the river Wey arising from the discharge into it of the refuse from the Cotteshall paper-mills. Messrs. Spicer, the proprietors, at an expense of 2,000L., had one of Messrs. Ladelle & Southy's patent evaporators erected, which, by a simple but clever process, takes this refuse, which was before wasted, and from a liquid reduces it to a chemical solid, namely, soda, which can be again used in the manufacture of paper. Up till now the evaporator had admirably answered all the purposes for which the patentee intended it, but there has been an unaccountable explosion, which has resulted in the death of one man, and very severe injury and disfigurement to three others. The evaporator is erected in a detached building adjoining the mills. It consists of a number of trays with a large tank above, and the trays are heated by a furnace underneath. The refuse in a liquid state is connected in the tank, passing thither through a large pipe. The process of solidifying begins as soon as the liquid drops on the first tray, and proceeds much in the same way as the different stages in the manufacture of paper. The residuum, or soda, is valuable. The explosion occurred about twelve, midnight, in the evaporator-room. Five or six men were in the building without permission, some, if not all of them, perhaps, under the influence of drink. It is supposed that "the generation of some gas" may have caused the explosion.

Malvern.—At a recent meeting of the local Board a letter was read from Mr. Ridler, of the Wyche, in which he stated that, in his opinion, the plans, as prepared by the Board surveyor, Mr. Sandoe, were weak and expensive, and that the design was not a good one, and could not be carried out with a certainty of success. The Board were of opinion that their surveyor was fully competent to carry out the work he had designed; and moreover, that the plans having been submitted to the Government Board, and subjected to the examination of their engineer, was a guarantee that the design was an effective one, or it would not have been passed or the sanction for the loan given; and that the proper time for Mr. Ridler to have objected to the plans was at the public inquiry held before Mr. Arnold Taylor, the Government inspector, and before the plans had received the sanction of the Local Government office. It was resolved to purchase a steam roller and crusher, at a cost of about 800L. Tenders were received and opened for the erection of a new reservoir at North Malvern; they were as follows:—T. Morgan, Malvern, 5,000L. 6,912L. 1s.; J. B. Oldham, Malvern, 5,000L.; John Everal, Malvern, 4,750L.; A. W. Ritson, London, 4,750L.; F. H. Dixon, Worcester, 4,698L. 5s.; and John Inwood, Malvern, 3,667L. there was another tender from J. H. Clark, of Warwick, but, as it was not delivered in accordance with the terms of the advertisement, it could not be considered. Mr. Inwood's tender was accepted.

The Tradesmen's Home, Bradford.—In the large central room—which, though originally intended as a reading-room for the inmates, is now used as a chapel, and as the central hall and the only public room connected with the Home—friends of the institution and of the deceased Mr. H. Harris have placed a couple of memorial windows, executed by Messrs. Camm, Bros., of Smetwick, near Birmingham. A third window is, we understand, already ordered, to be paid for chiefly out of surplus funds which were obtained for the first two, and others (either memorial or otherwise) will, it is believed, follow. The windows already completed consist of four lights, containing the following as their central subjects: the Adoration of the Magi, the Baptism of our Lord, the Transfiguration, and the Crucifixion. Above and below these, and divided from them by illuminated texts, are also the following subjects:—The Annunciation to Mary and the Shepherds, Christ and the Doctors in the Temple, the Temptation, Christ Walking on the Sea, the Raising of Lazarus, the Agony in Gethsemane, and the Entombment. The windows are designed so that the central subjects form the principal feature, the minor ones being more subdued in tone. They are placed upon a light ornamental ground, surrounded by a border of a conventional treatment of natural forms in quiet tones of colour. The windows form part of a scheme of Scriptural illustration for the whole of the windows.

New Congregational Church at Buckley, Wales.

The foundation-stone of a new Congregational chapel has been laid here. Attached to the old chapel is a graveyard, half an acre or thereabouts in extent, and in it a prominent ruin of what has been intended as a monument in honour of Nonconformity. Large stones are lying about, on one of which, intended, it is imagined, to form a part of an obelisk, there are inscriptions,—on one face, the names of "Wylliffe," "Crammer," "Ridley," "Latimer," &c., ending with "Miss Preston." The graveyard is not yet filled, and the centre of it is chosen as the site of the new chapel, which is designed by the Rev. Thomas Thomas, of Glandwr, a gentleman who is the architect of a great number of Congregational chapels in Wales, and whose style has been named "the Glandwr style." Over all it is to be 54 ft. in length and 43 ft. in breadth; inside the dimensions will be 51 ft. by 40 ft. There is to be a gallery, and the whole chapel is intended to seat 500. The contract, which is for 1,300L., has been taken by Mr. J. Williams, builder, Buckley, and the work has only just been commenced.

Concrete Building in Chicago.—The local *Tribune* says that Messrs. Farwell are erecting, on East Van Buren-street, a stable, 80 ft. by 100 ft., three stories and basement, the walls of which, 2 ft. thick from bottom to top, are composed of concrete, the elements of which are one part Louisville cement, and three parts sand, ashes, and the finer particles of burnt district *debris*. The stuff is mixed somewhat thinner than mortar, and is poured into the pine-board moulds which shape the walls, and at the same time broken brick and stone from the ruins are embedded as thick as may be in the concrete, which sets firmly in forty-eight hours, and in a few days hardens to the firmness of granite. It is then to be coated over with Portland cement, of which, also, the trimmings are composed. The cost of such a wall, while being far preferable to brick or stone for its fireproof qualities, is not more than one-half of those materials, inasmuch as the *debris* costs nothing but the handling and sorting, while no skilled labour is required in the construction.

Wolverhampton Congress of the British Archeological Association.—At the last meeting of the Town Council, a letter having been received from the hon. secretary of the Association announcing the intention of visiting Wolverhampton during the entire first week in August (5th to 10th), the following resolution was passed:—"That this council learns with pleasure that the members of the British Archeological Association have made arrangements to visit this borough in the month of August next, and that this council begs to assure the Association of the interest and pleasure they take in the proposed visit, which they trust will be made on the terms and under instruction." The mayor said he would ask every member of the council to assist him in the matter, so that he might be able to receive the members of this Association with credit to the town. Personally he would do all that he possibly could; and, considering that it was a matter of great importance to the borough, he hoped that other members of the council would do the same.

Sewage of Paris.—The sewage of Paris has been conceded for fifteen years to the Peat Ene, engineering and Sewage Filtration Company of London. For a long time the sewage has been dealt with by the Lesage Company in the most primitive manner—namely, by spreading the solid matter upon the ground to dry, causing fearful annoyance for miles around, and provoking general outcry against the barbarous practice. In consequence of protests from various Communes, a decree was issued by the Prefect of the Seine in February to the effect that the treatment of the sewage should be assigned to some company capable of dealing with the nuisance, and at the same time a special commission was appointed in whose presence competitors were required to give practical demonstration of their qualifications. Ten competitors were struck off the list as not complying with the requisite condition and the election was limited to eight, with the result as stated.

A Testimonial.—The carvers and other workmen now in the service of Mr. Harry Hemm of Exeter, in various parts of England, present their principal a few days ago,—the thirty-first anniversary of his birthday,—with a handsome scrap album, which had been made expressly for the occasion, and had been subscribed for by the whole of his employes.

Royal Italian Opera.—The production of Prince Poniatowski's opera, "Gelmira," was highly remarkable for the acting and singing of Adeline Patti, which has seldom been surpassed on the lyrical stage: still there is such bright and sparkling music in it, and it seems to us that the opera had not received that consideration which a work of this kind deserves. Performers are tired to death of the stock roles, repeated *ad nauseam*, and sigh for novelty; and yet, when novelty is attempted, it ordinarily receives with the greatest suspicion and unwillingness to be pleased. "Les Huguenots" has been given with great brilliancy, Madame Lucca distinguishing herself. Herr Koehler, who made his first appearance in England as *Marcello*, proved himself to be a sound singer and excellent actor. He made no special impression on the house, but conducted naturally to the success of the representation as a whole.

The Middlesbrough Water Supply.—Complaints have reached us as to the state of the water supply of Middlesbrough, and especially the discoloration of the water. The pollution of the River Tees above the source of the water supply to Middlesbrough, has long been a source of complaint. True the water has many miles to flow in an open river after receiving the sewage of the more populous places on its way before it reaches the more immediate sources of the Middlesbrough water supply; but the sewage of 10,000 persons is a serious consideration. The sanitary committee of the town council lately went to Middleham, Teesdale, Darlington, and Barnard Castle, with the view of inspecting the state of the river, and what they saw was by no means reassuring. Nevertheless, Mr. Thomas Spencer, who has that faith, and rightly so, in the power of oxidation and natural purification, in a river possessing such irregularities and movement as the Tees, links the apprehensions and complaints much aggregated.

The Sanitary State of Huddersfield.—Mr. Buchanan, medical inspector under the Local Government Board, who recently visited Huddersfield to inquire into the sanitary state of the town, especially with regard to the existence of enteric fever, has just made his report to the authorities. The report states that the inquiry made in consequence of forty-four deaths in "fever" being registered in the fourth quarter of 1871 in the sub-district of Huddersfield, with a population of 85,658. Various commendations are made in the report, as to the appointment of a medical officer of health and sanitary inspectors; as to the ventilation or oppression of back-to-back houses, cleaning of drains, cesspools, and privies, and the extension of water-closets, ventilation of the sewers, drains, and utilisation of the sewage, the improvement of hospital accommodation, &c.

Steam Ploughing.—A private meeting of gentlemen interested in agriculture was held at the Westminister Palace Hotel, to inaugurate the formation of a central association to provide steam ploughs at various agricultural fairs, which it was stated would be in great demand by farmers thus enabled to hire them, at rates leaving good profits to the company. Amongst the gentlemen present were the Right Hon. E. Horsman, M.P. (who presided), Mr. M. Bass, M.P., Mr. C. Wren Hoskyns, M.P., Mr. Chadwick, M.P., Mr. Haviland-Burke, M.P., Mr. Caird, C.B., Mr. J. Algeroun Clarke, &c. The following resolution was finally agreed to:— "That the extension of the application of steam ploughing is a subject of great public importance, and worthy the encouragement of all who have the means and opportunity of promoting cultural improvements."

The Early Church, Bradford-on-Avon.—It is being raised with the view to the preservation of this remarkable building, which is, indeed, unique. The church, which is dedicated to St. Laurence, was probably built towards the end of the tenth century. It consists of a nave, aisle, and porch on the north side. In the upper part of the eighteenth century the nave porch were conveyed by a member of the Bacon family for the purpose of a school for children of the parish. At that time the porch of the chancel arch was walled up and the nave and the two portions of the church being as separate buildings, the chancel being used as a cottage ever since. We have before given particulars of this interesting structure, and trust it will be carefully treated.

A Lady Surveyor.—A widow lady has been lately appointed surveyor of roads in a parish in Westmoreland, says the *Taunton Courier*. The lady had complained to the surveyor of the state of the roads, and at the next election he prevailed on the ratepayers to elect the widow herself. She accepted the office; and, as she keeps a clerk, and has ample means, she has no difficulty in obtaining a thorough supervision. It is said that she has made some awkward discoveries as to the state of the accounts. The refusal to undertake the duty of a surveyor of roads may entail a maximum penalty of 20*l*. The word used in the clause relating to the appointment of a surveyor is "person"; therefore women ratepayers are liable to be elected, and may be fined if they refuse to serve.

Monument to Mr. Charles, of Bala.—Thirty-four designs were sent in for this competition, and included several which exhibited much ability. From these a design by Mr. W. Davies, Exton-road, London, was selected; a full-length statue in Sicilian marble of Mr. Charles, in the costume of a Bachelor of Arts, in the act of pronouncing a sentence such as—"From my heart I wish all men to have the Bills." The figure is to be 7 ft. in height, exclusive of a 6 in. plinth. Underneath is a pedestal to be made of the same material, 8 ft. in height, with the base of Portland stone, 9 in. thick. The sides to be filled with inscriptions and sketches of incidents in the life of Mr. Charles. The cost is to be 600*l*.

Suffocation by Gas in a Bedroom.—A sad disaster recently befel the family of Mr. Stewart, postmaster at Mudley, near Plymouth. His wife was in her bedroom, with an infant and nurse. The latter warmed some food for the child, and must unconsciously have failed to turn off the gas in the gas-stove, thus permitting an escape of gas. When Mr. Stewart visited the bedroom about 7 o'clock he was horrified at finding the three inmates apparently dead. All efforts to restore animation to his wife proved futile, but the nurse and infant are still living, although little expectation is entertained of their recovery. Those gas-taps which have no check or catch on closing, but turn round at will, ought to be disused: they are dangerous.

Chelsea Bridge and Battersea Park.—In Parliament, the other day, Mr. Peck asked the First Commissioner of Works whether the financial position of the Government toll-bridge at Chelsea had improved or otherwise during the past two years; whether any of the land surrounding Battersea Park had within such period been sold; and when the freedom from toll anticipated and intended to be provided for by the Act of 1858 might be expected. Mr. Ayrton said the balance of the debt upon Chelsea Bridge in March, 1870, was 101,600*l*. In March, 1872, it was reduced to 92,000*l*. In regard to the land around Battersea Bridge, three-quarters of an acre had been sold for 2,250*l*.

British Association of Gas Managers.—The ninth annual conference of this Association has just terminated, having taken place in the rooms of the Society of Arts, Adelphi. The proceedings commenced with an address from the president, Mr. James Church, M.I.C.E., F.G.S. Dr. Odling delivered a lecture to the members on "The Best Means of Getting Rid of Bisulphide of Carbon." The choice of president fell upon Mr. Angus Croll, Mr. W. H. Bennett being re-elected honorary secretary. At the commencement of the conference the number of members was 360, and during the sitting seventy more were added.

The Damage to Wadhurst Church by Lightning.—A public meeting has been held in the Reading-room, Wadhurst, the vicar in the chair, for the purpose of considering the architect's report respecting the amount of damage done to the tower and steeple of the parish church by lightning. After reading the report, and discussing it, the meeting was adjourned till an estimate of the actual sum required for repARATION be submitted, and measures decided upon for the best means of raising the required amount.

Testimonial to a Town Clerk.—A presentation of several carved antique art works in metal,—namely, a pair of flagons in silver-gilt, a silver parcel-gilt cup, and a silver guild cup and cover,—has been made to Mr. Richard Woolf, lately town clerk of Worcester, and still holding important public offices there. The testimonial cost upwards of 300*l*.

A New Roof at the Walworth Coal Depot.—A few months ago the Midland Railway Company erected a large coal depot at Walworth, alongside the Chatham and Dover line, at an expense of 30,000*l*. This depot, which is, with one exception, the most spacious of its kind in the metropolis, occupying an area of 400 ft. in length by 90 ft. in width, the company are now covering in with an ornamental roof, consisting of one large span extending over the entire width and length of the depot. The estimated expense of the roof, which is composed of corrugated iron and glass, is upwards of 7,000*l*.

Walwyn's Castle Church.—The restoration of this church is shortly to be proceeded with. Some years ago difficulties of one kind or another connected with the locality caused its stoppage, whilst several portions of the sacred structure remained unroofed, and before any of the flooring had been laid. As a necessary consequence divine service has been since held in the schoolroom. Mr. H. Edwards, of Milford, has been commissioned to carry out the necessary works by the architect, Mr. E. H. Lingen Barker, to whom a vestry meeting, recently held and presided over by the archdeacon, has granted full discretionary powers.

National Health Society.—A meeting of this association, which is intended "to unite men and women in a systematic effort to promote health amongst all classes of society," was held on the 13th inst., in the rooms of the Social Science Association, when a paper was read, by Dr. W. H. Corfield, under the heading, "How to keep Typhoid Fever out of Houses." The rooms were well filled. Mr. James Heywood, F.R.S., presided; and at the close of the paper observations were made by Dr. Hardwick, Mr. Codwin, Mr. George Jennings, Dr. Elizabeth Blackwell, and others.

Civil and Mechanical Engineers' Society. At the annual meeting, held on the 7th inst., the following members were elected office-bearers for the year 1872-73:—President, Mr. C. W. Whitaker; vice-presidents, Messrs. Charles H. Rew and Geo. W. Willocks; members of council, Messrs. R. M. Bancroft, F. E. Cooper, Chas. H. Driver, C. Kingsford, William Meakin, C. J. Samuda, A. T. Walmisley; hon. treasurer, Mr. W. F. Butler; hon. secretary, Mr. Owen Ordish; hon. accountant, Mr. J. Wagstaff Blundell.

Inauguration of a Drinking Fountain at St. Alban's.—The inaugural ceremony connected with the drinking-fountain presented to this town by Mrs. Worley, and erected at a cost of 500*l*., has taken place in the presence of a large assemblage of townspeople. The fountain is placed opposite the Clock Tower. The steps and bowl are composed of granite, the final being made of yellow Mansfield Wodehouse stone, and the water issuing in four streams from animals' heads of bronze.

Consecration of a New Burial Ground at Annesley.—A new burial-ground for the village of Annesley has been consecrated. The ground, which measures 70 yards square, has been enclosed with a stone wall, and a mortuary chapel has been erected nearly in the centre. The wall and chapel are both of stone. The cost of the chapel and wall is, we are informed, between 600*l*. and 700*l*. The architect was Mr. Sanders, of Wheeler-gate; and the builder, Mr. Bailey.

Danger in Letting Railway Arches.—Last week, a fire, attended with great loss of property, broke out in the railway arches, the property of the South-Eastern Railway Company, but let out to sundry persons, some as manufactories, and others as private dwellings, situate in Hamilton-street and Payne-street, Deptford, Kent. The fire commenced in the bottle envelope manufactory belonging to Mr. Lloyd, forming three of the arches numbered 183, 184, and 185, in the first-named street.

The Guards' Institute, Westminster.—It is stated that the building known as the Guards' Institute, situated near the site of the proposed Roman Catholic cathedral in Westminster, has been purchased by the Archbishop of Westminster for 12,000*l*., and that it is to be converted into an archiepiscopal residence.

Croydon.—Mr. Baldwin Latham, C.E., has resigned the office of Consulting Engineer to the Croydon Local Board of Health, such resignation to take effect upon the completion of the works at present in progress.

Photo-Mezotint Portraits.—Messrs. Fradelle & Marshall, of Regent-street, have formed an interesting collection of portraits of celebrities, political, dramatic, musical, and otherwise, the getting together of which must have occupied some time. By peculiarities in printing, a dark background is given to each portrait, and the effect of a mezzotint obtained. In the department of literature the collection is weaker than in others.

How to Destroy Ants.—Fill small phials two-thirds with water, and add sweet oil, to float on the water to within ½ in. of the top. Plunge these upright in the ground, leaving only ½ in. standing out, near the nests or runs of the ants. Every ant will come for a sip, and go home to die. No insect can exist with oil in its throat; yet ants are very fond of it.—“C. L.” in the *Gardener's Chronicle*.

Engineering Contract.—Messrs. Andrew Handyside & Co., of London, engineers, have received from the India Government the order for the superstructure of the pontoon bridge over the Hooghly, at Calcutta. There are two bow-string spans of 180 ft., and other spans of 100 ft. and 80 ft., making up the total length of 1,528 ft. The total weight of iron is 872 tons.

Cab Stands.—The Commissioners of Police have applied to the Kensington Vestry for permission to erect a covering over the cab-stand in the Cromwell-road, opposite the South Kensington Museum. The application was referred to the works committee.

Louth Hospital and Dispensary.—The foundation-stone of an hospital and dispensary has been laid at Louth. Mr. Clark, the contractor, is progressing with the building.

The Ordnance Survey.—In reply to a question in the House of Commons, Mr. Ayrton says there is no prospect of the Ordnance survey for Lincolnshire being completed for ten years.

TENDERS

For alterations, repairs, and other works to Holy Trinity Church, Sisan-street. Mr. Arthur W. Blomfield, architect. Quantities supplied by Messrs. Widnall & Trollope:—
Field, Poole, & Sons £1,698 0 0

R. DIXON, GRAINER and MARBLER, 5, HUNTLEY-STREET, Tottenham Court-road, London. ESTIMATES FURNISHED.

W. H. BARBER, Surveyor, 12, Buckingham Palace Gardens, W. Twenty years with Messrs. Myers and Mansfield, REMOVED his OFFICES to the above address. Quantities and Estimates prepared, and every kind of assistance rendered on moderate and liberal terms.—Address, T. H. No. 14, Argyle-street, Kings-cross, W.C.

PERSPECTIVES, COMPETITION or WORKING DRAWINGS, PLANS of ESTATES, &c. artistically PREPARED by a first-class DRAUGHTSMAN and COLOURIST, at his own rooms, on moderate terms.—Address, T. H. No. 14, Argyle-street, Kings-cross, W.C. DESIGNS of every Description PREPARED by a Gentleman who has, for seventeen years, been almost exclusively engaged upon this class of work. The Advertiser has been employed upon the majority of the largest and most successful competitions of modern times; he cannot offer references, inasmuch as his engagements have been of a strictly private and confidential character. His services would be found valuable to gentlemen whose training has led them into the more practical portion of the profession. Address, ARCANUM, 44, Warrior-road, S.E.

PUPIL.—A CIVIL ENGINEER, having a position of considerable magnitude in operation, has a VACANCY in his Office for a PUPIL. The district in which the work is situated being one of considerable extent and importance, affords unusual opportunities for the advancement of engineering experience.—Address, A. B. 21, Grosvenor-street, E.C.

PUPIL WANTED.—A VACANCY for an ARTICLED PUPIL exists in the London Office of an ARCHITECT and SURVEYOR, with the advantage of the Principal's personal attention and supervision.—Address, A. B. care of Mr. Bell, No. 21, Strand, W.C.

TO PARENTS and GUARDIANS. AN ARCHITECT, in a healthy water-garden, place having an extensive business practice, and holding a discretionary appointment, has VACANCIES in his office for TWO ARTICLED PUPILS, who will be carefully instructed in the art of the profession, as well as the practical branches of the profession. The best references given and required.—Address, CHARLES NOEL ARMPFIELD, York Terrace, Surveyor, Architect, Whitby.

PARTNERSHIP.—The Advertiser, who has a thorough knowledge of the building business in all branches, wishes to meet with a PARTNER, to join him in forming a contract and jobbing business, or would join an established builder.—Address, N. Y. Post-office, Ball's Pond-road, W.C.

ROAD FOREMAN.—The Vestry of the U. Parish of Lambeth desire to engage the services of a competent person as a ROAD FOREMAN. He must write a good hand, be well acquainted with figures, be active in spirit, health, and not over forty years of age. A practical man who has had experience in road work and management will be preferred. Applicants' testimonials to be sent not later than THURSDAY, the 28th inst., addressed to the Committee for General Purposes, Vestry-hall, Kennington-green. The rate of pay will be 20s. per week.—By order, THOMAS HOBBS, Clerk to the Vestry. Vestry-hall, Kennington-green, June 20th, 1872.

WANTED, immediately, in the Borough Surveyor's Office, Nottingham, a competent LEVELLER, SURVEYOR, and DRAUGHTSMAN. One used to extensive works preferred. Salary, 24 2s. per week.—Apply, M. O. TARBOTTON, City Municipal Office, Nottingham.

WANTED, an experienced QUANTITY SURVEYOR'S ASSISTANT, who can take off, also make up accounts. A good draughtsman preferred. Salary, experience, reference, terms.—Address, 41, Office of "The Builder."

WANTED, a good ASSISTANT, in an Architect's Office—Apply to an "Advertiser's" Office, Coventry, stating age, terms, and qualifications.

WANTED, for a few weeks, an ASSISTANT, expeditiously—Apply, between Ten and Four, to H. & S. 7, Haverly-place, Bow-road, E.

TO ARCHITECTS' ASSISTANTS. WANTED, in a London Office, an ASSISTANT, with drawings, to Mr. CHANCELLOR, Architect, Finney, Bank, Old Broad-street.

WANTED, in a Building Contractor's Office, an ASSISTANT. One who is thoroughly competent to measure up work, take out quantities, and prepare drawings. One who has served his time in an architect and surveyor's office preferred. Apply by letter, stating age, qualification, and salary required, to ALPHA, Post-office, Abingdon.

WANTED, by a BUILDER, an ASSISTANT, who can undertake the duties of a General Foreman, and assist as Book-keeper. He would eventually be required more especially for the home department. Should be Carpenter and Joiner by trade.—Address, in own handwriting, stating age, terms, qualifications, and references, to I. FOSTER, Stationers' Street, Bucks.

TO ARCHITECTS' ASSISTANTS. WANTED, a JUNIOR ASSISTANT, who is competent to get out working drawings complete. Drawings to be forwarded, with particulars of salary, age, and previous engagements, to Mr. GEORGE BIDLAKE, Waterloo-road, Wolverhampton.

WANTED, a PAINTER and PAPER-HANGER.—Apply, T. BURGESS, 65, Tottenham-avenue, Camden-road, N.W.

WANTED, a CUTTER and LEAD-WORKER. Constant work for a good workman who is steady.—Apply to Mr. DRAKE, Stained Glass Works, Exeter.

WANTED, an experienced Man in the Valuation of PROPERTY for Rating Purposes.—Apply by letter to S. H. L. care of Mr. William Allison, 33, York-chambers, King-street, Manchester.

WANTED, a good WORKING FOREMAN of BRICKLAYERS. Competent to set out and superintend all the brickwork, brick arches, &c. in a large brick building near Oxford.—Apply to T. S. ORCHARD, Brixton, Brixton.

TO BUILDERS' FOREMEN. WANTED, by a London Firm, an experienced FOREMAN, to superintend the erection of extensive mill works and dock-sheds with machinery near London.—Address, stating age, where, and for how long last engaged, the salary required, and particulars of qualifications, to 979, Office of "The Builder."

WANTED, an energetic WORKING FOREMAN of CARPENTERS and JOINERS. Well up in all branches of the trade. No one need apply who cannot produce three years' testimonials from last situation.—Address, with age, references, &c. to No. 53, Office of "The Builder."

WANTED, a first-class FOREMAN of PAINTERS for London and a country job. Must be used to good work, and thorough management of men. None will be treated with but those with first-class testimonials.—Apply by letter, stating age, salary, and references, to A. E. the Groverian Library, 35, Chapel-street, Brixton-square, S.W.

WANTED, immediately, a good GRainer and PAPER-HANGER, who would not object to fill up his time with other work.—Apply to H. B. BLAUNT, Watlington-street, Derby.

WANTED, a respectable, intelligent JOBBING MAN, to attend to the letting and repairs of a large estate of new houses near London. Must be able to do all kinds of jobbing work and repairs himself, able to read and write, and of sober, steady, and industrious habits. Good character and security required. A fixed salary and commission, and a house to live in.—Apply fully by letter, addressed, Mr. WRAY, Surveyor, 10, Lincoln-inn-fields, W.C.

TO MACHINISTS. WANTED, a MAN, to WORK a GENERAL JOINER and CIRCULAR SAW-BENCH. Permanent Situation to suitable Man.—Apply, stating wages required, references as to competency and sobriety, to RICHARD YATES, Builder, Shifnal, Salop.

WANTED, an intelligent young Man as a CLERK, and to collect all water and fitting accounts for the Linton Water Company. Only those who thoroughly understand bookkeeping by double entry need apply. Applications, stating age, and salary expected, to be sent on or before WEDNESDAY, the 28th of JUNE, addressed to—THOMAS F. MIDDLEMISS, Engineer and Manager, Linton, Beds.

TO FOREMEN.—WANTED, on a large estate in the country, a thoroughly competent Man as WORKING FOREMAN of JOINERS, and with a good knowledge of Carpentry and Roofs. Must be a fair draughtsman and good estimator of work, a good judge of men's abilities, steady and active, not given to change and discontent. Only those applications containing the full particulars of age, experience, number in family, references both business and moral, and wages expected, will be noticed.—Address, ESTATE WORKS, Office of "The Builder."

TO ENGINEERS and SURVEYORS.—In consequence of the Surveyor to the Aldershot Local Board of Health having through illness resigned his Appointment, the Board have by their RESOLUTIONS from parties competent to undertake the said duties of SURVEYOR and COLLECTOR of all RATES levied by the Board. The person appointed will be required to devote the whole or his time to the duties of his office, and preference will be given to applicants who have held a similar appointment, or who can be recommended by a member of the Institution of Civil Engineers by whom they have been employed, or who are themselves members or associates of that Institution. The civil population of Aldershot is about 9,000, and the present rateable value is £40,000. Letters of application, accompanied by testimonials, stating age, health, and salary required, to be forwarded to me on or before SATURDAY, the 23rd inst. THOMAS W. H. BAYLEY, Clerk to the said Board. Station-road, Aldershot, 7th June, 1872.

WAREHOUSEMAN WANTED, in a Wholesale Lead, Oil, Colour, and Varnish Warehouse. One who understands the business. Apply to STARK, LAW, & WHITEMAN, the Grove, Southwark street, S.E.

TUNBRIDGE WELLS LOCAL BOARD. WANTED, by the Waterworks Committee, a thoroughly practical Man, to inspect House Fittings, Conduct Services to, and Lay and Joint Mains, &c. Salary, 35s. per week. Applications, with testimonials, to be forwarded to me, endorsed "Inspector," on or before the 6th JULY next. THOMAS LEWIS, Town Hall, Tunbridge Wells, 18th June, 1872.

CLERK OF WORKS.—WANTED, immediately, an experienced Man, who has acted previously in the above capacity, to SUPERINTEND the ERECTION of a number of COTTAGES and HOUSES in the North of England. Salary, 30s. per week. Applications, with testimonials, to be forwarded to LEWIS HORNBLLOWER, Architect, Bullie—buildings, Bedford street, Liverpool, N.B. As the whole of the houses will be built of concrete concrete no one need apply who has not had experience in that material.

ASSISTANT WANTED, for Plain Drawing and Writing. Terms, 12s. per week.—Apply by letter, stating particulars, to Mr. GLOVER, 9, Blomfield street, E.C.

WANTED, EMPLOYMENT, by a first-class GRAINER and MARBLER (Piecework).—Address, I. J. No. 151, Carlow-road, Kentish-town, N.W.

WANTED, immediately, EMPLOYMENT, as DRAUGHTSMAN, COLOURIST, QUANTITY CLERK, &c. And 30s. (Married). Town or country. No objection to a country builder's, contractor's, engineer's, &c. Terms from 32s. 6d. weekly.—Address, D. at Fackergill, Ware.

WANTED, an ENGAGEMENT, by an ARCHITECT. Has been Managing Assistant and in practice on own account.—Address, ARTIST, 17, Seymour-street, Easton-square, N.W.

TO CIVIL ENGINEERS, &c. WANTED, a permanent ENGAGEMENT as DRAUGHTSMAN. Has been engaged for the past sixteen years on plans, &c. or large public gas, water, and drainage works, and previously in connection with an architect. Good references. &c.—Address, C. E. 24, Stockbridge-terrace, Finsbury, London, S.W.

TO ARCHITECTS, BUILDERS, &c. WANTED, an ENGAGEMENT, by a thoroughly practical CLERK OF WORKS, or BUILDERS FOREMAN, or CLERK OF WORKS, or a combination of these. First-class testimonials and references. Over twenty years' experience in all branches. Joiner by trade. Age 40.—Address, A. D. B. Mill-hill, Westcote, London, N.W.

WANTED, a RE-ENGAGEMENT, as SHOP FOREMAN of JOINERS.—Address, T. 10, Alfred-street, Coleridge-row, Islington, N.

TO BUILDERS AND CONTRACTORS. WANTED, a RE-ENGAGEMENT, as GENERAL FOREMAN, Joiner by trade. Good references. Age 31. Town or country.—Address, S. M. Park Cottage, Station-road, Wood-green, London, N.

TO ARCHITECTS, SURVEYORS, &c. WANTED, a RE-ENGAGEMENT, by an ARCHITECTURAL ASSISTANT, of ten years' experience in London. First-class references. Terms, about 15 guineas per week. Address, H. G. care of Housekeeper, 54, King William-street, E.C.

TO BUILDERS, SMITHS, AND OTHERS. WANTED, a RE-ENGAGEMENT, by a thoroughly practical SMITH and FITTER; also well up in hot water, steam, and gas work. Town or country; would not object to go abroad.—Address, 266, Office of "The Builder."

TO BUILDERS AND CONTRACTORS. WANTED, a RE-ENGAGEMENT, as WORKING FOREMAN (PLASTERER), or piece work. Understands plain and ornamental plastering. Well experienced in getting out working drawings. Good references. Town or country, or the local works.—Address, I. TROSKI, 47, Birkbeck-street, New Town, Deptford, Kent, S.E.

TO BUILDERS AND CONTRACTORS. WANTED, a RE-ENGAGEMENT, as GENERAL FOREMAN OF WORKS, by a thoroughly practical and energetic man, who has considerable experience in building construction. Can make out all necessary details for the guidance of workmen. Carpenter and Joiner by trade. Town or country. Good references.—Address, A. V. 21, Old Kent-road, S.E.

WANTED, by a respectable Youth, a SITUATION in a BUILDERS OFFICE.—Address, H. M. No. 136, Marylebone-road, W.

WANTED, by a Young Man, a SITUATION as PLUMBER. Willing to fill up his time in painting and glazing. Has a thorough knowledge of the trade.—Address, H. H. No. 5, Charlotte-place, Finsbury-green.

TO ARCHITECTS, CONTRACTORS, BUILDERS, &c. WANTED, by a Young Man, a SITUATION as ASSISTANT. Is a good draughtsman, clean book-keeper, and has been used to superintending works. Good references. Address, W. K. 25, Bedford square, Brighton.

WANTED, by a Young Man, a SITUATION as TIMEKEEPER, and to fill up his time at the bench. Has had seven years' experience in the trade. No objection to travelling.—Address, A. D. L. Mr. Cunningham's, Market-place, Bexley Heath, Kent.

TO TIMBER MERCHANTS, &c. WANTED, by a Young Man, aged 26, a SITUATION as CLERK, or otherwise, in the Office of a Timber Merchant, or in a house of business where a good knowledge of the timber trade would be useful. References from previous employers unexceptionable.—Address, M. N. 7, Bond street, Fenchurch-lane.

WANTED, by the Advertiser, an ENGAGEMENT as ASSISTANT in the Office of a London Architect. Temporary or otherwise.—Address, C. S. 8, (House) keeper's 13, John-street, Adelphi, W.C.

TO ARCHITECTS AND SURVEYORS. WANTED, by the Advertiser, aged 21, a permanent ENGAGEMENT, as JUNIOR. Four years and a half experience. Neat draughtsman. Good references.—Address, A. 1, Wellington-grove, Greenwich-road, Greenwich, S.E.

TO ARCHITECTS. WANTED, by the Advertiser, an ENGAGEMENT, as JUNIOR ASSISTANT. Neat draughtsman and competent. Salary moderate.—Address, 36, Office of "The Builder."

TO ENGINEERS AND SURVEYORS. WANTED, by a PRACTICAL SURVEYOR, an APPOINTMENT as MANAGER, either in the office or to superintend works. Has had considerable experience in land and town surveying, drainage, railway works, and accounts.—Address, G. T. Office of "The Builder."

ARCHITECTS, SURVEYORS, AND BUILDERS. HOUSE AND ESTATE AGENTS, respectively, should send stamped address to the Principal Manager, for the name of the most extensive reference. Architects in the Kingdom.—Address, PERSEVERANCE, 13, Essex-street, Leicester.

A RE-ENGAGEMENT WANTED, as CLERK OF WORKS or GENERAL FOREMAN in Chamberlain's Office, or in the country. Address, W. F. 1, Prospect-Rochampton.

A GRAINER and MARBLER, of 10 years' experience, wishes for a JOB, PIECE WORK, Town or country.—Address, A. E. 24, Chaper-street, Edgware-road, N.W.

TO BUILDERS AND DECORATORS. A RESPECTABLE Young Man is open to an ENGAGEMENT, for a permanent office, as a competent PAINTER, PAPER-HANGER, and GLAZIER. Country preferred.—Address, J. R. Myrtle Cottage, Springfield-road, Colney Hatch.

TO BUILDERS AND DECORATORS. A STEADY, married Man, wishes an ENGAGEMENT as a JOBBING HAND, in Paper-hanging and Glazing. Can do plain zincwork and gilding. Expensive. &c.—Address, R. E. M. 16, Silchester-terrace, Brunley-road, N. Hill.

A good general PAPER-HANGING PAINTER, GLAZIER, &c. Town or country.—Address, STANOR, 1, Lewin Cottages, West-fildes, Barnes.

TO BUILDERS AND OTHERS. ANY CLASS OF JOINER'S WORK, to be done by the PIECE. Labour only. Good references given.—Address, C. B. Strudal's Coffee-house, 161, Drummond-street, Hampden-road, N.W.

TO BUILDERS AND OTHERS. AN experienced GENERAL FOREMAN (a Joiner) WANTS an ENGAGEMENT, in the Office of a Works, or to Take Charge of a Jobbing Firm. Is a good draughtsman and can estimate and measure up work, &c. Age 36. Salary, &c. Good references.—Address, A. B. Post-office, Duke-street, Chester-square, W.

MORTGAGES.—Several Sums of MONEY ready to be ADVANCED on MORTGAGES of HOUSES, COLLEGE LIBRARIAN, or approved London. JOSEPH HAYNES, Solicitor, 3, Warwick-court, Gray's-inn, W.C.

The Builder.

VOL. XXX.—No. 1534.

On Scale in Art.

THE word "scale,"—originally adopted from the Italian language, as expressive of the steps by which magnitudes increase or diminish,—may now be considered to indicate a special department of aesthetic study. We are in the habit of constantly using the term. It does not mean size, although it is intimately connected with that quality; but it may be most simply defined as expressing the relation of form to size. In the investigation of the subject we, therefore, come in contact with two distinct orders of relation—namely, the mechanical and the optical. Harmony of scale comprehends both the propor-

tions which the parts bear to the whole, the mechanical requisites of both being properly regarded, and the effect produced on the eye of the beholder, the actual size and relative distance of the object being duly determined.

Nature herself has taught those who study her works, how implicitly she is bound by the law of scale. All organic growth and development is limited by this great principle. The range of scale, which is primarily determined by the size of the earth itself, or, more correctly speaking, by the force of gravity on the surface of the planet, applies to the different great provinces of the organic kingdoms with a precision that is distinctly intelligible. Thus the widest range is found, as might be expected, in the vegetable kingdom. Among plants we find a perfect gradation of size, from the microscopic forms of the parasitic *fungi* to the lofty spires of the cone-bearing trees, the monarch of which, the *Wel- lingtonia gigantea*, springs to a height of 300 ft. Among animals, the range of scale is determined by the shade and habit of the class. Thus aquatic animals, of each of the three great provinces which are defined by the character of the nervous system, vary in size almost as much as vegetables themselves. The floor of the Atlantic is gradually rising in consequence of the deposit of the *exuvie* of the microscopic creatures that form the chalk *strata*. The bulk of the whale attains a magnitude which would render locomotion on land painful, if not impossible. Not only the marine animals proper, but the terrestrial animals of marine habits, are remarkable for the large size which they attain, when compared to their earth-inhabiting congeners. A full rotundity of form, admirably suited for flotation, marks the hippopotamus as the representative, in the equatorial lakes and rivers, of the great pachydermatous family now gradually becoming extinct.

In terrestrial animals the scale is more limited. The height of the giraffe and the bulk of the

elephant are small when compared to the proportions of the whale. On the other hand the smallest terrestrial animals are large in comparison to millions of the aquatic tribes. Among the vertebrate animals, the shrew-mouse is one of the tiniest forms. But this little mammal is gigantic when compared to the whitelait or the stickleback. The more minute air-breathing articulate animals, among which some of the spider and scorpion group may be cited, are rather aerial than terrestrial animals. Among those creatures that fill and inhabit the air, again, the limit of scale is still further reduced. From the wren to the condor is a range of size far less than from the shrew to the elephant. The class of insects proper, consisting of the six-legged orders, the greater number of which possess, at one period of their existence, two or four wings, contains no non-parasitic species so small, nor any so large, as those of the earth-haunting spiders and scorpions; a group, again, which is far more restricted as to range of size than the water-breathing *articulata*—the crabs and their congeners. We can understand how this distribution of animal forms according to scale is made, on mechanical grounds. The extreme limit of size attained, in any class or order, is determined by the capacity of the animal for free, independent motion. Those creatures that have their weight borne by the water in which they disport themselves, are able to combine great activity with enormous bulk. Those which have to bear their own weight, and to move, step by step, over the earth, are necessarily restricted to more moderate dimensions. Those that have, by their own mechanical powers, to raise themselves in an element lighter than their bodies, are, with equal justice, the most narrowly limited, not only as to size, but as to plan. Thus a few molluscous species are true terrestrial animals, but there is no aerial mollusc.

The observance of exactitude of scale may thus be seen to characterise the whole order of organic life. Within the comparatively narrow limits which the artist ordinarily contemplates, the mechanical causes which influence scale are less diverse. Still, they cannot with any safety be disregarded. In the variation of human stature, as in that of all moving tribes, the constant energy of mechanical law is to be observed. Gravity never sleeps. While the height of any form increases in a simple proportion, the augmentation of bulk that symmetrically accompanies this increase of height is in the ratio of the cubes of the linear dimensions. A well-grown man exerts on that portion of the ground on which his feet stand a pressure of about 9 lb. on the square inch. In walking, lifting one foot, and throwing the weight of the body on the toes and fore part of the sole of the other, this pressure will rise to from 20 lb. to 30 lb. per square inch. Raise the stature of the man to the 9 ft. which have been attained by well-known giants in modern times,—not to mention the stature of 12 ft., which the students of teratology declare to be not monstrous,—and the pressure on the foot will demand an increase of area to support it considerably greater than will be consistent with retaining the length of the foot at one-seventh part of the height.

It is difficult to tell how far this mechanical aptness is apprehended by the instinct of the artist. Men who are familiar with the construction of machinery attain a very accurate instinctive knowledge of the strength of materials, and of the due proportion of parts. It is thus quite within the limits of possibility that the incongruity which must actually result from enlarging or diminishing the size of a figure, in actual execution, while maintaining the unchanged proportion of its parts, is perceptible and obvious to the true artist. How far this mechanical law of scale may be appreciated, is a matter of individual capacity. As to its existence there is no room to doubt.

With regard to the optical causes that influence scale they are twofold, or, if we separate the study of colour from that of shade, threefold. They correspond to the division laid down by Leonardo da Vinci of linear and aerial perspective.

The first of these conditions is simply geometric. It regards the object,—sculpture, relief, or even painting,—as visible from a given point of view. Thus, if we take a statue of 6 ft. high, the difference in the apparent length of the *tibia*, when regarded from a distance of 18 ft., between that apparent when the figure is placed on the ground and that when it is raised on a pedestal 3 ft. high, is distinctly appreciable. In the case of a colossal figure, the correction that it is necessary to make in order to render the image formed on the retina symmetrical is thus very considerable. Geometry will furnish the leading rules for these corrections. But it can be only by the erection of a model in the proposed conditions, and by correction of the details that will then be found unexpectedly to offend the eye, that the sculptor can hope to succeed in a colossal work.

The laws of linear perspective may, as we have said, be geometrically stated. It is otherwise with that subtle variation of light and of shade which is called aerial perspective. Leonardo conceived that the diminution of clearness in outline which accompanies increase of distance was produced by the interposition of a greater thickness of air, or aerial matter. We now more simply regard it as a result of the decreasing quantity of light, reflected from the object that reaches the eye. But the aesthetic truth is independent of the scientific theory. We know that, independently of any intervening obstacle, objects become more and more indistinct as they are removed further and further from the observer. Not only do colours pale, and shades become less sharp, but (in consequence mainly of the latter changes), features become obliterated. Military men are accustomed to judge of distances by the clearness with which features or forms can be distinguished. The figure of a man, thrown on the sky, or on a background that contrasts with the colour of the skin or of the clothing, can be recognised when it appears almost microscopic. But if we represent the human figure, as did the Greek gem-cutters, of a size such as that which would indicate the distance, let us say, of a quarter of a mile, it is evident that the natural object is totally unlike the miniature sculpture. In the former, a dim, shadowy, indistinct spot has about it a something which tells of humanity. Look at it through a good telescope, and the lineaments become more clear, but they are still subdued and unpronounced. Now look at the gem. There we find clear, sharp lines, indicating both form and feature. Nothing is indistinct, nothing blurred. If we use a magnifying glass, instead of finding the figure gradually become more distinct, as in the former case, we only find that it is less critically perfect than it appeared to a good vision. In fact, the gem-cutter has seized the salient features, and produced what, exquisite as it is, is really a caricature. It is an appeal rather to the educated sense than to the natural perception. It may be beautiful, characteristic, wonderfully perfect and exact; but it is as unlike a man seen at the distance which would produce a corresponding diminution in size as can well be imagined. As an example, we find, by actual enlargement by means of the camera, that the head of Theseus, in one of the finest antique intaglios known, is one-sixth, instead of one-eighth, of the height of the figure.

In indication of any but the boundary outline of the figure, and even in the sharpness of this outline, the work of the microscopic or miniature artist is thus always characterised by a conventional treatment. It may be exquisite,

but it is unlike nature. A natural form can by no means be so presented to the eye. Between actual or apparent size, and sharpness of delineation, there is a relation in nature which does not prevail in art. The difference in shade is a portion of the same optical relation.

There is also another consideration regarding both *chiaroscuro* and colour. If a given quantity of black and white wool be mixed together in a fabric, it gives a certain tone of grey. If the same proportions be wrought into a pattern,—as, for instance, into a check,—the effect on the eye produced by the textile fabric will materially differ, according to the size of the squares. The apparent texture of the material will be appreciated mainly in consequence of this size. A large checked pattern will be visibly particoloured. The homogeneity of the tissue will seem to be greater, the smaller we make the pattern, till we come down to the intermingling of fibre with fibre.

Independently, then, of any fading of colour or of shade, the mere effect of difference of distribution caused by the alteration of the size of the pattern, or of the breaks and shadows in tint, gives a totally different impression to the eye. We speak of it as denoting a difference of texture,—but the result is not that alone. The whole effect of the object is changed. This is most distinctly apparent in the case of the enlargement or diminution of an engraving, by means of photography. We can refer to some of the finest engravings in existence, which have been reproduced by the camera in two or three sizes. Nothing can be more exact than the action of the lens; while keeping well within its optical limit, the reduction is strictly proportionate; but to the effect on the eye, *La Bella di Tiziano*, and the “Congress of Münster,” on a larger or smaller scale, are absolutely different things. No one can compare them without being struck with this fact. The smaller print has little or none of the charm of the larger one, and we think that it is clear, from the above considerations, why such is the case.

We have selected the simplest case, that of the admixture of black and white, in constant proportions, but with differing degrees of coarseness or fineness in the mode of mixing them. In the case of colour, the operation of this same law is even more striking. We have seen instances, lately, of the reproduction by chromolithography, on a reduced scale, of large and highly-finished landscapes. No pains or cost have been spared to make these pictures effective. As many as thirty distinct stones have, in some cases, been employed. The forms of the landscape have been, or may be, reproduced with absolute accuracy of proportion. But it must be remembered that a reduction to one-fourth the length and breadth of the original, is a reduction of any given spot of colour to one-sixteenth of its original size. If the tints of the larger picture be matched, there will be a series of contrasts in the smaller one so bright and glaring, as to produce altogether a different effect. If the tints, on the other hand, be toned down, we require the guidance of an amount of artistic skill and feeling which is tantamount to repainting the picture. No artist can have justice done to a painting, by a coloured reproduction on a smaller scale, without the process of repainting, including the due modulation of tint and shade proper for the altered scale, be judiciously effected.

In this view of the reduction of paintings we see, without any disguise, what actually occurs in all cases of reduction. In engravings the same rule may be shown to apply. No less is it the case with regard to sculpture. Whether we regard sharpness of outline and delineation of feature, or depth and modulation of light and shade, mechanical reduction in size does not give harmonious reduction in scale.

The observance of this natural law is not without its application to the works of that school of art, which has had an episodic existence in this country, under the name of Pre-Raphaelitism. Like theological heresies, it owed its origin to the sudden appreciation of the fact that a great truth had been hidden or overlooked. The leaders of this movement were revolted by the slovenly representations of natural forms which painters were too often contented to employ. They saw that the conventional treatment of nature was imperfect. But, instead of endeavouring to perfect what must ever be to some extent conventional, they sought to introduce what they thought was a natural treatment. Had they, in very deed, attained to this, they would have held the rank of reformers of art. But they failed to

effect this object because they forgot a great truth, no less important than that which they sought to establish. Nature may be studied in the minutest detail; but she is only appreciated in the *ensemble*. Push the investigation of the details a flower to a certain point, and instead of a flower-painting you produce a botanical diagram. Indicate too sharply the muscles, and you have an anatomical, not a pictorial, representation. The flower will entice you from a distance by its brilliancy or its fragrance. It will woo you to pluck it, to wear it,—to decorate the glory of raven or amber locks with its contrasted snow, or ruby petals; or even to tear it to fragments, with the cruel delight of the botanist, to count its anthers, and to admire the mechanism of its stigma. But the flower in the wood, in the hair, and under the magnifying glass, is, to a certain extent, in each case a different entity. In the former cases it is a part, and in the first a very small part, of the scene taken in by the eye. In the latter instance it occupies, not only all the attention, but all the field of vision. Now if, in landscape, or *genre* painting,—where flowers, to keep to the former illustration, form a very subordinate part of the general view,—they be depicted by the limner with the exact knowledge, and clear definition, which a special study of the species renders easy to his hand, the result is not nature, but something worse than slovenliness. A stroke of charcoal, or a dab of colour, rightly thrown in, so as to give the characteristic effect produced by any given detail in glancing at the *ensemble*, is more true to nature, more masterly, and more artistic, than an elaborate finish which is altogether out of scale.

In some of the recently exhibited works of modern English artists, this absence of truth has spoiled pictures that possessed elements of great merit. We see pretty women, in graceful attire, amid garden or woodland scenery. Look how faithfully the artist has laboured. Not only can you tell the very tint of the eye, the texture of the robes, the specific character of the gems worn as ornaments, but the class and order of any flower in the garden. The labour expended on these compositions, truthful as they are, if considered as diagrams, would, if rightly directed, have produced noble pictures. The appreciation of beauty is there, and the power of delineation, but the artist is ignorant of scale.

Nothing will more strikingly contrast with the enamel-like execution to which we refer as the rough sketches of a man of genius. Look, for example, at those of Gainsborough. It is not too much to say that this artist has produced works, especially in portraiture, of equal merit to those of any painter whatsoever. The “Parish Clerk,” for instance, may be advantageously compared, as to all that constitutes a noble and imaginative work of art, with almost any portrait of Van Dyck, of Rubens, or of Titian. But in Gainsborough’s landscapes there is the free, broad touch of the man who looked at nature, when the fresh breeze gives elasticity to the tread, and some slight dimness to the eye, and not under the roof of an academy. His sketches are yet more marvellous. There was one among a group in the possession of the late Dr. Monro, which merely gave a rustic peep, a tree and a hovel,—a donkey and a cart. That donkey, at the distance of the length of a large drawing-room, was *alive*. It did all but bray; and yet, when you came close, you could not distinguish either the eye or—still more essential feature—the ear. Some smudge or blot there was, but what you could not tell; nothing, it would seem, but an accidental mark; and yet, at a fit distance, the whole character and life of the animal had been thrown on paper in that hasty scrawl. A wonderful appreciation of the law of scale was one of the main elements of his grand artistic power.

One result of this view of the subject of scale is an explanation of the generally offensive character of photographic portraits. In the ordinary *carte de visite*, a full-length figure is reduced to from one-twentieth to one-thirtieth of its linear dimensions: that is to say, the area visible to the eye is reduced to the 1,400th, or even to the 1,900th part. In cases where the face alone is represented, we may reckon the reduction at a sixty-fourth. All the relations of light and shade are troubled by this reduction. We have neither the effect which is produced in nature by removal to a considerable distance, nor the effect which is produced in art by the miniature-painter or the gem-cutter, by the prominence instinctively given to the main traits of character.

We have something which has, indeed, perfect mechanical proportion, but which is neither natural nor artistic. It is like the geometric elevation of the architect or engineer,—a design drawn to scale,—a diagram, not a picture.

Photography can never contend with this fatal obstacle, when great reduction in size is made. And the reason why large photographs are so much more satisfactory than smaller ones thus becomes apparent. With the increase of reduction both the change of surface texture and the contrast between actual delineation and that of either nature or true art become greater. The admirable products of the camera, where size is little varied, are familiar to us all. So is the dissatisfaction produced,—we know not why,—by a reduction from which we might not unreasonably expect the most exquisite results. It is not the absolute dearth of beautiful faces to portray which makes the inspection of an album of photographic portraits so different from that of a drawer of gems or of medals. Art has her own province. She reigns supreme within her own precincts. Mechanism can do much, but cannot produce miniature. Perfect as a mechanic, the sun is inferior to man as an artist. Or rather he refuses to apply, under optical constraint, that power which, in simulating the subtle forces or organic chemistry, make beautiful the life of nature.

STREET ARCHITECTURE IN THE NEIGHBOURHOOD OF PICCADILLY.

SOME new shops and offices in Jernyn-street may be cited as an example of the common-sense style of street building, with no pretension, and little ornament, but that little well considered and well applied. The buildings comprise shops on the ground floor, with wide windows with lintel-heads, carried by heavy square pilasters, and offices in the upper stories. The main part of the building is of plain red brickwork, slightly relieved by bands of white, which, however, do not show very strongly now, and will, we fear, even be practically obliterated. The design is of the simplest possible kind; in the offices, long window openings, with round arched heads, are taken up through the first and second stories, the two floors being divided externally by a stone panel, ornamented with carved foliage of the elegant and flowing but symmetrical character which the architect, Mr. Truefitt, has usually adopted in his works: the heads of the windows above are filled with work of the same character. Above these the third-floor windows are decorated with ornamental iron balcony balustrades, somewhat after the French fashion; the keystone of the window arch below is worked so as to form a bracket and support for the centre of these balconies, in a somewhat novel manner. A string course divides off a perfectly plain attic, which is finished by a smaller string course, rather than cornice; the architect apparently regarding a marked projecting cornice as unsuitable for buildings in comparatively narrow streets. There is a good deal to be said in favour of this view; and there is no doubt that street buildings are often designed with cornices and enrichments at the top which, though they look well on paper, aid in shutting out valuable light, while at the same time their details and decorations are perfectly valueless from the position in which they are placed. We should have liked to see a rather heavier pier at the angle of the building on the ground-story, and also some kind of feature above to relieve the extreme plainness of the design at this corner, which can be seen from three different directions. While recognising the good taste and good sense displayed in the treatment of the building, we should stipulate for a little more varied skyline, a little more attempt at picturesque effect in grouping of windows, &c., in future new street buildings in the neighbourhood. Mr. Truefitt’s straight and plain attic, carried along the whole of Jernyn-street, would have a somewhat depressing effect on the mind’s eye.

This kind of charge, at least, cannot be brought against the tall, narrow block of building which has recently risen up in Piccadilly, not far from Burlington House, the specialties of which bring occasional passers by to a stand in the street to look and comment. These are the new premises of Messrs. Sotheman, Baer, & Co., publishers, built from the design of Messrs. Vanhagen & George, a drawing of which we incidentally noticed as among the architectural contributions to the International Exhibition. The architects

have aimed here at a striking and picturesque effect, for which the wide thoroughfare of Piccadilly affords excuse and opportunity. The style may be described as Gothic, of a modern type, and very freely treated, based upon the earlier Medieval style. Above the ground-floor (shop) window, long square-headed window openings are carried through the first floor, the piers between, decorated with small panels of foliage so placed in regard to the height of the openings, as to suggest the idea of an impost, though this feature in reality does not appear. The second-floor windows are deeply recessed, having a balcony before them with columns carrying the superstructure; it is this recess, and the appearance of the columns relieved against the dark shadow, which really gives force and picturesque interest to the front elevation, and one cannot help remarking how much such incidents of light and shadow in a building (not difficult to obtain), would do towards relieving our streets of their tame and monotonous aspect. The third story is occupied, in the piers between the lights, by panels filled with carved representations of scrolls, manuscripts, &c., and the date of erection; over these a dormer serves to break up the skyline and give point to the composition. There is a certain want of unity in the composition of the front; the various portions are not quite in keeping with each other; and some features, as the carved panels referred to in the lower piers, seem a little too accidentally placed. These defects do not belong to the return face of the building, up Swallow-street, which, on the whole, is architecturally the best portion, being simply and broadly treated, with rows of windows connected by bands of carved foliage, and with the spandrels of the pointed arches over them filled up with a wall-diaper. What, however, gives, in the eyes of most spectators, its individuality to this building, is the coloured decoration in the form of pictorial designs on tiles on the front and part of the side elevation. These comprise figure-subjects, about one-third life-size, designed in the flat conventional manner which the material renders necessary, but not without freedom of line and grace of composition. Immediately over the ground-story are allegorical figures, which do not completely explain themselves, but are evidently intended, in a general way, to represent emblematically the virtues and refinements which wait on the study of literature; these are in a low tone of cool colour. Above the first floor (which we must conclude to be one of the working departments of the establishment) are subjects in a somewhat warmer and stronger tone of colouring, representing in the half-realistic, half-emblematic manner we are becoming accustomed to in designs of this nature, the mechanical processes of book-making. Over the second-floor windows are carved portrait-heads, Shakespeare in the centre, and apparently Schiller and Dante at the sides, but that we never yet saw the latter represented with a man's face, though the general features seem to be those of the Florentine poet. While heartily commending such attempts to give increased life and interest to the exterior of our street buildings, let us be permitted to question whether the practice of representing outside a building the processes of the trade for which it is erected be not rather a weak and unnecessary form of decoration. Of the emblematic figures on the lower story we speak with approbation, for such subjects, even if the figures should not be drawn in first-rate style, suggest an interest beyond the mere material uses of the building, and by implication enable the purpose for which it is erected. But the idea of representing also the mechanical operations of the trade, which has frequently been suggested of late years in competitive designs, if not actually carried out, is in fact a reborn of times when people in general could not read, and required signs in what has been called "the universal language;" to give the information they wished for; in the present day this is certainly not necessary, and such external representations, we are obliged to confess, remind us too much of the drawings of animals which are fixed up outside the booth of a travelling menagerie, to indicate what may be seen inside. The principle is precisely the same, and we should like the matter to be reconsidered before our younger architects pledge themselves too much to the practice of style of decoration which has a little too much of the "childishness" characteristic of the Middle Ages to be quite suitable to our own. For the rest, we congratulate Messrs. Vaughan & George on having produced a building which is certainly in the

main an ornament to one of our great lines of thoroughfare, and shows a degree of originality and spirit which, with a little judicious tempering down, may provide better things in future. Messrs. Holland & Hannen, we may add, are the contractors for the work, which, so far as the stonework is concerned, has been exceedingly well carried out; the interior was not sufficiently forward at the time of making our notes to speak of in detail. The tiles referred to were supplied by Messrs. Powell, of Whitefriars; but whether they also supplied the design from the architects' instructions, or whether the latter were the *bona-fide* designers of the subjects, does not appear. The same architects are responsible for the design of a new house in Stratton-street, also displaying considerable originality of treatment. This likewise is a tall, narrow front, of red brick and stone. The upper part of this design is much the best; the width of the building is here occupied by three long arches, a centre one and two smaller side ones, running through two stories, and into which the windows are worked; the arches are connected by rows of panels between them at the impost level, and the gables above them covered with a diaper of small panels, with very rich effect. In the spandrels of the two side arches are life-size carved heads. The lower portion is less satisfactory; the balcony railings to some of the windows here are formed of miniature columns and capitals of "classic" proportions; these look out of keeping with the rest of the design, and more over in such a position and on such a scale have a most frail and insecure appearance. Over the ground-floor windows is a balcony formed of not very thick flags carried on light iron brackets beneath; upon this is built a stone bay-window, coming out as far as the front of the balcony, with nothing whatever under the flat soffit of the balcony to carry off the abruptness with which the feature is thus stuck on. This is a singularly unhappy mistake, which we hope the architects will not make again. The bay-window appears really to have nothing to stand upon; where there is stonework above such a point there should be stonework below, in the shape of corbelling, to carry it: the eye demands this; it is impossible to reconcile ourselves to the sight of the heavy bay and the light web of iron underneath which carries it. The openings on the ground story, too, are arranged without the slightest apparent reference to the width and position of those over them. The upper portion of the building is so good and solid-looking that this failure in the lower part is the more to be regretted as spoiling a good design. The interior is being finished in a solid, substantial manner with wainscoted walls, and a very pleasing and elegant wrought-iron stair-halustrade. We shall not be sorry to see other rebuildings of houses in the neighbourhood of Piccadilly, with the merits and without the faults of this design; and in the meantime are not unwilling to look kindly on such defects when accompanied by talent and originality, and an evident desire to improve on the dull and tame character of most of our existing metropolitan street architecture.

CHRISTIAN ART.

We have a book before us consisting of eleven essays on Art, originally delivered as lectures, during the winter and spring of 1871-2, at Winchester, Bradford, and Halifax.* The author's name will be recognised by some readers in connexion with a series of essays which appeared a little time ago in the *Contemporary Review*, under the title of "Ancilla Domini" wherein an effort was made, with considerable ability and learning, to define the true position and mission of modern art, as the handmaid and exponent of religious feeling, or rather of the author's own peculiar phase of religious feeling. Bearing this in mind, and that Mr. Tyrwhitt is a clergyman, and a friend and *élève* of Mr. Ruskin (who contributes a short and pleasantly characteristic preface), the reader will not be surprised to find that only one school of modern art is recognised as of any value; that Mr. Stanhope (among others) is a great painter; and that the value of a work is to be judged of by its appeal to our moral and religious feelings, rather than by its artistic power. The author, we admit, nowhere makes this last statement nakedly (in his introduction he says almost the

contrary), but it is what his art-principles will come to if reduced to their simplest form, and carried to their logical result. With this is some information, much good sense upon practical art-education, one or two really happy and original efforts of higher art-criticism, and an evidently sincere and genuine enthusiasm. The introductory chapter is occupied with general considerations on the use and value of art-culture, especially in supplying an outlet and scope for the better energies of those whose every-day business is not of an elevating nature, and in opening to the poorer classes, the uneducated at present, a vista of nobler and better enjoyments than are as yet open to them. "Art is a means to this end; that its pursuit gives peace, independence, the power of contemplation, and observation, and delight therein: in fact, it makes a man free in a world of his own." In connexion with this object, we may notice the practical suggestion that "to have art popularised, and made a means of culture for the people, it is practically necessary that it should be made to pay, and that, too, by the patronage of the people. . . . If you get beautiful things into the common market, you get them into common life, and then people begin to make progress from them. You want to get men into the art-world, because they will find comfort and culture there; and you must have accessible means for them. Their life is ugly, and you want it not to be so ugly. This is what our many art-schools and kindred societies want to do,—to get cheaply at the right sort of cup and platter, and wall-paper, and window-curtain, . . . to get the best work into the best place, or fullest circulation." And in connexion with art-education, Mr. Tyrwhitt, himself an old university student and lecturer, particularly urges that art should not only be represented in our universities, as it has (at last) got to be; but that it should be encouraged also by university prizes. This, which is, in fact, merely the application of common sense to the subject, is what we have again and again urged, and we hope yet to see it recognised that the power of appreciating the greatest productions of music and painting may be as valuable a part of higher intellectual culture as the power of translating and appreciating Sophocles and Pindar. There is much else that is well put and suggestive in this introductory chapter. Lecture II, on "Greek and Christian Art," gives, in a vivid, brilliant style, and in the main with much truth, the fundamental distinction between the two, as the art of bodily grace and beauty, and of spiritual expression, respectively. The author does not fail to see that in the earlier periods of Christian art (Byzantine especially), painting was, in reality, concerned much more with giving records and statements of facts and doctrines through the medium of drawing (of a sort), than with any striving after the realisation of beauty: the wide chasm existing between this and an art aiming at beauty (whether in conjunction with moral expression or not) should have been more clearly pointed out and discriminated; but the distinction is not so important in our author's eyes as it would be with a "secular" writer. Lecture III, deals, in a condensed form, with Italian art-history, giving some of the substance of what is to be found in a more extended form in larger works. One of the few references to architecture in the book, which occurs in this chapter, indicates that the author has something to learn on that head. After speaking of the round arch in Roman art, he adds,— "The Lombard or Saracen, or the latter first, or both of them together, pointed the arch like a lance-point, or the Norman noticed the intersections of his round arches; and he foliated it for symbolism of the Holy Trinity, and sometimes because he loved green leaves." We counsel Mr. Tyrwhitt, before another edition may be called for, to look up the *constructive* history of Gothic architecture a little, by the light of the most recent researches and criticisms, and he will expunge this little bit of nonsense. Lecture IV, is occupied by "Symbolism and the Grotesque," wherein, as may be expected, the author attaches far too much importance to the former, forgetting that its connexion with the art of painting was only necessary or advantageous in the pre-writing and pre-printing period. He admits that "the old traditional symbolism is thought of no more; though great works like Hunt's 'Scap-goat' and Schaeffer's 'Christus Consolator,' in some degree take its place." We had really hoped we had heard the last of the 'Scap-goat'; and the

* Christian Art and Symbolism, with some Hints on the Study of Landscape. By the Rev. R. St. John Tyrwhitt, London: Smith, Elder, & Co.

'Christna' is but a very theatrical affair, so deficient in genuine feeling that we really wonder at Mr. Tyrwhitt bringing it in as an example. In the same paragraph we read that if church decoration goes on in fresco and mosaic, there is no doubt that painters and sculptors "must and will go back to the ancient Craeco-Roman work of the catacombs and Christian sarcophagi for the original subjects which appeal from the Gospel to the Law." After this, it is alarming to be told that the feeling in favour of church decoration by fresco is "renewing itself vigorously." Looking at some of the developments in this direction, we should be more inclined to say that in them art has gone into its second childhood.

We can speak with much more sympathy of Mr. Tyrwhitt's lecture on Michelangelo and Raffaele; the critical characterisation of the latter (p. 147) is very good, and more impartial and reverent than we should have expected from a critic of our author's school. In regard to Michelangelo, and the place his genius occupied in the world of intellectual art, there is, we think, a grave mistake, which just now we pass over. The next chapter, on Dürer and Holbein, contains what we quite concur with Mr. Ruskin in thinking the best part of the book, the characterisation of Holbein and of the English whom he painted. The painter is regarded as the "great realist" of modern art, as Michelangelo is its great idealist. The chapter on landscape sketching is, we fear, not in reality so useful as it may appear at first sight. A good deal of it is only what has been said before, put into language which is a palpable (we do not say deliberate) imitation of a more distinguished writer's style, even to its defects of occasional mannered and rather affected colloquialism; and Mr. Ruskin's recipes for the beginner in landscape were, we think, of questionable value in their original form, and are no better coming second-hand through his disciple; and when "the two surviving Hunts, Mr. Brett, and Mr. Inebold" are named in a row as the best modern examples to be studied, this is only telling the student that he is to look at nature in the way in which Mr. Tyrwhitt and the particular school which he favours look at it; which is somewhat narrowing to the student's mind. A remark upon "character" is alike pithy and true. Character is the essence of sketching, he says, "and to say what that is comes to something like this: if you have to draw a fox and goose, the fox ought to look intensely foxy, and the goose intensely goosey; or, if your subject was a cat and a fiddle, the cat ought to be thoroughly feline, and the fiddle should express violinism in general." We would that all the painters who hang the walls of exhibitions with meaningless, characterless works, could get imbued with the principle somewhat quaintly expressed here. The essay on the poetry of landscape is not remarkable, and does not do justice to so very fertile and suggestive a subject; in the final one, on "Art, Craft, and Schools," are some very good remarks, especially on the haughty effect of incessant competing for prizes for dexterity of execution. "It will not do to have a number of senior pupils, especially ladies with great command of leisure, competing year after year in copying casts, and hatching and stippling their lives away, under the impression that they are studying art." It certainly will not do, and there is far too much of it in the places called art-schools, but which we should prefer to call drawing-schools, the word "art" having a much wider sense in reality. We should like to see some attention paid to this matter by those who rule over schools of this description. Appended to the lectures is a small memorial chart of the dates and origin of the principal schools of painting, which will be a useful help to the memory.

We have seen reason to speak with praise of a good deal in this book, and with respect of its author, but we do not the less believe that he is labouring under one very great mistake, which underlies all he has to say about art. He is persuaded that the highest object art can have is to minister to a particular phase of religious feeling. He is perfectly sincere in this, and we may take his word to be, what Mr. Ruskin describes it, "a true expression of the feelings with which a Christian gentleman of sense and learning should regard the art produced in ancient days by the dawn of the faiths which still guide his conduct and secure his peace." But when the said Christian gentleman wishes to draw everything within his own circle, and asks us to repudiate as comparatively valueless all that is without it, we must tell him that

thereby he is only further widening the gulf which separates many of his fellow-countrymen from sympathy with art, by thus inciting them to regard high art as a thing subservient to ecclesiastical Christianity. Mr. Tyrwhitt is, in fact, an apostle of the "great moral heresy" in art; for those who seek the beautiful only, he tells us, "their fall is prepared for them." This is a principle only true in one sense, and liable to be much abused. There is a degree of confusion, too, in his use of the term "Christian art," especially in reference to Michelangelo. He calls that artist the great Christian painter; and Michelangelo might be called so, in the sense that he was opposed to (superior to, if Mr. Tyrwhitt likes) the Paganism of his day. But Michelangelo was no Christian painter in the sense in which Messrs. Rossetti, Hunt, and Stanhope are said to be. His genius was essentially *Hebraistic* (in the wide sense in which the word has been used by Professor Arnold); he was no conventional decorator of shrines or illustrator of doctrines; his painting was simply the expression of the highest physical and moral grandeur which he could conceive and embody in painting. Rather than class him with the modern painters of sacred subjects as "Christian," we would say that he is "spiritual," they are "ecclesiastical." The difference is a wide and deep one indeed; and of the painters who think they can permanently attract mankind by allegorical frescoes of conventional saints and "adorations," we should say that, at least equally with the seekers after mere beauty, "their fall is prepared for them."

THE LONDON PUMPS AND IRON LADLES AGAIN.

OUR notice in the *Builder*, two or three weeks back, on the subject of the "London Pumps and Wells," seems to have obtained some little attention. In addition to this, it is to be noted that a "return" but recently issued shows, with not a few inaccuracies, the number of wells and accompanying pumps still open in the metropolis. It is a very curious matter indeed, and well worth the attention of those who are now so earnestly advocating the cause of temperance, and the putting down of public-houses, and artificial stimulating drinks. What is in store for the working man,—for we may presume the reform is to apply to but few else,—is the simple alternative between the London cistern-water, as supplied by the water companies, and the public-house drinking. Now, our position was, and is, that nothing can possibly be worse to the taste and palate than the hard, undrinkable, cistern, company's filtered water, with or without "organisms." This being so,—and no one can possibly gainsay it,—the pumps become not a little important. "Drink" being abolished, water must triumph. But from whence? There is but one answer,—from wells, either shallow or deep. The water must come from that great natural and perfect filter, the earth itself. Nothing in nature is so typical of purity, and clearness, and beauty, as the flowing water of a natural spring or well. All else may be "dirty" round it, but the water is pure and clean. In London there is dirt and mud enough, and smoke and fog enough, and there being no *art*, in its real sense, visible, would it not be quite an artistic, as well as a sanitary and health-giving thing, to have in London, every here and there, an open fountain or basin of pure spring water always flowing, if possible, but if not that, always ready by dint of pumping? Why, every dirt-hegged urchin would be clean if but the water were always at hand and flowing, and within reach. As it is, they go dirty. Lord Shaftesbury, at a late meeting of some ragged-school, said that "cleanliness being next to godliness, nothing more was needed to bring it about universally than no end of ragged-schools;" and very good things they are; but the water would still have to be got. We really, after a good deal of experience in the affairs, and doings, and *vents*, of Cockneydom, do not know of anything that could be done better by any philanthropist of the Peabody stamp than to go to work for the sake of others,—the whole London public,—and restore the London pumps and wells, properly sinking them out of the way of surface impurities, and adding to them.

It is wonderful what a patient mortal poor John Bull is. All his pumps have been taken from him by nobody seems to know whom, instead of putting them into a proper condition. Those

remaining are there by bappy accident. Some of them take strange fits. Let us name one or two noticed in the "returns" wherein the returning officer, by the way, who made note of it, does not seem to have seen after the pumps quite often enough to find out how they behave themselves. The "Exchange" pump is a variable pump: it was in full work a week back, it was dry yesterday. The Fenchurch-street pump, which, the return says, is now in full use, has been chained up and useless for a twelvemonth at least. We know it well. Butcher's-row pump, and a better once there could not be, has gone to grief within the last week. On Saturday night fortnight it was in active work; it has a large iron basin or tank under it, three parts full of water, and a large cool iron ladle, and a more practically useful and common-sense apparatus there cannot be. The Tower-bill pump has been very dry for a long, long time, but by miracle, or notice in the *Builder*, perhaps, is now all alive again, and vigorous pumping going on all day long! There is a little dripping drinking "fountain" beyond the reach of hoy or girl almost close to it—quite a design, for you must climb up to the basin to get at the tap, and wait patiently till the little dirty cup, not high enough for an infant, is full. We might go on and tell of a number of other pumps still only waiting for the public to insist on their being made again, useful and safe; but one other we must notice, and ask pardon for an error in which we inadvertently fell in our former notice. The pseudo-well, or slate-tank, with company's water, with its accompanying pump, in Dean's-yard, Westminster, is no longer available for utilitarian purposes. There is no water, so that the smart little apparatus (for it is coloured decoratively in quite an orthodox Gothic way) is now a mere "antiquity," and a mere but venerable relic of the past. A pump, with handle and basin, all complete, but no water, among so many thirsty scholars and noisy choristers!

But let us add a word or two by way of practical hint, in the happy event of the London pumps being made useful means of supplying to Londoners pure and refreshing water. The pumps, whether "monolithic" or "designs" or the good old shapeliness "pumps," we will suppose absolute necessities—for the well of water springing up to the earth's surface, and always full and running over, must be beyond imagination in these poverty-struck times, and in so needy a place as London! The pump, better than nothing—provided always, of course, that the source be not a cesspool. Under the pump there should always be, as in the Whitechapel pump, an iron or stone cistern sufficiently large to look at, at least, and deep enough to hold enough water to dabble your hands in, or for a poor dog to drink out of. Quite a novelty this, and a something to look at—the clear surface of the water down the length of a dull modern and improved street—a diamond in the brick-and-mortar desert. There is nothing, too, so good and useful as the old-fashioned iron ladle—a good large one, that will hold a quart of water, and of tough wrought-iron, that cannot be broken by either man or hoy. Another and indispensable requirement is the iron grating through which the waste water empties itself, and the drain under it, which should be so trapped as to be always full of water; thus all smell is avoided, and the pump can be approached without offence, for many is the unfortunate pump, innocent of harm, that has been sacrificed to the badly-constructed and untrapped drain close to it, and which, indeed, it helped to purify. Not the only thing in this world that has suffered from evil company, and neglect, and stupidity.

MR. FREDERICK MARRABLE, ARCHITECT.

THE death of Mr. Frederick Marrable, at the age of 54, will be heard of by many of our readers with equal surprise and regret. On Friday evening last we met him at dinner, and had a long conversation with him, which had in it more of feeling, or rather let us say sentiment, than he usually exhibited. On Saturday morning he left his house, in Avenue-road, Regent's Park, apparently in perfect health; went down to Witley, near Godalming, to inspect works at the Bethlehem Hospital for Convalescents there; and while talking to Mr. Pink, the builder, was seized with a fit. His decease was instant and painless. A medical man happened to pass within a very few minutes, and everything was done which kind-

ness and sympathy for his family could suggest, but in vain.

Mr. Marrable was a son of the late Sir Thos. Marrable, secretary to the Board of Green Cloth in the reigns of George IV. and William IV. If we mistake not, he served his articles with Mr. Rlore, and afterwards went abroad, as was then the usual way with students. On his return he built and altered various private houses and some churches, particularly a church at St. Leonards, near Hastings.

On the establishment of the Metropolitan Board of Works he was elected its Superintendent Architect, and during the time he held that office, designed and superintended the erection of the offices of the Board in Spring-gardens. In settling claims for compensation against the Board, Mr. Marrable displayed much skill, and after his retirement from the office he was much employed by the Board in the same capacity. Amongst his architectural works may be mentioned the Garrick Club House, an asylum at Stockwell, for the Asylum Board; St. Peter's Church at Deptford, of which we recently had occasion to speak; and Archbishop Tenison's Library in Leicester-square. We can personally testify to his honourable and kindly character. He was a thorough hater of all shams, but his desire and willingness to help those needing any services he could personally render will long be remembered by many. His independence and fearless conduct while architect to the Metropolitan Board of Works won him general esteem, and by his death the profession has lost a very distinguished member.

CONVERSAZIONE: ROYAL INSTITUTE OF BRITISH ARCHITECTS.

ROSALIND'S "Good plays prove the hotter by the help of good epilogues" seems to prove a sound quotable maxim. Sometimes, in truth, it is customary to present plays before limited audiences, and to further the circulation of few copies of books of the piece. But even in such cases, at the last shifting of the scenes, a larger number of spectators appear to take part with the actors, and Prospero are released by the help of good bands, and wafled homewards by the "gales of gentle breaths."

If well-greased actors are thus afforded a final appearance among their friends, by all good precedent the epilogue need only be happy in itself, connected, if at all, by merest almost imperceptible web-lines with things antecedent.

Such a last scene was arranged for by the Institute when the evening of Wednesday, June 26th, was appointed for the *conversazione* to terminate the 1871-72 session. The invitations brought together numerous members, and the due proportions of ladies and other guests. From about nine o'clock till midnight the building was well occupied by the more or less conversational groups usual at these reunions. The reception by Mr. T. H. Wyatt, president of the Institute, took place in the meeting-room,—necessarily savouring of many a bit of technicality to most members through "their remembrance of days foregone,"—albeit now well transformed, filled in parts with flowers, some in vases of Milton's modern majolica, and containing also mosaics, cabinets, glass, pottery, statuary, and paintings and drawings in oil and water. Among these may be mentioned Sir T. Lawrence's portrait of Sir J. Wyattville at work on his plans of Windsor Castle; Scenes in Italy, by E. A. Goodall; Portrait, by Mr. Charles Martin, of Mr. B. Hope, to be seen permanently hereafter on these walls,—the characteristic expression not missed, as is evidenced when the living original stands close by; paintings also by P. Calderon, F. Smallfield, D. Maciolo, Copley Fielding, Greuze, &c., and the now well-known dozen drawings of destroyed Paris by Mr. R. S. Spiers. There are also (by Copeland & Sons) Parian groups and figures; mosaics and table-glass by Salvati; modern French pottery imitating the old Ronen and other wares, exhibited by Mr. Oppenheim, in good quality, quantity, and variety; numerous gas standards and other examples of metal work by Hart, Son, & Peard; old Japanese (Satsuma ware) vases, with their pale grounds and vigorously-drawn subdued-tone flower painting, and other Japanese vases lent by Mr. Val. Prinsop. Messrs. Cillow have dark wood cabinets for sides and angles of rooms, their panels variously treated, some with gilt grounds and strong brown outlines and dead yellow figures, and anon with gilded leather and

sunk flowers and foliage in real colour. A drawing-room cabinet and a hanging wardrobe by Mr. H. Capel,—the latter designed by Mr. C. L. Estlake, and made very recognisable by insertion in the panels of varnished subjects from the Nursery Rhymes of Mr. H. S. Marks, A.R.A.; polished hard wood cabinet by Messrs. Hart; Japanese lacquer cabinet inlaid with tortoise shell,—a wonder of patient labour; much church plate; and an interesting collection of flagons and other small vessels in *gris de Flandres* were lent by Mr. Sidney Whiteford, all deserve notice.

In the library were illustrations of the arts of very early times in British pottery, &c.; the large urn, 17 in. diameter and 14 in. high, found in a cistvaen on the lands of the Marquis of Lothian, said to be the largest yet found,—not equalled in the British or Ashmolean Museums. These were lent by Mr. J. S. Phené, the antiquary whose energy and research may hereafter lead to valuable conclusions on the reptile-lumal and serpent-worship, and other works and customs of the early inhabitants of our country now hidden in mystery. The designs made by Sir Digby Wyatt for art-jewelry, exhibited at the International Exhibition by Howell, James, & Co.; terra-cotta hands (very ably) modelled by Rombillac (1695-1762), lent by Mr. E. Corbould; a quaint little Chinese tea-service, of nine pieces, in metal, with coloured enamels on sunk and engraved surfaces, lent by Mr. F. Leighton, R.A.; a large collection of photographs of the Acropolis at Athens, taken by Mr. W. J. Stillman, lent by Mr. Spiers; and the ivory-handled, richly-ornamented sword presented to Lord Napier of Magdala by the Corporation of London, "for his fortitude, skill, science, energy, and promptitude" shown in the Abyssinian war; may be mentioned as interesting for one reason or another.

Also paintings by E. George, an Associate of the Institute, and by Val. Prinsop; hand-painted tiles—children revelling in scenes of plenty in vintage and harvest, shown by Messrs. Brown, Westhead, & Co.; and others by Cox & Son, painted by C. Rossiter and J. Moyr Smith, with odd birds and fishes and grotesque humanities; certain hangings and tapestry, by R. Heilbronner; and church plate, designed by H. W. Lonsdale, B. J. Talbert, S. J. Nicholl, J. Jones, W. Butterfield, &c., and all made by Messrs. Cox & Son. Nor must the Oriental porcelain of all hues, sizes, and degrees of complexity, exhibited by Messrs. Farmer & Rogers, be forgotten; nor the immense Chinese *cloisonné* enamel metal ewer and basin (about 4 ft. diameter), also lent by them, though these and the other Chinese enamels, with their brighter and larger masses of colour, as usual just now, were regarded with some doubt by many an observer, apparently, when contrasted with the Japanese enamels and lacquered cabinets placed near at hand.

In the first lower gallery were shown paper-hangings by Messrs. Jeffreys & Co., designed by Mr. Owen Jones and Mr. W. Burges, set patterns, in subdued tones, enriching surfaces, without forcing the eye to see their forms and colours. And refreshments, satisfactorily served, at the ends of the two lower galleries, must of course be noted to convey anything like a *couleur de rose* impression of an English gathering.

The Coldstream Guards band, conducted by Mr. Frederick Godfrey, performed in the larger lower gallery selections of music during the evening. By the kind permission of Miss Leech, the exhibition of sketches, by her brother, was on view; a most remarkable collection in many ways. Political sketches, that have served to influence, and have now become a part of history made a long generation ago—when the *Builder* had only for a few years watched over and recorded the transactions of the Institute of Architects, mingled here with the first studies of the doings of Briggs, of the Brook-green hero, and of many other equally worthy persons whom we have known intimately since we first saw them years ago with the eyes of that kindly, unique humorist in the absolutely wonderful works of his matured skill.

Excursion of the Worcester Diocesan Architectural Society.—A project, long entertained by the committee of this Society, for an excursion along the Severn Valley, in order to visit the monastic ruins at Much Wenlock and Buildwas, has been successfully carried into effect by a party of about forty ladies and gentlemen, augmented by others who joined them on their way.

THE APPLICATION OF NATURAL LAWS

THERE is a ring of prophetic sadness in the words of Spenser when he speaks of the growth of children to men, and tells us how much is lost,—

"When neither heart nor eye,
Rose-wing'd delight, nor falling hope deceives;
When boyhood with quick thro' has ceased to spy
The dubious apple in the yellow leaves,
When springing from the couch where youth reposed
We find but deserts in the far-sought shore,
When the huge book of Fairy-land lies closed,
And those strong brazen clasps can yield no more."

Ariel has been released from material bondage, and with her have vanished some of the tenderest and most beautiful fancies of the past. The childhood of the world has gone by; and if our age does leave behind it any distinctive feature, it will be in its advance in science, in the faith, not of children, but of men; and yet in many of the early writers we can almost detect the struggle of nature, as it were, to manifest herself through science in the broken language of a child. Through the darkness of superstition which surrounded phenomena in earlier days, the glimmering of the day-star of modern discoveries could be seen,—at least, the herald of approaching day; and in return for the advantages a somewhat ungrateful generation has gathered from the stores of Nature, she only asks of us to apply her gifts,—to strive to understand her teaching, and to obey her laws. A retribution sometimes sudden, often terrible and destructive, awaits on those who disregard her warnings, trifle with her latent forces, or do not properly utilise her power.

Let us take for illustration, as a special question of the day, the natural purification of water. If it be true that rivers are the natural conduits for the water-supply of towns, the water of a river will be purified in its flow by the process of aeration for the use of man, and a portion of the rainfall, will natural filtration through the soil, will come forth again in the form of springs, or be reached by the means of wells, clear and limpid, for our use. Can we expect that the laws of nature will be perverted for our sake, if we empty a deadly poison into our rivers, or allow it to percolate through the earth to the purer waters of our springs? It is folly in a country like England, where our rivers are but as streams in comparison to those of other countries, to put a burden upon them too great for them to bear, or to suppose we can remedy by mechanical filtration the inevitable evils of such a course. When we are dealing with physical laws in ordinary cases—those, for instance, of forces—we are satisfied that only by certain causes certain results can be achieved; yet in another branch of science it would seem we are blind enough to suppose that we shall not reap as we have sown. Science has shown us that, as a consequence of this wilful disobedience to her laws, the seeds of preventible disease and death may be contained in the clearest and most sparkling water.

It is to be hoped that a further report upon the pollution of rivers, which we may shortly expect, will settle, at least, the question between the manufacturers and the public, who have to consume a portion of the refuse of their works.

The laws of nature, though different from the laws of man, if properly applied, contribute to his health and comfort, and even to the luxuries of his life. Over the decay which follows the creation of his hands, the craft of nature often weaves a veil of beauty. Age softens the outlines of his work, and paints with various shades of fungi and with mosses the monotonous colouring of his grandest buildings. The varied mineral components of the earth render the materials of construction more beautiful for his use, breaking up even the uniform surface of marbles with veins of colour, with delicately graduated tints and shadow. The trees themselves live and grow beautiful upon that which would be his death, and give to him again the produce of their growth, grained and painted as no hand of man can paint. But even as they fall to the ground beneath his stroke they obey a natural law, which only a madman would defy.

Few natural laws have been more neglected in their general application than those of colour, and in dress, especially, even they have their revenge, for they hold up to discerning eyes, in those most potent satire, the want of culture in those who outrage their harmonious laws. In this respect music has the advantage of painting, since its laws have long been studied upon known mathematical principles: of the laws of chromatics, especially relating to colour, we have much to learn.

If the simple and well-known rules for the juxtaposition of the complementary colours which renders more intense their brilliancy, and harmonises them with neutral tints, were carried out in their integrity, the glaring faults so often to be detected in decoration could never be perpetuated. It is easy enough to remember that if two of the three primary colours are mixed, the remaining colour is the complementary of the result; red being the complementary of green, blue of orange, orange-yellow of indigo, greenish yellow of violet. Those who have noticed the brilliancy of a scarlet geranium, and the corresponding intensity of its leaves, can understand how easy it is by approximation to enhance or depreciate the glory of colour. It is true, through recent experiments with light, that green has been claimed as a primary colour; and though the argument in support of it appears to be conclusive, it is not only directly opposed to the theory of previous writers upon this subject, but to the actual result of placing green in juxtaposition to red, for in no other combination of the complementary colours is the brilliancy of each so much increased as by the near relation of green to red. Only within the last few years a green has been discovered, and introduced upon the stage, which even in the yellow light of gas has all the prismatic brightness which it exhibits in the light of day, and in combination with red it has been the triumph of the pantomimes ever since.

When we remember how much we owe to colour, and how we can make beautiful by its proper application some of the commonest and most unsightly things around us; and in conjunction with curves how Nature elaborates her work in infinite variety by its use, we can but wonder at its neglect. BING GRAUD.

ENLARGEMENT OF THE GAILEY HOTEL AND RESTAURANT.

The hotel and restaurant which form a portion of the buildings in connexion with the Gailey Theatre, in the Strand, are about to be very considerably enlarged, by the addition of the premises, in Catherine-street, formerly occupied by the proprietors of the *Era* and the *Illustrated Times*, situated between the front part of the Gailey buildings and that portion in Catherine-street at the rear which is a part of the theatre. The premises in question, which have been purchased by the proprietors of the Gailey, are now being taken down, and on the site new buildings will be erected, uniform in their architectural elevation with the Catherine-street elevation of the Gailey next to the Strand. The frontage of the additional portion of the hotel about to be erected, which will extend to the spiral staircase or tower of the theatre in Catherine-street, is 58 ft. in length and 24 ft. in depth, giving an added area to the theatre and hotel block of about 1,400 square feet. The new buildings, which are intended to be carried to the full height of the present hotel elevation, will increase the size of the hotel to almost double its present capacity, and materially add to the architectural character and appearance of this portion of Catherine-street. When completed, the Catherine-street frontage of the hotel and theatre buildings, from the Strand to the rear, will be about 160 ft. in length, and the entire block will occupy an area of upwards of 9,600 square feet.

THE NEW GOODS WAREHOUSES AT BLACKFRIARS,

FOR THE MIDLAND AND GREAT NORTHERN COMPANIES.

A LARGE and extensive block of goods warehouses is now in course of erection at the Blackfriars Station by the London, Chatham, and Dover Railway Company, which are intended for the goods and merchandise traffic of the Midland and Great Northern Companies, in addition to the space which the two companies already occupy there for their goods and merchandise traffic. These warehouses, which, when completed, will be larger than any similar buildings in the metropolis, will involve an expenditure of upwards of 60,000. They are 270 ft. in length and 121 ft. in width, occupying an area of more than 3,600 square yards. The principal frontage of the building, which is in Green-walk, is 58 ft. 6 in. in height to the top of the parapet, and about 66 ft. to the roof, the elevation consisting of the ground-floor and three stories, in addition to the basement, which is 12 ft. below the

ground level. The materials used are yellow stock bricks, the piers being of white galf brick, whilst the window-sills and cornice are of stone. The ground-floor of the building is supported by 180 massive cast-iron pillars springing from the basement, upon which rest iron girders, and between the girders are turned iron arches, the whole supporting a substantial stone ground-floor. All the floors of the building are also supported by strong iron columns resting one upon another to the top of the building.

METROPOLITAN WATER-SUPPLY: CONSTANT SERVICE.

THE Board of Trade having prepared and passed a short Act to amend the Metropolitan Water Act, 1852, a new committee will on once be nominated, as provided for under clause 22, which recently failed by reason of the obscurity of its wording. We are sorry to learn that his Grace the Duke of Richmond may not now have time to undertake the duty, because as chairman of the Royal Commission which recently inquired into and reported upon "water-supply" the metropolitan water-supply question must be familiar to him, and his business habits are well known and highly appreciated. The Board of Trade may probably find a substitute for the Duke in Sir Charles Adderley, M.P., who, as chairman of the Royal Sanitary Commission, must be well up in water-supply questions. Mr. R. Rawlinson, C.B., and Captain Tyler, R.E., will, as before, "advise and assist" at the inquiry.

The inquiry will be as to constant service of water over the entire metropolitan area, and as to any necessary alterations or regulations in the supply-mains and house-fittings. It will be the duty of the committee to hear the several Water Companies, the Metropolitan Board, the City Corporation, and others, as to any proposed fittings and regulations.

LUNATIC ASYLUM COMPETITION, ST. ANN'S HEATH.

At the invitation of Mr. Thomas Holloway, who proposes to build, at his own cost, a lunatic asylum for the reduced middle classes, a limited number of architects have submitted designs, which are now before the intending donor. The conditions prescribe that the structure is to be simple and dignified, and to be designed in the style of the Geometrical period of Gothic architecture. The Cloth-hall at Ypres was pointed out as an excellent example of secular architecture of this date. The accommodation is to be for 200 patients; the cost, 40,000. The instructions were drawn out with considerable minuteness.

NEW BUILDINGS IN THE BOROUGH FOR THE MIDLAND RAILWAY COMPANY.

A VERY large and commodious building has for some time been in course of erection in High-street, in the Borough, and is intended as an extensive receiving house and goods-depot for the Midland Railway Company. The main elevation of the building is 67 ft. 6 in. in length, to High-street, and 54 ft. in height, to the top of the parapet, extending backwards to a depth of 43 ft., exclusive of a spacious shed or goods-depot in the rear. Beyond this, again, at the extreme back of the premises, there is stabling for thirty-six horses, the stables being on two floors,—namely, on the ground-floor and a story above, the upper stables being reached by an incline.

The building, which is four stories in height, is constructed of red patent bricks, with Bath stone window-dressings, cornice, and chimney-caps, and pilasters and piers of fine Derby stone, from the Matlock Quarries. Each story above the ground-floor contains four large and handsome triplet windows, the first-story windows being segment-headed, the second circular, and the third elliptical. The shed or depot at the rear of the building, for the receipt and dispatch of goods, is 138 ft. by 67 ft., containing an area of upwards of 9,000 ft., upon which a large stage or flooring has been erected, about 3 ft. above the ground-floor level, fitted with four powerful cranes, for receiving and despatching goods. This shed is covered in with a handsome roof, composed of glass and iron. The west portion of the ground-floor frontage of the building, in High-street, will be set apart as receiving-

offices, whilst the eastern portion will be let off as shops. The upper stories, which contain a large number of apartments, will be used as offices and storage-rooms, in connexion with the business of the company. The premises are rapidly approaching completion, and are expected to be ready for opening in about a month from the present time. The estimated cost of the structure is 15,000. It has been erected from designs by Mr. J. H. Sanders, of Derby; the architect to the company, Mr. W. R. Gill, of the Polygon, St. Pancras, being the contractor.

THE BETHNAL-GREEN MUSEUM.

Our readers know of all the steps that led to the foundation of the Bethnal-green Branch of the South Kensington Museum. In our last year's volume * we gave a view and plan of the building as then in progress, and more recently we described the structure. Our illustrations show in the front a library on one side of the museum proper, refreshment-rooms and house on the other, with corridors and a clock tower. These, however, have not yet been erected so that the design as a whole cannot be rightly judged of. But even as it is, we must dissent from the critics of the daily press, who pronounce it "dreary and most unartistic." We have no hesitation in saying that it is an excellent piece of brick construction—the design fitting and appropriate. It has been built under the direction of General Scott, from the drawings of Mr. James Wild, architect; Messrs. Perry & Co. were the contractors; the means of ingress and egress will need revision. On Monday last when it was opened, as every one now knows, by H.R.H. the Prince of Wales, the want of other doors besides the one in the entrance-front was greatly felt. The Eastern districts of London were never so gay before as they were on that day; and they might well rejoice, for there, in their midst, has been placed a source of delight, and a means of culture which will surely, even if slowly, work its good way,—an evangelist of art, elevation, and happiness. Nothing occurred to dim the brightness of the day. The Prince and Princess won all hearts by their unaffected geniality, and next to them in popular estimation stood, and rightly, Sir Richard Wallace, who has deposited here his priceless collection of pictures and other works of art, which, beyond the gratification they will afford to the thousands residing in the neighbourhood, will have the good effect of taking the West-end to the East, and making London better acquainted with itself. There are sad sights to be seen in Bethnal-green. Behind the bright bunting and joyful inscriptions of that sunshiny Monday we could have shown the Prince dens filled with festering humanity, which point to direful evils needing reform. The new Museum will help to bring about a change for the better, and we hail with joy its erection. We will make our readers acquainted with its contents before long.

ARCHITECTURAL ASSOCIATION OF IRELAND.

A GENERAL meeting of this Association was held at 212, Great Brunswick-street, Dublin, on the 20th inst. Mr. Jas. H. Owen, B.A., in the chair. The provisional secretaries then reported that several gentlemen had sent in their names since the last meeting.

A letter from Mr. Thomas Drew, R.H.A., was read, in which he said:—

"It has been with the greatest satisfaction and interest I have watched the inauguration of this movement; it is an evidence that all life and energy for improvement is not extinct among us, which I have long hoped for. As I am not enabled to be an active member of the Architectural Association of London, I have been sufficiently intimate with some of the younger and more active spirits in that body to have brought home to me at what an immeasurable disadvantage 'the coming men' of the profession stand here as compared with their London brethren, who have extraordinary advantages now. The present situation is not what it should be. A few persons here are aware what kind of competitors the high standard of education the London school affords is preparing for us, and will take extraordinary exertion on our part if with all our disadvantages we are able decently to hold our own, and send even an occasional Irish genius to the front.

I think the movement comes from the right direction, from the spontaneous desire of the younger men of our profession, inaugurated by the Institute (Irish), and nursed by it, such a movement could not have one-half the healthy vitality. The Institute has proved and very distinctly, the utility of its own, and deserves the support of the younger members of the profession. Had it no existence 'the coming men,' when they did come to the front would find that they had embarked in a profession or

* Vol. xxix, pp. 46, 47, 48.

calling very unsatisfactory to make a living by, and neither respectable nor respected."

A letter was also read from Mr. C. G. Doran, Queenstown, county Cork, in which the following passage occurs:—

"The association which you are now engaged in establishing will, I hope, lead the way to many good results. Amongst them may safely be reckoned one that has been overlooked by the architectural profession for the last three centuries. It is the encouragement and recognition of those classes to whom the architect's designs are entrusted for execution.

In the Middle Ages, the cloister of the monk, the study of the architect, and the scaffold of the mason were frequently occupied by the same person, and the models of architectural skill remaining to-day bear testimony to the excellent working of the combination. But in latter years, when design and execution were transferred to different hands, the harmony of parts was not quite so successful. Why it was not is easily explained. The designer neglected to encourage the craftsman, at whose hands the special features of his picture awaited development, and the craftsman in return 'machined' the design without infusing into it either feeling or spirit; the result being the absence of those happy effects which only mutual understanding could blend together."

Mr. J. J. O'Callaghan, F.R.I.A., was elected president, and the following gentlemen were chosen to form the committee:—Messrs. W. P. Ryan, W. G. Doolin, jun., Dan. J. Freeman, Thos. H. Longfield, Engene S. O'Callaghan, A. W. Robinson, R. S. Swan, John L. Robinson, and W. Butler. The committee as elected then nominated Messrs. T. H. Longfield and John L. Robinson, secretaries; J. D. Freeman, treasurer; and Messrs. W. Mitchell and C. H. Brien, auditors. The general meeting then confirmed their election.

The first session will commence early in October, when the President will deliver his inaugural address. Intending members are requested to send in their names as soon as possible. Forty names have been already received.

A NEW PUBLIC HALL IN KENSINGTON.

The Kensington Vestry have considered the report of a special committee appointed to deliberate upon the advisability of creating a public hall for holding meetings of the Vestry, &c. The committee reported that there were three sites in view, the present site, which was consecrated ground, the National Schools next door, now for sale, and a plot of land, opposite the Kensington (High-street) railway station. The committee believed there were legal difficulties in the way of enlarging the present Vestry-hall. As to the site of the National Schools, the frontage being 96 ft., and the superficial area, 6,263 ft., the committee considered the price asked (8,000l.) too high. The third site had a frontage of 50 ft., and a depth of 140 ft.; and the price was 5,500l., the superficial area being 8,000 ft. The committee, therefore, recommend this last site as the most eligible. Decision was postponed.

FIRE-RESISTING CONSTRUCTION.

At the ordinary general meeting of the Architectural Association, held on Friday evening, the 21st inst., a paper was read, by Mr. R. W. Edis, F.S.A., on "The Paris Fires," being a somewhat amplified statement of the data and conclusions as to fire-resisting construction, given in the paper read at the recent Conference, and noticed at p. 478 of the *Builder*. Mr. Edis insisted especially on the peculiar nature of the fires, on their being carefully planned, assisted, and allowed to obtain away without attempts at suppression. The conditions of the tests were most severe,—unprecedented, and, as he hoped, not likely to be imitated; but he considered that the experience they had supplied was not without its value,—enforcing in great cities, and the value of isolation districts, of blocks of buildings, and of complete separation of single structures, as well as the more obvious lesson with which he had then to deal; that increased attention is needed, and should be given, to the materials of which buildings are composed. Especially in monumental buildings, permanence, in spite of adverse influences, is a fundamental condition of real success; and this permanence is jeopardised by many of the materials and methods of construction now in common use.

Mr. Edmund Sharpe, on being called on by the chairman, said that, although only lately returned from Paris, he had not given careful study to the illustrations of imperfect resistance of the effects of fire, that Mr. Edis and Mr. Spiers had found on special search among the ruins in that city. He considered that the

researches of those gentlemen had been of much value; indeed (as far as he knew), the lessons taught by the disasters at Paris had been learned and stated in definite and intelligible terms only by them. Mr. Edis's observations, made before the fires were quite extinguished, supplied many new facts; samples of roughest practical tests of modern building appliances, supporting, no doubt, the general conclusions he had drawn. "Fire-proof building" had not maintained its character in face of deliberate incendiarism, and of the spread of destruction from artificially-created mountains of flame. But perhaps this might always have been expected, if such circumstances could have been imagined. Nobody had ever looked for endurance under all conditions. The materials available,—especially where restriction of the areas of bearing-piers is all-important, as in modern Western cities,—could not be expected to stand a temperature sufficient to overcome the cohesion of their particles, or to change the elements in their composition. His mind, however, he found habitually considering the real improvement on wooden floors and staircases, effected by the use of non-combustible iron, concrete, and stone. These were in no case perfect,—could not afford absolute security and permanence. Still, in the limitation of the quantity of inflammable material preventing the breaking out of many fires, and in the (at any rate) temporary localisation of a fire once started, the value of such constructions was constantly seen, as also in the actual preservation of life by affording prolonged opportunity for escape. A stone staircase may not eventually escape entire ruin; but a wooden one will probably be a mass of flame licking devouringly into every story of a house, long before the inmates, in the other case, have found any risk in descending their stone staircases. This led to an inquiry as to the effect of the Paris fires on other than calcareous stones, Mr. Sharpe suggesting that the ruin from calcination of the limestone could surprise no one; but that the black volcanic lava of Volvic (Puy-le-Dome, Auvergne), so largely used for the Paris *crochairs*, and for staircases in some parts of France, should have proved more truly fire-resisting. After describing the quarries situated a few miles from Riom, from careful personal inspection, as a solidified lava-stream that issued from the extinct crater called Puy de la Nugère, worked in Mediaeval times, used in the erection of the churches at Clermont, &c., he went on to say that these quarries furnished immense blocks capable of being split with wedges into slabs, &c. He had often thought that for staircases and similar purposes, this lava,—this slender-like, intensely hard material,—was most suitable on many grounds. He was not prepared with any results of practical tests, but thought that as it is clear that stones other than limestones should be used for staircases, for the jambs of iron doors, and similar purposes, the strength when heated, and the behavior under fire and water, of such volcanic products (molten masses cooled) deserved investigation, as well as that of the hard sandstones and gritstones. The millstone grit he knew was capable of standing, without injury, very considerable heat, if gradually applied.

Mr. R. P. Spiers said that the destruction wrought in stone vestibules, almost without furniture, was one of the most curious problems in the Paris fires. A peculiar blue colour on their walls had been attributed to petroleum, filling the space with flames and masses of vapour. Several French architects to whom he had spoken on the subject were of opinion that the unflammable nature of the materials used in modern Paris had largely prevented the spread of fire, even though, as he had stated, much stone architecture had itself been so helplessly ruined. As an example of the limitation of the effects of fire, he might instance the Galerie de Diane at the Tuilleries, where, at the time of making his drawing, in October, 1871, he found the floors erected within the last few years standing on each story (iron girders, filled in between and protected with concrete), while the older portions adjoining were burnt through from ground to roof.

Mr. J. D. Mathews wished for a complete isolation of each floor, in buildings of large area, by a set of fire-proof lobbies, leading to the continuous staircase. The use of iron was, he thought, absolutely beyond the region of choice in valuable City sites: architects were compelled to use it. Could not some solid non-conductor, in the nature of a very thick paint, be applied to the surfaces of iron,—to answer

decorative and protective purposes at once? He could not feel much real satisfaction in lath and plaster casings of important construction. Stone steps, supported only by talling into walls, should be abandoned universally; he thought they had been much less used of late years.

Mr. R. Plumbe, the chairman, mentioned the case of the New York Exhibition Building, of which he had witnessed the destruction years ago. The furniture caught fire, and in less than half an hour, in consequence of the elongation of the ties, the building was a ruin. The same results, from similar causes, at the Sydenham Crystal Palace, everybody would remember. Unless some method of construction can be devised, deprived of the destructive tendencies lurking in all ordinary iron buildings, the non-combustible character of that material must be considered as really of comparatively little importance. With reference to the protective power of plaster, he could give a personal experience, at Kesterton's coach factories, Long-acre, where a remarkable fire occurred some years ago. A brick wall, unplastered, he found split completely up its centre, and on the point of falling. Similar work, covered with two coats of plaster, exposed to similar fire, he cut into, and found in perfect condition. At least half an inch of plaster should cover the surfaces of brick walls, in order to prevent the destructive effects of fire on them. Yet brick he considered comparatively trustworthy; but our Portland and Bath stones are as bad as the Paris stone (*calcaire grassin*). One large London contractor uses his refuse Portland stone for ceilings, obtaining from it a most beautiful lime. For stairs and such purposes, Mr. Plumbe said he wished to see terra-cotta and artificial stones more frequently used.

Mr. Edis, in replying to the vote of thanks accorded to him, said that he had been informed that manufactured stone of flint and sand artificially compacted had absolutely stood severe fires, and had been found not to disintegrate under sudden cooling by water.

CONVALESCENT HOME, AT HIGHGATE.

SIR SIDNEY WATERLOW has done a good thing. Having bought a fine old mansion (Lauderdale House), of great historic interest, at Highgate, he has converted it into a convalescent home, and conveyed it for a period of seven years to the Almoners of St. Bartholomew's, to be used by the male patients of that hospital. There are thirty-four beds. The wards are airy and cheerful, and replete with every accommodation. It is a most charming place, with lovely terrace grounds, croquet grounds, and flower and kitchen gardens, commanding fine views over London to the Surrey hills. Sir Sidney Waterlow has entirely remodelled the building, fitted it with every appliance for the purpose to which it is appropriated, first-rate fixed and movable baths, excellent bedding, linen, crockery, and so forth; while another nobleman has given 300 books for the amusement of the patients, and Mr. Foster White adorns the walls with prints and chromes. Altogether, it is a very handsome present, and the gift is the more gracious as Lauderdale House is adjoining Fairseat, Sir Sidney's own residence; and his first intention in purchasing the property was to improve and enlarge his own grounds. It is expected that the Prince of Wales will open the "Home."

WATERWORKS AND RESERVOIRS.

The New Waterworks at Leicester.—On Saturday before last, about 150 students of the Institution of Civil Engineers accepted an invitation of their president, Mr. Hawksley, to inspect a part of these works, which were designed and carried out by that gentleman. The reservoir at Bradgate is nearly a mile in length, and at its broadest part about half a mile wide. The greatest depth is 38 ft.; but it has been so constructed that it can easily, it is said, bear the strain of an additional 2½ ft. of water which might, in case of violent rain, rush into it. The embankment, which has thus cut off the natural course of the water, and converted a valley into a lake, is made of enormous strength. It was first constructed of a mixture of silicious sand and clay; but as small streams of water were perceived to trickle through, it was found necessary to dig to a depth of 40 ft. below the surface, to make a puddle well, the whole embankment now rising some 50 ft. above the ground, and carrying on its summit the public road from Leicester to

Charnwood Forest. The hyvash, by which the surplus water is carried off into the natural bed of the brook, has been constructed with an eye to beauty as well as use. The four large filter beds to which the water is conducted from the reservoirs are also of a somewhat ornamental character. They are covered at the bottom with a thick layer of silicious sand from the river Trent, by slowly filtering through which nearly all impurities are removed, and the water loses its original brown colour. By a tank in each bed, the surface of the sand, when it has become thoroughly charged with impurity, and has assumed a dark green colour, can be washed and cleaned without leaving the beds. After clarification, the water is pumped up by two double-cylinder expansive steam-engines, each of 80-horse power, erected by Messrs. Nielson, Brothers, of Glasgow. The building in which they are placed is designed in the Mediaeval style, the chimney being concealed by a tower. The watershed is calculated at between 11 and 12 square miles, with an average rainfall of about 29 in. But even the minimum of 8 in. furnishes a daily quantity of four million gallons, which, at the rate of 20 gallons for each person, would supply 200,000 people. The engines pump 1,200 gallons per minute direct into the main conduit pipes, which are about 16 miles in length, although one service reservoir is already constructed, and a second is in course of completion, each of which can contain two million gallons. The Thornton reservoir is sufficiently large to supply the wants of the population should any accident to the pipes or machinery of the Bridgegate works temporarily stop the flow from that quarter. Mr. Hawkesley, Mr. Wyatt, Major-general Scott, Dr. Letheby, Messrs. Pell & Hoygate, the two county members; Mr. Ellis, the chairman of the company; and Mr. Stafford, the mayor of Leicester, were of the party.

Bursting of a Reservoir near Macclesfield.—One of the innumerable accidents resulting from recent thunderstorms was the bursting of a reservoir in Hnrdsfield. The reservoirs (better known by the name of Adshead's pools) are situated at the bottom of the Eastford and Ecton Hills. The water rushed down them at a terrific force, and after overflowing the first reservoir, the main embankment gave way, and the flood swept through the gardens and fields adjoining, flooding the houses in the immediate vicinity, and leaving the most valuable portion of a dye-works, which the reservoir supplied, in *tabris*. Passing on, the flood settled on the farm of Mr. Beard, doing considerable damage to the crops and outbuildings. Near Macclesfield, too, about forty yards of the canal gave way, and the water rushed out with great force, submerging a bridge and several gardens, besides flooding many houses.

Bermondsey.—The insufficient supply of water afforded to the district of Bermondsey by the Southwark and Vauxhall Water Company is creating a stir, and has induced the inhabitants to appeal at once to the Board of Trade, a body which, under a recent Act, is empowered to bring its influence to bear upon the water companies, with a view to satisfy the public requirements.

THE FEMALE SCHOOL OF ART.

On Friday afternoon, the 21st, the Egyptian Hall in the Mansion House was crowded with pupils and their friends, and the Lord Mayor took the chair, with the view of presenting the prizes to the successful competitors.

Professor Donaldson read the annual report, which stated that while in 1870 the largest number of pupils was 155, last year it was 170. This was the only school of art in the kingdom where the instruction was given entirely by female teachers, and the warmest thanks of the committee were tendered to the superintendent and her colleagues. The national awards at South Kensington were open to all the 114 schools of art in the kingdom, numbering 20,255 students, and 61,608 works were selected for the competition. The prizes were only ninety in number, and four were allotted to pupils of the institution. The Queen's Scholarship, of the value of 30l., had been won by Miss Julia Pocock, and her Majesty's prize medal by Miss Mary W. Webb; and the Queen had been pleased to express her satisfaction with the paintings of those pupils. The prize for the best notes of the paintings in the Exhibition of Old Masters had been adjudged to Miss Emily Austin, who also gained the silver national medal. The Gilchrist prizes were awarded to Misses Webb, Coffey, Austin, Ircson, and Rae; Dr. Hicks's prize of

5l. 5s., for the best fan design, went to Miss Ellis; and rewards for designs for playing-cards to Miss West. Two more students had obtained permanent employment in tile-painting at Messrs. Simpson's, who now employed six students from the school.

The Lord Mayor having presented the prizes, about 100 in number, the adoption of the report was moved by Mr. Horsley, R.A., who mentioned that in 1871 upwards of 110,000 works from British schools of art were sent for inspection and examination to South Kensington, and that this year there had been 129,000; and bore testimony to the great and deserved success of the institution, to the ability and energy of the lady teachers, and to the rapid progress of the pupils.

Sir John Bennett, who, it was announced, had offered to present a gold watch for the best design for the ornamentation of watches, dwelt upon the great benefits that might be conferred upon the country if women possessed a practical knowledge of the fine arts, and upon the disheartening fact that England, in some of its artistic manufactures, was being continually beaten by other countries, especially Belgium. He hoped that, before long, by the instrumentality of such institutions as the Female School of Art, this reproach would not exist.

Mr. Burchett spoke of the feeling with which the decoration of St. Paul's was regarded as an evidence of revival of art interest.

Mr. Bennoch proposed a vote of thanks to the managers, which was seconded by Mr. Godwin, who said that in the Mansion House of the richest city in the world there were no pictures on the walls. It was lamentable to contemplate. He hoped the present Lord Mayor would turn his attention to it. We wanted mural paintings. He hoped that St. Paul's would not be left to decorators at 30s. a week, but be made the opportunity for obtaining the highest art England could produce.

The Lord Mayor said he had felt for some time how desirable it was that something should be done to obtain great pictures for the Mansion House, and he had suggested to the Corporation, some years back, the advantage of having high-class pictures by eminent artists in the Mansion House, not only as an encouragement to native talent, but as some means of advancing the artistic taste of the nation.

With reference to the work of the school, which has been recently before the examiners, we are glad to be able to announce that the National Gold Medal has been awarded to Miss Emily Selous (now Mrs. Fennessey), for an admirable statuette of Cimalue; and the National Silver Medal to Miss Julia Pocock.

THE CHURCH SPIRE, BAMPTON.

In the case of the injury to the spire of the newly-restored church by lightning, the Sun Fire Office Company at once repudiated all liability thereunder for damage caused by concussion of lightning. They, however, despatched a surveyor, who inspected the spire and made his report. Subsequently, at a public meeting held at the Town-hall, Mr. Skinner laid on the table a letter from the managers of the Company, in which, although reiterating their repudiation of liability, they offered a donation of 200l. towards the expense of rebuilding. The amount of this offer was based upon a report of Mr. Christian, the architect, who fixed the probable amount of the cost of repairing the spire at from 200l. to 250l. This liberal present took the meeting by surprise, and a hearty vote of thanks was passed amid the greatest acclamation. The cost of repairing the damage will, it is understood, be under 200l., owing to the acceptance of a tender sent in by Mr. Frith, of Coventry, who performs the work without ordinary scaffolding or ladders. The repair is now being rapidly proceeded with.

HOSPITAL CONSTRUCTION.

At the last annual meeting of the British Medical Association, Mr. Henry Greenway, M.R.C.S., Plymouth, read a paper on "A New Mode of Hospital Construction." We print the pith of it as matter for consideration:—

Many will remember the able address "On the Construction of Hospitals," delivered by Captain Galton, in 1869, and the interesting discussion thereon. Having myself been present on that occasion, I was much impressed with the subject, and was led to devise a plan whereby I hoped to secure the advantages of a large

hospital without its dangers, and the safety of the lute system without its inconveniences.

The portion of the hospital allotted to patients consists of one or more substantial plain masonry buildings, not more than two stories high, and of any required length, according to the number of beds. The floor of each flat or story is to be waterproof. I first proposed glass and iron as suitable materials; and I would now also suggest glazed tiles, or wood covered with best Vieille Montagne zinc, or with sheet-lead, if there were no objections against the use of that metal, as it would also afford a very dead sound when walked on. Within each story, and extending nearly from end to end, is a block of compartments made of glass, fixed in iron framework. The block is divided longitudinally by a central glass partition, thus forming two rows of compartments, placed back to back, each compartment being 10 ft. square, 12 ft. high in front, and 17 ft. at the back (the central partition), thus causing its ceiling to be on an incline. The space on each side of the flat, between the fronts of these compartments and the main wall, forms a corridor, 7 ft. wide, its ceiling being likewise of glass. Into these corridors the compartments open. Each compartment receives its supply of air from a large tube which passes through the masonry wall, then across and underneath the corridor and the compartment; the air issuing from the floor of the latter through a long iron grating, which may run either transversely or from before backwards. This tube will be furnished with a valve to prevent excessive draught from high winds. The tops of the double row of compartments unite to form a flat ridge, 2 ft. wide. From this ridge, over each transverse pair of compartments, rises a flue, made of metal or of glass, in iron framework, which leads from the interior of the compartments to the outside of the roof. To prevent the possibility of foul air passing from the top of one compartment into the other, the flue is divided longitudinally by a partition, so as to form two flues; the area of each (beneath the roof) being 4 ft. by 9 in., the partition being continuous with the back wall of the compartments. Through these flues the outlet of foul air takes place. In order to insure an upward draught from the floors of the compartments, the air within the flues will be heated by a hot-water appliance in one of two ways:—1. By placing around the flue, a short distance above the ridge of the compartments, a "jacket" (part of a system which would extend underneath the roof over all the compartments); or 2. By passing a pipe, having an oval bore, through the flues, dividing the partition horizontally, the pipe itself thus forming a part of the partition, as seen in fig. 1. The latter plan is more simple, and would prove more efficient. In the main wall there is a large sash-window opposite each compartment, which gives light to the corridor and compartment. Outside each window is a small balcony for conducting window-gardening. On each side of the door of the compartment is fixed a pleasing transparency, such as a landscape. The corridors can be subdivided by a series of self-closing glass doors, so as to form ante-rooms to the compartments. A proper temperature will be maintained by means of hot-water pipes; the water being heated by a gas-furnace, or by asbestos rendered incandescent in a gas-furnace, thus insuring a constant supply of heat, easily regulated. The compartments will be illuminated at night by transmitted light from the corridors. At each end of the flat are placed the usual "ward-offices," and they are separated from the patients' compartments by a transverse corridor, which unites the side corridors. Doors furnished with springs are placed in the passages leading to the bath-rooms, &c., to prevent effluvia entering the corridors. The nurses' rooms are so placed that the nurse may be able to see the patients through either row of transparent compartments; and if a patient on any emergency require the nurse's attendance, by pulling a string he would ring a bell, and at the same time cause a signal to project from the front of the compartment, thus directing the nurse to the proper quarter. As the "ward-offices" not only extend across the ends of the flats, but project on each side of the building, the ground-plan of this portion of the hospital would somewhat resemble the letter I. The roof of the building to be of the ordinary kind, but furnished with skylights. The expense of such a building of one story for twenty beds has been estimated by an able Plymouth architect (Mr. James Hino) at about 3,000l., or 150l. a bed.

In the opinion of our best authorities, one-

story hospitals are the most desirable, and no hospital should be more than two stories high. I have made no allusion to administrative buildings, as they may be carried out according to taste. I have also abstained from entering into certain matters of detail.

The drawings here exhibited are from the office of Mr. Hine (the engravings are reduced copies). The first is that of a transverse section of a one-story building, or of the upper of two stories; the second is a plan of a story with twenty compartments (ten in each row), and offices at each end. The corridor on one side is shown subdivided into anterooms, the folding-doors being shut. If a building were constructed for a much longer block of compartments on one flat, then the block should be intersected by a cross passage, for the sake of convenience. The plan represents the building as isolated; but it would be connected with the administrative, and, if necessary, other detached portions of the hospital, by means of corridors or covered bridges.

The following are some of the advantages gained by the above plan, and they have been considered unattainable by any other at present in existence. Each patient has the enjoyment of his own special supply of atmospheric air, uncontaminated by exhalations from his neighbour. The supply is also being constantly renewed. The compartments being made of glass, no absorption of morbid product, or of emanations which may eventually become injurious (I refer to those particles which produce the well-known odour peculiar even to our best surgical wards),—no absorption, I say, can take place in their walls, and, by occasionally washing them with water, they will for ever retain their purity. There will be no danger on the score of fire. As the patient lies in his bed, he sees not the transparencies, but can look through his glass door, and across the corridor, at the little garden outside the window. He has also the advantage of an apartment to himself, thus avoiding the unpleasantness often felt in associating with strangers, whose company may possibly be deemed undesirable; also, he would not be so shocked by death occurring around him. Although thus isolated, he would not feel lonely, as he would see those around him, and, with a moderate amount of voice, could, if he were inclined, converse with his neighbour. The patient, although plentifully supplied with air, is not exposed to a draught, as the under surface of the bed acts as a screen. Patients not confined to their beds, and having no infection, may be allowed to associate and take their meals in the corridors during the day. The medical attendant or nurse, before entering the compartment of an infected patient, would see that the doors in that portion of the corridor immediately adjoining were closed. Any escape of infected air would then pass out through the open sash-window, and not be distributed through the whole corridor. If occasion required, as in the event of a patient fainting, an extra supply of air could be gained by throwing open the compartment-door and the sash-window, the corridor-doors remaining closed. Rules would be laid down as to the subdivision of the corridors during certain parts of the day.

It has been considered by Inspector-General Smart and other medical officers of large hospitals, that my plan of placing the compartments is far superior to the grouping them on the two sides of the area, leaving a central corridor. With a corridor between the fronts of the compartments and the main wall, the compartments are not exposed to extreme heat or cold, and those patients who are permitted to leave their beds have the advantage of a cheerful promenade or lounge. The greater portion of the glass to be used in the construction of the compartment will not be stouter than ordinary window-glass, and need not be transparent; but transparent glass, of good quality, should be employed in a small portion of their sides to enable the nurse to see through the range more distinctly. It has been said "that it is as difficult, *ceteris paribus*, to ventilate a cell with four angular corners as to ventilate a ward 100 ft. long." This is true as regards side ventilation; but the same assertion would not hold good in my plan, where the height of the compartment far exceeds its area, the compartment itself becoming a kind of flue, the current of air passing from the floor to the ceiling. I acknowledge that every cubic foot of space is not in the line of draught, nor do I think it necessary; but I believe the air will be more or less in motion in every part

Fig. 1.—Transverse Section.

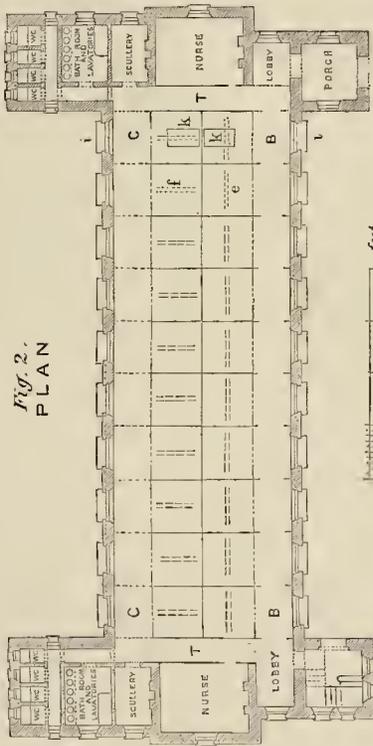

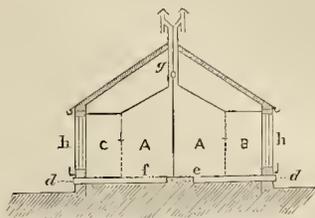

FIG. 1 represents a transverse section of a one-story building through the middle of a pair of compartments. A, A, compartments, separated by a central partition, forming their back. The lower dotted portions of the upright lines forming the fronts of the compartments, signify doors; B, C, side corridors; d, d, inlet ventilating tubes, having a square bore. One of them joins at right angles the side of a trough, which is covered by a grating, c, in the floor of the compartment. The other tube is longer, and has no upper side; underneath the grating, f, is the floor of the compartment. g, Outlet ventilating flues, with hot-water pipe in the partition. A A, Windows, with balconies projecting outside.

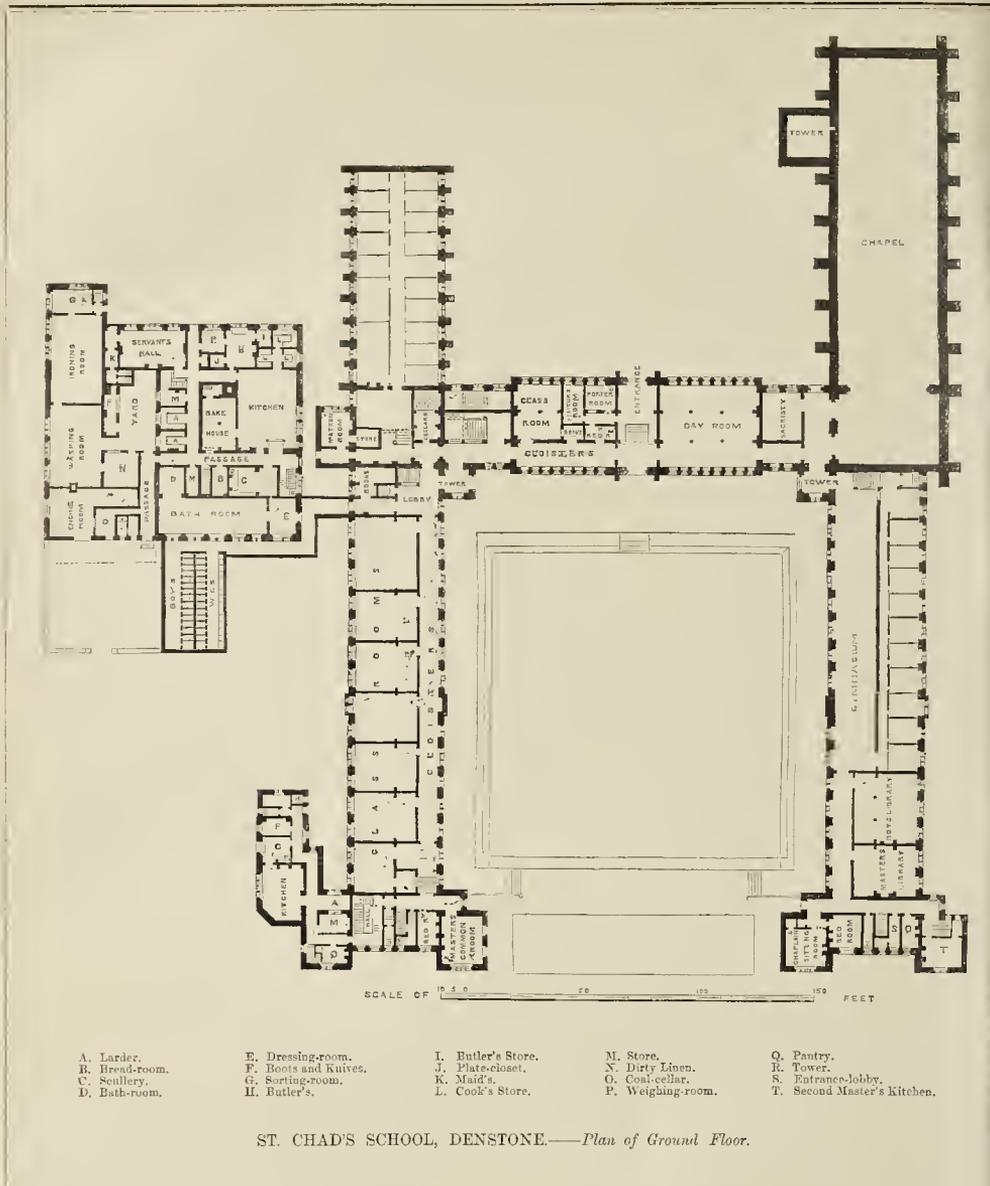

FIG. 2. Plan of a story containing a block of twenty compartments, with offices at each end. B, B, Side corridor; the two rows of projecting points signifying door-jamb, the doors not being shown. C, C, Side corridor, sub-divided by folding-doors (the dotted lines), so as to form ante-rooms to compartments. The dotted portions of the lines forming the fronts of the compartments in the side corridors signify doors. T, T, Transverse or end corridors, uniting the two side corridors. e, f, Gratings in the floors of the compartments, for the admission of air. i, i, Balconies and windows. k, k, Beds [similar letters in the two engravings refer to corresponding parts].

of the compartment, as the ceiling is made to slope, the outlet flue being placed at the summit of the incline. The great hindrance to perfect up-draught ventilation is the horizontal ceiling. Supposing, however, that a current or draught of air were required in every part of a ward or cell, I think I could provide for such condition in the following manner. I should construct my room in the form of a circle, the wall and ceiling having much the appearance of a cylinder supporting an inverted funnel; the entire floor to be perforated for the admission of fresh air, and the neck of the funnel, above the room, to be furnished with a hot-water-appliance. I fear the patients would complain of the excessive supply. At our meeting at Leeds, before referred to, there was a general feeling amongst the profession then present that, in the matter of ventilation, especially across a bed it is possible to

kill our patients with kindness, by producing pulmonary and other complaints.

As regards the oversight of the patients by the nurses, I should say that I propose, in addition to the means already mentioned, employing patrols, who would keep watch in the corridors during a stated period, and then be relieved by others. The patients would also, to a certain extent, watch each other when awake. In cases of extreme illness I have no doubt you would consider the constant presence of a nurse or friend at the bedside of the utmost importance, whether the patient be lodged in a hospital of the kind just described, or in an open ward, or in his own private dwelling.

Although the building just described is intended for the reception of all kinds of cases, I would venture to suggest the advisability of making additions of this character to existing

hospitals, for the reception of infectious cases from the general wards, thus locating without intensifying infection,—a condition which does not obtain in our fever hospitals. I would also advise the erection of such buildings for the upper and middle classes of society, so that infectious cases may be removed thither from private residences, and thus probably prevent the spread of infection in families,—the patients to be treated by their own private medical attendants, and to be charged moderately for board and lodging, nurse, &c.

ST. CHAD'S SCHOOL, DENSTONE.

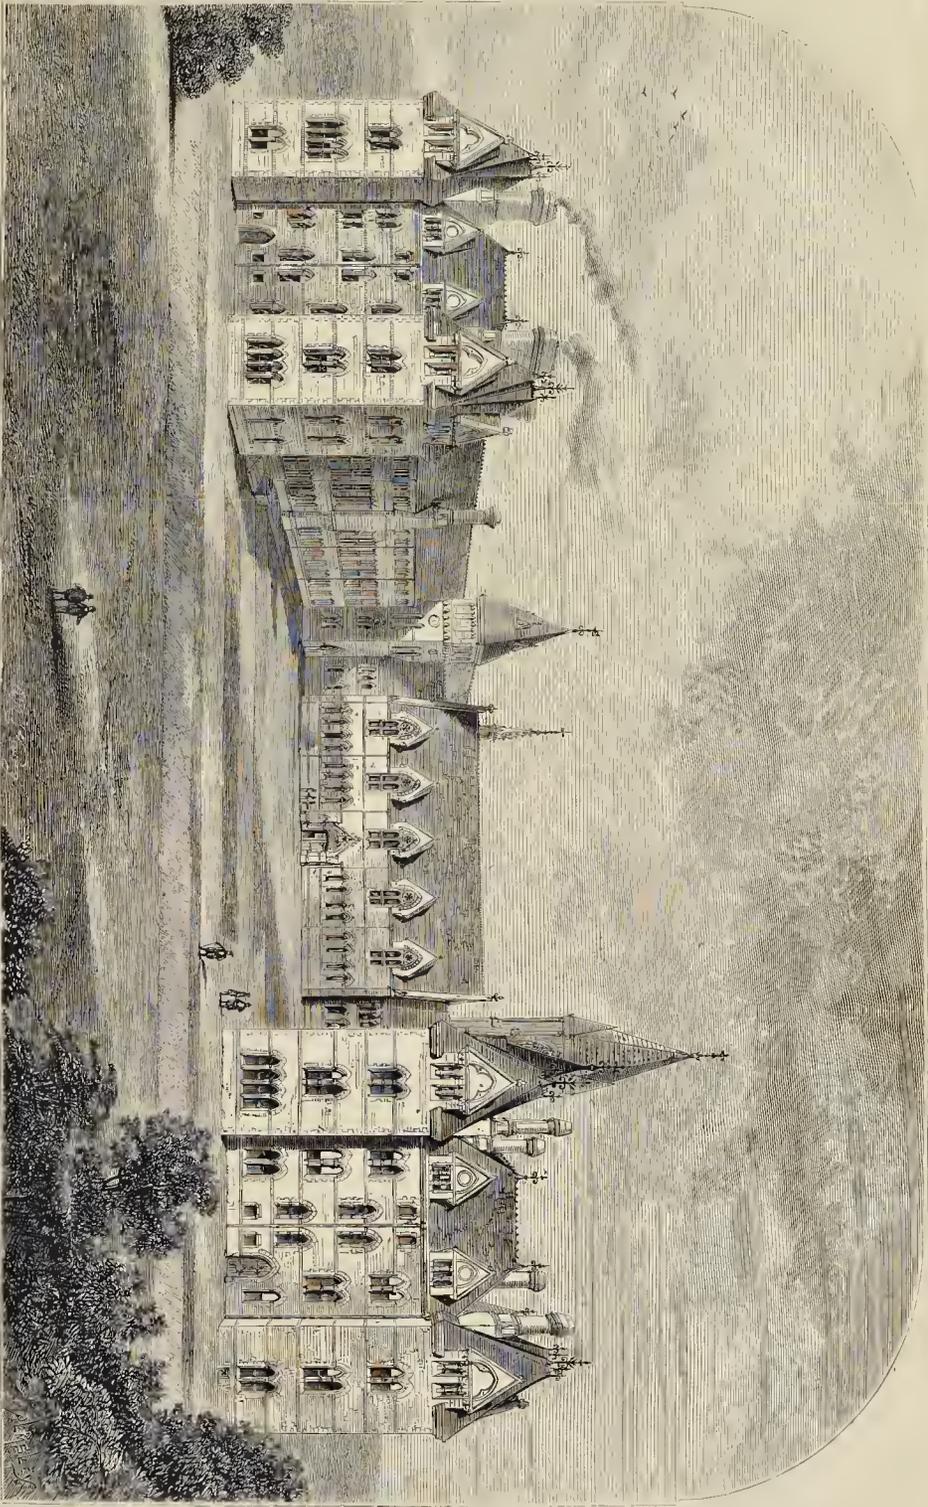

ST. CHAD'S SCHOOL is connected with St. Nicolas College, at Lancing, and is, like St. John's, Hurstpierpont, intended for the middle classes; the education and terms will also be the same. It is one of the three schools for the Midland Counties which are to be carried out in accordance with Canon Woodard's great scheme.

The first stone was laid October 22, 1868, by Canon Lonsdale (in the absence of the Marquis of Salisbury), and since that time the buildings have been steadily progressing. The view shows the western, or Lonsdale Quadrangle, so called in memory of the late Bishop of Lichfield, whose last public act was the presiding at a county meeting on its behalf. The north wing and headmaster's house, together with the central building and offices, are erected; the foundations of the dining-hall and the basement of the south wing are done; and the superstructure of this wing will very shortly be proceeded with. The number of boys will be 300, with dormitories in each wing, having masters' rooms, lavatories, &c., to each dormitory. The great schoolroom is on the upper floor of the central building, with a series of class-rooms in the north wing. The dining-hall will be on the same level as the schoolroom, and will have masters' and music rooms on the ground floor. The offices include a laundry, engine-house, &c.

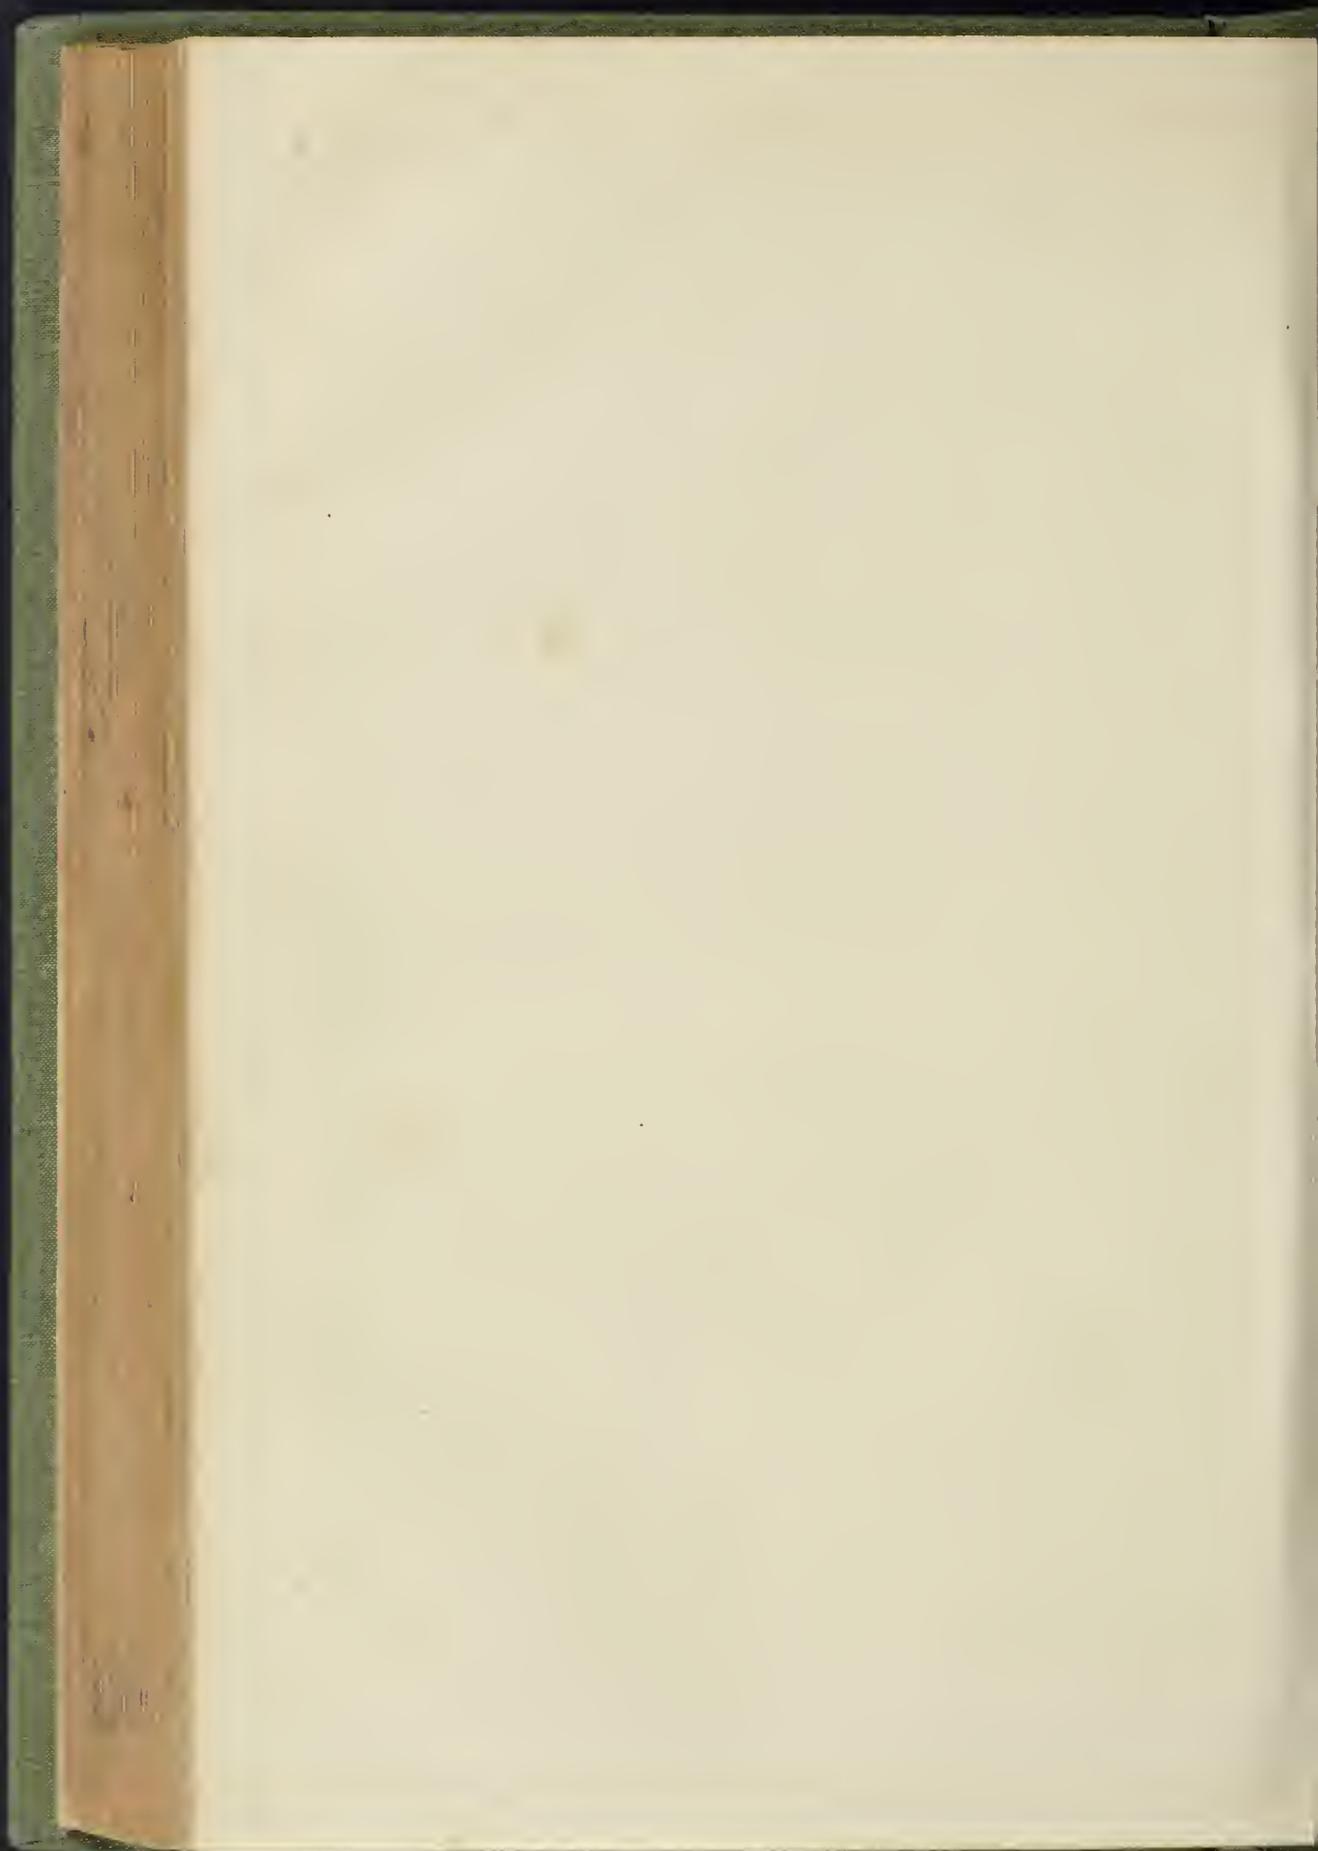

The water is pumped from the well into the tanks of the two water-towers; and at the points where these stand, the five portions of the building are completely divided (except by a door on each floor), so as to prevent the spreading of fire from one portion to the others. The chapel is not yet commenced. The whole is built with double external walls; the outer of Alton stone, which is also used for dressings, with bands of red Alton stone. The bricks for the inner walls were made on the site.

The school stands on the top of the valley side, opposite to the ruined Abbey of Croxden, and within sight of the charming Churnet Valley and the towers and spires of Alton Towers. The nearest station is Rochester, about 1½ mile distant, on the Derby and Macclesfield and Manchester Railways.

The contractor at present engaged on the works is Mr. G. W. Booth, of London and Gosport, under the college architects, Messrs. Slater & Carpenter.

ST CHAD'S SCHOOL, DENSTONE.—MESSRS. SLATER & CARPENTER, ARCHITECTS.

A HINT TO THE CITY GUILDS.

Sir,—Will you allow me to reply to the remarks under this heading in the *Builder* of May II, and to remind your correspondent "X." that I fear he is but imperfectly acquainted with the real good done by the London Livery Companies? I have the honour to be a member of the Ironmongers—one of the too-often wrongly-abused "Twelve,"—and as I have given the history of the City Companies some attention, I trust you will permit me to say that any inquiry instituted by the Crown Commissioners would only harm the "working" of the guilds, to the extent of curtailing the benefits derived from the charities, and involving the companies in unnecessary expenses, as we have seen already in the results of the Bedford Charity, the Tunbridge School, the Emanuel Hospital, Dulwich College, and a host of others too numerous to be here specified.

I would remind the writer of the article that the City Companies are not "trading" companies at the present time: consequently they are neither amenable to the laws appertaining to those companies, nor to be classed with the public insurance companies of the nineteenth century. When the City Guilds were incorporated three to four hundred years ago, they were chartered to oversee the trades under the names of which they were formed; and if we inquire into the manner of their authority, and the results, I do not think the country at that period was any less inconvenienced by the powers exercised by the companies. In course of time, however, Parliament, always ready to pass Acts, at that date, to please the people, granted to outsiders certain privileges, which seriously upset the chartered rights of the companies, and in the end every company (except a few, such as the Fishmongers, Stationers, Watermen, &c.) lost their original powers, and only had the management of charity trusts to carry out. And at the present time, if the trade would only give encouragement, and not oppose the City Guilds to the extent they do, the result would be more beneficial. Of course, in every society there are to be found members who think their position worse than it should be, or the managing body of the company radically wrong. Who can deny that the Fishmongers, Painters, Stationers, and Watermen have been useless? But the trades oppose the supervision of the City Guilds; and if the companies dispense their charities silently yet well, I really cannot see why the "outside" public, who have no interest in the matter, should complain. Let the trades only express a desire to co-operate with the companies, and the companies will not be backward,—as they never are, when any good cause requires a helping hand.

The Irish estates belonging to the City Companies are not such a profitable property as the world imagines, and I think it is much to the credit of the City Guilds that they have used their wealth to place in the north of Her Majesty's Kingdom of Ireland better buildings and a better tenantry than other parts can boast of. When Mr. Maguire's "scheme" to seize the City estates in Ireland was brought before (and subsequently withdrawn from) Parliament in 1869, I had the honour of publishing in the English and Irish papers statistical details, proving that the majority of the tenantry were well satisfied with the Companies' management, and not at all favourable to a change of landlords.

Our early monarchs, especially James I. and Charles II., were very fond of writing to the Lord Mayor of London desiring a loan of a few hundred thousand pounds, and upon receipt of this polite request, the Lord Mayor proportioned the amount among the City Companies, and requested a prompt payment. If the City Guilds refused, the King seized their charter, and charged them, you may be sure, a pretty round sum for its redemption. If they lent the money, all they received in return was the King's letter of thanks, but never to expect repayment. If the members were short of cash, the company had to sell on mortgage their estates (often left to them for charitable purposes), and pawn or sell their plate; and thus it is how many of the companies were ruined, and the property transferred. The Ironmongers' let their Irish estate to the Beresford family, whose only desire appears to have been to make as much out of it as possible; so that when the company regained possession some years since, the property was in a terrible condition, and the reparation of it cost a large sum. Those that live in the sunny reign of Victoria can form but a very imperfect idea of the troubled times of the Stuarts and earlier

reigns. Those that condemn the City Companies should read the history of London during these reigns, and I cannot but help saying that the reader's opinion will be changed; that the companies will be honoured for having so well managed their properties as to be able to have the balance, which outsiders look upon with so much envy, instead of being condemned. If they had not struggled with Crown Commissioners in the days of yore, they would have had at the present time but very little indeed of the estates and property left them for charitable purposes.

Respecting the distribution of charity funds by a City company, I would refer your readers to my article on "Thomas Betton, the Shore-ditch Worthy and National Benefactor," printed in the *Hackney Express*, of April 26th, this year. I have shown therein that Betton left his large property to the Ironmongers' Company, who, among other things, were to expend one-fourth part among the charity schools of the City, and one-half "unto the redemption of British slaves in Turkey or Barbary." They accordingly executed the trust; but after the adoration of Algiers by Lord Exmouth, the applications for redemption ceased. In 1830 the company, finding a large sum in their hands, proposed to set aside 7,000*l.* as an accumulating fund to meet any applications for redemption thereafter, and with the balance to increase the pensions, &c., of freemen, widows, and children, and to extend the number and radius of the charity schools; but the Crown Commissioners actually opposed the scheme; they put the charity to 8,000*l.* expenses, and probably would have done more had not the House of Lords confirmed the company's scheme as a good one. The result is that at the present time every charity school of the established religion throughout England and Wales receives an annual payment from Ironmongers' Hall, the total expenditure being nearly 5,000*l.*, and many pensioners have been added to the list of the company's charity. These facts, I think, speak for themselves; but any further information I shall be happy to supply. I only wish, for the sake of those to be benefited, that every charity, whether under the control of the Crown Commissioners or not, was as ably managed as the trust I have described. There are some companies who have not the means to stand expensive law-suits in the course of right against might. T. C. NOBLE.

QUANTITY AND QUALITY: PIECE-WORK AND DAY-WORK.

A CORRESPONDENT of the *Builder* makes very sensible remarks on the question of piece-work, and, indeed, as a whole, his observations hold good in his application of them to the existing condition of builders' workshops, masters, foremen, and workmen. Piece-work, *per se*, possesses all the advantages attributed to it, and more unthought of; but at the same time it is susceptible of much evil, and has actually worked a large amount of evil to architecture and the building trade in the hands of unprincipled patrons and advocates. From a lengthened experience of the building profession, extending over the kingdom, I have had an opportunity of testing the value of both systems, of seeing their good points and their weak ones; and, as at present conducted, I have no hesitation in asserting that two-thirds of the bad building and bad workmanship executed are attributable to "slush-work" and piece-work.

Slush-work is done by the day, as well as by the piece; but piece-work, as performed for small builders and "jerries," is, *de facto*, slush-work of the most patented description.

I have lately, for my own information, as well as to benefit the community when opportunity was offered me, made a tour of inspection in the suburban districts of London, east and north-east, for the purpose of scanning the method employed in building the cheap class of dwellings now so plentifully erecting.

I found the bricklaying, plastering, and joinery work, and that of other trades, parcelled away by separate contracts, and the small contractors had again sub-contracted with other workmen, who took the work, and with the aid of a man or two and a few boys were engaged like machines in slushing by the piece. The character of the work, if it could be credited with having a character at all, was of the very worst description. The bricklaying was scamped from footings to wall-plate, and was the work of scamps,—the employers instead of the workmen being the

greater criminals. The mortar used was not much better than road mud, and I could have kicked entire fronts down from story to story with the most ordinary thrust. So flimsy and ill-constructed were the majority of the houses I examined that, I undertake to say, none of them would withstand a stiff gale of wind, supposing they were deprived of their roofs of naked timber, and their floor-joists were cut through for sake of experiment.

The thickness of the sash-frames and sashes was, indeed, a matter to marvel at. Were these sash-frames deprived of their external casings, the beholder would see a 1-in. section, a 9-in. board being divided to form the two stiles, $\frac{3}{4}$ in. or $\frac{1}{2}$ in. casings being planted an internally and externally. The thickness of the sashes was about 1 $\frac{1}{2}$ in., or under in some cases. Is it any wonder that windows and window-sashes are always in want of repair where such atrocious work is executed? Sashes hung in such frames are in reality hung for life. Doors, architraves, shutters (where there are any), are in keeping with the other part of the works; and, as for the stairs, they are simply an elongated step-ladder, with "creaks" in them from the very beginning, like a new pair of boots; but, unlike the boots, the creaks in the stairs increase with their age,—the doors and sashes joining in the accompaniment.

These are some of the results of the piece-work system in the hands of unprincipled builders and workmen. Unfortunately the tendency of piecework is not to elevate the workman or his workmanship, but to lead to the perpetration of a vast amount of inferior work. A speculator,—and I have one in my eye now,—buys a piece of ground in the autumn, and he determines by the following July or August to have "run up" a row of two or three story dwellings; and, to carry out his idea, the piece-work system is set in full swing. The houses, twenty or forty in number, have no sooner assumed their carcass shape than hills or painted boards are put up, announcing that Nos. 3, 7, 9, and 15 are sold. This is the bait to kidnap the unwary. In a few days more, one or two *bona-fide* tenants perhaps undertake to rent one or two of the houses in the row; and then, after another short interval, a large painted board is hoisted on the end or angle house, announcing that "All these desirable Residences are to be sold." It is only the simple known truth to say, that the building owner of these new houses for the time being would no more retain them in his possession than he would cut his own head off. Sold they must be, and their purchaser is also sold.

The introduction of the piecework system into regular workshops would not lead to the benefit anticipated, so long as the lax conduct of the majority of the foremen in them remains unreformed. I have known workshops upwards of twenty years ago, where the piece-work system was tried, and tried for a long time, but it brought neither honour nor credit to workman, employer, or foreman. Quantity, indeed, was produced, but quality was nowhere apparent. The same employers (some of them) are now Government contractors, and day-work is the order of the day. The work is a great deal better executed, but the quantity is far too small. Foremen who levy a blackmail in the shape of drink, or accept drink to condone faults, in the shape of botchery or incapacity of any kind, ought to be drummed out of employment at once. It is a fact that "muffs" or hotchers are often kept on while sober and skilled hands are discharged; but even worse than this: many examples have occurred, to my knowledge, where habitual drunkards were kept in constant work, although the broker would not give them 5*s.* for their whole kit of tools. Such men, of course, could never compete with their fellows either at day-work or piece-work. A fair day's work for a fair day's wage is what should be absolutely required of every skilled operative; and I must say, as a rule, in all well-regulated workshops a fair day's work is performed or exacted as a matter of course. The work in general, in a respectable builder's workshop, is decently turned out; but as to any tendency towards artistic finish, or of a more deft, scientific manipulation, on the part of the craftsman, I fear I must write there is little indeed. There is a method for doing each piece of work,—a stereotyped method, known to the trade, the generation, the employer, and the foreman; and in accordance with this method the work is done. The workman has seldom or never a voice in the

matter. Under such a system as this, the brain of a Praxiteles, an Angelo, or a Christopher Wren, were it possessed by a working carpenter, would avail him nought. Happily, however, in these days, the bearing-rein can be cut by those possessed of talent and manhood, and success is possible, though the competition is great.

There are radical evils on each side of the subject we have been discussing, and great dishonesty. Indiscriminate piece-work has flooded, and will still further flood, the country with bad work of every description; and, as for day-work, although it covers a multitude of sins, the public in general are more benefited by the system in the end, though they often, as well as the employers of the workmen, pay rather dear for their whist.

The subject is a wide one, and leads to so many considerations that it would need chapters, instead of columns, of space to discuss it in detail, showing its relative advantages and disadvantages on our present condition of society.

A CRAFTSMAN.

PRIZES FOR LABOURERS' COTTAGES AND DRAINAGE IN IRELAND.

An evidence of the growing value and utility of concrete, as a constructive material for domestic buildings, will be found in the following report of the judges, who were appointed by the Royal Agricultural Society of Ireland to inspect labourers' cottages and drainage, competing for prizes:—

Cottages (Concrete), Mr. Mahony's, County Kerry.—The first cottages we inspected were four, entered by Mr. Mahony, County Kerry. These cottages, which are built of concrete, according to Mr. Tall's patent, are very neat-looking and commodious, containing a very good living-room, 12 ft. by 14 ft.; two bedrooms, 7 ft. 6 in. by 7 ft. each, on ground-floor, and a bedroom or loft over the two ground-floor rooms, lighted in the case of the two cottages by skylights, and in the case of the two end-houses by windows in the gable; the living-room is open to roof. These cottages are very reasonable as to price, considering the amount of accommodation given, and the care and attention with which everything is finished. We could not help remarking the entire absence of damp, which is quite excluded by the complete solidity of the walls, which allows no damp to rise from the ground; the gable walls were papered a very few weeks after they were finished; and, after one of the wettest winters on record, the paper showed no sign of damp, whilst a cottage built in the ordinary way, two or three years' since, the paper on the western gable showed evident signs of damp. Another great advantage arises from the fact of the walls being only 9 in. thick, giving an increase of at least 23 in. of internal width with the same roof. The yards and offices are most convenient, and the whole expense of each cottage and offices complete, as shown on the plan, would be under 70*l.*, or well within our maximum for much less accommodation. The great want that we felt in these houses was there being only one fireplace in each, but as the principal bedrooms are on the ground-floor, this may not be of so much consequence. Mr. Mahony stated for our information that rubble masonry with the necessary cut stone, would have cost at least one-third more per perch than the concrete. We have much pleasure in awarding Mr. Mahony the gold medal offered for the province of Munster.

Mr. Cosby's (Queen's County).—The next cottages we inspected were a pair entered for competition by Mr. Cosby, of Stradbally; they are neat and compact, well built, and well put together; the stairs leading to the upper story are well planned, giving a separate entrance to each room from the landing. The great interior want is a second fireplace in each of the houses; and we think that the privy and pig-stye, both discharging into an open dung-yard within 5 ft. of the door, are too close to the house.

Mr. Napier's (County Meath).—As these cottages compete with Mr. Cosby's for the Letestor gold medal, we will now consider them. Mr. Napier entered two sets of cottages for competition; one near Oldcastle, on which only we need make any observations, as the other pair, situated near Carracross, county Meath, exceed our maximum price. The Oldcastle cottages are built exactly on the plan which gained the Duke of Abercorn's prize, and for the estimate furnished, though we think it improbable that houses of this class will be built for the future for this amount, unless under very exceptional circumstances. These houses give such very superior accommodation, have two fireplaces in each, and such convenience in the way of presses, closets, &c., that we consider we must award them the Letestor gold medal as against Mr. Cosby's.

Sir H. Bruce's (Londonerry).—The next cottages we visited were those entered for competition by Sir Harvey Bruce. They are very neat-looking, and well finished, being built of the black basalt stone of the district, with freestone quoins and dressings. They are very compact, and give a large amount of accommodation. The arrangement of the interior, particularly of the two end-houses, is very good. We award to them the medal for Letestor, and likewise the Letestor Challenge Cup, as against Mr. Napier, he having only two cottages to compete, and as against Mr. Mahony, the plan being superior. Mr. Mahony's are built at a very much cheaper rate, and we have no doubt of the economy in the use of concrete for cottage walls; but having so little experience of the lasting qualities, we felt it hardly wise to award the Challenge Cup on account of superior economy.

In conclusion, we would here leave to suggest for future competition the propriety of establishing an average scale of prices on which all estimates shall be calculated, and to require from parties exhibiting accurate detailed tables of quantities and of qualities of materials, so that the decision of your judges shall be based on the workmanship, convenience, and economy of materials used, and not to be in any way influenced by apparent cheapness, which may arise from accidental circumstances, or the use of inferior materials. One man may be able to build for 7*s.* 6 perch; another may not be able to do the same work

for 10*s.*; in the latter case it is no fault, and in the former no merit. Such circumstances, if not explained, might cause a competitor to lose a prize for perhaps a better cottage.

DRAUGHTS.

We had, we are sorry to say, only one lot of drainage to adjudicate on, Mr. Cosby's, at Tuahoe, in the Queen's County. As we have had drainage works executed on his estate under our consideration, now several years, we need only observe that it is quite equal in quality and promise of durability of work to any we saw in former years; and we were glad to see many fields which we had judged on previous occasions, showing, by the grasses growing on them, the nature of the soil, and their general appearance, how well they were repaying Mr. Cosby for his outlay. We have, therefore, great pleasure in again awarding Mr. Cosby the provincial gold medal and the drainage challenge cup given by Lord Digby.

R. G. WADE,

C. UNLACKE TOWNSEND,

J. M. ROYCE.

HYDRAULIC.

SIR,—I have a well on my property situate in the West of England, the water of which has hitherto been salt and brackish, and totally unfit for anything but ordinary purposes. In addition to the foregoing defects, the supply usually ran short in the summer season. In order to augment the supply, and render the water more pure, I was advised to carry the rainfall water from the roofs of the premises into the well. The well in question is 25 ft. in depth, and the natural supply of water generally about 10 ft. A few copious showers raised the well to overflow, at which time the water is suitable for making tea, grog, &c., and remains so until from 10 ft. to 15 ft. have been pumped out. The pump-pipe is fixed to within 2 in. of the bottom of the well. Having stated the facts of the case, I should be extremely thankful if you or any of your subscribers would solve what to me has been a difficult problem for some months past, viz., "why is it that the rain-water, which I suppose to be of the least specific gravity, is first drawn off, the pump-pipe being, as before stated, so near the bottom of the well?" I should be glad to state that a neighbour who has a well 70 ft. deep, and a force-pump reaching to about midway, finds the same results.

GLASTON.

INSURANCE AGAINST LIGHTNING.

SIR,—May I ask you a question of some importance to all holders of house property? Can a house or other building be insured against damage done by lightning?

I believe that the forms of policy issued by some of the offices cover damage by fire, occasioned by lightning. But I believe they do not cover damage unless there is fire. For example; if a chimney be struck by lightning and knocked down through the roof and floors of a house; or if the wall of a house be rent from top to basement; or a tall factory-chimney rent and shaken down; I doubt if any compensation could be obtained under existing policies.

I should be very much obliged for any information on the subject. I need not point out what a serious event an accident of the kind might be to a tenant who is bound by his lease "to uphold, maintain," &c.

R. J.

TENDERS IN MANCHESTER.

SIR,—Allow me to call attention to the disparity in a series of tenders for a brewery in Manchester. The difference is 1,500*l.* in about 4,200*l.* Had the quantities been taken out in Manchester, 100*l.* would have covered all the difference. The great discrepancy does not arise from the mere fact that the quantities were supplied from London: we find that as a rule similar discrepancies occur very frequently in London.

There is not the slightest doubt that the Lancashire system of quantity-taking leaves less to the imagination of builders than that in use in the South; and that from this very fact works are wound up with more comfort both to client and builder. Manchester architects are not in the habit of publishing tenders. I may therefore be readily excused for pointing out a discrepancy which would (from want of means of comparison) escape your London readers.

R. W. A.

LEGISLATION FOR LABOUR.

There are some Bills of practical importance introduced by private members for which Government finds it difficult to "give a night." One of these is to make further provision for arbitration between masters and workmen. The Bill has been prepared and brought in by Messrs. Mundella, S. Morley, W. H. Smith, T. Brassey, and T. Hughes. The principal object of the Bill is to explain and amend the 13th section of an existing Act of George IV. The proposed provisions are to enable masters and workmen to agree for arbitration; to designate some board, council, person, or persons as arbitrators; to appoint an umpire; to bind themselves by agreement which is to last during the continuance of any contract of employment and service in force at the time of making the agreement, and thereafter, from time to time, by mutual consent. They may agree that the arbitrators shall have exclusive jurisdiction for the bearing and determination of

disagreements, and that on such determination no other proceeding shall be taken before any other court or person for the same matter. The hearing and determination must be within seven days from the time of the act or omission to which the disagreement relates. The Bill also proposes that arbitrators should have powers for compelling the attendance and submission of witnesses, and the production of any books, documents, or accounts bearing upon the matter in issue. It is to be hoped that such a useful and hopeful Bill will have a better fate than to be slaughtered among the innocents at the end of the Session.

Another Bill before the House, which is brought in by Messrs. Mundella, Anderson, Morley, Philips, T. Hughes, Carter, R. Shaw, Hinde Palmer, and Armistead, provides that the existing Factory Acts shall be so interpreted that no child, young person, or female shall be employed after one o'clock on any Saturday afternoon, either for recovery of lost time or for any other purpose; that they shall not be employed for more than 94 hours on any day, nor for more than 54 hours in any week. Although the Bill was introduced at the beginning of April there has not been, as yet, an opening for its second reading, which is postponed to the ominously distant date of July 31st.

SCHOOL BOARDS.

Ipswich.—At the last meeting Mr. Fraser moved that the Board should appoint an architect to prepare plans for the infant school to be built on land adjoining the Trinity National Schools. He thought it unnecessary, with the experience they had, of again advertising for plans. Dr. Chevallier took the opposite view. If they had at the outset appointed their architect to prepare all their plans, nothing could have been said; but having begun with the other system, it would be invidious to one or other of the two architects they had employed to pick out an architect, and, to a certain extent, it would be an imputation on the other architects of the town. Mr. Grimwade and other gentlemen agreed with Dr. Chevallier, and it was determined to advertise for plans from architects resident or practising in the School Board district, as in the former case. A letter from Mr. J. C. Cobbold, with reference to the site of the school, was referred to the committee.

Windlesham.—Considerable additions to the school accommodation at Bagshot and Windlesham are about to be carried out, under the direction of the Board's architect, Mr. E. Ingress Bell.

Brighton.—The design by Mr. Banister Fletcher & Mr. J. S. Nightingale, for the new schools in Richmond-street and Sussex-street, at an estimated cost of 4,357*l.*, has been adopted. Eight designs were sent in competition.

ST. PAUL'S CATHEDRAL.

The following is the text of a resolution adopted at a recent meeting of the London and Middlesex Archaeological Society, and forwarded to the Dean and Chapter of St. Paul's:—

"The London and Middlesex Archaeological Society, feeling concerned that the interior of St. Paul's Cathedral should be completed in the manner in which its architect, Sir Christopher Wren, would have completed it, calls upon the Executive Committee to use every endeavour to ascertain his intentions with respect thereto, and, so far as they can, to give effect to them."

DRAUGHTSMEN'S PROVIDENT SOCIETY.

SIR,—I venture to ask for a little of your valuable space to call attention to a subject which is of considerable importance to a large section of your readers.

In these days of trade strikes and combinations of various kinds for promoting the welfare of all classes of workers, there is one class who never yet have attempted anything like combination or co-operation for mutual benefit. I refer to assistant draughtsmen employed in architectural and other works in London, in very large numbers.

It would be the very last person to suggest any aggressive movement amongst such a body of educated men, but it strikes me as being the proper time, and your journal as being the proper medium through which to make a suggestion, for the formation of a provident or mutual benefit

society of a social character amongst this not-too-well-paid class of industrious and little-anticipated assistants; and if you will allow this subject a space for discussion in your columns (i.e., if it is of sufficient interest to elicit a discussion), I am sure you will be conferring a benefit where it is needed.

This want is not met by any of the existing associations, although they might assist in inaugurating what, I am obliged to confess, would be an important movement.

Some such course as the following might be adopted, viz., a preliminary meeting might be held (say at the Architectural Museum, of which, I imagine, the free use would be granted), and the subject being introduced by a few able speeches by influential men, what development such an idea might take might, I think, be left to the discretion of the meeting then held; and if the result be an ultimate good then no one will be better pleased than one who is not so much for himself as

POUR LES AUTRES.

INSTITUTE CONVERSAZIONE.

SIR,—How is it, Mr. Editor, that this *conversazione* is not what it used to be? Why are not members requested, as formerly, to lend works of art, &c., for the occasion; and why now do we have imitations of old china, had modern French articles, and other works, with their prices attached? Certainly, last night there was too much "shop" about the place; and as to the architectural exhibition-rooms below, the want of the usual architectural drawings, and the dreadfully dull appearance of those rooms last night, made one much regret the *conversations* of former days.

Otherwise, all went off well: plenty of people, plenty of music, and plenty of ices. The re-lighting of the Institute's large room was a great improvement. A.

EXPERIMENTS ON FIREPROOFING.

SOME experiments have been carried out on a cottage, with a stable below, which has been built at Edmonton, under Brannon's Monolithic Stone-felting processes. Pursuant to a circular of invitation, about 100 gentlemen and ladies assembled at the Bell Busk Estate, on Tuesday, the 25th inst. After examining the different stages of the work, which are nearly all illustrated in this little cottage, about sixty of the guests assembled round the little garden on the centre of the flat roof, and in reply to their questions the inventor explained the principles and details of his patent method. The partitions and bracketed-out apartments, of 2 in. to 4 in. thick; the doors, of 1 1/2 in. to 1 3/4 in. thick; and shelves, of 1 in. thick, were tested for strength with a 14 lb. sledge and heavy riveting-hammer, all returning clear, solid, or ringing sounds. The tenant's furniture was then collected into one room, and the apartments below it and by its side were piled with faggots, red pine timber, and coke, quickened with paraffine. The stone-felt door of the furnished room was then closed, and proved the effectual protection of the contents from the vast mass of fire which filled the adjoining room and passage, while as hence a combustion was sustained below. No discomfort was created by the surrounding fire, nor did it appear to injure the building.

CITY ARCHITECTURE: A NEW STYLE.

SIR,—I have been disappointed to find that the suggestion of your contributor, "Nemo," as to encaustic tiling, in his recent communication, on the "Architecture of Great Cities," has not been taken up by some of your professional readers with a view of determining its possible extensive use in out-door architecture. If it is capable of successful adaptation in this way, it seems to open a way out of the barren and interminable controversy as to styles, &c., to present a new point of departure for the development of a fresh system of design and decoration full of artistic promise, and possessed of such material advantages as to cleanliness, durability, &c., that it is a matter of great surprise that its thorough and complete use, as so fully urged by your correspondent in all these respects, has not sooner attracted the serious attention of our architects and builders. The great thing, however, must be its value as artistically developed in harmony of colour and appropriateness of design into perfect architectural expression;

and this would require genius and thought. A partial use of encaustic tiling is often attempted as a means of giving variety and effect; and where skillfully done—not in the piecemeal, scattered manner we often see,—with the happiest results; but I understand your correspondent to mean that the carrying out of his system would involve a study of design for applying it to the whole exterior surface of a building, which would require, as a ground work, good proportion of parts,—a main neutral tint for the major part of the building to give repose, suitably relieved throughout by coloured architectural ornamentation, chiefly of tertiary tints, and very sparingly, by secondary and primary ones. The beautiful tiles we now see about, and employed in minor ways, are very suggestive of what *can* be done. If properly carried out, I am persuaded the result would be so pleasing and refreshing in our cities, whose architecture becomes so dirt-laden and dismal, that a new era in domestic and street architecture would commence, as predicted by your correspondent, if not leading to quite all the results he was perhaps too sanguine in anticipating.

ALPHA.

"EDWARD PEARCE."

SIR,—Referring to the communications to you at pages 410 and 451, I am able to state that at the period mentioned by Mr. Papworth, one Edward Pearce, knight and architect, was a brother to General Sir Thomas Pearce, K.G., and, as I have heard, the architect of parts of the Houses of Parliament destroyed by fire in 1834. I presume this could be verified.

THOMAS PEARCE.

THE LOCK-OUT.

ENDEAVOURS are being made quietly to bring about an adjustment of the differences between the masters and the men, with what success remains to be seen.

A deputation from the London Trades' Council on Wednesday waited upon the committee of locked-out masons, and submitted a resolution suggesting a compromise, by which, on the nine hours being conceded, the question of wages and the code of working rules would be referred to a board of arbitrators. The committee promised to lay the matter before a general meeting of the masons, to be held on the following evening.

SIR,—There is no change. "Nine hours and Ninepence" is the present motto of the men, and nothing will take it out of their heads. We brought the masons' delegates to some reason, but their suggested compromise of fifty-three hours at 8s.4d. was "hooted" at the general meeting. Your proposition of fifty-four hours at 8s.4d. would no doubt be accepted by the masters, but it must be an average of fifty-four hours, or less. Building is an out-door trade, and as there are not more than eight hours' daylight in winter, to fix the same hours all the year round is an *absurdity*. The workmen say, "we need as much to keep us in winter as summer,"—which is, of course, admitting that they are not equal to the lower animals, and have not moral control sufficient to put by in summer for winter use. This strike is a most serious blow to the reviving building trade, and should be put down by public opinion. That all building work should be stopped in the middle of a summer's afternoon at half-past four seems a gross absurdity, and could never be maintained. The masters are quite willing to fix the rate of wages at the market value, but it would be unpatriotic on their part to fix an arbitrary limit of fifty-one hours *all the year round*.

A BUILDER.

A CHURCH FOR RAMSGATE.

WE hear from this favourite watering-place that a feeling is manifesting itself in favour of moderate High Church services, the Isle of Thanet having hitherto been rather a stronghold of the Low Church party, and that it is proposed to build a handsome church in a new district approved by the Ecclesiastical Commissioners, with the consent of the Archbishop of Canterbury. The site has been purchased, the plans have been prepared by Mr. Newton, and the work will be at once commenced. An energetic committee of resident gentlemen is strenuously exerting itself, and intends to appeal to all visitors to Ramsgate for help, as 400 sittings will be provided for their accommodation. That an

additional church was called for is evidenced by the following statistics. The population of the town is about 16,854; the number of visitors at one time is about 30,000; yet there is but present church accommodation for 4,200. The new church will accommodate 700, and 400 of the seats will be free and unappropriated. The Rev. J. Wardell, The Elms, Ramsgate, will furnish every information to those willing to assist in the work.

LONDON SCHOOL BOARD OFFICES.

At the last meeting of the Board, Mr. Langdale moved, against the recommendation of the Works Committee, that the designing of the proposed new offices of the Board be opened to the competition of four architects, instead of leaving it to Mr. Robson, the Board's Consulting Architect, to prepare the plans.

Some discussion arose upon this, and eventually Mr. Langdale's proposition was carried by sixteen against fifteen votes.

DAMAGE BY LIGHTNING.

The thunderstorms of last week have caused wide-spread damage and fatalities in far too numerous instances to be here particularised. Yorkshire has severely suffered from floods and otherwise. At Liverpool there were three thunderstorms in succession. At Oswestry, Mr. E. B. Smith, borough surveyor, and a man employed by him, had an almost miraculous escape. Mr. Smith was engaged in measuring the Pitcher Bank with one of Chesterfield's patent tapes, which are lined with thin brass wires, when the lightning struck him from wrist to elbow, and passing along the wires also struck the man who was at the other end of the tape, knocking him down. The extent of the injuries sustained by both, however, were very slight. At Cefn, Wrexham, a girl returning from school, with an umbrella over her head, was killed on the spot where she was struck. At Halifax, three men took shelter at an iron pillar in a cattle-shed, and one of them was struck lifeless. Another fell only a slight shock, and the third was untouched. A beam overhead was split, and part of the roof fell in. Many more persons, as well as horses, cattle, sheep, and poultry, have been killed in various parts of the country. At Wern, the lightning struck the small spire of the Baptist Chapel, stripped off the shingles, and laid the laths bare. At Penkridge the cattle-market was wrecked. At Stafford 14 yards of the glass roof of a railway-station were torn off. At Utkinton a house was struck and injured, as houses have been at various other places. At Mitcheldean, near Hereford, the Mitre Inn was struck, and both the landlord and his wife, who were in separate rooms, were injured. At South Shields the beacon facing the sea was struck and almost destroyed.

In 1867 and 1868 the increasing frequency and fatalities from lightning, not only in this but other countries, were followed up, as it were, by the crash of the great earthquake in America. We have not heard so much of increasing evils from lightning, during last year and this, in other countries as in our own; but other physical commotions in various countries, as we have already said, have been frequent and notable. It is to be hoped, however, that the strain of these destructive forces, which seem to be all connected, has reached its climax, and that no such shocking issue as that of 1868 is in store for any country, more especially for the more densely-peopled countries of Europe and Asia.

HEREFORD FREE PUBLIC LIBRARY.

ESTIMATES as to the cost of erecting a new and suitable building in Broad-street have been considered, and the lowest tender for the contract accepted. The establishment of this library is due entirely to Mr. Rankin, who presented the city with 5,000l. for the purpose of creditably carrying out the object in view. The sum of 1,750l. having been expended in the purchase of the site, it was found that the balance in hand from this gift was not enough, even with 1,000l. recently added by the corporation, to cover the amount of the lowest estimate entertained by the committee. In this dilemma Mr. Rankin again came to the rescue with the offer of another 1,000l. to carry out the plan in its integrity. The committee gladly availed themselves of this offer, and immediately decided upon accepting the lowest tender, made by Mr.

James Bowers, of Hereford, for the erection of the building at an estimated cost of 4,600*l*. The designs for the new building, which will be erected a few doors south of the Corn Exchange, in Broad-street, have not yet been submitted to public inspection, but it is intended, according to our authority, the local *Journal*, to form the ground-floor into shops. The estimate of Mr. James Bowers of 4,600*l*. provides for the erection of the building in native stone, with a dressing of Camden stone. The use of native stone as dressing would have entailed an extra cost of 575*l*., according to Mr. Bowers's estimate; and we are informed that, in addition to the smaller cost of the Camden stone, the employment of it embraces the advantage that it is more easily worked than the native stone. Subjoined is a list of the estimates:—

	With Camden stone dressing and stone dressing.	Extra with native stone dressing, principal doors in teak.
Collins & Cullis	£5,570	£200
Welah & Son	5,189	264
Colman, Brothers	5,103	130
Bigglestone	4,920	620
James Bowers'	4,600	575
	* Accepted.	

CHICAGO.

I HAVE just returned from the burnt-out city, and must confess all is bustle. Monster hotels are springing up; new shops, or stores, as we call them here—everything flourishing; but, alas! a superfluous number of useless hands are out of employ. The most amusing business is to see the numerous removals going on. I do not mean changing residences, but residences changing places. The "House Raisers and Movers" are now quite an institution. A number of men have banded themselves into a company, and for 50 dollars and upwards, agree to take and place your two-story tenement on their rollers and movers, and deposit it safely and snugly at its new location, with a guarantee not to hurt or injure the furniture.

Water seems to be at a premium—and will be until pipes and hydrants are laid down. Water for household use is somewhat scarce.

I cannot close my note without a word of warning to emigrants. Book-keepers, salesmen, and no-trade bands, are certainly faring very badly; it pains me to see the many emigrants land, looking hopefully, but, alas! there is little opening.

QUEBEC.

CHURCH-BUILDING NEWS.

Thetfordham.—The re-opening services in connection with the restoration of Thetfordham Church have taken place. The whole of the expense of the restoration has been defrayed by the rector of the parish, the Rev. J. C. Sawbridge; and we believe it is his intention to restore the roof, and other parts of the exterior. The unsightly high pews have been removed, and English oak benches have taken their place, which are moulded, the fronts and backs being filled with carved and cut tracery panels, and those in the chancel with carved poppy-heads and various foliages, such as vine and grapes, wheat and tares, wild roses, oak and acorn, ivy and hennies, passion-flower and leaves, forget-me-not and hawthorn, holly, ferns, &c. The entire surface of the nave, aisles, and chancel has been paved with Minton's encaustic tiles. On removing the pews from the nave, the old altar-stone was discovered, which has been placed in its original position; this being so defaced, the five crosses have again been cut thereon. The chancel floor has been raised 18 in., and is approached by two 4½-in. steps from the nave, and two steps of the same depth from the chancel to the sacristium. On the north side of the chancel the original vestry doorway was discovered, the jambs and head of which have been taken down, and fixed 4 ft. from its original position. The doorway on the south side has been raised 1 ft., and a new stone sill inserted, to bring it above the tiled floor. The tower floor has been lowered to within 6 in. of that of the nave. The old heltry floor has been entirely removed, and a new one of yellow pine substituted. The walls of the nave have been rough stuccoed. The arches, columns, and ancient font have been restored and re-faced. The stonework of the windows has been cleaned. The window at the south-west of the building is shortly to be filled with stained glass. The church will be warmed with Gidney's hot-air apparatus, which has been fixed. The north side of the chancel has been restored. The whole of

the work has been carried out by Messrs. Bishop & Son, of Diss. Mr. R. M. Phipson, of Norwich, was the architect, and the work done under his supervision.

Sunderland.—The foundation stone of St. Luke's Church, Pallion, has been laid by Mrs. C. M. Webster, of Pallion Hall. St. Luke's is one of the four districts created by the Bishopwearmouth Rectory Act. Of the other three churches, one has already been consecrated, and the other two are rapidly approaching completion. The church stands on a commanding site, given by Mr. Webster, at the corner of Pallion-road. The edifice, which is of Gothic architecture, and the adjoining vicarage, have been designed by Mr. W. Pritchett, of Darlington. Messrs. Webster, Oswald, & Doxford have undertaken the responsibility of erecting the spire.

Stevington.—The parish church, after having been closed a considerable time for restoration, has been re-opened with special services. New floors have been placed over the north and south aisles and chancel. The nave roof has been restored to its original state, with new timbers where required. The chancel is fitted up with open benches, in oak, with solid ends, and carved poppy-head terminals; the communion rail is of polished oak on ornamental iron standards, and the space within the rail paved with encaustic tiles from Messrs. Maw & Co.'s works. The seats in the nave and aisles are in yellow deal, varnished. In removing the plaster from the wall of the tower, a Saxon doorway and two windows were discovered, indicating the antiquity of the building. On the eastern side of the south porch door an ancient spout was discovered, and over the door a wall-painting representing a distinguished person in a sitting posture, and the east end of the south aisle a lancet doorway was discovered, likewise a stone stair, which apparently at some period formed an approach to the roof loft. In the wall on the north aisle was found a lychnoscope. In the south wall of the chancel a traceried window with a squint has been brought to view, likewise the arches connecting the chapels with the church and chancel. The peal of bells, five in number, have been rehung. The warming apparatus is by Mr. Gidney, of East Dereham. The work has been carried out by Mr. Robert Tooley, of Bury St. Edmunds, under the superintendence of Mr. Usher, of Bedford, architect.

Bloxwich.—Christ Church, Blakenall, Bloxwich, has been consecrated. The church, which has been used for the purpose of divine worship during the last two years, is situated some distance from the village of Bloxwich, in the centre of Blakenall, and erected on a piece of common land, the gift of the lord of the manor (the Earl of Bradford). The edifice is built in the pointed Gothic style, and contains a nave, side aisle, chancel, organ gallery, and vestry. The seats, which are free and unappropriated, are constructed of pitch pine. The church is lighted by windows on each side. The walls of the building are of local limestone, with tracings and facings of Bath stone; the columns and arches in the nave are also of Bath stone, with carved facings. The buildings, together with the vicarage and schools, occupy about two acres of land. The total cost of the erection will be about 3,500*l*., which has been raised, with the exception of about 500*l*.

Swobdon.—The new Church of St. Andrew, Swobdon, which is to take the place of the temporary iron erection within the district of St. Mark, has been consecrated by the Bishop of Winchester. The church, without tower, will cost about 6,000*l*. The tower is an additional expense. The architect was Mr. Bloomfield, and the builders were Messrs. Adamson & Son. The edifice comprises a nave, side aisles, transept, and baptistery. Externally the pinnacles of the building is of red brick, finished with blue Staffordshire splayed bricks; and the principal materials used in the rest of the structure are white and red stock bricks in alternate bands, and the buttresses, &c., have Bath stone dressings. It is roofed in with Broseley tiles, and in finishing the roof the ridge is covered with Cooper's ornamented tiles. The east window illustrates a series of the chief incidents of our Lord's Passion. The west window has the Expulsion from Paradise in the central compartment, and the four lower central figures of Abel, Noah, Abraham, and Melchizedec. There are other stained windows. All the representations have been executed by Messrs. Lavers, Barrand, & Westlake, of London.

Woottonbridge.—A new school chapel has been

opened here by the Bishop of Chichester. The cost is about 1,000*l*. The building was erected by Mr. Morris, of Ashurst Wood, East Gristead, from the designs of Mr. Nonnan Shaw, architect, London. It is 49 ft. long, by 19 ft. 9 in. wide.

Wolverhampton.—A proposal has been before the congregation of St. Peter's Church for re-modelling the seats of the edifice, and Mr. Christian, architect, who furnished the plans according to which the exterior of the church was restored, has been consulted upon the subject. The proposal embraced not only the improvement of the seating of the floor, but also the taking down of the side galleries and the seating of the west gallery for adults, and continuing it across the ends of the two aisles, which would provide good accommodation for those now occupying the side galleries. A letter has since been received from Mr. Christian, in which he gives as his opinion "that a western gallery extended all across the church would be a lesser evil than the three now standing, and that the appearance of the church would be improved." The committee formed to carry out the object have held a meeting and resolved that the floor of the church and the west gallery be fitted with open seats and that the north and south galleries be removed, and they have instructed a sub-committee to procure estimates from three builders for carrying out the work upon the basis of Mr. Christian's plans.

Bickenoller.—The church here, after having undergone extensive restoration, has been re-opened. A small door and all staircases have been discovered during the alterations, no doubt being the approach to the ancient rood-screen. The oak roof, which was in a very dilapidated state, has been replaced by an open red-oak roof, oak stained. A new oak roof has also been placed in the chancel. The church has been refloored throughout, the nave with Bridgwater and the chancel with encaustic tiles. Oak stalls have taken the place of the old pews in the chancel. The church has also been rescaued throughout, but the old carved ends have been utilised. A new font of Bath stone has been presented by Mr. J. Halliday, of Old Cleve, and also a new altar-table by the Rev. and Mrs. Trevelyan. The west end of the church has been thrown open by the removal of a gallery, and the interior of the walls has been stuccoed. The outside walls of the church have been scraped and pointed, and new cathedral-glass has also been placed in the windows, and the parapets and gables reset. The only part which remains to be restored is the tower. The work has been carried out by Mr. H. Davis, of Taunton. The restoration of the chancel has been effected under the supervision of Mr. E. Christian, architect to the Ecclesiastical Commissioners, and the rest of the church under Mr. J. Seddy, of Bristol. The cost has been about 1,400*l*.

Downham.—Alterations in the parish church here at last been begun. The works are under the direction of Mr. Lavrie, of this town, architect. The old vestry has been pulled down to make way for a new one, and a chapel on the north side of the chancel, corresponding to the Lady Chapel on the south side, will be erected, and used as an organ-chamber. During the demolition, several carved stones were found in the old wall of the several architectural periods commencing with the Norman, and a specimen of carving in chancel of the Decorated period.

Hull.—The foundation stone of St. Barnabas' Church has been laid on the south side of the Hossle-road, close to the east side of the boulevard. The church is to consist of nave and north aisle, with organ-chamber and vestry, and chancel, with apsidal termination. Accommodation is at present provided for 512 persons, but ground has been secured for tower and south aisle, and when these are erected the church will seat 800 people. The building will be a red brick structure, with stone dressings, and will have stock-brick facings to the interior, with moulded brick arches, Bath-stone shafts, &c. The roof will be open-timbered, and stained and varnished, and the passages to the seats will be paved with Staffordshire tiles. The work is in the hands of local tradesmen, and the architect is Mr. Samuel Musgrave, of Hull.

Fen Ditton.—The parish church of Fen Ditton near Cambridge, has been reopened for divine service, after undergoing material improvement to the interior. The church has been reset with plain oak benches, refloored with Minton tiles, and fitted with a warming-apparatus (by Mr. Gidney, of Dereham), on the hot-air principle. The work involved an expenditure of

something like 400l., and has been carried out by Messrs. Wilson & Son, of Histon. The architect was Mr. R. Reynolds Rowe, of Cambridge. **Kaversham.**—It being in contemplation to repair the parish church on a uniform plan, Mr. Gilbert Scott, the architect, came down and inspected the edifice. After talking the matter over with the vicar, churchwardens, and the estry clerk, he engaged to send down an estimate for carrying out the improvements.

Penre.—A new school chapel has been opened at Penre, near Flint. The building is Gothic, of fourteenth century. Being intended for use as a day and Sunday school, as well as for public worship, the chancel is so fitted up as to be divided from the nave by means of a movable screen. The dimensions of the chancel are 20 ft. by 22 ft., and the nave 25 ft. by 50 ft. It has an octagonal end, with partially-stained windows. The entire edifice is of red brick, except where relieved by black and white, which has been specially moulded. The open trefoil roof is of rich pine, stained and varnished. The architect was Mr. Daniel Lewis, of Manchester; and the contractors were Messrs. T. & P. Bibby, of Flint. The organ was built by Messrs. J. Bolton & Sons, of Liverpool. The cost of the buildings and fittings somewhat exceeded 1,200l.

Teovilton.—The church of this parish, after being closed for more than a year, has been reopened for Divine service. The church has undergone a restoration, the greater part of the nave and chancel having been rebuilt at the private expense of the landlords and rector of the parish. A heavy gallery has been removed, and no balcony, with its western window, opened into the nave, with seats for school children. The ceilings of both the nave and chancel, which are circular, are of pine divided into compartments by ribs of oak, with bosses at the intersections beautifully carved to imitate the old ones. The pews in the nave, which are open, are of pine varnished, and those in the chancel of oak, as well as the reading-desk. The windows, which are Early Perpendicular, are, with one or two exceptions, of the same character as the originals, and the others are *fac similes* of the old ones. Messrs. Slater & Carpenter, London, were the architects. Mr. Croed was clerk of the works. The carpenter's work was executed by Mr. Hull, of Northampton. The masons were Messrs. Denton & Carey, of Yorkville. The freestone work and windows were supplied by Mr. Trask, of Stoke and Douling; and the glazing was done by Mr. Crood, of Sherborne. The church is paved with Poole encaustic tiles.

Colkirk.—The reopening of the church in this village has taken place. Under the instructions of Mr. Charles Moxon, of London, a new aisle and organ-chamber have been added on the north side, and to the nave and chancel each a new roof, stained and varnished inside. Some carved stone corbels, comprising various kinds of foliage, and an ornamental stone cornice in the chancel, are the work of Mr. Blyth, carver and mason, of Akenham. Mr. Adams has restored the ancient monuments. Messrs. Brown & Son, of Whissonett, have executed the woodwork of the nave; Mr. Nelson, of Colkirk, that of the chancel; and Mr. P. Oakley, of Dereham, has cleaned and restored the stonework of the nave, and furnished the new arcade.

Bathford.—The church here has been reopened after restorations have been effected. In taking down the old chancel arch and other parts, fragments of Norman stonework were found in the walls, also the effigy of a bishop of the tenth century—supposed to be Swithun, to whom the church is dedicated. The south aisle has been widened about 4 in., and extended westwards about 7 ft., and a south chancel aisle, in which is placed the organ and vestry, and also some benches now occupied by the choir, has been added. The church is now seated uniformly on the ground-floor only, with open oak benches, stained and varnished, on wood seats, the passages being paved with stone, except the chancel, where Godwin's tiles are laid within the sanctuary. The roofs are of fir open timbered, and stained, and plastered between the rafters and covered with slates. The walls externally are lined with dressed stone, the niched openings being relieved with shafts and corbels moulded and carved, the foliage having been executed by Mr. Boulton, of Cheltenham, who also sculptured a subject in the centre of the reredos, representing the taking down from the Cross. The windows have all traceried heads of geometrically-formed cusped piercings, and a quarry-glazed in diamond shapes, except those containing stained glass, which have sub-

jects as follows:—The three-light east window of chancel contains in the lower half of the dexter light, "Christ journeying to Emmaus," in the centre, "The Supper at Emmaus," and in the sinister, "The incredulity of St. Thomas." One subject of "The Resurrection" extends across the upper portion of the three lights, surmounted in the centre of the head by the "Ascension of our Lord." This window was the joint gift of Mr. Wiltshire and Mr. Skrine. A three-light window in the south aisle, presented by Capt. Sainsbury, represents in the centre light, "The Adoration of the Magi;" in the dexter, "Christ Blessing Little Children;" and in the sinister, "The Good Shepherd." In the centre piercing of the head is a group of angels hearing a scroll, with the inscription, "Of such is the kingdom of Heaven." Two other stained glass windows have within the last few years been placed in the north aisle, the east window containing in the centre light, "Jacob's Dream," and in the side lights, "Abraham purchasing Macpella," and the "Meeting of Isaac and Rebecca," the head of the window having "Our Lord in Majesty," with angels on either side. In the west wall of north aisle is a window to the patron saint of the church. Across the upper half of the three lights is represented St. Athelwold, and an ecclesiastical procession translating the relics of St. Swithun to a shrine in the ancient cathedral of Winchester. Across the lower half of the lights is seen the Great Feast that took place after the ceremony, in which, as one of the attendant minstrels, is a portrait of a well-known local celebrity who died a few years ago at the age of ninety-three. All these windows are from the studio of the architect, Mr. Frederick Preedy, of London, who superintended the building of the north aisle as well as the recent alterations, the same firms of builders, namely, Mr. Newman, of Bathford, and Mr. Silver, of Maidenhead, having carried out both undertakings. A new organ has just been built by Messrs. Brindley & Foster, of Sheffield, the erection of which forms the completion of the present restoration. The cost of this has been 2,500l.

Swansea.—Christ Church, St. Helen's, Swansea, has been consecrated. The edifice has been erected at the expense of Mr. J. W. Clark. The entire cost of the church, with its fittings and furniture complete, together with the boundary walls and gates, amounts to about 2,800l. The whole 600 seats are free. The ground was presented by the corporation. The architect was Mr. Thomas Nicholson, the diocesan architect of Hereford, who also designed St. James's church, Walter-road, Swansea; and the builder was Mr. T. Gongli, of Bishop's Castle, Salop. The edifice consists of nave, north and south aisles, chancel, north and south chancel chapels, sacristy, and north and south porches. Under the north chancel is a crypt for a warming apparatus. The internal dimensions are 76 ft. in length by 56 ft. in width. The architecture is after the style that prevailed during the latter part of the thirteenth century.

DISSENTING CHURCH-BUILDING NEWS.

Penistone.—The foundation stone of a new Wesleyan chapel has been laid at Penistone. Considerable difficulty was experienced in obtaining a suitable site, but at length an eligible plot of land on the Penistone Green, containing 650 square yards, was bought. The design of Mr. Moxon, architect, Barnsley, was selected as the most suitable. The building will be in the Gothic style of architecture, and will cost about 1,400l. On the basement will be a school-room to accommodate 200 scholars, a class-room, and a minister's vestry. Above the school and two class-rooms, will be the chapel, and an orchestra will be erected over the minister's vestry. There will be an end gallery in the chapel which will seat 100 persons, and in the body of the chapel accommodation will be made for 300. The dimensions of the chapel will be 50 ft. long by 32 ft. wide; 19 ft. high at the sides, and 25 ft. in the centre. The schoolroom will be 32 ft. square, and the class-rooms each about 16 ft. square; the minister's vestry will be 18 ft. by 16 ft. The contract for the mason's work has been let to Mr. John Wainwright, of Thurlstone; the joiner's work, plumbing, and gasfitting, to Messrs. Hayward Brothers, Penistone; ironwork to Mr. G. Beard, Hadfield, near Manchester; and the painting to Barnelough Brothers, Barnsley.

Woodhouse, Normanton.—The United Metho-

dist Free Church body in the neighbourhood of Wakefield are providing additional church accommodation at Normanton. At the present time new houses are being put up—notably so at Woodhouse, where several blocks of buildings are being erected adjacent to the St. John's colliery, the builders being Messrs. Tadman & Benson, of Wakefield. The memorial stones of a New United Methodist Free Church School Chapel has been laid in that district. The building will be two stories high, the ground floor consisting of eight rooms, four of which are intended for chapel-keeper's residence, the remaining four as a cottage, but in future are intended for class-rooms for the chapel which at an early day the trustees hope to build on the vacant land adjoining and fronting the high road from Woodhouse to Normanton. The school chapel will be reached by a broad flight of easy stairs from the entrance in Church-lane, and is to be 50 ft. long, 30 ft. wide, and 20 ft. high, lighted by five windows on each side, the roof open, and the main timbers wrought and exposed to sight. The fittings will be movable bench-stalls, platform, and reading-desk, all of which will be stained and varnished. The building externally will be faced with red bricks, white brick arches, bands, and cornices, and stone dressings. The contractor for the whole of the building and fittings, is Mr. John Foster, of Normanton, whose tender for 710l. was accepted. The architect is Mr. William Watson, of Wakefield and Doncaster.

Woodbridge.—The new Wesleyan Chapel for the town of Woodbridge, has been completed, and opened for divine service. The chapel, which stands in St. John's-street, facing the thoroughfare, is a plain building, of white brick with stone facings. The front entrances are reached by flights of stone steps on either side, while there are three long single-light windows in the centre, the blank wall of the gable above being relieved by a circular stone, with the sacred monogram, I.H.S. The lobbies are paved with tiles, and fitted with double doors. The building is 60 ft. long by 37 ft. in width, and will seat 350 persons, there being no galleries. It is benched with polished deal benches. The front of the platform is of the same material stained, and is of open panel work with blue cloth behind it. At the back of the platform is an ornamental arch, which is coloured a light blue, as is also the plaster work round the windows. The roof is ceiling, but the principal beams of stained deal are seen. They spring from stone corbels between each pair of windows. An organ has been placed at the further end of the chapel facing the platform. At the back of the chapel are a school-room, classroom, infant school-room, and vestry, the three latter being on the ground-floor, and the school-room, which will accommodate 250, above it. The chapel will be warmed with hot air, but the apparatus is not yet fixed. The whole of the work has been carried out by Mr. Fosdike, of Woodbridge, under the superintendance of Messrs. Cattermole & Eade, of Ipswich, architects, at a cost of about 1,900l., of which within 150l. of the whole are raised.

Etruria.—The Wesleyan Chapel has undergone considerable extension and improvement, and the alterations are so far completed that the edifice has been reopened. It has been extended 16 ft. at the rear, so that accommodation is provided for the choir and the Sunday-school children during service. The body of the chapel has been paved, the old forms hitherto used having been removed. The interior has been newly fitted up and decorated; the exterior has been cemented, and the chapel has the appearance of being quite new. The porch has been laid with encaustic tiles, furnished gratuitously by Messrs. Cork, Edge, & Malkin, of Burslem. The alterations have been made by Mr. Barlow, of Stoke, from the designs of Messrs. Scrivener & Son, of Hanley; the gas-fittings and interior decorations being the work of Mr. E. J. Sadler, of Etruria. The alterations involved an outlay of upwards of 500l.

Tunbridge Wells.—The memorial stone of a new Wesleyan Chapel, on the site of the old building, has been laid. The interior appearance of the old chapel was unsightly in the extreme, and was far from being adapted to the requirements of the cause, or on a par with erections of a like character in Tunbridge Wells. The Wesleyans determined, therefore, to build a new chapel. The designs of Mr. Charles Bell, of London, architect, were accepted, and the work has been undertaken by Messrs. Wilkoomb & Oakley, builders, at a cost of 4,700l. Accom-

modation will be made for 700 persons, exclusive of class-rooms, school-rooms, &c.

Tunbridge.—The Wesleyans have laid the memorial-stone of a new chapel in East-street, Tunbridge. The architects are Messrs. Cater, Mole & Eade, of Ipswich, and the builders Messrs. Pannett, of Tunbridge; the contract-price being upwards of 1,700*l*.

Chester.—The Wesleyans of the city, having found their chapel accommodation much too small for some time, decided a few months ago to erect a new building upon the right of the City-road. The design of Mr. Wm. Botterill, of Hull, architect, has been selected from a limited competition. The style adopted is Geometrical, and the design includes a tower and spire. The contract has been entered into with Mr. J. Stringer, of Sandbach, the amount being 4,445*l*. 10*s*., which sum, however, does not include the spire, nor heating and lighting. The building will be of Chester red sandstone, from the Handbridge quarries, and will afford accommodation for 600 persons.

Fornham.—The memorial stone of a new Wesleyan Chapel has been laid here. Mr. Wonsnot is the architect of the building.

Holbeach.—The memorial stone of a new Non-conformist Chapel has been laid in Holbeach, Lincolnshire. The chapel is to seat 350 persons, and to cost about 1,600*l*. The style of architecture is Romanesque. The architect is Mr. Tait, of Leicester.

Trowbridge.—A new Wesleyan Chapel has been dedicated at New Town, Trowbridge. Mr. Stent, of Warmistone, was the architect. The style is a free adaptation of late Italian. New schools are also to be erected contiguous.

STAINED GLASS.

Holy Trinity Church, Halifax.—In addition to the memorial window placed in this church to the memory of the late Rev. H. A. Weston, some time curate at Trinity, and already noticed, we have now to record the fixing of another stained-glass window in the same church. It is from the same artists as the other windows,—Messrs. Ward & Hughes, of London, and is also a memorial one. The window selected is the large semicircular one at the west end of the church. The design differs from the usual studies of church windows, in the respect that it does not portray any given incident from the life of our Lord, but sets him forth in His character as benefactor and friend. The subject may be termed "The Comforter." In the centre is the figure of our Lord, vested in a chocolate-coloured robe and blue mantle, with his arms extended, in the act of blessing. Grouped around him are thirteen figures typical of human suffering, all laying their sorrows before him. At his feet kneels a young mother with her dead babe in her arms; behind is a lame man, and next to him the bent figure of a widowed old woman. Clinging to his arm is the figure of a sorrowing female, and below is the form of a wretched paralytic; in rear of whom is a black slave holding out his manacled wrists to the Consoler or Comforter. Trinity has now five stained-glass windows, and we understand that one or two others will shortly be added.

St. Mary's Church, Halifax.—The first stained-glass window has been placed in this church. It is a memorial one given by Mr. Waterhouse, woolstapler, to the memory of his children, and is the first three-light window on the north side of the nave counting from the east end. The subject is taken from the text, "Suffer little children to come unto me, and forbid them not, for of such is the kingdom of heaven." In the central light is the seated figure of our Lord, with a child on his knee, and his hand placed on the head of another. In the respective side-lights are female figures leading their children to him. The tracery in the head of the window is fitted in with initials, the sacred monogram, and conventional foliage. The glass has been supplied by Mr. S. Evans, of Smethwick, near Birmingham.

St. John's College, Hurstpierpoint.—A window has just been completed at St. John's College Chapel to the memory of the late Bishop Gilbert, of Chichester, the first visitor of St. Nicolas College, who laid the first stone of Hurst College on June 21, 1851, opened the buildings there in June, 1853, assisted at the stone-laying of the chapel in 1861, which, on October 17, St. Etheldreda's Day, 1865, he inaugurated. The window is placed immediately above the stall, or throne, which the Bishops of Chichester, as

Visitors of St. Nicolas College, occupy in the chapel. The size of the window is 20 ft. high, by 7 ft. 6 in. in breadth; and the glass has been executed by Messrs. Clayton & Bell. The subjects represent—1. In the circular tracery in the head of the window, Prester John, surmounted by a mitre, the arms of the See of Chichester; 2. The centre of the three lights which form the window contains in the upper part the Baptism of the first Sussex converts by S. Wilfrid, and in the lower, J. Richards, of Chichester, while at the base are the Gilbert arms; 3. The side-lights represent—the one, the Confirmation at Samaria by SS. Peter and John; the other, the Consecration of SS. Paul and Barnabas. These groups are the centre and more prominent subjects. Above them are respectively St. Edmund, Archbishop, and St. Alphege, Archbishop and Martyr; below them, St. David and St. Chad on one side, and Archbishop Land and Bishop Pateson, of Melanesia, on the other; Bishop Pateson bearing in his hand the five-knotted palm branch, which his murderers had laid upon his corpse.

All Saints', Maidstone.—A new stained glass window has been erected in this church in memory of the late Mr. Alexander Randall. The subject of the representation is typical of the Ascension of our Saviour. The window has been heightened by 5 ft., and new stone mullions and tracery have been put in, but the design of the window is the same as before. Above the principal figures is the text, "Ye men of Galilee, why stand ye gazing up into heaven? This same Jesus, which is taken from you into heaven, shall so come, in like manner as ye have seen Him go into heaven."—Acts i. 11. Immediately under this are the two angels clothed in white, and beneath them again are the Apostles, with the Virgin, the three Marys, and Catherine, making in all nineteen figures. The compartments of the window above the principal group are filled up with allegorical figures: at the top are representations of the lamb and pelican, underneath which are two grape-vines and sheafs of wheat, emblematical of the bread and wine of the Sacrament. The work has cost upwards of 1,000*l*. The artist was Mous. J. B. Capronnier, of Brussels. Mr. Vaughan, of the West Borough, did the masonry of the window.

Trinity Church, Westvale, Yorkshire.—Another stained-glass window has been placed in this church by Messrs. Ward & Hughes. The subject is "The Supper at Emmaus," after the resurrection. Our Lord is represented as seated at a table, with the two disciples left and right, and is in the act of being made known to them "In breaking of bread."

All Saints', Huntingdon.—A new stained-glass window has just been placed in the chancel of this church, as a memorial of the late Mr. D. Veasey. The subject is the Sermon on the Mount. The artists were Messrs. Heaton, Butler, & Bayne, of Covent-garden.

FROM SCOTLAND.

Dunblane.—A short time ago it was resolved to restore the portion of Dunblane Cathedral which is used as the parish church, and subscriptions to the amount of 600*l*. having been raised in the neighbourhood, the work was commenced, under the superintendence of Mr. Mathieson, of Her Majesty's Board of Works. In the course of the work several interesting discoveries have been made. Above the door leading to the church is the transept-arch, which had been built over and obliterated, but which will now be cleared, and the mouldings and pillars of the arch will be disclosed. It is proposed to put in a very thin wall, and fill up the transept-arch with a framework of glass. Above the transept-arch is a double-mullioned window, which has also been blocked up, and which it is intended to open into the choir. The floor of the church, and the chapter-house, are to be lowered to their original level, and the church reseated, while the pulpit will be removed from the south end to the side, and the galleries removed altogether, allowing another window to be opened up. In the chapter-house a number of tiles have been discovered,—one of them bearing a fleur-de-lis upon it,—and also a large stone, bearing Culdee marks similar to those found at Brechin and Abernethy. The chapter-house is to be relaid with tile, the groined arches restored, the gallery-stair taken down, and the compartment which is at present occupied by the stair is to be restored as before. It is estimated that the alterations will cost about 2,000*l*.

Miscellaneous.

A Crystal Palace Prize.—The directors of the Crystal Palace Company having determined to give a challenge-prize, value 1,000*l*., to be competed for at the national music meeting which are about to commence, architects were invited to send in designs. Two premiums, of 50*l*. and 25*l*., respectively,—were offered for the successful candidates, the judges being Sir M. D. Wyatt and Professor Poynter, A.R.A. Eighteen designs were sent in. The first premium has been awarded to Mr. S. J. Nichol, Grove-road, St. John's Wood. The cup is 10 in. across the bowl and 10½ in. high, surrounded by very elaborate flutings and repoussé work, there being four medallions in the centre, two of which represent King David and St. Cecilia, while the two others will bear a suitable inscription. The cover is of a conical form, 18 in. high, adorned by memorial shields, on which the names of the present and past holders will be engraved. It terminates in a triumphal wreath, in which the shield of the winning society will be suspended. The stand is a square pedestal, with a kind of gate running round it, each corner of which will bear a miniature statue of some eminent composer, such as Mozart, Handel, &c. Mr. Owen Gibbons, of Moore-street, Chelsea, takes the second premium. A design by Mr. William Wise, of Saxon-street, Warrick-square, received honourable mention.

The Christian Era.—At the last meeting of the Society of Antiquaries, held at Somerset House, Dr. Gustav Oppert, of the Royal Library at Windsor Castle, read a paper "On the Origin of the Christian Era." He remarked that although the subject was one of great historical and scientific interest, it was one to which very little attention had been given. From the investigations he had made, those who had attempted to settle the date of the Christian era had treated the subject very unsatisfactorily. It was a curious fact that they all began the calculations from the day of Christ's Resurrection, reckoning back to the date of His birth. But even the day of Resurrection was not unanimously agreed on, and hence various conclusions were arrived at. In fact, it was notorious that there had been eras dated twenty-two years before, and others as much as 191 years after, that now in general use. At the present time the era used in Ethiopia and Abyssinia differs by eight years from our own, and this era was followed by all the Byzantine writers.

Accident in a Sewer at Liverpool.—In descent of sewer in Commercial-road, Kirkdale, in connexion with the Liverpool Sewage Utilitarians' Company's reservoir, a man has lost his life, and five others narrowly escaped. A number of men, employed by the corporation, have been engaged in cleaning out this sewer, which is a branch one, 6 ft. in size. The foul gases lurking in the sewer rendered it impossible for the men to remain any time in it, and they accordingly took turns at the work. Five men were working in the sewer, when, having stirred a quantity of putrid matter, a gust of foul air caught the men and instantly rendered them insensible. A man standing at the manhole observed one of the men below to fall down, and, suspecting the cause, went down, and was also made insensible by the poisonous air. With as much speed as possible the men were extricated, but one of them died in a few minutes after the accident. The others quickly recovered consciousness.

The Severn Bridge and Tunnel Bill in Parliament.—The two railway projects for crossing over and under the river Severn, both by a bridge and tunnel, which are antagonistic schemes, having been before Parliament during the past few weeks, have at length both been sanctioned, having finally passed the committee of the House of Lords last week. The cost of the bridge and railway over the Severn is estimated at 227,973*l*., the railway being only a single line, whilst the tunnel project is for a double line of railway, the estimated expenditure being 750,000*l*.

The Tug-Dredger, "Canada."—Advices have been received that the new patent combined screw dredge hopper, *Canada*, has arrived at Halifax, after a voyage across the Atlantic in eighteen days, under steam. The vessel averages 135 miles per day. It was designed, built and engineered by W. Simons & Co., London Work-Shop.

Diamond Stone-Cutting Machines.—The invention of Messrs. H. & J. L. Young, of Stamford, Conn., U.S., relates to that class of stoncutting machines in which reciprocating blades armed with, or protected by, diamonds, are used for cutting or dividing stones into slabs, and which are known as diamond-gang-saws. And he said improvements consist, first, in operating the said reciprocating blades in relation to the stone to be cut thereby, in such a manner that the diamonds are kept in contact with the part of the stone to be cut only when the blades carrying the said diamonds are moving in one direction, whilst when the said blades are moving in the opposite direction the diamonds are kept away from the part of the stone to be cut, either by the blades or blades carrying them being brought away from the stone, or the stone itself having been withdrawn from the blades or blades.

A New Cemetery in South London.—A new cemetery is about to be formed in South London, to meet the requirements of the South Metropolitan district, in which there are only two other cemeteries,—Norwood and Nunhead,—both of which are said to be rapidly filling, as well as nearly all the public cemeteries around London. A public company has been formed for the construction of the cemetery, with a capital of £10,000. The site of the proposed cemetery is in the parish of Beckenham, near South Peckham and South Norwood, and in the immediate vicinity of several railway stations. It is to be 20 acres in extent, and it is stated that the promoters have already secured land for the purpose, which has been purchased from Mr. Morgan Evans, the owner, the property being rehold.

Permanent Shade for Glass Houses.—A correspondent of the *Garden*, says,—The best permanent shade for plant-houses is linseed oil and sugar of lead, in the proportion of about a teaspoonful of the lead to a quart of oil; but the exact tint must be governed by the amount of shade required. Therefore apply the lead gradually, and prove it upon a few pieces of waste glass until you get the tint desired. The *modus operandi* is this: first wash the glass thoroughly clean, and then (having previously prepared the oil and lead) on a dry clear morning, take the oil and paint as thinly as possible over the glass with an ordinary paint-brush; then follow with what the painters call a dust-brush, loose and quite dry, and, dabbing it gently on the dried portion, impart a frosted or ground-glass appearance to it.

Swindon New Town Main Outfall Sewage Works.—These works being now completed, the board have passed a cordial vote of thanks to their engineers, Messrs. Bass & Mims, for the skill and ability with which the works had been designed and executed. The saving to the ratepayers effected is considerable, as it avoids all outlay for labour, fuel, and wear and tear of machinery. The whole of the sewage now flows rapidly by gravitation through a tunnel and invert, 2,000 yards long, on to the highest part of the farm, and thence over every part of it by surface carriers. The tunnel is driven at a depth of 37 ft. in the centre below the surface. The farm, which is 105 acres in extent, is now receiving the sewage, the necessary irrigation works being rapidly proceeded with.

Nuneaton Sewage Works.—These works have been inspected by the directors of the General Sewage and Manure Company, to whom the sewage and works have been handed over, and by whom they have been greatly enlarged. The sewage is mixed with rough sulphate of alumina and lime, and, in tanks, agitated and settled, and thence the water is run off clean into the river Anker, a tributary of the Thames, pure enough, according to Dr. Letheby, for any stream twelve times its volume. The patent is that of Dr. Anderson, of Coventry, who is, of course, opposed to irrigation.

The Sale of the Poultry Chapel and the new Building.—It transpired at the closing services of the Poultry Chapel held last week, at the price for which the land and buildings have been sold is £50,000. This will enable the parties connected with the chapel to erect a new building of a very superior character, and it appears that the structure about to be erected is one of the old edifice just sold is to be large and capacious, having accommodation for 2,500 persons.

Extensive Landship on the Midland Railway.—A deluge of rain during one of the thunder-storms of last week caused the loose shaly rock of the Derbyshire hills, where so many as thirty tunnels exist on the line from Buxton to Derby, to slip. At the Dove-holes, near Buxton, where the slip took place, two tunnels cross each other; and a piece of rock or earth with a surface of more than an acre was displaced, and formed an independent hill on the top of the smaller tunnel. A train was brought to a sudden stand by the *débris*. The driver was injured, and a first-class passenger taken out insensible, with a double fracture in his thigh bone.

Libel.—In a case tried in the Court of Exchequer on Saturday, Messrs. Studd & Bouverie, a firm of auctioneers and estate agents, carrying on business in Westbourne-terrace, obtained damages from Mr. Worthington, an architect, for an alleged libel. In the course of the hearing, a witness deposed that he had himself written the letter complained of, and in consequence of an expression of opinion from the Chief Baron, Mr. Haddleston, the plaintiffs' counsel, retired from the case, saying that he had not been allowed to go to the jury in consequence of the tone which his lordship had taken. The plaintiffs were therefore nonsuited.

An Australian Railway.—A project is under consideration in South Australia to construct a railway from Port Augusta to Port Darwin, with branches, if considered desirable, towards Melbourne, Sydney, and Brisbane. It is anticipated that the first cost will not be less than 10,000,000, and to induce English capitalists to engage in it, a concession of 200,000,000 acres of land, laid out in blocks, along the proposed route, will be asked for. The proposal originates with the South Australian Government.

The Proposed Wet Dock at Maryport.—A correspondent writes:—"We understand that the trustees for the town and harbour of Maryport have taken the opinion of Mr. Lloyd, barrister, as to their ability to compel Mr. Walker, the contractor with them, to construct the new wet dock, they having accepted his tender, which was the lowest sent in." It is reported that the opinion of Mr. Lloyd is that the trustees cannot compel Mr. Walker to fulfil his contract.

Patriotic Fund: Boys' School.—The architect of the building writes:—"With regard to the observation you have appended to the description of the system of drainage (a doubt as to the advisability of adopting the earth-closet system whilst there is another system of drains ready to hand), permit me to say that the acreage of the land over which the sewage is available for pumping is much too small to admit the additional fecal matter of 230 boys, and therefore the resort to the earth-closet system was deemed advisable."

The New Wood-Pavement.—It has been decided to lay down in King William-street, Gracechurch-street, Ludgate-hill, and that portion of the Strand skirting St. Mary-le-Strand, the same kind of wood-pavement which has already been laid in St. Bartholomew-lane.

TENDERS

For new sewer, Blythe-lane, Hammersmith. Mr. A. C. Bean, engineer:—

Newell & Robson	£3,950 0 0
Gough	3,530 0 0
Marshall	3,400 0 0
Young	3,100 0 0
Neave	3,250 0 0
Ritson	3,220 0 0
Wignane	3,075 0 0
Groveham	2,990 0 0
Williams & Co.	2,550 0 0

For villa residence at Sydenham. Mr. John Norton, architect:—

Burchell	£3,300 0 0
Boden	3,228 0 0
Wagner	3,124 0 0
Dover & Co.	2,993 0 0
Gough	2,930 0 0
Hughesdon	2,880 0 0
Lowell	2,865 0 0
Clarke	2,858 0 0
Mansbridge	2,830 0 0
Stephenson	2,737 0 0
Ranking	2,690 0 0
Gooding	2,690 0 0
Crook & Wall	2,610 0 0
Lord	2,320 0 0

For the construction of 420 ft. of 30-inch single ring sewer, and sediment tank, at The Grange, West Mounting, Surrey, for Mr. Alexander J. B. Stewart. Messrs. Bateman & Mather, surveyors:—

Hibbins & Trinder	£2,171 0 0
Condon & Sons	1,710 0 0
Jarvis (accepted)	1,620 0 0
Sease	1,100 0 0

For St. Augustine's Church, Honor Oak, Forest-hill. Mr. W. Oakley, architect:—

Conder	£3,315 0 0
Brass	3,736 0 0
Dove, Brothers	3,775 0 0
Jerrard	3,694 0 0
Roberts	3,263 0 0

For house and shop, Prince Arthur Tavern, Bondary-road, St. John's-wood. Mr. Gribble, architect:—

Scott	£2,777 0 0
Tully	2,750 0 0
Sabey & Son	2,700 0 0
Gough	2,590 0 0
Bowden (accepted)	2,480 0 0

For erecting four houses, being the first portion of the west wing of the London Foresters' Asylum, Bexley-heath, Kent. Mr. W. E. Potter, architect. Quantities prepared by Mr. C. R. Griffiths:—

Beckett	£2,860 0 0
Vickery	2,855 0 0
Keal	2,849 0 0
Sabey & Son	2,820 0 0
Ashtown	2,817 0 0
Hersee	2,800 0 0
R. & J. Butler	2,784 15 0
Nightingale	2,720 0 0
Clark	2,678 15 0
Ellingham	2,665 0 0
Horne (accepted)	2,633 0 0

For alterations and additions to a dwelling-house at New Barnet, for Mr. F. Newth. Mr. John Usher, architect. Quantities supplied:—

Moore	£2,608 0 0
Staines & Son	2,597 0 0
Chavlin	2,590 0 0
Taylor (accepted)	2,528 11 0

For four houses, The Grove, Blackheath, for the Earl of Ashburnham. Mr. Herbert Williams, architect:—

Newman & Mann	£2,298 0 0
Manley & Rogers	2,637 0 0
Poster	2,576 0 0
Adams & Son	2,480 0 0
Turner & Son	2,196 0 0
Merritt & Ashby	2,047 0 0
Jerrard	2,093 0 0

For the erection of schools, &c., in Saint Helen's-street, for the Chesterfield School Board. Mr. S. Rollinson, architect:—

Wade	£2,180 0 0
Forrest	1,819 0 0
Heath	1,810 0 0

For the erection of schools, &c., in Hippo-street, for the Chesterfield School Board. Mr. S. Rollinson, architect:—

Wade	£2,169 0 0
Forrest	1,674 0 0
Heath	1,665 0 0
Heathcote & Son (accepted)	1,631 0 0

For new school in connection with St. Jude's Church, Gryn's-inn-road. Mr. Joseph Peacock, architect. Quantities by Messrs. Northercroft:—

Cole & Sons	£2,538 0 0
Oxford	2,385 0 0
Roberts & Roberts	2,347 0 0
Manley & Rogers	2,338 0 0
Simpson	2,200 0 0
Macey	2,234 0 0
Lathey, Brothers (accepted)	2,173 0 0

For Wesleyan chapel at Bridlington Quay. Mr. W. Botterill, Hull, architect:—

Renard (accepted)	£1,048 6 0
-------------------	------------

N.B. The old materials now upon the site to be again used, subject to the architect's approval.

For stabling, coach-house, and buildings, for James Hodgson, Belmont, Hesse. Mr. W. Botterill, Hull, architect. Quantities not supplied:—

Kelsey	£1,825 0 0
Stephens	1,610 0 0
Habbershaw	1,581 15 0
Clarison	1,652 0 0
Lison & Wilkinson	1,544 0 0
Drewery	1,539 0 0
Suddaby	1,510 0 0
Stanley (accepted)	1,473 0 0

For the erection of the new building, No. 55, Ludgate-hill, E.C., for Mr. Henry Ellis, Messrs. Gadsden, Ellis, & Co., architects. Quantities by Messrs. R. L. Curtis & Son:—

Brown	£3,234 0 0
Elkington	2,890 0 0
Sharlington & Coles	2,793 0 0

For Tunbridge Sewerage Works. Mr. C. Jones, engineer:—

Crockett	£10,244 4 9 1
Ritson	9,638 11 1
Cole	9,429 6 0
Marshall	9,320 0 0
Neave	8,998 8 8
Pannett & Sons	8,781 3 0
Blackmore & Howard	7,211 11 0

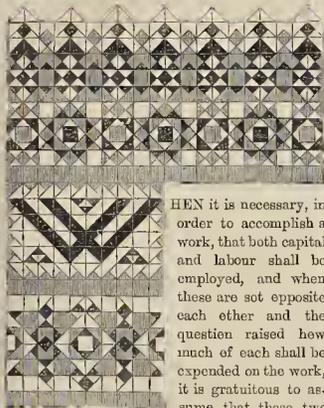

For restoration of Preston Bisset Church, Bucks, for the Rev. J. S. Holden. Messrs. E. Habershon & Brock, architects:—

Franklin	£1,065 0 0
Cooper	1,012 0 0
Nightingale	1,021 0 0
Munday	982 0 0
Tibbets	946 0 0
Hawkins	821 11 0

The Builder.

VOL. XXX.—No. 1535.

Wages.

WHEN it is necessary, in order to accomplish a work, that both capital and labour shall be employed, and when these are set opposite each other and the question raised how much of each shall be expended on the work, it is gratuitous to assume that these two sides of the question

form the whole of it; there is a third side, that of abstract justice, or, to express the same idea more practically, of mutual interest, without which the work is only a kind of slave-work, capital being converted into tyranny and labour into slavery. But the recognised theory is that no slave can set foot on English soil or touch an English tool or weapon, and it is mutual interest that makes this so. If this is not taken into account the theory is not true. Mutual interest, indeed, is but the lowest form of the great idea of freedom and equality. If a man in England wants something done that he cannot or will not do himself he does not say to another, as of right, "Do this thing and I will pay you for it," but, rather, "If you please to do this thing for me I shall be obliged to you," the feeling of obligation being mutual and equal. And thus we always hear a gentleman address a labourer in exactly the same manner as that in which he addresses every one else. How then does it come about that workmen strike? Clearly from the fault of both master and workman regarding a piece of work as having only two sides, and these opposed to each other,—capital and labour. That damnable doctrine that it is self-interest alone that governs all the actions of every man, and the assumption that there is no principle of justice applicable to any rate of wages, and no other permanent interest influencing the motives and actions of men than the merest self-interest, is as untrue as any proposition can be, and is made to fit the philosophy and to apologise for the actions of those who can see only two sides to the wages question. If it were true, indeed, it would be an excuse for any coercion that a combination of individuals could exercise for the purpose of increasing the weal of the whole.

Capital is employed in either of two ways,—by simply spending it, in which case it goes to pay for the labour of unknown persons, and is not productive of profit to the capitalist, or by doing some useful work with it by the employment of the labour of known persons, with whom agreements are made to exchange work for money; for it is not the labour but the work that constitutes the value given by the labourer for the money of the capitalist.

The workman says, "So far good, but the money is not sufficient, or, which is the same thing, the

master makes too much profit; we should be satisfied if by paying us 20s. he received for the work we do for him 22s. or 23s., but he receives 25s. for every 20s. he pays." Well, after all, it is but a question of investment and assurance against the stoppage of the need for labour. The master who pays 20s. with the hope of getting 25s. may not get even his 20s. back again, and if he does not do so he will not again pay 20s. on the same terms, but will rather hoard it, and so it cannot be employed in remuneration of other labour; whereas, if he succeeds in getting his 25s. he is ready to make other engagements with those who want his money and will give him its value in return.

Thus moderate wages are in truth better in the long run, for the difference between moderate and high wages is but an investment and an assurance of the continuation of the need for labour. We are inclined to look very fairly at this question, and not to take merely an optimist's view of it; and nothing would excite us to take a decided stand on the part of the workmen against the masters so soon as to think that the forbearance of workmen to ask for more than moderate wages should be misunderstood, or that advantage should be taken of that forbearance to misappropriate funds that belong not to any individuals, but to the people at large.

The voice of the people is a mighty power, and any one appealing to it on the side of justice need have no fear of inaction; but the one thing to be first determined before appealing to it is that the cause be just: and in proportion to the facility of commanding the voice of the people in a just cause is the opprobrium of exciting it in a wrong one.

Higher wages mean either reduced profits to the capitalist, or, if by a tacit understanding with other capitalists he increases the price of his productions, a reduction of the means of those persons who have to pay for them must take place, and in these are included other workmen,—brother workmen,—in which case the high wages paid to the workmen of one trade are taken from the earnings of those of another trade, and so the transaction is merely an exchange, and as it is not a voluntary exchange an ugly word might in strictness be applied to it.

Now, taking the case in either of these aspects, say the first, the question for consideration is whether the increased amount supposed to be received by the workman is as well spent, *i. e.*, for the good of the community, by him as it would have been by the capitalist. To answer that question it must first be inquired what the workman does or would do with the additional money he receives or may receive. Granting it to be well spent or appropriated, then there is a reason for his having it. If it remains in the hands of the master it will probably be used in increasing still further his profits, by undertaking further work; but that cannot be done without the employment of a greater number of men, and this is one of the aims of the trade-unions. But trade-unionists go further, and say, seeing no more than two sides of the question, let us have all we earn, to the last farthing, and we will find a use for it. Nobody has a right to inquire what we do with that we earn,—that is an impertinent inquiry, and interferes with our liberty. The framers and supporters of the trade-unions have taken a short and narrow view of the case; but it is in accordance with the doctrines they have been taught, and was certainly justified by the conduct of the masters in the first instance. The selfishness of the masters naturally begat selfishness in the workmen, until they have almost come to the conclusion that the two bodies are not only distinct classes, but of antagonistic interests.

The trade-union system of increasing wages is a very unscientific one, and fictitious, although in some cases it has been successful in its object, and is a practical measure. It may, indeed, be

called a rough form of justice. It is, however, founded on a wrong idea. Its advocates' views fall short of comprehending the whole position, and the only two sides of it they see appear to be antagonistic, and to admit of no amalgamation of interests; but the truth probably is that hereafter there will be but one interest, and that class distinctions will be done away with (and a good riddance that will be), and that there will be no such thing as wages paid for labour. If this is probable, as the natural result of civilised society, its progress towards accomplishment ought not to be hindered. It may not be accomplished in our day, and we cannot much hasten its approach, but we may at least refrain from trying to establish principles on fictitious bases, which will have to be overthrown before true principles can be established. In the meantime, we think that arbitration ought to be applied in disputes in the building-trade. It has often been tolerably successful, and may yet be entirely so. For each trade or class of trades, as the building trade, which is a class involving many individual occupations, as excavators, labourers, brick-makers, quarrymen, bricklayers, masons, carpenters, joiners, plumbers, glaziers, plasterers, paper-hangers, draughtsmen, clerks of works, master builders,—let there be a board or committee formed of a number of men proportionate to the number employed in building works, the number of each to be ascertained from the statistics of the country from time to time, for we must in such cases as this deal with average numbers.

SOME SPECULATIONS AFFECTING THE STRIKE.

We are very much afraid that at this moment neither party in the struggle that has commenced care to read much on the subject, or are likely to be much affected by anything that is written. Still there are thoughtful men amongst them who know very well that any violent and partial attempt to hurry or to modify the great movement of social progress may defeat its own ends. Artificial stimulus is not health. And when we see class, and craft, and calling banding itself together in a manner that implies hostility to every other class and calling, it is impossible to predicate any good result. The least harm that can happen, the greatest good that can be hoped, is for matters to remain much where they are. For any assertion, on the part of any single trade, of its own exclusive interest, will lead to a corresponding assertion, sooner or later, on the part of every other trade. And so we find that we are treading the path backwards to the old system of protection,—that old system that was so quaintly characterised by the expression, "All protection means robbing somebody else."

We suppose that no one will quarrel with us for saying that one main, if not the main, object of the present strike is the wider distribution of work among workmen. If a tenth of the time be cut off from the working day, one-tenth of the number of workmen, in addition to the actual number, will be required to do the same quantity of work. In itself we think the idea sound and even laudable. In one respect we have ourselves long urged that it ought to be made universal. In all those cases where employment is constant, and where its general or even its partial suspension on one day of the week is attended with great public inconvenience, the only proper remedy is to be found in the application of this principle. In the telegraph service, in the railway service, in the Post-office service, in many other cases that can be named, a certain amount of Sunday work cannot be neglected without serious inconvenience, loss, and danger. We may point to the water-supply of towns as a remarkable case in point. The water companies, to give a day's rest to their servants, inflict an amount of annoyance, toil, and danger to health on the holders of the smaller tenements which they supply that can ill be estimated. For the saving of the seventh part of the labour they employ, they make the public lose far more than a seventh of the whole benefit of a supply of one of the first necessities of life. In all these cases we should be glad to see it rendered imperative that the companies should employ seven men to do the work of six, so that

on each day of the week, one seventh part of their force should be at rest. It could then easily be so arranged that each man should have his fair share of rest on the Sunday. Nor can there be any real objection to the introduction of this salutary distribution of labour except the desire, expressed or understood, to make each servant of the company work seven days, or at all events six days and a bit, for six days' pay.

Again, in the case of a pressure of work, it would be far better to utilise the eighteen hours of daylight which we enjoy at this season of the year by the employment of two sets of workmen for nine hours each, than to keep the same men on for twelve or fourteen hours at a stretch. But the sound rule is, that the amount of work to be done should regulate the number of hands employed. When the object is to save time, or to avoid overworking the artificer without incurring delay, the proper remedy is to take on additional hands. But to divide the work of two men among three, and to shorten the hours of work in order to do this, is an artificial interference with the course of labour that can only produce an evil result. Labour, rightly directed, is capital. But also time is money. Anything that positively checks the producing power of the country, directly impoverishes it. And there can be little question that the limitation of the hours of labour directly checks this power. The money-earning value of each laborer is directly diminished. It is all very well to say that this is counterbalanced by acting a man who would otherwise be idle to do this omitted work. But the proper thing to do is, to let each man engaged have his fair and adequate amount of employment, and to turn elsewhere the attention of the spare hands.

For it cannot be too clearly borne in mind by the workmen that increase of their numbers will not produce increase of employment. When work is pressing, and hands few, no doubt additional workmen will expedite the quantity of work. But the very existence of the present contest denotes that the case just now is widely different. We have rather too many than too few laborers for the labour we have in hand. Otherwise, there would be no question of an enforced distribution of work among a larger number of workmen. The movement, then, cannot increase employment. On the contrary, it both can and will diminish it. There is no question that that work is rendered in every respect inferior, more cumbersome, and more costly, when it is carried on by too large a force. If, for instance, we only speak of the reduction of one hour out of ten in the day's work, this is an addition of ten per cent. to every charge incurred by the builder, with the single exception of the actual wage-sheet. Interest on capital, superintendence, horse-power, engine-power, correspondence, travelling, rent, taxes,—all these items will be increased one-tenth by the sole alteration of the time-table. And if we compare the actual cost of labour of a piece of work with the price which the purchaser of the work has to pay for it, we shall find that the latter ordinarily averages from one-half as much again to twice as much as the former.

Now the amount of money to be spent yearly in building is not unlimited. It cannot be enlarged by increasing the cost of building. On the contrary, it can, and no doubt will, be considerably diminished. That for a time it will be very seriously curtailed by any uneasiness among the men, any strike, or prospect of a strike, there can be no doubt at all. No great public or private work that is not urgently necessary will be taken in hand in the presence of such an uncertainty. But let us look beyond the present year. Let us suppose that a certain amount of building, if not executed in 1872, will be crammed into 1873-4-5, in addition to the natural work of those years. How much that might otherwise have been taken in hand will be deferred altogether? The positive building demands of the country are limited, after all, by the annual growth of the population. Increased luxury of accommodation, such as is now going on at the West-end of London, and elsewhere, is all very well, but it is not essential, nor will it be provided at more than a certain cost. It is probable that at this moment London is rather over-building than under-building itself. Now the annual increase of the population of England may be taken at 220,000 souls. (Between 1868 and 1869 it was 220,230.) The ratio of population in London is 8·4 persons per house. That would require the erection of 26,200 houses per annum in the whole of England, to provide for

the actual increase of the population, on the supposition that all our existing houses are fully occupied. As to the expenditure involved in the erection of those houses, different views may be taken. But if we are looking, not at luxury, but at what is necessary alone, we may take the approximate measure of 500 cubic feet per pair of lungs, which of course is much in excess of our actual cottage accommodation. A shilling a cube foot will not be considered too low a price for such building. That gives us a natural steady demand of 220,000 times 257, say 5,500,000 sterling per annum, required for housing the people. What is to be added for maintenance and repairs must also be borne in mind; but it is to new work that the workman has chiefly to look.

Now in London, by the occupation census of 1861, there were,—

Carpenters and joiners	27,598
Plumbers, painters, and glaziers ..	20,366
Bricklayers	16,335
Cabinetmakers	11,410
Wood-carvers	2,067
Masons	5,224
Plasterers	5,206
Gasfitters	2,160
Sawyers	3,627
	94,033

To this total of men employed almost exclusively in building and maintenance, must be added a proportion of 48,688 laborers (exclusive of dock labourers), of 3,221 brassfounders, and of 9,527 blacksmiths; so that we shall be on the underside of the truth in saying that 120,000 able-bodied men, many of them heads and supporters of families, were dependent on the building trade, within the metropolis, in 1861. The increase of the city, which doubles itself in forty years, will have increased this number, since that date, by one-fourth. That gives us 150,000 men directly supported by building, exclusive of all indirectly so occupied, for London alone, in the present year.

Now, the estimate by the Registrar-General, in his last annual report, of the population of London in the year 1869 was 3,170,751 souls, "within the domain of the Metropolitan Board of Works." The population of England, in the same year, according to the same authority, was 21,869,607,—that is to say, one-seventh of the population of England dwells in London. If the proportion of builders of all sorts to other inhabitants in the country, including all our great towns and cities, be the same as in the metropolis, we shall have 850,000 men in England alone who are engaged in building occupations. If the necessary repairs cost the half of what we have taken as the necessary outlay in building, we still do not find the sum amount to quite a pound a week for each member of this great army. These numbers are, of course, rough and tentative; but we give the data on which they are based, which are positive and exact. Let each of our readers work the sum for himself. We have given the figures rather with the intent that a definite idea should be formed than with any thought that they are more than approximate. But the fact comes out clearly that the one thing that is fixed, imperative, and annually increasing, is the number of mouths for which the occupation of the builder has to provide bread. The other side of the balance, the natural requirement for enlargement of abode, is already inferior to this demand, and is eminently liable to be checked by any increase in the cost at which that accommodation can be provided.

These matters are not opinion. They are hard, definite facts. They are facts against which, it seems to us, the authors and promoters of a strike run their heads. Especially it is incumbent on the workman to bear in mind the fact that his gain does not measure the public loss. The great sum which, in this country, we pay for the direction and distribution of labour has never yet been estimated. It cannot be far short of the sum which we pay for the actual labour of which we thus enjoy the results. All retail trade lives on this difference,—all capitalists' returns and masters' profits come out of it. Take, for instance, in that which ought, one would think, to be more directly and ungrudgingly rewarded than almost any species of labour, the sweat of the brain,—the exhausting toil of the literary man. Do our readers know what it costs to publish a book? We do not mean to print and to publish,—but to publish alone.—It costs 45 per cent.—more nearly 46 per cent.—on

the nominal selling price. For the mere handing over to the reader of the book, which has first to be written, printed, corrected, stitched, and bound, forty-five shillings out of every hundred are divided between the original publisher, at the regular trade profit, and the retail booksellers. It is thus we see so many of the latter able to take twopence in the shilling off the published price; it may be said that this is only a nominal price; but the effect on the original producer, the author, is most crushing. Take any other calling. In goldsmiths' work goods can readily be obtained from manufacturers at a reduction of one-third below the shopkeepers' price. Lace is made to order at half the price asked for it at the counter. We do not wish to pry into any trade secrets, but the fact of the enormous proportion which the cost of distribution bears to that of production is patent. We are of opinion that it exceeds the due limits. When we see the palpable signs of the immense fortunes that are made, often with very little toil, or skill, or desert, in consequence of the state of the produce-market, we are not surprised at such unbusiness being displayed by the actual producer. In this respect co-operative associations are indicative of the same conviction that is displayed in other cases by strikes. But there is this difference between them. The first are guided by reason. They are established by men who not only have a definite aim, but have an intelligent method of attaining that aim. That the co-operative system, by extinguishing the too great risks of trade, want of custom, and bad debts, brings the most wholesome check to bear upon that large proportion of profit which is absorbed by our present machinery of distribution, there can be no doubt. Thus, while the strike is certainly limited in its results, and almost certainly disastrous, in reducing that very amount of employment which its object is to increase,—the opposite route, that of hearty and intelligent co-operation, tends to increase at once individual welfare and public wealth.

The establishment of co-operative builders' associations must prove the downfall of the strike system, and may lead, with good fortune, to the establishment of a really co-operative interest between the employers and the producers of labour. To such an accordance alone can those look with hope who have at heart the welfare of old England.

THE PRINCE CONSORT NATIONAL MEMORIAL.

ON Monday morning last her Majesty the Queen, accompanied by Princess Beatrice and Prince Leopold, and afterwards met by the Princess Louise and the Duke of Edinburgh, visited the Prince Consort National Memorial, previous to its being opened to the public. The Right Hon. A. S. Ayrton, Chief Commissioner of Works, was also present. Mr. Gilbert Scott, the architect, Mr. John Kell, the contractor, and the following artists who had been engaged on various portions of the structure, were presented to her Majesty:—Mr. J. H. Foley, Mr. W. Theod. and Mr. J. Bell, the sculptors of the lower groups; Mr. H. Weeks, Mr. T. Thornycroft, Mr. J. Lawlor, and Mr. W. C. Marshall, the sculptors of the upper groups; Mr. H. H. Armistead and Mr. J. B. Philip, the sculptor of the pedium and of the bronze statues. Mr. F. A. Skidmore, who executed the metal-work; Messrs. Clayton & Bell, the designers of the mosaics; and Mr. Brindley, who executed the carving of the stone-work, were present.

Her Majesty was conducted round the memorial, and examined the sculptural work and other details, and expressed her entire approval of the manner in which this great work has been executed.

Since then the barriers have been removed, and the memorial thrown open to the public.

Just at the proper moment Mr. Murray issued a shilling Handbook, which enabled the morning papers to give very full and correct particulars of the structure and its remarkable adornments.* This little book includes an architectural account by Mr. G. G. Scott, and an account of all the statury. We have but one quarrel with it. The original committee, from whose labours the whole matter grew, are entirely ignored, beyond mention of the meeting, under the presidency of the Lord Mayor (William Cubitt), at which they were appointed, in January, 1862. The executive

* Handbook to the Prince Consort National Memorial. Published by authority of the Executive Committee. London: John Murray.

committee, which was a small one, worked sedulously, week by week, for many months; they discussed various proposed memorials, smoothed the way for a right selection, and ultimately handed over some 60,000*l.* if we remember rightly, to the committee afterwards appointed to assist her Majesty in selecting a suitable design. The present executive committee, who came into being later still, and under whose authority the book before us is issued, will scarcely be satisfied, we think, to have the names of the original executive committee left out of the record when the facts are brought to their memory.

ACCIDENT IN A SEWER AT LIVERPOOL

FIVE men working in a sewer at Liverpool, as we mentioned last week, were rendered insensible by foul air, and one of them died. This sewer was 6 ft. in height, and contained putrid matter, which the five men were employed to remove. Now, why should this death be termed an accident? There was no accident about it. The five men are said to have entered the sewer, and to have commenced to stir the putrid refuse, when the foul air (or gas) instantly rendered them insensible. They were removed, but in a few minutes one died. This was no accident, but the result of well-ascertained laws. Unventilated sewers of deposit, it has been proved over and over again, are liable to generate gases deadly to life; and here was a sewer, having these deadly conditions, into which five men are made to enter, to the peril of all and to the immediate death of one. Accident, indeed! This, we say again, was no accident, excepting we are to understand that the Liverpool corporation officials having charge of the sewers are utterly uneducated, as also utterly inexperienced. Educated men know that diluted, and therefore weakened, sewage-gases are injurious to health; but they also know that concentrated gases from putrid matters are deadly, and that to enter a sewer, a well, a brewer's vat, or other receptacle, filled with carbonic acid gas, is instant death. Men were formerly killed on entering the foul unventilated sewers of the metropolis, but since these sewers have been ventilated (very rudely ventilated, it is true), "accidents" from sewage-gases have ceased. The London sewers are as foul with deposit as the Liverpool sewers are, and were, in their unventilated state, as deadly; but abundant ventilation from the crown of the sewer to the surface of the street has permitted unceasing dilution and dispersion of sewage-gases in the open air, to the improvement of the health of the whole community. Stop these rude sewer ventilators, and the mortality of London might rise as high as that of Liverpool. The Liverpool sewers are not ventilated in the London manner, nor are they sufficiently ventilated in any manner: hence this "accident" to five men and the sudden death of one of them.

When will the Liverpool officials learn, and put the knowledge into practice, that town sewers may be under-ventilated, but cannot by any possibility be over-ventilated?

The sewers of Liverpool are not sufficiently ventilated, and along the steep gradients of the town, in their foul and unventilated form, they are answerable for very many deaths, and will continue to be so answerable, until they are fully and freely ventilated to the open air. These "accidental deaths" are not, however, so sudden and palpable as the one commented upon, hence do not cause so much alarm.

NOTES ON FOREIGN PICTURES IN THE INTERNATIONAL EXHIBITION.*

Among other works of interest in the French Gallery may be named Cormon's "The Niebelungen" (1,145), a fine specimen of drawing and painting of the female figure; Banvier's "Idyll" (1,235), in which a real modern interest is given to a classical subject by its spirited treatment and rich colouring; Mdme. Mamont's "Caught!" a splendid piece of still-life painting of fruit and flowers, on a large scale, the title indicating the predicament of two small children, who endeavour to hide under the table, having been found in the act of uncharitable deprecation. "Bibot's" "The Samaritan" (1,290), is a thing not to be passed over, equally powerful in conception and execution; the single figure of the man who has "fallen among thieves," lies on the ground, naked and pale

from loss of blood, amid a rocky landscape: the drawing of the figure, sharply foreshortened, is admirable; the Samaritan approaches in the distance. This is a remarkable and original work, which leaves its impression on the mind. Tissot has two remarkable works: "Before the Departure" (1,176) represents two girls, and a hard-featured seaman in some kind of uniform, watching with different degrees of interest the clearing of a ship out of dock; the picture is in the painter's usual hard white tone, and completely filled with details of masts and rigging crossing the composition; the scene and the personages are as completely English as the work, artistically, is completely French. "Portrait of Captain * * *" (1,282) is an admirably painted and characteristic specimen of realistic portraiture: the "captain" is shown seated in a railway-carriage at the moment of taking out his watch to note the time; every detail, the rug, the railway-guide, &c., finished minutely; the whole effect as natural and life-like as such a picture could well be made. One or two works of the late M. De Poitvin (1,237, 1,241), lent by the French Government, are delightful to look at, from the perfect grasp and mastery of the subject and materials on the part of the artist. A very charming picture also is Jundt's "Return from the Feast" (1,247), a young peasant girl returning by summer moonlight, laden with flowers and presents, pausing at a brook side; there is much sentiment, and a very good atmosphere effect in this. Landscapes are not numerous, but some are admirable: "The Village in Snow," by Chenu Fleury (1,171), is one of the finest; a flat landscape, a straight road leading to the village in the middle distance, the whole buried in snow, the main part of the canvas occupied by an expanse of sky of that peculiar dingy yellow tone which a foggy atmosphere in winter acquires by contrast with the dead white of the snow. This painting is almost sublime in its effect, yet how simple in its treatment and materials. The French landscape-painters shine in the treatment of snow, as shown again in Lavezzari's "The Wood of Monthuis" (1,155). They have acquired a broad and yet truthful treatment, analogous in its principles to that which our own artist, Mr. Hook, bestows upon sea and sand. Lapostolle's "View of the Canal St. Martin, Paris" (1,117), Gniaud's "Autumn Landscape" (1,154), and Lansvers's "Pond of Montefontaine" (1,271) should be looked at. Schmidt's "Hollow Way in Brittany" (1,300) is a little gem. Grisebille's "Verge in a Wood" (1,153) is another of those small, broadly-painted landscapes in which French painters delight, and is an admirable specimen of a method of treatment largely illustrated in French landscape-painting; laying on the colour in broad masses, with scarcely any attempt at texture or detail; the artist trusting to his truth of tone, light and shade, to secure the intended effect. This is particularly illustrated in the grass-lawn which forms the foreground of this little work. An English artist would almost certainly have stippled and broken up the mass of green, to give the idea of grass-blades. The French artist shows an unbroken, thick mass of colour, but so carefully studied as to tone and the effect of the varying lights from slight irregularities of the ground that, at the proper distance, the illusion is perfect. We suspect that more thought goes to the French method than the English. At all events, we should incline to regard it as a more intellectual and aesthetically correct way of using pigments in imitation of nature.

In Gallery XVIII, Bavaria and Baden show the usual number of mountainous landscapes of considerable similarity of style and composition; Winkler's "Mountain Scene" (1,375) and Parnmann's "Thunder-storm" (1,461) are among the best of these, though both somewhat sensational in effect. A "Sketch on the Simsee," by Poschinger (1,377), is a very good specimen of landscape of a less pretentious and more truly artistic style. There is scarcely a figure subject calling for remark. Italy, represented in the same gallery, is much better in this respect, though, perhaps, hardly equal to last year; Baccani, whose beautiful "Idyll" attracted admiration last year, has a picture in quite a different manner, "The Evening after the Massacre of St. Bartholomew" (1,500), which may be briefly characterised by saying that it strongly resembles, in character, motive, expression, even to a great extent in colour, Calderon's "Funeral of a Puritan." Rinaldi's "Rehearsal of the New Mass" (1,493) is a clever

and interesting work, a scene in the choristers' gallery of a convent; and in a totally opposite way, Bianchi's "Violoncello Amatore" (1,469), representing an old gentleman puzzling over his instrument in the middle of a large and richly-furnished room, is very good; in manner and treatment this picture bears some resemblance to Tissot. Ferroni's "Female Straw-plaiter" (1,519), a large painting of women at work as indicated by the title, is very characteristic in treatment and colour, especially in the figure of the old woman with the handkerchief over her head, intent upon her task; there is something of Northern feeling and tone of colour in this work. A very beautiful and feeling work is that of Sorbi, "The Evening Work—Environ of Florence" (1,515), two figures in earnest talk, in a kind of public garden apparently, with a distant peep of the city showing over the wall: the repose obtained by the level lines of the composition harmonises precisely with the sentiment of the figures; there is a nationality, too, in the subject and manner of the work which detracts in no way from its interest. In the main, however, there is not much of specially Italian interest among the collection, unless we except Ceccoli's "Aurora d'Italia" (1,486), a symbolical female figure floating in the air over the domes and towers of Florence, which gives, however, little indication of a dawn in art; it is a pretentious and very unsatisfactory affair. We do not know, indeed, when we have seen so many commonplace and utterly uninteresting nudities and classicisms got together as are to be found in Rooms XVIII. and XIX., among the Austrian and Italian productions.

It is a contrast, indeed, to come from some of these tame and meagre productions to the few pictures by which Russia is represented at one end of Room XVI. Russia is chronologically behind other European nations in all the arts—they are comparatively late achievements with her; yet in every branch of art to which she has seriously set her hand, her artists have shown a vigour and originality which promise great things from her in future. We come here upon what we should certainly call the finest landscape in the Exhibition: "The Bed of a River," by E. Ducker (1,535). The river is nearly dry, and its rocky bed, covered with loose whitish shingle, is exposed, over which loaves a tremendous and tempestuous sky, threatening a thunderstorm. In tone and powerful effect, this is a most unusual work. Equally admirable, in a totally different way, is Wasiloff's "A Thaw" (1,682); the sloppy brown luge of the half-melted ice on the road, succumbing to a feeble and struggling sun-light, has been most carefully studied and successfully represented. Makowski's "Carnival at St. Petersburg" (1,669), is a large and important work, crowded with figures, and with much variety of character and interest in the various faces. A large picture, illustrating a Russian tale, painted in wax by Wereshshagin (1,538), is interesting not only as a good composition, but as a specimen of a medium we are unaccustomed to on a large scale here. The tone and general effect is somewhat like fresco, flat and thin: it is painted on a very rough cordy canvas; so rough, indeed, as to render the details unintelligible on a near inspection, though the whole is clear enough at the proper point of sight. A small picture by the same artist, in a totally different manner, is "Opium-eaters at Tashkent" (1,690), a sad and fearful study of the wreck of human intellects, very powerfully portrayed; the tone is peculiar, cold and very grey.

Among the Belgian pictures there is not a single figure-subject of sufficient importance or individuality to demand a separate comment; of landscapes there are several of unusual merit: Rodiaen's "Lake of Briens" (1,600), Baron's "Autumn Snow, Environ of Brussels" (1,619); Asselberg's "Ravine near Mont Aigle" (1,568), a very bold and grand landscape composition; and "Early Autumn" (1,575), by Lamorinière, an artist who excels in painting some of the quieter aspects of nature in a truthful and natural manner peculiar to himself, and the result, notwithstanding its apparent simplicity, of a great deal of conscientious study. We noticed his picture last year in the same gallery as the only Belgian landscape worth looking at, and his contribution this year is decidedly the best of the set. Kindermans, J. Van Suppen, and Mdle. E. Beernaert, exhibit good landscapes; and there is a "View in Seville" by Bossuet (1,559), in which this well-known painter of architectural subjects is seen in his very best manner; the truthfulness of texture and colour in some parts

* See p. 461, ante.

of the building, particularly the brick quay on the right, deserves every praise. There is a splendid still-life piece by E. Vandenhosch, who like one or two other Belgian artists, can challenge all Europe in this particular class of work.

We reiterate, in conclusion, our conviction that the attempt to make an annual international picture exhibition will prove a mistake. If the picture-galleries were open, say, once in three years, and the years of opening duly advertised, the artists of different countries would work for the Exhibition, and send contributions which would not only represent their best powers, but would furnish a periodical index of the progress of art in their respective countries.

BATHS IN OLD LONDON.

The Turkish Bath, introduced into England as a novelty about the year 1856, is merely a revival of a bath which was very popular in the seventeenth century. This, however, fell into disrepute, on account of the circumstances and immoralities that were practised under the cover of its supposed object. The very names of the sweating-bath,—such as *Bagnio* and *Hothouse*,—obtained an unsavoury meaning; and, to a great extent, the bath went out of use when its name became disreputable.

The practice of sweating in hot-houses is often referred to in the works of Ben Jonson; and in "The Parian," one of the supposititious plays attributed to Shakespeare, a character exclaims, "Marry, it will take me much sweat; I were better go to sixteen hothouses."

One of the earliest and best-conducted of these baths was the celebrated hotel in Covent Garden known as the *Hummums*, from the Turkish word, *Hammam*, which is now used to designate the bath in Jermyn-street. The house was built about the year 1631, when the piazza was laid out by Inigo Jones for Francis Earl of Bedford, and the vaulted ceiling of the entrance-hall and corridor was designed by the great architect. It was very beautifully decorated with scrolls, wreaths, &c., and fortunately escaped injury from the fire which consumed the whole of the upper part of the front portion of the house about ninety years ago. The back part of the house also escaped, as well as the bathing establishment, which consisted at that time of the hot-room, &c., two bath-rooms, heated by means of flues from a large furnace, and also a large plunge-bath, with marble floor, and sides tiled like those of the bath-rooms. This bath has for many years been covered in, and used merely as a water-tank for the supply of the house. Many years ago, when some alterations were being made in the basement of the house, the original brickwork forming the foundations of the Covent of Covent Garden were laid bare. An ancient passage, or arched gallery, of considerable length, leading from one of the cellars in an easterly direction, was then discovered. It formed the means of communication between some of the subterranean cells, one of which still remains, and has at one end an arched way or recess, that has been bricked up either by the monks or their successors, at a very early period.

The south-east side of the piazza was originally built with an arcade like the north-east and north sides, and this is seen in Rooker's fine engraving of Paul Sandby's view of Covent Garden, which is dated 1777; but after the fire mentioned above the fronts of the houses were rebuilt as we now see them.

The Old *Hummums* was the scene of the notorious Parson Ford's ghost, which Dr. Johnson called the best accredited ghost story he had ever heard; and when the house ceased to be used as a bath, it attained a high character as an hotel, and was long the favourite resort of the military heroes of the Peninsular War. The Old and New *Hummums* remained side by side for some years; but lately the proprietors of the Old *Hummums* (Hewitts) have retired, and the proprietors of the New *Hummums* (Rockleys) have thrown the two houses into one and called the hotel the *Hummums*. The Old *Hummums* had been in the possession of Mrs. Hewitt's family for upwards of 100 years, and about the same length of time in that of their predecessor, Mr. John Rigg. Mr. Rigg, in his prospectus, lays great stress on the decorum of his establishment. The following is a copy from a handsome engraved plate, with ornamental border, by Woodfield, of Maiden-lane:—"John Rigg, Copper at the *Hummums*, in the Little

Piazza, Covent Garden, with a back door from Charles Street, where gentlemen only may be always accommodated (if not full) in the best and neatest manner with Lodging, Sweating, Bathing, or Cupping, and with the utmost decorum, as has always been kept and preserved for near a hundred years. Likewise Ladies are permitted only to Sweating, Bathing, and Cupping, with great care and proper attendance. N.B. Gentlemen or Ladies who desire to be Cupped at their own Homes, either in Town or Country, shall be waited on. There is likewise a good Cold Bath." In the *Postman* of Nov. 15, 1701, appeared the following advertisement:—"The *Hummums* in Covent Garden having for several years past been neglected and abused by those persons that had the care and management of them, whereby several Persons of Quality have been disgusted and have left off coming thither to sweat and bathe as formerly. This is to give notice, that the said *Hummums* are now in the possession of others, who have re-fitted the same, and rectified all those neglects and abuses that were formerly done there, where persons may sweat and bathe in the clearest and be Cupped after the newest manner. There is likewise provided good lodging for any persons who shall desire to lodge there all night, where who pleases may see the same. The price, as was always, for sweating and bathing is 5s. 6d. For two in a room, 8s.; but who lodges there all night, 10s." In Strype's edition of "Stow's Survey" (1720), the "*Hummum*" is said to be "much resorted unto by the Gentry."

The *Bagnio*, in *Bagnio-court* (now Bath-street), Newgate-street, was built by some Turkish merchants, and opened in December, 1679, for sweating, hot bathing, and cupping; but the most celebrated of these establishments was the Duke's *Bagnio*, on the south side of the west end of Long-acre, called after James, Duke of York. Samuel Haworth, M.D., published an account of this bath in 1683, which is interesting as giving us a good idea of what these old baths were like. He writes:—"In one of the rooms hangs a pair of scales, to weigh such as out of curiosity would know how much they lose in weight while they are in the *bagnio*. The *bagnio* itself is a stately oval edifice, with a cupola roof, in which are round glasses to let in the light. The cupola is supported by eight columns, between which and the sides is a sumptuous walk arched over with brick. The *bagnio* is paved with marble, and has a marble table; the sides are covered with white gully-tiles, and within the wall are ten seats, such as are in the baths at Bath. There are also fourteen niches in the walls, in which are placed so many fountains or basins, with cocks over them of hot or cold water. Adjoining to the *bagnio* are four little round rooms, about 8 ft. over, which are made for degrees of heat, some being hotter, others colder, as persons can best bear and are pleased to use. These rooms are also covered with cupolas, and their walls with gully-tiles." On the accession of the Duke of York to the Crown, the bath was called "the King's *Bagnio*," and in 1694 it was rebuilt. The following is from the description of the new house by the proprietor, Leonard Cundit, who does not forget to run down the rival *Hummums*:—"These are to give notice, that the late great *bagnio* in Long-acre, known by the name of the King's *Bagnio*, is now rebuilt, and divided into several rooms, and is far more convenient than before for the reception of all persons of both sexes that are pleased to reap the benefit thereof, every day in the week, all persons being private to themselves except they bring company with them; for it much exceeds the *Hummums* and other like sweating-houses for decency and convenience, and much more advantage may be reaped thereby, their fire being directly underneath, but ours at a distance."

The house, No. 73, St. James's-street, now occupied by Fenton's Hotel, was formerly Peyrant, Pierault, or Pero's *Bagnio*, which became a very fashionable place on its being set up about the year 1699. The prices charged were 2s. 6d. for a cold bath, and 5s. for a warm one. These *bagnios* were not the only baths in London, for besides them there were certain cold baths, such as St. Agnes-le-Clair Baths, Tahernaale-square, Finsbury; Peerless Pond, Baldwin-street, City-road; the Cold Bath, Clerkenwell; Queen Elizabeth's Bath, near the King's Mews, Charing-cross; Queen Anne's Bath, Endell-street, Long-acre; and the floating baths on the Thames. We thus see that plenty of bathing accommodation was supplied to the inhabitants of Old London. Some men nowa-

days seem to think that the virtue of cleanliness was left to be discovered by the present generation. In old times there was probably less "tubbing" at home than now, but there were more out-of-door baths in proportion to the size of London than at present.

THE IRON TRADE IN THE NORTH OF ENGLAND.

ERECTION OF EXTENSIVE NEW BUILDINGS.

BUILDINGS involving an immense outlay are now in course of erection at Stockton-upon-Tees, Middlesbrough, and other surrounding places in the north of England, in order to meet the requirements demanded by the extraordinary impetus which has been lately given to the iron trade in that district. The quantity of pig-iron produced in the neighbourhood is at the rate of about 2,000,000 tons per annum, or a value of 10,000,000l. at present prices. It will be admitted that this is something enormous both in quantity and value, and yet it is inadequate to the vast requirements of the trade, the demand being considerably in excess of what can possibly be produced. This being so, the various firms are endeavouring by every means to increase their productive powers by the erection of new blast furnaces. At the present time there are not less than thirteen new furnaces in course of erection at Stockton and the immediate neighbourhood, representing a value of 260,000l., in addition to which several of the leading ironmasters are about to erect new and distinct works. A Glasgow firm has just leased land at Redcar, near Stockton, on which to erect two new blast furnaces, whilst Messrs. Ross, Willis, and some other gentlemen have purchased a royalty of 500 acres of land at Kenningrove, near Redcar, on which they are about to erect blast furnaces, at an outlay of upwards of 150,000l. Messrs. Bolckow, Vaughan, & Co., of Middlesbrough, are also about to erect several blast furnaces at a place called Eston Junction, not far from Middlesbrough. Besides this immense outlay in the erection of new works and buildings, the Erimus Iron Company, with a capital of 50,000l., has been formed to erect iron-works on Dank's principle (a patent for puddling machines), near Stockton. This company has purchased 25 acres of land, and it is stated that the new works which they are about to erect will produce 500 tons of puddled iron per week. The several new schemes represent a total capital of 1,018,000l. about to be laid out in new works and buildings, in addition to other works now being carried out; and the total capital required for the completion of new works and the extension of established concerns within the next twelve months, as at present decided upon, is estimated at from 1,500,000l. to 2,000,000l.

SCHOOL BOARDS.

London.—The following architects have been invited to submit competitive designs, viz.:—For schools for 720 children, at West Ferry-road, Millwall,—Messrs. Arthur & C. Harston, Mr. J. Young, jun., Mr. P. Spiers, and Mr. John S. Quilter. For schools for 750 children, at Blundell-street, Finsbury,—Mr. Thomas Archer, Mr. Laey W. Ridge, Mr. T. Roger Smith, and Messrs. Arthur & C. Harston.

Ross.—Mr. G. Pearson, jun., has been unanimously appointed surveyor to this Board.

Rochester.—This Board, at its last meeting, proceeded to the opening of the designs for the new schools to be built by the Board. Mr. Hayward, before the plans were opened, said he understood that several members of the Board had been written to by one of the competing architects, who signed himself "Invicta," and he trusted the Board would mark its sense of the impropriety of his conduct by refusing to look at his plans. He had also been informed that another architect had addressed letters to some of the members of the Board; but as he (Mr. Hayward) had not been favoured with one he could not say under what name the writer went. He would propose that neither of the plans respecting which communications had been sent should be opened. The motion, however, was not seconded. The various competing plans, twenty-seven in number, were then opened and inspected, after which Mr. Aveling proposed that application be made to the Mayor to allow the use of the library at the Corn Exchange, in which the drawings and plans might be placed for inspection, and that the Board adjourn for a week. The Rev. C.

Bosanquet did not think that the Board would be able to go through the whole of the plans at their next meeting, and suggested the appointment of a committee to do so. Mr. Aveling hoped, after the expense and trouble the gentlemen had been at in preparing their designs, the Board would give them more than one evening's consideration. He trusted that there would be no unnecessary delay, as he wanted the new schools to be roofed in before the winter. Mr. Hayward seconded the appointment of a committee to go through the plans. Many of the plans, he said, could not be carried out under 1,000l. more than they intended spending, and it was of no use wasting valuable time over their consideration. The Chairman thought that most of the specifications would state the probable cost of the schools, as well as the name of a contractor who would carry out the work for the sum. After some further remarks the Board adjourned the meeting for one week.—The design of Mr. Walker, of Moorgate-street, has been selected. The design submitted by Mr. Banister Fletcher was considered next in merit.

Scarborough.—At a special meeting of this Board, the Clerk read a letter from the Education Department, with reference to the central school site, stating that the Education Department approves of the site for the erection of a school for 800 boys, girls, and infants (in Trafalgar-street West). The clerk read the minutes of a committee of the whole Board held on the 17th, which recommended that a competition amongst architects be invited for the plans of the school; that the school be named the "Central Board School;" that the Education Department be requested to give authority to the Board to borrow the money required to purchase the whole of the land near Trafalgar-street West, on the understanding that in the event of any portion being sold as surplus land, the money realised by such sale will be appropriated towards the payment of the loan; and that Mr. John Petch, architect, be instructed to prepare the necessary plan and levels of the site to be applied to the competing architects. The adoption of the minutes was carried.

THE COPENHAGEN EXHIBITION BUILDING.

The Scandinavian Exhibition has been opened, with some éclat. A Danish correspondent of the Times, in an account of the proceedings, gives some particulars of the structure, which we condense:—

The building erected for the purpose, but destined to be converted into a permanent institution, has found its place in the largest and most important of the four passages connecting the inner town with the suburbs. Until five years ago, Copenhagen was in name a fortress, a high wall with expanding bastions and deep ditches, drawing a broad belt between the old city and its modern enlargements. These traces of former fortifications are about to disappear in Copenhagen just as in Vienna, the State having sold to the municipality the whole ground of the ancient fortress, which is now to be converted into a semicircular boulevard and new streets. The Exhibition building is erected in the Western Passage, close to the renowned pleasure-ground, the Tivoli, partly on the even ground and partly in what was, until two years ago, a portion of the ditch. It reminds one, in this respect, of some Edinburgh houses, in which what may be third or fourth floor towards Prince's-street is ground floor on the Canongate side. The choice of place has been severely, and not undeservedly, criticised; but, after all, the irregularity of the terrain may have contributed not a little to the favourable impression now made by the palace and the adjacent grounds. The material employed is the red backstone characteristic of the period of King Christian IV., corresponding with your Elizabethan era, enlivened by greyish sandstone window-frames, numerous statues, large flower-pots, and waving banners. The four wings of the main building enclose a glass-covered court, upon which all the four stories of surrounding galleries open, and in this large space, where all the lions of the Exhibition have been collected in picturesque variety, the opening solemnity was performed. The inner court lying a good deal deeper than the principal entrance from the street, the hall or vestibule leads to a double flight of descending stairs, forming between them a broad platform with a balustrade, flanked by two of Thorwaldsen's masterpieces, — Mercury the Argus-killer and

Venus with the apple. From this platform, dominating the central court, and easily to be seen from all parts of the crowded house, the Royal family assisted at the opening. In the body of the court, placed between the china collections, the jewelry-cases, the terra-cotta groups, the trophies of armour, the bunches of singularly-twisted iron bars, and all the other incongruous items of the catalogue, the light and tasteful toilettes of the ladies enlivened the picture.

CHURCH WORK IN WORCESTER.

WE condense the following from an article on this subject in the Worcester Herald. Some of the churches in the article have already been noticed in our columns:—

Worcestershire for the last quarter of a century has been conspicuous for the prominent position it has taken in the restoration and rebuilding of parochial churches, as also for the establishment of new districts, provided with churches and chapels of ease.

"The time is conscious of her wants; through England's bounds In rival haste the wish'd-for temples rise."

The great exertions which have everywhere been made of late to atone for the neglect and to sweep away the barbarities of a previous century or two are still continued; and, as a proof of the zeal in this good work for which our own district is remarkable, we have put together a few notes respecting church-work at this present moment in hand:—

Malvern.—There is no part of the diocese where so much energy in church matters has been shown within the last quarter of a century as that around the Malvern Hills. The separation of a new district, to be called Christ Church, has just been legally effected. At present there is only an iron church to supply the wants of a district; but it is intended as soon as possible to build a church somewhere in the Mill-road. A successful effort has been made to raise an endowment fund. The chapel of Holy Trinity Church, North Malvern, has been richly decorated with gold and colours by Mr. Forsyth, of Worcester.

Hanley Castle.—St. Gabriel's Chapel of Ease, in this parish, which is being built at the cost of Mr. Samuel Martin, of Catterall, has so far advanced that the roof-timbers are being laid on, and it is hoped to complete the church by the end of the year.

Welland proposed new church has not yet been commenced. The parishioners are unable to raise the amount (2,000l.) which the architect, Mr. Huggill, of Oxford, has estimated as the cost of a church to hold 400 persons. A site in a central part of the parish has been given by Mr. A. Watkins, and plans have been prepared. Owing to the dilapidated condition of the parish church and the crowded state of the churchyard, something must be done speedily.

Eldersfield.—A school-church is about to be built on Corso Lawn.

Bengworth.—The old parish church here, it may be remembered, had fallen into hopeless decay, and to rebuild rather than restore was considered by far the wiser plan. Lord Northwick generously gave a site; while Miss Porter, of Birlingham, contributed 1,000l. The first stone was laid in October last by Lord Northwick, and the work has proceeded till the new church is now partly roofed in, and will probably be ready for consecration in August next. The cost of the erection, exclusive of the site and the value of the materials in the old church, is estimated at 4,000l., besides 550l. for extra works, walls, fences, and laying out the grounds. The church will be Early Decorated, and built of stone, faced and lined with blue lias and Bath stone; 700 sittings. Messrs. Barry & Sons, of Liverpool, are the architects; Mr. Yates, of Liverpool, is the builder. The old church is nearly pulled down, but a small portion of the tower will remain as an entrance to the churchyard.

Birlingham Church, which has been rebuilt at the expense of the late rector, Rev. R. E. Landon, and Miss Porter, of Birlingham House, is nearly completed, and when the churchyard is laid out and re-arranged, the consecration will take place. The building is in the Decorated style, and has a chancel, organ-chamber, vestry, nave, and aisles. Mr. B. Ferrey, of London, is the architect; and Mr. Estcourt, of Gloucester, is the builder.

Charlton.—This is a hamlet of the parish of Cropton. The handsome little ecclesiastical

structure now approaching completion was a short time ago an old barn. Mr. Workman called in the aid of Mr. Forsyth, of Worcester, and the transformation of the old building into an apparently new one was soon accomplished. It will be licensed and opened for divine service in a few weeks. The church is 72 ft. long by 21 ft. wide; has a chancel, vestry, nave, and porch, with bell-turret and clock at the west gable; open wooden roof, tastefully decorated; and Mr. Hughes, of Frith-street, London, has cleverly stained a three-light east window with the subjects of the Resurrection, the Good Shepherd, and Christ blessing little children. Other windows represent the Evangelists. The eight nave windows have stained-glass centres and borders. A neat gallery, with open front, contains a fine-toned organ. Stone pulpit, cleverly carved, and the floors laid with handsome tiles, of various patterns. No expense has been spared in the decoration of the structure. The church adjoins the village street, and is approached by stone steps.

Elmbridge.—Here a great restoration in the church has been going on, with some intervals of inaction, for the last two years. Mr. Forsyth, of this city, has superintended the entire work, with the assistance of Messrs. Bourne, of the Tything, builders. It is intended to complete the restoration this summer.

Kingsnorton Church restoration is so near completion that the reopening is expected to take place shortly. Mr. Hopkins, of this city, has been the architect; and Mr. Estcourt, of Gloucester, the builder. The church had been shored up with great unsightly buttresses in the year 1712, or it could not have stood so long. The estimated cost of the restoration is about 2,500l. The church and tower have been thoroughly restored, a new north aisle built, and new roofs to nave and south aisle. All defective masonry has been made good, pillars and arches set upright, and many unsightly excrescences removed.

Kidderminster.—A new organ-chamber is being erected at the parish church of Kidderminster, from designs by Mr. W. J. Hopkins, consulting architect to the Worcester Diocesan Society. The north gallery has been taken down; and a grand new organ, to cost 1,000l., is to be erected by Mr. Hill, of London.

DUBBIN'S PATENT.

Sir,—With reference to the new machinery for repairing houses, &c., engraved in the Builder, No. 1,533, p. 489, it deserves notice whether the invention might not include a plan for preserving the lives of workmen, by means of a movable chain fixed to the wall, on a wooden parapet or wooden rail, sufficiently high to prevent such a fatal accident as that which occurred to the late Mr. Basevi in Ely Cathedral, or that which threatened to close the career of Sir James Thornhill, when he was engaged in painting the ceiling of St. Paul's Cathedral. An attack of giddiness, as well as a false step, has ended the career of many promising workmen, in the absence of such a safeguard, which was suggested by the late Mr. George Combe, in one of his works, as a desirable improvement. Window-cleaners are liable, especially, to fatal accidents under the present system. CHAS. COOKE.

THE MOSAICS AND FRESCOES IN THE HOUSES OF PARLIAMENT.

In Committee of Supply, on a vote for lighting and warming the Houses, Mr. C. Bentinck referred to the mosaics and frescoes. He said he had always understood that mosaics were in future to take the place of frescoes in the decoration of the Houses of Parliament, and wanted some explanation, therefore, of the charge of 500l. for painting one panel in fresco for the central hall.

A desultory discussion on this and other subjects ensued, and Mr. Ayrton said in regard to the frescoes, it was determined by the Royal Commission that the four patron saints should be illustrated in the four compartments of the central hall. St. George had been exhibited in what was called glass or Venetian mosaic. It was generally considered, however, that glass mosaic was not a satisfactory mode of decoration for the walls of that building, and he asked all the artists concerned in fresco painting to give their opinion on the subject. They thought it

would be quite premature to abandon fresco painting; because an eminent chemist, who was associated with them in the inquiry, was of opinion that the failures of the frescoes could be traced to definite causes with the knowledge of which that class of painting might be revived in all its perfection. If the glass mosaics were to be gone on with, the cost would be 500*l.* apiece, instead of 650*l.* The question was an open one for the House to decide, and if they decided to grant the 500*l.*, further counsel would be taken with the artist, Mr. Poynter, who was a gentleman of great eminence. There was great difficulty in going on with the glass mosaic, because Mr. Poynter declined to proceed with the designs. Finally, the item of 500*l.* was struck out of the vote. Between two stools art came to the ground.

ARCHITECTURE AT UNIVERSITY COLLEGE.

The following is a list of the students who obtained prizes in Professor Lewis's classes:—*Architecture (Junior Class)*.—W. G. Field, First Certificate and Prize; P. Warne, Second ditto.

Senior Class.—F. E. Eales, Certificate and Medal.

Architectural Construction (Junior Class).—F. P. Johnson, First Certificate and Prize; W. H. Lloyd, Second ditto; C. C. Ogle, Third ditto.

Senior Class.—W. H. Lloyd, First Certificate and Medal; F. P. Johnson, Second ditto; F. A. Butler, Third ditto; P. Warne, Fourth ditto.

ARCHITECTURAL ASSOCIATION.

The final meeting of the session was held on Friday evening, the 28th of June. A paper was read by Mr. E. R. Robson, architect to the School Board for London, which will be found elsewhere in this number. The examination of the balloting papers for officers for the ensuing session gave the following result:—

President.—J. Douglas Mathews.
Vice-Presidents.—Edward J. Tarver and George H. Birch.
Committee.—T. Blashill, E. C. Lee, R. Plumble, J. S. Quilter, G. R. Redgrave, L. C. Riddett, L. W. Ridge, T. R. Smith, W. L. Spiers, and T. H. Watson.
Treasurer.—J. Douglas Mathews.
Secretary.—Francis Truett.
Auditors.—Stephen Salter and E. B. F. Anson.
Librarian.—H. C. Boyes.
Assistant Librarians.—Ernest Elliot and R. E. F. Pownall.
Secretaries.—Bones A. Faice and S. Flint Clarkson.
Registrar.—John S. Quilter.
Collector.—Edmund Marshall.

BEDFORD.

THE large mansion, from the designs of Mr. John Usher, of Bedford, now in course of erection at Clapham Park, near Bedford, for Mr. James Howard, M.P. for Bedford, and a partner in the well-known firm of agricultural implement makers of that town, stands upon slightly elevated ground in the midst of the park, and commands a fine prospect. It is built entirely of red brick, with dressings of Hare-hill stone, and is Early French Domesticated Gothic in general treatment. The house is carried well up, somewhat higher in proportion to its ground plan than are mansions of this class generally; and now that during the past fortnight the whole of the scaffolding has been cleared away, the general effect is seen to advantage, and the diversity of grouping and of sky-line afforded at every point of view cannot be deemed anything but satisfactory. The effect altogether, especially from the eastern elevation, is very picturesque. The principal entrance is on the north side, where there is a large groined porch. Fareham bricks are used throughout the building, the cut bricks being from Cossey, near Norwich; the cut-work of the chimneys and other parts of the building come out well and are successful. The tiles are Burslem ones, of varied shapes and hues: the roofs being steep in their pitch, these show out to advantage. The staircase is of oak, and is well lighted by a lantern, carried by an arched Bath stone, around which is a corridor communicating with the upper rooms. There are four bays on either side, the arches being supported by columns of red Mansfield stone, upon which are foliated capitals; the arch moulds are also enriched with running ornament. The encaustic tiles are by Mr. J. K. Cooper, tile and pottery works, Maidenhead. The arrangement in the basement, whereby the

chimneys of the principal rooms may at any time be swept and the soot carted away without the sweeps entering the building, thus saving a vast amount of dirt and muddle, is worthy of attention, and will gladly be shown and explained by Mr. Edward Dencon, the obliging clerk of works. The stables and coachman's house are well removed from the house, and are built in character with it, only that the bricks used are local ones, not quite so regular in colour as the Fareham brick. Mr. Samuel Foster, of Kempston, near Bedford, is the contractor; Mr. Dennis is his foreman on the works. The carving is in the hands of Mr. Harry Hems, of Exeter. The cost of the whole of the works will probably be about 17,000*l.*

THE TRADES MOVEMENT.

London.—A committee of the Social Science Association, with a view to bring about a settlement of the dispute in the building trade, passed a resolution suggesting that a court of arbitration should be at once constituted, consisting of an equal number of the representatives of employers and employed, who shall, at their first meeting, elect an umpire or referee, and that all matters in dispute shall be referred to such court, whose decision shall be final, it being agreed that, pending such award, both parties may maintain their present position. On Saturday, at a general meeting of the masons locked out, held in the Sun Concert Hall, Westminster-road, Mr. Broadhurst in the chair, about 600 men were present. The resolutions and recommendations for a settlement of the dispute emanating from the committee of the Social Science Association were discussed, and they were ordered to be upon the table, but not to be further entertained. The carpenters generally repudiate any sympathy with the recommendation. They refuse to entertain for a moment the idea of submitting the nine hours to arbitration. At a crowded meeting of the masons it was also resolved that it is advisable to allow those shops now working to continue to do so until further notice on the same terms as at present, but under protest. It was also resolved that no mason be allowed to resume work in any firm where the lock-out has been adopted until the present dispute is brought to a settlement.

The resolution passed by the London Trades' Council, suggesting that the question as to wages and working rules should be referred to arbitration, on the nine hours being agreed to, and which was identical with that submitted to the delegate meeting of carpenters, was rejected by acclamation, on the motion of Mr. Broadhurst. A second meeting of the Social Science (Labour and Capital) Committee was held on Saturday last: present, Mr. Frederick Hill, in the chair, Mr. Walter Morrison, M.P., Mr. Thos. Brassey, M.P., Mr. Godwin, Mr. Edwin Pears, and other members, when the position was further considered with a view of taking such further steps as might seem likely to promote a proper termination of the present disastrous state of things. It was ultimately determined, however, that it was desirable before moving further to ascertain in what spirit their first resolution had been received. Since then, the Master Builders' Association have expressed their willingness to adopt the suggestion made by the committee. It is stated, too, that some sections of the men hold an opinion favourable to it. Surely there are some men of position to whom both sides would listen, who could now usefully interfere. The question as to the formation of a company of co-operative builders seems to have so far attained the following shape:—The proposed company is to be called the London Company of Builders (Limited), with Mr. Thomas Hughes, M.P., and Mr. Walter Morrison, M.P., as trustees; to have a capital of 10,000*l.* in 10,000 shares of 1*l.* each; and to be based upon the co-operative principle, whereby a preference would be given to employes who were shareholders, and who would, by virtue thereof, be entitled to a share of half the surplus profits over 10 per cent. per annum, and other privileges. The company, which had already received promises of support from two eminent architects, would be registered for the purpose of carrying on all business incidental to building and contracting, and the purchase in fee or taking on lease of the requisite land for prosecuting the same. Mr. W. Morrison, M.P., had undertaken to subscribe for 1,000*l.*, and afterwards for 200*l.* for every 100*l.* subscribed by working men.

Lowestoft.—On Saturday evening a large

meeting of bricklayers was held at the Clapham Hotel, "to consider their present position with that of other towns." Resolutions were passed, "that an advance of a halfpenny per hour be asked for upon the present rate of wages, making 5*d.* per hour the lowest." The present wages are 4*d.* and 5*d.* Also "that a circular be sent to the masters immediately, requesting that the advance commence on the 1st of July."

Bristol.—The following is the decision of Mr. Lewis Fry relative to the dispute between the operative carpenters and joiners of this city and their employers:—

"Having given deliberate consideration to the facts and arguments laid before me by the employers and by the operative carpenters and joiners, I have arrived at the conclusion that it will be fair under the circumstances to fix the rate of wages at 6*d.* per hour, the hours of work to be fifty-four per week in summer (instead of fifty-six as at present) and fifty and a half in winter (as at present). I therefore make my award on these points accordingly. With regard to payment for overtime, I am of opinion that the evidence adduced would not justify me in altering the existing rate, viz., 25 per cent. for the first two hours and overtime (per day) for the remainder of the employment, and 50 per cent. after such two hours; the present rule will therefore stand good. Lewis Fry.

Bristol, June 24th."

Ponza.—A large number of the operative masons struck for an advance of 2*s.* per week, viz., from 20*s.* to 22*s.* They alleged that this increase of wages was promised in the spring of the year, to take effect at Midsummer, but that the promise was not fulfilled. Several important pieces of work were not in question, and the differences were arranged.

Glasgow.—At a meeting in the Trades' Hall, the following resolutions were passed:—

"That this meeting of the building trades of Glasgow cordially approves of the desire of the operative masons to introduce the system of the payment of wages weekly; deeply regrets that the deliberate refusal of the Master Masons' Association to entertain the proposal has forced the present course, viz., that of a strike,—upon them, and resolves to afford the operatives their best moral influence, and, if need be, financial aid, in maintaining their present struggle; and declares its thorough disapproval of the policy pursued by the Master Masons' Association in endeavouring to cause the employers in Edinburgh to lock out the operatives there, and its conviction that such action is contrary to the spirit of the Criminal Law Amendment Act, or otherwise a strong argument in favour of its repeal as a measure which interferes with the action of combined workmen only."

MR. G. G. SCOTT.

OUR readers will hear with great pleasure that her Majesty has been pleased to intimate her intention of conferring the honour of knighthood on Mr. G. Gilbert Scott, the eminent architect, on the occasion of the completion of the Prince Consort National Memorial in Hyde Park.

SEWAGE IRRIGATION AND THE GOVERNMENT BOARD.

Sir,—The article relative to proposed sewage irrigation at West Ham, by Mr. L. Angell, which appeared in the *Builder*, is most misleading. It is neither the whole truth nor half the truth. There is no alteration of opinion at the Local Government Board as to the advantages of sewage irrigation. There is no opposition to sewage irrigation. In West Ham proper Mr. Angell's letter needs no refutation. The Local Government Board must be assumed to accept honest reports from its inspectors; as, also, to decide from full knowledge of each question. The Local Governments' Board most certainly heard both sides at West Ham before giving any decision on their inspectors' reports.

SANTARIAN.

PREMIUMS OF THE INSTITUTION OF CIVIL ENGINEERS.

THE Council of the Institution of Civil Engineers have just awarded the following premiums for papers read at the meetings during the session 1871-2:—

1. A Telford Medal, and a Telford Premium, in Books, to Bradford Lewis, for his "Account of the Bridge over the Gaura River on the Goolundo Extension of the Eastern Bengal Railway."
2. A Telford Medal, and a Telford Premium, in Books, to Carl Siemens, for his Paper on "Pneumatic Dispatch Tubes."
3. A Telford Medal, and a Telford Premium, in Books, to William Bell, for his Paper "On the Stresses of Rigid Arches, &c."
4. A Telford Medal, and a Telford Premium, in Books, to John Herbert Latham, for his "Description of the Sookbaisa Canal."
5. A Telford Medal, and a Telford Premium, in Books, to George Gordon, for his Paper on "The Value of Water, and its Storage and Distribution in Southern India."

6. A Telford Premium, in Books, to Frederick Augustus Abel, F.R.S., for his Paper on "Explosive Agents applied to Industrial Purposes."

7. A Telford Premium, in Books, to Hensley Britton, for his Paper on "The Construction of Heavy Arches, with reference to Economy of the Mechanical Forces engaged."

8. The Manby Premium, in Books, to Charles Andrews, for his Paper on "The Best Mode of Making Mortar."

The Council have likewise awarded the following prizes to students of the Institution—

1. A Miller Prize to Oswald Brown, for his paper on "Sewage Utilization."

2. A Miller Prize to Arthur Tournon Atchison, B.A., for his paper on "Railway Bridges of Great Span."

3. A Miller Prize to John Atkin, for his paper on "The most suitable Materials for, and the Best Mode of Formation of, the Surfaces of the Streets of Large Towns."

4. A Miller Prize to Alfred Edward Preston, for his paper on "Wood-Working Machinery."

5. A Miller Prize to William Patterson Orchard, D.E., for his paper on "The Education of a Civil Engineer."

TILE PANELS, PICCADILLY.

Sir,—In your article on our buildings in Piccadilly (page 489), you wonder whether the pictured panels are actually designed by the architects.

I beg to state that these cartoons were drawn by Mr. Henry Gray, for Mr. G. G. Scott, a glass (opus secti) artist, and we have pleasure in expressing our satisfaction both with the drawing and the execution of the work.

GEORGE & VAUGHAN.

TENDERS IN MANCHESTER.

Most of your readers feel interested in the question of quantity-taking, and it is for this reason that your correspondent, "R. W. A.," would give some outline of the Lancashire system, of which he speaks so lightly.

R. W.

BRICK ARCHES.

Sir,—Permit me to ask through your paper a question which has long occupied my mind respecting the construction of brick vaulted arches. We have a reservoir in course of construction which we propose to cover with 9 in. brick segment arches of 8 ft. span. We wish to know which of the two following methods possesses the greatest amount of strength, viz. two separate rings of bricks, or the arch turned and bonded with headers and stretchers. We are inclined to think the best method is, as it were, to use the first method on one key. We wish to know if the above has ever been tested.

AVALON.

THE INSTITUTE CONVERSATION.

Sir,—In reference to the question which your correspondent "A," asked last week, allow me to say that every year members of the Institute are invited to contribute works of art for exhibition at our Conversations, and this year the council added a special note to their annual report with the same object in view. In addition to this, letters conveying a similar request were sent to a great number of artists who have kindly contributed on previous occasions. The result may not have been all that could be wished as far as pictorial art is concerned; but at this season of the year the works of painters are being exhibited elsewhere, and it is not easy to find private collectors who are good-natured enough to dismantle their own walls for the sake of decorating those of our meeting-rooms.

With respect to the rest of your correspondent's remarks, I am not aware that any "bad modern French works" were exhibited. We had many creditable examples of decorative manufacture, and the reproduction of medals and old Roman ware were, I believe, generally considered very interesting specimens of ceramic art. If in a few instances the price of any article was left upon it, it was through inadvertence. As a rule, particular care is taken to have such labels removed.

Whether contemporary architectural designs—of the grade usually applied on such occasions—would have been more interesting to the ladies and gentlemen assembled here on the 26th ult. is, I venture to think, doubtful. I can only assure your correspondent that no pains were spared to render the soirée an agreeable one, and though he seems to have found our walls "dreadfully dull," I hope that most of our visitors were of a different opinion.

CHARLES L. ESTLAKE, Sec. R.I.B.A.

A HINT TO MASTER BUILDERS.

A CORRESPONDENT, writing to the *Standard*, says:—

"It is not a great mistake to assume, as is too often the case, that a struggle is a struggle in any sense between Labour and Capital? Say I have capital and wish to build a mansion. I place the matter in the hands of a first-rate architect. He pleases me with his design and I agree to proceed. Having an idea that it is I who represent Capital, I wish to deal directly with my friend Labour. My professional adviser, the architect, however, tells me it will be a very costly method of proceeding, as I shall have to provide plans; that he cannot get Labour to give a contract, and that, without that, he does not like to bind himself to cost. Having great faith in his friend I follow it, and give up the notion of playing cardinals. The drawings prepared for me by my friend are thrown open to competition. Twelve gentlemen, desirous of representing me, send in prices at which they are willing to spend my money for me, and Mr. Chips carries the day. Mr. Chips calls on me in his brougham. I am proud, for I feel that I am well represented. My professional friend prepares an agreement, binding Mr. Chips to keep good faith both in the matter of cost and completion by a given date. There is a clause, however, exempting Mr. Chips from any responsibility in the event of that most unusual occurrence, a strike. I protest, but in vain. I am informed that all builders of position insist on that clause. My house is at all costs 20,000*l.*, and I hug myself with the belief that at all events I shall be turning over some portion of that

money while it is being erected! but I find that Mr. Chips is 'down upon' me with a certificate very speedily. In other words, he begins, as I have already said, to spend my money, not his own, almost from the commencement, while I remunerate him to the extent of 15 to 20 per cent. for the trouble. I may have a shrewd idea that even the first instalment goes to meet a 'little bill,' but the brougham undoes me. Of course there is a strike, and my building is brought to a stand-still. I cannot do anything—I cannot help myself. I am told that a struggle is going on between Labour and Capital. The proper place for Mr. Chips is the workshop from whence he came, not helping his fellow tradesmen at the bench, but aiding them with that strong head and clear brain of his. He is shrewd, intelligent, and pushing, and if only those shrewd, intelligent, and pushing men were to honestly represent their own trade for its amelioration instead of being, as is so often the case, mere impediments, fattening on Capital and on Labour too, and obstructing both, it would be well for the workmen and well for the capitalists of England, though fatal, perhaps, to that exquisite little brougham. What is my friend the architect about that he does not take his proper position as a professional adviser acting between those two old friends, Labour and Capital? He belongs to a powerful and learned body of professional men. In the old days, I take it, Mr. Chips was a stranger in the land, and it is not possible in these days of restoration for architects to assert their own position once again? With Labour and with Labour, the possessors of plant, are subject to a committee of shrewd, intelligent men, these subject again to a body of professional men, representatives of Capital, strikes would become impossible."

SCHOOL-BUILDING NEWS.

Gloucester.—The infants' and girls' department of St. Nicholas's schools has been opened. The buildings, designed by Mr. J. E. Jones, architect, and built by Mr. Fream, jun., are in two stories. The ground-floor contains the girls' school, 40 ft. by 20 ft., with class-room adjoining. The infants' school is at right angles to the girls' school, and measures 35 ft. by 20 ft. 6 in., and both schools are 14 ft. high. The upper floor contains the boys' school, 62 ft. by 20 ft., with class-room, 20 ft. by 14 ft. 6 in. The height of this story is 13 ft. to the wall-plates. The roof is ceiled to the underside of the rafters. Fresh air is admitted into the buildings by openings under the floors, and by the windows; and the warm air escapes through ventilators in the roofs and walls; and the boys and girls have separate entrances in Quay-street; the infants' entrance is in Upper Quay-lane. The hall hung over the galle in the Quay-street elevation. The inside of the walls are painted and lime-washed, and each room has wall-lining of wood, 4 ft. 6 in. high. The floor of the boys' school has been plugged to prevent the noise disturbing the occupants of the lower rooms. The buildings were recently visited by Mr. J. Bowstead, the Government Inspector, and on his estimate they have space sufficient for 380 children—200 girls and infants, and 180 boys. The elevations are plain, with no attempt at ornament, the walls being built of red brick, relieved with strings of black and white bricks; and the roofs are covered with Broseley tiles. The usual offices have been provided. The bare cost of the buildings is 860*l.* The total cost of site, buildings, and fittings, is 1,850*l.*

Halifax.—St. Joseph's Roman Catholic Schools for the north and east portion of the borough, are shortly to be commenced, the plans having been passed by the Southwam board. The site of the schools is on a portion of Bloody field near to Godley-bridge. The new building will be Gothic in style, built in the form of a quadrangle. Accommodation will be provided for several hundreds of children. Mr. Simpson, of Bradford, is the architect.

Brighouse.—The plans of the proposed new school in connexion with the Clifton Church, are now drawn by Mr. J. S. Barbor, of Halifax, architect. The schools will be used both as day and Sunday school, the present schools being too small. The new building will accommodate between 200 and 300 children, and will be built on a piece of ground adjoining the church, at the east end, given by Sir George Armatage, bart., who has also given the stone, and a donation of 50*l.* towards the erection. Several tenant farmers have likewise offered to lead the stone from the quarry, free of cost. The schools are to be erected for the purpose of doing away with the necessity of a School Board in the district, and with this object in view the Low Moor Company have given 300*l.*, there being now about 600*l.* towards the whole cost.

Sunmerstown.—The parish schools have been re-opened by the Bishop of Oxford. In order to meet the requirements of the New Education Act, they have been considerably enlarged. The cost of the work was about 300*l.*, the greater portion of which amount has already been raised by voluntary contribution. The alterations were

carried out from designs by Mr. Wilkinson, of Oxford, architect. Mr. Green, of Cassington, was the contractor.

Oxford.—The chief stone of St. Paul's parochial boys' school, which is being built to meet the requirements of the Education Act, has been laid by the Provost of Worcester College. The site selected for the building is in "Allum's Field," Upper Walton-street, and the school is intended to accommodate 200 children. The schoolroom will be 75 ft. long and 2½ ft. wide, and there will be two classrooms, 16 ft. square, besides two laboratories and an entrance porch. The cost of the work will be about 950*l.* Mr. Buckenidge is the architect, and Mr. Selby the builder.

Adelaide Bridge.—The new schoolroom just built at Adelaide Bridge has been opened. It was built to accommodate fifty persons. The architect was Mr. W. T. Pierce, of Southampton; and the builders were Messrs. Holl, of Cambridge. The total cost is about 300*l.*, towards which Government contributes 60*l.*; the remainder is raised by subscriptions of church people. The ground was given by Miss Brady.

Wolverhampton.—St. James's schools, Wolverhampton, have been enlarged. The alterations have doubled the original size of the schools, and in addition there are three class-rooms, whilst there were none in the old schools. Accommodation is now provided for about 550 children. The alterations have been carried out, according to the designs of Messrs. Weller & Proud, architects, by Mr. David Evans, builder. The alterations, together with additions which have recently been made at the Causeway Lake schools, will cost altogether about 1,600*l.*, and the greater portion of the money has already been subscribed.

Cheetham.—The foundation stone of a new school, in connexion with Rydal Mount Wesleyan Chapel, and situate close to Waterloo-road, Cheetham, has been laid. The site immediately adjoins the chapel, covers an area of about 70 ft. by 40 ft., and will accommodate 400 children. A plain brick building, in harmony with the chapel, the structure will be two stories high, the lower room the principal schoolroom, and the upper one will be used by infants. In addition to these rooms, on each floor provision will be made for class-rooms. It is estimated that the total cost of the building, including the purchase of the land, will be 3,500*l.*, and towards providing this sum 2,500*l.* have already been promised by members of the congregation and friends.

Chester.—The Blue Girls' new school, Vicar's-lane, has been opened. The Marquis of Westminster provided the site, which is ample for the purposes of a school and play-ground. The plans of Messrs. Kelly & Edwards, architects, of this city, were chosen, and the contract of Messrs. B. & O. Owens, builders, accepted. The building is of brick, with stone dressings, being a half-timbered one, presenting two gables, and a gablet in the centre, which overlook the park. The building will afford accommodation for twenty-six scholars, although there are only sixteen at present on the foundation. It contains on the ground-floor a vestibule, lobby, school-room, matron's sitting-room, board-room, kitchen and scullery, laundry, &c.; and on the first floor two large dormitories, bath-room, lavatory, bedrooms, and sick-room.

Thetford.—The new school-house recently erected by Sir R. J. Buxton, bart., M.P., in the village of Rushford, is nearly completed. The building has been erected under the superintendence of Mr. Myhill, of Shadwell, and is of ample dimensions to accommodate all the children in the villages of Rushford and Brettenham.

Barking.—The foundation-stone of new school-rooms for this parish has been laid. The building when completed will consist of a boys' and girls' school and a teacher's residence, the builder being Mr. Thomas Emuor, of Commercial-road; the architects are Mr. Wm. Slater and Mr. B. Carpenter; and the clerk of the works is Mr. J. E. Walker.

Bromley.—A new national school has just been erected at Mason's Hill. The building is in the Gothic style, and is erected on a large piece of ground presented by the Rev. Le Griz White, of Leeming, near Penrith. The architect was Mr. W. C. Banks, of London, and the builder, Mr. W. A. Grubb, of Bromley. The cost of the building is 1,150*l.* The number of boys and girls which the school will accommodate is 200. There is a covered playground, as well as an open one.

Barwell.—National schools have been opened here. They are to accommodate 220 children.

The building is in the Gothic style, and built of red bricks, and the front partly of stone. It contains three large rooms, a class-room, and two porches. The entrance to the boys' room is through a porch and cloak-room, 8 ft. 6 in. square. The boys' room is 40 ft. by 18 ft., and height of ceiling, 18 ft. It is lighted by one large tracery window, and three other windows. The girls' room is separated from the boys' by large folding-doors, and is 36 ft. long and 18 ft. wide. In the infants' room, which is 40 ft. by 18 ft., two galleries have been built. All the rooms have been laid with gas, and are heated with Penfold's patent warming and ventilating apparatus. The architect was Mr. Osborne, of Birmingham, and Mr. Simpson, of Leicester, was the contractor. The schools are supplied with desks, the invention of Mr. Simpson, useful, it is said, also for tables, seats with rest for back, or may be converted by a simple method into seats with hook-rest, for divine service. At the back of the school is a playground, walled round.

Stafford.—The memorial-stone for Wesleyan schools in Earl-street have been laid. The ground floor will be divided into class-rooms, large infant class-room, library, &c., and the general school-room above will accommodate a large number of children. The estimated outlay is 1,200l., towards which about 800l. have been subscribed, including the proceeds of the stone-laying, leaving a deficiency of 400l., nearly half of which is mainly attributable to the increased cost of labour and material. It will be a plain building, the outer walls faced with pressed bricks. The entrances are in Queen-street, and the ground floor, which is about 56 ft. by 40 ft. in the clear, is laid out for library, four lofty class-rooms, and a large infant class-room, which will also be suitable for Band of Hope and other meetings. The upper room will cover the extent of the whole building, and will be lofty and well ventilated, with ceiled roof, 24 ft. 6 in. in height from the centre. The whole will be heated with Redfern & Co.'s hot-air apparatus; and there will also be a yard and the requisite out-offices. Mr. Thos. Roberts, of Trentham, has given his services gratuitously as architect, and Mr. A. F. Whitton, of Stafford, is the builder.

Bayton.—The memorial-stone of the Bayton and Marnham school has been laid by Mrs. Charles Wicksted, of Ludlow.

London.—The corner-stone of the new schools, Kingsgate-street, has been laid by Lady Marian Alford.

Cheddar.—A new British school has been provided for Cheddar, on a piece of land a little to the west of the village. Mr. J. Bevan, architect, Bristol, prepared the plans. The building is Gothic in character, and built of conglomerate stone quarried at Dreycott (a few miles distant), with dressings of Bath stone. It has a bell-turret in front. The structure forms a conspicuous object from the Cheddar Valley line. The school buildings consist of two rooms, the principal one of which is large and lofty. On the right-hand side, and forming part of the building, is a residence intended for the master and mistress. There is school accommodation for about 120 children. The total cost of the building will be nearly 1,300l.

Sheriff Hutton.—The foundation-stone of the new Church schools at Sheriff Hutton has been laid. The schools will be built chiefly of stone, to contain 130 children. The principal school-room, 35 ft. 8 in. by 18 ft., will accommodate 80 children; and the smaller room, for girls (sewing) and infants, will hold 50, and measures 25 ft. by 16 ft. This will meet the Government requirement of 8 square feet to each child. The design is by Messrs. Perkin & Son, Leeds, and the contractor is Mr. John Tomlinson, also of Leeds. A master's house will afterwards be added.

STAINED GLASS.

St. Mark's, Lewisham.—The east window of this church has been filled with stained glass, representing the Crucifixion of our Lord and the scenes attending His Passion. A window (proposed to be one of a series) has also been placed in the south aisle, representing the Raising of the Widow's Son, subscribed by the members of the choir, in commemoration of the Prince of Wales's restoration to health. The whole has been executed by the firm of Messrs. Lavers, Barrard, & Westlake, with the general supervision of Mr. W. C. Banks, the architect of the building.

Glasgow.—In the premises of Messrs. Ballantine & Son, of Edinburgh, is a stained-glass window for a new Free Church just erected at

Sighthill, Glasgow. It is a memorial of the late Mr. William Collins, the founder, in 1834, of the Glasgow Church Building Society. The illustration of the centurion's faith in the power of Christ, occupies the three upright lights in the window. The dexter light contains Christ to see Hinu restore the sick servant to health; the centre lights represent Jesus met by two of the centurion's servants, and in the sinister light is seen the centurion tending his sick servant. The whole story is illustrated.

Bonsall Church.—Mr. William Henstock, of Manchester, and Mr. Francis Henstock, of Slaley Hall (near relatives of the late Miss Woodviss), having commissioned Mr. George Shaw, of Saddleworth, to design and prepare three stained-glass windows for the chancel of this church, that gentleman has now completed his task, and put the various subjects chosen for illustration in suitable order. On the south side of the chancel, as it is approached from the nave, there is the first window of three lights representing, by various groups, such as the Adoration of the Shepherds, and the Visit of the Magi, the Incarnation of the Redeemer. On the same side of the chancel, nearer to the eastern window, there is the second window of three lights, representing again by groups of figures the Transfiguration. In the east window is placed a representation of the Last Supper. Close upon 500l. have been laid out upon these windows.

Sutton Madlock Church, near Shiphal.—A stained glass memorial window has been fixed in this church. The window consists of two openings, one subject occupying each, the one on the left-hand opening being "The Baptism," and the other on the right "Suffer Little Children." Below the subjects are two angels surrounded with light grisailed work, and in the upper part of the window are light canopies with ruby backgrounds; also in a small tracery piece between the two openings is the Agnus Dei. A narrow border runs all round the window except the bottom, which has the inscription. The tone of colouring throughout the window is like that of old stained glass. The window was designed and painted by Messrs. Donn & Davies.

Berkhamstead Church.—A stained-glass window has just been placed in the chancel of this church, to the memory of the poet Cowper, who was born in Berkhamstead, and whose father and mother are buried in the chancel. The subject of the window is the Resurrection; beneath the central figure being the poet, with hands clasped on an open Bible. On one side is the Royal Psalmist, and on the other the Prophet Jeremiah. Cowper's name hares are also included in the representation. The inscription is as follows:—"William Cowper, the poet, son of John Cowper, D.D., rector of this parish, and Ann, his wife. Born at Berkhamstead, November 15, 1731; died April 25, 1800."

SCHOOL PLANNING.*

THE subject of school-planning is one which may appear to architects as so simple and even trivial as apparently to need little discussion, but in reality the problem of how to produce the best planned school (depending, as it does, upon the previous problem of how to teach in the most efficient manner) is one well worthy of their careful attention.

Various forms of schools have been adopted in different countries with various degrees of success, but it would still seem that none of these forms a perfect model for our country to adopt, although each may furnish a contribution on some point or other.

The Irish school consisted generally of large rooms, planned to give either a double arrangement of benches and desks along each side of the schoolroom, with classes intended to stand at certain points, or were arranged with desks down the middle of the room and standing-space for classes on both sides. The line of desks being generally broken at intervals of two, this plan had the advantage of enabling the teacher to pass easily to one side of any pupil at any moment by the intervening gangway; and the classrooms were few in number.

On the other hand, the "Prussian System," as it is called, has been much praised from the circumstance of its classes being all taught in separate rooms. It has not, as a rule, any general schoolroom, but the school consists

* By Mr. E. R. Robson, architect to the Central School Board. Read at a meeting of the Architectural Association on the 23rd ult.

entirely of classrooms, although in some instances a hall is provided for lectures and examinations.* The advocates of the Prussian system allege that it produces the greatest results when tested by public examinations, while others say that without a general school-room such a plan merely offers facilities for the greatest amount of "craming." I had expected to be able to lay before you a full description of a Prussian school, by a gentleman in Vienna, but, owing to the shortness of time, it has not reached me.

The Americans have followed the plan of the Irish schools to a considerable extent, and in their schools, as shown in the published reports and plans thereon, many of the main features of an Irish school are frequently to be found, although there are of course differences arising from the different opinions on education prevailing in America.† On one point American opinion differs widely from that prevalent on this side the Atlantic in the circumstance that the whole of the education is carried on by mixed schools, the sexes being taught together to the end of the course. A specimen of this system of mixed schools, throughout may be found in the Wesleyan Schools, near Tredegar-square, Boylston.

In England, hitherto, owing to the want of a general system of public education, funds have always been exceedingly scanty, the only moneys derivable from the State being "grants in aid." The result has been to necessitate the greatest economy in school buildings. As the funds have been generally raised with great difficulty, proper arrangements have been curtailed, and due regard to efficiency (especially in the article of class-rooms) frequently neglected. As before remarked, the advocates of the Prussian system show that it produces the greatest results when tested by public examinations; but the advocates of the English system, on the other hand, maintain that the latter promotes general intelligence in a much higher degree, in consequence of that attrition of mind arising from the assembling of a great number, and are commonly called "the sympathy of numbers." The English system seems to demand a general schoolroom as an indispensable necessity; and if this be provided, in addition to the number of separate classrooms required for the whole of the children; then there is a serious increase in the expense of the building, and, in fact, a superfluous and extravagant amount of accommodation. And it may fairly be laid down as a proposition, that in schools of the very largest size, where the cost of the additional school or hall can be distributed over a large area of children should such a system be adopted, and even then only for special reasons sufficient to outweigh motives of economy.

The accompanying plan sets forth a suggestion by the Rev. Canon Cromwell.

At the risk of being considered unnecessarily elementary, I must now proceed to indicate a few of the points which may be considered to govern, in most cases, the plan of a good school suitable for children in large English towns. I hesitate the less to do this, from perceiving many indications on the part of architects that the thoughtful planning of a school is a subject beneath their notice. As two instances, I may mention that I observed the other day published, in one of the professional journals, the plans of a new school, in which nearly all the internal uses,—the daily life, so to speak,—of the building, appeared to be overlooked or despised; and, again, I read with some astonishment a conspicuous article in another professional journal, criticizing plans, as though the only object in designing schools was to make them look pretty outside.

"Design prettily; usefully if thou canst, but prettily."

Still, I must crave the indulgence of the many architects who cannot be ranked in the same category, in stating many points so well known to them.

Infant Schools.—Under the Elementary Education Act, infants cannot be compelled to attend

* See accompanying plan of a German school. † Annexed will be found a plan of an American school. This plan may be found at page 72 of the fifth edition of "School Architecture; or, Contributions to the Improvement of School Houses in the United States," by Henry Barnard, Superintendent of the Common Schools in Connecticut, Hartford, 1854; 8vo. It was introduced there from another work, "The School and Schoolmaster," by George B. Emerson, first published in 1812. It is called there, "School for One Hundred and Twenty Pupils." The stairs lead up to recitation-rooms over the entry and wood-closet.

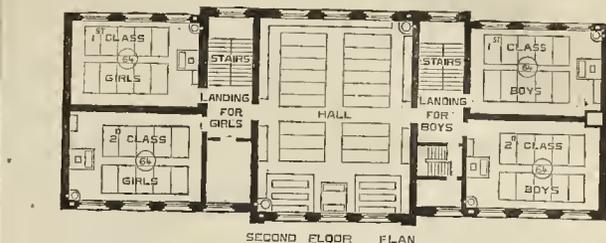

school before the age of five years, but, in point of fact, large numbers do attend before that age, and it is expected that they pass into the graded schools at the ages of six and a half to seven years. Architects cannot too clearly bear in mind the fact that in the infant school there are no standards or grades, but that these only commence after passing the infant stage. An infant school appears to divide itself naturally into three parts—1st. The youngest class of children who may be termed "babies," and who should have a room devoted to themselves, where they can be simply amused; 2nd. The main body of infants who are progressing through the usual stages of infant teaching, of which a large amount can be taught on a well-planned gallery, and to whom marching is a very important element, requiring clear floor space; and 3rd, an advanced class which is almost ready to be drafted into the graded schools, and who should be provided with benches and desks, and may be taught in a separate room. Sliding partitions are not, as a rule, desirable in infant schools, and the width and proportion are seldom those which are found to be most useful for a graded school. It is most important that the lighting to the large gallery should be from the side, and the class-rooms should enter from the side, and the panes of clear glass to enable the mistress to see what is going on. Circles in the floor for teaching classes, and lines for marching by, are also highly desirable. If the rooms are warmed by open fires, they should have guards to prevent accidents. Of all kinds of playground that for the infants must be considered the most important. The young children, depending so much upon sun and air, their playgrounds should be made to face the south, and have a portion roofed for protection from weather. Although it is not considered desirable to have the infant schools above the level of the ground-floor, still, recollecting that the proportion of the infant school is so different from that of a graded school, and looking to the value of land in the metropolis and other large towns, it seems desirable that in many cases where a large school is to be built, one infant school must be placed above another. Under such circumstances the staircases should be carefully planned so as to be easy and safe for such small children, and "winders" should be carefully omitted.

The general planning of a group of schools will be very much controlled by the site and its aspects in relation to school and playground; and, having secured the infant department in the best position for sun, the graded schools may be raised upon a low story of 8 ft. or 9 ft., so as to obtain their covered playgrounds, for some portion of the school, underneath.

Graded Schools.—In going into the question of graded schools, it is necessary to keep before us what is meant by the term "graded." According to the Education Act, the lessons are to be given in six separate "grades" or "standards," and although, when two standards are small in number, they may be taught in one class together, yet, as a general principle, there should be a separate class of from thirty to forty for each of the six standards. In the larger schools this arrangement will be doubled, so that each separate standard will have two class-rooms. And the school may then be planned in two portions as "junior" and "senior." Architects will do well to bear in mind that this question of grading the school in six standards,—in other words, of planning a class-room for every class,—is a vital point in all school-planning. Mixed schools are not at present in much favour in this country, because their adoption appears to narrow the field for the employment of school-mistresses to infant schools only.

Much has been said of the right kind of aspect for the main frontage of a school; and some have even gone so far as to say that none but a northern aspect was desirable; but it must be remembered that sun is to a child very much what it is to a flower; and that having due regard, by systems of blinds, to the inconvenience from heat in summer weather, it is difficult to make a school in this sunless climate of ours too sunny.

In planning a school-room and its class-rooms everything is, of course, subservient to convenience of teaching. Thus in the principal room the desks should be ranged along one wall and the principal amount of lighting should be from the back (as it cannot, as a rule, be supplied from the side). The lighting should be rather highly placed; but on the opposite side of the room it is necessary to have some other

Plan of One Storey of a German School. On other Storeys Class-rooms are formed in the space occupied on this Floor by the Hall. It will be noticed that the Class-rooms have light in each case at the Left of the Desks.

windows, so as to secure through ventilation in the hot summer weather. Each pair of class-rooms should be so arranged that two groups of from twenty-five to thirty-five, or even forty, each, may be taught together by the same teacher; and the same rule is applicable to the classes in the school-rooms, which, if arranged in couples, of twenty-five, thirty, thirty-five, or forty, will enable one master to teach the two; and in every case the wall opposite a group of benches or desks is of value for the display of diagrams, maps, and other objects used in teaching.

A girls' school should generally be grouped in relation to the infant school, and its entrances not far removed from those of the latter; while the entrance to the boys' school should be kept as far off as possible, and, in the case of a site having two frontages, be placed in the other street. It is necessary in the graded schools to have a lavatory, and also cap and bonnet rooms, compactly and economically planned, close to the school-room itself, with two doors, so that the children may be filed in and out by the teacher in an orderly manner.

The fittings of school-rooms have been much discussed, and much difference of opinion expressed as to the best methods; but in infant schools it is admitted that gallery teaching is mainly the best. When, however, we approach the graded schools there is much divergence, some insisting that benches and desks are the best, and others that there should be a gallery for occasional collective teaching. Both systems appear to be good; but the opponents of the gallery system allege that in a graded school the introduction of a gallery wastes space; and it would appear that a gallery is only likely to be well utilised for the two lowest standards. Another point appears to require consideration, namely, that in the senior standards the older children will require rather more space than in the lower standards, and that perhaps the best way of meeting the difficulty is to consider the class-rooms for these two senior standards as available only for a slightly-reduced number. This is supported by the circumstances that when Board schools have been in operation some time a per-centage of those who have commenced in the first standard will be lost by death before reaching the last. A pair of classes in the upper standards would hardly appear to require division, as in the lower standards, because of their better discipline.

Each class requires a separate cupboard, for its books and papers,—and, indeed, a separate room attached to each school, to be called an "apparatus-room," seems highly desirable; while in the case of large schools about to be erected in London, a general room, available as a committee-room for managers, and also for the use of the masters or mistresses, can hardly be dispensed with.

Much has been said and written upon the vexed question of ventilation, some advocating one system and some another. My own experience is that, for a large building, there is nothing like an artificial system constructed to supply warm fresh air, and extract foul. No doubt the open fire is the best of all; but in the face of the price of coals rising each successive winter, according to its hideous habit of late, it would appear that, as a matter of permanent economy, something else must be resorted to. It is not necessary merely to warm and rewarm the air which exists in any given room, and to

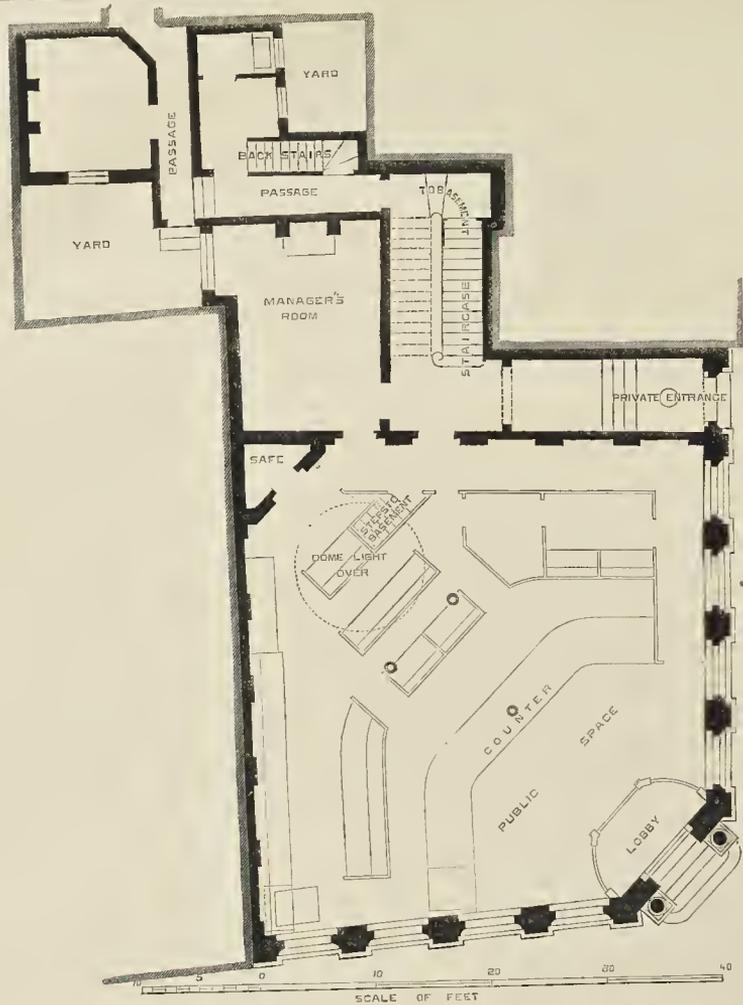

allow the children to breathe it again and again; but to take care that there is ample cubical supply per minute for each child, and that this is taken off in a regular and even manner, the great object of ventilation being to avoid stagnation of air. In the case of warming a church it may suffice to have the pipes above the floor, and to warm the cold air contained in the building for the purposes of a congregation present for an hour and a half at a time, and the same may be said of the practice of sending up volumes of air heated by means of hot iron plates, commonly known as "cookers," a system always liable more or less to vitiate and deteriorate the air, and not to be tolerated in connexion with an atmosphere which young children have to breathe throughout the day, and day after day. A chamber fitted with iron pipes, heated by hot water on the low pressure system, through which fresh air is passed and admitted to the various rooms at suitable points, while means of egress can easily be provided in connexion with some artificial extracting power, of which the furnace of the apparatus already mentioned can be easily made to supply the source, appears to me to be the safest and best. One reason why artificial warming and ventilation has not been hitherto more generally adopted is, that schools have hitherto been of a much smaller kind than they are now likely to be, and the cost of a caretaker continually on the premises, able to take charge of the apparatus as well as the repairs of the gas-piping, window-panes, warming apparatus, and various other matters about the building, was not to be thought of. And there is no doubt that the schoolmaster cannot himself properly manage the apparatus.

The cost of a school is a more serious point than architects seem at present disposed to consider; but it may be laid down that, irrespective of the price of land and of the cost of boundary-walls and playgrounds, the building *per se* should be admirably completed at 6*l.* to 7*l.* per head as a maximum.

On the subject of the external architecture of schools, I would venture to add that, as this Association has always laid down most strongly the principle that the design of a building should clearly express its purpose, its members will probably agree with me when I say that a school should appear like a school, and not like a monastery, a town-hall, or a set of almshouses. Large towers, prodigious roofs, exaggerated gables, wrought-iron ridge excrescences doomed to speedy decay, and wrought-iron "gable ornaments" are all better avoided. The really skilful architect will know how to make his school look like a school, without the use of unnecessary or absurd features, and will plan his building carefully, properly, and economically, giving due and thoughtful expression to the whole, so that his work may contribute, however humbly, to the world's wealth of architectural art, and even tend to produce, I will not say a new, but a better style of school architecture, arising out of the present great demand for school buildings.

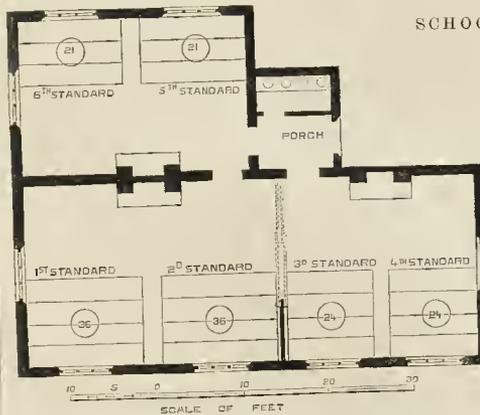

The student will find useful and interesting information in the following works:—

2. Reports of the Commissioners of National Education in Ireland.
3. Description of the Schools of Berlin. By Adolf Gerstenberg, Government Architect.
4. Practical Illustrations of the Principles of School Architecture. By Henry Barnard, Superintendent of Common Schools in Connecticut.

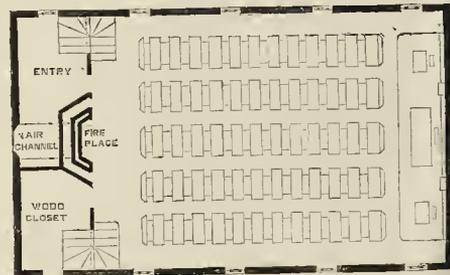

OFFICES OF THE HULL BANKING COMPANY, IN HULL.—Plan of Ground Floor.

SCHOOL PLANS.

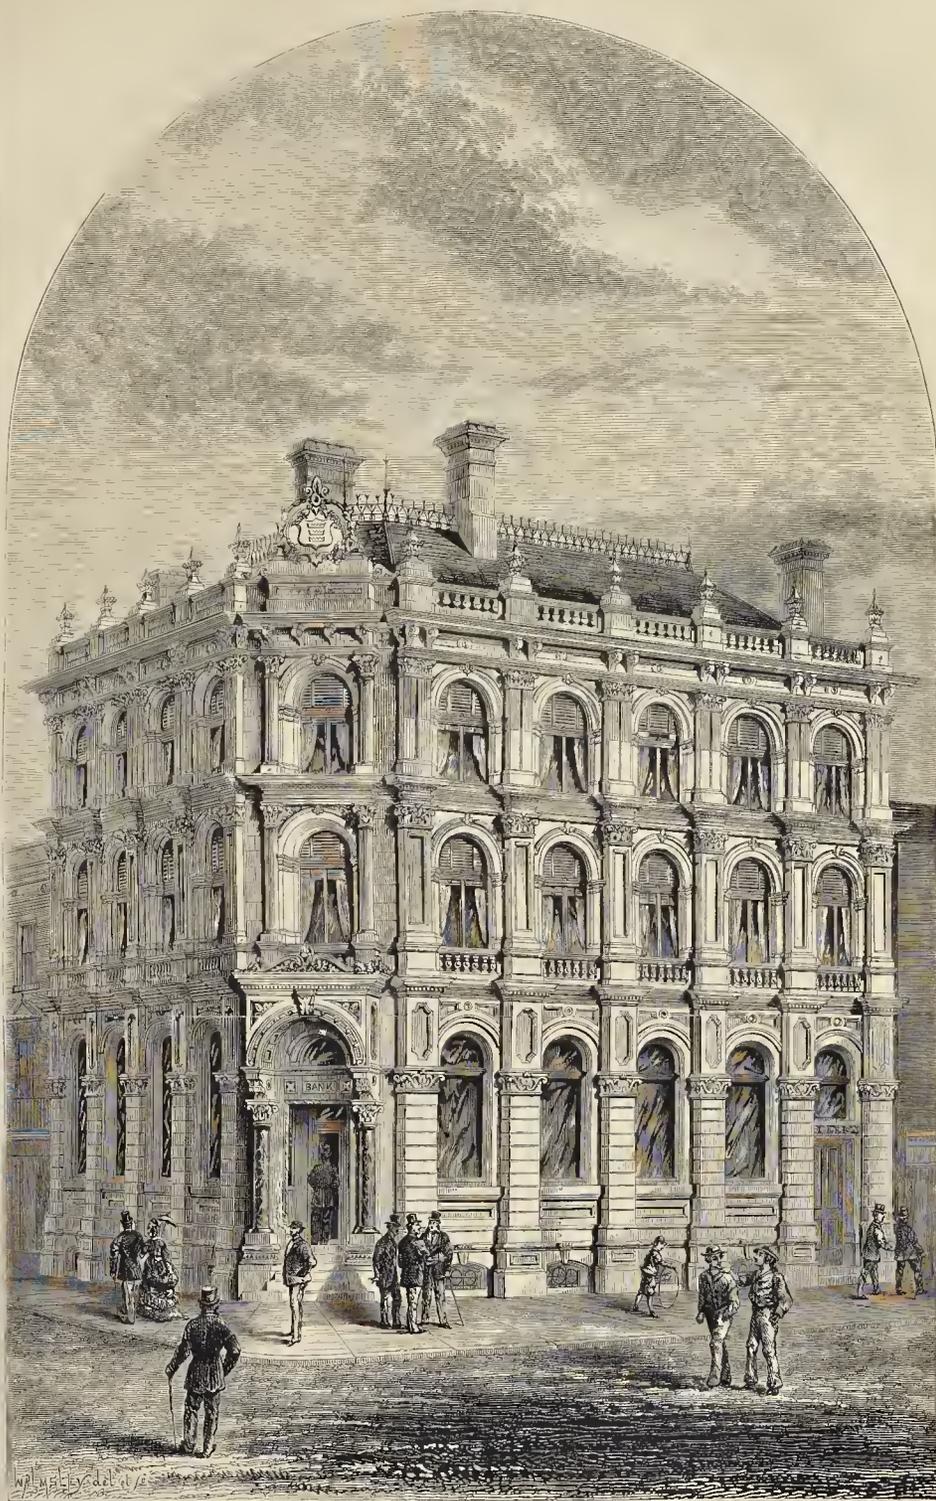

SCALE OF FEET

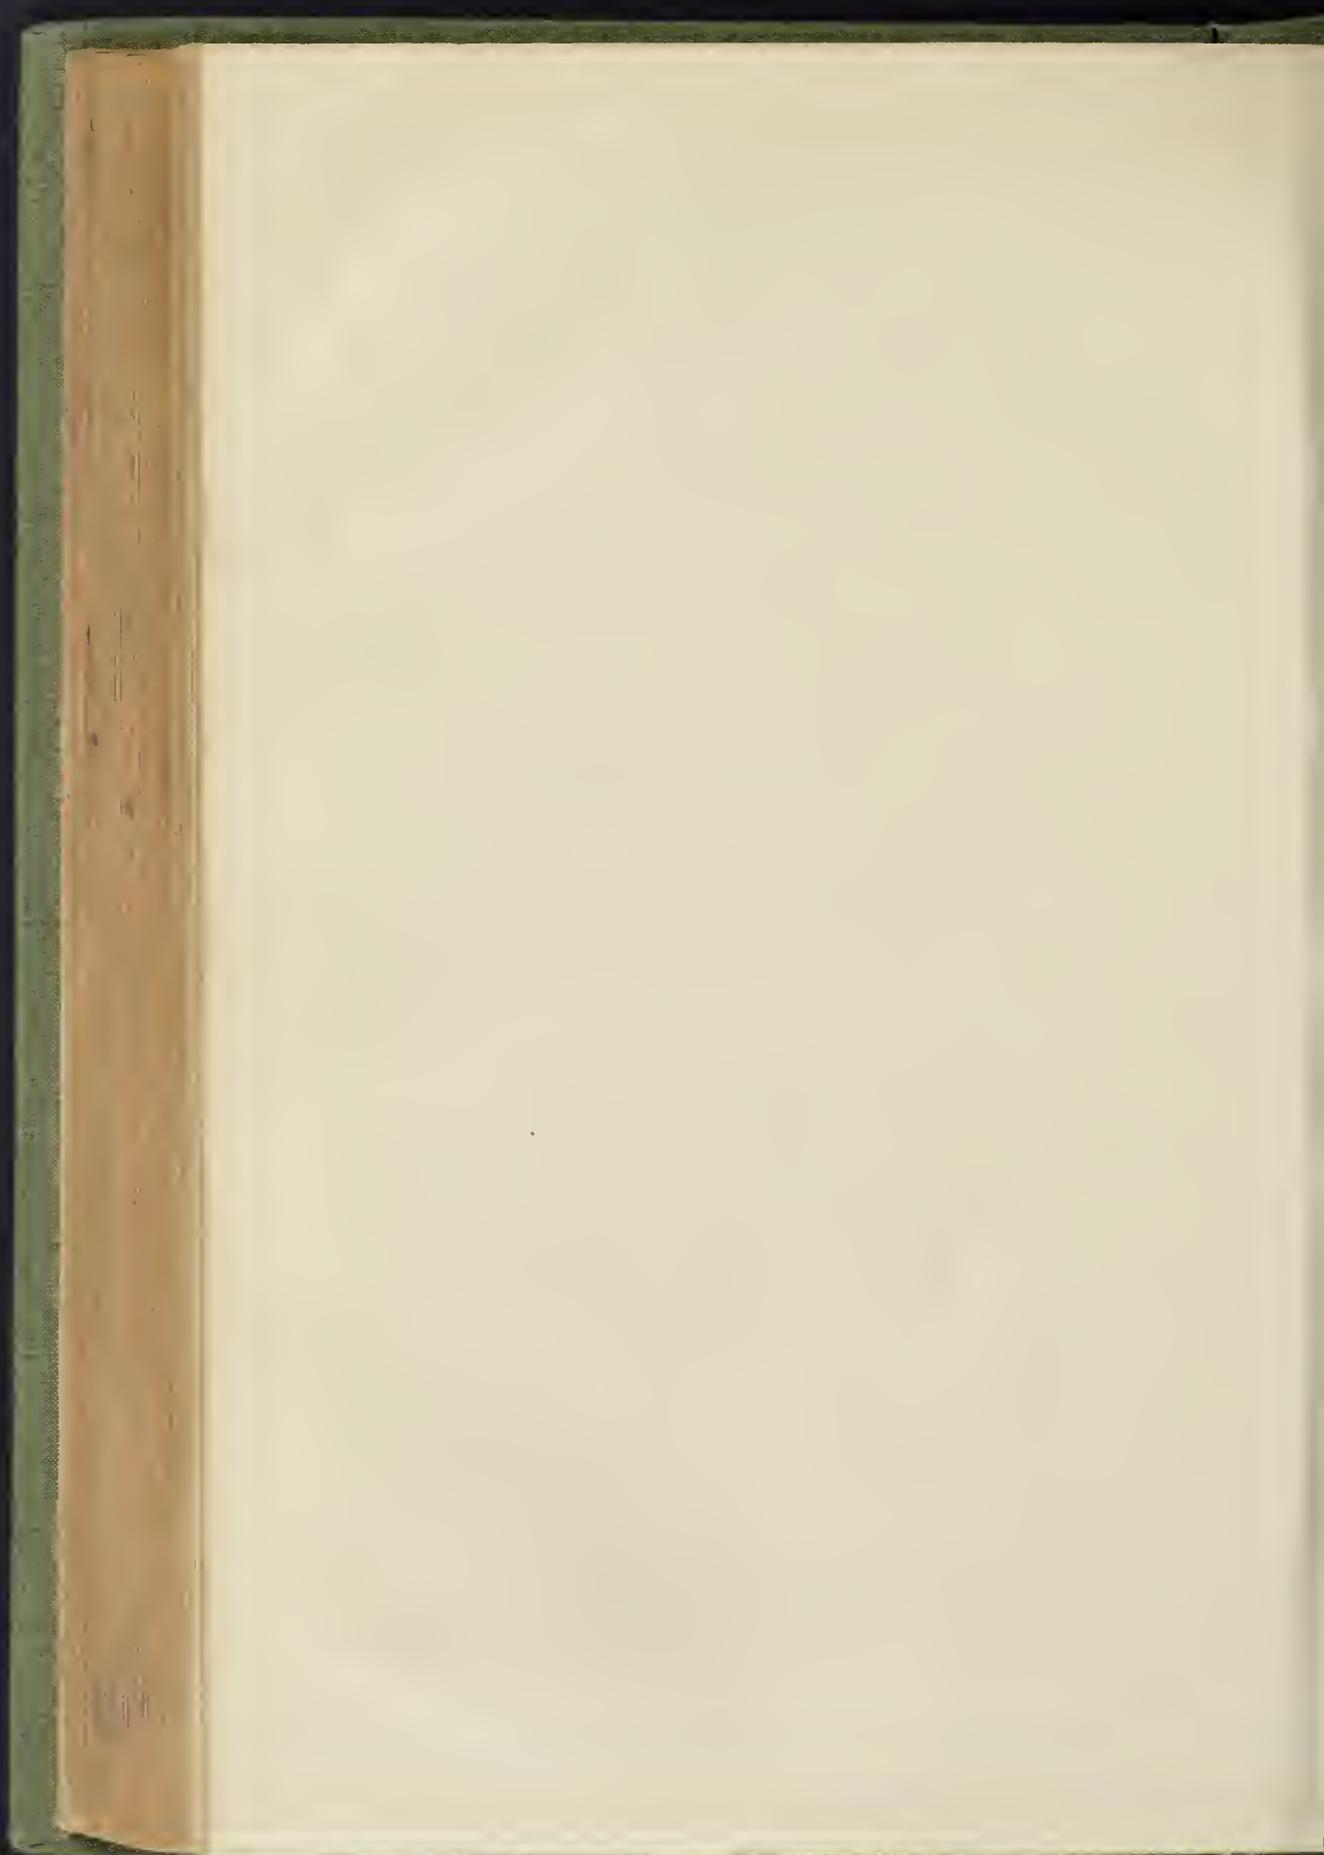

Plan of One Story of an American School.

General Sketch Plan by Canon Cromwell for an English Graded Elementary School; providing for each of the six Government Standards, with less numbers in the higher Standards to suit the average reduction by death and other causes, and giving a general Room for assemblage of the whole School when required.

OFFICES OF THE HULL BANKING COMPANY, IN HULL.—MR. W. BOTTERILL, ARCHITECT.

NEW OFFICES OF THE HULL BANKING COMPANY, AT HULL.

The structure of which illustrations are given in our present number has been erected by the Hull Banking Company at the corner of Silver-street and Lowgate, Hull, and recently opened as the chief offices of the company. The site is one of the most valuable within the borough, and comprises that of the former banking offices in Silver-street, with additional ground abutting on Lowgate, purchased by the company to meet the requirements of a largely-increasing business. On the clearing away of the old buildings from the site, advantage was taken by the Local Board of Health of the opportunity afforded for widening the above-named streets to the extent which could then be arranged. This was further aided by cutting off the angle in planning the new building, and thus the street-space has been increased at a point where it was much needed, and a considerable improvement in this respect effected. The length of the Silver-street frontage is 43 ft., and of that to Lowgate 50 ft.; and the height of the building from the street pavement to the capping of the half-straed on the main cornice is 52 ft. The bank-floor is 3 ft. 6 in. above the street-level, and the clear heights of the several stories are as follow:—Basement, 7 ft.; bank, 18 ft.; first floor, 12 ft., and second floor, 11 ft. The base of the building, to the height of the bank-floor, is executed in Calverley Wood stone, and the remainder of the façades in Ancaster stone. The principal entrance to the bank is in the splayed angle at the junction of the two streets, and has an arched stone canopy, panelled on the soffit, and supported on polished grey Aberdeen granite columns with carved capitals and trusses. The banking-office and manager's room, with the private entrance and staircase occupy nearly the whole of the ground-floor. The former is of somewhat irregular form, and measures internally about 40 ft. by 42 ft. Its wall-surfaces are recessed, and exhibit plasters and arcuation correspondent with the windows on the opposite sides, and are finished in Parian cement. The entrance-doors and internal lobby are of Spanish mahogany and embossed plate-glass. All the window-openings are fitted with oak sashes, those to the bank and also the entrance-doorway being protected by Bunnet & Co.'s bank-shutters. The counter and banking-fittings generally are executed in mahogany, arranged as shown on the ground-plan, and the floor of the public space is laid with Minton & Co.'s tiles. In addition to the plate-glass windows the banking-office has a domical skylight in a compartment of the ceiling, directly opposite the principal entrance, and rising into the area reserved for light to the back of the upper stories. The ventilation is secured by provision in connexion with the sky-light, and by a ventilating-shaft from the centre of the bank-ceiling, carried through the roof above the uppermost story, and under which a sun-burner is fixed. The basement-story extends over the entire area of the site, the greater portion of which is occupied with fireproof strong-rooms, having an aggregate area of about 800 superficial feet, provided with Chubb & Sons' doors, safes, and other fittings. The remainder is appropriated to lavatories and other necessary offices, a hoist communicating with the banking-office, and Perkins & Son's heating apparatus. There is a spacious hoard-room and waiting-room on the first floor; and the principal cashier's residence, with all convenient and suitable domestic arrangements, fills up the residue of the first and the entire of the second floor.

The building has been erected from the designs, and under the superintendance, of Mr. William Botterill, of Hull. Mr. Benjamin Musgrave was the contractor, and Mr. James Griffiths the clerk of works. The entire cost of the works is about 7,500l.

SCHOOL PLANNING DISCUSSED.

CANON CROMWELL (a member of the School Board for London), after the reading of Mr. Robson's paper, said that he had recently taken some pains in personally examining into the details of German and Swiss school buildings. Mr. Matthew Arnold, in his reports, spoke of the Zurich schools as better (in results) than any examined by him elsewhere. Being at Zurich, he (Canon Cromwell) therefore looked about him with a critical eye. He found there buildings of all sizes, and of almost all shapes; many mere adaptations of structures previously used for other purposes (one, for instance, was origi-

ally the town-hall). They practically agree, however, in possessing no large schoolrooms,—only series of class-rooms. These class-rooms are arranged pretty uniformly thus:—The teacher's desk is placed against one wall, the desks of the scholars facing towards it; gangways are left next the walls, and one down the centre; thus there are two blocks of desks, each desk containing sitting, &c., room for four children (in a few instances for five). The teacher by this arrangement reaches easily over or past the end child of any row, and is able to superintend the scholar's work to any necessary extent. This width of room allows each child to see thoroughly the teacher, and any blackboard diagrams made by him; also enables the teacher to see into the face of every child without effort, so as to observe whether he has succeeded in making himself understood; whether he may pass to a further stage of the subject, or should wisely go over again a part or the whole. At Zurich, however, he found a school-building (situated near to the minister) which has been recently erected, and is said to meet the views of the best teachers, and to be the outcome of their experience and careful thought. The school is for girls of the lower middle class. In general plan it resembles the colleges at Oxford, consisting of a set of buildings (two or three stories in height), surrounding a quadrangle on all the four sides; open corridors, not unlike those round the courtyards of the old London inns, surround the internal inclosure, and give access to a large number of separate class-rooms. These rooms are oblong on plan; the light always falls on one side of the ranges of desks placed longwise in the room. Between fifty and sixty children are taught in each such class-room by one teacher. When the number of children capable of being grouped together for similar instruction exceeds sixty, it is usual to place them under two teachers.

As to the American (United States) schools, he had studied the plans of the schools there as illustrated in the Reports of the Controllers of Public Schools in the important cities, and in other authorities. In schools recently erected in Cincinnati a wide entrance-hall gives access to separate square rooms, opening from it to right and left, showing an increased leaning towards the system of separate classes in distinct rooms, to which English experience has also been gradually leading. The example from Barnard's Hook on School Architecture (school for 129 pupils, with two small recitation-rooms over the end of the room; sitting, &c., room for all the children in one large room), he believed was now a little antiquated—certainly for the large schools of large towns. That, however, shows what is rarely deviated from in any school in the United States, viz., the arrangement of the desks, so as to facilitate a still closer approach of the master to the children than even in the German schools, a school-desk never being arranged for more than two children, and a gangway left at each end of it. In the more expensive schools, indeed, a separate desk is provided for each child. The external appearance of the American schools of which he had been speaking, he did not consider satisfactory examples of that harmony of look and purpose to which Mr. Robson had alluded in his paper, and that he hoped would mark the new schools of the London Board. The Ohio schools reminded him of nothing so strongly as of the blocks of offices erected of late years in the City of London.

As a typical instance of a large school building lately fitted up most completely, according to the instructions received from Berlin, Canon Cromwell mentioned the Lyceum at Strasburg, which he had recently carefully looked into, both as to the educational work and the arrangement of the building. Children of all ranks are educated here, and the instruction ranges from the teaching of the alphabet, to preparation for the university. The buildings inclose a quadrangle on the three sides, and are three, and, in parts, four stories in height; the staircases are placed at the two external angles; the whole consists of a number of separate class-rooms, entered on the sides next the quadrangle. No large rooms are provided. These class-rooms are oblong in form, the teacher placed in the middle of the longer side, with the desks opposite to him—five rows of desks on a platform slightly raised; the entrance is placed in the shorter side with a window also therein; and two windows in the opposite end wall. The stove is also placed against that wall, and a pipe frequently carried from it the whole length of the room towards the quadrangle.

As to the English schools, a considerable

change had come about in the ideas of those directing education and the erection of school buildings. The earlier public schools were erected to serve two purposes,—to be at the same time schoolrooms and places for public worship. In order to effect this, some of the arrangements desirable for the one function had to be given up and *vice versa*, so that in the result the buildings were thoroughly satisfactory for neither. Three-and-twenty years ago, when he left his University to engage in teaching, he found a pretty uniform type in vogue such as that of which in the course of his own education he had seen the unsuitableness,—a room 30 ft. by 55 ft. or 60 ft. he remembered,—and of course many other examples used for the systems of supervision by one master, of Lancaster and Bell. Gradually, however, the importance of reducing the distractions and keeping the minds of the scholars well bent on their work has been found out. The type of schoolroom shown by his diagram, some of the details of which he would describe, he thought gave this necessary separation (see plan). Four desks in depth,—placed as nearly as possible together so as to obviate the necessity of speaking very loudly in order to reach those seated at the back of the group, he thought the best number of rows. They would occupy less depth if the standard and back of a seat are made parts of the supports to the desk belonging to the next seat behind (he had adopted this with success). An additional seat should be formed in front of the first desk, without a desk in front of it; this will be required when several sections of the school are assembled for collective teaching. A group of benches and desks should not exceed 13 ft. (at a stretch 14 ft.) in length. A greater length than this for ordinary lessons makes the field of vision too wide for the teacher to range over easily and successfully. The desks should be raised on a slight platform; this is better in practice for the children than raising the teacher's desk. When possible a solid wall should be built between class-rooms, in order to avoid the reverberation from wooden and other partitions; and, for the same purpose, wooden hock flooring heddled solidly will be found to reduce the noise largely below that from a more or less elastic wooden floor. He had a few days ago been informed by a member of the School Board for Leeds that the system of building wide schools was being acted upon there; consequently the disadvantages of that method were evidently not so clear to others as they seemed to him. He could not for his part help considering double rooms an entire mistake, defeating all the objects had so specially in view in all recent changes. The distraction of the attention of the children by the noise, from the observation of opposite classes instead of their teacher, and the inconvenience to the teachers themselves in some instances, are immense hindrances to success.

On the sketch plan prepared to show some of his views, in deference to the suggestions of some of his brother members of the School Board, movable partitions were shown, so that a place for assembling for singing lessons, addresses, &c., was provided. From his previous observations it would be seen that, however much he recognised the value of this, his mind was much more fixed on the importance of the isolations of the sections of the school. Light should be admitted at the back of the children's desks; of course, in large quantities; it will be well aided and diffused by end windows in any room not exceeding about 50 ft. in length. For an extension of a school of this kind he would advise an L plan. This system of back and end lights he had recently adopted in some of his own school buildings with, in his judgment, satisfactory results. For warming, Galton's stoves seem suitable to clear away the heavy carbonic acid gas usually filling the lower portion of a school-room, and subjected to little movement in the absence of such an open fire. For the windows he recommended an opening of the main portion hopperwise. No cold draught descends from such windows on to the heads of the children. The cold air takes its course from the upper portion of the windows into the middle of the room, and is warmed as it descends. He had noticed that windows thus contrived could always be kept open with comfort nine months at least out of the twelve, only requiring to be shut when cold strong winds from some quarter have set in. When a number of hoys had occupied for three hours a room warmed and ventilated in this way, he had entered it from the external air, and found it perfectly sweet.

Mr. T. Roger Smith, in speaking of the German schools, noticed that the division was almost uniformly vertical, as in the plan shown by Mr. Robson,—the other portions of the girls' and boys' schools being placed on the other floors, similarly to those on that plan, and the space occupied by the hall divided into additional class-rooms, entered from one staircase landing or the other, according to the requirements of the school (as to proportions of sexes, special rooms for classes, &c.). The large hall is used for collecting some portions of the children, for addresses, the distribution of prizes, &c., and is arranged in size so as to hold the senior or selected sections of the children. In the class-rooms the usual plan is to provide seats for seventy, with the idea, however, that sixty will be very nearly the average requiring to be taught at one time. In his view, the end light or side light may be considered about equally good, so long as a strong light wholly from the right is avoided. For writing, arithmetic, and some reading, a light entirely from the left, no doubt, would be preferable; but if not obtainable, a good light behind and another from the left would be a good substitute. As to the sizes of the class-rooms, the Germans had considered the matter carefully, deciding that the child seated furthest from the window should have light enough on a dull day to see (say the letters of) a map or diagram without effort, and should not be placed so far from the teacher as to have any difficulty in catching all that he says. This distance has been settled at 26 ft. or 27 ft. at the longest; and consequently this dimension, by about 20 ft. or 21 ft. is the normal size of their class-rooms. The benches in no case touch the walls,—room being provided for the masters to go round on every side of a group of desks. The warming in the German schools is effected by stoves or heating apparatus placed in the basement (no open fireplaces). Vitiating air is often carried off by flues from the ceiling.

With reference to the English schools, Mr. Smith thought it impossible not to see what ground the system of separate class-rooms was gaining in the minds of most people who had to do with public education. The heavy curtains, that have been recommended and largely used for some years past, teachers pronounce a great improvement on the undivided school-room; but these are now frequently considered insufficient for securing the isolation wished for. At the same time the matter of supervision which dictated the large school-room only imperfectly divided, must neither be overlooked nor treated as chimerical. Teachers must be obtained for every standard who can go alone, trusting to their own judgment and authority, needing no moral support from the older and higher-placed teachers, before thorough separation can be safely ventured on; therefore some compromise has been generally deemed necessary in this particular. Before concluding, he should like to bring forward one or two points on which he found difference of opinion prevailing, and as to which some continued discussion on this occasion and thereafter (among those interested in such matters) might aid in bringing right conclusions; perhaps even some difference in practice might be permitted as experimental for the same reasons.

I. As to ventilation. Although opinions had been expressed in favour of school-rooms with windows on opposite sides, he personally failed yet to see that more would be secured by that plan than by (in a school-room of some moderate length) windows in one side-wall (at the back of the desks), and large windows giving a thorough current from end to end of the room. Great convenience, with reference to the general disposition of a school-building, is often to be gained, if, in designing, cross-lighting is not considered indispensable.

II. As to the conveniences (closets and urinals). In some of the recent competitions, it had been stipulated that these be kept away from the main building,—across a yard; and he thought it a wholesome kind of arrangement; neither could there be any inconvenience in it to children of the class by whom the public elementary schools would be attended. It had been, however, rather strongly argued that discipline would not be readily maintained, as these conveniences in the case of a school on the third floor, must necessarily be at some considerable distance from any superintendence; and it had been proposed that, on all the stories entering from half-landings of the staircases should be lobbies open to the air on both sides (a kind of covered way); and the conveniences situated

beyond,—cut off from the school-buildings, in fact, so effectually as to exclude any risk of effluvia reaching them. What opinion do the larger number of practical teachers hold as to this? And is uniformity of practice of importance?

III. As to the sliding-partitions to divide class-rooms, and in some cases the general school-rooms. They should be as sound-proof as possible, and thoroughly manageable without much exertion. Is it absolutely necessary that, in order to realise this, they shall be double? Has a partition of this kind (thoroughly effective) as yet been erected?

IV. As to the use of the general school-room for assembly of the greater proportion of the children in any school. Has any better plan been used or suggested than putting in front of each desk of the regular desks and benches an extra seat,—used only at the times of assembling,—and (at least) doubling the number of the seats in the school-room? It is true that this permanently increases the depth of the block of desks,—with the consequent disadvantages; but some method should be arranged by which the larger number of children may be seated at once, with as little labour as possible in altering the positions of their seats.*

Mr. Charles Clark (member of the School Board for London) said that he had lately examined some of the largest schools in Scotland. One large school (for 1,200 or 1,400 children) he found consisting of class-rooms arranged for fifty-four (fifty the ordinary number in constant attendance); these class-rooms being entered on each side of a large corridor of communication. Each class is taught by the same teacher every day; who is thus thoroughly acquainted with every child, and the progress made seems to be rapid and certain. The head-master in this school does not teach at all,—devoting himself to the management of the business,—to keeping all the machinery in motion. In another school for 1,400 girls,—taught by most capable masters, he found the system of separate class-rooms, with rooms capable of containing 120—for singing and similar lessons to grouped classes. In this building separate stairs are provided for ascent and descent; the rooms for clothes are placed below near the entrances, the clothes placed there under the direction of the teacher, the door locked till the end of the school session when the teacher superintends the exit of the children. It seems to be the custom in Scotland to raise the benches. As to the points named by Mr. Smith, he (Mr. C. Clark) thought some amount of ventilation across (the width of) a schoolroom must be provided in most instances; at the same time he remembered cases in which great compactness of plan had been combined with fair efficiency in ventilation as at the Birbeck Schools, Peckham, where are lofty rooms lighted by opening sky-lights; he considered, however, that the simplicity and certain efficiency of cross windows should make that system the rule in all except a very few exceptional instances. In the schools at Hamburg great attention is paid to the warming and ventilation; on examining them he had found an avoidance of open fireplaces, a large stove in the lower story warms air which is admitted by flues into the rooms, and a system of special shafts extracts the used air. As to the closets, &c., they should always be reached by a covered way when placed apart from the main building. If thought it would be worth considering whether rooms for dining the children as at the middle-class schools in Cowper-street should be provided; there it was found to save valuable time, and in bad weather the health of the children is not risked.

Mr. James Watson (member of the School Board for London) called attention to the value of the louvre system for ventilation (as used in the windows of the Middlesex Hospital and the new hospital in Soho-square). Being connected with these institutions he had witnessed experiments that convinced him as to the changing of the air and the absence of draught from these windows; the air ascends and comes down by the centre of the wards. As to general school systems, he would confess that he was not a convert to the German system,—he had had practical experience of the value of the sympathy of numbers, and of the possibility of sufficient

isolation and most efficient control in school-rooms for 120.

Mr. L. W. Ridge thought that no windows met the requirements of large schools so well as double-lung sashes up to a transom and upper portions hung hoppers-wise. The sliding partitions in the building of the Home and Colonial School Society in the Gray's-inn-road had been pointed out to him by Mr. Robson, and on careful study of them he (Mr. Ridge) considered them the most efficient contrivance of the kind he had seen.

Mr. J. D. Mathews suggested that the London School Board should start a competition for warming and ventilating a large school building of a plan supposed fairly typical; he thought some novelties of value would be elicited,—as ventilating engineers and similar specialists would give the matter much consideration.

Canon Cromwell, in responding, said that, in his view, schools were not on the same footing as hospital-wards; these latter are occupied night and day, and by patients suffering from wounds or disease, and the cross windows of the pavilion system are required in order to provide the utmost facility for constant movement of the air of the ward. In the intervals of school-work the open end-windows he had advocated should, however, entirely renew the air in the room. The closets, in his opinion, should be entirely detached from the other buildings. As to the raised desks much difference of practice prevails, though the value of bringing the head and chest of each scholar under the eye of the teacher is uniformly insisted on; if more than four desks deep they must be graduated. In the Zurich schools, however, the teacher is raised on a platform instead; at Strasburg the children are raised; in the American schools the children's desks are on the level. The general assembly-hall (of the German schools) he thought would prove more interesting than of much practical utility in our schools. In the case of the London School Board, such a provision coexisting with the limit of 10 superficial feet per child in general school-room and class-rooms together, will lead to a diminution of class-rooms in number or area which he thought undesirable. He advised architects to listen well to the views of practical teachers; but not to follow them implicitly in their definite suggestions as to buildings, rather to make provision as technical skill and knowledge will enable it, the simplest and completest way for the carrying out of the system of teaching to be pursued in all its details.

Mr. C. Clarke could say that there was no wish on the part of the London School Board to bind architects to a single form of building, or to uniformity in details; they only asked in each case for the most suitable building for the special school—the best fitted for the site, provided a the lowest proper cost.

Mr. Robson said that, in his individual opinion, we, in England, should have heard less of, and paid less heed to, the German system of school-teaching if the French had been victorious in the late war. The German system in its entirety at least at present, is impossible in England, where, for various reasons, it is stipulated by the Education Department that the head master of a school must not be allowed "to provide for carrying out the entire business of instruction without his own direct intervention in giving the lessons." He thought with more class-rooms than hitherto customary, the English system required little modification. Personally he looked on cross-ventilation of school-rooms as desideratum. The removal of air on any other system depends too much on the position of the axis of the schoolroom with reference to the prevailing winds. As to sliding partitions, he had derived the most valuable knowledge he possessed on the subject from those at the buildings of the Home and Colonial Society. It would be desirable, in all cases, that they should be prepared double, with a space of air between, being used single as a rule, double where required.

A Medal Commemorative of Thank-giving Day.—The Court of Common Council of the City of London have resolved to order a medal to be struck, at a cost not exceeding 500*l.* to commemorate the late national demonstration in the City of London on the day of thanksgiving for the recovery of the Prince of Wales. The medal will be distributed to such members of the Court, of the Royal Family, and of public institutions as may desire it.

* Could not this be effected by hanging each extra seat to the standards of the desk adjoining? The desks in front being on casters running on rails, the adjustment of them to marked lines in the floor, and the letting down of the seats, would be the work of about two minutes at most.

CHURCH-BUILDING NEWS.

Harleston.—A new church has recently been erected in the improving town of Harleston, and consecrated. The church, which is dedicated to St. John the Baptist, is built in the Decorated style. It consists of a nave, 68 ft. long by 20 ft. 6 in. wide, and 41 ft. high to the ridge of the roof, on each side of which are four arches and piers, the latter alternately circular and quatrefoil on plan, opening into aisles the same length as the nave, and 10 ft. wide. These aisles are lighted by three-light windows, and the nave has a cloistery of trefoils and quatrefoils enclosed in equilateral arches. There is a west entrance, the doorway being shafted and deeply moulded, and above it is a four-light window. The chancel is 30 ft. long and the same width as the nave, with an apsidal east end of five bays, and a single-light window in each bay. The roofs of the nave and aisles are of pitch pine, carved and moulded, and the chancel roof is formed of arched groining. The roofs are covered with green rag slates. The benching throughout and all the doors are of wainscot oak, carved and moulded, the latter having some curved ironwork, by Smith, of Weybread. The passages and chancel are laid with encaustic tiles. The five east windows are by O'Connor. The subjects are,—1st. The Birth of the Saviour; 2nd. The Baptism of our Lord; 3rd. The Crucifixion; 4th. The Entombment; 5th. The Ascension. The other windows are glazed with rough plate cathedral-glass and white margins, the tracery being filled with rough plate of two colours, worked in crosses and other devices. The outside walls are of flint and stone, the flint being in several places cut square, like bricks, and laid in regular courses. There are stone crosses to the nave and transepts, and a wrought-iron one at the top of the intersections of the roof of the apse. A stone hell-turret, with a bell by Warner, is fixed on the gable of the south transept. The church will hold about 400 persons. Mr. Phipson was the architect; the contractor, Mr. Grimwood, of Weybread. The carving has been done partly by Mr. Phipson, of London, partly by carvers in the employ of Mr. Grimwood, and partly by carvers from the atelier of Mr. Cornish, of North Walsham. The church is lighted by gas laid on by Mr. Chappell, of Harleston, and consists of simply a set of burners laid along the string under the cloistery windows, which lights the whole building completely. The heating apparatus was provided by Haysdon, of Trowbridge. The total cost has amounted to about 4,500*l.*, towards which Mr. Hazard, of Harleston, has contributed upwards of 2,000*l.*, besides giving the site.

Hatfield.—The Church of St. Etheldra, Bishop's Hatfield (the largest parish church in the county), having undergone a restoration by Mr. Brandon, the architect (of which almost the entire cost has been borne by the Marquis of Salisbury), is about to be reoccupied.

Sheerness.—The new church of St. Paul has been consecrated by the Archbishop of Canterbury. The edifice has been built on the Woll Marsh. It is in the Early English style, the plan consisting of nave, chancel, north aisle, chapel, and vestry. The arches of the south wall are temporarily filled with brickwork, so that, in the event of an extension of accommodation being required, a south aisle can readily be added to the present structure. The architect was Mr. R. Wheeler, of Tunbridge Wells. The ground was known to be very soft, and, on probing, it was found that the "softness" extended downwards for a depth of 10 ft. The problem to be solved was how to build without a foundation, and to save the enormous expense of driving piles. Mr. Wheeler built upon inverted arches, and the plan, which was at first doubted, has, it is said, succeeded, the settlement having been very slight, and, as Archdeacon Harrison said, there stands the church, literally without "a builder's foundation." The builder was Mr. Miller, of Sheerness, and the stone carving is the work of Mr. T. Darp, of Lambeth. Messrs. Hart, Son, Peard, & Co. supplied the gas-fittings; and Mr. L. Gathewald has acted as clerk of the works.

FROM SCOTLAND.

Edinburgh.—A new place of worship in connexion with the Free Church has been opened at Viewforth. The building was designed by Messrs. Pilkington & Bell, and occupies a site on the north side of West Gilmore-place. In order to suit the configuration of the ground, it was found necessary to adopt the form of a parallelogram. A result of the limitation of the site has been the introduction of galleries to a larger extent than might otherwise have been considered desirable, so as to provide the required number of sittings. The church will accommodate 1,000, of which number 546 are provided for in the area, and 454 in the galleries. The interior is fitted up in a simple style, such ornamentation as has been introduced being confined to the front of the galleries and the pulpit. The only available place for the vestry was in the sunk flat, and the access from thence to the pulpit involved the erection of a screen, which, as being the central object in the church, has been combined with the pulpit. The site being at the intersection of West Gilmore-place and Viewforth-place, the salient corner has been selected as a suitable spot for a tower. When finished, it will rise to a height of 113 ft. The church may be regarded as a specimen of the Geometrical Decorated style. The windows which light the area are square-headed, and there are more elaborate windows above. The elevation facing West Gilmore-place has, in addition to the tower, a large central gable occupied by a five-light window, the head of which is filled in with moulded bar tracery; also a smaller gable occupied by a two-light window, the tracery of which is treated more simply. The elevation facing Viewforth-place has to the north of the tower three gables, the centre one of which is, both as regards size and elaboration, the most conspicuous. The church, without the tower, has cost about 5,000*l.*

Books Received.

The Culture, Management, and Improvement of Landed Estates. By G. A. DEAN, Land Agent and Agricultural Engineer, &c. London: Longmans, Green, & Co. 1872.

THE author of this work is a man of experience, and the book is an elaborate and valuable one. Mr. Dean is well known; he is a referee to the Board of Trade, and author of various works on agriculture.

The work is divided into two parts, including a somewhat lengthened introduction. The first part also relates to climate and geological surface, soils and their properties, culture of all the various plants used and crops reared in agriculture; farming and high farming, stock cultivation, pasture land, manures, utilisation of sewage, insects and birds. The second relates to the tenure, transfer, and taxation of landed property, ownership and occupation of land, commons and waste lands, law of fixtures, dispendations, and waste; arbitrations and awards, leases and agreements, rents, valuations between tenants, tenant rights and obligations, farm labourers, choice and valuation, management, &c., of landed estates, farmhouses, and offices, construction of buildings, building materials, ventilation and dampness of buildings, sewerage, arificial and general land drainage, irrigation, varping, reclaiming of land, roads, timber and ornamental planting, underwood, &c. The work is illustrated by engravings of grasses and insects.

As an example of the author's manner, we quote what he says of stables under the heading "Arrangement of Farm Offices."

"The stables should be placed in such a position that workmen may have access to them, without passing through the yards and courts where cattle are kept. The horse, from being in a highly artificial state, is much predisposed to inflammatory action of the viscera, and requires to be treated with great care; consequently all stables should be cool, properly ventilated, well paved, and thoroughly drained.

Stables should be from 16 ft. to 18 ft. wide between the stalls; the walls about 8 ft. high, and the interior of the buildings open upwards to the roof. The doors should open outwards, and all the fastenings sunk in them, to prevent damage to the horses, by their running against them, when suddenly going in or out; or accident by the harness catching and getting entangled.

These buildings may be ventilated by means of louver-blinds, answering windows, but when glazed sashes are used, the louver-framing may be hung outside to act as shutters; the sashes should be made to slide past each other in grooves. The temperature should be about 45° or 50° in winter, and from 60° to 65° in summer. Excess of light is prejudicial, producing restlessness; therefore no more should be admitted than is sufficient to enable the workmen to cleanse the stables.

The best materials for the pavement are Dutch clinkers, or small square granite, which unquestionably are superior to any other descriptions for this purpose, and in the end the most economical. Asphaltum will not stand against the iron shoes of horses, and the common public paving, from its uneven surface, and its soon wearing into holes, leaves lodgments for the urine, which soon becomes putrescent, and gives off ammonia accompanied with a fetid odour. Powdered gypsum scattered over the paving two or three times per week will remedy much of this evil, by its combining permanently with the ammonia; and it will add much to the cleanliness of the stable. All paving should be kept dry and even on the surface; this will effect a great saving in the litter, and keep the atmosphere more wholesome.

Oak blocks, or blocks of any hard wood, which from its texture is not a great absorbent, form a good and warm pavement. A portion of each stable should be partitioned off for containing the harness, also the chaff and corn-bins; recesses may also be formed in the wall behind the horses, for placing in them the harness daily used, also curry-combs, brushes, and stable utensils. These recesses should have sliding doors, as the ammonia from the urine perishes leather, and acts strongly upon all brass-work.

Stalls, or divisions of a suitable description, should always be used, otherwise accidents will frequently occur by the horses kicking or biting each other. The stall divisions should be about 6 ft. apart, and may be framed as described for cattle sheds; but the posts should be oval in form, to prevent injury to the horses, should they run against them; the whole framing, if so constructed, will be removable, and in their places "horse-blocks" may be readily formed when required. The stalls for nag stables should be about 7 ft. high at the mangers, 6 ft. high at the other end, and 8 ft. long. The mangers may be either of wood or iron, and should be about 3 ft. long, 8 in. deep, and 16 in. wide, the back part being rather higher than the front. The preference should be given to cast-iron; racks are also best made of this material. Many persons think that the racks are best placed by the sides of the mangers, as the hay-seeds are apt to fall into the eyes of the horses, when they are placed above their heads; others, that horses who work at the bottom should have no rack-meat given, considering that they satisfy their hunger much quicker and better when fed from the manger, and consequently have more time for rest. This mode of manger feeding has come much into vogue, and is probably the most economical for draught horses.

The best means of securing horses in their stalls is with halters, having double ropes or chains, with stop-blocks at the ends, the ropes or chains working in separate rings fixed on the manger; each horse is thus confined to the centre of the stall, and cannot reach those next him. Cast-iron or wood brackets may be fixed in the harness-room and recesses, for hanging on the harness in frequent use. These brackets should be slightly inclined upwards, to prevent the harness slipping off, and have hooks at the bottom for head stalls, reins, &c. Wire-raze lanterns are the safest and best for stable use, and should be hung with weight's, lines, and pulleys."

VARIORUM.

Captain R. F. Burton, in *Cassell's Magazine*, gives some interesting particulars of the present state of Palmyra. Speaking of an excavation made by his party, the writer says,—

"During our absence the workmen came upon two oval slabs of soft limestone, each with its kit-cat in high relief. One was a man with straight features, short curly beard, and hair disposed, as appears to have been the fashion for both sexes, in three circular rolls. The other was a feminine bust with features of a type so exaggerated as to resemble the negro. A third and similar work of art was brought, but the head had been removed. It would be hard to explain to you the excitement caused by these wonderful discoveries. Report flew abroad that gold images of life-size had been dug up, and the least disposed to exaggeration declared that chests full of gold coins and ingots had fallen to our lot."

—A writer in the current number of the *Leisure Hour*, says as to cathedral libraries,—
"Cathedral chapters are usually spoken of as learned bodies, and are supposed to be zealously addicted to the study of grave and aged tomes; but the state of the libraries entrusted to their care is hardly very creditable to them. Book after book has been allowed to disappear even from cathedrals whose deans have acquired distinguished renown as men of letters. Only a few years ago, it was customary, by tipping the verger, to obtain permission to cut out the illuminations in the ancient manuscripts of one cathedral library; whilst in another, one of the most valuable works has been seriously injured by the rude handling of visitors, to whom it used to be shown as the largest and heaviest book in the collection. The dean and chapter of one of the cathedrals, not very many years ago, disposed of a number of Caxtons of priceless value, in order to purchase some current literature; and only the other year, an enthusiastic scholar, who had hunted in vain through the library for a magnificent copy of one of the rarest editions of the Bible, actually found it used by the ignorant verger as a convenient prop to keep the window open."

The Bermondsey Water Supply.—Energetic measures adopted by the Committee of Ratepayers in Bermondsey have resulted in a great improvement in the supply of water to the neighbourhood. The company, it is said, are actively pushing on their new works at Nunhead, which they hope to complete in ten months.

The Thames Embankment Surplus Land.
It is said that Government have refused to accept the alternative compromise proposed by the Metropolitan Board of Works for the settlement of the Thames Embankment surplus land question.

Miscellaneous.

Opening of the Madras Waterworks by Lord Napier.—The Madras Waterworks were formally opened by Lord Napier of Merchiston, ex-Governor of Madras and ex-Viceroy of India, on the 13th of May, about half-past six a.m., just before his departure from India. Notwithstanding the late hour at which notices were issued on Sunday evening, a pretty large number was present, and all classes of the community were represented. The crowd outside the railing was very great. The scheme for bringing water from Red Hill, prepared by Mr. Lee, executive engineer of the municipality, and to a loan of thirteen lacs of rupees to enable the Commissioners to carry it out, was given in 1869. In March of that year the delivery channel for conveying the water from the Red Hill tank to the town was commenced, and in March, 1870, a contract was concluded with Mr. Woolley for the supply and laying of the pipes. When the distribution works are complete there will be thirty-six miles of these, of which twenty have been already laid down, and it is expected that the entire length will be finished before the end of the year. The water will be made available for the use of the public by means of 127 fountains and 36 public wells and tanks. The number of inhabitants in the districts which it is proposed to supply with water is about 315,000 out of a total population of 397,000.

Opening of the New Town Hall, Wednesday.—This event has taken place in the presence of a large assemblage. The hall stands in the rear of the public offices, which front the Holyhead-road. The exterior of the building is devoid of all ornamentation. Internally, the walls are divided into panels, separated by Corinthian pilasters, supporting a full Corinthian cornice, with enriched modillions, from which spring a coffered and panelled ceiling, with moulded and panelled ribs, and enriched centre flowers, from which are suspended five star-light burners. By day, light is obtained from semicircular windows, groined into the coffering of the ceiling. The hall is supplied with a gallery, the front of which forms a continuous curvilinear line, and finishes in a curve at the end nearest the orchestra against each side wall of the building. The front, as also the front of the orchestra, is decorated with mountings, and fitted in with cast-iron panels of an ornamental pattern, and coloured. Means of ingress and egress are afforded by five doors. Mr. D. Moore, of Walsall, executed the work. The total cost of the building will be about 3,000l., including gasfittings, heating apparatus, and seats, which, like all the woodwork of the interior, are of pitched pine, stained and varnished. It will accommodate an audience of 780 persons, and the orchestra a hand and chorus of 120. The organ was given by Mr. Brogden, M.P.

Improvement of the Dwellings of the Working Classes.—The annual meeting of the Society for the Improvement of the Dwellings of the Working Classes has been held at Willis's Rooms, the Earl of Shaftesbury presiding. The secretary of the society (Mr. Payne) read the report of the committee, which stated that the houses owned by the society were well occupied. The mortality throughout the houses, with an average population of 1,588, has only been about 12.6 per 1,000, making the lowest death-rate the society has been enabled to record. The amount received by the society from all sources during the past year was 5,254l. 12s. 9d., which, with a balance in hand at the beginning of the year of 586l. 9s. 9d., made a total of 5,841l. 2s. 6d. The current expenses of all the lodging-houses, including repairs, amounted to 3,435l. 9s. repaid, and interest on loans, &c., 1,215l. 5s. 9d., salaries and agency, 563l. 17s. 3d.; publications and other printing, books and stationery, law charges, and advertisements, 82l. 16s. 2d.; rent of offices, postages, coals, cleaning, and all incidentals, 138l. 17s. 4d.; leaving a balance at bankers' and cash in hand, 404l. 16s. 11d. The real property, &c., belonging to the society is estimated as worth 35,412l. 17s., and the general liabilities of the society amount to 20,573l. 9s., leaving assets to the amount of 14,839l. 8s. It was resolved "that this meeting recognise in the success granted to the efforts of the society in past years, a call to continued operations in the time to come."

Report of Metropolitan Board of Works for 1871.—This report has been issued in a printed form. The metropolitan improvements of which it treats, include the Victoria, Albert, and Chelsea embankments; Queen Victoria-street, and the Whitechapel and Stimpson-lane improvements. Those projected, which are spoken of, include the new thoroughfare from New Oxford-street, through Old-street to Shore-ditch, and thence to Balnalgreen-road; and the widening of High-street; Shoreditch, of Wapping High-street, of Edgware and Harrow roads, and of Newington Butts. The superintending architect's annual report relates to the improvements. During the past year 105 applications had been made to the Board for their sanction to the formation of new streets, of which 70 were granted, and 35 refused. For the construction of porticoes, balconies, and verandahs, 78 applications were received, of which 65 were granted, and 13 refused. Since 1865 the Board have sanctioned loans to the amount of 1,657,497l. Of this sum 760,823l. were for sewerage works, 672,522l. for paving, and 224,102l. for street and other improvements.

Sale of Contractor's Plant, Sevenoaks and Orpington.—On Monday last Messrs. Fuller, Horsey, Son, & Co. concluded the sale of the first portion of the contractor's plant used in the construction of the Tunbridge direct line, lying at the depôts at Riverhead, Tunbs Hill, and Orpington. The importance of the sale attracted a large assemblage of buyers, among the principal of whom were Sir Morton Peto, Mr. Cowdy, Messrs. Homer, Mr. Deardon, the Landore Steel Company, Mr. Glassbrook, Mr. Tomlinson, C.E., Messrs. Colman, and Messrs. Walker. The rails, of which there were about 1,400 tons, realised from 7l. 5s. to 8l. 17s. 6d. per ton. Two locomotives, made in 1865, by G. England, 1,520l.; three by Brotherhood, made in 1863, 1,310l.; three by Hughes, 737l.; a mortar-mill, with 9-ft. pan, by Henry Clayton, 96l.; three Murray's pumps, 140l.; a 16-horse portable engine by Clayton & Shuttleworth, 186l. 350l.; four 14-horse power portable engines by same makers, 1863, 1,095l. The total amount was nearly 30,000l.

The Workmen at Redcliff Church, Bristol.—On Saturday last the workmen employed at Redcliff Church had a thorough day's enjoyment, through the liberality of the Mayor, the Rev. Canon Randall, and the Restoration Committee. Before starting each man was presented with a small packet of silver, containing three half-crowns, to enjoy himself with, independently of the cost of dinner, breaks, &c. so forth. They then proceeded to Porthead to luncheon, and thence to the Rock House Hotel, Clevedon, where they enjoyed a hearty dinner. After the usual loyal toasts, Mr. Williams proposed the health of Mr. Rice, clerk of the works, and read an address from himself and his fellow-workmen to him. Mr. Hammett, the shop foreman, then presented Mr. Rice with a silver cup, bearing the following inscription:—"Presented to Mr. W. Rice, clerk of works of St. Mary's Church, Redcliff, by the workmen, as a mark of respect, June 29th, 1872." Mr. Rice thanked them for their kindness, and said he would treasure the present as long as he lived.

Fall of Scaffolding in Nottingham.—A new chapel is being constructed on the plot of land at the corner of Shakespeare-street, Nottingham, for the "Christadelphians." The outer walls have been completed, and a good deal of interior brick, stone, and wood work had been done. Five men, bricklayers and their labourers, were engaged in carrying over an arch at the Shakespeare-street end of the building, and a scaffolding stretched across the chapel resting upon two stone corbels. Three of the men were engaged on the scaffolding when it suddenly gave way, and they were precipitated to the ground, a distance of 40 ft., a considerable quantity of bricks and wood falling with them. Two bricklayers were very seriously injured, and another less so. About 700 bricks fell. The stone corbels on which the scaffolding rested were not removed from their places, but the walls had bulged out, and it is said there was not sufficient strength in the abutments.

The International Exhibition and the Working Classes.—The Commissioners are to adopt measures for keeping the Exhibition open one evening in the week until ten p.m. On those occasions the charge for admission after six will be sixpence.

Improvements in Hyde Park.—In reply to questions as to these intended improvements, put to Mr. Ayrton, in Committee of Supply, he said that the sort of trees to be planted was settled by the chief gardener, who was a distinguished arboriculturist, and who decided to have evergreens and deciduous trees. With respect to bathing places, he held in his hands the sum of 50,000l., the legacy of a lady, for their erection, but until that lady's affairs had been finally settled he was not at liberty to dispose of the money. The fountain for Hamilton-place was in the hands of the sculptor, who was carrying on the work under contract. The sculptor was Mr. Thornycroft, the lady Mrs. Brown. The Park piling was going on, and there would be no cessation in the work until the whole had been completed. With respect to the water-borings had recently been made which would assure a certain supply. If more seats were required for the public, more would be added, but they did not interfere with the chairs, as those who used the chairs would not use the seats.

The New Wood-Pavement.—The wood-pavement laid in Bartholomew-lane, near the Bank, of which we have before spoken, is attracting attention. The new system consists, first, in the formation of a foundation of sand, of sufficient depth to make a good "grave." Upon this is laid a continuous flooring of 2-in. planks, with a similar one above it placed transversely. The pavement-blocks, which in form are rectangular, rest upon this double floor, and are studded by means of strips of wood nailed to the floor beneath. The whole structure is cemented together with a composition of hot pitch, tar, and gravel, and the surface receives a dressing of the same materials. The manufacturers maintain that, as each block cannot possibly sink below the level of the surrounding ones, and the wood itself is preserved from decay, the free surface of the pavement will always remain uniform, whatever be the traffic it may have to support.

A Memorial Mortuary Chapel at Chichester.—The family of the late John Ahol Smith, who for over thirty years represented Chichester in the Liberal interest, intend to erect a monument over the vault containing his remains at the cemetery. The town council, as a Burial Board, have inspected the plan, by Mr. Gilbert Scott, and the proposed site, and approved of them. The plans laid before the council were for a mortuary chapel, in Early English architecture, to stand in a triangle, formed by the meeting of the two main thoroughfares of the cemetery. The dimensions of the proposed chapel, so far as could be seen, would be 18 ft. high to the top of the gable, 20 ft. long outside and 15 ft. inside, and 7 ft. wide (inside). There is to be an open arcade round the building, and the entrance is to be by a metal gate of elaborate design on the east. The chapel is to be built of stone, and roofed with lead.

The Enlargement of the National Gallery.—On the vote of 37,250l. to complete the sum for the enlargement of the National Gallery, in Committee of Supply, Mr. Ayrton said the new buildings had been expressly designed in such a manner as that, whilst they might stand alone, they would also fit in well with an structure that might be raised round them. In the meantime, they would blend harmoniously with the existing National Gallery. The best pictures might be brought from Kensington, and there would be no difficulty in accommodating presents of pictures to the nation. The new buildings would be fire-proof, and every precaution had been taken with regard to existing buildings.

Royal Gallery of Illustration.—Mr. and Mrs. German Reed have been very successful of late. The proverb, "Charity begins at Home," sparkling with the melodious strains of Mr. Cellier, nightly retains large audiences in their seats till the fall of the curtain; and "My Aunt's Secret" eminently suits the peculiarities of the company. Mr. Corney Grain, in his last sketch, "A Five o'Clock Tea," displays a very great amount of humour, and admirably burlesques English, German, and Spanish songs.

The Building Societies Bill.—A deputation from 1,100 building societies have waited on the Home Secretary, to urge the Government to reconsider their amendments to the Building Societies Bill. Mr. Bruce, in his reply, said the Government were not in a position to legislate immediately and properly on the subject.

The Public Health Bill.—In Committee of Supply, Mr. Stanfield said it was unquestionably the intention of the Government to proceed with his Bill. The measure was committed *pro forma* the previous evening for the insertion of certain amendments and the withdrawal of certain clauses. He had unwillingly come to the conclusion, however, that, considering the advanced period of the session, and the pressure of other business, it was necessary in the interests of the Bill itself to do what was sometimes called "throwing part of the cargo overboard." It appeared to him the best course would be to stop that year with the creation and consolidation of the local authorities, and to withdraw all the clauses relating to nuisances, hospitals, river pollution, and other matters.

Drinking Fountains.—Some information as to the cost of these public conveniences was disclosed at the meeting of the Metropolitan Drinking Fountain and Cattle Trough Association, held on Tuesday, under the presidency of the Marquis of Westminster. There are more than 300 troughs and fountains under the care of the society, and all are visited, cleaned, supplied with cups, and reported at the office every week. The cost of the fountains for repair and water-supply averages nearly 10*l.* a year each, at the cost of the cattle-troughs varies with their size and locality. The small dog-troughs are supplied entirely with the waste water from the fountains, but for the larger troughs the water-rate alone is in some cases as much as 6*l.* per annum, more than 1,200 horses, besides other animals, frequently drinking at one trough in twenty-four hours.

New Institute for High Wycombe.—At a meeting in the Town-hall, High Wycombe, to promote a movement for the creation of new institute buildings at Wycombe, it has been resolved that the Literary and Scientific and Mechanics' Institutes of the town should be amalgamated, with a view to increase the advantages afforded by such institutes, and that to carry out the amalgamation a suitable building, with reading-rooms, library, class-rooms, and an assembly-room for lectures and other public gatherings, should be provided. Committees were then formed to carry out the objects proposed. Frogmore Gardens were proposed as a site.

The Beacon at Westminster.—Last week some alarm was occasioned by a rumour that a fire had broken out in the upper story of the clock-tower of the new Houses of Parliament. There was not, however, any cause for apprehension, as the damage done was confined to the destruction of a small deal box lined with iron, in which the new beacon had been displayed, which the new beacon had been displayed, which became over-heated, and broke into a blaze, the gas which supplied the illuminating power was turned off as soon as possible, and the fire was stamped out without the use of water. This beacon adds a pleasant feature to London at night, and we hold it to be valuable. It gives a hint to calculate for; steadies the thoughts, and leads to precision.

Decoration of Enderby Church, Leicester.—The internal decorations of this church have just been completed. The chancel has been decorated throughout, a choir of angels painted on the wall above the chancel arch, and quaint ribbands, bearing legends, carried round the nave arcade and over the aisle windows. The west end of the nave has also received ribband decorations. The works have been carried out by Powell, Roberts, of Leeds, from plans prepared by the architect, Mr. Edward Birchall, of the same town, at the cost of Mr. Charles Brook, of Enderby Hall.

Rochester Castle Gardens.—These gardens are opened to the public on Wednesday afternoon, by the Mayor, in the presence of a large company. The gardens have been taken on lease by the Corporation from Lord Jersey. A public subscription has been raised for laying out the gardens and other work, which has already cost more than 2,000*l.* We gave a view of the sign some time ago.

Fire-proofing Experiments.—With reference to our report of an experiment at Edmondson, in fire-proofing, at Mr. Brannon's cottage, Mr. Edward Marshall asks us to say that the roof and floors of stables, and coach-houses there, are covered with asphaltic made and laid by Mr.

New Enterprise in Scarborough.—Mr. W. A. Waddington, of York, is erecting a restaurant, an arcade, a theatre, and a gentleman's club all in one building. A spacious entrance serves the whole edifice, the restaurant being on the ground. On the second floor is the arcade. Round the sides are ranged stalls to be filled with articles of taste and convenience. On the third story is a theatre, to be ready for opening early in July. The theatre will seat 800 people in gallery, boxes, saloon, and private boxes. Above is the gentlemen's club, fitted up with news-room and billiard-tables.

A Novelty in the Building Trade.—Our Exeter correspondent writes:—"A twenty-roomed house, complete with grates, stoves, and fittings, has just been brought by ship to Exmouth, for transmission by rail to North Tawton (North Devon). The house was built in Norway for a gentleman at North Tawton named Vicary. It is mostly built of wood, and, it is said, can easily be taken to pieces and put up again in any locality desired. . . . Men have been brought from Norway to put it up, so that the owner will be altogether independent of home labour."—*Pall Mall Gazette.*

The "Cahman's Rest."—A curious little structure has just appeared in the streets of Birmingham. It is a "cahman's rest," and is neatly made of stained wood and glass. It contains sitting accommodation for several men, and has a locker for their food. There is also an apparatus for cooking. The current expenses of the "cahman's rest" are to be defrayed by subscriptions of the drivers who avail themselves of its advantages. Its cost has been about 70*l.*, and it is the gift of the town mission, who intend, it is stated, to supply it with literature of an "instructive and moral tendency."

Miss Glyn's Readings.—On Friday, the 28th ult., Miss Glyn brought out a series of her readings to a close with an admirable presentation of "Measure for Measure." Selections from the "Merchant of Venice" and "Romeo and Juliet" had preceded it. Miss Glyn is reading better than ever: the union of force and delicacy, of subtle appreciation and effective characterization, has probably never been so strikingly exhibited before as during this series. It is to be hoped that some of our rising actresses have not failed to profit by the opportunity thus afforded.

Northumberland House.—A direct approach from Charing-cross to the Thames Embankment being required for the public convenience, the Metropolitan Board of Works propose to apply to the Duke of Northumberland, with a view of ascertaining whether he would assent to the introduction of a Bill by the Board for the acquisition of Northumberland House and grounds, and such other portions of his property as may be necessary for the formation of the approach.

Schools for Girls.—The Board of the trust for errying on the North London Collegiate and Camden Schools for Girls, Camden Town, at a meeting held on June 24th, appointed Mr. E. C. Robins their architect. Miss Buss, who for twenty years has made a success of secondary education for girls, and has nobly resigned her interest into the hands of these trustees, to secure the permanency of the institution, deserves public sympathy.

Docks for Bristol.—The Bristol Town Council on Monday did an important day's work. The Council evidently felt, as was anticipated they would, that the time for talk had gone by, and acting upon this conviction they decided, by thirty-three to twenty-two, not to assist to purchase the Channel Docks at Avonmouth; and next, by thirty-six to nineteen, they resolved to contribute out of the city funds 100,000*l.* towards the construction of Docks at Portishead.

Grimston Park.—This domain, in the county of York, with its mansion and park, covering an area within a ring fence of nearly 2,500 acres, was recently submitted to competition by Messrs. Driver, auctioneers, of Whitehall. There was a keen competition, and the estate was ultimately knocked down to Mr. John Fielden, of Dobroyd Castle, Todmorden, for the sum of 265,000*l.*

The Loughborough Loop Line of the London, Chatham, and Dover Railway.—The three large wrought-iron bridges on this line were manufactured and erected by Messrs. Matt. T. Shaw & Co.

Fuseli.—"The Dream of Quoon Katherine," spoken of by Allan Cunningham, and engraved by Bartolozzi, which was counted as lost in a fire that consumed the property of Mr. Watts, the celebrated publisher, has recently been brought forward by a member of the family. It is a fair example of the peculiar style of the artist, and has good qualities. The picture may be seen in Mr. Robinson's shop, in Brownlow-street, Holborn.

Emigration to Brazil.—A small pamphlet on the possessions and products of the different provinces of the Empire of Brazil has been published by Joaquim M. de Almeida Portugal, F.R.G.S., at the Commercial Agency of Brazil in Leadenhall-street. It will be useful to many having an interest in Brazil.

Metal-work at the Institute Conversation.—It is right we should correct a little slip in our notice last week. The crosses, candlesticks, and vases designed by Mr. Lonsdale, for St. Andrew's, Wells-street, were executed and exhibited by Messrs. Barkentin & Co.

A Glazed Surface.—Several correspondents desire to hear more as to the practicability and expediency of using glass for the lining of walls. Perhaps Mr. James will go further into the subject.

Ground-rents in the City.—According to the *City Press*, 120,000 square feet of land on the Holborn Viaduct have been let upon a building lease for 15,000*l.* per annum.

TENDERS

For erection of six residences at Ramsgate, Kent, for Mr. N. B. Kennard, Mr. Charles Baily, architect. Quantities supplied by Mr. Poland:—

Wigmore	£8,008 10 0
Barwick	7,797 17 0
Wilson	7,447 18 0
Osborne	6,625 0 0
Hayward	5,838 0 0
Smith & Sons (accepted)	5,250 0 0
Harrison	4,915 0 0

For making roads at the West London District Schools, Ashford, Middlesex. Mr. H. H. Collins, architect:—

Jones	£87 14 6
Brooks	85 0 0
Heston	75 0 0
Kirk	71 0 0
King	70 0 0
Batch	69 10 0

A GENTLEMAN, of thoroughly practical experience, is open to an ENGAGEMENT, to TAKE THE SUPERINTENDING AND CHARGES in an Architect's Office.—Address, W. 88, Leppel-street, Kentish-town, N. W.

TO ENGINEERS AND SURVEYORS. A YOUNG GENTLEMAN, who has been three years in an Engineer's Office (part of the time on large works), an experienced Trencher, and able to Level and Survey, wishes an ENGAGEMENT. Terms moderate where plenty of practice may be had.—Address, S. W. 14, Brixton-street, Barnsbury, N.

TO ARCHITECTS. A THOROUGHLY efficient ASSISTANT desires an ENGAGEMENT.—Address, A. O. 19, Oakley-crescent, Chelsea, S. W.

A WELL-QUALIFIED GENERAL ASSISTANT will be DISENGAGED at the end of this week. Has been accustomed to prepare designs and details, specifications, estimates, surveys, schedules of disbursements, &c.—Address, 183, Office of 'The Builder.'

TO ARCHITECTS, SURVEYORS, ESTATE AGENTS, &c. A JUNIOR ASSISTANT, hitherto engaged in the two first-named offices, offers his SERVICES in any of the above. Would wish to enter an office where a most draughtsmanship and writer is required. He is desirous to make himself generally useful, therefore would be found an acquisition.—Address, D. G. Postoffice, South, Hackney.

A JUNIOR ASSISTANT, capable of taking in neatly and framing, is WANTED in an ARCHITECT'S OFFICE.—Apply on Saturday and Monday Mornings, with references, to Mr. FALMER, 37, Bedford-square, Bloomsbury.

TO ARCHITECTS, &c. A THOROUGHLY efficient ASSISTANT, of twenty years' practical experience, seeks an ENGAGEMENT. Good references. Terms moderate.—Address, 208, Office of 'The Builder.'

A THOROUGHLY practical CLERK of a WORKS desires a RE-ENGAGEMENT. Involvement in years' engagement with an eminent architect. References unexceptionable.—Address, R. F. Mr. Faulkner, 26, Villiers-street, Strand.

TO DECORATORS, &c. A SUPERIOR DECORATOR, WRITER, GILDER, CHAIN-Painter, and FAIRBANKS, wants a constant SITUATION. Country preferred. Used to having charge of good work.—Address, T. H. Postoffice, Sutton Coldfield.

TO BUILDERS, &c. A VERY Respectable Person wishes to PLACE her SON, aged 14, just left school, at a BUILDERS, where he can learn the Carpenter and Joinery. No premium. First-class recommendation.—Address, W. C. 8, Hayes-court-terrace, Turbham Green, W.

ADVERTISER, with practical knowledge of building and engineering works, levelling, surveying, abstracting quantities, making drawings, &c. desires EMPLOYMENT.—Address, F. 58, 'Mercury' Office, Liverpool.

CONTRACTS.—Continued from p. ii.

ST. MARTIN'S CHURCH RESTORATION.—Builder desires a TENDERER for TAKING DOWN and REBUILDING the BODY of ST. MARTIN'S CHURCH, Birmingham, are requested to apply for particulars to the Architect, Mr. J. H. CRAWFORD, 28, Tottenham-street, Birmingham, on or before the 7th JULY inst.

By order of the Committee, HENRY J. HARDING, Secretary.

TO BUILDERS.—Persons desirous of TENDERING for the BUILDING of a PARSONAGE HOUSE, OFFICES, STABLES, &c. situate at Moughton, in the County of Montgomery, may view the drawings and specifications on or after this date. Tenders to be sent in not later than the 16th day of JULY instant. The lowest or any Tender will not necessarily be accepted. Address, THOMAS STURKES, Architect, Newtown, 1st July, 1872.

TO BUILDERS.—Contract for building Walls at Hansell Cemetery, Middlesex.—The Burial Board for the Parish of Saint Mary Abchurch, Middlesex, are willing to CONTRACT for building a BRICK WALL to inclose the cemetery partly purchased by them, and immediately adjoining their cemetery at Hansell. Specifications, plans and particulars of the work may be seen at the Office of Mr. JAMES BROADBENT, Surveyor, Vestry-hall, Kensington, on and after MONDAY next. Sealed Tenders, addressed 'Tender for Wall,' are to be delivered at my Office, before FOUR O'CLOCK in the afternoon of MONDAY, the 29th JULY instant. The contractor will be required to execute a written contract and bond, and to provide two sureties in a penal sum of £200. The Board do not bind themselves to accept the lowest or any Tender. G. GREEN, Clerk.

Vestry-hall, Kensington, July 4, 1872.

BOROUGH OF WOLVERHAMPTON.—The ROAD CONTRACTORS.—The Streets Committee are desirous of receiving TENDERS for Works required to be done in SEWERING, DRAINING, FORMING, METALLING, PAVING, KERBSHING, and CHANNELLING about 3,000 lineal yards of Streets in the East Borough. Plans, sections, and specifications may be seen and forms of Tender obtained on application at the Borough Surveyor's Office, on and after the 9th day of JULY, 1872, and Tenders to be sent to the said Office at or before FOUR O'CLOCK on TUESDAY, the 30th day of JULY, 1872, addressed to the Chairman of the Streets Committee, and endorsed 'Tender for Works.' The Committee do not bind themselves to accept the lowest or any Tender.—By order, H. UNDERHILL, Town Clerk. Town-hall, Wolverhampton, 18th June, 1872.

BOROUGH OF SWANSEA.—TO CAPITALISTS, CONTRACTORS, and OTHERS.—The Swansea Local Board of Health are prepared to receive TENDERS for the SUPPLY of GAS for a term of not less than ten years. The contractor or lease to provide and lay down, at his own expense, the necessary mains, and connect the same with the lamp pillars and lamps of the Local Board. No new or additional mains are required, as the Local Board, or their contractor or lease, are already empowered, by Statute, to break up the streets and lay the pipes, and subject to the by-laws of the streets, or any of them, to supply private consumers, and recover the gas rents. The population of the borough is 22,000. For particulars and forms of Tender, apply to Mr. EDWARD COLSTONS, Surveyor, Guildhall, Swansea. Sealed Tenders, marked 'Gas Tender,' to be delivered by post, addressed to the Town Clerk, Swansea, not later than MONDAY, the 8th day of JULY, 1872.

RICHARD AUBREY ESKET, Town Clerk, &c. N.B.—The corporation have laid out contracts for the gas, and at the lowest level, which might be treated for by any new Gas Company. Guildhall, Swansea, May 13, 1872.

TO PAVIERS and OTHERS.—The Streets Committee of the Commissioners of Sewers of the City of London will meet in the Guildhall of the said City, on FRIDAY, the 13th JULY, 1872, at TWO O'CLOCK precisely, to receive TENDERS for a quantity of OIL PAVING-STONE, now lying at Phoenix Wharf, Whitehall, and which may be inspected by any person on or after the 10th day of JULY, 1872, in accordance with a specification which may be seen at the Office of the Engineer and Surveyor to the Commissioners. The Commissioners do not bind themselves to accept the highest or any Tender. Tenders must be sent, addressed to the undersigned, before TWELVE O'CLOCK on the day of TENDERS, to Mr. EDWARD DAW, Principal Clerk, Sewers Office, Guildhall, 4th July, 1872.

AUCTIONS.—See also p. xvi.

HAMPESTEAD.—First-class Building Plots in a favored locality, a short distance from the Finchley-road station on the Hampstead Branch of the Great Northern Railway, and near the residence of the villa residences, TO BE SOLD by AUCTION by MESSRS. JONES & RAGGETT, at the Rooms, 11, Abchurch-lane, London, on TUESDAY, JULY 16th, 1872, at TWO O'CLOCK, punctually, SIXTEEN FREELAND BUILDING SITES, in well-proportioned lots, and of various situate on the Hill-field estate, admirably placed, abutting on the Finchley-road and Fortune green, near the Great Northern Railway. The estates are ripe for immediate building operations, good roads are fully made, and 4 feet covers of the parish authorities at a great outlay. Four-fifths of the purchase-money may remain payable in four equal annual instalments—particulars and conditions of sale, with plans, of H. J. GODDEN, Esq. Solicitor, 188, Fenchurch-street; H. G. BARTON, Esq. Surveyor, 10, Old Jewry, Gunpowder-square; T. R. CRABB, Esq. Secretary, Land Company of London (Limited), 51, Abchurch-lane; or Messrs. JONES & RAGGETT, Auctioneers, Valuers, Surveyors, and Land Agents, 3, Adelaide-place, London-bridge.

Building Materials of a large Masson within five miles of the City. MR. PHILIP D. FUCKETT is offering for SALE by TENDER, in one lot, the whole of the valuable MATERIALS and costly FITTINGS of a large MANSION, very conveniently situated within five miles of the Bank, and close to one of the largest railway depots and manufacturing centers, where there is a constant demand for such materials, comprising about 100 tons of iron, including a mill, a boiler, and a steam engine, and fifty square of sound laths, some modern oak, and mahogany joinery, with a large stock of mahogany and other fine woods, and a large quantity of iron, including 40 feet of 20 feet, two smaller greenhouses, and the whole of the materials in the house, including the roof, &c. May be viewed at particular intervals at the Office of Mr. PHILIP D. FUCKETT, Surveyor, 10, Old Broad-street, E.C. where Tenders are to be delivered on MONDAY, JULY 15th, at TWO O'CLOCK.

CHELSEA.—FREELAND BUILDING LAND.—TO BE LET on Lease about 1/2 ac. of LAND, opposite the Hospital grounds, and fronting the Chelsea New Bridge-road, Commercial-road.—For particulars, apply to Messrs. FULTON, 9, Whitechapel.

DANIELCH-ROAD, PIMLICO.—To BUILDERS, CONTRACTORS, and OTHERS.—TO BE LET, important PREMISES, occupying an area of three-quarters of an acre of ground, with a large workshop, and a large water area, and a large office, &c. and extensive frontage to Belgrave Road, suitable for any business or manufacturing requiring space. Immediate possession can be had. For further particulars apply to Messrs. FAREBROTHER, LYE, & WHEELER, Surveyors, 8, Lancaster-street, Strand.

TO BUILDERS and OTHERS.—BUILDING LAND, at Shepherd's Bush, TO BE LET on Lease, a short distance from two railway stations. Omnibuses to the City. Roads and sewers made, and in all respects ready for building. The estate is well situated. Apply to Mr. HENDERSON, 30, Harwood-square, London, N. W.

TO BUILDERS.—Eligible GROUND, at Brighton, for workmen's cottages and small-class houses. TO BE LET, at low ground rent, and with the advantage of a water supply, as may be required. The land is within five minutes' walk of three railway stations, having trains to and from the city, and the sea, occupying fifteen minutes either way. When buildings are erected in, advances of 40 per cent. may be obtained. If required, by order of unexceptionable references, and on the most approved plan. For further particulars, apply to W. G. HABBESHON & PITE, Architects, 48, Bloomsbury-square.

TO BUILDERS.—A most desirable PLOT of GROUND TO BE LET, for Villas and Shops, with a fine view of the city, and a short distance from the Victoria-terminus, and in a most desirable locality. Advances supplied if required.—Address, Mr. N. DANDO, Torrington Park, North Finchley.

TO BUILDERS and OTHERS.—TO BE SOLD, in a finished neighbourhood, a piece of FREELAND LAND, suitable for three houses of two storeys each. Good soil. Omnibus to the City, &c.—For particulars apply to No. 6, Victoria-terminus, Russell-street, Victoria.

TO BUILDERS and OTHERS.—TO BE LET, on Leases, for 99 years, a direct frontage of 100 feet, in a most desirable locality, an excellent frontage of LAND, within a few minutes' walk of the new Railway Station at Stoke Newington. Respectable tenants, and the ground is in a most desirable locality. The above is a good business for a young man wishing to commence business.—Full particulars at the Auctioneers' Office, 20, Regent-street, Waterloo place. (Folio 317.)

GREAT NORTHERN BRICK COMPANY, LIMITED.—TO BE SOLD, by Private Contract, the PROPERTY of the above Company situated in a most desirable locality, and consisting of a large area of freehold and copyhold, more or less, containing an inextinguishable supply of sand, &c. of 200 acres, and a large quantity of building materials. Cards to view the property may be obtained at the Company's Office, No. 2, White, Great Northern Railway, King's Cross, June 27th, 1872.

WIGMORE-STREET, CAVENDISH-SQUARE.—MR. JAMES BEAL has FOR SALE the LEASE of excellent BUSINESS PREMISES, together with the appropriate furniture, and the good-will of a Flouring and Dressing Business. The above is a good chance for a young man wishing to commence business.—Full particulars at the Auctioneers' Office, 20, Regent-street, Waterloo place. (Folio 317.)

LAMB'S CONDUIT-PASSAGE, RED LION STREET, HOLBORN, and CHURCH ROW, ALDOSTRE.—TO BUILDERS and OTHERS.—TO BE LET by TENDER, from Michaelmas, 1872, on a Repairing Lease, for 14 years, EIGHT small but substantial HOUSES with SHOPS, on the southern side of Lamb's Conduit passage, and well adapted for trade. Also, TO BE LET, on a Repairing Lease for 21 years, from Michaelmas, 1872, NINE small HOUSES or TENEMENTS, with about No. 2, 10 on the western side of Church-row, leading from Aldgate to Houndsditch, and containing an excellent business, and well adapted for trade. The above being considerable.—Particulars of the repairs and conditions required in each case may be obtained at the Surveyor's Office of the Corporation, Newgate-street, City. Tenders, endorsed 'Tender for Lease,' are to be left, with references, at the Counting-house of the said Corporation, on or before the 10th day of JULY, 1872, at TWO O'CLOCK, precisely. M. S. DUNN, Clerk.

TO PLUMBERS, HOUSE DECORATORS, and OTHERS.—TO BE DISPOSED OF, a thorough genuine old-established BUSINESS, situated in a most commanding position in the City of London, Kensington.—Inquire on the Premises, a Newland-terrace, Kensington.

TO BUILDERS and OTHERS.—FOR DISPOSAL, an established Jobbing BUILDERS and UNDERTAKERS BUSINESS, well conducted, and profitable. An excellent chance for an energetic man. Terms very easy.—Address, Y. Z. Postoffice, Hallow.

TO BRICKMAKERS and OTHERS.—TO BE SOLD, with a royalty, NINE ACRES of FREELAND BRICK-CLAY, in a most desirable locality, about three miles from London, on the high road.—For particulars apply, by letter only, to Mr. A. B. BULLOCK, Brick-maker, Bullock's, Bullock, Bedfordshire.

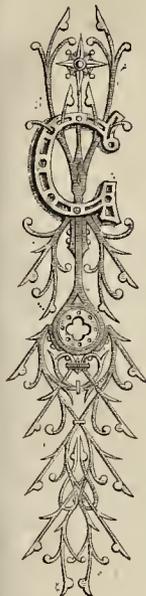

CLERKENWELL.—TO BE LET, on a building lease, a PLOT of BUILDING LAND, occupying an area of about 15,000 square feet, situate near the Farringdon-street, and on the high road, and in a most desirable locality. For particulars apply to Messrs. FULLER, HORSEY, SON, & CO. 11, Pall-mall-square.

HOUSES.—WANTED, the REPAIRING LEASES of a few substantial Houses in W. C. District, where a profit return is obtainable by letting in tenements. To obtain same, persons will be required to secure PROPOSALS for a lease. These will be allowed.—Address, G. H. 2, Buxton-street, W. C.

WANTED, FREELAND OR LEASEHOLD GROUNDS.—TO BE LET on Lease for 99 years, or for 21 years, or for 14 years, or for 7 years, or for 3 years, or for 1 year, or for 6 months, or for 3 months, or for 1 month, or for 6 weeks, or for 3 weeks, or for 1 week, or for 6 days, or for 3 days, or for 1 day, or for 6 hours, or for 3 hours, or for 1 hour, or for 6 minutes, or for 3 minutes, or for 1 minute, or for 6 seconds, or for 3 seconds, or for 1 second, or for 6 tenths, or for 3 tenths, or for 1 tenth, or for 6 hundredths, or for 3 hundredths, or for 1 hundredth, or for 6 thousandths, or for 3 thousandths, or for 1 thousandth, or for 6 ten-thousandths, or for 3 ten-thousandths, or for 1 ten-thousandth, or for 6 hundred-thousandths, or for 3 hundred-thousandths, or for 1 hundred-thousandth, or for 6 millionths, or for 3 millionths, or for 1 millionth, or for 6 billionths, or for 3 billionths, or for 1 billionth, or for 6 trillionths, or for 3 trillionths, or for 1 trillionth, or for 6 The Builder.

VOL. XXX.—No. 1536.

The Risk of Buildings from Fire.

AAPTAIN SHAW, of the London Fire Brigade, has published a little book, under the title of "Fire Surveys," which, if well studied and acted on by those engaged in the construction and the guarding of buildings, will save life and property in time to come.* If it were desired that we should point out its main purpose, we should say it was to enforce the truth which has only recently dawned upon legislators and constructors, that iron and stone are not fireproof materials,—stone is absolutely inadmissible for stairs, or to support weights internally, and no structure can properly be called fireproof the ultimate strength of which depends on any metal.

We will give a general view of the writer's argument, but we advise our readers to obtain the book for themselves. In the whole range of building materials, he maintains, there is perhaps none so unsuited for resisting fire as that most commonly in use—stone. It is true that, if imbedded in cement or in thoroughly good mortar of lime and sand, it will resist for a considerable time heat gradually applied; but even in such a case it will become calcined, and will crumble to so great an extent as to be unable to carry a load afterwards. In the case of any sudden change of temperature, either from cold to heat or from heat to cold, it cracks instantly without notice, not only leaving a passage for smoke and flame, but in many instances causing the wall to fall. Stone may, however, be used with a certain amount of safety for external walls, but even for this purpose it is very much inferior to bricks.

Bad mortar is frequently a cause of heavy loss; it has no adhesive power, and consequently fails to bind the other materials in such a way as to prevent buckling. A great quantity of the mortar used in this country during the last fifty years is but little better than road mud, which, though in itself well suited to resist fire, is wanting in the most essential qualities for combining with other materials.

Walls should be constructed in such a manner as not to separate easily either from defects in the foundation, irregularity of the loads placed on them, vibration, shocks, or other causes. A wall built of hard bricks laid in sound mortar or cement, and properly bonded, is perhaps the soundest of all for general purposes; but even such a wall is likely to fall on an emergency, if not firmly bonded into a cross wall. Enormous losses have been occasioned by the absence of

this latter kind of bond; in fact, most firemen of experience can call to their recollection numerous instances of a front and side wall becoming disconnected at the corner, each falling out separately, and breaking only on contact with the ground; thus showing that, although each may have been a sound wall in itself, the two together were useless as sides of a building for want of a proper corner tie.

Bond timber in walls is dangerous, as we have long taught, and should not be allowed. When it rots or burns, there is a tendency in the walls to crack. Hoop iron forms a much better bond, and is free from the drawbacks attending the use of wood. Lean-to buildings are dangerous if there are windows in the wall above them. Weather boarding causes two dangers,—one of taking fire from without, the other of conveying fire through the windows. Wherever iron is used, it must be allowed sufficient play for its elasticity, and also for the expansion and contraction which it undergoes unceasingly in consequence of changes of temperature. In some places it is the custom to encase the ends of a bresssummer in cast-iron shoes, but this is a very bad practice, and should not be permitted, as the iron would convey fire rapidly from one side to the other. An external wall should be firmly tied to party and return walls by strong wrought-iron anchors, of sufficient strength and number to keep the whole outside of the building firmly fixed without the assistance of floors, roofs, or internal ties of any kind.

Captain Shaw has no faith, nor have we, as a rule, in that mysterious, unsatisfactory, and most expensive process known by the vague and unmeaning title "under-pinning," which in point of fact is nothing more or less than a device or trick to hide what is in every case at least a damage, and, as all firemen of experience have frequently and bitterly realised, in many instances an imminent and serious danger. This process, or device, or trick, or whatever it may be called, may possibly be adopted with some degree of safety in small, light, new, and isolated buildings, to obviate defects arising from the ignorance or carelessness of the constructor, but it is wholly inadmissible on a large scale in warehouses or in those long continuous blocks of buildings which form the streets of all great towns. Even when this mode of patching up and concealing a damage is successful, it may be productive of incalculable mischief; as, for instance, if a single building of a row or block is under-pinned and the rest allowed to go on in their natural process of sinking, the result almost invariably is a settlement of the walls of the adjoining houses, accompanied by danger in direct proportion to the fracture. Walls may be destroyed by buckling outwards from a thrust or inwards after the falling of the floors, by inherent weakness, absence of proper ties, and in a variety of other ways which will be afterwards explained; but the principal cause of their "tumbling about," to use a fireman's expression, is undoubtedly in almost all cases the want of a proper foundation. The weights carried by different parts of the same wall frequently vary very considerably, and if the ground underneath be all of the same consistency, as is generally the case, some intermediate structure beyond a common foundation is absolutely necessary for buildings liable to be heavily or irregularly loaded. The neglect of this precaution has frequently been the cause of heavy losses.

Coppings, balconies, cornices, or other projections should never be constructed of stone, as this material is certain to fall down at an early stage of a fire, and is likely to kill both persons endeavouring to escape and those coming to render aid. Wherever such projections are placed, and whatever material they may be composed of, they should invariably be well

supported from the inside, and should be of a weight in proper proportion to the strength and tenacity of the internal supports. Cornices and other projections of the same kind are very dangerous when the internal supports are burned away, and the bond stones by which they are generally fastened to the walls are of no use when flames are coming out of the windows underneath. This is a point very much neglected in many large buildings, but it is one of paramount importance in connexion with fires.

No fireman of large experience has ever seen a stone staircase escape when subjected to much heat; and, this being the case, it would seem to be most desirable that there should be introduced a prohibition of the use of stone as a material for lobbies, corridors, passages, landings, or stairs, except where it is supported throughout and not overhanging in any part. We repeat that the use of stone is most dangerous for this purpose, except when it is supported throughout.

Ordinary stone steps are very dangerous, as their strength entirely depends on their being kept at the common temperature of the atmosphere; in other words, they are dependent on the power of the iron doors to resist the fire; and, when these fail or are left open, and the flames hurst through, the whole of the stairs above that level are crumbled into fragments in a moment, and would of course kill every one whose duty it might be to be at work on or under them at the time.

The author summarises some facts of recent date which serve to enforce what is said above. In the autumn of one year, and again in the beginning of the next, there were serious fires in some large waterside premises, and on both occasions large stocks of inflammable materials were stored in warehouses constructed of brick, wood, iron, and stone. After each of these fires the following results were observed:—The bricks were uninjured; the wood was seriously damaged, but only partially consumed; the iron was fractured, and consequently rendered worthless; and the stone was shivered into fragments, and totally destroyed. At a fire which took place in the basement of a private house, a cupboard and some small articles of furniture were burned, and the fire was confined to the spot in which it originated. The stairs leading from the basement to the ground-floor were of stone, and were separated from the basement by a door and partition, both of wood, only 1/2 in. thick in the panels, and this door and partition, though very much charred on the inside and blistered by the heat on the outside, were not burned through. No fire whatever reached the stone stairs, and nothing but heat from either above or below; no water was thrown on them to cool them suddenly, and no draught of cold air from outside passed over them; and yet they were broken into fragments and totally destroyed up as far as the first landing, where they ended, and the wooden stairs commenced.

At a fire which took place in some large warehouses, all the stone stairs and the so-called fireproof flooring failed utterly at an early stage, and as it was consequently impossible for the firemen to do their work inside, a large destruction of property took place, which certainly would not have been the case had there been means of access to the several floors either by wrought-iron stairs, strong enough to bear the weight of the men, but not so heavy as to be in danger of coming down with their own weight, or even by sound and well-constructed wooden stairs with wooden landings over.

A fire occurred in a house at the corner of two streets supported altogether by iron columns, and at an early stage of the fire the supports softened, and the house, without a moment's warning, fell completely down, not leaving a vestige of any kind, except a small portion of a chimney-breast, to show where it had originally

* "Fire Surveys; or, a Summary of the Principles to be observed in estimating the Risk of Buildings." London: Eillingham Wilson, 1872.

stood; and yet there is at the present moment to be seen at the corner of two streets a new building recently erected, 90 ft. long, 24 ft. deep, and from 70 ft. to 80 ft. high, supported entirely on iron columns, without any wall, wood, or brick work reacting to the ground along the whole line of the front. There is no doubt that at the ordinary temperature of from 60° to 70° Fahrenheit the whole building must inevitably fall down, and such a temperature could easily be created by the combustion of a very small quantity of household furniture or any other inflammable articles.

It will not be denied that there is matter here calling for wide and earnest consideration, and that Captain Shaw has done a good and useful work in bringing it together.

FINE ART IN BETHNAL-GREEN.

The opening of the Branch Museum at Bethnal-green, to which we alluded in a recent number, is an event of unusual interest among the exhibitions and art-displays of the year. The South Kensington Museum, as erected in 1857, shared the disadvantage which the entire group of kindred buildings inherited from their progenitor, the original Crystal Palace of 1851, of being essentially temporary in its structure. For a fairly palace, destined to shelter for three or four short summer months such a collection of beautiful objects as the world had never before seen collected, and then to vanish as rapidly as it rose, the building projected by Paxton, and scientifically designed, as well as practically executed, by Sir Charles Fox, was, no doubt, admirably suited. Rapidity of construction, abundance of light, and such constant repetition of the same detail as to economise to the utmost both time and cost in the preparation of the iron-work, were the objects aimed at, and attained, in the Hyde Park building. Architectural grandeur was thought of. Shelter was the thing sought. The effect actually produced by the exterior was striking from its novelty, its magnitude, and the summer brilliancy of its material, when new. For the English winter such a building was never designed, and was manifestly unsuitable. So great, however, was the effect produced on the imagination of the people by the unprecedented success of the first Exhibition, that a strong effort was made to retain in perpetuity the great summer conservatory in Hyde Park. When that effort failed, the next idea was to preserve the building as far as possible unchanged; and the Crystal Palace at Sydenham was the first resurrection of the Exhibition. This was inaugurated a style of architecture, for indulging in which the shareholders have to pay a yearly mulct in the shape of repairs, maintenance, and depreciation of material, that must by this time have amounted to a sum too large to be pleasant to calculate. The building that was erected at South Kensington in 1855 to receive various miscellaneous collections acquired from the first Exhibition, together with the fine-art collections exhibited, since 1852, at Marlborough House, consisted chiefly of iron and wood, and was generally known to the public by the name we gave to it (when the design was only on paper), hoping to prevent the transformation of its ugly forms into iron and glass,—the Brompton Boilers. It soon became necessary to replace this ill-designed structure by something of a more permanent nature; and by 1865 the brick buildings at South Kensington had so far advanced as to allow of the removal of parts of the original iron.

Our readers know of the circumstances which resulted in the purchase of land and the erection of a portion of the Brompton building in Bethnal-green. We cannot avoid a fear that the good people of the East will one day regret that they had anything to do with the old iron-work at all; however, it has gained them help in other ways, and it will at any rate serve their purpose for a time. Our present business is with its contents. The food collection and animal product collection of the South Kensington Museum have been removed to this branch establishment, together with the magnified drawings of articulate animals. Of the beauty and value of these collections we have already spoken in high terms. They form an educational element of great value, and appear to attract even more attention at the East, than they did at the West, end of the town. It is to be regretted that the light in which they are bestowed does not give them a better illumination. The remaining contents of the building are the property of Sir

Richard Wallace. They have been most generously lent by him to the Museum, and placed there at his own expense, most of them having been expressly sent from Paris for the purpose.

This collection is of a beauty hard to characterise in appropriate words. It is, in one respect, unique. It bears the impress of the same presiding taste, we do not say of the absolute taste of one individual, but of selection on the same principle. Never has there been a nobler apology for the possession of an immense fortune. Wealth has been directed in a manner that it would have been impossible to effect had it not been the wealth of one man. A nation would have shrunk from the price paid for some of the objects. Only the other day, it was the same not afford, which the National Gallery could not afford, presented it freely to that institution. It is evident that no object in this great collection has passed through the meshes of economy. What the noble owner chose, and thought appropriate, he bought, whatever was its cost. What he did not choose, he let alone. It thus happens that we have no rubbish,—no picture that can be called inferior, if we speak of its actual merit. Nay, though of course some are rarer and more costly than others, there is a homogeneity about them which is one chief charm of the whole. We are well acquainted with a unity of this kind in many a collection and in many a shop,—but then it is for the most part a unity of want of merit. Just as in certain shops,—we could supply the names of a good many,—you are sure never to get anything that is thoroughly good, never that which is best of its kind; just as you see in certain collections that the collector could never make up his mind to give more than a certain limited price for anything, so do you see in this grand series of paintings, porcelain, bronzes, build, and other objects, nothing admitted that has not on the wedding-garment of beauty and of merit.

The chief value of the collection as a whole is its wide representation of French, Dutch, and Flemish art. The Italian and Spanish schools are, indeed, represented; but it is to an extent that rather serves as an illustration of their continental neighbours than on their own account. Thus many collections may be named, notably that of our own National Gallery, where there are finer Italian pictures. There is no Correggio. There is only one painting attributed modestly to the "School of Raffaele." There are two Titians; one Giorgione, which we should have called a Titian, and works by, in all, twenty Italian painters. Five Spanish painters are represented, notably Murillo and Velasquez.

The works of no less than twenty Englishmen are also there, and selected with such admirable taste as not to contrast, but to harmonise with the general tone of the collection. Thus, Mr. Sant's "Portrait of a Lady" holds its own amid such distinguished company. The number of artists represented in all is 198, besides four pictures from unknown hands. The number of oil-paintings is 598, and that of water-colour drawings is 123.

While the greatest artistic novelty to the English visitor is the full and admirable representation of the French school, both late and present, the first interest, especially bearing in mind the locality of the Exhibition, attaches to the English pictures. Among them, notably, we have an example of the attraction of a well-chosen subject, even if imperfectly represented to the eye. Thus Morton's picture of the Duke of Wellington and Colonel Gurwood, although it cannot be called a work of high art, is one of the centres of attraction. The great commander is seated in a semi-military dress, handing a folio of paper to his historian. The costume is sufficiently bygone to look strange and quaint, although it has not yet attained to the dignity of actual antiquity. The attitudes are constrained; the faces are but shadowy presentations of the men. And yet the picture, which is from Lord Northwick's collection, is one that lays hold upon the memory, and seems to bring one thoroughly into relation with one of the greatest men of modern times.

Another picture of extreme interest is a small view of Conway Castle, painted by Sir George Howland Beaumont. Those who remember the life of Sir David Wilkie, or are familiar with the literature of that day, will be aware of the very high position which this gentleman deservedly held as a connoisseur. He was one of the very

few persons who were trained and judicious art critics; and whose intelligent and luminous discourse contrasts so strikingly with the tone of much of the flippant criticism of to-day. His remarks are enforced by his practice. In "Conway Castle" we have a proof that Sir George had the very best basis for sound criticism; the power of illustrating his own precepts. The picture is the very opposite of pretensions. In the first great requisite of a real landscape, unity of idea, it is perfect. In the scarcely less important element of masterly arrangement on the canvas, it is no less so. It fills the mind, without filling the scene. It is a distinct subject, not a square bit of country cut out. Nor is the manipulation inferior to the imagination. The quiet subdued harmony of the browns and greys, the natural mode in which the ancient walls moulder on the canvas, the tints and treatment of the whole, render this a most instructive, as well as a charming painting.

There are two Gainsboroughs,—the portrait of Miss Boothby, and a full-length "Portrait of a Lady,"—the tantalising non-explanation ought to be peremptorily banished from our catalogues—of great beauty. She is a woman of an exquisite pink and white complexion, which time has respected,—on the canvas. The dress is white, relieved with blue, and a fine little white Pomeranian dog is not out of place; as it is not made, as in modern portraits that we can cite, the *motive* of the picture. Very noticeable is the extreme freedom,—to use the politest word,—of the background; a mere green indication that the painter, the fair human personality, does not suffer by this masterly negligence. On the contrary, the manner in which the woman interests you is a strong condemnation of the marble columns, and elaborated perspectives, and highly-polished boots, which find favour with the public of to-day.

Of Reynolds, the great rival of Gainsborough, there are no less than thirteen examples, including "The Strawberry Girl," so well known from the engraving, from the Rogers Collection; to which Mr. Black appends the rubric,—"The painter thought so highly of this work that he called it 'one of the half-dozen of original things' he had produced." We wish that the accomplished editor of the catalogue had given us more of this explanatory gossip. Few men now living could do it better, and the value of the collection, to ninety-nine visitors out of a hundred would have been thus materially enhanced. "The Strawberry Girl," like almost every work of Sir Joshua, has sadly faded. The eyes yet look out with almost a supernatural brilliancy. They recall the look of one of those exquisite and tiny monkeys,—the silky tamarins,—that come to our climate only to die of consumption. Then there is the portrait of the famous Perdita, Mrs. Robinson, as to whose illustrious scandals the catalogue is mute; then the characteristic form of William, Duke of Queensberry, known as "Old Q.;" Miss Bowles, engraved under the title of "Love me love my Dog;" and Nelly O'Brien, *paraded* as a celebrated beauty of the time, and frequent sitter to Reynolds. There is Mrs. Carnac, a portrait engraved by J. R. Smith; and the tender and charming group of Mrs. Hoare and Son, in which the loving maternal glance tells of a care and tenderness which is never without its own reward.

With regard to the condition of the pictures, we must remark that perhaps there are not half a dozen Reynoldses in the world in anything like their original lustre. If we do not find one of these in the present group, none the less must we speak with unstinted admiration of the admirable condition of the whole collection. Not only has all care been taken, but it has been intelligent and learned care, which is a very rare thing as to pictures. So charming is the condition, that the had illumination of the gallery is to a great extent disguised by it. It is only by the comparison of known pictures, as they look here, and as we remember their appearance elsewhere, that we are enabled to speak so positively on the subject.

With the fine group of paintings by Sir Joshua Reynolds, and happily selected so as to harmonise with the tone of such illustrious companionship, are two pictures by John Hopper. One of them is a very beautiful portrait of an unnamed lady; the other a portrait of the late King George IV, when Prince of Wales. Hopper has been fortunate in seizing the best side of a character in which that aspect was ordinarily veiled by that personal irresponsibility which is

encouraged by the fictions, no less than by the imposing of the constitution of the country. There is much in the portrait to remind the spectator of the genial qualities of the actual inheritor of the title. Sir Thomas Lawrence was rarely more successful in his graceful mannerism than in the well-remembered portrait of Lady Blessington, which is here, together with another female portrait by the same artist. Gilbert Stuart Newton and James Sant are each represented by a graceful female portrait. By Charles Grant there is a sketch, rough almost to unintelligibility, of Count d'Orsay on horseback. There is a classic group, by William Hilton, of Venus appearing to Diana and her nymphs. The incident appears to have arisen in the imagination of the painter, and the picture is open to much criticism, but there is great beauty in some of the faces. The bold, frank, modest countenance of Frank Stone's "Boulogne Fish-Girl," whose comely face looks out from under a red kerchief, is an idealisation of the subject, so far as our own experience of the race and of the locality goes, that does much honour to the artist. "After the Masquerade" is another striking picture by the same painter.

There is a very graceful picture by W. P. Frith, of a lady, dressed in white silk, bearing wine on a salver. Westall's "Waking of Aphrodite" is a good example of the special treatment of classical subjects by that elegant but rather antiquated painter. The miniature finish of the flesh is remarkably delicate, and the sly glance of the opening eyes is admirable. Sir David Wilkie is represented by two small but life-like pieces of Scottish genre painting, "Scotch Lassies Dressing," and "The Sportsman Refreshing." The style and labour of Sir David are brought out with unusual distinctness by comparison with the fine view of Conway Castle, by the accomplished friend, patron, and critic of the Scottish artist, Sir George Beaumont, to which we above referred. From Clarkson Stanfield we have the view, so well known by the engraving, of "Bacharach, on the Rhine"; a little faded, but still an admirable landscape. There are six landscapes by David Roberts; churches in Spain, a mosque in Cairo, a Moorish festival, Seville, Valladolid, and Baalbec. A group of cattle by Thomas Sydney Cooper bears inspection alongside of the works of the famous Flemish cattle-painters. We must not omit the well-known "Humble Friend," by Sir E. Landseer; by whom there are also a "Highland Group," and a female portrait. Among these works of English painters (by virtue, no doubt, of the subject), is a family piece, the Earl of Hertford, on panel, by François Clouet, called Janet, a French artist of the sixteenth century. Another family picture, the portrait of Lady Elizabeth Seymour Conway, daughter of the Marquis of Hertford, by Sir Joshua Reynolds, is marked by a rare degree of noble feminine beauty. Rather further on in the gallery, but naturally classed among those English portraits and scenes, is the very graceful picture of Her Majesty, when in her bright girlhood she was suddenly called to occupy the throne, towards which she is represented as stepping, by T. Sully, an American painter. This picture is also well known by the engraving.

The paintings of which we have spoken hang on the walls of the gallery. On Screen A, in the immediate vicinity, are eleven pictures, of minor size, by Richard Parker Bonington, whose life of only twenty-seven years gave promise of so much fertility. Among these is the well-known incident of the entrance of the Spanish ambassador into the presence of King Henri Quatre, when his Excellency found the gallant monarch on all fours, acting as a horse to one of his children. The look of the king, caught in this unwonted attitude, is admirable, both as to likeness and as to expression. There is, as a pendant, a reception of the English ambassador by Henry III., accompanied by his monkey and his parrot,—a peep at the manners of that crowned madman who gave to Europe the noblest of the orders of modern chivalry.

From the well-selected and brilliant illustration of English painters, we pass, by a natural and appropriate transition, to the works of the Dutch and Flemish artists that occupy the west and north galleries. Here again we recognise a selection characterised by admirable taste; and possible only to splendid wealth. Familiar as we are with most of the pictures, whether by former exhibition in London or elsewhere, or by engravings, we feel it a great privilege to be able to refresh the memory. There are six magi-

ficent Vandycks. The Jane-like young Flemish lady, whose beauty so impressed on the writer of the catalogue of the Exhibition of Old Masters last year at Burlington House, as to lead him to attribute to her royal rank—the wife of Philippe Le Roi—is here, together with the no less admirable portrait of her husband. There is a figure called by the name of Paris, which is unsuitable for that designation, as being entirely foreign from Greek physiognomy, but which, this difference being laid aside, is a most happy imagination of the fascinating beauty attributed to that royal shepherd. It must be an idealised portrait, and it is wonderfully fine. The Virgin and Child, without being a Vandyck of the first class, bears signs of its pedigree. A full-length male portrait, the subject of which is, unfortunately, unknown, is one of the noblest we have noticed in this or in any collection of paintings. The portrait of the wife of the painter Cornelius de Vos, is also a most noble example of the manner in which this prince of portrait-painters could throw upon canvas the very life of his subject.

Eleven Rembrandts are here, including the portrait of an old lady, as to whom Mr. Black has not followed the example of the Royal Academician catalogues in describing her as "Rembrandt's mother." Chief among these for its impressiveness, and almost unique in its character as a Scripture scene, is the group of "The merciful Servant." Lavater would have decried for pages on the marvellous physiognomic power with which this unamiable personage is drawn. You see at a glance a selfish, remorseless, shifty personage, low in intellect, almost to the verge of egotism, but giving more distinctly the idea of aptness to grasp at any sudden advantage than can well be described. A young man, in leathern jerkin and steel morion, is the very embodiment of watchful, alert obedience. An elder man, who guards the culprit on the other side, looks eager in his desire for justice, no less than in his duty to his lord. The latter, a fine dignified figure, almost more of a Persian than of a Jew, is giving sentence as matter of justice, not of revenge. Altogether it is a wonderful group, and one of which the study is calculated to throw more than doubt on the authority of the very vulgar picture in our National Gallery, "Christ Blessing little Children," as to which so lively a controversy arose at the time of its purchase. Most of the other Rembrandts are portraits, including one of the painter himself, intermediate in age between the two in the National Gallery. There is a "Youthful Negro," which, not only from its physiognomic power, but as a study of sombre tints, black and blackening green and brown, and an underglow of gold, reflected one cannot tell whence, is of prime value as an academic canon. The famous portraits of the Burgomaster Palekan and his wife, from the collection of the King of Holland, which were at Burlington House last year, are also in this exhibition.

The indications occasionally given of the sources from which the late marquis derived his *chefs d'œuvre* are so interesting, that we only wish they were more numerous. Thus in the pictures from the collection of Cardinal Fesch, the absence of real taste in the *bourgeois* churchman is at once to be remarked. We observe that the evident slip of the pen in the catalogue, which entitles No. 64, "The Departure of Jacob into Egypt," has been corrected in the label of the picture. It represents the division by that acquisitive patriarch of his family and possessions into distinct companies, when he was about to pass over the ford Jabbok, and to come into the presence of the brother he had wronged. It is a vulgar picture. The "Virgin and Child," from the same collection, is poor for a Vandyck, if it be one.

There are five pictures by Hobbema, one of unusual interest, being what Englishmen would call his *diploma* picture, painted on the occasion of the artist's reception into the Royal Academy of Amsterdam, signed and dated 1663. There are also the famous "Watermill," from the collection of the King of Holland, and three other landscapes, including "A Woody Lane," and "The Outskirts of a Wood." There are four Ruysdaels, one from Baron Denon's collection, in which the water foams with great beauty. There are eleven Cuypes, two of them on panel, the finest perhaps being the "Man of War and Fishing Craft off Dort." The birds, game, fruits, flowers, and still life, by both J. and J. B. Weenix, and J. Van Huysum, are as faithful transcripts of that department of nature as can be found among the works of these

well-known painters. Peter de Hooge, who ought to have constant prominence given to his works as specimens of exactly what a real artist should avoid,—*fastidius* representations of all the petty and sordid incidents of domestic circumstance, with ugly and ignoble figures clumsily inserted amid the gleaming tiles and photographed pots and pans,—is represented by two remarkably characteristic examples. There is one landscape by Aldert Van Everdingen, in which the special beauties of Hobbema and of Ruysdael appear to be blended.

There are eleven paintings by Rubens. The well-known rainbow landscape is one of them; a picture which has suffered much. Near hangs a very interesting portrait, that of Helena Forman, the second wife of the painter; the original of the charming picture in the Peel collection, known as the *Chapeau de Paille*. As a question of technical work, or, perhaps, of preservation, the Hertford portrait is considerably the best. But it represents the fair subject at an age palpably more advanced, and in spite of the solid excellence of its execution, has not the wonderful charm of the more rapidly wrought sketch. It may seem cynical to say one is the work of a lover, and the other that of a husband; but we fear that it is true. There is one of these pictures that we would reverently commit to the flames, "A Crucified Saviour," that points out the limits of the genius of Sir Peter Paul. The Holy Family, from the Boursault and Casimir Perier collection, is one of these works, not unfrequently, which bear rather more of the impress of the imagination of Vandyck than that of Rubens. Nos. 133, 174, and 178 are sketches for the series of historical pictures in the Louvre; and, as sketches, are instructive and valuable. A mark of the rich exuberance of the fancy of Rubens is to be found in the fact that his paintings are always far more subdued than his sketches.

There are half a dozen of the evening water-side scenes which Vandermeer loved to paint. The glow in the wintry sky, and its ruddy reflexion on the ice, in the "Winter Scene, with Skaters" (98), is wonderfully truthful; and the angry winter sky, and deep piled snow, which frame the "Skating Scene" (106), are equally fine. This painter transports the observer in an extraordinary manner to the landscape that so powerfully affected his own imagination. Dutch they may be, but it only shows that there may be poetry in Dutchman. There are eight seapieces of W. Vandouvelde, including the Dutch man-of-war, saluting, known by the name of the *Coup de Canon*. There are three Van Ostades, two Terburgs, two Van der Werffs, and five examples of Teniers. Among these most deserving note is the Dutch version of the delivery of Peter from prison. Through a cavernous passage a winged angel may he seen busily engaged in removing the fetters. But the motive of the picture is a group of soldiers, in full costume, sashes and all (Herod's soldiers in Dutch dresses), who are playing dice on a bench in the foreground. On screens are some of the exquisitely finished and unmeaning *genre* pieces of Gabriel Metz and William Van Mieris; and a St. Anthony in prayer, and a monk reading by candlelight, by Gerard Douw, which are simply exquisite.

Italy is represented by but few of her sons. The most numerous Italian paintings are the landscapes by Antonio Canaletto, and the far more beautiful and much less generally known views by Francesco Guardi. The difference between the work of these two artists is that between the architect's design and a painter's sketch. Venice floats in light before our eyes, as we look on some of Guardi's landscapes. Probably the most valuable Italian picture is that of a woman in Eastern costume, by Domenico, which very closely resembles that painter's "Cumean Sibyl," in the tribune at Florence. This picture is in a most extraordinary frame,—a miracle of Rococo in carving. There is a "Venus disarming Love," attributed to Giorgione, which we should have called a Titian. The goddess has the same grave and stately beauty that characterises the Madonna in several of the Holy Families by Titian. Then come a Virgin and Child, by Leonardo da Vinci, and a cabinet gem, exquisite in execution, although exceptional and unpleasing in motive, a "Tarquin and Lucretia," on copper, by Guido Cagnacci, called Cagnacci. There are two Madonnas by Sasso Ferrato; a "Reading Girl," by Carlo Dolce; a Madonna, by Bernardino Luini; a quaint Holbein-like female portrait by Bronzino; and a very fine *Salvator Rosa*, from

Lord Ashburnham's collection. There is also a fine study of the "Danais" of Titian.

The Spanish school is chiefly confined to two names, although a "Vision of St. John," by Alonso Cano, displays the inability, customary to most Spanish painters, to distinguish between a saint and a heggar. There are eight pictures by Velasquez, three of which are portraits of Don Balthazar, Infante of Spain, two of which we have seen at Burlington House. The most interesting picture of this group is a study of Gaspar de Guzman, Duke of Olivarez, minister to Philip IV., a life-size reproduction of which is in the Royal Gallery at Madrid. There is also a portrait of Philip IV. himself, in whom the heavy Austrian lip and jaw are unpleasantly conspicuous. Of the yet greater Spanish artist, Murillo, there are eleven examples. Among them is an "Adoration of the Shepherds," remarkable not only for the light beaming from the infant, but for the expression of wonder, delight, and love that kindles the rough features of a peasant who, with clasped hands, is looking at that glorious cradle. In the "Annunciation" and seven other pictures in which the Madonna is introduced, we see repetitions of the same model or ideal,—rising into real beauty in one, but marked in all by a full, heavy under-lip, which easily degenerates into snkiness,—a feature which leads to the opinion that the paintings were all executed from a real living model. It is the Spanish type, beautiful, but far from being a specimen of the richest Spanish beauty. Of the "Clarity of St. Thomas de Villa Nuova," we spoke on the occasion of its display at Burlington House.

The French Collection, displayed in the East and South Galleries, is probably the most complete and well-chosen illustration of a certain portion of the French school that has appeared in this country. Its value is very great, and so is its beauty. It shows the bias of the founder of the collection that the name of David does not occur in the catalogue. Of Greuze there are twenty-two works,—a number sufficient to allow one to arrive at the conclusion that Greuze painted only one girl,—or, at all events, a series so closely resembling one another that they could have been taken from the same model. They are pictures which we feel ought not to please as much as they do. Their mannerism is extreme, the suggested idea is often odious, and yet there is a certain charm peculiar to the artist. "Innocence" (417), would be charming, if it were alone. "Filial Piety" is, perhaps, the most curious instance of utterly perverted sentiment that we can name. There are thirty-four pictures by Horace Vernet, who died in 1863. They cover a wide range of subject and of treatment, and contain examples of extraordinary power. Perhaps the most perfect picture is one the subject of which is such as to exclude it from most galleries in this country. It is entitled "Judah and Tamar," and for truthful representation of costume, habit, and physiognomic expression, for power in telling the story, and for beauty in the modelling of the figure, and the glances of the half-veiled eyes, is a work of extraordinary power. On the other hand, No. 351, "Allan Mac Anlay," is a mere caricature,—a signal proof of the inability of a French artist to paint a Highlander or chief. The Vernets alone require a morning to study them. There are fifteen Meissonniers, including the famous group of Napoleon and his staff; historic and genre painting, of miniature size and finish, yet with almost the breadth of fresco. Meissonnier is the founder of a school—almost of an art—apart from anything that has preceded him. Escosura, the Spanish painter, now bids fair to envelope him; but his merit is all but unapproached in his peculiar walk. There are two pictures by Gerôme; one, "The Draught-Players," on panel. Thirteen pictures (a favourite number, in spite of its uncanny character, in this collection), are by Paul De la Roche, including the memorable pendants of the last hours of the two Cardinal ministers, Richelieu and Mazarin. By Decamps there are twenty-six, many of them Oriental subjects, among which the fierce Irish of the Patrol through the Streets of Smyrna is the most strikingly original.

Watteau, Boucher, Nattier, all breathe the same atmosphere; cloyed with luxuriant fragrance, and heavy with the indications of that fearful storm, which, in sweeping from France the corruption of a depraved civilisation, seems to have swept away, at the same time, nearly all the seeds of a yet more ancient nobility of character. There is a very interesting and well-painted picture by Nicolas de Largillière, giving the portraits of

Louis XIV.; of his son, the Dauphin; of his grandson, the Duke of Burgundy, the pupil of Fénelon and the hope of France; and of his great-grandson, who, on the rapidly-succeeding deaths of his three immediate ancestors, ascended the throne of St. Louis under the all-omened name of Louis XV. With this striking page of modern history should be compared another scene, in some respects the finest work of art in the museum,—the Emperor Napoleon Bonaparte divorcing Josephine, in the vain hope of founding a permanent dynasty by the sacrifice of the only woman who loved him on the one hand, and of the dignity of the House of Austria on the other. This very fine composition is by Heinrich Frederick Schopin, a living German painter. Napoleon is seated in state. In the attempt to preserve a look of impassive dignity, the painter has made the only approach to failure in the picture. No wonder. The figure and face of Josephine, who, dressed in white satin, stands by a table, and lays her hand on the fatal document, are exquisitely rendered. Hortense weeps on her shoulder. Cambronne, a figure superbly attired, leans forward, and forms one of the most striking features of the scene. Eugène Beauharnais, close to the throne, has the baseness to look on. Murat stands by. The picture is a lesson of no ordinary value. Some excuse for a page of history so mournful, yet so futile as to rouse the sense of the monarchical, is to be found in the sketch by Camille Roqueplan, after a picture by Reynolds, that perished in the fire at Carlton House, of the culmination of French baseness,—"Philippe Egalité."

We trust that we have said enough to induce many of our readers to visit this noble collection. How much is due to Sir Richard Wallace it is not easy to express. As to the bronzes, faience, marbles, huhl and ornola furniture, and as to the superb case of miniatures, we have no room to speak. Indeed, the catalogue of the minor objects is yet incomplete. But the most sanguine hopes of the promoters of the British-grove Museum must have been exceeded by the detail which the liberal aid of the proprietor of these costly treasures has thrown on the opening of the Institution.

SCULPTURE IN THE INTERNATIONAL EXHIBITION.

THE contributions in sculpture to this year's exhibition comprise more of individuality and interest, on being fairly studied, than would be supposed at first inspection, and in proportion to their number are perhaps of more interest than the paintings. Mr. Boehm's large statue of her Majesty the Queen occupies, in right of its subject, the central position in the conservatory, between the east and west quadrants. This is a sitting statue, in which the artist has aimed especially at the realisation of a dignified, and what may be termed regal, deportment, not unsuccessfully. The attitude is noble and unconstrained, without losing the effect aimed at, which has been further contributed to by the large and massed treatment of the silk robes, the texture and folds of which are carefully indicated. On the whole this is a work with somewhat more of power and breadth of treatment than is usually seen in Royal portraits, whether in painting or sculpture. Having discharged our debt to etiquette in giving first place to this representation of the sovereign, we may feel at liberty to look at the works which depend more entirely on their own merits for their interest. One of the first that we notice among the works of English sculptors is the group entitled "Il Giuocatori" (2,501), by J. Adams-Acton: a naked boy with cap and bells on his head, playing with a rough-haired terrier. The figure of the boy is capital, full of life and expression, but the dog looks, of course, a shapeless mass of jagged marble—why that modern sculptors should forget that their art is essentially concerned with beauty of form and line, without which it is nothing; any attempt to give such rugged minutiae of nature in so stuhhorn a material must fail, as this does. The same artist contributes a very pleasing specimen of portrait sculpture in the shape of a half-length bas-relief "Portrait of Miss Marion Hall" (2,503), the figure of a young girl with loose hair, defined in high relief, within a frame, picture-wise, in ordinary costume, and with no attempt at anything but the simplest and most nonintrusive result; nor, in this case, any detail not completely within the true limits of sculpture. Boehm's bust of Mr. Millais (terra-cotta, 2,524) has an interest of course, and is a successful

portrait, showing very refined and delicate modelling in the forehead and upper portion of the face. The "monumental relief" (2,557) in memory of that Bishop of St. David's who first translated the Testament into Welsh, by E. Davis, deserves a note as a good specimen of a life-size figure in relief, with considerable energy of expression in the upturned face; and a little further on we come to an important new group in plaster, by J. Durham, A.R.A., "Siren and the drowned Leander" (2,572). The siren who has caused the hero's destruction in the effort to lure him to herself, sits with his head reclined upon her knees, gazing on the dying features with a face admirably expressive of bewildered surprise and dismay at the result: the heaviness and helpless drag of the dead body, and the face with closed eyelids and drawn-up brows, have been carefully studied. We congratulate Mr. Durham on the production of this fine work. Next to this is a little figure very well executed, and thoroughly modern and domestic in its interest as the last-named group is antique and mythical. "The first Dip," by W. Earle (2,573), shows a little boy standing on the margin of the water, huddling his shirt round him with a decided shiver, though with a funny smile on his face which indicates no very serious alarm at the prospect. This is one of the best specimens we have lately seen of those illustrations of child-life which some of our sculptors, in search of new ground, have taken up a good deal of late. Foley's noble figure of the "Youth at a Stream" (2,580) cannot be passed, well known as it is, without one more word of recognition; it comes upon one like a strain of fine music. Affording, again, a strange contrast to Fontana's clever little statuette next to it, "The early Propensity," a little boy with palette and brushes, and a bright expressive face, which seems to promise power, as well as enjoyment in the use of them. One may group together near these three little statues of modern life, T. Powke's "Croquet Player" (2,585) and Count Gleichen's "Prince and Princess of Wales (2,590-1), all in plaster, all in complete modern costume, with every detail given, so far as possible, by the modeller, and all remarkable for elegance of pose and high finish, and a display of cleverness (*habileté*, to borrow a French expression) by no means suited to the material, though attractive no doubt to a certain class of critics. The Princess is represented in the act of gliding along on one foot in skating; a pretty idea, but one almost impossible to realise in sculpture. Here motion is attempted to be indicated by the flying out of the dress behind, but not with much success. One cannot realise breeze and motion in that solid bulge of plaster. "The Indian Sister," by F. M. Miller (2,650), is one of the things which attracts by its original and poetic feeling; it is a small bas-relief, representing an Indian woman reclined in a kind of hammock, with a canopy of palm-leaves drooping over her, a little child asleep in her arms. There is a great deal of grace and quiet sentiment in the conception. A series of four small bas-reliefs by Theod, entitled "Four Acts of Mercy" (2,688); perhaps suggested by Flaxman's "Acts of Mercy," deserve attention. They are suited for architectural decoration in niches, and probably so intended; the best is the one representing the accordance of hospitality to some weary travellers, who enter from the left and are received by a figure on the right; the simplicity of the composition, and the grace yet kindly feeling expressed in the figure who the host as he heads forward, give "Sunrise" (2,921), by F. J. Williamson, speaks notice for its pretty and original turn of thought, happily carried out. A little child, whose figure is shown in alto-relief, peers out through his curtains to find out if it is not day; another specimen, and a very pleasing one of the child-fancies of modern sculptors. Weekes's "Young Naturalist" (2,912), a girl in loose raiment, which blows about in the wind, stooping over something evidently on the seashore, is a charming thing when seen from one side (the "weather side," as we may say); the tube figure and the young bright face, with drapery and hair blown from them, are admirable; but at the other side the effect is sadly marred by the solid mass of marble drapery blown aside by the wind, and hanging to the figure; another instance of the danger of attempting this kind of naturalistic effects in sculpture. The subject would have been perfectly suitable for bas-relief, because there the blown-out drapery could have been thrown back and given something of pictorial lightness and

airiness; but in the solid mass such an attempt is all but hopeless, and will always be a most dangerous temptation for sculptors to yield to. It is, if they would think of it, the special glory of their art that it is restricted in its possibilities; that no adventitious aids of detail and finish can be allowed, in work of a high class, to distract our minds from the main idea. It is to pure thought, expressed in pure form, that sculpture must look for its triumphs; and such *tours de force* as we have several times alluded to serve only to captivate and amuse the less educated mass of spectators.

As last year, Italy is comparatively well represented in sculptures, so far as number and importance of subjects and ability of execution are concerned. As to this latter point, the sculptors of modern Italy seem inclined, indeed, to go further and further past the line which separates ideal sculpture from minute realism in detail and millinery. Our old friend the "Reading Girl" is here, but other reading-girls, or works of a similar nature, have unfortunately sprung up after her. The Italian sculptors seem inclined to make the workroom and the nursery the field for the exercise of their art, in a great measure. We have, for instance, Martinioli's "Girl Embroidering" (2,348), in which all the materials of her work, the fringe, the worsted, &c., are worked in marble with an attempt at *emulation* of texture. There is again a figure by Torioli of "Young Torquato Tasso" reading a book (2,901: in the West Gallery); the face certainly is a very beautifully-modelled specimen of a youthful face, but the attention of the spectator is at least as much taken up by the execution of the garments, in particular the texture of the striped trousers, which is most elaborately given from top to bottom; the whole of the book too is engraved on its two pages with printed matter, title, and all complete. Such waste of time and manipulation over trifles which do not in the least affect, unless injuriously, the artistic expression of the work, is simply absurd; and such an example ought to be decried and protested against by all who have the true interests of sculpture at heart. Then Tautardini sends "The Veiled Model" (2,682), another of those elaborate tricks of the carver's craft of which we have seen too many. This is more sculpture in style, however, than the "Reading Girl," the figure being prominent enough in the main; and the execution of the waist and thigh on one side, represented as seen through a transparent starred gauze clinging close to the body, is very fine in its way; this part of the trick not interfering with the form. Magui (author of the "Reading Girl") sends a bust of Shakespeare, an Italianised Shakespeare; the face, as given by the southern artist, being characteristically robbed of much of its force and vigour, and smoothed down into a commonplace. "The Sign of Love" (2,657) by Pagani, though somewhat sensational, is a remarkable work in its impassioned expression and voluptuous roundness and breadth of modelling. It represents a nearly nude female figure, whose head is chapleted with flowers, tying on a wedding-ring, with an expression and pose implying more *abandon* of feeling than is quite consistent with northern notions in connexion with such a subject. Still, this is a work of genuine sculpture without trickery or millinery, and as such to be commended. There is not much for special notice among sculpture of other foreign nations than Italy. M. Antokolsky (Russia) sends a powerfully conceived and executed bronze sitting statue, life size, of "Ivan the Terrible"; we notice here again the banking after too free a use of the material, in the long loose strip of drapery-fold banging to the ground, the detailed making out of the cushions of the chair and so on. Have sculptors come to the conclusion that there is no path left to distinction but by triumphs of manipulation? Or are they in a league to make the labour of hands stand us instead of the greater and more immortal labour of thought? Belgium sends an admirably executed figure of a "Roman Shepherd" (2,673) by L. Simain; another of the costume developments, with breeches, hose, pipe, and all complete, just the sort of figure that Carl Haag has once or twice put upon canvas, and which is infinitely better suited to his colours than to the Belgian sculptor's marble. France is represented in sculpture by a few small things, busts and statuettes; among the latter, the "Birth of Venus" at one end of the French picture gallery, a very delicately-modelled little figure; and near this a bust of Beethoven, considerably more than life-size, by Dantan, in which the grand expres-

sive head, with its furrowed features and masses of hair, so suitable for the sculptor's art, is very finely delineated. There are sundry also of those ideal busts in terra-cotta, treated with great dash and freedom, of which the French sculptors are so fond, but nothing calling for special comment.

THE CASTLE AND CAVERNS OF GUILDFORD.

THE ARCHÆOLOGICAL INSTITUTE.

ON Tuesday, 2nd July, a party of the members of this body visited Guildford. Usually their excursions have been of an official character, annual, and lasting a week; the present visit was extemporised to suit the convenience of those members who were in town, and could spare a day. The notion seems to us a good one, and we hope the complete success of the day at Guildford will lead to its repetition next year. There is no lack of notable antiquities within two hours of London.

Guildford being the town selected for this experiment, Mr. Parker undertook the Church of St. Mary, Abbot's Hospital, and the crypts; and Mr. Clark, the castle, and the celebrated caverns.

The party left London at 11-30, and returned in good time between five and seven o'clock.

The Church of St. Mary is a very curious edifice, and contains remains of every period of English ecclesiastical architecture. It is composed of a central tower, a nave, and chancel, and two aisles, which are prolonged as far as the chancel east end, so that the church presents three equal aisles, each ending with a semicircular apse, though that of the chancel has been cut off in the present century. The skeleton of the whole is Norman, though of different dates.

The original church seems to have been composed of a central tower, nave, and chancel. The tower in outline, pattern, material, and workmanship, might well be called Saxon, though probably a little later than the Conquest. It hatters slightly, and on each face are three very narrow pilaster strips of slight projection. In its north and south walls are original loops of trumpet section. Then, probably towards A.D. 1100, transepts were added. Two round-headed plain arches of early Norman style, were cut in the tower walls, slightly infringing on the older loops.

Later in the style, the original east and west arches of the tower were taken out, and replaced by larger arches, pointed. The nave was lengthened, the aisles added, so as to include the transepts, and the east ends made apsidal. Then followed various additions, Early English, Decorated, and a little Perpendicular. In the west end of the north aisle is a low leper-window, and in the exterior corresponding wall of the south aisle a cinque-foil headed niche for a saint, as though the service for lepers was carried on outside the west end. In the apse of the north aisle are some curious and early fresco paintings.

Mr. Parker had an excellent plan, on a large scale, showing in colours the dates of the various parts of the edifice.

Abbot's Hospital, next visited, is a collegiate establishment for aged persons, of the date of James I, having a common hall, library, chapel, and master. In the library, a quaint room over the gateway, panelled in oak, with a high carved mantelpiece, was exhibited a remarkable and partly local collection of flint implements. In the windows are Archbishop Abbot's coat, with the motto of the hospital, worthy of the British Solomon himself, "Clanarnus Abba pater."

In the chapel are two windows of excellent stained glass, of the period of James I., which Mr. Parker thought to be of English workmanship. The crypts, which remain beneath the Angel Inn and a house opposite, on either side of the High-street, are thought to be thirteenth-century work, in the Early Decorated style. They are each of six bays, vaulted and groined, and divided by two columns into two aisles. They were entered each at the end furthest from the street, and each had two high windows towards the street, the level of which must have been originally much as now. They were evidently the cellars of rival hostels, though probably never filled with more generous liquor than at this time.

This inspection, shared in by but few, was followed by an excellent though plain luncheon in the Angel Inn.

At three o'clock a large party assembled at the castle, on the summit of the mound, in front of

the keep. Here Mr. Clark employed an hour in an address, of which the following is a very brief abstract. He remarked that the vale of the Thames was guarded by five castles, at Oxford, Wallingford, Windsor, Berkhamstead, and Guildford, all of which were pre-Norman, and all were peculiar in the possession of a mound, as an essential part of their works. Farnham probably may be added to this list, and, it may be, Reading, long since destroyed. All had been the seats of eminent Saxons. Of these castles, Berkhamstead and Guildford were placed in notches of the chalk, one on the northern and the other on the southern margin of the London basin, and one on the Oth and one on the Wey, tributaries of the Thames.

Guildford was one of two remarkable passages cut through the steep ridge part of which forms the Hog'sback, the other being occupied by the River Mole. Ryegate Castle stood at the eastern end of the ridge, Farnham at the western. Guildford was thus the key to an important pass on the south-western approach to London, and yet, though a very obvious place for a town, the British remains in the neighbourhood are few or none. Even the names of the rivers are Saxon, and there are no certain camps or dwelling-pits known of the British period.

Nor are the traces of Roman occupation a whit more frequent. The two great roads from Dover and Chichester passed by Rochester and Mickleham, and but very few Roman remains have been found about Guildford. The earliest mention of Guildford is in King Alfred's will,—a very respectable commencement. The name shows that even before that time a *guild* or trading body was there established, and that the river was crossed by a *ford*. The next notice relates to a reputed massacre of a certain Norman escort of the elder brother of the Confessor, and his detention at Guildford, where, therefore, was probably a royal residence.

The path of the Conqueror did not lie through Guildford. He took the Roman way by Canterbury and Rochester to Southwark, and marched up the right bank of the Thames to Wallingford, thus turning the flank of the passes. Guildford, however, appears in Domesday as a royal mansion, and Flamhard, so celebrated for his rapacity and his magnificence, was one of the tenants. It was thus that a connexion was formed between Guildford and the Church of Sarum, of which there are traces even now. It is thought that in those days the town lay beyond the river, where the names of Burgh and Bury are still found.

One of the early Norman kings formed a park at Guildford. Capt. James, to whom the town is much indebted for its admirable survey, and for several valuable remarks upon its antiquities, has traced the borders of this park, which lay to the south of the Hog's Back, and was extensive. It was a favourite place of resort for the Norman kings, and, indeed, was not finally broken up till the reign of James.

The castle is first mentioned in the reign of John, when it was also a prison. Though a royal residence, it remained for centuries the prison for the combined counties of Sussex and Surrey, and the sheriff was usually its custodian. Henry III. was much here, and the records show that he was always repairing and decorating the royal dwellings in the castle. Each king was here more or less frequently, but the castle does not appear ever to have been besieged, nor did any important historical event occur here. Finally, the building and demesne, having been Crown property from the ninth century, if not earlier, were alienated by James I. The mound stood in the upper part of the Saxon fortress, and was protected on its exposed or eastern side by a deep ditch, which still remains. To the west the fall of the ground rendered the defence less necessary. The Normans placed the rectangular keep partly on the mound and partly on the original ground at its base. Usually the rectangular keep was not built where there was a mound, and in only one other instance,—Christchurch,—is the keep placed upon the mound. Here it is a rude structure, with the usual pilaster strips, and with much irregular herring-bone masonry, but with all this the groins and apertures are distinguished by excellent ashlar. The basement is on the ground level, and has two loops only, the door being an insertion. The entrance was in the west front, about 12 ft. from the ground, on the first floor, reached by a flight of exterior steps. The basement was a store, and reached only by a trap in the floor above. From this floor a well-stair commenced in the north-west angle, and led up

to the battlements. Here, also, in the thick walls, were three mural chambers; one a very remarkable one, an oratory, in plan an L, occupying the south-west angle. It has an eastern altar and a southern long loop, and all along its outer wall is an arcade of good Norman work. This oratory contains some curious original carvings in its chalk walls, evidently the work of common prisoners, perhaps in the reign of Edward I. This was the state floor, and has three good windows, of two couple-lights, separated by a Norman column. The upper floor had four windows, probably similar to those below, though shorter, and very thick walls, but only one mural chamber, a guardroom, in the south-east angle. The openings and ashlar work look Late Norman, the ordinary masonry much earlier, but the whole can scarcely be older than the commencement of the reign of Henry II.

The keep formed a part of the polygonal wall which crested the top of the mound. There was a gate-house at its junction with the keep on the north-east quarter, connected with a bridge, now a causeway, across the ditch, and probably a postern opposite, covered by a barbican, in Castle-square. This circle formed the inner ward. The middle ward lay to the north-west, and contained the royal hall and dwelling, of which much walling remains of Norman date. South-west of this lay the outer ward, the buildings at the south-west angle of which remain, and are Late Norman. The great gate lay between the two. It is the work of Henry III., inserted into a Norman wall.

The enclosure of the castle seems to have run along Quarry-street, then across the Bowling-green to Castle-square, and along Castle-street to the King's Head Inn, which probably occupies the site of a tower at the north-west angle. If there was a wall further out towards High-street, it probably was the fence of a paddock, and no part of the regular defence of the place.

Of the caverns, Mr. Clark observed that they were evidently quarries. There is a hard bed of chalk, about 8 ft. thick, which was quarried by open working till it dipped too deep for this method. Then a gallery was driven a little within the cliff along the line of strike, and from this parallel stalls struck out down the dip. The chalk between them was then removed, and the rubbish, much more than skilful workmen would have made,—thrown back. He supposed the whole to be Late Saxon or Early Norman work, and to have supplied the material for the castle, the interior of the churches, and the original town.

Mr. Parker subsequently led a party of volunteers to visit Loseley House, but was unable to visit the very curious Norman church of Compton.

The excursion, suggested, planned, and managed by Mr. Burt, reflected great credit upon that gentleman. Mr. O. Morgan was the principal member of the Institute present.

INDIVIDUALITY IN WORKMEN, AND THE STRIKE.

THE great "strike" now going on shows that the working man is a constant quantity, and irrepressible, and cannot be put out of the way and forgotten, or left to go on like a machine always consuming the same quantity of fuel and joint-oil. As he "improves," if that be the term, he demands more fuel, and even now says that he must have it, come what may. But without going into the whole of the complicated and difficult politico-economical question, as Colclough would have said, there are one or two things connected with the capacities and workings of the trained mechanics of the present day, as contrasted with those of past times, which would seem to be well worth a few words, and will be ought to have some novelty, if not interest, to skilful working men. We ask their attention to these few thoughts; they can do no harm, even if they do no good: they may serve a purpose.

In the first place, our present race of skilful workmen are the successors of those who brought into existence the great works of the Past,—of that Past which now forms the great volume in which the modern man finds, as from an oracle or book of fate, what he wants, and the *how* to do his work. They are not a new race, but their mode of work is most certainly different,—may, may it not be fairly and truly said, that it is the *reverse* of the old mode of work. Is it better, or is it worse? Is it "improvement?" and if so, where is it? and if not, what is it? The old workmen had but little or no machinery to help them. It is not a little

curious to look into some worm-eaten book, and get a glimpse of the quaint machinery of past days in the way of building; at the heavy and complicated scaffolding, curious-looking ladders, gigantic tread-wheels for hoisting purposes, and raising timber and the blocks of stone which formed the future structure. But all this was the mere mechanical help to aid human strength; for time was, in still more ancient days, when even those helps were not, and main human strength did the work of carrying and lifting. But passing by all this, though a subject of no small interest, we here refer especially to that wide extension of and use of machinery in aid of human labour, which the "improvements" of modern times are hourly making. The hands of the modern workmen are getting of less and less use to him. The machine is taking the place of the hand. Every day tells us of some new machine which does away with the necessity of human hand labour, from the printing of an apple to the printing of a gigantic newspaper, and the moving work-machinery of a great war-ship. It is this, indeed, that constitutes modern progress and improvement; and there can be no sort of doubt that all things have been increased so enormously under this system, and that the numbers of working men have increased, and in full proportion to it; and were there no other element in the world of humanity but this of useful material and human-consuming machines, there would be little or nothing to say but to wish it well. But there is something more in human nature than mere "utility" and "living." There is nature and there is art, and fine art, and the sense in humanity of what may be termed *enjoyment* of existence, quite apart from mere usefulness.

But there is yet another and a deeper source of difference between the old workmen and their modern successors; and it is this, and it has to do, we cannot but think, with "strikes and locks-out." The workman himself as an individual power, and does his allotted and divided work as does the lifeless machine. Indeed, it is the boast of the political economist that in proportion as you divide the labour in the production of any single article, and parcel it out among a succession of hands, you perfect its production. You get more and more of it for your money, and it even would seem to be a question whether or no a perfectly divided and apportioned set of human machines cannot be made more "productive" than the iron machinery of framework, spindles, wheels, and cogs, and driving-pulleys. We have heard even this boldly argued for, so completely has the machine taken possession of the minds of men in this mechanical age! Here there is an enormous amount of difference between the position of the old workman and the new, and the main and chief tendency of it is to make all men alike or nearly so, and their *pay* consequently alike too. Let us, by way of illustration, take a simple instance,—common *wall-building* and *stone-sawing*. No "carving," be it understood, is here talked of, no "enrichment" of any kind, no art-work, but the very simple and intelligible problem of wall-building as in old days, and in these modern times. Hand sawing and hand stone-dressing are not yet quite gone out; every man knows what saving by hand is, and has seen it, and though it looks at first sight a merely mechanical operation, it is something more, and we have known a man point with no small pride to the saw-marks on the stone surface as a proof of the goodness of the work, and the skill and dexterity of the workman. Some doubtless will feel inclined to smile at this; if so, let them go into any of our old cathedrals, and look to the stone-cutting and mere wall-surface and common wall-building, and observe the evidence in them of the skill of the workman even in such, as it would seem, work which anybody or a machine could accomplish as well. But it is not so. One more instance,—the famous Parthenon. Nothing in it is more remarkable than the mere masonry of this building, the working of the plain marble surfaces, and the putting together of the walls and columns. It is really artistic work of the highest order, and utterly beyond the power of production of any sort of machine-work, however perfect. It is the joint result of the mind and hand of the artist-workman, the said workman from a mere human machine heaving, through the use of hand and mind together, an *artist-workman*. Here, then, is a problem interesting to workmen, as we would hope. Is it nothing, may we ask, to a man bow his work

looks, and whether or no it has in it any artistic value, any impress in it of himself and his own individuality as a human being? If it has, then has he a value, a money value, of his own. Everybody cannot do as he does. The appreciative employer must value him as an individual, not as mere part of a vast machine, composed of himself and others just exactly like him. If he "strikes," he strikes on his own account, and asks to be valued as a *workman*, not as a mere moving apparatus, or part and parcel of a moving apparatus of bones and muscles. If he be "locked out," he is locked out as a somebody doing a certain kind of work, in a certain way, and does not stop work as a cogwheel ceases to move when the steam is shut off. No subject, we are convinced, can well be worthier of interest to our working men in the building trades than this. They will find that the deeper they look into it the more interesting it grows, and the more they will find it to their account to study it thoroughly. The old workmen who preceded them doubtless had not a few disadvantages to contend with, and our present race of workmen have not a few advantages which they had not; but of one thing we may feel quite sure, that the old work as it came from the hands of the old workmen in the building trades can never be equalled, or in any way rivalled, by the men in these days, as things are. The old system of work, defective as it might be, produced—as we may see in the buildings—a confraternity of individual men, with each one a special, though may be humble, faculty, but the present system produces only a vast human apparatus, smart and skilful enough may be, and doing its work, as we see, with truly wonderful speed and accuracy, all the various parts of the human machine working as one towards a certain end; but all is mere mechanism, and the more perfect it gets, the more mechanical it grows. The man is fairly *lost* in the associated human machine, and the resultant work is not art, but "manufacture" in the strictest sense of the word. We think our working men might well give a little attention to this important subject, for it goes to the bottom of that great subject of modern activity, their *education*. The nine-hours movement means more leisure, or time to do something for oneself. Mental improvement, we are told, is for; but what sort of improvement, and what for, and for what final result? The mere acquisition of knowledge for its own sake is, we are often told, its own great reward; and there can be no doubt that to acquire knowledge of any kind is a pleasure in itself, and a gain; but no small judgment is needed to make a selection. And then, after all said about it, it seems but poor work for a humble man to strive after, the mere filling of his brain-pan for the mere pleasure and sake of filling it. All knowledge should certainly have an *object*, and all "improvement" should tend to some certain result; and the question then comes, how can a workman, a stonemason to wit, improve himself more to the purpose, or in a more profitable way, than by the effort to know more of his trade by finding out all about it—looking into its history, studying the examples of it left to us from the past, and, in short, making himself a *better mason*; not to remain a mere mechanical working man, but to make of himself an artist-mason? This would not prevent "strikes," it may be, but it would alter their character entirely; and according to the work he valued as an artist, and according to the "rate of wages," when every man is alike, and you cannot tell one from another, or even discover who it is that did the work. If the men think a little of these things, then may the strike do some real good and lasting work.

WORKS AT BARROW.

We have already, on more than one occasion, in the columns of the *Builder*, drawn attention to the rapid and marvellous increase and development of the new town of Barrow-in-Furness, and a very striking illustration of it is afforded by the interesting proceedings which took place at the town council last week, when the mayor, Sir James Ramsden, who has just had the honour of knighthood conferred upon him, announced the distinction to the municipal body. "I shall ever bear in mind," he observed, "that the town, and not the man, is thus honoured. The Crown has recognised the spirit and enterprise of the people of Barrow, who by their exertions, have added another great centre

of industry to the nation's wealth. Gentlemen, we must not lose sight of the fact that the public recognition of the town and port of Barrow will demand increased watchfulness and care in the administration of its affairs. If, with all the advantages we possess, we fail to make provision in a large and liberal spirit for the health and well-being of the inhabitants, we shall be indeed to blame. Our numbers will be doubled within the next few years. [The population is now estimated at 76,000.] In fact, the various works now in progress will demand an additional population of from 40,000 to 50,000. The Bill enabling the council to raise 200,000l. will shortly receive the Royal assent, and it will be your duty to urge forward the sanitary and other works in order to keep pace with the growing requirements of the town.

In the discussion which followed it transpired that the erection of a new town-hall and exchange has been decided upon. Several other public works are also announced as being about to be commenced, in addition to the several manufacturing works in progress. Amongst these are the new cemetery and park for which 100 acres of land have been secured, at a cost of 8,500l., and the works are to be at once proceeded with. There is also a pressing demand for the enlargement of the gasworks in consequence of the constantly increasing population, and the sum of 10,000l. is about to be expended in their extension. In addition to these, a large new cattle-market and commodious public slaughter-houses are about to be constructed, whilst a comprehensive scheme of drainage is about to be carried out.

STEPNEY PARISH CHURCH.

The old church of St. Dunstan, Stepney (or Steinhiltho), was reopened on Tuesday, the 2nd inst., by the Bishop of London, after a restoration occupying a period of nearly twelve months. It is known that there was a church here during the time of the Saxons, dedicated to "All Saints," and that in the tenth century St. Dunstan, then Archbishop of Canterbury, restored or rebuilt the church, after which it was dedicated to him, and has been called after him to the present time. There is a supposed relic of this early church still to be seen over the entrance-door in the south porch,—a rood cross of stone, about 3 ft. by 2 ft., with the figure of our Lord crucified rudely sculptured in bas-relief, and the accompanying figures of Mary and St. John standing at each side of the cross. The sun and moon are also carved on the arms of the cross, and round the stone a well-defined foliated border, 3 in. wide. It is in a good state of preservation considering its antiquity, and has been pronounced to be a piece of Saxon workmanship.

For many years the present building has been in a most unightly and dilapidated condition, the last so-called restoration having been done in Roman cement instead of stone, the embattled work round the church removed, and its place supplied by terra-cotta 3-inch coping, and the faces of rag walls plastered over with mortar and flint clippings, forming a surface that was continually decaying and falling to pieces.

The rector and churchwardens having called a meeting of the parishioners, it was unanimously resolved that a thorough and complete restoration of the church, under the advice of their architects, Messrs. Newman & Billing, should at once be undertaken.

The works, commenced in August last year, and now brought to completion, consist of a restoration in Bath stone of all the windows, cornices, battlements, buttresses, &c., throughout the building. Also four new windows in the bell-chamber of the tower filled with open quatrefoil tracery, and a new three-light window immediately over the west doorway in the tower. (This as well as the clerestory windows has been filled with stained glass by Messrs. Clayton & Bell.)

The south and north porches destroyed some years ago have been rebuilt with stone dressings and groined ceilings. A new vestry has also been built for the use of the rector, as rural dean, and the clergy of the deanery. This room is hexagonal on plan, and capable of seating 100 persons, and as one of its sides is open to the old vestry, the whole forming one large room, 150 persons can well be accommodated. The walls are of black flint laid in coal-ash mortar, Bath stone dressings externally and internally, square-headed three-light tracery windows, one

in each external bay; the walls internally stuccoed; and an open-timbered roof, stained and varnished, the principals and curved ribs resting on caps, columns, and bases of stone, and the intermediate ribs on carved corbels springing from the hoods of window-openings. The roofs of aisles have been repaired and re-covered with lead, and the whole of the windows (except those of stained glass) filled with cathedral glass in diamond quarried lights.

The interior of the church has also undergone a transformation. The imitation Sienna marble paint has been scraped from the nave columns, showing them now as constructed, of stone. The circular gallery at the west end, projecting so far into the nave, and used for the organ and choir, has been swept away, thereby opening up to view the fine western arch as originally seen, and the new stained glass window presented by the Messrs. Charrington.

A new organ is being built by Messrs. Bryceson, Brothers; but in consequence of a dispute with their men, it could not be completed in time for the reopening. This will be placed at the east end of the north aisle in a chamber adapted to the purpose.

The whole of the decorative painting and gilding of the interior of the church has been executed by Messrs. Pitman & Cuthbertson, under the direction of the architects.

The chancel-floor has been paved with Maw & Co.'s tiles, in coloured patterns. And the church has been re-lighted throughout with gas, for which the main and services have been supplied and fixed free of cost by the Commercial Gas Company. The coronas, standards, and side-lights were supplied by Mr. Gawthorpe, of Long-acre. The whole of the carving, including the sculptured half-figures of the four evangelists to the new vestry, has been executed by Mr. J. W. Scale, of Walworth. And the general builders were Messrs. F. & F. J. Wood, of Cleveland-street, Mile-end-road.

The style of the present building is Perpendicular, with two exceptions,—viz., a two-light decorated window in the north chapel, and the sedilia in the south wall of the chancel, which are thirteenth-century work.

Mr. Richards has acted throughout as clerk of the works, to the satisfaction of the architects. The rector has been untiring in his endeavours to raise money for the restoration. The cost of the whole will amount to about 5,000l.

METROPOLITAN WATER SUPPLY.

WHETHER or not the Board of Trade or the water companies take action upon the monthly reports of Major Frank Bofton, C.E., water examiner for the metropolis, it is a healthy, and ought to prove a useful practice, for that functionary to deliver, as he does, a monthly report to the Board. It is satisfactory to know, however, that practical results of an important character have already resulted from these reports, although the series has only extended over a few months.

In May the examiner, after a special examination of the works of the Chelsea Water Company, reported to the effect that the filtering area and reservoir capacity were insufficient, and that the point of intake at Seething Wells was objectionable. The report was forwarded to the company by the Board of Trade, and a meeting of shareholders has passed resolutions that the principal recommendations in the report be adopted, and that the works suggested be carried into effect forthwith. These embrace an addition to the present filtering area to the extent of four acres, by the conversion of the present reservoirs into filter-heds; the removal of the intake from Seething Wells to a point higher up the river, by which the objectionable outflow of the rivers Mole and Rye will be avoided; the construction of a reservoir of large capacity, to enable the company, when the river is in good condition, to impound and store water sufficient for several days' consumption, and thereby avoid the impounding and storage of turbid flood water. The extension of the filtering-beds will be proceeded with at once, under the powers already possessed by the company, and application will be made to Parliament in next session for powers to carry out the remainder of the proposed works.

In relation to the Lambeth Waterworks also, the Examiner in some of his earlier reports pronounced the reservoir capacity of the company insufficient, and recommended that the existing reservoir at Streatham should be covered. In conformity with these recommendations, the

directors of the company have instructed their engineer to prepare drawings and specifications, and to obtain tenders for constructing a new reservoir at Streatham, and for covering the existing reservoir. The company has also nearly completed the construction of a conduit, four miles in length, to convey water from the proposed intake above Molesey Lock to the existing reservoirs and filter-heds at Ditton. This conduit will be capable of carrying 20,000,000 of gallons per day, and delivering this quantity, by gravitation, at the Ditton Works.

Now works of greater or less importance are being prosecuted for increased quantity or improved quality of the water-supply by almost the whole of the remaining water companies. The New River Company has a new service reservoir in course of construction at Highgate; for the East London Company, the auxiliary works are far advanced for the intake and supplemental supply from the Thames at Sunbury, and the company has also nearly completed a new reservoir of about 50 acres at Walthamstow; the Southwark and Vauxhall Company is constructing reservoirs at Nunhead for the storage of 18,000,000 gallons of filtered water. The West Middlesex Company has good reservoir capacity, and avoids taking in water during or after heavy rainfall, and consequent turbidity of the river; the company is providing additional power at Hammersmith in a 68-inch cylinder engine and 24-inch pump. The engine-power of this company is already ample, in anticipation of a constant supply system. The means of storage of the Grand Junction Company is about to be increased by the completion of a new covered reservoir at Kilburn, to contain 6,000,000 gallons. The Kent Waterworks Company dispenses altogether with filters. Although the supply taken from deep chalk wells is clear and bright, containing little or no organic matter, the consumers of the water have a decided opinion that its quality would be greatly improved by the elimination of much, or all, of the mineral matter, of which it contains so much; they would be more than willing to allow some of the "degrees of hardness" to go with the chalk.

THE NATURAL HISTORY MUSEUM.

ON the question of a vote in the Commons of 29,900l. in Supply, for the Natural History Museum, Lord Eloho moved that the vote be negatived. He had reason, he said, to believe that the contract for this building had not yet been taken; but, whether or not, there seemed to have been such an utter want of system in dealing with the plans of the Natural History Museum that he thought the committee ought to pause before they voted this money. There were other buildings, such as the Foreign Office and the National Gallery, which might be cited as examples of the same system,—of buildings which had been erected upon no system whatever. The right hon. gentleman (the Chancellor of the Exchequer) appeared, from his inarticulate grumbling and the shaking of his head, to think it was a waste of time to discuss a question of this sort; but there were other things which might be economised as well as time, and amongst these was the public money. The present Government had "Economy" emblazoned on its standard; but this system of contracts for public buildings did not tend to economy. The system had been condemned by the Prime Minister himself in 1860. The system was bad, and he moved the reduction of the vote as a protest against it.

Mr. Ayrton said the failure with regard to the selection of designs was to be attributed throughout to the same cause—to the fact that gentlemen had been selected for the purpose purely on the ground of architectural taste. Their selection did not embrace the consideration of the whole question with which the Government found itself bound to deal. The first consideration, after all, was as to the purposes for which a building was to be erected, and the manner in which it was to be used. He maintained that they had arrived at a better system than that which formerly prevailed. He had made considerable inquiries in Paris upon this subject, and had found the same grievance in all the great offices. The general complaint was, "We are the victims of the architects." His opinion was, that no architect should be employed by the Government to construct any building until they were perfectly satisfied of the nature, character, and purposes for which that building was to built. Mr. Waterhouse had entered very

fully into the details, which were very numerous. At present the building trade was in a state of stagnation, but he thought if the present strike or lock-out terminated soon, it would not be long ere they would get in their tenders. As to the designs which the noble lord wished to see, the right hon. gentleman said he did not know what use it would be to exhibit the contract plans and designs to the public, especially as one had not been exhibited. The public in general could not deal with this question. When Mr. Waterhouse was first employed by the late Government, it appeared to him (Mr. Ayrton) that Parliament determined to allow Mr. Waterhouse, as a professional architect, to undertake the construction of this work; and he did not see how it was possible for that gentleman to perform his duties with the assistance of the public in general. He therefore hoped that the noble lord would see that everything possible had been done to construct this museum in a way that would give satisfaction.

Lord Elcho asserted that the right hon. gentleman had given no reply at all to him. He should resist the vote in order to induce the Government to show them the designs.

The Chancellor of the Exchequer contended that since this Government came in they had most materially improved the architecture of our public buildings.

Mr. W. O. Gore said that the proposal to place 350,000*l.* at the disposal of Mr. Waterhouse was one of the most preposterous proposals ever heard of.

Captain Trench thought they should either adopt the motion of Lord Elcho or adhere to the original design and bring in a supplementary estimate.

On division, there appeared,—For Lord Elcho's motion, 45; against it, 85: majority, 40.

THE PROPOSED NEW PUBLIC HALL AT KENSINGTON.

THE Kensington Vestry have adopted the report of a committee appointed to consider whether any and what alterations can be made in the vestry-hall. This committee have reported that the vestry-hall can be adapted to meet the wants of the Vestry by converting the present hall into offices, and erecting a similar hall above, to be approached by two staircases, at a cost of 2,000*l.* The building stands on consecrated ground, and the vicar and churchwardens have given their consent to the proposed alterations, contingent upon no political or festive meetings being allowed to be held in it. The committee recommended the Vestry to approve the plans on the conditions imposed, and they have done so. The Vestry have also adopted the recommendation of another committee to purchase a quantity of land in High-street, near the railway station, for 5,500*l.*, on which to erect a public hall. The result is, that it has been decided to improve and enlarge the vestry-hall for strictly vestry purposes only, and also to erect a new public hall for public meetings and general purposes.

SURREY ARCHÆOLOGICAL SOCIETY.

THE annual excursion of this Society has passed off successfully in every way. The rendezvous was at Dorking, where vehicles were in attendance at the railway stations to convey the members and their friends to the places selected for a visit,—Newdigate and Charlwood Churches.

At Newdigate, Mr. J. Gough Nichols read a lengthened paper on the Newdigate family; and Mr. John Green Waller gave a description of a painting of St. Christopher, on the wall, founded on the well-known legend. Mr. Gilbert Scott spoke of the wood tower, which, he said, there was nothing unusual in, as he had restored several similar ones. Where wood was plentiful and stone scarce, it was not uncommon to build towers of wood.

At Charlwood, Mr. Scott described the architectural design of the edifice. Judging from the style of one of the arches of the chancel it was one of the very earliest specimens of Norman architecture that could be found. The earliest specimens of Norman were in Westminster Abbey, but he could see no difference in those works by Edward the Confessor there and that arch, which was as early a specimen as one could well find in the kingdom, the first probable addition to the church being the aisle in which he was then standing, the date probably being from 1290 to 1300. The window between the paint-

ings was also a beautiful specimen of the style, though simple. Mr. Scott proceeded to show other points of interest, especially the screen, which he should have thought would have been of an earlier period, but that it bore the date on it of 1580; the windows and doorway of the west end, of the style of the fourteenth century; the chancel which was coeval with Queen Mary; and the north aisle, which was probably of the beginning of the fourteenth century, but very much altered at a later date. The rest of the chapel had been so thoroughly spoilt, outside and in, by so-called "restoration" that it was needless to say anything about it.

On the lawn of the rectory a paper was read by Mr. G. W. Leveson-Gower, F.S.A., on the "History of Charlwood." The fatigue from the heat of the day was agreeably relieved by a supply of "claret cup" from the rectory. Then Mr. John Wickham Flower, F.S.A., gave a long paper on "Flint Instruments," some rare specimens of which were produced as illustrations.

It was not until five o'clock that the company adjourned to the schoolroom to partake of a cold collation. The Rev. T. Birmingham presided, and the guests numbered about 200 ladies and gentlemen. The chairman, in proposing the health of "the readers of papers," caused much cheering at the mention of Sir Gilbert Scott.

SCHOOL BOARDS.

London.—Mr. John W. Walton has been appointed architect for carrying out the schools to be erected on the site in Bolingbroke-road, Battersea. The works committee are drafting specifications to obtain tenders. A report from the Works Committee, recommending certain arrangements, has been agreed to, the result of which is that a tender of Mr. E. J. Sargeant, for the conversion of Ebenezer Chapel, Shadwell, to the purposes of a school, at a cost of 1,597*l.*, has been accepted; and the Board are prepared to enter into formal agreements with Mr. J. Caudwell, of Wandsworth, for the purchase, at 1,000*l.*, of about 10,363 square feet of freehold land in Winstanley-road and Livingstone-road, Lambeth; with Lord Winterton, for the purchase, at 3,000*l.*, of the freehold of about 20,000 square feet of land, lying between Lower Chapman, Ann, and Chapel Streets, St. George's-in-the-East; and for the purchase, at 6,000*l.*, of about 9,000 square feet of freehold land, with buildings thereon, in Broad-street, Ratcliff.

Middlesbrough.—Plans from Messrs. Alexander & Henman, Sunderland, for the erection of a school in Denmark-street, to accommodate about 1,000 children, have been accepted; but it was agreed that the tenders should be obtained before the plans are forwarded to the Privy Council.

Brighton.—The Board have considered an offer made by Messrs. Jeffcoat & Lewis, on behalf of the Misses Gouly, to sell certain property in Hanover-terrace for 1,300*l.* Mr. Stevens, in moving that the offer be accepted, explained that the property consisted of ten houses, and was 150 ft. in length by 50 ft. in depth. The houses (he said) could be converted at a small expense; the outer walls could be used, and the inner walls could be knocked away. One of the proposed rooms would accommodate 198, and the other 182 infants, making a total of 380 children. This would be allowing more space to each child than Government required. If converted upon plans affording the space required by Government, the buildings would give accommodation for about 400 infants. The offer was unanimously accepted.

Wolverhampton.—At last meeting of this Board a report was read from the Education Department, disapproving of the architect's plans for the proposed Board school, because they were designed to provide accommodation for 528 children, when a school for 300 or 350 would be large enough, as they were in the neighbourhood of several denominational schools, none of which were full. The clerk pointed out that none of the schools referred to were available. Mr. Bantock censured the Rev. J. Sandford, Government inspector of schools, for first approving the plan for the Dudley-road school and afterwards objecting to it to the Government. After Mr. Sandford had been defended by the Rev. H. Hampton, the chairman explained that they were called upon by the Education Department to provide accommodation for 1,500 children, and it was much better to provide that accommodation in large and efficient schools at once than by gradual stages. Eventually the clerk

was instructed to explain to the Education Department that all difficulty in the carrying out of the plans would be removed.

Leicester.—At last meeting several members of the Board complained of the delay in the architect's work, and protested against it, and it was eventually decided that the Board at its rising adjourn for a week, to receive a plan of the rising-plate site; and if, at the expiration of that time, the architect at present employed could not have the plan in readiness, the clerk instructed to employ some other. Mr. Burgess, on behalf of the Architects' Committee, reported that the committee had met that morning, and that they approved of the elevation prepared by Mr. Goddard, which met every requirement of the Board, and which was founded on the plans sanctioned by the Education Department in London. Mr. Goddard recommended, in consequence of the high price of building just now, that no stone, or as little as possible, be used, and that the style be as plain as possible. The architect had estimated the cost on the cubic principle, and reckoning 8*fl.* to each child, which would accommodate 970 children, he estimated that the whole expense would be about 5,000*l.* The Chairman moved that the elevation of the plans be adopted; that Mr. Goddard be requested to make further plans and specifications as required by the Educational Department; and that the committee be requested to superintend the execution of his work. After some conversation the resolution proposed by the chairman was adopted, with the additional words "That the Architects' Committee report again to the Board." The following letter from the Education Department was read, relative to the King Richard's-road site:—

"I am directed by the Committee of Council on Education to return to you the accompanying plans (two) which are satisfactory.

I have to request that when your Board have obtained tenders for the erection of the buildings, but before any contract has been signed, the plans and specification may be returned to this office, together with the enclosed form (No. 7) duly completed.

My Lords will then be able to inform you what sum they will be able to recommend the Public Works Loan Commissioners to lend to your Board under section 57 of the Elementary Education Act.

P. S. These plans are arranged in accordance with their lordships' rules. Fittings should be provided as sketched in pencil."

It was resolved that Mr. Baker proceed with the necessary drawings, specifications, &c., under the directions of the Architects' Committee. Mr. Hollingworth gave notice that at a future meeting he will move that a clerk of works be appointed to the Board, the question as to whether one, or a clerk of works to each school, should be elected, being left for consideration.

SEWAGE IRRIGATION AND THE LOCAL GOVERNMENT BOARD.

THE "Sanitarian" in last week's *Builder* ventures the assertion that my recent epitome of the Local Government Report on the West Ham case "is most misleading,—it is neither the whole truth nor half the truth."

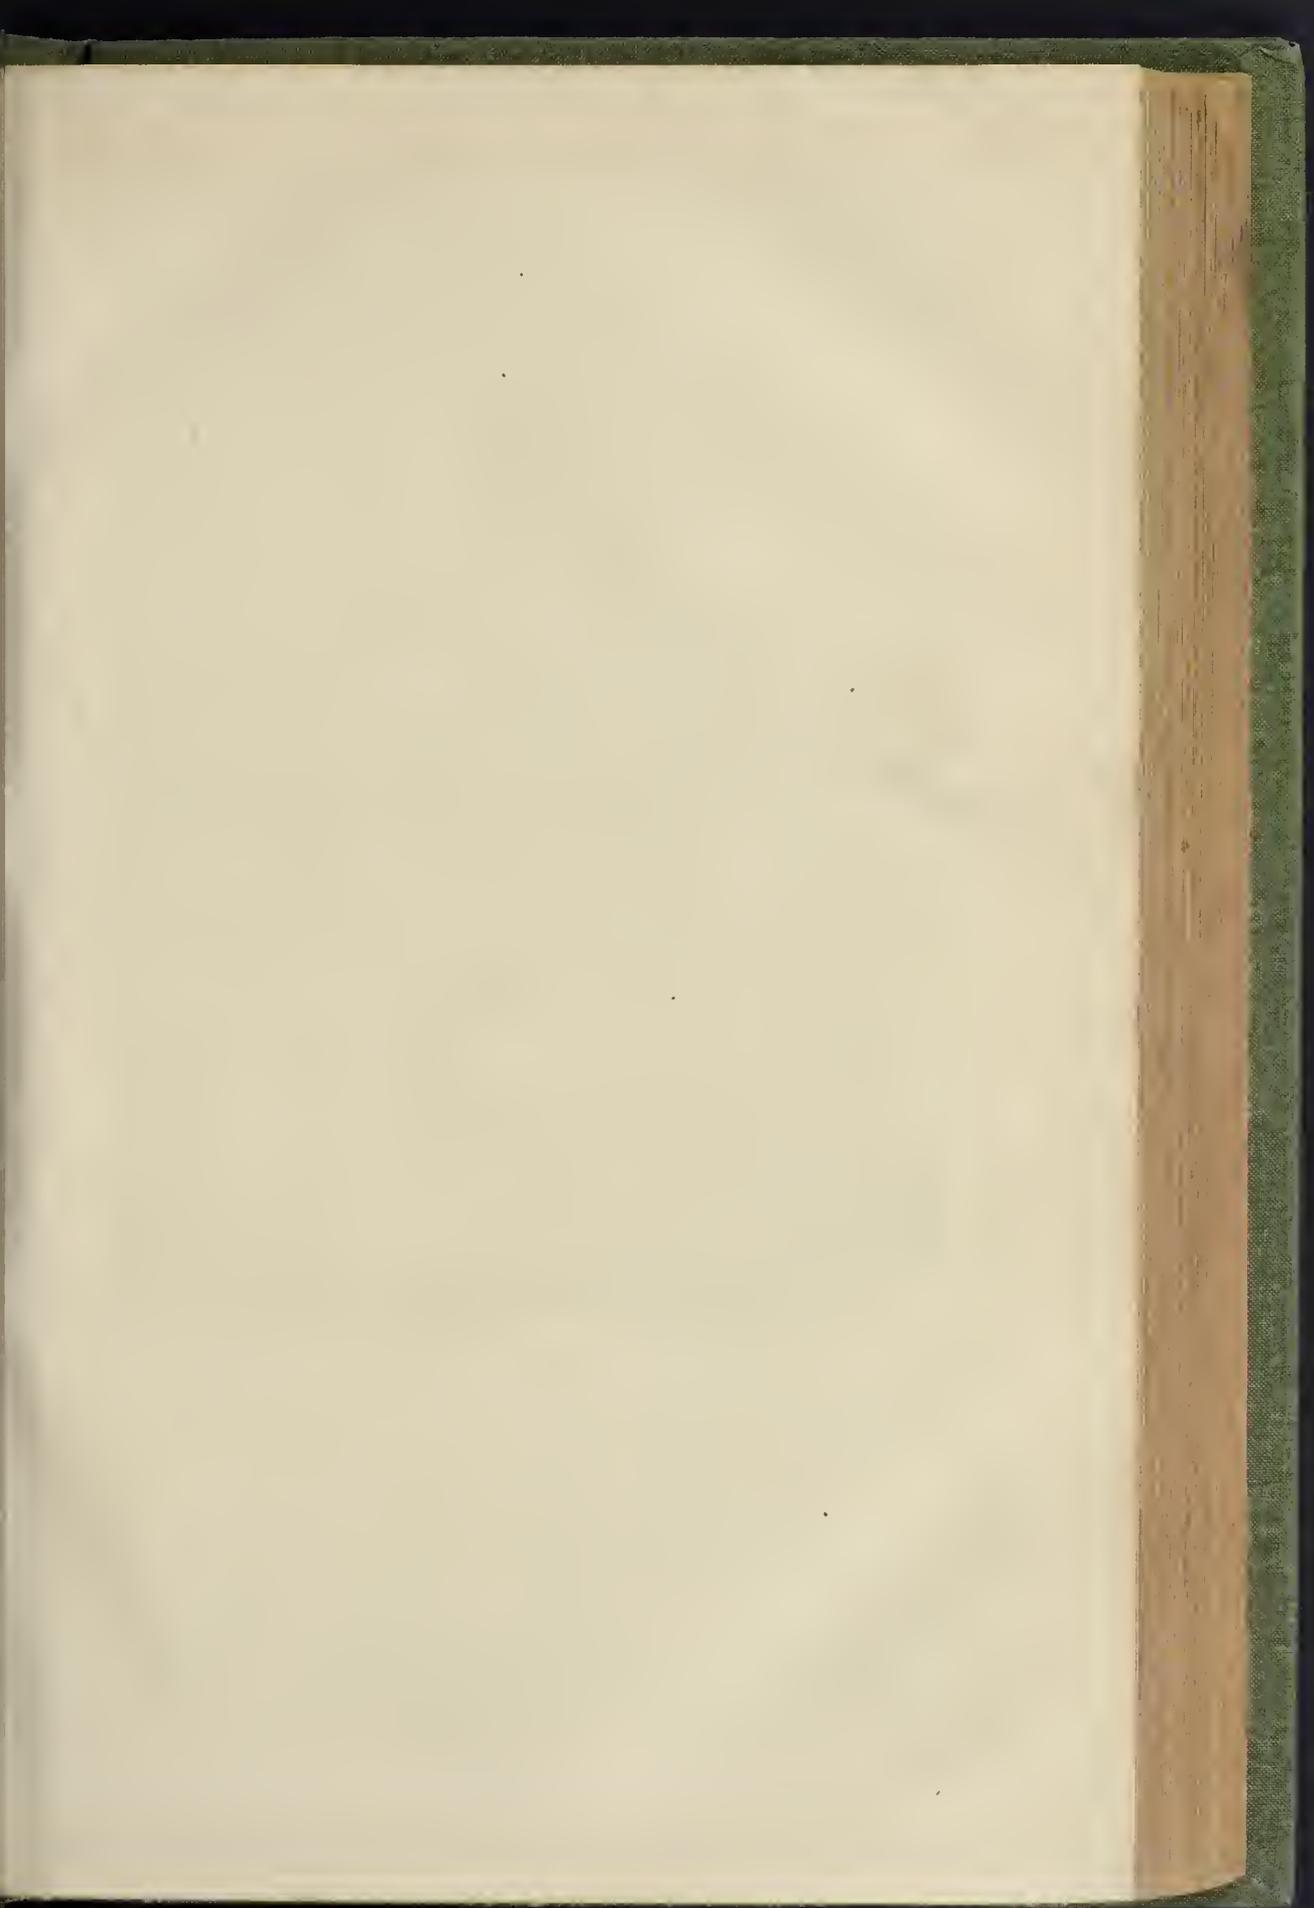

I challenge "Sanitarian" to proof, and I assert that the financial argument in the Report as to local rating, is utterly untenable; that the Report pronounces sewage irrigation elsewhere to have been unprofitable; and that the West Ham Board is not only told that tanks may be used without nuisance, but is directed to deal with the sewage of 70,000 persons, rapidly increasing, in tanks situated in a populous locality, notwithstanding that "disinfectants have previously reported that 'disinfectants do not disinfect, and filter-beds do not filter. Both attempts have been costly failures.'"

"Sanitarian" further states that, "In West Ham proper, Mr. Angell's letter needs no refutation." In reply to this, I will simply quote the following resolution of the Local Board "in West Ham proper," carried unanimously at a special meeting, July 4th:—

"That in the opinion of this Board, the report of Mr. Harrison is most unsatisfactory, and not supported by facts, and that the Local Government Board, by ignoring their previous recommendations and reports, and the facts gained by this Board at a considerable cost of time and money, has placed the parish of West Ham in a position of great difficulty, from which it does not seem to have any means of extricate itself."

I may add that I have received communications from all parts respecting this decision. One leading agricultural and sewage engineer writes spontaneously, after reading the full report, upon the necessity of counteracting "its pernicious effect."

LEWIS ANGELL.

FARM BUILDINGS, PADERBORN, GERMANY.—HERR GULDENPFENNIG, ARCHITECT.

FARM BUILDINGS AT PADERBORN.

The buildings represented in our illustration have been recently erected at a place called Werver, near Paderborn, in Westphalia, for the Baron von Brenkin. They are from the designs of Herr Guldenpfennig, diocesan architect to the Bishop of Paderborn, and one of the most recently-elected corresponding members of the Institute of British Architects.

These buildings consist of a gatehouse, two large stables, a large coach-house, harness-rooms, a cow-house, poultry-house, porter's room, outdoor servants' and coachmen's rooms; all these are in the lower or ground floor, which is constructed of stone, worked roughly, and partially covered with rough mortar. In the upper story, which is framed in oak, and filled in with patterns worked in red brick, are two large lofts, used as granaries, divided from one another by the upper portion of the gateway, which forms a large apartment with two projecting bay-windows. The roofs are covered with tiles made in the neighbourhood, the hips and ridges

being ornamented with finials and crestings of lead and iron. The entire cost of this very picturesque building, or rather range of buildings, was about 6,000 Prussian thalers (the thaler is about 3s. English money). This, however, does not include the timber, which was supplied from the very extensive woods belonging to the Baron von Brenkin, in the neighbourhood. As will be seen from our illustration, the buildings are of an elaborate description, all the timber being moulded and chamfered, and all the hickwork arranged in patterns. The general effect of the whole is singularly picturesque and pleasing.

EMANUEL CHURCH, CLIFTON.

This church has been several years in course of erection, under the direction of Mr. Norton, architect, on a site contiguous to the grounds of the new Clifton College, and near the Downs.

The first contract, embracing the nave and aisles, was carried out, by Messrs. Davis & Son; the second, embracing the transepts,

chancel, and chapels, by Mr. Diment; and the third, for the tower and spire, also by Mr. Diment. This latter has now been completed to the top of the tower and, if funds permit, it is intended to proceed with the spire, as shown in our view.

The church is spacious and lofty, measuring internally 122 ft. by 60 ft., and the roof carried through a uniform height of 60 ft. The chancel is apsidal, and measures 39 ft. by 28 ft. The nave is of five bays, with lofty arcade-arches springing from circular columns. Arcades of two bays divide north and south chapels from the chancel, designed for vestries and organ-chamber.

The church is built of the native stone, of a reddish tint, with bands of deep red sandstone. The dressings are of Bath stone; the chancel steps and dais of Limerick marbles and encaustic tiles. The reredos is carved with subjects in high relief, by Boulton, of Cheltenham. When completed, the spire will attain a height of 222 ft., the tower being 108 ft., and the spire 114 ft. high.

EMANUEL CHURCH, CLIFTON, BRISTOL.—MR. JOHN NORTON, ARCHITECT.

KENSINGTON GARDENS AND PALACE.

Sir,—After Windsor Castle, we have no position so beautiful and appropriate for a Royal residence as the now intramural palace of Kensington,—with a large scope of ground, say 250 acres, adjacent to Hyde Park, which, contains over 300 acres more. No Royal abode of Europe commands a finer site; but the state and condition of the palace, which might have been a suitable residence in the reign of William and Mary, is not commensurate with the requirements of our times; besides that, the stately forest-trees seem to have been wholly neglected for a century. There are, it is true, lovely forest glades and a profusion of stately trees; still, for want of the smallest care in thinning out and clearing away those in too close proximity, the great majority are grown up into bare poles, several interlacing each other, and thus obstructing free growth, and the natural development of forest scenery.

Is there no arborist empowered with authority to check this fearful waste of Nature's choicest products? It could not be expensive, for one full fourth part of the timber should be fallen: many trees are dead, many grown to bare poles; so that in case of a fall, the timber would pay several thousands of pounds.

When first erected, the palace might have commanded an extensive and pleasing western view; for then there were but few houses, and the prospect was open and unobscured; now suburban buildings extend for miles beyond it. Besides that, the site on the verge of the western boundary is 12 ft. lower than the ground near the Round Pond. In fact, the whole extent of the western extremity is bounded by an ancient wall, extending nearly from Notting-hill to the Kensington-road. At the Bayswater end there is a meadow of about eight acres, walled in as far as the palace. This may produce asparagus, sea-kale, and marrowfat for the establishment; but it is fearful out of place, and superior vegetables might be procured more economically from Covent-garden; and grounds in such positions are now risen to an enormous value, so that it would be absurd to convert them into kitchen gardens.

The Park railings have been cleared away along the whole *enceinte*, except at the north-west and south-west angles, and the recompense to the public by this improvement of open iron railings is beyond estimation; and perhaps the numerous allusions in the *Builder* long since published have had some influence in the removal of these *advertising* walls, and the erection of railings.

At the rear of the palace there is a green (about eight acres), bordering the fine Palace Garden-road; there is a small mean barrack on the south end, and a park-keeper's lodge of the ancient stamp at the angle of Kensington-road. Now, the opening out of these plots, and especially of the "*angulus iste*" at Kensington, would confer dignity and beauty upon the two most important of London suburbs—the Royal Kensington and the aristocratic Bayswater.

The proper site for a palace would be on the high ground, about 300 yards in advance of the old building, near the Round Pond, which might be somewhat withdrawn, in an oval or kidney form. At present the traverse broad walk runs between Bayswater and Kensington roads in a right line, and this would form a noble approach to a new palace, which might stand between that line and the Round Pond; and in exchange for this central position, the kitchen garden at the north-west, and the lodge at the south-west angles, together with the open green and hovel barrack, would, if properly embellished and laid out, afford the public a fourfold compensation. If a country mansion surrounded by park is more desirable than one on the roadside, how much preferable is the palace with trees and verdure all around?

It is only requisite to look at the iron railing, continuous along Park-lane and the Kensington and Bayswater roads, in order to appreciate the advantage of a similar railing encircling the whole scope of park and gardens, and giving extended freedom for a ramble round the whole as far as Palace Garden-road.

A Royal palace in this position would be more healthy for occupation than St. James's or Buckingham hollows; it would be sufficiently near to aristocratic quarters for levees and drawing-rooms; and if built in a style of architecture congenial to the improved taste of the time, must prove a lasting embellishment to the metropolis; the deficiency of accommodation in the shape of hospitality to Royal

visitors might be remedied by setting aside Buckingham Palace, or a portion of it, for that purpose; and lastly, the western margin, over 100 yards wide, which is now external to the gardens, might admit of a thoroughfare, so much needed for public use, between Notting-hill and Kensington; and this without marring the effect of fine trees standing near the boundary iron railing, which, by continuation, would give integrity to the whole park. QUONDAM.

THE TRADES MOVEMENT.

London.—The later incidents in the dispute show it to be in a different position now from what it was last week, but still not quite satisfactory. On Wednesday in last week the London Society of Operative Stone Masons, in a grand lodge meeting, composed of the "benefited" members of its twelve branches, resolved upon sending a deputation, with plenary powers, to treat for the termination of the strike and lock-out. In due course the masters were informed of this resolve, and having consented to receive the deputation, the interview, which extended over six hours, took place on Friday, when the following treaty of peace was agreed upon, viz. —

"2, Westminster Chambers, July 5. The Committee of the Central Association of Master Builders agree to settle the questions now pending between them and the masons (by their representatives in the following terms)—That the average working hours shall be fifty-one per week, as requested by the workmen, but that the shorter hours during which they cannot see to work in the winter shall be made up by additional hours in summer; and that the wages shall be 8s. 6d. instead of 8s., as at present. The hours to be as under:—Twelve weeks winter at forty-seven hours per week, the forty weeks remaining at fifty-two hours and a half. The hours of commencing to be six o'clock in the summer, seven o'clock in winter. In winter half an hour later on Monday morning. The hour of leaving off on Saturday to be five o'clock all the year round. The Committee of Masters will recommend the members of the Association to pay wages on Friday evening after work.

Signed for the masters,
B. HAYDEN, C. LUCAS, G. TROLOFF,
G. DINES, S. BIRD.
For the men,
H. BROADBENT, H. NISBET, W. BOWMAN,
M. KENNARD, F. WEIGHILL."

In accordance with a resolution adopted by the general committee of the Master Builders' Association, on Monday, the various shops, which had been deserted for the last few weeks, were on Tuesday morning, at six o'clock, reopened to the men of all branches who chose to resume work upon the terms accepted by the masons; but very few men availed themselves of the opportunity;—the masons, on the ground that their committee had received no official notice of the re-opening of the shops from the masters' committee; and the carpenters, and the men in the other branches, on the ground that they repudiate altogether the terms of arrangement made between the masters and the masons. The committee of carpenters had caused large bills to be posted outside the shops, cautioning all carpenters against resuming work upon the terms accepted by the masons, but this precaution was useless, as no men presented themselves. On Tuesday evening the masons' committee received the official notice from the employers, and they were to resume work as a body on Wednesday morning. The carpenters and joiners refuse to go in, and say they will carry on the struggle for the "nine hours and the ninepence." Surely it would be wiser for them to accept the compromise which the other trades have accepted. It has justice and common sense to recommend it.

Tamworth.—The joiners employed by the London and North-Western Railway Company have struck work for an increase of wages and a reduction in the hours of working. About eighteen weeks ago the men made application to the company for a rise in their wages of 6d. per day, —namely, from 4s. 6d. to 5s., and for the working hours to be reduced from 5½ to 5¼ per week. —Sunday work to be paid for as double time. An answer was received by the men from the railway company, refusing to grant the advance of 6d. per day, or to reduce the hours of working. In consequence of this, the majority of the men turned out, and are on strike; and the company, to meet the emergency, have collected men from various places and sent them to Tamworth.

Blackburn.—The joiners having applied for an increase of wages, the masters and men held a conference, and arranged to form a board of arbitration, to which all matters should be referred. Mr. Hulton, County Court Judge, is to be asked to act as umpire.

Glasgow.—We understand that there is some probability of the Glasgow masons' strike, which has now lasted for more than four weeks, coming to an end, two of the principal employers in the city having conceded the weekly payment of wages.

CENTRAL ASSOCIATION OF MASTER BUILDERS.

On Wednesday afternoon a conference was held at the Westminster Palace Hotel by the committee of the Central Association of Master Builders with representatives of provincial towns as under:—Mr. B. Briggs, president of the General Builders' Association; Mr. Urmon, president, of Liverpool; Mr. Neill, of Manchester; Mr. Johnson, of Manchester; Messrs. Bockett, of Northwich; Gibson, of Warrington; Hardwick, of Birmingham; Simpson, of Hull; Bennett, of Rugby; Marriott, of Coventry; Baker, of Bristol; Clutterhuck, of Gloucester; Fawcett, of Huddersfield; Bell, of Cambridge; and Mault. The following resolution was passed:—

"That it is desirable that the associations of master builders in the United Kingdom should enter into a close alliance with the view of ameliorating the position of the trade, and especially in regard to the labour question, to endeavour to settle matters without a resort to the system of strikes now so frequently occurring."

By a committee afterwards the following additional resolution was agreed to:—

"That in constituting a Central Association, it is desirable to make such arrangements as shall secure united action where united action is necessary, and, at the same time shall secure the various associations independence of local action in all local matters."

INAUGURATION OF THE WOOD MEMORIAL HALL OF THE MINING INSTITUTE, NEWCASTLE-UPON-TYNE.

The new building where professors and students will henceforth assemble in connexion with the North of England Institute of Mining and Mechanical Engineers has been inaugurated by the first meeting of the Institution of Engineers and Shipbuilders in Scotland, the South Lancashire and Cheshire Coal Association, and the Institute of Mining and Mechanical Engineers at Newcastle. The marble statue of the late Mr. Nicholas Wood was unveiled at the same time. The edifice forms a part of a block of buildings which attracts attention to the east of the Central Railway-station, and consists of a literary and philosophical institution, a museum, a medical college, a college of physical science, and the Mining Institute itself. The Wood Memorial Hall is rapidly approaching completion, and in its internal arrangements gives every evidence of comfort and convenience. It is 70 ft. in length by 20 ft. in width, the absolute height from floor to ceiling being 39 ft. 6 in. The style of decoration is mixed in character, being Franco-Gothic, with Gothic furniture to match. The cost of the Memorial Hall alone will be 20,000l. The Mayor and afterwards Professor Rankine presided at the inauguration meetings, and Sir W. Armstrong gave a banquet on the occasion.

THE ST. ALBAN'S ARCHÆOLOGICAL AND ARCHITECTURAL SOCIETY.

The annual meeting of this society was held at the Town-hall. Mr. J. Evans, F.S.A., occupied the chair, and there were also present the Revs. Canon Geo. Mackenzie Walcot, W. J. Lawrence, H. N. Dunning, F. Lipscomb, &c.; Messrs. G. Gilbert Scott, R. A. C. Longman, H. J. Toulmin, E. S. Wiles, T. W. Blagg, &c.; Rev. O. W. Davys and Mr. Ridgway Lloyd, secretaries.

A paper was read by Mr. Lloyd "On the Shrines and Altars in St. Alban's Abbey," not dealing with the architectural character of their remains, but tracing their history by means of extant documents (mainly the "*Gesta Aghatium Monasterii S. Albani*," edited by Mr. H. T. Riley), indicating also the evidence there existing as to the sites of the different altars. The Rev. M. Walcot, who has given much attention to this part of the subject, spoke *inter alia* as to the thoroughness with which Mr. Lloyd had done the work he had undertaken.

Mr. G. G. Scott made some remarks as to the works at the Abbey Church, —these among the rest:—"I believe that we can now say the [central] tower is perfectly safe. . . . One of the defects of the tower (in the south-east pier) extremely surprised me and all who saw it.

In digging away the foundations, there was a complete cave, of 5 ft. or 6 ft. in width, excavated underneath,—not fallen away, from weakness or disintegration, but actually cut away. This was, no doubt, excavated with a view to the destruction of the tower,—one of the modes of attacking fortifications in the old days was to undermine foundations. . . . In the event of sufficient funds being raised it is our intention to restore to a substantial state every portion which requires it; but while giving a perfect architectural restoration to those parts as to whose precise features we feel certain, we do not intend to introduce any conjectural embellishments. The abbey will thus be handed down by us as we have found it." As to the substructure of St. Alban's Shrine, discovered in a mass of fragments, Mr. Scott said,—“Through the extraordinary ingenuity of Mr. Chapple, the clerk of the works, and Mr. Jackson, the foreman, and the workmen, these innumerable pieces have been fitted together in a most admirable way, and the whole reconstructed. I will not take any credit to myself, as it was entirely their work. It was at first constructed in part, and then I suggested that it should be put up in its original place,—that is the only thing I can take credit for with reference to the shrine of St. Alban.” . . . Mr. Scott went on to state that Mr. Ruskin recently gave a subscription for its (the shrine's) restoration, and said that if the special subscriptions did not come in they might look to him for the whole amount. He hoped that Mr. Ruskin would not be allowed to do more than he had done, as the more he paid the more apathy might by some people be attributed to others. The audience (one of the largest ever brought together at a meeting of this society) then adjourned to the Abbey Church, and listened to Mr. Scott's explanation of the works of other days and of the present.

A prominent member of this society, Mr. Richard Grove Lowe, died on Friday, the 28th of June. At the time of his death (aged 71) he was the senior alderman of the borough, and had through life been settled therein,—for many years in practice as a solicitor. He had considerable acquaintance with the Roman and other antiquities of the neighbourhood; and the site of the Roman theatre, not far from St. Michael's Church, was first pointed out by him. His collection of coins, carefully brought together, is said to contain some specimens of unique interest.

THE NEW GLOBE BRIDGE AT PECKHAM: BURSTING OF THE DAM.

CONSIDERABLE expense has been incurred by the bursting of the dam at the works of the new Globe Bridge, over the Surrey Canal, at Peckham, now in course of construction. The contractor was put to considerable inconvenience by the accident, having to erect a second dam, and the progress of the work was much hindered. When the amount of the contractor's account for the expense incurred was last week submitted to the Camberwell Vestry for payment, several members took exception to it; but, the engineer having certified that the contractor was entitled to the money, the amount was ordered to be paid.

SMOKY WALLS.

Sir,—I wish to be informed by any of my fellow-readers, how smoke-stains can be removed from a new brick wall? J. W.

LIGNO-MINERAL PAVING.

Woop paving appears to be obtaining fresh attention. We mentioned lately the principle of one system; now another, Trenavay's mode, very strongly recommended, comes before us. The chief advantage claimed for this system is the fact that the wood blocks, being thoroughly impregnated with an impervious mineral substance, are impermeable to wet.

The foundation of the roadway is prepared in the usual way with concrete, and on this the prepared blocks are set, within interstitial joints solidly filled in with grout, penetrating to the grooves on either side of the blocks, and binding the whole together compactly. The blocks are bevelled or mitred at the ends to an angle of 60°; the inclined joints being set in opposite directions in adjacent rows, so as to break joint. The mineralisation is effected by a novel appliance of

mineral oils, of which the hydrocarburates render the wood impervious to damp, and proof against effects of variations of temperature.

This system has been tried in Paris, and vouched for by the official reports of the French Government engineer.

The City Commissioners of Sewers of London have allowed Messrs. A. McNeill & Co. (the English agents for the patent), to put down a piece of specimen paving in Gracechurch-street, immediately adjoining the asphalt previously laid down.

ERECTION OF NEW BUILDINGS AT ST. PANCRAS WORKHOUSE.

THE POOR-LAW BOARD AND THE GUARDIANS.

THE guardians of the St. Pancras Union and the Local Government Board are at issue as to the erection of a new laundry at the workhouse. The Local Government Board appear resolved on insisting upon the erection of the new laundry, and have called upon the guardians for an explanation why they do not proceed with the works and the alterations required. The guardians, in reply, have passed a resolution to the effect “That we inform the Local Government Board that we have no alterations to make.”

In the discussion which took place prior to this resolution being arrived at, several of the guardians protested against what they said would be a profligate and uncalled for expenditure of the money belonging to the ratepayers. The conduct of the Local Government Board towards the guardians was denounced as “nothing short of tyranny,” and “it was full time that they made a bold stand, and showed the Central Board that they would not be dictated to any longer.”

THE NEW LAW COURTS.

MR. C. BENTINCK asked her Majesty's Government whether it was their intention to authorise the expenditure of public money in the execution of the design for the Strand front of the New Law Courts, which was now exhibited by Mr. Street at the Royal Academy, and which was dated November, 1871.

Mr. Ayrton said the designs for the New Law Courts had not been approved of by him, but by the Lords of the Treasury. Since the sketch designs had been approved of, Mr. Street had intimated that he had made some small changes in the elevation of the Strand. What the nature and extent of those changes were could only be properly ascertained when Mr. Street had deposited the regular contract plan for the elevation of the building. The design which was exhibited at the Royal Academy was not really an elevation, but was merely a perspective drawing of the plan Mr. Street had in view at the time he drew it. At present it was impossible to judge what would be the nature and extent of the real elevation, but the matter would be taken into consideration when the regular contract plans were deposited.

UTILISING DRAINAGE.

CAN any of your readers inform me of a simple method of arranging the drainage of a detached house standing on about an acre of ground, by means of which the obnoxious large cess-pit may be avoided, and the liquid and solid manures may be so treated that they may be frequently distributed on a hungry soil without causing any unpleasantness, or running any risk of poisoning a good well of pure spring water? M. M.

* Employ a proper person to do the work.

HYDRAULIC.

Sir,—Allow me to suggest the probable cause of the peculiarity in the well alluded to in the letter of “Glaston.” First, premising that the rainwater collected from the roof is, doubtless, of less specific gravity than the brackish water the well obtains from the ground; and that during a continuance of dry weather, when there is no rainwater entering the well from the roof, the surface level of the brackish water within it will nearly coincide with the water-level in the ground outside it; the latter level being more or less the higher according to the draught upon the well, and the porosity of the ground the well is sunk in.

Now, supposing the level of this water to stand at 10 ft. from the bottom of the well, and to consist entirely of brackish water, undiluted with rainwater from the roof, then when a heavy fall of rain occurs, the rain-water from the roof pouring into the well will tend to fill it, and to raise the water surface within it; and if a heavy fall has occurred, the water may rise to the top of the well. Now, in such a case, it will follow consequently that there will be a greater weight or pressure of water within the well than on the outside of it, the water surface level within it being higher than outside it. The natural consequence will

therefore be, that the brackish water, which when the rain commenced filled the bottom of the well, will be driven back out of it into the ground around the bottom; and if the roof supplies a sufficient quantity of rainwater, not only will the brackish water be driven back out of the well, but also a greater or lesser amount of the rainwater will also follow it out of the well into the ground. The well will, therefore, after a moderate rain, contain nearly pure rainwater alone; and after a heavy rain the water-bearing stratum for some little distance around the well will also be filled by the rainwater from the roof.

The pump will, accordingly, after rain, draw pure or nearly pure rainwater; and will continue to do so, until the greater part of the rainwater poured into it from the roof is exhausted, when the brackish water will again find room for its return into the well, and thence again supply the pump.

J. R. M.

HAIRD AND SOFT WATER.

Sir,—Will you allow me, through the medium of your journal, to seek for information as to the best means of improving my supply of water? I want to soften hard water and catch rain-water. The spring water, which is excessively hard, is pumped into a large slate cistern, from which the house is supplied. How can I soften the water in the cistern? The tiles which cover my house are a shingle less than a foot continuous rain runs off. How can I make the tiles less porous at a moderate cost? F. M. K.

TREATMENT OF CONTRACTORS.

Sir,—A Building Committee to a large Institution invite tenders to erect same from some four or five builders in a radius of ten miles, to whom they forward the lithographic quantities, and fix twelve o'clock on a certain day to receive same. Only two tenders are received, both of which exceed the amount intended to be built. A builder present is asked for his price quantities, as the job must be cut down; one wing is suggested not to be built, and he states what he will deduct for that; several items are struck out of the quantities, and the amount allowed off; the site is selected, and position of building fixed. At half-past one o'clock he is told “they had expected to have received two more tenders; he need not stay longer, they would write him.” Now he hears that one or two more tenders have been sent in since by local men, and for less amounts, and one is likely to be accepted; but he has not heard from the committee.

Believing, as I do in this case, that honourable men may in ignorance of such rule and custom unwittingly encourage a most unprincipled proceeding by receiving tenders after the stated time, which enables others to bid out of the amount of the lowest tender, and send in accordingly, besides being most unbusinesslike, I hope you will insert this statement. A COMPETITOR.

NORTH CAMBRIDGESHIRE COTTAGE HOSPITAL, WISBECI.

THE plans of this hospital, which have been prepared by Messrs. Adams & Son, architects, King's Lynn and Wisbech, have been approved of by Miss Trafford Southwell, who has offered to erect the building, in a manner which shall make it a permanent benefit to the town, entirely at her own cost. Mr. William Peckover also has placed in the hands of the trustees the sum of 2,000*l.*, and Mr. Algernon Peckover a further sum of 500*l.*, to permanently endow the institution. The style of the building is Gothic, with a frontage of 62 ft. by 88 ft. in depth. The principal front will face the public pleasure-ground. The ground-floor will contain commodious sick-wards, another for special cases, dispensary, operating-rooms, nurses', committee, and domestic offices, bath-rooms. The chamber-floor will contain sick-wards, special ditto, convalescent-rooms, nurses' and bath-rooms, private bed-rooms, and other conveniences. A large cellar will be used as a hardy, stone, &c., under a portion of the building. The ventilation and drainage will be carried out on scientific principles. In addition to the hospital, there will be an entrance-lodge, with laundry and drying-rooms, and in the rear of the building will be placed the post-mortem and dead house, &c. The building, we understand, will be commenced forthwith.

THE HEREFORD FREE LIBRARY AND MUSEUM.

At the last monthly meeting of the Town Council of Hereford, a special report from the committee of the Free Library and Museum, was read. It stated that the premises in Broad-street, purchased by Mr. Rankin for the erection of the Free Library and Museum, have been conveyed to the Corporation. The plans for the new building were submitted to a selected number of builders, five of whom sent in tenders for the work. The lowest tender was that from Mr. James Bowers, of this city, and it amounted to 4,600*l.* It was at once evident that this amount, made thus high by the general rise of prices in building materials and labour during the last twelve months, amounting to about 25 per cent., was more than could be met by the funds at the disposal of the committee.

The plans had already been reduced as low as possible for the proper requirements of the institution, and the committee could not therefore have accepted the tender, or taken any further proceedings, but for the unolicited munificence of Mr. Rankin, who was present. He met the difficulty by adding another 1,000. to the 5,000. he had previously promised for this object. The tender of Mr. J. Bowers was then accepted, and arrangements were made to clear the site and commence the building. The plans, as finally agreed upon, will be presented to the Council for inspection. Meantime, the report was adopted with acclamation.

THE BRIDEWELL HOSPITAL ESTATE.

The land in New Bridge-street, Blackfriars, on which Radley's Hotel until recently stood, together with two houses facing New Bridge-street, having a frontage from the boundary of the hospital buildings to Bride-court, as well as a large quantity of land at the back of the premises, is being laid out by the construction of two new streets, one going from New Bridge-street westward to a junction with another new street, running north and south from Tudor-street to Bride-court, to complete which a number of houses at the north end and extending to Bride-court, are about to be taken down. The land on the north side of the new street from New Bridge-street, on which Radley's Hotel stood, will shortly, it is stated, be occupied by a large first-class hotel, whilst on that on the south side it is said offices and buildings of a commercial character will be erected, and that buildings of a similar character will in addition be erected on the land on the west side of the new street from Tudor-street to Bride-court.

CHURCH-BUILDING NEWS.

Folkestone.—A plan for restoring the church of Folkestone, now re-opened, and about half of which has been carried out, was made through the instrumentality of Lady Login and Lord Kimmsaid. The scheme consisted of re-building the chancel, raising the walls, and re-roofing the nave, adding north and south transepts, heightening the tower, and building a new porch. It was determined to begin at the east end, and the new chancel has been built, and the north transept with organ-chamber and vestry, the latter in the place of the box which, when the church was re-opened after the re-seating of the nave was completed, was economically papered, have been added, and there the restoration has abruptly stopped. The work has not been carried further because the funds have been expended. The lath and plaster ceiling of the nave is roughly broken off where the roof of the transept begins, and the intervening space is simply boarded up, whilst a strut, to support the roof at this point, comes down exactly in the centre of the passage in the nave. The new work belongs to the early period of the Decorated style. The chancel is apsidal, and is built of the bricks of which the Martello tower, formerly standing hard by, which has lately been pulled down, was composed, the grant of which by Government was obtained by Lady Login. In the original design the architects, Messrs. Edwards & Roberts, Dundee, contemplated that the bricks would be laid in courses, but, following a suggestion made by the contractor, Mr. R. S. Smith, of Ipswich, they have been laid irregularly, and it is said, with good effect; for, when looked at close, the appearance is much more in harmony with the style of the building than ordinary brickwork would have been, and at a little distance the walls would be taken for rubble. The plan might not, perhaps, have succeeded so well with new bricks. The same plan has been followed in the transept, and we presume will be carried out throughout, for there are about bricks enough to complete the restoration. The roof of the chancel is covered with the old plain tiles, and over the chancel-arch is what seems to be a bell-turret, the two sides of which are formed of the flues from the warming apparatus (supplied by Nichols, of Dundee). In each of the three easternmost walls of the chancel is a two-light window with a quatrefoil opening in the head, and there are similar windows in the west wall of the transept and the east wall of the organ-chamber which adjoins. The high-pitched roofs of the transept, &c., are slated. The quoins and dressings of the walls, buttresses, &c.,

are stone. Internally the chancel-roof is made of Memel fir darkly stained, and the principals which spring from stone corbels from the apsidal form of the building make it a groined roof. In the gable-wall are three plain, single-light windows, which, as well as the other windows in the new part of the church, are filled with cathedral glass, with a border of ruby. The stonemason's work was done by Mr. Frewer, of Ipswich. The plumbing and glazing was done by Mr. D. Thurman, Walton. At present the cost has been about 1,100., and a somewhat equal amount is required to complete the reconstruction.

Barley.—The church here has been reconsecrated. The whole of the new work (with the exception of the oak seating in the nave), has been carried out after the designs of Mr. Butterfield, by Mr. Gibbons, of Buntingford, builder, under the superintendence of Mr. Nash, clerk of the works. The stone-work, exclusive of flint-work, was undertaken by Mr. Bullen. A new aisle, 9 ft. 6 in. wide, has been built on the north side, also a porch, which forms the chief entrance to the church. The nave, with the exception of the old arcade, has been rebuilt and enlarged: it measures 50 ft. by 25 ft. The old arcade has been lengthened by the addition of a bay, made to correspond with the new arcade on the north side. The chancel is entirely new, as are also the small aisle and vestry, added to it on the south. The chancel is 37 ft. by 26 ft. The general walling is built with local flints, Box ground stone being used for all external dressings and for the windows, the tracery of the latter being of geometric design, and Corsham Down stone has been used for all inside masonry. Internally the walls are plastered and relieved by hands of coloured tiles. The roofs are of deal, the principal timbers being exposed to view, and the ceilings divided into compartments by chamfered ribs. The chancel roof has curved braces of English oak, and is filled in between the principals with ornamental tracery. The nave, chancel, and porch roofs are covered with red tiles, and the ridges finished with painted crosts. Encaustic tiles, mixed with some portions of stone paving, and laid to a pattern designed by the architect, are used for the chancel floor. The steps are of Portland stone, the risers being inlaid with figured tiles. All the other floors throughout the church, excepting where the seats are placed, are laid with 6-in. black and red quarries. New open seats of wainscot oak have been provided throughout the church, the floors upon which these seats are fixed being of yellow deal, with oak margins, and a level with the tile paving. For heating the church two Porritt's stoves have been provided. During the progress of the work the upper part of the tower was found to be in an unsafe condition; the walls were therefore taken down and rebuilt, new windows being inserted, new stone parapets provided, and all finished in a style corresponding with the previously existing work. A new spire, about 40 ft. in height, and octagonal in plan, has also been added to the tower. The upper part is covered with oak shingles, and terminates with an iron cross and weather vane. Improvements have been made in the appearance of the churchyard, and the church, which is a considerable height above the level of the road, is now approached by new steps from the entrance that has been formed on the north side. The style chosen by Mr. Butterfield for the new work is Geometrical Middle Pointed. Every original trace of Norman work has been left. A slightly new form has been given to the battlements, which were an addition of the fifteenth century. The stained glass of the east window, which is at present partially filled, is the work of Messrs. Hardman & Co., of Birmingham. In the central light is the Crucifixion, and below it the Virgin Mary bending over our Infant Lord in an attitude of devotion. The side lights will be filled (when money can be collected for the purpose) with the usual figures of the Virgin and St. John, and below with the Adoration of the Magi and the Shepherds.

Boston Spa.—St. Mary's Church, which is a very plain structure, built in 1814, is to be entirely reconstructed and much enlarged, as the want of more sittings is much felt. A few months ago plans were advertised for, and submitted by several architects in competition, and those of Mr. Walter H. Parkinson, of Leeds, were selected, and having been approved by the Archbishop of York, the first portion of the work will be commenced immediately. It consists of a new chancel, organ chapel, vestries,

south transept, and part of south aisle. Accommodation will be thus provided for 200 sittings, being 92 more than the church at present contains. The whole of the money is being raised by voluntary subscriptions.

FROM EDINBURGH.

The foundation-stone of a new church, in connexion with the United Presbyterian body, has been laid at the corner of Easter and London roads. The building has been designed by Mr. Starforth, architect, in the Early English style. The design shows, on the London-road side, an elevation consisting of a large central gable, flanked on the east by a tower and spire, and on the west by another tower of smaller dimensions. In the gable, which terminates above in a finial, combining the forms of cross and circle, the principal feature is a large window with five lights, the three in the centre being surmounted by quatrefoil perforations. On each side of the window is a niche, and underneath is the main entrance to the church, consisting of two flat-headed doorways enclosed within a pointed arch. The west tower, which only rises to the height of the side wall of the church, shows in front a two-light window, an enriched cornice along the wall-head, and a high-pitched roof with iron cresting. The east tower, rising close to that side of the central gable, is square in plan, and, in its lower stage, is supported by buttresses at the corners. Towards the front it shows a three-light window on the lower stage, and higher up a double window. The wall-head is finished with a blocked cornice, and supports a square spire, relieved with a pinnacled dormer on each side, and terminating at the height of 90 ft. from the ground, in an ornamental vane. The towers are pierced with doorways, which appear in the east and west elevations respectively; and each contains a staircase giving access to the gallery of the church. In the side elevation we have a range of wall divided by projecting buttresses into seven bays, and presenting in each bay two windows, the lower flat-headed, but the upper with two lancet-shaped lights, and head filled in with quatrefoil or circular perforation. From the wall-head rises a high-pitched roof, having its surface broken up by three pinnacled dormers. The north end of the church, so far as not hidden by certain subsidiary buildings, shows a large gable, pierced by a couple of three-light windows. Internally, the building will be fitted up to accommodate about 1,000 persons. A light gallery is to be carried round three sides, supported on ornamental iron brackets springing from the side walls. A series of wooden rafters, resting on carved corbels, will support a flat plastered ceiling, the rafters themselves being unvarnished. The pews will be open. In the erection of the church itself nothing has yet been done; but considerable progress has been made with a congregational hall and offices, which come in as a sort of annex on the north side of the main building. This is a stone structure, containing in the centre a hall, 44 ft. 4 in. by 32 ft. 2 in., which will be seated for 300 persons, and on either side apartments intended to be appropriated as session-room, vestry, ladies' waiting-room, and offices.

FROM AUSTRALASIA.

Melbourne.—The Ministry having decided upon at once commencing the building of a governor's house on the site in the botanical reserve, the plans were all prepared, and the following tenders for this and other works have been accepted by the Public Works Department:—Foundations and basements for Government House, Melbourne, Kilgower and Richardson, 7,576l. 6s. 10d.; additions and repairs to Public Works Office, Melbourne, Wm. J. Searlett, 647l. 10s.; additions to Court-house, Smythesdale, J. Milverton, 250l.; fencing Government Printing-office, Peter McCowan, 68l.; repairs, colouring, painting, &c., judge's ante-room and Crown presenter's-room, Supreme Court, Melbourne, F. S. Sterling, 20l. 15s.; supply of ladders for use at General Post-office, J. L. Kindon, 36l.; and works at Customs-house, Warrnambool, Kruger and others, 115l. 18s.—One of the most striking embellishments about to be added to Melbourne is a huestone fountain, to be erected on the open space in Spring-street, between the Parliament House and the Treasury, the Government having already determined on

the same. The material used has hitherto been considered utterly unfit for artistic purposes. This work has been designed and executed by Mr. William Stanford, who, for the last seventeen and a half years, having been an inmate of the penal establishment, has been therein immured from the early age of fifteen: so says the *Australian Illustrated News*, which gives a view of the fountain, and it is certainly an extraordinary production for such an artist. But how any crime committed at the age of fifteen could be punished by seventeen years' imprisonment we cannot imagine. It is unnecessary to add that the artist is not merely self-taught, in the usual acceptance of the term, but it is said to be an actual fact that he literally never saw a work of art worthy of the name previous to his recent liberation from his long captivity. The dimensions are:—Extreme height, 17 ft. 6 in.; extreme breadth, 40 ft. The whole is executed in what is colonially styled bluestone, but which, geologically, is trap-rock, save only the eight drinking fountains, which form the principal ornaments of the lower basin: these are zinc castings of a complex character, consisting of eagles standing on shells, in the act of seizing lizards, and, strange to say, this union of arts is in this instance found to be combined in the same individual, Mr. Stanford having executed them also. Extensive as this work is it has been completed in four years.—The new goods shed at the Spencer Street Station of the Victorian Railways has been opened. The building is nearly 900 ft. long, with platforms 42 ft. wide. The contractor was Mr. John Thomas, and the amount of contract 47,572l. 2s. 8d. About 80,000l. have been expended on improvements at Batman's-hill within the last eighteen months.

—Mr. Reilly has been chosen building surveyor by the City Council, to fill the office rendered vacant by the resignation of Mr. Everist. Mr. Reilly is the same gentleman who formerly held the position of city surveyor to the corporation, but retired about five years since upon a retiring allowance of 1,300l., and now comes in for 350l. per annum.

Sandhurst.—Sandhurst is to have the first theatre in the colony at a cost of 20,000l. Messrs. Heffernan & Crowley hold one-third of the shares and the rest are all taken up.

Fitzroy.—The Presbyterian Church at the corner of Napier and Gertrude streets, Fitzroy, having long been found unsuitable, owing to its position, it has been decided to purchase an allotment of land a short distance down the street, and the foundation-stone of the new building to be erected thereon has been laid. 400l. had been collected on account of the new building, but it was anticipated that the sale of the old building and land would realise a considerable amount of the balance required. The present contract is for 2,220l., but with extras it is expected the total cost will be fully 3,000l. The new building is to be of bluestone, faced with freestone, and in the Gothic style. It is 65 ft. by 40 ft. 6 in. (inside dimensions), and will seat about 450 persons. In the front to Napier-street there will be a large tracery window, with stained and ornamental glass. In the back gable will be a large wheel-light window, with ornamental glass, and the windows generally will be of cathedral embossed stained glass. At the back there will be a vestry, 25 ft. by 12 ft., which can be divided into two class-rooms by large folding-doors. The height of the walls inside the church will be 24 ft. 6 in. from the floor line. Above this are large ornamental open-urved principals, supported by corbels, with ornamental columns, &c., underneath; the rafters of open roof to the ridge, with diagonal panelled boarding, &c., are to be stained and varnished in imitation of cedar. The main entrance to the building is obtained by means of a porch, 9 ft. by 8 ft., from Napier-street, and will have a roof to match that of the church, with ornamental marble tile flooring. The design was chosen from those prepared by Mr. George Browne, of Melbourne, architect, and is now being carried out under his direction and general supervision by Mr. James Sumner, the contractor.

Queensland.—This colony is coming in to share with the Transvaal district at the Cape, the honours of its fields of precious stones. So at least it would appear from a story told, which runs thus:—When the *Governor Blackall*, conveying the Eclipse Expedition party, was anchored off one of the northern ports of Queensland, a gentleman came on board, saw Mr. Foord, and showed him some specimens of stone which Mr. Foord offered to bring to Melbourne to have them tested. The gentleman

assented, and requested that they might be set for him. When Mr. Foord arrived in Melbourne, he at once saw Mr. Spink, the lapidary, who pronounced the stones to be opals of great value. The smaller stone, which has been set as a ring, is estimated as worth between 300l. and 400l.; while on the larger, made into a gentleman's breast brooch, Mr. Spink says it is impossible to set a value, it being, he thinks, the largest opal ever found, within his knowledge.

Sydney.—In October, 1870, the Deaf and Dumb Institution invited architects to send competitive designs for the erection of a new building; a sufficient portion to be erected first to contain seventy beds, with all modern appliances and other necessary offices and accommodation, school and dining-rooms, hospital, &c., at a cost not exceeding 3,500l. Of ten designs sent in from most of the leading architects of Sydney, that of Mr. Backhouse, of Belmore Chambers, was adopted, and on the 30th of December, 1870, tenders were invited for the erection of the building according to the accepted design. The site on which the building is erected,—and granted to the committee by the Government,—is on the eastern side of the Newtown-road, opposite Victoria Park. It contains five acres, elevated above all surrounding land, a situation commanding views over the whole of Sydney. The front elevation, in the Italian style, shows a main cretion three stories in height, with extensions on each side of two stories high, and verandahs or arcades in front of each extension, in brick piers and arches, with stone paved floors. At each corner in the main cretion are a small tower with spire, and small dormers for ventilation. The roofs of these towers are of corrugated iron. At each end of the above described extensions are return wings fronting up to the same level as the main building, in front two stories in height, and the back portion, out-offices, &c., one story high. At the junction of the one and two story portions similar towers to those in front are placed, and at the further extremity of each wing will be a tower, rather lower than the front ones, but similar in all other respects. The front elevation of the wings shows a projecting or bay window, surmounted by a two-light window and a gabled roof over. Ample provision will be made for the drainage and water supply.

Utapu, New Zealand.—St. Joseph's Roman Catholic Church, Dunedin, is about to be rebuilt. A portion of the old building will form the eastern nave, 65 ft. by 30 ft.; the new north and south transepts, 85 ft. by 30 ft.; the chancel, entirely to the clergy, 35 ft. by 30 ft., which, further continued westward, incloses a sacristy, or priests' robing-room, 19 ft. by 12 ft. This is separated from the chancel by an isolated and perforated screen, forming a trefoil carved background to the principal altar. Over the sacristy will be a lofty open archway, reaching close to the roof, and which is constructed expressly for acoustic effect. Under this arch will be placed the first and successful specimen of colonial organ manufacture upon a large scale, by Fincham, of Melbourne. The choristers will be screened off from the congregation by a Gothic carved screen extending across the whole width of the chancel, affording, from a peculiarity of construction, an uninterrupted view of the congregation, without the choristers themselves being exposed to view. The church will be entered from the east, north, and south fronts, all the doors opening outwards. The north porch, fronting Dowling-street, will be pierced with dual arched openings, separated by a strictly primitive stone crucifix. The south porch is similar in character, but somewhat smaller. The church will be cruciform, the extreme length of the major axis being 150 ft., whilst the minor axis will be 100 ft. The extreme height from the ground-level to the apex of the roof will be 40 ft. The sides are flanked with massive buttresses and antique mullioned windows, the western one having octagonal turrets, inclosing stairs ascending to the organ-gallery, roof-loft, and choristers' gallery. The design is by Mr. John Millar, F.S.A., architect and civil engineer, whose works, engineering and architectural, are well known throughout the colonies.

The Price of Iron.—The extraordinary advances declared in the price of iron during the last twelve months have brought up quotations to a standard unsurpassed, and probably unequalled, in the experience of living ironmasters. Some one is making a deal of money.

VARIORUM.

Speaking of artists' descendants, Mr. Beavington Atkinson says, in the *People's Magazine*.—"In somewhat extended travels through Europe, I have failed to meet with living descendants of artists whose fame at least cannot die. The only exception I recall was in Florence; a descendant of Michelangelo I found making a poor copy of that weak product in the Corsini Palace, 'The Poesia' of Carlo Dolce. The family of Van Eyck is extinct; it lives only in immortal art."—**Mr. Llewellyn Jewitt's illustrated account of the Ashmolean Museum, Oxford, in the current number of the *Art Journal*, is interesting and valuable. The same must be said of Mr. Teniswood's paper on "Flaxman as a Designer."—"The *Essence of Fun*," selected and arranged by Mr. Tom Hood, is a capital shilling's worth, and will amuse a large public, to whom the periodical itself may be unknown. Every page is full of cuts.**

Miscellanea.

Memorial to Harvey, at Folkestone.—Harvey, the discoverer of the circulation of the blood, is at length to be honoured by the erection of a national memorial. The townsfolk of his native place, Folkestone, have resolved not to allow the tercentenary of his birth to pass unnoticed, and it has been decided that a bronze statue, if possible of a very superior class, shall be erected to his memory. A committee is in progress of formation in London to assist the Folkestone committee, and public scientific bodies and individuals are being asked for aid and co-operation. The Archbishop of Canterbury, Lord Granville, the Presidents of the Royal College of Physicians and Surgeons, Sir Thomas Watson, Sir Henry Holland, Sir William Fergusson, Sir William Gull, Sir James Paget, Baron M. de Rothschild, M.P., and others, have already promised support. As soon as sufficient funds are promised to assure the committee of success, the Prince of Wales will be asked to preside at a public meeting in the hall of the Royal College of Physicians of London. The treasurer of the fund is Dr. Bence Jones, F.R.S. Donations may be made payable to the "Harvey Tercentenary Memorial Fund" at the Western Branch of the Bank of England, or Burlington-gardens, London. A memorial window in the parish church of his native town is also contemplated. The large west window is to be filled with eight subjects from our Lord's miracles of healing.

Restoration of Tewkesbury Abbey.—A vestry meeting has been held, to consider the question of an application for a faculty to remove the galleries, and to substitute for the sittings, contained in them at least an equal number in other parts of the church. The meeting was called for the specific purpose of getting the authority of the Bishop's Court to remove the galleries. Mr. T. Collins generously made an offer to do the work, and to restore the stonework and pillars connected with it, without cost to the parish. It was unanimously resolved that the plans submitted by Mr. Collins be approved and adopted, and that the churchwardens be authorised to make the necessary application to the Bishop's Court for a faculty for the removal of the galleries and the alteration of the sittings, in accordance with Mr. Collins's plan, and for effecting such improvements as may be rendered necessary and as may be advised by Mr. Gilbert Scott. When the proposed work has been carried out the restoration committee will have funds at their disposal which will enable them to erect a suitable stone screen for the support of the organ, and a stone pulpit, which will be so placed as to be seen from all parts of the church.

Science and Art Department.—The examination of students' works submitted from night classes for drawing and from schools of art in competition for payments and prizes has just been concluded. From 397 night classes 56,016 works have been received. From 114 schools of art 73,226 works have been sent up, making a grand total of 129,242 drawings, models, or paintings, which have been executed in the classes during the year ending in April last. Ten gold, twenty-five silver, and sixty bronze medals have been awarded, together with a number of prizes of books. The prize works and some others will be found in the Western Gallery on the ground floor of the South Kensington Museum.

Blasting Operations in Dover Harbour.—The interesting blasting operations have taken place in Dover Harbour, in the presence of Mr. H. W. Shaw, C.E., Mr. Lee (of Messrs. Lee & Co.), and other gentlemen. Messrs. Lee have been engaged for several years in building the new Admiralty Pier, and have lately been improving and enlarging the Dover Harbour, according to Mr. H. W. Shaw's plans. For blasting purposes under water, Messrs. Lee were engaged to apply to Mr. France, who has extensively used what is known as Messrs. Krebs' explosive, the invention of a Cologne firm, and to come down to Dover to try the effect of the explosive on the hard chalk-beds. The operations were carried out under the direction of Mr. France and Mr. Bishop (of the Harbour Pier Works), and with success, large quantities of chalk being displaced. A characteristic of the explosive is that, when lighted by the ordinary match or vesuvian, it burns quietly away; but it is most powerful in its explosion when affected by the detonator, and gives a report like a large cannon. The safety of the explosive was satisfactorily demonstrated, as it was its value for submarine operations, owing to its not being affected by the water.

The Price of Coal.—The rapid rise in the price of coal appears to be starting the public. It is now 22s. per ton upon 22s.,—or 30s. per ton—looks like a fancy summer price; but next winter with its winter prices may astonish those who are not used to "out upon strike." Why should not the colliers strike as well as the building tradesmen? We may be able to do better than we have done for a few years, but we cannot well do without coals for a few winters. The extraordinary prosperity of the iron trade, however, has something to do with the rise in the price of coal. The next thing to be naturally expected, of course, is a strike among the ironworkers for more wages with less work, and so the problem of compound multiplication which brings all trades to a dead-lock is hastening its climax. Meantime, the colliers have not been striking the butchers for their high prices; but have not the butchers and the cattle-dealers and farmers just as much right to high prices as the colliers, the builders, or any others? The building workmen, we fear, however, will go the way before either the colliers or the butchers.

Dover Harbour.—The International Communication Bill, better known as Messrs. Fowler & Abernethy's scheme, now in the House of Commons after passing the Commons, is a project which embraces a harbour of refuge of about 200 acres as against Mr. H. W. Shaw's accommodation space for smaller mail packets. There are only three petitions against the Bill. The first is that of the Dover Harbour Board. They are going against the wishes of the town as expressed by the unanimous vote of the Corporation. The second petition is from the Corporation of Folkestone. The third petition is that of the South-Eastern Railway Company, who do not all they can for Folkestone. The Bill, as the *Dover Chronicle*, will go into committee in the House of Lords with stronger evidence in favour than was adduced in the Commons, and with a good understanding with the French Northern Railway; and, having passed the Peers, the co-operation of the French Government will easily be obtained.

Alarm on the Metropolitan District Railway.—On Wednesday morning last, some excitement was caused by the discovery that a section of the brick arch of the tunnel close to Clouster-road Station of the Metropolitan District Railway, was giving way, caused by the sight of a large mass of sand that had been piled on a vacant piece of land immediately over it. Numbers of men were put to work at once, to remove the great weight. Only one of the lines of rails was used for a time, the trains passing this portion of the line at the slowest possible speed. Some settlements in buildings near this line show that the vibration is very considerable. A correspondent wrote, a short time ago, to ask the reason why the trains moved so slowly between Praed-street and Bayswater stations of the Metropolitan Line.

Architecture at University College.—The prizes gained in the senior classes by Mr. G. H. Lloyd, as mentioned in our last, could have been stated severally as "Certificate of Donaldson-Medal." The recipients would be willing to lose the additional honour which the usual name connected with the medal gives.

The Great Landslip on the Midland Railway.—The obstruction caused by the great disaster at the mouth of the Peak Forest tunnel is likely to prove more serious than was at first anticipated. Five hundred men have been set to work to clear the line, but they look a mere handful, and make but slow progress at present, and the full extent of the damage to the short tunnel is not yet ascertained. The Midland Railway Company have connected their line by a junction with the London and North-Western Railway at Buxton, which has enabled them to run through with the London and North-Western engines, from Manchester to Derby and London *via* Buxton. The Midland continue running trains between Manchester and Chapel-en-le-Firth. The engineers, it is said, promise to restore the thoroughfare in a fortnight.

Sewer Grease.—A "grease" account has been opened in the ledger of the St. Olave's Board of Works for some time, says the *Clerkenwell News*. It shows a clear balance of 104*l.*, and what to do with this amount has been a moot question for a long time back. The origin of the account is somewhat singular. In Bermondsey, as is well known, there are numerous manufactories, at some of which fleshy matter forms an important element. Seven years ago the Board of Works appears to have permitted its sewermen to explore the underground channels in the neighbourhood of these factories, and the result was the collection of grease or fat, which, after paying liberally for expenses of collection, left a balance of the sum named. Mr. Strand moved that its obliteration should be effectual by its being applied to public improvements, and his proposition was agreed to.

St. Mary's Church, Saffron Walden, Struck by Lightning.—At Saffron Walden, on Monday week, the Church of St. Mary was struck by the electric current and considerably damaged. The storm, which lasted two hours with almost unabated fury, broke immediately over the town. The church was struck near the south-west window, which is chipped at several places, and the lightning would appear to have taken an oblique direction and then glanced upwards, as, in its course, a heavy piece of stone was forced out in the inside of the steeple, 125 ft. from the ground; it then shot across to the north-east, and effected a breach through the wall, about 1½ ft. square, hurling the stone a distance of 75 ft. Over a hundredweight of material is displaced. One or two of the flying buttresses on the turrets are also damaged.

Lessons from a Brick.—An Austrian savant has discovered, by means of a microscope, in a brick taken from the pyramid of Dashour, many interesting particulars connected with the life of the ancient Egyptians. The brick itself is made of mud of the Nile, chopped straw, and sand, thus confirming what the Bible and Herodotus had handed to us as to the Egyptian method of brick-making. Besides these materials, the microscope has brought other things to light,—the shells of river-shells, of fish, and of insects, seeds of wild and cultivated flowers, corn and barley, the field-pea, and the common flax, cultivated probably both for food and textile purposes, and the radish, with many others known to science. There were also manufactured products, such as fragments of tiles and pottery, and even small pieces of string made of flax and sheep's wool.

Society of Engineers.—On the 2nd inst. a party of members and associates of the Society of Engineers paid a visit of inspection to the Royal Arsenal, Woolwich, permission for which had been accorded by Colonel Campbell, R.A., the superintendent of the Gun Factories. They were received by Colonel Campbell, Captain Maitland, and Mr. Fraser, by whom they were conducted over the various departments of that establishment, the working details of which were fully explained. The visitors were finally conducted over the laboratory, and witnessed the series of highly interesting processes connected with the manufacture of the service cartridges. Altogether an instructive and pleasant afternoon was spent, and which was rendered more agreeable by the courtesy of those in charge of the various departments.

Value of Land in London.—The freehold site of the church of St. Mildred, Poultry, occupying an area of 2,293 square feet, was sold by tender, on the 10th inst., by Messrs. Fuller, Horsey, Son, & Co., for 46,105*l.*, or at the rate of 20*l.* 2s. per square foot. The purchasers are the Gresham Life Assurance Society.

The Little Bridge, Tunbridge.—At the last monthly meeting of the local Board, the chairman informed the Board that he had been in communication with Mr. Bohner, the county surveyor, who had informed him that tenders had been accepted for the works at the Little Bridge; that contracts were ordered to be prepared; and that they would begin the work in about ten days. He thought it would be desirable that the work of widening the approach to the bridge should be proceeded with at the same time, and he therefore moved that Mr. Dann should be appointed surveyor for this work. An amendment was moved that Mr. G. Richardson should be the surveyor, but the amendment was lost, and Mr. Dann was appointed.

The Institution of Civil Engineers.—Among the numerous signs of the return of confidence in engineering undertakings is the great increase of elections into this society. Since the last return, made three months ago, two hundred members (his Royal Highness Prince Arthur and Dr. Percy), 8 members, and 50 associates have been elected, and 21 students admitted by the council. Against this must be put the deaths or resignations of 23 members, leaving the actual net increase 58. The numbers of the different classes are now as follows:—Hon. members, 16; members, 756; associates, 1,127; and students, 214; making a gross total of 2,143, as against 2,009 at the same time last year.

Improvements in Mark-lane and Fenchurch-street.—Mark-lane and Fenchurch-street are both about to be widened at certain points. The Finance and Improvement Committee of the Commissioners of Sewers have arranged for a further improvement in Mark-lane, by setting back the frontage line at No. 10 several feet, the expense of obtaining the land being 1,148*l.* They have also arranged for a further improvement in Fenchurch-street, by setting back the line of frontage of one house in the street, the cost being 1,000*l.*, and also the setting back the line of frontage of two other houses in the street at a cost of 250*l.* The total cost of the land which has been acquired to carry out these several improvements, is 2,398*l.*

Ancient Monuments.—The report of the Sepulchral Monuments Committee of the Society of Antiquaries has been printed and issued as a Blue-book. This committee was formed in 1869, on the occasion of Mr. Layard, then First Commissioner of Works, requesting the society to draw up a list of such regal and other historical tombs or monuments existing in cathedrals, churches, and other public places and buildings, as in their opinion it would be desirable to place under the protection and supervision of the Government. The result of the labours of the committee, as now printed, forms a most valuable compilation, and will be found very useful for reference. To what extent the Government will act upon it remains to be seen.

Social Science Congress, 1872.—At the meeting of the Social Science Congress in September, in Plymouth and Devonport, the subjects for discussion will include, in the Health Department—1. "What are the principles on which a comprehensive measure for the improvement of sanitary laws should be based?" 2. "What steps should be taken to guard against sewage poisoning?" 3. "What means can be adopted to prevent the pollution of rivers?" The proposition to discuss the means by which a knowledge of sanitary science should be promulgated was not entertained. In the Economy and Trade Department it was resolved to initiate discussions on direct and indirect taxation, on local taxation and administration, on the condition of the agricultural labourer, and on outdoor relief to paupers.

Mr. James Howard's Mansion.—With reference to the recent notice in our columns of this building, we are asked to mention that as regards the encaustic tiles, Messrs. Maw's have been used; Mr. Cooper only provides the ridging and cresting of roofs. Messrs. Dennett's patent fire-proof arch system is adopted throughout the edifice, offices, and stabling. Messrs. Cranston & Luck, of Birmingham, have erected the spacious conservatories on their patent ventilating principle.

Sale of Land in Kent.—The Tunstall Estate, near Sittingbourne, containing nearly 1,000 acres of arable and wood lands, has been sold by auction, at the Mart, by Messrs. Foster, of Pall-mall, in twenty-two lots, for 72,250*l.*

Works at the Stock Exchange.—Messrs. Perry & Co. wish us to say that their tender was 11,600*l.*, not 11,000*l.*, as printed. If correct, respondents will write their thoughts as if they were sixes, and their sixes like noughts, they should be prepared to take the consequences. Another correspondent complains that we have commended his name with an L instead of an S, and in the very letter of complaint the S, if it be one, is written as an L. A fortnight ago a gentleman complained somewhat insolently of our having mistated his name. The signature at the end of his tirade was not decipherable. We hold very strong opinions concerning persons who commit such stupidities.

Kirby-le-Soken.—The commemoration-stone of a new school-house for Kirby-le-Soken, of which Mr. H. Stone, of London, is the architect (son of Mr. R. Stone, of Frinton), and Mr. C. Shephard, of Colchester, the builder, has been laid. It is estimated that the cost of the new school will be about 700*l.*, exclusive of site. The contract price accepted for the building is 497*l.*, exclusive of the cost of bricks and the cartage, which are found. Miss Barnard has provided a site for the school near to the church. The building is of red brick, with Bath stone dressings. It is capable of accommodating more than 150 children.

New Pier at Douglas.—The new low-water landing pier at Douglas, Isle of Man, has been opened by His Excellency Mr. Loch, the Lieutenant-Governor. The pier is 500 ft. in length, 52 ft. in height, 50 ft. in width, with 10 ft. of footway on each side. It has been built from plans prepared by Sir John Coode, at a cost of 46,000*l.* His Excellency named it the Queen's Pier. The company then crossed the hay in boats, and Mrs. Loch laid the foundation-hoek of the new Battery Pier Breakwater, which is intended to run out a distance of 650 ft., at a cost of 62,000*l.*, and which is intended as a pier, landing-place, and breakwater.

Decay of Stone, Lambeth Palace.—The Archbishop of Canterbury has addressed a letter to the Home Secretary calling his attention to the injurious effect upon Lambeth Palace and adjacent buildings, caused by the acid vapours emitted from the potteries in the neighbourhood. His Grace also drew attention to the fact that the decay of the stone of the Houses of Parliament was attributed to the same cause, the smoke containing large quantities of muriatic acid. A copy of the letter was read at the Lambeth Vestry, and the medical officer is about to make a report on the subject.

The Queen's Theatre, Long-acre.—The return of Mr. and Mrs. Bandmann to the London stage must be regarded as an advantage, we have so few actors at the present time devoting themselves to the poetic drama. Time and experience have much improved them, and we have no hesitation in pointing to "Narcissus" as a fine performance on their part. To Mr. George Reynolds also, and Miss Isabel Clifton, praise is justly due. The "Undergraduate," weak as it was in some respects, was worse treated by the press than it should have been. It was well put on the stage, and very well acted.

Burning of a Church.—A large portion of the fine church at Hartshill, near Stoke, Staffordshire, has been destroyed by fire. The large organ, which was about to have been opened, was literally reduced to ashes. The church was built at the cost of the late Mr. Herbert Minton, from designs by Mr. Gilbert Scott. The organ-builder's men were working until half-past eleven at night, and the fire was discovered an hour afterwards in the organ loft. The property was partly insured.

Monumental.—The city of Leyden (Holland) has just inaugurated a statue of Boerhaave, the great naturalist and physician, in presence of a vast multitude. The monument is 11 ft. 8 in. high, and stands on a pedestal of 10 ft. from the ground. The deceased is represented in his professional robe, with a book in his hand, and seems to be either beginning or terminating a lecture. The work was executed by M. Strackée, a sculptor to the king.

The Violence of Recent Storms.—Some evidence of the extreme violence of the recent storms has presented itself at the Chester Quarter Sessions, in a demand upon the county for nearly 11,000*l.*, being the estimated cost of repairs which will be necessary to eight bridges which have been extensively damaged by the rains.

Treat to Workmen.—The workmen, about eighty in number, who had been employed by Mr. Simpson, builder, of Egham, in erecting Heath Lodge, the new residence of Mr. Leeds Paine, were entertained by that gentleman, in the King's Head Inn, on Saturday. The building was designed by Mr. G. A. Dunninge, and is of red brick, with stone dressing.

Fall of a Building at Ashton.—In Park-street, Ashton, a new shaft had been put up less than a fortnight since in a blacksmith's shop, and whilst the men were busily pursuing their work, the shaft gave way, and, knocking out the sides of the building into the street, fell with the debris into the roadway. The roof of the building fell in at the same moment.

South Kensington Museum.—The report reaches us from a well-informed quarter that Mr. Henry Cole, C.B., is about to resign his appointment here, giving probably occasional assistance in the way of advice. If we say we are glad to hear it, it is only for Mr. Cole's own sake, who has nobly earned any leisure he may now desire.

Excavations for a new Building at Westminster Bridge.—The vacant piece of land on the Thames Embankment contiguous to the Metropolitan District Railway Station at Westminster Bridge, has been acquired by the trustees of the St. Stephen's Club as the site of their new club-house, the foundations for which are now being excavated. Much dissatisfaction is expressed.

Prizes for Athletic Sports.—The employees of Messrs. Morant, Boyd, & Blanford, of Bond-street, on the occasion of their annual day out, competed in racing, jumping, and so forth, for plated tea-pots, cruet-stands, knives and forks, and other tasteful and useful articles. About eighty of them afterwards sat down to dinner, and much good feeling was exhibited.

Proposed Monument to Burns at Kilmarnock.—The Kilmarnock Burns's Club have inaugurated a movement for the erection of a monument to the national poet in that town, from whence the first edition of his poems was issued.

The Roman Pavement at Bramden.—In the manor of Woodcote, Hampshire, having been threatened with entire destruction, will be placed in the new museum at Winchester as soon as the building is ready to receive it.

Great Fire at Scutari.—An extensive fire has broken out in a district of Scutari principally inhabited by poor persons, and up to the despatch of the news, 1,000 houses had been burnt down.

Bethnal-green Museum.—The visitors during the week ending July 6th, 1872, numbered 68,661.

TENDERS

For a detached house at Kenley, Surrey. Mr. R. Martin, architect:—

	House.	Felting Roof.
Walke	£1,650	227
Wright, Bros. & Goodchild	1,150	65
Jarrett	1,150	50
Simons	1,118	37
Smethurst	1,050	46
Ward (accepted)	989	48

For a detached house, Kenley, Surrey:—

Ward (accepted)	£800	0
-----------------	------	---

For mixed Juvenile and Infants' School, with teacher's residence, for the village of Farningham, Kent. Mr. T. Renton, architect:—

Sharp & Son	£1,161	0
Arsaud	1,054	0
Naylor	907	0
Gambrell (accepted)	906	0

For erection of two villa residences at Cambridge (exclusive of sand, lime, and bricks). Mr. E. Days, architect:—

Wilson & Son	£1,080	0
Bell & Sons	970	0
Clarke	907	0
Triplady	845	0
Thoday	790	0
Sharp (too late)		

For building gardener's cottage, at Holmberg, for Right Hon. E. F. Leveson-Gower, M.P. (brick supplied). Mr. R. A. Cane, architect:—

Shearburn	£282	0
Inkpen (accepted)	233	0

For offices and stables for the executors of the late Mr. J. M. Threlfall, Brewery, Liverpool. Mr. G. Schmitt, architect. Quantities by Messrs. Curtis & Son:—

	Stables.	Offices.
Holmes & Nicholl	£2,935	£3,901

For residence, stabling, and lodge, near Leamington for Mr. H. Ellis, Messrs. Payne & Talbot, architect. Quantities by Mr. T. Mansell:—

Jellery & Fritchard	£6,820	0
Smith	6,732	0
Horley, Brothers	6,587	0
Mason & Mills	6,382	0
W. & J. Webb	6,215	0
Farnell & Son	6,079	0

For new schools and master's residence, at Stam-in-the-Vale, Berks. Mr. W. Penstone, architect:—

Wheeler	£1,254	0
Newcombe	1,228	0
Honor & Castle	934	0
Williams (accepted)	932	0

For building carcass of house and screen wall on the Kent House Estate, Kensington, for Mr. Sang. Quantities by Mr. Ridley:—

	House.	Wall.
King	£925	£133
Stimpson & Co.	848	106
Richards	800	100
Thorn	735	100

For stables and cottage at Barking, Essex, for Mr. J. Smith, Mr. J. F. Walker, architect. Quantities Messrs. Curtis & Son:—

Henshaw	£1,093	0
Ennor	1,068	0
Brett (accepted)	985	0

For Welsh Congregational Chapel and three houses, the Southwark Bridge-road. Mr. T. Thomas, architect. Quantities supplied by Mr. Sarabole and Mr. J. Green:—

Gough (accepted)	£2,750	0
------------------	--------	---

For alterations and repairs to two houses in Lambeth. Mr. L. Solomon, architect:—

Bridgman & Nuthall	£378	0
James	317	0
Turrell	476	0
James (accepted)	393	0

For new front and alterations to No. 71, Queen-street City. Mr. F. Chancellor, architect. Quantities Messrs. Curtis & Son:—

Anley	£2,540	0
Sharprington & Cole	2,477	0
Tanner & Sons	2,460	0
Henshaw	2,415	0
Brown	2,337	0
Crabb	2,280	0
Merritt & Ashby	2,275	0

TEMPORARY OFFICES.
 28, Berners-street, Oxford-street, London, W.

PROSPECTUS.

The object of this Company is to take over and purchase of Mr. Blashfield, the well-known Terra-Cotta Manufacturer, of Stamford, his business, together with the Plant, Models, Moulds, Machinery, Stock, and other effects; and, by an increase of capital, fully to employ and develop the present works. For a long period past, public and private business of importance has been given up or returned from insolvency of capital.
 Large Beds of Clay are in close proximity to these works, especially suited for making red and buff Tiles and Ornamental Bricks. There are Fire Clay Beds also in the vicinity of Stamford, from which Bricks and Tiles have been made at these works, exceeding in durability at high temperatures, the best Article and made of Bluebridge Clay.
 The employment of these workshouses had therefore depended especially upon a trade for Ornamental and Artistic productions; but even at all times he fully occupied by works of common utility and every-day demand.
 The whole of the Buildings, Machinery, Plant, Models, Moulds, &c., have been recently valued in detail by an Architect who has had great experience in Terra-Cotta Work.
 The price to be paid for the whole of the Business, including the

Plant, Models, Moulds, Patterns, Designs, Manufactured Stock, &c., is 15,000*l.* Of this sum, 12,000*l.* is to be paid in cash and 3,000*l.* in paid-up shares. It is proposed to retain Mr. Blashfield's services as Manager. It is also proposed that Mr. Blashfield should join the Board of Directors as soon as the purchase from him is completed. It is estimated that 2,000*l.* as additional working capital will be sufficient for the present to conduct the business, beyond the 14,000*l.* purchase money. The Capital, therefore, to be called up at the present time, exclusive of the 2,000*l.* in paid-up shares, will be 15,000*l.*
 The Books of Accounts have been balanced yearly by well-known public Accountants, and the average profits of five years have been upwards of 10 per cent. per annum, notwithstanding all the drawbacks from insufficiency of capital to fully develop the works, and the great outlay that has been made to diversify and make the trade.
 An Agreement dated the 8th day of July, 1872, has been made between the said John Marriott Blashfield, of the one part, and Michael Parmenter Currie, on behalf of the Company, of the other part. Copies of the Memorandum and Articles of Association can be seen at the Office of the Solicitors, of whom Prospectuses can be obtained; also of the Brokers, and at the Office of the Company.

GRAINING.—WOODS, 6d. per square
 1 year; MARBLE, 2*l.* per square foot. Good references.—
 Address, GRAINER, 314, Vanwall-bridge-road, S.W.

LOCAL GOVERNMENT BOARD,
 - Bildeston. The Local Board for the Borough of Bildeston are
 - prepared to receive APPLICANTS from qualified persons for the
 - performance of the various duties of a BOROUGH SURVEYOR, at a
 - salary of not exceeding 100*l.* per annum. Applications for the office,
 - with Testimonials, to be sent to the undersigned, on or before the
 - 21st JULY instant, from which date the duties required to be
 - performed by the person appointed may be defined.
 - A. B. - The person selected will be required to enter on his duties
 - forthwith by order.

TO ARCHITECTS. A THOROUGHLY competent ARCHITECT'S ASSISTANT WANTS an ENGAGEMENT. Six years Assistant in present office. For qualifications, salary, and references, address, ARCHITECT, care of Messrs GIBB, ARCHER, and CO., 10, Pall-mall.

TO WATER COMPANIES, CONTRACTORS, &c. A THOROUGHLY practical WORKING FOREMAN is open to an ENGAGEMENT, at home or abroad, having just completed the erection of a water-works at Falmouth in the public hospital. &c. First-class references.—Address, C. K. 12, Manchester-road, Notting-hill, W.

TO MASTER MASONS, &c. A FIRST-RATE LETTER-CUTTER and CARVER and thorough practical MASON, who has carried out extensive works, and is competent to take charge of general yards, seeks a CONSTANCY. Good references.—Address, G. H. Mr. Wilson's, 13, High-street, Aldershot.

AS IMPROVER.—A Young Man, aged 21, having had a little experience in the PLUMBING and GASFITTING, wishes to ATTEND himself for two years to improve in the above branches. He is well experienced in jacking and ginning. A premium will be given.—Address, G. W. 4, Munster-terrace, Queen's-road, Hammersmith, W.

AS HANDY MAN.—A respectable Young Man (a BRICKLAYER) seeks a Constant SITUATION. Understands all jobs of work, repairing of roofs, whitewashing, &c. Will not be particular, and he can turn his hand to anything. Will go to any part of England. State wages.—Address, A. C. Mr. Osborne, 6, Dale-road, Reigate, Town, London.

TO ARCHITECTS, ENGINEERS, &c. A YOUNG MAN requires a RE-ENGAGEMENT as DRAUGHTSMAN, &c. (five years' and a half experience). Can survey estates and soil in preparing designs, &c.—Address, K. A. 20, Victoria-Park-road, E.

PERFECTION IN BOOKKEEPING.—Builders and Others desiring a really good system, can have a SET of MODELS FOR BUILDERS BOOKS, by DOUBLE ENTRY, to which was awarded the prize offered in "The Builder," No. 1129, and which has been adopted by many large firms. Also a Modified Management by Sir Henry Doulton, for Builders.—Address, E. A. 4, St. George's-road, Regent's Park, London.

Crown 8vo. price 2s. cloth (postage 2d.) THE TIMBER MERCHANT'S COMPANION: containing Tables of the Refined Weight and Measurement of Deals and Borders of all sizes; also a Relative Price list, each size given per Lineal Foot, No. to any ton price per Petersburg Standard Measure, &c. &c. By WILLIAM DOWSON, Timber Merchant, Hull. London: LOCKWOOD & CO., 7, Stationers' Hall-court, E.C.

Second Edition, with 5 Plates, Royal 8vo. 5s. cloth (postage 2d.) THE STRAINS ON STRUCTURES OF IRON WORK, with Practical Remarks on Iron Construction. By F. W. SHIELDS, M.T.C.E. London: LOCKWOOD & CO., 7, Stationers' Hall-court, E.C.

ARCHITECTURE. RE-ISSUE OF THE FOLLOWING STANDARD WORKS, PUBLISHED BY J. JOBBINS, 3, WARWICK-COURT, HOLBORN, LONDON, W.C.

EXAMPLES OF BUILDING CONSTRUCTION. Intended as an Aid Memoire for the Professional Man and the Operative. Being a Series of Notes Drawn up to a large scale, exemplifying the Arrangement and Details adopted in carrying out the several branches of Trade, requisite for Public and Private Edifices. In Eighty Parts, 2s. 6d. each; or in Four Volumes, bound in cloth, Twelve Guineas.

N.B.—This work extensively used in the Science and Art Department, South Kensington.

GOthic ORNAMENTS. Being a Series of Examples of Enriched Details and Accessories of the Architecture of Great Britain. By JAMES G. COLLING, Architect. In Forty-eight Parts, 3s. each; or in Two Volumes, bound in cloth, Seven Guineas.

DETAILS OF GOTHIC ARCHITECTURE. Measured and drawn from Existing Examples. By JAMES G. COLLING, Architect. In Thirty-eight Parts, 2s. 6d. each; or in Two Volumes, bound in cloth, Five Guineas.

AN ANALYSIS OF ANCIENT DOMESTIC ARCHITECTURE. Exhibiting some of the best Examples in Great Britain. From Drawings and Measurements taken on the Spot, by F. T. DOLLMAN and J. JOBBINS. In Twenty Parts, 2s. 6d. each; or in Two Volumes, bound in cloth, Five Guineas.

ARCHITECTURAL ANTIQUARIAN, NAVAL, MILITARY, & MEDICAL DRAWINGS. Landscape, Side Plans, Railway Plans, and Sectional Letter-pressed in the best style. Lists of Quantities, Circular Notes, Invoices, &c. By JAMES G. COLLING, Architect. In Forty-eight Parts, 3s. each; or in Two Volumes, bound in cloth, Seven Guineas.

EASTLAKES' GOTHIC REVIVAL. In one volume, JOURNAL 8vo., with 48 Illustrations, engraved on wood (39 the full size of the page), price 31s. 6d. cloth.

A HISTORY OF THE GOTHIC REVIVAL. An Attempt to Show how far the Taste for Medieval Architecture, which flourished in England during the two last centuries, since been Encouraged and Developed.

OPINIONS OF THE PRESS.—During the last fifty years countless churches have been restored, rebuilt, and those who feel interested to know exactly what has done in one branch of church architecture alone cannot but be desirous to possess themselves of Mr. Eastlake's "History of the Gothic Revival in England." Longmans & Co. We think it cannot be the case of the season, not only because it contains a great many illustrations, but because we believe it is just the book which the large number of persons who take an interest in the direction of ecclesiastical rather than of profane art would like to give and receive.

Mr. Eastlake writes well, and has a large and thorough knowledge of his subject. His engravings are so carefully and exactly done that they may serve the purpose of an architect. His work is not limited to the Gothic Revival, but gives various examples of the houses and public buildings which have followed the fashion for Gothic. His enthusiasm for the Gothic revival, if he were not he would scarcely have written a book about it.—but he is no bigot.

Mr. Eastlake, cherishing a decided sympathy with the Gothic movement, is yet so candid and impartial in his estimates of different schools and examples, so temperate in his remarks, whether to praise or to censure, that we find his book a most interesting reading. It contains a number of valuable and frequent introductions of short biographical notices, or anecdotes of persons and professions connected with the Gothic Revival, and one view of a great variety of instances, and constantly presents to the reader a series of illustrations, which are so judiciously displayed in them with more consistency as the movement in architecture. The volume is furnished with about fifty beautiful engravings on wood.

That great reaction from the Renaissance which has characterised the present century, and which has stamped indelible traces on the literature, the science, the art, the manners, and the taste of the nation. Mr. Eastlake, the secretary of the Institute of Architects, has taken an interest in this movement in one of its most important developments, the architecture.

We shall see, in our examination of Mr. Eastlake's volume, that he has not only done so, but that he has done so with a care and industry some of the facts have escaped his research or have been forgotten. This reflection is not a criticism, but a commendation. The author has been so red and impartiality with which he has undertaken, without fastidious delay, a difficult and very important task.

Mr. Eastlake traces the history of what he calls "the Gothic Revival" with care, criticism, and a keen eye for the facts. He contains a list of the names of the architects of the productions of a taste who built in the Gothic style during the early decades of the century, and traces the history forward to the present time.

Mr. Eastlake follows out minutely the history of Gothic Architecture, according to the various countries, every church, every conventual building of any importance which illustrated a period of the Gothic Revival. He has also included the consideration of the facts, forming quite a repertoire of interesting facts both to the professional and non-professional reader.

Mr. Eastlake's "Hints on Renaissance Style," published some years ago, are well known to all who are interested in the subject. In his present book he surveys the whole of the subject, and gives a full and complete account of the Gothic Revival in England. He has a list of the names of the architects of the productions of a taste who built in the Gothic style during the early decades of the century, and traces the history forward to the present time.

The Builder.

VOL. XXX.—No. 1537.

Canal and River Engineering.

IDEAL RIVERS, and all rivers as far as they are navigable in their natural condition, have always been, and must always be, in every country, most important means of communication for the transport of merchandise and produce. Besides these, in many countries, artificial canals have

been constructed to a great extent for the same purpose. These are laid out in level reaches, communicating with each other by means of locks, where the rising or falling ground makes a change of level necessary. These canals are fed with water at their summit levels, for the most part from the upper sources of the rivers. In addition to these artificial navigations, the natural river streams have been made navigable by constructing across them dams, which consist of a lock and a weir, the lock to permit the passage of vessels, and the weir to take over the surplus waters that come down the river, the head of water being thus kept up in the several reaches to a height which gives a sufficient depth for navigation. There have been so-called improvements of rivers, that have been done for the benefit of a particular interest, and to the detriment of more general interests. It has been not difficult, in time back, to pass through Parliament Bills authorising locks to be made here and there, for the so-called improvement of the navigation of a river, and other river courses have been blocked up by dams for mill purposes; but these things have been done in the way that is too common with us,—legislation for special and class interests, without considering its bearing on other interests. If you cannot prove to the satisfaction of the lawyers that you have a *locus standi*, you are not allowed to bring forward your arguments against a Bill for a proposed river navigation improvement; and to entitle you to this *locus standi* you must show that you are personally aggrieved, whereas the grievance in this case is a general one; and, unfortunately, that which is everybody's business is nobody's. The harm done to the general interests by damming up rivers for the purpose of navigation, which feeds the pockets of a few, is that the flood waters of rivers so dealt with overflow their banks, and create the miasma that always arises from damp ground. But, worse than this, it prevents the natural drainage of the land into the river-course, and keeps it in a condition which is perennially miasmatic. After the mischief has been done we hear complaints of loss of crops, illness, and other evils, and these are the general interests that nobody looks after at the proper time. It is, of course, from want of knowledge, and not from ill intention, that our legislators permit these things to be done. To those interested in river navigation, we do not know that we can point out a better source of information than the second edition of Mr. David Stevenson's treatise on "Canal and River Engineering." *

* The Principles and Practice of Canal and River Engineering, by David Stevenson, F.R.S.E. A. & C. Black Edinburgh, 1872.

As to inland and ordinary canal engineering, the book is meagre and poor in instruction, but upon the more important question to us at the present day of river improvements it is rich in information, derived, apparently, from personal experience, and given tentatively and modestly. In treating of such common things as everybody has or may have experience in, it may be sufficient to make assertion of one's own belief, and leave it to others to satisfy themselves whether it accords with their own experience; but in scientific questions we must always proceed from those things we know to those unknown things we wish to inquire into.

Mr. Stevenson proposes to divide rivers into three compartments:—1, (going upwards from the sea) there is the *sea proper* compartment; 2, the *tidal compartment*; and 3, the *river proper*. "These three compartments possess very different physical characteristics. The presence of unimpaired tidal phenomena in the lowest; the modified flow of the tide (produced by the inclination of the river's bed) in the intermediate; and the absence of all tidal influence in the highest compartment." These three divisions of a river require to be considered separately, if we would take any large view of the engineering requirements of them.

It is remarkable that in the "sea proper" reach of the river the level of low water is the same from end to end, however long the distance may be: thus, by observations made by Mr. Stevenson at Dornoch Firth, it was found that the level of low water at Portmahomac harbour, and at Meikleferry, 11 miles upwards, was identical; and, moreover, at a station called Bonar Quarry, 8 miles above Meikleferry, the level of low water was the same. From this circumstance Mr. Stevenson is led to the conclusion that the "sea proper" compartment of this river extends from the ocean to, or at least as far as, Bonar Quarry, 19 miles upwards from Portmahomac. But at this point begins a remarkable change in the phenomena. The fourth place of observation upwards was at Bonar Bridge, only 1,700 yards, or a little less than a mile, above Bonar Quarry, and in this short distance the level of low water rises as much as 6 ft. 6 in.

"It was, therefore, concluded that, in the Dornoch Firth, the point at which the low-water level of spring tides met the descending current of fresh water lay somewhere between the Quarry and Bonar Bridge." It was ascertained by intermediate observations that the exact point at which this junction takes place,—that is, where the sea-water meets the descending current,—was about 60 yards above the gauge at Bonar Quarry. We make a point of stating this to show how exactly observations ought to be made on rivers, for it is only by exact observations that the true regimen of a river can be ascertained. But although the level of low water is the same throughout this sea reach of the river, it is important to observe that the times of low water are different at the different places; thus, the time of low water at Meikleferry, 11 miles above Portmahomac Harbour, was found to be 50 minutes later than at the latter place, and at Bonar Quarry, 8 miles further up, it was found to be 50 minutes later than at Meikleferry, so that when the water had attained its lowest level at Bonar Quarry, it had been rising for 1 hour and 40 minutes at Portmahomac. Truly, the action of the tides is wonderful, and in an island like ours is of almost more interest than anything else. If a diagram be made of the action of a tidal wave, setting off the successive heights to which the water attains vertically, and spacing the horizontal distance to accord with the times, it will be found that in the reach that Mr. Stevenson calls the "sea proper," the curved line will be symmetrical, but, proceeding further up the river, a diagram of the same tide will show an irregular curve, the symmetrical flow and ebb of the tide being disturbed by the current of

fresh water coming down the river. Proceeding still further up a river, we get out of the influence of the tides altogether. Thus it will be seen how useful it is, in considering how to improve river channels, to divide them into the compartments suggested by Mr. Stevenson, for the engineering works required for each vary with the conditions which affect them.

Apparently, Mr. Stevenson's practice has lain chiefly in the estuaries of rivers; and, accordingly, we find the chief value of his book to consist of his experience in the outfalls of rivers, the shifting sand-banks, and other things affecting the free navigation. At the mouth of almost every river there is a "bar;" but the real bar, according to Mr. Stevenson, is not the sand-banks we see bared at low water, but submerged sand-banks, often far below, or to seawards of, the apparent bar of exposed sand-banks. At this part of a river's mouth the navigable channel is found to shift its position laterally; but it is a curious circumstance that the water upon a bar maintains nearly a uniform depth over long periods of time. Thus, at the mouth of the Mersey the mean height of high water of about 700 observations in each of the years 1768, 1769, and 1770, was 15.459 ft. above the datum of the old dock sill, and the mean height above the same datum in the years 1854, 1855, and 1856 was 15.454 ft. Further, the mean height of the highest spring tides throughout the year was, in the years 1768, 1769, and 1770, 18.993 ft., and in the years 1854, 1855, and 1856, 19.016 ft. above the same datum.

This nearly constant height of water at the bar above a dock-sill would, of course, indicate nothing of value unless we take into account the level to which the sand-bank attains at the bar. This, from one cause, is constantly increasing, and is as constantly diminished by another, viz., the outflow of backwater. This backwater is that which is spread out by every in-coming tide over the sand-banks, and is the more effective in scouring a channel through the bar the lower it is in level. In the formation and improvement of harbours, and of the mouths of rivers, this is an important point to be kept in view, and especially so in all questions of reclamation of land from the sea; and Mr. Stevenson lays down this axiom, that "by enlarging the tidal capacity of a river at a low level, where the acquired volume is filled at every tide, compensation may be given for a much larger amount of water excluded at a higher level;" thus pointing to the way in which land may be successfully reclaimed, and warning against attempts to reclaim it in improper situations.

The bar of the Mersey has a depth of from 9 to 10 ft. at low water; the Tyne, 6 to 7 ft.; the Wear, 3 to 4 ft.; the Ribbles, 7 to 8 ft.; the Tay, 16 to 18 ft.; and the Dee, 10 to 12 ft.

That famous old Professor, Dr. John Robison, who contributed to the *Encyclopædia Britannica* the article, "Theory of Rivers," and afterwards wrote his "Mechanical Philosophy," says, in the latter-named work, vol. iii., p. 353, Brewster's edition, "When a wave of a certain magnitude enters a channel, it has a certain quantity of motion, measured by the quantity of water and its velocity. If the channel, keeping the same depth, contract its width, the water, keeping for a while its momentum, must increase its velocity or its depth, or both, and thus it may happen that . . ." as we know, the range of tide is but 4 or 5 ft. in the open Atlantic Ocean, while it is ten times as much in some narrow rivers (e.g., the Wye at Choptow).

In considering the action of a tidal wave entering a river, it is important to distinguish between its rate of propagation and its velocity of current. Thus, in the Dornoch Firth, the distance of 11 miles from Portmahomac to Meikleferry is traversed by the tide wave in thirty minutes, being the interval between the first appearance of the tide, at the two stations,

giving a velocity of 22 miles per hour; but this is not that current which carries vessels over the bar, and onward to their destination; that current, at that place, Mr. Stevenson, never found to exceed 4 miles per hour.

A current of more than 6 miles an hour is hardly navigable. In almost every case which Mr. Stevenson had to investigate, he found that the rate of the tide current was, in common parlance, greatly exaggerated. Even in the Dee, where the rise of tide is great, and the current very rapid, he does not think that the current much exceeds 5 miles an hour; and in other rivers, where the rise of tide is not so great, he limits the probable rate of flow to 4 miles an hour. Every engineer accustomed to observations of the flow of tidal rivers will agree with this, as a general statement, although in the Severn the current is 9 miles per hour, and in the Mersey 7 miles. Mr. Stevenson quotes Capt. Otter's statement, that the current off the Pentland Skerries, is 10.6 nautical miles per hour, which he believes to be the highest tide current ever observed.

In connexion with the lower department of a river, to which we have, as yet, confined our remarks, there is in some rivers the phenomenon of the bore. This peculiarity of the tidal flow occurs wherever the obstructions offered by the river channel are such as to cause a heaving-up of the water at the mouth of the river, and so propagating itself with violence, instead of, as in ordinary cases, flowing quietly up the river. Quoting from the late Admiral Beechey's "Remarks on the Tidal Phenomena of the River Severn," the author says that the bore in that river is not dangerous to boats if afloat in the middle of the river, but that if they are allowed to remain near the shore they are liable to be swamped or stove in, for the wave breaks with great violence along the banks as it proceeds.

Now, having regard to the distinction to be made between the rate of propagation of a tide-wave and the velocity of the current of water, it is of importance to understand that by removing obstructions to the flow of water up a river from the sea, the rate of propagation is increased, and the velocity diminished; or, in other words, the quantity of tidal water that is driven up the river is increased, while from the removal of obstructions, its velocity is necessarily lessened, and thus the river is rendered more easy of navigation.

In the "tidal compartment" of a river various means are taken to preserve the channel for navigation. Mr. Stevenson objects to the system of jetties from the shore, as being likely to cause eddies between them, and so to deposit the sand and mud held in suspension in the water and form shoals, which may project into the stream beyond the line drawn from the head of one jetty to that of the next. To prevent this the heads of jetties are sometimes connected together by a wall, thus giving a clear run to the water; but when this has been done the character of the work is changed from the jetty system to that of walling. The latest example on a large scale of this latter system is the Thames Embankment, and interesting information on the same subject is given with respect to the Dee and the Ribble.

In the "river proper" compartment of a river the primitive method of navigating the shallow parts was by "stanches." These consisted of two substantial posts fixed in the bed of the river at a sufficient width apart to allow a boat to pass easily between them, and connected at the bottom by a cross sill. Upon one of these posts was a beam turning upon a hinge or joint, and long enough to span the opening. When the stanch was used the boatman turned the beam across the opening, and placed a number of planks vertically in the stream, resting against the sill at the bottom and the beam at the top, thus forming a weir, which raised the water about 5 ft. high. The boards were then rapidly withdrawn, the swinging-beam turned back, and all the hoast which had been collected above were carried by the flow of water over the shallow below. By repeating this operation at given intervals the boats were enabled to proceed a distance of twenty-three miles in two or three days, on the river Stour, in Essex, as reported by Sir William Cubitt.

This primitive system has been superseded by throwing permanent dams across the river, upon which Mr. Stevenson remarks that "the operation of damming up the river is important, and cannot be passed over without special notice. A river dam is a work in all cases demanding careful consideration, not only as regards its safe

construction, so as to resist the force of the stream, but also with reference to its effect in opposing the free discharge of the water, and causing the land above it to be flooded during heavy rains."

The dams constructed by Sir William Cubitt, on the Severn, consist of two rows of sheet piling driven across the river at a distance apart of about 30 ft., the heads of the upper row being cut off, and capped with a sill, at a height of 11 ft., and the lower row at 3 ft., above the bottom. The heads of the upper row of piles mark the height to which the water is to be raised in the upper reach, and those of the lower row the height in the lower reach, the difference of level between the two being 8 ft. Between the rows of piling the space is filled in with rubble stone, sloping off at the rate of 1 in 3.7. The upper row of piles is backed up also with rubble stone, sloped off at the rate of about 1 to 1.

In order to reduce the depth of any given quantity of water passing over a weir, the weir is made as long as possible, and for this purpose is not placed square across the river, but obliquely, its length being about three times the breadth of the river. The height at which the weir should be fixed may be determined on the following considerations. Having determined the height to which floods are to be permitted to rise in the reach above the weir, the top of the weir is to be at such a level that the rectangle formed by its length and the depth of water upon it in a flood shall be equal to the cross sectional area of the river above the weir, within the same flood limits.

Of ship canals there are three classes:—1. Those which on their route from sea to sea traverse high districts, surmounting the elevation by locks supplied by natural lakes or artificial reservoirs, such as the Languedoc Canal in France, and the Caledonian Canal. 2. Those in low-lying districts, which are carried on a uniform water-level from end to end, and are defended against the inroad of the sea at high-water by double-acting locks, which also retain the canal-water at low tide, such as the canals of Holland and other low-lying countries.

3. Canals of which the Suez is the only example yet made, without locks at either end, and communicating freely with the sea, from which it derives its water-supply.

The Caledonian Canal, constructed by Telford, was made 120 ft. wide at the top water-level, 50 ft. at the bottom, and 20 ft. deep; but from a survey Mr. Stevenson made in 1849, he was led to the conclusion that the standard depth of the canal cannot be regarded as more than 18 ft., giving access to vessels of 160 ft. in length, 38 ft. beam, and 17 ft. draught of water.

The North Holland Canal, designed by M. Blanken, and extending from Amsterdam to the IJelder, is fifty miles in length, 123½ ft. wide at the top water-level, 31 ft. wide at the bottom, and 18½ ft. deep. But this canal will soon be superseded by the New Amsterdam Canal, now being constructed under the directions of Mr. Hawkshaw. It is to be 197 ft. wide at top water-level, 89 ft. at the bottom, and 23 ft. deep.

The Suez Canal, designed and carried out by M. Ferdinand Lesseps, is eighty-eight miles in length, of which sixty-six miles are actual canal, formed by cuttings, fourteen miles by dredging through the lakes, and eight miles required no works, the natural depth being equal to that of the canal. The bottom width is 72 ft., and the top width varies according to the character of the cuttings, being, in the deep cuttings, 197 ft. The depth at which it was intended that the canal should be maintained is 26 ft.

THE RELATION OF PHOTOGRAPHY TO ART.

The range of photography as a practical craft has never yet, to our knowledge, been seriously discussed. It is, however, of no small importance to have a definite idea of the limit of that range. The question is, in fact, how far may art be, now or hereafter, superseded by a mechanical process. It is unnecessary to say how deeply this problem affects the future of all branches of art. Nor is the subject one that relates to the fine arts alone. It comes home to the practical craft of the builder. In the education of the architect much weight is laid, and properly laid, upon the actual admeasurement of every detail by the student. He is to jump at nothing. Now, the great triumph achieved by the applica-

tion of science to geodesic operations consists in the facility given to the surveyor by the substitution of angular for linear measurement. The practicability of producing, at any feasible cost, such a map of a country as that provided by our Ordnance Survey, depends implicitly upon the adoption of a trigonometric process. Any invention, therefore, that by optic means could supersede the toilsome procedure of architectural measurements, would be likely to effect a revolution in the practice of the draughtsman, if it proved to be as accurate as the hex sextant and the prismatic compass. We propose to inquire how far photography is to be relied on, as a substitute either for the fancy of the artist, or the toil of the architectural draughtsman.

The phenomena of microscopic enlargement are well known. The process is perfectly intelligible. The rays of light which proceed from the surface of the object regarded through the lens are so refracted by passing through that medium as to enter the eye at distorted angles; and the result is the apparent extension of the surface viewed. With this visual enlargement is necessarily connected a corresponding diminution of light. So indelibly is this the case, that it is necessary to throw, by means of a separate lens, or concave mirror, a large quantity of additional light on any object that it is wished highly to magnify. It would otherwise be so dark as to be invisible under the microscope.

In the use of the camera in photography occurs the converse of the operation of the microscope. The rays of light from the entire surface of the object focussed by the lens are made to converge on a much smaller area. The illumination thus obtained is intense, although some light is lost in the passage. But the chemical, or photographic, energy of the refracted light is not possessed by the entire pencil of rays. It resides in the blue portion of the spectrum alone; or rather in those invisible lines that accompany and overlap that blue portion. A compensation is thus provided, to a certain extent, for the extraordinary brilliancy of the concentrated light. All the light is brought to a focus, but only a certain portion of it—considerably less, we may say, than a third part,—produces any permanent effect on the chemical condition of the preparation that is to form the negative picture. Without this accidental compensation it would be impossible for photographs to be produced bearing less distinct marks of artificial optica action than in the case of objects magnified by the microscope.

The image which the converging actinic rays produce upon the negative plate in the camera is thus altogether different from that which would be formed on the retina, if it were placed in a corresponding position. The rays to which the retina and optic nerve are sensible, are inert on the chemically sensitised film. The rays which chemically affect the latter are insensible to the eye; yet so closely analogous, or rather so intimately connected, are the visible and the chemical lines of force, that a permanent, visible, approximately truthful picture is produced by this invisible light.

We learn, for the present, the further consideration of the optical or geometrical question of the refraction and subsequent action of the actinic rays, in order to pursue the analysis of their pictorial result.

We must, however, remember those causes of disturbance and distortion which are dependent on the size and refractive power of the lens employed. Such distortion varies according to laws not difficult to understand. The difference between the true perspective incidence of the rays of light on the eye and the convergent incidence of the artificially refracted rays is a constant source of trouble to the photographer. In some of the finest photographs yet produced such as those taken by Herr Braun of the marble sculpture of the Vatican, or those of Grecian temples and ruins taken by M. de Granges, the optical distortion is painfully apparent. A heroic figure which, in the positions which occupy the plane of proper distance is represented with a truth that mocks the ver gleam of the marble, stretches towards the spectator a hand that only resembles the monstrous foot, under the shadow of which the fabled Arimaspan sheltered his slumbers from the vertical sun. Lofty columns, on either side of the centre of the picture, curve and bow towards the perpendicular so as to emulate the arc of the rainbow. But this is not the difficult with which we are at present concerned. B the use of a lens of large diameter and moderate refractive power, combined with a diaphragm

that cuts off the rays at a certain distance from the centre, and by judicious choice of standpoint, the extreme of distortion may be, to a great extent, avoided. There will, of course, always be a mathematical distortion when the object photographed presents any but a plane surface, and accurate measurements from an image taken in the camera must not in consequence be expected; but by skill and costly apparatus the distortion of which we speak may almost be reduced within the limits of imperceptible error.

But even if we assume that these causes of error may be eliminated or compensated, and that we have a camera of size and power adequate to deal with the living form almost as if it was a picture or an object lying in a plane, we yet shall find that certain serious defects are inseparable from any process of optically magnifying or diminishing an object by the use of a lens.

The image which the actinic rays produce on the negative plate exhibits three very distinct qualities. We may regard it with reference to its outline or contour; with reference to its *chiaroscuro*, or masses of light and shade (which have to represent both natural light and shade and the concurrent effect of colour); and with reference to its surface or apparent texture. In each of these elements, where the size of the object is altered in the photograph, there is a material and irreconcilable difference between the image produced mechanically by the lens, and either the aspect of the natural object, on the one hand, or the satisfactory representation of that object, on the other hand, by competent art.

Let us first examine the third quality to which we referred, that of surface, or apparent texture. This is a matter of the highest pictorial importance. We must recollect the remarks which we made on this subject in a recent number (p. 498, *ante*) to the attention of our readers, as showing that it is not so much the tint, or proportion of light and shade, as the pattern, or apparent texture of the surface, that gives to the mind the idea of the nature of the material of which it is composed. We cannot think of a more familiar, and at the same time a more lucid, instance than that before suggested, of the mixture of given quantities of black and white fibre in threads, or twills, or checks. Varying from the microscopic finish of enamel, from the delicacy of the petals of a flower, or of the most exquisite human skin in early youth, to the roughness of canvas, of bark, or of hammer-dressed stone, or weather-worn rock, the surface texture has as much influence in determining the idea which the mind forms of the nature of an object as form itself—often more so. A face, however beautiful in form, loses all power to charm if the complexion be cadaverous, jaundiced, or spotted. Every sculptor knows what is the effect of the appearance of the blue stains in marble if they occur on the surface of his work. Roubiliac made a practice of destroying any statue on which he was engaged, however far advanced, if a stain appeared in an important place. Our readers may remember a French female statue, in the International Exhibition at South Kensington, from which the eye is instinctively averted as from a plague-stricken object, from the fact that the face is absolutely riddled with blue stains. In the mechanical reduction, by means of the lens, of the shaded and coloured surface of the objects represented, we have in some cases a change effected in their apparent texture which it is the especial study of the engraver to avoid. That artist, indeed, represents blending and modulated shades by a delicate diaper of black and white; but he does so of purpose, and under the guidance, in cases of excellence, of a sure and subtle instinct. He does not represent a satin or a velvet by a process at all akin to that of photography. Neither does the painter. The artist—

we speak of the thoroughly accomplished artist—gives to his work the effect of the texture which he wishes to represent. He does so by methods which he could not fully describe, but the secret of which is, that he reproduces, in his work, the general effect produced on his own eye by the material he copies. He is not concerned with the optical process. He does not give hair for hair and line for line. He grasps the idea of texture, and, by something akin to creative power, impresses that idea on canvas or on marble. It is only in his earliest stages, or in the very rudiments of art, that man seeks to reflect as does a mirror.

Now, when the artist who produced the origi-

nal object has been Nature herself, when she has clothed her work with an appropriate surface texture, a mere mechanical reduction of the scale must altogether alter the pictorial effect. We can see this most distinctly in the hair and in the eye-brows, eye-lashes, and beard. The physiognomic effect of their mammalian attributes is highly characteristic. At a distance exceeding three times the height of a human figure, the individuality of distinct hairs is lost. The eye-lash is visible only as a shadow. The hair is seen as a mass; whether of crisp or of hyacinthine curls, of tangled and dishevelled locks, or of harsh and stiff wiry fur. These distinct effects are, or have been, adequately represented by art, but it has not been done, except in certain rare cases of Japanese art, by any attempt to reproduce the individual hairs. The result of such an attempt is to destroy pictorial effect. But the camera can only delineate hair by hair, however reduced be the scale. Thus, the effect is often that of a blur. Sometimes the hair may lend itself to the reflexion of not unpicturesque masses; but almost always there is an unnatural rigidity, if carefully examined. The shadow thrown by well-arranged masses, may be such as to compensate to some degree for the poverty induced by minute accuracy of detail. But the shade which nature gives to the upper eyelid, which is always exaggerated by the artist, and on which the vivacity of the graphic or plastic representation of a face chiefly depends, is frittered away by the faithful detail presented by the camera on a reduced scale. When we consider that to this defect in delineation are added a partial flattening of the globe of the eye, due to the reflexive glaze of its surface, as well as to the blue contained in the white, and the exaggerated shade on the under eyelid, due to reduction in size, we can no longer be at a loss for the reasons which render the photographic representation of the eye almost always more or less of a failure.

We have been led to this analysis in speaking of the apparent surface, or texture, but it is evident that the question of contour and that of *chiaroscuro* are so intimately connected with the former quality, that it is difficult to treat of either alone. Again, the actinic effect of a surface is a very different matter from its optical, or pictorial effect. Certain glazed surfaces altogether refuse to lend themselves to clear reproduction by the camera. Something of this may be seen, as we have said, in the eye. The most striking example we can quote is that of the lustrated majolica of Gubbio. The photograph of a plate adorned with highly-prized enamel, which may have cost a hundred guineas, is only a hopeless snudge. The actinic condition of a surface is by no means identical with its physical condition. Thus equally polished surfaces of marble, of ivory, and of china, give thoroughly different images under the camera. But we repeat that, even apart from this chemical difficulty, the difference in apparent texture produced by reduction by a lens is often such as to alter altogether one of the most characteristic qualities of the object represented.

In what we may call, rather by way of illustration than of definition, the foreshortening of *chiaroscuro*, which is effected by the camera, the effect is often remarkably fine. It is to this power, and to the clearing tones produced by the metallic salts employed, that the chief admiration excited by photography is due. Striking contrasts of light and shade are produced, within distances far less than can often be obtained in nature. But the change from brilliancy to gloom in however brief a space, is always delicately graded. It is difficult for human art to effect anything so subtle as these gradations of the camera. Here lies what we may call the artistic merit of photography. It exaggerates light and shade; but it does so with an entire freedom from abrupt contrast, and thus from either harshness or poverty. No human touch can, in this respect, vie with the artistic power of the solar pencil.

In representation of texture, then, photography must often be at fault, excepting when it reproduces an object of its natural size. In the effects of *chiaroscuro*, on the contrary, the power obtained by the camera far exceeds that which the artist can hope to produce. But this power is far from being readily manageable. The camera has no taste; no imagination. It produces its brilliant contrasts of light and shade in total disregard of their artistic effect. Thus, in representing the human face, it may either flatter or the reverse, in a manner with which it is extremely difficult to deal. The intensified

shadow generally gives precision, energy, and often dignity, to the nose. The sharp precision of outline, in which slight irregularities are lost, the deep shadow thrown by the nostril, the clear definition of the alæ, are such as often to make this feature in a photograph far more beautiful than is the case in life. But the same cause that gives this artistic shadow to the nose converts the upper lip into a black stain, and usually obliterated the most tell-tale line in the whole countenance, that of the meeting of the lips. Again, the under lip and the under eyelid are distorted by a condensed shadow, and the most fugitive, most delicate, and most expressive trait of the entire countenance, the almost imperceptible modelling of the trait between the nostril and the angle of the mouth, is almost always utterly intractable by the lens. Good effects have been produced by such an incidence of light as to show the upper lip, and the line which parts the lips. But, in these cases, an ugly compensation is afforded by the deep and ghastly shadow thrown by the trait at the corner of the mouth.

There remains for investigation the subject of outline or contour, or what is technically spoken of as drawing. On this subject photography has thrown a new and most important light. It is obvious that the considerations above mentioned as affecting texture and shade do not apply to pure contour. We may refer to the drawings of Moritz Retach, or to the original rough sketches of John Leech, as instances of the most perfect delineation of outline, undisturbed by any attempt at colour or *chiaroscuro*. The question has arisen, and it was by no means one easy to solve, whether the laws of beautiful contour vary according to scale. Would a perfectly proportioned human figure, if drawn in outline of the natural size, be properly represented by the mechanical reduction of that outline to, let us say, an inch in height? The question is one of subtle delicacy, and of no slight importance. It is tolerably evident, in the first place, what is the fact in the converse case. If we wish to increase the size of a figure from the natural to the gigantic, the proportions must be varied. This results from the laws of perspective. It is intimated, although not distinctly expressed, in the *Traité de Peinture* of Leonardo da Vinci. It is very closely connected with another consideration, namely, that of the point of view from which a statue or a picture can be seen to most advantage. The more careful is our study of the antique, the more evident is the fact, that the greatest artists contemplated the position to be occupied by their works as an essential element in their design. In modern sculpture, at least in this country, the primary element of illumination is altogether disregarded. The result is often total confusion. But it is clear, both from Classic literature and from the peculiarities of all undoubted antique work, that the artists not only wrought under the illumination by which their work was to be viewed, but further so wrought as to render their statues most perfect in their effect when regarded from a definite and limited standpoint. It is difficult to cite any fine antique, except the Venus de' Medici, in which the two sides of the face are accurately alike, and there are peculiarities in the Venus which tend to the idea that the statue was intended for a piece of chamber sculpture,—for an object, not of worship, but of luxury.

We think it must be evident from the above observations that photography, while capable of rendering good service to the artist, can never displace the intelligent toil of the hand of man. It is not alone that great cost and great labour are requisite to produce really excellent photographs; it is not alone that a good and a bad photograph differ as much as a good and a bad painting; but there are inherent difficulties, and defects, in the action of the camera, which the true artist instinctively avoids. For memoranda of a known object, under a special aspect, the use of the camera is of the greatest value. But it is as furnishing the note and hint for the artist. We are speaking here of portraiture chiefly, not as in itself a work of art. Again, exquisite glimpses of nature may be at times petrified into durable beauty in the camera. Even the flitting clouds and the breaking spray have been seized by an instantaneous magic; and trees limned without even a shiver to slurr the outline of their foliage. But it must be remembered that these photographs, however pictorial, are not—or but very rarely—pictures. They may be bits cut out of the landscape, it is true, but in this very fact lies concealed not

only a defect, but a danger. We have seen something, and fear we shall see much more, of the reflex effect of photography on art. When the artist sees how nature is reflected in the mirror or in the camera, and when he hears on all sides, from those uncultured in art, how beautiful such a reflexion is, there is a great danger lest he should strive to copy it. Not infrequently he has done so. In the periodical literature of the day, when illustrated by portraits, the evil effect of the *carte de visite* is often too apparent. We see woodcuts of,—we need not recognise the subjects, but we do see that they are taken from photographs. Most of the defects, and none of the beauty, of the sun pictures are thus magnified and perpetuated, and a new chamber of horrors is added to the gallery of cheap illustration.

It will be very evident from what we have said that the rules of architectural draughtsmanship are not to be modified by the introduction of the camera. The proper use of photography by the portrait-painter and by the architectural draughtsman varies in this respect. In the former case a precise delineation, within certain limits of error, is attained, which may be of great service to the artist, if he avoids the above-described causes of pictorial bad effect. In the latter, evidence of the general effect of a building, and even of the exact character and state of the building material employed, is obtained and put on record, while for accuracy of plan and of detail the draughtsman must have recourse to the time-honoured method of absolute measurement. In either case photography is at once reliable to a certain extent, and capricious in an extraordinary degree. It is the most valuable servant of which the artist can avail himself, but becomes the most dangerous and destructive of masters.

THE PROPOSED PUBLIC HEALTH BILL.
